

FEDERAL REGISTER

Vol. 85

Thursday,

No. 84

April 30, 2020

Book 1 of 3 Books

Pages 23893–24172

OFFICE OF THE FEDERAL REGISTER

The **FEDERAL REGISTER** (ISSN 0097-6326) is published daily, Monday through Friday, except official holidays, by the Office of the Federal Register, National Archives and Records Administration, under the Federal Register Act (44 U.S.C. Ch. 15) and the regulations of the Administrative Committee of the Federal Register (1 CFR Ch. I). The Superintendent of Documents, U.S. Government Publishing Office, is the exclusive distributor of the official edition. Periodicals postage is paid at Washington, DC.

The **FEDERAL REGISTER** provides a uniform system for making available to the public regulations and legal notices issued by Federal agencies. These include Presidential proclamations and Executive Orders, Federal agency documents having general applicability and legal effect, documents required to be published by act of Congress, and other Federal agency documents of public interest.

Documents are on file for public inspection in the Office of the Federal Register the day before they are published, unless the issuing agency requests earlier filing. For a list of documents currently on file for public inspection, see www.federalregister.gov.

The seal of the National Archives and Records Administration authenticates the **Federal Register** as the official serial publication established under the Federal Register Act. Under 44 U.S.C. 1507, the contents of the **Federal Register** shall be judicially noticed.

The **Federal Register** is published in paper and on 24x microfiche. It is also available online at no charge at www.govinfo.gov, a service of the U.S. Government Publishing Office.

The online edition of the **Federal Register** is issued under the authority of the Administrative Committee of the Federal Register as the official legal equivalent of the paper and microfiche editions (44 U.S.C. 4101 and 1 CFR 5.10). It is updated by 6:00 a.m. each day the **Federal Register** is published and includes both text and graphics from Volume 1, 1 (March 14, 1936) forward. For more information, contact the GPO Customer Contact Center, U.S. Government Publishing Office. Phone 202-512-1800 or 866-512-1800 (toll free). E-mail, gpocusthelp.com.

The annual subscription price for the **Federal Register** paper edition is \$860 plus postage, or \$929, for a combined **Federal Register**, **Federal Register** Index and List of CFR Sections Affected (LSA) subscription; the microfiche edition of the **Federal Register** including the **Federal Register** Index and LSA is \$330, plus postage. Six month subscriptions are available for one-half the annual rate. The prevailing postal rates will be applied to orders according to the delivery method requested. The price of a single copy of the daily **Federal Register**, including postage, is based on the number of pages: \$11 for an issue containing less than 200 pages; \$22 for an issue containing 200 to 400 pages; and \$33 for an issue containing more than 400 pages. Single issues of the microfiche edition may be purchased for \$3 per copy, including postage. Remit check or money order, made payable to the Superintendent of Documents, or charge to your GPO Deposit Account, VISA, MasterCard, American Express, or Discover. Mail to: U.S. Government Publishing Office—New Orders, P.O. Box 979050, St. Louis, MO 63197-9000; or call toll free 1-866-512-1800, DC area 202-512-1800; or go to the U.S. Government Online Bookstore site, see bookstore.gpo.gov.

There are no restrictions on the republication of material appearing in the **Federal Register**.

How To Cite This Publication: Use the volume number and the page number. Example: 85 FR 12345.

Postmaster: Send address changes to the Superintendent of Documents, Federal Register, U.S. Government Publishing Office, Washington, DC 20402, along with the entire mailing label from the last issue received.

Rules and Regulations

Federal Register

Vol. 85, No. 84

Thursday, April 30, 2020

This section of the FEDERAL REGISTER contains regulatory documents having general applicability and legal effect, most of which are keyed to and codified in the Code of Federal Regulations, which is published under 50 titles pursuant to 44 U.S.C. 1510.

The Code of Federal Regulations is sold by the Superintendent of Documents.

DEPARTMENT OF AGRICULTURE

Federal Crop Insurance Corporation

7 CFR Part 457

[Docket ID FCIC-20-0003]

RIN 0563-AC67

Common Crop Insurance Regulations; Forage Production Crop Insurance Provisions and Forage Seeding Crop Insurance Provisions

AGENCY: Federal Crop Insurance Corporation, USDA.

ACTION: Final rule with request for comments.

SUMMARY: The Federal Crop Insurance Corporation (FCIC) amends the Common Crop Insurance Regulations, Forage Production Crop Insurance Provisions and Forage Seeding Crop Insurance Provisions. The intended effect of this action is to update existing policy provisions and definitions to better reflect current agricultural practices and allow for variations in insurance provisions based on regionally-specific agronomic conditions and potential future expansions. The changes are to be effective for the 2021 and succeeding crop years.

DATES: *Effective date:* The Forage Seeding amendments to 7 CFR 457.151 are effective April 30, 2020, and the Forage Production amendments to 7 CFR 457.117 are effective June 30, 2020.

Comment date: We will consider comments that we receive on this rule until the close of business June 29, 2020. FCIC will consider these comments and make changes to the rule if warranted in a subsequent rulemaking.

ADDRESSES: We invite you to submit comments on this rule. In your comments, include the date, volume, and page number of this issue of the **Federal Register**, and the title of rule. You may submit comments by any of

the following methods, although FCIC prefers that you submit comments electronically through the Federal eRulemaking Portal:

- *Federal eRulemaking Portal:* Go to <http://www.regulations.gov> and search for Docket ID FCIC-20-0003. Follow the online instructions for submitting comments.

- *Mail:* Director, Product Administration and Standards Division, Risk Management Agency, United States Department of Agriculture, P.O. Box 419205, Kansas City, MO 64133-6205.

All comments received, including those received by mail, will be posted without change and publicly available on <http://www.regulations.gov>.

Privacy Act: Anyone is able to search the electronic form of all comments received for any dockets by the name of the person submitting the comment (or signing the comment, if submitted on behalf of an association, business, labor union, etc.). Interested persons may review the complete User Notice and Privacy Notice for *Regulations.gov* at <http://www.regulations.gov/#!privacyNotice>.

FOR FURTHER INFORMATION CONTACT:

Francie Tolle; Product Administration and Standards Division, Risk Management Agency, United States Department of Agriculture, Beacon Facility, Stop 0812, Room 7829, P.O. Box 419205, Kansas City, MO 64141-6205, telephone (816) 926-7730; email francie.tolle@usda.gov.

SUPPLEMENTARY INFORMATION:

Forage Production Background

FCIC amends the Common Crop Insurance Regulations (7 CFR part 457) by revising 7 CFR 457.117 Forage Production Crop Insurance Provisions, to be effective for the 2021 and succeeding crop years. The intended effect of this action is to ensure cohesiveness and continual coverage between the Forage Seeding and Forage Production Crop Insurance Provisions.

The changes are as follows:

1. FCIC is removing the paragraph immediately preceding section 1, which refers to the order of priority if a conflict exists among the policy provisions. This same provision is contained in the Common Crop Insurance Policy, Basic Provisions ("Basic Provisions"). Therefore, the appearance here is duplicative and should be removed from the Crop Provisions.

2. Section 1—FCIC is revising the definition of "adequate stand." The new definition will rely upon the number of live alfalfa stems for making loss determinations for forage containing more than 60 percent alfalfa. Loss determinations for forage types that contain less than 60 percent alfalfa or no alfalfa at all, such as red clover, will be based upon the normal planting density because there is no demonstrable correlation between future yield and the number of live alfalfa stems when the forage type does not contain at least 60 percent alfalfa.

FCIC is revising the definition of "fall planted" by adding the phrase, "except when specified in the Special Provisions," following the phrase, "A forage crop seeded after June 30," to allow FCIC to provide area-specific dates that have distinctions outside of this range. For example, Maine is currently recognized as having a single growing season with planting dates that begin before June 30 but that can extend beyond June 30, which is inconsistent with existing definitions for "spring planted" and "fall planted." This change also allows FCIC to be responsive to new or evolving regional conditions as needed in the future.

FCIC is adding the definition of "normal planting density." The new definition will utilize the former definition of adequate stand to be "the minimum number of live plants per square foot as shown in the Special Provisions." The normal planting density is more appropriate for measuring successful establishment of forage with less than 60 percent alfalfa ground cover.

FCIC is revising the definition of "spring planted" to include a reference to the Special Provisions. The revised definition adds the phrase "except when specified in the Special Provisions," following the phrase "A forage crop seeded before July 1," to allow FCIC to provide area specific dates that have distinctions outside of this range. This change allows FCIC to be responsive to new or evolving regional conditions as needed in the future.

FCIC is revising the definition of "Year of establishment" by moving the sentences "Insurance under this policy does not attach until after the year of establishment" and "Insurance during the year of establishment may be

available under the forage seeding policy” to the end of the definition. FCIC is reordering this definition to reduce confusion and clear up potential misunderstandings by reorganizing the definition in a more logical order.

3. Section 2—FCIC is revising the section heading to state “Insurance Guarantees, Coverage Levels, and Prices for Determining Indemnities.” FCIC is revising this section heading to correct a typo and simplify the heading.

FCIC is removing the phrase, “(Insurance Guarantees, Coverage Levels, and Prices for Determining Indemnities)” when referring to section 3 of the Basic Provisions because the parenthetical section name is unnecessary and removing these titles will prevent FCIC from having to revise the Crop Provisions if section titles change in the Basic Provisions. FCIC is also removing the parenthetical reference to the Basic Provisions’ section number, “(§ 457.8)” to be consistent throughout the policy.

FCIC is revising section 2(a) by stating the price elections are found in the “actuarial documents,” not the “special provisions.” FCIC is replacing this term as price elections are referenced in actuarial documents, not the special provisions.

4. Section 3—FCIC is removing the phrase, “(Contract Changes)” when referring to section 4 of the Basic Provisions because the parenthetical section name is unnecessary and removing these titles will prevent FCIC from having to revise the Crop Provisions if section titles change in the Basic Provisions. FCIC is also removing the parenthetical reference to the Basic Provisions’ section number, “(§ 457.8)” to be consistent throughout the policy.

5. Section 4—FCIC is revising the cancellation and termination dates for Arizona from September 30 to October 31, to align the dates with those for California because Arizona is agronomically similar to California. FCIC is also revising the cancellation and termination dates for Nevada and Utah from October 31 to September 30 because insurance attaches October 16 and having a September sales closing date accommodates the insurance attachment date.

6. Section 6—FCIC is revising Section 6(a), by replacing paragraph (2) to clarify that the crop must not be intended to be grazed and cannot be grazed at any time during the insurance period to be insurable. This clarification ensures that insureds will not graze the stand in lieu of harvesting it and claim an indemnity for the harvested shortfall. FCIC is also adding paragraph (3) to indicate that the insured crop will

include all forage that follows a year of establishment that results in an adequate stand as shown in the Special Provisions. This clarification is provided as Forage Production is an Actual Production History (APH) plan of insurance that is based on actual harvest of the forage acreage following the year of establishment.

FCIC is revising Section 6(b) by removing the phrase, “(Insured Crop)” when referring to section 8 of the Basic Provisions because the parenthetical section name is unnecessary and removing these titles will prevent FCIC from having to revise the Crop Provisions if section titles change in the Basic Provisions. FCIC is also removing the parenthetical reference to the Basic Provisions’ section number, “(§ 457.8)” to be consistent throughout the policy.

7. Section 7—FCIC is removing the phrase, “(Insurance Period)” when referring to section 11 of the Basic Provisions because the parenthetical section name is unnecessary and removing these titles will prevent FCIC from having to revise the Crop Provisions if section titles change in the Basic Provisions. FCIC is also removing the parenthetical reference to the Basic Provisions’ section number, “(§ 457.8)” to be consistent throughout the policy.

FCIC is also removing all state and county references in Section 7(a) and 7(b)(6), Insurance Period, and instead refer to the attachment date and end of insurance period date shown in the actuarial documents to simplify the provision and allow FCIC to provide area specific dates, allow for future program expansion, and allow FCIC to continue to be responsive to new or evolving regional conditions as needed in the future.

FCIC is changing section 7(b) to state “forage production insurance” instead of “insurance” to provide clarity and to clear up potential misunderstandings.

FCIC is removing section 7(c) as the Forage Production Winter Coverage Endorsement is currently not an insurable coverage option.

8. Section 8—FCIC is revising Section 8, Causes of Loss by removing the phrase, “(Causes of Loss)” when referring to section 12 of the Basic Provisions because the parenthetical section name is unnecessary and removing these titles will prevent FCIC from having to revise the Crop Provisions if section titles change in the Basic Provisions. FCIC is also removing the parenthetical reference to the Basic Provisions’ section number, “(§ 457.8)” to be consistent throughout the policy.

FCIC is also revising section 8(b) to state that we will not insure against damage of loss of production that occurs

after “harvest” instead of after “removal from the windrow”. The two phrases are interchangeable but using the word “harvest” will apply consistent use of the definition of harvest throughout the policy.

9. Section 9—FCIC is revising Section 9(a) to replace “harvest” with “cutting”. The section will state that the producer must notify the approved insurance provider within 3 days of the date cutting should have started if the insured crop will not be harvested. The definition of cutting is more appropriate than harvest in this instance as harvest requires removal of the forage from the windrow or field, and cutting is the severance of the forage plant from its roots.

10. Section 10—FCIC is correcting references throughout Section 10(b) to reference Section 10 instead of Section 11. FCIC is also providing grammatical edits to example 1 and example 2 of Section 10.

FCIC is revising section 10(f) by removing the phrase, “(Production Included in Determining Indemnities)” when referring to section 15 of the Basic Provisions because the parenthetical section name is unnecessary and removing these titles will prevent FCIC from having to revise the Crop Provisions if section titles change in the Basic Provisions. FCIC is also removing the parenthetical reference to the Basic Provisions’ section number, “(§ 457.8)” to be consistent throughout the policy.

Forage Seeding Background

FCIC amends the Common Crop Insurance Regulations (7 CFR part 457) by revising 7 CFR 457.151 Forage Seeding Crop Insurance Provisions, to be effective for the 2021 and succeeding crop years. The intended effect of this action is to update existing policy provisions and definitions to better reflect current agricultural practices and allow for variations in insurance provisions based on regional agronomic conditions and potential future expansions.

The changes are as follows:

1. FCIC is removing the paragraph immediately preceding section 1, which refers to the order of priority if a conflict exists among the policy provisions. This same provision is contained in the Common Crop Insurance Policy, Basic Provisions (“Basic Provisions”). Therefore, the appearance here is duplicative and should be removed from the Crop Provisions.

2. Section 1—FCIC is adding the definition of “adequate stand.” The new definition will allow RMA to revise loss adjustment procedures to rely upon the number of live alfalfa stems rather than

the number of live plants (normal stand) for making loss determinations for forage containing more than 60 percent alfalfa. Plants can have more than one stem. Extension research across major forage growing areas has demonstrated that the number of live alfalfa stems is more closely correlated with future yield than the number of live plants when alfalfa is the dominant component of the forage mixture. Loss determinations for forage types that contain less than 60 percent alfalfa or no alfalfa at all, such as red clover, will have no change to existing loss adjustment procedures and, as stated below, will be based upon the normal planting density because there is no demonstrable correlation between future yield and the number of live alfalfa stems when the forage type does not contain at least 60 percent alfalfa.

FCIC is adding the definition of “amount of insurance.” The term “amount of insurance” refers to the dollar amount of insurance per acre obtained by multiplying the reference maximum dollar amount shown in the actuarial documents by the coverage level percentage elected by the insured. FCIC adds this definition to provide clarity because the term is used multiple times in the Crop Provisions but is not defined.

FCIC is removing the definition of “nurse crop (companion crop)” and adding the definition of “companion crop”. FCIC also replaces the definition “nurse crop (companion crop)” with the term “companion crop” throughout the Crop Provisions. FCIC replaces this definition to reduce ambiguity and increase clarity by using one term instead of referring to “nurse crop” and “companion crop” interchangeably.

FCIC is revising the definition of “fall planted” by adding the phrase “except when specified in the Special Provisions,” following the phrase “A forage crop seeded after June 30” to allow FCIC to provide area-specific dates that have distinctions outside of this range. For example, Maine is currently recognized as having a single growing season with planting dates that begin before June 30 but that can extend beyond June 30, which is inconsistent with existing definitions for “spring planted” and “fall planted.” This change also allows FCIC to be responsive to new or evolving regional conditions as needed in the future.

FCIC is revising the definition of “good farming practices.” The revised definition adds the phrase “in lieu of the definition in the Basic Provisions” to clarify that the “good farming practices” definition in the Crop Provisions will replace the definition

contained in the Basic Provisions. The definition in the Basic Provisions is not appropriate for forage seeding because it includes references to the insured’s approved yield, but these Crop Provisions provide coverage for a failed forage seeding, not for yield losses below an insured’s approved yield. The revised definition also replaces the phrase “normal stand” with “adequate stand,” because the adequate stand will be used to determine if the forage seeding was successful. The revised definition also replaces the phrase “and are those recognized by the National Institute of Food and Agriculture as compatible with agronomic and weather conditions in the county” with “which are those generally recognized by agricultural experts or organic agricultural experts, as compatible with agronomic and weather conditions for the area” to be more consistent with the definition of “good farming practices” contained in the Basic Provisions (even though the definition in the Basic Provisions is no longer applicable, some of the same principles apply). These changes are intended to ensure that the definition is consistent with the practices applicable to forage seeding crops.

FCIC is revising the definition of “harvest” to remove the word “only” before “grazed” to clarify that the acreage does not have to be exclusively grazed to not be considered harvested. If the acreage is grazed at any time regardless of whether the crop is removed from the field, it is not considered harvested.

FCIC is removing the definition of “normal stand” and replacing it with the definition of “normal planting density.” The new definition of “normal planting density” simplifies the previous definition of “normal stand” by replacing the phrase “a population of live plants per square foot that meets the minimum required number of plants” with the more concise phrase “the minimum number of live plants per square foot.” The normal planting density will be used to determine if the stand qualifies for replanting payments. The normal planting density will result in more accurate replanting payments than basing replant determinations on an adequate stand because not all stems may have emerged when replanting determinations are made.

FCIC is revising the definition of “planted acreage” by removing the reference to “provisions in section 1” and replacing it with the more specific phrase “definition in”. This is not a substantive change, but it makes it consistent with other definitions that

refer to the definitions in the Basic Provisions.

FCIC is revising the definition of “replanting” by removing the duplicative language that is already contained in the Basic Provisions. FCIC is revising the remaining sentence of the current definition by adding the phrase “in addition to the definition in the Basic Provisions” to clarify that the “replanting” definition in the Crop Provisions will add to the definition contained in the Basic Provisions, substituting the word “replacing” with the word “placing” as it is a more accurate term for seeding an existing stand, and replacing the phrase “which results in” with the word “using” to convey that using a reduced seeding rate to replace seed into an existing damaged stand will not be considered replanting.

FCIC is revising the definition of “sales closing date.” The revised definition replaces the term “fall seeded” with “fall planted” and “spring seeded” with “spring planted.” These terms are used interchangeably, and this change will add clarity and reduce confusion because “fall planted” and “spring planted” are defined within the policy, but “fall seeded” and “spring seeded” are not.

FCIC is revising the definition of “spring planted.” The revised definition adds the phrase “except when specified in the Special Provisions,” following the phrase “A forage crop seeded before July 1,” to allow FCIC to provide area specific dates that have distinctions outside of this range. For example, Maine is currently recognized as having a single growing season with planting dates that begin before June 30 but that can extend beyond June 30, which is inconsistent with existing definitions for “spring planted” and “fall planted”. This change also allows FCIC to be responsive to new or evolving regional conditions as needed in the future. FCIC proposes this change to reduce ambiguity and increase clarity because the definition of “crop year” references the calendar year of the planted acreage.

3. Section 3—FCIC is revising section 3(a) and 3(b) by removing the phrase, “(Insurance Guarantees, Coverage Levels, and Prices for Determining Indemnities)” when referring to section 3 of the Basic Provisions because the parenthetical section name is unnecessary and removing these titles will prevent FCIC from having to revise the Crop Provisions if section titles change in the Basic Provisions. FCIC is also removing the parenthetical reference to the Basic Provisions’ section number, “(§ 457.8)” to be consistent throughout the policy.

FCIC is also revising section 3 to clarify the circumstances under which a producer can make changes to their insurance in counties that have both fall and spring sales closing dates (often referred to as “dual counties”). Producers who do not plant any fall planted acreage may purchase or revise their insurance coverage until the spring (later) sales closing date. Producers who plant fall planted acreage may not revise their coverage at the spring sales closing date and may not purchase insurance on the spring planted acreage if no coverage was purchased on the fall planted acreage. These conditions mirror those of other insurance programs that provide coverage for both fall planted and spring planted acreage in the same county, but the conditions are new to the Forage Seeding insurance policy.

4. Section 5—FCIC is replacing the cancellation and termination date table with a new date table. The new dates allow for expansion of the fall planted practice and align forage seeding cancellation and termination dates with the dates for other fall planted crops in each state. Maine’s cancellation and termination dates will remain unchanged at March 15 to allow time after premium billing for a termination decision to be made. In all other states, the cancellation date will be July 31 and termination date will be September 30 to allow time after premium billing for a termination decision to be made.

5. Section 6—FCIC is replacing the term “acreage report date” with the term “acreage reporting date.” FCIC is making this change because the term “acreage reporting date” is defined in the Basic Provisions and also appears in the Special Provisions.

6. Section 7—FCIC is revising section 8 by removing the phrase, “(Insured Crop)” when referring to section 8 of the Basic Provisions because the parenthetical section name is unnecessary and removing these titles will prevent FCIC from having to revise the Crop Provisions if section titles change in the Basic Provisions. FCIC is also removing the parenthetical reference to the Basic Provisions’ section number, “(§ 457.8)” to be consistent throughout the policy.

FCIC is also replacing “a normal stand” with “an adequate stand” and “nurse crops” with “companion crops” to incorporate the references to the newly defined terms stated above, in Section 1.

7. Section 8—FCIC is revising section 8(a) to simplify this section by removing references to states and counties and applying the same replanting requirements to all insurable areas. FCIC

is removing section 8(b) which requires some California counties to replant if damage occurred anytime within the crop year, compared to all other areas, where replanting is only required for damage that occurred before the final planting date. This change was done concurrently with revisions to section 11, which outlines when replanting payments are allowed based on region and spring or fall planting. While these changes will simplify the Crop Provisions by streamlining requirements for all areas, cases may arise that necessitate different requirements for localized geographic areas. Therefore, FCIC is also allowing these provisions to be modified at the county-level in the Special Provisions to allow FCIC greater flexibility in determining regional specific distinctions for replanting requirements and to protect program integrity and insured interests by allowing FCIC, with assistance from forage subject matter experts and regional offices, to address regional specific production practices. FCIC is also replacing the phrase “a normal stand” with “the normal planting density,” consistent with the changes above regarding the definition change.

8. Section 9—FCIC is revising section 9 by removing the phrase, “(Insurance Period)” when referring to section 11 of the Basic Provisions because the parenthetical section name is unnecessary and removing these titles will prevent FCIC from having to revise the Crop Provisions if section titles change in the Basic Provisions. FCIC is also removing the parenthetical reference to the Basic Provisions’ section number, “(§ 457.8)” to be consistent throughout the policy.

FCIC is revising section 9(c) to be grammatically correct.

FCIC is also removing all state and county specific end of insurance dates in 9(g) and instead referring to the end of insurance period date shown in the actuarial documents. This change will simplify the provision and allow FCIC to provide area specific dates, allow for future program expansion, and allow FCIC to continue to be responsive to new or evolving regional conditions as needed in the future.

9. Section 10—FCIC is revising section 10 by removing the phrase, “(Causes of Loss)” when referring to section 12 of the Basic Provisions because the parenthetical section name is unnecessary and removing these titles will prevent FCIC from having to revise the Crop Provisions if section titles change in the Basic Provisions. FCIC is also removing the parenthetical reference to the Basic Provisions’

section number, “(§ 457.8)” to be consistent throughout the policy.

FCIC is replacing the phrase “a stand of forage that occur” with the phrase “an adequate stand that occurs.” This change reduces ambiguity and clarifies the provisions because “adequate stand” is a defined term but “stand of forage” is not, which could lead to different results when determining losses.

10. Section 11—In section 11(a), FCIC is moving the phrase “unless specified otherwise in the Special Provisions,” from paragraph (a)(1) (addressing California only) to the main paragraph (addressing all areas) to allow FCIC greater flexibility in determining regional specific distinctions for replanting payments and to protect program integrity and insured interests by allowing FCIC, with assistance from forage subject matter experts and regional offices, to address regional specific production practices.

FCIC is moving the phrase “It is practical to replant;” from paragraph (a)(2)(iii) (addressing Lassen, Modoc, Mono, Shasta, Siskiyou Counties, California and all other states) to the paragraph 11(a)(1) (addressing all areas). FCIC is moving this phrase to consistently apply the requirement that it be practical to replant in order to receive a replanting payment across all counties and states.

In section 11(a)(2), FCIC is moving the phrase “We give written consent to replant;” from paragraph (a)(2)(iv) (addressing Lassen, Modoc, Mono, Shasta, Siskiyou Counties, California and all other states) to the paragraph 11(a)(2) (addressing all areas). FCIC is moving this phrase to require written consent by approved insurance providers as a requirement of replanting payments across all counties and states. FCIC is renumbering subsequent paragraphs.

In the newly designated section 11(a)(3) FCIC is replacing the phrase “within the insurance period” with the phrase “before the spring final planting date in the actuarial documents.” FCIC is replacing this phrase so that allowable replanting payments correlate with replanting requirements. Specifically, this change corresponds with the removal of section 8(b), which removed the replanting requirement in California counties for damage occurring after the spring final planting date. Therefore, the spring final planting date is a more appropriate timeframe for defining when replanting payments are available. FCIC is replacing “a normal stand” with “the normal planting density” consistent with the changes made above.

FCIC is revising the newly designated section 11(a)(4) to remove the list of specific California counties. This list is not needed because the Special Provisions will include any county differences in replanting payment provisions.

FCIC is removing section 11(a)(4)(i), renumbering subsequent paragraphs, and adding the phrase “spring or” before “fall planted” in the newly designated section 11(a)(4)(i) to extend replanting payment eligibility to include both fall and spring planted practices, as opposed to the current provisions that allowed replanting only for a failed fall seeding in counties that designated both fall and spring final planting dates. FCIC is adding this language in order to allow replanting payments for producers engaged in the spring planted practice. A producer that plants a forage crop in the spring suffers the same financial consequences as a producer of a fall planted crop, if that crop fails to emerge or suffers damage and needs to be replanted. Therefore, FCIC is expanding coverage to allow replanting payments for spring planted forage as well as fall planted forage. As the plan requires replanting to maintain the insurance, this will provide some compensation to cover replanting costs. Additionally, FCIC is replacing the phrase “a normal stand” with the phrase “the normal planting density,” consistent with definition change.

In the newly designated section 11(a)(2)(ii), FCIC is revising the paragraph to clarify the provision only pertains to the fall planted practice, because a separate provision is added below to address the spring planted practice. FCIC is also adding the word “final” before “planting date” to eliminate ambiguity between planting dates. FCIC is also correcting the grammar.

FCIC is revising the newly designated section 11(a)(2)(iii) to provide that if spring planted, the original planting took place after the earliest planting date shown in the Special Provisions, and the acreage is replanted by the spring final planting date shown in the Special Provisions. FCIC is adding this language in order to allow replanting payments for producers engaged in the spring planted practice. A producer that plants a forage crop in the spring suffers the same financial consequences as a producer of a fall planted crop, if that crop fails to emerge or suffers damage and needs to be replanted. Therefore, FCIC is expanding coverage to allow replanting payments for spring planted forage as well as fall planted forage. Additionally, as the plan requires replanting to maintain the insurance,

this will provide some compensation to cover replanting costs.

In section 11(b), FCIC is adding “(a)” directly after “section 13” to more specifically reference section 13(a). This addition clarifies which specific part of section 13 this provision is referencing.

11. Section 12—In section 12(a) and 12(b), FCIC is removing the phrase, “(Duties in the Event of Damage or Loss)” when referring to section 14 of the Basic Provisions because the parenthetical section name is unnecessary and removing these titles will prevent FCIC from having to revise the Crop Provisions if section titles change in the Basic Provisions. FCIC is also removing the parenthetical reference to the Basic Provisions’ section number, “(§ 457.8)” to be consistent throughout the policy.

In section 12(b), FCIC is also adding the adjective “damaged” before “fall planted acreage” and removing the phrase “that is damaged” after the phrase “fall planted acreage” to simplify the language and clarify the provisions.

12. Section 13—FCIC is removing the sub-section designation of “(a)” as it is not needed in the introductory paragraph. FCIC is also adding paragraph designation “(a)” and the statement “Each type and practice:” directly following the introductory paragraph in order to clarify and simplify the section, because the steps for settling a claim should be followed for each type and practice, and then summed to any applicable unit.

FCIC is revising section 13(a)(1) to change the phrase, “Multiplying the insured acreage of each type and practice by the amount of insurance for the applicable type and practice;” to, “Determining the value of all insured acreage by multiplying the number of insured acres by the dollar amount of insurance;”. This change is intended to clarify that this is the outcome of the calculation in this step and to remove reference to type and practices because type and practice instructions are already stated in 13(a).

FCIC is removing 13(a)(2), because the step for totaling results by type and practice from 13(a) is moved to the newly designated 13(b).

FCIC is revising section 13(a)(3) to change the phrase, “multiplying the total acres with an established stand for the insured acreage of each type and practice in the unit by the amount of insurance for the applicable type and practice” to, “determining the value of the acreage with no insurable losses, by multiplying the dollar amount of insurance by the insured acreage that”. This change is intended to simplify the policy language by removing the term

“established stand,” which was referenced within the settlement steps of section 13(b); clarifying the outcome of the calculation in this step by adding the phrase, “value of the acreage with no insurable losses”; and removing the phrase “for each type and practice” because this instruction is already stated in 13(a). In addition, FCIC designates 13(a)(3) as 13(a)(2).

FCIC is moving the settlement steps in section 13(b), previously referred to as an “established stand” to section 13(a)(2)(i)–(iv). In moving these settlement steps, FCIC is also revising section 13(a)(2)(i)–(iv) to each start with a verb to provide more cohesive language and reduce redundancy between the introductory text and subordinate paragraphs.

FCIC is adding a new section 13(a)(3) to provide that determining the value of the acreage with partial insurable losses, by multiplying the dollar amount of insurance by the number of insured acres that have a stand less than 75 percent but more than 55 percent of an adequate stand, by 50 percent (0.5). This step was previously captured in section 13(c), which provided that the amount of indemnity on any spring planted acreage determined in accordance with section 13(a) will be reduced 50 percent if the stand is less than 75 percent but more than 55 percent of a normal stand. FCIC is moving this step to section 13(a)(3) so that all steps for settling a claim throughout section 13 are presented in sequential order. FCIC is updating the language of this step to clarify that the outcome of the calculation in this step is determining the value of acreage with partial insurable losses by adding the phrase, “determining the value of the acreage with partial insurable losses”. FCIC is also removing reference to spring planted acreage because the steps for settling a claim are first done by any applicable unit, which is already defined to allow basic units by spring planted and fall planted acreage. FCIC is replacing the term “a normal stand” with the term “an adequate stand,” consistent with the new definition. FCIC is removing section 13(c) because it is incorporated into section 13(a)(3), and it is no longer needed.

FCIC is revising section 13(a)(4), to state “Adding the results in section 13(a)(2) and section 13(a)(3);”. This revision calculates the total value of the acreage with no insurable loss by adding together the value of acreage with no insurable loss plus the value of acreage with partial insurable loss. FCIC removes the previous language because the step for totaling results by type and

practice from 13(a) is moved to the newly designated 13(b).

FCIC is updating section 13(a)(5) reference of section 13(a)(2) to section 13(a)(1) and change the words “result” to “results”. This step will function as subtracting the total value of the acreage with no insurable loss from the total value of all insured acreage to determine the total value of acreage with insurable losses. This calculation will be for each type and practice. FCIC is also removing the word “and” at the end of the section as it is not needed for this step.

FCIC is revising 13(a)(6) to update the section reference from section 13(a)(5) to 13(a)(3). FCIC is also adding the word “and” at the end of the section 13(a)(6) to provide a cohesive transition to the final step for settlement of a claim in 13(b).

FCIC is adding section 13(b) to state “totaling the results in section 13(a).” Totaling results for each type and practice to any applicable unit was previously included twice in the steps for settling a claim. With this revision, totaling results for each type and practice is only performed once.

FCIC is revising the indemnity calculation example to portray the revised steps for settlement of a claim in section 13. The revised example demonstrates the difference in calculations when a portion of the acreage has a stand between 55 and 75 percent of an adequate stand versus a stand with less than 55 percent of an adequate stand. Additional revisions to the indemnity calculation example include replacing each instance of, “remaining stand of 75 percent or greater” with, “remaining stand of 75 percent of an adequate stand or greater” and to replace, “75% stand or greater” with, “75% of an adequate stand or greater” to reduce ambiguity and clarify that loss determinations are to be determined relative to adequate stand. In the indemnity calculation, FCIC also is replacing “\$100.00” with “\$100” and “\$90.00” with “90.” This change simplifies the example calculations.

Effective Date and Notice and Comment

In general, the Administrative Procedure Act (APA, 5 U.S.C. 553) requires that a notice of proposed rulemaking be published in the **Federal Register** for interested persons to be given an opportunity to participate in the rulemaking through submission of written data, views, or arguments with or without opportunity for oral presentation and requires a 30-day delay in the effective date of rules, except when the rule involves a matter relating to public property, loans, grants, benefits, or contracts. This rule involves

matters relating to contracts and therefore the requirements in section 553 do not apply.

The Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA) normally requires that an agency delay the effective date of a major rule for 60 days from the date of publication to allow for Congressional review. This rule is not a major rule under SBREFA (Pub. L. 104–121). Therefore, FCIC is not required to delay the effective date for 60 days from the date of publication to allow for Congressional review.

This final rule is effective April 30, 2020. Although not required by APA, FCIC has chosen to request comments on this rule.

Executive Orders 12866, 13563, 13771 and 13777

Executive Order 12866, “Regulatory Planning and Review,” and Executive Order 13563, “Improving Regulation and Regulatory Review,” direct agencies to assess all costs and benefits of available regulatory alternatives, and if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). Executive Order 13563 emphasized the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. Executive Order 13777, “Enforcing the Regulatory Reform Agenda,” established a Federal policy to alleviate unnecessary regulatory burdens on the American people.

The Office of Management and Budget (OMB) designated this rule as not significant under Executive Order 12866, “Regulatory Planning and Review,” and therefore, OMB has not reviewed this rule.

Executive Order 13771, “Reducing Regulation and Controlling Regulatory Costs,” requires that in order to manage the private costs required to comply with Federal regulations that for every new significant or economically significant regulation issued, the new costs must be offset by the elimination of at least two prior regulations. As this rule is designated as not significant, it is not subject to Executive Order 13771.

Clarity of the Regulation

Executive Order 12866, as supplemented by Executive Order 13563, requires each agency to write all rules in plain language. In addition to your substantive comments on this rule, we invite your comments on how to

make the rule easier to understand. For example:

- Are the requirements in the rule clearly stated? Are the scope and intent of the rule clear?
- Does the rule contain technical language or jargon that is not clear?
- Is the material logically organized?
- Would changing the grouping or order of sections or adding headings make the rule easier to understand?
- Could we improve clarity by adding tables, lists, or diagrams?
- Would more, but shorter, sections be better? Are there specific sections that are too long or confusing?
- What else could we do to make the rule easier to understand?

Regulatory Flexibility Act

The Regulatory Flexibility Act (5 U.S.C. 601–612), as amended by SBREFA, generally requires an agency to prepare a regulatory analysis of any rule whenever an agency is required by APA or any other law to publish a proposed rule, unless the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities. This rule is not subject to the Regulatory Flexibility Act because as noted above, this rule is exempt from APA and no other law requires that a proposed rule be published for this rulemaking initiative.

Environmental Review

In general, the environmental impacts of rules are to be considered in a manner consistent with the provisions of the National Environmental Policy Act (NEPA, 42 U.S.C. 4321–4347) and the regulations of the Council on Environmental Quality (40 CFR parts 1500–1508). FCIC conducts programs and activities that have been determined to have no individual or cumulative effect on the human environment. As specified in 7 CFR 1b.4, FCIC is categorically excluded from the preparation of an Environmental Analysis or Environmental Impact Statement unless the FCIC Manager (agency head) determines that an action may have a significant environmental effect. The FCIC Manager has determined this rule will not have a significant environmental effect. Therefore, FCIC will not prepare an environmental assessment or environmental impact statement for this action and this rule serves as documentation of the programmatic environmental compliance decision.

Executive Order 12372

Executive Order 12372, “Intergovernmental Review of Federal

Programs,” requires consultation with State and local officials that would be directly affected by proposed Federal financial assistance. The objectives of the Executive order are to foster an intergovernmental partnership and a strengthened federalism, by relying on State and local processes for State and local government coordination and review of proposed Federal financial assistance and direct Federal development. For reasons specified in the final rule related notice regarding 7 CFR part 3015, subpart V (48 FR 29115, June 24, 1983), the programs and activities in this rule are excluded from the scope of Executive Order 12372.

Executive Order 12988

This rule has been reviewed under Executive Order 12988, “Civil Justice Reform.” This rule will not preempt State or local laws, regulations, or policies unless they represent an irreconcilable conflict with this rule. Before any judicial actions may be brought regarding the provisions of this rule, the administrative appeal provisions of 7 CFR part 11 are to be exhausted.

Executive Order 13132

This rule has been reviewed under Executive Order 13132, “Federalism.” The policies contained in this rule do not have any substantial direct effect on States, on the relationship between the Federal Government and the States, or on the distribution of power and responsibilities among the various levels of government, except as required by law. Nor does this rule impose substantial direct compliance costs on State and local governments. Therefore, consultation with the States is not required.

Executive Order 13175

This rule has been reviewed in accordance with the requirements of Executive Order 13175, “Consultation and Coordination with Indian Tribal Governments.” Executive Order 13175 requires Federal agencies to consult and coordinate with Tribes on a government-to-government basis on policies that have Tribal implications, including regulations, legislative comments or proposed legislation, and other policy statements or actions that have substantial direct effects on one or more Indian Tribes, on the relationship between the Federal Government and Indian Tribes or on the distribution of power and responsibilities between the Federal Government and Indian Tribes.

FCIC has assessed the impact of this rule on Indian Tribes and determined that this rule does not, to our

knowledge, have Tribal implications that require Tribal consultation under E.O. 13175. The regulation changes do not have Tribal implications that preempt Tribal law and are not expected have a substantial direct effect on one or more Indian Tribes. If a Tribe requests consultation, FCIC will work with the USDA Office of Tribal Relations to ensure meaningful consultation is provided where changes, additions and modifications identified in this rule are not expressly mandated by Congress.

The Unfunded Mandates Reform Act of 1995

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA, Pub. L. 104–4) requires Federal agencies to assess the effects of their regulatory actions of State, local, and Tribal governments or the private sector. Agencies generally must prepare a written statement, including cost benefits analysis, for proposed and final rules with Federal mandates that may result in expenditures of \$100 million or more in any 1 year for State, local or Tribal governments, in the aggregate, or to the private sector. UMRA generally requires agencies to consider alternatives and adopt the more cost effective or least burdensome alternative that achieves the objectives of the rule. This rule contains no Federal mandates, as defined in Title II of UMRA, for State, local, and Tribal governments or the private sector. Therefore, this rule is not subject to the requirements of sections 202 and 205 of UMRA.

Federal Assistance Program

The title and number of the Federal Domestic Assistance Program listed in the Catalog of Federal Domestic Assistance to which this rule applies is No. 10.450—Crop Insurance.

Paperwork Reduction Act of 1995

In accordance with the provisions of the Paperwork Reduction Act of 1995 (44 U.S.C. chapter 35, subchapter I), the rule does not change the information collection approved by OMB under control numbers 0563–0053.

E-Government Act Compliance

FCIC is committed to complying with the E-Government Act, to promote the use of the internet and other information technologies to provide increased opportunities for citizen access to Government information and services, and for other purposes.

List of Subjects in 7 CFR Part 457

Acreage allotments, Crop insurance, Reporting and recordkeeping requirements.

Final Rule

For the reasons discussed above, FCIC amends 7 CFR part 457 effective for the 2021 and succeeding crop years as follows:

PART 457—COMMON CROP INSURANCE REGULATIONS

- 1. The authority citation for 7 CFR part 457 is revised to read as follows:

Authority: 7 U.S.C. 1506(l), 1506(o).

- 2. Amend § 457.117 as follows:
 - a. Remove “2001” and add “2021” in its place in the introductory text;
 - b. Remove the undesignated paragraph immediately preceding section 1;
 - c. In section 1:
 - i. Revise the definitions of “Adequate stand” and “Fall planted”;
 - ii. Add the definition of “Normal planting density” in alphabetical order; and
 - iii. Revise the definitions of “Spring planted” and “Year of establishment”;
 - d. Revise sections 2, 3, and 4;
 - e. In section 6:
 - i. Revise paragraphs (a)(1) and (2);
 - ii. Add paragraph (a)(3); and
 - iii. Revise paragraph (b) introductory text;
 - f. In section 7:
 - i. Revise the introductory text and paragraphs (a), (b) introductory text, and (b)(6); and
 - ii. Remove paragraph (c);
 - g. In section (8), revise paragraphs (a) introductory text and (b);
 - h. In section 9, revise paragraph (a); and
 - i. In section 10:
 - i. Revise paragraphs (b)(2) through (7);
 - ii. In example 1, revise the introductory text and paragraph 1;
 - iii. In example 2, revise the introductory text and paragraphs 1 and 2; and
 - iv. Revise paragraph (f).

The revisions and additions read as follows:

§ 457.117 Forage production crop insurance provisions.

* * * * *

1. Definitions.

Adequate stand. The number shown in the Special Provisions, representing:

(a) For forage containing 60 percent or more alfalfa, the minimum required number of live alfalfa stems per square foot that are two inches or greater in height; or

(b) For forage containing less than 60 percent alfalfa, the normal planting density.

* * * * *

Fall planted. A forage crop seeded after June 30, except when specified in the Special Provisions.

* * * * *

Normal planting density. The minimum number of live plants per square foot as shown in the Special Provisions.

Spring planted. A forage crop seeded before July 1, except when specified in the Special Provisions.

* * * * *

Year of establishment. The period between seeding and when the forage crop has developed an adequate stand. The year of establishment is determined by the date of seeding. The year of establishment for spring planted forage is designated by the calendar year in which seeding occurred. The year of establishment for fall planted forage is designated by the calendar year after the year in which the crop was planted. Insurance under this policy does not attach until after the year of establishment. Insurance during the year of establishment may be available under the forage seeding policy.

2. Insurance Guarantees, Coverage Levels, and Prices for Determining Indemnities.

In addition to the requirements of section 3 of the Basic Provisions:

(a) You may only select one price election for all the forage in the county insured under this policy unless the actuarial documents provide different price elections by type, in which case you may select one price election for each forage type designated in the actuarial documents. The price elections you choose for each type must have the same percentage relationship to the maximum price offered by us for each type. For example, if you choose 100 percent of the maximum price election for a specific type, you must also choose 100 percent of the maximum price election for all other types.

(b) You must report the total production harvested from insurable acreage for all cuttings for each unit by the production reporting date.

(c) Separate guarantees will be determined by forage type, as applicable.

3. Contract Changes.

In accordance with section 4 of the Basic Provisions, the contract change date is June 30 preceding the cancellation date.

4. Cancellation and Termination Dates.

In accordance with section 2 of the Basic Provisions, the cancellation and termination dates are:

| State | Cancellation/ termination date |
|----------------------------|-----------------------------------|
| Arizona and California ... | October 31. |
| All other states | September 30. |

* * * * *

6. Insured Crop.

(a) * * *

(1) In which you have a share;

(2) That is not grown with the intent to be grazed, or grazed at any time during the insurance period; and

(3) That follows a year of establishment that results in an adequate stand as shown in the Special Provisions.

(b) In addition to the crops listed as not insured in section 8 of the Basic Provisions, we will not insure any forage that:

* * * * *

7. Insurance Period.

In lieu of the provisions of section 11 of the Basic Provisions:

(a) Insurance attaches on acreage with an adequate stand on the applicable date shown in the actuarial documents; and

(b) Forage production insurance ends at the earliest of:

* * * * *

(6) The end of the insurance period date shown in the actuarial documents.

8. Causes of Loss.

(a) In accordance with the provisions of section 12 of the Basic Provisions, insurance is provided only against the following causes of loss that occur during the insurance period:

* * * * *

(b) In addition to the causes of loss specifically excluded in section 12 of the Basic Provisions, we will not insure against damage of loss of production that occurs after harvest.

9. Duties in the Event of Damage or Loss.

* * * * *

(a) You must notify us within 3 days of the date cutting should have started if the insured crop will not be harvested;

* * * * *

10. Settlement of Claim.

* * * * *

(b) * * *

(2) Multiplying each result in section 10(b)(1) by the respective price election you selected;

(3) Totaling the results of each crop type in section 10(b)(2);

(4) Multiplying the total production to be counted of each type, if applicable, (see section 10(c)) by the respective price election you selected;

(5) Totaling the results of each crop type in section 10(b)(4);

(6) Subtracting the result in section 10(b)(5) from the result in section 10(b)(3); and

(7) Multiplying the result in section 10(b)(6) by your share.

Example 1

Assume you have a 100 percent share in 100 acres of type A forage in the unit, with a guarantee of 3.0 tons per acre and a price election of \$65 per ton. Due to adverse weather you were only able to harvest 50.0 tons. Your indemnity would be calculated as follows:

1. 100 acres type A \times 3 tons = 300-ton guarantee;

* * * * *

Example 2

Assume you also have a 100 percent share in 100 acres of type B forage in the same unit, with a guarantee of 1.0 ton per acre and a price election of \$50 per ton. Due to adverse weather you were only able to harvest 5.0 tons. Your total indemnity for forage production for both types A and B in the same unit would be calculated as follows:

1. 100 acres \times 3 tons = 300-ton guarantee for type A and 100 acres \times 1 ton = 100-ton guarantee for type B;

2. 300-ton guarantee \times \$65 price election = \$19,500 total value of the guarantee for type A and 100-ton guarantee \times \$50 price election = \$5,000 total value of the guarantee for type B;

* * * * *

(f) In addition to the provisions of section 15 of the Basic Provisions, we may determine the amount of production of any unharvested forage on the basis of our field appraisals conducted after the normal time for each cutting for the area.

* * * * *

■ 3. Amend § 457.151 as follows:

■ a. Remove “2003” and add “2021” in its place in the introductory text;

■ b. Remove the undesignated paragraph immediately preceding section 1;

■ c. In section 1:

■ i. Add the definitions of “Adequate stand”, “Amount of insurance”, and “Companion crop” in alphabetical order;

■ ii. Revise the definitions of “Fall planted”, “Good farming practices”, and “Harvest”;

■ iii. Add the definition of “Normal planting density” in alphabetical order;

■ iv. Remove the definitions of “Normal stand” and “Nurse Crop (companion crop)”; and

■ v. Revise the definitions of “Planted acreage”, “Replanting”, “Sales closing date”, and “Spring planted”;

■ d. Revise sections 3, 5, and 6;

- e. In section 7, revise the introductory text and paragraphs (b) and (d);
- f. Revise section 8;
- g. In section 9, revise the introductory text and paragraphs (c) and (g);
- h. In section 10, revise the introductory text;
- i. In section 11, revise paragraphs (a) and (b); and
- j. Revise sections 12 and 13.

The revisions and additions read as follows:

§ 457.151 Forage seeding crop insurance provisions.

* * * * *

1. Definitions.

Adequate stand. The number shown in the Special Provisions, representing:

(a) For forage containing 60 percent or more alfalfa, the minimum required number of live alfalfa stems per square foot that are two inches or greater in height; or

(b) For forage containing less than 60 percent alfalfa, the normal planting density.

Amount of insurance. The dollar amount of insurance per acre obtained by multiplying the reference maximum dollar amount shown in the actuarial documents by the coverage level percentage you elect.

Companion crop. A crop seeded into the same acreage as another crop, that is intended to be harvested separately, and that is planted to improve growing conditions for the crop with which it is grown.

* * * * *

Fall planted. A forage crop seeded after June 30, except when specified in the Special Provisions.

* * * * *

Good farming practices. In lieu of the definition in the Basic Provisions, the cultural practices generally in use in the county for the crop to make normal

progress toward maturity and produce an adequate stand, and which are those generally recognized by agricultural experts or organic agricultural experts as compatible with agronomic and weather conditions for the area.

Harvest. Severance of the forage plant from its roots. Acreage that is grazed will not be considered harvested.

Normal planting density. The minimum number of live plants per square foot as shown in the Special Provisions.

Planted acreage. In addition to the definition in the Basic Provisions, land on which seed is initially spread onto the soil surface by any method and subsequently is mechanically incorporated into the soil in a timely manner and at the proper depth will be considered planted, unless otherwise provided by the Special Provisions, actuarial documents, or written agreement.

Replanting. In addition to the definition in the Basic Provisions, placing new seed into an existing damaged stand, using a reduced seeding rate from the original seeding rate, will not be considered replanting.

Sales closing date. In lieu of the definition contained in the Basic Provisions, a date contained in the Special Provisions by which an application must be filed and by which you may change your crop insurance coverage for a crop year. If the Special Provisions provide a sales closing date for both fall planted and spring planted practices for the insured crop and you plant any insurable fall planted acreage, you may not change your crop insurance coverage after the sales closing date for the fall planted practice.

Spring planted. A forage crop seeded before July 1, except when specified in the Special Provisions.

* * * * *

3. Amounts of Insurance.

In addition to the requirements of section 3 of the Basic Provisions:

(a) You may only select one coverage level and the corresponding amount of insurance designated in the actuarial documents for the applicable type and practice for all the forage seeding in the county that is insured under this policy. The amount of insurance you choose for each type and practice must have the same percentage relationship to the maximum amount of insurance offered by us for each type and practice. For example, if you choose 100 percent of the maximum amount of insurance for a specific type and practice, you must also choose 100 percent of the maximum amount of insurance for all other types and practices.

(b) In counties with both fall and spring sales closing dates for the insured crop:

(1) If you do not have any fall planted acreage, you may purchase or revise your coverage for your spring planted acreage until the spring sales closing date;

(2) In accordance with section 3(a), if you insured your fall planted acreage, you must insure your spring planted acreage with the same coverage as the fall planted acreage; and

(3) If you did not insure your fall planted acreage, you are not eligible to purchase insurance for the spring planted acreage.

(c) The production reporting requirements contained in section 3 of the Basic Provisions, do not apply to forage seeding.

* * * * *

5. Cancellation and Termination Dates.

In accordance with section 2 of the Basic Provisions, the cancellation and termination dates are:

| State | Cancellation | Termination |
|------------------------|----------------|---------------|
| Maine | March 15 | March 15. |
| All other states | July 31 | September 30. |

6. Report of Acreage.

In lieu of the provisions of section 6(a) of the Basic Provisions, a report of all insured acreage of forage seeding must be submitted on or before each forage seeding acreage reporting date specified in the Special Provisions.

7. Insured Crop.

In accordance with section 8 of the Basic Provisions, the crop insured will be all the forage in the county for which

a premium rate is provided by the actuarial documents:

* * * * *

(b) That is planted during the current crop year, or replanted during the calendar year following planting, to establish an adequate stand of forage;

* * * * *

(d) That is not interplanted with another crop, except companion crops, unless allowed by the Special Provisions or by written agreement.

8. Insurable Acreage.

In addition to the provisions of section 9 of the Basic Provisions, unless otherwise specified in the Special Provisions, any acreage of the insured crop damaged before the spring final planting date, to the extent that such acreage has less than 75 percent of a normal planting density, must be replanted unless we agree that it is not practical to replant.

9. Insurance Period.

In lieu of the provisions of section 11 of the Basic Provisions regarding when

insurance ends, forage seeding insurance will end at the earliest of:

* * * * *

(c) The first harvest after the late harvest date, if a late harvest date is specified in the Special Provisions (You may harvest the crop as often as practical in accordance with good farming practices on or before the late harvest date);

* * * * *

(g) The end of insurance period date shown in the actuarial documents.

10. Causes of Loss.

In accordance with the provisions of section 12 of the Basic Provisions, insurance is provided only against the following causes that result in loss of, or failure to establish, an adequate stand that occurs during the insurance period:

* * * * *

11. Replanting Payment.

* * * * *

(a) Unless otherwise specified in the Special Provisions, a replanting payment is allowed if:

(1) It is practical to replant;

(2) We give written consent to replant;

(3) In California, acreage planted to the insured crop is damaged by an insurable cause of loss occurring before the spring final planting date in the actuarial documents to the extent that less than 75 percent of the normal planting density remains, and the crop can reach maturity before the end of the insurance period;

(4) In all other states:

(i) The insured spring or fall planted acreage is damaged by an insurable cause of loss to the extent that less than 75 percent of the normal planting density remains;

(ii) If fall planted, the acreage is replanted the following spring by the spring final planting date; and

(iii) If spring planted, the original planting took place after the earliest planting date shown in the Special Provisions, and the acreage is replanted by the spring final planting date shown in the Special Provisions.

(b) The amount of the replanting payment will be equal to 50 percent of the amount of indemnity determined in accordance with section 13(a) unless otherwise specified in the Special Provisions.

* * * * *

12. Duties in the Event of Damage or Loss.

(a) In accordance with the requirements of section 14 of the Basic Provisions, the representative samples of the crop must be at least 10 feet wide and extend the entire length of each field in the unit. The samples must not be harvested or destroyed until the

earlier of our inspection or 15 days after tilling of the balance of the unit is completed.

(b) In addition to the requirements of section 14 of the Basic Provisions, you must give us written notice if, during the period before destroying the crop on any damaged fall planted acreage, you decide to replant the acreage by the spring final planting date.

13. Settlement of Claim.

In the event of loss or damage covered by this policy, we will settle your claim on any unit by:

(a) For each type and practice:

(1) Determining the value of all insured acreage by multiplying the number of insured acres by the dollar amount of insurance;

(2) Determining the value of the acreage with no insurable losses, by multiplying the dollar amount of insurance by the insured acreage that:

(i) Has at least 75 percent of an adequate stand;

(ii) Was abandoned or put to another use without our prior written consent;

(iii) Was damaged solely by an uninsured cause; or

(iv) Was harvested and not reseeded.

(3) Determining the value of the acreage with partial insurable losses, by multiplying the dollar amount of insurance by the number of insured acres that have a stand less than 75 percent but more than 55 percent of an adequate stand, by 50 percent (0.5);

(4) Adding the results in section 13(a)(2) and section 13(a)(3);

(5) Subtracting the results in section 13(a)(4) from the results in section 13(a)(1); and

(6) Multiplying the result in section 13(a)(3) by your share; and

(b) Totaling the results in section 13(a).

Example:

Assume you have a 100 percent share in 30 acres of type A forage in the unit, with an amount of insurance of \$100 per acre. At the time of loss, the following findings are established: 10 acres had a remaining stand of 75 percent of an adequate stand or greater. 20 acres had a remaining stand less than 75 percent but more than 55 percent of an adequate stand.

You also have a 100 percent share in 20 acres of type B forage in the unit, with an amount of insurance of \$90 per acre. 10 acres had a remaining stand of 75 percent of an adequate stand or greater. 10 acres had a remaining stand less than 55 percent of an adequate stand.

Your indemnity would be calculated as follows:

1. 30 acres \times \$100 = \$3,000 amount of insurance for type A; 20 acres \times \$90 = \$1,800 amount of insurance for type B;

2. 10 acres with 75% of an adequate stand or greater \times \$100 = \$1,000 for type A; 10 acres with 75% of an adequate stand or greater \times \$90 = \$900 for type B;

3. 20 acres with less than 75% but greater than 55% of an adequate stand \times \$100 \times 50 percent = \$1,000 for type A; 0 acres with less than 75% but greater than 55% of an adequate stand \times \$90 \times 50 percent = \$0 for type B;

4. \$1,000 + \$1,000 = \$2,000 reduction for type A; \$900 + \$0 = \$900 reduction for type B;

5. \$3,000 – \$2,000 = \$1,000 for type A; \$1,800 – \$900 = \$900 for type B

6. \$1,000 \times 100 percent share = \$1,000 for type A; \$900 \times 100 percent share = \$900 for type B;

7. \$1,000 + \$900 = \$1,900 total indemnity

* * * * *

Martin R. Barbre,

Manager, Federal Crop Insurance Corporation.

BILLING CODE 3410-08-P

DEPARTMENT OF JUSTICE

Executive Office for Immigration Review

8 CFR Parts 1208, 1209, 1212, and 1235

[AG Order No. 4667–2020]

RIN 1125-AA95

Implementation of the Northern Mariana Islands U.S. Workforce Act of 2018

AGENCY: Executive Office for Immigration Review, DOJ.

ACTION: Final rule.

SUMMARY: The Department of Justice (“DOJ” or “the Department”) is making technical amendments to its regulations to conform to changes made by the Northern Mariana Islands U.S. Workforce Act of 2018 (Workforce Act). The Workforce Act, in part, extended the bar for asylum in the Commonwealth of the Northern Mariana Islands (CNMI) by fifteen years, providing that the current bar will continue to apply for asylum applications submitted prior to January 1, 2030. This final rule makes the necessary conforming date changes in the Department’s regulations.

DATES: This rule is effective June 1, 2020.

FOR FURTHER INFORMATION CONTACT:

Lauren Alder Reid, Assistant Director, Office of Policy, Executive Office for Immigration Review, 5107 Leesburg Pike, Suite 2616, Falls Church, VA 22041, telephone (703) 305-0289 (not a toll-free call).

SUPPLEMENTARY INFORMATION:**I. Background**

The Commonwealth of the Northern Mariana Islands (CNMI)-Only Transitional Worker (CW-1) program allows employers within the CNMI to apply for permission to employ nonimmigrant workers who are otherwise ineligible to work in the CNMI under other nonimmigrant worker categories. *See* Commonwealth of the Northern Mariana Islands Transitional Worker Classification, 76 FR 55502 (Sept. 7, 2011). This transitional worker program was intended to provide for an orderly transition for those workers from the CNMI permit system to the U.S. federal immigration system under the Immigration and Nationality Act (“INA”), and to mitigate potential harm to the CNMI economy as employers adjust their hiring practices and as foreign workers obtain U.S. immigrant or nonimmigrant status.

On July 24, 2018, President Donald J. Trump signed the Northern Mariana Islands U.S. Workforce Act of 2018 (“the Workforce Act”), Public Law 115–218, 132 Stat. 1547. The stated purposes of the Workforce Act are to increase the percentage of United States workers in the total workforce of the CNMI, while maintaining the minimum number of non-U.S. workers to meet the demands of the CNMI’s economy; to encourage the hiring of United States workers into the CNMI workforce; and to ensure that no U.S. worker is at a competitive disadvantage compared to a non-U.S. worker or is displaced by a non-U.S. worker. Workforce Act sec. 2.

The Workforce Act made a number of changes to the transitional provisions of Title VII of the Consolidated Natural Resources Act of 2008 (“CNRA”), Public Law 110–229, 122 Stat. 754, 853–854—which extended the U.S. immigration laws, with limited exceptions, to the CNMI—and requires the Secretaries of Homeland Security and Labor to each promulgate an Interim Final Rule (“IFR”) implementing the related statutory changes. The Department of Labor (“DOL”) IFR was published on April 1, 2019, and went into effect on April 4, 2019.¹

Most of the other changes implemented under the Workforce Act

that govern immigration policy and procedures will affect Department of Homeland Security (“DHS”) regulations. The resulting revisions to the DHS regulations will be addressed in a separate rulemaking. However, given the authority of the immigration judges and the Board of Immigration Appeals (“BIA”) to adjudicate asylum claims for aliens who are placed in proceedings before the immigration judges and the BIA, the Attorney General is making technical amendments to its regulations to reflect that the Workforce Act extended the statutory bar for asylum in the CNMI by fifteen years. Accordingly, this final rule replaces the current date of “January 1, 2015” with the new date of “January 1, 2030” in the applicable sections of the regulations.

II. Legal Authority

The Attorney General’s general authority for the regulatory amendments is found in the Immigration and Nationality Act (INA), 8 U.S.C. 1101 *et seq.*, and the Homeland Security Act of 2002 (HSA), Public Law 107–296, 116 Stat. 2135, 6 U.S.C. 101 *et seq.* The Attorney General’s specific authority for issuing this rule is found in section 103(g) of the INA, 8 U.S.C. 1103(g), which authorizes the Attorney General to administer and enforce the immigration and nationality laws, as well as section 1101 of the HSA, 6 U.S.C. 521.

III. Technical Amendments

The Attorney General is making technical amendments to regulations of the Executive Office for Immigration Review (“EOIR”) to reflect that Congress has extended the statutory bar for asylum in the CNMI by fifteen years. *See* Workforce Act at sec. 3(a); 48 U.S.C. 1806(a)(2). These technical amendments (*i.e.*, a change of date) are being made in the following provisions of the EOIR regulations: 8 CFR 1208.1(a)(2), 1208.2(c)(1)(iii), (iv), (vii), (viii), 1208.4(a)(2)(ii), 1208.5(a), (b)(1)(iii), 1208.30(a), 1209.2(a)(3), 1212.1(q)(8)(i)(A), (ii)(A), and 1235.6(a)(1)(ii), (iii). These are the only changes being made in the EOIR regulations.

IV. Statutory and Regulatory Requirements**A. Executive Orders 12866, 13563, and 13771**

This rule has been drafted and reviewed in accordance with Executive Order 12866, “Regulatory Planning and Review,” section 1(b), The Principles of Regulation; Executive Order 13563,

“Improving Regulation and Regulatory Review,” section 1(b), General Principles of Regulation; and Executive Order 13771, “Reducing Regulation and Controlling Regulatory Costs.” The rule merely revises regulations to conform to a new date set by the Workforce Act. The Office of Information and Regulatory Affairs, of the Office of Management and Budget, has determined that this final rule is not a “significant regulatory action” as defined in Executive Order 12866, section 3(f). Accordingly, this final rule has not been reviewed by the Office of Management and Budget.

Finally, because this rule is not a significant regulatory action, it is not subject to the requirements of Executive Order 13771. There are no costs associated with this regulation. Because there are no costs associated with this final rule, there are no monetized benefits.

B. Executive Order 13132

This final rule will not have substantial direct effects on the States, on the relationship between the Federal Government and the States, or on the distribution of power and responsibilities among the various levels of government. Therefore, in accordance with section 6 of Executive Order 13132, “Federalism,” the Attorney General has determined that this regulation does not have sufficient federalism implications to warrant the preparation of a federalism summary impact statement.

C. Executive Order 12988

This regulation meets the applicable standards set forth in sections 3(a) and 3(b)(2) of Executive Order 12988, “Civil Justice Reform.”

D. Administrative Procedure Act

Under the Administrative Procedure Act, 5 U.S.C. 553(b)(3)(B), an agency may, for good cause, find that the usual requirements of prior notice and comment are impracticable, unnecessary, or contrary to the public interest. The rule merely makes technical amendments to the EOIR regulations to reflect that Congress has extended the statutory bar for asylum in the CNMI by fifteen years. Because the Department must follow the mandate of Congress and has no discretion in the matter, the Department has determined that publishing a notice of proposed rulemaking and providing opportunity for public comment is unnecessary.

E. Regulatory Flexibility Act

In accordance with the Regulatory Flexibility Act, 5 U.S.C. 603, 604, and

¹ 84 FR 12380 (Apr. 1, 2019).

605(b), a Regulatory Flexibility Analysis is not required for this final rule because the Department was not required to publish a general notice of proposed rulemaking for this regulatory amendment.

F. Unfunded Mandates Reform Act of 1995

This rule will not result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of \$100 million or more in any one year, and it will not significantly or uniquely affect small governments. Therefore, no actions were deemed necessary under the provisions of the Unfunded Mandates Reform Act of 1995, 2 U.S.C. 1531–1535.

G. Paperwork Reduction Act of 1995

This final rule does not impose any new reporting or recordkeeping requirements under the Paperwork Reduction Act of 1995, 44 U.S.C. 3501–3521.

H. Congressional Review Act of 1996

This rule is not a major rule as defined by the Congressional Review Act of 1996, 5 U.S.C. 804.

List of Subjects

8 CFR Part 1208

Administrative practice and procedure, Aliens, Immigration, Reporting and recordkeeping requirements.

8 CFR Part 1209

Aliens, Immigration, Refugees.

8 CFR Part 1212

Administrative practice and procedure, Aliens, Immigration, Passports and visas, Reporting and recordkeeping requirements.

8 CFR Part 1235

Administrative practice and procedure, Aliens, Immigration, Reporting and recordkeeping requirements.

Accordingly, the Attorney General amends 8 CFR parts 1208, 1209, 1212, and 1235 as follows:

PART 1208—PROCEDURES FOR ASYLUM AND WITHHOLDING OF REMOVAL

- 1. The authority citation for part 1208 is revised to read as follows:

Authority: 8 U.S.C. 1101, 1103, 1158, 1226, 1252, 1282; Title VII of Pub. L. 110–229; Pub. L. 115–218.

§§ 1208.1, 1208.2, 1208.4, 1208.5, and 1208.30 [Amended]

- 2. In part 1208, remove the date “January 1, 2015” and add in its place the date “January 1, 2030” in the following places:
 - a. Section 1208.1(a)(2) (two occurrences);
 - b. Section 1208.2(c)(1)(iii), (iv), (vii), and (viii);
 - c. Section 1208.4(a)(2)(ii) (two occurrences);
 - d. Section 1208.5(a) and (b)(1)(iii);
 - e. Section 1208.30(a).

PART 1209—ADJUSTMENT OF STATUS OF REFUGEES AND ALIENS GRANTED ASYLUM

- 3. The authority citation for part 1209 is revised to read as follows:

Authority: 8 U.S.C. 1101, 1103, 1157, 1158, 1159, 1228, 1252, 1282; Title VII of Pub. L. 110–229; Pub. L. 115–218.

§ 1209.2 [Amended]

- 4. In § 1209.2, remove the date “January 1, 2015” and add in its place the date “January 1, 2030” in paragraph (a)(3).

PART 1212—DOCUMENTARY REQUIREMENTS; NONIMMIGRANTS; WAIVERS; ADMISSION OF CERTAIN INADMISSIBLE ALIENS; PAROLE

- 5. The authority citation for part 1212 is revised to read as follows:

Authority: 8 U.S.C. 1101 and note, 1102, 1103, 1182 and note, 1184, 1187, 1223, 1225, 1226, 1227, 1255; 8 U.S.C. 1185 note (section 7209 of Pub. L. 108–458); Title VII of Pub. L. 110–229; Pub. L. 115–218.

§ 1212.1 [Amended]

- 6. In § 1212.1, remove the date “January 1, 2015” and add in its place the date “January 1, 2030” wherever it appears in paragraphs (q)(8)(i)(A) and (q)(8)(ii)(A).

PART 1235—INSPECTION OF PERSONS APPLYING FOR ADMISSION

- 7. The authority citation for part 1235 is revised to read as follows:

Authority: 8 U.S.C. 1101 and note, 1103, 1183, 1185 (pursuant to E.O. 13323, 69 FR 241, 3 CFR, 2003 Comp., p. 278), 1201, 1224, 1225, 1226, 1228, 1365a note, 1379, 1731–32; Title VII of Pub. L. 110–229; 8 U.S.C. 1185 note (section 7209 of Pub. L. 108–458); Public Law 115–218.

§ 1235.6 [Amended]

- 8. In § 1235.6, remove the date “January 1, 2015” and add in its place the date “January 1, 2030” in paragraphs (a)(1)(ii) and (iii).

Dated: March 17, 2020.

William P. Barr,
Attorney General.

[FR Doc. 2020–07616 Filed 4–29–20; 8:45 am]

BILLING CODE 4410–30–P

NUCLEAR REGULATORY COMMISSION

10 CFR Part 72

[NRC–2019–0250]

RIN 3150–AK41

List of Approved Spent Fuel Storage Casks: Holtec International HI–STORM Flood/Wind Multipurpose Canister Storage System, Certificate of Compliance No. 1032, Amendment No. 4

AGENCY: Nuclear Regulatory Commission.

ACTION: Direct final rule.

SUMMARY: The U.S. Nuclear Regulatory Commission (NRC) is amending its spent fuel storage regulations by revising the Holtec International HI–STORM Flood/Wind Multipurpose Canister Storage System listing within the “List of approved spent fuel storage casks” to include Amendment No. 4 to Certificate of Compliance No. 1032. Amendment No. 4 revises the certificate of compliance to: Add multipurpose canister (MPC)–32ML for storage and allow the fuel assembly class 16x16D as content for MPC–32ML; add the fuel assembly class 16X16E as content for MPC–37; and make changes to the final safety analysis report to separate the design pressure for the short-term operation from the off-normal condition (to provide clarity in Table 2.2.1), add cautionary notes to Sections 9.2.1 and 9.2.3, update a definition, and replace a test program. These changes are discussed in more detail in the “Discussion of Changes” section of this direct final rule.

DATES: This direct final rule is effective July 14, 2020, unless significant adverse comments are received by June 1, 2020. If this direct final rule is withdrawn as a result of such comments, timely notice of the withdrawal will be published in the **Federal Register**. Comments received after this date will be considered if it is practical to do so, but the NRC is able to ensure consideration only for comments received on or before this date. Comments received on this direct final rule will also be considered to be comments on a companion proposed rule published in the Proposed Rules section of this issue of the **Federal Register**.

ADDRESSES: You may submit comments by any of the following methods:

- **Federal Rulemaking website:** Go to <https://www.regulations.gov> and search for Docket ID NRC-2019-0250. Address questions about NRC dockets to Carol Gallagher; telephone: 301-415-3463; email: Carol.Gallagher@nrc.gov. For technical questions contact the individuals listed in the **FOR FURTHER INFORMATION CONTACT** section of this document.

- **Email comments to:** Rulemaking.Comments@nrc.gov. If you do not receive an automatic email reply confirming receipt, then contact us at 301-415-1677.

- **Mail comments to:** Secretary, U.S. Nuclear Regulatory Commission, Washington, DC 20555-0001, ATTN: Rulemakings and Adjudications Staff.

For additional direction on obtaining information and submitting comments, see “Obtaining Information and Submitting Comments” in the **SUPPLEMENTARY INFORMATION** section of this document.

FOR FURTHER INFORMATION CONTACT: Yen-Ju Chen, Office of Nuclear Material Safety and Safeguards; telephone: 301-415-1018; email: Yen-Ju.Chen@nrc.gov or Vanessa Cox, Office of Nuclear Material Safety and Safeguards; telephone: 301-415-8342; email: Vanessa.Cox@nrc.gov. Both are staff of the U.S. Nuclear Regulatory Commission, Washington, DC 20555-0001.

I. Obtaining Information and Submitting Comments

A. Obtaining Information

Please refer to Docket ID NRC-2019-0250 when contacting the NRC about the availability of information for this action. You may obtain publicly-available information related to this action by any of the following methods:

- **Federal Rulemaking website:** Go to <https://www.regulations.gov> and search for Docket ID NRC-2019-0250.

- **NRC’s Agencywide Documents Access and Management System (ADAMS):** You may obtain publicly-available documents online in the ADAMS Public Documents collection at <https://www.nrc.gov/reading-rm/adams.html>. To begin the search, select “Begin Web-based ADAMS Search.” For problems with ADAMS, please contact the NRC’s Public Document Room (PDR) reference staff at 1-800-397-4209, 301-415-4737, or by email to pdr.resource@nrc.gov. For the convenience of the reader, instructions about obtaining materials referenced in this document are provided in the “Availability of Documents” section.

B. Submitting Comments

Please include Docket ID NRC-2019-0250 in your comment submission.

The NRC cautions you not to include identifying or contact information that you do not want to be publicly disclosed in your comment submission. The NRC will post all comment submissions at <https://www.regulations.gov> and enters all comment submissions into ADAMS.

The NRC does not routinely edit comment submissions to remove identifying or contact information. If you are requesting or aggregating comments from other persons for submission to the NRC, you should inform those persons not to include identifying or contact information that they do not want to be publicly disclosed in their comment submission. You should inform those persons that the NRC does not routinely edit comment submissions to remove such information before making the comment submissions available to the public or entering the comment into ADAMS.

II. Rulemaking Procedure

This rule is limited to the changes contained in Amendment No. 4 to Certificate of Compliance No. 1032 and does not include other aspects of the Holtec International HI-STORM Flood/Wind Multipurpose Canister Storage System design. The NRC is using the “direct final rule procedure” to issue this amendment because it represents a limited change to an existing certificate of compliance that is expected to be non-controversial. The NRC has determined that, with the requested change, adequate protection of public health and safety will continue to be ensured. The amendment to the rule will become effective on July 14, 2020. However, if the NRC receives any significant adverse comment on this direct final rule by June 1, 2020, then the NRC will publish a document that withdraws this action and will

subsequently address the comments received in a final rule as a response to the companion proposed rule published in the Proposed Rules section of this issue of the **Federal Register**. Absent significant modifications to the proposed revisions requiring republication, the NRC will not initiate a second comment period on this action.

A significant adverse comment is a comment where the commenter explains why the rule would be inappropriate, including challenges to the rule’s underlying premise or approach, or would be ineffective or unacceptable without a change. A comment is adverse and significant if:

(1) The comment opposes the rule and provides a reason sufficient to require a substantive response in a notice-and-comment process. Responses are considered substantive when:

(a) The comment causes the NRC to reevaluate (or reconsider) its position or conduct additional analysis;

(b) The comment raises an issue serious enough to warrant a substantive response to clarify or complete the record;

(c) The comment raises a relevant issue that was not previously addressed or considered by the NRC.

(2) The comment proposes a change or an addition to the rule, and it is apparent that the rule would be ineffective or unacceptable without incorporation of the change or addition; or

(3) The comment causes the NRC to make a change (other than editorial) to the rule, certificate of compliance, or technical specifications.

III. Background

Section 218(a) of the Nuclear Waste Policy Act of 1982, as amended, requires that “[t]he Secretary [of the Department of Energy] shall establish a demonstration program, in cooperation with the private sector, for the dry storage of spent nuclear fuel at civilian nuclear power reactor sites, with the objective of establishing one or more technologies that the [Nuclear Regulatory] Commission may, by rule, approve for use at the sites of civilian nuclear power reactors without, to the maximum extent practicable, the need for additional site-specific approvals by the Commission.” Section 133 of the Nuclear Waste Policy Act states, in part, that “[the Commission] shall, by rule, establish procedures for the licensing of any technology approved by the Commission under Section 219(a) [sic: 218(a)] for use at the site of any civilian nuclear power reactor.”

To implement this mandate, the Commission approved dry storage of

spent nuclear fuel in NRC-approved casks under a general license by publishing a final rule which added a new subpart K in part 72 of title 10 of the *Code of Federal Regulations* (10 CFR) entitled “General License for Storage of Spent Fuel at Power Reactor Sites” (55 FR 29181; July 18, 1990). This rule also established a new subpart L in 10 CFR part 72 entitled “Approval of Spent Fuel Storage Casks,” which contains procedures and criteria for obtaining NRC approval of spent fuel storage cask designs. The NRC subsequently issued a final rule on March 28, 2011 (76 FR 17019), that approved the Holtec International HI-STORM Flood/Wind Multipurpose Canister Storage System design and added it to the list of NRC-approved cask designs in § 72.214 as Certificate of Compliance No. 1032.

IV. Discussion of Changes

On March 11, 2016, as supplemented on September 16, 2016, January 31, 2017, April 27, 2018, July 27, 2018, April 12, 2019, June 11, 2019, and July 5, 2019, Holtec International submitted a request to amend Certificate of Compliance No. 1032 for the HI-STORM Flood/Wind Multipurpose Canister Storage System. Amendment No. 4 revises the certificate of compliance as follows:

1. Adds multipurpose canister (MPC)-32ML for storage in the HI-STORM flood/wind system and allows fuel assembly class 16x16D as content for MPC-32ML.
2. Adds fuel assembly class 16x16E as content for MPC-37.
3. Separates the design pressure for the short-term operation from the off-normal condition to provide clarity in Table 2.2.1 of the final safety analysis report (FSAR).
4. Adds a cautionary note in FSAR Section 9.2.1 that states fuel cladding is not exposed to air during loading operations.
5. Updates the definition of “undamaged fuel assembly” in the FSAR Glossary to be aligned with the definition in Appendix A and Table 2.1.3 of the FSAR (Note 14).
6. Replaces the Charpy test program with the fracture toughness test program from the revised Metamic-HT Sourcebook in FSAR Sections 1.2.1.4.1 and 3.4.
7. Adds a cautionary note in FSAR Section 9.2.3 that states low-enriched fuel must be shown to be without known or suspected grossly breached rods.

As documented in the preliminary safety evaluation report, the NRC performed a safety evaluation of the

proposed certificate of compliance amendment request. The NRC determined that this amendment does not reflect a significant change in design or fabrication of the cask. Specifically, the NRC determined that the design of the cask would continue to prevent loss of containment, shielding, and criticality control in the event of each evaluated accident condition. In addition, any resulting occupational exposure or offsite dose rates from the implementation of Amendment No. 4 would remain well within the limits specified by 10 CFR part 20, “Standards for Protection Against Radiation.” Thus, the NRC found there will be no significant change in the types or amounts of any effluent released, no significant increase in the individual or cumulative radiation exposure, and no significant increase in the potential for or consequences from radiological accidents.

The NRC staff has determined that the amended Holtec International HI-STORM Flood/Wind Multipurpose Canister Storage System cask design, when used under the conditions specified in the certificate of compliance, the technical specifications, and the NRC’s regulations, will meet the requirements of 10 CFR part 72; therefore, adequate protection of public health and safety will continue to be reasonably assured. When this direct final rule becomes effective, persons who hold a general license under § 72.210 may, consistent with the license conditions under § 72.212, load spent nuclear fuel into Holtec International HI-STORM Flood/Wind Multipurpose Canister Storage System casks that meet the criteria of Amendment No. 4 to Certificate of Compliance No. 1032.

V. Voluntary Consensus Standards

The National Technology Transfer and Advancement Act of 1995 (Pub. L. 104–113) requires that Federal agencies use technical standards that are developed or adopted by voluntary consensus standards bodies unless the use of such a standard is inconsistent with applicable law or otherwise impractical. In this direct final rule, the NRC revises the Holtec International HI-STORM Flood/Wind Multipurpose Canister Storage System design listed in § 72.214, “List of approved spent fuel storage casks.” This action does not constitute the establishment of a standard that contains generally applicable requirements.

VI. Agreement State Compatibility

Under the “Agreement State Program Policy Statement” approved by the

Commission on October 2, 2017, and published in the **Federal Register** on October 18, 2017 (82 FR 48535), this rule is classified as Compatibility V. Category “NRC—Areas of Exclusive NRC Regulatory Authority.” The NRC program elements in this category are those that relate directly to areas of regulation reserved to the NRC by the Atomic Energy Act of 1954, as amended, or the provisions of 10 CFR chapter I. Therefore, compatibility is not required for program elements in this category. Although an Agreement State may not adopt program elements reserved to the NRC, and the Category “NRC” does not confer regulatory authority on the State, the State may wish to inform its licensees of certain requirements by means consistent with the particular Agreement State’s administrative procedure laws.

VII. Plain Writing

The Plain Writing Act of 2010 (Pub. L. 111–274) requires Federal agencies to write documents in a clear, concise, and well-organized manner. The NRC has written this document to be consistent with the Plain Writing Act as well as the Presidential Memorandum, “Plain Language in Government Writing,” published June 10, 1998 (63 FR 31883).

VIII. Environmental Assessment and Finding of No Significant Impact

Under the National Environmental Policy Act of 1969, as amended, and the NRC’s regulations in 10 CFR part 51, “Environmental Protection Regulations for Domestic Licensing and Related Regulatory Functions,” the NRC has determined that this direct final rule, if adopted, would not be a major Federal action significantly affecting the quality of the human environment and, therefore, an environmental impact statement is not required. The NRC has made a finding of no significant impact on the basis of this environmental assessment.

A. The Action

The action is to amend § 72.214 to revise the Holtec International HI-STORM Flood/Wind Multipurpose Canister Storage System listing within the “List of approved spent fuel storage casks” to include Amendment No. 4 to Certificate of Compliance No. 1032.

B. The Need for the Action

This direct final rule amends the certificate of compliance for the Holtec International HI-STORM Flood/Wind Multipurpose Canister Storage System design within the list of approved spent fuel storage casks to allow power reactor licensees to store spent fuel at reactor

sites in casks with the approved modifications under a general license. Specifically, Amendment No. 4 revises the certificate of compliance to: Add multipurpose canister (MPC)–32ML for storage and allow the fuel assembly class 16X16D as content for MPC–32ML; add the fuel assembly class 16X16E as content for MPC–37; and make changes to the final safety analysis report to separate the design pressure for the short-term operation from the off-normal condition (to provide clarity in Table 2.2.1), add cautionary notes to Sections 9.2.1 and 9.2.3, update a definition, and replace a test program.

C. Environmental Impacts of the Action

The Holtec International HI–STORM Flood/Wind Multipurpose Canister Storage System is designed to mitigate the effects of design basis accidents that could occur during storage. Design basis accidents account for human-induced events and the most severe natural phenomena reported for the site and surrounding area. Postulated accidents analyzed for an independent spent fuel storage installation, the type of facility at which a holder of a power reactor operating license would store spent fuel in casks in accordance with 10 CFR part 72, can include tornado winds and tornado-generated missiles, a design basis earthquake, a design basis flood, an accidental cask drop, lightning effects, fire, explosions, and other incidents.

This amendment does not reflect a significant change in design or fabrication of the cask. Because there are no significant design or process changes, any resulting occupational exposure or offsite dose rates from the implementation of Amendment No. 4 would remain well within the 10 CFR part 20 limits. The NRC has also determined that the design of the cask as modified by this rule would still prevent loss of confinement, shielding, and criticality control in the event of an accident. Therefore, the proposed changes will not result in any radiological or non-radiological environmental impacts that significantly differ from the environmental impacts evaluated in the staff's finding in the environmental assessment supporting the July 18, 1990, final rule that the environmental impacts would not be significant. Therefore, the NRC concludes that there will be no significant change in the types or significant revisions in the amounts of any effluent released, no significant increase in the individual or cumulative radiation exposures, and no significant increase in the potential for or consequences from, radiological

accidents. The NRC documented its safety findings in the preliminary safety evaluation report.

D. Alternative to the Action

The alternative to this action is to deny approval of Amendment No. 4 and not issue the direct final rule. Consequently, any 10 CFR part 72 general licensee that seeks to load spent nuclear fuel into the Holtec International HI–STORM Flood/Wind Multipurpose Canister Storage System in accordance with the changes described in proposed Amendment No. 4 would have to request an exemption from the requirements of §§ 72.212 and 72.214. Under this alternative, interested licensees would have to prepare, and the NRC would have to review, a separate exemption request, thereby increasing the administrative burden upon the NRC and the costs to each licensee. The environmental impacts would be the same as the proposed action.

E. Alternative Use of Resources

Approval of Amendment No. 4 to Certificate of Compliance No. 1032 would result in no irreversible commitment of resources.

F. Agencies and Persons Contacted

No agencies or persons outside the NRC were contacted in connection with the preparation of this environmental assessment.

G. Finding of No Significant Impact

The environmental impacts of the action have been reviewed under the requirements in National Environmental Policy Act of 1969, as amended, and the NRC's regulations in in subpart A of 10 CFR part 51, "Environmental Protection Regulations for Domestic Licensing and Related Regulatory Functions." Based on the foregoing environmental assessment, the NRC concludes that this direct final rule entitled "List of Approved Spent Fuel Storage Casks: Holtec International HI–STORM Flood/Wind Multipurpose Canister Storage System, Certificate of Compliance No. 1032, Amendment No. 4" will not have a significant effect on the human environment. Therefore, the NRC has determined that an environmental impact statement is not necessary for this direct final rule.

IX. Paperwork Reduction Act Statement

This direct final rule does not contain any new or amended collections of information subject to the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 *et seq.*). Existing collections of

information were approved by the Office of Management and Budget, approval number 3150–0132.

Public Protection Notification

The NRC may not conduct or sponsor, and a person is not required to respond to, a request for information or an information collection requirement unless the requesting document displays a currently valid Office of Management and Budget control number.

X. Regulatory Flexibility Certification

Under the Regulatory Flexibility Act of 1980 (5 U.S.C. 605(b)), the NRC certifies that this direct final rule will not, if issued, have a significant economic impact on a substantial number of small entities. This direct final rule affects only nuclear power plant licensees and Holtec International. These entities do not fall within the scope of the definition of small entities set forth in the Regulatory Flexibility Act or the size standards established by the NRC (§ 2.810).

XI. Regulatory Analysis

On July 18, 1990 (55 FR 29181), the NRC issued an amendment to 10 CFR part 72 to provide for the storage of spent nuclear fuel under a general license in cask designs approved by the NRC. Any nuclear power reactor licensee can use NRC-approved cask designs to store spent nuclear fuel if: (1) It notifies the NRC in advance; (2) the spent fuel is stored under the conditions specified in the cask's certificate of compliance; and (3) the conditions of the general license are met. A list of NRC-approved cask designs is contained in § 72.214. On March 28, 2011 (76 FR 17019), the NRC issued an amendment to 10 CFR part 72 that approved the Holtec International HI–STORM Flood/Wind Multipurpose Canister Storage System design by adding it to the list of NRC-approved cask designs in § 72.214.

On March 11, 2016, as supplemented on September 16, 2016, January 31, 2017, April 27, 2018, July 27, 2018, April 12, 2019, June 11, 2019, and July 5, 2019, Holtec International submitted a request to amend the HI–STORM Flood/Wind Multipurpose Canister Storage System as described in Section IV, "Discussion of Changes," of this document.

The alternative to this action is to withhold approval of Amendment No. 4 and to require any 10 CFR part 72 general licensee seeking to load spent nuclear fuel into the Holtec International HI–STORM Flood/Wind Multipurpose Canister Storage System under the changes described in

Amendment No. 4 to request an exemption from the requirements of §§ 72.212 and 72.214. Under this alternative, each interested 10 CFR part 72 licensee would have to prepare, and the NRC would have to review, a separate exemption request, thereby increasing the administrative burden upon the NRC and the costs to each licensee.

Approval of this direct final rule is consistent with previous NRC actions. Further, as documented in the preliminary safety evaluation report and environmental assessment, this direct final rule will have no adverse effect on public health and safety or the environment. This direct final rule has no significant identifiable impact or benefit on other government agencies. Based on this regulatory analysis, the NRC concludes that the requirements of this direct final rule are commensurate with the NRC's responsibilities for public health and safety and the common defense and security. No other available alternative is believed to be as satisfactory, and therefore, this action is recommended.

XII. Backfitting and Issue Finality

The NRC has determined that the backfit rule (§ 72.62) does not apply to this direct final rule. Therefore, a backfit analysis is not required. This direct final rule revises Certificate of Compliance No. 1032 for the Holtec International HI-STORM Flood/Wind Multipurpose Canister Storage System, as currently listed in § 72.214. The revision consists of the changes in Amendment No. 4 previously described, as set forth in the revised certificate of compliance and technical specifications.

Amendment No. 4 to Certificate of Compliance No. 1032 for the Holtec International HI-STORM Flood/Wind Multipurpose Canister Storage System was initiated by Holtec International and was not submitted in response to new NRC requirements, or an NRC request for amendment. Amendment No. 4 applies only to new casks fabricated and used under Amendment No. 4. These changes do not affect existing users of the Holtec International HI-STORM Flood/Wind Multipurpose Canister Storage System, and the current

Amendment No. 3 continues to be effective for existing users. While current users of this storage system may comply with the new requirements in Amendment No. 4, this would be a voluntary decision on the part of current users.

For these reasons, Amendment No. 4 to Certificate of Compliance No. 1032 does not constitute backfitting under § 72.62 or § 50.109(a)(1), or otherwise represent an inconsistency with the issue finality provisions applicable to combined licenses in 10 CFR part 52. Accordingly, the NRC has not prepared a backfit analysis for this rulemaking.

XIII. Congressional Review Act

This direct final rule is not a rule as defined in the Congressional Review Act.

XIV. Availability of Documents

The documents identified in the following table are available to interested persons through one or more of the following methods, as indicated.

| Document | ADAMS Accession No./web link/ Federal Register citation |

NATIONAL CREDIT UNION ADMINISTRATION

12 CFR Part 722

RIN 3133–AE98

Real Estate Appraisals

AGENCY: National Credit Union Administration (NCUA).

ACTION: Final rule.

SUMMARY: The NCUA Board (Board) is amending the agency's regulation requiring appraisals for certain residential real-estate related transactions. The final rule increases the threshold level below which appraisals are not required for residential real-estate related transactions from \$250,000 to \$400,000. Instead of an appraisal, and consistent with the requirement for other transactions that fall below applicable appraisal thresholds, federally insured credit unions (FICUs) are required to obtain written estimates of market value of the real estate collateral consistent with safe and sound practices. For ease of reference, this final rule explicitly incorporates the existing statutory requirement that appraisals be subject to appropriate review for compliance with the Uniform Standards of Professional Appraisal Practice (USPAP). This final rule is consistent with the final rule, effective October 9, 2019, issued by the Board of Governors of the Federal Reserve System, the Federal Deposit Insurance Corporation, and the Office of the Comptroller of the Currency (federal banking agencies) that increases the threshold level at or below which appraisals are not required for residential real estate transactions from \$250,000 to \$400,000.

DATES: The final rule is effective April 30, 2020.

I. Introduction

A. Background

In November 2019, the Board invited comment on a notice of proposed rulemaking¹ (proposal or proposed rule) that would amend the NCUA's appraisal regulation promulgated pursuant to Title XI of the Financial Institutions Reform, Recovery, and Enforcement Act of 1989 (Title XI).² Specifically, the proposed rule would increase the monetary threshold below which FICUs would not be required to obtain appraisals in connection with residential real estate transactions from \$250,000 to \$400,000. Instead of an appraisal, and consistent with the requirement for other transactions that fall below applicable appraisal thresholds, the proposal would require FICUs to obtain written estimates of market value of the real estate collateral consistent with safe and sound practices. In addition, the proposed rule would amend the agency's appraisal regulation to explicitly incorporate the existing statutory requirement that appraisals be subject to appropriate review for compliance with the Uniform Standards of Professional Appraisal Practice (USPAP), as required by section 1473(e) of the Dodd Frank Wall Street Reform and Consumer Protection Act (the Dodd Frank Act).³

B. Summary of Proposed Rule

As noted in the proposed rule, the price of residential real estate has increased over time, but the residential appraisal threshold has not been adjusted since 2001.⁴ Further, the Board estimated under the proposal, the percentage of transactions exempted from the appraisal requirement would

¹ 84 FR 65707 (Nov. 29, 2019).

² 12 U.S.C. 3331 *et seq.*

³ Public Law 111–203, 124 Stat. 1376, codified at 12 U.S.C. 3339(3).

⁴ 66 FR 58656 (Nov. 23, 2001). The rule was effective March 1, 2002.

be restored to the level it was following the last threshold increase in 2001. The proposed residential appraisal threshold level of \$400,000 would exempt a similar number of transactions and dollar volume of transactions as did the current threshold of \$250,000 when it was set in 2001 thereby restoring the level of exempted transactions. The Board stated it believes increasing the appraisal threshold for residential real estate transactions will provide meaningful burden reduction for FICUs, while maintaining federal public policy interests in real-estate related transactions and the safety and soundness of FICUs.

Based on the NCUA's data analysis and supervisory experience, as set forth in the proposed rule, the increase in the appraisal threshold in the 2001 residential appraisal final rule did not result in a material increase in risk to safety and soundness. The Board estimated that the proposed rule would exempt from appraisal requirements approximately 46,000 residential real estate transactions, worth a combined \$14 billion, equating to approximately 0.9 percent of FICU assets.⁵ The Board estimated that approximately 77 percent of transactions, for a total of 55 percent of the dollar amount of transactions, are currently not subject to the NCUA's residential appraisal requirement. This is estimated to increase to 94 percent of transactions and 83 percent of the dollar amount with the increased threshold. In the proposed rule, the Board noted that in 2001, an estimated 95 percent of residential transactions and 80 percent of the dollar amount of residential transactions were exempt when the current \$250,000 threshold was set.⁶ The NCUA's current appraisal regulation requires FICUs to obtain written estimates of market value for all real-estate related transactions that do not require an appraisal pursuant to Title XI (Title XI appraisal), unless explicitly exempted from written estimates of market value requirements.⁷ As an important prudential safeguard, written estimates of market value must be prepared by qualified, experienced, and independent individuals.⁸ In addition, through the *Interagency Appraisal and Evaluation Guidelines (Interagency Guidelines)*,⁹ the NCUA has provided guidance to FICUs on its expectations regarding

when and how written estimates of market value should be used.¹⁰

II. Final Rule

This final rule follows publication of the November 29, 2019, proposed rule. After carefully considering the comments and conducting further analysis, the Board is adopting the final rule as proposed, and is increasing the residential real estate appraisal threshold from \$250,000 to \$400,000. As discussed in the proposal, and further detailed below in response to comments, increasing the residential real estate appraisal threshold will provide meaningful regulatory relief for FICUs while maintaining their safety and soundness and providing reasonable protection for consumers. This final rule also adopts without change the proposed conforming amendment to the NCUA's appraisal regulations explicitly incorporating the Dodd Frank Act amendment to Title XI that appraisals be subject to appropriate review for compliance with USPAP,¹¹ as well as a conforming amendment to remove additional requirements for the appraisal exemption for certain residential real estate transactions in rural areas.

III. Legal Authority

Title XI directs each federal financial institutions regulatory agency¹² to require regulated institutions to obtain appraisals meeting minimum standards for certain real estate-related transactions. The purpose of Title XI is to protect federal financial and public policy interests¹³ in real estate-related transactions by requiring that real estate appraisals used in connection with Title XI appraisals be performed in accordance with uniform standards, by individuals whose competency has been demonstrated, and whose professional

conduct will be subject to effective supervision.¹⁴

Title XI defines a "federally related transaction" as a real estate-related financial transaction that is regulated or engaged in by a federal financial institutions regulatory agency and requires the services of an appraiser.¹⁵ The NCUA has authority to determine those real estate-related financial transactions that do not require the services of a state-certified or state-licensed appraiser and are therefore exempt from the Title XI appraisal requirements. Such exempt real estate-related financial transactions are not federally related transactions under the statutory or regulatory definitions because they are not required to have Title XI appraisals.¹⁶

The NCUA has exercised this authority by exempting several categories of real estate-related financial transactions from the Title XI appraisal requirements, including transactions at or below certain designated dollar thresholds.¹⁷ The NCUA has determined that these categories of transactions do not require appraisals by state-certified or state-licensed appraisers in order to protect federal financial and public policy interests or to satisfy principles of safety and soundness.

Title XI expressly authorizes the NCUA to establish dollar threshold levels at or below which Title XI appraisals are not required if: (1) The NCUA determines, in writing, that the threshold does not represent a threat to the safety and soundness of financial institutions; and (2) the NCUA receives concurrence from the Consumer Financial Protection Bureau (CFPB) that such threshold level provides reasonable protection for consumers who purchase "1–4 unit single-family residences."¹⁸ As noted above, transactions below the threshold level are exempt from the Title XI appraisal requirements and thus are not deemed "federally related transactions."

IV. Discussion of Public Comments Received on the Proposed Rule

A. The Public Comments, Generally

The NCUA received 27 comments following publication of the November 29, 2019 proposed rule. Of the 27 comments received, 22 were in support of and five were in opposition to the proposed increase to the appraisal

threshold for residential real estate transactions.¹⁹

The five comments received in opposition to the proposed rule came from appraisal companies, appraisal trade organizations, and one individual. They expressed concern that the proposal would reduce the safety and soundness of credit unions and would not provide adequate consumer protections.

In contrast, comments received from credit unions, credit union trade associations, state credit union leagues, state credit union regulators and others supported the proposal, stating that it would reduce regulatory burden, reduce member costs, increase access to credit, and would provide reasonable protection for consumers.

B. Discussion of Specific Comments on the Proposed Rule

The Board requested comment on all aspects of the proposed rule and posed a number of specific questions related to the consumer protection aspect of appraisals and the analysis for the proposed rule and written estimates of market value. All comments received were in response to the proposed increase in the monetary threshold for residential real estate transactions. No comments were received regarding the proposed conforming amendment to the NCUA's appraisal regulations explicitly incorporating the Dodd Frank Act amendment to Title XI that appraisals be subject to appropriate review for compliance with USPAP. Commenters' rationale for opposing or supporting the \$400,000 threshold are discussed below.

1. Threshold Level.

a. "At or below" Standard. The final rule adopted by the federal banking agencies sets a threshold level at or below \$400,000. One credit union trade association encouraged the NCUA to adopt the same "at or below" language to maintain consistency with the federal banking agencies. Upon consideration, the Board has determined to keep the rule as proposed in order to be consistent with the NCUA's appraisal threshold for non-residential real estate transactions.²⁰

b. Accounting for regional variations. Three commenters, two from the

perspective of communities with house prices significantly lower than the proposed increased threshold and one from the perspective of a community with sales prices that largely exceed it, suggested the Board should consider an approach that takes into account regional home price variations rather than adopt a single figure nationwide. The Board believes that adopting such a regional approach would only add unnecessary regulatory burden and complexity by introducing numerous threshold levels across the country. In addition, FICUs and borrowers retain the option to obtain appraisals on exempt transactions, and some credit union commenters indicated that they would continue using appraisals for transactions below the threshold.

c. General support and concerns.

Commenters supporting the proposed increase generally stated that written estimates of market value are adequate substitutes for appraisals for transactions below the proposed \$400,000 threshold. Nevertheless, one credit union league stated that many of its members would continue to use appraisals even on loans eligible for written estimates of market value. A credit union trade association noted favorably that the rule is flexible enough that consumers and FICUs would still have the option of ordering an appraisal. Two state appraiser coalitions expressed concern that raising the threshold would exempt most transactions in their service area and lead to almost all real estate-related transactions being exempt from appraisal requirements in some regions or metropolitan statistical areas.

2. Safety and soundness. The majority of commenters opposed to the \$400,000 threshold expressed concern that the proposal increases risk for residential real estate transactions and would negatively affect safety and soundness. These commenters generally posited that appraisals offer an important safety and soundness tool because appraisals provide an unbiased opinion on the value of collateral, and without this valuation, credit unions are exposed to increased risk. One commenter stated that by focusing on the total dollar volume of loans originated, rather than the total volume of transactional activity, the proposal interprets safety and soundness as only a monetary safeguard and not as a safeguard on the volume of lending activity.

In contrast, commenters supportive of the proposed rule did not foresee an increased risk to FICUs or individual transactions. Most individual credit union commenters noted that their policies and procedures are designed to mitigate risk, and in those instances

where they currently use written estimates of market value, such estimates are performed by individuals who are independent from the loan process and are qualified and experienced in home valuation. A few commenters noted that while they support the proposed threshold increase, they would continue to prioritize sound underwriting practices, guide their decisions by the best interests of their members, and use business judgment in deciding when, and if, appraisals are necessary for transactions below the threshold. One commenter stated that the historically sound valuation practices of the credit union industry warrant the increased appraisal threshold. Several commenters expressly agreed with the safety and soundness considerations discussed in the proposed rule. Many commenters stated that the increased threshold would eliminate the competitive disadvantage that FICUs now face since the federal banking agencies raised the residential real estate transaction threshold for banks.

After taking into account the comments discussed above, the Board maintains that the threshold level of \$400,000 for residential real estate transactions does not pose a threat to the safety and soundness of FICUs. First, the \$400,000 threshold would exempt a similar number of transactions and dollar volume of transactions as did the current threshold of \$250,000 when it was set in 2001.²¹ Raising the threshold in 2001 did not result in a material increase in risk to safety and soundness. Second, the new threshold would not introduce significant additional risk to the credit union system. Based on 2018 Home Mortgage Disclosure Act (HMDA) data, the new

²¹ The NCUA conducted analyses using 2018 data reported under the Home Mortgage Disclosure Act (HMDA), which requires a variety of financial institutions to maintain, report, and publicly disclose loan-level information about residential mortgage originations. Information reported under HMDA includes various data points relevant to the NCUA's analysis, including loan size, loan type, property type, property location, and secondary market purchaser. While the HMDA data has limitations, including that certain low-volume originators and originators located in rural areas are not required to report, the Board believes it provides a representative sample of the universe of mortgage originations, including transactions subject to the NCUA's appraisal requirement. The NCUA used 2018 HMDA data to estimate the effect of the residential threshold increase. The NCUA used HMDA data to determine the number of transactions and dollar volume of transactions that would be affected relative to: (1) Total FICU originations reported in the HMDA data; and (2) transactions originated by NCUA-insured institutions that were not sold to a government-sponsored enterprise (GSE) or otherwise insured or guaranteed by a U.S. government agency (regulated transactions).

¹⁹ One commenter opposed to the rule did not provide a comment letter in response to the Board's proposed rule, but provided instead their response to the federal banking agencies' December 2018 proposal to increase the residential real estate threshold for their regulated financial institutions. Where relevant, their comments have been discussed in this preamble to the final rule.

²⁰ 12 CFR 722.3(b)(1) (requiring appraisals for non-residential transactions at or above \$1,000,000, which thus exempts such transactions below \$1,000,000).

threshold would only incrementally exempt real estate-secured loans granted each year, worth approximately \$14 billion, which equates to approximately 0.9 percent of FICU assets as of the December 31, 2019 Statement of Financial Condition (referred to as the Call Report). Third, FICUs' residential real estate-secured loans have performed well with relatively low delinquencies and net charge-off rates in an analysis of performance from 1994 to 2018. This period, which included two major recessionary periods, shows the prior threshold changes in 1995 and 2001 did not have a negative impact on loan performance.²² Furthermore, based on supervisory experience and analysis of material loss reviews conducted by the NCUA's Inspector General, appraisals have not been a substantial factor in any material FICU failures. The Board has also taken into consideration that \$400,000 is a reasonable limit that is consistent with the general appreciation in home prices since the last threshold increase.²³ Finally, the NCUA's appraisal regulations require FICUs to obtain written estimates of market value for all real estate-related financial transactions that do not require a Title XI appraisal, unless the real estate-related financial transaction is explicitly exempt from written estimates of market value requirements.²⁴

Written estimates of market value performed in accordance with the NCUA's regulations provide FICUs with suitable alternatives to appraisals.²⁵ In the agency's supervisory experience, written estimates of market value have provided sufficient information to enable FICUs to make prudent lending decisions.

For all these reasons, the Board concludes that past threshold increases did not adversely impact safety and soundness, and the current increase of the residential appraisal threshold to \$400,000 does not represent a threat to the safety and soundness of FICUs.²⁶

3. Consumer protection.

a. Consumer protections, in general. All five commenters that opposed the increased threshold raised consumer protection concerns. One stated that the proposal contradicts the position taken by the federal banking agencies and the

NCUA in their 2017 Economic Growth and Regulatory Paperwork Reduction Act²⁷ (EGRPA) report to Congress, at which time the federal financial regulators opted not to change the threshold based on considerations of safety and soundness and consumer protection. The same commenter stated that the proposed rule ignores congressional intent as reflected in the Economic Growth, Regulatory Relief, and Consumer Protection Act,²⁸ (EGRRCPA) in which Congress chose only to raise the threshold for rural areas on a case-by-case basis for individual transactions in which the lender was unable to secure the services of an appraiser. One commenter noted that lower-income and first-time homebuyers would be particularly impacted by not having an unbiased party value the purchase price.

In proposing the increase in the appraisal threshold, the Board stated that while appraisals can provide protection to consumers by facilitating the informed use of credit and helping to ensure that the estimated value of the property supports the loan amount, written estimates of market value have also provided these benefits for FICUs and borrowers for transactions below the current \$250,000 threshold. FICUs have used written estimates of market value for transactions below the applicable appraisal thresholds since the issuance of the first rule implementing Title XI.

With this final rule, the percentage of transactions exempted from the appraisal requirement would be restored to the same level following the last threshold increase in 2001. As an additional safeguard, under Title XI, the NCUA must receive CFPB concurrence that the residential appraisal threshold level provides reasonable protection for consumers who purchase "1–4 unit single-family residences."²⁹ By letter dated April 8, 2020, the CFPB Director provided this concurrence.

The NCUA recognizes that it decided against proposing a residential appraisal threshold increase during the EGRPA process due to safety and soundness and consumer protection concerns. The NCUA has reconsidered this decision based on comments received to date from FICUs and state credit union regulators, and in light of the recent action by the federal banking agencies to increase the residential real estate appraisal threshold for banks. The Board believes that consumer protection

and safety and soundness concerns are addressed and supported by the rationale as put forth in the proposed rule and in this preamble to the final rule.

The NCUA also recognizes that Congress recently amended Title XI to provide a narrow, self-effectuating appraisal exemption for rural transactions meeting certain requirements. However, the Board also observes that Congress did not amend the NCUA's long-standing authority in Title XI to establish a threshold level at or below which a certified or licensed appraiser is not required to perform an appraisal in connection with federally related transactions. Through the EGRRCPA amendment, Congress mandated that rural transactions meeting specific statutory criteria be exempted from the appraisal regulations; however, there is no indication that Congress intended to restrict the NCUA's authority to provide additional exemptions pursuant to its existing authority. Notably, unlike the analysis conducted pursuant to this rulemaking, the EGRRCPA amendment did not require a safety and soundness determination or CFPB concurrence.³⁰

With regard to the comment that an appraiser is the only unbiased party to a residential real estate transaction, this is not reflective of the agency's supervisory experience or regulatory expectations. As is the case currently for transactions under the threshold exemptions, written estimates of market value generally must be performed by individuals who are independent of the loan production and collection processes, with no direct, indirect, or prospective interest, financial or otherwise, in the property or the transaction.³¹ Written estimates of market value must also be conducted by individuals qualified and experienced to perform such estimates for the type and amount of credit being considered.³² Furthermore, the Valuation Independence Rule, which implements the Dodd Frank Act independence provisions, requires a valuation to be based on the independent judgment of the person preparing the valuation. The use of coercion, extortion, inducement, bribery, or intimidation of, compensation or instruction to, or collusion with a person that either prepares valuations or perform valuation management functions is prohibited.³³

²² Net charge-offs are charge-offs minus recoveries. Net charge-offs represent losses to financial institutions.

²³ Based on analysis of residential home prices using the S&P Case-Shiller Home Price Index, FHFA Index, as well as the Bureau of Labor Statistics Consumer Price Index.

The Valuation Independence Rule applies to both appraisals and written estimates of market value. During the supervisory review of a FICU's real estate lending activities, the NCUA's examiners assess the adequacy of risk management practices, including the independence of the collateral valuation function.

b. Specific requests for consumer protection comments. In addition to requesting comment on all aspects of the rule, the Board asked particularly about specific aspects of consumer protection raised by the proposal. The Board asked commenters how often FICUs use internal staff to prepare written estimates of market value and what valuation information, if any, would be lost if more written estimates of market value were performed rather than appraisals. The Board also requested comment on the extent to which appraisals and written estimates of market value provide benefits or protections for borrowers that are purchasing 1-to-4 family residential property and the nature and magnitude of the differences, if any, in consumer protection. The Board was also interested in knowing how well consumers have understood written estimates of market value and whether there are any concerns in this area that the Board should take into account. Finally, the Board asked for input on the extent to which useful and accurate property valuation information is readily available to borrowers through public sources.

Several credit union commenters stated that all of their written estimates of market value are performed by individuals who are independent of the loan or production process and have the necessary qualifications and experience. One credit union commenter stated specifically that it does not use internal staff to prepare written estimates of market value, as did one credit union trade association based on a survey of its members. In terms of the valuation information that would be lost if more written estimates of market value were performed rather than appraisals, two commenters, one supportive of the rule and one opposed, noted that the physical inspection of a property is the primary benefit of an appraisal to consumers. One commenter stated that appraisers conduct rigorous analysis of property features, such as number of bedrooms and proximity to open space, which may have an impact on a property's future marketability. On the other hand, one commenter noted that buyers conduct their own visual inspections and professional home inspections are a typical part of most

transactions. One credit union association, while supportive of the rule, stated that its members anticipated the loss of valuable information, such as the composition of a property's interior and data on comparable properties, with the use of written estimates of market value instead of appraisals. This commenter stated that many of its credit union members would continue using appraisals on properties for which written estimates of market value would be allowed.

In response to the comments concerning on-site inspections of real estate, the Board notes that USPAP does not require an on-site inspection of the subject property.³⁴ However, USPAP states that inspections are often conducted and that some appraisers use third parties to conduct inspections.³⁵ Property valuations, whether appraisals or written estimates of market value, should contain sufficient information and analysis to support the FICU's decision to engage in a particular transaction, including information relating to the actual physical condition and characteristics of the property. The appraiser's physical inspection of a property can provide additional information on the features of the property to the buyer, however, the primary purpose of the appraisal is to value the collateral behind the loan. As USPAP states, "the appraiser's inspection commonly is limited to those things readily observable without the use of special testing or equipment."³⁶ Furthermore, "an inspection conducted by an appraiser is usually not the equivalent of an inspection by an inspection professional (e.g. a structural engineer, [or] home inspector)."³⁷

While there is no requirement for a physical inspection with either an appraisal or a written estimate of market value, the *Interagency Guidelines* state that safe and sound written estimates of market value should be supported by a physical inspection of the property or any alternative method to confirm the property's condition, depending on transaction risks.³⁸ In the event a borrower requires further information

about the physical condition of a property, the borrower always retains the option of engaging a licensed property or building inspector.

One appraisal organization stated that the proposal would lead more consumers to lose out on the benefits of an appraisal that has been conducted in accordance with the USPAP. This commenter pointed out that there are other benefits reflected in an appraisal as a result of the appraiser acting in an ethical manner informed by the education, competency, qualifications and training that are required of USPAP compliant appraisers.

One commenter noted that lenders are increasingly willing to rely on automated valuation models (AVM) for which the federal financial regulators have not yet promulgated regulations despite the Dodd Frank Act requirement to do so. As a result, the commenter posits that the AVM represents a "black box" approach that may not be fully understood by lenders or comprehensible to prospective homeowners.

While USPAP itself does not apply to written estimates of market value, the Board believes that the regulatory framework requiring independence, qualifications, and experience, combined with the agency's longstanding supervisory experience with written estimates of market value, provides sufficient basis for raising the residential real estate appraisal threshold while maintaining reasonable consumer protection. In fact, the NCUA's supervisory experience shows that many FICUs still use appraisals for situations when only a written estimate of market value was required. These reasons include institutional preference, underwriting to secondary market standards for flexibility, ease of valuation policy implementation and, as the *Interagency Guidelines* recommend, for transactions with elevated risk.³⁹ As additional independent analysis, the NCUA reviewed the current residential real estate underwriting practices of over 120 FICUs⁴⁰ to confirm whether FICUs will continue to obtain appraisals for transactions under the threshold. The review found that 60 percent of these FICUs obtained appraisals in a majority of their residential real estate transactions below the current threshold of \$250,000. Similar reasons as listed

³⁷ *Id.*

³⁸ *Interagency Guidelines* at 77461. In addition, the Dodd Frank Act requires each creditor to furnish to an applicant a copy of any and all written appraisals and valuations developed in connection with the applicant's application for a loan that is secured or would have been secured by a first lien on a dwelling promptly upon completion, but in no case later than 3 days prior to the closing of the loan, whether the creditor grants or denies the applicant's request for credit or the application is incomplete or withdrawn. 15 U.S.C. 1691.

³⁹ *Interagency Guidelines*, Appendix A.

⁴⁰ The NCUA reviewed a sample of open examinations across all of its regional offices for a defined, limited period to gather feedback on typical FICU practices for real estate appraisals under the \$250,000 threshold.

above were cited for obtaining appraisals when not required.

Moreover, although limited in scope, the higher priced mortgage loan rule (HPML rule), requires lenders for certain HPMLs secured by a consumer's principal dwelling to obtain an appraisal—and in some cases, two appraisals—that include an interior property visit, and provide free copies to the consumer.⁴¹ The HPML Rule applies to certain higher-risk transactions. Thus, for a select group of loans, the HPML Rule requires that the information in an appraisal will be available for some first time or low-income borrowers mentioned by some commenters as being most affected by the threshold increase.

With regard to the increasing use of AVMs in the valuation industry, the Board believes that technology and data present an opportunity to improve and expand upon current property valuation methods. AVMs cannot be the sole source of collateral valuation, but may be used in the process of generating an appraisal, written estimate of market value, or even for credit union portfolio management purposes. The federal banking agencies and the NCUA have issued a public notice regarding the AVM rulemaking required by the Dodd Frank Act.⁴² As long as AVMs are subject to quality controls, such as testing for accuracy and rigorous analysis of the algorithms that drive them, there are many advancements that computer-based applications can make. As these automated models become more sophisticated and widespread in the market, it is important that they be used to promote fair lending and greater and more equitable access to credit.⁴³

⁴¹ 15 U.S.C. 1639h.

⁴² The federal banking agencies, the NCUA, the Federal Housing Finance Agency and the Consumer Financial Protection Bureau, in consultation with the Appraisal Subcommittee and the Appraisal Standards Board of the Appraisal Foundation, are required to promulgate regulations to enumerate quality control standards for automated valuation models. Section 1473(q) of the Dodd-Frank Act requires that automated valuation models used to estimate collateral value for mortgage lending comply with quality control standards designed to ensure a high level of confidence in the estimates produced by automated valuation models; protect against manipulation of data; seek to avoid conflicts of interest; require random sample testing and reviews; and account for other factors the agencies deem appropriate. Public notice available at <https://www.reginfo.gov/public/do/eAgendaViewRule?pubId=201910&RIN=3133-AE23>.

⁴³ This is consistent with the NCUA's longstanding regulatory requirement that federal credit unions may not consider lending policies which have the effect of discriminating on the basis of certain characteristics of the borrower, or rely on appraisals that they know or should know are based upon criteria, as enumerated in the NCUA's regulations, that have a discriminatory effect. 12 CFR 701.31.

On the extent to which appraisals and written estimates of market value provide benefits or protections to borrowers who are purchasing 1-to-4 family residential property, a commenter stated that appraisals protect against an inaccurate valuation of a property and requested that the Board provide another valuation option to protect the consumer. This commenter did not reference written estimates of market value, but, as noted above, both appraisals and written estimates of market value provide a reliable estimate of the market value of a property and must be performed by qualified individuals. As set forth in the *Interagency Guidelines*, written estimates of market value should contain sufficient information and analysis to support the valuation of the property.⁴⁴ In addition, lenders must provide borrowers with a copy of all appraisals and written estimates of market value developed in connection with an application for a first-lien loan secured by a dwelling.⁴⁵ Both consumers and lenders may always order an appraisal in the event of a dispute arising out of a written estimate of market value.

Some commenters stated the nature and magnitude of the differences in consumer protection between appraisals and written estimates of market value revolve largely around the physical inspections and USPAP protections discussed above. Commenters also noted that, with appraisals consumers have a direct mechanism for lodging a complaint for a faulty appraisal.

With respect to consumer recourse, lenders can order appraisals when disputes arise with written estimates of market value. In addition, the failure to comply with the independence requirements of the Valuation Independence Rule can result in civil liability.⁴⁶ From a supervisory standpoint, the NCUA can address deficiencies in a credit union's valuation process through informal or formal enforcement actions. Borrowers may also file a complaint through the NCUA's complaint process as well as through the CFPB's process. Therefore, the Board does not expect the increased threshold to materially affect options for consumer recourse.

With regard to how well consumers have understood written estimates of market value and any related concerns

the Board should take into account, two appraisal organizations stated that appraisals are more standardized than written estimates of market value, thus, making it easier for consumers to understand and compare appraisals. On the other hand, one credit union stated that appraisals are not user-friendly and have led to consumers disputing appraised values due to a misunderstanding of the contents of appraisals. The same commenter suggested that written estimates of market value could be drafted in such a way as to be more helpful to borrowers. One commenter asked the Board to provide additional guidance for credit unions on what constitutes an adequate written estimate of market value. One commenter stated that they would strongly support the NCUA creating a model form with a safe harbor from liability for unintentional and nonmaterial errors.

Based on the agency's supervisory experience and observations on the use of written estimates of market value, the Board does not believe that it is necessary to provide a model form for written estimates of market value at this time. The *Interagency Guidelines* encourage regulated institutions to establish policies and procedures for determining an appropriate collateral valuation method for a given transaction considering associated risks.⁴⁷ The *Interagency Guidelines* also set forth the information that a sufficient written estimate of market value should contain to support a credit decision, including, at a minimum, the location and description of the property, an estimate of the property's market value, the methods used to confirm the property's physical condition, the analysis that was performed along with the supporting information used to value the property, any supplemental information that was considered when using an analytical method or technological tool, and all sources of information used to arrive at the property valuation.⁴⁸ The Board reiterates that FICUs have been utilizing written estimates of market value under the \$250,000 threshold since 2001. It has not been the agency's experience that the existing *Interagency Guidelines* are insufficient or that written estimates of market value for transactions under the \$250,000 threshold harm consumers because they are not standardized. Although the Board recognizes that written estimates of market value are not subject to the same uniform

⁴⁴ *Interagency Guidelines* at 77461.

⁴⁵ 12 CFR 1002.14, 78 FR 7216 (January 31, 2013) (implementing amendment to the Equal Credit Opportunity Act (ECOA)), 15 U.S.C. 1691 *et seq.*, by the Dodd Frank Act section 1474. 15 U.S.C. 1691(e).

⁴⁷ *Interagency Guidelines* at 77461.

⁴⁸ *Id.*

standards as appraisals,⁴⁹ in terms of structure and content or the preparer's training and credentialing requirements, written estimates of market value provide sufficient consumer protections for transactions under \$400,000.⁵⁰

All commenters who discussed the extent to which useful and accurate property valuation information is readily available to borrowers through public sources acknowledged the broad availability of consumer-facing property valuation information through public sources, including websites such as Zillow, Trulia, and Realtor.com and the Multiple Listing Service. However, one appraisal organization commented that many of these consumer-facing tools are not necessarily useful to consumers or lenders in determining property values—rather they are designed for marketing purposes. Some individual credit union commenters specifically referenced the usefulness of publicly available tax assessed valuations (known as TAVs) in helping them determine property valuations and in making relatively conservative lending decisions. The Board finds that, although all sources of publicly available valuation information might not always accurately reflect the market value of a particular property, consumers can use a variety of available information to learn more about the availability of and the potential range of values for properties in a particular area or market.

4. Time and cost of appraisals.

The Board asked for comments on whether the proposed rule would lead to cost savings for FICUs and/or borrowers as well as reduce the time to close loans. Responses to this point were mixed. Many commenters who supported the proposed threshold noted that it would increase access to credit, reduce the regulatory burden on credit unions, and lead to cost savings for members. Some commenters who opposed the rule mentioned the cost savings do not outweigh consumer considerations and those commenters disputed the materiality of time savings.

Lenders generally require consumers to pay for costs associated with obtaining appraisals, which can include fees paid to appraisers and appraisal firms and fees charged by the Appraisal Management Companies (AMC) that lenders often use to administer the appraisal process. A few credit union commenters provided time and cost

estimates of appraisals as evidence of borrowers' potential savings. These commenters stated that appraisals generally cost between \$500 and \$1,000 and take up to four weeks to receive. One credit union commenter stated that in its rural area, appraisals could take up to eight weeks and range from \$600 to \$1,100.

In contrast, one commenter opposed to the proposed rule stated that the average cost of an appraisal is \$446 with an average turnaround time of 9 days, or 18 days if a lender orders an appraisal through an AMC. Another commenter stated that the average price of an appraisal is \$331 with an average turnaround time of 5 days. Some appraiser organizations commented that, regarding time and cost savings, the fee structure between appraisers and AMCs is not transparent to the consumer. They also noted that it is unfair to blame appraisers for the time that elapses before an appraisal is even requested, and, to the extent that appraisers affect timeliness of closing, this is often because of issues with the property that are not discovered until the inspection phase. One commenter noted that complaints about appraiser access in recent years have more to do with increased loan demand due to falling interest rates rather than appraiser supply issues. Some commenters noted that accurate data is not available on the cost and turnaround time for written estimates of market value, so it is not clear how much consumers and credit unions save.

The Board considered the comments relating to the amount of time it takes credit unions to receive a completed appraisal and the appraisal's related cost. The time it takes to complete a written estimate of market value may often be shorter than the time it takes to receive a Title XI appraisal, particularly in rural areas. In addition, written estimates of market value generally cost less than Title XI appraisals for the same properties. The Board believes, based on information available on the cost of written estimates of market value and appraisals, that there are likely to be time and cost savings for FICUs and borrowers where a written estimate of market value, as opposed to an appraisal, is obtained.

A few commenters supporting the proposed threshold increase specifically discussed the impact of the proposal on FICUs serving rural communities. These commenters stated that it is difficult to get an appraisal for a reasonable cost and in a reasonable time in rural areas. One commenter noted that it serves a community in which there is no appraiser within 100 miles, and thus

appraisers will often wait for enough transactions to justify the travel necessary to conduct a physical inspection of the property. Feedback from commenters is consistent with the Board's experience as appraisals for properties in high cost of living areas and rural areas tend to be more expensive than in low cost of living and urban areas. The Department of Veterans Affairs' (DVA) appraiser fee schedule by state ranges from a low of \$425 in South Carolina to a high of \$875 in Montana. In addition, based on DVA schedules and feedback from commenters, turnaround time and costs for appraisals is higher for rural areas than urban areas. The Board estimates the \$400,000 threshold would provide burden relief in terms of transaction volume and dollar amount to rural areas at a proportional rate to the burden reduction overall. However, the Board estimates the proportional amount of relief in terms of time and cost savings to credit unions and borrowers would exceed the burden relief in urban areas.

5. Other comments.

Hearing request. One group of state appraiser organizations submitted a copy of the comment letter that it sent to the federal banking agencies in response to their proposed rule to increase the residential real estate appraisal threshold. The letter to the federal banking agencies included a request for a hearing to more fully explore these issues. Separately, an appraisal organization strongly suggested that the Board conduct hearings to solicit more views. The Board declines to hold a hearing on this rulemaking. The Board does not believe that a hearing would elicit information that could not have been submitted through the notice and comment process. The Board has thoroughly considered all comment letters, including those submitted by these two organizations.

6. Comments beyond the scope of the rule.

One commenter noted that many residential real estate contracts include appraisal contingency clauses, which would not be available to consumers without an appraisal. Another commenter, however, raised the possibility of a valuation contingency clause in future residential contracts.⁵¹

⁴⁹ USPAP does not prescribe a model form, but institutions often use template forms, such as Fannie Mae Form 1004/Freddie Mac Form 70, known as the Uniform Residential Appraisal Report.

⁵⁰ 12 U.S.C. 3341(b).

⁵¹ The CFPB, in its concurrence to the federal banking agencies' final residential real estate appraisal rule, acknowledged the potential benefit of appraisal contingency clauses in the context of the few appraisals that come in below the contract price, but did not find them to be a significant enough consumer protection to outweigh the benefit of raising the threshold. Available at <https://www.consumerfinance.gov/notice-and-comment-requests/2018-06-residential-real-estate-appraisal-rule/>.

An appraisal contingency is an agreement confirming property valuation between the seller and the buyer not the financing institution. Furthermore, the appraisal contingency referenced by the commenter is outside the scope of this rulemaking.

Two commenters requested that the NCUA add a *de minimis* threshold to the requirement that transactions that are partially insured or guaranteed by a U.S. government agency or sponsored agency have written estimates of market value. The proposed rule did not make any changes to the provision regarding transactions partially insured or guaranteed by a U.S. government agency or a U.S. government sponsored agency. Accordingly, the Board declines to make any changes to this provision in this final rule.

One commenter requested the agency clarify the definition of “complex.” Under the NCUA’s current appraisal regulation, a residential real estate transaction at or above the \$250,000 threshold (not including any amount of the transaction that is guaranteed or insured by a U.S. government agency or government sponsored agency) that is deemed “complex,” must be accompanied by an appraisal from a state-certified appraiser, as opposed to a state-licensed appraiser who is not certified. The current regulation also provides that a FICU may presume that appraisals of 1-to-4 family residential properties are not complex unless the credit union has readily available information that a given appraisal will be complex. The commenter requested further clarity on what is considered “readily available information.” The proposed rule did not make any changes to this presumption or to the definition of “complex.”

The Board declines to consider these suggested changes to the regulation at this time as they are beyond the scope of the rule.

C. Final Rule

Based on the above analysis and consideration of the comments, the Board determines it is appropriate to adopt the proposed increase in the threshold below which appraisals for residential real estate transactions are not required from \$250,000 to \$400,000. In addition, the Board adopts the proposed conforming changes regarding review of appraisals for compliance with USPAP and the removal of additional requirements for the appraisal exemption for certain transactions in rural areas for the

reasons stated in the proposed rule. As discussed in the proposed rule, the additional requirements associated with the appraisal exemption for certain residential real estate transactions will be unnecessary once the threshold for all residential appraisals is raised to \$400,000.⁵² Removing these requirements from the regulation will reduce confusion for FICUs but does not affect the validity of this authority under the 2018 legislation. Neither provision substantively alters the rights or obligations of FICUs or other parties, which are addressed in the relevant statutes.

V. Effective Date

All provisions of the rule are effective upon publication of the final rule in the **Federal Register**. The 30-day delayed effective date required under the Administrative Procedure Act is waived pursuant to 5 U.S.C. 553(d)(1) and (3), which provides an exception to the 30-day delayed effective date requirement when a substantive rule grants or recognizes an exemption or relieves a restriction. The amendment to increase the residential appraisal threshold exempts additional transactions from the agency’s appraisal requirement, which would have the effect of relieving restrictions, and the final rule incorporates the existing statutory requirement that appraisals be subject to appropriate review for compliance with USPAP for ease of reference and removes additional requirements relating to residential real estate transactions in rural areas.

VI. Regulatory Procedures

A. Regulatory Flexibility Act

The Regulatory Flexibility Act (RFA) generally requires that, in connection with a final rule, an agency prepare a final regulatory flexibility analysis that describes the impact of a rule on small entities. A regulatory flexibility analysis is not required, however, if the agency certifies that the rule will not have a significant economic impact on a substantial number of small entities (defined for purposes of the RFA to include credit unions with assets less than \$100 million) and publishes its certification and a short, explanatory statement in the **Federal Register** together with the rule.

Data currently available to the NCUA are not sufficient to estimate how many small credit unions make residential real estate loans in amounts that fall between the current and amended thresholds. Therefore, the NCUA cannot

estimate how many small entities may be affected by the increased threshold and how significant the reduction in burden may be for such small entities. The NCUA believes, however, that the threshold increase will meaningfully reduce burden for small credit unions. Accordingly, the NCUA certifies that the final rule will not have a significant economic impact on a substantial number of small credit unions.

B. Paperwork Reduction Act

The Paperwork Reduction Act of 1995 (PRA) applies to rulemakings in which an agency by rule creates a new paperwork burden on regulated entities or modifies an existing burden (44 U.S.C. 3507(d)). For purposes of the PRA, a paperwork burden may take the form of a reporting, recordkeeping, or third-party disclosure requirement, referred to as an information collection. The NCUA may not conduct or sponsor, and the respondent is not required to respond to, an information collection unless it displays a valid Office of Management and Budget (OMB) control number.

This final rule increases the threshold from \$250,000 to \$400,000 for a residential real estate transaction on which an appraisal is required. Transaction values of less than \$400,000 do not require an appraisal, but a written estimate of market value. The information collection requirement of this part is that the FICU retain a record of either the appraisal or written estimate of market value, whichever applies. Even though the threshold has increased, the proposal will not result in a change in burden. This recordkeeping requirement is cleared under OMB control number 3133–0125. There are no new information collection requirements associated with this final rule.

C. Executive Order 13132

Executive Order 13132 encourages independent regulatory agencies to consider the impact of their actions on state and local interests. In adherence to fundamental federalism principles, the NCUA, an independent regulatory agency as defined in 44 U.S.C. 3502(5), voluntarily complies with the executive order. This rulemaking will not have a substantial direct effect on the states, on the connection between the national government and the states, or on the distribution of power and responsibilities among the various levels of government. The NCUA has determined that this final rule does not constitute a policy that has federalism implications for purposes of the executive order.

D. Assessment of Federal Regulations and Policies on Families

The NCUA has determined that this final rule will not affect family well-being within the meaning of Section 54 of the Treasury and General Government Appropriations Act of 1999.

E. Small Business Regulatory Enforcement Fairness Act

The Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA) generally provides for congressional review of agency rules. A reporting requirement is triggered in instances where the NCUA issues a final rule as defined by section 551 of the Administrative Procedure Act. An agency rule, in addition to being subject to congressional oversight, may also be subject to a delayed effective date if the rule is a “major rule.” The NCUA does not believe this rule is a “major rule” within the meaning of the relevant sections of SBREFA. As required by SBREFA, the NCUA has submitted this final rule to the OMB for it to determine if the final rule is a “major rule” for purposes of SBREFA. The NCUA also will file appropriate reports with Congress and the Government Accountability Office so this rule may be reviewed.

List of Subjects in 12 CFR Part 722

Appraisal, Appraiser, Credit unions, Mortgages, Reporting and recordkeeping requirements, Truth in lending.

By the National Credit Union Administration Board on April 16, 2020.

Gerard Poliquin,

Secretary of the Board.

For the reasons discussed above, the NCUA Board amends 12 CFR part 722 as follows:

PART 722—APPRAISALS

- 1. The authority citation for part 722 continues to read as follows:

Authority: 12 U.S.C. 1766, 1789, and 3331 *et seq.* Section 722.3(a) is also issued under 15 U.S.C. 1639h.

- 2. Amend § 722.3 by:
 - a. Revising paragraphs (b)(2) and (c)(1); and
 - b. Removing paragraph (f).

The revisions read as follows:

§ 722.3 Appraisals and written estimates of market value requirements for real estate-related financial transactions.

* * * * *

(b) * * *

(2) The transaction is complex, involves a residential real estate transaction, and \$400,000 or more of the

transaction value is not insured or guaranteed by a United States government agency or United States government sponsored agency.

(c) * * * (1) An appraisal performed by a state-certified appraiser or a state-licensed appraiser is required for any real estate-related financial transaction not exempt under paragraph (a) of this section in which the transaction is not complex, involves a residential real estate transaction, and \$400,000 or more of the transaction value is not insured or guaranteed by a United States government agency or United States government sponsored agency.

* * * * *

■ 3. Amend § 722.4 by:

- a. Redesignating paragraphs (c), (d), and (e) as (d), (e), and (f), respectively;
- b. Adding a new paragraph (c); and
- c. In newly designated paragraph (e) removing the text “§ 722.2(f)” and adding in its place the text “§ 722.2”.

The addition reads as follows:

§ 722.4 Minimum appraisal standards.

* * * * *

(c) Be subject to appropriate review for compliance with the Uniform Standards of Professional Appraisal Practice.

* * * * *

[FR Doc. 2020-08433 Filed 4-29-20; 8:45 am]

BILLING CODE 7535-01-P

DEPARTMENT OF THE TREASURY

13 CFR Part 120

[Docket Number TREAS-DO-2020-0009]

RIN 1505-AC67

Small Business Administration Business Loan Program Temporary Changes; Paycheck Protection Program—Additional Criterion for Seasonal Employers

AGENCY: U.S. Department of the Treasury.

ACTION: Interim final rule.

SUMMARY: The Coronavirus Aid, Relief, and Economic Security Act (the CARES Act or the Act) authorizes the U.S. Department of the Treasury (Treasury) to issue regulations for the Paycheck Protection Program (PPP) administered by the Small Business Administration (SBA), including regulations that allow additional lenders to originate loans and establish terms and conditions. In this interim final rule, Treasury authorizes all lenders eligible to originate loans under the PPP to use an alternative criterion for calculating the maximum loan amount for PPP loans issued to seasonal employers.

DATES:

Effective Date: This rule is effective April 30, 2020.

Comment Date: Comments must be received on or before June 1, 2020.

ADDRESSES: You may submit comments, identified by number TREAS-DO-2020-0009 through the Federal eRulemaking Portal: <http://www.regulations.gov>. Follow the instructions for submitting comments. Treasury will post all comments on www.regulations.gov. If you wish to submit confidential business information (CBI) as defined in the User Notice at www.regulations.gov, please highlight the information that you consider to be CBI and explain why you believe Treasury should hold this information as confidential. Treasury will review the information and make the final determination whether it will publish the information.

FOR FURTHER INFORMATION CONTACT:

Jonathan Greenstein, Office of Domestic Finance, 202-622-1408; Jonathan.Greenstein@Treasury.gov.

SUPPLEMENTARY INFORMATION:

I. Background Information

On March 27, 2020, the President signed the CARES Act, Public Law 116-136, to provide emergency assistance and health care response for individuals, families, and businesses affected by the coronavirus pandemic. Section 1102 of the Act establishes the PPP as a temporary addition to the SBA's 7(a) loan program. The PPP is designed to assist small businesses nationwide adversely impacted by the coronavirus pandemic. SBA has published information about the PPP in interim final rules available at 85 FR 20811 (April 15, 2020); 85 FR 20817 (April 15, 2020); 85 FR 21747 (April 20, 2020); and 85 FR 23450 (April 28, 2020).

Section 1109(b) of the Act authorizes Treasury to establish criteria for insured depository institutions, insured credit unions, institutions of the Farm Credit System chartered under the Farm Credit Act of 1971 (12 U.S.C. 2001 *et seq.*), and other lenders to participate in the PPP. The SBA is required to administer the program that Treasury establishes under section 1109 of the Act, with guidance from Treasury.

The Act authorizes Treasury to issue regulations and guidance to implement section 1109, including regulations that establish “terms and conditions” for PPP loans. *See* Section 1109(d)(2). The terms and conditions established by Treasury under section 1109 are not required to be identical to those set forth in section 1102. However, the Act requires that terms and conditions that

Treasury establishes under section 1109 pertaining to certain criteria—the maximum interest rate, maximum loan amount, and other specified terms—must be “consistent,” to “the maximum extent practicable,” with those set forth in section 1102. *See* Section 1109(d)(2).

In this rulemaking, Treasury is addressing the needs of certain potential borrowers that are seasonal employers by allowing seasonal employers to use an alternative base period for purposes of calculating the loan amount for which they are eligible under the PPP. Section 1102 of the Act permits seasonal employers to calculate their maximum loan amount by using their monthly average payments for payroll during “the 12-week period beginning February 15, 2019, or at the election of the eligible [borrower], March 1, 2019, and ending June 30, 2019.” Some seasonal employers, however, have seasons that occur later in the year. Without the ability to use an alternative base period, many summer seasonal businesses would be unable to obtain funding on terms commensurate with those available to winter and spring seasonal businesses. This interim final rule addresses that disparity and ensures consistency in program administration by providing a seasonal employer the option of using any consecutive 12-week period between May 1, 2019 and September 15, 2019 for determining its maximum loan amount.

As required by section 1109(d)(2)(B), Treasury has determined that this alternative period for seasonal employers is, to the “maximum extent practicable,” consistent with the terms applicable to the PPP in general. In section 1102, Congress gave seasonal employers the option to calculate their maximum loan amount using alternative base periods. By permitting seasonal employers to calculate the maximum loan amount using any consecutive 12 weeks within a specified 4.5-month period, this interim final rule ensures that seasonal employers affected by the pandemic are treated even-handedly.

Other than this adjustment, the terms and requirements applicable to PPP loans under this rule are identical to the terms and requirements that section 1102 and SBA regulations impose on other PPP loans. As a result, a seasonal borrower that elects to use the alternative timing criterion under this interim final rule may follow the same processes and procedures applicable to other PPP loans.

II. Comments and Immediate Effective Date

Congress intended that the PPP provide relief to America’s small

businesses expeditiously. Given this intent and the dramatic decrease in economic activity nationwide, there is good cause for Treasury to dispense with the 30-day delayed effective date provided in the Administrative Procedure Act. This interim final rule provides an alternative criterion for calculating the maximum loan amount for PPP loans issued to seasonal employers. Seasonal employers need timely additional guidance concerning the maximum loan available under the interim final rule because the last day to apply for and receive a loan is June 30, 2020. The immediate effective date of this interim final rule will benefit seasonal employers by providing a full understanding of loan terms and conditions. Although this interim final rule is effective immediately, comments are solicited from interested members of the public on all aspects of the interim final rule, including section III below. These comments must be submitted on or before June 1, 2020. Treasury will consider these comments and the need for any revisions as a result of these comments.

III. Paycheck Protection Program—Alternative Criterion for Seasonal Employers

Overview

The SBA administers the PPP to provide immediate assistance to small businesses affected by the coronavirus pandemic. Under section 1109 of the CARES Act, Treasury is authorized to issue regulations that allow lenders to originate PPP loans under terms and conditions established by the Secretary. Through this interim final rule, Treasury is exercising its section 1109 authority to address the needs of certain potential borrowers that are seasonal employers. The SBA will administer this rule as part of the PPP, with guidance from Treasury, until the date on which the national emergency declared by the President under the National Emergencies Act (50 U.S.C. 1601 *et seq.*) with respect to the Coronavirus Disease 2019 (COVID-19) expires. Except as modified in this interim final rule, PPP regulations, guidance, forms, and processes apply fully to PPP loans for seasonal employers utilizing the base period calculation option set forth in this rule.

1. General

This interim final rule supplements the SBA’s rules for the PPP by establishing an alternative criterion for calculating the maximum loan amount for seasonal employers.

2. What does this interim final rule apply to?

This rule applies to PPP loans issued to seasonal employers.

3. How does this rule affect the calculation of the maximum loan amount for seasonal employers?

Under section 1102 of the CARES Act, a seasonal employer may determine its maximum loan amount for purposes of the PPP by reference to the employer’s average total monthly payments for payroll “the 12-week period beginning February 15, 2019, or at the election of the eligible [borrower], March 1, 2019, and ending June 30, 2019.” Under this interim final rule issued pursuant to section 1109 of the Act, a seasonal employer may alternatively elect to determine its maximum loan amount as the average total monthly payments for payroll during any consecutive 12-week period between May 1, 2019 and September 15, 2019.

4. If a seasonal business was dormant or not fully operating as of February 15, 2020, is it still eligible?

Yes, in evaluating eligibility, a seasonal business will be considered to have been in operation as of February 15, 2020, if the business was in operation for any 8-week period between May 1, 2019 and September 15, 2019. This approach aligns with guidance previously provided by the Small Business Administration concerning other seasonal businesses under section 1102. *See* Treasury, Paycheck Protection Program Loans: Frequently Asked Questions (FAQs), FAQ 9 (posted April 6, 2020) (<https://home.treasury.gov/policy-issues/cares/assistance-for-small-businesses>).

6. Are any other SBA rules or guidance for the PPP affected by Treasury’s interim final rule?

No. This interim final rule only provides certain employers with an alternative means of calculating the maximum loan amount. All other terms and conditions in the PPP remain unchanged. All PPP applicants, borrowers, and lenders should continue to use existing SBA forms and follow all requirements set forth in the CARES Act and SBA regulations, except for the alternative approach described above for calculating the maximum loan amount.

7. What lenders are authorized to offer terms in Treasury’s interim final rule to seasonal employers?

All lenders authorized to originate PPP loans may offer the terms under this interim final rule to eligible applicants and borrowers. PPP loans

under this interim final rule are eligible for an SBA guarantee to the same extent as PPP loans based on existing PPP rules.

Compliance With Executive Orders 12866, 12988, 13132, 13563, and 13771, the Paperwork Reduction Act (44 U.S.C. Ch. 35), and the Administrative Procedure Act (5 U.S.C. 553)

Executive Orders 12866, 13563, and 13771

The Office of Management and Budget has determined that this interim final rule is economically significant for the purposes of Executive Orders 12866 and 13563, and is considered a major rule under the Congressional Review Act. Treasury, however, is proceeding under the emergency provision at Executive Order 12866 Section 6(a)(3)(D) based on the need to move expeditiously to mitigate the current economic conditions arising from the COVID-19 emergency. This rule's designation under Executive Order 13771 will be informed by public comment.

Executive Order 12988

Treasury has drafted this rule, to the extent practicable, in accordance with the standards set forth in section 3(a) and 3(b)(2) of Executive Order 12988, to minimize litigation, eliminate ambiguity, and reduce burden. The rule has no preemptive or retroactive effect.

Executive Order 13132

Treasury has determined that this rule will not have substantial direct effects on the States, on the relationship between the National Government and the States, or on the distribution of power and responsibilities among the various layers of government. Therefore, Treasury has determined that this rule has no federalism implications warranting preparation of a federalism assessment.

Paperwork Reduction Act, 44 U.S.C. Chapter 35

Treasury has determined that this rule will not impose new or modify existing recordkeeping or reporting requirements under the Paperwork Reduction Act.

Inapplicability of Notice and Delayed Effective Date

The Administrative Procedure Act (APA) requirements in 5 U.S.C. 553 govern agency rulemaking procedures. Section 553(b) of the APA generally requires notice and public comment before issuance of a final rule. In addition, section 553(d) of the APA requires that a final rule have a 30-day delayed effective date. The APA, however, provides exceptions from the

prior notice and public comment requirement and the delayed effective date requirements, when an agency for good cause finds that such procedures are impracticable, unnecessary, or contrary to the public interest. 5 U.S.C. 553(b)(B), (d)(3). Treasury finds that prior notice and comment are impracticable and contrary to the public interest and that good cause exists to issue this interim final rule immediately.

The ongoing unprecedented situation related to COVID-19 is having a nationwide impact, as demonstrated by the declaration of a national emergency by the President. See Proclamation 9994 of March 13, 2020, 85 FR 15337 (Mar. 18, 2020). The interim final rule supports seasonal employers affected by COVID-19 in obtaining PPP loans to maintain their businesses and keep people employed. To protect our public interests during the ongoing national emergency, Treasury concludes, pursuant to 5 U.S.C. 553(b)(B), that there is good cause to dispense with prior public notice and the opportunity to comment on this rule before issuing this interim final rule. For the same reasons, Treasury has determined, consistent with section 553(d)(3) of the APA, that there is good cause to make this temporary final rule effective immediately.

Michael Faulkender,

Assistant Secretary for Economic Policy.

BILLING CODE P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

21 CFR Part 1

[Docket No. FDA-2020-D-1304]

Temporary Policy Regarding Accredited Third-Party Certification Program Onsite Observation and Certificate Duration Requirements During the COVID-19 Public Health Emergency: Guidance for Industry; Availability

AGENCY: Food and Drug Administration, HHS.

ACTION: Notification of availability.

SUMMARY: The Food and Drug Administration (FDA, Agency, or we) is announcing the availability of a final guidance for industry entitled "Temporary Policy Regarding Accredited Third-Party Certification Program Onsite Observation and

Certificate Duration Requirements During the COVID-19 Public Health Emergency." Given the public health emergency presented by COVID-19, this guidance document is being implemented without prior public comment because FDA has determined that prior public participation is not feasible or appropriate, but it remains subject to comment in accordance with the Agency's good guidance practices. The guidance communicates the Agency's intention not to enforce certain requirements for the onsite monitoring activities and certificates for the currently recognized accreditation bodies (ABs) and accredited third-party certification bodies (CBs) in the Accredited Third-Party Certification Program for human and animal food in certain circumstances. Because travel restrictions and advisories related to COVID-19 may impact the ability of recognized ABs and accredited CBs to conduct onsite activities, this guidance provides temporary flexibility so that recognized ABs can maintain the accreditations of their CBs, and so that already-issued certifications need not lapse, in certain circumstances.

DATES: The announcement of the guidance is published in the **Federal Register** on April 30, 2020.

ADDRESSES: You may submit either electronic or written comments on Agency guidances at any time as follows:

Electronic Submissions

Submit electronic comments in the following way:

- **Federal eRulemaking Portal:** <https://www.regulations.gov>. Follow the instructions for submitting comments. Comments submitted electronically, including attachments, to <https://www.regulations.gov> will be posted to the docket unchanged. Because your comment will be made public, you are solely responsible for ensuring that your comment does not include any confidential information that you or a third party may not wish to be posted, such as medical information, your or anyone else's Social Security number, or confidential business information, such as a manufacturing process. Please note that if you include your name, contact information, or other information that identifies you in the body of your comments, that information will be posted on <https://www.regulations.gov>.

- If you want to submit a comment with confidential information that you do not wish to be made available to the public, submit the comment as a written/paper submission and in the

manner detailed (see “Written/Paper Submissions” and “Instructions”).

Written/Paper Submissions

Submit written/paper submissions as follows:

- *Mail/Hand Delivery/Courier (for written/paper submissions):* Dockets Management Staff (HFA-305), Food and Drug Administration, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852.

- For written/paper comments submitted to the Dockets Management Staff, FDA will post your comment, as well as any attachments, except for information submitted, marked and identified, as confidential, if submitted as detailed in “Instructions.”

Instructions: All submissions received must include the Docket No. FDA-2020-D-1304 for “Temporary Policy Regarding Accredited Third-Party Certification Program Onsite Observation and Certificate Duration Requirements During the COVID-19 Public Health Emergency.” Received comments will be placed in the docket and, except for those submitted as “Confidential Submissions,” publicly viewable at <https://www.regulations.gov> or at the Dockets Management Staff between 9 a.m. and 4 p.m., Monday through Friday.

- *Confidential Submissions—*To submit a comment with confidential information that you do not wish to be made publicly available, submit your comments only as a written/paper submission. You should submit two copies total. One copy will include the information you claim to be confidential with a heading or cover note that states “THIS DOCUMENT CONTAINS CONFIDENTIAL INFORMATION.” The Agency will review this copy, including the claimed confidential information, in its consideration of comments. The second copy, which will have the claimed confidential information redacted/blacked out, will be available for public viewing and posted on <https://www.regulations.gov>. Submit both copies to the Dockets Management Staff. If you do not wish your name and contact information to be made publicly available, you can provide this information on the cover sheet and not in the body of your comments and you must identify this information as “confidential.” Any information marked as “confidential” will not be disclosed except in accordance with 21 CFR 10.20 and other applicable disclosure law. For more information about FDA’s posting of comments to public dockets, see 80 FR 56469, September 18, 2015, or access the information at: <https://www.govinfo.gov/content/pkg/FR-2015-09-18/pdf/2015-23389.pdf>.

Docket: For access to the docket to read background documents or the electronic and written/paper comments received, go to <https://www.regulations.gov> and insert the docket number, found in brackets in the heading of this document, into the “Search” box and follow the prompts and/or go to the Dockets Management Staff, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852.

You may submit comments on any guidance at any time (see § 10.115(g)(5) (21 CFR 10.115(g)(5))).

Submit written requests for single copies of the guidance to the Office of Compliance, Center for Food Safety and Applied Nutrition, Food and Drug Administration (HFS-607), 5001 Campus Dr., College Park, MD 20740. Send two self-addressed adhesive labels to assist that office in processing your request. See the **SUPPLEMENTARY INFORMATION** section for electronic access to the guidance.

FOR FURTHER INFORMATION CONTACT:

Doriliz De Leon, Center for Food Safety and Applied Nutrition (HFS-607), Food and Drug Administration, 5001 Campus Dr., College Park, MD 20740, 240-402-2772.

SUPPLEMENTARY INFORMATION:

I. Background

We are announcing the availability of a guidance for industry entitled “Temporary Policy Regarding Accredited Third-Party Certification Program Onsite Observation and Certificate Duration Requirements During the COVID-19 Public Health Emergency.” This policy relates to the circumstances that gave rise to the public health emergency related to COVID-19 declared by the Department of Health and Human Services.

Given this public health emergency this guidance is being implemented without prior public comment because FDA has determined that prior public participation for this guidance is not feasible or appropriate. This guidance document is being implemented immediately, but it remains subject to comment in accordance with the Agency’s good guidance practices. The guidance represents the current thinking of FDA on this topic and should be viewed only as recommendations, unless specific regulatory or statutory requirements are cited.

This guidance document concerns certain requirements for the recognized ABs and accredited CBs in the Accredited Third-Party Certification Program that was established in 21 CFR part 1, subpart M, as part of our implementation of the FDA Food Safety

Modernization Act (Pub. L. 111-353). The Accredited Third-Party Certification Program regulation (<https://www.fda.gov/food/food-safety-modernization-act-fsma/fsma-final-rule-accredited-third-party-certification>) requires recognized ABs to monitor the performance of the CB(s) they accredited. While some of the monitoring activities can be conducted remotely, some of the activities must be conducted onsite. The Accredited Third-Party Certification Program regulation also requires that accredited CBs can issue certificates for a term only up to 12 months.

Due to the impact of the travel restrictions and advisories related to COVID-19, this guidance provides flexibility to the recognized ABs and accredited CBs in the Accredited Third-Party Certification Program for certain requirements related to the onsite monitoring activities and certificates that have already been issued, in certain circumstances.

II. Paperwork Reduction Act of 1995

This guidance refers to previously approved FDA collections of information. These collections of information are subject to review by the Office of Management and Budget (OMB) under the Paperwork Reduction Act of 1995 (44 U.S.C. 3501-3521). The collections of information in part 1, subpart M, have been approved under OMB control number 0910-0750.

III. Electronic Access

Persons with access to the internet may obtain the guidance at <https://www.fda.gov/FoodGuidances>, <https://www.fda.gov/emergency-preparedness-and-response/mcm-issues/coronavirus-disease-2019-covid-19> or <https://www.regulations.gov>. Use the FDA website listed in the previous sentence to find the most current version of the guidance.

Dated: April 24, 2020.

Lowell J. Schiller,

Principal Associate Commissioner for Policy.

[FR Doc. 2020-09169 Filed 4-29-20; 8:45 am]

BILLING CODE 4164-01-P

DEPARTMENT OF HOMELAND SECURITY**Federal Emergency Management Agency****44 CFR Part 64**

[Docket ID FEMA-2020-0005; Internal Agency Docket No. FEMA-8627]

Suspension of Community Eligibility

AGENCY: Federal Emergency Management Agency, DHS.

ACTION: Final rule.

SUMMARY: This rule identifies communities where the sale of flood insurance has been authorized under the National Flood Insurance Program (NFIP) that are scheduled for suspension on the effective dates listed within this rule because of noncompliance with the floodplain management requirements of the program. If the Federal Emergency Management Agency (FEMA) receives documentation that the community has adopted the required floodplain management measures prior to the effective suspension date given in this rule, the suspension will not occur and a notice of this will be provided by publication in the **Federal Register** on a subsequent date. Also, information identifying the current participation status of a community can be obtained from FEMA's Community Status Book (CSB). The CSB is available at <https://www.fema.gov/national-flood-insurance-program-community-status-book>.

DATES: The effective date of each community's scheduled suspension is the third date ("Susp.") listed in the third column of the following tables.

FOR FURTHER INFORMATION CONTACT: If you want to determine whether a particular community was suspended on the suspension date or for further information, contact Adrienne L. Sheldon, PE, CFM, Federal Insurance and Mitigation Administration, Federal Emergency Management Agency, 400 C Street SW, Washington, DC 20472, (202) 212-3966.

SUPPLEMENTARY INFORMATION: The NFIP enables property owners to purchase Federal flood insurance that is not otherwise generally available from private insurers. In return, communities agree to adopt and administer local floodplain management measures aimed at protecting lives and new construction

from future flooding. Section 1315 of the National Flood Insurance Act of 1968, as amended, 42 U.S.C. 4022, prohibits the sale of NFIP flood insurance unless an appropriate public body adopts adequate floodplain management measures with effective enforcement measures. The communities listed in this document no longer meet that statutory requirement for compliance with program regulations, 44 CFR part 59. Accordingly, the communities will be suspended on the effective date in the third column. As of that date, flood insurance will no longer be available in the community. We recognize that some of these communities may adopt and submit the required documentation of legally enforceable floodplain management measures after this rule is published but prior to the actual suspension date. These communities will not be suspended and will continue to be eligible for the sale of NFIP flood insurance. A notice withdrawing the suspension of such communities will be published in the **Federal Register**.

In addition, FEMA publishes a Flood Insurance Rate Map (FIRM) that identifies the Special Flood Hazard Areas (SFHAs) in these communities. The date of the FIRM, if one has been published, is indicated in the fourth column of the table. No direct Federal financial assistance (except assistance pursuant to the Robert T. Stafford Disaster Relief and Emergency Assistance Act not in connection with a flood) may be provided for construction or acquisition of buildings in identified SFHAs for communities not participating in the NFIP and identified for more than a year on FEMA's initial FIRM for the community as having flood-prone areas (section 202(a) of the Flood Disaster Protection Act of 1973, 42 U.S.C. 4106(a), as amended). This prohibition against certain types of Federal assistance becomes effective for the communities listed on the date shown in the last column. The Administrator finds that notice and public comment procedures under 5 U.S.C. 553(b), are impracticable and unnecessary because communities listed in this final rule have been adequately notified.

Each community receives 6-month, 90-day, and 30-day notification letters addressed to the Chief Executive Officer stating that the community will be suspended unless the required floodplain management measures are met prior to the effective suspension

date. Since these notifications were made, this final rule may take effect within less than 30 days.

National Environmental Policy Act. FEMA has determined that the community suspension(s) included in this rule is a non-discretionary action and therefore the National Environmental Policy Act of 1969 (42 U.S.C. 4321 *et seq.*) does not apply.

Regulatory Flexibility Act. The Administrator has determined that this rule is exempt from the requirements of the Regulatory Flexibility Act because the National Flood Insurance Act of 1968, as amended, Section 1315, 42 U.S.C. 4022, prohibits flood insurance coverage unless an appropriate public body adopts adequate floodplain management measures with effective enforcement measures. The communities listed no longer comply with the statutory requirements, and after the effective date, flood insurance will no longer be available in the communities unless remedial action takes place.

Regulatory Classification. This final rule is not a significant regulatory action under the criteria of section 3(f) of Executive Order 12866 of September 30, 1993, Regulatory Planning and Review, 58 FR 51735.

Executive Order 13132, Federalism. This rule involves no policies that have federalism implications under Executive Order 13132.

Executive Order 12988, Civil Justice Reform. This rule meets the applicable standards of Executive Order 12988.

Paperwork Reduction Act. This rule does not involve any collection of information for purposes of the Paperwork Reduction Act, 44 U.S.C. 3501 *et seq.*

List of Subjects in 44 CFR Part 64

Flood insurance, Floodplains.

Accordingly, 44 CFR part 64 is amended as follows:

PART 64—[AMENDED]

- 1. The authority citation for Part 64 continues to read as follows:

Authority: 42 U.S.C. 4001 *et seq.*; Reorganization Plan No. 3 of 1978, 3 CFR, 1978 Comp.; p. 329; E.O. 12127, 44 FR 19367, 3 CFR, 1979 Comp.; p. 376.

§ 64.6 [Amended]

- 2. The tables published under the authority of § 64.6 are amended as follows:

Proposed Rules

Federal Register

Vol. 85, No. 84

Thursday, April 30, 2020

This section of the FEDERAL REGISTER contains notices to the public of the proposed issuance of rules and regulations. The purpose of these notices is to give interested persons an opportunity to participate in the rule making prior to the adoption of the final rules.

NUCLEAR REGULATORY COMMISSION

10 CFR Part 72

[NRC–2019–0250]

RIN 3150–AK41

List of Approved Spent Fuel Storage Casks: Holtec International HI–STORM Flood/Wind Multipurpose Canister Storage System, Certificate of Compliance No. 1032, Amendment No. 4

AGENCY: Nuclear Regulatory Commission.

ACTION: Proposed rule.

SUMMARY: The U.S. Nuclear Regulatory Commission (NRC) is proposing to amend its regulations by revising the Holtec International HI–STORM Flood/Wind Multipurpose Canister Storage System listing within the “List of approved spent fuel storage casks” to include Amendment No. 4 to Certificate of Compliance No. 1032. Amendment No. 4 revises the certificate of compliance to: Add multipurpose canister (MPC)–32ML for storage and allow the fuel assembly class 16x16D as content for MPC–32ML; add the fuel assembly class 16X16E as content for MPC–37; and make changes to the final safety analysis report to separate the design pressure for the short-term operation from the off-normal condition (to provide clarity in Table 2.2.1), add cautionary notes to Sections 9.2.1 and 9.2.3, update a definition, and replace a test program.

DATES: Submit comments by June 1, 2020. Comments received after this date will be considered if it is practical to do so, but the NRC is able to ensure consideration only for comments received on or before this date.

ADDRESSES: You may submit comments by any of the following methods:

- *Federal Rulemaking website:* Go to <https://www.regulations.gov> and search for Docket ID NRC–2019–0250. Address questions about NRC dockets to Carol Gallagher; telephone: 301–415–3463;

email: Carol.Gallagher@nrc.gov. For technical questions contact the individuals listed in the **FOR FURTHER INFORMATION CONTACT** section of this document.

- *Email comments to:* Rulemaking.Comments@nrc.gov. If you do not receive an automatic email reply confirming receipt, then contact us at 301–415–1677.

- *Mail comments to:* Secretary, U.S. Nuclear Regulatory Commission, Washington, DC 20555–0001, ATTN: Rulemakings and Adjudications Staff.

For additional direction on obtaining information and submitting comments, see “Obtaining Information and Submitting Comments” in the **SUPPLEMENTARY INFORMATION** section of this document.

FOR FURTHER INFORMATION CONTACT: Yen-Ju Chen, Office of Nuclear Material Safety and Safeguards; telephone: 301–415–1018; email: Yen-Ju.Chen@nrc.gov or Vanessa Cox, Office of Nuclear Material Safety and Safeguards; telephone: 301–415–8342; email: Vanessa.Cox@nrc.gov. Both are staff of the U.S. Nuclear Regulatory Commission, Washington, DC 20555–0001.

SUPPLEMENTARY INFORMATION:

Table of Contents

- Obtaining Information and Submitting Comments
- Rulemaking Procedure
- Background
- Plain Writing
- Availability of Documents

I. Obtaining Information and Submitting Comments

A. Obtaining Information

Please refer to Docket ID NRC–2019–0250 when contacting the NRC about the availability of information for this action. You may obtain publicly-available information related to this action by any of the following methods:

- *Federal Rulemaking website:* Go to <https://www.regulations.gov> and search for Docket ID NRC–2019–0250.
- *NRC’s Agencywide Documents Access and Management System (ADAMS):* You may obtain publicly-available documents online in the ADAMS Public Documents collection at <https://www.nrc.gov/reading-rm/adams.html>. To begin the search, select “Begin Web-based ADAMS Search.” For problems with ADAMS, please contact

the NRC’s Public Document Room (PDR) reference staff at 1–800–397–4209, 301–415–4737, or by email to pdr.resource@nrc.gov. For the convenience of the reader, instructions about obtaining materials referenced in this document are provided in the “Availability of Documents” section.

B. Submitting Comments

Please include Docket ID NRC–2019–0250 in your comment submission.

The NRC cautions you not to include identifying or contact information that you do not want to be publicly disclosed in your comment submission. The NRC will post all comment submissions at <https://www.regulations.gov> as well as enter the comment submissions into ADAMS. The NRC does not routinely edit comment submissions to remove identifying or contact information.

If you are requesting or aggregating comments from other persons for submission to the NRC, then you should inform those persons not to include identifying or contact information that they do not want to be publicly disclosed in their comment submission. You should also inform those persons that the NRC does not routinely edit comment submissions to remove such information before making the comment submissions available to the public or entering the comment into ADAMS.

II. Rulemaking Procedure

Because the NRC considers this action to be non-controversial, the NRC is publishing this proposed rule concurrently with a direct final rule in the Rules and Regulations section of this issue of the **Federal Register**. The direct final rule will become effective on July 14, 2020. However, if the NRC receives any significant adverse comment by June 1, 2020, then the NRC will publish a document that withdraws the direct final rule. If the direct final rule is withdrawn, the NRC will address the comments in a subsequent final rule. Absent significant modifications to the proposed revisions requiring republication, the NRC will not initiate a second comment period on this action in the event the direct final rule is withdrawn.

A significant adverse comment is a comment where the commenter explains why the rule would be inappropriate, including challenges to the rule’s underlying premise or

approach, or would be ineffective or unacceptable without a change. A comment is adverse and significant if:

(1) The comment opposes the rule and provides a reason sufficient to require a substantive response in a notice-and-comment process. Responses are considered substantive when:

(a) The comment causes the NRC to reevaluate (or reconsider) its position or conduct additional analysis;

(b) The comment raises an issue serious enough to warrant a substantive response to clarify or complete the record;

(c) The comment raises a relevant issue that was not previously addressed or considered by the NRC; or

(2) The comment proposes a change or an addition to the rule, and it is apparent that the rule would be ineffective or unacceptable without incorporation of the change or addition.

(3) The comment causes the NRC to make a change (other than editorial) to the rule.

For a more detailed discussion of the proposed rule changes and associated analyses, see the direct final rule published in the Rules and Regulations section of this issue of the **Federal Register**.

III. Background

Section 218(a) of the Nuclear Waste Policy Act of 1982, as amended, requires that “[t]he Secretary [of the Department of Energy] shall establish a demonstration program, in cooperation with the private sector, for the dry storage of spent nuclear fuel at civilian nuclear power reactor sites, with the objective of establishing one or more technologies that the [Nuclear Regulatory] Commission may, by rule, approve for use at the sites of civilian nuclear power reactors without, to the maximum extent practicable, the need for additional site-specific approvals by the Commission.” Section 133 of the Nuclear Waste Policy Act states, in part, that “[the Commission] shall, by rule, establish procedures for the licensing of any technology approved by the Commission under section 219(a) [sic: 218(a)] for use at the site of any civilian nuclear power reactor.”

To implement this mandate, the Commission approved dry storage of spent nuclear fuel in NRC-approved casks under a general license by publishing a final rule which added a new subpart K in part 72 of title 10 of the *Code of Federal Regulations* (10 CFR) entitled “General License for Storage of Spent Fuel at Power Reactor Sites” (55 FR 29181; July 18, 1990). This

rule also established a new subpart L in 10 CFR part 72 entitled “Approval of Spent Fuel Storage Casks,” which contains procedures and criteria for obtaining NRC approval of spent fuel storage cask designs. The NRC subsequently issued a final rule on March 28, 2011 (76 FR 17019), that approved the Holtec International HI-STORM Flood/Wind Multipurpose Canister Storage System design and added it to the list of NRC-approved cask designs in § 72.214 as Certificate of Compliance No. 1032.

IV. Plain Writing

The Plain Writing Act of 2010 (Pub. L. 111–274) requires Federal agencies to write documents in a clear, concise, well-organized manner. The NRC has written this document to be consistent with the Plain Writing Act as well as the Presidential Memorandum, “Plain Language in Government Writing,” published June 10, 1998 (63 FR 31883). The NRC requests comment on the proposed rule with respect to clarity and effectiveness of the language used.

V. Availability of Documents

The documents identified in the following table are available to interested persons through one or more of the following methods, as indicated.

| Document | ADAMS accession No. |

BILLING CODE 7590–01–P

NUCLEAR REGULATORY COMMISSION

10 CFR Chapter I

[NRC–2020–0073]

Clarification of Personal Access Authorization Requirements for Non-Immigrant Foreign Nationals Working at Nuclear Power Plants

AGENCY: Nuclear Regulatory Commission.

ACTION: Draft regulatory issue summary; extension of comment period.

SUMMARY: On March 31, 2020, the U.S. Nuclear Regulatory Commission (NRC) solicited comments on a draft regulatory issue summary (RIS) to reinforce the existing requirement that prior to granting or reinstating unescorted access (UA), or certifying unescorted access authorization (UAA) to non-immigrant foreign nationals for the purpose of performing work, licensees shall take reasonable steps to access reliable, independent sources of information, in addition to the information provided by the applicant, to verify the applicant's claimed non-immigration status. The public comment period was originally scheduled to close on April 30, 2020. The NRC has decided to extend the public comment period to allow more time for members of the public to develop and submit their comments.

DATES: The due date of comments requested in the document published on March 31, 2020 (85 FR 17770) is extended. Comments should be filed no later than June 15, 2020. Comments received after this date will be considered, if it is practical to do so, but the Commission is able to ensure consideration only for comments received on or before this date.

ADDRESSES: You may submit comments by any of the following methods:

- *Federal Rulemaking website:* Go to <https://www.regulations.gov> and search for Docket ID NRC–2020–0073. Address

questions about NRC dockets IDs in *Regulations.gov* to Jennifer Borges; telephone: 301–287–9127; email: Jennifer.Borges@nrc.gov. For technical questions, contact the individual listed in the **FOR FURTHER INFORMATION CONTACT** section of this document.

- *Mail comments to:* Office of Administration, Mail Stop: TWFN–7–A60M, U.S. Nuclear Regulatory Commission, Washington, DC 20555–0001, ATTN: Program Management, Announcements and Editing Staff.

For additional direction on obtaining information and submitting comments, see “Obtaining Information and Submitting Comments” in the **SUPPLEMENTARY INFORMATION** section of this document.

FOR FURTHER INFORMATION CONTACT:

Mark Resner, Office of Nuclear Security and Incident Response, U.S. Nuclear Regulatory Commission, Washington, DC 20555–0001; telephone: 301–287–3680, email: Mark.Resner@nrc.gov.

SUPPLEMENTARY INFORMATION:

I. Obtaining Information and Submitting Comments

A. Obtaining Information

Please refer to Docket ID NRC–2020–0073 when contacting the NRC about the availability of information for this action. You may obtain publicly-available information related to this action by any of the following methods:

- *Federal Rulemaking website:* Go to <https://www.regulations.gov> and search for Docket ID NRC–2020–0073.
- *NRC's Agencywide Documents Access and Management System (ADAMS):* You may obtain publicly-available documents online in the ADAMS Public Documents collection at <https://www.nrc.gov/reading-rm/adams.html>. To begin the search, select “Begin Web-based ADAMS Search.” For problems with ADAMS, please contact the NRC's Public Document Room (PDR) reference staff at 1–800–397–4209, 301–415–4737, or by email to pdr.resource@nrc.gov. The Regulatory Issue Summary 2020–XX, “Clarification of Personnel Access Authorization Requirements for Non-Immigrant Foreign Nationals Working at Nuclear Power Plants,” is available in ADAMS under Accession No. ML20008D562.

B. Submitting Comments

Please include Docket ID NRC–2020–0073 in your comment submission.

The NRC cautions you not to include identifying or contact information that you do not want to be publicly disclosed in your comment submission. The NRC will post all comment submissions at <https://www.regulations.gov> as well as enter the comment submissions into ADAMS.

www.regulations.gov as well as enter the comment submissions into ADAMS. The NRC does not routinely edit comment submissions to remove identifying or contact information.

If you are requesting or aggregating comments from other persons for submission to the NRC, then you should inform those persons not to include identifying or contact information that they do not want to be publicly disclosed in their comment submission. Your request should state that the NRC does not routinely edit comment submissions to remove such information before making the comment submissions available to the public or entering the comment into ADAMS.

II. Discussion

On March 31, 2020 (85 FR 17770), the NRC solicited comments on a draft RIS entitled, “Clarification of Personal Access Authorization Requirements for Non-Immigrant Foreign Nationals Working at Nuclear Power Plants.” The purpose of that document was to solicit public comments on the NRC requirement for licensees to ensure that non-immigrant foreign nationals being granted access to work at U.S. nuclear plants have the correct non-immigrant status to do so. The public comment period was originally scheduled to close on April 30, 2020. The NRC has decided to extend the public comment period on the draft RIS until June 15, 2020, to allow more time for members of the public to submit their comments.

Dated: April 23, 2020.

For the Nuclear Regulatory Commission.

Lisa M. Regner,

Chief, Operating Experience Branch, Division of Reactor Oversight, Office of Nuclear Reactor Regulation.

[Docket No. FAA–2020–0009; Project Identifier MCAI–2019–00111–E]

RIN 2120–AA64

Airworthiness Directives; Rolls-Royce Deutschland Ltd & Co KG (Type Certificate Previously Held by Rolls-Royce plc) Turbofan Engines

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Notice of proposed rulemaking (NPRM).

SUMMARY: The FAA proposes to supersede airworthiness directive (AD) 2018-08-02 which applies to all Rolls-Royce Deutschland Ltd & Co KG (RRD) Trent 1000-A2, Trent 1000-AE2, Trent 1000-C2, Trent 1000-CE2, Trent 1000-D2, Trent 1000-E2, Trent 1000-G2, Trent 1000-H2, Trent 1000-J2, Trent 1000-K2, and Trent 1000-L2 model turbofan engines. AD 2018-08-02 requires initial and repetitive ultrasonic or visual inspections of the intermediate-pressure compressor (IPC) stage 1 rotor blades, IPC stage 2 rotor blades, and IPC shaft stage 2 dovetail posts, and removal of any cracked parts from service. Since the FAA issued AD 2018-08-02, the manufacturer identified cracking of parts in-service resulting in the need to require new inspections using new inspection thresholds and intervals. This proposed AD would require new inspections based on updated inspection thresholds and intervals for these IPC parts. This AD would also add an optional terminating action, amend the asymmetric power condition for engine inspection, and require an inspection after a cabin depressurization event. The FAA is proposing this AD to address the unsafe condition on these products.

DATES: The FAA must receive comments on this proposed AD by June 15, 2020.

ADDRESSES: You may send comments, using the procedures found in 14 CFR 11.43 and 11.45, by any of the following methods:

- *Federal eRulemaking Portal:* Go to <https://www.regulations.gov>. Follow the instructions for submitting comments.
- *Fax:* 202-493-2251.
- *Mail:* U.S. Department of Transportation, Docket Operations, M-30, West Building Ground Floor, Room W12-140, 1200 New Jersey Avenue SE, Washington, DC 20590.
- *Hand Delivery:* Deliver to Mail address above between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.

For service information identified in this NPRM, contact Rolls-Royce Deutschland Ltd & Co KG, Eschenweg 11, 15827 Blankenfelde-Mahlow, Germany; phone: +49 (0) 33 708 6 0; email: <https://www.rolls-royce.com/contact-us.aspx>. You may view this service information at the FAA, Airworthiness Products Section, Operational Safety Branch, 1200 District Avenue, Burlington, MA 01803. For information on the availability of this material at the FAA, call 781-238-7759.

Examining the AD Docket

You may examine the AD docket on the internet at <https://www.regulations.gov> by searching for and locating Docket No. FAA-2020-0009; or in person at Docket Operations between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays. The AD docket contains this NPRM, the mandatory continuing airworthiness information (MCAI), any comments received, and other information. The street address for Docket Operations is listed above. Comments will be available in the AD docket shortly after receipt.

FOR FURTHER INFORMATION CONTACT: Stephen Elwin, Aerospace Engineer, ECO Branch, FAA, 1200 District Avenue, Burlington, MA 01803; phone: 781-238-7236; fax: 781-238-7199; email: Stephen.L.Elwin@faa.gov.

SUPPLEMENTARY INFORMATION:

Comments Invited

The FAA invites you to send any written relevant data, views, or arguments about this proposed AD. Send your comments to an address listed under the **ADDRESSES** section. Include "Docket No. FAA-2020-0009; Project Identifier MCAI-2019-00111-E" at the beginning of your comments. The FAA specifically invites comments on the overall regulatory, economic, environmental, and energy aspects of this NPRM. The FAA will consider all comments received by the closing date and may amend this NPRM because of those comments.

Except for Confidential Business Information as described in the following paragraph, and other information as described in 14 CFR 11.35, the FAA will post all comments received, without change, to <https://www.regulations.gov>, including any personal information you provide. The FAA will also post a report summarizing each substantive verbal contact received about this NPRM.

Confidential Business Information

Confidential Business Information (CBI) is commercial or financial information that is both customarily and actually treated as private by its owner. Under the Freedom of Information Act (FOIA) (5 U.S.C. 552), CBI is exempt from public disclosure. If your comments responsive to this NPRM contain commercial or financial information that is customarily treated as private, that you actually treat as private, and that is relevant or responsive to this NPRM, it is important that you clearly designate the submitted comments as CBI. Please mark each page of your submission containing CBI as "PROPIN." The FAA will treat such marked submissions as confidential

under the FOIA, and they will not be placed in the public docket of this NPRM. Submissions containing CBI should be sent to Stephen Elwin, Aerospace Engineer, ECO Branch, FAA, 1200 District Avenue, Burlington, MA 01803. Any commentary that the FAA receives which is not specifically designated as CBI will be placed in the public docket for this rulemaking.

Discussion

The FAA issued AD 2018-08-02, Amendment 39-19255 (83 FR 17746, April 24, 2018), ("AD 2018-08-02"), for all RRD Trent 1000-A2, Trent 1000-AE2, Trent 1000-C2, Trent 1000-CE2, Trent 1000-D2, Trent 1000-E2, Trent 1000-G2, Trent 1000-H2, Trent 1000-J2, Trent 1000-K2, and Trent 1000-L2 model turbofan engines. AD 2018-08-02 requires initial and repetitive ultrasonic and visual inspections of the IPC stage 1 rotor blades, IPC stage 2 rotor blades, and IPC shaft stage 2 dovetail posts, and removal of any cracked parts from service. AD 2018-08-02 resulted from IPC blade separations resulting in engine failures. The FAA issued AD 2018-08-02 to prevent failure of the IPC.

Actions Since AD 2018-08-02 Was Issued

Since the FAA issued AD 2018-08-02, The European Union Aviation Safety Agency (EASA), which is the Technical Agent for the Member States of the European Community, has issued EASA AD 2019-0250, dated October 9, 2019 (referred to after this as "the MCAI"), to address the unsafe condition on these products. The MCAI states:

Occurrences were reported on Rolls-Royce Trent 1000 'Pack C' engines, where some IPC Rotor 1 and Rotor 2 blades were found cracked.

This condition, if not detected and corrected, could lead to in-flight blade release, possibly resulting in reduced control of the aeroplane.

To address this potential unsafe condition, Rolls-Royce initially issued Alert NMSB TRENT 1000 72-AJ814 and 72-AJ819 to provide inspection instructions for IPC Rotor 1 blades, and IPC Rotor 2 blades and IPC shaft Stage 2 dovetail posts, respectively. Rolls-Royce also issued NMSB TRENT 1000 72-J871 to provide rework instructions for the affected parts, and Alert NMSB TRENT 1000 72-AJ869 to inspect those post-rework parts. Consequently, EASA issued AD 2017-0248 to require repetitive inspections of the affected IPC Rotor blades and IPC shaft Stage 2 dovetail posts and, depending on findings, removal from service of the engine for corrective action.

After that [EASA] AD was issued, Rolls-Royce issued Alert NMSB TRENT 1000 72-AK058 to provide instructions for a one-time on-wing inspection. Consequently, EASA

issued AD 2018–0073, retaining the requirements of EASA AD 2017–0248, which was superseded, to require an additional borescope inspection of certain engines and, depending on findings, removal from service of the engine for corrective action.

After that [EASA] AD was issued, it was determined that repetitive borescope inspections are necessary on all engines to ensure fleet-wide continued safe operation. Consequently, Rolls-Royce revised Alert NMSB TRENT 1000 72–AJ869, Alert NMSB TRENT 1000 72–AJ814, Alert NMSB TRENT 1000 72–AJ819 and NMSB TRENT 1000 72–J871, and issued NMSB TRENT 1000 72–AK060 to consolidate all inspection instructions. Consequently, EASA issued AD 2018–0084 (later revised), retaining the requirements of EASA AD 2018–0073, which was superseded, and requiring repetitive on-wing borescope inspections of the affected Rotor 1 parts and affected Rotor 2 parts and, depending on findings, removal from service of the engine for corrective action. That [EASA] AD also introduced specific requirements for engines installed on aeroplanes involved in ETOPS, and inspection following operation in asymmetric power conditions.

Rolls-Royce then introduced NMSB Trent 1000 72–AK092 to provide inspections for the rear face of the Rotor 2 blades and NMSB TRENT 1000 72–AK060 was revised (R1) accordingly. Later, Rolls-Royce developed mod 72–J941, installing improved IPC Stage 1 and Stage 2 rotor blades, and issued the modification SB, providing the necessary instructions for in-service application. EASA issued AD 2018–0084R2 to exclude post-mod 72–J941 engines from the Applicability and introducing the modification SB as terminating action for the repetitive inspections as required by that [EASA] AD.

Since that [EASA] AD was issued, Rolls-Royce issued the NMSB and revised Alert NMSB TRENT 1000 72–AJ814, 72–AJ819 and 72–AK092 to introduce new inspections, new thresholds and new intervals, depending on engine configuration. These inspections are now applicable for all operations, ETOPS and

non-ETOPS. The latest revision of the NMSB also amended the asymmetric power conditions for engine inspection and introduced cabin depressurisation as an event to trigger engine inspection(s).

For the reason described above, this [EASA] AD requires introduction of the new inspections, replacing those previously imposed by EASA AD 2018–0084R2 (through NMSB TRENT 1000 72–AK060), and removes the references to Engine Health Monitoring messages and ETOPS-related requirements.

You may obtain further information by examining the MCAI in the AD docket on the internet at <https://www.regulations.gov> by searching for and locating Docket No. FAA–2020–0009.

Related Service Information Under 1 CFR Part 51

The FAA reviewed Rolls-Royce plc (RR) Alert Non-Modification Service Bulletin (NMSB) Trent 1000 72–AK313, Revision 1, dated August 22, 2019; and RR Service Bulletin (SB) Trent 1000 72–J941, Revision 1, dated February 6, 2019, and Initial Issue, dated December 6, 2018. RR Alert NMSB Trent 1000 72–AK313 defines the initial inspection threshold and repeat inspection intervals for Trent 1000 IPC stage 1 blade, stage 2 blade, and IPC shaft stage 2 dovetail posts. RR SB Trent 1000 72–J941 describes procedures for modifying the engine by installing the redesigned IPC stage 1 and stage 2 rotor blades. This service information is reasonably available because the interested parties have access to it through their normal course of business or by the means identified in the ADDRESSES section.

Other Related Service Information

The FAA reviewed RR Alert NMSB Trent 1000 72–AJ819, Revision 4, dated

May 3, 2019; RR Alert NMSB Trent 1000 72–AJ814, Revision 5, dated May 3, 2019; and RR Alert NMSB Trent 1000 72–AK092, Revision 4, dated May 3, 2019. RR Alert NMSB Trent 1000 72–AJ819 describes procedures for performing a visual borescope inspection of the IPC stage 2 rotor blades and IPC shaft stage 2 dovetail posts. RR Alert NMSB Trent 1000 72–AJ814 describes procedures for performing an ultrasonic inspection (USI) of the IPC stage 1 rotor blades. RR Alert NMSB Trent 1000 72–AK092 describes procedures for performing a USI of the IPC stage 2 rotor blades.

FAA's Determination

The FAA is proposing this AD because we evaluated all the relevant information and determined the unsafe condition described previously is likely to exist or develop in other products of the same type design.

Proposed AD Requirements

This proposed AD would retain certain requirements of AD 2018–08–02. This proposed AD would require initial and repetitive ultrasonic or visual inspections, of the IPC stage 1 blade root (front face), IPC stage 2 blade root (front and rear face), and IPC shaft stage 2 dovetail post (front face), and removal of any cracked parts from service. This AD would also require an inspection after asymmetric power and cabin depressurization events.

Costs of Compliance

The FAA estimates that this AD affects 7 engines installed on airplanes of U.S. registry.

The FAA estimates the following costs to comply with this proposed AD:

ESTIMATED COSTS

| Action | Labor cost | Parts cost | Cost per product | Cost on U.S. operators |
|---|---|------------|------------------|------------------------|
| Inspect the IPC stage 1 blade root (Front Face). | 20 work-hours × \$85 per hour = \$1,700 | \$0 | \$1,700 | \$11,900 |
| Inspect the IPC stage 2 blade root (Front Face) and IPC shaft stage 2 dovetail post (Front Face). | 6 work-hours × \$85 per hour = \$510 | 0 | 510 | 3,570 |
| Inspect the IPC stage 2 blade root (Rear Face). | 10 work-hours × \$85 per hour = \$850 | 0 | 850 | 5,950 |

The FAA estimates the following costs to do any necessary replacements that would be required based on the

results of the proposed inspection. The FAA has no way of determining the

number of engines that might need these replacements.

ON-CONDITION COSTS

| Action | Labor cost | Parts cost | Cost per product |
|--------------------------------|---|------------|------------------|
| Replace all 34 R1 Blades | 280 work-hours × \$85 per hour = \$23,800 | \$52,360 | \$76,160 |

ON-CONDITION COSTS—Continued

| Action | Labor cost | Parts cost | Cost per product |
|--------------------------------|---|------------|------------------|
| Replace all 49 R2 Blades | 280 work-hours × \$85 per hour = \$23,800 | 48,755 | 72,555 |
| Replace IPC Drum | 144 work-hours × \$85 per hour = \$12,240 | 1,370,000 | 1,382,240 |

Authority for This Rulemaking

Title 49 of the United States Code specifies the FAA's authority to issue rules on aviation safety. Subtitle I, Section 106, describes the authority of the FAA Administrator. Subtitle VII, Aviation Programs, describes in more detail the scope of the Agency's authority.

The FAA is issuing this rulemaking under the authority described in Subtitle VII, Part A, Subpart III, Section 44701, "General requirements." Under that section, Congress charges the FAA with promoting safe flight of civil aircraft in air commerce by prescribing regulations for practices, methods, and procedures the Administrator finds necessary for safety in air commerce. This regulation is within the scope of that authority because it addresses an unsafe condition that is likely to exist or develop on products identified in this rulemaking action.

Regulatory Findings

The FAA has determined that this proposed AD would not have federalism implications under Executive Order 13132. This proposed AD would not have a substantial direct effect on the States, on the relationship between the national Government and the States, or on the distribution of power and responsibilities among the various levels of government.

For the reasons discussed above, I certify that the proposed regulation:

- (1) Is not a "significant regulatory action" under Executive Order 12866,
- (2) Will not affect intrastate aviation in Alaska, and
- (3) Will not have a significant economic impact, positive or negative, on a substantial number of small entities under the criteria of the Regulatory Flexibility Act.

List of Subjects in 14 CFR Part 39

Air transportation, Aircraft, Aviation safety, Incorporation by reference, Safety.

The Proposed Amendment

Accordingly, under the authority delegated to me by the Administrator, the FAA proposes to amend 14 CFR part 39 as follows:

PART 39—AIRWORTHINESS DIRECTIVES

- 1. The authority citation for part 39 continues to read as follows:

Authority: 49 U.S.C. 106(g), 40113, 44701.

§ 39.13 [Amended]

- 2. The FAA amends § 39.13 by removing airworthiness directive (AD) 2018–08–02, Amendment 39–19255 (83 FR 17746, April 24, 2018), and adding the following new AD:

Rolls-Royce Deutschland Ltd & Co KG (Type Certificate previously held by Rolls-Royce plc): Docket No. FAA–2020–0009; Project Identifier MCAI–2019–00111–E.

(a) Comments Due Date

The FAA must receive comments on this AD action by June 15, 2020.

(b) Affected ADs

This AD replaces AD 2018–08–02, Amendment 39–19255 (83 FR 17746, April 24, 2018).

(c) Applicability

This AD applies to Rolls-Royce Deutschland Ltd & Co KG (Type Certificate previously held by Rolls-Royce plc) Trent 1000–A2, Trent 1000–AE2, Trent 1000–C2, Trent 1000–CE2, Trent 1000–D2, Trent 1000–E2, Trent 1000–G2, Trent 1000–H2, Trent 1000–J2, Trent 1000–K2, and Trent 1000–L2 model turbofan engines, except those that have the redesigned intermediate-pressure compressor (IPC) stage 1 and stage 2 rotor blades introduced by Rolls-Royce plc (RR) Service Bulletin (SB) Trent 1000 72–J941, Revision 1, dated February 6, 2019.

(d) Subject

Joint Aircraft System Component (JASC) Code 7230, Turbine Engine Compressor Section.

(e) Unsafe Condition

This AD was prompted by IPC blade separations resulting in engine failures. Subsequently, the manufacturer identified cracking of parts in-service resulting in the need to require new inspections using new inspection thresholds and intervals. The manufacturer also determined the need to add an optional terminating action, amend the asymmetric power condition for engine inspection, and require an inspection after a cabin depressurization event. The FAA is issuing this AD to prevent failure of the IPC. The unsafe condition, if not addressed, could result in failure of one or more engines, loss of thrust control, and loss of the airplane.

(f) Compliance

Comply with this AD within the compliance times specified, unless already done.

(g) Required Actions

(1) After the effective date of this AD, before exceeding the initial inspection thresholds and repeat inspection intervals specified in Table 1 of RR Alert Non-Modification Service Bulletin (NMSB) Trent 1000 72–AK313, Revision 1, dated August 22, 2019 ("RR NMSB Trent 1000 72–AK313, R1"):

(i) Perform initial ultrasonic inspections (USIs) of the IPC stage 1 blade root (front face).

(ii) Thereafter, perform repetitive USIs of the IPC stage 1 blade root (front face).

(iii) Use the Accomplishment Instructions, paragraph 3.A.(1)(a) (on-wing) or 3.A.(2)(a) and (b) (in-shop) of RR NMSB Trent 1000 72–AK313, R1 to perform the inspections.

(2) After the effective date of this AD, before exceeding the initial inspection thresholds and repeat inspection intervals specified in Table 2 of RR NMSB Trent 1000 72–AK313, R1:

(i) Perform initial visual inspections of the IPC stage 2 blade root (front face) and IPC shaft stage 2 dovetail post (front face).

(ii) Thereafter, perform repetitive visual inspections of the IPC stage 2 blade root (front face) and IPC shaft stage 2 dovetail post (front face).

(iii) Use the Accomplishment Instructions, paragraph 3.B.(1)(a) (on-wing) or 3.B.(2)(b) (in-shop) of RR NMSB Trent 1000 72–AK313, R1 to perform the inspections.

(3) After the effective date of this AD, before exceeding the initial inspection threshold and repeat inspection intervals specified in Table 2 of RR NMSB Trent 1000 72–AK313, R1:

(i) Perform initial USIs of IPC stage 2 blade root (rear face).

(ii) Thereafter, perform repetitive USIs of IPC stage 2 blade root (rear face).

(iii) Use the Accomplishment Instructions, paragraph 3.C.(1)(a) (on-wing) or 3.C.(2)(a) (in-shop) of RR NMSB Trent 1000 72–AK313, R1 to perform the inspections.

(4) After the effective date of this AD, within 5 engine flight cycles (FCs) after each occurrence in which any engine operates in asymmetric power conditions at an altitude of less than 28,000 feet, perform the following inspections on the engine not affected by the power reduction or in-flight shutdown (IFSD):

(i) Perform initial USIs and visual inspections required by paragraphs (g)(1), (2), and (3) of this AD.

(ii) Thereafter, perform the repetitive USIs and visual inspections required by paragraphs (g)(1), (2), and (3) of this AD.

(iii) Use the service information and repetitive inspection thresholds required by paragraphs (g)(1)(iii), (2)(iii), and (3)(iii) to perform the inspections, as applicable.

(5) After the effective date of this AD, within 5 engine FCs following a cabin depressurization event, perform the following inspections on both engines installed on the airplane:

(i) Perform initial USIs and visual inspections required by paragraphs (g)(1), (2), and (3) of this AD.

(ii) Thereafter, perform the repetitive USIs and visual inspections required by paragraphs (g)(1), (2), and (3) of this AD.

(iii) Use the service information and repetitive inspection thresholds required by paragraphs (g)(1)(iii), and (3)(iii) to perform the inspections, as applicable.

(6) If any IPC stage 1 blade root (front face), IPC stage 2 blade root (front face), IPC shaft stage 2 dovetail post (front face), or IPC stage 2 blade root (rear face) is found cracked during any inspection required by this AD, replace the part with a part eligible for installation before further flight.

(h) Terminating Action (Optional)

Modification of an engine by installing the redesigned IPC stage 1 and stage 2 rotor blades, using RR SB Trent 1000 72-J941, Revision 1, dated February 6, 2019, or Initial Issue, dated December 6, 2018, is the terminating action for the initial and repetitive ultrasonic or visual inspection requirements, as applicable, of paragraph (g)(1) through (5) of this AD for that engine.

(i) Definition

For the purpose of this AD, an "asymmetric power condition" is the operation of the airplane at an altitude of less than 28,000 feet, experiencing either single engine take-off, engine fault (reduced power on one engine), or single engine IFSD, which includes execution of any non-normal checklist procedure.

(j) Credit for Previous Actions

You may take credit for the initial inspections required by paragraphs (g)(1) through (5) of this AD if you performed these inspections before the effective date of this AD using any of the following.

(1) RR Alert NMSB Trent 1000 72-AJ819, Revision 3, dated April 13, 2018, or earlier revisions;

(2) RR NMSB Trent 1000 72-AJ814, Revision 4, dated September 28, 2018, or earlier revisions;

(3) RR Alert NMSB Trent 1000 72-AK313, Initial Issue, dated May 2, 2019; or

(4) RR Alert NMSB Trent 1000 72-AK092, Revision 3, dated February 28, 2019 or earlier revisions.

(k) Special Flight Permit

Special flight permits, as described in Section 21.197 and Section 21.199 of the Federal Aviation Regulations (14 CFR 21.197 and 21.199), are subject to the requirements of paragraph (k)(1) of this AD.

(1) Operators who are prohibited from further flight due to a crack finding as a result of paragraph (g) of this AD, may perform a one-time non-revenue ferry flight to a location where the engine can be

removed from service. This ferry flight must be performed without passengers, involve non-ETOPS operation, and consume no more than three FCs.

(2) [Reserved]

(l) Alternative Methods of Compliance (AMOCs)

(1) The Manager, ECO Branch, FAA, has the authority to approve AMOCs for this AD, if requested using the procedures found in 14 CFR 39.19. In accordance with 14 CFR 39.19, send your request to your principal inspector or local Flight Standards District Office, as appropriate. If sending information directly to the manager of the certification office, send it to the attention of the person identified in paragraph (m)(1) of this AD. You may email your request to: ANE-AD-AMOC@faa.gov.

(2) Before using any approved AMOC, notify your appropriate principal inspector, or lacking a principal inspector, the manager of the local flight standards district office/certificate holding district office.

(m) Related Information

(1) For more information about this AD, contact Stephen Elwin, Aerospace Engineer, ECO Branch, FAA, 1200 District Avenue, Burlington, MA 01803; phone: 781-238-7236; fax: 781-238-7199; email: Stephen.L.Elwin@faa.gov.

(2) Refer to European Union Aviation Safety Agency (EASA) AD 2019-0250, dated October 9, 2019, for more information. You may examine the EASA AD in the AD docket on the internet at <https://www.regulations.gov> by searching for and locating it in Docket No. FAA-2020-0009.

(3) For service information identified in this AD, contact Rolls-Royce Deutschland Ltd. & Co KG, Eschenweg 11, 15827 Blankenfelde-Mahlow, Germany; phone: +49 (0) 33 708 6 0; email: <https://www.rolls-royce.com/contact-us.aspx>. You may view this referenced service information at the FAA, Airworthiness Products Section, Operational Safety Branch, 1200 District Avenue, Burlington, MA, 01803. For information on the availability of this material at the FAA, call 781-238-7759.

Issued on April 23, 2020.

Gaetano A. Sciortino,

Deputy Director for Strategic Initiatives, Compliance & Airworthiness Division, Aircraft Certification Service.

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 39

[Docket No. FAA-2020-0424; Project Identifier MCAI-2019-00130-E]

RIN 2120-AA64

Airworthiness Directives; Rolls-Royce Deutschland Ltd & Co KG (Type Certificate Previously Held by Rolls-Royce plc) Turbofan Engines

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Notice of proposed rulemaking (NPRM).

SUMMARY: The FAA proposes to adopt a new airworthiness directive (AD) for all Rolls-Royce Deutschland Ltd & Co KG Trent 1000-A, Trent 1000-A2, Trent 1000-AE, Trent 1000-AE2, Trent 1000-C, Trent 1000-C2, Trent 1000-CE, Trent 1000-CE2, Trent 1000-D, Trent 1000-D2, Trent 1000-E, Trent 1000-E2, Trent 1000-G, Trent 1000-G2, Trent 1000-H, Trent 1000-H2, Trent 1000-J2, Trent 1000-K2, and Trent 1000-L2 model turbofan engines. This proposed AD was prompted by the manufacturer identifying 38 low-pressure compressor (LPC) front cases that have non-optimal properties that could inhibit their ability to contain certain engine failures. This proposed AD would require removing the LPC front case from service and replacing it with a part eligible for installation. The FAA is proposing this AD to address the unsafe condition on these products.

DATES: The FAA must receive comments on this proposed AD by June 15, 2020.

ADDRESSES: You may send comments, using the procedures found in 14 CFR 11.43 and 11.45, by any of the following methods:

- **Federal eRulemaking Portal:** Go to <https://www.regulations.gov>. Follow the instructions for submitting comments.

- **Fax:** 202 493 2251.

- **Mail:** U.S. Department of Transportation, Docket Operations, M-30, West Building Ground Floor, Room W12 140, 1200 New Jersey Avenue SE, Washington, DC 20590.

- **Hand Delivery:** Deliver to Mail address above between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays.

For service information identified in this NPRM, contact Rolls-Royce Deutschland Ltd & Co KG, Eschenweg 11, 15827 Blankenfelde-Mahlow, Germany; phone: +49 (0) 33 708 6 0; email: <https://www.rolls-royce.com/contact-us.aspx>. You may view this

service information at the FAA, Airworthiness Products Section, Operational Safety Branch, 1200 District Avenue, Burlington, MA 01803. For information on the availability of this material at the FAA, call 781-238-7759.

Examining the AD Docket

You may examine the AD docket on the internet at <https://www.regulations.gov> by searching for and locating Docket No. FAA-2020-0424; or in person at Docket Operations between 9 a.m. and 5 p.m., Monday through Friday, except Federal holidays. The AD docket contains this NPRM, the mandatory continuing airworthiness information (MCAI), any comments received, and other information. The street address for Docket Operations is listed above. Comments will be available in the AD docket shortly after receipt.

FOR FURTHER INFORMATION CONTACT: Stephen Elwin, Aerospace Engineer, ECO Branch, FAA, 1200 District Avenue, Burlington, MA 01803; phone: 781-238-7236; fax: 781-238-7199; email: stephen.l.elwin@faa.gov.

SUPPLEMENTARY INFORMATION:

Comments Invited

The FAA invites you to send any written relevant data, views, or arguments about this proposal. Send your comments to an address listed under the **ADDRESSES** section. Include “Docket No. FAA-2020-0424; Project Identifier MCAI-2019-00130-E” at the beginning of your comments. The FAA specifically invites comments on the overall regulatory, economic, environmental, and energy aspects of this NPRM. The FAA will consider all comments received by the closing date and may amend this NPRM because of those comments.

Except for Confidential Business Information as described in the following paragraph, and other information as described in 14 CFR 11.35, the FAA will post all comments received, without change, to <https://www.regulations.gov>, including any personal information you provide. The FAA will also post a report

summarizing each substantive verbal contact received about this NPRM.

Confidential Business Information

Confidential Business Information (CBI) is commercial or financial information that is both customarily and actually treated as private by its owner. Under the Freedom of Information Act (FOIA) (5 U.S.C. 552), CBI is exempt from public disclosure. If your comments responsive to this NPRM contain commercial or financial information that is customarily treated as private, that you actually treat as private, and that is relevant or responsive to this NPRM, it is important that you clearly designate the submitted comments as CBI. Please mark each page of your submission containing CBI as “PROPIN.” The FAA will treat such marked submissions as confidential under the FOIA, and they will not be placed in the public docket of this NPRM. Submissions containing CBI should be sent to Stephen Elwin, Aerospace Engineer, ECO Branch, FAA, 1200 District Avenue, Burlington, MA 01803. Any commentary that the FAA receives which is not specifically designated as CBI will be placed in the public docket for this rulemaking.

Discussion

The European Union Aviation Safety Agency (EASA), which is the Technical Agent for the Member States of the European Community, has issued EASA AD 2019-0286, dated November 26, 2019 (referred to after this as “the MCAI”), to address the unsafe condition on these products. The MCAI states:

Engineering analysis has identified that 38 LPC front cases have non-optimal material properties. This could inhibit the intended function of the LPC front case to contain certain engine failures. This condition, if not corrected, could, in case of fan blade failure, lead to high energy debris release, possibly resulting in damage to, and reduced control of, the aeroplane.

To address this potential unsafe condition, Rolls-Royce developed an updated life management and issued the NMSB, identifying those ESN that have an affected part installed, and providing the corresponding limit (date) for in-shop front fan case replacement. For the reason

described above, this [EASA] AD requires removal from service of the affected engines to replace the affected parts. This [EASA] AD also prohibits re-installation of affected parts.

You may obtain further information by examining the MCAI in the AD docket on the internet at <https://www.regulations.gov> by searching for and locating Docket No. FAA-2020-0424.

Related Service Information Under 1 CFR Part 51

The FAA reviewed Rolls-Royce Alert Non-Modification Service Bulletin (NMSB) Trent 1000 72-AK294, dated July 16, 2019. The NMSB contains the serial numbers of the affected LPC front cases, the engine serial number on which these LPC front cases are installed, and the date to remove each engine from service. This service information is reasonably available because the interested parties have access to it through their normal course of business or by the means identified in the **ADDRESSES** section.

FAA’s Determination

This product has been approved by EASA and is approved for operation in the United States. Pursuant to our bilateral agreement with the European Community, EASA has notified us of the unsafe condition described in the MCAI and service information referenced above. The FAA is proposing this AD because it evaluated all the relevant information provided by EASA and determined the unsafe condition described previously is likely to exist or develop in other products of the same type design.

Proposed AD Requirements

This proposed AD would require removing the LPC front case from service and replacing it with a part eligible for installation.

Costs of Compliance

The FAA estimates that this proposed AD affects three engines installed on airplanes of U.S. registry.

The FAA estimates the following costs to comply with this proposed AD:

ESTIMATED COSTS

| Action | Labor cost | Parts cost | Cost per product | Cost on U.S. operators |
|---|--|-------------|------------------|------------------------|
| Remove and replace the LPC front case | 390 work-hours × \$85 per hour = \$33,150 | \$1,238,654 | \$1,271,804 | \$3,815,412 |

Authority for This Rulemaking

Title 49 of the United States Code specifies the FAA’s authority to issue

rules on aviation safety. Subtitle I, section 106, describes the authority of the FAA Administrator. Subtitle VII:

Aviation Programs, describes in more detail the scope of the Agency’s authority.

The FAA is issuing this rulemaking under the authority described in Subtitle VII, Part A, Subpart III, Section 44701: "General requirements." Under that section, Congress charges the FAA with promoting safe flight of civil aircraft in air commerce by prescribing regulations for practices, methods, and procedures the Administrator finds necessary for safety in air commerce. This regulation is within the scope of that authority because it addresses an unsafe condition that is likely to exist or develop on products identified in this rulemaking action.

Regulatory Findings

The FAA determined that this proposed AD would not have federalism implications under Executive Order 13132. This proposed AD would not have a substantial direct effect on the States, on the relationship between the national Government and the States, or on the distribution of power and responsibilities among the various levels of government.

For the reasons discussed above, I certify this proposed regulation:

- (1) Is not a "significant regulatory action" under Executive Order 12866,
- (2) Will not affect intrastate aviation in Alaska, and
- (3) Will not have a significant economic impact, positive or negative, on a substantial number of small entities under the criteria of the Regulatory Flexibility Act.

List of Subjects in 14 CFR Part 39

Air transportation, Aircraft, Aviation safety, Incorporation by reference, Safety.

The Proposed Amendment

Accordingly, under the authority delegated to me by the Administrator, the FAA proposes to amend 14 CFR part 39 as follows:

PART 39—AIRWORTHINESS DIRECTIVES

- 1. The authority citation for part 39 continues to read as follows:

Authority: 49 U.S.C. 106(g), 40113, 44701.

§ 39.13 [Amended]

- 2. The FAA amends § 39.13 by adding the following new airworthiness directive (AD):

Rolls-Royce Deutschland Ltd & Co KG (Type Certificate previously held by Rolls-Royce plc): Docket No. FAA-2020-0424; Project Identifier MCAI-2019-00130-E.

(a) Comments Due Date

The FAA must receive comments by June 15, 2020.

(b) Affected ADs

None.

(c) Applicability

This AD applies to all Rolls-Royce Deutschland Ltd & Co KG (Type Certificate previously held by Rolls-Royce plc) Trent 1000-A, Trent 1000-A2, Trent 1000-AE, Trent 1000-AE2, Trent 1000-C, Trent 1000-C2, Trent 1000-CE, Trent 1000-CE2, Trent 1000-D, Trent 1000-D2, Trent 1000-E, Trent 1000-E2, Trent 1000-G, Trent 1000-G2, Trent 1000-H, Trent 1000-H2, Trent 1000-J2, Trent 1000-K2, and Trent 1000-L2 model turbofan engines.

(d) Subject

Joint Aircraft System Component (JASC) Code 7230, Turbine Engine Compressor Section.

(e) Unsafe Condition

This AD was prompted by the manufacturer identifying 38 low-pressure compressor (LPC) front cases, part number (P/N) KH26266 with individual serial numbers (S/Ns), that have non-optimal properties that could inhibit their ability to contain certain engine failures. The FAA is issuing this AD to prevent failure of the LPC front case when subjected to high-energy debris release. The unsafe condition, if not addressed, could result in uncontained release of high-energy debris, damage to the engine, and damage to the airplane.

(f) Compliance

Comply with this AD within the compliance times specified, unless already done.

(g) Required Actions

After the effective date of this AD, no later than the required removal date specified in Appendix 1 of Rolls-Royce Alert Non-Modification Service Bulletin (NMSB) Trent 1000 72-AK294, dated July 16, 2019 ("Rolls-Royce Alert NMSB Trent 1000 72-AK294"):

- (1) Remove LPC front case, P/N KH26266 and with a S/N identified in Appendix 1 of Rolls-Royce Alert NMSB Trent 1000 72-AK294, and
- (2) Replace the LPC front case with a part eligible for installation.

(h) Alternative Methods of Compliance (AMOCs)

(1) The Manager, ECO Branch, FAA, has the authority to approve AMOCs for this AD, if requested using the procedures found in 14 CFR 39.19. In accordance with 14 CFR 39.19, send your request to your principal inspector or local Flight Standards District Office, as appropriate. If sending information directly to the manager of the ECO Branch, send it to the attention of the person identified in paragraph (i)(1) of this AD. You may email your request to: ANE-AD-AMOC@faa.gov.

(2) Before using any approved AMOC, notify your appropriate principal inspector, or lacking a principal inspector, the manager of the local flight standards district office/certificate holding district office.

(i) Related Information

(1) For more information about this AD, contact Stephen Elwin, Aerospace Engineer,

ECO Branch, FAA, 1200 District Avenue, Burlington, MA 01803; phone: 781-238-7236; fax: 781-238-7199; email: stephen.l.elwin@faa.gov.

(2) Refer to European Union Aviation Safety Agency (EASA) AD 2019-0286, dated November 26, 2019, for more information. You may examine the EASA AD in the AD docket on the internet at <https://www.regulations.gov> by searching for and locating it in Docket No. FAA-2020-0424.

(3) For service information identified in this AD, contact Rolls-Royce Deutschland Ltd & Co KG, Eschenweg 11, 15827 Blankenfelde-Mahlow, Germany; phone: +49 (0) 33 708 6 0; email: <https://www.rolls-royce.com/contact-us.aspx>. You may view this referenced service information at the FAA, Airworthiness Products Section, Operational Safety Branch, 1200 District Avenue, Burlington, MA 01803. For information on the availability of this material at the FAA, call 781-238-7759.

Issued on April 23, 2020.

Lance T. Gant,

Director, Compliance & Airworthiness Division, Aircraft Certification Service.

BILLING CODE 4910-13-P

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 71

[Docket No. FAA-2020-0359; Airspace Docket No. 15-AAL-5]

Establishment of Class E Airspace; Sleetmute AK

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Notice of proposed rulemaking (NPRM).

SUMMARY: This action proposes to establish Class E airspace extending upward from 700 feet above the surface at Sleetmute Airport, Sleetmute AK, to accommodate new area navigation (RNAV) procedures at the airport. This action would ensure the safety and management of instrument flight rules (IFR) operations within the National Airspace System.

DATES: Comments must be received on or before June 15, 2020.

ADDRESSES: Send comments on this proposal to the U.S. Department of Transportation, Docket Operations, 1200 New Jersey Avenue SE, West Building Ground Floor, Room W12-140, Washington, DC 20590; telephone: 1-800-647-5527, or (202) 366-9826. You must identify FAA Docket No. FAA-2020-0359; Airspace Docket No. 15-AAL-5, at the beginning of your comments. You may also submit

comments through the internet at <http://www.regulations.gov>.

FAA Order 7400.11D, Airspace Designations and Reporting Points, and subsequent amendments can be viewed online at http://www.faa.gov/air_traffic/publications/. For further information, you can contact the Airspace Policy Group, Federal Aviation Administration, 800 Independence Avenue SW, Washington, DC 20591; telephone: (202) 267-8783. The Order is also available for inspection at the National Archives and Records Administration (NARA). For information on the availability of FAA Order 7400.11D at NARA, call (202) 741-6030, or go to <https://www.archives.gov/federal-register/cfr/ibr-locations.html>.

FAA Order 7400.11, Airspace Designations and Reporting Points, is published yearly and effective on September 15.

FOR FURTHER INFORMATION CONTACT: Richard Roberts, Federal Aviation Administration, Western Service Center, Operations Support Group, 2200 S. 216th Street, Des Moines, WA 98198; telephone (206) 231-2245.

SUPPLEMENTARY INFORMATION:

Authority for This Rulemaking

The FAA's authority to issue rules regarding aviation safety is found in Title 49 of the United States Code. Subtitle I, Section 106 describes the authority of the FAA Administrator. Subtitle VII, Aviation Programs, describes in more detail the scope of the agency's authority. This rulemaking is promulgated under the authority described in Subtitle VII, Part A, Subpart I, Section 40103. Under that section, the FAA is charged with prescribing regulations to assign the use of airspace necessary to ensure the safety of aircraft and the efficient use of airspace. This regulation is within the scope of that authority as it would establish Class E airspace to support new RNAV procedures at Sleetmute Airport, Sleetmute, AK.

Comments Invited

Interested parties are invited to participate in this proposed rulemaking by submitting such written data, views, or arguments, as they may desire. Comments that provide the factual basis supporting the views and suggestions presented are particularly helpful in developing reasoned regulatory decisions on the proposal. Comments are specifically invited on the overall regulatory, aeronautical, economic, environmental, and energy-related aspects of the proposal.

Communications should identify both docket numbers and be submitted in triplicate to the address listed above. Persons wishing the FAA to acknowledge receipt of their comments on this notice must submit with those comments a self-addressed, stamped postcard on which the following statement is made: "Comments to Docket No. FAA-2020-0359; Airspace Docket No. 15-AAL-05". The postcard will be date/time stamped and returned to the commenter.

All communications received before the specified closing date for comments will be considered before taking action on the proposed rule. The proposal contained in this notice may be changed in light of the comments received. A report summarizing each substantive public contact with FAA personnel concerned with this rulemaking will be filed in the docket.

Availability of NPRMs

An electronic copy of this document may be downloaded through the internet at <http://www.regulations.gov>. Recently published rulemaking documents can also be accessed through the FAA's web page at http://www.faa.gov/air_traffic/publications/airspace_amendments/.

You may review the public docket containing the proposal, any comments received, and any final disposition in person in the Dockets Office (see the **ADDRESSES** section for the address and phone number) between 9:00 a.m. and 5:00 p.m., Monday through Friday, except federal holidays. An informal docket may also be examined during normal business hours at the Northwest Mountain Regional Office of the Federal Aviation Administration, Air Traffic Organization, Western Service Center, Operations Support Group, 2200 S. 216th Street, Des Moines, WA 98198.

Availability and Summary of Documents for Incorporation by Reference

This document proposes to amend FAA Order 7400.11D, Airspace Designations and Reporting Points, dated August 8, 2019, and effective September 15, 2019. FAA Order 7400.11D is publicly available as listed in the **ADDRESSES** section of this document. FAA Order 7400.11D lists Class A, B, C, D, and E airspace areas, air traffic service routes, and reporting points.

The Proposal

The FAA is proposing an amendment to Title 14 Code of Federal Regulations (14 CFR) part 71 by establishing Class E airspace extending upward from 700

feet above the surface of the earth within a 6-mile radius of Sleetmute Airport, Sleetmute, AK, and that airspace 2 miles each side of the 166° bearing from the 6-mile radius to 19 miles south of the airport.

Class E airspace designations are published in paragraph 6005 of FAA Order 7400.11D, dated August 8, 2019, and effective September 15, 2019, which is incorporated by reference in 14 CFR 71.1. The Class E airspace designations listed in this document will be published subsequently in the Order.

Regulatory Notices and Analyses

The FAA has determined that this regulation only involves an established body of technical regulations for which frequent and routine amendments are necessary to keep them operationally current, is non-controversial and unlikely to result in adverse or negative comments. It, therefore: (1) Is not a "significant regulatory action" under Executive Order 12866; (2) is not a "significant rule" under DOT Regulatory Policies and Procedures (44 FR 11034; February 26, 1979); and (3) does not warrant preparation of a regulatory evaluation as the anticipated impact is so minimal. Since this is a routine matter that will only affect air traffic procedures and air navigation, it is certified that this rule, when promulgated, would not have a significant economic impact on a substantial number of small entities under the criteria of the Regulatory Flexibility Act.

Environmental Review

This proposal will be subject to an environmental analysis in accordance with FAA Order 1050.1F, "Environmental Impacts: Policies and Procedures" prior to any FAA final regulatory action.

List of Subjects in 14 CFR Part 71

Airspace, Incorporation by reference, Navigation (air).

The Proposed Amendment

Accordingly, pursuant to the authority delegated to me, the Federal Aviation Administration proposes to amend 14 CFR part 71 as follows:

PART 71—DESIGNATION OF CLASS A, B, C, D, AND E AIRSPACE AREAS; AIR TRAFFIC SERVICE ROUTES; AND REPORTING POINTS

- 1. The authority citation for 14 CFR part 71 continues to read as follows:

Authority: 49 U.S.C. 106(f), 106(g), 40103, 40113, 40120; E.O. 10854, 24 FR 9565, 3 CFR, 1959-1963 Comp., p. 389.

§ 71.1 [Amended]

■ 2. The incorporation by reference in 14 CFR 71.1 of FAA Order 7400.11D, Airspace Designations and Reporting Points, dated August 8, 2019, and effective September 15, 2019, is amended as follows:

Paragraph 6005 Class E Airspace Areas Extending Upward From 700 Feet or More Above the Surface of the Earth.

* * * * *

AAL AK E5 Sleetmute, AK [New]

Sleetmute Airport, AK

(Lat. 61°42'02" N, long. 157°09'57" W)

That airspace extending upward from 700 feet above the surface within 6 miles of the Sleetmute Airport, Sleetmute Alaska; and that airspace 2 miles each side of the 166° bearing from the airport extending from the 6-mile radius to 19 miles south of the Sleetmute Airport.

Issued in Seattle, Washington, on April 23, 2020.

Shawn M. Kozica,

Group Manager, Operations Support Group, Western Service Center.

BILLING CODE 4910-13-P

DEPARTMENT OF HOMELAND SECURITY

Coast Guard

33 CFR Part 117

[Docket No. USCG-2020-0052]

RIN 1625-AA09

Drawbridge Operation Regulation; Long Creek, Nassau, NY

AGENCY: Coast Guard, DHS.

ACTION: Notice of proposed rulemaking.

SUMMARY: The Coast Guard proposes to modify the operating schedule that governs the Loop Parkway Bridge across Long Creek, mile 0.7 at Nassau, New York. The bridge owner, New York State Department of Transportation (NYSDOT), submitted a request to modify bridge openings and expects that this change to the regulations will better serve the needs of the community while continuing to meet the reasonable needs of navigation.

DATES: Comments and related material must reach the Coast Guard on or before June 1, 2020.

ADDRESSES: You may submit comments identified by docket number USCG-2020-0052 using Federal eRulemaking Portal at <http://www.regulations.gov>.

See the "Public Participation and Request for Comments" portion of the **SUPPLEMENTARY INFORMATION** section

below for instructions on submitting comments.

FOR FURTHER INFORMATION CONTACT: If you have questions on this proposed rule, call or email Ms. Stephanie E. Lopez, First Coast Guard District, Project Officer, telephone 212-514-4335, email Stephanie.E.Lopez@uscg.mil.

SUPPLEMENTARY INFORMATION:

I. Table of Abbreviations

CFR Code of Federal Regulations
DHS Department of Homeland Security
FR Federal Register
OMB Office of Management and Budget
NPRM Notice of Proposed Rulemaking (Advance, Supplemental)
§ Section
U.S.C. United States Code

II. Background, Purpose and Legal Basis

The Loop Parkway Bridge at mile 0.7, across Long Creek, Nassau, New York, has a vertical clearance of 21 feet at mean high water and 25 at mean low water. Horizontal clearance is approximately 75.5 feet. The waterway users include recreational and commercial vessels including fishing vessels.

The existing drawbridge operating regulations are listed at 33 CFR 117.799(f).

In 2005, the owner of the bridge, New York State Department of Transportation, requested a temporary test deviation for an alternate drawbridge operation regulation; however, it was never followed up with a rulemaking. The bridge owner assumed since the temporary test deviation was a success, new signage reflecting the temporary deviation was installed and the bridge has been operating under that temporary test deviation for the past 15 years. After a recent construction operation commenced, the bridge operator began operating the bridge under the existing regulation. USCG Sector Long Island Sound received several complaints from mariners who were upset the bridge was no longer operating under the old temporary test deviation. We have implemented a new temporary test deviation for this proposed rule change. Based on the data that was provided by the bridge owner, the number of requested bridge openings has decreased over the years, while the vehicular traffic has increased. The schedule restricts bridge openings during vehicular rush hours, allowing openings twice per hour. This schedule allows less congestion buildup of vehicular traffic while providing

mariners with a reliable, consistent time they can request a bridge opening.

III. Discussion of Proposed Rule

The proposed rule provides for commercial vessels engaged in commerce, the draw shall open Monday thru Friday from 6:20 a.m. to 9:50 a.m. and 3:20 p.m. to 7:20 p.m. on signal at 20 and 50 minutes after the hour, and on signal at all other times. For all other vessels, the draw shall open on Monday thru Friday from 6:20 a.m. to 7:20 a.m. on signal at 20 and 50 minutes after the hour, and the draw shall open on Saturday, Sunday and Federal Holidays from 7:20 a.m. to 8:20 a.m. on signal at 20 and 50 minutes after the hour, and on signal at all other times. The reason for these changes is to minimize excessive bridge openings which were a direct cause of accelerated deterioration of the bridge.

IV. Regulatory Analyses

We developed this proposed rule after considering numerous statutes and Executive Orders related to rulemaking. Below we summarize our analyses based on these statutes and Executive Orders and we discuss First Amendment rights of protestors.

A. Regulatory Planning and Review

Executive Orders 12866 and 13563 direct agencies to assess the costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits. Executive Order 13771 directs agencies to control regulatory costs through a budgeting process. This NPRM has not been designated a "significant regulatory action," under Executive Order 12866. Accordingly, the NPRM has not been reviewed by the Office of Management and Budget (OMB) and pursuant to OMB guidance it is exempt from the requirements of Executive Order 13771.

This regulatory action determination is based on the ability that vessels can still transit the bridge given advanced notice.

B. Impact on Small Entities

The Regulatory Flexibility Act of 1980 (RFA), 5 U.S.C. 601-612, as amended, requires federal agencies to consider the potential impact of regulations on small entities during rulemaking. The term "small entities" comprises small businesses, not-for-profit organizations that are independently owned and operated and are not dominant in their fields, and governmental jurisdictions with populations of less than 50,000. The Coast Guard certifies under 5 U.S.C.

605(b) that this proposed rule would not have a significant economic impact on a substantial number of small entities.

While some owners or operators of vessels intending to transit the bridge may be small entities, for the reasons stated in section IV.A above this proposed rule would not have a significant economic impact on any vessel owner or operator.

If you think that your business, organization, or governmental jurisdiction qualifies as a small entity and that this rule would have a significant economic impact on it, please submit a comment (see **ADDRESSES**) explaining why you think it qualifies and how and to what degree this rule would economically affect it.

Under section 213(a) of the Small Business Regulatory Enforcement Fairness Act of 1996 (Pub. L. 104–121), we want to assist small entities in understanding this proposed rule. If the rule would affect your small business, organization, or governmental jurisdiction and you have questions concerning its provisions or options for compliance, please contact the person listed in the **FOR FURTHER INFORMATION CONTACT** section. The Coast Guard will not retaliate against small entities that question or complain about this proposed rule or any policy or action of the Coast Guard.

C. Collection of Information

This proposed rule would call for no new collection of information under the Paperwork Reduction Act of 1995 (44 U.S.C. 3501–3520.).

D. Federalism and Indian Tribal Government

A rule has implications for federalism under Executive Order 13132 (Federalism), if it has a substantial direct effect on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. We have analyzed this proposed rule under that Order and have determined that it is consistent with the fundamental federalism principles and preemption requirements described in Executive Order 13132.

Also, this proposed rule does not have tribal implications under Executive Order 13175 (Consultation and Coordination with Indian Tribal Governments) because it would not have a substantial direct effect on one or more Indian tribes, on the relationship between the Federal Government and Indian tribes, or on the distribution of power and responsibilities between the Federal Government and Indian tribes.

If you believe this proposed rule has implications for federalism or Indian tribes, please contact the person listed in the **FOR FURTHER INFORMATION CONTACT** section.

E. Unfunded Mandates Reform Act

The Unfunded Mandates Reform Act of 1995 (2 U.S.C. 1531–1538) requires Federal agencies to assess the effects of their discretionary regulatory actions. In particular, the Act addresses actions that may result in the expenditure by a State, local, or tribal government, in the aggregate, or by the private sector of \$100,000,000 (adjusted for inflation) or more in any one year. Though this proposed rule will not result in such an expenditure, we do discuss the effects of this proposed rule elsewhere in this preamble.

F. Environment

We have analyzed this proposed rule under Department of Homeland Security Management Directive 023–01, Rev.1, associated implementing instructions, and Environmental Planning Policy COMDTINST 5090.1 (series), which guide the Coast Guard in complying with the National Environmental Policy Act of 1969 (NEPA)(42 U.S.C. 4321–4370f). The Coast Guard has determined that this action is one of a category of actions which do not individually or cumulatively have a significant effect on the human environment. This proposed rule simply promulgates the operating regulations or procedures for drawbridges. Normally such actions are categorically excluded from further review, under figure 2–1, paragraph (32)(e), of the Instruction.

Neither a Record of Environmental Consideration nor a Memorandum for the Record are required for this rule. We seek any comments or information that may lead to the discovery of a significant environmental impact from this proposed rule.

G. Protest Activities

The Coast Guard respects the First Amendment rights of protesters. Protesters are asked to contact the person listed in the **FOR FURTHER INFORMATION CONTACT** section to coordinate protest activities so that your message can be received without jeopardizing the safety or security of people, places or vessels.

V. Public Participation and Request for Comments

We view public participation as essential to effective rulemaking, and will consider all comments and material received during the comment period.

Your comment can help shape the outcome of this rulemaking. If you submit a comment, please include the docket number for this rulemaking, indicate the specific section of this document to which each comment applies, and provide a reason for each suggestion or recommendation.

We encourage you to submit comments through the Federal eRulemaking Portal at <http://www.regulations.gov>. If your material cannot be submitted using <http://www.regulations.gov>, contact the person in the **FOR FURTHER INFORMATION CONTACT** section of this document for alternate instructions.

We accept anonymous comments. All comments received will be posted without change to <http://www.regulations.gov> and will include any personal information you have provided. For more about privacy and the docket, visit <http://www.regulations.gov/privacynotice>.

Documents mentioned in this NPRM as being available in this docket and all public comments, will be in our online docket at <http://www.regulations.gov> and can be viewed by following that website's instructions. Additionally, if you go to the online docket and sign up for email alerts, you will be notified when comments are posted or a final rule is published.

List of Subjects in 33 CFR Part 117

Bridges.

For the reasons discussed in the preamble, the Coast Guard proposes to amend 33 CFR part 117 as follows:

PART 117—DRAWBRIDGE OPERATION REGULATIONS

■ 1. The authority citation for part 117 continues to read as follows:

Authority: 33 U.S.C. 499; 33 CFR 1.05–1; Department of Homeland Security Delegation No. 0170.1.

■ 2. Revise § 117.799(f) to read as follows:

§ 117.799 Long Island, New York Inland Waterway from East Rockaway Inlet to Shinnecock Canal.

* * * * *

(f) The draw of the Loop Parkway Bridge across Long Creek, mile 0.7, shall open for commercial vessels engaged in commerce, the draw shall open Monday thru Friday from 6:20 a.m. to 9:50 a.m. and 3:20 p.m. to 7:20 p.m. on signal at 20 and 50 minutes after the hour, and on signal at all other times. For all other vessels, the draw shall open on Monday thru Friday from 6:20 a.m. to 7:20 p.m. on signal at 20 and 50 minutes after the hour, and the draw shall open on

Saturday, Sunday and Federal Holidays from 7:20 a.m. to 8:20 p.m. on signal at 20 and 50 minutes after the hour, and on signal at all other times.

* * * * *

Dated: April 21, 2020.

A.J. Tiongson,
Rear Admiral, U.S. Coast Guard, Commander,
First Coast Guard District.

BILLING CODE 9110-04-P

DEPARTMENT OF THE INTERIOR

National Park Service

36 CFR Parts 1 and 13

[NPS-AKRO-29973; PPAKAKROZ5,
PPMPRL1Y.L00000]

RIN 1024-AE63

National Park Service Jurisdiction in Alaska

AGENCY: National Park Service, Interior.

ACTION: Proposed rule.

SUMMARY: This rule would revise National Park Service regulations to comply with the decision of the U.S. Supreme Court in *Sturgeon v. Frost*. In the *Sturgeon* decision, the Court held that National Park Service regulations apply exclusively to public lands (meaning federally owned lands and waters) within the external boundaries of National Park System units in Alaska. Lands which are not federally owned, including submerged lands under navigable waters, are not part of the unit subject to the National Park Service's ordinary regulatory authority.

DATES: Comments on the proposed rule must be received by June 29, 2020.

ADDRESSES: You may submit comments, identified by Regulation Identifier Number (RIN) 1024-AE63, by either of the following methods:

(1) *Electronically:* Go to the Federal eRulemaking Portal: <http://www.regulations.gov> and search for "1024-AE63". Follow the instructions for submitting comments.

(2) *By hard copy:* Mail or hand deliver to: National Park Service, Regional Director, Alaska Regional Office, 240 West 5th Ave., Anchorage, AK 99501.

Instructions: Comments will not be accepted by fax, email, or in any way other than those specified above. All submissions received must include the words "National Park Service" or "NPS" and must include the RIN 1024-AE63 for this rulemaking. Bulk comments in any format (hard copy or electronic) submitted on behalf of others

will not be accepted. Comments received may be posted without change to www.regulations.gov, including any personal information provided.

Docket: For access to the docket to read background documents or comments received, go to www.regulations.gov and search for "1024-AE63".

FOR FURTHER INFORMATION CONTACT:

Donald Striker, Acting Regional Director, Alaska Regional Office, 240 West 5th Ave., Anchorage, AK 99501. Phone (907) 644-3510. Email: AKR_Regulations@nps.gov.

SUPPLEMENTARY INFORMATION:

Background

Sturgeon v. Frost

In March 2019, the U.S. Supreme Court in *Sturgeon v. Frost* (139 S. Ct. 1066, March 26, 2019) unanimously determined the National Park Service's (NPS) ordinary regulatory authority over National Park System units in Alaska only applies to federally owned "public lands" (as defined in section 102 of the Alaska National Interest Lands Conservation Act, 16 U.S.C. 3102)—and not to State, Native, or private lands—irrespective of unit boundaries on a map. Lands not owned by the federal government, including submerged lands beneath navigable waters, are not deemed to be a part of the unit (slip op. 17). More specifically, the Court held that the NPS could not enforce a System-wide regulation prohibiting the operation of a hovercraft on part of the Nation River that flows through the Yukon-Charley Rivers National Preserve (Preserve). A brief summary of the factual background and Court opinion follow, as they are critical to understanding the purpose of this proposed rule.

The Preserve is a conservation system unit established by the 1980 Alaska National Interest Lands Conservation Act (ANILCA) and administered by the NPS as a unit of the National Park System. The State of Alaska owns the submerged lands underlying the Nation River, a navigable waterway. In late 2007, John Sturgeon was using his hovercraft on the portion of the Nation River that passes through the Preserve. NPS law enforcement officers encountered him and informed him such use was prohibited within the boundaries of the Preserve under 36 CFR 2.17(e), which states that "[t]he operation or use of a hovercraft is prohibited." According to NPS regulations at 36 CFR 1.2(a)(3), this rule applies to persons within "[w]aters subject to the jurisdiction of the United States located within the boundaries of

the National Park System, including navigable waters" without any regard to ownership of the submerged lands. See 54 U.S.C. 100751(b) (authorizing the Secretary of the Interior to regulate "boating and other activities on or relating to water located within System units").

Mr. Sturgeon disputed that NPS regulations could apply to his activities on the Nation River, arguing that the river is not public land and is therefore exempt from NPS rules pursuant to ANILCA section 103(c) (16 U.S.C. 3103(c)), which provides that only the public lands within the boundaries of a System unit are part of the unit, and that State-owned lands are exempt from NPS regulations, including the hovercraft rule. Mr. Sturgeon appealed his case through the federal court system.

In its March 2019 opinion, the Court agreed with Mr. Sturgeon. The questions before the Court were: (1) Whether the Nation River in the Preserve is public land for the purposes of ANILCA, making it indisputably subject to NPS regulation; and (2) if not, whether NPS has an alternative source of authority to regulate Mr. Sturgeon's activities on that portion of the Nation River. The Court answered "no" to both questions.

Resolution turned upon several definitions in ANILCA section 102 and the aforementioned section 103(c). Under ANILCA, 16 U.S.C. 3102, "land" means "lands, waters, and interests therein"; "Federal land" means "lands the title to which is in the United States"; and "public lands" are "Federal lands," subject to several statutory exclusions that were not at issue in the *Sturgeon* case. As such, the Court found "public lands" are "most but not quite all [lands, waters, and interests therein] that the Federal Government owns" (slip op. 10). The Court held that the Nation River did not meet the definition of "public land" because: (1) "running waters cannot be owned"; (2) "Alaska, not the United States, has title to the lands beneath the Nation River"; and, (3) federal reserved water rights ("not the type of property interests to which title can be held") do not "give the Government plenary authority over the waterway" (slip op. 12-14).

Regarding the second question, the Court found no alternative basis to support applying NPS regulations to Mr. Sturgeon's activities on the Nation River, concluding that, pursuant to ANILCA section 103(c), "only the federal property in system units is subject to the Service's authority" (slip op. 19). As stated by the Court, "non-federally owned waters and lands inside system units (on a map) are declared outside them (for the law). So those

areas are no longer subject to the Service's power over 'System units' and the 'water located within' them" (slip op. 18) (quoting 54 U.S.C. 100751(a), (b)).

There are four additional aspects of the *Sturgeon* opinion and ANILCA that inform this rulemaking. First, by incorporating the provisions of the Submerged Lands Act of 1953, the Alaska Statehood Act gave the State "title to and ownership of the lands beneath navigable waters" effective as of the date of Statehood. The Court recognized that a State's title to lands beneath navigable waters brings with it regulatory authority over public uses of those waters (slip op. 12–13). While the specific example cited by the Court involved the State of Alaska, the conclusion logically extends to any submerged lands owner. Thus, in cases where the United States holds title to submerged lands within the external boundaries of a System unit, the NPS maintains its ordinary regulatory authority over the waters.

Second, the Court noted but expressly declined to address Ninth Circuit precedent finding that "public lands" in ANILCA's subsistence fishing provisions include navigable waters with a reserved water right held by the federal government. The NPS participates in regulating subsistence fisheries as part of the Federal Subsistence Management Program, a joint effort between the Departments of the Interior and Agriculture implementing Title VIII of ANILCA. Applicable regulations can be found at 36 CFR part 242 and 50 CFR part 100 and are unaffected by the *Sturgeon* decision.

Third, the Court acknowledged that NPS maintains its authority to acquire lands, enter into cooperative agreements, and propose needed regulatory action to agencies with jurisdiction over non-federal lands (slip op. 20, 28). Cooperative agreements with the State, for example, could stipulate that certain NPS regulations would apply to activities on the waters and that NPS would have authority to enforce those regulations under the terms of the agreement.

Fourth, ANILCA section 906 (o)(2) contains an administrative exception relative to State and Native corporation land selections, which are excluded from the definition of "public land" in section 102. This exemption did not feature in the *Sturgeon* case and would not be affected by this rulemaking.

Proposed Rule

This rule would modify NPS regulations at 36 CFR parts 1 and 13 to

conform to the U.S. Supreme Court's decision in *Sturgeon*. In the interest of making the regulations unambiguous, and in response to a petition for rulemaking filed by the State of Alaska, the NPS is proposing a set of targeted amendments to ensure its regulations accurately reflect the outcome of the *Sturgeon* case and provide fair notice of where regulations in 36 CFR Chapter I apply and where they do not in System units in Alaska.

Regulations at 36 CFR 1.2 address the "Applicability and Scope" of regulations found in 36 CFR Chapter I, which "provide for the proper use, management, government, and protection of persons, property, and natural and cultural resources within areas under the jurisdiction of the National Park Service" (36 CFR 1.1(a)). Section 1.2(a) identifies where the regulations apply unless otherwise stated. In order to reflect the Court's holding in *Sturgeon*, the NPS proposes to amend 36 CFR 1.2(a)(3) to add the words "except in Alaska" before "without regard to the ownership of submerged lands, tidelands, or lowlands." This ensures that, consistent with the Court's holding, NPS regulations "will apply exclusively to public lands (meaning federally owned lands and waters) within system units" (slip op. 19).

The NPS proposes to add a new 36 CFR 1.2(f) to clarify that, under ANILCA, "[o]nly the 'public lands' (essentially, the federally owned lands) within unit boundaries in Alaska are 'deemed' a part of that unit," and non-public lands (including waters) "may not be regulated as part of the park" (slip op. 16–17). As stated by the Court, "[g]eographic inholdings thus become regulatory outholdings, impervious to the Service's ordinary authority" (slip op. 19). The proposed addition states that, except as otherwise provided, the boundaries of National Park System units in Alaska do not include non-federally owned lands, including submerged lands, irrespective of external unit boundaries. The definition of "boundary" in 36 CFR 1.4 has limited operation in Alaska, as NPS published legal descriptions for each unit boundary in 1992 and modifications must be consistent with ANILCA sections 103(b) and 1302(c) and (h).

NPS also proposes changes to its regulations at 36 CFR part 13, which "are prescribed for the proper use and management of park areas in Alaska" and as a "supplement" to general NPS regulations found elsewhere in Chapter I (36 CFR 13.2(a), (b)). In section 13.1, "park areas" is currently defined as "lands and waters administered by the

National Park Service within the State of Alaska." NPS proposes to modify this definition, and to add a definition of "federally owned lands" (incorporating and relocating the description at 36 CFR 13.2(f)), to reflect ANILCA's limitations on the lands and waters that are administered by the NPS in Alaska, as outlined in the *Sturgeon* decision. As stated above, this would not affect NPS administration under a valid cooperative agreement, which would be governed by the terms of the agreement.

The term "federally owned lands" is used instead of "public lands" to account for the authority granted by ANILCA section 906(o)(2) over validly selected lands, an exception to the definition of "public lands" in ANILCA (16 U.S.C. 3102(3)). As before, selected lands are not considered "federally owned lands" once they are subject to a tentative approval or an interim conveyance; title has been transferred although it is not recordable until the lands are surveyed.

Compliance With Other Laws, Executive Orders and Department Policy

Regulatory Planning and Review (Executive Orders 12866 and 13563)

Executive Order 12866 provides that the Office of Information and Regulatory Affairs (OIRA) in the Office of Management and Budget will review all significant rules. The OIRA has waived review of this proposed rule and, at the final rule stage, will make a separate decision as to whether the rule is a significant regulatory action as defined by Executive Order 12866.

Executive Order 13563 reaffirms the principles of E.O. 12866 while calling for improvements in the nation's regulatory system to promote predictability, to reduce uncertainty, and to use the best, most innovative, and least burdensome tools for achieving regulatory ends. The executive order directs agencies to consider regulatory approaches that reduce burdens and maintain flexibility and freedom of choice for the public where these approaches are relevant, feasible, and consistent with regulatory objectives. Executive Order 13563 emphasizes further that regulations must be based on the best available science and that the rulemaking process must allow for public participation and an open exchange of ideas. The NPS has developed this rule in a manner consistent with these requirements.

Reducing Regulation and Controlling Regulatory Costs (Executive Order 13771)

Enabling regulations are considered deregulatory under guidance implementing E.O. 13771 (M–17–21). This rule would clarify that activities on lands which are not federally owned, including submerged lands under navigable waters, are not subject to the NPS's ordinary regulatory authority.

Regulatory Flexibility Act

This rule will not have a significant economic effect on a substantial number of small entities under the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*). The proposed rule would modify NPS regulations at 36 CFR parts 1 and 13 to conform to the U.S. Supreme Court's decision in *Sturgeon*. These proposed changes are considered legal in nature with the intent to provide clarification to existing regulations pertinent to the U.S. Supreme Court's decision. The costs and benefits of a regulatory action are measured with respect to its existing baseline conditions. Since this regulatory action is legal in nature, changes are not anticipated compared to baseline conditions. In addition, this action will not impose restrictions on local businesses in the form of fees, training, record keeping, or other measures that would increase costs. Given those findings, this proposed regulatory action will not impose a significant economic impact on a substantial number of small entities.

Small Business Regulatory Enforcement Fairness Act

This rule is not a major rule under 5 U.S.C. 804(2). This rule:

- (a) Does not have an annual effect on the economy of \$100 million or more.
- (b) Will not cause a major increase in costs or prices for consumers, individual industries, Federal, State, or local government agencies, or geographic regions.
- (c) Does not have significant adverse effects on competition, employment, investment, productivity, innovation, or the ability of U.S.-based enterprises to compete with foreign-based enterprises.

Unfunded Mandates Reform Act

This rule does not impose an unfunded mandate on State, local, or Tribal governments or the private sector of more than \$100 million per year. The rule does not have a significant or unique effect on State, local, or Tribal governments or the private sector. It addresses public use of national park lands and imposes no requirements on other agencies or governments. A statement containing the information

required by the Unfunded Mandates Reform Act (2 U.S.C. 1531 *et seq.*) is not required.

Takings (Executive Order 12630)

This rule does not effect a taking of private property or otherwise have takings implications under Executive Order 12630. A takings implication assessment is not required.

Federalism (Executive Order 13132)

Under the criteria in section 1 of Executive Order 13132, the rule does not have sufficient federalism implications to warrant the preparation of a Federalism summary impact statement. This rule only affects public use of federally-administered lands. It has no outside effects on other areas. A Federalism summary impact statement is not required.

Civil Justice Reform (Executive Order 12988)

This rule complies with the requirements of Executive Order 12988. This rule:

- (a) Meets the criteria of section 3(a) requiring that all regulations be reviewed to eliminate errors and ambiguity and be written to minimize litigation; and
- (b) Meets the criteria of section 3(b)(2) requiring that all regulations be written in clear language and contain clear legal standards.

Tribal Consultation (Executive Order 13175 and Department Policy)

The Department of the Interior strives to strengthen its government-to-government relationship with Tribes and Alaska Native corporations through a commitment to consultation and recognition of their right to self-governance and tribal sovereignty. The NPS has evaluated this rule under the criteria in Executive Order 13175 and under the Department's Tribal consultation policy and has determined that consultation is not required because the rule will have no substantial direct effect on federally recognized Tribes or Alaska Native corporations.

Paperwork Reduction Act

This rule does not contain information collection requirements, and a submission to the Office of Management and Budget under the Paperwork Reduction Act is not required. The NPS may not conduct or sponsor and you are not required to respond to a collection of information unless it displays a currently valid OMB control number.

National Environmental Policy Act

This rule does not constitute a major Federal action significantly affecting the quality of the human environment. A detailed statement under the National Environmental Policy Act of 1969 (NEPA) is not required because the rule is covered by a categorical exclusion. The NPS has determined the rule is categorically excluded under 43 CFR 46.210(i) which applies to "policies, directives, regulations, and guidelines: that are of an administrative, financial, legal, technical, or procedural nature; or whose environmental effects are too broad, speculative, or conjectural to lend themselves to meaningful analysis and will later be subject to the NEPA process, either collectively or case-by-case." This rule is legal in nature. The *Sturgeon* decision has governed how the NPS administers lands and waters in Alaska since it was issued in March 2019. This rule would have no legal effect beyond what was announced by the Court. It would revise NPS regulations to be consistent with the decision and make no additional changes. The NPS has determined that the rule does not involve any of the extraordinary circumstances listed in 43 CFR 46.215 that would require further analysis under NEPA.

Effects on the Energy Supply (Executive Order 13211)

This rule is not a significant energy action under the definition in Executive Order 13211. A Statement of Energy Effects is not required.

List of Subjects

36 CFR Part 1

National parks, Penalties, Reporting and recordkeeping requirements, Signs and symbols.

36 CFR Part 13

Alaska, National Parks, Reporting and recordkeeping requirements.

In consideration of the foregoing, the National Park Service proposes to amend 36 CFR parts 1 and 13 as set forth below:

PART 1—GENERAL PROVISIONS

- 1. The authority citation for part 1 continues to read as follows:

Authority: 54 U.S.C. 100101, 100751, 320102.

- 2. Amend § 1.2 by revising paragraph (a)(3) and adding paragraph (f) to read as follows:

§ 1.2 Applicability and scope.

(a) * * *

(3) Waters subject to the jurisdiction of the United States located within the boundaries of the National Park System, including navigable waters and areas within their ordinary reach (up to the mean high water line in places subject to the ebb and flow of the tide and up to the ordinary high water mark in other places) and, except in Alaska, without regard to the ownership of submerged lands, tidelands, or lowlands;

* * * * *

(f) In Alaska, unless otherwise provided, the boundaries of the National Park System include only federally owned lands, as defined in 36 CFR. 13.1, regardless of external unit boundaries.

PART 13—NATIONAL PARK SYSTEM UNITS IN ALASKA

■ 3. The authority citation for part 13 continues to read as follows:

Authority: 16 U.S.C. 3124; 54 U.S.C. 100101, 100751, 320102; Sec. 13.1204 also issued under Sec. 1035, Pub. L. 104–333, 110 Stat. 4240.

■ 4. In § 13.1, add a definition for “Federally owned lands” in alphabetical order and revise the definition of “Park areas” to read as follows:

§ 13.1 Definitions.

* * * * *

Federally owned lands means lands, waters, and interests therein the title to which is in the United States, and does not include those land interests tentatively approved to the State of Alaska; or conveyed by an interim conveyance to a Native corporation.

* * * * *

Park areas means federally owned lands administered by the National Park Service in Alaska.

* * * * *

§ 13.2 [Amended]

■ 5. In § 13.2, remove paragraph (f).

George Wallace,

Assistant Secretary for Fish and Wildlife and Parks.

BILLING CODE 4312–52–P

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 52

[EPA–R02–OAR–2018–0647; FRL–10006–15–Region 2]

Approval of Air Quality Implementation Plans; New York; Infrastructure SIP Requirements for the 2012 PM_{2.5} NAAQS; Interstate Transport Provisions

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed rule.

SUMMARY: The Environmental Protection Agency (EPA) is proposing to approve elements of the New York State Implementation Plan (SIP) submittal regarding infrastructure requirements for interstate transport of pollution with respect to the 2012 annual fine particulate matter (PM_{2.5}) National Ambient Air Quality Standard (NAAQS) or standard.

DATES: Written comments must be received on or before June 1, 2020.

ADDRESSES: Submit your comments, identified by Docket ID Number EPA–R02–OAR–2018–0647 at <http://www.regulations.gov>. Follow the online instructions for submitting comments. Once submitted, comments cannot be edited or removed from *Regulations.gov*. The EPA may publish any comment received to its public docket. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be accompanied by a written comment. The written comment is considered the official comment and should include discussion of all points you wish to make. The EPA will generally not consider comments or comment contents located outside of the primary submission (*i.e.*, on the web, cloud, or other file sharing system). For additional submission methods, the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit <http://www2.epa.gov/dockets/commenting-epa-dockets>.

SUPPLEMENTARY INFORMATION:

I. Background

II. Summary of the SIP Revision and the EPA’s Analysis

III. The EPA’s Proposed Action

IV. Statutory and Executive Order Reviews

I. Background

A. General

The EPA is proposing to approve elements of the 2012 PM_{2.5} infrastructure SIP submission from the State of New York, received on November 30, 2016. Specifically, this rulemaking proposes to approve the portion of the submission addressing the interstate transport provisions for the 2012 PM_{2.5} NAAQS under Clean Air Act (CAA) section 110(a)(2)(D)(i)(I), otherwise known as the “good neighbor” provision.

On December 14, 2012 (78 FR 3086), the EPA promulgated a revised primary NAAQS for PM_{2.5} for the annual standard. The revised standard was set at the level of 12 micrograms per cubic meter (µg/m³) calculated as an annual average, which is averaged over a three-year period.

B. EPA’s Infrastructure Requirements

Whenever the EPA promulgates a new or revised NAAQS, CAA section 110(a)(1) requires states to make SIP submissions to provide for the implementation, maintenance, and enforcement of the NAAQS. This particular type of SIP submission is commonly referred to as an “infrastructure SIP.” These submissions must meet the various requirements of CAA section 110(a)(2), as applicable. Due to ambiguity in some of the language of CAA section 110(a)(2), the EPA believes that it is appropriate to interpret these provisions in the specific context of acting on infrastructure SIP submissions. The EPA has previously provided comprehensive guidance on the application of these provisions through a guidance document for infrastructure SIP submissions and through regional actions on infrastructure submissions.¹ Unless otherwise noted below, we are following that existing approach in acting on this submission. In addition, in the context of acting on such infrastructure

¹ The EPA explains and elaborates on these ambiguities and its approach to address them in its September 13, 2013 Infrastructure SIP Guidance (available at https://www3.epa.gov/airquality/urbanair/sipstatus/docs/Guidance_on_Infrastructure_SIP_Elements_Multipollutant_FINAL_Sept_2013.pdf), as well as in numerous agency actions, including the EPA’s prior action on New York’s infrastructure SIPs submitted on April 4, 2013 for 2008 Ozone, October 3, 2013 for 2010 SO₂, and November 30, 2016 for 2012 annual PM_{2.5} NAAQS that addressed the portion of the submissions not germane to transport (84 FR 54502, October 10, 2019).

submissions, the EPA evaluates the submitting state's SIP for facial compliance with statutory and regulatory requirements, not for the state's implementation of its SIP.² The EPA has other authority to address any issues concerning a state's implementation of the rules, regulations, consent orders, etc. that comprise its SIP.

C. Interstate Pollution Transport Requirements

Section 110(a)(2)(D)(i)(I) of the CAA requires a state's SIP to include adequate provisions prohibiting any emissions activity in one state that contributes significantly to nonattainment, or interferes with maintenance, of the NAAQS in any downwind state. The EPA sometimes refers to these requirements as prong 1 (significant contribution to nonattainment) and prong 2 (interference with maintenance) or jointly as the "good neighbor" provision of the CAA. On March 17, 2016, the EPA issued a memorandum providing information on the development and review of SIPs that address CAA section 110(a)(2)(D)(i)(I) for the 2012 PM_{2.5} NAAQS (2016 guidance memorandum).³

II. Summary of the SIP Revision and the EPA's Analysis

On November 30, 2016, New York submitted a revision to its SIP to satisfy the infrastructure requirements of section 110(a)(2) of the CAA for the 2012 PM_{2.5} annual standard, including the interstate transport requirements of section 110(a)(2)(D)(i)(I).

This proposed rulemaking action addresses the portion of New York's infrastructure submittal for the 2012 PM_{2.5} annual NAAQS that pertains to interstate transport, CAA section 110(a)(2)(D)(i)(I) (referred to as prongs 1 and 2). On October 10, 2019 (84 FR 54502) the EPA acted on all other applicable elements of section 110(a)(2) for the 2012 PM_{2.5} NAAQS, including 110(a)(2)(D)(i)(II) (prong 3), which relates to the prevention of significant deterioration (PSD), and 110(a)(2)(D)(i)(II) (prong 4), which relates to visibility.

The portion of New York's November 30, 2016 SIP submittal addressing the "good neighbor" provision indicates that New York considers CAA 110(a)(2)(D)(i)(I) to be adequately addressed based on the State's contribution analysis to determine whether emissions from New York State contribute significantly to nonattainment or interference with maintenance in another state.

In their analysis, New York considered the areas that were designated⁴ as nonattainment for the 2012 PM_{2.5} NAAQS (*i.e.*, California, Idaho, Ohio, and Pennsylvania), and the violating air monitors (*i.e.*, in Cuyahoga County, Ohio and Allegheny County, Pennsylvania) located in states that New York was linked to as contributing by the 2012 EPA modeling performed for the Cross-State Air Pollution Rule (CSAPR).⁵ New York performed air modeling (*i.e.*, Community Multiscale Air Quality (CMAQ) modeling) to determine projected annual PM_{2.5} Design Values (DVs) for year 2018, which included the violating monitors in both Cuyahoga County, Ohio and Allegheny County, Pennsylvania. Based on New York's modeling, which did not show violations of the NAAQS at either location in 2018, New York concluded that the "good neighbor" provision of the CAA was adequately addressed. The EPA notes that New York provided the results of its CMAQ modeling but did not include information necessary for the EPA to fully evaluate New York's modeling, including emissions and meteorological data used, and other relevant information to determine the adequacy of New York's modeling analysis.

Since November 30, 2016, the date of New York's SIP submission, actual 2018 annual PM_{2.5} DVs show that there are no longer violating monitors in Cuyahoga County, Ohio, but that monitors in Allegheny County, Pennsylvania continue to show violations.

In the submission, New York noted that in both the State of Pennsylvania's recommendation to the EPA for the 2012 PM_{2.5} NAAQS, and the EPA's

Technical Support Document (TSD)⁶ for the 2012 PM_{2.5} NAAQS designations, PM_{2.5} exceedances in Allegheny County were identified as a local issue and were not linked to out of state emissions from New York. The EPA specifically limited the nonattainment area to Allegheny County only, even though an adjacent county (Cambria County) also contained a violating monitor at the time of the designation.

New York's submittal also described existing SIP-approved measures that apply to PM_{2.5} sources located within New York State.

Based on our analysis, the EPA agrees with New York's general conclusion that the existing New York SIP is adequate to prevent sources located in New York State from significantly contributing to nonattainment or interfering with maintenance in another state with respect to the 2012 annual PM_{2.5} NAAQS. As discussed in more detail in the TSD for this rulemaking action, the EPA identified potential downwind nonattainment and maintenance receptors, and then evaluated them to determine if New York's emissions could potentially contribute to nonattainment and maintenance problems in 2021, the attainment year for moderate PM_{2.5} nonattainment areas. Specifically, the EPA analysis identified the following areas as potential nonattainment and maintenance areas: (i) 17 potential receptors in California; (ii) one potential receptor in Shoshone County, Idaho, and (iii) one potential receptor in Allegheny County, Pennsylvania. For the potential receptors in California and Idaho, based on the EPA's evaluation of the distance between New York and the potential receptors, as well as wind direction, and other supporting information, the EPA proposes to conclude that New York's emissions do not significantly impact the potential receptors in California or Idaho. For the potential receptor in Allegheny County, Pennsylvania, as discussed in greater detail in the TSD for this action, the EPA expects the air quality to improve to the point where the monitor will not be a nonattainment or maintenance receptor by 2021 and is therefore unlikely to be a receptor for purposes of interstate transport.

Based on our analysis, the EPA agrees with New York's conclusion that the existing New York SIP is adequate to prevent sources in New York from significantly contributing to nonattainment or interfering with

³ "Information on the Interstate Transport 'Good Neighbor' Provision for the 2012 Fine Particulate Matter National Ambient Air Quality Standards under Clean Air Act section 110(a)(2)(D)(i)(I)" (March 17, 2016). The document is available at https://www.epa.gov/sites/production/files/2016-08/documents/good-neighbor-memo_implementation.pdf. A copy is included in the docket for this rulemaking.

⁴ Air Quality Designations for the 2012 Primary Annual Fine Particle (PM_{2.5}) National Ambient Air Quality Standards (NAAQS) was published in the *Federal Register* at 80 FR 2206 (January 15, 2015). Additional Air Quality Designations and Technical Amendment to Correct Errors in Air Quality Designations was published at 80 FR 18535 (April 7, 2015).

⁵ Final June Revisions Rule Significant Contribution Assessment TSD, Docket ID No. EPA-HQ-OAR-2009-0491, June 2012. The document is available at <https://www.epa.gov/sites/production/files/2017-06/documents/epa-hq-oar-2009-0491-4990.pdf>

⁶ New York included EPA's TSD for the 2012 PM_{2.5} NAAQS designations in Appendix B of the November 30, 2016 SIP submittal.

maintenance in another state with respect to the 2012 annual PM_{2.5} NAAQS. The EPA believes there is sufficient information to conclude that New York's SIP contains adequate provisions without further consideration of New York's modeling that was provided in their November 30, 2016 submittal.

A detailed summary of the EPA's review and rationale for the proposed approval of this SIP revision as meeting CAA section 110(a)(2)(D)(i)(I) for the 2012 annual PM_{2.5} NAAQS may be found in the TSD.

III. The EPA's Proposed Action

The EPA is proposing to approve the portions of New York's November 30, 2016 SIP submittal addressing interstate transport for the 2012 annual PM_{2.5} NAAQS as meeting the requirements in section 110(a)(2)(D)(i)(I) of the CAA. The EPA is soliciting public comments on the issues discussed in this document. These comments will be considered before taking final action.

IV. Statutory and Executive Order Reviews

Under the CAA, the Administrator is required to approve a SIP submission that complies with the provisions of the CAA and applicable federal regulations. 42 U.S.C. 7410(k); 40 CFR 52.02(a). Thus, in reviewing SIP submissions, the EPA's role is to approve state choices, provided that they meet the criteria of the CAA. Accordingly, this action merely approves state law as meeting federal requirements and does not impose additional requirements beyond those imposed by state law. For that reason, this proposed action:

- Is not a "significant regulatory action" subject to review by the Office of Management and Budget under Executive Orders 12866 (58 FR 51735, October 4, 1993) and 13563 (76 FR 3821, January 21, 2011);
- Is not an Executive Order 13771 (82 FR 9339, February 2, 2017) regulatory action because SIP approvals are exempted under Executive Order 12866.
- Does not impose an information collection burden under the provisions of the Paperwork Reduction Act (44 U.S.C. 3501 *et seq.*);
- Is certified as not having a significant economic impact on a substantial number of small entities under the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*);
- Does not contain any unfunded mandate or significantly or uniquely affect small governments, as described in the Unfunded Mandates Reform Act of 1995 (Public Law 104-4);

- Does not have federalism implications as specified in Executive Order 13132 (64 FR 43255, August 10, 1999);

- Is not an economically significant regulatory action based on health or safety risks subject to Executive Order 13045 (62 FR 19885, April 23, 1997);

- Is not a significant regulatory action subject to Executive Order 13211 (66 FR 28355, May 22, 2001);

- Is not subject to requirements of section 12(d) of the National Technology Transfer and Advancement Act of 1995 (15 U.S.C. 272 note) because this action does not involve technical standards; and

- Does not provide EPA with the discretionary authority to address, as appropriate, disproportionate human health or environmental effects, using practicable and legally permissible methods, under Executive Order 12898 (59 FR 7629, February 16, 1994).

In addition, this proposed rule, addressing New York's interstate transport requirements for the 2012 annual PM_{2.5} NAAQS is not approved to apply on any Indian reservation land or in any other area where EPA or an Indian tribe has demonstrated that a tribe has jurisdiction. In those areas of Indian country, the rule does not have tribal implications and will not impose substantial direct costs on tribal governments or preempt tribal law as specified by Executive Order 13175 (65 FR 67249, November 9, 2000).

RIN 2040-AF93

Announcement of Preliminary Regulatory Determinations for Contaminants on the Fourth Drinking Water Contaminant Candidate List; Extension of Comment Period

AGENCY: Environmental Protection Agency (EPA).

ACTION: Request for public comment; extension of comment period.

SUMMARY: The U.S. Environmental Protection Agency (EPA) is extending the comment period for the document issued in the **Federal Register** on March 10, 2020, titled "Announcement of Preliminary Regulatory Determinations for Contaminants on the Fourth Drinking Water Contaminant Candidate List." In response to stakeholder requests, the EPA is extending the comment period an additional 30 days from May 11, 2020 to June 10, 2020. Please note changes for public visitors to the EPA Docket Center and Reading Room in the **SUPPLEMENTARY INFORMATION** section of this document.

DATES: Comments for the proposed rule published on March 10, 2020 (85 FR 14098) must be received on or before June 10, 2020.

ADDRESSES: You may send comments, identified by Docket ID No. EPA-HQ-OW-2019-0583, by any of the following methods:

- **Federal eRulemaking Portal:** <https://www.regulations.gov/> (the EPA's preferred method). Follow the online instructions for submitting comments.

Instructions: All submissions received must include the Docket ID No. EPA-HQ-OW-2019-0583. Comments received may be posted without change to <https://www.regulations.gov/>, including any personal information provided. For detailed instructions on sending comments, see the Public Participation under the **SUPPLEMENTARY INFORMATION** section of this document. Out of an abundance of caution for members of the public and our staff, the EPA Docket Center and Reading Room was closed to public visitors on March 31, 2020, to reduce the risk of transmitting COVID-19. Our Docket Center staff will continue to provide remote customer service via email, phone, and webform. We encourage the public to submit comments via <https://www.regulations.gov/> or email, as there

is a temporary suspension of mail delivery to the EPA, and no hand deliveries are currently accepted. For further information on the EPA Docket Center services and the current status, please visit us online at <https://www.epa.gov/dockets>.

FOR FURTHER INFORMATION CONTACT:

Richard Weisman, Standards and Risk Management Division, Office of Ground Water and Drinking Water, MC: 4607M, Environmental Protection Agency, 1200 Pennsylvania Avenue NW, Washington, DC 20460; telephone number: (202) 564-2822; email address: weisman.richard@epa.gov.

SUPPLEMENTARY INFORMATION:

I. Public Participation

Submit your comments, identified by Docket ID No. EPA-HQ-OW-2019-0583 via the <https://www.regulations.gov> (the EPA's preferred method) or any other method listed in the **ADDRESSES** section of this document. Follow the online instructions for submitting comments. Once submitted, comments cannot be edited or withdrawn. The EPA may publish any comment received to its public docket. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be accompanied by a written comment. The written comment is considered the official comment and should include discussion of all points you wish to make. The EPA will generally not consider comments or comment contents located outside of the primary submission (*i.e.*, on the web, cloud, or other file sharing system). For additional submission methods, the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit

<https://www.epa.gov/dockets/commenting-epa-dockets>.

II. General Information

On March 10, 2020, the EPA published in the **Federal Register** (85 FR 14098) a request for public comment for the "Announcement of Preliminary Regulatory Determinations for Contaminants on the Fourth Drinking Water Contaminant Candidate List." The proposed preliminary determinations and request for comment, as initially published in the **Federal Register**, provided for written comments to be submitted to the EPA on or before May 11, 2020 (a 60-day public comment period). Since publication, the EPA has received requests for additional time to submit comments. The EPA is extending the comment period for 30 days until June 10, 2020. The EPA will consider public comments in the development of final regulatory determinations for contaminants on the Fourth Drinking Water Contaminant Candidate List. The Preliminary Regulatory Determinations and supporting documents are available at <https://www.regulations.gov> (Docket ID No. EPA-HQ-OW-2019-0583).

David P. Ross,

Vol. 85, No. 84

Thursday, April 30, 2020

This section of the FEDERAL REGISTER contains documents other than rules or proposed rules that are applicable to the public. Notices of hearings and investigations, committee meetings, agency decisions and rulings, delegations of authority, filing of petitions and applications and agency statements of organization and functions are examples of documents appearing in this section.

DEPARTMENT OF AGRICULTURE

Submission for OMB Review; Comment Request

April 27, 2020.

The Department of Agriculture has submitted the following information collection requirement(s) to OMB for review and clearance under the Paperwork Reduction Act of 1995, Public Law 104–13. Comments are requested regarding; whether the collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility; the accuracy of the agency's estimate of burden including the validity of the methodology and assumptions used; ways to enhance the quality, utility and clarity of the information to be collected; and ways to minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology.

Comments regarding this information collection received by June 1, 2020 will be considered. Written comments and recommendations for the proposed information collection should be submitted within 30 days of the publication of this notice on the following website www.reginfo.gov/public/do/PRAMain. Find this particular information collection by selecting "Currently under 30-day Review—Open for Public Comments" or by using the search function.

An agency may not conduct or sponsor a collection of information unless the collection of information displays a currently valid OMB control number and the agency informs potential persons who are to respond to the collection of information that such persons are not required to respond to the collection of information unless it

displays a currently valid OMB control number.

Foreign Agricultural Service

Title: Certificate for Quota Eligibility (CQE)

OMB Control Number: 0551–0014.

Summary of Collection: Imports of raw cane sugar are subject to a tariff-rate import quota (TRQ) that is allocated on a country-by-country basis to foreign countries or areas. A U.S. certificate for quota eligibility (CQE) issued by USDA and authenticated by a certifying authority in the foreign country permits entry of raw cane sugar under the TRQ. U.S. Note 5 (a)(i) of the Harmonized Tariff Schedule of the United States requires the Secretary to establish a TRQ for raw-cane sugar (entered under HTS 1701.12.10 and 1701.14.10) during each fiscal year with a minimum TRQ amount of 1,117,195 metric tons, raw value. In addition 5 (b)(1) authorizes the U.S. Trade Representative to allocate the raw-cane sugar tariff-rate quota among supplying countries. CQEs are issued to the 40 countries that receive TRQ allocations to export sugar to the United States. The CQE is completed by the certifying authority in the foreign country that certifies that the sugar being exported to the United States was produced in the foreign country that has the TRQ allocation. The Foreign Agriculture Service (FAS) will collect information using form FAS–961.

Need and Use of the Information: FAS will collect the following information: (1) Country of origin or area of the eligible raw cane sugar; (2) quota period; (3) quantity of raw cane sugar to be exported; (4) details of the shipment (shipper, vessel, port of loading); and (5) additional details if available at the time of shipment (consignee, address of consignee, expected date of departure, expected date of arrival in the U.S., expected port of arrival). The information will help determine if the quantity to be imported is eligible to be entered under the TRQ. Without the CQEs, USDA/FAS and CBP could not administer the raw cane sugar TRQs authorized under U.S. law.

Description of Respondents: Business or other for-profit.

Number of Respondents: 30.

Frequency of Responses: Reporting: Annually.

Total Burden Hours: 619.

Ruth Brown,

Departmental Information Collection Clearance Officer.

Food and Nutrition Service

Title: Modernizing Channels of Communication with SNAP Participants.

OMB Control Number: 0584-NEW.

Summary of Collection: Section 17 [7 U.S.C. 2026] (a)(1) of the Food and Nutrition Act of 2008, as amended, provides general legislative authority for the planned data collection. It authorizes the Secretary of Agriculture to enter into contracts with private institutions to undertake research that will help improve the administration and effectiveness of Supplemental Nutrition Assistance Program (SNAP) agencies in delivering nutrition-related benefits.

The primary purpose of the study is to highlight best practices and lessons learned from various mobile communication strategies (MCS) implemented by State SNAP agencies. This examination will help FNS and States improve communication and identify best practices that lead to improved program outcomes.

Need and Use of the Information: Food and Nutrition Service (FNS) needs this study to determine best practices and lessons learned from various mobile communication strategies MCS tested and implemented by State SNAP agencies. This information will be used to help FNS and States improve communication and identify best practices that lead to improved program outcomes. This data will provide information on States' and program recipients' use of MCS and client satisfaction with and perspectives of MCS.

Description of Respondents: 336 Individuals or households; 30 Business-for-or-not for-profit organizations; 67 State, Local or Tribal Government.

COMMISSION ON CIVIL RIGHTS**Notice of Public Meeting of the Texas Advisory Committee**

AGENCY: U.S. Commission on Civil Rights

ACTION: Announcement of meeting.

SUMMARY: Notice is hereby given, pursuant to the provisions of the rules

and regulations of the U.S. Commission on Civil Rights (Commission) and the Federal Advisory Committee Act (FACA) that a teleconference meeting of the Texas Advisory Committee (Committee) to the Commission will be held at 2:00 p.m. (Central) Tuesday, May 19, 2020. The purpose of the meeting is for the Committee to discuss potential project prompts.

DATES: The meeting will be held on Tuesday, May 19, 2020 at 2:00 p.m. CDT.

Public Call Information:

Dial: 800-367-2403.

Conference ID: 2991884.

FOR FURTHER INFORMATION CONTACT:

Brooke Peery, Designated Federal Officer (DFO) at bpeery@usccr.gov or (202) 701-1376.

SUPPLEMENTARY INFORMATION: This meeting is available to the public through the following toll-free call-in number: 800-367-2403, conference ID number: 2991884. Any interested member of the public may call this number and listen to the meeting. Callers can expect to incur charges for calls they initiate over wireless lines, and the Commission will not refund any incurred charges. Callers will incur no charge for calls they initiate over land-line connections to the toll-free telephone number. Persons with hearing impairments may also follow the proceedings by first calling the Federal Relay Service at 1-800-877-8339 and providing the Service with the conference call number and conference ID number.

Members of the public are entitled to make comments during the open period at the end of the meeting. Members of the public may also submit written comments; the comments must be received in the Regional Programs Unit within 30 days following the meeting. Written comments may be mailed to the Western Regional Office, U.S. Commission on Civil Rights, 300 North Los Angeles Street, Suite 2010, Los Angeles, CA 90012 or emailed to Brooke Peery (DFO) at bpeery@usccr.gov.

Records and documents discussed during the meeting will be available for public viewing prior to and after the meeting at https://www.facadatabase.gov/FACA/FACA_PublicViewCommitteeDetails?id=a10t0000001gzkoAAA.

Please click on the "Meeting Details" and "Documents" links. Records generated from this meeting may also be inspected and reproduced at the Regional Programs Unit, as they become available, both before and after the meeting. Persons interested in the work of this Committee are directed to the

Commission's website, <https://www.usccr.gov>, or may contact the Regional Programs Unit at the above email or street address.

BILLING CODE P

COMMISSION ON CIVIL RIGHTS**Agenda and Notice of Public Meeting of the Indiana Advisory Committee**

AGENCY: Commission on Civil Rights.

ACTION: Announcement of meeting.

SUMMARY: Notice is hereby given, pursuant to the provisions of the rules and regulations of the U.S. Commission on Civil Rights (Commission), and the Federal Advisory Committee Act (FACA), that a planning meeting of the Indiana State Advisory Committee to the Commission will convene by conference call, on Thursday, May 28, 2020 at 2:00 p.m. (EST). The purpose is to continue project planning on lead poisoning and hear from interested parties.

DATES: Thursday, May 28, 2020 at 2:00 p.m. (EST).

Call-In Information: 1-206-800-4892 and conference call ID: 677467701#.

FOR FURTHER INFORMATION CONTACT:

Mallory Trachtenberg at mtrachtenberg@usccr.gov or by phone at (312) 353-8311.

SUPPLEMENTARY INFORMATION: This meeting is available to the public through the telephone number and conference ID listed above. Callers can expect to incur charges for calls they initiate over wireless lines, and the Commission will not refund any incurred charges. Persons with hearing impairments may also follow the proceedings by first calling the Federal Relay Service at 1-800-877-8339 and providing the Service with the conference call-in numbers: 1-206-800-4892 and conference call ID: 677467701#.

Members of the public are entitled to make comments during the open period at the end of the meeting. Members of the public may also submit written comments; the comments must be received in the Regional Programs Unit within 30 days following the respective

meeting. Written comments may be emailed to Mallory Trachtenberg at mtrachtenberg@usccr.gov. Persons who desire additional information may contact the Regional Programs Unit at (312) 353-8311. Records and documents discussed during the meeting will be available for public viewing as they become available at <https://www.facadatabase.gov/FACA/apex/FACAPublicCommittee?id=a10t0000001gzlgAAA>; click the "Meeting Details" and "Documents" links. Records generated from this meeting may also be inspected and reproduced at the Midwestern Regional Office, as they become available, both before and after the meetings. Persons interested in the work of this advisory committee are advised to go to the Commission's website, www.usccr.gov, or to contact the Midwestern Regional Office at the above phone number or email.

Agenda

- I. Roll Call
- II. Approval of Minutes
- III. Announcements and Updates
- IV. Discussion Civil Rights Project: Lead Poisoning and Environmental Justice
- V. Public Comment
- VI. Adjournment

Dated: April 24, 2020.

David Mussatt,

Supervisory Chief, Regional Programs Unit.

BILLING CODE P

DEPARTMENT OF COMMERCE

Bureau of the Census

National Advisory Committee on Racial, Ethnic and Other Populations

AGENCY: Bureau of the Census, Department of Commerce.

ACTION: Notice of renewal of the National Advisory Committee on Racial, Ethnic and Other Populations.

SUMMARY: The Secretary of the Department of Commerce renewed and filed the charter for the National Advisory Committee on Racial, Ethnic and Other Populations (NAC). The purpose of the NAC is to provide advice to the Director of the Bureau of the Census (Census Bureau) on the full range of economic, housing, demographic, socioeconomic, linguistic, technological, methodological, geographic, behavioral and operational variables affecting the cost, accuracy and implementation of Census Bureau programs and surveys, including the decennial census. The Secretary has

determined that the work of the NAC is in the public interest and relevant to the duties of the Census Bureau. Additional information concerning the NAC can be found by visiting the NAC's website at: <https://www.census.gov/about/cac/nac.html>.

FOR FURTHER INFORMATION CONTACT:

Kimberly L. Leonard, External Stakeholder Program Manager, Office of Program, Performance and Stakeholder Integration (PPSI), Room 2K137, U.S. Census Bureau, 4600 Silver Hill Road, Washington, DC 20233, by telephone at 301-763-7281 or by email at Kimberly.L.Leonard@census.gov. Individuals who use telecommunication devices for the deaf (TDD) may call the Federal Information Relay Service (FIRS) at 1-800-877-8339 between 8:00 a.m. and 8:00 p.m., Eastern Standard Time, Monday through Friday.

SUPPLEMENTARY INFORMATION:

Background

In accordance with the Federal Advisory Committee Act (FACA), the Secretary of the Department of Commerce renewed and filed the charter for the NAC. The NAC will operate under the provisions of FACA and will report to the Secretary of the Department of Commerce through the Director of the Census Bureau. The NAC will advise the Director of Census Bureau on the full range of Census Bureau programs and activities.

Objectives and Duties

1. The NAC addresses economic, housing, demographic, socioeconomic, linguistic, technological, methodological, geographic, behavioral, and operational variables affecting the cost, accuracy, and implementation of Census Bureau programs and surveys, including the decennial census.

2. The NAC will provide feedback on the identification of new strategies for improved census operations, and survey and data collection methods, including identifying cost efficient ways to increase response rates.

3. The NAC provides guidance on census policies, research and methodology, tests, operations, communications/messaging, and other activities to ascertain needs and best practices to improve censuses, surveys, operations, and programs.

4. The NAC reviews and provides formal recommendations and feedback on working papers, reports, and other documents related to the design and implementation of Census Bureau programs and surveys.

5. In providing insight, perspectives, and expertise on the full spectrum of

Census Bureau surveys and programs, the NAC examines such areas as hidden households, language barriers, students and youth, aging populations, American Indian and Alaska Native tribal considerations, new immigrant populations, populations affected by natural disasters, highly mobile and migrant populations, complex households, poverty, race/ethnic distribution, privacy and confidentiality, rural populations and businesses, individuals and households with limited access to information and communications technologies, the dynamic nature of new businesses, minority ownership of businesses, as well as other concerns impacting Census Bureau survey design and implementation.

6. The NAC uses formal advisory committee meetings, webinars, web conferences, working groups, and other methods to accomplish its goals, consistent with the requirements of the FACA. The NAC will consult with regional office staff to help identify regional, local, tribal and grass roots issues, trends and perspectives related to Census Bureau surveys and programs.

7. The NAC functions solely as an advisory body under the FACA.

Membership

1. The NAC consists of up to 32 members who serve at the discretion of the Director. The Census Bureau is seeking eight qualified candidates to be considered for appointment.

2. The NAC aims to have a balanced representation among its members, considering such factors as geography, age, sex, race, ethnicity, technical expertise, community involvement, and knowledge of census programs and/or activities.

3. The NAC aims to include members from diverse backgrounds, including state, local and tribal governments; academia; research, national and community-based organizations; and, the private sector.

4. Members will be selected from the public and private sectors. Members may serve as Special Government Employees (SGEs) or representatives who are selected to represent specific organizations.

5. SGEs and representatives will be selected based on their expertise in or representation of specific areas to include: Diverse populations (including race and ethnic populations); national, state, local, and tribal interest organizations serving hard-to-count populations; researchers; community-based organizations; academia; business interests; marketing and media professionals; researchers; and,

members of professional associations. Members will be individually advised of the capacity in which they will serve through their appointment letters.

6. Membership is open to persons who are not seated on other Census Bureau stakeholder entities (*i.e.*, State Data Centers, Census Information Centers, Federal State Cooperative on Populations Estimates Program, other Census Advisory Committees, etc.). People who have already served one full-term on a Census Bureau Advisory Committee may not serve on any other Census Bureau Advisory Committee for three years from the termination of previous service. No employee of the federal government can serve as a member of the NAC.

7. Members will serve for a three-year term. All members will be reevaluated at the conclusion of each term with the prospect of renewal, pending NAC needs. Active attendance and participation in meetings and activities (*e.g.*, conference calls and assignments) will be factors considered when determining term renewal or membership continuance. Members may be appointed for a second three-year term at the discretion of the Director.

8. Members will be selected on a standardized basis, in accordance with applicable Department of Commerce guidance.

Miscellaneous

1. Members of the NAC serve without compensation, but receive reimbursement for NAC-related travel and lodging expenses.

2. The NAC meets once or twice a year, budget permitting, but additional meetings may be held as deemed necessary by the Director or Designated Federal Officer. NAC meetings are open to the public in accordance with the FACA.

3. Members must be able to actively participate in the tasks of the NAC, including, but not limited to, regular meeting attendance, NAC meeting discussant responsibilities, review of materials, as well as participation in conference calls, webinars, working groups, and/or special committee activities.

4. The Department of Commerce is committed to equal opportunity in the workplace and seeks diverse NAC membership.

Steven D. Dillingham, Director, Bureau of the Census has approved the

publication of this notice in the **Federal Register**.

Sheleen Dumas,

Department PRA Clearance Officer, Office of the Chief Information Officer, Commerce Department.

DEPARTMENT OF COMMERCE

International Trade Administration

[A–201–845, C–201–846]

Sugar From Mexico: Continuation of Suspension of Antidumping and Countervailing Duty Investigations

AGENCY: Enforcement and Compliance, International Trade Administration, Department of Commerce.

SUMMARY: As a result of determinations by the Department of Commerce (Commerce) that termination of the Agreements Suspending the Antidumping (AD) and Countervailing (CVD) Duty Investigations on Sugar from Mexico, as amended (the Agreements), and the suspended AD and CVD investigations on sugar from Mexico would likely lead to a continuation or recurrence of dumping and countervailable subsidies, and by the International Trade Commission (ITC) that termination of the suspended AD and CVD investigations would likely lead to material injury to an industry in the United States, Commerce is publishing this notice of continuation of the AD and CVD Agreements on sugar from Mexico.

DATES: Applicable April 30, 2020.

FOR FURTHER INFORMATION CONTACT: Sally C. Gannon or David Cordell, Bilateral Agreements Unit, Enforcement and Compliance, International Trade Administration, U.S. Department of Commerce, 1401 Constitution Avenue NW, Washington, DC 20230; telephone: (202) 482–0162 or (202) 482–0408, respectively.

SUPPLEMENTARY INFORMATION:

Background

On December 3, 2019, Commerce published the initiation of the first sunset reviews of the AD and CVD Agreements, pursuant to section 751(c) of the Tariff Act of 1930, as amended (the Act).¹ On December 18, 2019, we received notices of intent to participate in the sunset reviews from the following

parties (both of which are domestic interested parties) within the deadline specified in 19 CFR 351.218(d)(1)(i): Imperial Sugar Company (Imperial Sugar) and the American Sugar Coalition (ASC).²

On January 2, 2020, Commerce received complete substantive responses from the domestic interested parties within the 30-day deadline specified in 19 CFR 351.218(d)(3)(i).³ Commerce received no substantive responses from respondent interested parties. Pursuant to section 751(c)(3)(B) of the Act and 19 CFR 351.218(e)(1)(ii)(C)(2), Commerce conducted expedited sunset reviews of the AD and CVD Agreements.

As a result of its reviews, pursuant to sections 751(c) and 752(b) and (c) of the Act, Commerce determined that termination of the AD and CVD Agreements and suspended AD and CVD investigations on sugar from Mexico would likely lead to a continuation or recurrence of dumping and countervailable subsidies. Therefore, Commerce notified the ITC of the magnitude of the margin likely to prevail and the net countervailable subsidy rates likely to prevail should the AD and CVD Agreements be terminated, in accordance with sections 752(b)(3) and (c)(3) of the Act.⁴

On April 24, 2020, pursuant to section 751(c) of the Act, the ITC published its determination that termination of the suspended AD and CVD duty investigations on sugar from Mexico would be likely to lead to continuation or recurrence of material injury to an industry in the United States within a reasonably foreseeable time pursuant to sections 751(c) and 752(a) of the Act.⁵

⁵ See *Sugar from Mexico; Determination, Investigation No. 701–TA–513 and 731–TA–1249 (Review)*, 85 FR 23063 (April 4, 2020); see also ITC Publication, *Sugar from Mexico (701–TA–513 and 731–TA–1249 (Review))*, USITC Publication 5045 (April 2020).

¹ See *Initiation of Five-Year (Sunset) Reviews*, 84 FR 58687 (November 1, 2019); *Initiation of Five-Year (Sunset) Review; Correction*, 84 FR 66153 (December 3, 2019).

Scope of the Agreements

The merchandise subject to the AD and CVD Agreements is raw and refined sugar of all polarimeter readings derived from sugar cane or sugar beets. The chemical sucrose gives sugar its essential character. Sucrose is a nonreducing disaccharide composed of glucose and fructose linked by a glycosidic bond via their anomeric carbons. The molecular formula for sucrose is C₁₂H₂₂O₁₁; the International Union of Pure and Applied Chemistry (IUPAC) International Chemical Identifier (InChI) for sucrose is 1S/C₁₂H₂₂O₁₁/c13-1-4-6(16)8(18)9(19)11(21-4)23-12(3-15)10(20)7(17) 5(2-14)22-12/h4-11,13-20H,1-3H2/t4-,5-,6-,7-,8+,9-,10+,11-,12+/m1/s1; the InChI Key for sucrose is CZMRCDWAGMRECN-UGDNZRGBSA-N; the U.S. National Institutes of Health PubChem Compound Identifier (CID) for sucrose is 5988; and the Chemical Abstracts Service (CAS) Number of sucrose is 57-50-1.

Sugar includes products of all polarimeter readings described in various forms, such as raw sugar, estandar or standard sugar, high polarity or semi-refined sugar, special white sugar, refined sugar, brown sugar, edible molasses, de-sugaring molasses, organic raw sugar, and organic refined sugar. Other sugar products, such as powdered sugar, colored sugar, flavored sugar, and liquids and syrups that contain 95 percent or more sugar by dry weight are also within the scope of these AD and CVD Agreements. Merchandise covered by these AD and CVD Agreements is typically imported under the following headings of the HTSUS: 1701.12.1000, 1701.12.5000, 1701.13.1000, 1701.13.5000, 1701.14.1000, 1701.14.5000, 1701.91.1000, 1701.91.3000, 1701.99.1010, 1701.99.1025, 1701.99.1050, 1701.99.5010, 1701.99.5025, 1701.99.5050, and 1702.90.4000.

The scope of the AD and CVD Agreements excludes sugar imported under the Refined Sugar Re-Export Programs of the U.S. Department of Agriculture, sugar products produced in Mexico that contain 95 percent or more sugar by dry weight that originated outside of Mexico, inedible molasses (other than inedible desugaring molasses noted above), beverages, candy, certain specialty sugars, and processed food products that contain sugar (e.g., cereals). Specialty sugars excluded from the scope of these AD and CVD Agreements are limited to the following: Caramelized slab sugar candy, pearl sugar, rock candy, dragees

for cooking and baking, fondant, golden syrup, and sugar decorations.⁶

Continuation of Suspension of Investigations

As a result of the determinations by Commerce and the ITC that termination of the AD and CVD Agreements and suspended AD and CVD investigations would likely lead to continuation or recurrence of dumping, countervailable subsidies, and material injury to an industry in the United States, pursuant to section 751(d)(2) of the Act and 19 CFR 351.218(a), Commerce hereby orders the continuation of the AD and CVD Agreements.

The effective date of continuation of the AD and CVD Agreements will be the date of publication in the **Federal Register** of this notice of continuation. Pursuant to section 751(c)(2) of the Act and 19 CFR 351.218(c)(2), Commerce intends to initiate the next five-year (sunset) reviews of the AD and CVD Agreements not later than 30 days prior to the fifth anniversary of the effective date of continuation.

Administrative Protective Order (APO)

This notice also serves as the only reminder to parties subject to APO of their responsibility concerning the return, destruction, or conversion to judicial protective order of proprietary information disclosed under APO in accordance with 19 CFR 351.305(a)(3). Failure to comply is a violation of the APO which may be subject to sanctions.

Notification to Interested Parties

These five-year (sunset) reviews and notice are in accordance with section 751(c) of the Act and published pursuant to section 777(i)(1) of the Act and 19 CFR 351.218(f)(4).

Dated: April 24, 2020.

Jeffrey I. Kessler,

Assistant Secretary for Enforcement and Compliance.

Meeting of the United States Travel and Tourism Advisory Board

AGENCY: International Trade Administration, U.S. Department of Commerce

⁶ See *Sugar from Mexico: Suspension of Antidumping Investigation*, 79 FR 78039 (December 29, 2014); see also *Sugar from Mexico: Suspension of Countervailing Duty Investigation*, 79 FR 78044 (December 29, 2014).

ACTION: Notice of an open meeting.

SUMMARY: The United States Travel and Tourism Advisory Board (Board or TTAB) will hold a meeting on Friday, May 22, 2020. The Board advises the Secretary of Commerce on matters relating to the U.S. travel and tourism industry. The purpose of the meeting is for Board members to consider recommendations on accelerating recovery in the travel and tourism sector following the COVID-19 pandemic. The final agenda will be posted on the Department of Commerce website for the Board at <http://trade.gov/ttab> at least one week in advance of the meeting.

DATES: Friday, May 22, 2020, 2:30 p.m.–3:30 p.m. EDT. The deadline for members of the public to register, including requests to make comments during the meeting and for auxiliary aids, or to submit written comments for dissemination prior to the meeting, is 5:00 p.m. EDT on Friday, May 15, 2020.

ADDRESSES: The meeting will be held via conference call. The call-in number and passcode will be provided by email to registrants.

Requests to register (including to speak or for auxiliary aids) and any written comments should be submitted by email to TTAB@trade.gov.

FOR FURTHER INFORMATION CONTACT: Jennifer Aguinaga, the United States Travel and Tourism Advisory Board, National Travel and Tourism Office, U.S. Department of Commerce; telephone: 202-482-2404; email: TTAB@trade.gov.

SUPPLEMENTARY INFORMATION:

Background: The Board advises the Secretary of Commerce on matters relating to the U.S. travel and tourism industry.

Public Participation: The meeting will be open to the public and will be accessible to people with disabilities. Any member of the public requesting to join the meeting is asked to register in advance by the deadline identified under the **DATES** caption. Requests for auxiliary aids must be submitted by the registration deadline. Last minute requests will be accepted, but may not be possible to fill. There will be fifteen (15) minutes allotted for oral comments from members of the public joining the meeting. To accommodate as many speakers as possible, the time for public comments may be limited to three (3) minutes per person. Members of the public wishing to reserve speaking time during the meeting must submit a request at the time of registration, as well as the name and address of the proposed speaker. If the number of registrants requesting to make

statements is greater than can be reasonably accommodated during the meeting, the International Trade Administration may conduct a lottery to determine the speakers. Speakers are requested to submit a written copy of their prepared remarks by 5:00 p.m. EDT on Friday, May 15, 2020, for inclusion in the meeting records and for circulation to the members of the Board.

In addition, any member of the public may submit pertinent written comments concerning the Board's affairs at any time before or after the meeting. Comments may be submitted to Jennifer Aguinaga at the contact information indicated above. To be considered during the meeting, comments must be received no later than 5:00 p.m. EDT on Friday, May 15, 2020, to ensure transmission to the Board prior to the meeting. Comments received after that date and time will be distributed to the members but may not be considered during the meeting. Copies of Board meeting minutes will be available within 90 days of the meeting.

Jennifer Aguinaga,

Designated Federal Officer, United States Travel and Tourism Advisory Board.

Certain Activated Carbon From the People's Republic of China: Preliminary Results of Antidumping Duty Administrative Review, Intent To Rescind the Review, in Part, and Preliminary Determination of No Shipments; 2018-2019

AGENCY: Enforcement and Compliance, International Trade Administration, Department of Commerce.

SUMMARY: The Department of Commerce (Commerce) preliminarily determines that Carbon Activated Tianjin Co., Ltd. (Carbon Activated) and Datong Juqiang Activated Carbon Co., Ltd. (Datong Juqiang), exporters of certain activated carbon from the People's Republic of China (China), sold subject merchandise in the United States at prices below normal value (NV) during the period of review (POR) April 1, 2018 through March 31, 2019. Interested parties are invited to comment on these preliminary results.

DATES: Applicable April 30, 2020.

FOR FURTHER INFORMATION CONTACT: Jinny Ahn or George Ayache, AD/CVD Operations, Office VIII, Enforcement

and Compliance, International Trade Administration, Department of Commerce, 1401 Constitution Avenue NW, Washington, DC 20230; telephone: (202) 482-0339 or (202) 482-2623, respectively.

SUPPLEMENTARY INFORMATION:

Background

This administrative review is being conducted in accordance with section 751(a) of the Tariff Act of 1930, as amended (the Act). Commerce published the notice of initiation of this administrative review on June 13, 2019.¹ On November 19, 2019, Commerce extended the preliminary results deadline until April 29, 2020.²

Scope of the Order³

The merchandise subject to the order is certain activated carbon. The products are currently classifiable under the Harmonized Tariff Schedule of the United States (HTSUS) subheading 3802.10.00. Although the HTSUS subheading is provided for convenience and customs purposes, the written description of the scope of the order remains dispositive.⁴

Intent To Rescind Administrative Review, in Part

In the *Initiation Notice*, we included Jacobi Carbons, Inc. among the companies for which a review was requested. Commerce has previously determined that Jacobi Carbons, Inc. is a U.S. shareholder of Jacobi,⁵ and the record of this review supports that determination. Therefore, we intend to rescind the review with respect to Jacobi Carbons, Inc.⁶

Preliminary Determination of No Shipments

Based on our analysis of U.S. Customs and Border Protection (CBP) information, and the no shipment

¹ See *Initiation of Antidumping and Countervailing Duty Administrative Reviews*, 84 FR 27587 (June 13, 2019) (*Initiation Notice*).

² See Memorandum, "Certain Activated Carbon from the People's Republic of China: Extension of Deadline for Preliminary Results of the Twelfth Antidumping Duty Administrative Review," dated November 19, 2019.

³ See *Notice of Antidumping Duty Order: Certain Activated Carbon from the People's Republic of China*, 72 FR 20988 (April 27, 2007) (*Order*).

⁴ For a complete description of the scope of the Order, see Memorandum, "Decision Memorandum for the Preliminary Results of Antidumping Duty Administrative Review: Certain Activated Carbon from the People's Republic of China; 2018-2019," dated concurrently with, and hereby adopted by, this notice (Preliminary Decision Memorandum).

⁵ Jacobi Carbons AB and its affiliates, Tianjin Jacobi International Trading Co. Ltd., and Jacobi Carbons Industry (Tianjin) Co. Ltd. (collectively, Jacobi).

⁶ See Preliminary Decision Memorandum at 8.

certifications submitted by Ningxia Guanghua Cherishmet Activated Carbon Co., Ltd., Jilin Bright Future Chemicals Co., Ltd., Shanxi Dapu International Trade Co., Ltd., and Tianjin Channel Filters Co., Ltd., Commerce preliminarily determines that these companies had no shipments of subject merchandise during the POR. For additional information regarding this determination, see the Preliminary Decision Memorandum.

Consistent with our practice in non-market economy (NME) cases, we are not rescinding this review but instead intend to complete the review with respect to these four companies, for which we have preliminarily found no shipments, and issue appropriate instructions to CBP based on the final results of the review.⁷

Methodology

Commerce is conducting this review in accordance with section 751(a)(1)(B) of the Act. We calculated export prices and constructed export prices in accordance with section 772 of the Act. Because China is an NME country within the meaning of section 771(18) of the Act, NV has been calculated in accordance with section 773(c) of the Act.

For a full description of the methodology underlying our conclusions, see the Preliminary Decision Memorandum. A list of the topics discussed in the Preliminary Decision Memorandum is included as Appendix I to this notice. The Preliminary Decision Memorandum is a public document and is made available to the public via Enforcement and Compliance's Antidumping and Countervailing Duty Centralized Electronic Service System (ACCESS). ACCESS is available to registered users at <https://access.trade.gov>. In addition, a complete version of the Preliminary Decision Memorandum is available at <http://enforcement.trade.gov/frn/>. The signed and electronic versions of the Preliminary Decision Memorandum are identical in content.

Preliminary Results of the Review

Commerce preliminarily finds that 63 companies for which a review was requested⁸ did not establish eligibility for a separate rate because they failed to provide either a separate rate application or separate rate certification. As such, we preliminarily determine

⁷ See *Non-Market Economy Antidumping Proceedings: Assessment of Antidumping Duties*, 76 FR 65694, 65694-95 (October 24, 2011) (*NME Practice*).

⁸ See Appendix II of this notice for a full list of the 63 companies.

that these 63 companies are part of the China-wide entity.⁹

For those companies that have established their eligibility for a separate rate,¹⁰ Commerce preliminarily

determines that the following weighted-average dumping margins exist for the POR:

| Exporter | Weighted-average dumping margin (U.S. dollars per kilogram) ¹¹ |
|---|---|
| Beijing Pacific Activated Carbon Products Co., Ltd | 0.49 |
| Carbon Activated Tianjin Co., Ltd | 1.66 |
| Datong Juqiang Activated Carbon Co., Ltd | 0.22 |
| Jacobi Carbons AB ¹² | 0.49 |
| Ningxia Huahui Activated Carbon Co., Ltd | 0.49 |
| Ningxia Mineral & Chemical Limited | 0.49 |
| Shanxi Sincere Industrial Co., Ltd | 0.49 |
| Shanxi Tianxi Purification Filter Co., Ltd | 0.49 |
| Datong Municipal Yunguang Activated Carbon Co., Ltd | 0.49 |
| Shanxi Industry Technology Trading Co., Ltd | 0.49 |
| Tancarb Activated Carbon Co., Ltd | 0.49 |

For the respondents that were not selected for individual examination in this administrative review but qualified for a separate rate, we have assigned to them the weighted-average margin calculated based on the publicly available ranged U.S. sales quantities of the mandatory respondents consistent with section 735(c)(5)(A) of the Act.¹³

Disclosure and Public Comment

Commerce intends to disclose the calculations performed for these preliminary results to the parties no later than five days after the date of publication of this notice in accordance with 19 CFR 351.224(b). Pursuant to 19 CFR 351.309(c)(ii), interested parties may submit case briefs no later than 30 days after the date of publication of these preliminary results of review. Parties who submit case briefs or rebuttal briefs in this proceeding are encouraged to submit with each argument: (1) A statement of the issue; (2) a brief summary of the argument; and (3) a table of authorities. Rebuttal briefs, limited to issues raised in the case briefs, may be filed no later than

seven days after the case briefs are filed.¹⁴ Note that Commerce has temporarily modified certain of its requirements for serving documents containing business proprietary information, until May 19, 2020, unless extended.¹⁵

Pursuant to 19 CFR 351.310(c), interested parties who wish to request a hearing must submit a written request to the Assistant Secretary for Enforcement and Compliance within 30 days of the date of publication of this notice. Requests should contain: (1) The party's name, address and telephone number; (2) the number of participants; and (3) a list of issues parties intend to discuss. Issues raised in the hearing will be limited to those raised in the respective case and rebuttal briefs.¹⁶ If a request for a hearing is made, Commerce intends to hold the hearing at the U.S. Department of Commerce, 1401 Constitution Avenue NW, Washington, DC 20230, at a date and time to be determined.¹⁷ Parties should confirm by telephone the date, time, and location of the hearing two days before the scheduled date.

All submissions to Commerce must be filed electronically using ACCESS¹⁸ and must also be served on interested parties.¹⁹ An electronically filed document must be received successfully in its entirety by ACCESS, by 5 p.m. Eastern Time (ET) on the date that the document is due.

Unless otherwise extended, Commerce intends to issue the final results of this administrative review, which will include the results of its analysis of issues raised in any briefs, within 120 days of publication of these preliminary results, pursuant to section 751(a)(3)(A) of the Act.

Assessment Rates

Upon issuance of the final results, Commerce will determine, and CBP shall assess, antidumping duties on all appropriate entries covered by this review.²⁰ Commerce intends to issue assessment instructions to CBP 15 days after the publication date of the final results of this review. For any individually examined respondent whose (estimated) *ad valorem* weighted-average dumping margin is not zero or

⁹ Because no interested party requested a review of the China-wide entity and Commerce no longer considers the China-wide entity as an exporter conditionally subject to administrative reviews, we did not conduct a review of the China-wide entity. Thus, the rate for the China-wide entity is not subject to change as a result of this review. See *Antidumping Proceedings: Announcement of Change in Department Practice for Respondent Selection in Antidumping Duty Proceedings and Conditional Review of the Nonmarket Economy Entity in NME Antidumping Duty Proceedings*, 78 FR 65963, 65969–70 (November 4, 2013). The China-wide entity rate of 2.42 U.S. dollars per kilogram was last reviewed in *Certain Activated Carbon from the People's Republic of China: Final Results of Antidumping Duty Administrative Review; 2012–2013*, 79 FR 70163 (November 25, 2014).

¹⁰ See Preliminary Decision Memorandum.

¹¹ In the second administrative review of the Order, Commerce determined that it would

calculate per-unit weighted-average dumping margins and assessment rates for all future reviews. See *Certain Activated Carbon from the People's Republic of China: Final Results and Partial Rescission of Second Antidumping Duty Administrative Review*, 75 FR 70208, 70211 (November 17, 2010).

¹² In the third administrative review of the Order, Commerce found that Jacobi Carbons AB, Tianjin Jacobi International Trading Co. Ltd., and Jacobi Carbons Industry (Tianjin) should be treated as a single entity, and because there were no facts presented on the record of this review which would call into question our prior finding, we continue to treat these companies as part of a single entity for this administrative review, pursuant to sections 771(33)(E), (F), and (G) of the Act and 19 CFR 351.401(f). See *Certain Activated Carbon from the People's Republic of China: Final Results and Partial Rescission of Third Antidumping Duty Administrative Review*, 76 FR 67142, 67145, n. 25 (October 31, 2011); see also Preliminary Decision Memorandum.

¹³ See Memorandum, "Certain Activated Carbon from the People's Republic of China: Calculation of the Margin for Respondents Not Selected for Individual Examination," dated concurrently with this notice; see also Preliminary Decision Memorandum.

¹⁴ See 19 CFR 351.309(d); see also *Temporary Rule Modifying AD/CVD Service Requirements Due to COVID-19*, 85 FR 17006 (March 26, 2020) (*Temporary Rule*) ("To provide adequate time for release of case briefs via ACCESS, E&C intends to schedule the due date for all rebuttal briefs to be 7 days after case briefs are filed (while these modifications are in effect)").

¹⁵ See *Temporary Rule*.

¹⁶ See 19 CFR 351.310(c).

¹⁷ See 19 CFR 351.310(d).

¹⁸ See 19 CFR 351.303.

¹⁹ See 19 CFR 351.303(f).

²⁰ See 19 CFR 351.212(b)(1).

de minimis (i.e., less than 0.50 percent) in the final results of this review, Commerce will calculate importer-specific assessment rates on the basis of the ratio of the total amount of dumping calculated for the importer's examined sales and the total quantity of those sales, in accordance with 19 CFR 351.212(b)(1).²¹ Commerce will also calculate (estimated)²² *ad valorem* importer-specific assessment rates with which to assess whether the per-unit assessment rate is *de minimis*.²³ We will instruct CBP to assess antidumping duties on all appropriate entries covered by this review when the importer-specific *ad valorem* assessment rate calculated in the final results of this review is not zero or *de minimis*. Where either the respondent's *ad valorem* weighted-average dumping margin is zero or *de minimis*, or an importer-specific *ad valorem* assessment rate is zero or *de minimis*,²⁴ we will instruct CBP to liquidate the appropriate entries without regard to antidumping duties.

For the respondents that were not selected for individual examination in this administrative review but qualified for a separate rate, the assessment rate will be the margin established for these companies in the final results of this review.

For the final results, if we continue to treat the 63 companies, identified at

Appendix II to this notice, as part of the China-wide entity, we will instruct CBP to apply a per-unit assessment rate of \$2.42 per kilogram to all entries of subject merchandise during the POR which were produced and/or exported by those companies.²⁵

For entries that were not reported in the U.S. sales data submitted by companies individually examined during this review, Commerce will instruct CBP to liquidate such entries at the rate for the China-wide entity.²⁶ Additionally, if Commerce determines that an exporter under review had no shipments of the subject merchandise, any suspended entries that entered under that exporter's case number (i.e., at that exporter's cash deposit rate) will be liquidated at the rate for the China-wide entity.²⁷

In accordance with section 751(a)(2)(C) of the Act, the final results of this review shall be the basis for the assessment of antidumping duties on entries of merchandise covered by the final results of this review and for future deposits of estimated antidumping duties, as applicable.

Cash Deposit Requirements

The following cash deposit requirements will be effective upon publication of the final results of this administrative review for shipments of the subject merchandise from China entered, or withdrawn from warehouse, for consumption on or after the publication date, as provided by section 751(a)(2)(C) of the Act: (1) For each specific company listed in the final results of this review, the cash deposit rate will be equal to the weighted-average dumping margin established in the final results of this review (except that if the *ad valorem* rate is *de minimis*, then the cash deposit rate will be zero); (2) for previously investigated or reviewed Chinese and non-Chinese exporters not listed above that have separate rates, the cash deposit rate will continue to be the existing exporter-specific cash deposit rate; (3) for all Chinese exporters of subject merchandise that have not been found to be entitled to a separate rate, the cash deposit rate will be the rate for the China-wide entity; and (4) for all non-Chinese exporters of subject merchandise which have not received their own separate rate, the cash deposit rate will be the rate applicable to the Chinese exporter that supplied that non-

Chinese exporter. These cash deposit requirements, when imposed, shall remain in effect until further notice.

Notification to Importers

This notice also serves as a preliminary reminder to importers of their responsibility under 19 CFR 351.402(f)(2) to file a certificate regarding the reimbursement of antidumping duties prior to liquidation of the relevant entries during this POR. Failure to comply with this requirement could result in Commerce's presumption that reimbursement of antidumping duties occurred and the subsequent assessment of double antidumping duties.

Notification to Interested Parties

This administrative review and notice are issued and published in accordance with sections 751(a)(1) and 777(i)(1) of the Act, 19 CFR 351.213, and 19 CFR 351.221(b)(4).

Dated: April 24, 2020.

Jeffrey I. Kessler,

Assistant Secretary for Enforcement and Compliance.

Appendix I

List of Topics Discussed in the Preliminary Decision Memorandum

- I. Summary
- II. Background
- III. Scope of the Order
- IV. Discussion of the Methodology
- V. Recommendation

Appendix II

Companies Preliminarily Not Eligible for a Separate Rate and Treated as Part of the China-Wide Entity

1. AM Global Shipping Lines Co., Ltd.
2. Apex Maritime (Tianjin) Co., Ltd.
3. Beijing Kang Jie Kong International Cargo Agent Co Ltd.
4. Bengbu Modern Environmental Co., Ltd.
5. Brilliant Logistics Group Inc.
6. China Combi Works Oy Ltd
7. China International Freight Co., Ltd.
8. Cohesion Freight (HK) Ltd.
9. Datong Municipal Yunguang
10. De Well Container Shipping Corp.
11. Derun Charcoal Carbon Co., Ltd.
12. Endurance Cargo Management Co., Ltd.
13. Envitek (China) Ltd.
14. Excel Shipping Co., Ltd.
15. Fujian Xinsen Carbon Co., Ltd.
16. Fuzhou Yihuan Carbon Co., Ltd.
17. Fuzhou Yuemengfeng Trade Co., Ltd.
18. Gongyi City Bei Shan Kou Water Purification Materials Factory
19. Guangdong Hanyan Activated Carbon Manufacturing Co., Ltd.
20. Guangzhou Four E'S Scientific Co., Ltd.
21. Hangzhou Hengxing Activated Carbon
22. Henan Dailygreen Trading Co., Ltd.
23. Honour Lane Shipping Ltd.
24. Ingevity Corp.
25. Ingevity Performance Materials
26. Jiangsu Kejing Carbon Fiber Co., Ltd.

²¹ In these preliminary results, Commerce applied the assessment rate calculation method adopted in *Antidumping Proceedings: Calculation of the Weighted-Average Dumping Margin and Assessment Rate in Certain Antidumping Proceedings: Final Modification*, 77 FR 8101 (February 14, 2012).

²² See *Certain Activated Carbon from the People's Republic of China: Final Results and Partial Rescission of Second Antidumping Duty Administrative Review*, 75 FR 70208 (November 17, 2010), and accompanying Issues and Decision Memorandum at Comment 3. In the second administrative review of this proceeding, we analyzed the difference between reported entered values and estimated customs values. In that segment, we found substantial differences between the estimated customs values for entries of certain activated carbon and the entered values reported to CBP. We determined that the entered values of constructed export price sales were being systematically understated, which we also determined would result in the under-collection of antidumping duties by CBP. Accordingly, we made a determination to switch to per-unit assessment and cash deposit rates in that and subsequent reviews.

²³ For calculated (estimated) *ad valorem* importer-specific assessment rates used in determining whether the per-unit assessment rate is *de minimis*, see Memoranda, "Preliminary Results Margin Calculation for Datong Juqiang Activated Carbon Co., Ltd.," and "Antidumping Duty Administrative Review of Certain Activated Carbon from the People's Republic of China: Preliminary Results Calculation Memorandum for Carbon Activated," both dated concurrently with this notice, and attached Margin Calculation Program Logs and Outputs.

BILLING CODE 3510-DS-P

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration

[RTID 0648-XA148]

New England Fishery Management Council; Public Meeting

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Notice of public meeting via webinar.

SUMMARY: The New England Fishery Management Council's is convening an ad-hoc sub-panel of its Scientific and Statistical Committee (SSC) to conduct a peer review of an interdisciplinary review of Atlantic Cod stock structure in the Western North Atlantic Ocean via webinar to consider actions affecting New England fisheries in the exclusive

economic zone (EEZ).

Recommendations from this group will be brought to the full Council for formal consideration and action, if appropriate.

DATES: This webinar will be held for three days beginning on Monday, May 18, 2020 through Wednesday, May 20, 2020 and will begin each day at 9 a.m. Webinar registration URL information: <https://attendee.gotowebinar.com/rt/6183591128820865293>. Call in information: Phone: +1 (415) 655-0052; Access Code: 805-785-106

ADDRESSES: The meeting will be held via webinar.

Council address: New England Fishery Management Council, 50 Water Street, Mill 2, Newburyport, MA 01950.

FOR FURTHER INFORMATION CONTACT: Thomas A. Nies, Executive Director, New England Fishery Management Council; telephone: (978) 465-0492.

SUPPLEMENTARY INFORMATION:

Agenda

An ad-hoc peer review subpanel Scientific and Statistical Committee (SSC) will meet via webinar to review An Interdisciplinary Review of Atlantic Cod (*Gadus morhua*) Stock Structure in the Western North Atlantic Ocean prepared by the Atlantic Cod Stock Structure Working Group organized specifically to complete this report.

Although non-emergency issues not contained on the agenda may come before this Council for discussion, those issues may not be the subject of formal action during this meeting. Council action will be restricted to those issues specifically listed in this notice and any issues arising after publication of this notice that require emergency action under section 305(c) of the Magnuson-Stevens Act, provided the public has been notified of the Council's intent to take final action to address the emergency. The public also should be aware that the meeting will be recorded. Consistent with 16 U.S.C. 1852, a copy of the recording is available upon request.

Special Accommodations

This meeting is physically accessible to people with disabilities. Requests for sign language interpretation or other auxiliary aids should be directed to Thomas A. Nies, Executive Director, at (978) 465-0492, at least 5 days prior to the meeting date.

Authority: Authority: 16 U.S.C. 1801 *et seq.*

Dated: April 27, 2020.

Tracey L. Thompson,

Acting Deputy Director, Office of Sustainable Fisheries, National Marine Fisheries Service.

BILLING CODE 3510-22-P

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration

Proposed Information Collection; Comment Request; Conflict of Interest Disclosure for Non-Federal Government Individuals Who Are Candidates To Conduct Peer Reviews Required by the OMB Peer Review Bulletin

AGENCY: National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Notice.

SUMMARY: The Department of Commerce, as part of its continuing effort to reduce paperwork and respondent burden, invites the general public and other Federal agencies to comment on proposed and/or continuing information collections, as required by the Paperwork Reduction Act of 1995.

DATES: To ensure consideration, written or on-line comments must be submitted on or before June 29, 2020.

ADDRESSES: Direct all written comments to Adrienne Thomas, PRA Officer, NOAA, 151 Patton Avenue, Room 159, Asheville, NC 28801 (or via the internet at PRAComments@doc.gov). All comments received are part of the public record. Comments will generally be posted without change. All Personally Identifiable Information (for example, name and address) voluntarily submitted by the commenter may be publicly accessible. Do not submit Confidential Business Information or otherwise sensitive or protected information.

FOR FURTHER INFORMATION CONTACT: Requests for additional information or copies of the information collection instrument and instructions should be directed to Jeffrey Dillen, NOAA OGC, 14th & Constitution Avenue NW, Herbert C Hoover Bldg., Rm 78032, Washington, DC 20230-0001, Jeff.dillen@noaa.gov or by telephone at (301) 713-7382.

SUPPLEMENTARY INFORMATION:

I. Abstract

This request is for extension of a currently approved collection.

The Office of Management and Budget (OMB) issued government-wide guidance to enhance the practice of peer review of government science documents. OMB's Final Information Quality Bulletin for Peer Review ("Peer Review Bulletin" or PRB) (available at https://obamawhitehouse.archives.gov/omb/memoranda_fy2005_m05-03/) establishes minimum peer review standards for influential scientific information that Federal agencies intend to disseminate.

The Peer Review Bulletin also directs Federal agencies to adopt or adapt the National Academy of Sciences (NAS) policy for evaluating conflicts of interest when selecting peer reviewers who are not Federal government employees (federal employees are subject to Federal ethics requirements). For peer review purposes, the term "conflicts of interest" means any financial or other interest which conflicts with the service of the individual because it could: (1) Significantly impair the individual's objectivity; or (2) create an unfair competitive advantage for any person or organization. NOAA has adapted the NAS policy and developed two confidential conflict disclosure forms which the agency will use to examine prospective reviewers' potential financial conflicts and other interests that could impair objectivity or create an unfair advantage. One form is for peer reviewers of studies related to government regulation and the other form is for all other influential scientific information subject to the Peer Review Bulletin. In addition, the latter form has been adapted by NOAA's Office of Oceanic and Atmospheric Research for potential reviewers of scientific laboratories.

The forms include questions about employment as well as investment and property interests and research funding. Both forms also require the submission of curriculum vitae. NOAA is seeking to collect this information from potential peer reviewers who are not government employees when conducting a peer review pursuant to the PRB. The information collected in the conflict of interest disclosure is essential to NOAA's compliance with the OMB PRB, and helps to ensure that government studies are reviewed by independent, impartial peer reviewers.

II. Method of Collection

Forms may be downloaded from the internet and are fillable and signed electronically or manually. They may be submitted, along with the Curriculum Vitae, via email or regular mail.

III. Data

OMB Control Number: 0648–0567.
Form Number(s): None.

Type of Review: Regular submission (extension of a current information collection).

Affected Public: Individuals or households.

Estimated Number of Respondents: 321.

Estimated Time per Response: 30 minutes each: Conflict of Interest Disclosure for General Scientific and Technical Studies and Assistance; and Conflict of Interest Disclosure for Studies Related to Government Regulation.

Estimated Total Annual Burden Hours: 161 hours.

Estimated Total Annual Cost to Public: \$0.

IV. Request for Comments

Comments are invited on: (a) Whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information shall have practical utility; (b) the accuracy of the agency's estimate of the burden (including hours and cost) of the proposed collection of information; (c) ways to enhance the quality, utility, and clarity of the information to be collected; and (d) ways to minimize the burden of the collection of information on respondents, including through the use of automated collection techniques or other forms of information technology.

Comments submitted in response to this notice will be summarized and/or included in the request for OMB approval of this information collection; they also will become a matter of public record.

Sheleen Dumas,

Department PRA Clearance Officer, Office of the Chief Information Officer, Commerce Department.

SUPPLEMENTARY INFORMATION:

Agenda

Friday, May 15, 2020

The agenda will be to review emergency rule requests that have been submitted for Council consideration, including but not limited to, a request to modify IFQ transfer provisions of the Halibut and Sablefish IFQ Program, and a request regarding halibut charter measures in 2C and 3A; and other business. The agenda is subject to change, and the latest version will be posted at <https://meetings.npfmc.org/Meeting/Details/1463> prior to the meeting, along with meeting materials.

Connection Information

You can attend the meeting online using a computer, tablet, or smart phone, at npfmc.adobeconnect.com/may2020/; or by phone as listed at www.npfmc.org.

Public Comment

Public comment will be accepted, and written comments should be submitted electronically to <https://meetings.npfmc.org/Meeting/Details/1463>. Deadline for written public comments is May 14, 2020, at 5 p.m.

Special Accommodations

These meetings are physically accessible to people with disabilities. Requests should be directed to Shannon Gleason at (907) 903–3107 at least 7 working days prior to the meeting date. (Authority: 16 U.S.C. 1801 *et seq.*)

Dated: April 27, 2020.

BILLING CODE 3510–22–P

ELECTION ASSISTANCE COMMISSION**Sunshine Act Meeting; Public Hearing:
The VVSG 2.0 Requirements Hearing 2:
Implementation of the VVSG at the
State and Local Level**

AGENCY: United States Election Assistance Commission.

ACTION: Notice of public hearing agenda.

DATES: Wednesday, May 6, 2020 1:30–3:30 p.m. Eastern.

ADDRESSES: Livestream on the U.S. Election Assistance YouTube channel: <https://www.youtube.com/channel/UCpN6i0g2rIF4ITWhwvBwwZW>.

FOR FURTHER INFORMATION CONTACT: Jerome Lovato, Telephone: (301) 960–1216, Email: jlovato@eac.gov.

SUPPLEMENTARY INFORMATION:**Status**

This hearing will be open to the public.

Agenda

EAC Commissioners will hold a virtual hearing to discuss the proposed Voluntary Voting System Guidelines (VVSG) 2.0 Requirements as submitted by the Technical Guidelines Development Committee (TGDC). This second hearing will focus on how state and local election offices utilize the VVSG program, and how the VVSG program supports state and local efforts. The hearing will also include a discussion on the questions around accessibility and security regarding the VVSG program, including how to balance the issues at hand while ensuring accessibility and security.

Commissioners will also hear from members of the public who wish to offer verbal testimony on the VVSG 2.0 requirements. Public testimony during the hearing will be limited to 5 minutes maximum per person. If you would like to participate in public testimony, please contact Jerome Lovato (jlovato@eac.gov) with your full name and phone number no later than 11:30 a.m. Eastern Time on May 6, 2020.

The VVSG 2.0 Requirements are currently published for a 90-day public comment period that concludes on June 22nd. The first VVSG public hearing on March 27, 2020 covered an introduction to the VVSG process as well as a high-level overview of the proposed VVSG 2.0 requirements. A recording of the hearing is available on the EAC's website: <https://www.eac.gov/events/2020/03/27/eac-virtual-public-hearing-introduction-and-foundation-vvsg-20-requirements>.

The TGDC unanimously approved to recommend VVSG 2.0 Requirements on

February 7, 2020, and sent the Requirements to the EAC Acting Executive Director via the Director of the National Institute of Standards and Technology (NIST), in the capacity of the Chair of the TGDC on March 9, 2020. Upon adoption, the VVSG 2.0 would become the fifth iteration of national level voting system standards. The Federal Election Commission published the first two sets of federal standards in 1990 and 2002. The EAC then adopted Version 1.0 of the VVSG on December 13, 2005. In an effort to update and improve version 1.0 of the VVSG, on March 31, 2015, the EAC commissioners unanimously approved VVSG 1.1.

Amanda Joiner,

Associate Counsel, U.S. Election Assistance Commission.

BILLING CODE P

DEPARTMENT OF ENERGY**Federal Energy Regulatory
Commission**

[Docket No. TX20–3–000]

**City of Goose Creek, South Carolina;
Notice of Filing**

Take notice that on April 23, 2020, pursuant to sections 211 and 212 of the Federal Power Act,¹ and Rule 204 and 212 of the Federal Energy Regulatory Commission's (Commission) Rules of Practice and Procedure,² the City of Goose Creek, South Carolina filed an application requesting that the Commission issue an order directing the South Carolina Public Service Authority to provide transmission service to the City of Goose Creek.

Any person desiring to intervene or to protest this filing must file in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR 385.211 and 385.214). Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a notice of intervention or motion to intervene, as appropriate. Such notices, motions, or protests must be filed on or before the comment date. Anyone filing a motion to intervene or protest must serve a copy of that document on the Applicant. On or before the comment date, it is not necessary to serve motions to intervene

¹ 16 U.S.C. 824j, 824k (2019).

² 18 CFR 385.204, 385.212 (2019).

or protests on persons other than the Applicant.

In addition to publishing the full text of this document in the **Federal Register**, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the internet through the Commission's Home Page (<http://ferc.gov>) using the "eLibrary" link. Enter the docket number excluding the last three digits in the docket number field to access the document. At this time, the Commission has suspended access to the Commission's Public Reference Room, due to the proclamation declaring a National Emergency concerning the Novel Coronavirus Disease (COVID–19), issued by the President on March 13, 2020. For assistance, contact FERC at FERCOnlineSupport@ferc.gov or call toll-free, (886) 208–3676 or TTY, (202) 502–8659.

The Commission strongly encourages electronic filings of comments, protests and interventions in lieu of paper using the "eFiling" link at <http://www.ferc.gov>. Persons unable to file electronically may mail similar pleadings to the Federal Energy Regulatory Commission, 888 First Street NE, Washington, DC 20426. Hand delivered submissions in docketed proceedings should be delivered to Health and Human Services, 12225 Wilkins Avenue, Rockville, Maryland 20852.

Comment Date: 5:00 p.m. Eastern Time on May 14, 2020.

Dated: April 24, 2020.

BILLING CODE 6717–01–P

DEPARTMENT OF ENERGY**Federal Energy Regulatory
Commission**

[Docket No. ER20–1641–000]

**Southern Illinois Generation Company,
LLC; Supplemental Notice That Initial
Market-Based Rate Filing Includes
Request for Blanket Section 204
Authorization**

This is a supplemental notice in the above-referenced proceeding of Southern Illinois Generation Company, LLC's application for market-based rate authority, with an accompanying rate tariff, noting that such application includes a request for blanket authorization, under 18 CFR part 34, of

future issuances of securities and assumptions of liability.

Any person desiring to intervene or to protest should file with the Federal Energy Regulatory Commission, 888 First Street NE, Washington, DC 20426, in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR 385.211 and 385.214). Anyone filing a motion to intervene or protest must serve a copy of that document on the Applicant.

Notice is hereby given that the deadline for filing protests with regard to the applicant's request for blanket authorization, under 18 CFR part 34, of future issuances of securities and assumptions of liability, is May 14, 2020.

The Commission encourages electronic submission of protests and interventions in lieu of paper, using the FERC Online links at <http://www.ferc.gov>. To facilitate electronic service, persons with internet access who will eFile a document and/or be listed as a contact for an intervenor must create and validate an eRegistration account using the eRegistration link. Select the eFiling link to log on and submit the intervention or protests.

Persons unable to file electronically may mail similar pleadings to the Federal Energy Regulatory Commission, 888 First Street NE, Washington, DC 20426. Hand delivered submissions in docketed proceedings should be delivered to Health and Human Services, 12225 Wilkins Avenue, Rockville, Maryland 20852.

In addition to publishing the full text of this document in the **Federal Register**, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the internet through the Commission's Home Page (<http://www.ferc.gov>) using the "eLibrary" link. Federal Energy Regulatory Commission

[Docket No. CP20-49-000]

Transcontinental Gas Pipe Line Company, LLC; Notice of Availability of the Environmental Assessment for the Proposed Northeast Supply Enhancement Project Amendment

The staff of the Federal Energy Regulatory Commission (FERC or Commission) has prepared an environmental assessment (EA) to assess the environmental impacts associated with a proposed amendment to Transcontinental Gas Pipe Line Company, LLC's (Transco) Northeast Supply Enhancement Project which was authorized on May 3, 2019 in Docket No. CP17-101-000. The Northeast Supply Enhancement Project Amendment (Amendment) involves utilizing an alternative road for permanent access to Compressor Station 206 in Somerset County, New Jersey, rather than constructing the approved access road to the site.

The EA assesses the potential environmental effects of the construction and operation of the Amendment in accordance with the requirements of the National Environmental Policy Act of 1969 (NEPA). The FERC staff concludes that approval of the Amendment would not constitute a major federal action significantly affecting the quality of the human environment.

The Commission mailed a copy of the *Notice of Availability* for the EA to federal, state, and local government representatives and agencies; elected officials; environmental and public interest groups; Native American tribes; potentially affected landowners and other interested individuals and groups; and newspapers and libraries in the area of the Amendment. The EA is only available in electronic format. It may be viewed and downloaded from FERC's website (www.ferc.gov), on the Environmental Documents page (<http://www.ferc.gov/industries/gas/enviro/eis.asp>). In addition, the EA may be accessed by using the eLibrary link on FERC's website. Click on the eLibrary link (<https://www.ferc.gov/docs-filing/elibrary.asp>), click on General Search, and enter the docket number in the

"Docket Number" field, excluding the last three digits (*i.e.*, CP20-49). Be sure you have selected an appropriate date range. For assistance, please contact FERC Online Support at: FercOnlineSupport@ferc.gov or toll free at (866) 208-3676, or for TTY, contact (202) 502-8659.

Any person wishing to comment on the EA may do so. Your comments should focus on the EA's discussion of potential environmental effects, reasonable alternatives, and measures to avoid or lessen environmental impacts. The more specific your comments, the more useful they will be. To ensure that the Commission has the opportunity to consider your comments prior to making its decision on the Amendment, it is important that the Commission receive your comments on or before 5:00 p.m. Eastern Time on May 26, 2020.

For your convenience, there are three methods you can use to file your comments with the Commission. In all instances, please reference the Amendment's docket number (CP20-49-000) with your submission. The Commission encourages electronic filing of comments and has expert staff available to assist you at (866) 208-3676 or FercOnlineSupport@ferc.gov.

(1) You can file your comments electronically using the *eComment* feature located on the Commission's website (www.ferc.gov) under the link to *Documents and Filings*. This is an easy method for submitting brief, text-only comments on a project;

(2) You can also file your comments electronically using the *eFiling* feature on the Commission's website (www.ferc.gov) under the link to *Documents and Filings*. With eFiling, you can provide comments in a variety of formats by attaching them as a file with your submission. New eFiling users must first create an account by clicking on "eRegister." You must select the type of filing you are making. If you are filing a comment on a particular project, please select "Comment on a Filing" as the filing type; or

(3) The Commission strongly encourages electronic filings of comments, protests and interventions in lieu of paper using the "eFiling" link at <http://www.ferc.gov>. Persons unable to file electronically may mail similar pleadings to the Federal Energy Regulatory Commission, 888 First Street NE, Washington, DC 20426. Hand delivered submissions in docketed proceedings should be delivered to Health and Human Services, 12225 Wilkins Avenue, Rockville, Maryland 20852.

Any person seeking to become a party to the proceeding must file a motion to

intervene pursuant to Rule 214 of the Commission's Rules of Practice and Procedures (18 CFR 385.214). Motions to intervene are more fully described at <https://www.ferc.gov/resources/guides/how-to/intervene.asp>. Only intervenors have the right to seek rehearing or judicial review of the Commission's decision. The Commission may grant affected landowners and others with environmental concerns intervenor status upon showing good cause by stating that they have a clear and direct interest in this proceeding which no other party can adequately represent. Simply filing environmental comments will not give you intervenor status, but you do not need intervenor status to have your comments considered.

Additional information about the Amendment is available from the Commission's Office of External Affairs, at (866) 208-FERC, or on the FERC website (www.ferc.gov) using the eLibrary link. The eLibrary link also provides access to the texts of formal documents issued by the Commission, such as orders, notices, and rulemakings.

In addition, the Commission offers a free service called eSubscription that allows you to keep track of all formal issuances and submittals in specific dockets. This can reduce the amount of time you spend researching proceedings by automatically providing you with notification of these filings, document summaries, and direct links to the documents. Go to <http://www.ferc.gov/docs-filing/esubscription.asp>.

BILLING CODE 6717-01-P

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Docket No. IC20-10-000]

Commission Information Collection Activities (FERC Form Nos. 2 and 2-A; Comment Request; Extension

AGENCY: Federal Energy Regulatory Commission.

ACTION: Notice of information collection and request for comments.

SUMMARY: In compliance with the requirements of the Paperwork Reduction Act of 1995 (PRA), the Federal Energy Regulatory Commission (Commission or FERC) is soliciting public comment on the currently

approved information collection, FERC Form No. 2 (Annual Report for Major Natural Gas Companies) and FERC Form No. 2-A (Annual Report for Non-Major Natural Gas Companies).¹

DATES: Comments on the collection of information are due June 29, 2020.

ADDRESSES: You may submit comments (identified by Docket No. IC20-10-000) by either of the following methods:

- eFiling at Commission's website: <http://www.ferc.gov/docs-filing/efiling.asp>
- Mail/Hand Delivery/Courier: Federal Energy Regulatory Commission, Secretary of the Commission, at Health and Human Services, 12225 Wilkins Avenue, Rockville, Maryland 20852.

Instructions: All submissions must be formatted and filed in accordance with submission guidelines at: <http://www.ferc.gov/help/submission-guide.asp>. For user assistance, contact FERC Online Support by email at ferconlinesupport@ferc.gov, or by phone at: (866) 208-3676 (toll-free).

Docket: Users interested in receiving automatic notification of activity in this docket or in viewing/downloading comments and issuances in this docket may do so at <http://www.ferc.gov/docs-filing/docs-filing.asp>.

FOR FURTHER INFORMATION CONTACT:

Ellen Brown may be reached by email at DataClearance@FERC.gov, telephone at (202) 502-8663.

SUPPLEMENTARY INFORMATION:

Title: FERC Form No. 2, Annual Report for Major Natural Gas Companies; OMB Control No. 1902-0028.

FERC Form No. 2-A, Annual Report for Non-Major Natural Gas Companies; OMB Control No. 1902-0030.

OMB Control No.: 1902-0028, 1902-0030.

Type of Request: Three-year extension of the FERC Form No. 2 and FERC Form No. 2-A information collection requirements without a change to the current reporting and recordkeeping requirements.

Abstract: Pursuant to sections 8, 10 and 14 of the Natural Gas Act (NGA), (15 U.S.C. 717g-717m), the Commission is authorized to conduct investigations and collect and record data, and to prescribe rules and regulations concerning accounts, records and memoranda as necessary or appropriate

for purposes of administering the NGA. The Commission may prescribe a system of accounts for jurisdictional companies and, after notice and opportunity for hearing, may determine the accounts in which particular outlays and receipts will be entered, charged or credited.

The Commission collects FERC Form Nos. 2 and 2-A information as prescribed in 18 CFR 260.1 and 18 CFR 260.2. These forms provide information concerning a company's current performance, compiled using the Commission's Uniform System of Account (USoA).² FERC Form No. 2 is filed by "Major" natural gas companies that have combined natural gas transported or stored for a fee that exceeds 50 million Dekatherms in each of the three previous calendar years. FERC Form No. 2-A is filed by "Non-Major" natural gas companies that do not meet the filing threshold for the FERC Form No. 2, but have total gas sales or volume transactions that exceeds 200,000 Dekatherms in each of the three previous calendar years.

The forms provide information concerning a company's financial and operational information. The forms contain schedules which include a basic set of financial statements: Comparative Balance Sheet, Statement of Income and Retained Earnings, Statement of Cash Flows, and the Statement of Comprehensive Income and Hedging Activities. Supporting schedules containing supplementary information are filed, including revenues and the related quantities of products sold or transported; account balances for various operating and maintenance expenses; selected plant cost data; and other information.

The information collected assists the Commission in the administration of its jurisdictional responsibilities and is used by Commission staff, state regulatory agencies, customers, financial analysts and others in the review of the financial condition of regulated companies. The information is also used in various rate proceedings, industry analyses and in the Commission's audit programs and as appropriate, for the computation of annual charges. The information is made available to the public, intervenors and all interested parties to assist in the proceedings before the Commission. For financial information to be useful to the Commission, it must be understandable, relevant, reliable and timely. The Form Nos. 2 and 2-A financial statements are

¹ FERC Form Nos. 2 and 2-A are part of the "Forms Refresh" effort, which is a separate activity and not addressed here. See *Revisions to the Filing Process for Commission Forms*, 166 FERC ¶61,027 (2019) (started in Docket No. AD15-11-000 and ongoing in Docket No. RM19-12-000). OMB issued its decisions on the proposed changes in the Forms Refresh Notice of Proposed Rulemaking in Docket RM19-12-000 on March 14, 2019.

² See 18 CFR part 201 (Uniform System of Accounts Prescribed for Natural Gas Companies Subject to the Provisions of the Natural Gas Act).

prepared in accordance with the Commission's USofA and related regulations, and provide data that enables the Commission to develop and monitor cost-based rates, analyze costs of different services and classes of assets, and compare costs across lines of business. The use of the USofA permits natural gas companies to account for similar transactions and events in a consistent manner, and to communicate those results to the Commission on a periodic basis. Comparability of data

and financial statement analysis for a particular entity from one period to the next, or between entities, within the same industry, would be difficult to achieve if each company maintained its own accounting records using dissimilar accounting methods and classifications to record similar transactions and events.

In summary, without the information collected in the forms, it would be difficult for the Commission to ensure, as required by the NGA, that a

pipeline's rates remain just and reasonable, respond to Congressional and outside inquiries, and make decisions in a timely manner.

Type of Respondent: Major and Non-Major Natural Gas Companies.

*Estimate of Annual Burden*³: The Commission estimates the annual public reporting burden and cost⁴ for the information collection as shown in the following table:

| Information collection (FERC Form No.) | Number of respondents | Annual number of responses per respondent | Total number of responses | Average burden & cost per response | Total annual burden hours & cost ⁵ | Annual cost per respondent (\$) |
|--|-----------------------|---|---------------------------|------------------------------------|---|---------------------------------|
| | (1) | (2) | (1)*(2)=(3) | (4) | (3)*(4)=(5) | (5)-(1) |
| 2 | 100 | 1 | 100 | 1,671.66 hrs.; \$133,733 | 167,166 hrs.; 13,373,280 | 133,733 |
| 2-A | 81 | 1 | 81 | 296 hrs.; \$23,680 | 23,976 hrs.; 1,918,080 | 23,680 |

⁵ Every figure in this column is rounded to the nearest dollar.

Comments: Comments are invited on:

- (1) Whether the collection of information is necessary for the proper performance of the functions of the Commission, including whether the information will have practical utility;
- (2) the accuracy of the agency's estimate of the burden and cost of the collection of information, including the validity of the methodology and assumptions used;
- (3) ways to enhance the quality, utility and clarity of the information collection;
- and (4) ways to minimize the burden of the collection of information on those who are to respond, including the use of automated collection techniques or other forms of information technology.

Dated: April 24, 2020.

Kimberly D. Bose,
Secretary.

BILLING CODE 6717-01-P

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Docket No. AD20-3-000]

Review of Cost Submittals by Other Federal Agencies for Administering Part I of the Federal Power Act; Notice Requesting Questions and Comments on Fiscal Year 2019 Other Federal Agency Cost Submissions

In its *Order On Rehearing Consolidating Administrative Annual Charges Bill Appeals And Modifying Annual Charges Billing Procedures*, 109 FERC ¶ 61,040 (2004) (October 8 Order), the Commission set forth an annual process for Other Federal Agencies (OFAs) to submit their costs related to Administering Part I of the Federal Power Act. Pursuant to the established process, the Chief of Financial Operations, Financial Management Division, Office of the Executive Director, on October 4, 2019, issued a letter requesting the OFAs to submit their costs by December 31, 2019 using the OFA Cost Submission Form.

Upon receipt of the agency submissions, the Commission posted the information in eLibrary, and issued, on March 12, 2020, a notice announcing the date for a technical conference to review the submitted costs. On March 26, 2020 the Commission held the technical conference. Technical conference transcripts, submitted cost

forms, and detailed supporting documents are all available for review under Docket No. AD20-3. These documents are accessible on-line at <http://www.ferc.gov>, using the "eLibrary" link. Enter the docket number excluding the last three digits in the docket number field to access the document. At this time, the Commission has suspended access to the Commission's Public Reference Room, due to the proclamation declaring a National Emergency concerning the Novel Coronavirus Disease (COVID-19), issued by the President on March 13, 2020. For assistance, contact the Federal Energy Regulatory Commission at FERCOnlineSupport@ferc.gov or call toll-free, (886) 208-3676 or TTY, (202) 502-8659.

Interested parties may file specific questions and comments on the FY 2019 OFA cost submissions with the Commission under Docket No. AD20-3, no later than May 8, 2020. Once filed, the Commission will forward the questions and comments to the OFAs for response.

Anyone with questions pertaining to the technical conference or this notice should contact Raven A. Rodriguez at (202) 502-6276 (via email at raven.rodriguez@ferc.gov).

Dated: April 24, 2020.

Nathaniel J. Davis, Sr.,
Deputy Secretary.

BILLING CODE 6717-01-P

³ Burden is defined as the total time, effort, or financial resources expended by persons to generate, maintain, retain, or disclose or provide information to or for a Federal agency. For further explanation of what is included in the information

collection burden, refer to 5 Code of Federal Regulations 1320.3.

⁴ The Commission staff believes the FERC FTE (full-time equivalent) average cost for wages plus

benefits is representative of the corresponding cost for the industry respondents. Based upon the FERC's 2019 average cost for salary plus benefits, the average hourly cost is \$80/hour.

BILLING CODE 6717–01–P

ENVIRONMENTAL PROTECTION AGENCY

[FRL–10000–31–OMS]

Cross-Media Electronic Reporting: Authorized Program Revision Approval, Commonwealth of Virginia

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice.

SUMMARY: This notice announces the Environmental Protection Agency's (EPA) approval of the Commonwealth of Virginia's Department of Environmental Quality (DEQ) request to revise/modify certain its EPA-authorized programs to allow electronic reporting.

DATES: EPA approves the authorized program revisions/modifications as of April 30, 2020.

FOR FURTHER INFORMATION CONTACT:

Shirley M. Miller, U.S. Environmental Protection Agency, Office of Environmental Information, Mail Stop 2824T, 1200 Pennsylvania Avenue NW, Washington, DC 20460, (202) 566–2908, miller.shirley@epa.gov.

SUPPLEMENTARY INFORMATION:

On October 13, 2005, the final Cross-Media Electronic Reporting Rule (CROMERR) was published in the **Federal Register** (70 FR 59848) and codified as part 3 of title 40 of the CFR. CROMERR establishes electronic reporting as an acceptable regulatory alternative to paper reporting and establishes requirements to assure that electronic documents are as legally dependable as their paper counterparts. Subpart D of CROMERR requires that state, tribal or local government agencies that receive, or wish to begin receiving, electronic reports under their EPA-authorized programs must apply to EPA for a revision or modification of those programs and obtain EPA approval. Subpart D provides standards for such approvals based on consideration of the electronic document receiving systems that the state, tribe, or local government will use to implement the electronic reporting. Additionally, § 3.1000(b) through (e) of 40 CFR part 3, subpart D provides special procedures for program revisions and modifications to allow electronic reporting, to be used at the option of the state, tribe or local government in place of procedures available under existing program-specific authorization regulations. An application submitted under the subpart D procedures must show that the state, tribe or local government has sufficient legal authority to implement the electronic reporting components of the programs covered by the application and will use electronic document receiving systems that meet the applicable subpart D requirements.

On January 13, 2010, the Virginia Department of Environmental Quality (VA DEQ) submitted an application titled "Electronic Environmental Data Exchange Reporting System" for revision/modification to its EPA-approved stormwater program under

title 40 CFR to allow new electronic reporting. EPA reviewed VA DEQ's request to revise/modify its EPA-authorized Part 123—EPA Administered Permit Programs: The National Pollutant Discharge Elimination System program and, based on this review, EPA determined that the application met the standards for approval of authorized program revision/modification set out in 40 CFR part 3, subpart D. In accordance with 40 CFR 3.1000(d), this notice of EPA's decision to approve Virginia's request to revise/modify its Part 123—EPA Administered Permit Programs: The National Pollutant Discharge Elimination System program to allow electronic reporting under 40 CFR part 122 is being published in the **Federal Register**.

VA DEQ was notified of EPA's determination to approve its application with respect to the authorized program listed above.

Dated: April 24, 2020.

Yvonne Lee,

Acting Director, Office of Information Management.

BILLING CODE 6560–50–P

ENVIRONMENTAL PROTECTION AGENCY

[FRL–9998–23–OMS]

Cross-Media Electronic Reporting: Authorized Program Revision Approval, State of Michigan

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice.

SUMMARY: This notice announces the Environmental Protection Agency's (EPA) approval of the State of Michigan's request to revise its EPA-authorized program—National Primary Drinking Water Regulations Implementation to allow electronic reporting.

DATES: EPA's approval is effective June 1, 2020 for the State of Michigan's National Primary Drinking Water Regulations Implementation program, if no timely request for a public hearing is received and accepted by the Agency.

FOR FURTHER INFORMATION CONTACT:

Shirley Miller, U.S. Environmental Protection Agency, Office of Information Management, Mail Stop 2824T, 1200 Pennsylvania Avenue NW, Washington, DC 20460, (202) 566–2908, miller.shirley@epa.gov, or Erin McGown, U.S. Environmental Protection Agency, Office of Information Management, Mail Stop 2824T, 1200

Pennsylvania Avenue NW, Washington, DC 20460, (202) 564-6381, mcgown.erin@epa.gov.

SUPPLEMENTARY INFORMATION: On October 13, 2005, the final Cross-Media Electronic Reporting Rule (CROMERR) was published in the **Federal Register** (70 FR 59848) and codified as part 3 of title 40 of the CFR. CROMERR establishes electronic reporting as an acceptable regulatory alternative to paper reporting and establishes requirements to assure that electronic documents are as legally dependable as their paper counterparts. Subpart D of CROMERR requires that state, tribal or local government agencies that receive, or wish to begin receiving, electronic reports under their EPA-authorized programs must apply to EPA for a revision or modification of those programs and obtain EPA approval. Subpart D provides standards for such approvals based on consideration of the electronic document receiving systems that the state, tribe, or local government will use to implement the electronic reporting. Additionally, § 3.1000(b) through (e) of 40 CFR part 3, subpart D provides special procedures for program revisions and modifications to allow electronic reporting, to be used at the option of the state, tribe or local government in place of procedures available under existing program-specific authorization regulations. An application submitted under the subpart D procedures must show that the state, tribe or local government has sufficient legal authority to implement the electronic reporting components of the programs covered by the application and will use electronic document receiving systems that meet the applicable subpart D requirements.

On March 22, 2019, the State of Michigan Department of Environment, Great Lakes, and Energy (EGLE) submitted an application titled "Compliance Monitoring Data Portal (CMDP)" for revision of its EPA-authorized Part 142 program under title 40 CFR. EPA reviewed EGLE's request to revise its EPA-authorized program and, based on this review, EPA determined that the application met the standards for approval of authorized program revision set out in 40 CFR part 3, subpart D. In accordance with 40 CFR 3.1000(d), this notice of EPA's decision to approve Michigan's request to revise its Part 142—National Primary Drinking Water Regulations Implementation program to allow electronic reporting under 40 CFR part 141 is being published in the **Federal Register**.

EGLE was notified of EPA's determination to approve its application

with respect to the authorized program listed above.

Also, in today's notice, EPA is informing interested persons that they may request a public hearing on EPA's action to approve the State of Michigan's request to revise its authorized public water system program under 40 CFR part 142, in accordance with 40 CFR 3.1000(f). Requests for a hearing must be submitted to EPA within 30 days of publication of today's **Federal Register** notice. Such requests should include the following information:

- (1) The name, address and telephone number of the individual, organization or other entity requesting a hearing;
- (2) A brief statement of the requesting person's interest in EPA's determination, a brief explanation as to why EPA should hold a hearing, and any other information that the requesting person wants EPA to consider when determining whether to grant the request;
- (3) The signature of the individual making the request, or, if the request is made on behalf of an organization or other entity, the signature of a responsible official of the organization or other entity.

In the event a hearing is requested and granted, EPA will provide notice of the hearing in the **Federal Register** not less than 15 days prior to the scheduled hearing date. Frivolous or insubstantial requests for hearing may be denied by EPA. Following such a public hearing, EPA will review the record of the hearing and issue an order either affirming today's determination or rescinding such determination. If no timely request for a hearing is received and granted, EPA's approval of the State of Michigan's request to revise its part 142—National Primary Drinking Water Regulations Implementation program to allow electronic reporting will become effective 30 days after today's notice is published, pursuant to CROMERR section 3.1000(f)(4).

Dated: April 24, 2020.

Yvonne Lee,

Acting Director, Office of Information Management.

[EPA-HQ-OECA-2013-0317; FRL-10006-06-OMS]

Information Collection Request Submitted to OMB for Review and Approval; Comment Request; NESHAP for Gold Mine Ore Processing (Renewal)

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice.

SUMMARY: The Environmental Protection Agency (EPA) has submitted an information collection request (ICR), NESHAP for Gold Mine Ore Processing (EPA ICR Number 2383.05, OMB Control Number 2060-0659), to the Office of Management and Budget (OMB) for review and approval in accordance with the Paperwork Reduction Act. This is a proposed extension of the ICR, which is currently approved through June 30, 2020. Public comments were previously requested via the **Federal Register** on May 6, 2019 during a 60-day comment period. This notice allows for an additional 30 days for public comments. A fuller description of the ICR is given below, including its estimated burden and cost to the public. An agency may neither conduct nor sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number.

DATES: Additional comments may be submitted on or before June 1, 2020.

ADDRESSES: Submit your comments to EPA, referencing Docket ID No. EPA-HQ-OAR-2003-0152, online using www.regulations.gov (our preferred method), by email to a-and-r-docket@epa.gov, or by mail to: EPA Docket Center, Environmental Protection Agency, Mail Code 28221T, 1200 Pennsylvania Ave. NW, Washington, DC 20460. EPA's policy is that all comments received will be included in the public docket without change including any personal information provided, unless the comment includes profanity, threats, information claimed to be Confidential Business Information (CBI), or other information whose disclosure is restricted by statute.

Submit written comments and recommendations to OMB for the proposed information collection within 30 days of publication of this notice to www.reginfo.gov/public/do/PRAMain. Find this particular information collection by selecting "Currently under 30-day Review—Open for Public Comments" or by using the search function.

FOR FURTHER INFORMATION CONTACT:

Patrick Yellin, Monitoring, Assistance, and Media Programs Division, Office of Compliance, Mail Code 2227A, Environmental Protection Agency, 1200 Pennsylvania Ave. NW, Washington, DC 20460; telephone number: (202) 564-2970; fax number: (202) 564-0050; email address: yellin.patrick@epa.gov.

SUPPLEMENTARY INFORMATION:

Supporting documents, which explain in detail the information that the EPA will be collecting, are available in the public docket for this ICR. The docket can be viewed online at

www.regulations.gov, or in person at the EPA Docket Center, EPA West, Room 3334, 1301 Constitution Ave. NW, Washington, DC. The telephone number for the Docket Center is 202-566-1744. For additional information about EPA's public docket, visit: <http://www.epa.gov/dockets>.

Abstract: The National Emission Standards for Hazardous Air Pollutants (NESHAP) for Gold Mine Ore Processing (40 CFR part 63, subpart EEEEEEE) were proposed on April 28, 2010; and promulgated on February 17, 2011. These regulations apply to both existing and new gold mine ore processing and production facilities that are area sources and use ore pretreatment, carbon processes with mercury retorts, carbon processes without mercury retorts, and non-carbon concentrate processes. The regulation sets mercury emission limits for each of the affected processes at both new and existing facilities. New facilities include those that either commenced construction or reconstruction after the date of proposal. This information is being collected to assure compliance with 40 CFR part 63, subpart EEEEEEE.

In general, all NESHAP standards require initial notifications, performance tests, and periodic reports by the owners/operators of the affected facilities. They are also required to maintain records of the occurrence and duration of any startup, shutdown, or malfunction in the operation of an affected facility, or any period during which the monitoring system is inoperative. These notifications, reports, and records are essential in determining compliance, and are required of all affected facilities subject to NESHAP.

Form Numbers: None.

Respondents/affected entities: Gold mine ore processing and production facilities.

Respondent's obligation to respond: Mandatory (40 CFR part 63, subpart EEEEEEE).

Estimated number of respondents: 21 (total).

Frequency of response: Initially, occasionally, semiannually, and annually.

Total estimated burden: 2,840 hours (per year). Burden is defined at 5 CFR 1320.3(b).

Total estimated cost: \$556,000 (per year), which includes \$227,000 in annualized capital/startup and/or operation & maintenance costs.

Changes in the Estimates: The burden in labor hours is unchanged from the previous ICR renewal and the number of responses is unchanged. The costs of performance testing and CEMS monitoring are unchanged from the previous ICR renewal. The regulations have not changed over the past three years and are not anticipated to change over the next three years. The growth rate for the industry is very low, negative or non-existent, so there is no change in the estimate of the number of sources subject to these regulations since the previous ICR renewal.

Courtney Kerwin,

Director, Regulatory Support Division.

BILLING CODE 6560-50-P

ENVIRONMENTAL PROTECTION AGENCY

[EPA-HQ-OW-2020-0193; FRL-10008-67-OW]

Proposed Information Collection Request; Comment Request; Effluent Limitation Guidelines Dental Category (Renewal)

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice.

SUMMARY: The Environmental Protection Agency (EPA) is planning to submit an information collection request (ICR), "Information Collection Request for Effluent Limitation Guidelines for the Dental Category (Renewal)" (EPA ICR No. 2514.03, OMB Control No. 2040-0287) to the Office of Management and Budget (OMB) for review and approval in accordance with the Paperwork Reduction Act (PRA). Before doing so, the EPA is soliciting public comments on specific aspects of the proposed information collection. This is a proposed extension of the ICR which is currently approved through November 30, 2020. An Agency may not conduct or sponsor and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number.

DATES: Comments must be submitted on or before June 29, 2020.

ADDRESSES: You may send comments, identified by Docket ID No. EPA-HQ-OW-2020-0193, by any of the following methods:

- **Federal eRulemaking Portal:** <https://www.regulations.gov/> (our preferred method). Follow the online instructions for submitting comments.

- **Email:** Tubbs.Marvin@epa.gov. Include Docket ID No. EPA-HQ-OW-2020-0193 in the subject line of the message.

Instructions: All submissions received must include the Docket ID No. for this rulemaking. Comments received may be posted without change to <https://www.regulations.gov/>, including any personal information provided. For detailed instructions on sending comments and additional information on the rulemaking process, see the "How do I submit written comments?" heading of the **SUPPLEMENTARY INFORMATION** section of this document. Out of an abundance of caution for members of the public and our staff, the EPA Docket Center and Reading Room was closed to public visitors on March 31, 2020, to reduce the risk of transmitting COVID-19. Our Docket Center staff will continue to provide remote customer service via email, phone, and webform. We encourage the public to submit comments via <https://www.regulations.gov/> or email, as there is a temporary suspension of mail delivery to the EPA, and no hand deliveries are currently accepted. For further information on the EPA Docket Center services and the current status, please visit us online at <https://www.epa.gov/dockets>.

FOR FURTHER INFORMATION CONTACT:

Marvin Tubbs, National Program Branch, Water Permits Division, OWM Mail Code: 4203M, Environmental Protection Agency, 1200 Pennsylvania Ave. NW, Washington, DC 20460; telephone number: (202) 564-2996; email address: Tubbs.Marvin@epa.gov.

SUPPLEMENTARY INFORMATION:**I. How do I submit written comments?**

Submit your comments, identified by Docket ID No. EPA-HQ-OW-2020-0193, at <https://www.regulations.gov/> (our preferred method), or the other methods identified in the **ADDRESSES** section. Once submitted, comments cannot be edited or removed from the docket. The EPA may publish any comment received to its public docket. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be

accompanied by a written comment. The written comment is considered the official comment and should include discussion of all points you wish to make. The EPA will generally not consider comments or comment contents located outside of the primary submission (*i.e.* on the web, cloud, or other file sharing system). For additional submission methods, the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit <https://www.epa.gov/dockets/commenting-epa-dockets>.

The EPA is temporarily suspending its Docket Center and Reading Room for public visitors to reduce the risk of transmitting COVID-19. Written comments submitted by mail are temporarily suspended and no hand deliveries will be accepted. Our Docket Center staff will continue to provide remote customer service via email, phone, and webform. We encourage the public to submit comments via <https://www.regulations.gov>. For further information and updates on the EPA Docket Center services, please visit us online at <https://www.epa.gov/dockets>.

The EPA continues to carefully and continuously monitor information from the Centers for Disease Control and Prevention (CDC), local area health departments, and our Federal partners so that we can respond rapidly as conditions change regarding COVID-19.

II. Executive Summary

Supporting documents which explain in detail the information that the EPA will be collecting are available in the public docket for this ICR. The docket can be viewed online at <https://www.regulations.gov>. The telephone number for the Docket Center is 202-566-1744. For additional information about the EPA's public docket, visit <https://www.epa.gov/dockets>.

Pursuant to section 3506(c)(2)(A) of the PRA, the EPA is soliciting comments and information to enable it to: (i) Evaluate whether the proposed collection of information is necessary for the proper performance of the functions of the Agency, including whether the information will have practical utility; (ii) evaluate the accuracy of the Agency's estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used; (iii) enhance the quality, utility, and clarity of the information to be collected; and (iv) minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated

electronic, mechanical, or other technological collection techniques or other forms of information technology, *e.g.*, permitting electronic submission of responses. The EPA will consider the comments received and amend the ICR as appropriate. The final ICR package will then be submitted to OMB for review and approval. At that time, the EPA will issue another **Federal Register** notice to announce the submission of the ICR to OMB and the opportunity to submit additional comments to OMB.

Abstract: This ICR calculates the burden and costs associated with reporting and recordkeeping requirements of the Effluent Limitations Guidelines (ELG) Dental Category. For purposes of this estimate, the EPA assumed all existing dentists affected by the original rulemaking would have complied with the One-Time Compliance Reporting by the time of this ICR renewal. This estimate includes the effort for One-Time Compliance Reporting for new dental offices which open during the ICR period and those which transfer ownership and conduct annual recordkeeping. This estimate is based on average total compensation labor rates from the Bureau of Labor Statistics for the dental office personnel involved in collecting and reporting the information required. This estimate also includes the effort for control authorities to review the information submitted by dentists that certify they meet the requirements of the final rule. The EPA estimates that there would be no start-up or capital costs associated with the information described above. Burden is defined at 5 CFR 1320(b). This ICR is a revision of the "Information Collection Request for Effluent Limitation Guidelines for the Dental Category (Renewal)" (EPA ICR No. 2514.03, OMB Control No. 2040-0287) that estimated the burden and costs associated with reporting and record-keeping activities associated with the Final ELG and Standards for the Dental Category. Respondent reports may contain confidential business information. If a respondent does consider this information to be of a confidential nature, the respondent may request that such information be treated as confidential. All confidential data will be handled in accordance with 40 CFR 122.7, 40 CFR part 2, and the EPA's Security Manual part III, chapter 9, dated August 9, 1976.

Form numbers: None.

Respondents/affected entities: Dentists, Control Authorities.

Respondent's obligation to respond: Mandatory. Sections 403 and 441 of the CWA.

Estimated number of respondents: 124,378 annual average (122,741 permittees and 1,637 States/Tribes/Territories).

Frequency of response: One time.

Total estimated burden: 392,646 hours (per year). Burden is defined at 5 CFR 1320.03(b).

Total estimated cost: \$11,065,942 (per year), includes \$6,655 in non-labor costs (*i.e.*, postage and file storage).

Changes in estimates: The labor hours decreased since the last OMB approved ICR. However, the number of respondents and the labor rates increased; therefore, the overall burden increased. The EPA presumed a one percent growth rate in dental offices and that the EPA is presuming only new dental offices and dental offices transferring ownership will be doing the One-Time Compliance Reporting. However, the EPA revised labor rates to 2018 dollars and included total compensation rather than just wages.

Dated: April 24, 2020.

Andrew D. Sawyers,

Director, Office of Wastewater Management.

BILLING CODE 6560-50-P

ENVIRONMENTAL PROTECTION AGENCY

[FRL_9998-24-OMS]

Cross-Media Electronic Reporting: Authorized Program Revision Approval, State of South Carolina

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice.

SUMMARY: This notice announces the Environmental Protection Agency's (EPA) approval of the State of South Carolina's request to revise/modify certain of its EPA-authorized programs to allow electronic reporting.

DATES: EPA approves the authorized program revisions/modifications as of April 30, 2020.

FOR FURTHER INFORMATION CONTACT: Shirley M. Miller, U.S. Environmental Protection Agency, Office of Environmental Information, Mail Stop 2824T, 1200 Pennsylvania Avenue NW, Washington, DC 20460, (202) 566-2908, miller.shirley@epa.gov.

SUPPLEMENTARY INFORMATION: On October 13, 2005, the final Cross-Media Electronic Reporting Rule (CROMERR) was published in the **Federal Register** (70 FR 59848) and codified as part 3 of title 40 of the CFR. CROMERR establishes electronic reporting as an acceptable regulatory alternative to

paper reporting and establishes requirements to assure that electronic documents are as legally dependable as their paper counterparts. Subpart D of CROMERR requires that state, tribal or local government agencies that receive, or wish to begin receiving, electronic reports under their EPA-authorized programs must apply to EPA for a revision or modification of those programs and obtain EPA approval. Subpart D provides standards for such approvals based on consideration of the electronic document receiving systems that the state, tribe, or local government will use to implement the electronic reporting. Additionally, § 3.1000(b) through (e) of 40 CFR part 3, subpart D provides special procedures for program revisions and modifications to allow electronic reporting, to be used at the option of the state, tribe or local government in place of procedures available under existing program-specific authorization regulations. An application submitted under the subpart D procedures must show that the state, tribe or local government has sufficient legal authority to implement the electronic reporting components of the programs covered by the application and will use electronic document receiving systems that meet the applicable subpart D requirements.

On April 15, 2019, the South Carolina Department of Health and Environmental Control (SCDHEC) submitted an application titled South Carolina e-Permitting for revisions/modifications to its EPA-approved programs under title 40 CFR to allow new electronic reporting. EPA reviewed SCDHEC's request to revise/modify its EPA-authorized programs and, based on this review, EPA determined that the application met the standards for approval of authorized program revisions/modifications set out in 40 CFR part 3, subpart D. In accordance with 40 CFR 3.1000(d), this notice of EPA's decision to approve South Carolina's request to revise/modify its following EPA-authorized programs to allow electronic reporting under 40 CFR parts 60, 61, 63, 64, 70, 122, 125, 233, 240, 241, 243, 246, 247, 254, 255, 256, 257, 260, 261, 262, 263, 264, 265, 266, 268, 270, 272, 273, 279, 280, and 403 is being published in the **Federal Register**:

Part 63: National Emission Standards for Hazardous Air Pollutants for Source Categories (NESHAP MACT/Clean Air Act Title III) Reporting under CFR 61, 63 & 65 Part 70: State Operating Permit Programs (Clean Air Act Title V) Part 123: EPA-Administered Permit Programs: The National Pollutant Discharge

Elimination System (NPDES) Part 233: "404" State Program Regulations (Ocean Dumping) Reporting under CFR 233 Part 239: Requirements for State Permit Program Determination of Adequacy (RCRA Subtitle C) Part 271: Requirements for Authorization of State Hazardous Waste Programs (RCRA Subtitle C) Part 281: Technical Standards and Corrective Action Requirements for Owners and Operators of Underground Storage Tanks (UST) Part 403: General Pretreatment Regulations for Existing and New Sources of Pollution

SCDHEC was notified of EPA's determination to approve its application with respect to the authorized programs listed above.

Dated: April 24, 2020.

Yvonne Lee,

Acting Director, Office of Information Management.

[FR Doc. 2020-09131 Filed 4-29-20; 8:45 am]

BILLING CODE 6560-50-P

FEDERAL TRADE COMMISSION

Agency Information Collection Activities; Proposed Collection; Comment Request

AGENCY: Federal Trade Commission.

ACTION: Notice.

SUMMARY: In accordance with the Paperwork Reduction Act of 1995 ("PRA"), the Federal Trade Commission ("FTC" or "Commission") is seeking public comment on its proposal to extend for an additional three years the Office of Management and Budget clearance for information collection requirements in the Privacy of Consumer Financial Information Rule ("Privacy Rule" or "Rule"). That clearance expires on November 30, 2020.

DATES: Comments must be submitted by June 29, 2020.

ADDRESSES: Interested parties may file a comment online or on paper, by following the instructions in the Request for Comment part of the **SUPPLEMENTARY INFORMATION** section below. Write "Privacy Rule: Paperwork Comment: FTC File No. P085405" on your comment and file your comment online at <https://www.regulations.gov>, by following the instructions on the web-based form. If you prefer to file your comment on paper, mail your comment to the following address: Federal Trade Commission, Office of the Secretary, 600 Pennsylvania Avenue NW, Suite

CC-5610 (Annex J), Washington, DC 20580, or deliver your comment to the following address: Federal Trade Commission, Office of the Secretary, Constitution Center, 400 7th Street, SW, 5th Floor, Suite 5610 (Annex J), Washington, DC 20024.

FOR FURTHER INFORMATION CONTACT:

David Lincicum, Attorney, Division of Privacy and Identity Protection, Bureau of Consumer Protection, Federal Trade Commission, 600 Pennsylvania Ave. NW, Washington, DC 20580, (202) 326-2773.

SUPPLEMENTARY INFORMATION:

Title of Collection: Privacy of Consumer Financial Information (Gramm-Leach-Bliley Act Privacy Rule), 16 CFR part 313.

OMB Control Number: 3084-0121.

Type of Review: Extension without change of currently approved collection.

Affected Public: Private Sector: Businesses and other for-profit entities.

Estimated Annual Burden Hours: 1,345,950.

Estimated Annual Labor Costs: \$30,363,151.

Abstract:

The Privacy Rule is designed to ensure that customers and consumers, subject to certain exceptions, will have access to the privacy policies of the covered financial institutions with which they conduct business—namely, motor vehicle dealers that do not routinely extend credit to consumers directly without assigning the credit to unaffiliated third parties (hereafter, "motor vehicle dealers"). As mandated by the Gramm-Leach-Bliley Act ("GLBA"), 15 U.S.C. 6801–6809, the Rule requires motor vehicle dealers to disclose to consumers: (1) Initial notice of the financial institution's privacy policy when establishing a customer relationship with a consumer and/or before sharing a consumer's nonpublic personal information with certain nonaffiliated third parties; (2) notice of the consumer's right to opt out of information sharing with such parties; (3) annual notice of the institution's privacy policy to any continuing customer;¹ and (4) notice of changes in

¹ On December 4, 2015, Congress amended the GLBA as part of the Fixing America's Surface Transportation Act ("FAST Act"). This amendment, titled Eliminate Privacy Notice Confusion (FAST Act, Public Law 114094, section 75001) added new GLBA section 503(f). This subsection provides an exception under which financial institutions that meet certain conditions are not required to provide annual privacy notices to customers. Section 503(f) requires that to qualify for this exception, a financial institution must not share nonpublic personal information about customers except as described in certain statutory exceptions, under which sharing does not trigger a customer's

the institution's practices on information sharing. These requirements are subject to the PRA. The Rule does not require recordkeeping. For PRA burden calculations, the FTC shares the PRA burden with the CFPB for financial institutions over which both agencies have enforcement authority under the CFPB's regulation corresponding to the Privacy Rule, titled Privacy of Consumer Financial Information (Regulation P), 12 CFR pt. 1016, and attributes to itself the burden for all motor vehicle dealers. *See* 12 U.S.C. 5519.

Burden Estimates:

FTC staff estimates that approximately 29,500 non-motor vehicle dealer financial institutions are subject to FTC jurisdiction under Regulation P, consisting of approximately 29,000 established entities and 500 new entrants annually during the renewal period. The complete burden estimates for new entrants and established entities are detailed in the charts below.

1. Established Financial Institutions

For established entities, staff believes that the model privacy form and the Online Form Builder reduce the time associated with providing required

initial and annual notices. Businesses who have not changed their privacy notice since the last notice sent and who do not share information with non-affiliated third parties outside of certain statutory exceptions are not required to issue annual notices to their customers under GLBA section 503(f). FTC staff thus estimates that at least 80% of businesses covered by Regulation P will not be required to issue annual notices. Finally, staff estimates that no more than 1% of the estimated 29,000 established-entity respondents would make additional changes to privacy policies at any time other than the occasion of the annual notice.

| Activity | Hours per respondent | Approx. number of respondents ² | Approx. total annual hrs. | FTC portion | Hourly wage and labor category ³ | Approx. total labor costs |
|---|----------------------|--|---------------------------|-------------|---|---------------------------|
| Reviewing internal policies and developing GLB Act-implementing instructions ⁴ . | 4 | 29,000 | 116,000 | 58,000 | \$38.55 Professional/Technical. | \$2,235,900 |
| Disseminating initial notices to new customers. | 15 | 29,000 | 435,000 | 217,500 | 17.19 Clerical | 3,738,825 |
| Disseminating annual disclosure to pre-existing customers. | 15 | 4,060 | 60,900 | 30,450 | 17.19 Clerical | 523,436 |
| | 5 | 4,060 | 20,300 | 10,150 | 38.55 Professional/Technical. | 391,283 |
| Updating privacy policies and related disclosures. | 7 | 290 | 2,030 | 1,015 | 17.19 Clerical | 17,448 |
| | 3 | 290 | 870 | 435 | | 7,478 |
| Totals: | | | 635,100 | 317,550 | | 6,914,370 |

² The estimate of respondents which are required to disseminate annual notices is based on the following assumptions: (1) 29,000 established respondents, approximately 70% of whom maintain customer relationships exceeding one year; (2) no more than 20% (4,060) of whom have made changes to their policies and share nonpublic information outside of the statutory exceptions, and therefore are required to provide annual notices under GLB Act section 503(f); and (3) and no more than 1% (290) of whom make additional changes to privacy policies at any time other than the occasion of the annual notice; and (4) such changes will occur no more often than once per year.

³ Staff calculated labor costs by applying appropriate hourly cost figures to burden hours. The hourly rates used were based on median wages for Financial Examiners and for Office and Administrative Support, corresponding to professional/technical time (e.g., compliance evaluation and planning, designing and producing notices, reviewing and updating information systems), and clerical time (e.g., reproduction tasks, filing, and, where applicable to the given event, typing or mailing) respectively. See BLS Occupational Employment and Wages, May 2018, Table 1 at <http://www.bls.gov/news.release/pdf/ocwage.pdf>.

⁴ This includes all efforts performed by or for the respondent to: determine whether and to what extent the respondent is covered by an agency collection of information, understand the nature of the request, and determine the appropriate response (including the creation and dissemination of documents and/or electronic disclosures).

2. New Entrant Financial Institutions

New entrant financial institutions subject to FTC jurisdiction under

Regulation P must provide initial disclosure notices to their consumers, including taking the time to develop implementing policies and procedures

and create disclosure documents to effectuate the disclosure requirements. Staff's estimates of annual burden for established entities is as follows:

| Activity | Hours per respondent | Approx. number of respondent | Approx. total annual hrs. | FTC portion | Hourly wage and labor category ⁵ | Approx. total labor costs |
|---|----------------------|------------------------------|---------------------------|-------------|---|---------------------------|
| Reviewing internal policies and developing GLB Act-implementing instructions. | 20 | 500 | 10,000 | 5,000 | \$38.55 Professional/Technical. | \$192,750 |
| Creating disclosure document or electronic disclosure (including initial, annual, and opt-out disclosures). | 1 | 500 | 500 | 250 | 17.19 Clerical | 4,298 |
| | 2 | 500 | 1,000 | 500 | 38.55 Professional/Technical. | 19,275 |
| Disseminating initial disclosure (including opt-out notices). | 15 | 500 | 7,500 | 3,750 | 17.19 Clerical | 64,463 |
| | 10 | 500 | 5,000 | 2,500 | 38.55 Professional/Technical. | 96,375 |

statutory right to opt out of the sharing. In addition, section 503(f)(2) requires that the financial institution must not have changed its policies and

practices with regard to disclosing nonpublic personal information from those that the institution

disclosed in the most recent privacy notice the customer received.

| Activity | Hours per respondent | Approx. number of respondent | Approx. total annual hrs. | FTC portion | Hourly wage and labor category ⁵ | Approx. total labor costs |
|--------------|----------------------|------------------------------|---------------------------|-------------|---|---------------------------|
| Totals | | | 240,000 | 12,000 | | 377,161 |

⁵ Staff calculated labor costs by applying appropriate hourly cost figures to burden hours, as described in footnote 3 above.

3. Established Motor Vehicle Dealers

FTC has sole authority over motor vehicle dealers subject to the Rule. Staff

estimates that approximately 44,000 auto dealers are subject to the Rule's requirements, consisting of 42,000 established dealers and 2,000 new

entrants during the renewal period. FTC staff provides the following burden estimates for established motor vehicle dealers:

| Activity | Hours per respondent | Approx. number of respondents ⁶ | Approx. total annual hrs. | Hourly wage and labor category ⁷ | Approx. total labor costs |
|---|----------------------|--|---------------------------|---|---------------------------|
| Reviewing internal policies and developing GLB Act-implementing instructions. | 4 | 42,000 | 168,000 | \$38.55 Professional/ Technical. | \$6,476,000 |
| Disseminating initial notices to new customers | 15 | 42,000 | 630,000 | \$17.19 Clerical | 10,829,700 |
| Disseminating annual disclosure | 15 | 5,880 | 88,200 | \$17.19 Clerical | 1,516,158\$ |
| | 5 | 5,880 | 29,400 | \$38.55 Professional/ Technical. | 1,133,370 |
| Updating privacy policies and related disclosures | 7 | 420 | 2,940 | \$17.19 Clerical | 50,539 |
| | 3 | 420 | 1,260 | \$38.55 Professional/ Technical. | 48,573 |
| Totals: | | | 920,400 | | 20,054,340 |

⁶ For this estimate, Commission staff relies on industry estimates based on census data and information from the National Automobile Dealers Association and National Independent Automobile Dealers Association.

⁷ Staff calculated labor costs by applying appropriate hourly cost figures to the burden hours described above. See BLS Occupational Employment and Wages, May 2018, Table 1 at <http://www.bls.gov/news.release/pdf/ocwage.pdf>.

4. New Entrant Motor Vehicle Dealers

FTC staff provides the following burden estimates for established new entrant motor vehicle dealers:

| Activity | Hours per respondent | Approx. number of respondents | Approx. total annual hrs. | Hourly wage and labor category | Approx. total labor costs |
|---|----------------------|-------------------------------|---------------------------|----------------------------------|---------------------------|
| Reviewing internal policies and developing GLB Act-implementing instructions. | 20 | 2,000 | 40,000 | \$38.55 Professional/ Technical. | \$1,542,000 |
| Creating disclosure document or electronic disclosure (including initial, annual, and opt-out disclosures). | 1 | 2,000 | 2,000 | \$17.19 Clerical | 34,380 |
| | 2 | 2,000 | 4,000 | \$38.55 Professional/ Technical. | 154,200 |
| Disseminating initial disclosure (including opt-out notices). | 15 | 2,000 | 30,000 | \$17.19 Clerical | 515,700 |
| | 10 | 2,000 | 20,000 | \$38.55 Professional/ Technical. | 771,000 |
| Totals: | | | 96,000 | | 3,017,280 |

Estimated non-labor costs:

Staff believes that capital or other non-labor costs associated with these information collection requirements are minimal. Staff anticipates that covered entities are already equipped to provide written notices (e.g., computers with word processing programs, copying machines, mailing capabilities). In addition, staff anticipates that entities that offer consumers the choice to receive notices via electronic format will already have an online presence to support this option. As such, these entities will already be equipped with the computer equipment and software

necessary to disseminate the required disclosures via electronic means.

Under the PRA, 44 U.S.C. 3501–3521, federal agencies must obtain approval from OMB for each collection of information they conduct or sponsor. “Collection of information” means agency requests or requirements that members of the public submit reports, keep records, or provide information to a third party. 44 U.S.C. 3502(3); 5 CFR 1320.3(c). As required by section 3506(c)(2)(A) of the PRA, the FTC is providing this opportunity for public comment before requesting that OMB extend the existing clearance for the

information collection requirements contained in the Privacy Rule, 16 CFR part 313 (OMB Control No. 3084–0121).

Request for Comment

Pursuant to Section 3506(c)(2)(A) of the PRA, the FTC invites comments on: (1) Whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility; (2) the accuracy of the agency's estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used; (3) ways to enhance the quality, utility,

and clarity of the information to be collected; and (4) ways to minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology, *e.g.*, permitting electronic submission of responses.

You can file a comment online or on paper. For the Commission to consider your comment, we must receive it on or before June 29, 2020. Write "Privacy Rule: Paperwork Comment: FTC File No. P085405" on your comment. Postal mail addressed to the Commission is subject to delay due to heightened security screening. As a result, we encourage you to submit your comments online. To make sure that the Commission considers your online comment, you must file it through the <https://www.regulations.gov> website by following the instructions on the web-based form provided. Your comment, including your name and your state—will be placed on the public record of this proceeding, including the <https://www.regulations.gov> website.

If you file your comment on paper, write "Privacy Rule: Paperwork Comment: FTC File No. P085405" on your comment and on the envelope, and mail your comment to the following address: Federal Trade Commission, Office of the Secretary, 600 Pennsylvania Avenue NW, Suite CC-5610 (Annex J), Washington, DC 20580, or deliver your comment to the following address: Federal Trade Commission, Office of the Secretary, Constitution Center, 400 7th Street SW, 5th Floor, Suite 5610, Washington, DC 20024. If possible, please submit your paper comment to the Commission by courier or overnight service.

Because your comment will be placed on the public record, you are solely responsible for making sure that your comment does not include any sensitive or confidential information. In particular, your comment should not include any sensitive personal information, such as your or anyone else's Social Security number; date of birth; driver's license number or other state identification number, or foreign country equivalent; passport number; financial account number; or credit or debit card number. You are also solely responsible for making sure that your comment does not include any sensitive health information, such as medical records or other individually identifiable health information. In addition, your comment should not include any "trade secret or any commercial or financial information

which . . . is privileged or confidential"—as provided by Section 6(f) of the FTC Act, 15 U.S.C. 46(f), and FTC Rule 4.10(a)(2), 16 CFR 4.10(a)(2)—including in particular competitively sensitive information such as costs, sales statistics, inventories, formulas, patterns, devices, manufacturing processes, or customer names.

Comments containing material for which confidential treatment is requested must be filed in paper form, must be clearly labeled "Confidential," and must comply with FTC Rule 4.9(c). In particular, the written request for confidential treatment that accompanies the comment must include the factual and legal basis for the request, and must identify the specific portions of the comment to be withheld from the public record. See FTC Rule 4.9(c). Your comment will be kept confidential only if the General Counsel grants your request in accordance with the law and the public interest. Once your comment has been posted on the <https://www.regulations.gov> website—as legally required by FTC Rule 4.9(b)—we cannot redact or remove your comment, unless you submit a confidentiality request that meets the requirements for such treatment under FTC Rule 4.9(c), and the General Counsel grants that request.

The FTC Act and other laws that the Commission administers permit the collection of public comments to consider and use in this proceeding as appropriate. The Commission will consider all timely and responsive public comments that it receives on or before June 29, 2020. For information on the Commission's privacy policy, including routine uses permitted by the Privacy Act, see <https://www.ftc.gov/site-information/privacy-policy>.

Josephine Liu,

Assistant General Counsel for Legal Counsel.

BILLING CODE 6750–01–P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Centers for Disease Control and Prevention

[Docket No. CDC–2020–0042]

Healthcare Infection Control Practices Advisory Committee (HICPAC); Notice of Meeting and Request for Comment

AGENCY: Centers for Disease Control and Prevention (CDC), Department of Health and Human Services (HHS).

ACTION: Notice of meeting.

SUMMARY: In accordance with the Federal Advisory Committee Act, the CDC announces the following meeting for the Healthcare Infection Control Practices Advisory Committee (HICPAC). This meeting is open to the public, limited only by audio phone lines available. The public is welcome to listen to the meeting by teleconference at 1–800–369–1817, and the passcode is 5200122; 200 teleconference lines are available. Registration is required. Interested parties may register at <https://www.cdc.gov/hicpac>.

DATES: The meeting will be held on June 4, 2020, 9:00 a.m. to 3:00 p.m., EDT.

Written comments must be received on or before May 21, 2020.

ADDRESSES: You may submit comments, identified by Docket No. CDC–2020–0042 by any of the following methods:

- *Federal eRulemaking Portal:* <https://www.regulations.gov>. Follow the instructions for submitting comments.

- *Mail:* Koo-Whang Chung, M.P.H., Centers for Disease Control and Prevention, 1600 Clifton Road, NE, MS H16–3, Atlanta, Georgia 30329–4027, Attn: HICPAC meeting.

Instructions: All submissions received must include the Agency name and Docket Number. All relevant comments received in conformance with the <https://www.regulations.gov> suitability policy will be posted without change to <https://www.regulations.gov>, including any personal information provided. For access to the docket to read background documents or comments received, go to <https://www.regulations.gov>. Written comments received in advance of the meeting will be included in the official record of the meeting.

Meeting information: The teleconference access is 1–800–369–1817, and the passcode is 5200122.

FOR FURTHER INFORMATION CONTACT: Koo-Whang Chung, M.P.H., HICPAC, Division of Healthcare Quality Promotion, NCEZID, CDC, 1600 Clifton Road NE, MS H16–3, Atlanta, Georgia 30329–4027; Telephone: 404–639–4000; Email: hicpac@cdc.gov.

SUPPLEMENTARY INFORMATION:

Purpose: The Committee is charged with providing advice and guidance to the Director, Division of Healthcare Quality Promotion (DHQP), the Director, National Center for Emerging and Zoonotic Infectious Diseases (NCEZID), the Director, CDC, the Secretary, Health and Human Services regarding (1) the practice of healthcare infection prevention and control; (2) strategies for surveillance, prevention, and control of infections, antimicrobial resistance, and related events in settings where

healthcare is provided; and (3) periodic updating of CDC guidelines and other policy statements regarding prevention of healthcare-associated infections and healthcare-related conditions.

Public Participation

Procedure for Public Comment: Time will be available for public comment. Members of the public who wish to provide public comments should plan to attend the public comment session at the start time listed. Please note that the public comment period may end before the time indicated, following the last call for comments.

Written Public Comment: The public is welcome to submit written comments in advance of the meeting. Comments should be submitted on or before May 21, 2020. All requests must contain the name, and organizational affiliation of the speaker, as well as the topic being addressed. Written comments should not exceed one single-spaced typed page in length. Written comments received in advance of the meeting will be included in the official record of the meeting. Comments received, including attachments and other supporting materials, are part of the public record and are subject to public disclosure. Comments will be posted on <https://www.regulations.gov>. Therefore, do not include any information in your comment or supporting materials that you consider confidential or inappropriate for public disclosure. If you include your name, contact information, or other information that identifies you in the body of your comments, that information will be on public display. CDC will review all submissions and may choose to redact, or withhold, submissions containing private or proprietary information such as Social Security numbers, medical information, inappropriate language, or duplicate/near duplicate examples of a mass-mail campaign. CDC will carefully consider all comments submitted to the docket.

Matters To Be Considered: The agenda will include updates from the following HICPAC workgroups: The Healthcare Personnel Guideline Workgroup; the Long-term Care/Post-acute Care Workgroup; the National Healthcare Safety Network Workgroup; and the Bloodstream Infection Guideline Workgroup. Agenda items are subject to change as priorities dictate.

The Director, Strategic Business Initiatives Unit, Office of the Chief Operating Officer, Centers for Disease Control and Prevention, has been delegated the authority to sign **Federal Register** notices pertaining to announcements of meetings and other

committee management activities, for both the Centers for Disease Control and Prevention and the Agency for Toxic Substances and Disease Registry.

Dated: April 24, 2020.

Kalwant Smagh,

*Director, Strategic Business Initiatives Unit,
Office of the Chief Operating Officer, Centers
for Disease Control and Prevention.*

BILLING CODE 4163-18-P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Centers for Disease Control and Prevention

[Docket No. CDC-2020-0041]

Advisory Council for the Elimination of Tuberculosis Meeting (ACET); Notice of Meeting and Request for Comment

AGENCY: Centers for Disease Control and Prevention (CDC), Department of Health and Human Services (HHS).

ACTION: Notice of meeting.

SUMMARY: In accordance with the Federal Advisory Committee Act, the CDC announces the following meeting of the Advisory Council for the Elimination of Tuberculosis Meeting (ACET). This meeting is open to the public, limited only by audio and web conference lines (100 audio and web conference lines are available) by accessing the following telephone number at 1-877-927-1433; the passcode is 12016435. The web

conference access is <https://adobeconnect.cdc.gov/r5p8l2tytpq/>.

DATES: The meeting will be held on June 16, 2020, 10:00 a.m. to 3:30 p.m., EDT.

Written comments must be received on or before June 15, 2020.

ADDRESSES: You may submit comments, identified by Docket No. CDC-2020-0041 by any of the following methods:

- **Federal eRulemaking Portal:** <https://www.regulations.gov>. Follow the instructions for submitting comments.
- **Mail:** Margie Scott-Cseh, CDC, 1600 Clifton Road NE, MS US8-6, Atlanta, Georgia 30329-4027, Attn: ACET Meeting.

Instructions: All submissions received must include the Agency name and Docket Number. All relevant comments received in conformance with the <https://www.regulations.gov> suitability policy will be posted without change to <https://www.regulations.gov>, including any personal information provided. For access to the docket to read background documents or comments received, go to <https://www.regulations.gov>. Written comments received in advance of the meeting will be included in the official record of the meeting.

Meeting information: The teleconference access is 1-877-927-1433, and the passcode: 12016435. The web conference access is <https://adobeconnect.cdc.gov/r5p8l2tytpq/>.

FOR FURTHER INFORMATION CONTACT:

Margie Scott-Cseh, Committee Management Specialist, CDC, 1600 Clifton Road, NE, Mailstop US8-6, Atlanta, Georgia 30329-4027; Telephone: 404-639-8317; Email: zkr7@cdc.gov.

SUPPLEMENTARY INFORMATION:

Purpose: This Council advises and makes recommendations to the Secretary of Health and Human Services, the Assistant Secretary for Health, and the Director, CDC, regarding the elimination of tuberculosis (TB). Specifically, the Council makes recommendations regarding policies, strategies, objectives, and priorities; addresses the development and application of new technologies; and reviews the extent to which progress has been made toward eliminating tuberculosis.

Public Participation

Procedure for Public Comment: Time will be available for public comment. Persons who desire to make an oral statement, may request it at the time of the public comment period on June 16, 2020 at 3:20 p.m., EDT.

Written Public Comment: The public is welcome to submit written comments in advance of the meeting. Comments

should be submitted on or before June 15, 2020. All requests must contain the name, and organizational affiliation of the speaker, as well as the topic being addressed. Written comments received in advance of the meeting will be included in the official record of the meeting. Comments received, including attachments and other supporting materials, are part of the public record and are subject to public disclosure. Comments will be posted on <https://www.regulations.gov>. Therefore, do not include any information in your comment or supporting materials that you consider confidential or inappropriate for public disclosure. If you include your name, contact information, or other information that identifies you in the body of your comments, that information will be on public display. CDC will review all submissions and may choose to redact, or withhold, submissions containing private or proprietary information such as Social Security numbers, medical information, inappropriate language, or duplicate/near duplicate examples of a mass-mail campaign. CDC will carefully consider all comments submitted to the docket.

Matters To Be Considered: The agenda will include discussions on (1) Updates from Global Tuberculosis Branch; (2) Updates from NCHHSTP Epidemiologic and Economic Modeling Agreements (NEEMA) Consortium; (3) A tool to assist TB Programs with integration of Whole Genome Sequencing data; (4) Ongoing challenges with TB drugs and diagnostics supplies; Results from national survey; and (5) Update from ACET workgroups. Agenda items are subject to change as priorities dictate.

The Director, Strategic Business Initiatives Unit, Office of the Chief Operating Officer, Centers for Disease Control and Prevention, has been delegated the authority to sign **Federal Register** notices pertaining to announcements of meetings and other committee management activities, for both the Centers for Disease Control and Prevention and the Agency for Toxic Substances and Disease Registry.

Dated: April 24, 2020.

[FR Doc. 2020-09134 Filed 4-29-20; 8:45 am]

BILLING CODE 4163-18-P

DEPARTMENT OF HEALTH AND HUMAN SERVICES**Administration for Children and Families****Submission for OMB Review; Personal Responsibility Education Program (PREP) Performance Measures and Adulthood Preparation Subjects (PMAPS) Studies—Data Collection Related to the Performance Measures Study—Revision (OMB #0970–0497)**

AGENCY: Office of Planning, Research, and Evaluation, Administration for Children and Families, HHS.

ACTION: Request for public comment.

SUMMARY: A goal of the Performance Measures and Adulthood Preparation Subjects (PMAPS) studies project is to collect, analyze, and report on performance measures data for the Personal Responsibility Education Program (PREP) programs. The Office of Planning, Research, and Evaluation (OPRE) and the Family and Youth Services Bureau (FYSB) in the Administration for Children and Families (ACF) request a revision to a currently approved information collection (OMB No. 0970–0497; expiration date: 04/30/2020). The

purpose of the request is to make adaptations to the participant entry and exit surveys, and continue the ongoing data collection of the performance measures from PREP grantees.

DATES: Comments due within 30 days of publication. OMB is required to make a decision concerning the collection of information between 30 and 60 days after publication of this document in the **Federal Register**. Therefore, a comment is best assured of having its full effect if OMB receives it within 30 days of publication.

ADDRESSES: Written comments and recommendations for the proposed information collection should be sent within 30 days of publication of this notice to www.reginfo.gov/public/do/PRAMain. Find this particular information collection by selecting “Currently under 30-day Review—Open for Public Comments” or by using the search function.

SUPPLEMENTARY INFORMATION:

Description: The PMAPS studies consist of two components: The Performance Measures Study and the Adulthood Preparation Subjects Study. The data collection for the Adulthood Preparation Subjects Study is complete. This notice is specific to data collection

activities for the Performance Measures Study only. The Performance Measures Study component includes collection and analysis of performance measure data from State PREP (SPREP), Tribal PREP (TPREP), Competitive PREP (CPREP), and Personal Responsibility Education Innovative Strategies (PREIS) grantees. Data will be used to determine if PREP and PREIS grantees are meeting performance benchmarks related to the program’s mission and priorities.

This request includes the development of adapted participant entry and exit surveys for middle school students (6th, 7th, and 8th grade youth) that exclude the most sensitive questions pertaining to sexual behavior. This is because some of the PREP middle school curricula do not include topics on sexual behavior, *i.e.*, focus only on healthy relationship education. The adapted surveys will be used by all grantees that serve middle school youth. In addition, some minor edits have been made to the high school surveys.

Respondents: Performance measurement data collection instruments will be administered to individuals representing SPREP, TPREP, CPREP, and PREIS grantees, their sub-awardees, and program participants.

ANNUAL BURDEN ESTIMATES

| Instrument | Total number of respondents | Annual number of respondents | Number of responses per respondent | Average burden hours per response | Annual burden hours |
|---|-----------------------------|------------------------------|------------------------------------|-----------------------------------|---------------------|
| PREP Participant Entry Survey (all versions) | 319,673 | 106,558 | 1 | 0.15 | 15,984 |
| PREP Participant Exit Survey (all versions) | 291,624 | 97,208 | 1 | 0.13333 | 12,961 |
| Performance Reporting System Data Form—State grantees | 153 | 51 | 2 | 18 | 1,836 |
| Performance Reporting System Data Form—TPREP grantees | 28 | 9 | 2 | 18 | 324 |
| Performance Reporting System Data Form—CPREP grantees | 75 | 25 | 2 | 14 | 700 |
| Performance Reporting System Data Form—PREIS grantees | 38 | 13 | 2 | 14 | 364 |
| Performance Reporting System Data Form—State sub-awardees | 987 | 329 | 2 | 14 | 9,212 |
| Performance Reporting System Data Form—TPREP sub-awardees | 85 | 28 | 2 | 14 | 784 |
| Performance Reporting System Data Form—CPREP sub-awardees | 110 | 37 | 2 | 12 | 888 |
| Performance Reporting System Data Form—PREIS sub-awardees | 66 | 22 | 2 | 12 | 528 |
| Estimated Total Annual Burden Hours: | | | | | 43,581 |

BILLING CODE 4184–37–P

DEPARTMENT OF HEALTH AND HUMAN SERVICES**Food and Drug Administration**

[Docket No. FDA-2017-N-6644]

Fiscal Year 2020 Generic Drug Regulatory Science Initiatives; Public Workshop; Remote Only**AGENCY:** Food and Drug Administration, HHS.**ACTION:** Notice.

SUMMARY: The Food and Drug Administration is announcing that the following public workshop entitled “FY 2020 Generic Drug Regulatory Science Initiatives” announced in the **Federal Register** on March 10, 2020, is being modified to take place remotely.

DATES: The public workshop will be held on May 4, 2020, from 8:30 a.m. to 4:30 p.m. Submit either electronic or written comments on this public workshop by June 4, 2020. See the **SUPPLEMENTARY INFORMATION** section for registration and participation information.

FOR FURTHER INFORMATION CONTACT: Stephanie Choi, Center for Drug Evaluation and Research, Food and Drug Administration, 10903 New Hampshire Ave., Bldg. 75, Rm. 4732, Silver Spring, MD 20993-0002, 240-402-7960, Stephanie.Choi@fda.hhs.gov; or Robert Lionberger, Center for Drug Evaluation and Research, Food and Drug Administration, 10903 New Hampshire Ave., Bldg. 75, Rm. 4722, Silver Spring, MD 20993, 240-402-7957, Robert.Lionberger@fda.hhs.gov.

SUPPLEMENTARY INFORMATION: Due to the ongoing COVID-19 pandemic, this workshop announced in the **Federal Register** on March 10, 2020 (85 FR 13905) is being changed from in person to remote only. How to register and participate in this remote meeting will be communicated on the FDA web page at the following address: <https://www.fda.gov/news-events/fda-meetings-conferences-and-workshops/fy-2020-generic-drug-regulatory-science-initiatives-public-workshop-05042020-05042020>.

Dated: April 24, 2020.

BILLING CODE 4164-01-P**DEPARTMENT OF HEALTH AND HUMAN SERVICES****Food and Drug Administration**

[Docket No. FDA-2017-D-2834]

Extension of Certain Tobacco Product Compliance Deadlines Related to the Final Deeming Rule; Withdrawal of Guidance**AGENCY:** Food and Drug Administration, HHS.**ACTION:** Notice; withdrawal.

SUMMARY: The Food and Drug Administration (FDA or Agency) is announcing the withdrawal of a guidance for industry entitled “Extension of Certain Tobacco Product Compliance Deadlines Related to the Final Deeming Rule,” which was issued in 2017. The guidance was intended to assist persons who manufacture, package, sell, offer to sell, distribute, or import for sale and distribution within the United States newly regulated tobacco products, roll-your-own (RYO) tobacco, and cigarette tobacco in complying with the Federal Food, Drug, and Cosmetic Act (FD&C Act), as amended by the Family Smoking Prevention and Tobacco Control Act (Tobacco Control Act), and FDA regulations. FDA is withdrawing the guidance because the compliance deadlines contained therein have passed, have been vacated or stayed, or are otherwise described in other guidance.

DATES: The withdrawal is applicable April 30, 2020.

FOR FURTHER INFORMATION CONTACT: Eric C. Mandle, Center for Tobacco Products, Food and Drug Administration, 10903 New Hampshire Ave., Document Control Center, Bldg. 71, Rm. G335, Silver Spring, MD 20993-0002; 1-877-287-1373, CTPRegulations@fda.hhs.gov.

SUPPLEMENTARY INFORMATION: FDA is withdrawing the guidance for industry entitled “Extension of Certain Tobacco Product Compliance Deadlines Related to the Final Deeming Rule,” which was issued in 2017 (see 82 FR 37459 (August 10, 2017)) and which has been revised several times since then. The guidance was intended to assist persons who manufacture, package, sell, offer to sell, distribute, or import for sale and distribution within the United States newly regulated tobacco products, RYO tobacco, and cigarette tobacco in complying with the FD&C Act, as amended by the Tobacco Control Act, and FDA regulations.

The Tobacco Control Act (Pub. L. 111-31) granted FDA the authority to immediately regulate the manufacture, marketing, and distribution of cigarettes, cigarette tobacco, RYO, and smokeless tobacco products to protect the public health and to reduce tobacco use by minors.

The Tobacco Control Act also gave FDA the authority to issue a regulation deeming all other products that meet the statutory definition of a tobacco product to be subject to chapter IX of the FD&C Act (section 901(b) (21 U.S.C. 387a(b)) of the FD&C Act). On May 10, 2016, FDA issued that rule, extending FDA’s tobacco product authority to all products that meet the definition of tobacco product in the law (except for accessories of newly regulated tobacco products), including electronic nicotine delivery systems, cigars, hookah, pipe tobacco, nicotine gels, dissolvables that were not already subject to the FD&C Act, and other tobacco products that may be developed in the future (81 FR 28974 at 28976) (“the final deeming rule”).

In May 2017, FDA published the first edition of this guidance, under which it provided a 3-month extension of all future compliance deadlines under the final deeming rule. The second edition of the guidance, published in August 2017, revised and updated the first edition by further extending certain of the future compliance dates.

On May 15, 2019, the U.S. District Court for the District of Maryland issued an order vacating the extended compliance dates for premarket review in the guidance.¹ On July 12, 2019, the court issued an order directing FDA to require that premarket authorization applications for all new—i.e., not “grandfathered”—²deemed tobacco products to be submitted to the Agency within 10 months, by May 12, 2020, and providing for a 1-year period during which products with timely filed applications might remain on the market pending FDA review.³ As

¹ *American Academy of Pediatrics, et al. v. Food and Drug Administration, et al.*, 379 F.Supp.3d 461 (D. Md. 2019).

² A “grandfathered” product is one that was on the market as of February 15, 2007. “Guidance for Industry, Establishing That a Tobacco Product Was Commercially Marketed in the United States as of February 15, 2007,” dated September 2014, available at: <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/establishing-tobacco-product-was-commercially-marketed-united-states-february-15-2007>.

³ *American Academy of Pediatrics, et al. v. Food and Drug Administration, et al.*, 399 F.Supp.3d 479 (D. Md. 2019). The court has granted intervention to vapor industry trade associations for purposes of appealing the court’s decision and remedies order. See *American Academy of Pediatrics, et al. v. Food and Drug Administration, et al.*, No. 8:18-cv-883

required by the court's order, deemed new tobacco products on the market as of August 8, 2016, for which premarket authorization applications are not filed by May 12, 2020, are subject to FDA enforcement actions, in the Agency's discretion. The court subsequently clarified that its order did not restrict FDA's authority to enforce the premarket review provisions against deemed products, prior to May 12, 2020, or during the 1-year review period.⁴ On April 22, 2020, the court, upon FDA's motion, extended the premarket application deadline set out in its order by 120 days (until September 9, 2020) in light of the global outbreak of respiratory illness caused by a new coronavirus.⁵

FDA is withdrawing the guidance because the compliance deadlines contained therein have passed, have been vacated, or are stayed, with the exception of those for reporting requirements for harmful or potentially harmful constituents (HPHC). FDA has published and described these deadlines in the Small Entity Compliance Guide for the final deeming rule;⁶ they are also listed on the Center for Tobacco Products' HPHC website.⁷

Dated: April 24, 2020.

Lowell J. Schiller,

Principal Associate Commissioner for Policy.

BILLING CODE 4164-01-P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

[Docket No. FDA-2010-N-0597]

Agency Information Collection Activities; Submission for Office of Management and Budget Review; Comment Request; Index of Legally Marketed Unapproved New Animal Drugs for Minor Species

AGENCY: Food and Drug Administration, HHS.

ACTION: Notice.

SUMMARY: The Food and Drug Administration (FDA) is announcing that a proposed collection of information has been submitted to the

Office of Management and Budget (OMB) for review and clearance under the Paperwork Reduction Act of 1995.

DATES: Submit written comments (including recommendations) on the collection of information by June 1, 2020.

ADDRESSES: To ensure that comments on the information collection are received, OMB recommends that written comments be submitted to <https://www.reginfo.gov/public/do/PRAMain>. Find this particular information collection by selecting "Currently under Review—Open for Public Comments" or by using the search function. The OMB control number for this information collection is 0910-0620. Also include the FDA docket number found in brackets in the heading of this document.

FOR FURTHER INFORMATION CONTACT: Ila S. Mizrahi, Office of Operations, Food and Drug Administration, Three White Flint North, 10A-12M, 11601 Landsdown St., North Bethesda, MD 20852, 301-796-7726, PRASStaff@fda.hhs.gov.

SUPPLEMENTARY INFORMATION: In compliance with 44 U.S.C. 3507, FDA has submitted the following proposed collection of information to OMB for review and clearance.

Index of Legally Marketed Unapproved New Animal Drugs for Minor Species—21 CFR Part 516

OMB Control Number 0910-0620—Extension

The Minor Use and Minor Species Animal Health Act of 2004 (the MUMS Act) (Pub. L. 108-282) added section 572 of the Federal Food, Drug, and Cosmetic Act (FD&C Act) (21 U.S.C. 360ccc-1), which authorizes FDA to establish new regulatory procedures intended to make more medications legally available to veterinarians and animal owners for the treatment of minor animal species (species other than cattle, horses, swine, chickens, turkeys, dogs, and cats). In enacting the MUMS Act, Congress sought to encourage the development of these new animal drugs. Congress recognized that the markets for drugs intended to treat these species are so small that there are often insufficient economic

incentives to motivate drug companies to develop data to support approvals. Further, Congress recognized that some minor species populations are too small or their management systems too diverse to make it practical to conduct traditional studies to demonstrate safety and effectiveness of animal drugs for such uses.

As a result of these limitations, drug companies have generally not been willing or able to collect data to support legal marketing of drugs for these species. Consequently, Congress enacted the MUMS Act to provide incentives to develop new animal drugs for minor species, while still ensuring appropriate safeguards for animal and human health. Section 572 of the FD&C Act provides for a public index listing of legally marketed unapproved new animal drugs for minor species. FDA regulations in part 516 (21 CFR part 516) specify, among other things, the criteria and procedures for requesting eligibility for indexing and for requesting addition to the index, as well as the annual reporting requirements for index holders. The administrative procedures and criteria for indexing a new animal drug for use in a minor species are set forth in §§ 516.111 through 516.171 (21 CFR 516.111 through 516.171). Section 516.165 sets forth the annual reporting requirements for index holders. FDA needs the information to determine: (1) The eligibility of a new animal drug for indexing; (2) that a qualified expert panel proposed to review certain information regarding the new animal drug meets the selection criteria listed in the regulations; (3) whether the Agency agrees with the recommendation of a qualified expert panel that a drug be added to the index; and (4) whether there may be grounds for removing a drug from the index.

In the **Federal Register** of January 7, 2020 (85 FR 714), we published a 60-day notice requesting public comment on the proposed collection of information. Although one comment was received, it was not responsive to the four collection of information topics solicited.

FDA estimates the burden of this collection of information as follows:

(PWG), Dkt. No. 154 (October 2, 2019). An appeal is pending. See *American Academy of Pediatrics v. Cigar Ass'n of America*, Nos. 19-2130, -2132, -2198 (4th Cir.).

⁴ *American Academy of Pediatrics, et al. v. Food and Drug Administration, et al.*, Case No. 8:18-cv-883 (PWG), (D. Md. August 12, 2019), Dkt. No. 132.

⁵ *American Academy of Pediatrics, et al. v. Food and Drug Administration, et al.*, Case No. 8:18-cv-883 (PWG), (D. Md. April 22, 2020), Dkt. No. 182.

⁶ <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/fda-deems-certain-tobacco-products-subject-fda-authority-sales-and-distribution-restrictions-and>.

⁷ For more information, please see <https://www.fda.gov/tobacco-products/products-ingredients-components/harmful-and-potentially-harmful-constituents-hphcs>.

TABLE 1—ESTIMATED ANNUAL REPORTING BURDEN ¹

| 21 CFR section | Number of respondents | Number of responses per respondent | Total annual responses | Average burden per response | Total hours |
|---|-----------------------|------------------------------------|------------------------|-----------------------------|--------------|
| 516.119; requires a foreign drug company to submit and update the name and address of a permanent U.S. resident agent | 5 | 1 | 5 | 1 | 5 |
| 516.121; written request for a meeting with FDA to discuss the requirements for indexing a new animal drug ... | 30 | 2 | 60 | 4 | 240 |
| 516.123; written request for an informal conference and a requestor's written response to an FDA initial decision denying a request | 3 | 1 | 3 | 8 | 24 |
| 516.125; correspondence and information associated with investigational use of new animal drugs intended for indexing | 2 | 3 | 6 | 20 | 120 |
| 516.129; content and format of a request for determination of eligibility for indexing | 30 | 2 | 60 | 20 | 1,200 |
| 516.141; information to be submitted to FDA by a requestor seeking to establish a qualified expert panel | 20 | 1 | 20 | 16 | 320 |
| 516.143; content and format of the written report of the qualified expert panel | 20 | 1 | 20 | 120 | 2,400 |
| 516.145; content and format of a request for addition to the index | 20 | 1 | 20 | 20 | 400 |
| 516.161; content and format of a request for modification of an indexed drug | 3 | 1 | 3 | 4 | 12 |
| 516.163; information to be contained in a request to FDA to transfer ownership of a drug's index file to another person | 1 | 1 | 1 | 2 | 2 |
| 516.165; requires drug experience reports and distributor statements to be submitted to FDA | 10 | 10 | 100 | 5 | 500 |
| Total | | | | | 5,223 |

¹ There are no capital costs or operating and maintenance costs associated with this collection of information.

TABLE 2—ESTIMATED ANNUAL RECORDKEEPING BURDEN ¹

| 21 CFR Section | Number of recordkeepers | Number of records per recordkeeper | Total annual records | Average burden per recordkeeping | Total hours |
|--|-------------------------|------------------------------------|----------------------|----------------------------------|-------------|
| 516.141, requires the qualified expert panel leader to maintain a copy of the written report and all notes or minutes relating to panel deliberations that are submitted to the requestor for 2 years after the report is submitted. | 30 | 2 | 60 | 0.5 (30 minutes) | 30 |
| 516.165, requires the holder of an indexed drug to maintain records of all information pertinent to the safety or effectiveness of the indexed drug, from foreign and domestic sources. | 10 | 2 | 20 | 1 | 20 |
| Total | | | | | 50 |

¹ There are no capital costs or operating and maintenance costs associated with this collection of information.

We based our estimates in tables 1 and 2 on our experience with the MUMS indexing program and the requests for eligibility for indexing and for addition to the index, as well as the periodic drug experience reports submitted during the past 3 years.

Our estimated burden for the information collection reflects an overall increase of 351 reporting hours and a corresponding increase of 85 responses. We attribute this adjustment, generally, to an increase in the number of submissions we received over the last few years. We also reduced our burden hour estimate for drug experience

reports and distributor statements under § 516.165 from 8 hours per submission to 5 hours per submission based on our experience with this type of reporting.

Dated: April 23, 2020.

BILLING CODE 4164-01-P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

[Docket No. FDA-2020-N-0008]

Ophthalmic Devices Panel of the Medical Devices Advisory Committee: Notice of Meeting; Postponement

AGENCY: Food and Drug Administration, HHS.

ACTION: Notice of meeting; postponement.

SUMMARY: The Food and Drug Administration (FDA) is postponing the

meeting of the Ophthalmic Devices Panel of the Medical Devices Advisory Committee scheduled for June 9, 2020. The meeting was announced in the **Federal Register** of April 1, 2020. FDA, like other government agencies, is taking the necessary steps to ensure the Agency is prepared to continue our vital public health mission in the event that our day-to-day operations are impacted by the COVID-19 public health emergency. Therefore, we are postponing this meeting and will reassess on an ongoing basis for future months. A future meeting date will be announced in the **Federal Register**.

FOR FURTHER INFORMATION CONTACT: Aden Asefa, Center for Devices and Radiological Health, Food and Drug Administration, 10903 New Hampshire Ave., Bldg. 66, Rm. 5214, Silver Spring, MD 20993-0002, Aden.Asefa@fda.hhs.gov, 301-796-0400, or FDA Advisory Committee Information Line, 1-800-741-8138 (301-443-0572 in the Washington, DC area) and follow the prompts to the desired center or product area. Please call the Information Line for up-to-date information on this meeting.

SUPPLEMENTARY INFORMATION: The meeting of the Ophthalmic Devices Panel of the Medical Devices Advisory Committee was originally announced in the **Federal Register** of April 1, 2020 (85 FR 18249), and was initially scheduled for June 9, 2020. FDA continues to evaluate whether and how to proceed with upcoming scheduled meetings while our day-to-day operations are impacted by the COVID-19 public health emergency, and we have decided to postpone this public meeting until further notice.

Dated: April 27, 2020.

Lowell J. Schiller,

Principal Associate Commissioner for Policy.

BILLING CODE 4164-01-P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

[Docket No. FDA-2008-N-0424]

Agency Information Collection Activities; Proposed Collection; Comment Request; Postmarketing Safety Information Sharing by Constituent Part Applicants for Combination Products

AGENCY: Food and Drug Administration, HHS.

ACTION: Notice.

SUMMARY: The Food and Drug Administration (FDA or Agency) is announcing an opportunity for public comment on the proposed collection of certain information by the Agency. Under the Paperwork Reduction Act of 1995 (PRA), Federal Agencies are required to publish notice in the **Federal Register** concerning each proposed collection of information, including each proposed extension of an existing collection of information, and to allow 60 days for public comment in response to the notice. This notice solicits comments on the requirements under the Postmarketing Safety Reporting Rule for Combination Product for Constituent Part Applicants to share specified adverse event information with one another.

DATES: Submit either electronic or written comments on the collection of information by June 29, 2020.

ADDRESSES: You may submit comments as follows. Please note that late, untimely filed comments will not be considered. Electronic comments must be submitted on or before June 29, 2020. The <https://www.regulations.gov> electronic filing system will accept comments until 11:59 p.m. Eastern Time at the end of June 29, 2020. Comments received by mail/hand delivery/courier (for written/paper submissions) will be considered timely if they are postmarked or the delivery service acceptance receipt is on or before that date.

Electronic Submissions

Submit electronic comments in the following way:

- **Federal eRulemaking Portal:** <https://www.regulations.gov>. Follow the instructions for submitting comments. Comments submitted electronically, including attachments, to <https://www.regulations.gov> will be posted to the docket unchanged. Because your comment will be made public, you are solely responsible for ensuring that your comment does not include any confidential information that you or a third party may not wish to be posted, such as medical information, your or anyone else's Social Security number, or confidential business information, such as a manufacturing process. Please note that if you include your name, contact information, or other information that identifies you in the body of your comments, that information will be posted on <https://www.regulations.gov>.

- If you want to submit a comment with confidential information that you do not wish to be made available to the public, submit the comment as a written/paper submission and in the

manner detailed (see "Written/Paper Submissions" and "Instructions").

Written/Paper Submissions

Submit written/paper submissions as follows:

- **Mail/Hand Delivery/Courier (for written/paper submissions):** Dockets Management Staff (HFA-305), Food and Drug Administration, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852.

- For written/paper comments submitted to the Dockets Management Staff, FDA will post your comment, as well as any attachments, except for information submitted, marked and identified, as confidential, if submitted as detailed in "Instructions."

Instructions: All submissions received must include the Docket No. FDA-2008-N-0424 for "Postmarketing Safety Information Sharing by Constituent Part Applicants for Combination Products." Received comments, those filed in a timely manner (see **ADDRESSES**), will be placed in the docket and, except for those submitted as "Confidential Submissions," publicly viewable at <https://www.regulations.gov> or at the Dockets Management Staff between 9 a.m. and 4 p.m., Monday through Friday.

- **Confidential Submissions—**To submit a comment with confidential information that you do not wish to be made publicly available, submit your comments only as a written/paper submission. You should submit two copies total. One copy will include the information you claim to be confidential with a heading or cover note that states "THIS DOCUMENT CONTAINS CONFIDENTIAL INFORMATION." The Agency will review this copy, including the claimed confidential information, in its consideration of comments. The second copy, which will have the claimed confidential information redacted/blacked out, will be available for public viewing and posted on <https://www.regulations.gov>. Submit both copies to the Dockets Management Staff. If you do not wish your name and contact information to be made publicly available, you can provide this information on the cover sheet and not in the body of your comments and you must identify this information as "confidential." Any information marked as "confidential" will not be disclosed except in accordance with 21 CFR 10.20 and other applicable disclosure law. For more information about FDA's posting of comments to public dockets, see 80 FR 56469, September 18, 2015, or access the information at: <https://www.govinfo.gov/content/pkg/FR-2015-09-18/pdf/2015-23389.pdf>.

Docket: For access to the docket to read background documents or the electronic and written/paper comments received, go to <https://www.regulations.gov> and insert the docket number, found in brackets in the heading of this document, into the “Search” box and follow the prompts and/or go to the Dockets Management Staff, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852.

FOR FURTHER INFORMATION CONTACT: Amber Sanford, Office of Operations, Food and Drug Administration, Three White Flint North, 10A–12M, 11601 Landsdown St., North Bethesda, MD 20852, 301–796–8867, PRAStaff@fda.hhs.gov.

SUPPLEMENTARY INFORMATION: Under the PRA (44 U.S.C. 3501–3521), Federal Agencies must obtain approval from the Office of Management and Budget (OMB) for each collection of information they conduct or sponsor. “Collection of information” is defined in 44 U.S.C. 3502(3) and 5 CFR 1320.3(c) and includes Agency requests or requirements that members of the public submit reports, keep records, or

provide information to a third party. Section 3506(c)(2)(A) of the PRA (44 U.S.C. 3506(c)(2)(A)) requires Federal Agencies to provide a 60-day notice in the **Federal Register** concerning each proposed collection of information, including each proposed extension of an existing collection of information, before submitting the collection to OMB for approval. To comply with this requirement, FDA is publishing notice of the proposed collection of information set forth in this document.

With respect to the following collection of information, FDA invites comments on these topics: (1) Whether the proposed collection of information is necessary for the proper performance of FDA’s functions, including whether the information will have practical utility; (2) the accuracy of FDA’s estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used; (3) ways to enhance the quality, utility, and clarity of the information to be collected; and (4) ways to minimize the burden of the collection of information on

respondents, including through the use of automated collection techniques, when appropriate, and other forms of information technology.

Information Sharing Among Constituent Part Applicants—21 CFR 4.103

OMB Control Number 0910–0834—Extension

This information collection request applies to “constituent part applicants” as defined under 21 CFR 4.101 (*i.e.*, any person holding an application under which a constituent part (drug, device, or biological product) of a combination product received marketing authorization if the other constituent part(s) received marketing authorization under an application held by a different person). Under this collection, constituent part applicants must share safety information they receive related to certain events with the other constituent part applicant(s) and maintain associated records.¹

FDA estimates the burden of this collection of information as follows:

TABLE 1—ESTIMATED ANNUAL THIRD-PARTY DISCLOSURE AND RECORDKEEPING BURDEN

| 21 CFR section/activity | Number of respondents/recordkeepers | Number of disclosures/records per respondent/recordkeeper | Total annual disclosures/records | Average burden per disclosure/recordkeeping | Total hours |
|---|-------------------------------------|---|----------------------------------|---|-------------|
| 4.103, Sharing information with other constituent part applicants. | 33 | 18 | 594 | 0.35 (21 minutes) | 208 |
| 4.103(b) and 4.105(a)(2), Records of information shared by constituent part applicants. | 33 | 18 | 594 | 0.1 (6 minutes) ... | 59 |
| Total | | | | | 267 |

¹ The Postmarketing Safety Reporting (PMSR) information collections for drugs, biological products, and devices found in §§ 314.80, 314.81, 600.80, 600.81, 606.170, 606.171, 803.50, 803.53, 803.56, 806.10, and 806.20 (21 CFR 314.80, 314.81, 600.80, 600.81, 606.170, 606.171, 803.50, 803.53, 803.56, 806.10, and 806.20) have already been approved and are in effect or their extension is being sought separately as required, including with respect to burden for combination products (reflected in the authorization for OMB control

number 0910–0834, but, therefore, not addressed in this extension request). The pertinent PMSR information collection provisions for § 314.80(c) and (e), as well as for § 314.81(b) are approved under OMB control numbers 0910–0001, 0910–0230, and 0910–0291. The information collection provisions for §§ 600.80 and 600.81 are approved under OMB control number 0910–0308. Those for § 606.170 are approved under OMB control number 0910–0116. Those for § 606.171 are approved under OMB control number 0910–0458. The information

collection provisions for §§ 803.50, 803.53, and 803.56 are approved under OMB control numbers 0910–0291 and 0910–0437. The information collection provisions for §§ 806.10 and 806.20 are approved under OMB control number 0910–0359.
² See Compliance Policy for Combination Product Postmarketing Safety Reporting (April 2019) (<https://www.fda.gov/regulatory-information/search-fda-guidance-documents/compliance-policy-combination-product-postmarketing-safety-reporting>).

Based on a review of the information collection since our last request for OMB approval, we have made no adjustments to our burden estimate. We note in this regard that FDA extended the compliance date for 21 CFR part 4, subpart B, until July 2020 for most combination products, and until January 2021 for the remainder, in response to stakeholder feedback, to ensure that Combination Product Applicants have sufficient time to update reporting and recordkeeping systems and procedures.² Consequently, entities subject to this rule have not yet had to comply with this information request.

Dated: April 23, 2020.

Lowell J. Schiller,

Principal Associate Commissioner for Policy.

Food and Drug Administration

[Docket No. FDA-2019-D-0661]

Enforcement Priorities for Electronic Nicotine Delivery Systems and Other Deemed Products on the Market Without Premarket Authorization (Revised); Guidance for Industry; Availability

AGENCY: Food and Drug Administration, HHS.

ACTION: Notice of availability.

SUMMARY: The Food and Drug Administration (FDA) is announcing the availability of a final guidance for industry entitled “Enforcement Priorities for Electronic Nicotine Delivery Systems (ENDS) and Other Deemed Products on the Market Without Premarket Authorization (Revised).” This is a revision to the guidance which describes, among other things, how FDA intends to prioritize its enforcement resources with regard to the marketing of ENDS products that do not have premarket authorization. FDA is revising this guidance to change the date required to submit premarket authorization applications to the Agency from May 12, 2020, to September 9, 2020.

DATES: The announcement of the guidance is published in the **Federal Register** on April 30, 2020.

² See Compliance Policy for Combination Product Postmarketing Safety Reporting (April 2019) (<https://www.fda.gov/regulatory-information/search-fda-guidance-documents/compliance-policy-combination-product-postmarketing-safety-reporting>).

ADDRESSES: You may submit either electronic or written comments on Agency guidances at any time as follows:

Electronic Submissions

Submit electronic comments in the following way:

- **Federal eRulemaking Portal:** <https://www.regulations.gov>. Follow the instructions for submitting comments. Comments submitted electronically, including attachments, to <https://www.regulations.gov> will be posted to the docket unchanged. Because your comment will be made public, you are solely responsible for ensuring that your comment does not include any confidential information that you or a third party may not wish to be posted, such as medical information, your or anyone else's Social Security number, or confidential business information, such as a manufacturing process. Please note that if you include your name, contact information, or other information that identifies you in the body of your comments, that information will be posted on <https://www.regulations.gov>.

- If you want to submit a comment with confidential information that you do not wish to be made available to the public, submit the comment as a written/paper submission and in the manner detailed (see “Written/Paper Submissions” and “Instructions”).

Written/Paper Submissions

Submit written/paper submissions as follows:

- **Mail/Hand Delivery/Courier (for written/paper submissions):** Dockets Management Staff (HFA-305), Food and Drug Administration, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852.

- For written/paper comments submitted to the Dockets Management Staff, FDA will post your comment, as well as any attachments, except for information submitted, marked and identified, as confidential, if submitted as detailed in “Instructions.”

Instructions: All submissions received must include the Docket No. FDA-2019-D-0661 for “Enforcement Priorities for Electronic Nicotine Delivery Systems (ENDS) and Other Deemed Products on the Market Without Premarket Authorization (Revised).” Received comments will be placed in the docket and, except for those submitted as “Confidential Submissions,” publicly viewable at <https://www.regulations.gov> or at the Dockets Management Staff between 9 a.m. and 4 p.m., Monday through Friday.

- **Confidential Submissions—**To submit a comment with confidential

information that you do not wish to be made publicly available, submit your comments only as a written/paper submission. You should submit two copies total. One copy will include the information you claim to be confidential with a heading or cover note that states “THIS DOCUMENT CONTAINS CONFIDENTIAL INFORMATION.” The Agency will review this copy, including the claimed confidential information, in its consideration of comments. The second copy, which will have the claimed confidential information redacted/blacked out, will be available for public viewing and posted on <https://www.regulations.gov>. Submit both copies to the Dockets Management Staff. If you do not wish your name and contact information to be made publicly available, you can provide this information on the cover sheet and not in the body of your comments and you must identify this information as “confidential.” Any information marked as “confidential” will not be disclosed except in accordance with 21 CFR 10.20 and other applicable disclosure law. For more information about FDA's posting of comments to public dockets, see 80 FR 56469, September 18, 2015, or access the information at: <https://www.govinfo.gov/content/pkg/FR-2015-09-18/pdf/2015-23389.pdf>.

Docket: For access to the docket to read background documents or the electronic and written/paper comments received, go to <https://www.regulations.gov> and insert the docket number, found in brackets in the heading of this document, into the “Search” box and follow the prompts and/or go to the Dockets Management Staff, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852.

You may submit comments on any guidance at any time (see 21 CFR 10.115(g)(5)).

Submit written requests for single copies of this guidance to the Center for Tobacco Products, Food and Drug Administration, 10903 New Hampshire Ave., Document Control Center, Bldg. 71, Rm. G335, Silver Spring, MD 20993-0002. Send one self-addressed adhesive label to assist that office in processing your request or include a Fax number to which the guidance document may be sent. See the **SUPPLEMENTARY INFORMATION** section for information on electronic access to the guidance.

FOR FURTHER INFORMATION CONTACT:

Gerie Voss, Center for Tobacco Products, Food and Drug Administration, 10903 New Hampshire Ave., Document Control Center, Bldg. 71, Rm. G335, Silver Spring, MD 20993-

0002, email: CTPRegulations@fda.hhs.gov.

SUPPLEMENTARY INFORMATION:

I. Background

FDA is announcing the availability of a guidance for industry entitled “Enforcement Priorities for Electronic Nicotine Delivery Systems (ENDS) and Other Deemed Products on the Market Without Premarket Authorization (Revised).”

On June 22, 2009, the President signed the Family Smoking Prevention and Tobacco Control Act (Pub. L. 111–31) (Tobacco Control Act) into law. The Tobacco Control Act grants FDA authority to regulate the manufacture, marketing, and distribution of tobacco products to protect public health generally and to reduce tobacco use by minors. The Tobacco Control Act also gave FDA the authority to issue regulations deeming other products that meet the statutory definition of a tobacco product to be subject to chapter IX of the Federal Food, Drug, and Cosmetic Act (FD&C Act).

In accordance with that authority, on May 10, 2016, FDA issued a final rule entitled “Deeming Tobacco Products to be Subject to the Federal Food, Drug, and Cosmetic Act, as Amended by the Family Smoking Prevention and Tobacco Control Act: Restrictions on the Sale and Distribution of Tobacco Products and Required Warning Statements for Tobacco Products” (the final deeming rule) deeming all products that meet the statutory definition of a tobacco product, except accessories of deemed tobacco products, to be subject to FDA’s tobacco product authority. This included ENDS, cigars, waterpipe (hookah) tobacco, pipe tobacco, nicotine gels, and dissolvables that were not already subject to the FD&C Act (81 FR 28974 at 28976, May 10, 2016).

The requirements in chapter IX of the FD&C Act (21 U.S.C. 387 through 387u) now apply to deemed tobacco products. This includes section 910 (21 U.S.C. 387j), which imposes certain premarket review requirements for “new tobacco products”—i.e., those that were not commercially marketed in the United States as of February 15, 2007. Accordingly, after the rule’s effective date, deemed new tobacco products were required to obtain premarket authorization under section 910 of the FD&C Act. Deemed new tobacco products that remain on the market without marketing authorization are marketed unlawfully in contravention of the Tobacco Control Act.

On January 2, 2020, FDA issued a final guidance entitled “Enforcement

Priorities for Electronic Nicotine Delivery Systems (ENDS) and Other Deemed Products on the Market Without Premarket Authorization” to communicate its enforcement priorities with respect to ENDS products (January 7, 2020; 85 FR 720) (available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/enforcement-priorities-electronic-nicotine-delivery-system-ends-and-other-deemed-products-market>). It also stated that manufacturers of other deemed tobacco products would be required to submit marketing applications for those products by May 12, 2020.

On April 22, 2020, the court granted a motion for a 120-day extension (until September 9, 2020) in light of the global outbreak of respiratory illness caused by a new coronavirus.¹ Accordingly, FDA is revising the guidance to change the date required to submit premarket authorization applications to the Agency from May 12, 2020, to September 9, 2020.

II. Significance of Guidance

This guidance is being issued consistent with FDA’s good guidance practices regulation (21 CFR 10.115). The guidance represents the current thinking of the Agency’s enforcement priorities with respect to ENDS products and the submission of marketing applications for other deemed tobacco products. It does not establish any rights for any person and is not binding on FDA or the public. You can use an alternative approach if it satisfies the requirements of the applicable statutes and regulations.

III. Paperwork Reduction Act of 1995

This final guidance refers to previously approved FDA collections of information. These collections of information are subject to review by the Office of Management and Budget (OMB) under the Paperwork Reduction Act of 1995 (44 U.S.C. 3501–3521). The collections of information in 21 CFR 1107.1(b) and (c) have been approved under OMB control number 0910–0684; the collections of information under section 910 of the FD&C Act have been approved under OMB control number 0910–0768. The collections of information in section 905(j) of the FD&C Act (21 U.S.C. 387e(j)) have been approved under OMB control number 0910–0673.

¹ *American Academy of Pediatrics, et al. v. Food and Drug Administration, et al.*, Case No. 8:18–cv–883 (PWG), (D. Md. April 22, 2020), Dkt. No. 182.

IV. Electronic Access

Persons with access to the internet may obtain an electronic version of the guidance at either <https://www.regulations.gov> or <https://www.fda.gov/TobaccoProducts/Labeling/RulesRegulationsGuidance/default.htm>.

Dated: April 24, 2020.

Lowell J. Schiller,

Principal Associate Commissioner for Policy.

BILLING CODE 4164–01–P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Health Resources and Services Administration

Correction to Establishment and Solicitation of Nominations for Tribal Advisory Council

AGENCY: Health Resources and Services Administration (HRSA), HHS.

ACTION: Notice; correction.

SUMMARY: HRSA is soliciting comments and recommendations regarding HRSA’s intent to establish the HRSA Tribal Advisory Council (TAC) and is seeking nominations of qualified tribal officials as candidates for consideration for appointment as voluntary delegate members of the HRSA TAC. Due to delays caused by the global impact of the Coronavirus Disease 2019 (COVID–19), HRSA is extending the deadline for the submissions of nominations of qualified tribal officials for consideration for appointment as voluntary delegate members of the HRSA TAC. Nominations for membership must now be received on or before July 6, 2020. This 60-day extension will allow tribes and tribal serving organizations the additional time needed to identify qualified tribal officials as candidates and submit comprehensive nomination packages.

FOR FURTHER INFORMATION CONTACT: CAPT Elijah K. Martin, Jr. EdD, MPH, Manager, Tribal Health Affairs, Office of Health Equity, HRSA, 5600 Fishers Lane, Room 13N44, Rockville, Maryland 20857, 301–443–7526, aianhealth@hrsa.gov.

Correction—Due to COVID–19, HRSA OHE is extending the deadline for HRSA TAC membership nominations by 60 days from May 7, 2020, to July 6, 2020.

Maria G. Button,

Director, Executive Secretariat.

BILLING CODE 4165–15–P

DEPARTMENT OF HEALTH AND HUMAN SERVICES**Health Resources and Services Administration****Agency Information Collection****Activities: Proposed Collection: Public****Comment Request Information****Collection Request Title: Teaching****Health Centers Graduate Medical****Education Program Cost Evaluation,****OMB No. 0906—XXXX—New**

AGENCY: Health Resources and Services Administration (HRSA), Department of Health and Human Services.

ACTION: Notice.

SUMMARY: In compliance with the requirement for opportunity for public comment on proposed data collection projects of the Paperwork Reduction Act of 1995, HRSA announces plans to submit an Information Collection Request (ICR), described below, to the Office of Management and Budget (OMB). Prior to submitting the ICR to OMB, HRSA seeks comments from the public regarding the burden estimate, below, or any other aspect of the ICR.

DATES: Comments on this ICR should be received no later than June 29, 2020.

ADDRESSES: Submit your comments to paperwork@hrsa.gov.

FOR FURTHER INFORMATION CONTACT: To request more information on the proposed project or to obtain a copy of the data collection plans and draft instruments, email paperwork@hrsa.gov or call Lisa Wright-Solomon, the HRSA Information Collection Clearance Officer at (301) 443-1984.

SUPPLEMENTARY INFORMATION: When submitting comments or requesting information, please include the information request collection title for reference.

Information Collection Request Title: Teaching Health Centers Graduate Medical Education Program Cost Evaluation, OMB No. 0906—XXXX—New.

Abstract: The Teaching Health Center Graduate Medical Education (THCGME)

program, authorized by Section 340H of the Public Health Service Act, was established by Section 5508 of Public Law (Pub. L.) 111-148. The Bipartisan Budget Act of 2018 (Pub. L. 115-123) provided continued funding for the THCGME program for fiscal years 2018 and 2019 and the Coronavirus Aid, Relief, and Economic Security Act extends funding for Fiscal Year (FY) 2020 for the first two months of FY 2021 (until November 30, 2020).

Need and Proposed Use of the Information: The THCGME program awards payment for both direct and indirect expenses to support training for primary care residents in community-based ambulatory patient care settings. Direct medical expense payments are designed to compensate eligible teaching health centers (THC) for those expenses directly associated with sponsoring approved graduate medical residency training programs, while indirect medical expense payments are intended to compensate for the additional costs of training residents in such programs. The primary goals of this program are to increase the production of primary care providers who are better prepared to practice in community settings, particularly with underserved populations, and improve the geographic distribution of primary care providers.

The statute requires the Secretary of HHS (the Secretary) to determine an appropriate THCGME program payment for indirect medical expenses (IME) as well as to update, as deemed appropriate, the per resident amount used to determine the Program's payment for direct medical expenses (DME). To inform these determinations and to increase understanding of this model of residency training, the George Washington University, under contract with HRSA, is conducting an evaluation of the costs associated with training residents in the THC model. George Washington University has developed a standardized THC Costing Instrument to gather data from all THCGME programs which they will use to gather costing

information related to both DME and IME. The information gathered in the THC Costing Instrument includes, but is not limited to, resident and faculty full-time equivalents salaries and benefits, residency administration costs, educational costs, residency clinical operations and administrative costs, patient visits and clinical revenue generated by medical residents, financial reports, as well as general program information to understand the characteristics of the THCGME program and sponsoring institutions that are involved in residency training.

HRSA is collecting costing information related to both DME and IME in an effort to establish a THC's total cost of running a residency program, to assist the Secretary in determining an appropriate update to the per resident amount used to calculate the payment for DME and an appropriate IME payment. The described data collection activities will serve to inform these statutory requirements for the Secretary in a uniform and consistent manner.

Likely Respondents: The likely responders to the THC Costing Instrument are THCGME program award recipients.

Burden Statement: Burden in this context means the time expended by persons to generate, maintain, retain, disclose or provide the information requested. This includes the time needed to review instructions; to develop, acquire, install, and utilize technology and systems for the purpose of collecting, validating, and verifying information, processing and maintaining information, and disclosing and providing information; to train personnel and to be able to respond to a collection of information; to search data sources; to complete and review the collection of information; and to transmit or otherwise disclose the information. The total annual burden hours estimated for this ICR are summarized in the table below.

TOTAL ESTIMATED ANNUALIZED BURDEN HOURS

| Form name | Number of respondents | Number of responses per respondent | Total responses | Average burden per response (in hours) | Total burden hours |
|---|-----------------------|------------------------------------|-----------------|--|--------------------|
| Teaching Health Center Costing Instrument | 56 | 1 | 56 | 10 | 560 |
| Total | 56 | | 56 | | 560 |

HRSA specifically requests comments on (1) The necessity and utility of the

proposed information collection for the proper performance of the agency's

functions, (2) the accuracy of the estimated burden, (3) ways to enhance

the quality, utility, and clarity of the information to be collected, and (4) the use of automated collection techniques or other forms of information technology to minimize the information collection burden.

Maria G. Button,

Director, Executive Secretariat.

BILLING CODE 4140-01-P

DEPARTMENT OF HEALTH AND HUMAN SERVICES**National Institutes of Health****Proposed Collection; 60-day Comment Request; Chimpanzee Research Use Form (Office of the Director)**

AGENCY: National Institutes of Health, HHS.

ACTION: Notice.

SUMMARY: In compliance with the requirement of the Paperwork Reduction Act of 1995 to provide opportunity for public comment on

proposed data collection projects, the Division of Program Coordination, Planning, and Strategic Initiatives (DPCPSI), Office of the Director (OD), National Institutes of Health (NIH), will publish periodic summaries of proposed projects to be submitted to the Office of Management and Budget (OMB) for review and approval.

DATES: Comments regarding this information collection are best assured of having their full effect if received within 60 days of the date of this publication.

FOR FURTHER INFORMATION CONTACT: To obtain a copy of the data collection plans and instruments, submit comments in writing, or request more information on the proposed project, contact: C. Taylor Gilliland, The Division of Program Coordination, Planning, and Strategic Initiatives, OD, NIH, Building 1, Room 260, 1 Center Drive, Bethesda, MD 20892; or call non-toll-free number 301-402-9852; or email your request, including your address, to dpcpsi@od.nih.gov. Formal requests for additional plans and instruments must be requested in writing.

SUPPLEMENTARY INFORMATION: Section 3506(c)(2)(A) of the Paperwork Reduction Act of 1995 requires: Written comments and/or suggestions from the public and affected agencies are invited to address one or more of the following points: (1) Whether the proposed collection of information is necessary for the proper performance of the function of the agency, including whether the information will have practical utility; (2) The accuracy of the agency's estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used; (3) Ways to enhance the quality, utility, and clarity of the information to be

collected; and (4) Ways to minimize the burden of the collection of information on those who are to respond, including the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology.

Proposed Collection Title: Chimpanzee Research Use Form, 0925-0705, exp., date 9/30/2020, Extension, Division of Program Coordination, Planning, and Strategic Initiatives (DPCPSI), Office of the Director (OD), National Institutes of Health (NIH).

Need and Use of Information Collection: The purpose of this form is to obtain information needed by the NIH to assess whether the proposed research satisfies the agency's policy for permitting only noninvasive research involving chimpanzees. The NIH will consider the information submitted through this form prior to the agency making funding decisions or otherwise allowing the research to begin. Completion of this form is a mandatory step toward receiving NIH support or approval for noninvasive research involving chimpanzees. The NIH does not fund any research involving chimpanzees proposed in new or other competing projects (renewals or revisions) unless the research is consistent with the definition of "noninvasive research," as described in the "Standards of Care for Chimpanzees Held in the Federally Supported Chimpanzee Sanctuary System" (42 CFR part 9). See NOT-OD-16-095 at <https://grants.nih.gov/grants/guide/notice-files/NOT-OD-16-095.html> and 81 FR 6873.

OMB approval is requested for three years. There are no costs to respondents other than their time. The total estimated annualized burden hours is 10.

ESTIMATED ANNUALIZED BURDEN HOURS

| Type of respondent | Number of respondents | Number of responses per respondent | Average time per response (in hours) | Total annual burden hour |
|--------------------------|-----------------------|------------------------------------|--------------------------------------|--------------------------|
| Research Community | 20 | 1 | 30/60 | 10 |
| Total | | 20 | | 10 |

Dated: April 22, 2020.

SUMMARY: In compliance with the requirement of the Paperwork Reduction Act of 1995 to provide opportunity for public comment on proposed data collection projects, the National Institutes of Health Office of Research on Women's Health (ORWH) will publish periodic summaries of proposed projects to be submitted to the Office of Management and Budget (OMB) for review and approval.

DATES: Comments regarding this information collection are best assured of having their full effect if received within 60 days of the date of this publication.

FOR FURTHER INFORMATION CONTACT: To obtain a copy of the data collection plans and instruments, submit comments in writing, or request more

information on the proposed project, contact: Dr. Chyren Hunter, Associate Director, Basic and Translational Research, 6707 Democracy Blvd., Room 437, Bethesda, Maryland 20817 or call non-toll-free number (301) 402-1770 or email your request to ORWHinfo@mail.nih.gov. Formal requests for additional plans and instruments must be requested in writing.

SUPPLEMENTARY INFORMATION: Section 3506(c)(2)(A) of the Paperwork Reduction Act of 1995 requires: written comments and/or suggestions from the public and affected agencies are invited to address one or more of the following points: (1) Whether the proposed collection of information is necessary for the proper performance of the function of the agency, including whether the information will have practical utility; (2) The accuracy of the agency's estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used; (3) Ways to enhance the quality, utility, and clarity of the information to be collected; and (4) Ways to minimize the burden of the collection of information on those who are to respond, including the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology.

Proposed Collection Title: Bench to Bedside: Integrating Sex and Gender to Improve Human Health & Sex as a Biological Variable: A Primer, 0925-NEW, expiration date XX/XX/XXXX, Office of Research on Women's Health (ORWH), Office of the Director (OD), National Institutes of Health (NIH).

Need and Use of Information Collection: Bench to Bedside:

Integrating Sex and Gender to Improve Human Health" is an online course developed by ORWH, the FDA Office of Women's Health, and other non-federal subject matter experts. "Sex as a Biological Variable: A Primer" is an online course developed by ORWH, NIGMS, and other non-federal subject matter experts. Together, these two courses will provide learners a rationale for the study of biological differences between the sexes, the impact of sex and gender difference on illness, guidance on incorporating the NIH policy on sex as a biological variable (SABV) into studies, and an exploration of sex- and gender-related differences in key disease areas. The Bench to Bedside course will also offer free continuing medical education credits.

In conjunction with these two courses, ORWH will collect information through registration information and surveys (knowledge checks, attitude assessments, and course evaluations). The information collected will be used in the following ways: 1. To assess uptake and learning of concepts in each lesson; 2. To identify demographic trends across learners in order to inform targeted outreach 3. To assess effectiveness of course materials; and 4. To identify areas of focus for future course improvement, modifications, and expansion.

OMB approval is requested for 3 years. There are no costs to respondents other than their time. The total estimated annualized burden hours are 970.

ESTIMATED ANNUALIZED BURDEN HOURS

| Form name | Type of respondents | Number of respondents | Number of responses per respondent | Average burden per response (in hours) | Total annual burden hours |

National Institute of Dental & Craniofacial Research; Notice of Closed Meeting

Pursuant to section 10(d) of the Federal Advisory Committee Act, as amended, notice is hereby given of the following meeting.

The meeting will be closed to the public in accordance with the provisions set forth in sections 552b(c)(4) and 552b(c)(6), Title 5 U.S.C., as amended. The grant applications and the discussions could disclose confidential trade secrets or commercial

property such as patentable material, and personal information concerning individuals associated with the grant applications, the disclosure of which would constitute a clearly unwarranted invasion of personal privacy.

Name of Committee: NIDCR Special Grants Review Committee.

Date: June 18–19, 2020.

Time: 9:00 a.m. to 5:00 p.m.

Agenda: To review and evaluate grant applications.

Place: National Institute of Dental and Craniofacial Research, National Institutes of Health, 6701 Democracy Boulevard, Room 672, Bethesda, MD 20892 (Virtual Meeting).

Contact Person: Latarsha J. Carithers, Scientific Review Officer, Scientific Review Branch, National Institute of Dental and Craniofacial Research, National Institutes of Health, 6701 Democracy Boulevard, Room 672, Bethesda, MD 20892, 301-594-4859, latarsha.carithers@nih.gov.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

National Institutes of Health

Best Pharmaceuticals for Children Act (BPCA) Priority List of Needs in Pediatric Therapeutics

AGENCY: National Institutes of Health, HHS.

ACTION: Notice.

SUMMARY: The National Institutes of Health (NIH), *Eunice Kennedy Shriver* National Institute of Child Health and Human Development (NICHD) hereby announces updates to the Best Pharmaceuticals for Children Act (BPCA) Program priorities for 2020–2021. The Best Pharmaceuticals for Children Act (BPCA) seeks to improve the level of information on the safe and effective use of pharmaceuticals used to treat children. The BPCA requires that the NIH identify the drugs of highest priority for study in pediatric populations, publish a list of drugs/needs in pediatric therapeutics, and fund studies in the prioritized areas. This notice will provide a brief update

on the current progress of the BPCA Program and provide the current Priority List of Needs in Pediatric Therapeutics.

DATES: The next BPCA stakeholders meeting will take place on December 14–15, 2020. More information will be provided on the BPCA website as it becomes available.

ADDRESSES: The complete Priority List of Needs in Pediatric Therapeutics 2020–2021 can be found on the BPCA website at the following address: <https://www.nichd.nih.gov/research/supported/bpca/activities>.

FOR FURTHER INFORMATION CONTACT: Dr. Perdita Taylor-Zapata via email at taylorpe@mail.nih.gov; or by phone at 301-496-9584.

SUPPLEMENTARY INFORMATION: The BPCA requires that the NIH, in consultation with the Food and Drug Administration and experts in pediatric research, identify the drugs and therapeutic areas of highest priority for study in pediatric populations. The NIH BPCA Program has been in existence since 2004 and is overseen by the Obstetric and Pediatric Pharmacology and Therapeutics Branch (OPPTB) of the NICHD. To date, the BPCA Program has prioritized over one-hundred and fifty (150) drugs and therapeutic areas, funded more than forty (40) clinical studies, and improved the labeling to date of eleven (11) drugs and two (2) devices in the ongoing effort of advancing the knowledge of dosing, safety and effectiveness of medicines used in children. However, despite these and many other efforts, many gaps in knowledge still remain regarding the use of therapeutics in children including the correct dosage, appropriate indications, side effects, and safety concerns in the short- and long-term. These gaps result in inadequate labeling and/or wide-spread off-label use of prescription drugs in children. Off-label use of a drug substantially limits the ability to obtain important clinical information for more generalized use of a drug product, such as characterizing changes in drug metabolic pathways and response during growth and development, identifying precision-based treatments (*i.e.*, impact of genotype and phenotype of medication responses), and determining short- and long-term effects of medications. The mandate of the NIH BPCA Program is to identify knowledge gaps that exist in pediatric therapeutics and to promote an increase in evidence-based data about medications used in children. Please see the BPCA website for more information: <https://www.nichd.nih.gov/research/supported/bpca/about>.

Update on BPCA Prioritization

The BPCA Priority List consists of key therapeutic needs in the medical treatment of children and adolescents identified for further study; it is organized by therapeutic area, which can be a group of conditions, a subgroup of the population, or a setting of care. The first priority list of off-patent drugs needing further study under the 2002 BPCA legislation Public Law 107-109, was published in January 2003 in the **Federal Register** (FR Vol. 68, No. 13; Tuesday, January 21, 2003: 2789–2790). The most recent priority list has been published to the BPCA website; more information on the prioritization process, all BPCA priority lists, and all **Federal Register** Notices can be found on the BPCA website: <https://www.nichd.nih.gov/research/supported/bpca/prioritizing-pediatric-therapies>. The BPCA Priority List consists of key therapeutic needs in the medical treatment of children and adolescents identified for further study; it is organized by therapeutic area, which can be a group of conditions, a subgroup of the population, or a setting of care. The BPCA authorizing legislation requires the NIH to hold meetings with stakeholders for input into the prioritization process and to update the priority list every three years.

The most recent BPCA stakeholders meeting was held in Bethesda, Maryland on March 22, 2019. Please save the date for December 14–15, 2020 for the next stakeholders meeting. More information will be provided on the BPCA website as it becomes available. All inquiries should be submitted to Dr. Perdita Taylor-Zapata at the contact information above. This Notice serves as an update to the BPCA priority list of needs in pediatric therapeutics.

Priority List of Needs in Pediatric Therapeutics 2020–2021

In accordance with the BPCA legislation, the list outlines priority needs in pediatric therapeutics for multiple therapeutic areas listed below. The complete updated list of therapeutic areas and drugs that have been prioritized for study since the inception of the BPCA, and a summary of the NICHD's plans and progress in all of these areas to date, can be found on the BPCA website at the following address: <https://www.nichd.nih.gov/research/supported/bpca/activities>.

BILLING CODE 4140-01-P

DEPARTMENT OF HOMELAND SECURITY

U.S. Customs and Border Protection

[Docket No. USCBP-2019-0018]

Response to Public Comments Regarding the Construction of Border Wall Within Certain Areas in the Rio Grande Valley, Texas

AGENCY: U.S. Customs and Border Protection, Department of Homeland Security.

ACTION: Notice.

SUMMARY: On June 27, 2019, U.S. Customs and Border Protection (CBP) published a notice in the **Federal**

Register (84 FR 30745), requesting public comments regarding the construction of border wall within the Rio Grande Valley in Starr County, Texas, including within the cities of Roma, Escobares, La Grulla, Rio Grande City, and the census-designated place of Salineño, Texas (the Affected Areas). CBP also requested comments on potential impacts to the environment, historical preservation, culture, quality of life, and commerce, including socioeconomic impacts from the construction of primary border wall in the Affected Areas. This document provides CBP's responses to the comments received as well as CBP's plans for construction in the Affected Areas, as required by section 232(b) of the Consolidated Appropriations Act, 2019.

FOR FURTHER INFORMATION CONTACT: Paul Enriquez, Acquisition, Real Estate, and Environmental Director, Border Wall Program Management Office, U.S. Border Patrol at (949) 643-6365 or visit CBP's website: <http://www.cbp.gov/about/environmental-cultural-stewardship/nepa-documents/docs-review>.

SUPPLEMENTARY INFORMATION:

I. Background and Summary

U.S. Customs and Border Protection (CBP) is proposing to construct approximately 12 miles of primary border wall within the U.S. Border Patrol Rio Grande Valley (RGV) Sector in Starr County, Texas, including within "Affected Areas" that include the cities of Roma, Escobares, La Grulla, Rio Grande City, and the census-designated place of Salineño, Texas. The project is funded by Congress through the Consolidated Appropriations Act, 2019, Public Law 115-141, 132 Stat. 348 (Feb. 15, 2019) (the 2019 Appropriations Act).

On June 27, 2019, CBP published a notice in the **Federal Register** requesting public comments on its proposal to locate and construct primary border wall in the Affected Areas, as required by section 232(b) of the 2019 Appropriations Act. *See* 84 FR 30745. Comments were requested by August 26, 2019. In that notice, CBP also sought input on potential impacts to the environment, historical preservation, culture, quality of life, and commerce, including socioeconomic impacts, from the construction of primary border wall in the Affected Areas. On August 26, 2019, CBP published a notice in the **Federal Register** extending the comment period until September 25, 2019. *See* 84 FR 44629.

II. Rio Grande Valley Border Wall Construction Plans for Starr County, Texas

In addition to requesting public comments regarding CBP's proposal to locate and construct border wall in the Affected Areas, as required by 232(b) of the 2019 Appropriations Act, CBP also consulted with local elected officials, as required by section 232(a) of the 2019 Appropriations Act. Specifically CBP consulted with elected officials in Roma, Escobares, La Grulla, Rio Grande City, and Saliñeno to review the alignment and design of planned border wall in these areas. Additionally, pursuant to section 102(b)(1)(C) of the Illegal Immigration Reform and Immigrant Responsibility Act of 1996, Public Law 104–208, Div. C, 110 Stat. 3009–546 (8 U.S.C. 1103 note), as amended, CBP conducted a separate consultation with stakeholders regarding the potential impacts to the environment, culture, commerce, and quality of life for a range of proposed border wall projects in the Rio Grande Valley, including the proposed construction of border wall in Starr County, Texas.

As part of the Department of Homeland Security's (DHS) commitment to responsible environmental and cultural stewardship, CBP will consider stakeholder feedback and the results of natural, biological and cultural resource surveys. Information collected through CBP's public outreach and its consultation with local officials will be taken into consideration and will inform the review of impacts to the environment, culture, quality of life, and commerce, including socioeconomic impacts.

CBP is currently in the planning phase for border wall construction in Starr County, Texas. The Supporting Documents section of docket #USCBP–2019–0018 (available at <http://www.regulations.gov>) includes maps that depict the proposed location of the border wall in the Affected Areas within Starr County. CBP and the United States Army Corps of Engineers (USACE) have begun outreach and consultation with landowners to obtain Rights-of-Entry for real estate and environmental surveys.

III. Summary of Comments Received and Responses

1. General

In response to the **Federal Register** notice requesting public comment on the proposed border wall in the Affected Areas, CBP received 2,566 comments, including 887 unique comments and 1,679 form letters. The comments

covered a range of topics, such as: Impacts to natural resources, including ecosystems, wildlife, water, flooding, and landscape or visual impacts; impacts to cultural, archaeological and historical resources, including Native American tribal lands; impacts to landowners, including property devaluation, business and economic impacts, and gate access to property south of the border wall; concerns about the need and efficacy of the border wall; concerns about the cost of border wall construction; humanitarian concerns; support for border security, including efforts to stop human and narcotics trafficking; concerns about immigration policy; and other concerns. CBP received 72 general comments expressing support or disapproval. Of these comments, nearly 90 percent were in favor of wall construction.

CBP has analyzed these comments and is providing its responses and plans for construction in this document. It is important to note that the number of comments in each category does not reflect the total number of comments received. Many comments received included concerns from multiple categories. Also, while CBP solicited comments only for Starr County, Texas, comments were received for proposed border wall construction projects throughout the Rio Grande Valley. CBP has analyzed all of these comments.

2. Historical/Cultural

Comment: CBP received 43 comments related to the historical and cultural impacts of wall construction. Of these, 42 were against border wall construction and one was neither for nor against such construction. A number of commenters expressed general concerns about the historical and cultural impacts of construction. A general response is provided below followed by an analysis of the specific comments.

Response: CBP agrees that the preservation of historical and cultural resources is important, and CBP is fully engaged in efforts that consider the environment as we work to secure our nation's borders. As such, CBP is conducting or will conduct cultural surveys of the project areas within Starr County. CBP will also coordinate and consult with relevant agencies and evaluate possible resources, including those that relate to historical and cultural sites. Site-specific design elements and best management practices are a standard part of construction contracts awarded for the border wall projects which are intended to minimize impacts to historical and cultural resources.

Comment: Several commenters expressed concerns about the impact to Fort Brown, a historical site in Brownsville and the first U.S. military outpost located along the Rio Grande, dating back to 1846.

Response: CBP consults with stakeholders such as the Texas State Historic Preservation Office, local governments, the Department of the Interior and other interested stakeholders to identify potential impacts to historic resources or sites that may be affected by the construction of the border wall. In addition, to the extent practicable, CBP identifies and implements construction best management practices and mitigation measures to avoid or minimize impacts.

Comment: One commenter was concerned about the Government's requests for right of entry and site assessment to La Lomita, a sanctuary for the Missionary Oblates of Mary Immaculate. The commenter was concerned that border wall construction would divide the site, thus destroying this place which continues to be a sanctuary and safe place for Catholics on both sides of the border.

Response: As provided in the 2019 Appropriations Act, border wall construction will not occur in specifically excluded areas, including the La Lomita Chapel.

Comment: Several commenters were concerned about impacts related to other cultural resources, including sites designated as National Historic Landmarks, listed in the National Register of Historic Places, and recognized as Recorded Texas Historic Landmarks. These sites include Jackson Ranch Church and Cemetery, Eli Jackson Cemetery, the riverbank at Cavazos Ramp/Ranch, and the family campsites that are considered sacred, including Kamp Keralum.

Response: While border wall construction is occurring adjacent to the Eli Jackson Cemetery, construction plans in this location will not directly affect the Eli Jackson Cemetery or the Jackson Ranch Church. Regarding the riverbank at Cavazos Ramp and locations that are considered sacred such as the Kamp Keralum, CBP will, to the extent practicable, develop and implement design considerations and best management practices to avoid or minimize impacts if it is determined that these locations will be affected.

3. Natural Resources

Comment: 361 commenters expressed concerns related to the impacts of border wall construction on wildlife and plant life. Of these, 358 commenters were opposed to construction and three

were neither for nor against construction. The commenters who were opposed to construction cited negative impacts on biodiversity, ecosystems, and various plant and wildlife habitats. A general response is provided below followed by an analysis of the specific comments.

Response: CBP agrees that the preservation of our valuable natural resources is important, and CBP is fully engaged in efforts that consider the environment as we work to secure our nation's borders. As such, CBP is conducting or will conduct biological surveys of the project areas. In addition, CBP coordinates and consults with resource agencies to evaluate possible environmental impacts as a result of border wall construction. To the extent practicable, CBP identifies and implements construction best management practices and mitigation measures to avoid or minimize impacts.

Comment: A number of commenters were concerned about the impact of border wall construction on native endangered and threatened species, including the destruction of their habitats and their ability to travel across the border. The commenters highlighted numerous endangered or threatened species that could be affected by border wall construction including, Ocelots, Jaguarondi, Golden Crown Heron, Red Crowned Green Parrot, Mexican Whip-poor-wills, indigo snake, alligator gar, various nonmarine mollusks, terrestrial snails, flattened pinecone, sabal palm, Zapata bladderpod, and whiskerbush cactus. One commenter, a wildlife biologist, focused on the riparian habitats along the river in Cameron, Hidalgo and Starr counties, upon which various endangered and threatened species depend. Commenters also pointed out that American Ocelots need to be able to cross the border and mate with Mexican Ocelots in order to keep their small populations viable. Several commenters were concerned about the impact that waiving the Endangered Species Act would have on flora and fauna. Additionally, commenters specifically asked that construction not occur in national parks and refuges, including Big Bend National Park, the Lower Rio Grande Valley National Wildlife Refuge, and Santa Ana National Wildlife Refuge.

Response: As part of its environmental stewardship, CBP provides environmental awareness training to the construction contractors and performs biological monitoring during the construction process. Regarding comments related to the movement of wildlife across the border, CBP is actively engaging with the U.S.

Fish and Wildlife Service to identify wildlife migration corridors and to develop design elements in the planned border wall that support both wildlife migration and border security. These design elements could include animal gates that can be open during migration season, strategically placed gaps in the wall, and other wildlife access points that could be the same or similar to previous design elements used by CBP for border wall construction in 2008. As required by the 2019 Appropriations Act, CBP will not construct border wall within the Santa Ana National Wildlife Refuge. Currently, there are no plans to construct border wall within Big Bend National Park.

Comment: Several commenters were concerned about the impact of border wall construction on bird populations, including loss of habitat, effects of the border wall on migratory paths and on local birding centers. Commenters also cited potential impacts for bird watchers visiting the area. One commenter expressed concern about the effect of waiving the Migratory Bird Treaty Act.

Response: CBP develops comprehensive construction best management practices for each project that include migratory bird surveys during the migratory bird season. If nesting birds are identified during the construction project, biologists working on behalf of CBP implement protective measures. In addition, CBP conducts biological surveys to identify potential impacts to the habitats of threatened and endangered species and develops avoidance and mitigation measures to minimize impacts.

Comment: 41 commenters were concerned about the impact of the border wall on the landscape. All of these commenters were opposed to border wall construction. The commenters stated that the border wall would negatively affect the beauty of the landscape and that the wall would be an eyesore.

Response: To the extent practicable and without compromising U.S. Border Patrol's operational requirements, CBP works with communities and landowners to minimize visual impacts of the border wall.

Comment: 204 commenters expressed concerns related to flooding. Of these, 203 commenters were opposed to border wall construction and one expressed no opinion. Commenters cited concerns relating to the increased risk of flooding from building in the Rio Grande floodplain. Some commenters stated that the existing border wall has resulted in flooding, streams clogged with debris, and drainage backups, and stated that similar issues are likely with

the construction of additional border wall. One commenter suggested that the gates be opened during times of flood risk to reduce impacts. Other commenters stated that they already experience flooding in their communities and that construction could exacerbate the frequency of flooding.

Response: CBP conducts a hydraulic analysis of each location proposed for border wall construction. Additionally, CBP coordinates with the International Boundary and Water Commission to ensure the proposed locations meet the standards outlined in the Treaty to Resolve Pending Boundary and Maintain the Rio Grande and Colorado River as the International Boundary, U.S.-Mex. (1970). This treaty prohibits any works in the United States that will cause deflection or obstruction of the normal flow of the Rio Grande River or its flood flows.

Comment: One commenter cited concerns about the impact of the wall on the flood control system, drinking water, and irrigation systems.

Response: In certain areas, CBP is constructing or will construct border wall on a levee. The border wall will be comprised of concrete wall and bollard infrastructure with the primary purpose of meeting U.S. Border Patrol's operational requirements. The ratio of concrete to bollard fence fluctuates depending on the particular segment and location of the wall. The border wall may also provide flood control because it will take the place of what would have been an earthen levee. CBP has not identified any impacts to drinking water and works closely with the irrigation districts to minimize or eliminate impacts to irrigation systems.

Comment: Several commenters were concerned about the waiver of various federal laws, including the National Environmental Policy Act, the Endangered Species Act, and the Clean Water Act.

Response: On various occasions, the Secretary of Homeland Security (Secretary) has used his statutory authority pursuant to section 102(c) of the Illegal Immigration Reform and Immigrant Responsibility Act of 1996, Public Law 104-208, Div. C, 110 Stat. 3009-546, 3009-554 (8 U.S.C. 1103 note), as amended, to waive certain laws for the construction of border wall. The Secretary has not made a final decision relating to the waiver of laws for the construction of proposed border wall in the Affected Areas. However, even when a waiver applies, CBP is committed to responsible environmental stewardship. As such, CBP is conducting or will conduct cultural and

biological surveys of the project areas within Starr County. CBP has and will continue to coordinate and consult with resource agencies and evaluate possible environmental impacts from the projects. Site-specific design elements and best management practices are a standard part of construction contracts awarded for the border wall projects. In addition, to the extent practicable, CBP identifies and implements mitigation measures to avoid or minimize impacts.

4. Impacts to Landowners/Stakeholders

332 commenters were concerned that the proposed border wall would decrease property values, divide properties, and negatively affect local businesses. 60 commenters were concerned about reliable access through gates in the proposed border wall.

Comment: Most commenters who expressed concerns about gate access are concerned that the border gates will malfunction and emergency vehicles will be unable to provide timely services, possibly resulting in preventable deaths. Some commenters stated that they have already experienced situations in which a gate became inoperable and vehicles had to reroute to a different gate.

Response: CBP works closely with potentially affected landowners and stakeholders during the planning, design, and construction processes. Part of this coordination includes incorporating feedback from landowners to ensure gate and wall designs meet their needs. CBP will also coordinate with emergency responders and local law enforcement to ensure continued access during emergencies. CBP has improved gate functionality and is committed to addressing inoperable gate issues quickly. CBP also enters into agreements with landowners and stakeholders to ensure gates remain open on a case-by-case basis to meet specific community needs.

Comment: Commenters expressed concerns relating to the loss of property value and the risk of physical damage to their property resulting from the construction of the border wall. Multiple commenters were worried that if the border wall is constructed through their property or north of their property, they will be unable to sell their property at market value or rent it out at a reasonable rate. One commenter stated that he lives on a fixed income and will be unable to save enough to purchase new property elsewhere. Another commenter stated that insurance companies may not be able to provide coverage for his property if it is located south of the border wall. Another commenter suggested the government

should pay affected landowners the market value of their property.

Response: When the Government determines private property is required for border wall construction, the Government must determine fair market value for that property based on appraisals. The Government then prepares an offer to sell and presents it to each affected landowner. In many instances, landowners may choose to negotiate a counter offer based on other factors. New border wall construction cannot proceed until the Government has negotiated an offer to sell with each landowner or has obtained legal possession of property required for the project. It is always CBP's preference to acquire land needed for border wall construction through a negotiated sale. Landowners will continue to have access south of the wall and U.S. Border Patrol will continue to patrol that area.

Comment: Some commenters expressed concern that a border wall built through their community would isolate a large number of residents, inhibit access to community facilities, hinder socializing and social functions, and damage the community atmosphere. These commenters believe that the construction of the border wall has the potential to destroy their entire community and way of life. A few commenters expressed concerns that homes located south of the wall would be used as hiding spaces for refugees and immigrants.

Response: CBP is working closely with landowners to gather feedback on potential adjustments, including gates that will meet the needs of the community, as well as U.S. Border Patrol's operational requirements.

Comment: Some commenters expressed concern that the border wall will negatively affect local businesses and the local economy. One commenter was concerned that farming and oil and gas production revenue could be affected. Other commenters were concerned that eco-tourism would be negatively affected.

Response: It is part of CBP's mission to safeguard America's borders, while also enhancing the nation's global economic competitiveness by enabling legitimate trade and travel. CBP continues to work with affected stakeholders and communities to ensure their needs are met, such as ensuring continued access south of the wall, among other important considerations and concerns.

Comment: One commenter was particularly concerned about the impacts to the property of a particular private individual. The two main areas of concern were the likelihood of total

loss or damage to the property and business and the potential for total loss of access.

Response: CBP will work with all landowners to minimize impacts to their property and businesses and to ensure continued access through gates. It is CBP's preference to avoid damage or loss to structures such as private residences and businesses wherever possible.

Comment: A few commenters were concerned about continued access to cell phone services, as well as underground utilities such as internet, cable, and electric.

Response: CBP coordinates all border infrastructure projects with local utility providers and municipalities to ensure utility and water lines are not affected by border wall construction.

5. Tribal Consultation

Comment: Multiple commenters were concerned about the negative impact that border wall construction would have on Native Americans and their tribal lands. These included the Carrizo/Comecrudo Nation of Texas, the Lipan Apache of south Texas, the Kickapoo Tribe in the Eagle Pass area and the Ysleta del Sur Pueblo in the El Paso area of west Texas.

Response: CBP regularly consults with federally recognized tribal governments to mitigate impacts to natural and cultural resources. For example, in June 2019, CBP solicited input from the Kickapoo Traditional Tribe of Texas. CBP received a response from the Kickapoo Traditional Tribe of Texas on July 22, 2019 that indicated that the Tribe does not own land located in the project areas and that the project would not affect any of the Tribe's cultural, historical, or sacred sites that they were aware of. CBP did not consult with the Carrizo/Comecrudo Nation of Texas, the Lipan Apache of south Texas, or the federally recognized tribe of Ysleta Del Sur Pueblo of Texas. Additional dialogue with Federal, tribal, state and local agencies, and non-governmental organizations will occur as needed.

6. Effectiveness/Need for Wall

Comment: CBP received 252 comments that question the need for the border wall and the ability of the border wall to effectively secure the border. All of these comments are against the construction of the border wall. Many of these comments do not elaborate on why the border wall is unnecessary or ineffective. A few commenters stated that they already feel safe and do not require further protection.

Response: Physical walls, and other tactical infrastructure including roads, lighting, and surveillance technology, have long been a critical component of CBP's multilayered, risk-based approach to securing our nation's southern border. Border wall continues to enhance U.S. Border Patrol's operational capabilities by providing significant obstacles that deter illegal cross-border activity.

Comment: Many commenters who dispute the effectiveness of the wall suggest alternative methods to securing the border. The most commonly suggested alternative is the development of a virtual wall and the improvement of border surveillance and technology, such as lighting and cameras.

Response: CBP's overall border security strategy includes physical walls and other tactical infrastructure including roads, lighting, and surveillance technology. These additional elements have long been a critical component of CBP's multilayered, risk-based approach to securing our nation's southern border. Border wall continues to enhance U.S. Border Patrol's operational capabilities by providing significant obstacles that deter illegal cross-border activity.

7. Humanitarian

Comment: 33 commenters cited humanitarian concerns related to the border wall and all of these commenters were opposed to border wall construction. The reasons cited were abuse of refugees, particularly children, family separation, challenges for asylum seekers and refugees escaping violence, and the violation of human rights.

Response: The border wall is intended to slow or stop those who are seeking to evade law enforcement, not prevent individuals who present themselves to law enforcement officials for the purpose of seeking asylum or other protections. The border wall helps secure the southern border.

8. Immigration Reform

Comment: 99 commenters cited the need for immigration reform either in addition to or as an alternative to construction of a border wall. All but one of these commenters were against construction. Some commenters included suggestions for discouraging illegal entry into the United States, such as returning those who illegally enter the United States to their country of origin and denying benefits to those who illegally enter the United States. Others noted that comprehensive immigration reform would be more effective than a border wall. Still others commented that constructing a border

wall would not solve the root causes of illegal entry.

Response: Part of CBP's mission is to safeguard America's borders, which contributes to the Administration's overarching immigration strategy. In an effort to safeguard American's borders, CBP utilizes a comprehensive approach to border security that leverages local, state, and federal law enforcement partners and the use of technology, infrastructure, and enforcement personnel to secure the southern border. The border wall is one element of border security that provides significant obstacles that deter illegal cross-border activity. Comments regarding immigration reform are outside the scope of this notice.

9. Cost

Comment: CBP received 272 comments that expressed concern about the cost of the border wall construction and all opposed such construction. Most of the comments stated that the construction of the border wall is a waste of taxpayer money. Many commenters believe that the construction of the border wall is too expensive and that the maintenance costs will be too high. Some commenters suggested that funds for the construction of the wall should be used instead for some of the following initiatives: Immigration reform, veteran compensation, infrastructure repair, border screening process, environmental resilience, education, and healthcare. At least one commenter stated that there are cheaper alternatives available to secure the border.

Response: In the 2019 Appropriations Act, Congress has made funding available for border wall construction in the Affected Areas.

10. Border Security

CBP received 101 comments that address the need for secure borders and 20 comments that address crime or drug trafficking.

Comment: Many of the commenters that addressed the need for secure borders stated that the border wall will prevent unwanted trespassing and property damage. Others suggested that the border wall functions as a necessary separator between countries. Other commenters stated that the current border wall is and will continue to be ineffective in securing the country and that the proposed border wall will be equally ineffective in increasing security. One commenter suggested that the presence of a border wall will encourage legal entry.

Response: Physical walls, and other tactical infrastructure including roads,

lighting, and surveillance technology, have long been a critical component of CBP's multilayered, risk-based approach to securing our nation's southern border. Border wall continues to enhance U.S. Border Patrol's operational capabilities and provides a significant obstacle that deters illegal cross-border activity.

Comment: Some commenters expressed concerns about crime or drug trafficking and stated that the border wall will prevent illegal smuggling of people and drugs. Other commenters believe that the construction of the border wall will prevent crime in communities along the border. However, some commenters stated that additional wall construction is unnecessary because most smuggling occurs at legal points of entry.

Response: Physical walls, and other tactical infrastructure including roads, lighting, and surveillance technology, have long been a critical component of CBP's multilayered, risk-based approach to securing our nation's southern border. Border wall continues to enhance U.S. Border Patrol's operational capabilities by providing significant obstacles that deter illegal cross-border activity.

11. Other Comments

99 comments addressed issues that were not covered by the previous categories. Of these, 89 comments were opposed to border wall construction.

Comment: Multiple commenters stated that they were opposed to the border wall due to its racist or xenophobic symbolism. Others drew parallels to historical examples of why the wall should not be built, such as the Berlin Wall.

Response: CBP strives to serve the American public with vigilance, integrity and professionalism. Physical walls, and other tactical infrastructure including roads, lighting, and surveillance technology, have long been a critical component of CBP's multilayered, risk-based approach to securing our nation's southern border. Border wall continues to enhance U.S. Border Patrol's operational capabilities by providing significant obstacles that deter illegal cross-border activity.

Comment: Multiple commenters discussed the political aspects of border wall construction. These commenters expressed frustration with the current Administration and Congress. Some felt that because Congress did not approve construction, the border wall should not be built. Several voiced frustrations with the process, and felt that the request for comments would not have

an impact, since the wall would be built anyway.

Response: Congress has made funding available for border wall construction.

Comment: One commenter was concerned that the wall would make it more difficult for U.S. citizens to travel to Mexico for medical and dental care.

Response: Part of CBP's mission is to safeguard America's borders while enhancing the nation's global economic competitiveness by enabling legitimate trade and travel. Border wall construction will not affect the ability of U.S. citizens to lawfully travel to and from Mexico.

Dated: April 27, 2020.

Loren Flossman,

Director, Infrastructure Program, Program Management Office Directorate, U.S. Border Patrol, U.S. Customs and Border Protection.

BILLING CODE 9111-14-P

DEPARTMENT OF THE INTERIOR

Fish and Wildlife Service

[FWS-R1-ES-2019-N071;
FXES11130100000-190-FF01E00000]

Endangered and Threatened Wildlife and Plants; Draft Kauai Islandwide Recovery Plan

AGENCY: Fish and Wildlife Service, Interior.

ACTION: Notice of document availability for review and public comment.

SUMMARY: We, the U.S. Fish and Wildlife Service, announce the availability of the Draft Kauai Islandwide Recovery Plan under the Endangered Species Act. This draft recovery plan addresses 175 listed species occurring on the island of Kauai, Hawaii, 111 of which are endemic to Kauai. The draft recovery plan includes specific goals, objectives, and criteria that should be met to remove the Kauai endemic species from the Federal List of Endangered and Threatened Wildlife

and Plants. For the listed species that occur on multiple Hawaiian islands, the draft recovery plan describes those actions specific to Kauai; complete recovery actions and recovery criteria for these species will be covered in a subsequent multi-island recovery plan. We request review and comment on this draft recovery plan from local, State, and Federal agencies and the public. We will also accept any new information on the species' status throughout their range.

DATES: In order to be considered, comments on the draft recovery plan must be received on or before July 29, 2020. However, we will accept information about any species at any time.

ADDRESSES: An electronic copy of the draft recovery plan is available at our website at <http://www.fws.gov/endangered/species/recovery-plans.html> and <http://www.fws.gov/pacific/ecoservices/endangered/recovery/plans.html>. If you wish to comment on the plan, you may submit your comments in writing by any one of the following methods:

(1) You may submit written comments and materials to Field Supervisor, Pacific Islands Fish and Wildlife Office, U.S. Fish and Wildlife Service, 300 Ala Moana Boulevard, Room 3122, Honolulu, HI 96850.

(2) You may submit written comments to our Pacific Islands Fish and Wildlife Office by fax at (808)792-9581.

(3) You may send comments by email to gregory_koob@fws.gov.

For additional information about submitting comments, see the "Request for Public Comments" section below.

FOR FURTHER INFORMATION CONTACT: Gregory Koob, Deputy Field Supervisor, by mail at the above Honolulu address, or by telephone at (808)792-9400. Individuals who are hearing impaired may call the Federal Relay Service at 800-877-8339 for TTY assistance.

SUPPLEMENTARY INFORMATION: We, the U.S. Fish and Wildlife Service,

announce the availability of the Draft Kauai Islandwide Recovery Plan under the Endangered Species Act (Act; 16 U.S.C. 1531 *et seq.*). This draft recovery plan addresses 175 listed species occurring on the island of Kauai, Hawaii, 111 of which are endemic to Kauai. The draft recovery plan includes specific goals, objectives, and criteria that should be met to remove the Kauai endemic species from the Federal List of Endangered and Threatened Wildlife and Plants. For the listed species that occur on multiple Hawaiian islands, the draft recovery plan describes those actions specific to Kauai; complete recovery actions and recovery criteria for these species will be covered in a subsequent multi-island recovery plan. We request review and comment on this draft recovery plan from local, State, and Federal agencies and the public. We will also accept any new information on any species' status throughout its range.

Background

Recovery of endangered or threatened animals and plants to the point where they are again secure, self-sustaining members of their ecosystems is a primary goal of our endangered species program and the Act (16 U.S.C. 1531 *et seq.*). Recovery means improvement of the status of listed species to the point at which listing is no longer appropriate under the criteria set out in section 4(a)(1) of the Act. The Act requires the development of recovery plans for listed species, unless such a plan would not promote the conservation of a particular species.

Species Addressed in Recovery Plan

This draft recovery plan addresses 175 species, as listed in the table below. Many of these species have been addressed previously in earlier recovery plans; this plan will update and supersede the Kauai-specific actions in those documents, and is intended to provide a single unified reference for the recovery of all listed species on Kauai.

| Scientific name | Common name | Listing status | Kauai endemic | Most recent recovery plan |
|---|---------------------------------|----------------|---------------|---------------------------|
| PLANTS | | | | |
| <i>Acaena exigua</i> | Liliwai | Endangered | No | D |

 W: Recovery Plan for the Hawaiian Hoary Bat (FWS 1998d)
 *: Addressed only as candidate species.

Major threats to the various Kauai species addressed in this draft recovery plan include habitat degradation, predation and herbivory by nonnative mammals and invertebrates, disease spread by nonnative species, and competition with invasive nonnative plant species.

Recovery Plan Goals

The objective of a recovery plan is to provide a framework for the recovery of a listed species so that protection under the Act is no longer necessary. A recovery plan includes scientific information about the species and provides criteria and actions necessary for us to be able to reclassify the species or remove it from the Federal List of

Endangered and Threatened Wildlife and Plants. Recovery plans help guide our recovery efforts by describing actions we consider necessary for the species' conservation, and by estimating time and costs for implementing needed recovery measures.

The draft recovery plan recommends a combination of islandwide recovery actions (e.g., biosecurity), management

of ecosystem-level threats within specific geographic management units, and species-specific recovery actions such as propagation and reintroduction.

Request for Public Comments

Section 4(f) of the Act requires us to provide public notice and an opportunity for public review and comment during recovery plan development. It is also our policy to request peer review of recovery plans (July 1, 1994; 59 FR 34270). In an appendix to the approved recovery plan, we will summarize and respond to the issues raised by the public and peer reviewers. Substantive comments may or may not result in changes to the recovery plan; comments regarding recovery plan implementation will be forwarded as appropriate to Federal or other entities so that they can be taken into account during the course of implementing recovery actions.

We request written comments on the draft recovery plan. Before we approve the plan, we will consider all comments we receive by the date specified in **DATES**. Methods of submitting comments are described in **ADDRESSES**.

Public Availability of Comments

Before including your address, phone number, email address, or other personal identifying information in your comment, you should be aware that your entire comment—including your personal identifying information—may be made publicly available at any time. While you can ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

Authority

The authority for this action is section 4(f) of the Endangered Species Act of 1973, as amended (16 U.S.C. 1531 *et seq.*).

Mary Abrams,

Acting Regional Director, U.S. Fish and Wildlife Service.

Endangered and Threatened Species; Issuance of Enhancement of Survival and Incidental Take Permits for Safe Harbor Agreements, Candidate Conservation Agreements, Habitat Conservation Plans, and Recovery Activities, January 1, 2019, Through December 31, 2019

AGENCY: Fish and Wildlife Service, Interior.

ACTION: Notice.

SUMMARY: We, the U.S. Fish and Wildlife Service, in accordance with the Endangered Species Act (ESA), provide a list to the public of permits issued under the ESA. With some exceptions, the ESA prohibits take of listed species unless a Federal permit is issued that authorizes or exempts the taking under the ESA. We provide this list to the public as a summary of our permit issuances for candidate conservation agreements with assurances, safe harbor agreements, habitat conservation plans, and recovery activities for calendar year 2019.

FOR FURTHER INFORMATION CONTACT: For general information about the ESA permit process, contact Amanda Murnane, via phone at 703–358–2469, via email at Amanda_murnane@fws.gov, or via the Federal Relay Service at 800–877–8339. For information on specific permits, see the contact information below in Permits Issued.

SUPPLEMENTARY INFORMATION: We, the U.S. Fish and Wildlife Service, in accordance with section 10(d) of the Endangered Species Act of 1973 (ESA; 16 U.S.C. 1531 *et seq.*), as amended, provide a list to the public of the permits issued under section 10(a)(1)(A) and 10(a)(1)(B) of the ESA. With some exceptions, the ESA prohibits take of listed species unless a Federal permit is issued that authorizes the taking, or the take is exempted through section 7 of the ESA. Under section 10(a)(1)(A) of the ESA, we issue enhancement of survival permits in conjunction with candidate conservation agreements with assurances (CCAAs) and safe harbor agreements (SHAs). Section 10(a)(1)(A) also authorizes recovery permits. Section 10(a)(1)(B) permits authorize take of listed species incidental to otherwise lawful activities associated with habitat conservation plans (HCPs). We provide this list to the public as a summary of our permit issuances for

CCAAs, SHAs, HCPs, and recovery permits for calendar year 2019.

Background

Under the authority of section 10(a)(1)(A) of the ESA, we have issued enhancement of survival permits to conduct activities that provide a conservation benefit for endangered or threatened species, or for unlisted species should they become listed in the future, in response to permit applications that we received in conjunction with a SHA or a CCAA.

Recovery permits have been issued under ESA section 10(a)(1)(A) to allow for take as part of activities intended to foster the recovery of listed species, typically for scientific research in order to understand better the species' long-term survival needs.

Under ESA section 10(a)(1)(B), we may issue permits for any taking otherwise prohibited by ESA section 9 if such taking is incidental to, and not the purpose of, carrying out an otherwise lawful activity (known as an incidental take permit (ITP)) and the permit applicant submits a habitat conservation plan (HCP) that meets the permit issuance criteria under section 10(a)(2)(B). Typically, applicants seek an ITP to conduct activities such as residential and commercial development, infrastructure development or maintenance, and energy development projects that range in scale from small to landscape-level planning efforts.

The permits associated with SHAs, CCAAs, HCPs, and recovery activities that we issued between January 1 and December 31, 2019, are listed below.

Under section 10(a)(1)(A), we issued each permit only after we determined that it was applied for in good faith, that granting the permit would not be to the disadvantage of the listed species, or to the unlisted species should it be listed; that the proposed activities would benefit the recovery or the enhancement of survival of the species; and that the terms and conditions of the permits were consistent with the purposes and policy set forth in the ESA.

Under section 10(a)(1)(B), we issued permits only after we determined that the applicant is eligible and has submitted a complete application and HCP that fully meets the permit issuance criteria consistent with section 10(a)(2)(B).

Permits Issued

Hawaii, Idaho, Oregon (Except for the Klamath Basin), Washington, American Samoa, Commonwealth of the Northern Mariana Islands, Guam, and the Pacific Trust Territories

The following permits, sorted by type of permit or agreement and date issued in the table below, were applied for and issued by the Regional office

responsible for section 10 permitting in the States and territories listed above.

HCPs, CCAAs, and SHAs

For more information about any of the following HCP, CCAA, or SHA permits, contact the field office that issued the permit by telephone at the appropriate telephone number:

Oregon Fish and Wildlife Office (OR):
503-231-6179

Washington Fish and Wildlife Office (WA): 360-753-9440.

Pacific Islands (HI): 808-792-9400.

Recovery Permits

For more information about any of the following recovery permits, contact the Recovery Permit Coordinator by email at PermitsR1ES@fws.gov or by telephone at 503-231-6131.

Availability of Documents

You may request copies of the **Federal Register** documents publishing the receipt of applications for these permits from the office that issued the permit (see contact information above). Documents and other information submitted with these applications are available for review subject to the requirements of the Privacy Act (5 U.S.C. 552a) and Freedom of Information Act (5 U.S.C. 552), by any party who submits a written request for a copy of such documents.

Authority

We provide this notice under the authority of section 10 of the ESA (16 U.S.C. 1531 *et seq.*).

Gary Frazer,

Assistant Director for Ecological Services.

BILLING CODE 4333–15–P

DEPARTMENT OF THE INTERIOR

U.S. Geological Survey

[GX20EE000101100]

Public Meeting of the National Geospatial Advisory Committee

AGENCY: U.S. Geological Survey, Interior.

ACTION: Notice of public webinar meeting.

SUMMARY: In accordance with the Federal Advisory Committee Act of 1972, the U.S. Geological Survey (USGS) is publishing this notice to announce that a Federal Advisory Committee meeting of the National Geospatial Advisory Committee (NGAC) will take place.

DATES: The webinar meeting will be held on Tuesday, June 9, 2020 from 1:00 p.m. to 5:00 p.m., and on Wednesday, June 10, 2020 from 1:00 p.m. to 5:00 p.m. (Eastern Daylight Time).

ADDRESSES: The meeting will be held via webinar and teleconference. Send your comments to Mr. James Sayer, Group Federal Officer by email to gs-faca-mail@usgs.gov.

FOR FURTHER INFORMATION CONTACT: Mr. John Mahoney, Federal Geographic Data Committee, U.S. Geological Survey, 909 First Avenue, Suite 800, Seattle, WA 98104; by email at jmahoney@usgs.gov; or by telephone at (206) 220–4621.

SUPPLEMENTARY INFORMATION: This meeting is being held under the provisions of the Federal Advisory Committee Act of 1972 (5 U.S.C., Appendix, as amended), the Government in the Sunshine Act of 1976 (5 U.S.C. 552B, as amended), and 41 CFR 102–3.140 and 102–3.150.

Purpose of the Meeting: The NGAC provides advice and recommendations related to management of Federal and national geospatial programs, the development of the National Spatial Data Infrastructure, and the implementation of the Geospatial Data

Act of 2018 and Office of Management and Budget Circular A–16. The NGAC reviews and comments on geospatial policy and management issues and provides a forum to convey views representative of non-federal stakeholders in the geospatial community. The NGAC meeting is one of the primary ways that the FGDC collaborates with its broad network of partners. Additional information about the NGAC meeting is available at: www.fgdc.gov/ngac.

Agenda Topics:

- FGDC Update
- Geospatial Data Act Implementation
- National Spatial Data Infrastructure Strategic Plan
- Landsat Advisory Group
- NGAC Operations
- Public-Private Partnerships

Meeting Accessibility/Special

Accommodations: The webinar meeting is open to the public and will take place from 1:00 p.m. to 5:00 p.m. on June 9 and from 1:00 p.m. to 5:00 p.m. on June 10. Members of the public wishing to attend the meeting should contact Mr. John Mahoney by email at jmahoney@usgs.gov to register no later than three (3) business days prior to the meeting. Webinar/conference line instructions will be provided to registered attendees prior to the meeting. Individuals requiring special accommodations to access the public meeting should contact Mr. John Mahoney at the email stated above or by telephone at (206) 220–4621 at least five (5) business days prior to the meeting so that appropriate arrangements can be made.

Public Disclosure of Comments: There will be an opportunity for public comment during the meeting. Depending on the number of people who wish to speak and the time available, the time for individual comments may be limited. Written comments may also be sent to the Committee for consideration. To allow for full consideration of information by the Committee members, written comments must be provided to John Mahoney, Federal Geographic Data Committee, U.S. Geological Survey, 909 First Avenue, Seattle, WA 98104; by email at jmahoney@usgs.gov; or by telephone at (206) 220–4621, at least three (3) business days prior to the meeting. Any written comments received will be provided to the committee members before the meeting.

Before including your address, phone number, email address, or other personal identifying information in your comment, you should be aware that your entire comment—including your personal identifying information—may

be made publicly available at any time. While you may ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

Authority: 5 U.S.C. Appendix 2.

Kenneth Shaffer,

Deputy Executive Director, Federal Geographic Data Committee, USGS.

Indian Gaming; Extension of Tribal-State Class III Gaming Compact (Rosebud Sioux Tribe and the State of South Dakota)

AGENCY: Bureau of Indian Affairs, Interior.

ACTION: Notice.

SUMMARY: This notice announces the extension of the Class III gaming compact between the Rosebud Sioux Tribe and the State of South Dakota.

DATES: The extension takes effect on April 30, 2020.

FOR FURTHER INFORMATION CONTACT: Ms. Paula L. Hart, Director, Office of Indian Gaming, Office of the Assistant Secretary—Indian Affairs, Washington, DC 20240, (202) 219–4066.

SUPPLEMENTARY INFORMATION: An extension to an existing Tribal-State Class III gaming compact does not require approval by the Secretary if the extension does not modify any other terms of the compact. 25 CFR 293.5. The Rosebud Sioux Tribe and the State of South Dakota have reached an agreement to extend the expiration date of their existing Tribal-State Class III gaming compact to July 19, 2020. This publication provides notice of the new expiration date of the compact.

Tara Sweeney,

Assistant Secretary—Indian Affairs.

Indian Child Welfare Act; Designated Tribal Agents for Service of Notice

AGENCY: Bureau of Indians Affairs, Interior.

ACTION: Notice.

SUMMARY: The regulations implementing the Indian Child Welfare Act provide that Indian Tribes may designate an agent other than the Tribal chairman for service of notice of proceedings under the Act. This notice includes the current list of designated Tribal agents for service of notice.

FOR FURTHER INFORMATION CONTACT:

Bureau of Indian Affairs, Evangeline M. Campbell, Chief, Division of Human Services, 1849 C Street NW, Mail Stop 3641–MIB, Washington, DC 20240; Phone: (202) 513–7621.

SUPPLEMENTARY INFORMATION: The regulations implementing the Indian Child Welfare Act, 25 U.S.C. 1901 *et seq.*, provide that Indian Tribes may designate an agent other than the Tribal chairman for service of notice of proceedings under the Act. *See* 25 CFR 23.12. The Secretary of the Interior is required to update and publish in the **Federal Register** as necessary the names and addresses of the designated Tribal agents. This notice is published in exercise of authority delegated by the Secretary of the Interior to the Principal Deputy Assistant Secretary—Indian Affairs by 209 DM 8.

In any involuntary proceeding in a State court where the court knows or has reason to know that an Indian child is involved, and where the identity and location of the child's parent or Indian custodian or Tribe is known, the party seeking the foster-care placement of, or termination of parental rights to, an Indian child must directly notify the parents, the Indian custodians, and the child's Tribe by registered or certified mail with return receipt requested, of the pending child-custody proceedings and their right of intervention. Copies of these notices must be sent to the appropriate Regional Director by registered or certified mail with return receipt requested or by personal delivery. *See* 25 CFR 23.11.

If the identity or location of the child's parents, the child's Indian custodian, or the Tribes in which the Indian child is a member or eligible for membership cannot be ascertained, but there is reason to know the child is an Indian child, notice of the child-custody

proceeding must be sent to the appropriate Bureau of Indian Affairs Regional Director (see www.bia.gov). See 25 CFR 23.111.

No notices, except for final adoption decrees, are required to be sent to the BIA Central Office in Washington, DC.

This notice presents the names and addresses of current designated Tribal agents for service of notice, and includes each designated Tribal agent received by the Secretary of the Interior prior to the date of this publication. This notice lists designated Tribal

agents by region and alphabetically by Tribe within each region, and is also available electronically at <https://www.bia.gov/bia/ois/dhs/icwa>.

ICWA Designated agents will be updated every four months on the website link to assist the public.

BILLING CODE 4337-15-P

INTERNATIONAL TRADE COMMISSION

Notice of Receipt of Complaint; Solicitation of Comments Relating to the Public Interest

AGENCY: U.S. International Trade Commission.

ACTION: Notice.

SUMMARY: Notice is hereby given that the U.S. International Trade Commission has received a complaint entitled *Certain Synthetic Roofing Underlayment Products and Components Thereof*, DN 3452; the Commission is soliciting comments on any public interest issues raised by the complaint or complainant's filing pursuant to the Commission's Rules of Practice and Procedure.

FOR FURTHER INFORMATION CONTACT: Lisa R. Barton, Secretary to the Commission, U.S. International Trade Commission, 500 E Street SW, Washington, DC 20436, telephone (202) 205-2000. The

public version of the complaint can be accessed on the Commission's Electronic Document Information System (EDIS) at <https://edis.usitc.gov>. For help accessing EDIS, please email EDIS3Help@usitc.gov.

General information concerning the Commission may also be obtained by accessing its internet server at United States International Trade Commission (USITC) at <https://www.usitc.gov>. The public record for this investigation may be viewed on the Commission's Electronic Document Information System (EDIS) at <https://edis.usitc.gov>. Hearing-impaired persons are advised that information on this matter can be obtained by contacting the Commission's TDD terminal on (202) 205-1810.

SUPPLEMENTARY INFORMATION: The Commission has received a complaint and a submission pursuant to § 210.8(b) of the Commission's Rules of Practice and Procedure filed on behalf of Kirsch Research and Development, LLC on April 24, 2020. The complaint alleges violations of section 337 of the Tariff Act of 1930 (19 U.S.C. 1337) in the importation into the United States, the sale for importation, and the sale within the United States after importation of

certain synthetic roofing underlayment products and components thereof. The complaint names as respondents: Atlas Roofing Corporation of Atlanta, GA; CertainTeed Corporation of Malvern, PA; DuPont De Nemours, Inc. of Wilmington, DE; E.I. Du Pont De Nemours and Company of Wilmington, DE; Epilay, Inc. of Carson, CA; GAF Corporation of Parsippany, NJ; InterWrap Corp. of Toledo, OH; Owens Corning of Toledo, OH; Owens Corning Roofing & Asphalt, LLC, of Toledo, OH; System Components Corporation of Issaquah, WA; and Tamko Building Products LLC of Joplin, MO. The complainant requests that the Commission issue a limited exclusion order, cease and desist orders, and impose a bond upon respondents' alleged infringing articles during the 60-day Presidential review period pursuant to 19 U.S.C. 1337(j).

Proposed respondents, other interested parties, and members of the public are invited to file comments on any public interest issues raised by the complaint or § 210.8(b) filing. Comments should address whether issuance of the relief specifically requested by the complainant in this investigation would affect the public

health and welfare in the United States, competitive conditions in the United States economy, the production of like or directly competitive articles in the United States, or United States consumers.

In particular, the Commission is interested in comments that:

(i) Explain how the articles potentially subject to the requested remedial orders are used in the United States;

(ii) identify any public health, safety, or welfare concerns in the United States relating to the requested remedial orders;

(iii) identify like or directly competitive articles that complainant, its licensees, or third parties make in the United States which could replace the subject articles if they were to be excluded;

(iv) indicate whether complainant, complainant's licensees, and/or third party suppliers have the capacity to replace the volume of articles potentially subject to the requested exclusion order and/or a cease and desist order within a commercially reasonable time; and

(v) explain how the requested remedial orders would impact United States consumers.

Written submissions on the public interest must be filed no later than by close of business, eight calendar days after the date of publication of this notice in the **Federal Register**. There will be further opportunities for comment on the public interest after the issuance of any final initial determination in this investigation. Any written submissions on other issues must also be filed by no later than the close of business, eight calendar days after publication of this notice in the **Federal Register**. Complainant may file replies to any written submissions no later than three calendar days after the date on which any initial submissions were due. Any submissions and replies filed in response to this Notice are limited to five (5) pages in length, inclusive of attachments.

Persons filing written submissions must file the original document electronically on or before the deadlines stated above and submit 8 true paper copies to the Office of the Secretary by noon the next day pursuant to § 210.4(f) of the Commission's Rules of Practice and Procedure (19 CFR 210.4(f)). Submissions should refer to the docket number ("Docket No. 3452") in a prominent place on the cover page and/or the first page. (See Handbook for Electronic Filing Procedures, Electronic

Filing Procedures¹). Persons with questions regarding filing should contact the Secretary (202–205–2000).

Any person desiring to submit a document to the Commission in confidence must request confidential treatment. All such requests should be directed to the Secretary to the Commission and must include a full statement of the reasons why the Commission should grant such treatment. See 19 CFR 201.6. Documents for which confidential treatment by the Commission is properly sought will be treated accordingly. All information, including confidential business information and documents for which confidential treatment is properly sought, submitted to the Commission for purposes of this Investigation may be disclosed to and used: (i) By the Commission, its employees and Offices, and contract personnel (a) for developing or maintaining the records of this or a related proceeding, or (b) in internal investigations, audits, reviews, and evaluations relating to the programs, personnel, and operations of the Commission including under 5 U.S.C. Appendix 3; or (ii) by U.S. government employees and contract personnel,² solely for cybersecurity purposes. All nonconfidential written submissions will be available for public inspection at the Office of the Secretary and on EDIS.³

This action is taken under the authority of section 337 of the Tariff Act of 1930, as amended (19 U.S.C. 1337), and of §§ 201.10 and 210.8(c) of the Commission's Rules of Practice and Procedure (19 CFR 201.10, 210.8(c)).

By order of the Commission.

Issued: April 24, 2020.

Lisa Barton,

Secretary to the Commission.

[FR Doc. 2020–09154 Filed 4–29–20; 8:45 am]

BILLING CODE 7020–02–P

DEPARTMENT OF LABOR

Employment and Training Administration

Workforce Innovation and Opportunity Act (WIOA) 2020 Lower Living Standard Income Level (LLSIL)

AGENCY: Employment and Training Administration (ETA), Labor.

¹ Handbook for Electronic Filing Procedures: https://www.usitc.gov/documents/handbook_on_filing_procedures.pdf

² All contract personnel will sign appropriate nondisclosure agreements.

³ Electronic Document Information System (EDIS): <https://edis.usitc.gov>.

ACTION: Notice.

SUMMARY: Title I of WIOA requires the U.S. Secretary of Labor (Secretary) to update and publish the LLSIL tables annually, for uses described in the law (including determining eligibility for youth). WIOA defines the term "low-income individual" as one whose total family annual income does not exceed the higher level of the poverty line or 70 percent of the LLSIL. This issuance provides the Secretary's annual LLSIL for 2020 and references the current 2020 Health and Human Services "Poverty Guidelines."

DATES: This notice is effective April 30, 2020.

FOR FURTHER INFORMATION OR QUESTIONS:

Please contact Samuel Wright, Department of Labor, Employment and Training Administration, 200 Constitution Avenue NW, Room C–4526, Washington, DC 20210; Telephone: 202–693–2870; Fax: 202–693–3015 (these are not toll-free numbers); Email address: wright.samuel.e@dol.gov. Individuals with hearing or speech impairments may access the telephone number above via Text Telephone (TTY/TDD) by calling the toll-free Federal Information Relay Service at 1–877–889–5627 (TTY/TDD).

FOR FURTHER INFORMATION OR QUESTIONS ON FEDERAL YOUTH EMPLOYMENT PROGRAMS:

Please contact Sara Hastings, Department of Labor, Employment and Training Administration, 200 Constitution Avenue NW, Room N–4464, Washington, DC 20210; Telephone: 202–693–3599; Email: hastings.sara@dol.gov. Individuals with hearing or speech impairments may access the telephone number above via TTY by calling the toll-free Federal Information Relay Service at 1–877–889–5627 (TTY/TDD).

SUPPLEMENTARY INFORMATION: The purpose of WIOA is to provide workforce investment activities through statewide and local workforce investment systems that increase the employment, retention, and earnings of participants. WIOA programs are intended to increase the occupational skill attainment by participants and the quality of the workforce, thereby reducing welfare dependency and enhancing the productivity and competitiveness of the Nation.

LLSIL is used for several purposes under the WIOA. Specifically, WIOA SEC.3(36) defines the term "low-income individual" for eligibility purposes, and Sections 127(b)(2)(C) and 132(b)(1)(B)(V)(IV) define the terms "disadvantaged youth" and

“disadvantaged adult” in terms of the poverty line or LLSIL for State formula allotments. The governor and state and local workforce development boards use the LLSIL for determining eligibility for youth and adults for certain services. ETA encourages governors and state/local boards to consult the WIOA Final Rule and ETA guidance for more specific guidance in applying LLSIL to program requirements. The U.S. Department of Health and Human Services (HHS) published the most current poverty-level guidelines in the **Federal Register** on January 17, 2020 (Volume 85, No. 12), pp. 3060–3061. The HHS 2020 Poverty guidelines may also be found on the internet at <https://aspe.hhs.gov/poverty-guidelines>. ETA will have the 2020 LLSIL and the HHS Poverty guidelines available on its website at <http://www.doleta.gov/llsil>.

WIOA Section 3(36)(B) defines LLSIL as “that income level (adjusted for regional, metropolitan, urban and rural differences and family size) determined annually by the Secretary [of Labor] based on the most recent lower living family budget issued by the Secretary.” The most recent lower living family budget was issued by the Secretary in fall 1981. The four-person urban family budget estimates, previously published by the U.S. Bureau of Labor Statistics (BLS), provided the basis for the Secretary to determine the LLSIL. BLS terminated the four-person family budget series in 1982, after publication of the fall 1981 estimates. Currently, BLS provides data to ETA, which ETA then uses to develop the LLSIL tables.

This notice updates the LLSIL to reflect cost of living increases for 2019, by calculating the percentage change in the most recent 2019 Consumer Price Index for All Urban Consumers (CPI-U) for an area to the 2019 CPI-U, and then applying this calculation to each of the May 29, 2019 LLSIL figures (published in the **Federal Register** of May 29, 2019, at Vol. 84, No. 103 pp. 24818–24819) for the 2020 LLSIL.

Microsoft Excel files are used in place of the LLSIL tables that were published in the **Federal Register** notice in previous years. The LLSIL tables will be available on the ETA LLSIL website at <http://www.doleta.gov/llsil>.

The website contains updated figures for a four-person family in Table 1, listed by region for both metropolitan and non-metropolitan areas. Incomes in all of the tables are rounded up to the nearest dollar. Since program eligibility for low-income individuals, “disadvantaged adults,” and “disadvantaged youth” may be determined by family income at 70 percent of the LLSIL, pursuant to WIOA

Section 3 (36)(A)(ii) and Section 3(36)(B), respectively, those figures are listed as well.

I. Jurisdictions

Jurisdictions included in the various regions, based generally on the Census Regions of the U.S. Department of Commerce, are as follows:

A. Northeast

Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont, and the U.S. Virgin Islands.

B. Midwest

Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

C. South

Alabama, American Samoa, Arkansas, Delaware, District of Columbia, Florida, Georgia, Northern Marianas, Oklahoma, Palau, Puerto Rico, South Carolina, Kentucky, Louisiana, Marshall Islands, Maryland, Micronesia, Mississippi, North Carolina, Tennessee, Texas, Virginia, and West Virginia.

D. West

Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

Additionally, the LLSIL Excel file provides separate figures for Alaska, Hawaii, and Guam.

Data for 23 selected Metropolitan Statistical Areas (MSAs) are also available. These are based on annual CPI-U changes for a 12-month period ending in December 2019. The updated LLSIL figures for these MSAs and 70 percent of LLSIL are also available in the LLSIL Excel file.

The LLSIL Excel file also lists each of the various figures at 70 percent of the updated 2019 LLSIL for family sizes of one to six persons. Please note, for families larger than six persons, an amount equal to the difference between the six-person and the five-person family income levels should be added to the six-person family income level for each additional person in the family. Where the poverty level for a particular family size is greater than the corresponding 70 percent of the LLSIL figure, the figure is shaded.

The LLSIL Excel file also indicates 100 percent of LLSIL for family sizes of one to six, and is used to determine self-sufficiency as noted at Section 3 (36)(A)(ii) and Section 3 (36)(B) of WIOA.

II. Use of These Data

Governors should designate the appropriate LLSILs for use within the State using the LLSIL Excel files on the website. The governor’s designation may be provided by disseminating information on MSAs and metropolitan and non-metropolitan areas within the state or it may involve further calculations. An area can be part of multiple LLSIL geographies. For example, an area in the State of New Jersey may have four or more LLSIL figures. All cities, towns, and counties that are part of a metro area in New Jersey are a part of the Northeast metropolitan; some of these areas can also be a portion of the New York City MSA. New Jersey also has areas that are part of the Philadelphia MSA, a less populated area in New Jersey may be a part of the Northeast non-metropolitan. If a workforce investment area includes areas that would be covered by more than one LLSIL figure, the governor may determine which is to be used.

A state’s policies and measures for the workforce investment system shall be accepted by the Secretary to the extent that they are consistent with WIOA and WIOA regulations.

III. Disclaimer on Statistical Uses

It should be noted that publication of these figures is only for the purpose of meeting the requirements specified by WIOA as defined in the law and regulations. BLS has not revised the lower living family budget since 1981, and has no plans to do so. The four-person urban family budget estimates series has been terminated. The CPI-U adjustments used to update LLSIL for this publication are not precisely comparable, most notably because certain tax items were included in the 1981 LLSIL, but are not in the CPI-U. Thus, these figures should not be used for any statistical purposes, and are valid only for those purposes under WIOA as defined in the law and regulations.

John Pallasch,

Assistant Secretary.

BILLING CODE 4510–FT–P

DEPARTMENT OF LABOR**Office of the Secretary****Agency Information Collection Activities; Submission for OMB Review; Comment Request; Labor Organization and Auxiliary Reports**

ACTION: Notice of availability; request for comments.

SUMMARY: The Department of Labor (DOL) is submitting this Office of Labor-Management Standards (OLMS)-sponsored information collection request (ICR) to the Office of Management and Budget (OMB) for review and approval in accordance with the Paperwork Reduction Act of 1995 (PRA). Public comments on the ICR are invited.

DATES: The OMB will consider all written comments that agency receives on or before June 1, 2020.

ADDRESSES: Written comments and recommendations for the proposed information collection should be sent within 30 days of publication of this notice to www.reginfo.gov/public/do/PRAMain. Find this particular information collection by selecting "Currently under 30-day Review—Open for Public Comments" or by using the search function.

Comments are invited on: (1) Whether the collection of information is necessary for the proper performance of the functions of the Department, including whether the information will have practical utility; (2) if the information will be processed and used in a timely manner; (3) the accuracy of the agency's estimates of the burden and cost of the collection of information, including the validity of the methodology and assumptions used; (4) ways to enhance the quality, utility and clarity of the information collection; and (5) ways to minimize the burden of the collection of information on those who are to respond, including the use of automated collection techniques or other forms of information technology.

FOR FURTHER INFORMATION CONTACT: Anthony May by telephone at 202-693-4129, TTY 202-693-8064, (these are not toll-free numbers) or by email at DOL_PRA_PUBLIC@dol.gov.

SUPPLEMENTARY INFORMATION: This program helps to ensure that requested data can be provided in the desired format, reporting burden (time and financial resources) is minimized, collection instruments are clearly understood, and the impact of collection requirements on respondents can be properly assessed. Currently, the Office of Labor-Management Standards

(OLMS) of the Department of Labor (Department) is soliciting comments concerning the proposed extension of the collection of information requirements implementing the Labor Management Reporting and Disclosure Act of 1959, as amended (LMRDA). In particular, the Department seeks to revise the existing ICR in order to ensure a fully comprehensive estimate of such burden associated with the LMRDA, by including the recordkeeping burden associated with union officer elections. See 29 U.S.C. 481. Under 29 U.S.C. 481, election officials designated in the constitution and bylaws or the secretary, if no other official is designated, shall preserve for one year the ballots and all other records pertaining to a labor organization's election of officers. Additionally, the revision is necessary in order to incorporate the reporting burden associated with the voluntary submission of collective bargaining agreements to OLMS pursuant to Labor Management Relations Act section 211(a) and Secretary's Order 4-2007. Finally, the revision is necessary due to electronic filing changes associated with the Forms LM-1, LM-3, LM-4, LM-10, LM-20, and LM-21. The Department proposes to remove the continuing hardship exemption for Form LM-3 and LM-4 filers, and also seeks to make mandatory electronic filing for labor organizations that file the Form LM-1, labor relations consultants that file the Form LM-20 and Form LM-21, and employers that file the Form LM-10. For additional substantive information about this ICR, see the related notice published in the **Federal Register** on December 23, 2019 (84 FR 70567).

This information collection is subject to the PRA. A Federal agency generally cannot conduct or sponsor a collection of information, and the public is generally not required to respond to an information collection, unless the OMB approves it and displays a currently valid OMB Control Number. In addition, notwithstanding any other provisions of law, no person shall generally be subject to penalty for failing to comply with a collection of information that does not display a valid OMB Control Number. See 5 CFR 1320.5(a) and 1320.6.

DOL seeks PRA authorization for this information collection for three (3) years. OMB authorization for an ICR cannot be for more than three (3) years without renewal. The DOL notes that information collection requirements submitted to the OMB for existing ICRs receive a month-to-month extension while they undergo review.

Agency: DOL-OLMS.

Title of Collection: Labor Organization and Auxiliary Reports.

OMB Control Number: 1245-0003.

Affected Public: Private Sector: Businesses or other for-profits, not-for-profit institutions.

Total Estimated Number of Respondents: 37,367.

Total Estimated Number of Responses: 37,367.

Total Estimated Annual Time Burden: 4,818,977 hours.

Total Estimated Annual Other Costs Burden: \$0.

(Authority: 44 U.S.C. 3507(a)(1)(D))

Dated: April 24, 2020.

Anthony May,

Acting Departmental Clearance Officer.

[FR Doc. 2020-09178 Filed 4-29-20; 8:45 am]

BILLING CODE 4510-86-P

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

[Notice 20-046]

Aerospace Safety Advisory Panel; Meeting

AGENCY: National Aeronautics and Space Administration (NASA).

ACTION: Notice of meeting.

SUMMARY: In accordance with the Federal Advisory Committee Act, the National Aeronautics and Space Administration announces a forthcoming meeting of the Aerospace Safety Advisory Panel.

DATES: Friday, May 15, 2020, 3:00 p.m. to 3:45 p.m., Eastern Time.

ADDRESSES: Virtual meeting by teleconference only.

FOR FURTHER INFORMATION CONTACT: Ms. Lisa M. Hackley, Administrative Officer, Aerospace Safety Advisory Panel, NASA Headquarters, Washington, DC 20546, (202) 358-1947 or lisa.m.hackley@nasa.gov.

SUPPLEMENTARY INFORMATION: The Aerospace Safety Advisory Panel (ASAP) will hold Part 2 of its Second Quarterly Meeting for 2020. This discussion is pursuant to carrying out its statutory duties for which the Panel reviews, identifies, evaluates, and advises on those program activities, systems, procedures, and management activities that can contribute to program risk. Priority is given to those programs that involve the safety of human flight. The agenda will include:

—Updates on the Commercial Crew Program

—Updates on Human Lunar Exploration Program.

This meeting is a virtual meeting, and only available telephonically. The

meeting will be open to the public. Any interested person may call the USA toll free conference call number 800-988-9661; passcode 5009142 and then the # sign. At the beginning of the meeting, members of the public may make a verbal presentation to the Panel on the subject of safety in NASA, not to exceed 5 minutes in length. To do so, members of the public must contact Ms. Lisa M. Hackley at lisa.m.hackley@nasa.gov or at (202) 358-1947 at least 48 hours in advance. Any member of the public is permitted to file a written statement with the Panel at the time of the meeting. Verbal presentations and written comments should be limited to the subject of safety in NASA. It is imperative that the meeting be held on this date to accommodate the scheduling priorities of the key participants.

Patricia Rausch,

*Advisory Committee Management Officer,
National Aeronautics and Space
Administration.*

BILLING CODE 7510-13-P

NATIONAL FOUNDATION ON THE ARTS AND THE HUMANITIES

Institute of Museum and Library Services

Submission for OMB Review, Comment Request, Proposed Collection Requests: Building a National Network of Museums and Libraries for School Readiness Project (SRP)

AGENCY: Institute of Museum and Library Services, National Foundation on the Arts and the Humanities.

ACTION: Submission for OMB review, comment request.

SUMMARY: The Institute of Museum and Library Services announces the following information collection has been submitted to the Office of Management and Budget (OMB) for review and approval in accordance with the Paperwork Reduction Act. This program helps to ensure that requested data can be provided in the desired format, reporting burden (time and financial resources) is minimized, collection instruments are clearly understood, and the impact of collection requirements on respondents can be properly assessed. The purpose of this Notice is to solicit comments about this assessment process, instructions and data collections. A copy of the proposed information collection request can be obtained by contacting the individual

listed below in the **ADDRESSES** section of this notice.

DATES: Written comments must be submitted to the office listed in the **FOR FURTHER INFORMATION CONTACT** section below on or before May 29, 2020. OMB is particularly interested in comments that help the agency to:

- Evaluate whether the proposed collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility;
- Evaluate the accuracy of the agency's estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used;
- Enhance the quality, utility, and clarity of the information to be collected; and
- Minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology (e.g., permitting electronic submission of responses).

ADDRESSES: Comments should be sent to Office of Information and Regulatory Affairs, *Attn.:* OMB Desk Officer for Education, Office of Management and Budget, Room 10235, Washington, DC 20503, (202) 395-7316.

FOR FURTHER INFORMATION CONTACT: Dr. Marvin Carr, Institute of Museum and Library Services, 955 L'Enfant Plaza North SW, Suite 4000, Washington, DC 20024-2135. Dr. Carr can be reached by Telephone: 202-653-4752, Fax: 202-653-4601, or by email at mcarr@imls.gov, or by teletype (TTY/TDD) for persons with hearing difficulty at 202-653-4614.

SUPPLEMENTARY INFORMATION: The Institute of Museum and Library Services is the primary source of federal support for the nation's libraries and museums. We advance, support, and empower America's museums, libraries, and related organizations through grant making, research, and policy development. Our vision is a nation where museums and libraries work together to work together to transform the lives of individuals and communities. To learn more, visit www.imls.gov.

Current Actions: Over its history, the Institute of Museum and Library Services (IMLS) has invested in a wide range of projects supporting research and practice in early childhood education through grant making and special initiatives. This project builds

off the Boston Children's Museum's (BCM) and IMLS's previous work in piloting School Readiness Project in South Carolina and Virginia by scaling it into Iowa, Mississippi, and New Mexico. It addresses persistent gaps in early childhood education and school readiness and aims to amplify the strength of organizations serving children and families by forming networks between and across these organizations. The purpose of this data collection effort is to obtain a holistic view of the museum target audience and needs for capacity building support, identify potential gaps in the suite of current offerings, and define both opportunities and partnerships for new and expanded offerings.

This action is to seek approval for the information collection for the Building a National Network of Museums and Libraries for School Readiness Project for the next three years.

Agency: Institute of Museum and Library Services.

Title: Building a National Network of Museums and Libraries for School Readiness Project.

The 30-day notice for the Building a National Network of Museums and Libraries for School Readiness Project, was published in the **Federal Register** on November 4, 2019 (84 FR 59422). One comment was received.

Agency: Institute of Museum and Library Services.

Title: Building a National Network of Museums and Libraries for School Readiness Project.

OMB Number: 3137-TBD.

Agency Number: 3137.

Affected Public: Federal, State and local governments, museums.

Number of Respondents: 520.

Frequency: Once.

Burden Hours per Respondent: 6.

Total Burden Hours: 806.

Total Annual Costs: \$20,188.06.

Dated: April 27, 2020.

Kim Miller,

*Senior Grants Management Specialist,
Institute of Museum and Library Services.*

BILLING CODE 7036-01-P

NATIONAL SCIENCE FOUNDATION

Agency Information Collection Activities: Comment Request

AGENCY: National Science Foundation.

ACTION: Submission for OMB review; comment request.

SUMMARY: The National Science Foundation (NSF) has submitted the following information collection

requirement to OMB for review and clearance under the Paperwork Reduction Act of 1995. This is the second notice for public comment; the first was published in the **Federal Register**, and no comments were received. NSF is forwarding the proposed submission to the Office of Management and Budget (OMB) for clearance simultaneously with the publication of this second notice.

DATES: Written comments and recommendations for the proposed information collection should be sent within 30 days of publication of this notice to www.reginfo.gov/public/do/PRAMain. Find this particular information collection by selecting "Currently under 30-day Review—Open for Public Comments" or by using the search function.

FOR FURTHER INFORMATION CONTACT: Suzanne H. Plimpton, Reports Clearance Officer, National Science Foundation, 2415 Eisenhower Avenue, Alexandria, VA 22314, or send email to splimpto@nsf.gov. Individuals who use a telecommunications device for the deaf (TDD) may call the Federal Information Relay Service (FIRS) at 1-800-877-8339, which is accessible 24 hours a day, 7 days a week, 365 days a year (including federal holidays).

Copies of the submission may be obtained by calling 703-292-7556.

SUPPLEMENTARY INFORMATION: NSF may not conduct or sponsor a collection of information unless the collection of information displays a currently valid OMB control number and the agency informs potential persons who are to respond to the collection of information that such persons are not required to respond to the collection of information unless it displays a currently valid OMB control number.

Comments regarding (a) whether the collection of information is necessary for the proper performance of the functions of the agency, including whether the information will have practical utility; (b) the accuracy of the agency's estimate of burden including the validity of the methodology and assumptions used; (c) ways to enhance the quality, utility and clarity of the information to be collected; (d) ways to minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology should be addressed to the points of contact in the **FOR FURTHER INFORMATION CONTACT** section.

Title of Collection: Grantee Reporting Requirements for NSF SBIR/STTR Program.

OMB Number: 3145-NEW.

Proposed Project: The NSF's Division of Industrial Innovation and Partnerships (IIP), within the Engineering Directorate, serves a wide range of grantees across 5 major programs. The SBIR (Small Business Innovation Research)/STTR (Small Business Technology Transfer) program is designed to stimulate technological innovation in the private sector by strengthening the role of small business, increasing the commercial application of federally supported research results, as well as fostering and encouraging participation by socially and economically disadvantaged and women-owned small businesses.

The NSF SBIR/STTR program has two phases: Phase I and Phase II (with an optional Phase IIB as matching supplements). SBIR/STTR Phase I is a 6-12 month experimental or theoretical investigation on the proposed innovative research or study, and allows the grantees to determine the scientific, technical, and commercial merit of the idea or concept. Phase II further develops the proposed concept, building on the feasibility project undertaken in Phase I, and accelerate the Phase I project to the commercialization stage and enhance the overall strength of the commercial potential. As such, Phase II SBIR/STTR awards have an expected period of performance of 24 months.

The Phase II interim report will be required every six months for the life of the Phase II award. We will use this report to collect information on the technical progress of the funded NSF work, which will allow the managing Program Director to monitor the project and ensure that the award is in good standing. The report will also request a discussion of progress on other company aspects that would allow us to assess the boarder and commercial impacts that are core to our review criteria. This report will also be used to ensure awardee compliance with both SBIR/STTR-wide and NSF-wide compliance requirements (such as lifecycle program certifications and requirements of our Phase II cooperative agreement instrument). Finally, it will be used to collect data that is required by the SBIR Policy Directive.

All the information collected is for internal use by the Division of Industrial Innovation and Partnerships, and will not be made publicly available.

Burden on the Public: Estimated at 16 hours per award for 300 awards for a total of 4,800 hours (per year).

COMMENTS: Comments are invited on (a) whether the proposed collection of information is necessary for the proper performance of the functions of the Agency, including whether the information shall have practical utility; (b) the accuracy of the Agency's estimate of the burden of the proposed collection of information; (c) ways to enhance the quality, utility, and clarity of the information on respondents, including through the use of automated collection techniques or other forms of information technology; and (d) ways to minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology.

Dated: April 24, 2020.

Suzanne H. Plimpton,
Reports Clearance Officer, National Science Foundation.

[FR Doc. 2020-09156 Filed 4-29-20; 8:45 am]

BILLING CODE 7555-01-P

NATIONAL SCIENCE FOUNDATION (NSF)

Sunshine Act Meetings; National Science Board

The National Science Board (NSB), pursuant to NSF regulations (45 CFR part 614), the National Science Foundation Act, as amended, (42 U.S.C. 1862n-5), and the Government in the Sunshine Act (5 U.S.C. 552b), hereby gives notice of the scheduling of meetings for the transaction of NSB business as follows:

TIME AND DATE: Tuesday, May 5, 2020 from 11:00 a.m. to 6:00 p.m., and Wednesday, May 6, 2020 from 11:00 a.m. to 4:35 p.m. EDT.

PLACE: These meetings will be held by videoconference. There will be no in-person meetings to attend. The public may observe the public meetings, which will be streamed to the NSF YouTube channel. For meetings on Monday, May 5, go to: <https://youtu.be/0Wu1pi6fDYc>. For meetings on Tuesday, May 6, go to: <https://youtu.be/agxFF9JB5pM>.

STATUS: Some of these meetings will be open to the public. Others will be closed to the public. See full description below.

MATTERS TO BE CONSIDERED:

Tuesday, May 6, 2020

Plenary Board Meeting

Open Session:

11:00 a.m.–12:00 p.m.

12:15 a.m.–1:15 p.m.

- NSB Chair's Welcome
- Acting NSF Director's Remarks
- *Vision 2030* Rollout
- NSF COVID–19 Briefing

Committee on External Engagement (EE)

Open Session: 1:15 p.m.–2:00 p.m.

- Committee Chair's Opening Remarks
- Approval of Prior Minutes
- Discussion of NSB Alumni Communication Network
- Update on *SEI 2020* Engagement
- *Vision 2030* External Engagement Plans

Committee on National Science and Engineering Policy (SEP)

Open Session: 2:30 p.m.–3:45 p.m.

- Committee Chair's Opening Remarks
- Approval of Prior SEP Minutes
- Update on *Indicators 2020* Thematic Reports Publication
- Update on State Indicators
- Update on COVID–19 Impacts on NCSES and the Federal Data System
- Report on SEP Spring Retreat
- Discussion of Policy Products Stemming from *SEI 2020*

Task Force on Vision 2030 (Vision TF)

Open Session: 4:00 p.m.–4:45 p.m.

- Task Force Chair's Opening Remarks
- Approval of Prior Minutes
- Next Steps for *Vision 2030*

Committee on Strategy (CS)

Open Session: 5:00 p.m.–6:00 p.m.

- Committee Chair's Opening Remarks
- Approval of Prior Minutes
- Update on FY 2020 Current Plan, FY 2020 CARES Act, FY 2021 Appropriations
- NSF Briefing on U.S. Geopolitical Role in the Polar Regions

Wednesday, May 6, 2020

Committee on Oversight (CO)

Open Session: 11:00 a.m.–11:45 a.m.

- Committee Chair's Opening Remarks
- Approval of Committee Meeting Minutes
- Inspector General's Update
- Chief Financial Officer's Update

Committee on Awards and Facilities (A&F)

Open Session: 11:45 a.m.–12:20 p.m.

- Committee Chair's Opening Remarks
- Approval of Prior Minutes
- Rolling Calendar Year 2020–2021 Schedule of Planned Action and Context Items
- COVID–19 Infrastructure Brief
- Written Item: Update on the Ocean Observatories Initiative

Committee on Awards and Facilities (A&F)

Closed Session: 12:30 p.m.–2:00 p.m.

- Committee Chair's Opening Remarks
- Approval of Prior Minutes
- Action Item: Mid-scale Research Infrastructure Track 2 Portfolio
- Context Item: NSF's National Optical-Infrared Astronomy Research Laboratory (NOIR Lab)
- Written Item: COVID Facility Information on Finances and Personnel

Committee on Strategy (CS)

Closed Session: 2:30 p.m.–3:00 p.m.

- Committee Chair's Opening Remarks
- Approval of Prior Minutes
- Update on FY 2020 Current Plan, COVID–19 Spending, FY 2022 Planning

Plenary Board

Closed Session: 3:00 p.m.–3:15 p.m.

- NSB Chair's Opening Remarks
- Approval of Prior Minutes

 3:15 p.m.–3:45 p.m. Plenary Executive

CONTACT PERSONS FOR MORE

INFORMATION: The NSB Office contact is Brad Gutierrez, bgutierrez@nsf.gov, 703–292–7000. The NSB Public Affairs contact is Nadine Lynn, nlynn@nsf.gov, 703–292–2490. The following persons will be available to provide technical support in accessing the YouTube video: Angel Ntumu (antumu@associates.nsf.gov); Phillip Moulden (pmoulden@associates.nsf.gov).

SUPPLEMENTARY INFORMATION: Public portions of meetings will be streamed on YouTube so the public can view them. For meetings on Monday, May 5, go to: <https://youtu.be/0Wu1pi6fDYc>. For meetings on Tuesday, May 6, go to: <https://youtu.be/agxFF9JB5pM>.

Please refer to the NSB website for additional information. You will find any updated meeting information and schedule updates (time, place, subject matter, or status of meeting) at <https://www.nsf.gov/nsb/meetings/notices.jsp#sunshine>.

The NSB provides some flexibility around meeting times. After the first meeting of each day, a meeting may be allowed to run over by as much as 15 minutes if the Chair decides the extra time is warranted. The next meeting would start no later than 15 minutes after the noticed start time. For the May 2020 meetings, the NSB will not start any meetings earlier than the noticed start time.

Chris Blair,

Executive Assistant to the National Science Board Office.

[FR Doc. 2020–09363 Filed 4–28–20; 4:15 pm]

BILLING CODE 7555–01–P

NUCLEAR REGULATORY COMMISSION

[NRC–2020–0101]

Notice To Conduct Scoping and Prepare an Advanced Nuclear Reactor Generic Environmental Impact Statement

AGENCY: Nuclear Regulatory Commission.

ACTION: Intent to conduct scoping process and prepare an Advanced Nuclear Reactor Generic Environmental

Impact Statement (ANR GEIS); public meeting webinar; request for comment.

SUMMARY: The U.S. Nuclear Regulatory Commission (NRC) will conduct a scoping process to gather information necessary to prepare an ANR GEIS for small-scale advanced nuclear reactors. The NRC is seeking stakeholder input and comments on this action and has scheduled a public meeting webinar.

DATES: The NRC will hold a webinar on May 28, 2020 from 1:00 p.m. to 4:00 p.m. Members of the public are invited to submit comments on the scope of the ANR GEIS by June 30, 2020. Scoping comments received after this date will be considered if it is practical to do so, but the NRC is able to ensure consideration only for comments received before this date.

ADDRESSES: You may submit comments by any of the following methods:

- *Federal Rulemaking website:* Go to <https://www.regulations.gov> and search for Docket ID NRC–2020–0101. Address questions about docket IDs on [Regulations.gov](https://www.regulations.gov) to Jennifer Borges; telephone: 301–287–9127; email: Jennifer.Borges@nrc.gov. For technical questions, contact the individual listed in the **FOR FURTHER INFORMATION**

CONTACT section of this document.

- *Email comments to:*

AdvancedReactors-GEIS@nrc.gov.

- *Mail comments to:* Office of Administration, Mail Stop TWFN–7–A60M, U.S. Nuclear Regulatory Commission, Washington, DC 20555–0001. For additional direction on obtaining information and submitting comments, see “Obtaining Information and Submitting Comments” in the **SUPPLEMENTARY INFORMATION** section of this document.

FOR FURTHER INFORMATION CONTACT: Jack Cushing, Office of Nuclear Material Safety and Safeguards, U.S. Nuclear Regulatory Commission, Washington DC 20555–0001; telephone: 301–415–1424 email: Jack.Cushing@nrc.gov.

SUPPLEMENTARY INFORMATION:

I. Obtaining Information and Submitting Comments

A. Obtaining Information

Please refer to Docket ID NRC–2020–0101 when contacting the NRC about the availability of information regarding this action. You may obtain publicly-available information related to this action by any of the following methods:

- *Federal Rulemaking website:* Go to <https://www.regulations.gov> and search for Docket ID NRC–2020–0101.

- *NRC’s Agencywide Documents Access and Management System (ADAMS):* You may obtain publicly-

available documents online in the NRC Library at <https://www.nrc.gov/reading-rm/adams.html>. To begin the search, select “Begin Web-based ADAMS Search.” For problems with ADAMS, please contact the NRC’s Public Document Room reference staff at 1–800–397–4209 or 1–301–415–4737 between 8:00 a.m. and 4:00 p.m., Monday through Friday, except Federal Holidays, or by email to pdr.resource@nrc.gov. The ADAMS accession number for each document referenced (if it is available in ADAMS) is provided the first time that it is mentioned in this document.

- *Project web page:* Information related to the ANR GEIS project can be accessed on the NRC’s web page at: <https://www.nrc.gov/reactors/new-reactors/advanced.html>.

B. Submitting Comments

Please include Docket ID NRC–2020–0101 in the subject line of your comment submission in order to ensure that the NRC is able to make your comment submission available to the public in this docket.

The NRC cautions you not to include identifying or contact information that you do not want to be publicly disclosed in your comment submission. The NRC will post all comment submissions at <https://www.regulations.gov> and will enter the comment submissions into ADAMS. The NRC does not routinely edit comment submissions to remove identifying or contact information.

If you are requesting or aggregating comments from other persons for submission to the NRC, then you should inform those persons not to include identifying or contact information that they do not want to be publicly disclosed in their comment submission. Your request should state that the NRC does not routinely edit comment submissions to remove such information before making the comment submissions available to the public or entering the comment submissions into ADAMS.

II. Discussion

The NRC intends to develop a GEIS for advanced nuclear reactors with a small generating output and correspondingly small environmental footprint in order to streamline the environmental review process for future small-scale advanced nuclear reactor environmental reviews. The purpose of an ANR GEIS is to determine which environmental impacts could result in essentially the same (generic) impact for different advanced nuclear reactor designs that fit within the parameters

set in the GEIS, and which environmental impacts could result in different levels of impacts requiring a plant-specific analysis. Environmental reviews for small-scale advanced nuclear reactor license applications could incorporate the ANR GEIS by reference and provide site-specific information and analyses in a Supplemental Environmental Impact Statement (SEIS), thereby streamlining the environmental review process. In SECY–20–0020 (ADAMS Accession No. ML20052D175), the staff informed the Commission that it plans to use a technology-neutral plant parameter envelope (or PPE) approach to bound small-scale ANR projects. For the purposes of the ANR GEIS, the staff considers a “small-scale” ANR as having the potential to generate up to approximately 30 megawatts thermal per reactor with a correspondingly small environmental footprint. The actual bounding thermal power level of the ANR and the environmental footprint used in the ANR GEIS are topics to be determined during the scoping process.

Because small-scale advanced reactors are not specific to only one reactor design and could be sited anywhere in the United States that meets NRC siting requirements, the NRC decided to pursue a technology neutral approach using a PPE. The PPE will consist of a table of bounding values or parameters for different reactor designs located on a site. In addition, a table of values representing the site parameter envelope (e.g., size of site, quantity of water used, demographics) will be developed to describe the affected environment. The ANR GEIS will evaluate the impacts of a reactor that fits within the bounds of the PPE on a site that fits within the bounds of the site parameter envelope to determine the environmental impact.

An application that references the ANR GEIS will need to demonstrate that its project is bounded by the analysis in the ANR GEIS and that there is no significant new information affecting the evaluation. The application will also need to analyze the site-specific resources not resolved generically in the ANR GEIS. If the project is bounded by the ANR GEIS and there is no significant new information, the NRC will incorporate by reference the ANR GEIS and no further analysis would be needed for a resource that was resolved generically. If impacts to a resource have not been resolved generically by the ANR GEIS, the site-specific SEIS will evaluate the impacts to the resource.

The NRC will not authorize construction or operation of any advanced nuclear reactors through the

ANR GEIS. Consultation required by Section 106 of the National Historic Preservation Act and Section 7 of the Endangered Species Act will be conducted and included in the SEIS for each application and will not be part of the ANR GEIS.

III. Request for Comments

This document informs the public of the NRC's intention to conduct scoping and prepare an ANR GEIS for small-scale advanced nuclear reactors. The NRC is seeking input from the public and stakeholders regarding the parameters that the NRC should use to bound the small-scale advanced reactors in the plant parameter envelope (including power level and size of the site) and the parameters that should be used to bound the affected environment in the site parameter envelope. In addition, the NRC is seeking input on resources or issues that can be resolved generically and ones that cannot.

This document is being published in accordance with National Environmental Policy Act and the NRC's regulations found at part 51 of title 10 of the *Code of Federal Regulations* (10 CFR). The NRC will first conduct scoping for the ANR GEIS and, as soon as practicable thereafter, will prepare a draft ANR GEIS for public comment. Participation in the scoping process by members of the public and local, State, Tribal, and Federal

government agencies is encouraged. In accordance with 10 CFR 51.29 the scoping process will be used to accomplish the following:

- a. Define the proposed action;
- b. Determine the scope of the ANR GEIS and identify the significant issues to be analyzed in depth;
- c. Identify and eliminate from detailed study those issues that are peripheral or are not significant; or were covered by a prior environmental review;
- d. Identify any Environmental Assessments and other Environmental Impact Statements (EISs) that are being or will be prepared that are related to, but are not part of, the ANR GEIS being considered;
- e. Identify other environmental review and consultation requirements related to the proposed action;
- f. Indicate the relationship between the timing of the preparation of the ANR GEIS and the Commission's tentative planning and decision-making schedule;
- g. Identify any cooperating agencies and, as appropriate, allocate assignments for preparation and schedules for completing the ANR GEIS to the NRC and any cooperating agencies; and
- h. Describe how the ANR GEIS will be prepared, including any contractor assistance to be used.

The NRC invites the following entities to participate in scoping:

a. Any Federal agency that has jurisdiction by law or special expertise with respect to any environmental impact involved or that is authorized to develop and enforce relevant environmental standards;

b. Affected State and local government agencies, including those authorized to develop and enforce relevant environmental standards;

c. Any affected Indian Tribe; and

d. Any person who requests or has requested an opportunity to participate in the scoping process.

IV. Public Scoping Webinar

In accordance with 10 CFR 51.26(b), the scoping process for an EIS may include a public scoping meeting, which may help identify significant issues related to a proposed activity and to determine the scope of issues to be addressed in an EIS.

The NRC is announcing that it will hold the public meeting as a webinar. The webinar will be held online and will offer a telephone line for members of the public to submit comments. A court reporter will be recording all comments received during the webinar. To be considered, comments must be provided either at the transcribed public meeting or in writing, as discussed in the **ADDRESSES** section of this document. The date and time for the public webinar are as follows:

| Meeting | Date | Time | Location |
|----------------------|-----------|--------------------------------|---|
| Public Webinar | 5/28/2020 | 1:00 PM to 4:00 PM (EDT) | Webinar Information: https://usnrc.webex.com . Event number: 905642855. Telephone Bridge Line: 1-888-622-9844. Participant Passcode: 5484985. |

Persons interested in attending this webinar should monitor the NRC's Public Meeting Schedule web page at <https://www.nrc.gov/pmns/mtg> for additional information, agendas for the meeting, and access information for the webinar. Participants should register in advance of the meeting by visiting the website (<https://usnrc.webex.com>) and using the event number provided above. A confirmation email will be generated providing additional details and a link to the webinar.

Dated: April 21, 2020.

For the Nuclear Regulatory Commission.

Kenneth T. Erwin,

Chief, Environmental Review New Reactor Branch, Division of Rulemaking, Environmental, and Financial Support, Office of Office of Nuclear Material Safety and Safeguards.

[FR Doc. 2020-08798 Filed 4-29-20; 8:45 am]

BILLING CODE 7590-01-P

NUCLEAR REGULATORY COMMISSION

673rd Meeting of the Advisory Committee on Reactor Safeguards (ACRS)

In accordance with the purposes of Sections 29 and 182b of the Atomic Energy Act (42 U.S.C. 2039, 2232b), the Advisory Committee on Reactor Safeguards (ACRS) will hold meetings

on May 6–9, 2020. As part of the coordinated government response to combat COVID-19, the Committee will conduct virtual meetings. The public will be able to participate any open sessions via 1-866-822-3032, pass code 8272423#.

Wednesday, May 6, 2020

1:00 p.m.–1:05 p.m.: Opening Remarks by the ACRS Chairman (Open)—The ACRS Chairman will make opening remarks regarding the conduct of the meeting.

1:05 p.m.–6:00 p.m.: Preparation of ACRS Reports (Open/Closed)—The Committee will continue its discussion of proposed ACRS reports. [NOTE: A portion of this session may be closed in order to discuss and protect information designated as proprietary, pursuant to 5 U.S.C 552b(c)(4)].

Thursday, May 7, 2020

9:30 a.m.–6:00 p.m.: *Preparation of ACRS Reports* (Open/Closed)—The Committee will continue its discussion of proposed ACRS reports. [NOTE: A portion of this session may be closed in order to discuss and protect information designated as proprietary, pursuant to 5 U.S.C 552b(c)(4)].

Friday, May 8, 2020

9:30 a.m.–11:30 a.m.: *Future ACRS Activities/Report of the Planning and Procedures Subcommittee and Reconciliation of ACRS Comments and Recommendations* (Open/Closed)—The Committee will hear discussion of the recommendations of the Planning and Procedures Subcommittee regarding items proposed for consideration by the Full Committee during future ACRS meetings. [NOTE: A portion of this meeting may be closed pursuant to 5 U.S.C. 552b(c)(2) and (6) to discuss organizational and personnel matters that relate solely to internal personnel rules and practices of the ACRS, and information the release of which would constitute a clearly unwarranted invasion of personal privacy.] [NOTE: A portion of this session may be closed in order to discuss and protect information designated as proprietary, pursuant to 5 U.S.C 552b(c)(4)].

11:30 a.m.–6:00 p.m.: *Preparation of ACRS Reports* (Open/Closed)—The Committee will continue its discussion of proposed ACRS reports. [NOTE: A portion of this session may be closed in order to discuss and protect information designated as proprietary, pursuant to 5 U.S.C 552b(c)(4)].

Saturday, May 9, 2020

9:30 a.m.–1:00 p.m.: *Preparation of ACRS Reports* (Open/Closed)—The Committee will continue its discussion of proposed ACRS reports. [NOTE: A portion of this session may be closed in order to discuss and protect information designated as proprietary, pursuant to 5 U.S.C 552b(c)(4)].

Procedures for the conduct of and participation in ACRS meetings were published in the **Federal Register** on June 13, 2019 (84 FR 27662). In accordance with those procedures, oral or written views may be presented by members of the public, including representatives of the nuclear industry. Persons desiring to make oral statements should notify Quynh Nguyen, Cognizant ACRS Staff and the Designated Federal Official (DFO) (Telephone: 301–415–5844, Email: Quynh.Nguyen@nrc.gov), 5 days before the meeting, if possible, so that appropriate arrangements can be made to allow necessary time during the

meeting for such statements. In view of the possibility that the schedule for ACRS meetings may be adjusted by the Chairman as necessary to facilitate the conduct of the meeting, persons planning to attend should check with the Cognizant ACRS staff if such rescheduling would result in major inconvenience.

An electronic copy of each presentation should be emailed to the Cognizant ACRS Staff at least one day before meeting.

In accordance with Subsection 10(d) of Public Law 92–463 and 5 U.S.C. 552b(c), certain portions of this meeting may be closed, as specifically noted above. Use of still, motion picture, and television cameras during the meeting may be limited to selected portions of the meeting as determined by the Chairman. Electronic recordings will be permitted only during the open portions of the meeting.

ACRS meeting agendas, meeting transcripts, and letter reports are available through the NRC Public Document Room at pdr.resource@nrc.gov, or by calling the PDR at 1–800–397–4209, or from the Publicly Available Records System (PARS) component of NRC's document system (ADAMS) which is accessible from the NRC website at <http://www.nrc.gov/reading-rm/adams.html> or <http://www.nrc.gov/reading-rm/doc-collections/#ACRS/>.

Video teleconferencing service is available for observing open sessions of ACRS meetings. Those wishing to use this service should contact Thomas Dashiell, ACRS Audio Visual Technician (301–415–7907), between 7:30 a.m. and 3:45 p.m. (ET), at least 10 days before the meeting to ensure the availability of this service. Individuals or organizations requesting this service will be responsible for telephone line charges and for providing the equipment and facilities that they use to establish the video teleconferencing link. The availability of video teleconferencing services is not guaranteed.

NOTE: This notice is late due to the COVID–19 public health emergency and current health precautions which required the Committee to prepare for the meeting to be held remotely.

Dated: April 24, 2020.

Russell E. Chazell,

Federal Advisory Committee Management Officer, Office of the Secretary.

[FR Doc. 2020–09127 Filed 4–29–20; 8:45 am]

BILLING CODE 7590–01–P

POSTAL REGULATORY COMMISSION

[Docket No. C2020–1; Presiding Officer's Ruling No. 3]

Complaint of Randall Ehrlich

AGENCY: Postal Regulatory Commission.
ACTION: Notice.

SUMMARY: The Commission is revising the procedural schedule for the Complaint of *Randall Ehrlich v. United States Postal Service*, which relates to alleged discrimination by Postal Service management in continuing a suspension of mail service due to a dog hold on the Complainant's residence. This notice informs the public of the revised procedural schedule.

DATES: *Deadline for notices of intervention:* June 1, 2020; *Prehearing Conference:* August 20, 2020 at 1:00 p.m. Eastern Daylight Time (10:00 a.m. Pacific Daylight Time) by telephone; *Hearing of evidence to begin:* October 1, 2020; *Deadline for requests to hold a hearing before the Presiding Officer for oral presentation of evidence:* No later than 7 days before the prehearing conference.

ADDRESSES: For additional information, Presiding Officer's Ruling No. 3 can be accessed electronically through the Commission's website at <https://www.prc.gov>.

FOR FURTHER INFORMATION CONTACT: David A. Trissell, General Counsel, at 202–789–6820.

SUPPLEMENTARY INFORMATION:**Table of Contents**

- I. Introduction
- II. Revised Procedural Schedule

I. Introduction

Pursuant to 39 CFR 3001.19 and 39 CFR 3001.17, the Commission gives notice that the procedural schedule has been extended 30 days for the Complaint of *Randall Ehrlich v. United States Postal Service*, which relates to alleged discrimination by Postal Service management in continuing a suspension of mail service due to a dog hold on the Complainant's residence, potentially violating 39 U.S.C. 403(c).¹ This notice informs the public of the revised procedural schedule established in Presiding Officer's Ruling No. 3.²

II. Revised Procedural Schedule

1. The deadline to file a notice of intervention pursuant to 39 CFR

¹ Complaint of Randall Ehrlich, December 23, 2019.

² See Presiding Officer's Ruling Denying Request for an Indefinite Abeyance and Granting 30-Day Extension of Procedural Deadlines, April 24, 2020.

3001.20 (formal intervention) or 39 CFR 3001.20a (limited participation) is June 1, 2020.

2. A prehearing conference is scheduled to be conducted before the Presiding Officer on August 20, 2020 at 1:00 p.m. Eastern Daylight Time (10:00 a.m. Pacific Daylight Time) by telephone.

3. The hearing of evidence in this case shall begin October 1, 2020.

4. A request to hold a hearing before the Presiding Officer for the oral presentation of evidence (including any testimony) shall be filed no later than 7 days before the prehearing conference and shall specify each witness for which oral testimony is proposed.

Erica A. Barker,
Secretary.

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34–88741; File No. SR–CBOE–2020–040]

Self-Regulatory Organizations; Cboe Exchange, Inc.; Notice of Filing and Immediate Effectiveness of a Proposed Rule Change To Add a New Version of the Silexx Platform

April 24, 2020.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 (the “Act”),¹ and Rule 19b–4 thereunder,² notice is hereby given that on April 20, 2020, Cboe Exchange, Inc. (the “Exchange” or “Cboe Options”) filed with the Securities and Exchange Commission (the “Commission”) the proposed rule change as described in Items I and II below, which Items have been prepared by the Exchange. The Exchange filed the proposal as a “non-controversial” proposed rule change pursuant to Section 19(b)(3)(A)(iii) of the Act³ and Rule 19b–4(f)(6) thereunder.⁴ The Commission is publishing this notice to solicit comments on the proposed rule change from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

Cboe Exchange, Inc. (the “Exchange” or “Cboe Options”) proposes to add a new version of the Silexx platform. The text of the proposed rule change is provided in Exhibit 5.

The text of the proposed rule change is also available on the Exchange's website (<http://www.cboe.com/AboutCBOE/CBOELegalRegulatoryHome.aspx>), at the Exchange's Office of the Secretary, and at the Commission's Public Reference Room.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the Exchange included statements concerning the purpose of and basis for the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. The Exchange has prepared summaries, set forth in sections A, B, and C below, of the most significant aspects of such statements.

¹ 15 U.S.C. 78s(b)(1).² 17 CFR 240.19b–4.³ 15 U.S.C. 78s(b)(3)(A)(iii).⁴ 17 CFR 240.19b–4(f)(6).**A. Self-Regulatory Organization's Statement of the Purpose of, and the Statutory Basis for, the Proposed Rule Change****1. Purpose**

The Exchange proposes to add a new version of the Silexx platform (“Cboe Silexx”).⁵ By way of background, Silexx is a User-optional order entry and management trading platform. The current versions of the Silexx platform, other than Silexx FLEX, are designed so that a User may enter orders into the platform to send to the executing broker, including Trading Permit Holders (“TPHs”), of its choice with connectivity to the platform. The executing broker can then send orders to Cboe Options (if the broker-dealer is a TPH) or other U.S. exchanges (and trading centers) in accordance with the User's instructions. Users cannot directly route orders through any of the current versions of Silexx, other than Silexx FLEX, to an exchange or trading center nor is the platform integrated into or directly connected to Cboe Option's System. The Exchange recently made available an additional version of the Silexx platform, Silexx FLEX, which supports the trading of FLEX Options and allows authorized Users with direct access to the Exchange.⁶

In addition to supporting the trading of FLEX Options,⁷ the proposed new version, Cboe Silexx, will also support the trading of non-FLEX options and allow for direct access to the Exchange. Additionally, functionality that will be available on Cboe Silexx, which was previously adopted by the Exchange and is already available on other versions of Silexx, include real-time data, alerts, trade reports, views of exchange books, management of the customer's orders and positions, simple and complex order tickets, basic risk features, and availability of clearing fields in order tickets.⁸ The Exchange notes that Cboe Silexx is essentially the same platform, with the same applicable functionality as Silexx FLEX, except that it additionally supports direct access for non-FLEX trading. As is the case with Silexx FLEX, only authorized Users and associated persons of Users may

⁵ The Exchange originally filed this proposed rule change on April 15, 2020 (SR–CBOE–2020–038). On April 20, 2020, the Exchange withdrew that filing and replaced it with this filing.

⁶ See Securities Exchange Act Release No. 87028 (September 19, 2019) 84 FR 50529 (September 25, 2019) (SR–CBOE–2019–061).

⁷ Only Users authorized for direct access and who are approved to trade FLEX Options may trade FLEX Options via Cboe Silexx.

⁸ See Securities Exchange Act Release No. 82088 (November 15, 2017) 82 FR 55449 (November 21, 2017) (SR–CBOE–2017–068).

establish connectivity to and directly access the Exchange, pursuant to Rule 5.5, however, a User that is not authorized for direct access will be able to send orders through the Exchange's broker community who will have access to Cboe Silexx and can submit orders directly on the User's behalf.⁹ The Exchange notes there will be a verification process for Users that wish to access Cboe Silexx to ensure that each User is authorized for direct Exchange access. Each verified User will require a username and password to authenticate their access. The Exchange notes that those authorized to directly access the Exchange must uphold supervisory duties over those associated with it to ensure that only authorized Users access the platform. Other than the above noted differences, the new Cboe Silexx platform will function in the same manner as the Silexx versions currently available to Users: It will be completely voluntary; orders entered through the platform will receive no preferential treatment as compared to orders electronically sent to Cboe Options in any other manner; orders entered through the platform will be subject to current trading rules in the same manner as all other orders sent to the Exchange, which is the same as orders that are sent through the Exchange's System today; the Exchange's System will not distinguish between orders sent from Silexx and orders sent in any other manner; and Silexx¹⁰ will provide technical support, maintenance and user training for the new platform version upon the same terms and conditions for all Users.¹¹ The Exchange notes that it currently offers a similar front-end order entry system, the PULSe workstation, which also permits connectivity to Cboe Options. The Exchange notes that no changes are being made to the other current Silexx platform versions.

The Exchange lastly noted that at this time, it does not propose to assess a fee

in connection with the Cboe Silexx platform.¹²

2. Statutory Basis

The Exchange believes the proposed rule change is consistent with the Securities Exchange Act of 1934 (the "Act") and the rules and regulations thereunder applicable to the Exchange and, in particular, the requirements of Section 6(b) of the Act.¹³ Specifically, the Exchange believes the proposed rule change is consistent with the Section 6(b)(5)¹⁴ requirements that the rules of an exchange be designed to prevent fraudulent and manipulative acts and practices, to promote just and equitable principles of trade, to foster cooperation and coordination with persons engaged in regulating, clearing, settling, processing information with respect to, and facilitating transactions in securities, to remove impediments to and perfect the mechanism of a free and open market and a national market system, and, in general, to protect investors and the public interest. Additionally, the Exchange believes the proposed rule change is consistent with the Section 6(b)(5)¹⁵ requirement that the rules of an exchange not be designed to permit unfair discrimination between customers, issuers, brokers, or dealers. Additionally, the Exchange also believes the proposed rule change is consistent with Section 6(b)(4) of the Act,¹⁶ which requires that Exchange rules provide for the equitable allocation of reasonable dues, fees, and other charges among its Trading Permit Holders and other persons using its facilities.

The Exchange believes that offering the Cboe Silexx platform to market participants protects investors and is in the public interest because it will allow the Exchange to directly offer Users an order entry and management tool for both non-FLEX and FLEX trading in addition to the technology products it currently offers, such as the other versions of the Silexx platform and the PULSe workstation. Indeed, as noted above, the Cboe Silexx is essentially the same platform as Silexx FLEX in particular, but merely allows for non-FLEX trading in addition to supporting FLEX trading. In addition, firms can create their own proprietary front-end order entry technology or obtain systems with such functionality from

third-party vendors.¹⁷ The Exchange believes providing an alternative tool for trading, may encourage more Users to submit orders in both FLEX and non-FLEX options (including into price improvement auctions), which may lead to additional execution opportunities for market participants and liquidity in the market, which ultimately benefits investors.

The Exchange believes the proposed rule change does not discriminate among market participants because use of the Cboe Silexx platform is completely voluntary. Users can choose to route orders, including to Cboe Options, and directly submit orders to Cboe Options, without the use of the platform. The Exchange is making the platform available as a convenience to market participants, who will continue to have the option to use any order entry and management system available in the marketplace to send orders to the Exchange and other exchanges; the platform is merely an alternative that will be offered by the Exchange. Cboe Silexx is not an exclusive means available to market participants to send orders to Cboe Options or other markets. Any orders sent through the platform to Cboe Options for execution will receive no preferential treatment. Additionally, Cboe Silexx will be available to all market participants, and the Exchange will license the platform to market participants pursuant to the same terms and conditions.

The Exchange believes Cboe Silexx removes impediments to and perfects the mechanism of a free and open market and a national market system because users have discretion to determine to which broker-dealer they will route orders from the platform. Non-broker-dealer users may separately enter into an agreement with a broker-dealer (the Exchange will have no involvement with the entry into such agreements), which can provide for routing to U.S. options and stock exchanges (and trading centers). Only Trading Permit Holders will continue to be permitted to directly submit orders using Cboe Silexx to Cboe Options, and only members of other U.S. exchanges will be able to enter orders for execution at those exchanges that they receive from the platform. The Exchange also notes that broker-dealers must continue to ensure that orders they receive from the platform will be subject to applicable pre-trade risk control

⁹ The Exchange notes that Users may also send orders through a Cboe Silexx certified broker, once brokers begin electing to become certified. The Exchange has implemented a certification process which is open to any broker that supports trading and will allow Users without direct access to submit through an electronic broker certified with Silexx. The Exchange currently conducts similar certifications for any broker that wishes to connect to Cboe, and for other platform offerings (e.g. PULSe).

¹⁰ Silexx is the wholly owned subsidiary of Cboe Options' parent company, Cboe Global Markets, Inc., which purchased Silexx in 2017.

¹¹ See Securities Exchange Act Release No. 82088 (November 15, 2017), 82 FR 55443 (November 21, 2017) (Notice of Filing and Immediate Effectiveness of a Proposed Rule Change To Describe Functionality of and Adopt Fees for a New Front-End Order Entry and Management Platform) (SR-CBOE-2017-068).

¹² The Exchange will submit a separate rule filing to address any fees it may wish to adopt in the future.

¹³ 15 U.S.C. 78f(b).

¹⁴ 15 U.S.C. 78f(b)(5).

¹⁵ *Id.*

¹⁶ 15 U.S.C. 78f(b)(4).

¹⁷ Market participants are free to do so by accessing the Exchange's specs via the publicly accessible Application Programming Interface and using such information in order to support trading within their own technology, software, and front-end systems.

requirements of the broker-dealer that directly submits the orders to an exchange in accordance with Rule 15c3–5 under the Act.¹⁸

The Exchange believes that its reasonable to not assess a monthly Login ID fee for Cboe Silexx as market participants won't be subject to a fee for this product. Additionally, the Exchange notes Silexx FLEX is also currently provided at no cost.¹⁹ The Exchange believes not assessing a fee at this time also serves as an incentive to market participants to start using the Silexx platform as a trading tool on their trading desks. The proposal is equitable and not unfairly discriminatory as it applies to all market participants.

B. Self-Regulatory Organization's Statement on Burden on Competition

The Exchange does not believe that the proposed rule change will impose any burden on competition that is not necessary or appropriate in furtherance of the purposes of the Act. The proposed change will not impose any burden on intramarket competition that is not necessary or appropriate in furtherance of the purposes of the Act because the Exchange will make the Cboe Silexx version of the platform available to all market participants and at no additional cost. Indeed, all market participants may use Cboe Silexx, both those with direct access and those without, by sending orders through the Exchange's broker community who will be able to submit orders directly through Cboe Silexx.

As described in detail above, the use of the platform will be completely voluntary and market participants will continue to have the flexibility to use any entry and management tool that is proprietary or from third-party vendors, and/or market participants may choose any executing brokers to enter their orders. The proposed platform is not an exclusive means of trading, and if market participants believe that other products, vendors, front-end builds, etc. available in the marketplace are more beneficial than the Cboe Silexx platform, they may simply use those products instead. Use of such functionality is completely voluntary. Also, the Exchange notes that use of the platform will not provide market participants with any additional access to the Exchange than that which is available through the use of any other front-end order entry system supporting trading. Orders executed through the platform will not receive preferential treatment and the Exchange's System

will not distinguish between orders sent from Cboe Silexx and orders sent in any other manner. The Exchange notes that similar platforms, such as other Silexx versions and PULSe workstations, are currently offered today.

The Exchange does not believe that the proposed change will impose any burden on intermarket competition that is not necessary or appropriate in furtherance of the purposes of the Act because Cboe Options will be offering a type of product that is widely available throughout the industry, including from some exchanges. As noted above, market participants can also develop their own proprietary products with the same functionality. Additionally, ISE currently offers a similar front-end order entry application (PrecICE). The offering of Cboe Silexx to market participants to enter and manage orders for routing or submitting to U.S. exchanges will be an addition to the Exchange's current suite of technology products it offers, including other current Silexx platforms. As such, market participants will be able to choose to execute, or continue to execute, orders through any of these means.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

The Exchange neither solicited nor received comments on the proposed rule change.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Because the foregoing proposed rule change does not: (i) Significantly affect the protection of investors or the public interest; (ii) impose any significant burden on competition; and (iii) become operative for 30 days from the date on which it was filed, or such shorter time as the Commission may designate, it has become effective pursuant to Section 19(b)(3)(A) of the Act²⁰ and Rule 19b–4(f)(6) thereunder.²¹

A proposed rule change filed pursuant to Rule 19b–4(f)(6) under the Act²² normally does not become operative for 30 days after the date of its filing. However, Rule 19b–4(f)(6)(iii)²³

²⁰ 15 U.S.C. 78s(b)(3)(A).

²¹ 17 CFR 240.19b–4(f)(6). In addition, Rule 19b–4(f)(6)(iii) requires a self-regulatory organization to give the Commission written notice of its intent to file the proposed rule change, along with a brief description and text of the proposed rule change, at least five business days prior to the date of filing of the proposed rule change, or such shorter time as designated by the Commission. The Exchange has satisfied this requirement.

²² 17 CFR 240.19b–4(f)(6).

²³ 17 CFR 240.19b–4(f)(6)(iii).

permits the Commission to designate a shorter time if such action is consistent with the protection of investors and the public interest. The Exchange has requested that the Commission waive the 30-day operative delay so that the proposed rule change may become operative upon filing. Cboe Options asserts that the proposed rule change doesn't present novel or unique issues because the proposed Cboe Silexx platform is similar to technology already available on the Exchange.²⁴ The Exchange notes that the proposed Cboe Silexx platform is an extension of the Silexx FLEX platform, with the main substantive difference being that it permits entry of non-FLEX orders, as discussed above. The Commission believes that waiver of the 30-day operative delay is consistent with the protection of investors and the public interest. The Commission hereby waives the operative delay and designates the proposed rule change operative upon filing.²⁵

At any time within 60 days of the filing of the proposed rule change, the Commission summarily may temporarily suspend such rule change if it appears to the Commission that such action is necessary or appropriate in the public interest, for the protection of investors, or otherwise in furtherance of the purposes of the Act. If the Commission takes such action, the Commission will institute proceedings to determine whether the proposed rule change should be approved or disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's internet comment form (<http://www.sec.gov/rules/sro.shtml>); or
- Send an email to rule-comments@sec.gov. Please include File Number SR–CBOE–2020–040 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE, Washington, DC 20549–1090.

²⁴ See *supra* note 6.

²⁵ For purposes only of waiving the 30-day operative delay, the Commission also has considered the proposed rule's impact on efficiency, competition, and capital formation. See 15 U.S.C. 78c(f).

¹⁸ See 17 CFR 240.15c3–5.

¹⁹ See Cboe Silexx Fees Schedule.

All submissions should refer to File Number SR-CBOE-2020-040. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's internet website (<http://www.sec.gov/rules/sro.shtml>). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for website viewing and printing in the Commission's Public Reference Room, 100 F Street NE, Washington, DC 20549, on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of the filing also will be available for inspection and copying at the principal office of the Exchange. All comments received will be posted without change. Persons submitting comments are cautioned that we do not redact or edit personal identifying information from comment submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File Number SR-CBOE-2020-040 and should be submitted on or before May 21, 2020.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.²⁶

J. Matthew DeLesDernier,
Assistant Secretary.

BILLING CODE 8011-01-P

SECURITIES AND EXCHANGE COMMISSION

[Release No. IA-5488/File No. 803-00246]

Edmunds Private Capital, LLC

April 24, 2020.

AGENCY: Securities and Exchange Commission ("Commission").

ACTION: Notice.

Notice of application for an exemptive order under section 202(a)(11)(H) of the Investment Advisers Act of 1940 ("Advisers Act").

Applicant: Edmunds Private Capital, LLC ("Applicant").

Relevant Advisers Act Sections: Exemption requested under section 202(a)(11)(H) of the Advisers Act from section 203(a)(11) of the Advisers Act.

Summary of Application: Applicant requests that the Commission issue an order declaring it to be a person not within the intent of section 202(a)(11) of the Advisers Act, which defines the term "investment adviser."

Filing Dates: The application was filed on April 13, 2018, and amended on October 17, 2018, April 11, 2019, September 23, 2019, December 19, 2019, and January 29, 2020.

Hearing or Notification of Hearing: An order granting the application will be issued unless the Commission orders a hearing. Interested persons may request a hearing by emailing the Commission's Secretary at Secretarys-Office@sec.gov and serving the Applicant with a copy of the request by email. Hearing requests should be received by the Commission by 5:30 p.m. on May 19, 2020 and should be accompanied by proof of service on the Applicant, in the form of an affidavit or, for lawyers, a certificate of service. Pursuant to rule 0-5 under the Advisers Act, hearing requests should state the nature of the writer's interest, any facts bearing upon the desirability of a hearing on the matter, the reason for the request, and the issues contested. Persons may request notification of a hearing by emailing the Commission's Secretary at Secretarys-Office@sec.gov.

ADDRESSES: The Commission: Secretarys-Office@sec.gov. Applicants: S. Brian Farmer, Esq., bfarmer@hf-law.com.

FOR FURTHER INFORMATION CONTACT:

Laura J. Riegel, Senior Counsel, at (202) 551-3038 or Andrea Ottomanelli Magovern, Branch Chief, at (202) 551-6821 (Division of Investment Management, Chief Counsel's Office).

SUPPLEMENTARY INFORMATION: The following is a summary of the application. The complete application may be obtained via the Commission's website either at <http://www.sec.gov/rules/ia/releases.shtml> or by calling (202) 551-8090.

Applicant's Representations

1. Applicant is a multi-generational single-family office that provides services to the family and descendants of Henry Garnett Chesley. Applicant is wholly-owned by Family Clients and is exclusively controlled by one or more Family Members and/or Family Entities in compliance with rule 202(a)(11)(G)-1 ("Family Office Rule"). For purposes of the application, the term "Chesley Family" means the lineal descendants

of Henry Garnett Chesley, their spouses or spousal equivalents, and all other persons and entities that qualify as Family Clients as defined in paragraph (d)(4) of the Family Office Rule.¹ Capitalized terms herein have the same meaning as defined in the Family Office Rule.

2. Applicant provides both advisory and non-advisory services (collectively, the "Services") to members of the Chesley Family. Any Service provided by Applicant that relates to investment advice about securities or may otherwise be construed as advisory in nature is considered an "Advisory Service."

3. Prior to forming Applicant, Paul C. Edmunds was associated with a broker-dealer and afterwards a registered investment adviser ("Predecessor RIA") that for approximately 24 years managed substantially all of the advisory accounts of the Chesley Family and the accounts of the Additional Family Clients (as defined below). Effective as of September, 2015, Paul C. Edmunds terminated his association with the Predecessor RIA and formed Applicant. Commencing October 1, 2015, the advisory accounts of the Family Clients and the Additional Family Clients managed by the Predecessor RIA were transitioned to Applicant.

4. Applicant represents that: (i) Each of the persons served by Applicant is a Family Client, *i.e.*, Applicant has no investment advisory clients other than Family Clients as required by paragraph (b)(1) of the Family Office Rule, with the limited exception that Applicant provides Services to the Additional Family Clients (as defined below), (ii) Applicant is owned and controlled in a manner that complies in all respects with paragraph (b)(2) of the Family Office Rule, and (iii) Applicant does not hold itself out to the public as an investment adviser as required by paragraph (b)(3) of the Family Office Rule. At the time of the application, Applicant represents that Family Clients that are natural persons account for approximately 67% of the natural persons to whom Applicant provides Advisory Services.

5. Applicant provides Services, including Advisory Services, to the parents of the spouse of Paul C. Edmunds (the "Additional Family Clients"). The Additional Family Clients do not have an ownership interest in Applicant. The assets owned by the Additional Family Clients

¹ Specifically, Applicant is wholly-owned and exclusively controlled by Paul C. Edmunds II, a lineal descendant of Henry Garnett Chesley.

²⁶ 17 CFR 200.30-3(a)(12).

represent approximately 11% of the Applicant's assets under management.

6. Applicant represents that the Additional Family Clients have important familial ties to and are an integral part of the Chesley Family. Applicant maintains that including the Additional Family Clients in the "family" simply recognizes and memorializes the familial ties and intra-familial relationships that already exist, and have existed for over two decades, and that the inclusion of the Additional Family Clients as members of the Chesley Family for which Applicant provides services will be consistent with the existing familial relationship among the Family Members.

Applicant's Legal Analysis

1. Section 202(a)(11) of the Advisers Act defines the term "investment adviser" to mean "any person who, for compensation, engages in the business of advising others, either directly or through publications or writings, as to the value of securities or as to the advisability of investing in, purchasing, or selling securities, or who, for compensation and as a part of a regular business, issues or promulgates analyses or reports concerning securities . . ."

2. Applicant falls within the definition of an investment adviser under section 202(a)(11). The Family Office Rule provides an exclusion from the definition of investment adviser for which the Applicant would be eligible but for the provision of Advisory Services to the Additional Family Clients. Section 203(a) of the Advisers Act requires investment advisers to register with the Commission. Absent relief, upon reaching the required level of regulatory assets under management, Applicant would be subject to registration with the Commission under section 203(a) of the Advisers Act.

3. Applicant submits that its relationship with the Additional Family Clients does not change the nature of the office into that of a commercial advisory firm. In support of this argument, Applicant notes that if the Additional Family Clients were the parents of a lineal descendent of Henry Garnett Chesley, rather than the parents of a spouse of a lineal descendent of Henry Garnett Chesley, there would be no question that each of them would be a Family Member. Applicant states that in requesting the order, the office is not attempting to expand its operations or engage in any level of commercial activity to which the Advisers Act is designed to apply. Indeed, although the Additional Family Clients do not fall within the definition of Family Member, they are considered to be, and are

treated as, members of the Chesley Family.

4. Mr. Edmunds has managed accounts for the Additional Family Clients for 24 years. Applicant maintains that, from the perspective of the Chesley Family, allowing Applicant to provide Services to the Additional Family Clients is consistent with the family's previous experience with investment management services provided by Mr. Edmunds and the existing familial relationship among Family Members.

5. Applicant also submits that declaring Applicant to be a Family Office under the Advisers Act is not contrary to the public interest. Applicant states that the office is a private organization that was formed to be the "family office" for the Chesley Family, and that the office does not have any public clients. Applicant maintains that the office's Services are exclusively tailored to the needs of the Chesley Family and the Additional Family Clients. Applicant argues that the provision of Advisory Services to the Additional Family Clients, who have been receiving Advisory Services from Mr. Edmunds in the same manner as Family Members for over 24 years, does not create any public interest that is different in any manner than the considerations that apply to a "family office" that complies in all respects with the Family Office Rule.

6. Applicant argues that, although the Family Office Rule largely codified the exemptive orders that the Commission had previously issued before the enactment of the Dodd-Frank Wall Street Reform and Consumer Protection Act, the Commission recognized in proposing the rule that the exact representations, conditions, or terms contained in every exemptive order could not be captured in a rule of general applicability. The Commission noted that family offices would remain free to seek a Commission exemptive order to advise an individual or entity that did not meet the proposed family client definition, and that certain situations may raise unique conflicts and issues that are more appropriately addressed through an exemptive order process where the Commission can consider the specific facts and circumstances, than through a rule of general applicability.

7. Applicant maintains that, based on its unusual circumstances—providing Services to Family Clients and to the Additional Family Clients who are relatives who have been considered and treated as Family Members for 26 years and whose status as clients of Applicant would not change the nature of

Applicant's operations to that of a commercial advisory business—an exemptive order is appropriate based on Applicant's specific facts and circumstances.

8. For the foregoing reasons, Applicant requests an order declaring it to be a person not within the intent of section 202(a)(11) of the Advisers Act. Applicant submits that the order is necessary and appropriate, in the public interest, consistent with the protection of investors, and consistent with the purposes fairly intended by the policy and provisions of the Advisers Act.

Applicant's Conditions

1. Applicant will offer and provide Advisory Services only to Family Clients and to the Additional Family Clients, who generally will be deemed to be, and be treated as if they are, Family Clients; provided, however, that the Additional Family Clients will be deemed to be, and treated as if they are, Family Members for purposes of paragraph (b)(1) and for purposes of paragraph (d)(4)(vi) of the Family Office Rule.

2. Applicant will at all times be wholly-owned by Family Clients and exclusively controlled (directly or indirectly) by one or more Family Members and/or Family Entities (excluding the Additional Family Clients' Family Entities) as defined in paragraph (d)(5) of the Family Office Rule.

3. At all times the assets beneficially owned by Family Members and/or Family Entities (excluding the Additional Family Clients' Family Entities) will account for at least seventy-five percent (75%) of the assets for which Applicant provides Advisory Services.

4. Applicant will comply with all the terms for exclusion from the definition of investment adviser under the Advisers Act set forth in the Family Office Rule except for the limited exception requested by the application.

For the Commission, by the Division of Investment Management, under delegated authority.

J. Matthew DeLesDernier,
Assistant Secretary.

April 24, 2020.

On January 14, 2020, NYSE Arca, Inc. (“Exchange” or “NYSE Arca”) filed with the Securities and Exchange Commission (“Commission”), pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 (“Act” or “Exchange Act”) ¹ and Rule 19b–4 thereunder, ² a proposed rule change to list and trade shares (“Shares”) of the SPDR SSGA Responsible Reserves ESG ETF (“Fund”), under NYSE Arca Rule 8.600–E (Managed Fund Shares). The proposed rule change was published for comment in the **Federal Register** on January 30, 2020. ³ On March 12, 2020, pursuant to Section 19(b)(2) of the Act, ⁴ the Commission designated a longer period within which to approve the proposed rule change, disapprove the proposed rule change, or institute proceedings to determine whether to disapprove the proposed rule change. ⁵ On April 22, 2020, the Exchange filed Amendment No. 1 to the proposed rule change, which superseded the proposed rule change as originally filed. ⁶ The Commission has received no comments on the proposed rule change. The Commission is publishing this notice and order to solicit comments on the proposed rule change, as modified by Amendment No. 1, from interested persons and to institute proceedings pursuant to Section 19(b)(2)(B) of the Act ⁷ to determine whether to approve or disapprove the proposed rule change, as modified by Amendment No. 1.

⁴ 15 U.S.C. 78s(b)(2).

⁵ See Securities Exchange Act Release No. 88364, 85 FR 15550 (March 18, 2020). The Commission designated April 29, 2020, as the date by which the Commission shall approve or disapprove, or institute proceedings to determine whether to disapprove, the proposed rule change.

⁶ Amendment No. 1 is available on the Commission’s website at <https://www.sec.gov/rules/sro/nysearca.htm>.

⁷ 15 U.S.C. 78s(b)(2)(B).

I. The Exchange’s Description of the Proposed Rule Change, as Modified by Amendment No. 1

The Exchange proposes to list and trade shares of the SPDR SSGA Responsible Reserves ESG ETF (the “Fund”), under NYSE Arca Rule 8.600–E (“Managed Fund Shares”). This Amendment 1 to SR–NYSEArca–2020–07 replaces SR–NYSEArca–2020–07 as originally filed and supersedes such filing in its entirety.

The proposed change is available on the Exchange’s website at www.nyse.com, at the principal office of the Exchange, and at the Commission’s Public Reference Room.

II. Self-Regulatory Organization’s Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the self-regulatory organization included statements concerning the purpose of, and basis for, the proposed rule change and discussed any comments it received on the proposed rule change. The text of those statements may be examined at the places specified in Item IV below. The Exchange has prepared summaries, set forth in sections A, B, and C below, of the most significant parts of such statements.

A. Self-Regulatory Organization’s Statement of the Purpose of, and the Statutory Basis for, the Proposed Rule Change

1. Purpose

The Exchange proposes to list and trade shares (“Shares”) of the SPDR SSGA Responsible Reserves ESG ETF under NYSE Arca Rule 8.600–E (the “Fund”), a series of the SSGA Active Trust (“Trust”) ⁸, under NYSE Arca Rule 8.600–E, which governs the listing and trading of Managed Fund Shares ⁹ on the Exchange.

⁸ The Trust is registered under the 1940 Act. On December 20, 2019, the Trust filed with the Commission an amendment to its registration statement on Form N–1A under the Securities Act of 1933 (15 U.S.C. 77a) (“Securities Act”) and the 1940 Act relating to the Fund (File Nos. 333–173276 and 811–22542) (the “Registration Statement”). The description of the operation of the Trust and the Fund herein is based, in part, on the Registration Statement. In addition, the Commission has issued an order granting certain exemptive relief under the 1940 Act to the Trust. See Investment Company Act Release No. 29524, December 13, 2010 (File No. 812–13487) (“Exemptive Order”). Investments made by the Fund will comply with the conditions set forth in the Exemptive Order.

⁹ A Managed Fund Share is a security that represents an interest in an investment company registered under the Investment Company Act of 1940 (15 U.S.C. 80a–1) (“1940 Act”) organized as an open-end investment company or similar entity

SSGA Funds Management, Inc. (“Adviser”) will be the investment adviser to the Fund. The Adviser is a wholly-owned subsidiary of State Street Global Advisors, Inc. (“SSGA”), which itself is a wholly-owned subsidiary of State Street Corporation. State Street Global Advisors Funds Distributors, LLC (“Distributor”) will be the distributor of the Fund’s Shares. State Street Bank and Trust Company will be the custodian (“Custodian”) and transfer agent for the Fund.

Commentary .06 to Rule 8.600–E provides that, if the investment adviser to the investment company issuing Managed Fund Shares is affiliated with a broker-dealer, such investment adviser shall erect and maintain a “fire wall” between the investment adviser and the broker-dealer with respect to access to information concerning the composition and/or changes to such investment company portfolio. ¹⁰ In addition, Commentary .06 further requires that personnel who make decisions on the open-end fund’s portfolio composition must be subject to procedures designed to prevent the use and dissemination of material nonpublic information regarding the open-end fund’s portfolio. The Adviser is not registered as a broker-dealer but is affiliated with a broker-dealer and has implemented and will maintain a fire wall with respect to

that invests in a portfolio of securities selected by its investment adviser consistent with its investment objectives and policies. In contrast, an open-end investment company that issues Investment Company Units, listed and traded on the Exchange under NYSE Arca Rule 5.2–E(j)(3), seeks to provide investment results that correspond generally to the price and yield performance of a specific foreign or domestic stock index, fixed income securities index or combination thereof.

¹⁰ An investment adviser to an open-end fund is required to be registered under the Investment Advisers Act of 1940 (the “Advisers Act”). As a result, the Adviser and its related personnel are subject to the provisions of Rule 204A–1 under the Advisers Act relating to codes of ethics. This Rule requires investment advisers to adopt a code of ethics that reflects the fiduciary nature of the relationship to clients as well as compliance with other applicable securities laws. Accordingly, procedures designed to prevent the communication and misuse of non-public information by an investment adviser must be consistent with Rule 204A–1 under the Advisers Act. In addition, Rule 206(4)–7 under the Advisers Act makes it unlawful for an investment adviser to provide investment advice to clients unless such investment adviser has (i) adopted and implemented written policies and procedures reasonably designed to prevent violation, by the investment adviser and its supervised persons, of the Advisers Act and the Commission rules adopted thereunder; (ii) implemented, at a minimum, an annual review regarding the adequacy of the policies and procedures established pursuant to subparagraph (i) above and the effectiveness of their implementation; and (iii) designated an individual (who is a supervised person) responsible for administering the policies and procedures adopted under subparagraph (i) above.

such broker-dealer affiliate regarding access to information concerning the composition and/or changes to the portfolio. In the event (a) the Adviser becomes registered as a broker-dealer or newly affiliated with one or more broker-dealers, or (b) any new adviser or sub-adviser is a registered broker-dealer or becomes affiliated with a broker-dealer, it will implement and maintain a fire wall with respect to its relevant personnel or its broker-dealer affiliate regarding access to information concerning the composition and/or changes to the portfolio, and will be subject to procedures designed to prevent the use and dissemination of material non-public information regarding such portfolio.

SPDR SSGA Responsible Reserves ESG ETF

According to the Registration Statement, the investment objective of the Fund will be to seek to maximize current income while giving consideration to environmental, social and governance (“ESG”) criteria, consistent with the preservation of capital and liquidity by investing in a portfolio of high-quality, short-term debt obligations.

The Fund will follow a disciplined investment process in which the Adviser bases its decisions on the relative attractiveness of different short-term debt instruments (“Short-Term Fixed Income Securities”) while considering ESG criteria at the time of purchase.

Under normal market conditions,¹¹ the Fund will invest at least 80% of its net assets in Short-Term Fixed Income Securities (as described below), cash and cash equivalents¹² to maintain a maximum dollar-weighted average maturity of sixty days or less and dollar-weighted average life of 120 days or less. Short-Term Fixed Income Securities in which the Fund will invest will have remaining maturities of 397 calendar days or less.

The Adviser intends to consider ESG criteria at the time of purchase by using ESG-related metrics for each Fund investment. The potential investment universe will first be screened to remove issuers involved in, and/or which derive significant revenue from, certain practices, industries or product lines, including: Extreme event controversies, controversial weapons, civilian firearms, thermal coal extraction, tobacco, and UN global compact

violations. While issuers in the financial services sector are not included in the initial screening process, the Adviser will consider scoring criteria to assign an ESG rating to issuers in the financial services sector.

Principal Investments

According to the Registration Statement, the Fund will attempt to meet its investment objective by investing in a broad range of Short-Term Fixed Income Securities, as described below.

The Fund may invest in the following Short-Term Fixed Income Securities:

- Short-term obligations of the U.S. Government, its agencies, instrumentalities, authorities or political subdivisions (other than cash equivalents);¹³
 - mortgage pass-through securities;¹⁴
 - corporate bonds, floating rate bonds or variable rate bonds (including “inverse floaters”);
 - bank obligations, including negotiable certificates of deposit, time deposits and bankers’ acceptances¹⁵ (other than cash equivalents);
 - zero coupon securities;
 - Eurodollar Certificates of Deposit (“ECDs”), Eurodollar Time Deposits (“ETDs”) and Yankee Certificates of Deposit (“YCDs”);¹⁶
 - inflation-protected public obligations (“TIPS”) of the U.S. Treasury, as well as TIPS of major governments, excluding the United States;
 - repurchase and reverse repurchase agreements (other than repurchase and reverse repurchase agreements that are cash equivalents);
 - sovereign debt obligations issued or guaranteed by foreign governments or their agencies;
 - commercial paper (other than cash equivalents);
 - private placements, restricted securities and Rule 144A securities.
- The Fund may hold cash and cash equivalents.

Other Investments

While the Fund, under normal market conditions, will invest at least 80% of

the Fund’s net assets in the securities described above in “Principal Investments,” the Fund may invest its remaining assets in the securities described below.

The Fund may invest in exchange traded funds (“ETFs”).¹⁷

The Fund may invest in the securities of non-exchange-traded investment company securities, subject to applicable limitations under Section 12(d)(1) of the 1940 Act.¹⁸

The Fund will not invest in securities or other financial instruments that have not been described in this proposed rule change.

Creation and Redemption of Creation Units

The Fund will issue and redeem its Shares on a continuous basis, at net asset value (“NAV”), only in a large specified number of Shares (a “Creation Unit”). Creation Unit sizes are 50,000 Shares per Creation Unit. The Creation Unit size for the Fund may change.

The Trust will issue and sell Shares of the Fund only in Creation Units on a continuous basis through the Distributor at their NAV per Share next determined after receipt of an order, on any Business Day (as defined below), in proper form pursuant to the terms of the Authorized Participant Agreement (“Participant Agreement”). A “Business Day” with respect to the Fund is, generally, any day on which the NYSE is open for business.

The consideration for purchase of a Creation Unit of the Fund generally will consist of either (i) the in-kind deposit of a designated portfolio of securities (the “Deposit Securities”) per each Creation Unit and the “Cash Component” (defined below), computed as described below or (ii) the cash value of the Deposit Securities (“Deposit Cash”) and Cash Component, computed as described below.

Together, the Deposit Securities or Deposit Cash, as applicable, and the Cash Component constitute the “Fund Deposit,” which represents the minimum initial and subsequent investment amount for a Creation Unit of the Fund. The “Cash Component”, is an amount equal to the difference

¹³ The term “cash equivalents” is defined in Commentary .01(c) to NYSE Arca Rule 8.600–E.

¹⁴ The Fund will seek to obtain exposure to U.S. agency mortgage pass-through securities primarily through the use of “to-be-announced” or “TBA transactions.”

¹⁵ Under normal market conditions, the Fund intends to invest more than 25% of its total assets in bank obligations.

¹⁶ ECDs and ETDs are U.S. dollar denominated certificates of deposit and time deposits, respectively, issued by non-U.S. branches of domestic banks and non-U.S. banks. YCDs are U.S. dollar denominated certificates of deposit issued by U.S. branches of non-U.S. banks.

¹⁷ For purposes of this filing, “ETFs” are Investment Company Units (as described in NYSE Arca Rule 5.2–E(j)(3)); Portfolio Depositary Receipts (as described in NYSE Arca Rule 8.100–E); and Managed Fund Shares (as described in NYSE Arca Rule 8.600–E). All ETFs will be listed and traded in the U.S. on a national securities exchange. The Fund will not invest in inverse or leveraged (e.g., 2X, -2X, 3X or -3X) ETFs.

¹⁸ Investments in other non-exchange-traded open-end management investment company securities will not exceed 20% of the total assets of the Fund.

¹¹ The term “normal market conditions” is defined in NYSE Arca Rule 8.600–E(c)(5).

¹² The term “cash equivalents” is defined in Commentary .01(c) to NYSE Arca Rule 8.600–E.

between the NAV of the Shares (per Creation Unit) and the market value of the Deposit Securities or Deposit Cash, as applicable.

The Custodian, through the National Securities Clearing Corporation ("NSCC"), will make available on each Business Day, prior to the opening of business on the Exchange (currently 9:30 a.m., Eastern time), the list of the names and the required number of shares of each Deposit Security or the required amount of Deposit Cash, as applicable, to be included in the current Fund Deposit (based on information at the end of the previous Business Day) for the Fund.

To be eligible to place orders to purchase a Creation Unit of the Fund, an entity must be (i) a "Participating Party", *i.e.*, a broker-dealer or other participant in the clearing process through the Continuous Net Settlement System of the NSCC (the "Clearing Process"), a clearing agency that is registered with the SEC; or (ii) a Depository Trust Company participant.

Redemption of Shares

Shares may be redeemed only in Creation Units at their NAV next determined after receipt of a redemption request in proper form by the Fund and only on a Business Day. With respect to the Fund, the Custodian, through the NSCC, will make available prior to the opening of business on the Exchange on each Business Day, the list of the names and share quantities of the Fund's portfolio securities that will be applicable on that day ("Fund Securities"). Fund Securities received on redemption may not be identical to Deposit Securities.

Redemption proceeds for a Creation Unit will be paid either in-kind or in cash or a combination thereof, as determined by the Trust. With respect to in-kind redemptions of the Fund, redemption proceeds for a Creation Unit will consist of Fund Securities, as announced by the Custodian prior to the opening of business on the Business Day of the request for redemption received in proper form plus cash in an amount equal to the difference between the NAV of the Shares being redeemed, as next determined after a receipt of a request in proper form, and the value of the Fund Securities (the "Cash Redemption Amount"), less a fixed redemption transaction fee and any applicable additional variable charge. Notwithstanding the foregoing, at the Trust's discretion, an Authorized Participant may receive the corresponding cash value of the securities in lieu of the in-kind

securities value representing one or more Fund Securities.¹⁹

Investment Restrictions

The Fund's investments in sovereign debt obligations and corporate bonds, floating rate bonds and variable rate bonds will be limited to 30% of the Fund's total assets.

The Fund's investments will be consistent with the Fund's investment objective and will not be used to enhance leverage (although certain derivatives and other investments may result in leverage). That is, while the Fund will be permitted to borrow as permitted under the 1940 Act, the Fund's investments will not be used to seek performance that is the multiple or inverse multiple (*e.g.*, 2Xs and 3Xs) of the Fund's primary broad-based securities benchmark index (as defined in Form N-1A).²⁰

Application of Generic Listing Requirements

The Exchange is submitting this proposed rule change because the portfolio for the Fund will not meet all of the "generic" listing requirements of Commentary .01 to NYSE Arca Rule 8.600-E applicable to the listing of Managed Fund Shares. The Fund's portfolio would meet all such requirements except for those set forth in Commentary .01(a)(1)(A) through (E) (with respect to the Fund's investments in non-exchange-traded investment company securities) and Commentary .01(b)(3) to NYSE Arca Rule 8.600-E with respect to the Fund's investments in Short-Term Fixed Income Securities.²¹

The Fund's Short-Term Fixed Income Securities may not comply with the requirements set forth in Commentary .01(b)(3) to NYSE Arca Rule 8.600-E. While the requirement set forth in Commentary .01(b)(3) is intended to ensure that the Short-Term Fixed Income Securities included in the Fund's portfolio are sufficiently

diversified among non-affiliated issuers, the Exchange believes that any concerns related to non-compliance are mitigated by the types of instruments that the Fund would hold. As noted above, with respect to the Fund's holdings in Short-Term Fixed Income Securities, cash and cash equivalents, such Fund holdings will maintain a maximum dollar-weighted average maturity of sixty days or less and dollar-weighted average life of 120 days or less and will have remaining maturities of 397 calendar days or less. The Fund's Short-Term Fixed Income Securities primarily will include those instruments that are included in the definition of cash and cash equivalents, but are not considered cash and cash equivalents because they have maturities of three months or longer. The Exchange believes, however, that Short-Term Fixed Income Securities are less susceptible than other types of fixed income instruments both to price manipulation and volatility and that the holdings as proposed are generally consistent with the policy concerns which Commentary .01(b)(3) is intended to address. Because the Short-Term Fixed Income Securities will consist generally of high-quality Short-Term Fixed Income Securities described above, the Exchange believes that the policy concerns that Commentary .01(b)(3) is intended to address are otherwise mitigated and that the Fund should be permitted to hold these securities in a manner that may not comply with such provision.

The Adviser represents that the Fund is not a money market fund but its investment strategy follows certain guidelines applicable to such funds. Specifically, the Fund will only invest in Short-Term Fixed Income Securities to maintain a maximum dollar-weighted average maturity of sixty days or less and dollar-weighted average life of 120 days or less. The Fund will invest in Short-Term Fixed Income Securities that have remaining maturities of 397 calendar days or less. While the Fund will have portfolio holdings that meet the definition of cash and cash equivalents under NYSE Arca Rule 8.600-E, Commentary .01(c), the other assets may at times be invested in longer dated securities, including U.S. and foreign government securities, and corporate bonds. The exemption from the 13 non-affiliated issuer requirement for the fixed income portion of the Fund's portfolio will allow the Fund to invest in a limited number of Short-Term Fixed Income Securities without having to allocate a small percentage of assets under management to the required minimum 13 issuers.

¹⁹ The Adviser represents that, to the extent the Trust effects the creation or redemption of Shares wholly or partially in cash, such transactions will be effected in the same manner for all Authorized Participants.

²⁰ The Fund's broad-based securities benchmark index will be identified in a future amendment to the Registration Statement following the Fund's first full calendar year of performance.

²¹ Commentary .01(b)(3) to NYSE Arca Rule 8.600-E provides as follows: "An underlying portfolio (excluding exempted securities) that includes fixed income securities shall include a minimum of 13 non-affiliated issuers, provided, however, that there shall be no minimum number of non-affiliated issuers required for fixed income securities if at least 70% of the weight of the portfolio consists of equity securities as described in Commentary .01(a) above".

The Fund's investments in sovereign debt obligations and corporate bonds, floating rate bonds and variable rate bonds will be limited to 30% of the Fund's total assets.

All Short-Term Fixed Income Securities will comply with the requirements of Commentary .01(b) to NYSE Arca Rule 8.600–E, except for Commentary .01(b)(3) as described above, and the cash equivalents the Fund may invest in will comply with the requirements of Commentary .01(c).

The Fund may invest in shares of investment company securities (other than ETFs), which are equity securities. Therefore, to the extent the Fund invests in shares of other non-exchange-traded open-end management investment company securities, the Fund will not comply with the requirements of Commentary .01(a)(1)(A) through (E) to NYSE Arca Rule 8.600–E (U.S. Component Stocks) with respect to its non-exchange-traded investment securities holdings.²²

However, it is appropriate and in the public interest to approve listing and

trading of Shares of the Fund notwithstanding that the Fund's holdings in such securities would not meet the requirements of Commentary .01(a)(1)(A) through (E) to Rule 8.600–E. Investments in other non-exchange-traded open-end management investment company securities will not exceed 20% of the total assets of the Fund. Such investments, which may include mutual funds that invest, for example, principally in fixed income securities, would be utilized to help the Fund meet its investment objective and to equitize cash in the short term. The Fund will invest in such securities only to the extent that those investments would be consistent with the requirements of Section 12(d)(1) of the 1940 Act and the rules thereunder.²³ Because such securities must satisfy applicable 1940 Act diversification requirements, and have a net asset value based on the value of securities and financial assets the investment company holds, it is both unnecessary and inappropriate to apply to such investment company securities the criteria in Commentary .01(a)(1).

The Exchange notes that Commentary .01(a)(1)(A) through (D) to Rule 8.600–E exclude certain “Derivative Securities Products” that are exchange-traded investment company securities, including Investment Company Units (as described in NYSE Arca Rule 5.2–E(j)(3)), Portfolio Depositary Receipts (as described in NYSE Arca Rule 8.100–E)) and Managed Fund Shares (as described in NYSE Arca Rule 8.600–E)).²⁴ In its

2008 Approval Order approving amendments to Commentary .01(a) to Rule 5.2(j)(3) to exclude Derivative Securities Products from certain provisions of Commentary .01(a) (which exclusions are similar to those in Commentary .01(a)(1) to Rule 8.600–E), the Commission stated that “based on the trading characteristics of Derivative Securities Products, it may be difficult for component Derivative Securities Products to satisfy certain quantitative index criteria, such as the minimum market value and trading volume limitations.” The Exchange notes that it would be difficult or impossible to apply to mutual fund shares certain of the generic quantitative criteria (*e.g.*, market capitalization, trading volume, or portfolio criteria) in Commentary .01(a)(1) (A) through (D) applicable to U.S. Component Stocks. For example, the requirements for U.S. Component Stocks in Commentary .01(a)(1)(B) that there be minimum monthly trading volume of 250,000 shares, or minimum notional volume traded per month of \$25,000,000, averaged over the last six months are tailored to exchange-traded securities (*i.e.*, U.S. Component Stocks) and not to mutual fund shares, which do not trade in the secondary market and for which no such volume information is reported. In addition, Commentary .01(a)(1)(A) relating to minimum market value of portfolio component stocks, Commentary .01(a)(1)(C) relating to weighting of portfolio component stocks, and Commentary .01(a)(1)(D) relating to minimum number of portfolio components are not appropriately applied to open-end management investment company securities; open-end investment companies hold multiple individual securities as disclosed publicly in accordance with the 1940 Act, and application of Commentary .01(a)(1)(A) through (D) would not serve the purposes served with respect to U.S. Component Stocks, namely, to establish minimum liquidity

26, 2008), 73 FR 17390 (April 1, 2008) (Notice of Filing of Proposed Rule Change and Amendment No. 1 Thereto to Amend the Eligibility Criteria for Components of an Index Underlying Investment Company Units). The Commission subsequently approved generic criteria applicable to listing and trading of Managed Fund Shares, including exclusions for Derivative Securities Products and Index-Linked Securities in Commentary .01(a)(1)(A) through (D), in Securities Exchange Act Release No. 78397 (July 22, 2016), 81 FR 49320 (July 27, 2016) (Order Granting Approval of Proposed Rule Change, as Modified by Amendment No. 7 Thereto, Amending NYSE Arca Rule 8.600–E To Adopt Generic Listing Standards for Managed Fund Shares). See also Amendment No. 7 to SR–NYSEArca–2015–110, available at <https://www.sec.gov/comments/sr-nysearca-2015-110/nysearca2015110-9.pdf>.

²² Commentary .01(a)(1) to NYSE Arca Rule 8.600–E provides that the component stocks of the equity portion of a portfolio that are U.S. Component Stocks shall meet the following criteria initially and on a continuing basis: (A) Component stocks (excluding Derivative Securities Products and Index-Linked Securities) that in the aggregate account for at least 90% of the equity weight of the portfolio (excluding such Derivative Securities Products and Index-Linked Securities) each shall have a minimum market value of at least \$75 million; (B) Component stocks (excluding Derivative Securities Products and Index-Linked Securities) that in the aggregate account for at least 70% of the equity weight of the portfolio (excluding such Derivative Securities Products and Index-Linked Securities) each shall have a minimum monthly trading volume of 250,000 shares, or minimum notional volume traded per month of \$25,000,000, averaged over the last six months; (C) The most heavily weighted component stock (excluding Derivative Securities Products and Index-Linked Securities) shall not exceed 30% of the equity weight of the portfolio, and, to the extent applicable, the five most heavily weighted component stocks (excluding Derivative Securities Products and Index-Linked Securities) shall not exceed 65% of the equity weight of the portfolio; (D) Where the equity portion of the portfolio does not include Non-U.S. Component Stocks, the equity portion of the portfolio shall include a minimum of 13 component stocks; provided, however, that there shall be no minimum number of component stocks if (i) one or more series of Derivative Securities Products or Index-Linked Securities constitute, at least in part, components underlying a series of Managed Fund Shares, or (ii) one or more series of Derivative Securities Products or Index-Linked Securities account for 100% of the equity weight of the portfolio of a series of Managed Fund Shares; (E) Except as provided herein, equity securities in the portfolio shall be U.S. Component Stocks listed on a national securities exchange and shall be NMS Stocks as defined in Rule 600 of Regulation NMS under the Securities Exchange Act of 1934; and (F) American Depositary Receipts (“ADRs”) in a portfolio may be exchange-traded or non-exchange-traded. However, no more than 10% of the equity weight of a portfolio shall consist of non-exchange-traded ADRs.

²³ The Commission has previously approved proposed rule changes under Section 19(b) of the Act for series of Managed Fund Shares that may invest in non-exchange traded investment company securities to the extent permitted by Section 12(d)(1) of the 1940 Act and the rules thereunder. See, *e.g.*, Securities Exchange Act Release Nos. 86362 (July 12, 2019), 84 FR 34457 (July 18, 2019) (SR–NYSEArca–2019–36 (Notice of Filing of Amendment No. 3 and Order Granting Accelerated Approval of a Proposed Rule Change, as Modified by Amendment No. 3, to List and Trade Shares of JPMorgan Income Builder Blend ETF under NYSE Arca Rule 8.600–E); 83319 (May 24, 2018) (SR–NYSEArca–2018–15) (Order Approving a Proposed Rule Change, as Modified by Amendment No. 1 Thereto, to Continue Listing and Trading Shares of the PGIM Ultra Short Bond ETF Under NYSE Arca Rule 8.600–E).

²⁴ The Commission initially approved the Exchange's proposed rule change to exclude “Derivative Securities Products” (*i.e.*, Investment Company Units and securities described in Section 2 of Rule 8) and “Index-Linked Securities (as described in Rule 5.2–E(j)(6)) from Commentary .01(a)(A) (1) through (4) to Rule 5.2–E(j)(3) in Securities Exchange Act Release No. 57751 (May 1, 2008), 73 FR 25818 (May 7, 2008) (SR–NYSEArca–2008–29) (Order Granting Approval of a Proposed Rule Change, as Modified by Amendment No. 1 Thereto, to Amend the Eligibility Criteria for Components of an Index Underlying Investment Company Units) (“2008 Approval Order”). See also Securities Exchange Act Release No. 57561 (March

and diversification criteria for U.S. Component Stocks held by series of Managed Fund Shares.

The Exchange notes that the Commission has previously approved listing and trading of an issue of Managed Fund Shares that may invest in equity securities that are non-exchange-traded securities of other open-end investment company securities notwithstanding that the fund would not meet the requirements of Commentary .01(a)(1)(A) through (E) to Rule 8.600–E with respect to such fund's investments in such securities.²⁵ Thus, the Exchange believes that it is appropriate to permit the Fund to invest in non-exchange-traded open-end management investment company securities, as described above.

The Exchange notes that, other than Commentary .01(a)(1)(A) through (E) regarding the Fund's investments in non-exchange-traded investment company securities and Commentary .01(b)(3) to Rule 8.600–E regarding the Fund's investments in Short-Term Fixed Income Securities, as described above, the Fund will meet all other requirements of Rule 8.600–E.

Availability of Information

The Fund's website (www.spdrs.com) will include a form of the prospectus for the Fund that may be downloaded. The Fund's website will include additional quantitative information updated on a daily basis, including, for the Fund, (1) daily trading volume, the prior Business Day's reported closing price, NAV and mid-point of the bid/ask spread at the time of calculation of such NAV (the "Bid/Ask Price"),²⁶ and a calculation of the premium and discount of the Bid/Ask Price against the NAV, and (2) data in chart format displaying the frequency distribution of discounts and premiums of the daily Bid/Ask Price against the NAV, within appropriate ranges, for each of the four previous calendar quarters. On each Business Day, before commencement of trading in Shares in the Core Trading Session on the Exchange, the Adviser will disclose on the Fund's website the Disclosed Portfolio for the Fund as defined in NYSE Arca Rule 8.600–E(c)(2) that will form the basis for the Fund's calculation of NAV at the end of the business day.²⁷

On a daily basis, the Fund will disclose on its website the information regarding the Disclosed Portfolio required under NYSE Arca Rule 8.600–E (c)(2) to the extent applicable. The Fund's website information will be publicly available at no charge.

Investors can also obtain the Fund's Statement of Additional Information ("SAI"), its Shareholder Reports, its Form N–CSR and Form N–PORT, filed quarterly, and its Form N–CEN, filed annually. The Fund's SAI and Shareholder Reports are available free upon request from the Trust, and those documents and the Form N–CSR and Form N–CEN may be viewed on-screen or downloaded from the Commission's website at www.sec.gov.

Quotation and last sale information for the Shares and ETFs will be available via the CTA high speed line. Quotation and last sale information for such U.S. exchange-listed securities will be available from the exchange on which they are listed and from major market data vendors. Information regarding market price and trading volume for the Shares will be continually available on a real-time basis throughout the day on brokers' computer screens and other electronic services. Information regarding the previous day's closing price and trading volume information for the Shares will be published daily in the financial section of newspapers.

Quotation information for Short-Term Fixed Income Securities and cash equivalents may be obtained from brokers and dealers who make markets in such securities or through nationally recognized pricing services through subscription agreements. The U.S. dollar value of foreign securities, instruments and currencies can be derived by using foreign currency exchange rate quotations obtained from nationally recognized pricing services. Price information for non-exchange-traded investment company securities is available from major market data vendors.

In addition, the Portfolio Indicative Value ("PIV"), as defined in NYSE Arca Rule 8.600–E(c)(3), will be widely disseminated by one or more major market data vendors at least every 15 seconds during the Core Trading Session.²⁸ The dissemination of the PIV,

current business day ("T+1"). Accordingly, the Fund will be able to disclose at the beginning of the Business Day the portfolio that will form the basis for the NAV calculation at the end of the Business Day.

²⁸ Currently, it is the Exchange's understanding that several major market data vendors display and/or make widely available PIVs taken from the CTA or other data feeds.

together with the Disclosed Portfolio, will allow investors to determine the approximate value of the underlying portfolio of the Fund on a daily basis and will provide a close estimate of that value throughout the trading day.

Trading Halts

With respect to trading halts, the Exchange may consider all relevant factors in exercising its discretion to halt or suspend trading in the Shares of the Fund.²⁹ Trading in Shares of the Fund will be halted if the circuit breaker parameters in NYSE Arca Rule 7.12–E have been reached. Trading also may be halted because of market conditions or for reasons that, in the view of the Exchange, make trading in the Shares of the Fund inadvisable.

Trading in the Shares will be subject to NYSE Arca Rule 8.600–E(d)(2)(D), which sets forth circumstances under which Shares of the Fund may be halted.

Trading Rules

The Exchange deems the Shares to be equity securities, thus rendering trading in the Shares subject to the Exchange's existing rules governing the trading of equity securities. Shares will trade on the NYSE Arca Marketplace from 4:00 a.m. to 8:00 p.m. E.T. in accordance with NYSE Arca Rule 7.34–E (Early, Core, and Late Trading Sessions). The Exchange has appropriate rules to facilitate transactions in the Shares during all trading sessions. As provided in NYSE Arca Rule 7.6–E, the minimum price variation ("MPV") for quoting and entry of orders in equity securities traded on the NYSE Arca Marketplace is \$0.01, with the exception of securities that are priced less than \$1.00 for which the MPV for order entry is \$0.0001.

Except as described herein with respect to the generic listing requirements in Commentary .01 to NYSE Arca Rule 8.600–E, the Shares of the Fund will conform to the initial and continued listing criteria under NYSE Arca Rule 8.600–E. The Exchange represents that, for initial and continued listing, the Fund will be in compliance with Rule 10A–3³⁰ under the Act, as provided by NYSE Arca Rule 5.3–E. A minimum of 100,000 Shares of the Fund will be outstanding at the commencement of trading on the Exchange. The Exchange will obtain a representation from the issuer of the Shares of the Fund that the NAV and the Disclosed Portfolio will be made

²⁵ See note 22, *supra*.

²⁶ The Bid/Ask Price of the Fund's Shares will be determined using the mid-point of the highest bid and the lowest offer on the Exchange as of the time of calculation of the Fund's NAV. The records relating to Bid/Ask Prices will be retained by the Fund and its service providers.

²⁷ Under accounting procedures to be followed by the Fund, trades made on the prior business day ("T") will be booked and reflected in NAV on the

²⁹ See NYSE Arca Rule 7.12–E.

³⁰ 17 CFR 240.10A–3.

available to all market participants at the same time.

Surveillance

The Exchange represents that trading in the Shares will be subject to the existing trading surveillances administered by the Exchange, as well as cross-market surveillances administered by the Financial Industry Regulatory Authority (“FINRA”) on behalf of the Exchange, which are designed to detect violations of Exchange rules and applicable federal securities laws.³¹ The Exchange represents that these procedures are adequate to properly monitor Exchange trading of the Shares in all trading sessions and to deter and detect violations of Exchange rules and applicable federal securities laws.

The surveillances referred to above generally focus on detecting securities trading outside their normal patterns, which could be indicative of manipulative or other violative activity. When such situations are detected, surveillance analysis follows and investigations are opened, where appropriate, to review the behavior of all relevant parties for all relevant trading violations.

The Exchange or FINRA, on behalf of the Exchange, or both, will communicate as needed regarding trading in the Shares and ETFs with other markets and other entities that are members of the Intermarket Surveillance Group (“ISG”), and the Exchange or FINRA, on behalf of the Exchange, or both, may obtain trading information regarding trading in Shares and ETFs from such markets and other entities. In addition, the Exchange may obtain information regarding trading in Shares and ETFs from markets and other entities that are members of ISG or with which the Exchange has in place a comprehensive surveillance sharing agreement.³² FINRA, on behalf of the Exchange, is able to access, as needed, trade information for certain fixed income securities held by the Fund reported to FINRA’s Trade Reporting and Compliance Engine (“TRACE”).

In addition, the Exchange also has a general policy prohibiting the distribution of material, non-public information by its employees.

All statements and representations made in this filing regarding (a) the description of the portfolio holdings or reference assets, (b) limitations on portfolio holdings or reference assets, or (c) the applicability of Exchange listing rules specified in this rule filing shall constitute continued listing requirements for listing the Shares on the Exchange.

The issuer has represented to the Exchange that it will advise the Exchange of any failure by the Fund to comply with the continued listing requirements, and, pursuant to its obligations under Section 19(g)(1) of the Act, the Exchange will monitor for compliance with the continued listing requirements. If the Fund is not in compliance with the applicable listing requirements, the Exchange will commence delisting procedures under NYSE Arca Rule 5.5–E(m).

Information Bulletin

Prior to the commencement of trading, the Exchange will inform its Equity Trading Permit (“ETP”) Holders in an Information Bulletin (“Bulletin”) of the special characteristics and risks associated with trading the Shares of the Fund. Specifically, the Bulletin will discuss the following: (1) The procedures for purchases and redemptions of Shares in Creation Units (and that Shares are not individually redeemable); (2) NYSE Arca 9.2–E(a), which imposes a duty of due diligence on its ETP Holders to learn the essential facts relating to every customer prior to trading the Shares; (3) the risks involved in trading the Shares during the Early and Late Trading Sessions when an updated PIV will not be calculated or publicly disseminated; (4) how information regarding the PIV and the Disclosed Portfolio is disseminated; (5) the requirement that ETP Holders deliver a prospectus to investors purchasing newly issued Shares prior to or concurrently with the confirmation of a transaction; and (6) trading information.

In addition, the Bulletin will reference that the Fund is subject to various fees and expenses described in the Registration Statement. The Bulletin will discuss any exemptive, no-action, and interpretive relief granted by the Commission from any rules under the Act. The Bulletin will also disclose that the NAV for the Shares of the Fund will be calculated after 4:00 p.m. E.T. each trading day.

2. Statutory Basis

The basis under the Act for this proposed rule change is the requirement

under Section 6(b)(5)³³ that an exchange have rules that are designed to prevent fraudulent and manipulative acts and practices, to promote just and equitable principles of trade, to remove impediments to, and perfect the mechanism of a free and open market and, in general, to protect investors and the public interest.

The Exchange believes that the proposed rule change is designed to prevent fraudulent and manipulative acts and practices in that the Shares will be listed and traded on the Exchange pursuant to the initial and continued listing criteria in NYSE Arca Rule 8.600–E. The Adviser is not registered as a broker-dealer but is affiliated with a broker-dealer and has implemented and will maintain a fire wall with respect to such broker-dealer affiliate regarding access to information concerning the composition and/or changes to the portfolio. The Exchange represents that trading in the Shares will be subject to the existing trading surveillances administered by the Exchange, as well as cross-market surveillances administered by FINRA on behalf of the Exchange, which are designed to detect violations of Exchange rules and applicable federal securities laws. The Exchange represents that these procedures are adequate to properly monitor Exchange trading of the Shares in all trading sessions and to deter and detect violations of Exchange rules and applicable federal securities laws. The Exchange or FINRA, on behalf of the Exchange, or both, will communicate as needed regarding trading in the Shares and ETFs with other markets and other entities that are members of the ISG, and the Exchange or FINRA, on behalf of the Exchange, or both, may obtain trading information regarding trading such securities from such markets and other entities. In addition, the Exchange may obtain information regarding trading in such securities from markets and other entities that are members of ISG or with which the Exchange has in place a comprehensive surveillance sharing agreement. FINRA, on behalf of the Exchange, is able to access, as needed, trade information for certain fixed income securities held by the Fund reported to FINRA’s TRACE.

The PIV, as defined in NYSE Arca Rule 8.600–E (c)(3), will be widely disseminated by one or more major market data vendors at least every 15 seconds during the Core Trading Session.

Except as described herein, the Shares of the Fund will conform to the initial

³¹ FINRA conducts cross-market surveillances on behalf of the Exchange pursuant to a regulatory services agreement. The Exchange is responsible for FINRA’s performance under this regulatory services agreement.

³² For a list of the current members of ISG, see www.isgportal.org. The Exchange notes that not all components of the Disclosed Portfolio for the Fund may trade on markets that are members of ISG or with which the Exchange has in place a comprehensive surveillance sharing agreement.

³³ 15 U.S.C. 78f(b)(5).

and continued listing criteria under NYSE Arca Rule 8.600–E. The Exchange represents that, for initial and/or continued listing, the Fund will be in compliance with Rule 10A–3 under the Act, as provided by NYSE Arca Rule 5.3–E. A minimum of 100,000 Shares of the Fund will be outstanding at the commencement of trading on the Exchange. The Exchange will obtain a representation from the issuer of the Shares of the Fund that the NAV per Share will be calculated daily and that the NAV and the Disclosed Portfolio will be made available to all market participants at the same time. In addition, a large amount of information is publicly available regarding the Fund and the Shares, thereby promoting market transparency. The Fund’s portfolio holdings will be disclosed on its website daily after the close of trading on the Exchange and prior to the opening of trading on the Exchange the following day. On a daily basis, the Fund will disclose the information regarding the Disclosed Portfolio required under NYSE Arca Rule 8.600–E (c)(2) to the extent applicable. The Fund’s website information will be publicly available at no charge.

Investors can also obtain the Fund’s Statement of Additional Information (“SAI”), its Shareholder Reports, its Form N–CSR, filed twice a year, and its Form N–CEN, filed annually. The Fund’s SAI and Shareholder Reports are available free upon request from the Trust, and those documents and the Form N–CSR and Form N–CEN may be viewed on-screen or downloaded from the Commission’s website at www.sec.gov. Quotation and last sale information for the Shares and ETFs will be available via the CTA high speed line.

With respect to the Fund’s non-compliance with Commentary .01(b)(3) (with respect to Short-Term Fixed Income Securities),³⁴ the requirement set forth in Commentary .01(b)(3) is intended to ensure that the Short-Term Fixed Income Securities included in the Fund’s portfolio are sufficiently diversified among non-affiliated issuers, and the Exchange believes that any concerns related to non-compliance are mitigated by the types of instruments that the Fund would hold. The Fund’s Short-Term Fixed Income Securities primarily will include those instruments that are included in the definition of cash and cash equivalents, but are not considered cash and cash equivalents because they have maturities of three months or longer. The Exchange believes, however, that

Short-Term Fixed Income Securities are less susceptible than other types of fixed income instruments both to price manipulation and volatility and that the holdings as proposed are generally consistent with the policy concerns which Commentary .01(b)(3) is intended to address. As noted above, with respect to the Fund’s holdings in Short-Term Fixed Income Securities, cash and cash equivalents, such Fund holdings will maintain a maximum dollar-weighted average maturity of sixty days or less and dollar-weighted average life of 120 days or less and will have remaining maturities of 397 calendar days or less. Because the Short-Term Fixed Income Securities will consist generally of high-quality Short-Term Fixed Income Securities described above, the Exchange believes that the policy concerns that Commentary .01(b)(3) is intended to address are otherwise mitigated and that the Fund should be permitted to hold these securities in a manner that may not comply with such provision.

As noted above, the Fund’s portfolio will not meet the requirements of Commentary .01(a)(1)(A) through (E) to Rule 8.600–E with respect to the Fund’s investments in non-exchange-traded securities of open-end investment company securities. The Exchange believes that it is appropriate and in the public interest to approve listing and trading of Shares of the Fund on the Exchange notwithstanding that the Fund would not meet the requirements of Commentary .01(a)(1)(A) through (E) to Rule 8.600–E with respect to the Fund’s investments in non-exchange-traded securities of open-end investment company securities. Investments in non-exchange-traded securities of open-end investment company securities will not be principal investments of the Fund. Such investments, which may include mutual funds that invest, for example, principally in fixed income securities, would be utilized to help the Fund meet its investment objective and to equitize cash in the short term. Investments in non-exchange-traded open-end management investment company securities will not exceed 20% of the total assets of the Fund.

The website for the Fund will include the prospectus for the Fund and additional data relating to NAV and other applicable quantitative information. Moreover, prior to the commencement of trading, the Exchange will inform its ETP Holders in an Information Bulletin of the special characteristics and risks associated with trading the Shares of the Fund. Trading in Shares of the Fund will be halted if

the circuit breaker parameters in NYSE Arca Rule 7.12–E have been reached or because of market conditions or for reasons that, in the view of the Exchange, make trading in the Shares inadvisable, and trading in the Shares will be subject to NYSE Arca Rule 8.600–E(d)(2)(D), which sets forth circumstances under which Shares of the Fund may be halted. In addition, as noted above, investors will have ready access to information regarding the Fund’s holdings, the PIV, the Disclosed Portfolio, and quotation and last sale information for the Shares. The Fund’s investments will be consistent with the Fund’s investment objective and will not be used to enhance leverage. That is, while the Fund will be permitted to borrow as permitted under the 1940 Act, the Fund’s investments will not be used to seek performance that is the multiple or inverse multiple (e.g., 2Xs and 3Xs) of the Fund’s primary broad-based securities benchmark index (as defined in Form N–1A).³⁵

The proposed rule change is designed to perfect the mechanism of a free and open market and, in general, to protect investors and the public interest in that it will facilitate the listing and trading of an actively-managed exchange-traded product and will enhance competition among market participants, to the benefit of investors and the marketplace. As noted above, the Exchange has in place surveillance procedures relating to trading in the Shares and may obtain information via ISG from other exchanges that are members of ISG or with which the Exchange has entered into a comprehensive surveillance sharing agreement. In addition, as noted above, investors have ready access to information regarding the Fund’s holdings, the PIV, the Disclosed Portfolio for the Fund, and quotation and last sale information for the Shares.

B. Self-Regulatory Organization’s Statement on Burden on Competition

The Exchange does not believe that the proposed rule change will impose any burden on competition that is not necessary or appropriate in furtherance of the purpose of the Act. The Exchange notes that the proposed rule change will facilitate the listing and trading of an additional type of actively-managed exchange-traded product that holds fixed income securities and equity securities and that will enhance competition among market participants, to the benefit of investors and the marketplace.

³⁴ See note 21, *supra*.

³⁵ See note 20, *supra*.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

No written comments were solicited or received with respect to the proposed rule change.

III. Proceedings To Determine Whether To Approve or Disapprove SR-NYSEArca-2020-07, as Modified by Amendment No. 1, and Grounds for Disapproval Under Consideration

The Commission is instituting proceedings pursuant to Section 19(b)(2)(B) of the Exchange Act³⁶ to determine whether the proposed rule change, as modified by Amendment No. 1, should be approved or disapproved. Institution of such proceedings is appropriate at this time in view of the legal and policy issues raised by the proposed rule change. Institution of proceedings does not indicate that the Commission has reached any conclusions with respect to any of the issues involved. Rather, as described below, the Commission seeks and encourages interested persons to provide comments on the proposed rule change.

Pursuant to Section 19(b)(2)(B) of the Exchange Act,³⁷ the Commission is providing notice of the grounds for disapproval under consideration. The Commission is instituting proceedings to allow for additional analysis of the proposed rule change's consistency with Section 6(b)(5) of the Exchange Act, which requires, among other things, that the rules of a national securities exchange be "designed to prevent fraudulent and manipulative acts and practices, to promote just and equitable principles of trade, . . . to remove impediments to and perfect the mechanism of a free and open market and a national market system, and, in general, to protect investors and the public interest."³⁸

IV. Procedure: Request for Written Comments

The Commission requests that interested persons provide written submissions of their views, data, and arguments with respect to the issues identified above, as well as any other concerns they may have with the proposal. In particular, the Commission invites the written views of interested persons concerning whether the proposed rule change, as modified by Amendment No. 1, is consistent with Section 6(b)(5) or any other provision of

the Exchange Act, or the rules and regulations thereunder. Although there do not appear to be any issues relevant to approval or disapproval that would be facilitated by an oral presentation of views, data, and arguments, the Commission will consider, pursuant to Rule 19b-4, any request for an opportunity to make an oral presentation.³⁹

Interested persons are invited to submit written data, views, and arguments regarding whether the proposed rule change, as modified by Amendment No. 1, should be approved or disapproved by May 21, 2020. Any person who wishes to file a rebuttal to any other person's submission must file that rebuttal by June 4, 2020.

The Commission asks that commenters address the sufficiency of the Exchange's statements in support of the proposal, which are set forth in Amendment No. 1,⁴⁰ and any other issues raised by the proposed rule change under the Act. In particular, the Commission seeks commenters' views regarding whether the Exchange has adequately described the proposed investments of the Fund for the Commission to make a determination under Section 6(b)(5) of the Act.

Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's internet comment form (<http://www.sec.gov/rules/sro.shtml>); or
- Send an email to rule-comments@sec.gov. Please include File Number SR-NYSEArca-2020-07 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE, Washington, DC 20549-1090. All submissions should refer to File Number SR-NYSEArca-2020-07. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's internet website (<http://www.sec.gov/rules/sro.shtml>). Copies of the

³⁹ Section 19(b)(2) of the Exchange Act, as amended by the Securities Act Amendments of 1975, Public Law 94-29 (June 4, 1975), grants the Commission flexibility to determine what type of proceeding—either oral or notice and opportunity for written comments—is appropriate for consideration of a particular proposal by a self-regulatory organization. See Securities Act Amendments of 1975, Senate Comm. on Banking, Housing & Urban Affairs, S. Rep. No. 75, 94th Cong., 1st Sess. 30 (1975).

⁴⁰ See *supra* note 6.

submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for website viewing and printing in the Commission's Public Reference Room, 100 F Street NE, Washington, DC 20549, on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of the filing also will be available for inspection and copying at the principal office of the Exchange. All comments received will be posted without change. Persons submitting comments are cautioned that we do not redact or edit personal identifying information from comment submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File Number SR-NYSEArca-2020-07 and should be submitted on or before May 21, 2020. Rebuttal comments should be submitted by June 4, 2020.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.⁴¹

J. Matthew DeLesDernier,
Assistant Secretary.

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34-88740; File No. SR-NYSEAMER-2020-29]

Self-Regulatory Organizations; NYSE American LLC; Notice of Filing of Proposed Rule Change, as Modified by Amendment No. 2, To Modify Rule 967NY Regarding the Treatment of Orders Subject to Trade Collar Protection

April 24, 2020.

Pursuant to Section 19(b)(1)¹ of the Securities Exchange Act of 1934 (the "Act")² and Rule 19b-4 thereunder,³ notice is hereby given that, on April 9, 2020, NYSE American LLC ("NYSE American" or the "Exchange") filed with the Securities and Exchange Commission (the "Commission") the

³⁷ *Id.*

³⁸ 15 U.S.C. 78f(b)(5).

proposed rule change as described in Items I, II, and III below, which Items have been prepared by the self-regulatory organization. On April 22, 2020, the Exchange filed Amendment No. 1 to the proposed rule change. On April 23, 2020, the Exchange withdrew Amendment No. 1 and filed Amendment No. 2 to the proposed rule change, which superseded and replaced the proposed rule change in its entirety. The Commission is publishing this notice to solicit comments on the proposed rule change, as modified by Amendment No. 2, from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The Exchange proposes to modify Rule 967NY (Price Protection—Orders) regarding the treatment of orders subject to Trade Collar Protection. This Amendment No. 2 supersedes Amendment No. 1 and the original filing (SR-NYSEAMER-2020-29 in its entirety). The proposed change is available on the Exchange's website at www.nyse.com, at the principal office of the Exchange, and at the Commission's Public Reference Room.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the self-regulatory organization included statements concerning the purpose of, and basis for, the proposed rule change and discussed any comments it received on the proposed rule change. The text of those statements may be examined at the places specified in Item IV below. The Exchange has prepared summaries, set forth in sections A, B, and C below, of the most significant parts of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and the Statutory Basis for, the Proposed Rule Change

1. Purpose

The Exchange proposes to modify Rule 967NY(a) regarding the treatment of orders subject to Trade Collar Protection.

The Exchange has in place various price check features, including Trade Collar Protection, that are designed to help maintain a fair and orderly market.⁴ The Exchange proposes to

modify its rule regarding Trading Collars (*i.e.*, Rule 967NY(a) or the "Rule") to modify functionality and to adopt an enhancement to the operation of the Trading Collars.

Overview of Trading Collar Functionality

Trading Collars mitigate the risks associated with orders sweeping through multiple price points (including during extreme market volatility) and resulting in executions at prices that are potentially erroneous (*i.e.*, because they are away from the last sale price or best bid or offer). By applying Trading Collars to incoming orders, the Exchange provides an opportunity to attract additional liquidity at tighter spreads and its "collars" affected orders at successive price points until the bid and offer are equal to the bid-ask differential guideline for that option, *i.e.*, equal to the Trading Collar. Similarly, by applying Trading Collars to partially executed orders, the Exchange prevents the balance of such orders from executing away from the prevailing market after exhausting interest at or near the top of book on arrival.

The Exchange applies Trade Collar Protection to incoming Market Orders and marketable Limit Orders (collectively, "Marketable Orders"; and each a "collared order") if the width of the NBBO is greater than one Trading Collar.⁵ The Exchange applies Trade Collar Protection to the balance of Marketable Orders to buy (sell) that would execute at a price that exceeds the NBO (NBB) plus one Trading Collar.⁶ Incoming collared orders are assigned a collar execution price⁷ and are eligible to trade against contra-side interest priced equal to its collar execution price or at prices within one Trading Collar above (for buy orders) or below (for sell orders) the collar execution price (the "Collar Range").⁸

The display price of a collared order is determined once such order has traded with any contra-side interest within the Collar Range. Pursuant to Rule 967NY(a)(5), a Market Order that does not trade on arrival is displayed at

differential guidelines established pursuant to Rule 925NY(b)(4). Per Rule 967NY(a)(3), Trade Collar Protection does not apply to quotes or to order types that have contingencies, namely, IOC, NOW, AON and FOK orders.

⁵ See Rule 967NY(a)(1)(A) (under the heading "Types of collared orders") and (a)(1)(A)(i), (ii).

⁶ See Rule 967NY(a)(1)(A)(ii).

⁷ The collar execution price depends upon the order type (Market or Limit) and whether (when the order arrives) the Exchange is already in receipt of another order being collared. See *e.g.*, Rule 967NY(a)(4)(A)–(C).

⁸ See Rule 967NY(a)(4)(D).

its collar execution price; whereas the display price of the balance of a partially executed Marketable Order collared pursuant to paragraph (a)(1)(B) of the Rule, depends upon eligible contra-side interest.⁹ Specifically, per paragraph (a)(5)(A) of the Rule, if the collared order has traded against all contra-side interest within the Collar Range, the order would be displayed at the most recent execution price.¹⁰ If, however, there is contra-side interest priced within one Trading Collar of the most recent execution price, per paragraph (a)(5)(B) of the Rule, the order to buy (sell) would be displayed at the higher (lower) of its assigned collar execution price or the best execution price of the order that is both within the Collar Range and at least one Trading Collar away from the best priced contra-side trading interest (*i.e.*, lowest sell interest for collared buy orders/highest buy interest for collared sell orders).¹¹

The Rule also enumerates circumstances under which a collared order may be repriced as a result of certain updates to market interest.¹² Relevant to this filing is that a collared order to buy (sell) would "be assigned a new collar execution price one Trading Collar above (below) the current displayed price of the collared order and processed at the updated price consistent with paragraphs (a)(4)(D) and (a)(5) above," after the "expiration of one second and absent an update to the NBBO" (the "One-Second Collar Reprice Provision").¹³

Proposed Modifications to Trading Collar Functionality

The Exchange proposes to make a number of changes to the Trading Collar functionality that would simplify its operation and would provide order senders more certainty about the handling of orders submitted to the Exchange.

First, the Exchange proposes to modify the treatment of incoming Market Orders received when the width of the NBBO is greater than one Trading Collar (*i.e.*, a "wide market") and there is an existing contra-side collared order. Currently, an incoming market order would immediately execute against the contra-side collared order, which may result in a bad fill for the order sender.

⁹ See Rule 967NY(a)(5).

¹⁰ See Rule 967NY(a)(5)(A).

¹¹ See Rule 967NY(a)(5)(B).

¹² See Rule 967NY(a)(6)(A)–(C).

¹³ See Rule 967NY(a)(6)(C). The Exchange notes, however, that "if the collared order is a Market Order to sell that has reached \$0.00, it will not be assigned a new collar execution price but will be posted in the Consolidated Book at its MPV (*e.g.*, \$0.01 or \$0.05)." See *id.*

⁴ Per Rule 967NY(a)(2), Trading Collars are determined by the Exchange on a class-by-class basis and, unless announced otherwise via Trader Update, are the same value as the bid-ask

As proposed, the Exchange would reject Market Orders to buy (sell) received in a wide market if there is already a collared Marketable Order to sell (buy).¹⁴ In other words, if there is a collared Marketable Order on one side of the market (e.g., buy), and then, during a wide market, the Exchange receives a Market Order on the other side of the market (e.g., sell), it would reject that later-arriving sell Market Order thereby preventing the execution of the order at a potentially erroneous price.

The Exchange believes this proposed change would allow the collared order to continue to seek liquidity while providing the latter-arriving, contra-side order protection from execution in a wide market. The Exchange believes that rejecting the second Market Order rather than collaring it while there is already a collared order on the contra-side would provide greater opportunity for the collared order to receive execution opportunities.

Second, the Exchange proposes to modify the Trading Collar to adopt a single standard for the display price of Marketable Orders. As described above, currently the display price of a collared Marketable Order could be based on either the available contra-side trading interest within (or outside of) one Trading Collar or the Collar Range of the collared order. Instead, the Exchange proposes to amend the operation of the collar so that the display price would be the last execution price of the collared order. To effect this change, the Exchange proposes to amend Rule 967NY(a)(5) to provide that “[a]fter trading against all available interest within the Collar Range, the Marketable Order to buy (sell) that is subject to Trade Collar Protection pursuant to paragraph (a)(1)(B) above will display at its current collar execution price,” signaling the most recent indications of market interest to buy (sell).¹⁵ The rule would continue to provide that each collared order is displayed at the Minimum Price Variation (“MPV”) for the option, pursuant to Rule 960NY (Trading Differentials).¹⁶ The Exchange believes this proposed rule change would simplify the method of selecting the display price (*i.e.*, the current collar execution price) thereby enabling

investors to gauge market interest, and would also provide additional clarity to the operation of the functionality and provide more certainty for order senders.

Third, the Exchange proposes to clarify the One-Second Collar Reprice Provision to define the circumstances that qualify for an “Expiration” under this section of the Rule. This current Rule is silent as to the impact of any portion of the collared order routing to an away market as well as which side of the NBBO needs to update during the one-second time period. To provide additional detail, the Exchange proposes to modify the first sentence of the One-Second Collar Reprice Provision to delete the clause “upon the expiration of one second and absent an update to the NBBO” and replace it with rule text providing that “a collared order is subject to expiration if it displays without executing, routing, or repricing and there is no update to the same-side NBBO price for a period of at least one second” and to define such occurrences as an Expiration.¹⁷ The proposed modification makes clear that any such routing or same-side NBBO updates would restart the one-second timer for repricing purposes. Collared orders subject to conditions that qualify as a proposed Expiration would be repriced as set forth in current Rule.¹⁸ The Exchange believes adding this information to the Rule would add transparency, clarity and internal consistency to Exchange rules.

Finally, in connection with the concept of an Expiration, the Exchange proposes to add new a paragraph that places a limit on the collaring of Market Orders. Specifically, as proposed, “[a] Market Order that is collared will cancel after it is subject to a specified number of Expirations, to be determined by the Exchange and announced by Trader Update.”¹⁹ The Exchange believes this would simplify the operation of the functionality and provide more certainty for order senders.

Implementation

The Exchange will announce the implementation of this rule change in a Trader Update to be published no later than 60 days following the approval date of this rule.

2. Statutory Basis

The proposed rule change is consistent with Section 6(b)²⁰ of the Act, in general, and furthers the

objectives of Section 6(b)(5),²¹ in particular, in that it is designed to prevent fraudulent and manipulative acts and practices, to promote just and equitable principles of trade, to foster cooperation and coordination with persons engaged in facilitating transactions in securities, and to remove impediments to and perfect the mechanisms of a free and open market and a national market system.

Overall, the proposed changes to the Trading Collar functionality would promote just and equitable principles of trade as well as protect investors and the public interest because collared orders would continue to be handled in a fair and orderly manner, as described above.

The proposed modifications and clarifications would remove impediments to and perfect the mechanism of a free and open market and a national market system by simplifying the Trading Collar functionality by rejecting incoming Market Orders received in a wide market when a contra-side order is already being collared and standardizing the selection of the display price, defining the concept of an Expiration, and placing a limit on the number of Expirations that a collared Market Order endures before being canceled back to the order sender.

The Exchange believes the proposal to reject incoming Market Orders when there is a contra-side collared order would allow the collared order to continue to seek liquidity while providing the latter-arriving, contra-side order protection from execution in a wide market—which could be indicative of unstable market conditions or market dislocation thereby helping to remove impediments to and perfect the mechanism of a free and open market and a national market system. The Exchange believes that rejecting the second order (*i.e.*, the Market Order) rather than collaring it while there is already a collared order on the contra-side would provide greater opportunity for the collared order to receive execution opportunities, which would help remove impediments to and perfect the mechanism of a free and open market and a national market system.

The Exchange believes that the proposal to streamline the manner in which it selects the display price of a collared order (*i.e.*, the current collar execution price) would provide order senders with more certainty as to the handling of their orders as well as enable them to gauge indications of market interest. The current selection of

¹⁴ See proposed Rule 967NY(a)(1)(B) (under heading, “Condition preventing collaring of incoming order”).

¹⁵ Because the modified rule text would cover “[a] Market Order that does not trade on arrival,” the Exchange proposes to delete this sentence. See proposed Rule 967NY(a)(5).

¹⁶ See *id.* (providing that “[c]ollared orders are displayed at the MPV for the option, pursuant to Rule 960NY (Trading Differentials)”).

¹⁷ See proposed Rule 967NY(a)(6)(C).

¹⁸ See Rule 967NY(a)(6)(C).

¹⁹ See proposed Rule 967NY(a)(6)(C)(i).

²⁰ 15 U.S.C. 78f(b).

²¹ 15 U.S.C. 78f(b)(5).

the display price is dependent upon various factors and results in the collared order being displayed a one of three potential prices: The most recent execution price, the best execution price, or the collar execution price. Thus, the proposed simplified standard for selecting the display price would help to remove impediments to and perfect the mechanism of a free and open market and a national market system.

The Exchange also believes that the concept of an Expiration and the accompanying change to limit the number of Expirations per collared Market Order would improve the operation of the Trading Collar functionality because cancelling back Market Orders that have persisted for a certain number of Expirations, which could be indicative of unstable market conditions, should provide order senders more certainty of the handling of such orders and help avoid such orders receiving bad executions in times of market dislocation. Thus, this proposal would help remove impediments to and perfect the mechanism of a free and open market and a national market system.

Finally, the Exchange believes that the proposed rule would remove impediments to and perfect the mechanism of a free and open market by clarifying and enhancing the operation of the Trading Collar functionality—which is designed to mitigate the risk of orders sweeping through multiple price points and executing at potentially erroneous prices—as the proposed rule would continue to protect investors from receiving bad executions away from prevailing market prices. The Exchange notes that Trading Collar functionality is not new or novel and is available on other options exchanges.²² Thus, this proposal would foster cooperation and coordination with persons engaged in facilitating transactions in securities, and remove impediments to and perfect the mechanism of a free and open market and a national market system.

Technical Changes

The Exchange notes that the proposed technical changes to the text regarding the selection of the display price would

provide clarity and transparency to Exchange rules and would remove impediments to, and perfect the mechanism of, a free and open market and a national market system by making the Exchange rules easier to navigate and comprehend.

B. Self-Regulatory Organization's Statement on Burden on Competition

The Exchange does not believe that this proposed rule change would impose any burden on competition not necessary or appropriate in furtherance of the purposes of the Act. Instead, the Exchange believes the proposal provides modifications and enhancements to the Trading Collars that provide market participants with protection from anomalous executions. Thus, the Exchange does not believe the proposal creates any significant impact on competition.

The proposed enhancements to the Trading Collars would streamline the operation of the Trading Collars thereby further protecting investors against the execution of orders at erroneous prices. As such, the proposal does not impose any burden on competition. To the contrary, the Exchange believes that the proposed clarifications and enhancements may foster more competition. Specifically, the Exchange notes that it operates in a highly competitive market in which market participants can readily favor competing venues. The Exchange's proposed rule change would enhance its ability to compete with other exchanges that already offer similar trading collar functionality by eliminating complexity while at the same time maintaining the core functionality.²³ Thus, the Exchange believes that this type of competition amongst exchanges is beneficial to the market place as a whole as it can result in enhanced processes, functionality, and technologies. The Exchange further believes that because the proposed rule change would be applicable to all ATP Holders it would not impose any burden on intra-market competition that is not necessary or appropriate in furtherance of the purposes of the Act.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

No written comments were solicited or received with respect to the proposed rule change.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Within 45 days of the date of publication of this notice in the **Federal Register** or up to 90 days (i) as the Commission may designate if it finds such longer period to be appropriate and publishes its reasons for so finding or (ii) as to which the self-regulatory organization consents, the Commission will:

- (A) By order approve or disapprove the proposed rule change, or
- (B) institute proceedings to determine whether the proposed rule change should be disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change, as modified by Amendment No. 2, is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's internet comment form (<http://www.sec.gov/rules/sro.shtml>); or
- Send an email to rule-comments@sec.gov. Please include File Number SR-NYSEAMER-2020-29 on the subject line.

Paper Comments

- Send paper comments in triplicate to: Secretary, Securities and Exchange Commission, 100 F Street NE, Washington, DC 20549-1090.

All submissions should refer to File Number SR-NYSEAMER-2020-29. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's internet website (<http://www.sec.gov/rules/sro.shtml>). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for website viewing and printing in the Commission's Public Reference Room, 100 F Street NE, Washington, DC 20549 on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of the

BILLING CODE 8011-01-P

SECURITIES AND EXCHANGE COMMISSION

[Investment Company Act Release No. 33853; 812-15008]

Legg Mason Partners Equity Trust, et al.; Notice of Application

April 24, 2020.

AGENCY: Securities and Exchange Commission ("Commission").

ACTION: Notice.

Notice of an application under section 6(c) of the Investment Company Act of 1940 ("Act") for an exemption from section 15(a) of the Act, as well as from certain disclosure requirements in rule 20a-1 under the Act, Item 19(a)(3) of Form N-1A, Items 22(c)(1)(ii), 22(c)(1)(iii), 22(c)(8) and 22(c)(9) of Schedule 14A under the Securities Exchange Act of 1934 ("1934 Act"), and sections 6-07(2)(a), (b), and (c) of Regulation S-X ("Disclosure Requirements").

Applicants: Legg Mason Partners Equity Trust (the "Trust"), a Maryland statutory trust registered under the Act as an open-end management investment company with multiple series (each a "Fund") and Legg Mason Partners Fund Advisor, LLC ("Adviser"), a Delaware limited liability company registered as an investment adviser under the Investment Advisers Act of 1940 ("Advisers Act") that serves an investment adviser to the Funds (collectively with the Trust, the "Applicants").

Summary of Application: The requested exemption would permit Applicants to enter into and materially amend subadvisory agreements with

subadvisers without shareholder approval and would grant relief from the Disclosure Requirements as they relate to fees paid to the subadvisers. The requested order would supersede a prior order.¹

Filing Dates: The application was filed on March 8, 2019, and amended on December 6, 2019, and March 16, 2020.

Hearing or Notification of Hearing: An order granting the requested relief will be issued unless the Commission orders a hearing. Interested persons may request a hearing by emailing the Commission's Secretary at *Secretarys-Office@sec.gov* and serving applicants with a copy of the request by email. Hearing requests should be received by the Commission by 5:30 p.m. on May 19, 2020, and should be accompanied by proof of service on the applicants, in the form of an affidavit, or, for lawyers, a certificate of service. Pursuant to rule 0-5 under the Act, hearing requests should state the nature of the writer's interest, any facts bearing upon the desirability of a hearing on the matter, the reason for the request, and the issues contested. Persons who wish to be notified of a hearing may request notification by emailing the Commission's Secretary at *Secretarys-Office@sec.gov*.

ADDRESSES: The Commission: *Secretarys-Office@sec.gov*. The Trust and the Adviser: *RDEmmens@leggmason.com* (with a copy to *roger.joseph@morganlewis.com*).

FOR FURTHER INFORMATION CONTACT: Benjamin Kalish, Senior Counsel, at (202) 551-7361, or David Nicolardi, Branch Chief at (202) 551-6825 (Division of Investment Management, Chief Counsel's Office).

SUPPLEMENTARY INFORMATION: The following is a summary of the application. The complete application may be obtained via the Commission's website by searching for the file number or an Applicant using the "Company" name box, at <http://www.sec.gov/search/search.htm> or by calling (202) 551-8090.

I. Requested Exemptive Relief

1. Applicants request an order to permit the Adviser,² subject to the

¹ See In the Matter of Legg Mason Partners Equity Trust, Legg Mason Partners Variable Equity Trust and Permal Asset Management LLC, Investment Company Act Release Nos. 30923 (Feb. 24, 2014) (notice) and 30990 (Mar. 24, 2014) (order).

² The term "Adviser" means (i) Legg Mason Partners Fund Advisor, LLC, (ii) its successors, and (iii) any entity controlling, controlled by or under common control with, the Adviser or its successors that serves as the primary adviser to a Subadvised Fund (as defined below). For the purposes of the requested order, "successor" is limited to an entity

approval of the board of trustees of the Trust (collectively, the "Board"),³ including a majority of the trustees who are not "interested persons" of the Trust or the Adviser, as defined in section 2(a)(19) of the Act (the "Independent Trustees"), without obtaining shareholder approval, to: (i) Select investment subadvisers ("Subadvisers") for all or a portion of the assets of one or more of the Funds pursuant to an investment subadvisory agreement with each Subadviser (each a "Subadvisory Agreement"); and (ii) materially amend Subadvisory Agreements with the Subadvisers.

2. Applicants also request an order exempting the Subadvised Funds (as defined below) from the Disclosure Requirements, which require each Fund to disclose fees paid to a Subadviser. Applicants seek relief to permit each Subadvised Fund to disclose (as a dollar amount and a percentage of the Fund's net assets): (i) The aggregate fees paid to the Adviser and any Wholly-Owned Subadvisers; and (ii) the aggregate fees paid to Affiliated and Non-Affiliated Subadvisers ("Aggregate Fee Disclosure").⁴ Applicants seek an exemption to permit a Subadvised Fund to include only the Aggregate Fee Disclosure.⁵

3. Applicants request that the relief apply to Applicants, as well as to any future Fund and any other existing or future registered open-end management investment company or series thereof that intends to rely on the requested order in the future and that: (i) Is advised by the Adviser; (ii) uses the multi-manager structure described in the application; and (iii) complies with the terms and conditions of the

that results from a reorganization into another jurisdiction or a change in the type of business organization.

³ The term "Board" also includes the board of trustees or directors of a future Subadvised Fund (as defined below), if different from the board of trustees of the Trust.

⁴ A "Wholly-Owned Subadviser" is any investment adviser that is (1) an indirect or direct "wholly-owned subsidiary" (as such term is defined in section 2(a)(43) of the 1940 Act) of the Adviser, (2) a "sister company" of the Adviser that is an indirect or direct "wholly-owned subsidiary" of the same company that indirectly or directly wholly owns the Adviser (the Adviser's "parent company"), or (3) a parent company of the Adviser. A "Non-Affiliated Subadviser" is any investment adviser that is not an "affiliated person" (as defined in the 1940 Act) of a Fund or the Adviser, except to the extent that an affiliation arises solely because the Subadviser serves as a subadviser to one or more Funds. Section 2(a)(43) of the 1940 Act defines "wholly-owned subsidiary" of a person as a company 95 per centum or more of the outstanding voting securities of which are, directly or indirectly, owned by such a person.

⁵ Applicants note that all other items required by sections 6-07(2)(a), (b) and (c) of Regulation S-X will be disclosed.

²⁴ 17 CFR 200.30-3(a)(12).

application (each, a “Subadvised Fund”).⁶

II. Management of the Subadvised Funds

4. The Adviser serves or will serve as the investment adviser to each Subadvised Fund pursuant to an investment advisory agreement with the Fund (each an “Investment Advisory Agreement”). Each Investment Advisory Agreement has been or will be approved by the Board, including a majority of the Independent Trustees, and by the shareholders of the relevant Subadvised Fund in the manner required by sections 15(a) and 15(c) of the Act. The terms of these Investment Advisory Agreements comply or will comply with section 15(a) of the Act. Applicants are not seeking an exemption from the Act with respect to the Investment Advisory Agreements. Pursuant to the terms of each Investment Advisory Agreement, the Adviser, subject to the oversight of the Board, will provide continuous investment management for each Subadvised Fund. For its services to each Subadvised Fund, the Adviser receives or will receive an investment advisory fee from that Fund as specified in the applicable Investment Advisory Agreement.

5. Consistent with the terms of each Investment Advisory Agreement, the Adviser may, subject to the approval of the Board, including a majority of the Independent Trustees, and the shareholders of the applicable Subadvised Fund (if required by applicable law), delegate portfolio management responsibilities of all or a portion of the assets of a Subadvised Fund to a Subadviser. The Adviser will retain overall responsibility for the management and investment of the assets of each Subadvised Fund. This responsibility includes recommending the removal or replacement of Subadvisers, allocating the portion of that Subadvised Fund’s assets to any given Subadviser and reallocating those assets as necessary from time to time.⁷ The Subadvisers will be “investment advisers” to the Subadvised Funds within the meaning of section 2(a)(20) of the Act and will provide investment

management services to the Funds subject to, without limitation, the requirements of sections 15(c) and 36(b) of the Act.⁸ The Subadvisers, subject to the oversight of the Adviser and the Board, will determine the securities and other investments to be purchased, sold or entered into by a Subadvised Fund’s portfolio or a portion thereof, and will place orders with brokers or dealers that they select.⁹

6. The Subadvisory Agreements will be approved by the Board, including a majority of the Independent Trustees, in accordance with sections 15(a) and 15(c) of the Act. In addition, the terms of each Subadvisory Agreement will comply fully with the requirements of section 15(a) of the Act. The Adviser may compensate the Subadvisers or the Subadvised Funds may compensate the Subadvisers directly.

7. Subadvised Funds will inform shareholders of the hiring of a new Subadviser pursuant to the following procedures (“Modified Notice and Access Procedures”): (a) Within 90 days after a new Subadviser is hired for any Subadvised Fund, that Fund will send its shareholders either a Multi-manager Notice or a Multi-manager Notice and Multi-manager Information Statement;¹⁰ and (b) the Subadvised Fund will make the Multi-manager Information Statement available on the website identified in the Multi-manager Notice no later than when the Multi-

⁸ The Subadvisers will be registered with the Commission as an investment adviser under the Advisers Act or not subject to such registration.

⁹ A “Subadviser” also includes an investment subadviser that provides or will provide the Adviser with a model portfolio reflecting a specific strategy, style or focus with respect to the investment of all or a portion of a Subadvised Fund’s assets. The Adviser may use the model portfolio to determine the securities and other instruments to be purchased, sold or entered into by a Subadvised Fund’s portfolio or a portion thereof, and place orders with brokers or dealers that it selects.

¹⁰ A “Multi-manager Notice” will be modeled on a Notice of Internet Availability as defined in Rule 14a-16 under the 1934 Act, and specifically will, among other things: (a) Summarize the relevant information regarding the new Subadviser (except as modified to permit Aggregate Fee Disclosure); (b) inform shareholders that the Multi-manager Information Statement is available on a website; (c) provide the website address; (d) state the time period during which the Multi-manager Information Statement will remain available on that website; (e) provide instructions for accessing and printing the Multi-manager Information Statement; and (f) instruct the shareholder that a paper or email copy of the Multi-manager Information Statement may be obtained, without charge, by contacting the Subadvised Fund. A “Multi-manager Information Statement” will meet the requirements of Regulation 14C, Schedule 14C and Item 22 of Schedule 14A under the 1934 Act for an information statement, except as modified by the requested order to permit Aggregate Fee Disclosure. Multi-manager Information Statements will be filed with the Commission via the EDGAR system.

manager Notice (or Multi-manager Notice and Multi-manager Information Statement) is first sent to shareholders, and will maintain it on that website for at least 90 days.¹¹

III. Applicable Law

8. Section 15(a) of the Act states, in part, that it is unlawful for any person to act as an investment adviser to a registered investment company “except pursuant to a written contract, which contract, whether with such registered company or with an investment adviser of such registered company, has been approved by the vote of a majority of the outstanding voting securities of such registered company.”

9. Form N-1A is the registration statement used by open-end investment companies. Item 19(a)(3) of Form N-1A requires a registered investment company to disclose in its statement of additional information the method of computing the “advisory fee payable” by the investment company with respect to each investment adviser, including the total dollar amounts that the investment company “paid to the adviser (aggregated with amounts paid to affiliated advisers, if any), and any advisers who are not affiliated persons of the adviser, under the investment advisory contract for the last three fiscal years.”

10. Rule 20a-1 under the Act requires proxies solicited with respect to a registered investment company to comply with Schedule 14A under the 1934 Act. Items 22(c)(1)(ii), 22(c)(1)(iii), 22(c)(8) and 22(c)(9) of Schedule 14A, taken together, require a proxy statement for a shareholder meeting at which the advisory contract will be voted upon to include the “rate of compensation of the investment adviser,” the “aggregate amount of the investment adviser’s fee,” a description of the “terms of the contract to be acted upon,” and, if a change in the advisory fee is proposed, the existing and proposed fees and the difference between the two fees.

11. Regulation S-X sets forth the requirements for financial statements required to be included as part of a registered investment company’s registration statement and shareholder reports filed with the Commission. Sections 6-07(2)(a), (b), and (c) of Regulation S-X require a registered investment company to include in its

¹¹ In addition, Applicants represent that whenever a Subadviser is hired or terminated, or a Subadvisory Agreement is materially amended, the Subadvised Fund’s prospectus and statement of additional information will be supplemented promptly pursuant to rule 497(e) under the Securities Act of 1933.

⁶ All registered open-end investment companies that currently intend to rely on the requested order are named as Applicants. Any entity that relies on the requested order will do so only in accordance with the terms and conditions contained in the application.

⁷ Applicants represent that if the name of any Subadvised Fund contains the name of a subadviser, the name of the Adviser that serves as the primary adviser to the Fund, or a trademark or trade name that is owned by or publicly used to identify the Adviser, will precede the name of the subadviser.

financial statements information about investment advisory fees.

12. Section 6(c) of the Act provides that the Commission may exempt any person, security, or transaction or any class or classes of persons, securities, or transactions from any provisions of the Act, or any rule thereunder, if such exemption is necessary or appropriate in the public interest and consistent with the protection of investors and the purposes fairly intended by the policy and provisions of the Act. Applicants state that the requested relief meets this standard for the reasons discussed below.

IV. Arguments in Support of the Requested Relief

13. Applicants assert that, from the perspective of the shareholder, the role of the Subadvisers is substantially equivalent to the limited role of the individual portfolio managers employed by an investment adviser to a traditional investment company. Applicants also assert that the shareholders expect the Adviser, subject to review and approval of the Board, to select a Subadviser who is in the best position to achieve the Subadvised Fund's investment objective. Applicants believe that permitting the Adviser to perform the duties for which the shareholders of the Subadvised Fund are paying the Adviser—the selection, oversight and evaluation of the Subadviser—without incurring unnecessary delays or expenses of convening special meetings of shareholders is appropriate and in the interest of the Fund's shareholders, and will allow such Fund to operate more efficiently. Applicants state that each Investment Advisory Agreement will continue to be fully subject to section 15(a) of the Act and approved by the relevant Board, including a majority of the Independent Trustees, in the manner required by section 15(a) and 15(c) of the Act.

14. Applicants submit that the requested relief meets the standards for relief under section 6(c) of the Act. Applicants state that the operation of the Subadvised Fund in the manner described in the Application must be approved by shareholders of that Fund before it may rely on the requested relief. Applicants also state that the proposed conditions to the requested relief are designed to address any potential conflicts of interest or economic incentives, and provide that shareholders are informed when new Subadvisers are hired.

15. Applicants contend that, in the circumstances described in the application, a proxy solicitation to approve the appointment of new

Subadvisers provides no more meaningful information to shareholders than the proposed Multi-manager Information Statement. Applicants state that, accordingly, they believe the requested relief is necessary or appropriate in the public interest, and consistent with the protection of investors and the purposes fairly intended by the policy and provisions of the Act.

16. With respect to the relief permitting Aggregate Fee Disclosure, Applicants assert that disclosure of the individual fees paid to the Subadvisers does not serve any meaningful purpose. Applicants contend that the primary reasons for requiring disclosure of individual fees paid to Subadvisers are to inform shareholders of expenses to be charged by a particular Subadvised Fund and to enable shareholders to compare the fees to those of other comparable investment companies. Applicants believe that the requested relief satisfies these objectives because the Subadvised Fund's overall advisory fee will be fully disclosed and, therefore, shareholders will know what the Subadvised Fund's fees and expenses are and will be able to compare the advisory fees a Subadvised Fund is charged to those of other investment companies. In addition, Applicants assert that the requested relief would benefit shareholders of the Subadvised Fund because it would improve the Adviser's ability to negotiate the fees paid to Subadvisers. In particular, Applicants state that if the Adviser is not required to disclose the Subadvisers' fees to the public, the Adviser may be able to negotiate rates that are below a Subadviser's "posted" amounts. Applicants assert that the relief will also encourage Subadvisers to negotiate lower subadvisory fees with the Adviser if the lower fees are not required to be made public.

V. Relief for Affiliated Subadvisers

17. The Commission has granted the requested relief with respect to Wholly-Owned and Non-Affiliated Subadvisers through numerous exemptive orders. The Commission also has extended the requested relief to Affiliated Subadvisers.¹² Applicants state that although the Adviser's judgment in recommending a Subadviser can be affected by certain conflicts, they do not warrant denying the extension of the requested relief to Affiliated Subadvisers. Specifically, the Adviser

faces those conflicts in allocating fund assets between itself and a Subadviser, and across Subadvisers, as it has an interest in considering the benefit it will receive, directly or indirectly, from the fee the Subadvised Fund pays for the management of those assets. Applicants also state that to the extent the Adviser has a conflict of interest with respect to the selection of an Affiliated Subadviser, the proposed conditions are protective of shareholder interests by ensuring the Board's independence and providing the Board with the appropriate resources and information to monitor and address conflicts.

18. With respect to the relief permitting Aggregate Fee Disclosure, Applicants assert that it is appropriate to disclose only aggregate fees paid to Affiliated Subadvisers for the same reasons that similar relief has been granted previously with respect to Wholly-Owned and Non-Affiliated Subadvisers.

VI. Applicants' Conditions

Applicants agree that any order granting the requested relief will be subject to the following conditions:

1. Before a Subadvised Fund may rely on the order requested in the Application, the operation of the Subadvised Fund in the manner described in the Application will be, or has been, approved by a majority of the Subadvised Fund's outstanding voting securities as defined in the Act, or, in the case of a Subadvised Fund whose public shareholders purchase shares on the basis of a prospectus containing the disclosure contemplated by condition 2 below, by the initial shareholder before such Subadvised Fund's shares are offered to the public.

2. The prospectus for each Subadvised Fund will disclose the existence, substance and effect of any order granted pursuant to the Application. In addition, each Subadvised Fund will hold itself out to the public as employing the multi-manager structure described in the Application. The prospectus will prominently disclose that the Adviser has the ultimate responsibility, subject to oversight by the Board, to oversee the Subadvisers and recommend their hiring, termination, and replacement.

3. The Adviser will provide general management services to each Subadvised Fund, including overall supervisory responsibility for the general management and investment of the Subadvised Fund's assets, and subject to review and oversight of the Board, will (i) set the Subadvised Fund's overall investment strategies, (ii) evaluate, select, and recommend

¹² See *Carillon Series Trust and Carillon Tower Advisers, Inc.*, Investment Company Act Rel. Nos. 33464 (May 2, 2019) (notice) and 33494 (May 29, 2019) (order).

Subadvisers for all or a portion of the Subadvised Fund's assets, (iii) allocate and, when appropriate, reallocate the Subadvised Fund's assets among Subadvisers, (iv) monitor and evaluate the Subadvisers' performance, and (v) implement procedures reasonably designed to ensure that Subadvisers comply with the Subadvised Fund's investment objective, policies and restrictions.

4. Subadvised Funds will inform shareholders of the hiring of a new Subadviser within 90 days after the hiring of the new Subadviser pursuant to the Modified Notice and Access Procedures.

5. At all times, at least a majority of the Board will be Independent Trustees, and the selection and nomination of new or additional Independent Trustees will be placed within the discretion of the then-existing Independent Trustees.

6. Independent Legal Counsel, as defined in Rule 0–1(a)(6) under the Act, will be engaged to represent the Independent Trustees. The selection of such counsel will be within the discretion of the then-existing Independent Trustees.

7. Whenever a Subadviser is hired or terminated, the Adviser will provide the Board with information showing the expected impact on the profitability of the Adviser.

8. The Board must evaluate any material conflicts that may be present in a subadvisory arrangement. Specifically, whenever a subadviser change is proposed for a Subadvised Fund ("Subadviser Change") or the Board considers an existing Subadvisory Agreement as part of its annual review process ("Subadviser Review"):

(a) The Adviser will provide the Board, to the extent not already being provided pursuant to section 15(c) of the Act, with all relevant information concerning:

(i) Any material interest in the proposed new Subadviser, in the case of a Subadviser Change, or the Subadviser in the case of a Subadviser Review, held directly or indirectly by the Adviser or a parent or sister company of the Adviser, and any material impact the proposed Subadvisory Agreement may have on that interest;

(ii) any arrangement or understanding in which the Adviser or any parent or sister company of the Adviser is a participant that (A) may have had a material effect on the proposed Subadviser Change or Subadviser Review, or (B) may be materially affected by the proposed Subadviser Change or Subadviser Review;

(iii) any material interest in a Subadviser held directly or indirectly by

an officer or Trustee of the Subadvised Fund, or an officer or board member of the Adviser (other than through a pooled investment vehicle not controlled by such person); and

(iv) any other information that may be relevant to the Board in evaluating any potential material conflicts of interest in the proposed Subadviser Change or Subadviser Review.

(b) the Board, including a majority of the Independent Trustees, will make a separate finding, reflected in the Board minutes, that the Subadviser Change or continuation after Subadviser Review is in the best interests of the Subadvised Fund and its shareholders and, based on the information provided to the Board, does not involve a conflict of interest from which the Adviser, a Subadviser, any officer or Trustee of the Subadvised Fund, or any officer or board member of the Adviser derives an inappropriate advantage.

9. Each Subadvised Fund will disclose in its registration statement the Aggregate Fee Disclosure.

10. In the event that the Commission adopts a rule under the Act providing substantially similar relief to that in the order requested in the Application, the requested order will expire on the effective date of that rule.

11. Any new Subadvisory Agreement or any amendment to an existing Investment Advisory Agreement or Subadvisory Agreement that directly or indirectly results in an increase in the aggregate advisory fee rate payable by the Subadvised Fund will be submitted to the Subadvised Fund's shareholders for approval.

For the Commission, by the Division of Investment Management, under delegated authority.

J. Matthew DeLesDernier,
Assistant Secretary.

BILLING CODE 8011–01–P

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34–88746; File No. SR–BX–2020–007]

Self-Regulatory Organizations; Nasdaq BX, Inc.; Notice of Filing of Proposed Rule Change, as Modified by Amendment No. 1, To Assume Operational Responsibility for Certain Enforcement Functions Currently Performed by FINRA Under the Exchange's Authority and Supervision

April 24, 2020.

Pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934

("Act"),¹ and Rule 19b–4 thereunder,² notice is hereby given that on April 16, 2020, Nasdaq BX, Inc. ("BX" or "Exchange") filed with the Securities and Exchange Commission ("SEC" or "Commission") the proposed rule change. On April 23, 2020, the Exchange filed Amendment No. 1 to the proposed rule change, which amended and replaced the rule change in its entirety.³ The proposed rule change, as modified by Amendment No. 1, as described in Items I, II, and III, below, which Items have been prepared by the Exchange. The Commission is publishing this notice to solicit comments on the proposed rule change, as modified by Amendment No. 1, from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The Exchange proposes to assume operational responsibility for certain enforcement functions currently performed by the Financial Industry Regulatory Authority ("FINRA") under the Exchange's authority and supervision. Specifically, the Exchange proposes to assume operational responsibility for litigating certain contested disciplinary proceedings arising out of BX Regulation-led investigation and enforcement activities. BX Rule General 2, Section 7⁴ requires Commission approval for this proposal.

The text of the proposed rule change is available on the Exchange's website at <http://nasdaqbx.cchwallstreet.com/>, at the principal office of the Exchange, and at the Commission's Public Reference Room.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the Exchange included statements concerning the purpose of and basis for the proposed rule change and discussed any comments it received on the proposed rule change. The text of these statements may be examined at the places specified in Item IV below. The Exchange has prepared summaries, set forth in sections A, B, and C below, of

¹ 15 U.S.C. 78s(b)(1).

² 17 CFR 240.19b–4.

³ Amendment No. 1 replaces and supersedes in its entirety the proposal as originally filed. In Amendment No. 1, the Exchange makes clear in Item 8 of Form 19b–4 that the Staff for each of Phlx, ISE, GEMX, and MRX act in a similar manner to what the proposal seeks for BX Staff and that the Commission recently approved Nasdaq Staff to do the same with respect to Nasdaq. See note 17 *infra*.

⁴ Formerly BX Rule 0150.

the most significant aspects of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

1. Purpose

Section 6 of the Act requires that national securities exchanges enforce their members' compliance with federal securities laws and rules as well as the exchanges' own rules.⁵ As a self-regulatory organization ("SRO"), BX must have a comprehensive regulatory program that includes investigation and prosecution of violative activity. Since its acquisition by The NASDAQ OMX Group, Inc., BX has contracted with FINRA through various regulatory services agreements ("RSAs") to perform certain of these regulatory functions on its behalf. However, as the Commission has made clear with respect to BX's affiliate, The Nasdaq Stock Market LLC ("Nasdaq"), "the Nasdaq Exchange bears the responsibility for self-regulatory conduct and primary liability for self-regulatory failures, not the SRO retained to perform regulatory functions on the Exchange's behalf."⁶

In June 2019, BX received Commission approval to reallocate operational responsibility from FINRA to BX Regulation⁷ for certain investigation and enforcement activity,⁸ namely:

- Investigation and enforcement responsibilities for conduct occurring on The BX Options Market,⁹ and
- investigation and enforcement responsibilities for conduct occurring on BX's equity market only, *i.e.*, not also on non-Nasdaq-affiliated equities markets.¹⁰

Notwithstanding that approval, FINRA continues to perform certain

functions pursuant to a RSA,¹¹ including, among other things, the handling of contested disciplinary proceedings arising out of BX Regulation-led investigation and enforcement activities.¹² BX now requests Commission approval to reallocate operational responsibility from FINRA to BX Regulation for certain enforcement activity, namely the handling of certain contested disciplinary proceedings.¹³ Specifically, BX Regulation anticipates handling those contested disciplinary proceedings that FINRA is unable or unwilling to handle due to strained resources or other similar limitations.¹⁴ For those contested disciplinary proceedings over which BX Regulation does not assume operational responsibility, the Exchange will continue to use FINRA to litigate those matters.

In its prior request for Commission approval to reallocate operational responsibility from FINRA to BX Regulation for certain investigation and enforcement functions, the Exchange noted that its expertise in its own market structure coupled with its expertise in surveillance activities will enable it to conduct investigation and enforcement responsibilities for the Exchange effectively, efficiently and with immediacy.¹⁵ The Exchange believes that assuming responsibility for litigating certain contested disciplinary proceedings, as discussed above, will similarly ensure that matters are handled effectively, efficiently and with immediacy. The Exchange notes that this proposal would not change or alter

in any way the disciplinary processes around how contested matters are handled. For example, the rules applicable to the disciplinary process remain the same and FINRA's Office of Hearing Officers will continue to administer the hearing process for all contested disciplinary proceedings. Therefore, regardless of whether FINRA or the Exchange is responsible for litigating the matter, FINRA's Office of Hearing Officers will administer the hearing process.¹⁶

BX Rule General 2, Section 7 requires that BX obtain Commission approval if regulatory functions subject to RSAs in effect at the time BX executed the agreement in 2008 are no longer performed by FINRA or an affiliate thereof, or by another independent self-regulatory organization. BX believes that assuming operational responsibility for certain contested disciplinary proceedings will further its regulatory program and benefit investors and the markets. Commission approval of the proposal would allow BX to deliver increased efficiencies in the regulation of its market and to act promptly and provide more effective regulation.¹⁷

Finally, BX notes that its proposal is consistent with work performed by other national securities exchanges. For example, in 2015, the SEC approved the New York Stock Exchange's ("NYSE") application whereby NYSE amended certain of its disciplinary rules to facilitate the reintegration of certain market surveillance, investigation and enforcement functions performed on behalf of NYSE by FINRA.¹⁸ That reintegration also included the handling of contested disciplinary proceedings.

¹¹ In addition to work performed pursuant to a RSA, FINRA also performs work for matters covered by agreements to allocate regulatory responsibility under Rule 17d-2 of the Act.

¹² For example, pursuant to Rule 9216, if at the conclusion of a BX Regulation-led investigation, BX Regulation has reason to believe that a violation occurred but the Respondent disputes the violation and therefore does not execute an Acceptance, Waiver, and Consent ("AWC") letter, or if the Respondent executes the AWC letter but the Exchange Review Council, Review Subcommittee or FINRA's Office of Disciplinary Affairs does not accept the executed letter, the Exchange may decide to pursue formal disciplinary proceedings. In such a case, the Exchange would refer the matter to FINRA to handle the formal disciplinary proceedings on its behalf. FINRA's Office of Hearing Officers will continue to be responsible for the administration of the hearing process.

¹³ BX may determine to engage a third party, such as a law firm, to litigate the matter on its behalf. In all cases, the Exchange will continue to use FINRA's Office of Hearing Officers to administer the hearing process.

¹⁴ BX Regulation's decision to assume operation responsibility for any given contested disciplinary proceeding will be made on a case by case basis.

¹⁵ Securities Exchange Act Release No. 85691 (April 18, 2019), 84 FR 17219, 17220 (April 24, 2019).

¹⁶ FINRA's Office of Hearing Officers plays no role in uncontested disciplinary proceedings.

¹⁷ In a separate filing Nasdaq also proposed to reallocate operational responsibility from FINRA to Nasdaq Regulation for enforcement responsibilities for litigating certain contested disciplinary proceedings arising out of Nasdaq Regulation-led investigation and enforcement activities. *See* SR-Nasdaq-2020-007. The Commission approved that rule filing on March 30, 2020. *See* Securities Exchange Act Release No. 34-88516 (Order Granting Accelerated Approval of a Proposed Rule Change, as Modified by Amendment No. 1, to Assume Operational Responsibility for Certain Enforcement Functions Currently Performed by FINRA under the Exchanges Authority and Supervision).

¹⁸ *See* Securities Exchange Act Release No. 75721 (August 18, 2015), 80 FR 51334 (August 24, 2015) and Order Granting Accelerated Approval of a Proposed Rule Change, as Modified by Amendment Nos. 1, 3 and 5, Amending Exchange Disciplinary Rules to Facilitate the Reintegration of Certain Regulatory Functions from Financial Industry Regulatory Authority, Inc., Securities Exchange Act Release No. 76436 (November 13, 2015), 80 FR 72460 (November 19, 2015) (SR-NYSE-2015-35).

⁵ 15 U.S.C. 78(f).

⁶ Securities Exchange Act Release No. 53128 (January 13, 2006), 71 FR 3550, 3556 (January 23, 2006).

⁷ Under BX Rule 9120(t), the Exchange's Regulation Department includes the Exchange's Enforcement Department. The Exchange notes that the Staff that comprises the Exchange's Regulation Department is the same that comprises the Nasdaq Regulation Department.

⁸ Securities Exchange Act Release No. 86051 (June 6, 2019), 84 FR 27387 (June 12, 2019).

⁹ As appropriate, the Exchange's Regulation Department will coordinate with other SROs to the extent it is investigating activity occurring on non-Nasdaq-affiliated options markets to ensure no regulatory duplication occurs.

¹⁰ With respect to the operational responsibilities described in both bullet points, Nasdaq Regulation Staff currently performs these functions for the Nasdaq PHLX LLC ("Phlx"), Nasdaq ISE, LLC ("ISE"), Nasdaq GEMX, LLC ("GEMX"), and Nasdaq MRX, LLC ("MRX") because there is no comparable rule to General 2, Section 7 on those markets.

2. Statutory Basis

The Exchange believes that its proposal is consistent with Section 6(b) of the Act,¹⁹ in general, and furthers the objectives of Section 6(b)(5) of the Act,²⁰ in particular, in that it is designed to promote just and equitable principles of trade, to remove impediments to and perfect the mechanism of a free and open market and a national market system, and, in general to protect investors and the public interest. In addition, the Exchange believes that the proposal furthers the objectives of Section 6(b)(7) of the Act,²¹ in particular, in that these changes will continue to provide for fair procedures for the disciplining of members and persons associated with members, the denial of membership to any person seeking membership therein, the barring of any person from becoming associated with a member thereof, and the prohibition or limitation by the Exchange of any person with respect to access to services offered by the Exchange or a member thereof.

The Exchange believes that this proposal is in keeping with those principles because it will ensure that certain contested matters retained by BX Regulation are handled effectively, efficiently and with immediacy. The ability to assume responsibility for the handling of certain contested matters will ensure that contested cases are handled promptly when, for example, FINRA's litigation resources are strained or when it is otherwise unable or unwilling to handle a particular matter. This will enable the Exchange to take timely action when appropriate to enforce its rules, hold bad actors accountable, and protect investors and market integrity. This proposal, however, would not change or alter in any way the disciplinary processes around how contested matters are handled. Rather, it will result in more effective regulation because it will facilitate timely and more efficient action. Internalizing the litigation function in certain contested matters will also facilitate effective regulation because the Exchange will continue to bring to bear its overall market and surveillance expertise throughout the disciplinary proceedings.

B. Self-Regulatory Organization's Statement on Burden on Competition

The Exchange does not believe that the proposed rule change will impose any burden on competition not necessary or appropriate in furtherance

of the purposes of the Act. The proposed rule change is not intended to address competitive issues but rather to enable the Exchange to have the option to litigate certain contested matters when FINRA is unable or unwilling to do so through the RSA.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

No written comments were either solicited or received.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Within 45 days of the date of publication of this notice in the **Federal Register** or within such longer period (i) as the Commission may designate up to 90 days of such date if it finds such longer period to be appropriate and publishes its reasons for so finding or (ii) as to which the Exchange consents, the Commission shall: (a) By order approve or disapprove such proposed rule change, or (b) institute proceedings to determine whether the proposed rule change should be disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change, as modified by Amendment No. 1, is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's internet comment form (<http://www.sec.gov/rules/sro.shtml>); or
- Send an email to rule-comments@sec.gov. Please include File Number SR-BX-2020-007 on the subject line.

Paper Comments

- Send paper comments in triplicate to Secretary, Securities and Exchange Commission, 100 F Street NE, Washington, DC 20549-1090. All submissions should refer to File Number SR-BX-2020-007. This file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's internet website (<http://www.sec.gov/rules/sro.shtml>). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the

Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for website viewing and printing in the Commission's Public Reference Room, 100 F Street NE, Washington, DC 20549, on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of the filing also will be available for inspection and copying at the principal office of the Exchange. All comments received will be posted without change. Persons submitting comments are cautioned that we do not redact or edit personal identifying information from comment submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File Number SR-BX-2020-007 and should be submitted on or before May 21, 2020.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.²²

J. Matthew DeLesDernier,

Assistant Secretary.

SECURITIES AND EXCHANGE COMMISSION

[Investment Company Act Release No. 33855]

Notice of Applications for Deregistration Under Section 8(f) of the Investment Company Act of 1940

April 24, 2020.

The following is a notice of applications for deregistration under section 8(f) of the Investment Company Act of 1940 for the month of April 2020. A copy of each application may be obtained via the Commission's website by searching for the file number, or for an applicant using the Company name box, at <http://www.sec.gov/search/search.htm> or by calling (202) 551-8090. An order granting each application will be issued unless the SEC orders a hearing. Interested persons may request a hearing on any application by emailing the SEC's Secretary at Secretaries-Office@sec.gov and serving the relevant applicant with a copy of the request by email, if an email address is listed for the relevant applicant below, or personally or by mail, if a physical address is listed for

¹⁹ 15 U.S.C. 78f(b).

²⁰ 15 U.S.C. 78f(b)(5).

²¹ 15 U.S.C. 78f(b)(7).

²² 17 CFR 200.30-3(a)(12).

the relevant applicant below. Hearing requests should be received by the SEC by 5:30 p.m. on May 19, 2020, and should be accompanied by proof of service on applicants, in the form of an affidavit or, for lawyers, a certificate of service. Pursuant to Rule 0–5 under the Act, hearing requests should state the nature of the writer's interest, any facts bearing upon the desirability of a hearing on the matter, the reason for the request, and the issues contested. Persons who wish to be notified of a hearing may request notification by writing to the Commission's Secretary at Secretaries-Office@sec.gov.

BILLING CODE 8011-01-P

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34-88743; File No. SR-NASDAQ-2020-011]

Self-Regulatory Organizations; The Nasdaq Stock Market LLC; Order Approving Proposed Rule Change To Amend Rules 4702(b)(14) and (b)(15) To Shorten the Holding Period Requirements for Midpoint Extended Life Orders and Midpoint Extended Life Orders Plus Continuous Book

April 24, 2020.

I. Introduction

On February 26, 2020, The Nasdaq Stock Market LLC ("Exchange" or "Nasdaq") filed with the Securities and Exchange Commission ("Commission"), pursuant to Section 19(b)(1) of the Securities Exchange Act of 1934 ("Act")¹ and Rule 19b-4 thereunder,² a proposed rule change to amend Nasdaq Rules 4702(b)(14) and (b)(15) to shorten the holding period requirements for Midpoint Extended Life Orders ("M-ELOs") and Midpoint Extended Life Orders Plus Continuous Book ("M-ELO+CBs"). The proposed rule change was published for comment in the **Federal Register** on March 10, 2020.³

This order approves the proposed rule change.

II. Description of the Proposal

M-ELO is an order type with a non-display order attribute that is priced at the midpoint between the national best bid and national best offer ("NBBO") and that will not be eligible to execute until a holding period of one-half second ("Holding Period") has passed after acceptance of the order by the system.⁴ Once a M-ELO becomes eligible to execute, the order may only execute against other eligible M-ELOs and M-ELO+CBs.⁵

M-ELO+CB is an order type that has all of the characteristics and attributes of a M-ELO, except that after satisfying its Holding Period, in addition to executing against other eligible M-ELO+CBs and M-ELOs, it may also execute against certain orders on the Exchange's continuous book.⁶ Specifically, a M-ELO+CB may execute against non-displayed orders with midpoint pegging and midpoint peg post-only orders (collectively, "Midpoint Orders") resting on the Exchange's continuous book, if: (1) The Midpoint Order has the midpoint trade now order attribute enabled; (2) the Midpoint Order has rested on the continuous book for at least one-half second ("Resting Period") after the NBBO midpoint falls within the limit price set by the participant; (3) no other order is resting on the continuous book that has a more aggressive price than the current NBBO midpoint; and (4) the Midpoint Order satisfies any minimum quantity requirement of the M-ELO+CB.⁷

The Exchange now proposes to shorten the Holding Period for M-ELOs and M-ELO+CBs from one-half second to ten milliseconds.⁸ The Exchange also proposes to shorten the corresponding Resting Period for Midpoint Orders from one-half second to ten milliseconds.⁹ According to the Exchange, after observing M-ELO and M-ELO+CB trading over the past two years and gathering feedback from market participants (in particular, those that trade with a longer time horizon and are concerned with market impact), it has determined that the length of the Holding Period should be recalibrated.¹⁰

The Exchange states that reducing the Holding Period to ten milliseconds would not compromise the purpose of the M-ELO and M-ELO+CB order types.¹¹ In particular, the Exchange states that it examined historical M-ELO executions and found that reducing the Holding Period to ten milliseconds would not have a material impact on its protective effect.¹²

The Exchange states that it will continue to conduct real-time surveillance to monitor the use of M-ELOs and M-ELO+CBs to ensure that such usage remains appropriately tied to the intent of the order types.¹³ If, as a result of such surveillance, the Exchange determines that the shortened Holding Period does not serve its intended purpose or adversely impacts market quality, the Exchange would seek to make further recalibrations.¹⁴

The Exchange intends to make the proposed changes effective in the second quarter of 2020 and will publish a trader alert at least 14 days in advance of making the proposed changes effective.¹⁵

III. Discussion and Commission Findings

After careful review, the Commission finds that the proposed rule change is consistent with the requirements of the Act and the rules and regulations thereunder applicable to a national securities exchange.¹⁶ In particular, the Commission finds that the proposed rule change is consistent with Section 6(b)(5) of the Act,¹⁷ which requires, among other things, that the rules of a national securities exchange be designed to prevent fraudulent and manipulative acts and practices, to promote just and equitable principles of trade, to foster cooperation and coordination with persons engaged in facilitating transactions in securities, to

symbols that on average have a lower time-to-execution than one-half second, they are reticent to enter M-ELOs and M-ELO+CBs because the Holding Period is too long and presents countervailing risks (*i.e.*, the Holding Period is longer than necessary and participants risk losing out on favorable execution opportunities that would otherwise be available to them had they placed a non-M-ELO or M-ELO+CB order). *See id.* In addition, the Exchange states that many institutional routing strategies recalibrate and will route an order based on where trading activity is occurring, and this recalibration could occur before the completion of the Holding Period. *See id.*

⁸ *See* proposed Nasdaq Rule 4702(b)(14).

⁹ *See* proposed Nasdaq Rule 4702(b)(15).

¹⁰ *See* Notice, *supra* note 3, at 13963. The Exchange also states that participants have informed the Exchange that in certain circumstances, such as when they seek to trade

remove impediments to and perfect the mechanism of a free and open market and a national market system, and, in general, to protect investors and the public interest.

In its original order approving M-ELO on the Exchange, the Commission noted its belief that the M-ELO order type could create additional and more efficient trading opportunities on the Exchange for investors with longer investment time horizons, including institutional investors, and could provide these investors with an ability to limit the information leakage and the market impact that could result from their orders.¹⁸ In its order approving M-ELO+CB, the Commission noted its belief that, as with M-ELOs, M-ELO+CBs represent a reasonable effort to further enhance the ability of longer-term trading interest to participate effectively on an exchange.¹⁹ A commenter expressed concern that the proposal would defeat the original intent of M-ELOs and that M-ELOs would lose a significant amount of protection as a result of the shortened Holding Period.²⁰ The commenter asked how the Exchange determined to propose the ten-millisecond Holding Period, and expressed its belief that the proposal would result in more information leakage and therefore most long-term investors would decide to no longer use M-ELOs.²¹ In response, the Exchange disagreed that the proposal would cause M-ELOs and M-ELO+CBs to lose a significant amount of protection to the detriment of long-term investors and referenced the discussion in the Notice regarding how the Exchange selected the proposed ten-millisecond Holding Period.²² The Exchange also stated that even if the commenter was correct in asserting that the proposal would diminish the protective power of M-ELOs and M-ELO+CBs, that conclusion should have

no bearing on whether the proposal is consistent with the Act.²³

The Commission notes that, with the proposed ten-millisecond Holding Period and Resting Period, M-ELOs and M-ELO+CBs would continue to be optional order types that are available to investors with longer investment time horizons, including institutional investors. The Commission also believes that the proposal could make M-ELOs and M-ELO+CBs more attractive for securities that on average have a time-to-execution of less than one-half second and, for investors who currently do not use M-ELOs and M-ELO+CBs for these securities, provide optional order types that could enhance their ability to participate effectively on the Exchange. The Commission notes that, if market participants determine that the proposal would make M-ELOs and M-ELO+CBs less attractive for their particular investment objectives, such market participants may elect to reduce or eliminate their use of these optional order types. Moreover, as noted above, the Exchange will continue to conduct real-time surveillance to monitor the use of M-ELOs and M-ELO+CBs to ensure that such usage remains appropriately tied to the intent of the order types.²⁴ If, as a result of such surveillance, the Exchange determines that the shortened Holding Period does not serve its intended purpose or adversely impacts market quality, the Exchange would seek to make further recalibrations.²⁵

Based on the foregoing, the Commission finds that the proposed rule change is consistent with the Act.

IV. Conclusion

It is therefore ordered, pursuant to Section 19(b)(2) of the Act,²⁶ that the proposed rule change (SR-NASDAQ-2020-011) be, and hereby is, approved.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.²⁷

J. Matthew DeLesDernier,
Assistant Secretary.

[FR Doc. 2020-09123 Filed 4-29-20; 8:45 am]

BILLING CODE 8011-01-P

SECURITIES AND EXCHANGE COMMISSION

[Release No. 34-88737; File No. SR-NYSEArca-2020-31]

Self-Regulatory Organizations; NYSE Arca, Inc.; Notice of Filing of Proposed Rule Change, as Modified by Amendment No. 2, To Modify Rule 6.60-O Regarding the Treatment of Orders Subject to Trade Collar Protection

April 24, 2020.

Pursuant to Section 19(b)(1)¹ of the Securities Exchange Act of 1934 (the “Act”)² and Rule 19b-4 thereunder,³ notice is hereby given that, on April 9, 2020, NYSE Arca, Inc. (“NYSE Arca” or the “Exchange”) filed with the Securities and Exchange Commission (the “Commission”) the proposed rule change as described in Items I, II, and III below, which Items have been prepared by the self-regulatory organization. On April 22, 2020, the Exchange filed Amendment No. 1 to the proposed rule change. On April 23, 2020, the Exchange withdrew Amendment No. 1 and filed Amendment No. 2 to the proposed rule change, which superseded and replaced the proposed rule change in its entirety. The Commission is publishing this notice to solicit comments on the proposed rule change, as modified by Amendment No. 2, from interested persons.

I. Self-Regulatory Organization's Statement of the Terms of Substance of the Proposed Rule Change

The Exchange proposes to modify 6.60-O (Price Protection—Orders) regarding the treatment of orders subject to Trade Collar Protection. This Amendment No. 2 supersedes Amendment No. 1 and the original filing (SR-NYSEArca-2020-31) in its entirety. The proposed change is available on the Exchange's website at www.nyse.com, at the principal office of the Exchange, and at the Commission's Public Reference Room.

II. Self-Regulatory Organization's Statement of the Purpose of, and Statutory Basis for, the Proposed Rule Change

In its filing with the Commission, the self-regulatory organization included statements concerning the purpose of, and basis for, the proposed rule change and discussed any comments it received

¹⁸ See Securities Exchange Act Release No. 82825 (March 7, 2018), 83 FR 10937, 10938–39 (March 13, 2018) (order approving SR-NASDAQ-2017-074).

¹⁹ See Securities Exchange Act Release No. 86938 (September 11, 2019), 84 FR 48978, 48980–81 (September 17, 2019) (order approving SR-NASDAQ-2019-048).

on the proposed rule change. The text of those statements may be examined at the places specified in Item IV below. The Exchange has prepared summaries, set forth in sections A, B, and C below, of the most significant parts of such statements.

A. Self-Regulatory Organization's Statement of the Purpose of, and the Statutory Basis for, the Proposed Rule Change

1. Purpose

The Exchange proposes to modify Rule 6.60–O(a) regarding the treatment of orders subject to Trade Collar Protection.

The Exchange has in place various price check features, including Trade Collar Protection, that are designed to help maintain a fair and orderly market.⁴ The Exchange proposes to modify its rule regarding Trading Collars (*i.e.*, Rule 6.60–O(a) or the “Rule”) to modify functionality and to adopt an enhancement to the operation of the Trading Collars.

Overview of Trading Collar Functionality

Trading Collars mitigate the risks associated with orders sweeping through multiple price points (including during extreme market volatility) and resulting in executions at prices that are potentially erroneous (*i.e.*, because they are away from the last sale price or best bid or offer). By applying Trading Collars to incoming orders, the Exchange provides an opportunity to attract additional liquidity at tighter spreads and it “collars” affected orders at successive price points until the bid and offer are equal to the bid-ask differential guideline for that option, *i.e.*, equal to the Trading Collar. Similarly, by applying Trading Collars to partially executed orders, the Exchange prevents the balance of such orders from executing away from the prevailing market after exhausting interest at or near the top of book on arrival.

The Exchange applies Trade Collar Protection to incoming Market Orders and marketable Limit Orders (collectively, “Marketable Orders”; and each a “collared order”) if the width of the NBBO is greater than one Trading

Collar.⁵ The Exchange applies Trade Collar Protection to the balance of Marketable Orders to buy (sell) that would execute at a price that exceeds the NBO (NBB) plus one Trading Collar.⁶ Incoming collared orders are assigned a collar execution price⁷ and are eligible to trade against contra-side interest priced equal to its collar execution price or at prices within one Trading Collar above (for buy orders) or below (for sell orders) the collar execution price (the “Collar Range”).⁸

The display price of a collared order is determined once such order has traded with any contra-side interest within the Collar Range. Pursuant to Rule 6.60–O(a)(5), a Market Order that does not trade on arrival is displayed at its collar execution price; whereas the display price of the balance of a partially executed Marketable Order collared pursuant to paragraph (a)(1)(B) of the Rule, depends upon eligible contra-side interest.⁹ Specifically, per paragraph (a)(5)(A) of the Rule, if the collared order has traded against all contra-side interest within the Collar Range, the order would be displayed at the most recent execution price.¹⁰ If, however, there is contra-side interest priced within one Trading Collar of the most recent execution price, per paragraph (a)(5)(B) of the Rule, the order to buy (sell) would be displayed at the higher (lower) of its assigned collar execution price or the best execution price of the order that is both within the Collar Range and at least one Trading Collar away from the best priced contra-side trading interest (*i.e.*, lowest sell interest for collared buy orders/highest buy interest for collared sell orders).¹¹

The Rule also enumerates circumstances under which a collared order may be repriced as a result of certain updates to market interest.¹² Relevant to this filing is that a collared order to buy (sell) would “be assigned a new collar execution price one Trading Collar above (below) the current displayed price of the collared order and processed at the updated price consistent with paragraphs (a)(4)(D) and (a)(5) above,” after the “expiration of one second and absent an update to the

NBBO” (the “One-Second Collar Reprice Provision”).¹³

Proposed Modifications to Trading Collar Functionality

The Exchange proposes to make a number of changes to the Trading Collar functionality that would simplify its operation and would provide order senders more certainty about the handling of orders submitted to the Exchange.

First, the Exchange proposes to modify the treatment of incoming Market Orders received when the width of the NBBO is greater than one Trading Collar (*i.e.*, a “wide market”) and there is an existing contra-side collared order. Currently, an incoming market order would immediately execute against the contra-side collared order, which may result in a bad fill for the order sender. As proposed, the Exchange would reject Market Orders to buy (sell) received in a wide market if there is already a collared Marketable Order to sell (buy).¹⁴ In other words, if there is a collared Marketable Order on one side of the market (*e.g.*, buy), and then, during a wide market, the Exchange receives a Market Order on the other side of the market (*e.g.*, sell), it would reject that later-arriving sell Market Order thereby preventing the execution of the order at a potentially erroneous price.

The Exchange believes this proposed change would allow the collared order to continue to seek liquidity while providing the latter-arriving, contra-side order protection from execution in a wide market. The Exchange believes that rejecting the second Market Order rather than collaring it while there is already a collared order on the contra-side would provide greater opportunity for the collared order to receive execution opportunities.

Second, the Exchange proposes to modify the Trading Collar to adopt a single standard for the display price of Marketable Orders. As described above, currently the display price of a collared Marketable Order could be based on either the available contra-side trading interest within (or outside of) one Trading Collar or the Collar Range of the collared order. Instead, the Exchange proposes to amend the operation of the collar so that the display price would be

⁵ See Rule 6.60–O(a)(1)(A) (under the heading “Types of collared orders”) and (a)(1)(A)(i),(ii).

⁶ See Rule 6.60–O(a)(1)(A)(ii).

⁷ The collar execution price depends upon the order type (Market or Limit) and whether (when the order arrives) the Exchange is already in receipt of another order being collared. See *e.g.*, Rule 6.60–O(a)(4)(A)–(C).

⁸ See Rule 6.60–O(a)(4)(D).

⁹ See Rule 6.60–O(a)(5).

¹⁰ See Rule 6.60–O(a)(5)(A).

¹¹ See Rule 6.60–O(a)(5)(B).

¹² See Rule 6.60–O(a)(6)(A)–(C).

¹³ See Rule 6.60–O(a)(6)(C). The Exchange notes, however, that “if the collared order is a Market Order to sell that has reached \$0.00, it will not be assigned a new collar execution price but will be posted in the Consolidated Book at its MPV (*e.g.*, \$0.01 or \$0.05).” See *id*.

¹⁴ See proposed Rule 6.60–O(a)(1)(B) (under heading, “Condition preventing collaring of incoming order”).

⁴ Per Rule 6.60–O(a)(2), Trading Collars are determined by the Exchange on a class-by-class basis and, unless announced otherwise via Trader Update, are the same value as the bid-ask differential guidelines established pursuant to Rule 6.37–O(b)(4). Per Rule 6.60–O(a)(3), Trade Collar Protection does not apply to quotes or to order types that have contingencies, namely, IOC, NOW, AON and FOK orders.

the last execution price of the collared order. To effect this change, the Exchange proposes to amend Rule 6.60–O(a)(5) to provide that “[a]fter trading against all available interest within the Collar Range, the Marketable Order to buy (sell) that is subject to Trade Collar Protection pursuant to paragraph (a)(1)(B) above will display at its current collar execution price,” signaling the most recent indications of market interest to buy (sell).¹⁵ The rule would continue to provide that each collared order is displayed at the Minimum Price Variation (“MPV”) for the option, pursuant to Rule 6.72–O (Trading Differentials).¹⁶ The Exchange believes this proposed rule change would simplify the method of selecting the display price (*i.e.*, the current collar execution price) thereby enabling investors to gauge market interest, and would also provide additional clarity to the operation of the functionality and provide more certainty for order senders.

Third, the Exchange proposes to clarify the One-Second Collar Reprice Provision to define the circumstances that qualify for an “Expiration” under this section of the Rule. This current Rule is silent as to the impact of any portion of the collared order routing to an away market as well as which side of the NBBO needs to update during the one-second time period. To provide additional detail, the Exchange proposes to modify the first sentence of the One-Second Collar Reprice Provision to delete the clause “upon the expiration of one second and absent an update to the NBBO” and replace it with rule text providing that “a collared order is subject to expiration if it displays without executing, routing, or repricing and there is no update to the same-side NBBO price for a period of at least one second” and to define such occurrences as an Expiration.¹⁷ The proposed modification makes clear that any such routing or same-side NBBO updates would restart the one-second timer for repricing purposes. Collared orders subject to conditions that qualify as a proposed Expiration would be repriced as set forth in current Rule.¹⁸ The Exchange believes adding this information to the Rule would add

transparency, clarity and internal consistency to Exchange rules.

Finally, in connection with the concept of an Expiration, the Exchange proposes to add a new paragraph that places a limit on the collaring of Market Orders. Specifically, as proposed, “[a] Market Order that is collared will cancel after it is subject to a specified number of Expirations, to be determined by the Exchange and announced by Trader Update.”¹⁹ The Exchange believes this would simplify the operation of the functionality and provide more certainty for order senders.

Implementation

The Exchange will announce the implementation of this rule change in a Trader Update to be published no later than 60 days following the approval date of this rule.

2. Statutory Basis

The proposed rule change is consistent with Section 6(b)²⁰ of the Act, in general, and furthers the objectives of Section 6(b)(5),²¹ in particular, in that it is designed to prevent fraudulent and manipulative acts and practices, to promote just and equitable principles of trade, to foster cooperation and coordination with persons engaged in facilitating transactions in securities, and to remove impediments to and perfect the mechanisms of a free and open market and a national market system.

Overall, the proposed changes to the Trading Collar functionality would promote just and equitable principles of trade as well as protect investors and the public interest because collared orders would continue to be handled in a fair and orderly manner, as described above.

The proposed modifications and clarifications would remove impediments to and perfect the mechanism of a free and open market and a national market system by simplifying the Trading Collar functionality by rejecting incoming Market Orders received in a wide market when a contra-side order is already being collared and standardizing the selection of the display price, defining the concept of an Expiration, and placing a limit on the number of Expirations that a collared Market Order endures before being canceled back to the order sender.

The Exchange believes the proposal to reject incoming Market Orders when there is a contra-side collared order

would allow the collared order to continue to seek liquidity while providing the latter-arriving, contra-side order protection from execution in a wide market—which could be indicative of unstable market conditions or market dislocation thereby helping to remove impediments to and perfect the mechanism of a free and open market and a national market system. The Exchange believes that rejecting the second order (*i.e.*, the Market Order) rather than collaring it while there is already a collared order on the contra-side would provide greater opportunity for the collared order to receive execution opportunities, which would help remove impediments to and perfect the mechanism of a free and open market and a national market system.

The Exchange believes that the proposal to streamline the manner in which it selects the display price of a collared order (*i.e.*, the current collar execution price) would provide order senders with more certainty as to the handling of their orders as well as enable them to gauge indications of market interest. The current selection of the display price is dependent upon various factors and results in the collared order being displayed a one of three potential prices: the most recent execution price, the best execution price, or the collar execution price. Thus, the proposed simplified standard for selecting the display price would help to remove impediments to and perfect the mechanism of a free and open market and a national market system.

The Exchange also believes that the concept of an Expiration and the accompanying change to limit the number of Expirations per collared Market Order would improve the operation of the Trading Collar functionality because cancelling back Market Orders that have persisted for a certain number of Expirations, which could be indicative of unstable market conditions, should provide order senders more certainty of the handling of such orders and help avoid such orders receiving bad executions in times of market dislocation. Thus, this proposal would help remove impediments to and perfect the mechanism of a free and open market and a national market system.

Finally, the Exchange believes that the proposed rule would remove impediments to and perfect the mechanism of a free and open market by clarifying and enhancing the operation of the Trading Collar functionality—which is designed to mitigate the risk of orders sweeping through multiple price points and executing at potentially

¹⁵ Because the modified rule text would cover “[a] Market Order that does not trade on arrival,” the Exchange proposes to delete this sentence. See proposed Rule 6.60–O(a)(5).

¹⁶ See *id.* (providing that “[c]ollared orders are displayed at the MPV for the option, pursuant to Rule 9.72–O (Trading Differentials)”).

¹⁷ See proposed Rule 6.60–O(a)(6)(C).

¹⁸ See Rule 6.60–O(a)(6)(C).

¹⁹ See proposed Rule 6.60–O(a)(6)(C)(i).

²⁰ 15 U.S.C. 78f(b).

²¹ 15 U.S.C. 78f(b)(5).

erroneous prices—as the proposed rule would continue to protect investors from receiving bad executions away from prevailing market prices. The Exchange notes that Trading Collar functionality is not new or novel and is available on other options exchanges.²² Thus, this proposal would foster cooperation and coordination with persons engaged in facilitating transactions in securities, and remove impediments to and perfect the mechanism of a free and open market and a national market system.

Technical Changes

The Exchange notes that the proposed technical changes to the text regarding the selection of the display price would provide clarity and transparency to Exchange rules and would remove impediments to, and perfect the mechanism of, a free and open market and a national market system by making the Exchange rules easier to navigate and comprehend.

B. Self-Regulatory Organization's Statement on Burden on Competition

The Exchange does not believe that this proposed rule change would impose any burden on competition not necessary or appropriate in furtherance of the purposes of the Act. Instead, the Exchange believes the proposal provides modifications and enhancements to the Trading Collars that provide market participants with protection from anomalous executions. Thus, the Exchange does not believe the proposal creates any significant impact on competition.

The proposed enhancements to the Trading Collars would streamline the operation of the Trading Collars thereby further protecting investors against the execution of orders at erroneous prices. As such, the proposal does not impose any burden on competition. To the contrary, the Exchange believes that the proposed clarifications and enhancements may foster more competition. Specifically, the Exchange notes that it operates in a highly competitive market in which market participants can readily favor competing venues. The Exchange's proposed rule change would enhance its ability to compete with other exchanges that

already offer similar trading collar functionality by eliminating complexity while at the same time maintaining the core functionality.²³ Thus, the Exchange believes that this type of competition amongst exchanges is beneficial to the market place as a whole as it can result in enhanced processes, functionality, and technologies. The Exchange further believes that because the proposed rule change would be applicable to all OTP Holders it would not impose any burden on intra-market competition that is not necessary or appropriate in furtherance of the purposes of the Act.

C. Self-Regulatory Organization's Statement on Comments on the Proposed Rule Change Received From Members, Participants, or Others

No written comments were solicited or received with respect to the proposed rule change.

III. Date of Effectiveness of the Proposed Rule Change and Timing for Commission Action

Within 45 days of the date of publication of this notice in the **Federal Register** or up to 90 days (i) as the Commission may designate if it finds such longer period to be appropriate and publishes its reasons for so finding or (ii) as to which the self-regulatory organization consents, the Commission will:

- (A) by order approve or disapprove the proposed rule change, or
- (B) institute proceedings to determine whether the proposed rule change should be disapproved.

IV. Solicitation of Comments

Interested persons are invited to submit written data, views, and arguments concerning the foregoing, including whether the proposed rule change, as modified by Amendment No. 2, is consistent with the Act. Comments may be submitted by any of the following methods:

Electronic Comments

- Use the Commission's internet comment form (<http://www.sec.gov/rules/sro.shtml>); or
- Send an email to rule-comments@sec.gov. Please include File Number SR-NYSEArca-2020-31 on the subject line.

Paper Comments

- Send paper comments in triplicate to: Secretary, Securities and Exchange Commission, 100 F Street NE, Washington, DC 20549-1090.
- All submissions should refer to File Number SR-NYSEArca-2020-31. This

file number should be included on the subject line if email is used. To help the Commission process and review your comments more efficiently, please use only one method. The Commission will post all comments on the Commission's internet website (<http://www.sec.gov/rules/sro.shtml>). Copies of the submission, all subsequent amendments, all written statements with respect to the proposed rule change that are filed with the Commission, and all written communications relating to the proposed rule change between the Commission and any person, other than those that may be withheld from the public in accordance with the provisions of 5 U.S.C. 552, will be available for website viewing and printing in the Commission's Public Reference Room, 100 F Street NE, Washington, DC 20549 on official business days between the hours of 10:00 a.m. and 3:00 p.m. Copies of the filing also will be available for inspection and copying at the principal office of the Exchange. All comments received will be posted without change. Persons submitting comments are cautioned that we do not redact or edit personal identifying information from comment submissions. You should submit only information that you wish to make available publicly. All submissions should refer to File Number SR-NYSEArca-2020-31 and should be submitted on or before May 21, 2020.

For the Commission, by the Division of Trading and Markets, pursuant to delegated authority.²⁴

J. Matthew DeLesDernier,

Assistant Secretary.

DEPARTMENT OF STATE

[Public Notice: 11102]

Bureau of Oceans and International Environmental and Scientific Affairs; Annual Certification of Shrimp-Harvesting Nations

ACTION: Notice of annual certification.

SUMMARY: On April 24, 2020, Keith J. Krach, the Under Secretary of State for Economic Growth, Energy, and the Environment declared that wild-caught shrimp harvested in the following nations, particular fisheries of certain nations, and Hong Kong are eligible to enter the United States: Argentina, Australia (Northern Prawn Fishery, the Queensland East Coast Trawl Fishery, the Spencer Gulf, and the Torres Strait Prawn Fishery), the Bahamas, Belgium, Belize, Canada, Chile, Colombia, Costa Rica, Denmark, the Dominican

Republic, Ecuador, El Salvador, Fiji, Finland, France (French Guiana), Gabon, Germany, Guatemala, Guyana, Honduras, Iceland, Ireland, Jamaica, Japan (shrimp baskets in Hokkaido), Republic of Korea (mosquito nets), Malaysia (Kelantan, Terengganu, Pahang, and Johor), Mexico, Netherlands, New Zealand, Nicaragua, Nigeria, Norway, Oman, Panama, Peru, Russia, Spain (Mediterranean red shrimp), Sri Lanka, Suriname, Sweden, the United Kingdom, and Uruguay. For nations, economies, and fisheries not listed above, only shrimp harvested from aquaculture is eligible to enter the United States. All shrimp imports into the United States must be accompanied by the DS-2031 Shrimp Exporter's/Importer's Declaration.

DATES: This certification is effective on April 30, 2020.

FOR FURTHER INFORMATION CONTACT:

Joseph Fette, Section 609 Program Manager, Office of Marine Conservation, Bureau of Oceans and International Environmental and Scientific Affairs, Department of State, 2201 C Street, NW, Washington, DC 20520-2758; telephone: (202) 647-2335; email: DS2031@state.gov.

SUPPLEMENTARY INFORMATION: Section 609 of Public Law 101-162 ("Sec. 609") prohibits imports of wild-caught shrimp or products from shrimp harvested with commercial fishing technology unless the President certifies to the Congress by May 1, 1991, and annually thereafter, that either: (1) The harvesting nation has adopted a regulatory program governing the incidental taking of relevant species of sea turtles in the course of commercial shrimp harvesting that is comparable to that of the United States and that the average rate of that incidental taking by the vessels of the harvesting nation is comparable to the average rate of incidental taking of sea turtles by United States vessels in the course of such harvesting; or (2) the particular fishing environment of the harvesting nation does not pose a threat of the incidental taking of sea turtles in the course of shrimp harvesting. The President has delegated the authority to make this certification to the Secretary of State ("Secretary") who further delegated the authority to the Under Secretary of State for Economic Growth, Energy, and the Environment ("Under Secretary"). The Department of State's ("Department") Revised Guidelines for the Implementation of Section 609 were published in the **Federal Register** on July 8, 1999, at 64 FR 36946.

On April 24, 2020, Under Secretary Keith J. Krach certified the following nations on the basis that their sea turtle

protection programs are comparable to that of the United States: Colombia, Ecuador, El Salvador, Gabon, Guatemala, Guyana, Honduras, Mexico, Nicaragua, Nigeria, Panama, and Suriname. The Department changed the basis of certification for Costa Rica from Section 609(b)(2)(A) and (B) to Section 609(b)(2)(C), as noted below, due to a change in the method of harvesting shrimp. Under Secretary Krach also certified several shrimp-harvesting nations and one economy as having fishing environments that do not pose a danger to sea turtles. The following nations have shrimp grounds only in cold waters where the risk of taking sea turtles is negligible: Argentina, Belgium, Canada, Chile, Denmark, Finland, Germany, Iceland, Ireland, the Netherlands, New Zealand, Norway, Russia, Sweden, the United Kingdom, and Uruguay. The following nations and Hong Kong only harvest shrimp using small boats with crews of less than five that use manual rather than mechanical means to retrieve nets or catch shrimp using other methods that do not threaten sea turtles: The Bahamas, Belize, Costa Rica, the Dominican Republic, Fiji, Jamaica, Oman, Peru, and Sri Lanka. Use of such small-scale technology does not adversely affect sea turtles. The Department suspended the certification of the People's Republic of China ("PRC") due to the use of methods of harvesting shrimp that may adversely affect sea turtles. The Department certified Costa Rica pursuant to Section 609(b)(2)(C) because the current method of harvesting shrimp involves small boats with crews of less than five manually casting and retrieving nets. The Department suspended Venezuela's certification due to the inability to confirm whether its methods of harvesting shrimp may adversely affect sea turtles.

A completed DS-2031 Shrimp Exporter's/Importer's Declaration ("DS-2031") must accompany all imports of shrimp and products from shrimp into the United States. Importers of shrimp and products from shrimp harvested in the certified nations and one economy listed above must either provide the DS-2031 form to Customs and Border Protection at the port of entry or provide the information required by the DS-2031 through the Automated Commercial Environment. DS-2031 forms accompanying all imports of shrimp and products from shrimp harvested in uncertified nations and economies must be originals with Box 7(A)(1), 7(A)(2), or 7(A)(4) checked, consistent with the form's instructions with regard to the method of harvest of

the shrimp and based on any relevant prior determinations by the Department, and signed by a responsible government official of the harvesting nation. The Department did not determine that shrimp or products from shrimp harvested in a manner as described in 7(A)(3) in any uncertified nation or economy is eligible to enter the United States.

Shrimp and products of shrimp harvested with turtle excluder devices ("TEDs") in an uncertified nation may, under specific circumstances, be eligible for importation into the United States under the DS-2031 Box 7(A)(2) provision for "shrimp harvested by commercial shrimp trawl vessels using TEDs comparable in effectiveness to those required in the United States." Use of this provision requires that the Secretary or his or her delegate determine in advance that the government of the harvesting nation has put in place adequate procedures to monitor the use of TEDs in the specific fishery in question and to ensure the accurate completion of the DS-2031 forms. At this time, the Department as determined that only shrimp and products from shrimp harvested in the Northern Prawn Fishery, the Queensland East Coast Trawl Fishery, and the Torres Strait Prawn Fishery in Australia, in the French Guiana domestic trawl fishery, and in the fisheries of Kelantan, Terengganu, Pahang, and Johor, Malaysia, are eligible for entry under this provision. The importation of TED-caught shrimp from any other uncertified nation will not be allowed. A responsible government official of Australia, France, or Malaysia must sign in Block 8 of the DS-2031 form accompanying these imports into the United States.

In addition, the Department has determined that shrimp and products from shrimp harvested in the Spencer Gulf region in Australia, with shrimp baskets in Hokkaido, Japan, with "mosquito" nets in the Republic of Korea, and Mediterranean red shrimp (*Aristeus antennatus*) and products from that shrimp harvested in the Mediterranean Sea by Spain may be imported into the United States under the DS-2031 Box 7(A)(4) provision for "shrimp harvested in a manner or under circumstances determined by the Department of State not to pose a threat of the incidental taking of sea turtles." A responsible government official of Australia, Japan, the Republic of Korea, or Spain must sign in Block 8 of the DS-2031 form accompanying these imports into the United States.

The Department has communicated these certifications and determinations

under Sec. 609 to the Office of International Trade of U.S. Customs and Border Protection.

Joseph A. Fette,

Section 609 Program Manager.

BILLING CODE 4710–09–P

OFFICE OF THE UNITED STATES TRADE REPRESENTATIVE

[Docket Number USTR–2020–0018]

Request for Comments Concerning the Extension of Particular Exclusions Granted Under the July 2019 Product Exclusion Notice from the \$16 Billion Action Pursuant to Section 301: China's Acts, Policies, and Practices Related to Technology Transfer, Intellectual Property, and Innovation

AGENCY: Office of the United States Trade Representative.

ACTION: Notice and request for comments.

SUMMARY: Effective August 23, 2018, the U.S. Trade Representative imposed additional duties on goods of China with an annual trade value of approximately \$16 billion as part of the action in the Section 301 investigation of China's acts, policies, and practices related to technology transfer, intellectual property, and innovation. The U.S. Trade Representative initiated the exclusion process in September 2018 and granted multiple sets of exclusions. He granted the first set of exclusions in July 2019, which are scheduled to expire on July 31, 2020. The U.S. Trade Representative has decided to consider a possible extension for up to 12 months of particular exclusions granted in July 2019. The Office of the U.S. Trade Representative (USTR) invites public comment on whether to extend particular exclusions.

DATES: May 1, 2020 at 12:01 a.m. ET: The public docket on the web portal at <https://comments.USTR.gov> will open for parties to submit comments on the possible extension of particular exclusions. June 1, 2020 at 11:59 p.m. ET: To be assured of consideration, submit written comments on the public docket by this deadline.

ADDRESSES: You must submit all comments through the online portal: <https://comments.USTR.gov>.

FOR FURTHER INFORMATION CONTACT: Associate General Counsel Philip Butler or Assistant General Counsel Benjamin Allen at (202) 395–5725.

SUPPLEMENTARY INFORMATION:

A. Background

For background on the proceedings in this investigation, please see prior notices including 82 FR 40213 (August 23, 2017), 83 FR 14906 (April 6, 2018), 83 FR 28710 (June 20, 2018), 83 FR 33608 (July 17, 2018), 83 FR 38760 (August 7, 2018), 83 FR 40823 (August 16, 2018), 83 FR 47236 (September 18, 2018), 83 FR 47974 (September 21, 2018), 83 FR 65198 (December 19, 2018), 84 FR 7966 (March 5, 2019), 84 FR 20459 (May 9, 2019), 84 FR 29576 (June 24, 2019), 84 FR 37381 (July 31, 2019), 84 FR 49600 (September 20, 2019), 84 FR 52553 (October 2, 2019), and 84 FR 69011 (December 17, 2019).

Effective August 23, 2018, the U.S. Trade Representative imposed additional 25 percent duties on goods of China classified in 279 8-digit subheadings of the Harmonized Tariff Schedule of the United States (HTSUS), with an approximate annual trade value of \$16 billion. See 83 FR 40823. The U.S. Trade Representative's determination included a decision to establish a process by which U.S. stakeholders may request exclusion of particular products classified within an 8-digit HTSUS subheading covered by the \$16 billion action from the additional duties. The U.S. Trade Representative issued a notice setting out the process for the product exclusions, and opened a public docket. See 83 FR 47236 (September 18 notice).

The September 18 notice required submission of requests for exclusion from the \$16 billion action no later than December 18, 2018, and noted that the U.S. Trade Representative periodically would announce decisions. The U.S. Trade Representative granted multiple sets of exclusions. He granted the first set of exclusions in July 2019, which are scheduled to expire on July 31, 2020. See 84 FR 37381 (July 31, 2019) (the July 2019 notice).

B. Possible Extensions of Particular Product Exclusions

The U.S. Trade Representative has decided to consider a possible extension for up to 12 months of particular exclusions granted in the July 2019 notice. Accordingly, USTR invites public comments on whether to extend particular exclusions granted in the July 2019 notice. For exclusions amended or corrected by a later issued notice of product exclusions, parties should provide their extension comments on the docket corresponding to the initial notice of product exclusions.

USTR will evaluate the possible extension of each exclusion on a case-by-case basis. The focus of the

evaluation will be whether, despite the first imposition of these additional duties in August 2018, the particular product remains available only from China. In addressing this factor, commenters should address specifically:

- Whether the particular product and/or a comparable product is available from sources in the United States and/or in third countries.
- Any changes in the global supply chain since August 2018 with respect to the particular product or any other relevant industry developments.

- The efforts, if any, the importers or U.S. purchasers have undertaken since August 2018 to source the product from the United States or third countries.

In addition, USTR will continue to consider whether the imposition of additional duties on the products covered by the exclusion will result in severe economic harm to the commenter or other U.S. interests.

C. Procedures To Comment on the Extension of Particular Exclusions

To submit a comment regarding the extension of a particular exclusion granted in the July 2019 notice, commenters must first register on the portal at <https://comments.USTR.gov>. As noted above, the public docket on the portal will be open from May 1, 2020, to June 1, 2020. After registration, the commenter may submit an exclusion extension comment form to the public docket.

Fields on the comment form marked with an asterisk (*) are required fields. Fields with a gray (BCI) notation are for Business Confidential Information and the information entered will not be publicly available. Fields with a green (Public) notation will be publicly available. Additionally, parties will be able to upload documents and indicate whether the documents are BCI or public. Commenters will be able to review the public version of their comments before they are posted.

In order to facilitate the preparation of comments prior to the May 1 opening of the public docket, a facsimile of the exclusion extension comment form parties will use on the portal is annexed to this notice. Please note that the color-coding of public fields and BCI fields is not visible on the attached facsimile, but will be apparent on the actual comment form used on the portal.

Set out below is a summary of the information to be entered on the exclusion extension comment form.

- Contact information, including the full legal name of the organization making the comment, whether the commenter is a third party (e.g., law firm, trade association, or customs

broker) submitting on behalf of an organization or industry, and the name of the third party organization, if applicable.

- The number for the exclusion on which you are commenting as provided in the Annex of the **Federal Register** notice granting the exclusion and the description. For descriptions amended or corrected by a later issued notice of product exclusions, parties should use the amended or corrected description.

- Whether the product or products covered by the exclusion are subject to an antidumping or countervailing duty order issued by the U.S. Department of Commerce.

- Whether you support or oppose extending the exclusion and an explanation of your rationale.

Commenters must provide a public version of their rationale, even if the commenter also intends to submit a more detailed business confidential rationale.

- Whether the products covered by the exclusion or comparable products are available from sources in the U.S. or in third countries. Please include information concerning any changes in the global supply chain since August

2018 with respect to the particular product.

- The efforts you have undertaken since August 2018 to source the product from the United States or third countries.

- The value and quantity of the Chinese-origin product covered by the specific exclusion request purchased in 2018 and 2019. Whether these purchases are from a related company, and if so, the name of and relationship to the related company.

- Whether Chinese suppliers have lowered their prices for products covered by the exclusion following the imposition of duties.

- The value and quantity of the product covered by the exclusion purchased from domestic and third country sources in 2018 and 2019.

- If applicable, the commenter's gross revenue for 2018 and 2019.

- Whether the Chinese-origin product of concern is sold as a final product or as an input.

- Whether the imposition of duties on the products covered by the exclusion will result in severe economic harm to the commenter or other U.S. interests.

- Any additional information in support of or in opposition to extending the exclusion.

Commenters also may provide any other information or data that they consider relevant.

D. Submission Instructions

To be assured of consideration, you must submit your comment between the opening of the public docket on the portal on May 1, 2020, and the June 1, 2020 submission deadline. Parties seeking to comment on two or more exclusions must submit a separate comment for each exclusion.

By submitting a comment, the commenter certifies that the information provided is complete and correct to the best of their knowledge.

E. Paperwork Reduction Act

In accordance with the requirements of the Paperwork Reduction Act of 1995 and its implementing regulations, the Office of Management and Budget assigned control number 0350-0015, which expires January 31, 2023.

Joseph Barloon,

General Counsel, Office of the U.S. Trade Representative.

BILLING CODE 3290-F0-P

**OFFICE OF THE UNITED STATES
TRADE REPRESENTATIVE**

[Docket Number USTR-2020-0017]

**Request for Comments Concerning the
Extension of Particular Exclusions
Granted Under the July 2019 Product
Exclusion Notice From the \$34 Billion
Action Pursuant to Section 301:
China's Acts, Policies, and Practices
Related to Technology Transfer,
Intellectual Property, and Innovation**

AGENCY: Office of the United States
Trade Representative.

ACTION: Notice and request for
comments.

SUMMARY: Effective July 6, 2018, the U.S. Trade Representative imposed additional duties on goods of China with an annual trade value of approximately \$34 billion as part of the action in the Section 301 investigation of China's acts, policies, and practices related to technology transfer, intellectual property, and innovation. The U.S. Trade Representative initiated

the exclusion process in July 2018 and granted multiple sets of exclusions. He granted the sixth set of exclusions in July 2019, which are scheduled to expire on July 9, 2020. The U.S. Trade Representative has decided to consider a possible extension for up to 12 months of particular exclusions granted in July 2019. The Office of the U.S. Trade Representative (USTR) invites public comment on whether to extend particular exclusions.

DATES:

May 1, 2020 at 12:01 a.m. ET: The public docket on the web portal at <https://comments.USTR.gov> will open for parties to submit comments on the possible extension of particular exclusions.

June 1, 2020 at 11:59 p.m. ET: To be assured of consideration, submit written comments on the public docket by this deadline.

ADDRESSES: You must submit all comments through the online portal: <https://comments.USTR.gov>.

SUPPLEMENTARY INFORMATION:

A. Background

For background on the proceedings in this investigation, please see prior notices including 82 FR 40213 (August 23, 2017), 83 FR 14906 (April 6, 2018), 83 FR 28710 (June 20, 2018), 83 FR 40823 (August 16, 2018), 83 FR 47974 (September 21, 2018), 83 FR 65198 (December 19, 2018), 84 FR 7966 (March 5, 2019), 84 FR 20459 (May 9, 2019), 84 FR 43304 (August 20, 2019), 84 FR 45821 (August 30, 2019), 84 FR 69447 (December 18, 2019), and 85 FR 3741 (January 22, 2020).

Effective July 6, 2018, the U.S. Trade Representative imposed additional 25 percent duties on goods of China classified in 818 8-digit subheadings of the Harmonized Tariff Schedule of the United States (HTSUS), with an approximate annual trade value of \$34 billion. See 83 FR 28710. The U.S. Trade Representative's determination included a decision to establish a process by which U.S. stakeholders can request exclusion of particular products classified within an 8-digit HTSUS subheading covered by the \$34 billion action from the additional duties. The U.S. Trade Representative issued a notice setting out the process for the

product exclusions, and opened a public docket. *See* 83 FR 32181 (July 11 notice).

The July 11 notice required submission of requests for exclusion from the \$34 billion action no later than October 9, 2018, and noted that the U.S. Trade Representative periodically would announce decisions. The U.S. Trade Representative granted multiple sets of exclusions. He granted the sixth set of exclusions in July 2019, which are scheduled to expire on July 9, 2020. *See* 84 FR 32821 (July 9, 2019) (July 2019 notice).

B. Possible Extensions of Particular Product Exclusions

The U.S. Trade Representative has decided to consider a possible extension for up to 12 months of particular exclusions granted in the July 2019 notice. Accordingly, USTR invites public comments on whether to extend particular exclusions granted in the July 2019 notice. For exclusions amended or corrected by a later issued notice of product exclusions, parties should provide their extension comments on the docket corresponding to the initial notice of product exclusions.

USTR will evaluate the possible extension of each exclusion on a case-by-case basis. The focus of the evaluation will be whether, despite the first imposition of these additional duties in July 2018, the particular product remains available only from China. In addressing this factor, commenters should address specifically:

- Whether the particular product and/or a comparable product is available from sources in the United States and/or in third countries.
- Any changes in the global supply chain since July 2018 with respect to the particular product or any other relevant industry developments.
- The efforts, if any, the importers or U.S. purchasers have undertaken since July 2018 to source the product from the United States or third countries.

In addition, USTR will continue to consider whether the imposition of additional duties on the products covered by the exclusion will result in severe economic harm to the commenter or other U.S. interests.

C. Procedures To Comment on the Extension of Particular Exclusions

To submit a comment regarding the extension of a particular exclusion granted in the July 2019 notice, commenters must first register on the portal at <https://comments.ustr.gov>.

As noted above, the public docket on the portal will be open from May 1, 2020, to June 1, 2020. After registration, the commenter may submit an exclusion extension comment form to the public docket.

Fields on the comment form marked with an asterisk (*) are required fields. Fields with a gray (BCI) notation are for Business Confidential Information and the information entered will not be publicly available. Fields with a green (Public) notation will be publicly available. Additionally, parties will be able to upload documents and indicate whether the documents are BCI or public. Commenters will be able to review the public version of their comments before they are posted.

In order to facilitate the preparation of comments prior to the May 1 opening of the public docket, a facsimile of the exclusion extension comment form parties will use on the portal is annexed to this notice. Please note that the color-coding of public fields and BCI fields is not visible on the attached facsimile, but will be apparent on the actual comment form used on the portal.

Set out below is a summary of the information to be entered on the exclusion extension comment form.

- Contact information, including the full legal name of the organization making the comment, whether the commenter is a third party (e.g., law firm, trade association, or customs broker) submitting on behalf of an organization or industry, and the name of the third party organization, if applicable.

- The number for the exclusion on which you are commenting as provided in the Annex of the **Federal Register** notice granting the exclusion and the description. For descriptions amended or corrected by a later issued notice of product exclusions, parties should use the amended or corrected description.

- Whether the product or products covered by the exclusion are subject to an antidumping or countervailing duty order issued by the U.S. Department of Commerce.

- Whether you support or oppose extending the exclusion and an explanation of your rationale.

Commenters must provide a public version of their rationale, even if the commenter also intends to submit a more detailed business confidential rationale.

- Whether the products covered by the exclusion or comparable products are available from sources in the U.S. or in third countries. Please include

information concerning any changes in the global supply chain since July 2018 with respect to the particular product.

- The efforts you have undertaken since July 2018 to source the product from the United States or third countries.

- The value and quantity of the Chinese-origin product covered by the specific exclusion request purchased in 2018 and 2019. Whether these purchases are from a related company, and if so, the name of and relationship to the related company.

- Whether Chinese suppliers have lowered their prices for products covered by the exclusion following the imposition of duties.

- The value and quantity of the product covered by the exclusion purchased from domestic and third country sources in 2018 and 2019.

- If applicable, the commenter's gross revenue for 2018 and 2019.

- Whether the Chinese-origin product of concern is sold as a final product or as an input.

- Whether the imposition of duties on the products covered by the exclusion will result in severe economic harm to the commenter or other U.S. interests.

- Any additional information in support of or in opposition to extending the exclusion.

Commenters also may provide any other information or data that they consider relevant.

D. Submission Instructions

To be assured of consideration, you must submit your comment between the opening of the public docket on the portal on May 1, 2020, and the June 1, 2020 submission deadline. Parties seeking to comment on two or more exclusions must submit a separate comment for each exclusion.

By submitting a comment, the commenter certifies that the information provided is complete and correct to the best of their knowledge.

E. Paperwork Reduction Act

In accordance with the requirements of the Paperwork Reduction Act of 1995 and its implementing regulations, the Office of Management and Budget assigned control number 0350-0015, which expires January 31, 2023.

Joseph Barloon,

General Counsel, Office of the U.S. Trade Representative.

BILLING CODE 3290-F0-P

DEPARTMENT OF TRANSPORTATION

Federal Motor Carrier Safety Administration

[Docket No. FMCSA-2014-0420]

Hours of Service of Drivers: Specialized Carriers & Rigging Association (SC&RA); Application for Renewal of Exemption

AGENCY: Federal Motor Carrier Safety Administration (FMCSA), DOT.

ACTION: Notice of application for renewal of exemption; request for comments.

SUMMARY: FMCSA announces that it has received an application from the Specialized Carriers & Rigging Association (SC&RA) for a renewal of its exemption from the minimum 30-minute rest break provision of the Agency's hours-of-service (HOS) regulations. The exemption covers drivers for all specialized carriers transporting loads that exceed normal weight and dimensional limits—

oversize/overweight (OS/OW) loads—and require a permit issued by a government authority. SC&RA currently holds an exemption for the period from June 18, 2015, through June 17, 2020. FMCSA requests public comment on SC&RA's application for a renewal of its exemption.

DATES: Comments must be received on or before June 1, 2020. The requested exemption renewal would be effective from June 18, 2020 through June 18, 2025.

ADDRESSES: You may submit comments identified by Federal Docket Management System Number FMCSA-2014-0420 by any of the following methods:

- **Federal eRulemaking Portal:** www.regulations.gov. Follow the online instructions for submitting comments.
- **Mail:** Docket Operations, U.S. Department of Transportation, 1200 New Jersey Avenue SE, West Building, Ground Floor, Room W12-140, Washington, DC 20590-0001.
- **Hand Delivery or Courier:** Bring comments to Docket Operations, West Building, Ground Floor, Room W12-140, 1200 New Jersey Avenue SE, between 9 a.m. and 5 p.m. E.T., Monday

through Friday, except Federal holidays. To be sure someone is there to help you, please call (202) 366-9317 or (202) 366-9826 before visiting Docket Operations.

- **Fax:** 1-202-493-2251.

Each submission must include the Agency name and the docket number for this notice. Note that DOT posts all comments received without change to www.regulations.gov, including any personal information included in a comment. Please see the *Privacy Act* heading below.

Docket: For access to the docket to read background documents or comments, go to www.regulations.gov at any time or visit Room W12-140 on the ground level of the West Building, 1200 New Jersey Avenue SE, Washington, DC, between 9 a.m. and 5 p.m., ET, Monday through Friday, except Federal holidays. To be sure someone is there to help you, please call (202) 366-9317 or (202) 366-9826 before visiting Docket Operations.

Privacy Act: In accordance with 5 U.S.C. 553(c), DOT solicits comments from the public to better inform its rulemaking process. DOT posts these comments, without edit, including any personal information the commenter provides, to www.regulations.gov, as

described in the system of records notice (DOT/ALL-14 FDMS), which can be reviewed at www.dot.gov/privacy.

FOR FURTHER INFORMATION CONTACT: For information concerning this notice, contact Ms. Pearlie Robinson, FMCSA Driver and Carrier Operations Division; Office of Carrier, Driver and Vehicle Safety Standards; Telephone: 202-366-4225. Email: MCPDSD@dot.gov. If you have questions on viewing or submitting material to the docket, contact Docket Services, telephone (202) 366-9826.

SUPPLEMENTARY INFORMATION:

I. Public Participation and Request for Comments

FMCSA encourages you to participate by submitting comments and related materials.

Submitting Comments

If you submit a comment, please include the docket number for this notice (FMCSA-2014-0420), indicate the specific section of this document to which the comment applies, and provide a reason for suggestions or recommendations. You may submit your comments and material online or by fax, mail, or hand delivery, but please use only one of these means. FMCSA recommends that you include your name and a mailing address, an email address, or a phone number in the body of your document so the Agency can contact you if it has questions regarding your submission.

To submit your comment online, go to www.regulations.gov and put the docket number, "FMCSA-2014-0420" in the "Keyword" box, and click "Search." When the new screen appears, click on "Comment Now!" button and type your comment into the text box in the following screen. Choose whether you are submitting your comment as an individual or on behalf of a third party and then submit. If you submit your comments by mail or hand delivery, submit them in an unbound format, no larger than 8½ by 11 inches, suitable for copying and electronic filing. If you submit comments by mail and would like to know that they reached the facility, please enclose a stamped, self-addressed postcard or envelope.

II. Legal Basis

FMCSA has authority under 49 U.S.C. 31136(e) and 31315 to grant exemptions from certain Federal Motor Carrier Safety Regulations (FMCSRs). FMCSA must publish a notice of each exemption request in the **Federal Register** (49 CFR 381.315(a)). The Agency must provide the public an opportunity to inspect the information relevant to the application, including any safety analyses that have

been conducted. The Agency must also provide an opportunity for public comment on the request.

The Agency reviews safety analyses and public comments submitted, and determines whether granting the exemption would likely achieve a level of safety equivalent to, or greater than, the level that would be achieved by the current regulation (49 CFR 381.305). The decision of the Agency must be published in the **Federal Register** (49 CFR 381.315(b)) with the reasons for denying or granting the application and, if granted, the name of the person or class of persons receiving the exemption, and the regulatory provision from which the exemption is granted. The notice must also specify the effective period and explain the terms and conditions of the exemption. The exemption may be renewed (49 CFR 381.300(b)).

III. Background

The SC&RA, requested a renewal of its exemption from the mandatory rest break requirement of 49 CFR 395.3(a)(3)(ii) on behalf of all specialized carriers and drivers responsible for the transportation of loads exceeding standard legal weight and dimensional limits—oversize/overweight (OS/OW) loads—that require a permit issued by a government authority. The exemption was first published on June 18, 2015 (80 FR 34957) with an expiration date of June 18, 2017.

On November 14, 2016 (81 FR 79556), FMCSA announced the extension of the SC&RA exemption notice that was published on June 18, 2015. The Agency extended the expiration date of the exemption to June 17, 2020 in response to section 5206(b)(2)(A) of the "Fixing America's Surface Transportation Act" (FAST Act). That section extends the expiration date of all HOS exemptions in effect on the date of enactment to five years from the date of issuance of the exemptions.

SC&RA has requested a renewal of the exemption that would be effective from June 18, 2020 through June 18, 2025. A copy of SC&RA's request is in the docket referenced at the beginning of this notice.

IV. Request for Comments

In accordance with 49 U.S.C. 31315(b)(6), FMCSA requests public comment from all interested persons on SC&RA's request for a renewal of its exemption from the 30-minute rest break rule. All comments received before the close of business on the comment closing date indicated at the beginning of this notice will be

considered and will be available for examination in the docket at the location listed under the **ADDRESSES** section of this notice. Comments received after the comment closing date will be filed in the public docket and will be considered to the extent practicable. In addition to late comments, FMCSA will also continue to file, in the public docket, relevant information that becomes available after the comment closing date. Interested persons should continue to examine the public docket for new material.

Larry W. Minor,

Associate Administrator for Policy.

Qualification of Drivers; Exemption Applications; Vision

AGENCY: Federal Motor Carrier Safety Administration (FMCSA), DOT.

ACTION: Notice of final disposition.

SUMMARY: FMCSA announces its decision to renew exemptions for 95 individuals from the vision requirement in the Federal Motor Carrier Safety Regulations (FMCSRs) for interstate commercial motor vehicle (CMV) drivers. The exemptions enable these individuals to continue to operate CMVs in interstate commerce without meeting the vision requirement in one eye.

DATES: Each group of renewed exemptions were applicable on the dates stated in the discussions below and will expire on the dates provided below.

FOR FURTHER INFORMATION CONTACT: Ms. Christine A. Hydock, Chief, Medical Programs Division, (202) 366-4001, fmcsamedical@dot.gov, FMCSA, Department of Transportation, 1200 New Jersey Avenue SE, Room W64-224, Washington, DC 20590-0001. Office hours are from 8:30 a.m. to 5 p.m., ET, Monday through Friday, except Federal holidays. If you have questions regarding viewing or submitting material to the docket, contact Docket Operations, (202) 366-9826.

Next, click the "Open Docket Folder" button and choose the document to review. If you do not have access to the internet, you may view the docket online by visiting the Docket Operations in Room W12-140 on the ground floor of the DOT West Building, 1200 New Jersey Avenue SE, Washington, DC 20590, between 9 a.m. and 5 p.m., ET, Monday through Friday, except Federal holidays. To be sure someone is there to help you, please call (202) 366-9317 or (202) 366-9826 before visiting Docket Operations.

B. Privacy Act

In accordance with 5 U.S.C. 553(c), DOT solicits comments from the public to better inform its rulemaking process.

DOT posts these comments, without edit, including any personal information the commenter provides, to www.regulations.gov, as described in the system of records notice (DOT/ALL-14 FDMS), which can be reviewed at www.transportation.gov/privacy.

II. Background

On March 5, 2020, FMCSA published a notice announcing its decision to renew exemptions for 95 individuals from the vision requirement in 49 CFR 391.41(b)(10) to operate a CMV in interstate commerce and requested comments from the public (85 FR 12959). The public comment period ended on April 6, 2020, and no comments were received.

FMCSA has evaluated the eligibility of these applicants and determined that renewing these exemptions would achieve a level of safety equivalent to, or greater than, the level that would be achieved by complying with the current regulation § 391.41(b)(10).

The physical qualification standard for drivers regarding vision found in § 391.41(b)(10) states that a person is physically qualified to drive a CMV if that person has distant visual acuity of at least 20/40 (Snellen) in each eye without corrective lenses or visual acuity separately corrected to 20/40 (Snellen) or better with corrective lenses, distant binocular acuity of at least 20/40 (Snellen) in both eyes with or without corrective lenses, field of vision of at least 70° in the horizontal meridian in each eye, and the ability to recognize the colors of traffic signals and devices showing red, green, and amber.

III. Discussion of Comments

FMCSA received no comments in this proceeding.

IV. Conclusion

Based on its evaluation of the 95 renewal exemption applications and comments received, FMCSA confirms its decision to exempt the following drivers from the vision requirement in § 391.41(b)(10).

As of April 1, 2020, and in accordance with 49 U.S.C. 31136(e) and 31315, the following 25 individuals have satisfied the renewal conditions for obtaining an exemption from the vision requirement in the FMCSRs for interstate CMV drivers (70 FR 48797; 70 FR 61493; 71 FR 4194; 71 FR 13450; 72 FR 54971; 73 FR 6242; 73 FR 9158; 73 FR 16950; 74 FR 49069; 74 FR 65842; 75 FR 9477; 75 FR 9482; 75 FR 9484; 76 FR 17481; 76 FR 28125; 76 FR 53710; 76 FR 62143; 76 FR 70212; 76 FR 75943; 77 FR 3552; 77 FR 10604; 77 FR 10606; 77 FR 13689; 77 FR 13691; 78 FR 24300; 78 FR 34143;

78 FR 52602; 78 FR 64271; 79 FR 1908; 79 FR 2748; 79 FR 6993; 79 FR 10619; 79 FR 12565; 79 FR 14328; 79 FR 14331; 79 FR 14333; 80 FR 18696; 80 FR 59225; 80 FR 63869; 80 FR 70060; 80 FR 76345; 80 FR 80443; 81 FR 1474; 81 FR 16265; 81 FR 20433; 81 FR 48493; 81 FR 60117; 82 FR 33542; 82 FR 37504; 82 FR 47309; 82 FR 47312; 82 FR 58262; 83 FR 2311; 83 FR 6681; 83 FR 6694; 83 FR 6919; 83 FR 6922; 83 FR 6925; 83 FR 15232; 83 FR 18648; 83 FR 24151; 83 FR 24571); Ronald C. Ashley (GA) Jonathan E. Burt (VT) Daryl Carpenter (MD) Efrain R. Cisneros (CA) Dana L. Colberg (OR) Gary W. Ellis (NC) Roberto Espinosa (FL) Spencer L. Goard (KY) Ethan A. Hale (KY) Trevor M. Hilton (IL) Ronald E. Howard (PA) Clifford D. Johnson (VA) Thomas M. Leadbitter (PA) Jonathan P. Lovel (IL) Raul Martinez (FL) John M. Moore (LA) Millard F. Neace II (WV) Harold D. Pressley (TX) Richard E. Purvenas, Jr. (DE) William L. Richardson (IN) Jake F. Richter (KS) Douglas L. Riddell (CA) Edward G. Thurston (TX) William B. Wilson (KY) George J. Worthington (NY)

The drivers were included in docket numbers FMCSA-2005-21711; FMCSA-2005-23099; FMCSA-2007-0071; FMCSA-2007-0071; FMCSA-2007-0071; FMCSA-2009-0291; FMCSA-2011-0024; FMCSA-2011-0141; FMCSA-2011-0365; FMCSA-2013-0029; FMCSA-2013-0029; FMCSA-2013-0167; FMCSA-2013-0174; FMCSA-2015-0072; FMCSA-2015-0344; FMCSA-2015-0347; FMCSA-2017-0022; FMCSA-2017-0024; FMCSA-2017-0026; FMCSA-2017-0026; FMCSA-2017-0028; FMCSA-2017-0028; FMCSA-2017-0028; FMCSA-2017-0028; FMCSA-2017-0028; and FMCSA-2018-0006. Their exemptions are applicable as of April 1, 2020, and will expire on April 1, 2022.

As of April 12, 2020, and in accordance with 49 U.S.C. 31136(e) and 31315, the following 35 individuals have satisfied the renewal conditions for obtaining an exemption from the vision requirement in the FMCSRs for interstate CMV drivers (68 FR 61857; 68 FR 74699; 68 FR 74699; 68 FR 75715; 69 FR 10503; 69 FR 10503; 70 FR 57353; 70 FR 71884; 70 FR 72689; 71 FR 644; 71 FR 4194; 71 FR 4632; 71 FR 6829; 71 FR 6829; 71 FR 13450; 72 FR 39879; 72 FR 52422; 72 FR 71995; 73 FR 5259; 73

FR 8392; 73 FR 9158; 74 FR 49069; 74 FR 65842; 74 FR 65847; 75 FR 1451; 75 FR FR 8184; 75 FR 9477; 75 FR 9482; 75 FR 9484; 76 FR 49528; 76 FR 61143; 76 FR 64164; 76 FR 70213; 76 FR 75942; 76 FR 79760; 77 FR 541; 77 FR 545; 77 FR 3547; 77 FR 3552; 77 FR 5874; 77 FR 7233; 77 FR 7657; 77 FR 10604; 77 FR 10606; 77 FR 13689; 77 FR 13691; 77 FR 17117; 77 FR 17119; 77 FR 22059; 78 FR 62935; 78 FR 63302; 78 FR 64271; 78 FR 64274; 78 FR 67452; 78 FR 74223; 78 FR 76395; 78 FR 76705; 78 FR 77778; 78 FR 77780; 78 FR 78475; 79 FR 1908; 79 FR 2247; 79 FR 2748; 79 FR 10602; 79 FR 10619; 79 FR 12565; 79 FR 13085; 79 FR 14328; 79 FR 14331; 79 FR 14332; 79 FR 14333; 79 FR 18390; 80 FR 67472; 80 FR 67476; 80 FR 67481; 80 FR 70060; 80 FR 76345; 80 FR 79414; 80 FR 80443; 81 FR 6573; 81 FR 11642; 81 FR 15401; 81 FR 15404; 81 FR 16265; 81 FR 20433; 81 FR 20435; 81 FR 28136; 81 FR 44680; 81 FR 60117; 83 FR 15195); Donald J. Bierwirth, Jr. (CT) Bryan Borrowman (UT) Eugene Contreras (NM) Levi R. Coutcher (WA) Herman R. Dahmer (MD) Jim L. Davis (NM) Michael P. Eisenreich (MN) Daniel W. Eynon (OH) Richard P. Watson (NC) Charles T. Whitehead (NC)

The drivers were included in docket numbers FMCSA–2003–16241; FMCSA–2003–16564; FMCSA–2003–16564; FMCSA–2005–22194; FMCSA–2005–22727; FMCSA–2005–23099; FMCSA–2007–27897; FMCSA–2009–0291; FMCSA–2009–0291; FMCSA–2009–0291; FMCSA–2009–0291; FMCSA–2011–0142; FMCSA–2011–0275; FMCSA–

2011–0298; FMCSA–2011–0324; FMCSA–2011–0324; FMCSA–2011–0365; FMCSA–2011–0366; FMCSA–2011–0366; FMCSA–2013–0166; FMCSA–2013–0167; FMCSA–2013–0167; FMCSA–2013–0168; FMCSA–2013–0169; FMCSA–2013–0174; FMCSA–2013–0174; FMCSA–2015–0070; FMCSA–2015–0070; FMCSA–2015–0071; FMCSA–2015–0072; FMCSA–2015–0344; FMCSA–2015–0344; FMCSA–2015–0345; and FMCSA–2015–0348. Their exemptions are applicable as of April 12, 2020, and will expire on April 12, 2022.

As of April 14, 2020, and in accordance with 49 U.S.C. 31136(e) and 31315, the following seven individuals have satisfied the renewal conditions for obtaining an exemption from the vision requirement in the FMCSRs for interstate CMV drivers (64 FR 54948; 64 FR 68195; 65 FR 159; 65 FR 20251; 67 FR 10475; 67 FR 17102; 69 FR 8260; 69 FR 17267; 71 FR 4194; 71 FR 5105; 71 FR 6824; 71 FR 6826; 71 FR 13450; 71 FR 16410; 71 FR 19600; 71 FR 19602; 73 FR 11989; 75 FR 1835; 75 FR 9482; 75 FR 13653; 77 FR 17107; 79 FR 18391; 81 FR 20435; 83 FR 15195); Mark A. Baisden (OH) Curtis J. Crowston (ND) Walter R. Hardiman (WV) Michael W. Jones (IL) Matthew J. Konecki (MT) Joseph S. Nix, IV (MO) Robert V. Sloan (NC)

The drivers were included in docket numbers FMCSA–1999–6156; FMCSA–1999–6480; FMCSA–2005–23099; FMCSA–2005–23238; FMCSA–2006–23773; and FMCSA–2009–0321. Their exemptions are applicable as of April 14, 2020, and will expire on April 14, 2022.

As of April 16, 2020, and in accordance with 49 U.S.C. 31136(e) and 31315, the following nine individuals have satisfied the renewal conditions for obtaining an exemption from the vision requirement in the FMCSRs for interstate CMV drivers (81 FR 14190; 81 FR 39100; 83 FR 15195); William H. Brence (SD) Larry D. Fulk (MO) Darrell K. Harber (MO) Robert E. Holbrook (TN) Maurice L. Kinney (PA) Richard R. Krafczynski (PA) Michael S. McHale (PA) Darin P. Milton (TN) William J. Powell (KY)

The drivers were included in docket number FMCSA–2015–0350. Their exemptions are applicable as of April 16, 2020, and will expire on April 16, 2022.

As of April 17, 2020, and in accordance with 49 U.S.C. 31136(e) and

31315, the following two individuals have satisfied the renewal conditions for obtaining an exemption from the vision requirement in the FMCSRs for interstate CMV drivers (77 FR 19749; 77 FR 22838; 79 FR 15794; 81 FR 20435; 83 FR 15195);

Gilberto M. Rosas (AZ) and Kim A. Shaffer (PA)

The drivers were included in docket number FMCSA–2011–0378. Their exemptions are applicable as of April 17, 2020, and will expire on April 17, 2022.

As of April 18, 2020, and in accordance with 49 U.S.C. 31136(e) and 31315, the following eight individuals have satisfied the renewal conditions for obtaining an exemption from the vision requirement in the FMCSRs for interstate CMV drivers (79 FR 10606; 79 FR 22003; 81 FR 28138; 83 FR 15195); Thomas R. Abbott (TN) Thomas Benavidez, Jr. (ID) Daniel Fedder (IL) Mark La Fleur (MD) Michael Nichols (GA) Dino J. Pires (CT) John B. Theres (IL) Robert S. Waltz (ME)

The drivers were included in docket number FMCSA–2014–0002. Their exemptions are applicable as of April 18, 2020, and will expire on April 18, 2022.

As of April 23, 2020, and in accordance with 49 U.S.C. 31136(e) and 31315, the following two individuals have satisfied the renewal conditions for obtaining an exemption from the vision requirement in the FMCSRs for interstate CMV drivers (68 FR 74699; 69 FR 10503; 71 FR 6829; 73 FR 6242; 73 FR 15254; 73 FR 16950; 75 FR 20881; 77 FR 17115; 79 FR 17641; 81 FR 20435; 83 FR 15195);

Thomas R. Hedden (IL) and Douglas A. Mendoza (MD)

The drivers were included in docket numbers FMCSA–2003–16564 and FMCSA–2007–0071. Their exemptions are applicable as of April 23, 2020, and will expire on April 23, 2022.

As of April 27, 2020, and in accordance with 49 U.S.C. 31136(e) and 31315, the following individual has satisfied the renewal conditions for obtaining an exemption from the vision requirement in the FMCSRs for interstate CMV drivers (75 FR 9480; 75 FR 22176; 77 FR 17108; 79 FR 17643; 81 FR 20435; 83 FR 15195);

Gerald L. Rush, Jr. (NJ)

The driver was included in docket number FMCSA–2009–0011. The exemption is applicable as of April 27, 2020, and will expire on April 27, 2022.

As of April 28, 2020, and in accordance with 49 U.S.C. 31136(e) and

31315, the following six individuals have satisfied the renewal conditions for obtaining an exemption from the vision requirement in the FMCSRs for interstate CMV drivers (81 FR 17237; 81 FR 52516; 83 FR 15195):

Lee R. Boykin (TX)
Hugo N. Gutierrez (IN)
William J. Kanaris (NY)
Ronnie L. McHugh (KS)
Donald P. Ruckinger (PA)
Trent Wipf (SD)

The drivers were included in docket number FMCSA–2015–0351. Their exemptions are applicable as of April 28, 2020, and will expire on April 28, 2022.

In accordance with 49 U.S.C. 31315(b), each exemption will be valid for 2 years from the effective date unless revoked earlier by FMCSA. The exemption will be revoked if the following occurs: (1) the person fails to comply with the terms and conditions of the exemption; (2) the exemption has resulted in a lower level of safety than was maintained prior to being granted; or (3) continuation of the exemption would not be consistent with the goals and objectives of 49 U.S.C. 31136(e) and 31315(b).

Larry W. Minor,

Associate Administrator for Policy.

BILLING CODE 4910–EX–P

DEPARTMENT OF THE TREASURY

Internal Revenue Service

Low Income Taxpayer Clinic Grant Program; Availability of 2021 Grant Application Package

AGENCY: Internal Revenue Service (IRS), Treasury.

ACTION: Notice.

SUMMARY: This document contains a notice that the IRS has made available the 2021 Grant Application Package and Guidelines (Publication 3319) for organizations interested in applying for a Low Income Taxpayer Clinic (LITC) matching grant for the 2021 grant year, which runs from January 1, 2021, through December 31, 2021. The application period runs from April 30, 2020, through June 16, 2020.

DATES: All applications and requests for continued funding for the 2021 grant year must be filed electronically by 11:59 p.m. (Eastern Time) on June 16, 2020. The IRS is authorized to award multi-year grants not to exceed three years. For an organization not currently receiving a grant for 2020, an

organization that received a single year grant in 2020, or an organization whose multi-year grant ends in 2020, the organization must apply electronically at www.grants.gov. For an organization currently receiving a grant for 2020 that is requesting funding for the second or third year of a multi-year grant, the organization must submit a request for continued funding electronically at www.grantsolutions.gov. All organizations must use the funding number of TREAS–GRANTS–052021–001, and the Catalog of Federal Domestic Assistance program number is 21.008. See <https://beta.sam.gov/>. The LITC Program Office is scheduling a teleconference to cover the application process in mid-May. See www.irs.gov/advocate/low-income-taxpayer-clinics for more details, including registration information.

FOR FURTHER INFORMATION CONTACT: Bill Beard at (949) 575–6200 (not a toll-free number) or by email at beard.william@irs.gov. The LITC Program Office is located at: IRS, Taxpayer Advocate Service, LITC Grant Program Administration Office, TA: LITC, 1111 Constitution Avenue NW, Room 1034, Washington, DC 20224. Copies of the *2021 Grant Application Package and Guidelines*, IRS Publication 3319 (Rev. 5–2020), can be downloaded from the IRS internet site at www.irs.gov/advocate or ordered by calling the IRS Distribution Center toll-free at 1–800–829–3676. (Note, however, that the Distribution Center may be closed due to COVID–19. If so, the publication will only be available online.)

SUPPLEMENTARY INFORMATION:

Background

Pursuant to Internal Revenue Code (IRC) section 7526, the IRS will annually award up to \$6,000,000 (unless otherwise provided by specific Congressional appropriation) to qualified organizations, subject to the limitations set forth in the statute. Grants may be awarded for the development, expansion, or continuation of low-income taxpayer clinics. For calendar year 2020, Congress appropriated a total of \$12,000,000 in federal funds for LITC matching grants. See Public Law 116–93, 133 Stat. 2317, 2439 (2019).

A qualified organization may receive a matching grant of up to \$100,000 per year. A qualified organization is one that represents low-income taxpayers in controversies with the IRS and informs individuals for whom English is a second language (ESL taxpayers) of their taxpayer rights and responsibilities, and does not charge more than a nominal fee

for its services (except for reimbursement of actual costs incurred).

Examples of a qualified organization include (1) a clinical program at an accredited law, business, or accounting school whose students represent low-income taxpayers in tax controversies with the IRS and (2) an organization exempt from tax under IRC section 501(a) whose employees and volunteers represent low-income taxpayers in controversies with the IRS and may also make referrals to qualified volunteers to provide representation. A clinic will be treated as representing low-income taxpayers in controversies with the IRS if at least 90 percent of the taxpayers represented by the clinic have incomes that do not exceed 250 percent of the federal poverty level, taking into account geographic location and family size. Federal poverty guidelines are published annually in the **Federal Register**. See, for example, 85 FR 3060 (Jan. 17, 2020).

In addition, the amount in controversy for the tax year to which the controversy relates generally cannot exceed the amount specified in IRC section 7463 (currently \$50,000) for eligibility for special small tax case procedures in the United States Tax Court. The IRS may award grants to qualified organizations to fund one-year, two-year, or three-year project periods. Grant funds may be awarded for start-up expenditures incurred by new clinics during the grant year. IRC section 7526(c)(5) requires dollar-for-dollar matching funds.

Mission Statement

Low Income Taxpayer Clinics ensure the fairness and integrity of the tax system for taxpayers who are low-income or speak English as a second language by: Providing *pro bono* representation on their behalf in tax disputes with the IRS; educating them about their rights and responsibilities as taxpayers; and identifying and advocating for issues that impact them.

Selection Consideration

Despite the IRS's efforts to foster parity in availability and accessibility in the selection of organizations receiving LITC matching grants and the continued increase in clinic services nationwide, there remain communities that are underrepresented by clinics. Although each application and request for continued funding for the 2021 grant year will be given due consideration, the IRS is particularly interested in applicants from the following underserved geographic areas:

Arizona-Central
California-Kern County

Florida-Mid-Florida and the Eastern Coast
Hawaii-Entire State
Montana-Entire State
Nevada-Entire State
New York-Southeast Corner
North Dakota-Entire State
Pennsylvania-Northeast Corner
Puerto Rico-Entire Territory
West Virginia-Entire State
Wyoming-Entire State

A more detailed list of the underserved counties within each state is available in Publication 3319 at www.irs.gov/pub/irs-pdf/p3319.pdf.

In determining whether to award a grant, the IRS will consider a variety of factors, including: (1) The number of taxpayers who will be assisted by the organization, including the number of ESL taxpayers in that geographic area; (2) the existence of other LITCs assisting the same population of low-income and ESL taxpayers; (3) the quality of the program offered by the organization, including the qualifications of its administrators and qualified representatives, and its record, if any, in

providing representation services to low-income taxpayers; (4) the quality of the application, including the reasonableness of the proposed budget; (5) the organization's compliance with all federal tax obligations (filing and payment); (6) the organization's compliance with all federal nontax monetary obligations (filing and payment); (7) whether debarment or suspension (31 CFR part 19) applies or whether the organization is otherwise excluded from or ineligible for a federal award; and (8) alternative funding sources available to the organization, including amounts received from other grants and contributors and the endowment and resources of the institution sponsoring the organization. Applications that pass the eligibility screening process will undergo a Technical Evaluation and must receive a minimum score to be considered further. Details regarding the scoring process can be found in Publication 3319. Applications achieving the minimum score will be subject to a

Program Office evaluation. An organization submitting a request for continued funding for the second or third year of a multi-year grant will be required to submit an abbreviated Non-competing Continuation Request and will be subject to a streamlined screening process. The final funding decision is made by the National Taxpayer Advocate, unless recused. The costs of preparing and submitting an application (or a request for continued funding) are the responsibility of each applicant. Applications and requests for continued funding may be released in response to Freedom of Information Act requests. Therefore, applicants must not include any individual taxpayer information.

The LITC Program Office will notify each applicant in writing once funding decisions have been made.

Bridget T. Roberts,

Deputy National Taxpayer Advocate.

BILLING CODE 4830-01-P

FEDERAL REGISTER

Vol. 85

Thursday,

No. 84

April 30, 2020

Part II

Environmental Protection Agency

40 CFR Part 50

Review of the National Ambient Air Quality Standards for Particulate Matter; Proposed Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 50

[EPA-HQ-OAR-2015-0072; FRL-10008-31-OAR]

RIN 2060-AS50

Review of the National Ambient Air Quality Standards for Particulate Matter

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed action.

SUMMARY: Based on the Environmental Protection Agency's (EPA's) review of the air quality criteria and the national ambient air quality standards (NAAQS) for particulate matter (PM), the Administrator has reached proposed decisions on the primary and secondary PM NAAQS. With regard to the primary standards meant to protect against fine particle exposures (*i.e.*, annual and 24-hour PM_{2.5} standards), the primary standard meant to protect against coarse particle exposures (*i.e.*, 24-hour PM₁₀ standard), and the secondary PM_{2.5} and PM₁₀ standards, the EPA proposes to retain the current standards, without revision.

DATES: Comments must be received on or before June 29, 2020.

Public Hearings: The EPA will hold one or more virtual public hearings on this proposed rule. These will be announced in a separate **Federal Register** notice that provides details, including specific dates, times, and contact information for these hearings.

ADDRESSES: You may submit comments, identified by Docket ID No. EPA-HQ-OAR-2015-0072, by any of the following means:

- **Federal eRulemaking Portal:** <https://www.regulations.gov> (our preferred method). Follow the online instructions for submitting comments.
- **Email:** a-and-r-Docket@epa.gov. Include the Docket ID No. EPA-HQ-OAR-2015-0072 in the subject line of the message.

Instructions: All submissions received must include the Docket ID No. for this document. Comments received may be posted without change to <https://www.regulations.gov>, including any personal information provided. For detailed instructions on sending comments, see the **SUPPLEMENTARY INFORMATION** section of this document. Out of an abundance of caution for members of the public and our staff, the EPA Docket Center and Reading Room was closed to public visitors on March 31, 2020, to reduce the risk of

transmitting COVID-19. Our Docket Center staff will continue to provide remote customer service via email, phone, and webform. We encourage the public to submit comments via <https://www.regulations.gov> or email, as there is a temporary suspension of mail delivery to EPA, and no hand deliveries are currently accepted. For further information of EPA Docket Center services and the current status, please visit us online at <https://www.epa.gov/dockets>.

FOR FURTHER INFORMATION CONTACT: Dr. Scott Jenkins, Health and Environmental Impacts Division, Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Mail Code C504-06, Research Triangle Park, NC 27711; telephone: (919) 541-1167; fax: (919) 541-5315; email: jenkins.scott@epa.gov.

SUPPLEMENTARY INFORMATION:

General Information

Written Comments: Submit your comments, identified by Docket ID No. EPA-HQ-OAR-2015-0072, at <https://www.regulations.gov> (our preferred method), or the other methods identified in the **ADDRESSES** section. Once submitted, comments cannot be edited or removed from the docket. The EPA may publish any comment received to its public docket. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be accompanied by a written submission. The written submission is considered the official submission and should include discussion of all points you wish to make. The EPA will generally not consider submissions or submission content located outside of the primary submission (*i.e.*, on the web, cloud, or other file sharing system). For additional submission methods, the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit <https://www.epa.gov/dockets/commenting-epa-dockets>.

The EPA is temporarily suspending its Docket Center and Reading Room for public visitors to reduce the risk of transmitting COVID-19. Written comments submitted by mail are temporarily suspended and no hand deliveries will be accepted. Our Docket Center staff will continue to provide remote customer service via email, phone, and webform. We encourage the public to submit comments via <https://www.regulations.gov>.

For further information and updates on EPA Docket Center services, please visit us online at <https://www.epa.gov/dockets>.

The EPA continues to carefully and continuously monitor information from the Centers for Disease Control and Prevention (CDC), local area health departments, and our Federal partners so that we can respond rapidly as conditions change regarding COVID-19.

Availability of Information Related to This Action

A number of the documents that are relevant to this proposed decision are available through the EPA's website at <https://www.epa.gov/naaqs/particulate-matter-pm-air-quality-standards>. These documents include the Integrated Review Plan for the National Ambient Air Quality Standards for Particulate Matter (U.S. EPA, 2016), available at <https://www3.epa.gov/ttn/naaqs/standards/pm/data/201612-final-integrated-review-plan.pdf>, the Integrated Science Assessment for Particulate Matter (U.S. EPA, 2019), available at <https://cfpub.epa.gov/ncea/isa/recordisplay.cfm?deid=347534>, and the Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter (U.S. EPA, 2020), available at <https://www.epa.gov/naaqs/particulate-matter-pm-standards-policy-assessments-current-review-0>. These and other related documents are also available for inspection and copying in the EPA docket identified above.

Executive Summary

This document presents the Administrator's proposed decisions on the primary (health-based) and secondary (welfare-based) National Ambient Air Quality Standards (NAAQS) for particulate matter (PM). In ambient air, PM is a mixture of substances suspended as small liquid and/or solid particles. Particles in the atmosphere range in size from less than 0.01 to more than 10 micrometers (μm) in diameter. Particulate matter and its precursors are emitted from both anthropogenic sources (e.g., electricity generating units, cars and trucks, agricultural operations) and natural sources (e.g., sea salt, wildland fires, biological aerosols).

When describing PM, subscripts are used to denote particle size. For example, PM_{2.5} includes particles with diameters generally less than or equal to 2.5 μm and PM₁₀ includes particles with diameters generally less than or equal to 10 μm.

The EPA has established primary (health-based) and secondary (welfare-based) NAAQS for PM_{2.5} and PM₁₀. This includes two primary PM_{2.5} standards, an annual average standard with a level of 12.0 μg/m³ and a 24-hour standard with a 98th percentile form and a level of 35 μg/m³. It also includes a primary PM₁₀ standard with a 24-hour averaging time, a 1-expected exceedance form, and a level of 150 μg/m³. Secondary PM standards are set equal to the primary

standards, except that the level of the secondary annual PM_{2.5} standard is 15.0 μg/m³. In reaching proposed decisions on these PM standards in the current review, the Administrator has considered the available scientific evidence assessed in the Integrated Science Assessment (ISA), analyses in the Policy Assessment (PA), and advice from the Clean Air Scientific Advisory Committee (CASAC).

For the primary PM_{2.5} standards, the Administrator proposes to conclude that there are important uncertainties in the evidence for adverse health effects below the current standards and in the potential public health impacts of reducing ambient PM_{2.5} concentrations below those standards. As a result, he proposes to conclude that the available evidence and information do not call into question the adequacy of the current primary PM_{2.5} standards, and he proposes to retain those standards (*i.e.*, both the annual and 24-hour standards) without revision in this review.

For the primary PM₁₀ standard, the Administrator observes that, while the available health effects evidence has expanded, recent studies are subject to the same types of uncertainties that were judged important in the last review. He proposes to conclude that the newly available evidence does not call into question the adequacy of the current primary PM₁₀ standard, and he proposes to retain that standard without revision in this review.

For the secondary standards, the Administrator observes that the expanded evidence for non-ecological welfare effects is consistent with the last review¹ and that updated quantitative analyses show results similar to those in the last review. Therefore, he proposes to conclude that the newly available evidence and updated analyses do not call into question the adequacy of the current secondary PM standards, and he proposes to retain those standards without revision in this review.

These proposed decisions are consistent with the CASAC's consensus advice on the primary 24-hour PM_{2.5} standard, the primary PM₁₀ standard, and the secondary standards. The CASAC did not reach consensus on the primary annual PM_{2.5} standard, with some committee members

¹ The welfare effects considered in this review include visibility impairment, climate effects, and materials effects. Ecological effects associated with PM, and the adequacy of protection provided by the secondary PM standards for those effects, are being addressed in the separate review of the secondary NAAQS for oxides of nitrogen, oxides of sulfur and PM. Information on the current review of these secondary NAAQS can be found at <https://www.epa.gov/naaqs/nitrogen-dioxide-no2-and-sulfur-dioxide-so2-secondary-air-quality-standards>.

recommending that EPA retain the current standard and other members recommending revision of that standard.

I. Background

A. Legislative Requirements

Two sections of the Clean Air Act (CAA) govern the establishment and revision of the NAAQS. Section 108 (42 U.S.C. 7408) directs the Administrator to identify and list certain air pollutants and then to issue air quality criteria for those pollutants. The Administrator is to list those pollutants “emissions of which, in his judgment, cause or contribute to air pollution which may reasonably be anticipated to endanger public health or welfare”; “the presence of which in the ambient air results from numerous or diverse mobile or stationary sources”; and for which he “plans to issue air quality criteria . . .” (42 U.S.C. 7408(a)(1)). Air quality criteria are intended to “accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of [a] pollutant in the ambient air . . .” (42 U.S.C. 7408(a)(2)).

Section 109 [42 U.S.C. 7409] directs the Administrator to propose and promulgate “primary” and “secondary” NAAQS for pollutants for which air quality criteria are issued [42 U.S.C. 7409(a)]. Section 109(b)(1) defines primary standards as ones “the attainment and maintenance of which in the judgment of the Administrator, based on such criteria and allowing an adequate margin of safety, are requisite to protect the public health.”² Under section 109(b)(2), a secondary standard must “specify a level of air quality the attainment and maintenance of which, in the judgment of the Administrator, based on such criteria, is requisite to protect the public welfare from any known or anticipated adverse effects associated with the presence of [the] pollutant in the ambient air.”³

In setting primary and secondary standards that are “requisite” to protect

public health and welfare, respectively, as provided in section 109(b), the EPA’s task is to establish standards that are neither more nor less stringent than necessary. In so doing, the EPA may not consider the costs of implementing the standards. See generally *Whitman v. American Trucking Associations*, 531 U.S. 457, 465–472, 475–76 (2001). Likewise, “[a]ttainability and technological feasibility are not relevant considerations in the promulgation of national ambient air quality standards.” *American Petroleum Institute v. Costle*, 665 F.2d 1176, 1185 (D.C. Cir. 1981); *accord Murray Energy Corporation v. EPA*, 936 F.3d 597, 623–24 (D.C. Cir. 2019).

The requirement that primary standards provide an adequate margin of safety was intended to address uncertainties associated with inconclusive scientific and technical information available at the time of standard setting. It was also intended to provide a reasonable degree of protection against hazards that research has not yet identified. See *Lead Industries Association v. EPA*, 647 F.2d 1130, 1154 (D.C. Cir. 1980); *American Petroleum Institute v. Costle*, 665 F.2d at 1186; *Coalition of Battery Recyclers Ass’n v. EPA*, 604 F.3d 613, 617–18 (D.C. Cir. 2010); *Mississippi v. EPA*, 744 F.3d 1334, 1353 (D.C. Cir. 2013). Both kinds of uncertainties are components of the risk associated with pollution at levels below those at which human health effects can be said to occur with reasonable scientific certainty. Thus, in selecting primary standards that include an adequate margin of safety, the Administrator is seeking not only to prevent pollution levels that have been demonstrated to be harmful but also to prevent lower pollutant levels that may pose an unacceptable risk of harm, even if the risk is not precisely identified as to nature or degree. The CAA does not require the Administrator to establish a primary NAAQS at a zero-risk level or at background concentration levels, see *Lead Industries Ass’n v. EPA*, 647 F.2d at 1156 n.51, *Mississippi v. EPA*, 744 F.3d at 1351, but rather at a level that reduces risk sufficiently so as to protect public health with an adequate margin of safety.

In addressing the requirement for an adequate margin of safety, the EPA considers such factors as the nature and severity of the health effects involved, the size of the sensitive population(s), and the kind and degree of uncertainties. The selection of any particular approach to providing an adequate margin of safety is a policy choice left specifically to the Administrator’s judgment. See *Lead*

Industries Ass’n v. EPA, 647 F.2d at 1161–62; *Mississippi v. EPA*, 744 F.3d at 1353.

Section 109(d)(1) of the Act requires the review every five years of existing air quality criteria and, if appropriate, the revision of those criteria to reflect advances in scientific knowledge on the effects of the pollutant on public health and welfare. Under the same provision, the EPA is also to review every five years and, if appropriate, revise the NAAQS, based on the revised air quality criteria.

Section 109(d)(2) addresses the appointment and advisory functions of an independent scientific review committee. Section 109(d)(2)(A) requires the Administrator to appoint this committee, which is to be composed of “seven members including at least one member of the National Academy of Sciences, one physician, and one person representing State air pollution control agencies.” Section 109(d)(2)(B) provides that the independent scientific review committee “shall complete a review of the criteria . . . and the national primary and secondary ambient air quality standards . . . and shall recommend to the Administrator any new . . . standards and revisions of existing criteria and standards as may be appropriate. . . .” Since the early 1980s, this independent review function has been performed by the Clean Air Scientific Advisory Committee (CASAC) of the EPA’s Science Advisory Board. A number of other advisory functions are also identified for the committee by section 109(d)(2)(C), which reads:

Such committee shall also (i) advise the Administrator of areas in which additional knowledge is required to appraise the adequacy and basis of existing, new, or revised national ambient air quality standards, (ii) describe the research efforts necessary to provide the required information, (iii) advise the Administrator on the relative contribution to air pollution concentrations of natural as well as anthropogenic activity, and (iv) advise the Administrator of any adverse public health, welfare, social, economic, or energy effects which may result from various strategies for attainment and maintenance of such national ambient air quality standards.

As previously noted, the Supreme Court has held that section 109(b) “unambiguously bars cost considerations from the NAAQS-setting process.” *Whitman v. Am. Trucking Associations*, 531 U.S. 457, 471 (2001). Accordingly, while some of these issues regarding which Congress has directed the CASAC to advise the Administrator are ones that are relevant to the standard setting process, others are not. Issues

² The legislative history of section 109 indicates that a primary standard is to be set at “the maximum permissible ambient air level . . . which will protect the health of any [sensitive] group of the population,” and that for this purpose “reference should be made to a representative sample of persons comprising the sensitive group rather than to a single person in such a group.” S. Rep. No. 91–1196, 91st Cong., 2d Sess. 10 (1970).

³ Under CAA section 302(h) (42 U.S.C. 7602(h)), effects on welfare include, but are not limited to, “effects on soils, water, crops, vegetation, manmade materials, animals, wildlife, weather, visibility, and climate, damage to and deterioration of property, and hazards to transportation, as well as effects on economic values and on personal comfort and well-being.”

that are not relevant to standard setting may be relevant to implementation of the NAAQS once they are established.⁴

B. Related PM Control Programs

States are primarily responsible for ensuring attainment and maintenance of ambient air quality standards once the EPA has established them. Under section 110 and 171–190 of the CAA, and related provisions and regulations, states are to submit, for EPA's approval, state implementation plans (SIPs) that provide for the attainment and maintenance of such standards through control programs directed to sources of the pollutants involved. The states, in conjunction with the EPA, also administer the Prevention of Significant Deterioration (PSD) program (CAA sections 160 to 169). In addition, Federal programs provide for nationwide reductions in emissions of PM and other air pollutants through the Federal motor vehicle and motor vehicle fuel control program under title II of the Act (CAA sections 202 to 250), which involves controls for emissions from mobile sources and controls for the fuels used by these sources, and new source performance standards for stationary sources under section 111 of the CAA.

C. Review of the Air Quality Criteria and Standards for Particulate Matter

1. Reviews Completed in 1971 and 1987

The EPA first established NAAQS for PM in 1971 (36 FR 8186, April 30, 1971), based on the original Air Quality Criteria Document (AQCD) (DHEW, 1969).⁵ The federal reference method (FRM) specified for determining attainment of the original standards was

the high-volume sampler, which collects PM up to a nominal size of 25 to 45 μm (referred to as total suspended particulates or TSP). The primary standards were set at 260 $\mu\text{g}/\text{m}^3$, 24-hour average, not to be exceeded more than once per year, and 75 $\mu\text{g}/\text{m}^3$, annual geometric mean. The secondary standards were set at 150 $\mu\text{g}/\text{m}^3$, 24-hour average, not to be exceeded more than once per year, and 60 $\mu\text{g}/\text{m}^3$, annual geometric mean.

In October 1979 (44 FR 56730, October 2, 1979), the EPA announced the first periodic review of the air quality criteria and NAAQS for PM. Revised primary and secondary standards were promulgated in 1987 (52 FR 24634, July 1, 1987). In the 1987 decision, the EPA changed the indicator for particles from TSP to PM_{10} , in order to focus on the subset of inhalable particles small enough to penetrate to the thoracic region of the respiratory tract (including the tracheobronchial and alveolar regions), referred to as thoracic particles.⁶ The level of the 24-hour standards (primary and secondary) was set at 150 $\mu\text{g}/\text{m}^3$, and the form was one expected exceedance per year, on average over three years. The level of the annual standards (primary and secondary) was set at 50 $\mu\text{g}/\text{m}^3$, and the form was annual arithmetic mean, averaged over three years.

2. Review Completed in 1997

In April 1994, the EPA announced its plans for the second periodic review of the air quality criteria and NAAQS for PM, and in 1997 the EPA promulgated revisions to the NAAQS (62 FR 38652, July 18, 1997). In the 1997 decision, the EPA determined that the fine and coarse fractions of PM_{10} should be considered separately. This determination was based on evidence that serious health effects were associated with short- and long-term exposures to fine particles in areas that met the existing PM_{10} standards. The EPA added new standards, using $\text{PM}_{2.5}$ as the indicator for fine particles (with $\text{PM}_{2.5}$ referring to particles with a nominal mean aerodynamic diameter less than or equal to 2.5 μm). The new primary standards were as follows: (1) An annual standard with a level of 15.0 $\mu\text{g}/\text{m}^3$, based on the 3-year average of annual arithmetic mean $\text{PM}_{2.5}$ concentrations from single or multiple community-oriented monitors;⁷ and (2) a 24-hour standard

with a level of 65 $\mu\text{g}/\text{m}^3$, based on the 3-year average of the 98th percentile of 24-hour $\text{PM}_{2.5}$ concentrations at each monitor within an area. Also, the EPA established a new reference method for the measurement of $\text{PM}_{2.5}$ in the ambient air and adopted rules for determining attainment of the new standards. To continue to address the health effects of the coarse fraction of PM_{10} (referred to as thoracic coarse particles or $\text{PM}_{10-2.5}$; generally including particles with a nominal mean aerodynamic diameter greater than 2.5 μm and less than or equal to 10 μm), the EPA retained the primary annual PM_{10} standard and revised the form of the primary 24-hour PM_{10} standard to be based on the 99th percentile of 24-hour PM_{10} concentrations at each monitor in an area. The EPA revised the secondary standards by setting them equal in all respects to the primary standards.

Following promulgation of the 1997 PM NAAQS, petitions for review were filed by several parties, addressing a broad range of issues. In May 1999, the U.S. Court of Appeals for the District of Columbia Circuit (D.C. Circuit) upheld the EPA's decision to establish fine particle standards, holding that "the growing empirical evidence demonstrating a relationship between fine particle pollution and adverse health effects amply justifies establishment of new fine particle standards." *American Trucking Associations, Inc. v. EPA*, 175 F. 3d 1027, 1055–56 (D.C. Cir. 1999). The D.C. Circuit also found "ample support" for the EPA's decision to regulate coarse particle pollution, but vacated the 1997 PM_{10} standards, concluding that the EPA had not provided a reasonable explanation justifying use of PM_{10} as an indicator for coarse particles. *American Trucking Associations v. EPA*, 175 F. 3d at 1054–55. Pursuant to the D.C. Circuit's decision, the EPA removed the vacated 1997 PM_{10} standards, and the pre-existing 1987 PM_{10} standards remained in place (65 FR 80776, December 22, 2000). The D.C. Circuit also upheld the EPA's determination not to establish more stringent secondary standards for fine particles to address

oriented monitoring site recording the highest concentration or, if specific constraints were met, measurements from multiple community-oriented monitoring sites could be averaged (*i.e.*, "spatial averaging"). In the last review (completed in 2012) the EPA replaced the term "community-oriented" monitor with the term "area-wide" monitor. Area-wide monitors are those sited at the neighborhood scale or larger, as well as those monitors sited at micro- or middle-scales that are representative of many such locations in the same core-based statistical area (CBSA) (78 FR 3236, January 15, 2013).

⁴ Some aspects of the CASAC's advice may not be relevant to the EPA's process of setting primary and secondary standards that are requisite to protect public health and welfare. Indeed, were EPA to consider costs of implementation when reviewing and revising the standards "it would be grounds for vacating the NAAQS." *Whitman*, 531 U.S. at 471 n.4. At the same time, the CAA directs the CASAC to provide advice on "any adverse public health, welfare, social, economic, or energy effects which may result from various strategies for attainment and maintenance" of the NAAQS to the Administrator under section 109(d)(2)(C)(iv). In *Whitman*, the Court clarified that most of that advice would be relevant to implementation but not standard setting, as it "enable[s] the Administrator to assist the States in carrying out their statutory role as primary implementers of the NAAQS." *Id.* at 470 (emphasis in original). However, the Court also noted that the CASAC's "advice concerning certain aspects of 'adverse public health . . . effects' from various attainment strategies is unquestionably pertinent" to the NAAQS rulemaking record and relevant to the standard setting process. *Id.* at 470 n.2.

⁵ Prior to the review initiated in 2007 (see below), the AQCD provided the scientific foundation (*i.e.*, the air quality criteria) for the NAAQS. Beginning in that review, the Integrated Science Assessment (ISA) has replaced the AQCD.

⁶ PM_{10} refers to particles with a nominal mean aerodynamic diameter less than or equal to 10 μm . More specifically, 10 μm is the aerodynamic diameter for which the efficiency of particle collection is 50 percent.

⁷ The 1997 annual $\text{PM}_{2.5}$ standard was compared with measurements made at the community-

effects on visibility. *American Trucking Associations v. EPA*, 175 F. 3d at 1027.

The D.C. Circuit also addressed more general issues related to the NAAQS, including issues related to the consideration of costs in setting NAAQS and the EPA's approach to establishing the levels of NAAQS. Regarding the cost issue, the court reaffirmed prior rulings holding that in setting NAAQS the EPA is "not permitted to consider the cost of implementing those standards." *American Trucking Associations v. EPA*, 175 F. 3d at 1040–41. Regarding the levels of NAAQS, the court held that the EPA's approach to establishing the level of the standards in 1997 (*i.e.*, both for PM and for the ozone NAAQS promulgated on the same day) effected "an unconstitutional delegation of legislative authority." *American Trucking Associations v. EPA*, 175 F. 3d at 1034–40. Although the court stated that "the factors EPA uses in determining the degree of public health concern associated with different levels of ozone and PM are reasonable," it remanded the rule to the EPA, stating that when the EPA considers these factors for potential non-threshold pollutants "what EPA lacks is any determinate criterion for drawing lines" to determine where the standards should be set.

The D.C. Circuit's holding on the cost and constitutional issues were appealed to the United States Supreme Court. In February 2001, the Supreme Court issued a unanimous decision upholding the EPA's position on both the cost and constitutional issues. *Whitman v. American Trucking Associations*, 531 U.S. 457, 464, 475–76. On the constitutional issue, the Court held that the statutory requirement that NAAQS be "requisite" to protect public health with an adequate margin of safety sufficiently guided the EPA's discretion, affirming the EPA's approach of setting standards that are neither more nor less stringent than necessary.

The Supreme Court remanded the case to the D.C. Circuit for resolution of any remaining issues that had not been addressed in that court's earlier rulings. *Id.* at 475–76. In a March 2002 decision, the D.C. Circuit rejected all remaining challenges to the standards, holding that the EPA's PM_{2.5} standards were reasonably supported by the administrative record and were not "arbitrary and capricious." *American Trucking Associations v. EPA*, 283 F. 3d 355, 369–72 (D.C. Cir. 2002).

3. Review Completed in 2006

In October 1997, the EPA published its plans for the third periodic review of the air quality criteria and NAAQS for

PM (62 FR 55201, October 23, 1997). After the CASAC and public review of several drafts, the EPA's National Center for Environmental Assessment (NCEA) finalized the AQCD in October 2004 (U.S. EPA, 2004). The EPA's Office of Air Quality Planning and Standards (OAQPS) finalized a Risk Assessment and Staff Paper in December 2005 (Abt Associates, 2005, U.S. EPA, 2005).⁸ On December 20, 2005, the EPA announced its proposed decision to revise the NAAQS for PM and solicited public comment on a broad range of options (71 FR 2620, January 17, 2006). On September 21, 2006, the EPA announced its final decisions to revise the primary and secondary NAAQS for PM to provide increased protection of public health and welfare, respectively (71 FR 61144, October 17, 2006). With regard to the primary and secondary standards for fine particles, the EPA revised the level of the 24-hour PM_{2.5} standards to 35 µg/m³, retained the level of the annual PM_{2.5} standards at 15.0 µg/m³, and revised the form of the annual PM_{2.5} standards by narrowing the constraints on the optional use of spatial averaging. With regard to the primary and secondary standards for PM₁₀, the EPA retained the 24-hour standards, with levels at 150 µg/m³, and revoked the annual standards.⁹ The Administrator judged that the available evidence generally did not suggest a link between long-term exposure to existing ambient levels of coarse particles and health or welfare effects. In addition, a new reference method was added for the measurement of PM_{10-2.5} in the ambient air in order to provide a basis for approving federal equivalent methods (FEMs) and to promote the gathering of scientific data to support future reviews of the PM NAAQS.

⁸ Prior to the review initiated in 2007, the Staff Paper presented the EPA staff's considerations and conclusions regarding the adequacy of existing NAAQS and, when appropriate, the potential alternative standards that could be supported by the evidence and information. More recent reviews present this information in the Policy Assessment.

⁹ In the 2006 proposal, the EPA proposed to revise the 24-hour PM₁₀ standard in part by establishing a new PM_{10-2.5} indicator for thoracic coarse particles (*i.e.*, particles generally between 2.5 and 10 µm in diameter). The EPA proposed to include any ambient mix of PM_{10-2.5} that was dominated by resuspended dust from high density traffic on paved roads and by PM from industrial sources and construction sources. The EPA proposed to exclude any ambient mix of PM_{10-2.5} that was dominated by rural windblown dust and soils and by PM generated from agricultural and mining sources. In the final decision, the existing PM₁₀ standard was retained, in part due to an "inability . . . to effectively and precisely identify which ambient mixes are included in the [PM_{10-2.5}] indicator and which are not" (71 FR 61197, October 17, 2006).

Several parties filed petitions for review following promulgation of the revised PM NAAQS in 2006. These petitions addressed the following issues: (1) Selecting the level of the primary annual PM_{2.5} standard; (2) retaining PM₁₀ as the indicator of a standard for thoracic coarse particles, retaining the level and form of the 24-hour PM₁₀ standard, and revoking the PM₁₀ annual standard; and (3) setting the secondary PM_{2.5} standards identical to the primary standards. On February 24, 2009, the D.C. Circuit issued its opinion in the case *American Farm Bureau Federation v. EPA*, 559 F. 3d 512 (D.C. Cir. 2009). The court remanded the primary annual PM_{2.5} NAAQS to the EPA because the Agency had failed to adequately explain why the standards provided the requisite protection from both short- and long-term exposures to fine particles, including protection for at-risk populations. *Id.* at 520–27. With regard to the standards for PM₁₀, the court upheld the EPA's decisions to retain the 24-hour PM₁₀ standard to provide protection from thoracic coarse particle exposures and to revoke the annual PM₁₀ standard. *Id.* at 533–38. With regard to the secondary PM_{2.5} standards, the court remanded the standards to the EPA because the Agency failed to adequately explain why setting the secondary PM standards identical to the primary standards provided the required protection for public welfare, including protection from visibility impairment. *Id.* at 528–32. The EPA responded to the court's remands as part of the next review of the PM NAAQS, which was initiated in 2007 (discussed below).

4. Review Completed in 2012

In June 2007, the EPA initiated the fourth periodic review of the air quality criteria and the PM NAAQS by issuing a call for information (72 FR 35462, June 28, 2007). Based on the NAAQS review process, as revised in 2008 and again in 2009,¹⁰ the EPA held science/policy issue workshops on the primary and secondary PM NAAQS (72 FR 34003, June 20, 2007; 72 FR 34005, June 20, 2007), and prepared and released the planning and assessment documents that comprise the review process (*i.e.*, IRP (U.S. EPA, 2008), ISA (U.S. EPA, 2009c), REA planning documents for health and welfare (U.S. EPA, 2009b, U.S. EPA, 2009a), a quantitative health risk assessment (U.S. EPA, 2010a) and an urban-focused visibility assessment

¹⁰ The history of the NAAQS review process, including revisions to the process, is discussed at <https://www.epa.gov/naaqs/historical-information-naaqs-review-process>.

(U.S. EPA, 2010a), and PA (U.S. EPA, 2011)). In June 2012, the EPA announced its proposed decision to revise the NAAQS for PM (77 FR 38890, June 29, 2012).

In December 2012, the EPA announced its final decisions to revise the primary NAAQS for PM to provide increased protection of public health (78 FR 3086, January 15, 2013). With regard to primary standards for PM_{2.5}, the EPA revised the level of the annual PM_{2.5} standard¹¹ to 12.0 µg/m³ and retained the 24-hour PM_{2.5} standard, with its level of 35 µg/m³. For the primary PM₁₀ standard, the EPA retained the 24-hour standard to continue to provide protection against effects associated with short-term exposure to thoracic coarse particles (*i.e.*, PM_{10-2.5}). With regard to the secondary PM standards, the EPA generally retained the 24-hour and annual PM_{2.5} standards¹² and the 24-hour PM₁₀ standard to address visibility and non-visibility welfare effects.

As with previous reviews, petitioners challenged the EPA's final rule. Petitioners argued that the EPA acted unreasonably in revising the level and form of the annual standard and in amending the monitoring network provisions. On judicial review, the revised standards and monitoring requirements were upheld in all respects. *NAM v. EPA*, 750 F.3d 921 (D.C. Cir. 2014).

5. Current Review

In December 2014, the EPA announced the initiation of the current periodic review of the air quality criteria for PM and of the PM_{2.5} and PM₁₀ NAAQS and issued a call for information (79 FR 71764, December 3, 2014). On February 9 to 11, 2015, the EPA's NCEA and OAQPS held a public workshop to inform the planning for the current review of the PM NAAQS (announced in 79 FR 71764, December 3, 2014). Workshop participants, including a wide range of external experts as well as EPA staff representing a variety of areas of expertise (*e.g.*, epidemiology, human and animal toxicology, risk/exposure analysis, atmospheric science, visibility impairment, climate effects), were asked to highlight significant new and emerging PM research, and to make recommendations to the Agency regarding the design and scope of this review. This workshop provided for a public discussion of the key science and

policy-relevant issues around which the EPA has structured the current review of the PM NAAQS and of the most meaningful new scientific information that would be available in this review to inform understanding of these issues.

The input received at the workshop guided the EPA staff in developing a draft IRP, which was reviewed by the CASAC Particulate Matter Panel and discussed on public teleconferences held in May 2016 (81 FR 13362, March 14, 2016) and August 2016 (81 FR 39043, June 15, 2016). Advice from the CASAC, supplemented by the Particulate Matter Panel, and input from the public were considered in developing the final IRP (U.S. EPA, 2016). The final IRP discusses the approaches to be taken in developing key scientific, technical, and policy documents in this review and the key policy-relevant issues.

In May 2018, the Administrator issued a memorandum describing a "back-to-basics" process for reviewing the NAAQS (Pruitt, 2018). This memo announced the Agency's intention to conduct the current review of the PM NAAQS in such a manner as to ensure that any necessary revisions are finalized by December 2020. Following this memo, on October 10, 2018 the Administrator additionally announced that the role of reviewing the key assessments developed as part of the ongoing review of the PM NAAQS (*i.e.*, drafts of the ISA and PA) would be performed by the seven-member chartered CASAC (*i.e.*, rather than the CASAC Particulate Matter Panel that reviewed the draft IRP).¹³

The EPA released the draft ISA in October 2018 (83 FR 53471, October 23, 2018). The draft ISA was reviewed by the chartered CASAC at a public meeting held in Arlington, VA in December 2018 (83 FR 55529, November 6, 2018) and was discussed on a public teleconference in March 2019 (84 FR 8523, March 8, 2019). The CASAC provided its advice on the draft ISA in a letter to the EPA Administrator dated April 11, 2019 (Cox, 2019b). In that letter, the CASAC's recommendations address both the draft ISA's assessment of the science for PM-related effects and the process under which this review of the PM NAAQS is being conducted.

Regarding the assessment of the evidence, the CASAC letter states that

"the Draft ISA does not provide a sufficiently comprehensive, systematic assessment of the available science relevant to understanding the health impacts of exposure to particulate matter (PM)" (Cox, 2019b, p. 1 of letter). The CASAC recommended that this and other limitations (*i.e.*, "[i]nadequate evidence for altered causal determinations" and the need for a "[c]learer discussion of causality and causal biological mechanisms and pathways") be remedied in a revised ISA (Cox, 2019b, p. 1 of letter).

Given the Administrator's timeline for this review, as noted above (Pruitt, 2018), the EPA did not prepare a second draft ISA. Rather, the EPA has taken steps to address the CASAC's comments in the Final PM ISA (U.S. EPA, 2019). In particular, the final ISA includes additional text and a new appendix to clarify the comprehensive and systematic process employed by the EPA to develop the PM ISA. In addition, several causality determinations were re-examined and, consistent with the CASAC advice, the final ISA reflects a revised causality determination for long-term ultrafine particle (UFP) exposures and nervous system effects (*i.e.*, from "likely to be causal" to "suggestive of, but not sufficient to infer, a causal relationship").¹⁴ The final ISA also contains additional text to clarify the evidence for biological pathways of particular PM-related effects and the role of that evidence in causality determinations.

Among its comments on the process, the chartered CASAC recommended "that the EPA reappoint the previous CASAC PM panel (or appoint a panel with similar expertise)" (Cox, 2019b). The Agency's response to this advice was provided in a letter from the Administrator to the CASAC chair dated July 25, 2019.¹⁵ In that letter, the Administrator announced his intention to identify a pool of non-member subject matter expert consultants to support the CASAC's review activities for the PM and ozone NAAQS. A **Federal Register** notice requesting the nomination of scientists from a broad range of disciplines "with demonstrated expertise and research in the field of air pollution related to PM and ozone" was published in August 2019 (84 FR 38625,

¹¹ The EPA also eliminated the option for spatial averaging.

¹² Consistent with the primary standard, the EPA eliminated the option for spatial averaging with the annual standard.

¹³ The CASAC charter is available at: [https://yosemite.epa.gov/sab/sabproduct.nsf/WebCASAC/2019casaccharter/\\$File/CASAC%202019%20Renewal%20Charter%203.21.19%20-%20final.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/WebCASAC/2019casaccharter/$File/CASAC%202019%20Renewal%20Charter%203.21.19%20-%20final.pdf). The Administrator's announcement is available at: <https://archive.epa.gov/epa/newsreleases/acting-administrator-wheeler-announces-science-advisors-key-clean-air-act-committee.html>.

¹⁴ Based on the CASAC's comments, the EPA also re-examined the causality determinations for cancer and for nervous system effects following long-term PM_{2.5} exposures. The EPA's consideration of these comments in the final ISA is discussed below in sections II.B.1.d and II.B.1.e.

¹⁵ Available at: [https://yosemite.epa.gov/sab/sabproduct.nsf/0/6CBCBBC3025E13B4852583D90047B352/\\$File/EPA-CASAC-19-002_Response.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/0/6CBCBBC3025E13B4852583D90047B352/$File/EPA-CASAC-19-002_Response.pdf).

August 7, 2019). The Administrator selected consultants from among those nominated, and input from members of this pool of consultants informed the CASAC's review of the draft PA.

The EPA released the draft PA in September 2019 (84 FR 47944, September 11, 2019). The draft PA drew from the assessment of the evidence in the draft ISA. It was reviewed by the chartered CASAC and discussed in October 2019 at a public meeting held in Cary, NC. Public comments were received via a separate public teleconference (84 FR 51555, September 30, 2019). A public meeting to discuss the chartered CASAC letter and response to charge questions on the draft PA was held in Cary, NC in December 2019 (84 FR 58713, November 1, 2019), and the CASAC provided its advice on the draft PA, including its advice on the current primary and secondary PM standards, in a letter to the EPA Administrator dated December 16, 2019 (Cox, 2019a).

With regard to the primary standards, the CASAC recommended retaining the current 24-hour PM_{2.5} and PM₁₀ standards but did not reach consensus on the adequacy of the current annual PM_{2.5} standard. With regard to the secondary standards, the CASAC recommended retaining the current standards. The CASAC's advice on the primary and secondary PM standards, and the Administrator's consideration of that advice in reaching proposed decisions, is discussed in detail in sections II.C.2 and II.C.3 (primary PM_{2.5} standards), III.C.2 and III.C.3 (primary PM₁₀ standards), and IV.D.2 and IV.D.3 (secondary standards) of this document.

The CASAC additionally made a number of recommendations regarding the information and analyses presented in the draft PA. Specifically, the CASAC recommended that a revised PA include (1) additional discussion of the current CASAC and NAAQS review process; (2) additional characterization of PM-related emissions, monitoring and air quality information, including uncertainties in that information; (3) additional discussion and examination of uncertainties in the PM_{2.5} health evidence and the risk assessment; (4) updates to reflect changes in the ISA's causality determinations; and (5) additional discussion of the evidence for PM-related welfare effects, including uncertainties (Cox, 2019a, pp. 2–3 in letter). In response to the CASAC's comments, the final PA¹⁶ incorporated

a number of changes, including the following (U.S. EPA, 2020):

- Text was added to Chapter 1 to clarify the process followed for this review of the PM NAAQS, including how the process has evolved since the initiation of the review.
- Text and figures were added to Chapter 2 on emissions of PM and PM precursors, and a section discussing uncertainty in emissions estimates was added. A discussion of measurement uncertainty for FRM, FEM, CSN, and IMPROVE monitors was also added.
- Chapter 3 and Appendices B and C include a number of changes, including:
 - An expanded characterization and discussion of the evidence related to exposure measurement error, the potential confounders examined by key studies, the shapes of concentration-response functions, and the results of causal inference and quasi-experimental studies.
 - An expanded and clarified discussion of uncertainties in the risk assessment, and additional air quality model performance evaluations for each of the urban study areas included in the risk assessment.
 - Additional detail on the procedure used to derive concentration-response functions used in the risk assessment.
 - Changes in the text to reflect the change in the final ISA's causality determination from “likely to be causal” to “suggestive of, but not sufficient to infer, a causal relationship.”
 - Throughout the document (Chapters 3, 4 and 5), summaries of the CASAC advice on the PM standards are included, and expanded discussions of data gaps and areas for future research in the health and welfare effects evidence are presented.

D. Air Quality Information

This section provides a summary of basic information related to PM ambient air quality. It summarizes information on the distribution of particle size in ambient air (I.D.1), sources and emissions contributing to PM in the ambient air (I.D.2), monitoring of ambient PM in the U.S. (I.D.3), ambient PM concentrations and trends in the U.S. (I.D.4), and background PM (I.D.5). Additional detail on PM air quality can be found in Chapter 2 of the Policy Assessment (U.S. EPA, 2020; PA).

1. Distribution of Particle Size in Ambient Air

In ambient air, PM is a mixture of substances suspended as small liquid and/or solid particles (U.S. EPA, 2019, section 2.2). Particle size is an important consideration for PM, as distinct health and welfare effects have been linked

with exposures to particles of different sizes. Particles in the atmosphere range in size from less than 0.01 to more than 10 µm in diameter (U.S. EPA, 2019, section 2.2). When describing PM, subscripts are used to denote the aerodynamic diameter¹⁷ of the particle size range, in µm, of 50% cut points of sampling devices. The EPA defines PM_{2.5}, also referred to as fine particles, as particles with aerodynamic diameters generally less than or equal to 2.5 µm. The size range for PM_{10-2.5}, also called coarse or thoracic coarse particles, includes those particles with aerodynamic diameters generally greater than 2.5 µm and less than or equal to 10 µm. PM₁₀, which is comprised of both fine and coarse fractions, includes those particles with aerodynamic diameters generally less than or equal to 10 µm. In addition, UFP are often defined as particles with a diameter of less than 0.1 µm based on physical size, thermal diffusivity or electrical mobility (U.S. EPA, 2019, section 2.2).

Atmospheric distributions of particle size generally exhibit distinct modes that roughly align with the PM size fractions defined above. The nucleation mode is made up of freshly generated particles, formed either during combustion or by atmospheric reactions of precursor gases. The nucleation mode is especially prominent near sources like heavy traffic, industrial emissions, biomass burning, or cooking (Vu et al., 2015). While nucleation mode particles are only a minor contributor to overall ambient PM mass and surface area, they are the main contributors to ambient particle number (U.S. EPA, 2019, section 2.2). By number, most nucleation mode particles fall into the UFP size range, though some fraction of the nucleation mode number distribution can extend above 0.1 µm in diameter. Nucleation mode particles can grow rapidly through coagulation or uptake of gases by particle surfaces, giving rise to the accumulation mode. The accumulation mode is typically the predominant contributor to PM_{2.5} mass, though only a minor contributor to particle number (U.S. EPA, 2019, section 2.2). PM_{2.5} sampling methods measure most of the accumulation mode mass, although a small fraction of particles that make up the accumulation mode are greater than 2.5 µm in diameter. Coarse mode particles are formed by mechanical generation, and through processes like dust resuspension and sea spray formation

¹⁶ Given the Administrator's timeline for this review, as noted above (Pruitt, 2018), the EPA did not prepare a second draft PA. Rather, the CASAC's advice was considered in developing the final PA (U.S. EPA, 2020).

¹⁷ Aerodynamic diameter is the size of a sphere of unit density (*i.e.*, 1 g/cm³) that has the same terminal settling velocity as the particle of interest (U.S. EPA, 2019, section 4.1.1).

(Whitby et al., 1972). Most coarse mode mass is captured by PM_{10-2.5} sampling, but small fractions of coarse mode mass can be smaller than 2.5 µm or greater than 10 µm in diameter (U.S. EPA, 2019, section 2.2).

Most particles are found in the lower troposphere, where they can have residence times ranging from a few hours to weeks. Particles are removed from the atmosphere by wet deposition, such as when they are carried by rain or snow, or by dry deposition, when particles settle out of suspension due to gravity. Atmospheric lifetimes are generally longest for PM_{2.5}, which often remains in the atmosphere for days to weeks (U.S. EPA, 2019, Table 2–1) before being removed by wet or dry deposition. In contrast, atmospheric lifetimes for UFP and PM_{10-2.5} are shorter. Within hours, UFP can undergo coagulation and condensation that lead to formation of larger particles in the accumulation mode, or can be removed from the atmosphere by evaporation, deposition, or reactions with other atmospheric components. PM_{10-2.5} are also generally removed from the atmosphere within hours, through wet or dry deposition (U.S. EPA, 2019, Table 2–1).

2. Sources and Emissions Contributing to PM in the Ambient Air

PM is composed of both primary (directly emitted particles) and secondary particles. Primary PM is derived from direct particle emissions from specific PM sources while secondary PM originates from gas-phase chemical compounds present in the atmosphere that have participated in new particle formation or condensed onto existing particles (U.S. EPA, 2019, section 2.3). As discussed further in the ISA (U.S. EPA, 2019, section 2.3.2.1), secondary PM is formed in the atmosphere by photochemical oxidation reactions of both inorganic and organic gas-phase precursors. Precursor gases include sulfur dioxide (SO₂), nitrogen oxides (NO_x), and volatile organic compounds (VOC) (U.S. EPA, 2019, section 2.3.2.1). Ammonia also plays an important role in the formation of nitrate PM by neutralizing sulfuric acid and nitric acid. Sources and emissions of PM are discussed in more detail in section 2.1.1 of the PA (U.S. EPA, 2020).

Direct emissions of PM have remained relatively unchanged in recent years, while emissions of some precursor gases have declined substantially.¹⁸ From

1990 to 2014, SO₂ emissions have undergone the largest declines while NH₃ emissions have undergone the smallest change. Declining SO₂ emissions during this time period are primarily a result of reductions at stationary sources such as EGUs, with substantial reductions also from mobile sources (U.S. EPA, 2019, section 2.3.2.1).¹⁹

3. Monitoring of Ambient PM

To promote uniform enforcement of the air quality standards set forth under the CAA and to achieve the degree of public health and welfare protection intended for the NAAQS, the EPA established PM Federal Reference Methods (FRMs)²⁰ for both PM₁₀ and PM_{2.5} (40 CFR appendix J and L to Part 50) and performance requirements for approval of Federal Equivalent Methods (FEMs) (40 CFR part 53). Amended following the 2006 and 2012 p.m. NAAQS reviews, the current PM monitoring network relies on FRMs and automated continuous FEMs, in part to support changes necessary for implementation of the revised PM standards. The requirements for measuring ambient air quality and reporting ambient air quality data and related information are the basis for 40 CFR appendices A through E to Part 58. More information on PM ambient monitoring networks is available in section 2.2 of the PA (U.S. EPA, 2020).

4. Ambient Concentrations and Trends

This section summarizes available information on recent ambient PM concentrations in the U.S. and on trends in PM air quality. Sections I.D.4.a and I.D.4.b summarize information on PM_{2.5} mass and components, respectively. Section I.D.4.c summarizes information on PM₁₀. Sections I.D.4.d and I.D.4.e summarize the more limited information on PM_{10-2.5} and UFP, respectively. Additional detail on PM air quality and trends can be found in section 2.3 of the PA (U.S. EPA, 2020).

a. PM_{2.5} Mass

At monitoring sites in the U.S., annual PM_{2.5} concentrations from 2015 to 2017 averaged 8.0 µg/m³ (and ranged

from 3.0 to 18.2 µg/m³) and the 98th percentiles of 24-hour concentrations averaged 20.9 µg/m³ (and ranged from 9.2 to 111 µg/m³) (U.S. EPA, 2020, section 2.3.2.1). The highest ambient PM_{2.5} concentrations occur in the west, particularly in California and the Pacific northwest (U.S. EPA, 2020, Figure 2–8). Much of the eastern U.S. has lower ambient concentrations, with annual average concentrations generally at or below 12.0 µg/m³ and 98th percentiles of 24-hour concentrations generally at or below 30 µg/m³ (U.S. EPA, 2020, section 2.3.2).

Recent ambient PM_{2.5} concentrations reflect the substantial reductions that have occurred across much of the U.S. (U.S. EPA, 2020, section 2.3.2.1). From 2000 to 2017, national annual average PM_{2.5} concentrations have declined from 13.5 µg/m³ to 8.0 µg/m³, a 41% decrease (U.S. EPA, 2020, section 2.3.2.1).²¹ These declines have occurred at urban and rural monitoring sites, although urban PM_{2.5} concentrations remain consistently higher than those in rural areas (Chan et al., 2018) due to the impact of local sources in urban areas. Analyses at individual monitoring sites indicate that declines in ambient PM_{2.5} concentrations have been most consistent across the eastern U.S. and in parts of coastal California, where both annual average and 98th percentiles of 24-hour concentrations have declined significantly (U.S. EPA, 2020, section 2.3.2.1). In contrast, trends in ambient PM_{2.5} concentrations have been less consistent over much of the western U.S., with no significant changes since 2000 observed at some sites in the Pacific northwest, the northern Rockies and plains, and the southwest, particularly for 98th percentiles of 24-hour concentrations (U.S. EPA, 2020, section 2.3.2.1).

The recent deployment of PM_{2.5} monitors near major roads in large urban areas provides information on PM_{2.5} concentrations near an important emissions source. Of the 25 CBSAs with valid design values at near-road monitoring sites,²² 52% measured the highest annual design value at the near-road site while 24% measured the highest 24-hour design value at the near-road site (U.S. EPA, 2020, section 2.3.2.2). Of the CBSAs with highest

¹⁸ More information on these trends, including details on methods and explanations on the noted changes over time is available at <https://gispub.epa.gov/neireport/2014/>.

¹⁹ State-specific emission trends data for 1990 to 2014 can be found at: <https://www.epa.gov/air-emissions-inventories/air-pollutant-emissions-trends-data>.

²⁰ FRMs provide the methodological basis for comparison to the NAAQS and also serve as the “gold-standard” for the comparison of other methods being reviewed for potential approval as equivalent methods. The EPA keeps a complete list of designated reference and equivalent methods available on its Ambient Monitoring Technology Information Center (AMTIC) website (<https://www.epa.gov/amtic/air-monitoring-methods-criteria-pollutants>).

²¹ See <https://www.epa.gov/air-trends/particulate-matter-pm25-trends> and <https://www.epa.gov/air-trends/particulate-matter-pm25-trends#pmnat> for more information.

²² A design value is considered valid if it meets the data handling requirements given in 40 CFR appendix N to Part 50. Several large CBSAs such as Chicago-Naperville-Elgin, IL-IN-WI and Houston-The Woodlands-Sugar Land, TX had near-road sites that did not have valid PM_{2.5} design values for the 2015–2017 period.

annual design values at near-road sites, those design values were, on average, 0.7 $\mu\text{g}/\text{m}^3$ higher than at the highest measuring non-near-road sites (range is 0.1 to 2.0 $\mu\text{g}/\text{m}^3$ higher at near-road sites). Although most near-road monitoring sites do not have sufficient data to evaluate long-term trends in near-road $\text{PM}_{2.5}$ concentrations, analyses of the data at one near-road-like site in Elizabeth, NJ,²³ show that the annual average near-road increment has generally decreased between 1999 and 2017 from about 2.0 $\mu\text{g}/\text{m}^3$ to about 1.3 $\mu\text{g}/\text{m}^3$ (U.S. EPA, 2020, section 2.3.2.2).

b. $\text{PM}_{2.5}$ Components

Based on recent air quality data, the major chemical components of $\text{PM}_{2.5}$ have distinct spatial distributions. Sulfate concentrations tend to be highest in the eastern U.S., while in the Ohio Valley, Salt Lake Valley, and California nitrate concentrations are highest, and relatively high concentrations of organic carbon are widespread across most of the continental U.S. (U.S. EPA, 2020, section 2.3.2.3). Elemental carbon, crustal material, and sea-salt are found to have the highest concentrations in the northeast U.S., southwest U.S., and coastal areas, respectively.

An examination of $\text{PM}_{2.5}$ composition trends can provide insight into the factors contributing to overall reductions in ambient $\text{PM}_{2.5}$ concentrations. The biggest change in $\text{PM}_{2.5}$ composition that has occurred in recent years is the reduction in sulfate concentrations due to reductions in SO_2 emissions. Between 2000 and 2015, the nationwide annual average sulfate concentration decreased by 17% at urban sites and 20% at rural sites. This change in sulfate concentrations is most evident in the eastern U.S. and has resulted in organic matter or nitrate now being the greatest contributor to $\text{PM}_{2.5}$ mass in many locations (U.S. EPA, 2019, Figure 2–19). The overall reduction in sulfate concentrations has contributed substantially to the decrease in national average $\text{PM}_{2.5}$ concentrations as well as the decline in the fraction of PM_{10} mass accounted for by $\text{PM}_{2.5}$ (U.S. EPA, 2019, section 2.5.1.1.6; U.S. EPA, 2020, section 2.3.1).

c. PM_{10}

At monitoring sites in the U.S., the 2015–2017 average of 2nd highest 24-hour PM_{10} concentration was 56 $\mu\text{g}/\text{m}^3$ (ranging from 18 to 173 $\mu\text{g}/\text{m}^3$) (U.S.

EPA, 2020, section 2.3.2.4).²⁴ The highest PM_{10} concentrations tend to occur in the western U.S. Seasonal analyses indicate that ambient PM_{10} concentrations are generally higher in the summer months than at other times of year, though the most extreme high concentration events are more likely in the spring (U.S. EPA, 2019, Table 2–5). This is due to fact that the major PM_{10} emission sources, dust and agriculture, are more active during the warmer and drier periods of the year.

Recent ambient PM_{10} concentrations reflect reductions that have occurred across much of the U.S. (U.S. EPA, 2020, section 2.3.2.4). From 2000 to 2017, annual second highest 24-hour PM_{10} concentrations have declined by about 30% (U.S. EPA, 2020, section 2.3.2.4).²⁵ These PM_{10} concentrations have generally declined in the eastern U.S., while concentrations in the much of the midwest and western U.S. have remained unchanged or increased since 2000 (U.S. EPA, 2020, section 2.3.2.4). Analyses at individual monitoring sites indicate that annual average PM_{10} concentrations have also declined at most sites across the U.S., with much of the decrease in the eastern U.S. associated with reductions in $\text{PM}_{2.5}$ concentrations.

d. $\text{PM}_{10-2.5}$

Since the last review, the availability of $\text{PM}_{10-2.5}$ ambient concentration data has greatly increased. As illustrated in the PA (U.S. EPA, 2020, section 2.3.2.5), annual average and 98th percentile $\text{PM}_{10-2.5}$ concentrations exhibit less distinct differences between the eastern and western U.S. than for either $\text{PM}_{2.5}$ or PM_{10} . Additionally, compared to $\text{PM}_{2.5}$ and PM_{10} , changes in $\text{PM}_{10-2.5}$ concentrations have been small in magnitude and inconsistent in direction (U.S. EPA, 2020, section 2.3.2.5).

e. UFP

Compared to $\text{PM}_{2.5}$ mass, there is relatively little data on U.S. particle number concentrations, which are dominated by UFP. Based on measurements in two urban areas (New York City, Buffalo) and at a background site (Steuben County) in New York, urban particle number counts were several times higher than at the background site (U.S. EPA, 2020, section 2.3.2.6; U.S. EPA, 2019, Figure 2–18). The highest particle number counts in an urban area with multiple

sites (Buffalo) were observed at a near-road location.

Long-term trends in UFP are not routinely available at U.S. monitoring sites. At one site in Illinois with long-term data available, the annual average particle number concentration declined between 2000 and 2017, closely matching the reductions in annual $\text{PM}_{2.5}$ mass over that same period (U.S. EPA, 2020, section 2.3.2.6). In addition, a small number of published studies have examined UFP trends over time. While limited, these studies also suggest that UFP number concentrations have declined over time along with decreases in $\text{PM}_{2.5}$ (U.S. EPA, 2020, section 2.3.2.6).

5. Background PM

In this review, background PM is defined as all particles that are formed by sources or processes that cannot be influenced by actions within the jurisdiction of concern. U.S. background PM is defined as any PM formed from emissions other than U.S. anthropogenic (*i.e.* manmade) emissions. Potential sources of U.S. background PM include both natural sources (*i.e.*, PM that would exist in the absence of any anthropogenic emissions of PM or PM precursors) and transboundary sources originating outside U.S. borders. Background PM is discussed in more detail in section 2.4 of the PA (U.S. EPA, 2020).

At annual and national scales, estimated background PM concentrations in the U.S. are small compared to contributions from domestic anthropogenic emissions. For example, based on zero-out modeling in the last review of the PM NAAQS, annual background $\text{PM}_{2.5}$ concentrations were estimated to range from 0.5–3 $\mu\text{g}/\text{m}^3$ across the sites examined. In addition, speciated monitoring data from IMPROVE sites can provide some insights into how contributions from different PM sources, including sources of background PM, may have changed over time. As discussed further in the PA (U.S. EPA, 2020, section 2.4), such data suggests that estimates of background concentrations at IMPROVE monitors are around 1–3 $\mu\text{g}/\text{m}^3$, and have not changed significantly since the last PM NAAQS Review.

As discussed further in the PA (U.S. EPA, 2020, section 2.4), sources that contribute to natural background PM include dust from the wind erosion of natural surfaces, sea salt, wildland fires, primary biological aerosol particles such as bacteria and pollen, oxidation of biogenic hydrocarbons such as isoprene and terpenes to produce secondary

²³ The Elizabeth Lab site in Elizabeth, NJ is situated approximately 30 meters from travel lanes of the Interchange 13 toll plaza of the New Jersey Turnpike and within 200 meters of travel lanes for Interstate 278 and the New Jersey Turnpike.

²⁴ The form of the current 24-hour PM_{10} standard is one-expected-exceedance, averaged over three years.

²⁵ For more information, see <https://www.epa.gov/air-trends/particulate-matter-pm10-trends#pmnat>.

organic aerosols (SOA), and geogenic sources such as sulfate formed from volcanic production of SO₂ and oceanic production of dimethyl-sulfide. While most of these sources release or contribute predominantly to fine aerosol, some sources including windblown dust, and sea salt also produce particles in the coarse size range (U.S. EPA, 2019, section 2.3.3).

The magnitude and sources of background PM can vary widely by region and time of year. Coastal sites may experience a consistent contribution of PM from sea spray aerosol, while other areas covered with dense vegetation may be impacted by biogenic aerosol production during the summertime. Sources of background PM also operate across a range of time scales. While some sources like biogenic aerosol vary at monthly to seasonal scales, many sources of background PM are episodic in nature. These episodic sources (*e.g.*, large wildfires) can be characterized by infrequent contributions to high-concentration events occurring over shorter periods of time (*e.g.*, hours to several days). Such episodic events are sporadic and do not necessarily occur in all years. While these exceptional episodes can lead to exceedances of the 24-hour PM_{2.5} standard (35 µg/m³) in some cases (Schweizer *et al.*, 2017), such events are routinely screened for and usually identifiable in the monitoring data. As described further in the PA (U.S. EPA, 2020, section 2.4), contributions to background PM in the U.S. result mainly from sources within North America. Contributions from intercontinental events have also been documented (*e.g.*, transport from dust storms occurring in deserts in North Africa and Asia), but these events are less frequent and represent a relatively small fraction of background PM in most places.

II. Rationale for Proposed Decisions on the Primary PM_{2.5} Standards

This section provides the rationale supporting the Administrator's proposed decisions on the primary PM_{2.5} standards. Section II.A describes the Agency's approach to reaching decisions on the primary PM_{2.5} standards in the last review and summarizes the general approach to reaching proposed decisions in this review. Section II.B summarizes the scientific evidence for PM_{2.5}-related health effects. Section II.C presents the Administrator's proposed conclusions regarding the adequacy of the current primary PM_{2.5} standards and his

proposed decision to retain those standards in this review.²⁶

A. General Approach

1. Approach Used in the Last Review

The last review of the primary PM NAAQS was completed in 2012 (78 FR 3086, January 15, 2013). As noted above (section 1.3), in the last review the EPA lowered the level of the primary annual PM_{2.5} standard from 15.0 to 12.0 µg/m³,²⁷ and retained the existing 24-hour PM_{2.5} standard with its level of 35 µg/m³. The 2012 decision to strengthen the suite of primary PM_{2.5} standards was based on the prior Administrator's consideration of the extensive body of scientific evidence assessed in the 2009 ISA (U.S. EPA, 2009c); the quantitative risk analyses presented in the 2010 health risk assessment (U.S. EPA, 2010a); the advice and recommendations of the CASAC (Samet, 2009; Samet, 2010c; Samet, 2010b); and public comments on the proposed rule (78 FR 3086, January 15, 2013; U.S. EPA, 2012a). She particularly noted the "strong and generally robust body of evidence of serious health effects associated with both long- and short-term exposures to PM_{2.5}" (78 FR 3120, January 15, 2013). This included epidemiologic studies reporting health effect associations based on long-term average PM_{2.5} concentrations ranging from about 15.0 µg/m³ or above (*i.e.*, at or above the level of the then-existing annual standard) to concentrations "significantly below the level of the annual standard" (78 FR 3120, January 15, 2013). Based on her "confidence in the association between exposure to PM_{2.5} and serious public health effects, combined with evidence of such an association in areas that would meet the current standards" (78 FR 3120, January 15, 2013), the prior Administrator concluded that revision of the suite of primary PM_{2.5} standards was necessary in order to provide increased public health protection.

The prior Administrator next considered what specific revisions to the existing primary PM_{2.5} standards were appropriate, given the available evidence and quantitative risk information. She considered both the annual and 24-hour PM_{2.5} standards, focusing on the basic elements of those standards (*i.e.*, indicator, averaging time, form, and level). These

considerations, and the prior Administrator's conclusions, are summarized in sections II.A.1.a to II.A.1.d below.

a. Indicator

In the last review, the EPA considered issues related to the appropriate indicator for fine particles, with a focus on evaluating support for the existing PM_{2.5} mass-based indicator and for potential alternative indicators based on the UFP fraction or on fine particle composition (78 FR 3121, January 15, 2013).²⁸ With regard to PM_{2.5} mass, as in the 1997 and 2006 reviews, the health studies available during the last review continued to link adverse health outcomes (*e.g.*, premature mortality, hospital admissions, emergency department visits) with long- and short-term exposures to fine particles indexed largely by PM_{2.5} mass (78 FR 3121, January 15, 2013). With regard to the ultrafine fraction of ambient PM, the 2011 PA noted the limited body of health evidence assessed in the 2009 ISA (summarized in U.S. EPA, 2009c, section 2.3.5 and Table 2–6) and the limited monitoring information available to characterize ambient concentrations of UFP (U.S. EPA, 2011, section 1.3.2). With regard to PM composition, the 2009 ISA concluded that "the evidence is not yet sufficient to allow differentiation of those constituents or sources that are more closely related to specific health outcomes" (U.S. EPA, 2009c, pp. 2–26 and 6–212; 78 FR 3123, January 15, 2013). The 2011 PA further noted that "many different constituents of the fine particle mixture as well as groups of components associated with specific source categories of fine particles are linked to adverse health effects" (U.S. EPA, 2011, p. 2–55; 78 FR 3123, January 15, 2013). Consistent with the considerations and conclusions in the 2011 PA, the CASAC advised that it was appropriate to consider retaining PM_{2.5} as the indicator for fine particles. In light of the evidence and the CASAC's advice, the prior Administrator concluded that it was "appropriate to retain PM_{2.5} as the indicator for fine particles" (78 FR 3123, January 15, 2013).

²⁶ Sections III and IV provide the rationales supporting the Administrator's proposed decisions on the primary PM₁₀ standard and secondary standards, respectively.

²⁷ The Agency also eliminated spatial averaging provisions as part of the form of the annual standard.

²⁸ In the last review, the ISA defined UFP as generally including particles with a mobility diameter less than or equal to 0.1 µm. Mobility diameter is defined as the diameter of a particle having the same diffusivity or electrical mobility in air as the particle of interest, and is often used to characterize particles of 0.5 µm or smaller (U.S. EPA, 2009c, pp. 3–2 to 3–3).

b. Averaging Time

In 1997, the EPA set an annual PM_{2.5} standard to provide protection from health effects associated with long- and short-term exposures to PM_{2.5}, and a 24-hour standard to supplement the protection afforded by the annual standard (62 FR 38667 to 38668, July 18, 1997). In the 2006 review, the EPA retained both annual and 24-hour averaging times (71 FR 61164, October 17, 2006). In the last review, the EPA again considered issues related to the appropriate averaging times for PM_{2.5} standards, with a focus on evaluating support for the existing annual and 24-hour averaging times and for potential alternative averaging times based on sub-daily or seasonal metrics.

Based on the evidence assessed in the ISA, the 2011 PA noted that the overwhelming majority of studies that had been conducted since the 2006 review continued to utilize annual (or multi-year) or 24-hour PM averaging periods (U.S. EPA, 2011, section 2.3.2). Given this, and limitations in the data for alternatives, the 2011 PA reached the overall conclusions that the available information provided strong support for considering retaining the current annual and 24-hour averaging times (U.S. EPA, 2011, p. 2–58). The CASAC agreed that these conclusions were reasonable (Samet, 2010a, p. 13). The prior Administrator concurred with the PA conclusions and with the CASAC's advice. Specifically, she judged that it was “appropriate to retain the current annual and 24-hour averaging times for the primary PM_{2.5} standards to protect against health effects associated with long- and short-term exposure periods” (78 FR 3124, January 15, 2013).

c. Form

In 1997, the EPA established the form of the annual PM_{2.5} standard as an annual arithmetic mean, averaged over 3 years, from single or multiple community-oriented monitors.²⁹ That is, the level of the annual standard was to be compared to measurements made at each community-oriented monitoring site or, if specific criteria were met, measurements from multiple community-oriented monitoring sites could be averaged together (*i.e.*, spatial

averaging)³⁰ (62 FR 38671 to 38672, July 18, 1997). In the 1997 review, the EPA also established the form of the 24-hour PM_{2.5} standard as the 98th percentile of 24-hour concentrations at each monitor within an area (*i.e.*, no spatial averaging), averaged over three years (62 FR at 38671 to 38674, July 18, 1997). In the 2006 review, the EPA retained these standard forms but tightened the criteria for using spatial averaging with the annual standard (71 FR 61167, October 17, 2006).³¹

In the last review, the EPA's consideration of the form of the annual PM_{2.5} standard again included a focus on the issue of spatial averaging. An analysis of air quality and population demographic information indicated that the highest PM_{2.5} concentrations in a given area tended to be measured at monitors in locations where the surrounding populations were more likely to live below the poverty line and to include larger percentages of racial and ethnic minorities (U.S. EPA, 2011, p. 2–60). Based on this analysis, the 2011 PA concluded that spatial averaging could result in disproportionate impacts in at-risk populations, including minority populations and populations with lower socioeconomic status (SES). Therefore, the PA concluded that it was appropriate to consider revising the form of the annual PM_{2.5} standard such that it did not allow for the use of spatial averaging across monitors (U.S. EPA, 2011, p. 2–60). The CASAC agreed with the PA conclusions that it was “reasonable” for the EPA to eliminate the spatial averaging provisions (Samet, 2010c, p. 2).

The prior Administrator concluded that public health would not be protected with an adequate margin of safety in all locations, as required by law, if disproportionately higher PM_{2.5} concentrations in low income and minority communities were averaged together with lower concentrations measured at other sites in a large urban area. Therefore, she concluded that the form of the annual PM_{2.5} standard should be revised to eliminate spatial

averaging provisions (78 FR 3124, January 15, 2013).

In the last review, the EPA also considered the form of the 24-hour PM_{2.5} standard. The Agency recognized that the existing 98th percentile form for the 24-hour standard was originally selected to provide a balance between limiting the occurrence of peak 24-hour PM_{2.5} concentrations and identifying a stable target for risk management programs.³² Updated air quality analyses in the last review provided additional support for the increased stability of the 98th percentile PM_{2.5} concentration, compared to the 99th percentile (U.S. EPA, 2011, Figure 2–2, p. 2–62). Consistent with the PA conclusions based on this analysis, the prior Administrator concluded that it was appropriate to retain the 98th percentile form for the 24-hour PM_{2.5} standard (78 FR 3127, January 15, 2013).

d. Level

The EPA's approach to considering alternative levels of the PM_{2.5} standards in the last review was based on evaluating the public health protection afforded by the annual and 24-hour standards, taken together, against mortality and morbidity effects associated with long-term or short-term PM_{2.5} exposures. This approach recognized that it is appropriate to consider the protection provided by attaining the air quality needed to meet the suite of standards, and that there is no bright line clearly directing the choice of levels. Rather, the choice of what is appropriate is a public health policy judgment entrusted to the Administrator. See *Mississippi*, 744 F.3d at 1358, *Lead Industries Ass'n*, 647 F.2d at 1147.

In selecting the levels of the annual and 24-hour PM_{2.5} standard, the prior Administrator placed the greatest emphasis on health endpoints for which the evidence was strongest, based on the assessment of the evidence in the ISA and on the ISA's causality determinations (U.S. EPA, 2009c, section 2.3.1). She particularly noted that the evidence was sufficient to conclude a causal relationship exists between PM_{2.5} exposures and mortality and cardiovascular effects (*i.e.*, for both long- and short-term exposures) and that the evidence was sufficient to conclude a causal relationship is “likely” to exist between PM_{2.5} exposures and respiratory effects (*i.e.*, for both long-

²⁹ In the last review, the EPA replaced the term “community-oriented” monitor with the term “area-wide” monitor (U.S. EPA, 2020, section 1.3). *Area-wide* monitors are those sited at the neighborhood scale or larger, as well as those monitors sited at micro- or middle scales that are representative of many such locations in the same core-based statistical area (CBSA; 78 FR 3236, January 15, 2013). CBSAs are required to have at least one area-wide monitor sited in the area of expected maximum PM_{2.5} concentration.

³⁰ The original criteria for spatial averaging included: (1) The annual mean concentration at each site shall be within 20% of the spatially averaged annual mean, and (2) the daily values for each monitoring site pair shall yield a correlation coefficient of at least 0.6 for each calendar quarter (62 FR 38671 to 38672, July 18, 1997).

³¹ Specifically, the Administrator revised spatial averaging criteria such that “(1) [t]he annual mean concentration at each site shall be within 10 percent of the spatially averaged annual mean, and (2) the daily values for each monitoring site pair shall yield a correlation coefficient of at least 0.9 for each calendar quarter (71 FR 61167, October 17, 2006).

³² See *ATA III*, 283 F.3d at 374–76 which concludes that it is legitimate for the EPA to consider overall stability of the standard and its resulting promotion of overall effectiveness of NAAQS control programs in setting a standard that is requisite to protect the public health.

and short-term exposures). She also noted additional, but more limited, evidence for a broader range of health endpoints, including evidence “suggestive of a causal relationship” between long-term exposures and developmental and reproductive effects as well as carcinogenic effects (78 FR 3158, January 15, 2013).

To inform her decisions on an appropriate level for the annual standard, the prior Administrator considered the degree to which epidemiologic studies indicate confidence in the reported health effect associations over distributions of ambient PM_{2.5} concentrations. She noted that a level of 12.0 µg/m³ was below the long-term mean PM_{2.5} concentrations reported in key epidemiologic studies that provided evidence of an array of serious health effects (78 FR 3161, January 15, 2013). She further noted that 12.0 µg/m³ generally corresponded to the lower portions (*i.e.*, about the 25th percentile) of distributions of health events in the limited number of epidemiologic studies for which population-level information was available. A level of 12.0 µg/m³ also reflected placing some weight on studies of reproductive and developmental effects, for which the evidence was more uncertain (78 FR 3161–3162, January 15, 2013).³³

Given the uncertainties remaining in the scientific information, the prior Administrator judged that an annual standard level below 12.0 µg/m³ was not supported. She specifically noted uncertainties related to understanding the relative toxicity of the different components in the fine particle mixture, the role of PM_{2.5} in the complex ambient mixture, exposure measurement errors in epidemiologic studies, and the nature and magnitude of estimated risks at relatively low ambient PM_{2.5} concentrations. Furthermore, she noted that epidemiologic studies had reported heterogeneity in responses both within and between cities and in geographic regions across the U.S. She recognized that this heterogeneity may be attributed, in part, to differences in fine particle composition in different regions

and cities. With regard to evidence for reproductive and developmental effects, the prior Administrator recognized that there were a number of limitations associated with this body of evidence, including the following: The limited number of studies evaluating such effects; uncertainties related to identifying the relevant exposure time periods of concern; and limited toxicological evidence providing little information on the mode of action(s) or biological plausibility for an association between long-term PM_{2.5} exposures and adverse birth outcomes. On balance, she found that the available evidence, interpreted in light of these remaining uncertainties, did not justify an annual standard level set below 12.0 µg/m³ as being “requisite” to protect public health with an adequate margin of safety (*i.e.*, a standard with a lower level would have been more stringent than necessary).

In conjunction with a revised annual standard with a level of 12.0 µg/m³, the prior Administrator concluded that the evidence supported retaining the 35 µg/m³ level of the 24-hour PM_{2.5} standard. She noted that the existing 24-hour standard, with its 35 µg/m³ level and 98th percentile form, would provide supplemental protection, particularly for areas with high peak-to-mean ratios possibly associated with strong seasonal sources and for areas with PM_{2.5}-related effects that may be associated with shorter than daily exposure periods (78 FR 3163, January 15, 2013). Thus, she concluded that the available evidence and information, interpreted in light of remaining uncertainties, supported an annual standard with a level of 12.0 µg/m³ combined with a 24-hour standard with a level of 35 µg/m³.

2. Approach in the Current Review

The EPA’s approach to reaching proposed decisions on the primary PM_{2.5} standards in the current review builds on the decisions made in the last review. Consistent with that review, the approach focuses on evaluating the public health protection afforded by the annual and 24-hour standards, taken together, against mortality and morbidity associated with long-term or short-term PM_{2.5} exposures. As discussed in the PA (U.S. EPA, 2020, section 3.1.2), in adopting this approach the EPA recognizes that changes in PM_{2.5} air quality designed to meet an annual standard would likely result not only in lower annual average PM_{2.5} concentrations, but also in fewer and lower short-term peak PM_{2.5} concentrations. Additionally, changes designed to meet a 24-hour standard, with a 98th percentile form, would

result not only in fewer and lower peak 24-hour PM_{2.5} concentrations, but also in lower annual average PM_{2.5} concentrations. Thus, the EPA’s approach recognizes that it is appropriate to consider the protection provided by attaining the air quality needed to meet the suite of standards.

This approach to reviewing the primary PM_{2.5} standards is based most fundamentally on considering the available scientific evidence and technical information as assessed and discussed in the ISA (U.S. EPA, 2019) and PA (U.S. EPA, 2020), including the uncertainties inherent in that evidence and information, and on consideration of advice received from the CASAC in this review (Cox, 2019a). The EPA emphasizes the health outcomes for which the ISA determines that the evidence supports either a “causal” or a “likely to be causal” relationship with PM_{2.5} exposures (U.S. EPA, 2019). This approach focuses proposed decisions on the health outcomes for which the evidence is strongest. Such a focus, which is supported by the CASAC (Cox, 2019a, p. 12 of consensus responses), recognizes that standards set based on evidence supporting “causal” and “likely to be causal” health outcomes will also provide some measure of protection against the broader range of PM_{2.5}-associated outcomes, including those for which the evidence is less certain.

As in past reviews, the EPA’s approach recognizes that there is no bright line clearly directing the choice of standards. Rather, the choice of what is appropriate is a public health policy judgment entrusted to the Administrator. Specifically, the CAA requires primary standards that, in the judgment of the Administrator, are requisite to protect public health with an adequate margin of safety. In setting primary standards that are “requisite” to protect public health, the EPA’s task is to establish standards that are neither more nor less stringent than necessary for this purpose. Thus, as discussed above (I.A.), the CAA does not require that primary standards be set at a zero-risk level, but rather at a level that, in the judgment of the Administrator, limits risk sufficiently so as to protect public health with an adequate margin of safety. As in previous reviews, this judgment includes consideration of the strengths and limitations of the scientific and technical information, and the appropriate inferences to be drawn from that information.

³³ With respect to cancer, mutagenic, and genotoxic effects, the Administrator observed that the PM_{2.5} concentrations reported in studies evaluating these effects generally included ambient concentrations that are equal to or greater than ambient concentrations observed in studies that reported mortality and cardiovascular and respiratory effects (U.S. EPA, 2009c, section 7.5). Therefore, the Administrator concluded that, in selecting a standard level that provides protection from mortality and cardiovascular and respiratory effects, it is reasonable to anticipate that protection will also be provided for carcinogenic effects (78 FR 3161–3162, January 15, 2013).

B. Health Effects Related to Fine Particle Exposures

This section draws from the EPA's synthesis and assessment of the scientific evidence presented in the ISA (U.S. EPA, 2019) and the summary of that evidence in the PA (U.S. EPA, 2020, section 3.2.1). The ISA uses a weight-of-evidence framework for characterizing the strength of the available scientific evidence for health effects attributable to PM exposures (U.S. EPA, 2015, Preamble, Section 5). As in the last review (U.S. EPA, 2009c), the ISA for this review has adopted a five-level hierarchy to classify the overall weight-of-evidence into one of the following categories: Causal relationship; a likely to be causal relationship; suggestive of, but not sufficient to infer, a causal relationship;³⁴ inadequate to infer the presence or absence of a causal relationship; and not likely to be a causal relationship (U.S. EPA, 2015, Preamble Table II). In using the weight-of-evidence approach to inform judgments about the likelihood that various health effects are caused by PM exposures, evidence is evaluated for major outcome categories or groups of related outcomes (e.g., respiratory effects), integrating evidence from across disciplines, including epidemiologic, controlled human exposure, and animal toxicological studies and evaluating the coherence of evidence across a spectrum of related endpoints as well as biological plausibility of the effects observed (U.S. EPA, 2015, Preamble, Section 5.c.). Based on application of this approach, the EPA believes that the final ISA "accurately reflects the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of [PM] in the ambient air, in varying quantities" as required by the CAA (42 U.S.C. 7408(a)(2)).

In this review of the NAAQS, the EPA considers the full body of health evidence, placing the greatest emphasis on the health effects for which the evidence has been judged in the ISA to demonstrate a "causal" or a "likely to be causal" relationship with PM exposures. The ISA defines these causality determinations as follows (U.S. EPA, 2019, p. p–20):

- **Causal relationship:** The pollutant has been shown to result in health effects at relevant exposures based on studies encompassing multiple lines of evidence and chance, confounding, and

other biases can be ruled out with reasonable confidence.

- **Likely to be a causal relationship:** There are studies in which results are not explained by chance, confounding, or other biases, but uncertainties remain in the health effects evidence overall. For example, the influence of co-occurring pollutants is difficult to address, or evidence across scientific disciplines may be limited or inconsistent.

The sections below briefly summarize the health effects evidence determined in the ISA to support either a "causal" or a "likely to be causal" relationship with fine particle exposures (II.B.1), the populations potentially at increased risk for PM-related effects (II.B.2), and the CASAC's advice on the draft ISA (II.B.3). Additional detail on these topics can be found in the ISA (U.S. EPA, 2019) and in the PA (U.S. EPA, 2020, section 3.2).

1. Nature of Effects

Drawing from the assessment of the evidence in the ISA (U.S. EPA, 2019), and the summaries of that assessment in the PA (U.S. EPA, 2020), the sections below summarize the evidence for relationships between long- or short-term PM_{2.5} exposures and mortality (II.B.1.a), cardiovascular effects (II.B.1.b), respiratory effects (II.B.1.c), cancer (II.B.1.d), and nervous system effects (II.B.1.e). For these outcomes, the ISA concludes that the evidence supports either a "causal" or a "likely to be causal" relationship with PM_{2.5} exposures.

a. Mortality

i. Long-term PM_{2.5} exposures

In the last review, the 2009 PM ISA reported that the evidence was "sufficient to conclude that the relationship between long-term PM_{2.5} exposures and mortality is causal" (U.S. EPA, 2009c, p. 7–96). The strongest evidence supporting this conclusion was provided by epidemiologic studies, particularly those examining two seminal cohorts, the American Cancer Society (ACS) cohort and the Harvard Six Cities cohort. Analyses of the Harvard Six Cities cohort included demonstrations that reductions in ambient PM_{2.5} concentrations are associated with reduced mortality risk (Laden et al., 2006) and with increases in life expectancy (Pope et al., 2009). Further support was provided by other cohort studies conducted in North America and Europe that also reported positive associations between long-term PM_{2.5} exposures and risk of mortality (U.S. EPA, 2009c).

Recent cohort studies, which have become available since the 2009 ISA, continue to provide consistent evidence of positive associations between long-term PM_{2.5} exposures and mortality. These studies add support for associations with total and non-accidental mortality,³⁵ as well as with specific causes of death, including cardiovascular disease and respiratory disease (U.S. EPA, 2019, section 11.2.2). Many of these recent studies have extended the follow-up periods originally evaluated in the ACS and Harvard Six Cities cohort studies and continue to observe positive associations between long-term PM_{2.5} exposures and mortality (U.S. EPA, 2019, section 11.2.2.1; Figures 11–18 and 11–19). Adding to recent evaluations of the ACS and Six Cities cohorts, studies conducted with other cohorts also show consistent, positive associations between long-term PM_{2.5} exposure and mortality across various demographic groups (e.g., age, sex, occupation), spatial and temporal extents, exposure assessment metrics, and statistical techniques (U.S. EPA, 2019, sections 11.2.2.1, 11.2.5). This includes some of the largest cohort studies conducted to date, with analyses of the U.S. Medicare cohort that include nearly 61 million enrollees (Di et al., 2017b) and studies that control for a range of individual and ecological covariates.

A recent series of retrospective studies has additionally tested the hypothesis that past reductions in ambient PM_{2.5} concentrations have been associated with increased life expectancy or a decreased mortality rate (U.S. EPA, 2019, section 11.2.2.5). Pope et al. (2009) conducted a cross-sectional analysis using air quality data from 51 metropolitan areas across the U.S., beginning in the 1970s through the early 2000s, and found that a 10 µg/m³ decrease in long-term PM_{2.5} concentration was associated with a 0.61-year increase in life expectancy. In a subsequent analysis, the authors extended the period of analysis to include 2000 to 2007 (Correia et al., 2013), a time period with lower ambient PM_{2.5} concentrations. In this follow-up study, a decrease in long-term PM_{2.5} concentration continued to be associated with an increase in life expectancy, though the magnitude of the increase was smaller than during the earlier time period (i.e., a 10 µg/m³ decrease in long-term PM_{2.5}

³⁴ As noted in the 2019 p.m. ISA (U.S. EPA, 2019, p. ES–15), this causality determination language has been updated since the last review.

³⁵ The majority of these studies examined non-accidental mortality outcomes, though some Medicare studies lack cause-specific death information and, therefore, examine total mortality.

concentration was associated with a 0.35-year increase in life expectancy). Additional studies conducted in the U.S. or Europe similarly report that reductions in ambient PM_{2.5} are associated with improvements in longevity (U.S. EPA, 2019, section 11.2.2.5).

The 2019 ISA specifically evaluates the degree to which recent studies that examine the relationship between long-term PM_{2.5} exposure and mortality have addressed key policy-relevant issues and/or previously identified data gaps in the scientific evidence. For example, based on its assessment of the evidence, the ISA concludes that positive associations between long-term PM_{2.5} exposures and mortality are robust across analyses examining a variety of study designs (e.g., U.S. EPA, 2019, section 11.2.2.4), approaches to estimating PM_{2.5} exposures (U.S. EPA, 2019, section 11.2.5.1), approaches to controlling for confounders (U.S. EPA, 2019, sections 11.2.3 and 11.2.5), geographic regions and populations, and temporal periods (U.S. EPA, 2019, sections 11.2.2.5 and 11.2.5.3). Recent evidence further demonstrates that associations with mortality remain robust in copollutant analyses (U.S. EPA, 2019, section 11.2.3), and that associations persist in analyses restricted to long-term exposures below 12 µg/m³ (Di et al., 2017b) or 10 µg/m³ (Shi et al., 2016).

An additional important consideration in characterizing the public health impacts associated with PM_{2.5} exposure is whether concentration-response relationships are linear across the range of concentrations or if nonlinear relationships exist along any part of this range. Several recent studies examine this issue, and continue to provide evidence of linear, no-threshold relationships between long-term PM_{2.5} exposures and all-cause and cause-specific mortality (U.S. EPA, 2019, section 11.2.4). However, interpreting the shapes of these relationships, particularly at PM_{2.5} concentrations near the lower end of the air quality distribution, can be complicated by relatively low data density in the lower concentration range, the possible influence of exposure measurement error, and variability among individuals with respect to air pollution health effects. These sources of variability and uncertainty tend to smooth and “linearize” population-level concentration-response functions, and thus could obscure the existence of a threshold or nonlinear relationship (U.S. EPA, 2015, Preamble section 6.c).

The biological plausibility of PM_{2.5}-attributable mortality is supported by the coherence of effects across scientific disciplines (i.e., animal toxicological, controlled human exposure studies, and epidemiologic), including in recent studies evaluating the morbidity effects that are the largest contributors to total (nonaccidental) mortality. The ISA outlines the available evidence for plausible pathways by which inhalation exposure to PM_{2.5} could progress from initial events (e.g., respiratory tract inflammation, autonomic nervous system modulation) to endpoints relevant to population outcomes, particularly those related to cardiovascular diseases such as ischemic heart disease, stroke and atherosclerosis (U.S. EPA, 2019, section 6.2.1), and to metabolic disease and diabetes (U.S. EPA, 2019, section 7.2.1). The ISA notes “more limited evidence from respiratory morbidity” (U.S. EPA, 2019, p. 11–101) to support the biological plausibility of mortality due to long-term PM_{2.5} exposures (U.S. EPA, 2019, section 11.2.1).

Taken together, recent studies reaffirm and further strengthen the body of evidence from the 2009 ISA for the relationship between long-term PM_{2.5} exposure and mortality. Recent epidemiologic studies consistently report positive associations with mortality across different geographic locations, populations, and analytic approaches. Such studies reduce key uncertainties identified in the last review, including those related to potential copollutant confounding, and provide additional information on the shape of the concentration-response curve. Recent experimental and epidemiologic evidence for cardiovascular effects, and respiratory effects to a more limited degree, supports the plausibility of mortality due to long-term PM_{2.5} exposures. The 2019 ISA concludes that, “collectively, this body of evidence is sufficient to conclude that a causal relationship exists between long-term PM_{2.5} exposure and total mortality” (U.S. EPA, 2019, section 11.2.7; p. 11–102).

ii. Short-term PM_{2.5} exposures

The 2009 PM ISA concluded that “a causal relationship exists between short-term exposure to PM_{2.5} and mortality” (U.S. EPA, 2009c). This conclusion was based on the evaluation of both multi- and single-city epidemiologic studies that consistently reported positive associations between short-term PM_{2.5} exposure and non-accidental mortality. These associations were strongest, in terms of magnitude and precision, primarily at lags of 0 to 1 days.

Examination of the potential confounding effects of gaseous copollutants was limited, though evidence from single-city studies indicated that gaseous copollutants have minimal effect on the PM_{2.5}-mortality relationship (i.e., associations remain robust to inclusion of other pollutants in copollutant models). The evaluation of cause-specific mortality found that effect estimates were larger in magnitude, but also had larger confidence intervals, for respiratory mortality compared to cardiovascular mortality. Although the largest mortality risk estimates were for respiratory mortality, the interpretation of the results was complicated by the limited coherence from studies of respiratory morbidity. However, the evidence from studies of cardiovascular morbidity provided both coherence and biological plausibility for the relationship between short-term PM_{2.5} exposure and cardiovascular mortality.

Recent multicity studies evaluated since the 2009 ISA continue to provide evidence of primarily positive associations between daily PM_{2.5} exposures and mortality, with percent increases in total mortality ranging from 0.19% (Lippmann et al., 2013) to 2.80% (Kloog et al., 2013)³⁶ at lags of 0 to 1 days in single-pollutant models. Whereas most studies rely on assigning exposures using data from ambient monitors, associations are also reported in recent studies that employ hybrid modeling approaches using additional PM_{2.5} data (i.e., from satellites, land use information, and modeling, in addition to monitors), allowing for the inclusion of more rural locations in analyses (Kloog et al., 2013, Shi et al., 2016, Lee et al., 2015).

Some recent studies have expanded the examination of potential confounders (e.g., U.S. EPA, 2019, section 11.1.5.1), including copollutants. Associations between short-term PM_{2.5} exposures and mortality remain positive and relatively unchanged in copollutant models with both gaseous pollutants and PM_{10-2.5} (U.S. EPA, 2019, Section 11.1.4). Additionally, the low ($r < 0.4$) to moderate correlations ($r = 0.4$ – 0.7) between PM_{2.5} and gaseous pollutants and PM_{10-2.5} increase the confidence in PM_{2.5} having an independent effect on mortality (U.S. EPA, 2019, section 11.1.4).

The generally positive associations reported with mortality are supported

³⁶ As detailed in the Preface to the ISA, risk estimates are for a 10 µg/m³ increase in 24-hour avg PM_{2.5} concentrations, unless otherwise noted (U.S. EPA, 2019).

by a small group of studies employing causal inference or quasi-experimental statistical approaches (U.S. EPA, 2019, section 11.1.2.1). For example, a recent study examines whether a specific regulatory action in Tokyo, Japan (*i.e.*, a diesel emission control ordinance) resulted in a subsequent reduction in daily mortality (Yorifuji et al., 2016). The authors report a reduction in mortality in Tokyo due to the ordinance, compared to Osaka, which did not have a similar diesel emission control ordinance in place.

The positive associations for total mortality reported across the majority of studies evaluated are further supported by analyses reporting generally consistent, positive associations with both cardiovascular and respiratory mortality (U.S. EPA, 2019, section 11.1.3). For both cardiovascular and respiratory mortality, there has been only limited assessment of potential copollutant confounding, though initial evidence indicates that associations remain positive and relatively unchanged in models with gaseous pollutants and PM_{10-2.5}. This evidence further supports the copollutant analyses conducted for total mortality. The evidence for ischemic events and heart failure, as detailed in the assessment of cardiovascular morbidity (U.S. EPA, 2019, Chapter 6), provides biological plausibility for PM_{2.5}-related cardiovascular mortality, which comprises the largest percentage of total mortality (*i.e.*, ~33%) (U.S. National Institutes of Health, 2013). Although there is evidence for exacerbations of chronic obstructive pulmonary disease (COPD) and asthma, the collective body of evidence, particularly from controlled human exposure studies of respiratory effects, provides only limited support for the biological plausibility of PM_{2.5}-related respiratory mortality (U.S. EPA, 2019, Chapter 5).

In the 2009 ISA, one of the main uncertainties identified was the regional and city-to-city heterogeneity in PM_{2.5}-mortality associations. Recent studies examine both city-specific as well as regional characteristics to identify the underlying contextual factors that could contribute to this heterogeneity (U.S. EPA, 2019, section 11.1.6.3). Analyses focusing on effect modification of the PM_{2.5}-mortality relationship by PM_{2.5} components, regional patterns in PM_{2.5} components and city-specific differences in composition and sources indicate some differences in the PM_{2.5} composition and sources across cities and regions, but these differences do not fully explain the observed heterogeneity. Additional studies find that factors related to potential exposure

differences, such as housing stock and commuting, as well as city-specific factors (*e.g.*, land-use, port volume, and traffic information), may explain some of the observed heterogeneity (U.S. EPA, 2019, section 11.1.6.3). Collectively, recent studies indicate that the heterogeneity in PM_{2.5}-mortality risk estimates cannot be attributed to one factor, but instead a combination of factors including, but not limited to, PM composition and sources as well as community characteristics that could influence exposures (U.S. EPA, 2019, section 11.1.12).

A number of recent studies conducted systematic evaluations of the lag structure of associations for the PM_{2.5}-mortality relationship by examining either a series of single-day or multiday lags and these studies continue to support an immediate effect (*i.e.*, lag 0 to 1 days) of short-term PM_{2.5} exposures on mortality (U.S. EPA, 2019, section 11.1.8.1). Recent studies also conducted analyses comparing the traditional 24-hour average exposure metric with a sub-daily metric (*i.e.*, 1-hour max). These initial studies provide evidence of a similar pattern of associations for both the 24-hour average and 1-hour max metric, with the association larger in magnitude for the 24-hour average metric.

Recent multicity studies indicate that positive and statistically significant associations with mortality persist in analyses restricted to short-term PM_{2.5} exposures below 35 µg/m³ (Lee et al., 2015),³⁷ below 30 µg/m³ (Shi et al., 2016), and below 25 µg/m³ (Di et al., 2017a). Additional studies examine the shape of the concentration-response relationship and whether a threshold exists specifically for PM_{2.5} (U.S. EPA, 2019, section 11.1.10). These studies have used various statistical approaches and consistently found linear relationships with no evidence of a threshold. Recent analyses provide initial evidence indicating that PM_{2.5}-mortality associations persist and may be stronger (*i.e.*, a steeper slope) at lower concentrations (*e.g.*, Di et al., 2017a; Figure 11–12 in U.S. EPA, 2019). However, given the limited data available at the lower end of the distribution of ambient PM_{2.5} concentrations, the shape of the concentration-response curve remains uncertain at these low concentrations and, to date, studies have not conducted extensive analyses exploring alternatives to linearity when examining

the shape of the PM_{2.5}-mortality concentration-response relationship.

Overall, recent epidemiologic studies build upon and extend the conclusions of the 2009 ISA for the relationship between short-term PM_{2.5} exposures and total mortality. Supporting evidence for PM_{2.5}-related cardiovascular morbidity, and more limited evidence from respiratory morbidity, provides biological plausibility for mortality due to short-term PM_{2.5} exposures. The primarily positive associations observed across studies conducted in diverse geographic locations is further supported by the results from copollutant analyses indicating robust associations, along with evidence from analyses of the concentration-response relationship. The 2019 ISA states that, collectively, “this body of evidence is sufficient to conclude that a causal relationship exists between short-term PM_{2.5} exposure and total mortality” (U.S. EPA, 2019, pp. 11–58).

b. Cardiovascular Effects

i. Long-Term PM_{2.5} Exposures

The scientific evidence reviewed in the 2009 PM ISA was “sufficient to infer a causal relationship between long-term PM_{2.5} exposure and cardiovascular effects” (U.S. EPA, 2009c). The strongest line of evidence comprised findings from several large epidemiologic studies of U.S. cohorts that consistently showed positive associations between long-term PM_{2.5} exposure and cardiovascular mortality (Pope et al., 2004, Krewski et al., 2009, Miller et al., 2007, Laden et al., 2006). Studies of long-term PM_{2.5} exposure and cardiovascular morbidity were limited in number. Biological plausibility and coherence with the epidemiologic findings were provided by studies using genetic mouse models of atherosclerosis demonstrating enhanced atherosclerotic plaque development and inflammation, as well as changes in measures of impaired heart function, following 4- to 6-month exposures to PM_{2.5} concentrated ambient particles (CAPs), and by a limited number of studies reporting CAPs-induced effects on coagulation factors, vascular reactivity, and worsening of experimentally induced hypertension in mice (U.S. EPA, 2009c).

Studies conducted since the last review continue to support the relationship between long-term exposure to PM_{2.5} and cardiovascular effects. As discussed above, results from recent U.S. and Canadian cohort studies consistently report positive associations between long-term PM_{2.5} exposure and cardiovascular mortality (U.S. EPA, 2019, Figure 6–19) in evaluations

³⁷ Lee et al. (2015) also report that positive and statistically significant associations between short-term PM_{2.5} exposures and mortality persist in analyses restricted to areas with long-term concentrations below 12 µg/m³.

conducted at varying spatial scales and employing a variety of exposure assessment and statistical methods (U.S. EPA, 2019, section 6.2.10). Positive associations between long-term PM_{2.5} exposures and cardiovascular mortality are generally robust in copollutant models adjusted for ozone, NO₂, PM_{10-2.5}, or SO₂. In addition, most of the results from analyses examining the shape of the concentration-response relationship for cardiovascular mortality support a linear relationship with long-term PM_{2.5} exposures and do not identify a threshold below which effects do not occur (U.S. EPA, 2019, section 6.2.16; Table 6–52).³⁸

The body of literature examining the relationship between long-term PM_{2.5} exposure and cardiovascular morbidity has greatly expanded since the 2009 PM ISA, with positive associations reported in several cohorts (U.S. EPA, 2019, section 6.2). Though results for cardiovascular morbidity are less consistent than those for cardiovascular mortality (U.S. EPA, 2019, section 6.2), recent studies provide some evidence for associations between long-term PM_{2.5} exposures and the progression of cardiovascular disease. Positive associations with cardiovascular morbidity (*e.g.*, coronary heart disease, stroke) and atherosclerosis progression (*e.g.*, coronary artery calcification) are observed in several epidemiologic studies (U.S. EPA, 2019, sections 6.2.2. to 6.2.9). Associations in such studies are supported by toxicological evidence for increased plaque progression in mice following long-term exposure to PM_{2.5} collected from multiple locations across the U.S. (U.S. EPA, 2019, section 6.2.4.2). A small number of epidemiologic studies also report positive associations between long-term PM_{2.5} exposure and heart failure, changes in blood pressure, and hypertension (U.S. EPA, 2019, sections 6.2.5 and 6.2.7). Associations with heart failure are supported by animal toxicological studies demonstrating decreased cardiac contractility and function, and increased coronary artery wall thickness following long-term PM_{2.5} exposure (U.S. EPA, 2019, section 6.2.5.2). Similarly, a limited number of animal toxicological studies demonstrating a relationship between long-term exposure to PM_{2.5} and consistent increases in blood pressure in rats and mice are coherent with epidemiologic studies reporting positive

associations between long-term exposure to PM_{2.5} and hypertension.

Longitudinal epidemiologic analyses also report positive associations with markers of systemic inflammation (U.S. EPA, 2019, section 6.2.11), coagulation (U.S. EPA, 2019, section 6.2.12), and endothelial dysfunction (U.S. EPA, 2019, section 6.2.13). These results are coherent with animal toxicological studies generally reporting increased markers of systemic inflammation, oxidative stress, and endothelial dysfunction (U.S. EPA, 2019, section 6.2.12.2 and 6.2.14).

In summary, the 2019 ISA concludes that there is consistent evidence from multiple epidemiologic studies illustrating that long-term exposure to PM_{2.5} is associated with mortality from cardiovascular causes. Associations with CHD, stroke and atherosclerosis progression were observed in several additional epidemiologic studies providing coherence with the mortality findings. Results from copollutant models generally support an independent effect of PM_{2.5} exposure on mortality. Additional evidence of the independent effect of PM_{2.5} on the cardiovascular system is provided by experimental studies in animals, which support the biological plausibility of pathways by which long-term exposure to PM_{2.5} could potentially result in outcomes such as CHD, stroke, CHF and cardiovascular mortality. The combination of epidemiologic and experimental evidence results in the ISA conclusion that “a causal relationship exists between long-term exposure to PM_{2.5} and cardiovascular effects” (U.S. EPA, 2019, p. 6–222).

ii. Short-Term PM_{2.5} Exposures

The 2009 PM ISA concluded that “a causal relationship exists between short-term exposure to PM_{2.5} and cardiovascular effects” (U.S. EPA, 2009c). The strongest evidence in the 2009 PM ISA was from epidemiologic studies of emergency department visits and hospital admissions for ischemic heart disease (IHD) and heart failure (HF), with supporting evidence from epidemiologic studies of cardiovascular mortality (U.S. EPA, 2009c). Animal toxicological studies provided coherence and biological plausibility for the positive associations reported with myocardial ischemia, emergency department visits, and hospital admissions. These included studies reporting reduced myocardial blood flow during ischemia and studies indicating altered vascular reactivity. In addition, effects of PM_{2.5} exposure on a potential indicator of ischemia (*i.e.*, ST segment depression on an

electrocardiogram) were reported in both animal toxicological and epidemiologic panel studies.³⁹ Key uncertainties from the last review resulted from inconsistent results across disciplines with respect to the relationship between short-term exposure to PM_{2.5} and changes in blood pressure, blood coagulation markers, and markers of systemic inflammation. In addition, while the 2009 PM ISA identified a growing body of evidence from controlled human exposure and animal toxicological studies, uncertainties remained with respect to biological plausibility.

A large body of recent evidence confirms and extends the evidence from the 2009 ISA supporting the relationship between short-term PM_{2.5} exposure and cardiovascular effects. This includes generally positive associations observed in multicity epidemiologic studies of emergency department visits and hospital admissions for IHD, HF, and combined cardiovascular-related endpoints. In particular, nationwide studies of older adults (65 years and older) using Medicare records report positive associations between PM_{2.5} exposures and hospital admissions for HF (U.S. EPA, 2019, section 6.1.3.1). Additional multicity studies conducted in the northeast U.S. report positive associations between short-term PM_{2.5} exposures and emergency department visits or hospital admissions for HF (U.S. EPA, 2019, section 6.1.2.1) while studies conducted in the U.S. and Canada reported positive associations between short-term PM_{2.5} exposures and emergency department visits for HF. Epidemiologic studies conducted in single cities contribute some support, though associations reported in single-city studies are less consistently positive than in multicity studies, and include a number of studies reporting null associations (U.S. EPA, 2019, sections 6.1.2 and 6.1.3). When considered as a whole; however, the recent body of IHD and HF epidemiologic evidence supports the evidence from previous ISAs reporting mainly positive associations between short-term PM_{2.5} concentrations and emergency department visits and hospital admissions.

In addition, a number of more recent controlled human exposure, animal toxicological, and epidemiologic panel studies provide evidence that PM_{2.5}

³⁸ As noted above for mortality, uncertainty in the shape of the concentration-response relationship increases near the upper and lower ends of the concentration distribution where the data are limited.

³⁹ Some animal studies included in the 2009 PM ISA examined exposures to mixtures, such as motor vehicle exhaust or woodsmoke. In these studies, it was unclear if the resulting cardiovascular effects could be attributed specifically to the particulate components of the mixture.

exposure could plausibly result in IHD or HF through pathways that include endothelial dysfunction, arterial thrombosis, and arrhythmia (U.S. EPA, 2019, section 6.1.1). The most consistent evidence from recent controlled human exposure studies is for endothelial dysfunction, as measured by changes in brachial artery diameter or flow mediated dilation. All but one of the available controlled human exposure studies examining the potential for endothelial dysfunction report an effect of PM_{2.5} exposure on measures of blood flow (U.S. EPA, 2019, section 6.1.13.2). These studies report variable results regarding the timing of the effect and the mechanism by which reduced blood flow occurs (*i.e.*, availability vs sensitivity to nitric oxide). Some controlled human exposure studies using PM_{2.5} CAPs report evidence for small increases in blood pressure (U.S. EPA, 2019, section 6.1.6.3). In addition, although not entirely consistent, there is also some evidence across controlled human exposure studies for conduction abnormalities/arrhythmia (U.S. EPA, 2019, section 6.1.4.3), changes in heart rate variability (HRV) (U.S. EPA, 2019, section 6.1.10.2), changes in hemostasis that could promote clot formation (U.S. EPA, 2019, section 6.1.12.2), and increases in inflammatory cells and markers (U.S. EPA, 2019, section 6.1.11.2). Thus, when taken as a whole, controlled human exposure studies are coherent with epidemiologic studies in that they provide evidence that short-term exposures to PM_{2.5} may result in the types of cardiovascular endpoints that could lead to emergency department visits and hospital admissions in some people.

Animal toxicological studies published since the 2009 ISA also support a relationship between short-term PM_{2.5} exposure and cardiovascular effects. A recent study demonstrating decreased cardiac contractility and left ventricular pressure in mice is coherent with the results of epidemiologic studies that report associations between short-term PM_{2.5} exposure and heart failure (U.S. EPA, 2019, section 6.1.3.3). In addition, and as with controlled human exposure studies, there is generally consistent evidence in animal toxicological studies for indicators of endothelial dysfunction (U.S. EPA, 2019, section 6.1.13.3). Studies in animals also provide evidence for changes in a number of other cardiovascular endpoints following short-term PM_{2.5} exposure. Although not entirely consistent, these studies provide some evidence of conduction abnormalities and arrhythmia (U.S.

EPA, 2019, section 6.1.4.4), changes in HRV (U.S. EPA, 2019, section 6.1.10.3), changes in blood pressure (U.S. EPA, 2019, section 6.1.6.4), and evidence for systemic inflammation and oxidative stress (U.S. EPA, 2019, section 6.1.11.3).

In summary, recent evidence supports the conclusions reported in the 2009 ISA indicating relationships between short-term PM_{2.5} exposures and hospital admissions and ED visits for IHD and HF, along with cardiovascular mortality. Epidemiologic studies reporting robust associations in copollutant models are supported by direct evidence from controlled human exposure and animal toxicological studies reporting independent effects of PM_{2.5} exposures on endothelial dysfunction as well as endpoints indicating impaired cardiac function, increased risk of arrhythmia, changes in HRV, increases in BP, and increases in indicators of systemic inflammation, oxidative stress, and coagulation (U.S. EPA, 2019, section 6.1.16). Epidemiologic panel studies, although not entirely consistent, provide some evidence that PM_{2.5} exposures are associated with cardiovascular effects, including increased risk of arrhythmia, decreases in HRV, increases in BP, and ST segment depression. Overall, the results from epidemiologic panel, controlled human exposure, and animal toxicological studies (in particular those related to endothelial dysfunction, impaired cardiac function, ST segment depression, thrombosis, conduction abnormalities, and changes in blood pressure) provide coherence and biological plausibility for the consistent results from epidemiologic studies reporting positive associations between short-term PM_{2.5} exposures and IHD and HF, and ultimately cardiovascular mortality. The 2019 ISA concludes that, overall, “there continues to be sufficient evidence to conclude that a causal relationship exists between short-term PM_{2.5} exposure and cardiovascular effects” (U.S. EPA, 2019, p. 6–138).

c. Respiratory Effects

i. Long-Term PM_{2.5} Exposures

The 2009 PM ISA concluded that “a causal relationship is likely to exist between long-term PM_{2.5} exposure and respiratory effects” (U.S. EPA, 2009c). This conclusion was based mainly on epidemiologic evidence demonstrating associations between long-term PM_{2.5} exposure and changes in lung function or lung function growth in children. Biological plausibility was provided by a single animal toxicological study examining pre- and post-natal exposure to PM_{2.5} CAPs, which found impaired

lung development. Epidemiologic evidence for associations between long-term PM_{2.5} exposure and other respiratory outcomes, such as the development of asthma, allergic disease, and COPD; respiratory infection; and the severity of disease was limited, both in the number of studies available and the consistency of the results. Experimental evidence for other outcomes was also limited, with one animal toxicological study reporting that long-term exposure to PM_{2.5} CAPs results in morphological changes in the nasal airways of healthy animals. Other animal studies examined exposure to mixtures, such as motor vehicle exhaust and woodsmoke, and effects were not attributed specifically to the particulate components of the mixture.

Recent cohort studies provide additional support for the relationship between long-term PM_{2.5} exposure and decrements in lung function growth (as a measure of lung development), indicating a robust and consistent association across study locations, exposure assessment methods, and time periods (U.S. EPA, 2019, section 5.2.13). This relationship is further supported by a recent retrospective study that reports an association between declining PM_{2.5} concentrations and improvements in lung function growth in children (U.S. EPA, 2019, section 5.2.11). Epidemiologic studies also examine asthma development in children (U.S. EPA, 2019, section 5.2.3), with recent prospective cohort studies reporting generally positive associations, though several are imprecise (*i.e.*, they report wide confidence intervals). Supporting evidence is provided by studies reporting associations with asthma prevalence in children, with childhood wheeze, and with exhaled nitric oxide, a marker of pulmonary inflammation (U.S. EPA, 2019, section 5.2.13). A recent animal toxicological study showing the development of an allergic phenotype and an increase in a marker of airway responsiveness supports the biological plausibility of the development of allergic asthma (U.S. EPA, 2019, section 5.2.13). Other epidemiologic studies report a PM_{2.5}-related acceleration of lung function decline in adults, while improvement in lung function was observed with declining PM_{2.5} concentrations (U.S. EPA, 2019, section 5.2.11). A recent longitudinal study found declining PM_{2.5} concentrations are also associated with an improvement in chronic bronchitis symptoms in children, strengthening evidence reported in the 2009 ISA for a relationship between

increased chronic bronchitis symptoms and long-term PM_{2.5} exposure (U.S. EPA, 2019, section 5.2.11). A common uncertainty across the epidemiologic evidence is the lack of examination of copollutants to assess the potential for confounding. While there is some evidence that associations remain robust in models with gaseous pollutants, a number of these studies examining copollutant confounding were conducted in Asia, and thus have limited generalizability due to high annual pollutant concentrations.

When taken together, the 2019 ISA concludes that the “epidemiologic evidence strongly supports a relationship with decrements in lung function growth in children” (U.S. EPA, 2019, p. 1–34). Additional epidemiologic evidence “supports a relationship with asthma development in children, increased bronchitic symptoms in children with asthma, acceleration of lung function decline in adults, and respiratory mortality, including cause-specific respiratory mortality for COPD and respiratory infection” (U.S. EPA, 2019, p. 1–34). In support of the biological plausibility of such associations reported in epidemiologic studies of respiratory health effects, animal toxicological studies continue to provide direct evidence that long-term exposure to PM_{2.5} results in a variety of respiratory effects. Recent animal studies show pulmonary oxidative stress, inflammation, and morphologic changes in the upper (nasal) and lower airways. Other results show that changes are consistent with the development of allergy and asthma, and with impaired lung development. Overall, the ISA concludes that “the collective evidence is sufficient to conclude a likely to be causal relationship between long-term PM_{2.5} exposure and respiratory effects” (U.S. EPA, 2019, p. 5–220).

ii. Short-Term PM_{2.5} Exposures

The 2009 PM ISA (U.S. EPA, 2009c) concluded that a “causal relationship is likely to exist” between short-term PM_{2.5} exposure and respiratory effects. This conclusion was based mainly on the epidemiologic evidence demonstrating positive associations with various respiratory effects. Specifically, the 2009 ISA described epidemiologic evidence as consistently showing PM_{2.5}-associated increases in hospital admissions and emergency department visits for COPD and respiratory infection among adults or people of all ages, as well as increases in respiratory mortality. These results were supported by studies reporting associations with increased respiratory

symptoms and decreases in lung function in children with asthma, though the available epidemiologic evidence was inconsistent for hospital admissions or emergency department visits for asthma. Studies examining copollutant models showed that PM_{2.5} associations with respiratory effects were robust to inclusion of CO or SO₂ in the model, but often were attenuated (though still positive) with inclusion of O₃ or NO₂. In addition to the copollutant models, evidence supporting an independent effect of PM_{2.5} exposure on the respiratory system was provided by animal toxicological studies of PM_{2.5} CAPs demonstrating changes in some pulmonary function parameters, as well as inflammation, oxidative stress, injury, enhanced allergic responses, and reduced host defenses. Many of these effects have been implicated in the pathophysiology for asthma exacerbation, COPD exacerbation, or respiratory infection. In the few controlled human exposure studies conducted in individuals with asthma or COPD, PM_{2.5} exposure mostly had no effect on respiratory symptoms, lung function, or pulmonary inflammation. Available studies in healthy people also did not clearly find respiratory effects following short-term PM_{2.5} exposures.

Recent epidemiologic studies provide evidence for a relationship between short-term PM_{2.5} exposure and several respiratory-related endpoints, including asthma exacerbation (U.S. EPA, 2019, section 5.1.2.1), COPD exacerbation (U.S. EPA, 2019, section 5.1.4.1), and combined respiratory-related diseases (U.S. EPA, 2019, section 5.1.6), particularly from studies examining emergency department visits and hospital admissions. The generally positive associations between short-term PM_{2.5} exposure and asthma and COPD emergency department visits and hospital admissions are supported by epidemiologic studies demonstrating associations with other respiratory-related effects such as symptoms and medication use that are indicative of asthma and COPD exacerbations (U.S. EPA, 2019, sections 5.1.2.2 and 5.4.1.2). The collective body of epidemiologic evidence for asthma exacerbation is more consistent in children than in adults. Additionally, epidemiologic studies examining the relationship between short-term PM_{2.5} exposure and respiratory mortality provide evidence of consistent positive associations, demonstrating a continuum of effects (U.S. EPA, 2019, section 5.1.9).

Building on the studies evaluated in the 2009 ISA, recent epidemiologic studies expand the assessment of

potential copollutant confounding. There is some evidence that PM_{2.5} associations with asthma exacerbation, combined respiratory-related diseases, and respiratory mortality remain relatively unchanged in copollutant models with gaseous pollutants (*i.e.*, O₃, NO₂, SO₂, with more limited evidence for CO) and other particle sizes (*i.e.*, PM_{10-2.5}) (U.S. EPA, 2019, section 5.1.10.1).

Insight into whether there is an independent effect of PM_{2.5} on respiratory health is provided by findings from animal toxicological studies. Specifically, short-term exposure to PM_{2.5} has been shown to enhance asthma-related responses in an animal model of allergic airways disease and lung injury and inflammation in an animal model of COPD (U.S. EPA, 2019, sections 5.1.2.4.4 and 5.1.4.4.3). The experimental evidence provides biological plausibility for some respiratory-related endpoints, including limited evidence of altered host defense and greater susceptibility to bacterial infection as well as consistent evidence of respiratory irritant effects. Animal toxicological evidence for other respiratory effects is inconsistent and controlled human exposure studies provide limited evidence of respiratory effects (U.S. EPA, 2019, section 5.1.12).

The 2019 ISA concludes that “[t]he strongest evidence of an effect of short-term PM_{2.5} exposure on respiratory effects is provided by epidemiologic studies of asthma and COPD exacerbation. While animal toxicological studies provide biological plausibility for these findings, some uncertainty remains with respect to the independence of PM_{2.5} effects” (U.S. EPA, 2019, p. 5–155). When taken together, the ISA concludes that this evidence “is sufficient to conclude a likely to be causal relationship between short-term PM_{2.5} exposure and respiratory effects” (U.S. EPA, 2019, p. 5–155).

d. Cancer

The 2009 ISA concluded that the overall body of evidence was “suggestive of a causal relationship between relevant PM_{2.5} exposures and cancer” (U.S. EPA, 2009c). This conclusion was based primarily on positive associations observed in a limited number of epidemiologic studies of lung cancer mortality. The few epidemiologic studies that had evaluated PM_{2.5} exposure and lung cancer incidence or cancers of other organs and systems generally did not show evidence of an association. Toxicological studies did not focus on exposures to specific PM size fractions,

but rather investigated the effects of exposures to total ambient PM, or other source-based PM such as wood smoke. Collectively, results of in vitro studies were consistent with the larger body of evidence demonstrating that ambient PM and PM from specific combustion sources are mutagenic and genotoxic. However, animal inhalation studies found little evidence of tumor formation in response to chronic exposures. A small number of studies provided preliminary evidence that PM exposure can lead to changes in methylation of DNA, which may contribute to biological events related to cancer.

Since the 2009 ISA, additional cohort studies provide evidence that long-term PM_{2.5} exposure is positively associated with lung cancer mortality and with lung cancer incidence, and provide initial evidence for an association with reduced cancer survival (U.S. EPA, 2019, section 10.2.5). Reanalyses of the ACS cohort using different years of PM_{2.5} data and follow-up, along with various exposure assignment approaches, provide consistent evidence of positive associations between long-term PM_{2.5} exposure and lung cancer mortality (U.S. EPA, 2019, Figure 10–3). Additional support for positive associations with lung cancer mortality is provided by recent epidemiologic studies using individual-level data to control for smoking status, by studies of people who have never smoked (though such studies generally report wide confidence intervals due to the small number of lung cancer mortality cases within this population), and in analyses of cohorts that relied upon proxy measures to account for smoking status (U.S. EPA, 2019, section 10.2.5.1.1). Although studies that evaluate lung cancer incidence, including studies of people who have never smoked, are limited in number, recent studies generally report positive associations with long-term PM_{2.5} exposures (U.S. EPA, 2019, section 10.2.5.1.2). A subset of the studies focusing on lung cancer incidence also examined histological subtype, providing some evidence of positive associations for adenocarcinomas, the predominate subtype of lung cancer observed in people who have never smoked (U.S. EPA, 2019, section 10.2.5.1.2). Associations between long-term PM_{2.5} exposure and lung cancer incidence were found to remain relatively unchanged, though in some cases confidence intervals widened, in analyses that attempted to reduce exposure measurement error by accounting for length of time at residential address or by examining

different exposure assignment approaches (U.S. EPA, 2019, section 10.2.5.1.2).

The 2019 ISA evaluates the degree to which recent epidemiologic studies have addressed the potential for confounding by copollutants and the shape of the concentration-response relationship. To date, relatively few studies have evaluated the potential for copollutant confounding of the relationship between long-term PM_{2.5} exposure and lung cancer mortality or incidence. The small number of such studies have generally focused on O₃ and report that PM_{2.5} associations remain relatively unchanged in copollutant models (U.S. EPA, 2019, section 10.2.5.1.3). However, available studies have not systematically evaluated the potential for copollutant confounding by other gaseous pollutants or by other particle size fractions (U.S. EPA, 2019, section 10.2.5.1.3). Compared to total (non-accidental) mortality (discussed above), fewer studies have examined the shape of the concentration-response curve for cause-specific mortality outcomes, including lung cancer. Several studies have reported no evidence of deviations from linearity in the shape of the concentration-response relationship (Lepeule et al., 2012; Raaschou-Nielsen et al., 2013; Puett et al., 2014), though authors provided only limited discussions of results (U.S. EPA, 2019, section 10.2.5.1.4).

In support of the biological plausibility of an independent effect of PM_{2.5} on cancer, the 2019 ISA notes evidence from recent experimental studies demonstrating that PM_{2.5} exposure can lead to a range of effects indicative of mutagenicity, genotoxicity, and carcinogenicity, as well as epigenetic effects (U.S. EPA, 2019, section 10.2.7). For example, both in vitro and in vivo toxicological studies have shown that PM_{2.5} exposure can result in DNA damage (U.S. EPA, 2019, section 10.2.2). Although such effects do not necessarily equate to carcinogenicity, the evidence that PM exposure can damage DNA, and elicit mutations, provides support for the plausibility of epidemiologic associations with lung cancer mortality and incidence. Additional supporting studies indicate the occurrence of micronuclei formation and chromosomal abnormalities (U.S. EPA, 2019, section 10.2.2.3), and differential expression of genes that may be relevant to cancer pathogenesis, following PM exposures. Experimental and epidemiologic studies that examine epigenetic effects indicate changes in DNA methylation, providing some

support for PM_{2.5} exposure contributing to genomic instability (U.S. EPA, 2019, section 10.2.3).

Epidemiologic evidence for associations between PM_{2.5} exposure and lung cancer mortality and incidence, together with evidence supporting the biological plausibility of such associations, contributes to the 2019 ISA's conclusion that the evidence "is sufficient to conclude there is a likely to be causal relationship between long-term PM_{2.5} exposure and cancer" (U.S. EPA, 2019, p. 10–77).

In its letter to the Administrator on the draft ISA, the CASAC states that "the Draft ISA does not present adequate evidence to conclude that there is likely to be a causal relationship between long-term PM_{2.5} exposure and . . . cancer" (Cox, 2019a, p. 1 of letter). The CASAC specifically states that this causality determination "relies largely on epidemiology studies that . . . do not provide exposure time frames that are appropriate for cancer causation and that there are no animal studies showing direct effects of PM_{2.5} on cancer formation" (Cox, 2019a, p. 20 of consensus responses).

With respect to the latency period, it is well recognized that "air pollution exposures experienced over an extended historical time period are likely more relevant to the etiology of lung cancer than air pollution exposures experienced in the more recent past" (Turner et al. 2011). However, many epidemiologic studies conducted within the U.S. that examine long-term PM_{2.5} exposure and lung cancer incidence and lung cancer mortality rely on more recent air quality data because routine PM_{2.5} monitoring did not start until 1999–2000. An exception to this is the American Cancer Society (ACS) study that had PM_{2.5} concentration data from two time periods, 1979–1983 and from 1999–2000. Turner et al. (2011), conducted a comparison of PM_{2.5} concentrations between these two time periods and found that they were highly correlated ($r > 0.7$), with the relative rank order of metropolitan statistical areas (MSAs) by PM_{2.5} concentrations being "generally retained over time." Therefore, areas where PM_{2.5} concentrations were high remained high over decades (or low remained low) relative to other locations. Long-term exposure epidemiologic studies rely on spatial contrasts between locations; therefore, if a location with high PM_{2.5} concentrations continues to have high concentrations over decades relative to other locations a relationship between the PM_{2.5} exposure and cancer should persist. This was confirmed in a sensitivity analysis conducted by

Turner et al. (2011), where the authors reported a similar hazard ratio (HR) for lung cancer mortality for participants assigned exposure to PM_{2.5} (1979–1983) and PM_{2.5} (1999–2000) in two separate analyses.

While experimental studies showing a direct effect of PM_{2.5} on cancer formation were limited to an animal model of urethane-induced tumor initiation, a large number of experimental studies report that PM_{2.5} exhibits several key characteristics of carcinogens, as indicated by genotoxic effects, oxidative stress, electrophilicity, and epigenetic alterations, all of which provide biological plausibility that PM_{2.5} exposure can contribute to cancer development. The experimental evidence, in combination with multiple recent and previously evaluated epidemiologic studies examining the relationship between long-term PM_{2.5} exposure and both lung cancer incidence and lung cancer mortality that reported generally positive associations across different cohorts, exposure assignment methods, and in analyses of never smokers further addresses uncertainties identified in the 2009 PM ISA. Therefore, upon re-evaluating the causality determination for cancer, when considering CASAC comments on the Draft PM ISA and applying the causal framework as described (U.S. EPA, 2015; U.S. EPA, 2019, section A.3.2.1), the EPA continues to conclude in the 2019 Final PM ISA that the evidence for long-term PM_{2.5} exposure and cancer supports a “likely to be causal relationship” (U.S. EPA, 2019, p. 10–77).

e. Nervous System Effects

Reflecting the very limited evidence available in the last review, the 2009 ISA did not make a causality determination for long-term PM_{2.5} exposures and nervous system effects (U.S. EPA, 2009c). Since the last review, this body of evidence has grown substantially (U.S. EPA, 2019, section 8.2). Recent studies in adult animals report that long-term PM_{2.5} exposures can lead to morphologic changes in the hippocampus and to impaired learning and memory. This evidence is consistent with epidemiologic studies reporting that long-term PM_{2.5} exposure is associated with reduced cognitive function (U.S. EPA, 2019, section 8.2.5). Further, while the evidence is limited, early markers of Alzheimer’s disease pathology have been reported in rodents following long-term exposure to PM_{2.5} CAPs. These findings support reported associations with neurodegenerative changes in the brain (*i.e.*, decreased brain volume), all-cause dementia, and

hospitalization for Alzheimer’s disease in a small number of epidemiologic studies (U.S. EPA, 2019, section 8.2.6). Additionally, loss of dopaminergic neurons in the substantia nigra, a hallmark of Parkinson disease, has been reported in mice following long-term PM_{2.5} exposures (U.S. EPA, 2019, section 8.2.4), though epidemiologic studies provide only limited support for associations with Parkinson’s disease (U.S. EPA, 2019, section 8.2.6). Overall, the lack of consideration of copollutant confounding introduces some uncertainty in the interpretation of epidemiologic studies of nervous system effects, but this uncertainty is partly addressed by the evidence for an independent effect of PM_{2.5} exposures provided by experimental animal studies.

In addition to the findings described above, which are most relevant to older adults, several recent studies of neurodevelopmental effects in children have also been conducted. Positive associations between long-term exposure to PM_{2.5} during the prenatal period and autism spectrum disorder (ASD) are observed in multiple epidemiologic studies (U.S. EPA, 2019, section 8.2.7.2), while studies of cognitive function provide little support for an association (U.S. EPA, 2019, section 8.2.5.2). Interpretation of these epidemiologic studies is limited due to the small number of studies, their lack of control for potential confounding by copollutants, and uncertainty regarding the critical exposure windows. Biological plausibility is provided for the ASD findings by a study in mice that found inflammatory and morphologic changes in the corpus collosum and hippocampus, as well as ventriculomegaly (*i.e.*, enlarged lateral ventricles) in young mice following prenatal exposure to PM_{2.5} CAPs.

Taken together, the 2019 ISA concludes that the strongest evidence of an effect of long-term exposure to PM_{2.5} on the nervous system is provided by toxicological studies that show inflammation, oxidative stress, morphologic changes, and neurodegeneration in multiple brain regions following long-term exposure of adult animals to PM_{2.5} CAPs. These findings are coherent with epidemiologic studies reporting consistent associations with cognitive decrements and with all-cause dementia. There is also initial, and limited, evidence for neurodevelopmental effects, particularly ASD. The ISA determines that “[o]verall, the collective evidence is sufficient to conclude a likely to be causal relationship between long-term

PM_{2.5} exposure and nervous system effects” (U.S. EPA, 2019, p. 8–61).

In its letter to the Administrator on the draft ISA, the CASAC states that “the Draft ISA does not present adequate evidence to conclude that there is likely to be a causal relationship between long-term PM_{2.5} exposure and nervous system effects” (Cox, 2019a, p. 1 of letter). The CASAC specifically states that “[f]or a likely causal conclusion, there would have to be evidence of health effects in studies where results are not explained by chance, confounding, and other biases, but uncertainties remain in the overall evidence” (Cox, 2019a, p. 20 of consensus responses). These uncertainties in the eyes of CASAC reflect that animal toxicological studies “have largely been done by a single group” (P.20), and for epidemiologic studies that examined brain volume that “brain volumes can vary . . . between normal people” and the results from studies of cognitive function were “largely non-statistically significant”.

With these concerns in mind, the EPA re-evaluated the evidence and note that animal toxicological studies were conducted in “multiple research groups [and show a range of effects including] inflammation, oxidative stress, morphologic changes, and neurodegeneration in multiple brain regions following long-term exposure of adult animals to PM_{2.5} CAPs” (U.S. EPA, 2019, p. 8–61). The results from the animal toxicological studies “are coherent with a number of epidemiologic studies reporting consistent associations with cognitive decrements and with all-cause dementia” (U.S. EPA, 2019, p. 8–61). Additionally, as discussed in the Preamble to the ISAs (U.S. EPA, 2015):

“ . . . the U.S. EPA emphasizes the importance of examining the pattern of results across various studies and does not focus solely on statistical significance or the magnitude of the direction of the association as criteria of study reliability. Statistical significance is influenced by a variety of factors including, but not limited to, the size of the study, exposure and outcome measurement error, and statistical model specifications. Statistical significance . . . is just one of the means of evaluating confidence in the observed relationship and assessing the probability of chance as an explanation. Other indicators of reliability such as the consistency and coherence of a body of studies as well as other confirming data may be used to justify reliance on the results of a body of epidemiologic studies, even if results in individual studies lack statistical significance . . . [Therefore, the U.S. EPA] . . . does not limit its focus or consideration to statistically significant results in epidemiologic studies.”

Therefore, upon re-evaluating the causality determination, when considering the CASAC comments on the Draft PM ISA and applying the causal framework as described (U.S. EPA, 2015; U.S. EPA, 2019, section A.3.2.1), the EPA continues to conclude in the 2019 Final PM ISA that the evidence for long-term PM_{2.5} exposure and nervous system effects supports a “likely to be causal relationship” (U.S. EPA, 2019, p. 8–61).

2. Populations at Risk of PM_{2.5}-Related Health Effects

The NAAQS are meant to protect the population as a whole, including groups that may be at increased risk for pollutant-related health effects. In the last review, based on the evidence assessed in the 2009 ISA (U.S. EPA, 2009c), the 2011 PA focused on children, older adults, people with pre-existing heart and lung diseases, and those of lower socioeconomic status as populations that are “likely to be at increased risk of PM-related effects” (U.S. EPA, 2011, p. 2–31). In the current review, the 2019 ISA cites extensive evidence indicating that “both the general population as well as specific populations and lifestages are at risk for PM_{2.5}-related health effects” (U.S. EPA, 2019, p. 12–1). For example, in support of its “causal” and “likely to be causal” determinations, the ISA cites substantial evidence for:

- PM-related mortality and cardiovascular effects in older adults (U.S. EPA, 2019, sections 11.1, 11.2, 6.1, and 6.2);
- *PM-related cardiovascular effects* in people with pre-existing cardiovascular disease (U.S. EPA, 2019, section 6.1);
- *PM-related respiratory effects* in people with pre-existing respiratory disease, particularly asthma exacerbations in children (U.S. EPA, 2019, section 5.1); and
- PM-related impairments in lung function growth and asthma development in children (U.S. EPA, 2019, sections 5.1 and 5.2; 12.5.1.1).

The ISA additionally notes that stratified analyses (*i.e.*, analyses that directly compare PM-related health effects across groups) provide support for racial and ethnic differences in PM_{2.5} exposures and in PM_{2.5}-related health risk (U.S. EPA, 2019, section 12.5.4). Drawing from such studies, the ISA concludes that “[t]here is strong evidence demonstrating that black and Hispanic populations, in particular, have higher PM_{2.5} exposures than non-Hispanic white populations” and that “there is consistent evidence across multiple studies demonstrating an increase in risk for nonwhite

populations” (U.S. EPA, 2019, p. 12–38). Stratified analyses focusing on other groups also suggest that populations with pre-existing cardiovascular or respiratory disease, populations that are overweight or obese, populations that have particular genetic variants, populations that are of low socioeconomic status, and current/former smokers could be at increased risk for PM_{2.5}-related adverse health effects (U.S. EPA, 2019, Chapter 12).

Thus, the groups at risk of PM_{2.5}-related health effects represent a substantial portion of the total U.S. population. In evaluating the primary PM_{2.5} standards, an important consideration is the potential PM_{2.5}-related public health impacts in these populations.

3. CASAC Advice

In its review of the draft ISA, the CASAC provided advice on the assessment of the scientific evidence for PM-related health and welfare effects and on the process under which this review of the PM NAAQS is being conducted (Cox, 2019b). With regard to the assessment of the evidence, the CASAC recommended that a revised ISA should “provide a clearer and more complete description of the process and criteria for study quality assessment” and that it should include a “[c]learer discussion of causality and causal biological mechanisms and pathways” (Cox, 2019b, p. 1 of letter). The CASAC further advised that the draft ISA “does not present adequate evidence to conclude that there is likely to be a causal relationship between long-term PM_{2.5} exposure and nervous system effects; between long-term ultrafine particulate (UFP) exposure and nervous system effects; or between long-term PM_{2.5} exposure and cancer” (Cox, 2019b, p. 1 of letter).

As discussed above in section I.C.5, and as detailed in the final ISA, to address these comments the EPA: (1) Added text to the Preface and developed a new Appendix to more clearly articulate the process of ISA development; (2) added text to the Preface and to the health effects chapters to clarify the discussion of biological plausibility and its role in forming causality determinations; and (3) revised the determination for long-term UFP exposure and nervous system effects to *suggestive of, but not sufficient to infer, a causal relationship*. The EPA’s rationales for not revising the other causality determinations questioned by the CASAC are discussed above in sections II.B.1.d (*i.e.*, for cancer) and II.B.1.e (*i.e.*, for nervous system effects).

With regard to the process for reviewing the PM NAAQS, the CASAC requested the opportunity to review a 2nd draft ISA (Cox, 2019b, p. 1 of letter) and recommended that “the EPA reappoint the previous CASAC PM panel (or appoint a panel with similar expertise)” (Cox, 2019b, p. 2 of letter). As discussed above in section I.C.5, the Agency’s responses to these recommendations were described in a letter from the Administrator to the CASAC chair.⁴⁰

In addition to the consensus advice noted above, the CASAC did not reach consensus on some issues related to the assessment of the PM_{2.5} health effects evidence. In particular, the CASAC members “had varying opinions on whether there is robust and convincing evidence to support the EPA’s conclusion that there is a causal relationship between PM_{2.5} exposure and mortality” (Cox, 2019b, p. 3 of letter). “Some members of the CASAC” concluded that “the EPA must better justify their determination that short-term or long-term exposure to PM_{2.5} causes mortality” (Cox, 2019b, p. 1 of consensus responses). These members recommended that the ISA should specifically address the biological action of PM and how exposures to low concentrations of PM_{2.5} could cause mortality; the geographic heterogeneity in effect estimates between PM_{2.5} exposure and mortality; concentration concordance across epidemiologic, controlled human exposure and animal toxicological studies (*i.e.*, how the continuum of effects is impacted by the concentrations at which different effects have been observed); uncertainties in the shapes of concentration-response functions and in the potential for thresholds to exist; how results compare between and within studies; and whether PM_{2.5} exposures result in mortality in animal studies (Cox, 2019b, pp. 1–2).

In contrast, “[o]ther members of the CASAC are of the opinion that, although uncertainties remain, the evidence supporting the causal relationship between PM_{2.5} exposure and mortality is robust, diverse, and convincing” (Cox, 2019b, p. 3 of consensus responses). These members noted that epidemiologic observations “have been reproduced around the world in communities with widely varying exposures” and that “the findings of many of the largest studies have been repeatedly reanalyzed, with

⁴⁰ Available at: [https://yosemite.epa.gov/sab/sabproduct.nsf/0/6CBCBCC3025E13B4852583D90047B352/\\$File/EPA-CASAC-19-002_Response.pdf](https://yosemite.epa.gov/sab/sabproduct.nsf/0/6CBCBCC3025E13B4852583D90047B352/$File/EPA-CASAC-19-002_Response.pdf).

confirmation of the original findings” (Cox, 2019b, p. 3). These committee members additionally stated that the ISA’s causality determinations consider “a wide range of evidence from a variety of sources, including human clinical exposure and animal toxicology studies that have provided rational biological plausibility and potential mechanisms” (Cox, 2019b, p. 3). They highlighted the fact that there is new evidence in the current review from epidemiologic studies supporting associations between PM_{2.5} and mortality and new evidence from toxicology studies informing the biological plausibility of mechanisms that could lead to mortality (Cox, 2019b, p. 3).

C. Proposed Conclusions on the Current Primary PM_{2.5} Standards

This section describes the Administrator’s proposed conclusions regarding the adequacy of the current primary PM_{2.5} standards. His approach to reaching these proposed conclusions draws from the ISA’s assessment of the scientific evidence for health effects attributable to PM_{2.5} exposures (U.S. EPA, 2019) and the analyses in the PA (U.S. EPA, 2020), including uncertainties in the evidence and analyses. Section II.C.1 discusses the evidence- and risk-based considerations in the PA. Section II.C.2 summarizes CASAC advice on the current primary PM_{2.5} standards, based on its review of the draft PA (Cox, 2019a). Section II.C.3 presents the Administrator’s proposed decision to retain the current primary PM_{2.5} standards.

1. Evidence- and Risk-Based Considerations in the Policy Assessment

The Administrator’s proposed decision in this review draws from his consideration of the PM_{2.5} health evidence assessed in the ISA (U.S. EPA, 2019) and the evidence- and risk-based analyses presented in the PA (U.S. EPA, 2020), including the uncertainties inherent in the evidence and analyses. The sections below summarize the consideration of the evidence-based information (II.C.1.a) and risk-based information (II.C.1.b) in the PA.

a. Evidence-Based Considerations

The PA considers the degree to which the available scientific evidence provides support for the current and potential alternative standards in terms of the basic elements of those standards (*i.e.*, indicator, averaging time, form, and level). With regard to the current indicator, averaging times, and forms, the PA concludes that the available evidence continues to support these elements in the current review. For

indicator, the PA specifically concludes that available studies provide strong support for health effects following long- and short-term PM_{2.5} exposures and that the evidence is too limited to support potential alternatives (U.S. EPA, 2020, section 3.5.2.1). For averaging time, the PA notes that epidemiologic studies continue to provide strong support for health effects based on annual (or multiyear) and 24-hour PM_{2.5} averaging periods and concludes that the evidence does not support considering alternatives (U.S. EPA, 2020, section 3.5.2.2). For form, the PA notes that the foremost consideration is the adequacy of the public health protection provided by the combination of the form and the other elements of the standard. It concludes that (1) the form of the current annual standard (*i.e.*, arithmetic mean, averaged over three years) remains appropriate for targeting protection against the annual and daily PM_{2.5} exposures around the middle portion of the PM_{2.5} air quality distribution, and (2) the form of the current 24-hour standard (98th percentile, averaged over three years) continues to provide an appropriate balance between limiting the occurrence of peak 24-hour PM_{2.5} concentrations and identifying a stable target for risk management programs (U.S. EPA, 2020, section 3.5.2.3).

With regard to level, the considerations in the PA reflect analyses of the PM_{2.5} exposures and ambient concentrations in studies reporting PM_{2.5}-related health effects (U.S. EPA, 2020). As noted above, the focus is on health outcomes for which the ISA concludes the evidence supports a “causal” or a “likely to be causal” relationship with PM exposures.⁴¹ While the causality determinations in the ISA are informed by studies evaluating a wide range of PM_{2.5} concentrations, the PA considers the degree to which the evidence supports the occurrence of PM-related effects at concentrations relevant to informing conclusions on the primary PM_{2.5} standards. Section II.C.1.a.i below summarizes the PA’s consideration of exposure concentrations that have been evaluated in experimental studies and section II.C.1.a.ii summarizes the PA’s consideration of ambient concentrations in locations evaluated by epidemiologic studies.

⁴¹ As discussed above in II.A.2, such a focus recognizes that standards set to provide protection based on evidence for “causal” and “likely to be causal” health outcomes will also provide some measure of protection against the broader range of PM_{2.5}-associated outcomes, including those for which the evidence is less certain.

i. PM_{2.5} Exposure Concentrations Evaluated in Experimental Studies

Evidence for a particular PM_{2.5}-related health outcome is strengthened when results from experimental studies demonstrate biologically plausible mechanisms through which adverse human health outcomes could occur (U.S. EPA, 2015, Preamble p. 20). Two types of experimental studies are of particular importance in understanding the effects of PM exposures: Controlled human exposure and animal toxicology studies. In such studies, investigators expose human volunteers or laboratory animals, respectively, to known concentrations of air pollutants under carefully regulated environmental conditions and activity levels. Thus, controlled human exposure and animal toxicology studies can provide information on the health effects of experimentally administered pollutant exposures under well-controlled laboratory conditions (U.S. EPA, 2015, Preamble, p. 11). The sections below summarize the PA’s evaluation of the PM_{2.5} exposure concentrations that have been examined in controlled human exposure studies and animal toxicology studies.

Controlled Human Exposure Studies

Controlled human exposure studies have reported that PM_{2.5} exposures lasting from less than one hour up to five hours can impact cardiovascular function (U.S. EPA, 2019, section 6.1). The most consistent evidence from these studies is for impaired vascular function (U.S. EPA, 2019, section 6.1.13.2). In addition, although less consistent, the ISA notes that studies examining PM_{2.5} exposures also provide evidence for increased blood pressure (U.S. EPA, 2019, section 6.1.6.3), conduction abnormalities/arrhythmia (U.S. EPA, 2019, section 6.1.4.3), changes in heart rate variability (U.S. EPA, 2019, section 6.1.10.2), changes in hemostasis that could promote clot formation (U.S. EPA, 2019, section 6.1.12.2), and increases in inflammatory cells and markers (U.S. EPA, 2019, section 6.1.11.2).

Table 3–2 in the PA (U.S. EPA, 2020) summarizes information from the ISA on available controlled human exposure studies that evaluate effects on markers of cardiovascular function following exposures to PM_{2.5}. Most of the controlled human exposure studies in Table 3–2 of the PA have evaluated average PM_{2.5} exposure concentrations at or above about 100 µg/m³, with exposure durations typically up to about two hours. Statistically significant effects on one or more indicators of

cardiovascular function are often, though not always, reported following 2-hour exposures to average PM_{2.5} concentrations at and above about 120 µg/m³, with less consistent evidence for effects following exposures to lower concentrations. Impaired vascular function, the effect identified in the ISA as the most consistent across studies (U.S. EPA, 2019, section 6.1.13.2), is shown following 2-hour exposures to PM_{2.5} concentrations at and above 149 µg/m³. Mixed results are reported in the few studies that evaluate longer exposure durations (*i.e.*, longer than 2 hours) and lower PM_{2.5} concentrations (U.S. EPA, 2020, section 3.2.3.1).

To provide some insight into what these studies may indicate regarding the primary PM_{2.5} standards, analyses in the PA examine monitored 2-hour PM_{2.5} concentrations at sites meeting the current standards (U.S. EPA, 2020, section 3.2.3.1). At these sites, most 2-hour concentrations are below 11 µg/m³, and they almost never exceed 32 µg/m³. Even the highest 2-hour concentrations remain well-below the exposure concentrations consistently shown to cause effects in controlled human exposure studies (*i.e.*, 99.9th percentile of 2-hour concentrations is 68 µg/m³ during the warm season). Thus, while controlled human exposure studies support the plausibility of the serious cardiovascular effects that have been linked with ambient PM_{2.5} exposures (U.S. EPA, 2019, Chapter 6), the PA notes that the PM_{2.5} exposures evaluated in most of these studies are well-above the ambient concentrations typically measured in locations meeting the current primary standards (U.S. EPA, 2020, section 3.2.3.2.1).

Animal Toxicology Studies

The ISA relies on animal toxicology studies to support the plausibility of a wide range of PM_{2.5}-related health effects. While animal toxicology studies often examine more severe health outcomes and longer exposure durations than controlled human exposure studies, there is uncertainty in extrapolating the effects seen in animals, and the PM_{2.5} exposures and doses that cause those effects, to human populations.

As with controlled human exposure studies, most of the animal toxicology studies assessed in the ISA have examined effects following exposures to PM_{2.5} concentrations well-above the concentrations likely to be allowed by the current PM_{2.5} standards. Such studies have generally examined short-term exposures to PM_{2.5} concentrations from 100 to >1,000 µg/m³ and long-term exposures to concentrations from 66 to

>400 µg/m³ (*e.g.*, see U.S. EPA, 2019, Table 1–2). Two exceptions are a study reporting impaired lung development following long-term exposures (*i.e.*, 24 hours per day for several months prenatally and postnatally) to an average PM_{2.5} concentration of 16.8 µg/m³ (Mauad et al., 2008) and a study reporting increased carcinogenic potential following long-term exposures (*i.e.*, 2 months) to an average PM_{2.5} concentration of 17.7 µg/m³ (Cangerana Pereira et al., 2011). These two studies report serious effects following long-term exposures to PM_{2.5} concentrations close to the ambient concentrations reported in some PM_{2.5} epidemiologic studies (U.S. EPA, 2019, Table 1–2), though still above the ambient concentrations likely to occur in areas meeting the current primary standards. Thus, as is the case with controlled human exposure studies, animal toxicology studies support the plausibility of various adverse effects that have been linked to ambient PM_{2.5} exposures (U.S. EPA, 2019), but have not evaluated PM_{2.5} exposures likely to occur in areas meeting the current primary standards.

ii. Ambient Concentrations in Locations of Epidemiologic Studies

As summarized above in section II.B.1, epidemiologic studies examining associations between daily or annual average PM_{2.5} exposures and mortality or morbidity represent a large part of the evidence base supporting several of the ISA's "causal" and "likely to be causal" determinations for cardiovascular effects, respiratory effects, cancer, and mortality. The PA uses two approaches to consider what information from epidemiologic studies may indicate regarding primary PM_{2.5} standards (U.S. EPA, 2020, section 3.2.3.2). In one approach, the PA evaluates the PM_{2.5} air quality distributions reported by key epidemiologic studies, with a focus on overall mean PM_{2.5} concentrations (*i.e.*, averages over the study period of the daily or annual PM_{2.5} concentrations used to estimate exposures) and the concentrations somewhat below these overall means (*i.e.*, corresponding to the lower quartiles of exposure or health data) (U.S. EPA, 2020, section 3.2.3.2.1). In another approach, the PA calculates study area air quality metrics similar to PM_{2.5} design values (*i.e.*, referred to as pseudo-design values) and considers the degree to which such metrics indicate that study area air quality would likely have met or violated the current standards during study periods (U.S. EPA, 2020, section 3.2.3.2.2). These approaches are discussed briefly below.

PM_{2.5} Air Quality Distributions Associated With Mortality or Morbidity

The PA evaluates the PM_{2.5} air quality distributions over which epidemiologic studies support health effect associations and the degree to which such distributions are likely to occur in areas meeting the current standards. As discussed further in the PA (U.S. EPA, 2020, section 3.2.3.2.1), epidemiologic studies generally provide the strongest support for reported health effect associations over the part of the air quality distribution corresponding to the bulk of the underlying data (*i.e.*, estimated exposures and/or health events), often falling in the middle part of the distribution (*i.e.*, rather than at the extreme upper or lower ends). Thus, in considering PM_{2.5} air quality data from epidemiologic studies, the PA evaluates study-reported means (or medians) of daily and annual average PM_{2.5} concentrations as proxies for the middle portions of the air quality distributions that support reported associations. When data are available, the PA also considers the broader PM_{2.5} air quality distributions around the overall mean concentrations, with a focus on the lower quartiles of data to provide insight into the concentrations below which data supporting reported associations become relatively sparse.

Based on its evaluation of study-reported PM_{2.5} concentrations, the PA notes that key epidemiologic studies conducted in the U.S. or Canada report generally positive and statistically significant associations between estimated PM_{2.5} exposures (short- or long-term) and mortality or morbidity across a wide range of ambient PM_{2.5} concentrations (U.S. EPA, 2020, section 3.2.3.2.1). With regard to these study-reported concentrations, the PA makes a number of observations, including the following:

- For the large majority of key studies, the PM_{2.5} air quality distributions that support reported associations are characterized by overall mean (or median) PM_{2.5} concentrations ranging from just above 8.0 µg/m³ to just above 16.0 µg/m³. Most of these key studies, including all but one U.S. study, report overall mean (or median) concentrations at or above 9.6 µg/m³.
- Several U.S. studies report positive and statistically significant health effect associations in analyses restricted to annual average PM_{2.5} concentrations <12 µg/m³ (Lee et al. (2015); Shi et al. (2016); Di et al., 2017b). Studies also report positive and statistically significant health effect associations in analyses restricted to days with 24-hour average PM_{2.5} concentrations <35 µg/m³

(Lee et al. (2015); Shi et al. (2016); Di et al. (2017a)).

- For some key studies, information on the broader distributions of PM_{2.5} exposure estimates and/or health events is available. In these studies, ambient PM_{2.5} concentrations corresponding to 25th percentiles of the underlying data (*i.e.*, estimated exposures or health events) are generally >6.0 µg/m³.

- A small group of studies report increased life expectancy, decreased mortality, and decreased respiratory effects following past declines in ambient PM_{2.5} concentrations. These studies have examined “starting” annual average PM_{2.5} concentrations (*i.e.*, prior to the reductions being evaluated) ranging from about 13 to >20 µg/m³ (*i.e.*, U.S. EPA, 2020, Table 3–3).

The PA concludes that the overall mean PM_{2.5} concentrations reported by several of these key epidemiologic studies are likely below the long-term mean concentrations (*i.e.*, averaged across space and over time) in areas just meeting the current annual PM_{2.5} standard (U.S. EPA, 2020, section 3.2.3.3). The PA also concludes that there are uncertainties in using study-reported concentrations to inform conclusions on the primary PM_{2.5} standards (U.S. EPA, 2020, section 3.2.3.2.1). For example, the overall mean PM_{2.5} concentrations reported by key epidemiologic studies are not the same as the ambient concentrations used by the EPA to determine whether areas meet or violate the PM NAAQS. Overall mean PM_{2.5} concentrations in key studies reflect averaging of short- or long-term PM_{2.5} exposure estimates across locations (*i.e.*, across multiple monitors or across modeled grid cells) and over time (*i.e.*, over several years). In contrast, to determine whether areas meet or violate the NAAQS, the EPA measures air pollution concentrations at individual monitors (*i.e.*, concentrations are not averaged across monitors) and calculates “design values” at monitors meeting appropriate data quality and completeness criteria. For the annual PM_{2.5} standard, design values are calculated as the annual arithmetic mean PM_{2.5} concentration, averaged over 3 years (described in appendix N of 40 CFR part 50). For an area to meet the NAAQS, all valid design values in that area, including the highest monitored values, must be at or below the level of the standard. Additional uncertainties associated with using the PM_{2.5} concentrations reported by key epidemiologic studies to inform conclusions on the primary PM_{2.5} standards result from the fact that (1) epidemiologic studies do not identify specific PM_{2.5} exposures that result in

health effects or exposures below which effects do not occur and (2) exposure estimates in some recent studies are based on hybrid modeling approaches for which performance depends on the availability of monitoring data and varies by location. These results and uncertainties are discussed in detail in the PA (U.S. EPA, 2020, section 3.2.3.2.1).

PM_{2.5} Pseudo-Design Values in Epidemiologic Study Locations

As noted above, a key uncertainty in using study-reported PM_{2.5} concentrations to inform conclusions on the primary PM_{2.5} standards is that they reflect the averages of daily or annual PM_{2.5} air quality concentrations or exposure estimates in the study population over the years examined by the study, and are not the same as the PM_{2.5} design values used by the EPA to determine whether areas meet the NAAQS. Therefore, the PA also considers a second approach to evaluating information from epidemiologic studies. In this approach, the PA calculates study area air quality metrics similar to PM_{2.5} design values (*i.e.*, referred to in the PA as pseudo-design values; U.S. EPA, 2020, section 3.2.3.2.2) and considers the degree to which such metrics indicate that study area air quality would likely have met or violated the current standards during study periods. When pseudo-design values in individual study locations are linked with the populations living in those locations, or with the number of study-specific health events recorded in those locations, these values can provide insight into the degree to which reported health effect associations are based on air quality likely to have met or violated the current (or alternative) primary PM_{2.5} standards. The results of these analyses are summarized below in Table 1 (from U.S. EPA, 2020, Appendix B, Tables B–5 and B–6).

TABLE 1—SUMMARY OF RESULTS FROM ANALYSIS OF PM_{2.5} PSEUDO-DESIGN VALUES IN LOCATIONS OF KEY U.S. AND CANADIAN MULTICITY STUDIES

[From U.S. EPA, 2020, Table B–5]

| Percent of population/ health events in locations meeting current standards | Number of studies (of the 29 evaluated) |
|--|--|
| > 25% | 17 |
| > 50% | 9 |
| > 75% | 4 |
| < 25% | 12 |

Given the results of these analyses, the PA concludes that several key epidemiologic studies report positive and statistically significant PM_{2.5} health effect associations based largely, or entirely, on air quality likely to be allowed by the current primary PM_{2.5} standards (U.S. EPA, 2020, section 3.2.3.3). The PA also concludes that there are important uncertainties to consider when using this information to inform conclusions on the primary PM_{2.5} standards. For example, for most key multicity studies, some study locations would likely have met the current primary standards over study periods while others would likely have violated one or both standards, complicating the interpretation of these analyses. In addition, pseudo-design values are averaged over multiyear study periods of varying lengths, rather than reflecting the three-year averages of actual design values; analyses necessarily focus on locations with at least one PM_{2.5} monitor, while unmonitored areas are not included; and recent changes to PM_{2.5} monitoring requirements are not reflected in analyses of pseudo-design values. These results and uncertainties are discussed in greater detail in the PA (U.S. EPA, 2020, section 3.2.3.2.2).

b. Risk-Based Considerations

In addition to evaluating PM_{2.5} concentrations in locations of key epidemiologic studies, the PA includes a risk assessment that estimates population-level health risks associated with PM_{2.5} air quality that has been adjusted to simulate air quality scenarios of policy interest (*e.g.*, “just meeting” the current standards). The general approach to estimating PM_{2.5}-associated health risks combines concentration-response functions from epidemiologic studies with model-based PM_{2.5} air quality surfaces, baseline health incidence data, and population demographics for forty-seven urban study areas (U.S. EPA, 2020, section 3.3, Figure 3–10 and Appendix C).

The risk assessment estimates that the current primary PM_{2.5} standards could allow a substantial number of PM_{2.5}-associated deaths in the U.S. For example, when air quality in the 47 study areas is adjusted to simulate just meeting the current standards, the risk assessment estimates from about 16,000 to 17,000 long-term PM_{2.5} exposure-related deaths from ischemic heart disease in a single year (*i.e.*, confidence intervals range from about 12,000 to

21,000 deaths).⁴² Compared to the current annual standard, meeting a revised annual standard with a lower level is estimated to reduce PM_{2.5}-associated health risks by about 7 to 9% for a level of 11.0 µg/m³, 14 to 18% for a level of 10.0 µg/m³, and 21 to 27% for a level of 9.0 µg/m³.

Limitations in the underlying data and risk assessment approaches lead to uncertainty in these estimates of PM_{2.5}-associated risks (e.g., in the size of risk estimates). Uncertainty in risk estimates results from a number of factors, including assumptions about the shape of the concentration-response relationship with mortality at low ambient PM concentrations, the potential for confounding and/or exposure measurement error in the underlying epidemiologic studies, and the methods used to adjust PM_{2.5} air quality. The PA characterizes these and other sources of uncertainty in risk estimates using a combination of quantitative and qualitative approaches (U.S. EPA, 2020, Appendix C, section C.3).

2. CASAC Advice

As part of its review of the draft PA, the CASAC has provided advice on the adequacy of the public health protection afforded by the current primary PM_{2.5} standards.⁴³ Its advice is documented in a letter sent to the EPA Administrator (Cox, 2019a). In this letter, the committee recommends retaining the current 24-hour PM_{2.5} standard but does not reach consensus on whether the scientific and technical information support retaining or revising the current annual standard. In particular, though the CASAC agrees that there is a long-standing body of health evidence supporting relationships between PM_{2.5} exposures and various health outcomes, including mortality and serious morbidity effects, individual CASAC members “differ in their assessments of the causal and policy significance of these associations” (Cox, 2019a, p. 8 of consensus responses). Drawing from this evidence, “some CASAC members” express support for retaining the current

annual standard while “other members” express support for revising that standard in order to increase public health protection (Cox, 2019a, p.1 of letter). These views are summarized below.

The CASAC members who support retaining the current annual standard express the view that substantial uncertainty remains in the evidence for associations between PM_{2.5} exposures and mortality or serious morbidity effects. These committee members assert that “such associations can reasonably be explained in light of uncontrolled confounding and other potential sources of error and bias” (Cox, 2019a, p. 8 of consensus responses). They note that associations do not necessarily reflect causal effects, and they contend that recent epidemiologic studies reporting positive associations at lower estimated exposure concentrations mainly confirm what was anticipated or already assumed in setting the 2012 NAAQS. In particular, they conclude that such studies have some of the same limitations as prior studies and do not provide new information calling into question the existing standard. They further assert that “accountability studies provide potentially crucial information about whether and how much decreasing PM_{2.5} causes decreases in future health effects” (Cox, 2019a, p. 10), and they cite recent reviews (i.e., Henneman et al., 2017; Burns et al., 2019) to support their position that in such studies, “reductions of PM_{2.5} concentrations have not clearly reduced mortality risks” (Cox, 2019a, p. 8 of consensus responses). Thus, the committee members who support retaining the current annual standard advise that, “while the data on associations should certainly be carefully considered, this data should not be interpreted more strongly than warranted based on its methodological limitations” (Cox, 2019a, p. 8 of consensus responses).

These members of the CASAC further conclude that the PM_{2.5} risk assessment does not provide a valid basis for revising the current standards. This conclusion is based on concerns that (1) “the risk assessment treats regression coefficients as causal coefficients with no justification or validation provided for this decision;” (2) the estimated regression concentration-response functions “have not been adequately adjusted to correct for confounding, errors in exposure estimates and other covariates, model uncertainty, and heterogeneity in individual biological (causal) [concentration-response] functions;” (3) the estimated concentration-response functions “do

not contain quantitative uncertainty bands that reflect model uncertainty or effects of exposure and covariate estimation errors;” and (4) “no regression diagnostics are provided justifying the use of proportional hazards . . . and other modeling assumptions” (Cox, 2019a, p. 9 of consensus responses). These committee members also contend that details regarding the derivation of concentration-response functions, including specification of the beta values and functional forms, are not well-documented, hampering the ability of readers to evaluate these design details. Thus, these members “think that the risk characterization does not provide useful information about whether the current standard is protective” (Cox, 2019a, p. 11 of consensus responses).

Drawing from their evaluation of the evidence and the risk assessment, these committee members conclude that “the Draft PM PA does not establish that new scientific evidence and data reasonably call into question the public health protection afforded by the current 2012 PM_{2.5} annual standard” (Cox, 2019a, p.1 of letter).

In contrast, “[o]ther members of CASAC conclude that the weight of the evidence, particularly reflecting recent epidemiology studies showing positive associations between PM_{2.5} and health effects at estimated annual average PM_{2.5} concentrations below the current standard, does reasonably call into question the adequacy of the 2012 annual PM_{2.5} [standard] to protect public health with an adequate margin of safety” (Cox, 2019a, p.1 of letter). The committee members who support this conclusion note that the body of health evidence for PM_{2.5} includes not only the repeated demonstration of associations in epidemiologic studies, but also includes support for biological plausibility established by controlled human exposure and animal toxicology studies. They point to recent studies demonstrating that the associations between PM_{2.5} and health effects occur in a diversity of locations, in different time periods, with different populations, and using different exposure estimation and statistical methods. They conclude that “the entire body of evidence for PM health effects justifies the causality determinations made in the Draft PM ISA” (Cox, 2019a, p. 8 of consensus responses).

The members of the CASAC who support revising the current annual standard particularly emphasize recent findings of associations with PM_{2.5} in areas with average long-term PM_{2.5} concentrations below the level of the

⁴² For the only other cause-specific mortality endpoint evaluated (i.e., lung cancer), substantially fewer deaths were estimated (U.S. EPA, 2020, section 3.3.2, e.g., Figure 3–5). Risk estimates were not generated for other “likely to be causal” outcome categories (i.e., respiratory effects, nervous system effects).

⁴³ The CASAC also provided advice on the draft ISA’s assessment of the scientific evidence (Cox, 2019b) and on the analyses and information in the draft PA (Cox, 2019a), which drew from the draft ISA. That advice, and the resulting changes made in the final ISA and final PA, are summarized above in sections I.C.5, II.B.1.d, II.B.1.e and II.B.3, and in the final ISA (U.S. EPA, 2019, ES–3 to ES–4) and the final PA (U.S. EPA, 2020, section 1.4).

annual standard and studies that show positive associations even when estimated exposures above 12 $\mu\text{g}/\text{m}^3$ are excluded from analyses. They find it “highly unlikely” that the extensive body of evidence indicating positive associations at low estimated exposures could be fully explained by confounding or by other non-causal explanations (Cox, 2019a, p. 8 of consensus responses). They additionally conclude that “the risk characterization does provide a useful attempt to understand the potential impacts of alternate standards on public health risks” (Cox, 2019a, p. 11 of consensus responses). These committee members conclude that the evidence available in this review reasonably calls into question the protection provided by the current primary $\text{PM}_{2.5}$ standards and supports revising the annual standard to increase that protection (Cox, 2019a).

3. Administrator’s Proposed Decision on the Current Primary $\text{PM}_{2.5}$ Standards

This section summarizes the Administrator’s considerations and conclusions related to the current primary $\text{PM}_{2.5}$ standards and presents his proposed decision to retain those standards, without revision. As described above (section II.A.2), his approach to considering the adequacy of the current standards focuses on evaluating the public health protection afforded by the annual and 24-hour standards, taken together, against mortality and morbidity associated with long- or short-term $\text{PM}_{2.5}$ exposures. This approach recognizes that changes in $\text{PM}_{2.5}$ air quality designed to meet either the annual or the 24-hour standard would likely result in changes to both long-term average and short-term peak $\text{PM}_{2.5}$ concentrations and that the protection provided by the suite of standards results from the combination of all of the elements of those standards (*i.e.*, indicator, averaging time, form, level). Thus, the Administrator’s consideration of the public health protection provided by the current primary $\text{PM}_{2.5}$ standards is based on his consideration of the combination of the annual and 24-hour standards, including the indicators ($\text{PM}_{2.5}$), averaging times, forms (arithmetic mean and 98th percentile, averaged over three years), and levels (12.0 $\mu\text{g}/\text{m}^3$, 35 $\mu\text{g}/\text{m}^3$) of those standards.

In establishing primary standards under the Act that are “requisite” to protect public health with an adequate margin of safety, the Administrator is seeking to establish standards that are neither more nor less stringent than necessary for this purpose. He recognizes that the requirement to

provide an adequate margin of safety was intended to address uncertainties associated with inconclusive scientific and technical information and to provide a reasonable degree of protection against hazards that research has not yet identified. However, the Act does not require that primary standards be set at a zero-risk level; rather, the NAAQS must be sufficiently protective, but not more stringent than necessary.

Given these requirements, the Administrator’s final decision in this review will be a public health policy judgment drawing upon scientific and technical information examining the health effects of $\text{PM}_{2.5}$ exposures, including how to consider the range and magnitude of uncertainties inherent in that information. This public health policy judgment will be based on an interpretation of the scientific and technical information that neither overstates nor understates its strengths and limitations, nor the appropriate inferences to be drawn, and will be informed by the Administrator’s consideration of advice from the CASAC and public comments received on this proposal document.

With regard to the CASAC, the Administrator recognizes that while the committee supports retaining the current 24-hour $\text{PM}_{2.5}$ standard, it does not reach consensus on the annual standard (Cox, 2019a, pp. 1–3 of letter). In particular, some members of the CASAC conclude that the new scientific evidence and data do not reasonably call into question the public health protection afforded by the current annual standard, while other members conclude that the weight of the evidence does reasonably call into question the adequacy of that standard (Cox, 2019a, p. 1 of letter).

As discussed above (II.C.2), the CASAC members who support retaining the annual standard emphasize their concerns with available $\text{PM}_{2.5}$ epidemiologic studies. They assert that recent studies “mainly confirmed what had already been anticipated or assumed in setting the 2012 NAAQS” (Cox, 2019a, p. 8 consensus responses) and do not provide a basis for revising the current standards. They also identify several key concerns regarding the associations reported in $\text{PM}_{2.5}$ epidemiologic studies and conclude that “while the data on associations should certainly be carefully considered, this data should not be interpreted more strongly than warranted based on its methodological limitations” (Cox, 2019a, p. 8 consensus responses).

One of the methodological limitations highlighted by these committee members is that associations reported in

epidemiologic studies are not necessarily indicative of causal relationships and such associations “can reasonably be explained in light of uncontrolled confounding and other potential sources of error and bias” (Cox, 2019a, p. 8). Thus, these committee members do not think that recent epidemiologic studies reporting health effect associations at $\text{PM}_{2.5}$ air quality concentrations likely to have met the current primary standards support revising those standards.

Consistent with the views expressed by these CASAC members, the Administrator recognizes that epidemiologic studies examine associations between distributions of $\text{PM}_{2.5}$ air quality and health outcomes, and they do not identify particular $\text{PM}_{2.5}$ exposures that cause effects (U.S. EPA, 2020, section 3.1.2). In contrast, he notes that experimental studies (*i.e.*, controlled human exposure, animal toxicology) do provide evidence for health effects following particular $\text{PM}_{2.5}$ exposures under carefully controlled laboratory conditions (*e.g.*, U.S. EPA, 2015, Preamble Chapters 5 and 6). He further notes that the evidence for a given $\text{PM}_{2.5}$ -related health outcome is strengthened when results from experimental studies demonstrate biologically plausible mechanisms through which such an outcome could occur (*e.g.*, U.S. EPA, 2015, Preamble p. 20). Thus, when using the $\text{PM}_{2.5}$ health evidence to inform conclusions on the adequacy of the current primary standards, the Administrator is most confident in the potential for $\text{PM}_{2.5}$ exposures to cause adverse effects at concentrations supported by multiple types of studies, including experimental studies as well as epidemiologic studies.

In light of this approach to considering the evidence, the Administrator recognizes that controlled human exposure and animal toxicology studies report a wide range of effects, many of which are plausibly linked to the serious cardiovascular and respiratory outcomes reported in epidemiologic studies (including mortality), though the $\text{PM}_{2.5}$ exposures examined in these studies are above the concentrations typically measured in areas meeting the current annual and 24-hour standards (U.S. EPA, 2020, section 3.2.3.1). In the absence of evidence from experimental studies that $\text{PM}_{2.5}$ exposures typical of areas meeting the current annual and 24-hour standards can activate biological pathways that plausibly contribute to serious health outcomes, the Administrator is cautious about placing too much weight on reported $\text{PM}_{2.5}$ health effect associations for air quality

meeting those standards. He concludes that such associations alone, without supporting experimental evidence at similar PM_{2.5} concentrations, leave important questions unanswered regarding the degree to which the typical PM_{2.5} exposures likely to occur in areas meeting the current standards can cause the mortality or morbidity outcomes reported in epidemiologic studies. Given this concern, the Administrator does not think that recent epidemiologic studies reporting health effect associations at PM_{2.5} air quality concentrations likely to have met the current primary standards support revising those standards. Rather, he judges that the overall body of evidence, including controlled human exposure and animal toxicological studies, in addition to epidemiologic studies, indicates continuing uncertainty in the degree to which adverse effects could result from PM_{2.5} exposures in areas meeting the current annual and 24-hour standards.

The Administrator additionally considers the emerging body of evidence from studies examining past reductions in ambient PM_{2.5}, and the degree to which those reductions have resulted in public health improvements. As an initial matter, he notes the observation from some CASAC members (*i.e.*, those who support retaining the current annual standard) that in accountability studies, “reductions of PM_{2.5} concentrations have not clearly reduced mortality risks, especially when confounding was tightly controlled” (Cox, 2019a, p. 8). The Administrator recognizes that interpreting such studies in the context of the current primary PM_{2.5} standards is also complicated by the fact that some of the available studies have not evaluated PM_{2.5} specifically (*e.g.*, as opposed to PM₁₀ or total suspended particulates), did not show changes in PM_{2.5} air quality, or have not been able to disentangle health impacts of the interventions from background trends in health (U.S. EPA, 2020, section 3.5.1). He further recognizes that the small number of available studies that do report public health improvements following past declines in ambient PM_{2.5} have not examined air quality meeting the current standards (U.S. EPA, 2020, Table 3–3). This includes recent U.S. studies that report increased life expectancy, decreased mortality, and decreased respiratory effects following past declines in ambient PM_{2.5} concentrations. Such studies have examined “starting” annual average PM_{2.5} concentrations (*i.e.*, prior to the reductions being evaluated) ranging

from about 13 to > 20 µg/m³ (*i.e.*, U.S. EPA, 2020, Table 3–3). It also includes a recent study conducted in Japan that reports reduced mortality following reductions in ambient PM_{2.5} due to the introduction of diesel emission controls (Yorifuji et al., 2016). As in the U.S. studies, ambient PM_{2.5} concentrations in this study were above those allowed by the current primary PM_{2.5} standards. Given the lack of studies reporting public health improvements attributable to reductions in ambient PM_{2.5} in locations meeting the current standards, together with his broader concerns regarding the lack of experimental studies examining PM_{2.5} exposures typical of areas meeting the current standards (discussed above), the Administrator judges that there is considerable uncertainty in the potential for increased public health protection from further reductions in ambient PM_{2.5} concentrations beyond those achieved under the current primary PM_{2.5} standards.

In addition to the evidence, the Administrator considers the potential implications of the risk assessment for his proposed decision. In doing so, he notes that all risk assessments have limitations and that, in previous reviews, these limitations have often resulted in less weight being placed on quantitative estimates of risk than on the underlying scientific evidence itself (*e.g.*, 78 FR 3128, January 15, 2013). Such limitations in risk estimates can result from uncertainty in the shapes of concentration-response functions, particularly at low concentrations; uncertainties in the methods used to adjust air quality; and uncertainty in estimating risks for populations, locations and air quality distributions different from those examined in the underlying epidemiologic study (U.S. EPA, 2020, section 3.3.2.4).

In addition to these general uncertainties with risk assessments, the Administrator notes the concerns expressed by members of the CASAC who support retaining the current standards. Their concerns largely reflect their overall views on the limitations in the PM_{2.5} epidemiologic evidence, which provides key inputs to the risk assessment. These committee members assert that “the conclusions from the risk assessment do not comprise valid empirical evidence or grounds for revising the current NAAQS” (Cox, 2019a, p. 9 consensus responses). As discussed above, the Administrator agrees with the broad concerns expressed by these members of the CASAC regarding associations at PM_{2.5} concentrations meeting the current standards. He further notes their

concerns regarding the characterization of uncertainty in the risk assessment and the evaluation of modeling assumptions (Cox, 2019a). In light of these concerns, together with the more general uncertainty in risk estimates summarized above, the Administrator judges it appropriate to place little weight on quantitative estimates of PM_{2.5}-associated mortality risk in reaching conclusions on the primary PM_{2.5} standards.

When the above considerations are taken together, the Administrator proposes to conclude that the scientific evidence that has become available since the last review of the PM NAAQS, together with the analyses in the PA based on that evidence, does not call into question the public health protection provided by the current annual and 24-hour PM_{2.5} standards. In particular, the Administrator judges that there is considerable uncertainty in the potential public health impacts of reductions in ambient PM_{2.5} below the concentrations achieved under the current primary standards and, therefore, that standards more stringent than the current standards (*e.g.*, with lower levels) are not supported. That is, he judges that such standards would be more than requisite to protect the public health with an adequate margin of safety. As described above, this judgment reflects his consideration of the uncertainties in the potential implications of recent epidemiologic studies due in part to the lack of supporting evidence from experimental studies and retrospective accountability studies conducted at PM_{2.5} concentrations meeting the current standards.

For the 24-hour standard, he notes that this judgment is consistent with the consensus advice of the CASAC (Cox, 2019). For the annual standard, this judgment is consistent with the advice of some CASAC members and reflects the Administrator’s disagreement with the “[o]ther members of CASAC” who recommend revising the current annual standard based largely on evidence from recent epidemiology studies (Cox, 2019a, p. 1 of letter).

In addition, based on the Administrator’s review of the science, including experimental and accountability studies conducted at levels just above the current standard, he judges that the degree of public health protection provided by the current standard is not greater than warranted. This judgment, together with the fact that no CASAC member expressed support for a less stringent standard, leads the Administrator to conclude that standards less stringent

than the current standards (*e.g.*, with higher levels) are also not supported.

When the above information is taken together, the Administrator proposes to conclude that the available scientific evidence and technical information continue to support the current annual and 24-hour PM_{2.5} standards. This proposed conclusion reflects the fact that important limitations in the evidence remain. The Administrator proposes to conclude that these limitations lead to considerable uncertainty regarding the potential public health implications of revising the existing suite of PM_{2.5} standards. Given this uncertainty, and the advice from some CASAC members, he proposes to conclude that the current suite of primary standards, including the current indicators (PM_{2.5}), averaging times (annual and 24-hour), forms (arithmetic mean and 98th percentile, averaged over three years) and levels (12.0 µg/m³, 35 µg/m³), when taken together, remain requisite to protect the public health. Therefore, the Administrator proposes to retain the current suite of primary PM_{2.5} standards, without revision, in this review. He solicits comment on this proposed decision and on the supporting rationale described above.

III. Rationale for Proposed Decisions on the Primary PM₁₀ Standard

The current primary PM₁₀ standard is intended to protect the public health against exposures to PM_{10-2.5} (78 FR 3164, January 15, 2013). This section provides the rationale supporting the Administrator's proposed decision to retain the current primary PM₁₀ standard. Section III.A summarizes the Agency's approach to reaching a decision on the primary PM₁₀ standard in the last review and presents the general approach to reaching a proposed decision in this review. Section III.B summarizes the scientific evidence for PM_{10-2.5}-related health effects. Section III.C presents the Administrator's proposed conclusions regarding the adequacy of the current primary PM₁₀ standard.

A. General Approach

1. Approach Used in the Last Review

The last review of the PM NAAQS was completed in 2012 (78 FR 3086, January 15, 2013). In that review the EPA retained the existing primary 24-hour PM₁₀ standard, with its level of 150 µg/m³ and its one-expected-exceedance form on average over three years, to continue to provide public health protection against exposures to PM_{10-2.5}. In support of this decision, the

prior Administrator emphasized her consideration of three issues: (1) The extent to which it was appropriate to maintain a standard that provides some measure of protection against all PM_{10-2.5} (regardless of composition or source or origin), (2) the extent to which a standard with a PM₁₀ indicator can provide protection against exposures to PM_{10-2.5}, and (3) the degree of public health protection provided by the existing PM₁₀ standard. Her consideration of each of these issues is summarized below.

First, the prior Administrator judged that the evidence provided "ample support for a standard that protects against exposures to all thoracic coarse particles, regardless of their location or source of origin" (78 FR 3176, January 15, 2013). In support of this, she noted that epidemiologic studies had reported positive associations between PM_{10-2.5} and mortality or morbidity in a large number of cities across North America, Europe, and Asia, encompassing a variety of environments where PM_{10-2.5} sources and composition are expected to vary widely. Though most of the available studies examined associations in urban areas, she noted that some studies had also linked mortality and morbidity with relatively high ambient concentrations of particles of non-urban crustal origin. In light of this body of available evidence, and consistent with the CASAC's advice, the prior Administrator concluded that it was appropriate to maintain a standard that provides some measure of protection against exposures to all thoracic coarse particles, regardless of their location, source of origin, or composition (78 FR 3176, January 15, 2013).

In reaching the conclusion that it was appropriate to retain a PM₁₀ indicator for a standard meant to protect against exposures to ambient PM_{10-2.5}, the prior Administrator noted that PM₁₀ mass includes both coarse PM (PM_{10-2.5}) and fine PM (PM_{2.5}). As a result, the concentration of PM_{10-2.5} allowed by a PM₁₀ standard set at a single level declines as the concentration of PM_{2.5} increases. Because PM_{2.5} concentrations tend to be higher in urban areas than rural areas, she observed that a PM₁₀ standard would generally allow lower PM_{10-2.5} concentrations in urban areas than in rural areas. She judged it appropriate to maintain such a standard given that much of the evidence for PM_{10-2.5} toxicity, particularly at relatively low particle concentrations, came from study locations where thoracic coarse particles were of urban origin, and given the possibility that PM_{10-2.5} contaminants in urban areas could increase particle toxicity. Thus, in

the last review the prior Administrator concluded that it remained appropriate to maintain a standard that allows lower ambient concentrations of PM_{10-2.5} in urban areas, where the evidence was strongest that exposure to thoracic coarse particles was associated with morbidity and mortality, and higher concentrations in non-urban areas, where the public health concerns were less certain. The prior Administrator concluded that the varying concentrations of coarse particles that would be permitted in urban versus non-urban areas under the 24-hour PM₁₀ standard, based on the varying levels of PM_{2.5} present, appropriately reflected the differences in the strength of evidence regarding coarse particle health effects.

Finally, in specifically evaluating the degree of public health protection provided by the primary PM₁₀ standard, with its level of 150 µg/m³ and its one-expected-exceedance form on average over three years, the prior Administrator recognized that the available health evidence and air quality information was much more limited for PM_{10-2.5} than for PM_{2.5}. In particular, the strongest evidence for health effects attributable to PM_{10-2.5} exposure was for cardiovascular effects, respiratory effects, and/or premature mortality following short-term exposures. For each of these categories of effects, the 2009 ISA concluded that the evidence was "suggestive of a causal relationship" (U.S. EPA, 2009c, section 2.3.3). These determinations contrasted with those for PM_{2.5}, as described in Chapter 3 above, which were determined in the ISA to be either "causal" or "likely to be causal" for mortality, cardiovascular effects, and respiratory effects (U.S. EPA, 2009c, Tables 2-1 and 2-2).

The prior Administrator judged that the important uncertainties and limitations associated with the PM_{10-2.5} evidence and information raised questions as to whether additional public health improvements would be achieved by revising the existing PM₁₀ standard. She specifically noted several uncertainties and limitations, including the following:

- The number of epidemiologic studies that have employed copollutant models to address the potential for confounding, particularly by PM_{2.5}, was limited. Therefore, the extent to which PM_{10-2.5} itself, rather than one or more copollutants, contributes to reported health effects remained uncertain.
- Only a limited number of experimental studies provided support for the associations reported in epidemiologic studies, resulting in

further uncertainty regarding the plausibility of the associations between $PM_{10-2.5}$ and mortality and morbidity reported in epidemiologic studies.

- Limitations in $PM_{10-2.5}$ monitoring data (*i.e.*, limited data available from FRM/FEM sampling methods) and the different approaches used to estimate $PM_{10-2.5}$ concentrations across epidemiologic studies resulted in uncertainty in the ambient $PM_{10-2.5}$ concentrations at which the reported effects occur, increasing uncertainty in estimates of the extent to which changes in ambient $PM_{10-2.5}$ concentrations would likely impact public health.

- While $PM_{10-2.5}$ effect estimates reported for mortality and morbidity were generally positive, most were not statistically significant, even in single-pollutant models. This included effect estimates reported in some study locations with PM_{10} concentrations above those allowed by the current 24-hour PM_{10} standard.

- The composition of $PM_{10-2.5}$, and the effects associated with various components, were also key uncertainties in the available evidence. Without more information on the chemical speciation of $PM_{10-2.5}$, the apparent variability in associations across locations was difficult to characterize.

In considering these uncertainties and limitations, the prior Administrator particularly emphasized the considerable degree of uncertainty in the extent to which health effects reported in epidemiologic studies are due to $PM_{10-2.5}$ itself, as opposed to one or more co-occurring pollutants. This uncertainty reflected the relatively small number of $PM_{10-2.5}$ studies that had evaluated copollutant models, particularly copollutant models that included $PM_{2.5}$, and the very limited body of controlled human exposure evidence supporting the plausibility of $PM_{10-2.5}$ -attributable adverse effects at ambient concentrations.

When considering the evidence as a whole, the prior Administrator concluded that the degree of public health protection provided by the current PM_{10} standard against exposures to $PM_{10-2.5}$ should be maintained (*i.e.*, neither increased nor decreased). Her judgment that protection did not need to be increased was supported by her consideration of uncertainties in the overall body of evidence. Her judgment that the degree of public health protection provided by the current standard is not greater than warranted was supported by the observation that positive and statistically significant associations with mortality were reported in some single-city U.S. study locations likely to have violated the

current PM_{10} standard. Thus, the prior Administrator concluded that the existing 24-hour PM_{10} standard, with its one-expected exceedance form on average over three years and a level of $150 \mu g/m^3$, was requisite to protect public health with an adequate margin of safety against effects that have been associated with $PM_{10-2.5}$. In light of this conclusion, the EPA retained the existing PM_{10} standard.

2. Approach in the Current Review

The approach for this review builds on the last review, taking into account the more recent scientific information now available. The approach summarized below draws from the approach taken in the PA (U.S. EPA, 2020) and is most fundamentally based on using the ISA's assessment of the current scientific evidence for health effects of $PM_{10-2.5}$ exposures (U.S. EPA, 2019).

As discussed above for $PM_{2.5}$ (II.A.2), the approach in the PA places the greatest weight on effects for which the evidence has been determined to demonstrate a "causal" or a "likely to be causal" relationship with PM exposures (U.S. EPA, 2019). This approach focuses policy considerations and conclusions on health outcomes for which the evidence is strongest. Unlike for $PM_{2.5}$, the ISA does not identify any $PM_{10-2.5}$ -related health outcomes for which the evidence supports either a "causal" or a "likely to be causal" relationship. Thus, for $PM_{10-2.5}$ the PA considers the evidence determined to be "suggestive of, but not sufficient to infer, a causal relationship," recognizing the greater uncertainty in such evidence.

The preamble to the ISA states that "suggestive" evidence is "limited, and chance, confounding, and other biases cannot be ruled out" (U.S. EPA, 2015, Preamble Table II). In light of the additional uncertainty in the evidence for $PM_{10-2.5}$ -related health outcomes, compared to the evidence supporting "causal" or "likely to be causal" relationships for $PM_{2.5}$, the approach to evaluating the primary PM_{10} standard in this review is more limited than the approach to evaluating the primary $PM_{2.5}$ standards (discussed in II.A.2). Specifically, the approach for PM_{10} does not include evaluations of air quality distributions in locations of individual epidemiologic studies, comparisons of experimental exposures with ambient air quality, or the quantitative assessment of $PM_{10-2.5}$ health risks. The substantial uncertainty in such analyses, if they were to be conducted based on the currently available $PM_{10-2.5}$ health studies, would limit their utility for informing conclusions on the primary

PM_{10} standard. Therefore, as discussed further below, the focus of the evaluation of the primary PM_{10} standard is on the overall body of evidence for $PM_{10-2.5}$ -related health effects. This includes consideration of the degree to which uncertainties in the evidence from the last review have been reduced and the degree to which new uncertainties have been identified.

B. Health Effects Related to Thoracic Coarse Particle Exposures

This section briefly outlines the key evidence for health effects associated with $PM_{10-2.5}$ exposures. This evidence is discussed more fully in the ISA (U.S. EPA, 2019) and the PA (U.S. EPA, 2020, Chapter 4).

While studies conducted since the last review have strengthened support for relationships between $PM_{10-2.5}$ exposures and some health outcomes (discussed below), several key uncertainties in the evidence from the last review have, to date, "still not been addressed" (U.S. EPA, 2019, section 1.4.2, p. 1–41). For example, epidemiologic studies available in the last review relied on various methods to estimate $PM_{10-2.5}$ exposures, and these methods had not been systematically compared to evaluate spatial and temporal correlations in exposure estimates. Methods included (1) calculating the difference between PM_{10} and $PM_{2.5}$ concentrations at co-located monitors, (2) calculating the difference between county-wide averages of monitored PM_{10} and $PM_{2.5}$ based on monitors that are not necessarily co-located, and (3) direct measurement of $PM_{10-2.5}$ using a dichotomous sampler (U.S. EPA, 2019, section 1.4.2). In the current review, more recent epidemiologic studies continue to use these approaches to estimate $PM_{10-2.5}$ concentrations. Additionally, some recent studies estimate long-term $PM_{10-2.5}$ exposures as the difference between PM_{10} and $PM_{2.5}$ concentrations based on information from spatiotemporal or land use regression (LUR) models, in addition to monitors. As in the last review, the various methods used to estimate $PM_{10-2.5}$ concentrations have not been systematically evaluated (U.S. EPA, 2019, section 3.3.1.1), contributing to uncertainty regarding the spatial and temporal correlations in $PM_{10-2.5}$ concentrations across methods and in the $PM_{10-2.5}$ exposure estimates used in epidemiologic studies (U.S. EPA, 2019, section 2.5.1.2.3 and section 2.5.2.2.3). Given the greater spatial and temporal variability of $PM_{10-2.5}$ and fewer $PM_{10-2.5}$ monitoring sites, compared to $PM_{2.5}$,

this uncertainty is particularly important for the coarse size fraction.

Beyond uncertainty associated with $PM_{10-2.5}$ exposure estimates in epidemiologic studies, the limited information on the potential for confounding by copollutants and the limited support available for the biological plausibility of serious effects following $PM_{10-2.5}$ exposures also continue to contribute broadly to uncertainty in the $PM_{10-2.5}$ health evidence. Uncertainty related to potential confounding stems from the relatively small number of epidemiologic studies that have evaluated $PM_{10-2.5}$ health effect associations in copollutants models with both gaseous pollutants and other PM size fractions. Uncertainty related to the biological plausibility of serious effects caused by $PM_{10-2.5}$ exposures results from the small number of controlled human exposure and animal toxicology⁴⁴ studies that have evaluated the health effects of experimental $PM_{10-2.5}$ inhalation exposures. The evidence supporting the ISA's "suggestive" causality determinations for $PM_{10-2.5}$, including uncertainties in this evidence, is summarized below in sections III.B.1 to III.B.7.

1. Mortality

a. Long-Term Exposures

Due to the dearth of studies examining the association between long-term $PM_{10-2.5}$ exposure and mortality, the 2009 PM ISA concluded that the evidence was "inadequate to determine if a causal relationship exists" (U.S. EPA, 2009c). Since the completion of the 2009 ISA, some recent cohort studies conducted in the U.S. and Europe report positive associations between long-term $PM_{10-2.5}$ exposure and total (nonaccidental) mortality, though results are inconsistent across studies (U.S. EPA, 2019, Table 11–11). The examination of copollutant models in these studies remains limited and, when included, $PM_{10-2.5}$ effect estimates are often attenuated after adjusting for $PM_{2.5}$ (U.S. EPA, 2019, Table 11–11). Across studies, $PM_{10-2.5}$ exposure concentrations are estimated using a variety of approaches, including direct measurements from dichotomous samplers, calculating the difference between PM_{10} and $PM_{2.5}$ concentrations measured at collocated monitors, and calculating difference of area-wide concentrations of PM_{10} and $PM_{2.5}$. As

discussed above, temporal and spatial correlations between these approaches have not been evaluated, contributing to uncertainty regarding the potential for exposure measurement error (U.S. EPA, 2019, section 3.3.1.1 and Table 11–11). The 2019 ISA concludes that this uncertainty "reduces the confidence in the associations observed across studies" (U.S. EPA, 2019, p. 11–125). The ISA additionally concludes that the evidence for long-term $PM_{10-2.5}$ exposures and cardiovascular effects, respiratory morbidity, and metabolic disease provide limited biological plausibility for $PM_{10-2.5}$ -related mortality (U.S. EPA, 2019, sections 11.4.1 and 11.4). Taken together, the 2019 ISA concludes that, "this body of evidence is suggestive, but not sufficient to infer, that a causal relationship exists between long-term $PM_{10-2.5}$ exposure and total mortality" (U.S. EPA, 2019, p. 11–125).

b. Short-Term Exposures

The 2009 ISA concluded that the evidence is "suggestive of a causal relationship between short-term exposure to $PM_{10-2.5}$ and mortality" (U.S. EPA, 2009c). Since the completion of the 2009 ISA, multicity epidemiologic studies conducted primarily in Europe and Asia continue to provide consistent evidence of positive associations between short-term $PM_{10-2.5}$ exposure and total (nonaccidental) mortality (U.S. EPA, 2019, Table 11–9). Although these studies contribute to increasing confidence in the $PM_{10-2.5}$ -mortality relationship, the use of a variety of approaches to estimate $PM_{10-2.5}$ exposures continues to contribute uncertainty to the associations observed. In addition, the 2019 ISA notes that an analysis by Adar et al. (2014) indicates "possible evidence of publication bias, which was not observed for $PM_{2.5}$ " (U.S. EPA, 2019, section 11.3.2, p. 11–106). Recent studies expand the assessment of potential copollutant confounding of the $PM_{10-2.5}$ -mortality relationship and provide evidence that $PM_{10-2.5}$ associations generally remain positive in copollutant models, though associations are attenuated in some instances (U.S. EPA, 2019, section 11.3.4.1, Figure 11–28, Table 11–10). The 2019 ISA concludes that, overall, the assessment of potential copollutant confounding is limited due to the lack of information on the correlation between $PM_{10-2.5}$ and gaseous pollutants and the small number of locations in which copollutant analyses have been conducted. Associations with cause-specific mortality provide some support for associations with total

(nonaccidental) mortality, though associations with cause-specific mortality, particularly respiratory mortality, are more uncertain (*i.e.*, wider confidence intervals) and less consistent (U.S. EPA, 2019, section 11.3.7). The ISA concludes that the evidence for $PM_{10-2.5}$ -related cardiovascular and respiratory effects provides only limited support for the biological plausibility of a relationship between short-term $PM_{10-2.5}$ exposure and cardiovascular mortality (U.S. EPA, 2019, Section 11.3.7). Based on the overall evidence, the 2019 ISA concludes that, "this body of evidence is suggestive, but not sufficient to infer, that a causal relationship exists between short-term $PM_{10-2.5}$ exposure and total mortality" (U.S. EPA, 2019, p. 11–120).

2. Cardiovascular Effects

a. Long-term Exposures

In the 2009 PM ISA, the evidence describing the relationship between long-term exposure to $PM_{10-2.5}$ and cardiovascular effects was characterized as "inadequate to infer the presence or absence of a causal relationship." The limited number of epidemiologic studies reported contradictory results and experimental evidence demonstrating an effect of $PM_{10-2.5}$ on the cardiovascular system was lacking (U.S. EPA, 2019, section 6.4).

The evidence relating long-term $PM_{10-2.5}$ exposures to cardiovascular mortality remains limited, with no consistent pattern of associations across studies and, as discussed above, uncertainty stemming from the use of various approaches to estimate $PM_{10-2.5}$ concentrations (U.S. EPA, 2019, Table 6–70). The evidence for associations with cardiovascular morbidity has grown and, while results across studies are not entirely consistent, some epidemiologic studies report positive associations with IHD and myocardial infarction (MI) (U.S. EPA, 2019, Figure 6–34); stroke (U.S. EPA, 2019, Figure 6–35); atherosclerosis (U.S. EPA, 2019, section 6.4.5); venous thromboembolism (VTE) (U.S. EPA, 2019, section 6.4.7); and blood pressure and hypertension (U.S. EPA, 2019, Section 6.4.6). $PM_{10-2.5}$ cardiovascular mortality effect estimates are often attenuated, but remain positive, in copollutants models that adjust for $PM_{2.5}$. For morbidity outcomes, associations are inconsistent in copollutant models that adjust for $PM_{2.5}$, NO_2 , and chronic noise pollution (U.S. EPA, 2019, p. 6–276). The lack of toxicological evidence for long-term $PM_{10-2.5}$ exposures represents a substantial data gap (U.S. EPA, 2019, section 6.4.10), resulting in the 2019

⁴⁴ Compared to humans, smaller fractions of inhaled $PM_{10-2.5}$ penetrate into the thoracic regions of rats and mice (U.S. EPA, 2019, section 4.1.6), contributing to the relatively limited evaluation of $PM_{10-2.5}$ exposures in animal studies.

ISA conclusion that “evidence from experimental animal studies is of insufficient quantity to establish biological plausibility” (U.S. EPA, 2019, p. 6–277). Based largely on the observation of positive associations in some high-quality epidemiologic studies, the ISA concludes that “evidence is suggestive of, but not sufficient to infer, a causal relationship between long-term PM_{10-2.5} exposure and cardiovascular effects” (U.S. EPA, 2019, p. 6–277).

b. Short-Term Exposures

The 2009 ISA found that the available evidence for short-term PM_{10-2.5} exposure and cardiovascular effects was “suggestive of a causal relationship.” This conclusion was based on several epidemiologic studies reporting associations between short-term PM_{10-2.5} exposure and cardiovascular effects, including IHD hospitalizations, supraventricular ectopy, and changes in heart rate variability (HRV). In addition, dust storm events resulting in high concentrations of crustal material were linked to increases in total cardiovascular disease emergency department visits and hospital admissions. However, the 2009 ISA noted the potential for exposure measurement error and copollutant confounding in these epidemiologic studies. In addition, there was only limited evidence of cardiovascular effects from a small number of experimental studies (e.g. animal toxicological studies and controlled human exposure studies) that examined short-term PM_{10-2.5} exposures (U.S. EPA, 2009c, section 6.2.12.2). In the last review, key uncertainties included the potential for exposure measurement error, copollutant confounding, and limited evidence of biological plausibility for cardiovascular effects following inhalation exposure (U.S. EPA, 2019, section 6.3.13).

The evidence for short-term PM_{10-2.5} exposure and cardiovascular outcomes has expanded since the last review, though important uncertainties remain. The 2019 ISA notes that there are a small number of epidemiologic studies reporting positive associations between short-term exposure to PM_{10-2.5} and cardiovascular-related morbidity outcomes. However, there is limited evidence to suggest that these associations are biologically plausible, or independent of copollutant confounding. The ISA also concludes that it remains unclear how the approaches used to estimate PM_{10-2.5} concentrations in epidemiologic studies may impact exposure measurement error. Taken together, the 2019 ISA

concludes that “the evidence is suggestive of, but not sufficient to infer, a causal relationship between short-term PM_{10-2.5} exposures and cardiovascular effects” (U.S. EPA, 2019, p. 6–254).

3. Respiratory Effects—Short-Term Exposures

Based on a small number of epidemiologic studies observing associations with some respiratory effects and limited evidence from experimental studies to support biological plausibility, the 2009 ISA (U.S. EPA, 2009c) concluded that the relationship between short-term exposure to PM_{10-2.5} and respiratory effects is “suggestive of a causal relationship.” Epidemiologic findings were consistent for respiratory infection and combined respiratory-related diseases, but not for COPD. Studies were characterized by overall uncertainty in the exposure assignment approach and limited information regarding potential copollutant confounding. Controlled human exposure studies of short-term PM_{10-2.5} exposures found no lung function decrements and inconsistent evidence for pulmonary inflammation. Animal toxicological studies were limited to those using non-inhalation (e.g., intratracheal instillation) routes of PM_{10-2.5} exposure.

Recent epidemiologic findings consistently link PM_{10-2.5} exposure to asthma exacerbation and respiratory mortality, with some evidence that associations remain positive (though attenuated in some studies of mortality) in copollutant models that include PM_{2.5} or gaseous pollutants. Studies provide limited evidence for positive associations with other respiratory outcomes, including COPD exacerbation, respiratory infection, and combined respiratory-related diseases (U.S. EPA, 2019, Table 5–36). As noted above for other endpoints, an uncertainty in these epidemiologic studies is the lack of a systematic evaluation of the various methods used to estimate PM_{10-2.5} concentrations and the resulting uncertainty in the spatial and temporal variability in PM_{10-2.5} concentrations compared to PM_{2.5} (U.S. EPA, 2019, sections 2.5.1.2.3 and 3.3.1.1). Taken together, the 2019 ISA concludes that “the collective evidence is suggestive of, but not sufficient to infer, a causal relationship between short-term PM_{10-2.5} exposure and respiratory effects” (U.S. EPA, 2019, p. 5–270).

4. Cancer—Long-Term Exposures

In the last review, little information was available from studies of cancer

following inhalation exposures to PM_{10-2.5}. Thus, the 2009 ISA determined the evidence was “inadequate to assess the relationship between long-term PM_{10-2.5} exposures and cancer” (U.S. EPA, 2009c). Since the 2009 ISA, the assessment of long-term PM_{10-2.5} exposure and cancer remains limited, with a few recent epidemiologic studies reporting positive, but imprecise, associations with lung cancer incidence. Uncertainty remains in these studies with respect to exposure measurement error due to the use of PM_{10-2.5} predictions that have not been validated by monitored PM_{10-2.5} concentrations (U.S. EPA, 2019, sections 3.3.2.3 and 10.3.4). Relatively few experimental studies of PM_{10-2.5} have been conducted, though available studies indicate that PM_{10-2.5} exhibits two key characteristics of carcinogens: Genotoxicity and oxidative stress. While limited, such experimental studies provide some evidence of biological plausibility for the findings in a small number of epidemiologic studies (U.S. EPA, 2019, section 10.3.4).

Taken together, the small number of epidemiologic and experimental studies, along with uncertainty with respect to exposure measurement error, contribute to the determination in the 2019 ISA that, “the evidence is suggestive of, but not sufficient to infer, a causal relationship between long-term PM_{10-2.5} exposure and cancer” (U.S. EPA, 2019, p. 10–87).

5. Metabolic Effects—Long-Term Exposures

The 2009 ISA did not make a causality determination for PM_{10-2.5}-related metabolic effects. Since the last review, one epidemiologic study shows an association between long-term PM_{10-2.5} exposure and incident diabetes, while additional cross-sectional studies report associations with effects on glucose or insulin homeostasis (U.S. EPA, 2019, section 7.4). As discussed above for other outcomes, uncertainties with the epidemiologic evidence include the potential for copollutant confounding and exposure measurement error (U.S. EPA, 2019, Tables 7–15 and 7–15). The evidence base to support the biological plausibility of metabolic effects following PM_{10-2.5} exposures is limited, but a cross-sectional study that investigated biomarkers of insulin resistance and systemic and peripheral inflammation may support a pathway leading to type 2 diabetes (U.S. EPA, 2019, sections 7.4.1 and 7.4.3). Based on the expanded, though still limited evidence base, the 2019 ISA concludes that, “[o]verall, the evidence is

suggestive of, but not sufficient to infer, a causal relationship between [long]-term PM_{10-2.5} exposure and metabolic effects” (U.S. EPA, 2019, p. 7–56).

6. Nervous System Effects—Long-Term Exposures

The 2009 ISA did not make a causality determination for PM_{10-2.5}-related nervous system effects. In the current review, newly available epidemiologic studies report associations between PM_{10-2.5} and impaired cognition and anxiety in adults in longitudinal analyses (U.S. EPA, 2019, Table 8–25, section 8.4.5). Associations of long-term exposure with neurodevelopmental effects are not consistently reported in children (U.S. EPA, 2019, sections 8.4.4 and 8.4.5). Uncertainties in these studies include the potential for copollutant confounding, as no studies examined copollutants models (U.S. EPA, 2019, section 8.4.5), and for exposure measurement error, given the use of various model-based subtraction methods to estimate PM_{10-2.5} concentrations (U.S. EPA, 2019, Table 8–25). In addition, there is only limited animal toxicological evidence supporting the biological plausibility of nervous system effects (U.S. EPA, 2019, sections 8.4.1 and 8.4.5). Overall, the 2019 ISA concludes that, “the evidence is suggestive of, but not sufficient to infer, a causal relationship between long-term PM_{10-2.5} exposure and nervous system effects (U.S. EPA, 2019, p. 8–75).

C. Proposed Conclusions on the Current Primary PM₁₀ Standard

This section describes the Administrator’s proposed conclusions regarding the adequacy of the current primary PM₁₀ standard. The approach to reaching these proposed conclusions draws from the ISA’s assessment of the scientific evidence for health effects attributable to PM_{10-2.5} exposures (U.S. EPA, 2019). Section III.C.1 discusses the evidence-based considerations from the PA. Section III.C.2 summarizes CASAC advice on the current primary PM₁₀ standard, based on its review of the draft PA. Section III.C.3 presents the Administrator’s proposed conclusions on the current primary PM₁₀ standard.

1. Evidence-Based Considerations in the Policy Assessment

In the last review, the strongest evidence for PM_{10-2.5}-related health effects was for cardiovascular effects, respiratory effects, and premature mortality following short-term exposures. For each of these categories of effects, the ISA concluded that the evidence was “suggestive of a causal

relationship” (U.S. EPA, 2009c, section 2.3.3). As summarized in the sections above, key uncertainties in the evidence resulted from limitations in the approaches used to estimate ambient PM_{10-2.5} concentrations in epidemiologic studies, limited examination of the potential for confounding by co-occurring pollutants, and limited support for the biological plausibility of the serious effects reported in many epidemiologic studies. Since 2009, the evidence base for several PM_{10-2.5}-related health effects has expanded, broadening our understanding of the range of health effects linked to PM_{10-2.5} exposures (U.S. EPA, 2020, Chapter 4). This includes expanded evidence for the relationships between long-term exposures and cardiovascular effects, metabolic effects, nervous system effects, cancer, and mortality. However, key limitations in the evidence that were identified in the 2009 ISA persist in studies that have become available since the last review. As discussed in the PA, these limitations include the following:

- The use of a variety of methods to estimate PM_{10-2.5} exposures in epidemiologic studies and the lack of systematic evaluation of these methods, together with the relatively high spatial and temporal variability in ambient PM_{10-2.5} concentrations and the small number of monitoring sites, results in uncertainty in exposure estimates;
- The limited number of studies that evaluate PM_{10-2.5} health effect associations in copollutant models, together with evidence from some studies for attenuation of associations in such models, results in uncertainty in the independence of PM_{10-2.5} health effect associations from co-occurring pollutants;
- The limited number of controlled human exposure and animal toxicology studies of PM_{10-2.5} inhalation contributes to uncertainty in the biological plausibility of the PM_{10-2.5}-related effects reported in epidemiologic studies.

Thus, while new evidence is available for a broader range of health outcomes in the current review, including an increase in the number of studies that report effects related to long-term PM_{10-2.5} exposure, that evidence is subject to the same types of uncertainties that were identified in the last review of the PM NAAQS. As in the last review, these uncertainties contribute to the conclusions in the 2019 ISA that the evidence for the PM_{10-2.5}-related health effects discussed in this section is “suggestive of, but not sufficient to infer” causal relationships.

2. CASAC Advice

As part of its review of the draft PA, the CASAC has provided advice on the adequacy of the public health protection afforded by the current primary PM₁₀ standard. As for PM_{2.5} (section II.C.2), the CASAC’s advice is documented in a letter sent to the EPA Administrator (Cox, 2019a).

In its comments on the draft PA, the CASAC concurs with the draft PA’s overall preliminary conclusions that it is appropriate to consider retaining the current primary PM₁₀ standard without revision. The CASAC finds the more limited approach taken for PM₁₀, compared with the approach taken for PM_{2.5}, to be “reasonable and appropriate” given the less certain evidence and the conclusion that “key uncertainties identified in the last review remain” (Cox, 2019a, p. 13 of consensus responses). To reduce these uncertainties in future reviews, the CASAC recommends improvements to PM_{10-2.5} exposure assessment, including a more extensive network for direct monitoring of the PM_{10-2.5} fraction (Cox, 2019a, p. 13 of consensus responses). The CASAC also recommends additional human clinical and animal toxicology studies of the PM_{10-2.5} fraction to improve the understanding of biological causal mechanisms and pathways (Cox, 2019a, p. 13 of consensus responses). Overall, the CASAC agrees with the EPA that “. . . the available evidence does not call into question the adequacy of the public health protection afforded by the current primary PM₁₀ standard and that evidence supports considering of retaining the current standard in this review” (Cox, 2019a, p. 3 of letter).

3. Administrator’s Proposed Decision on the Current Primary PM₁₀ Standard

This section summarizes the Administrator’s considerations and proposed conclusions related to the current primary PM₁₀ standard and presents his proposed decision to retain that standard, without revision. As discussed above for PM_{2.5} (II.C.3), in establishing primary standards under the Act that are “requisite” to protect the public health with an adequate margin of safety, the Administrator is seeking to establish standards that are neither more nor less stringent than necessary for this purpose. He recognizes that the Act does not require that primary standards be set at a zero-risk level; rather, the NAAQS must be sufficiently protective, but not more stringent than necessary.

Given these requirements, and consistent with the primary PM_{2.5}

standards discussed above (II.C.3), the Administrator's final decision in this review will be a public health policy judgment that draws upon the scientific information examining the health effects of PM_{10-2.5} exposures, including how to consider the range and magnitude of uncertainties inherent in that information. His decision will require judgments based on an interpretation of the science that neither overstates nor understates its strengths and limitations, nor the appropriate inferences to be drawn.

As an initial matter, the Administrator notes that the decision to retain the primary PM₁₀ standard in the last review recognized that epidemiologic studies had reported positive associations between PM_{10-2.5} and mortality or morbidity in cities across North America, Europe, and Asia. These studies encompassed a variety of environments where PM_{10-2.5} sources and composition were expected to vary widely. Although most of these studies examined PM_{10-2.5} health effect associations in urban areas, some studies had also linked mortality and morbidity with relatively high ambient concentrations of particles of non-urban crustal origin. Drawing from this evidence, the EPA judged it appropriate to maintain a standard that provides some measure of protection against exposures to PM_{10-2.5}, regardless of location, source of origin, or particle composition (78 FR 3176, January 15, 2013). The Agency further judged it appropriate to retain a PM₁₀ standard to provide such protection given that the varying concentrations of PM_{10-2.5} permitted in urban versus non-urban areas under a PM₁₀ standard, based on the varying levels of PM_{2.5} present (*i.e.*, lower PM_{10-2.5} concentrations allowed in urban areas, where PM_{2.5} concentrations tend to be higher), appropriately reflected differences in the strength of PM_{10-2.5} health effects evidence.

Since the last review, the Administrator notes that the evidence for several PM_{10-2.5}-related health effects has expanded, particularly for long-term exposures. Recent epidemiologic studies continue to report positive associations with mortality and morbidity in cities across North America, Europe, and Asia, where PM_{10-2.5} sources and composition are expected to vary widely. While the Administrator recognizes that important uncertainties remain, as described below, he also recognizes that the expansion in the evidence since the last review has broadened the range of effects that have been linked with PM_{10-2.5} exposures. Such studies provide an important part of the body of evidence supporting the ISA's

strengthened causality determinations (and new determinations) for long-term PM_{10-2.5} exposures and mortality, cardiovascular effects, metabolic effects, nervous system effects and cancer (U.S. EPA, 2019; U.S. EPA, 2020, section 4.2). Drawing from his consideration of this evidence, the Administrator proposes to conclude that the scientific studies that have become available since the last review do not call into question the decision to maintain a primary PM₁₀ standard that provides some measure of public health protection against PM_{10-2.5} exposures, regardless of location, source of origin, or particle composition.

With regard to uncertainties in the evidence, the Administrator notes that the decision in the last review highlighted limitations in estimates of ambient PM_{10-2.5} concentrations used in epidemiologic studies, the limited evaluation of copollutant models to address the potential for confounding, and the limited number of experimental studies supporting biologically plausible pathways for PM_{10-2.5}-related effects. These and other limitations in the PM_{10-2.5} evidence raised questions as to whether additional public health improvements would be achieved by revising the existing PM₁₀ standard.

In the current review, despite the expanded body of evidence for PM_{10-2.5}-related health effects, the Administrator recognizes that similar uncertainties remain. As summarized above (III.B), these include uncertainties in the PM_{10-2.5} exposure estimates used in epidemiologic studies, in the independence of PM_{10-2.5} health effect associations, and in support for the biological plausibility of PM_{10-2.5}-related effects (*e.g.*, from controlled human exposure and animal toxicology studies) (U.S. EPA, 2020, section 4.2). These uncertainties contribute to the determinations in the 2019 ISA that the evidence for key PM_{10-2.5}-related health effects is "suggestive of, but not sufficient to infer" causal relationships (U.S. EPA, 2019). In light of his emphasis on evidence supporting "causal" and "likely to be causal" relationships (II.A.2, III.A.2), the Administrator judges that the PM_{10-2.5}-related health effects evidence provides an uncertain scientific foundation for making standard-setting decisions. He further judges that, as in the last review, limitations in this evidence raise questions as to whether additional public health improvements would be achieved by revising the existing PM₁₀ standard.

In reaching conclusions on the primary PM₁₀ standard, the Administrator also considers advice from the CASAC. As noted above, the

CASAC recognizes the uncertainties in the evidence for PM_{10-2.5}-related health effects, stating that "key uncertainties identified in the last review remain" (Cox, 2019a, p. 13 of consensus responses). Given these uncertainties, the CASAC agrees with the PA conclusion that the evidence "does not call into question the adequacy of the public health protection afforded by the current primary PM₁₀ standard" (Cox, 2019a, p. 3 of letter). The CASAC further recommends that this evidence "supports consideration of retaining the current standard in this review" (Cox, 2019a, p. 3 of letter).

When the above information is taken together, the Administrator proposes to conclude that the available scientific evidence continues to support a PM₁₀ standard to provide some measure of protection against PM_{10-2.5} exposures. This conclusion reflects the expanded evidence for PM_{10-2.5}-related health effects in the current review. However, important limitations in the evidence remain. Consistent with the decision in the last review, the Administrator proposes to conclude that these limitations lead to considerable uncertainty regarding the potential public health implications of revising the existing PM₁₀ standard. Given this uncertainty, and consistent with the CASAC's advice, the Administrator proposes to conclude that the available evidence does not call into question the adequacy of the public health protection afforded by the current primary PM₁₀ standard. Therefore, he proposes to retain the primary PM₁₀ standard, without revision, in the current review. The Administrator solicits comment on this proposed decision and on the supporting rationale described above.

IV. Rationale for Proposed Decisions on the Secondary PM Standards

This section presents the rationale for the Administrator's proposed decision to retain the current secondary PM standards, without revision. This rationale is based on a thorough review of the latest scientific information generally published through December 2017,⁴⁵ as presented in the ISA, on non-ecological public welfare effects

⁴⁵ In addition to the review's opening "call for information" (79 FR 71764, December 3, 2014), "the current ISA identified and evaluated studies and reports that have undergone scientific peer review and were published or accepted for publication between January 1, 2009 and March 31, 2017. A limited literature update identified some additional studies that were published before December 31, 2017" (U.S. EPA, 2019, Appendix, p. A-3). References that are cited in the ISA, the references that were considered for inclusion but not cited, and electronic links to bibliographic information and abstracts can be found at: <https://hero.epa.gov/hero/particulate-matter>.

associated with PM and pertaining to the presence of PM in ambient air. The Administrator's rationale also takes into account the PA's evaluation of the policy-relevant information in the ISA and quantitative analyses of air quality related to visibility impairment and the CASAC's advice and recommendations, as reflected in discussions of the drafts of the ISA and PA at public meetings and in the CASAC's letters to the Administrator.

In presenting the rationale for the Administrator's proposed decision and its foundations, section IV.A provides background on the general approach for review of the secondary PM standards, including a summary of the approach used in the last review (section IV.A.1) and the general approach for the current review (section IV.A.2). Section IV.B summarizes the currently available evidence for PM-related visibility impairment and section IV.C summarizes the available information for other PM-related welfare effects. Section IV.D presents the Administrator's proposed conclusions on the current secondary PM standards.

A. General Approach

In the last review of the PM NAAQS, completed in 2012, the EPA retained the secondary 24-hour PM_{2.5} standard, with its level of 35 µg/m³, and the 24-hour PM₁₀ standard, with its level of 150 µg/m³ (78 FR 3228, January 15, 2013). The EPA also retained the level, set at 15 µg/m³, and averaging time of the secondary annual PM_{2.5} standard, while revising the form. With regard to the form of the annual PM_{2.5} standard, the EPA removed the option for spatial averaging (78 FR 3228, January 15, 2013). Key aspects of the Administrator's decisions on the secondary PM standards for non-visibility effects and visibility effects are described below in section IV.A.1.

1. Approach Used in the Last Review

The 2012 decision on the adequacy of the secondary PM standards was based on consideration of the protection provided by those standards for visibility and for the non-visibility effects of materials damage, climate effects and ecological effects. As noted earlier, the current review of the public welfare protection provided by the secondary PM standards against ecological effects is occurring in the separate, on-going review of the secondary NAAQS for oxides of nitrogen and oxides of sulfur (U.S. EPA, 2016, Chapter 1, section 5.2; U.S. EPA, 2020, Chapter 1, section 5.1.1). Thus, the consideration of ecological effects in the 2012 review is not discussed here. Rather, the sections below focus on the

prior Administrator's consideration of climate and materials effects (section IV.A.1.a) and visibility effects (section IV.A.1.b).

a. Non-Visibility Effects

With regard to the role of PM in climate, the prior Administrator considered whether it was appropriate to establish any distinct secondary PM standards to address welfare effects associated with climate impacts. In considering the scientific evidence, she noted the 2009 ISA conclusion "that a causal relationship exists between PM and effects on climate" and that aerosols⁴⁶ alter climate processes directly through radiative forcing and by indirect effects on cloud brightness, changes in precipitation, and possible changes in cloud lifetimes (U.S. EPA, 2009c, section 9.3.10). Additionally, the major aerosol components with the potential to affect climate processes (*i.e.*, black carbon (BC), organic carbon (OC), sulfates, nitrates and mineral dusts) vary in their reflectivity, forcing efficiencies, and direction of climate forcing (U.S. EPA, 2009c, section 9.3.10).

Noting the strong evidence indicating that aerosols affect climate, the prior Administrator further considered what the available information indicated regarding the adequacy of protection provided by the secondary PM standards. She noted that a number of uncertainties in the scientific information affected our ability to quantitatively evaluate the standards in this regard. For example, the ISA and PA noted the spatial and temporal heterogeneity of PM components that contribute to climate forcing, uncertainties in the measurement of aerosol components, inadequate consideration of aerosol impacts in climate modeling, insufficient data on local and regional microclimate variations and heterogeneity of cloud formations. In light of these uncertainties and the lack of sufficient data, the 2011 PA concluded that it was not feasible in the last review "to conduct a quantitative analysis for the

⁴⁶ In the climate sciences research community, PM is encompassed by what is typically referred to as aerosol. An aerosol is defined as a solid or liquid suspended in a gas, but PM refers to the solid or liquid phase of an aerosol. In this review of the secondary PM NAAQS the discussion on climate effects of PM uses the term PM throughout for consistency with the ISA (U.S. EPA, 2019) as well as to emphasize that the climate processes altered by aerosols are generally altered by the PM portion of the aerosol. Exceptions to this practice include the discussion of climate effects in the last review, when aerosol was used when discussing suspending aerosol particles, and for certain acronyms that are widely used by the climate community that include the term aerosol (*e.g.*, aerosol optical depth, or AOD).

purpose of informing revisions [to the secondary PM NAAQS] based on climate" (U.S. EPA, 2011, pp. 5–11 to 5–12) and that there was insufficient information available to base a national ambient air quality standard on climate impacts associated with ambient air concentrations of PM or its constituents (U.S. EPA, 2011, section 5.2.3). The prior Administrator agreed with this conclusion (78 FR 3225–3226, January 15, 2013).

With regard to materials effects, the she also considered effects associated with the deposition of PM (*i.e.*, dry and wet deposition), including both physical damage (materials effects) and aesthetic qualities (soiling effects). The deposition of PM can physically affect materials, adding to the effects of natural weathering processes, by promoting or accelerating the corrosion of metals; by degrading paints; and by deteriorating building materials such as stone, concrete, and marble (U.S. EPA, 2009c, section 9.5). Additionally, the deposition of PM from ambient air can reduce the aesthetic appeal of buildings and objects through soiling. The ISA concluded that evidence was "sufficient to conclude that a causal relationship exists between PM and effects on materials" (U.S. EPA, 2009c, sections 2.5.4 and 9.5.4). However, the 2011 PA noted that quantitative relationships were lacking between particle size, concentrations, and frequency of repainting and repair of surfaces and that considerable uncertainty exists in the contributions of co-occurring pollutants to materials damage and soiling processes (U.S. EPA, 2011, p. 5–29). The 2011 PA concluded that none of the evidence available in the last review called into question the adequacy of the existing secondary PM standards to protect against material effects (U.S. EPA, 2011, p. 5–29). The prior Administrator agreed with this conclusion (78 FR 3225–3226, January 15, 2013).

In considering non-visibility welfare effects in the last review, as discussed above, the prior Administrator concluded that, while it is important to maintain an appropriate degree of control of fine and coarse particles to address non-visibility welfare effects, "[i]n the absence of information that would support any different standards . . . it is appropriate to retain the existing suite of secondary standards" (78 FR 3225–3226, January 15, 2013). Her decision was consistent with the CASAC advice related to non-visibility effects. Specifically, the CASAC agreed with the 2011 PA conclusions that, while these effects are important, "there is not currently a strong technical basis

to support revisions of the current standards to protect against these other welfare effects” (Samet, 2010a, p. 5). Thus, the prior Administrator concluded that it was appropriate to retain all aspects of the existing 24-hour $PM_{2.5}$ and PM_{10} secondary standards. With regard to the secondary annual $PM_{2.5}$ standard, she concluded that it was appropriate to retain a level of $15.0 \mu\text{g}/\text{m}^3$ while revising only the form of the standard to remove the option for spatial averaging (78 FR 3225–3226, January 15, 2013).

b. Visibility Effects

Having reached the conclusion to retain the existing secondary PM standards to protect against non-visibility welfare effects, the prior Administrator next considered the level of protection that would be requisite to protect public welfare against PM-related visibility impairment and whether to adopt a distinct secondary standard to achieve this level of protection. In reaching her final decision that the existing 24-hour $PM_{2.5}$ standard provides sufficient protection against PM-related visibility impairment (78 FR 3228, January 15, 2013), she considered the evidence assessed in the 2009 ISA (U.S. EPA, 2009c) and the analyses included in the Urban-Focused Visibility Assessment (2010 UFVA; U.S. EPA, 2010b) and the 2011 PA (U.S. EPA, 2011). She also considered the degree of protection for visibility that would be provided by the existing secondary standard, focusing specifically on the secondary 24-hour $PM_{2.5}$ standard with its level of $35 \mu\text{g}/\text{m}^3$. These considerations, and the prior Administrator’s conclusions regarding visibility are discussed in more detail below.

In the last review, the ISA concluded that, “collectively, the evidence is sufficient to conclude that a causal relationship exists between PM and visibility impairment” (U.S. EPA, 2009c, p. 2–28). Visibility impairment is caused by light scattering and absorption by suspended particles and gases, including water content of aerosols.⁴⁷ The available evidence in the last review indicated that specific components of PM have been shown to contribute to visibility impairment. For

example, at sufficiently high relative humidity values, sulfate and nitrate are the PM components that scatter more light and thus contribute most efficiently to visibility impairment. Elemental carbon (EC) and organic carbon (OC) are also important contributors, especially in the northwestern U.S. where their contribution to $PM_{2.5}$ mass is higher. Crustal materials can be significant contributors to visibility impairment, particularly for remote areas in the arid southwestern U.S. (U.S. EPA, 2009c, section 2.5.1).

Visibility impairment can have implications for people’s enjoyment of daily activities and for their overall sense of well-being (U.S. EPA, 2009c, section 9.2). In consideration of the potential public welfare implication of various degrees of PM-related visibility impairment, the prior Administrator considered the available visibility preference studies that were part of the overall body of evidence in the 2009 ISA and reviewed as a part of the 2010 UFVA. These preference studies provided information about the potential public welfare implications of visibility impairment from surveys in which participants were asked questions about their preferences or the values they placed on various visibility conditions, as displayed to them in scenic photographs or in images with a range of known light extinction levels.⁴⁸

In noting the relationship between PM concentrations and PM-related light extinction, the prior Administrator focused on identifying an adequate level of protection against visibility-related welfare effects. She first concluded that a standard in terms of a $PM_{2.5}$ visibility index would provide a measure of protection against PM-related light extinction that directly takes into account the factors (*i.e.*, species composition and relative humidity) that influence the relationship between $PM_{2.5}$ in ambient air and PM-related visibility impairment. A $PM_{2.5}$ visibility index standard would afford a relatively high degree of uniformity of visual air quality protection in areas across the country by directly incorporating the effects of differences of $PM_{2.5}$

composition and relative humidity. In defining a target level of protection in terms of a $PM_{2.5}$ visibility index, as discussed below, she considered specific elements of the index, including the basis for its derivation, as well as an appropriate averaging time, level, and form.

With regard to the basis for derivation of a visibility index, the prior Administrator concluded that it was appropriate to use an adjusted version of the original IMPROVE algorithm,⁴⁹ in conjunction with monthly average relative humidity data based on long-term climatological means. In so concluding, she noted the CASAC conclusion on the reasonableness of reliance on a $PM_{2.5}$ light extinction indicator calculated from $PM_{2.5}$ chemical composition and relative humidity. In considering alternative approaches for a focus on visibility, she recognized that the available mass monitoring methods did not include measurement of the full water content of ambient $PM_{2.5}$, nor did they provide information on the composition of $PM_{2.5}$, both of which contribute to visibility impacts (77 FR 38980, June 29, 2012). In addition, at the time of the proposal, she recognized that suitable equipment and performance-based verification procedures did not then exist for direct measurement of light extinction and could not be developed within the time frame of the review (77 FR 38980–38981, June 29, 2012).

With regard to the averaging time of the index, the prior Administrator concluded that a 24-hour averaging time would be appropriate for a visibility index (78 FR 3226, January 15, 2013). Although she recognized that hourly or sub-daily (4- to 6-hour) averaging times, within daylight hours and excluding hours with relatively high humidity, are more directly related to the short-term nature of the perception of PM-related visibility impairment and relevant exposure periods for segments of the viewing public than a 24-hour averaging time, she also noted that there were data quality uncertainties associated with the instruments used to provide the hourly $PM_{2.5}$ mass measurements required for an averaging time shorter than 24 hours. She also considered the results of analyses that compared 24-hour and 4-hour averaging times for calculating the index. These analyses showed good correlation between 24-hour and 4-hour

⁴⁷ All particles scatter light and, although a larger particle scatters more light than a similarly shaped smaller particle of the same composition, the light scattered per unit of mass is greatest for particles with diameters from ~ 0.3 – $1.0 \mu\text{m}$ (U.S. EPA, 2009c, section 2.5.1). Particles with hygroscopic components (*e.g.*, particulate sulfate and nitrate) contribute more to light extinction at higher relative humidity than at lower relative humidity because they change size in the atmosphere in response to relative humidity.

⁴⁸ Preference studies were available in four urban areas in the last review. Three western preference studies were available, including one in Denver, Colorado (Ely *et al.*, 1991), one in the lower Fraser River valley near Vancouver, British Columbia, Canada (Pryor, 1996), and one in Phoenix, Arizona (BBC Research & Consulting, 2003). A pilot focus group study was also conducted for Washington, DC (Abt Associates, 2001), and a replicate study with 26 participants was also conducted for Washington, DC (Smith and Howell, 2009). More details about these studies are available in Appendix D of the PA.

⁴⁹ The revised IMPROVE algorithm (Pitchford *et al.*, 2007) uses major PM chemical composition measurements and relative humidity estimates to calculate light extinction. For more information about the derivation of and input data required for the original and revised IMPROVE algorithms, see 78 FR 3168–3177, January 15, 2013.

average PM_{2.5} light extinction, as evidenced by reasonably high city-specific and pooled R-squared values, generally in the range of over 0.6 to over 0.8. Based on these analyses and the 2011 PA conclusions regarding them, the prior Administrator concluded that a 24-hour averaging time would be a reasonable and appropriate surrogate for a sub-daily averaging time.

With regard to the statistical form of the index, the prior Administrator settled on a 3-year average of annual 90th percentile values. In so doing, she noted that a 3-year average form provided stability from the occasional effect of inter-annual meteorological variability that can result in unusually high pollution levels for a particular year (78 FR 3198, January 15, 2013; U.S. EPA, 2011, p. 4–58).⁵⁰ Regarding the annual statistic to be averaged, the 2010 UFVA evaluated three different statistics: 90th, 95th, and 98th percentiles (U.S. EPA, 2010b, chapter 4). In considering these alternative percentiles, the 2011 PA noted that the Regional Haze Program targets the 20 percent most impaired days for improvements in visual air quality in Federal Class I areas and that the median of the distribution of these 20 percent worst days would be the 90th percentile. The 2011 PA further noted that strategies that are implemented so that 90 percent of days would have visual air quality that is at or below the level of the standard would reasonably be expected to lead to improvements in visual air quality for the 20 percent most impaired days. Lastly, the 2011 PA recognized that the available studies on people's preferences did not address frequency of occurrence of different levels of visibility and did not identify a basis for a different target for urban areas than that for Class I areas (U.S. EPA, 2011, p. 4–59). These considerations led the prior Administrator to conclude that 90th percentile form was the most appropriate annual statistic to be averaged across three years (78 FR 3226, January 15, 2013).

With regard to the level of the index, she considered the visibility preferences studies conducted in four urban areas (U.S. EPA, 2011, p. 4–61). Based on these studies, the PA identified a range

of levels from 20 to 30 deciviews (dv)⁵¹ as being a reasonable range of “candidate protection levels” (CPLs).⁵² In considering this range of CPLs, she noted the uncertainties and limitations in public preference studies, including the small number of stated preference studies available; the relatively small number of study participants and the extent to which the study participants may not be representative of the broader study area population in some of the studies; and the variations in the specific materials and methods used in each study. She concluded that the substantial degree of variability and uncertainty in the public preference studies should be reflected in a target protection level at the upper end of the range of CPLs. Therefore, she concluded that it was appropriate to set a target level of protection in terms of a 24-hour PM_{2.5} visibility index at 30 dv (78 FR 3226–3227, January 15, 2013).

Based on her considerations and conclusions summarized above, the prior Administrator concluded that the protection provided by a secondary standard based on a 3-year visibility metric, defined in terms of a PM_{2.5} visibility index with a 24-hour averaging time, a 90th percentile form averaged over 3 years, and a level of 30 dv, would be requisite to protect public welfare with regard to visual air quality (78 FR 3227, January 15, 2013). Having reached this conclusion, she next determined whether an additional distinct secondary standard in terms of a visibility index was needed given the degree of protection from visibility impairment afforded by the existing secondary standards. Specifically, she noted that the air quality analyses showed that all areas meeting the existing 24-hour PM_{2.5} standard, with its level of 35 µg/m³, had visual air quality at least as good as 30 dv, based on the visibility index defined above (Kelly et al., 2012b, Kelly et al., 2012a). Thus, the secondary 24-hour PM_{2.5} standard would likely be controlling relative to a 24-hour visibility index set at a level of 30 dv. Additionally, areas would be unlikely to exceed the target level of protection for visibility of 30 dv without also exceeding the existing secondary 24-hour standard. Thus, the prior Administrator judged that the 24-hour PM_{2.5} standard “provides sufficient protection in all areas against the effects

of visibility impairment—i.e., that the existing 24-hour PM_{2.5} standard would provide *at least* the target level of protection for visual air quality of 30 dv which [she] judges appropriate” (78 FR 3227, January 15, 2013). She further judged that “[s]ince sufficient protection from visibility impairment would be provided for all areas of the country without adoption of a distinct secondary standard, and adoption of a distinct secondary standard will not change the degree of over-protection for some areas of the country. . . adoption of such a distinct secondary standard is not needed to provide requisite protection for both visibility and nonvisibility related welfare effects” (78 FR 3228, January 15, 2013).

2. Approach for the Current Review

To evaluate whether it is appropriate to consider retaining the current secondary PM standards, or whether consideration of revision is appropriate, the EPA has adopted an approach in this review that builds upon the general approach used in the last review and reflects the body of evidence and information now available. As summarized above, past approaches have been based most fundamentally on using information from studies of PM-related visibility effects, quantitative analyses of PM-related visibility impairment, information from studies of non-visibility welfare effects, advice from the CASAC, and public comments to inform the selection of secondary PM standards that, in the Administrator's judgment, protect the public welfare from any known or anticipated effects.

Similarly, in this review, the EPA draws on the available evidence and quantitative assessments pertaining to the public welfare impacts of PM in ambient air. In considering the scientific and technical information, the Agency considers both the information available at the time of the last review and the information that is newly available in this review. This includes information on PM-related visibility and non-visibility effects. Consistent with the approach in the last review, the quantitative air quality analyses for PM-related visibility effects provide a context for interpreting the evidence of visibility impairment and the potential public welfare significance of PM concentrations in ambient air associated with recent air quality conditions.

B. PM-Related Visibility Impairment

The information summarized here is based on the EPA's scientific assessment of the latest evidence on visibility effects associated with PM; this assessment is documented in the ISA

⁵⁰ The EPA recognized that a percentile form averaged over multiple years offers greater stability to the air quality management process by reducing the possibility that statistically unusual indicator values will lead to transient violations of the standard, thus reducing the potential for disruption of programs implementing the standard and reducing the potential for disruption of the protections provided by those programs.

⁵¹ Deciview (dv) refers to a scale for characterizing visibility that is defined directly in terms of light extinction. The deciview scale is frequently used in the scientific and regulatory literature on visibility.

⁵² For comparison, 20 dv, 25 dv, and 30 dv are equivalent to 64, 112, and 191 megameters (Mm⁻¹), respectively.

and its policy implications are further discussed in the PA. In considering the scientific and technical information, the PA reflects upon both the information available in the last review and information that is newly available since the last review. Policy implications of the currently available evidence are discussed in the PA (as summarized in section IV.D.1). The subsections below briefly summarize the following aspects of the evidence: The nature of PM-related visibility impairment (section IV.B.1), the relationship between ambient PM and visibility (section IV.B.2), and public perception of visibility impairment (section IV.B.3).

1. Nature of PM-Related Visibility Impairment

Visibility refers to the visual quality of a human's view with respect to color rendition and contrast definition. It is the ability to perceive landscape form, colors, and textures. Visibility involves optical and psychophysical properties involving human perception, judgment, and interpretation. Light between the observer and the object can be scattered into or out of the sight path and absorbed by PM or gases in the sight path. The conclusions of the ISA that "the evidence is sufficient to conclude that a causal relationship exists between PM and visibility impairment" is consistent with conclusions of causality in the last review (U.S. EPA, 2019, section 13.2.6). These conclusions are based on strong and consistent evidence that ambient PM can impair visibility in both urban and remote areas (U.S. EPA, 2019, section 13.1; U.S. EPA, 2009c, section 9.2.5).

2. Relationship Between Ambient PM and Visibility

The fundamental relationship between light extinction and PM mass, and the EPA's understanding of this relationship, has changed little since the 2009 ISA (U.S. EPA, 2009c). The combined effect of light scattering and absorption by particles and gases is characterized as light extinction, *i.e.*, the fraction of light that is scattered or absorbed per unit of distance in the atmosphere. Light extinction is measured in units of 1/distance, which is often expressed in the technical literature as visibility per megameter (abbreviated Mm^{-1}). Higher values of light extinction (usually given in units of Mm^{-1} or dv) correspond to lower visibility. When PM is present in the air, its contribution to light extinction is typically much greater than that of gases (U.S. EPA, 2019, section 13.2.1). The impact of PM on light scattering

depends on particle size and composition, as well as relative humidity. All particles scatter light, as described by the Mie theory, which relates light scattering to particle size, shape, and index of refraction (U.S. EPA, 2019, section 13.2.3; Van de Hulst, 1981; Mie, 1908). Fine particles scatter more light than coarse particles on a per unit mass basis and include sulfates, nitrates, organics, light-absorbing carbon, and soil (Malm et al., 1994). Hygroscopic particles like ammonium sulfate, ammonium nitrate, and sea salt increase in size as relative humidity increases, leading to increased light scattering (U.S. EPA, 2019, section 13.2.3).

Direct measurements of PM light extinction, scattering, and absorption are considered more accurate for quantifying visibility than PM mass-based estimates because measurements do not depend on assumptions about particle characteristics (*e.g.*, size, shape, density, component mixture, etc.) (U.S. EPA, 2019, section 13.2.2.2). Measurements of light extinction can be made with high time resolution, allowing for characterization of subdaily temporal patterns of visibility impairment. A variety of measurement methods have been used (*e.g.*, transmissometers, integrating nephelometers, teleradiometers, telephotometers, and photography and photographic modeling), each with its own strengths and limitations (U.S. EPA, 2019, Table 13–1). However, there are no common performance-based criteria to evaluate these methods and none have been deployed broadly across the U.S. for routine measurement of visibility impairment.

In the absence of a robust monitoring network for the routine measurement of light extinction across the U.S., estimation of light extinction based on existing PM monitoring can be used. A theoretical relationship between light extinction and PM characteristics has been derived from Mie theory (U.S. EPA, 2019, Equation 13.5) and can be used to estimate light extinction by combining mass scattering efficiencies of particles with particle concentrations (U.S. EPA, 2019, section 13.2.3; U.S. EPA, 2009c, sections 9.2.2.2 and 9.2.3.1). However, routine ambient air monitoring rarely includes measurements of particle size and composition information with sufficient detail for these calculations. Accordingly, a much simpler algorithm has been developed to make estimating light extinction more practical.

This algorithm, known as the IMPROVE algorithm,⁵³ provides for the estimation of light extinction (b_{ext}), in units of Mm^{-1} , using routinely monitored components of fine ($\text{PM}_{2.5}$) and coarse ($\text{PM}_{10-2.5}$) PM. Relative humidity data are also needed to estimate the contribution by liquid water that is in solution with the hygroscopic components of PM. To estimate each component's contribution to light extinction, their concentrations are multiplied by extinction coefficients and are additionally multiplied by a water growth factor that accounts for their expansion with moisture. Both the extinction efficiency coefficients and water growth factors of the IMPROVE algorithm have been developed by a combination of empirical assessment and theoretical calculation using particle size distributions associated with each of the major aerosol components (U.S. EPA, 2019, section 13.2.3.1, section 13.2.3.3).

The *original IMPROVE algorithm*, so referenced here to distinguish it from subsequent variations developed later, was found to underestimate the highest light scattering values and overestimate the lowest values at IMPROVE monitors throughout the U.S. (Malm and Hand, 2007; Ryan et al., 2005; Lowenthal and Kumar, 2004) and at sites in China (U.S. EPA, 2019, section 13.2.3.3). To resolve these biases, a *revised IMPROVE equation* was developed (Pitchford et al., 2007). Since the last review, Lowenthal and Kumar (2016) further offered a number of modifications to the revised IMPROVE equation, with a focus of the application of the IMPROVE equation in remote sites. In particular, one of the modifications was to increase the multiplier to estimate the concentration of organic matter, [OM], from the concentration of organic carbon, [OC]. This modification was based on their evaluations of monitoring data from remote IMPROVE sites, which showed that in areas further away from PM sources, PM mass is often more oxygenated and contains a larger amount of organic PM. (U.S. EPA, 2019, section 13.2.3.3). As discussed below in section IV.D.1, analyses conducted in the current review estimate PM-related visibility impairment using each of these versions of the IMPROVE equation.

⁵³ The algorithm is referred to as the IMPROVE algorithm as it was developed specifically to use monitoring data generated at IMPROVE network sites and with equipment specifically designed to support the IMPROVE program and was evaluated using IMPROVE optical measurements at the subset of monitoring sites that make those measurements (Malm et al., 1994).

3. Public Perception of Visibility Impairment

In the last review, visibility preference studies were available from four areas in North America.⁵⁴ Study participants were queried regarding multiple images that, depending on the study, were either photographs of the same location and scenery that had been taken on different days on which measured extinction data were available or digitized photographs onto which a uniform “haze” had been superimposed. Results of those studies indicated a wide range of judgments on what study participants considered to be acceptable visibility across the different study areas, depending on the setting depicted in each photograph. As a part of the 2010 UFVA, each study was evaluated separately, and figures were developed to display the percentage of participants that rated the visual air quality depicted as “acceptable” (U.S. EPA, 2010b). Based on the results of the studies in the four cities, a range encompassing the PM_{2.5} visibility index values from images that were judged to be acceptable by at least 50% of study participants across all four of the urban preference studies was identified (U.S. EPA, 2010b, p. 4–24; PA, Figure 5–2). Much lower visibility (considerably more haze resulting in higher values of light extinction) was considered acceptable in Washington, DC, than was in Denver, and 30 dv reflected the highest degree of visibility impairment judged to be acceptable by at least 50 percent of study participants (78 FR 3226–3227, January 15, 2013).

Since the time of the last review, no new visibility preference studies have been conducted in the U.S. Similarly, there is little newly available information regarding acceptable levels of visibility impairment in the U.S.

C. Other PM-Related Welfare Effects

The information summarized here is based on the EPA’s scientific assessment of the latest evidence on the non-visibility welfare effects associated with PM. This assessment is documented in the ISA and its policy implications are further discussed in the PA. In considering the scientific and technical information, the PA reflects consideration of both the information available in the last review and information that is newly available since the last review. The subsections

below briefly summarize the evidence related to climate effects (section IV.C.1) and materials effects (section IV.C.2).

1. Climate

In this review, as in the last review, the ISA concludes that “overall the evidence is sufficient to conclude that a causal relationship exists between PM and climate effects” (U.S. EPA, 2019, section 13.3.9). Since the last review, climate impacts have been extensively studied and recent research reinforces and strengthens the evidence evaluated in the 2009 ISA. New evidence provides greater specificity about the details of radiative forcing effects⁵⁵ and increases the understanding of additional climate impacts driven by PM radiative effects. The Intergovernmental Panel on Climate Change (IPCC) assesses the role of anthropogenic activity in past and future climate change, and since the last review, has issued the Fifth IPCC Assessment Report (AR5; IPCC, 2013) which summarizes any key scientific advances in understanding the climate effects of PM since the previous report. As in the last review, the ISA draws substantially on the IPCC report to summarize climate effects. As discussed in more detail below, the general conclusions are similar between the IPCC AR4 and AR5 reports with regard to effects of PM on global climate.

Atmospheric PM has the potential to affect climate in multiple ways, including absorbing and scattering of incoming solar radiation, alterations in terrestrial radiation, effects on the hydrological cycle, and changes in cloud properties (U.S. EPA, 2019, section 13.3.1). Atmospheric PM interacts with incoming solar radiation. Many species of PM (e.g., sulfate and nitrate) efficiently scatter solar energy. By enhancing reflection of solar energy back to space, scattering PM exerts a cooling effects on the surface below. Certain species of PM such as black carbon (BC), brown carbon (BrC), or dust can also absorb incoming sunlight. A recent study found that whether absorbing PM warms or cools the underlying surface depends on several factors, including the altitude of the PM

layer relative to cloud cover and the albedo (*i.e.*, reflectance) of the surface (Ban-Weiss *et al.*, 2014). PM also perturbs incoming solar radiation by influencing cloud cover and cloud lifetime. For example, PM provides nuclei upon which water vapor condenses, forming cloud droplets. Finally, absorbing PM deposited on snow and ice can diminish surface albedo and lead to regional warming (U.S. EPA, 2019, section 13.3.2).

PM has direct and indirect effects on climate processes. PM interactions with solar radiation through scattering and absorption, collectively referred to as aerosol-radiation interactions (ARI), are also known as the direct effects on climate, as opposed to the indirect effects that involve aerosol-cloud interactions (ACI). The direct effects of PM on climate result primarily from particles scattering light away from Earth and sending a fraction of solar energy back into space, decreasing the transmission of visible radiation to the surface of the Earth and resulting in a decrease in the heating rate of the surface and the lower atmosphere. The IPCC AR5, taking into account both model simulations and satellite observations, reports a radiative forcing from aerosol-radiation interactions (RFari) from anthropogenic PM of -0.35 ± 0.5 watts per square meter (Wm^{-2}) (Boucher, 2013), which is comparable to AR4 ($-0.5 \pm 0.4 \text{ Wm}^{-2}$). Estimates of effective radiative forcing⁵⁶ from aerosol-radiation interactions (ERFari), which include the rapid feedback effects of temperature and cloud cover, rely mainly on model simulations, as this forcing is complex and difficult to observe (U.S. EPA, 2019, section 13.3.4.1). The IPCC AR5 best estimate for ERFari is $-0.45 \pm 0.5 \text{ Wm}^{-2}$, which reflects this uncertainty (Boucher, 2013).

By providing cloud condensation nuclei, PM increases cloud droplet number, thereby increasing cloud droplet surface area and albedo (Twomey, 1977). The climate effects of these perturbations are more difficult to quantify than the direct effects of aerosols with RF but likely enhance the cooling influence of clouds by increasing cloud reflectivity (traditionally referred to as the first indirect effect) and lengthening cloud lifetime (second indirect effect). These effects are reported as the radiative

⁵⁵ Radiative forcing (RF) for a given atmospheric constituent is defined as the perturbation in net radiative flux, at the tropopause (or the top of the atmosphere) caused by that constituent, in watts per square meter (Wm^{-2}), after allowing for temperatures in the stratosphere to adjust to the perturbation but holding all other climate responses constant, including surface and tropospheric temperatures (Fiore *et al.*, 2015; Myhre *et al.*, 2013). A positive forcing indicates net energy trapped in the Earth system and suggests warming of the Earth’s surface, whereas a negative forcing indicates net loss of energy and suggests cooling (U.S. EPA, 2019, section 13.3.2.2).

⁵⁶ Effective radiative forcing (ERF), new in the IPCC AR5, takes into account not just the instantaneous forcing but also a set of climate feedbacks, involving atmospheric temperature, cloud cover, and water vapor, that occur naturally in response to the initial radiative perturbation (U.S. EPA, 2019, section 13.3.2.2).

⁵⁴ Preference studies were available in four urban areas in the last review: Denver, Colorado (Ely *et al.*, 1991), Vancouver, British Columbia, Canada (Pryor, 1996), Phoenix, Arizona (BBC Research & Consulting, 2003), and Washington, DC (Abt Associates, 2001; Smith and Howell, 2009).

forcing from aerosol-cloud interaction (ERF_{aci}) (U.S. EPA, 2019, section 13.3.3.2).⁵⁷ IPCC AR5 estimates ERF_{aci} at -0.45 Wm^{-2} , with a 90% confidence interval of -1.2 to 0 Wm^{-2} (U.S. EPA, 2019, section 13.3.4.2). Studies have also calculated the combined effective radiative forcing from aerosol-radiation and aerosol-cloud interactions (ERF_{ari+aci}) (U.S. EPA, 2019, section 13.3.4.3). IPCC AR5 reports a best estimate of ERF_{ari+aci} of -0.90 (-1.9 to -0.1) Wm^{-2} , consistent with these estimates (Boucher, 2013).

PM can also strongly reflect incoming solar radiation in areas of high albedo, such as snow- and ice-covered surfaces. The transport and subsequent deposition of absorbing PM such as BC to snow- and ice-covered regions can decrease the local surface albedo, leading to surface heating. The absorbed energy can then melt the snow and ice cover and further depress the albedo, resulting in a positive feedback loop (U.S. EPA, 2019, section 13.3.3.3; Bond et al., 2013; U.S. EPA, 2012b). Deposition of absorbing PM, such as BC, may also affect surface temperatures over glacial regions (U.S. EPA, 2019, section 13.3.3.3). The IPCC AR5 best estimate of RF from the albedo effects is $+0.04 \text{ Wm}^{-2}$, with an uncertainty range of $+0.02$ to $+0.09 \text{ Wm}^{-2}$ (Boucher, 2013).

A number of new studies are available since the last review that have examined the individual climate effects associated with key PM components, including sulfate, nitrate, OC, BC, and dust, along with updated quantitative estimate of the radiative forcing with the individual species. Sulfate particles form through oxidation of SO_2 by OH in the gas phase and in the aqueous phase by a number of pathways, including in particular those involving ozone and H_2O_2 (U.S. EPA, 2019, section 13.3.5.1). The main source of anthropogenic sulfate is from coal-fired power plants, and global trends in the anthropogenic SO_2 emissions are estimated to have increased dramatically during the 20th and early 21st centuries, although the recent implementation of more stringent air pollution controls on sources has led to a reversal in such trends in many places (U.S. EPA, 2019, section 13.3.5.1; U.S. EPA, 2020, section 2.3.1). Sulfate particles are highly reflective. Consistent with other recent estimates (Takemura, 2012; Zelinka et al., 2014; Adams et al., 2001, described below), on

a global scale, the IPCC AR5 estimates that sulfate contributes more than other PM types to RF, with RF_{ari} of -0.4 (-0.6 to -0.2) Wm^{-2} , where the 5% and 95% uncertainty range is represented by the numbers in the parentheses (Myhre et al., 2013), which is the same estimate from AR4. Sulfate is also a major contributor to the influence of PM on clouds (Takemura, 2012). A total effective radiative forcing (ERF_{ari+aci}) for anthropogenic sulfate has been estimated to be nearly -1.0 Wm^{-2} (Zelinka et al., 2014; Adams et al., 2001).

Nitrate particles form through the oxidation of nitrogen oxides and occur mainly in the form of ammonium nitrate. Ammonium preferentially associates with sulfate rather than nitrate, leading to formation of ammonium sulfate at the expense of ammonium nitrate (Adams et al., 2001). As anthropogenic emissions of SO_2 decline, more ammonium will be available to react with nitrate, potentially leading to future increases in ammonium nitrate particles in the atmosphere (U.S. EPA, 2019, section 13.3.5.2; Hauglustaine et al., 2014; Lee et al., 2013; Shindell et al., 2013). Warmer global temperatures, however, may decrease nitrate abundance given that it is highly volatile at higher temperatures (Tai et al., 2010). The IPCC AR5 estimates RF_{ari} of nitrate of -0.11 (-0.3 to -0.03) Wm^{-2} (Boucher, 2013), which is one-fourth of the RF_{ari} of sulfate.

Primary organic carbonaceous PM, including BrC, are emitted from wildfires, agricultural fires, and fossil fuel and biofuel combustion. SOA form when anthropogenic or biogenic nonmethane hydrocarbons are oxidized in the atmosphere, leading to less volatile products that may partition into PM (U.S. EPA, 2019, section 13.3.5.3). Organic particles are generally reflective, but in the case of BrC, a portion is significantly absorbing at shorter wavelengths ($<400 \text{ nm}$). The IPCC AR5 estimates an RF_{ari} for primary organic PM from fossil fuel combustion and biofuel use of -0.09 (-0.16 to -0.03) Wm^{-2} and an RF_{ari} estimate for SOA from these sources of -0.03 (-0.27 to $+0.20$) Wm^{-2} (Myhre et al., 2013). Changes in the RF_{ari} estimates for individual PM components since AR4 have generally been modest, with one exception for the estimate for primary organic PM from fossil fuel combustion and biofuel use (Myhre et al., 2013).⁵⁸ The wide range in these estimates, including inconsistent signs

for forcing, reflect uncertainties in the optical properties of organic PM and its atmospheric budgets, including the production pathways of anthropogenic SOA (Scott et al., 2014; Myhre et al., 2013; McNeill et al., 2012; Heald et al., 2010). The IPCC AR5 also estimates an RF_{ari} of -0.2 Wm^{-2} for primary organic PM arising from biomass burning (Boucher, 2013).

Black carbon (BC) particles occur as a result of inefficient combustion of carbon-containing fuels. Like directly emitted organic PM, BC is emitted from biofuel and fossil fuel combustion and by biomass burning. BC is absorbing at all wavelengths and likely has a large impact on the Earth's energy budget (Bond et al., 2013). The IPCC AR5 estimates a RF_{ari} from anthropogenic fossil fuel and biofuel use of $+0.4$ ($+0.5$ to $+0.8$) Wm^{-2} (Myhre et al., 2013). Biomass burning contributes an additional $+0.2$ ($+0.03$ to $+0.4$) Wm^{-2} to BC RF_{ari}, while the albedo effect of BC on snow and ice adds another $+0.04$ ($+0.02$ to $+0.09$) Wm^{-2} (Myhre et al., 2013; U.S. EPA, 2019, section 13.3.5.4, section 13.3.4.4).

Dust, or mineral dust, is mobilized from dry or disturbed soils as a result of both meteorological and anthropogenic activities. Dust has traditionally been classified as scattering, but a recent study found that dust may be substantially coarser than currently represented in climate models, and thus more light-absorbing (Kok et al., 2017). The IPCC AR5 estimates RF_{ari} as $-0.1 \pm 0.2 \text{ Wm}^{-2}$ (Boucher, 2013), although the results of the study by Kok et al. (2017) would suggest that in some regions dust may have led to warming, not cooling (U.S. EPA, 2019, section 13.3.5.5).

The new research available in this review expands upon the evidence available at the time of the last review. Consistent with the evidence available in the last review, the key PM components, including sulfate, nitrate, OC, BC, and dust, that contribute to climate processes vary in their reflectivity, forcing efficiencies, and direction of forcing.

Radiative forcing due to PM elicits a number of responses in the climate system that can lead to significant effects on weather and climate over a range of spatial and temporal scales, mediated by a number of feedbacks that link PM and climate. Since the last review, the evidence base has expanded with respect to the mechanisms of climate responses and feedbacks to PM radiative forcing. However, the new literature published since the last review does not reduce the considerable

⁵⁷ While the ISA includes estimates of RF_{aci} and ERF_{aci} from a number of studies (U.S. EPA, 2019, sections 13.3.4.2, 13.3.4.3, 13.3.3.3), this discussion focuses on the single best estimate with a range of uncertainty, as reported in the IPCC AR5 (Boucher, 2013).

⁵⁸ The estimate of RF_{ari} for SOA is new in AR5 and was not included in AR4 (Myhre et al., 2013).

uncertainties that continue to exist related to these mechanisms.

Unlike well-mixed, long-lived greenhouse gases in the atmosphere, PM has a very heterogeneous distribution across the Earth. As such, patterns of RF_{air} and RF_{aci} tend to correlate with PM loading, with the greatest forcings centralized over continental regions. The climate response to this PM forcing, however, is more complicated since the perturbation to one climate variable (e.g., temperature, cloud cover, precipitation) can lead to a cascade of effects on other variables. While the initial PM radiative forcing may be concentrated regionally, the eventual climate response can be much broader spatially or be concentrated in remote regions, and may be quite complex, affecting multiple climate variables with possible differences in the sign of the response in different regions or for different variables (U.S. EPA, 2019, section 13.3.6). The complex climate system interactions lead to variation among climate models, with some studies showing relatively close correlation between forcing and surface response temperatures (e.g., Leibensperger et al., 2012), while other studies show much less correlation (e.g., Levy et al., 2013). Many studies have examined observed trends in PM and temperature in the U.S. Climate models have suggested a range of factors which can influence large-scale meteorological processes and may affect temperature, including local feedback effects involving soil moisture and cloud cover, changes in the hygroscopicity of the PM, and interactions with clouds alone (U.S. EPA, 2019, section 13.3.7). While evidence in this review suggests that PM influenced temperature trends across the southern and eastern U.S. in the 20th century, this evidence is not conclusive and significant uncertainties continue to exist. Further research is needed to better characterize the effects of PM on regional climate in the U.S. before PM climate effects can be quantified.

While expanded since the last review, the evidence of PM-related climate effects is still limited by significant uncertainties, particularly for understanding effects at regional scales. Large spatial and temporal heterogeneities in direct and indirect PM radiative forcing, and associated climate effects, can occur for a number of reasons, including the frequency and distribution of emissions of key PM components contributing to climate forcing, the chemical and microphysical processing that occurs in the atmosphere, and the atmospheric lifetime of PM relative to other

pollutants contributing to radiative forcing (U.S. EPA, 2019, section 13.3). In addition to the uncertainty in characterizing radiative forcing, large uncertainty exists in quantifying changes in specific climate variables associated with PM-related radiative forcing. Moreover, studies have shown that predicting climate variables for regions within the U.S. (which is of particular interest for the review of the PM NAAQS) is more uncertain than predicting climate variables globally due to natural climate variability (e.g., Deser et al., 2012) and uncertainties in the representation of key atmospheric processes in state-of-the-art climate models. Furthermore, quantifying the influence of incremental changes in U.S. anthropogenic emissions on regional climate is subject to even greater uncertainty because the signal of U.S. anthropogenic emissions is relatively small compared with the global emissions considered in the studies cited above. Overall, these limitations and uncertainties make it difficult to quantify how incremental changes in the level of PM mass in ambient air in the U.S. would result in changes to climate in the U.S. Thus, as in the last review, the PA concludes that the data remain insufficient to conduct quantitative analyses for PM effects on climate in the current review (U.S. EPA, 2020, section 5.2.2.2.1).

2. Materials

In considering the evidence available in the current review of PM-related materials effects, the current evidence continues to support the conclusion from the last review that there is a causal relationship between PM deposition and materials effects. Effects of deposited PM, particularly sulfates and nitrates, to materials include both physical damage and impaired aesthetic qualities. Because of their electrolytic, hygroscopic, and acidic properties and their ability to sorb corrosive gases, particles contribute to materials damage by adding to the effects of natural weathering processes, by potentially promoting or accelerating the corrosion of metals, degradation of painted surfaces, deterioration of building materials, and weakening of material components.⁵⁹ The newly available evidence on materials effects of PM in

this review are primarily from studies conducted outside of the U.S. on buildings and other items of cultural heritage and at concentrations greater than those typically observed in the U.S.; however, they provide limited new data for consideration in this review (U.S. EPA, 2019, section 13.4).

Materials damage from PM generally involves one or both of two processes: soiling and corrosion (U.S. EPA, 2019, section 13.4.2). Soiling and corrosion are complex, interdependent processes, typically beginning with deposition of atmospheric PM or SO₂ to exposed surfaces. Constituents of deposited PM can interact directly with materials or undergo further chemical and/or physical transformation to cause soiling, corrosion, and physical damage. Weathering, including exposure to moisture, ultraviolet (UV) radiation and temperature fluctuations, affects the rate and degree of damage (U.S. EPA, 2019, section 13.4.2).

Soiling is the result of PM accumulation on an object that alters its optical characteristics or appearance. These soiling effects can impact the aesthetic value of a structure or result in reversible or irreversible damage to the surface. The presence of air pollution can increase the frequency and duration of cleaning and can enhance biodeterioration processes on the surface of materials. For example, deposition of carbonaceous components of PM can lead to the formation of black crusts on surfaces, and the buildup of microbial biofilms⁶⁰ can discolor surfaces by trapping PM more efficiently (U.S. EPA, 2009c, p. 9–195; U.S. EPA, 2019, section 13.4.2). The presence of PM may alter light transmission or change the reflectivity of a surface. Additionally, the organic and nutrient content of deposited PM may enhance microbial growth on surfaces.

Since the last review, very little new evidence has become available related to deposition of SO₂ to materials such as limestone, granite, and metal. Deposition of SO₂ onto limestone can transform the limestone into gypsum, resulting in a rougher surface, which allows for increased surface area for accumulation of deposited PM (Camuffo and Bernardi, 1993; U.S. EPA, 2019, section 13.4.2). Oxidation of deposited SO₂ that contributes to the transformation of limestone to gypsum can be enhanced by the formation of surface coatings from deposited

⁵⁹ As discussed in the ISA (U.S. EPA, 2019, section 13.4.1), corrosion typically involves reactions of acidic PM (i.e., acidic sulfate or nitrate) with material surfaces, but gases like SO₂ and nitric acid (HNO₃) also contribute. Because “the impacts of gaseous and particulate N and S wet deposition cannot be clearly distinguished” (U.S. EPA, 2019, p. 13–1), the assessment of the evidence in the ISA considers the combined impacts.

⁶⁰ Microbial biofilms are communities of microorganisms, which may include bacteria, algae, fungi and lichens, that colonize an inert surface. Microbial biofilms can contribute to biodeterioration of materials via modification of the chemical environment.

carbonaceous PM (both elemental and organic carbon) (McAlister et al., 2008, Grossi et al., 2007). Ozga et al. (2011) characterized damage to two concrete buildings in Poland and Italy. Gypsum was the main damage product on surfaces of these buildings that were sheltered from rain runoff, while PM embedded in the concrete, particularly carbonaceous particles, were responsible for darkening of the building walls (Ozga et al., 2011).

Building on the evidence available in the 2009 ISA, research has progressed on the theoretical understanding of soiling of cultural heritage in a number of studies. Barca et al. (2010) developed and tested a new methodological approach for characterizing trace elements and heavy metals in black crusts on stone monuments to identify the origin of the chemicals and the relationship between the concentrations of elements in the black crusts and local environmental conditions. Recent research has also used isotope tracers to distinguish between contributions from local sources versus atmospheric pollution to black crusts on historical monuments in France (Kloppmann et al., 2011). A study in Portugal found that biological activity played a major role in soiling, specifically in the development of colored layers and in the detachment process (de Oliveira et al., 2011). Another study found damage to cement renders, often used for restoration, consolidation, and decorative purposes on buildings, following exposure to sulfuric acid, resulting in the formation of gypsum (Lanzon and Garcia-Ruiz, 2010).

Corrosion of stone and the decay of stone building materials by acid deposition and sulfate salts were described in the 2009 ISA (U.S. EPA, 2009c, section 9.5.3). Since that time, advances have been made on the quantification of degradation rates and further characterization of the factors that influence damage of stone materials (U.S. EPA, 2019, section 13.4.2). Decay rates of marble grave stones were found to be greater in heavily polluted areas compared to a relatively pristine area (Mooers et al., 2016). The time of wetness and the number of dissolution/crystallization cycles were identified as hazard indicators for stone materials, with greater hazard during the spring and fall when these indicators are relatively high (Casati et al., 2015).

A study examining the corrosion of steel as a function of PM composition and particle size found that changes in the composition of resulting rust gradually changed with particle size (Lau et al., 2008). In a study of damage to metal materials under in Hong Kong,

which generally has much higher PM concentrations than those observed in the U.S., Liu et al. (2015) found that iron and steel were corroded by both PM and gaseous pollutants (SO_2 and NO_2), while copper and copper alloys were mainly corroded by gaseous pollutants (SO_2 and O_3) and aluminum and aluminum alloy corrosion was mainly attributed to PM and NO_2 .

A number of studies have also found materials damage from PM components besides sulfate and black carbon and atmospheric gases besides SO_2 . Studies have characterized impacts of nitrates, NO_x , and organic compounds on direct materials damage or on chemical reactions that enhance materials damage (U.S. EPA, 2019, section 13.4.2). Other studies have found that soiling of building materials can be attributed to enhanced biological processes and colonization, including the development and thickening of biofilms, resulting from the deposition of PM components and atmospheric gases (U.S. EPA, 2019, section 13.4.2).

Since the last review, other materials have been studied for damage attributable to PM, including glass and photovoltaic panels. Soiling of glass can impact its optical and thermal properties and can lead to increased cleaning costs and frequency. The development of haze⁶¹ on modern glass has been measured and modeled, with a strong correlation between the size distribution of particles and the evolution of the mass deposited on the surface of the glass. Measurements showed that, under sheltered conditions, mass deposition accelerated regularly with time in areas closest to sources of PM (*i.e.*, near roadways) and coarse mineral particles were more prevalent compared to other sites (Alfaro et al., 2012). Model predictions were found to correctly simulate the development of haze at site locations when compared with measurements (Alfaro et al., 2012).

Soiling of photovoltaic panels can lead to decreased energy efficiency. For example, soiling by carbonaceous PM decreased solar efficiency by nearly 38%, while soil particles reduced efficiency by almost 70% (Radonjic et al., 2017). The rate of photovoltaic power output can also be degraded by soiling and has been found to be related

to the rate of dust accumulation. In five sites in the U.S. representing different meteorological and climatological conditions,⁶² photovoltaic module power transmission was reduced by approximately 3% for every g/m^2 of PM deposited on the cover plate of the photovoltaic panel, independent of geographical location (Boyle et al., 2017). Another study found that photovoltaic module power output was reduced by 40% after 10 months of exposure without cleaning, although a number of anti-reflective coatings can generally mitigate power reduction resulting from dust deposition (Walwil et al., 2017). Energy efficiency can also be impacted by the soiling of building materials, such as light-colored marble panels on building exteriors, that are used to reflect a large portion of solar radiation for passive cooling and to counter the urban heat island effect. Exposure to acidic pollutants in urban environments have been found to reduce the solar reflectance of marble, decreasing the cooling effect (Rosso et al., 2016). Highly reflective roofs, or cool roofs, have been designed and constructed to increase reflectance from buildings in urban areas, to both decrease air conditioning needs and urban heat island effects, but these efforts can be impeded by soiling of materials used for constructing cool roofs. Methods have been developed for accelerating the aging process of roofing materials to better characterize the impact of soiling and natural weather on materials used in constructing cool roofs (Sleiman et al., 2014).

Some progress has been made since the last review in the development of dose-response relationships for soiling of building materials, yet some key relationships remain poorly characterized. The first general dose-response relationships for soiling of materials were generated by measuring contrast reflectance of a soiled surface to the reflectance of the unsoiled substrate for different materials, including acrylic house paint, cedar siding, concrete, brick, limestone, asphalt shingles, and window glass with varying total suspended particulate (TSP) concentrations (Beloin and Haynie, 1975; U.S. EPA, 2019, section 13.4.3). Continued efforts to develop dose-response curves for soiling have led to some advancements for modern materials, but these relationships

⁶¹ In this discussion of non-visibility welfare effects, haze is used as it has been defined in the scientific literature on soiling of glass, *i.e.*, the ratio of diffuse transmitted light to direct transmitted light (Lombardo et al., 2010). This differs from the definition of haze as used in the discussion of visibility welfare effects in section V.B above, where it is used as a qualitative description of the blockage of sunlight by dust, smoke, and pollution.

⁶² Of the five sites studied, three were in rural, suburban, and urban areas representing a semi-arid environment (Front Range of Colorado), one site represented a hot and humid environment (Cocoa, Florida), and one represented a hot and arid environment (Albuquerque, New Mexico) (U.S. EPA, 2019, section 13.4.2; Boyle et al., 2017).

remain poorly characterized for limestone. One study quantified the dose-response relationships between PM₁₀ and soiling for painted steel, white plastic, and polycarbonate filter material, but there was too much scatter in the data to produce a dose-response relationship for limestone (Watt et al., 2008). A dose-response relationship for silica-soda-lime window glass soiling by PM₁₀, NO₂, and SO₂ was quantified based on 31 different locations (Lombardo et al., 2010; U.S. EPA, 2019, section 13.4.3, Figure 13–32, Equation 13–8). The development of this dose-response relationship required several years of observation time and had inconsistent data reporting across the locations.

Since the time of the last review, there has also been progress in developing methods to more rapidly evaluate soiling of different materials by PM mixtures. Modern buildings typically have simpler lines, less detailed surfaces, and a greater use of glass, tile, and metal, which are easier to clean than stone. There have also been major changes in the types of materials used for buildings, including a variety of polymers available for use as coatings and sealants. New economic and environmental considerations beyond aesthetic appeal and structural damage are emerging (U.S. EPA, 2019, section 13.4.3). Changes in building materials and design, coupled with new approaches in quantifying the dose-response relationship between PM and materials effects, may reduce the amount of time needed for observations to support the development of material-specific dose-response relationships.

In addition to dose-response functions, damage functions have also been used to quantify material decay as a function of pollutant type and load. Damage can be determined from sample surveys or inspection of actual damage and a damage function can be developed to link the rate of material damage to time of replacement or maintenance. A cost function can then link the time for replacement and maintenance to a monetary cost, and an economic function links cost to the dose of pollution based on the dose-response relationship (U.S. EPA, 2019, section 13.4.3). Damage functions are difficult to assess because it depends on human perception of the level of soiling deemed to be acceptable and evidence in this area remains limited in the current review. Since the last review, damage functions for a wide range of building materials (*i.e.*, stone, aluminum, zinc, copper, plastic, paint, rubber, stone) have been developed and reviewed (Brimblecombe and Grossi,

2010). One study estimated long-term deterioration of building materials and found that damage to durable building material (such as limestone, iron, copper, and discoloration of stone) is no longer controlled by pollution as was historically documented but rather that natural weathering is a more important influence on these materials in modern times (Brimblecombe and Grossi, 2009). Even as PM-attributable damage to stone and metals has decreased over time, it has been predicted that there will be potentially higher degradation rates for polymeric materials, plastic, paint, and rubber due to increased oxidant concentrations and solar radiation (Brimblecombe and Grossi, 2009).

As at the time of the last review and described just above, sufficient evidence is not available to conduct a quantitative assessment of PM mass or component-related soiling and corrosion effects. While soiling associated with PM can lead to increased cleaning frequency and repainting of surfaces, no quantitative relationships have been established between characteristics of PM or the frequency of cleaning or repainting that would help to inform the EPA's understanding of the public welfare implications of soiling (U.S. EPA, 2019, section 13.4). Similarly, while some information is available with regard to microbial deterioration of surfaces and the contribution of carbonaceous PM to the formation of black crusts that contribute to soiling, the available evidence does not support quantitative analyses (U.S. EPA, 2019, section 13.4). While some new evidence is available with respect to PM-attributable materials effects, the data are insufficient to conduct quantitative analyses for PM effects on materials in the current review.

D. Proposed Conclusions on the Current Secondary PM Standards

In reaching proposed conclusions on the current secondary PM standards, the Administrator takes into account policy-relevant evidence-based and quantitative information-based considerations, as well as advice from the CASAC. Evidence-based considerations draw from the EPA's assessment and integrated synthesis of the scientific evidence of PM-related welfare effects in the ISA (U.S. EPA, 2019, section 13.2). Quantitative information-based considerations draw from the EPA's assessment of recent air quality and associated PM-related visibility impairment in the PA (U.S. EPA, 2020, Chapter 5). Section IV.D.1 below summarizes evidence- and quantitative information-based considerations and the associated

conclusions reached in the PA. Section IV.D.2 describes advice received from the CASAC on the secondary standards. Section IV.D.3 presents the Administrator's proposed decision on the current secondary PM standards.

1. Evidence- and Quantitative Information-Based Considerations in the Policy Assessment

The PA considers the degree to which the available scientific evidence and quantitative information supports or calls into question the adequacy of the protection afforded by the current secondary PM standards. In doing so, the PA considers the evidence assessed in the ISA, including the extent to which the new evidence for PM-related visibility impairment, climate effects, or materials effects alters key conclusions from the last review. The PA also considers quantitative analyses of visibility impairment and the extent to which they may indicate different conclusions from those in the last review regarding the degree of protection from adverse effects provided by the current secondary standards.

With regard to visibility impairment, the PA presents updated analyses based on recent air quality information, with a focus on locations meeting the current 24-hour PM_{2.5} and PM₁₀ standards. In the absence of advances in the monitoring methods for directly measuring light extinction, and given the lack of a robust monitoring network for the routine measurement of light extinction across the U.S. (section IV.B.2), as in the last review, the PA analyses use calculated light extinction to estimate PM-related visibility impairment (U.S. EPA, 2020, section 5.2.1.1). Compared to the last review, updated analyses incorporate several refinements. These include (1) the evaluation of three versions of the IMPROVE equation⁶³ to calculate light extinction (U.S. EPA, 2020, Appendix D, Equations D–1 through D–3) in order to better understand the influence of variability in equation inputs;⁶⁴ (2) the

⁶³ Given the lack of new information to inform a different visibility metric, the metric used in the PA is that defined by the EPA in the last review as the target level of protection for visibility (discussed above in section IV.A.1): A PM_{2.5} visibility index with a 24-hour averaging time, a 90th percentile form averaged over 3 year, and a level of 30 dv (U.S. EPA, 2020, section 5.2.1.2).

⁶⁴ While the PM_{2.5} monitoring network has an increasing number of continuous FEM monitors reporting hourly PM_{2.5} mass concentrations, there continue to be data quality uncertainties associated with providing hourly PM_{2.5} mass and component measurements that could be input into IMPROVE equation calculations for sub-daily visibility impairment estimates. Therefore, the inputs to these light extinction calculations are based on 24-hour

use of 24-hour relative humidity data, rather than monthly average relative humidity as was used in the last review (U.S. EPA, 2020, section 5.2.1.2, Appendix D); and (3) the inclusion of the coarse fraction in the estimation of light extinction in the subset of areas with PM_{10-2.5} monitoring data available for the time period of interest (U.S. EPA, 2020, section 5.2.1.2, Appendix D). The PA's updated analyses include 67 monitoring sites that measure PM_{2.5}, including 20 sites that measure both PM₁₀ and PM_{2.5}, that are geographically distributed across the U.S. in both urban and rural areas (U.S. EPA, 2020, Appendix D, Figure D-1).⁶⁵

In areas that meet the current 24-hour PM_{2.5} standard for the 2015–2017 time period, all sites have light extinction estimates at or below 27 dv using the original and revised IMPROVE equations (and most areas are below 25 dv; U.S. EPA, 2020, section 5.2.1.2). In addition, the one location that exceeds the current 24-hour PM_{2.5} standard also has light extinction estimates at or below 27 dv (U.S. EPA, 2020, Figure 5-3). These findings are consistent with the findings of the analysis in the last review with older air quality data from 102 sites (Kelly et al., 2012b; 78 FR 3201, January 15, 2013).

When light extinction is calculated using the updated IMPROVE equation from Lowenthal and Kumar (2016), the resulting 3-year visibility metrics are slightly higher at all sites compared to light extinction calculated using the IMPROVE equations used in previous reviews (U.S. EPA, 2020, Figure 5-4). These results are consistent with the higher OC multiplier included in the IMPROVE equation from Lowenthal and Kumar (2016), reflecting the use of data from remote areas with higher concentrations of organic PM when validating that equation. As such, it is important to note that the Lowenthal and Kumar (2016) version of the IMPROVE equation may overestimate light extinction in non-remote areas, including in the urban areas in the PA's analyses.

Nevertheless, when light extinction is calculated using the Lowenthal and Kumar (2016) equation for those sites that meet the current 24-hour PM_{2.5} standard, the 3-year visibility metric is

generally at or below 30 dv. The one exception to this is a site in Fairbanks, Alaska that just meets the current 24-hour PM_{2.5} standard in 2015–17 and has a 3-year visibility index value just above 30 dv, rounding to 31 dv (compared to 27 dv when light extinction is calculated with the original and revised IMPROVE equations) (U.S. EPA, 2020, Appendix D, Table D-3). However, the unique conditions at this urban site (e.g., higher OC concentrations, much lower temperatures, and the complete lack of sunlight for long periods) affect quantitative relationships between OC, OM and visibility (e.g., Hand et al., 2012; Hand et al., 2013), making the most appropriate approach for characterizing light extinction in this area unclear.

In the last review, the EPA noted that PM_{2.5} is the size fraction of PM responsible for most of the visibility impairment in urban areas (77 FR 38980, June 29, 2012). Data available at the time of the last review suggested that PM_{10-2.5} is often a minor contributor to visibility impairment (U.S. EPA, 2010b), though it may make a larger contribution in some areas in the desert southwestern region of the U.S. However, at the time of the last review, there was little data available from PM_{10-2.5} monitors to quantify the contribution of coarse PM to calculated light extinction.

Since the last review, an expansion of PM_{10-2.5} monitoring efforts has increased the availability of data for use in estimating light extinction with both PM_{2.5} and PM_{10-2.5} concentrations included as inputs in the equations. For 2015–2017, 20 of the 67 PM_{2.5} sites analyzed in the PA have collocated PM_{10-2.5} monitoring data available. These 20 sites meet both the 24-hour PM_{2.5} standard and 24-hour PM₁₀ standard. All of these sites have 3-year visibility metrics at or below 30 dv regardless of whether light extinction is calculated with or without the coarse fraction, and for all three versions of the IMPROVE equation. Generally, the contribution of the coarse fraction to light extinction at these sites is minimal, contributing less than 1 dv to the 3-year visibility metric. However, these 20 locations would be expected to have relatively low concentrations of coarse PM. If PM₁₀ and PM_{10-2.5} data were available in locations with higher concentrations of coarse PM, such as in the southwestern U.S., the coarse fraction may be a more important contributor to light extinction and visibility impairment than in the locations examined in the PA analyses.

In summary, the findings of these updated quantitative analyses are

consistent with those in the last review. The 3-year visibility metric is generally at or below 27 dv in areas that meet the current secondary standards, with only small differences observed for the three versions of the IMPROVE equation. Though such differences are modest, the IMPROVE equation from Lowenthal and Kumar (2016) always results in higher light extinction values, which is expected given the higher OC multiplier included in the equation and its validation using data from remote areas far away from emissions sources. There is very little difference in estimates of light extinction when PM_{10-2.5} is included in the equation, although a somewhat larger coarse fraction contribution to light extinction would be expected in areas with higher coarse particle concentrations. Overall, the PA finds that updated quantitative analyses indicate that the current secondary PM standards provide a degree of protection against visibility impairment similar to the target level of protection identified in the last review, defined in terms of a PM visibility index.

With regard to PM-related climate effects, the PA recognizes that while the evidence base has expanded since the last review, the new evidence has not appreciably improved the understanding of the spatial and temporal heterogeneity of PM components that contribute to climate forcing (U.S. EPA, 2020, sections 5.2.2.1.1 and 5.4). Despite continuing research, there are still significant limitations in quantifying the contributions of PM and PM components to the direct and indirect effects on climate forcing (e.g., changes to the pattern of rainfall, changes to wind patterns, effects on vertical mixing in the atmosphere) (U.S. EPA, 2020, sections 5.2.2.1.1 and 5.4). In addition, while a number of improvements and refinements have been made to climate models since the last review, these models continue to exhibit variability in estimates of the PM-related climate effects on regional scales (e.g., ~100 km) compared to simulations at the global scale (U.S. EPA, 2020, sections 5.2.2.1.1 and 5.4). While new research has added to the understanding of climate forcing on a global scale, there remain significant limitations to quantifying potential adverse effects from PM on climate in the U.S. and how they would vary in response to incremental changes in PM concentrations in the U.S. Overall, the PA recognizes that while new research is available on climate forcing on a global scale, the remaining uncertainties and limitations are significant, and the new global scale

average measurements of PM_{2.5} mass and components, rather than sub-daily information.

⁶⁵ These sites are those that have a valid 24-hour PM_{2.5} design value for the 2015–2017 period and met strict criteria for PM species for this analysis, based on 24-hour average PM_{2.5} mass and component data that were available from monitors in the IMPROVE network, CSN, and NCore Multipollutant Monitoring Network (U.S. EPA, 2020, Appendix D). PM_{10-2.5} monitoring data is available for 20 of the 67 sites examined.

research does not translate directly to use at regional spatial scales. Thus, the evidence does not provide a clear understanding at the spatial scales needed for the NAAQS of a quantitative relationship between concentrations of PM mass in ambient air and the associated climate-related effects (U.S. EPA, 2020, sections 5.2.2.2.1 and 5.4). The PA concludes that the evidence does not call into question the adequacy of the current secondary PM standards for climate effects.

With regard to materials effects, the PA notes the availability of new evidence in this review related to the soiling process and the types of materials that are affected. Such evidence provides some limited information to inform dose-response relationships and damage functions associated with PM, though most recent studies have been conducted outside the U.S. (U.S. EPA, 2020, section 5.2.2.1.2; U.S. EPA, 2019, section 13.4). The recent evidence includes studies examining PM-related effects on the energy efficiency of solar panels and passive cooling building materials, though there remains insufficient evidence to establish quantitative relationships between PM in ambient air and these or other materials effects (U.S. EPA, 2020, section 5.2.2.1.2). While new research has expanded the body of evidence for PM-related materials effects, the PA recognizes the lack of information to inform quantitative analyses assessing materials effects or the potential public welfare implications of such effects. Thus, the PA concludes that the evidence does not call into question the adequacy of the current secondary PM standards for materials effects.

Overall, the PA recognizes that the newly available welfare effects evidence, critically assessed in the ISA as part of the full body of evidence, reaffirms the conclusions on the visibility, climate, and materials effects of PM as recognized in the last review (U.S. EPA, 2020, sections 5.2.1.1., 5.2.2.1, and 5.4). Further, there is a general consistency of the currently available evidence with the evidence that was available in the last review, including with regard to key aspects of the decision to retain the standards in the last review (U.S. EPA, 2020, sections 5.2.1.1, 5.2.2.1, and 5.4). The quantitative analyses for visibility impairment for recent air quality conditions indicate a similar level of protection against visibility effects considered to be adverse in the last review (U.S. EPA, 2020, sections 5.2.1.2 and 5.4). Collectively, the PA finds that the evidence and quantitative

information-based considerations support consideration of retaining the current secondary PM standards, without revision (U.S. EPA, 2020, section 5.4).

2. CASAC Advice

As part of its review of the draft PA, the CASAC has provided advice on the adequacy of the current secondary PM standards. In its comments on the draft PA, the CASAC concurs with staff's overall preliminary conclusions that it is appropriate to consider retaining the current secondary PM standards without revision (Cox, 2019a). The CASAC "finds much of the information . . . on visibility and materials effects of PM_{2.5} to be useful, while recognizing that uncertainties and controversies remain about the best ways to evaluate these effects" (Cox, 2019a, p. 13 of consensus responses). Regarding climate, while the CASAC agrees that research on PM-related effects has expanded since the last review, it also concludes that "there are still significant uncertainties associated with the accurate measurement of PM contributions to the direct and indirect effects of PM on climate" (Cox, 2019a, pp. 13–14 of consensus responses). The committee recommends that the EPA summarize the "current scientific knowledge and quantitative modeling results for effects of reducing PM_{2.5}" on several climate-related outcomes (Cox, 2019a, p. 14 of consensus responses), while also recognizing that "it is appropriate to acknowledge uncertainties in climate change impacts and resulting welfare impacts in the United States of reductions in PM_{2.5} levels" (Cox, 2019a, p. 14 of consensus responses). When considering the overall body of scientific information for PM-related effects on visibility, materials, and climate, the CASAC agrees that "the available evidence does not call into question the protection afforded by the current secondary PM standards and concurs that they should be retained" (Cox, 2019a, p. 3 of letter).

3. Administrator's Proposed Decision on the Current Secondary PM Standards

This section summarizes the Administrator's considerations and conclusions related to the current secondary PM_{2.5} and PM₁₀ standards and presents his proposed decision to retain those standards, without revision. In establishing secondary standards under the Act that are "requisite" to protect the public welfare from any known or anticipated adverse effects, the Administrator is seeking to establish standards that are neither more nor less stringent than necessary for this

purpose. He notes that secondary standards are not meant to protect against all known or anticipated effects, but rather those that are judged to be adverse to the public welfare. Consistent with the primary standards discussed above (sections II.C.3 and III.C.3), the Act does not require standards to be set at a zero-risk level; but rather at a level that limits risk sufficiently so as to protect the public welfare, but not more stringent than necessary to do so.

Given these requirements, the Administrator's final decision in this review will be a public welfare policy judgment that draws upon the scientific and technical information examining PM-related visibility impairment, climate effects and materials effects, including how to consider the range and magnitude of uncertainties inherent in that information. The Administrator recognizes that his final decision will be based on an interpretation of the scientific evidence and technical analyses that neither overstates nor understates their strengths and limitations, nor the appropriate inferences to be drawn.

As an initial matter in considering the secondary standards, the Administrator notes the longstanding body of evidence for PM-related visibility impairment. As in the last review, this evidence continues to demonstrate a causal relationship between ambient PM and effects on visibility (U.S. EPA, 2019, section 13.2). The Administrator recognizes that visibility impairment can have implications for people's enjoyment of daily activities and for their overall sense of well-being. Therefore, as in previous reviews, he considers the degree to which the current secondary standards protect against PM-related visibility impairment.

In doing so, the Administrator adopts an approach consistent with the approach used in the last review (section IV.A.1). That is, he first defines an appropriate target level of protection in terms of a PM visibility index that accounts for the factors that influence the relationship between particles in the ambient air and visibility (*i.e.*, size fraction, species composition, and relative humidity). He then considers air quality analyses examining this PM visibility index in locations meeting the current 24-hour PM_{2.5} and PM₁₀ standards (U.S. EPA, 2020, section 5.2.1.2).

To identify a target level of protection, the Administrator first defines the specific characteristics of the visibility index. He notes that in the last review, the EPA used an index based on estimates of light extinction by PM_{2.5}

components calculated using an adjusted version of the original IMPROVE algorithm. As described above (sections IV.B and IV.D.1), this algorithm allows the estimation of light extinction using routinely monitored components of $PM_{2.5}$ and $PM_{10-2.5}$,⁶⁶ along with estimates of relative humidity. While revisions have been made to the IMPROVE algorithm since the last review (U.S. EPA, 2020, section 5.2.1.1), the Administrator recognizes that our fundamental understanding of the relationship between ambient PM and light extinction has changed little and that the various IMPROVE algorithms can appropriately reflect this relationship across the U.S. In the absence of a robust monitoring network to directly measure light extinction (sections IV.B.2 and IV.D.1), he judges that estimated light extinction, as calculated using the IMPROVE algorithms, continues to provide a reasonable basis for defining a target level of protection against PM-related visibility impairment in the current review.

In further defining the characteristics of a visibility index based on estimates of light extinction, the Administrator considers the appropriate averaging time, form, and level of the index. With regard to the averaging time and form, the Administrator judges that the decisions made in the last review remain reasonable. In that review, a 24-hour averaging time was selected and the form was defined as the 3-year average of annual 90th percentile values. The decision on averaging time recognized the relatively strong correlations between 24-hour and sub-daily (*i.e.*, 4-hour average) $PM_{2.5}$ light extinction (78 FR 3226, January 15, 2013), indicating that a 24-hour averaging time is an appropriate surrogate for the sub-daily time periods relevant for visual perception. This decision also recognized that the longer averaging time may be less influenced by atypical conditions and/or atypical instrument performance (78 FR 3226, January 15, 2013). The decision to set the form as the 3-year average of annual 90th percentile values noted that (1) a 3-year average provides stability from the occasional effect of inter-annual meteorological variability (78 FR 3198, January 15, 2013; U.S. EPA, 2011, p. 4–58); (2) the 90th percentile corresponds to the median of the distribution of the 20 percent worst days for visibility,

which are targeted in Class I areas by the Regional Haze Program;⁶⁷ and (3) available studies on people's visibility preferences did not identify a basis for a different target than that identified for Class I areas (U.S. EPA, 2011, p. 4–59). Given the similar information available in the current review, the Administrator judges that these decisions remain reasonable and, therefore, that it remains appropriate to define a visibility index in terms of a 24-hour averaging time and a form based on the 3-year average of annual 90th percentile values.

The level of the index was set at 30 dv in the last review, reflecting the highest degree of visibility impairment judged to be acceptable by at least 50% of study participants in the available visibility preference studies (78 FR 3226–3227, January 15, 2013). The focus on 30 dv, rather than a lower level, was supported in light of the important uncertainties and limitations in the underlying public preference studies. Consistent with the last review, the Administrator notes the following uncertainties and limitations in these studies (U.S. EPA, 2020, section 5.2.1.1):

- The available studies may not capture the full range of visibility preferences in the U.S. population, particularly given the potential for preferences to vary based on the visibility conditions commonly encountered and the types of scenes being viewed.
- The available preference studies were conducted 15 to 30 years ago and may not reflect the visibility preferences of the U.S. population today.
- The available preference studies have used a variety of methods, potentially influencing responses as to what level of visibility impairment is deemed acceptable.
- Factors that are not captured by the methods used in available preference studies may influence people's judgments on acceptable visibility, including the duration of visibility impairment, the time of day during which light extinction is greatest, and the frequency of episodes of visibility impairment.

Because no visibility preference studies have been conducted in the U.S. since the last review, the Administrator recognizes that these uncertainties and limitations persist. Therefore, in the current review his consideration of the

degree of visibility impairment constituting an adverse public welfare impact is based on the same preference studies, with the same uncertainties and limitations, that were available in the last review. Drawing from this information, the Administrator judges it appropriate to again use 30 dv as the level of the visibility index.

Having concluded that it remains appropriate in this review to define the target level of protection in terms of a visibility index based on estimated light extinction as described above (*i.e.*, with a 24-hour averaging time; a 3-year, 90th percentile form; and a level of 30 dv), the Administrator next considers the degree of protection from visibility impairment afforded by the existing secondary standards. He considers the updated analyses of PM-related visibility impairment presented in the PA (U.S. EPA, 2020, section 5.2.1.2), which reflect several improvements over the previous review. Specifically, the updated analyses examine multiple versions of the IMPROVE algorithm, including the version incorporating revisions since the last review (section IV.D.1). This approach provides an improved understanding of how variation in equation inputs impacts calculated light extinction (U.S. EPA, 2020, Appendix D). In addition, for a subset of monitoring sites with available $PM_{10-2.5}$ data, updated analyses better characterize the influence of the coarse fraction on light extinction (U.S. EPA, 2020, section 5.2.1.2).

The Administrator notes that the results of these updated analyses are consistent with the results from the last review. Regardless of the IMPROVE equation used, they demonstrate that the 3-year visibility metric is at or below about 30 dv in all areas meeting the current 24-hour $PM_{2.5}$ standard,⁶⁸ and below 25 dv in most of those areas (section IV.D.1). In the locations with available $PM_{10-2.5}$ monitoring, which met both the current 24-hour $PM_{2.5}$ and PM_{10} standards, 3-year visibility metrics were at or below 30 dv regardless of whether the coarse fraction was included in the calculation (U.S. EPA, 2020, section 5.2.1.2). Given the results of these analyses, the Administrator concludes that the updated scientific

⁶⁶ In the last review, the focus was on $PM_{2.5}$ components given their prominent role in PM-related visibility impairment in urban areas and the limited data available for $PM_{10-2.5}$ (77 FR 38980, June 29, 2012; U.S. EPA, 2020, section 5.2.1.2).

⁶⁷ In the last review, 90th, 95th, and 98th percentile forms were evaluated (U.S. EPA, 2010b, section 4.3.3; 78 FR 3198, January 15, 2013), and a standard with a 90th percentile form was reasonably expected to limit the occurrence of days with peak PM-related light extinction (78 FR 3198, January 15, 2013).

⁶⁸ As discussed in the PA (U.S. EPA, 2020, section 5.2.1.2), one site in Fairbanks, Alaska just meets the current 24-hour $PM_{2.5}$ standard and has a 3-year visibility index value of 27 dv based on the original IMPROVE equation and 31 dv based on the Lowenthal and Kumar (2016) equation. At this site, use of the Lowenthal and Kumar (2016) equation may not be appropriate given that PM composition and meteorological conditions may differ considerably from those under which revisions to the equation have been validated (U.S. EPA, 2020, section 5.2.1.2).

evidence and technical information support the adequacy of the current secondary PM_{2.5} and PM₁₀ standards to protect against PM-related visibility impairment. While the inclusion of the coarse fraction had a relatively modest impact on calculated light extinction in these analyses, he nevertheless recognizes the continued importance of the PM₁₀ standard given the potential for larger impacts in locations with higher coarse particle concentrations, such as in the southwestern U.S., which were not included in the PA's analyses due to insufficient coarse particle data (U.S. EPA, 2019, section 13.2.4.1; U.S. EPA, 2020, section 5.2.1.2).

With respect to non-visibility welfare effects, the Administrator considers the evidence for PM-related impacts on climate and on materials and concludes that it is generally appropriate to retain the existing secondary standards and that it is not appropriate to establish any distinct secondary PM standards to address non-visibility PM-related welfare effects. With regard to climate, he recognizes that a number of improvements and refinements have been made to climate models since the time of the last review. However, despite continuing research and the strong evidence supporting a causal relationship with climate effects (U.S. EPA, 2019, section 13.3.9), the Administrator notes that there are still significant limitations in quantifying the contributions of the direct and indirect effects of PM and PM components on climate forcing (U.S. EPA, 2020, sections 5.2.2.1.1 and 5.4). He also recognizes that models continue to exhibit considerable variability in estimates of PM-related climate impacts at regional scales (e.g., ~100 km), compared to simulations at the global scale (U.S. EPA, 2020, sections 5.2.2.1.1 and 5.4). The resulting uncertainty leads the Administrator to conclude that the scientific information available in the current review remains insufficient to quantify, with confidence, the impacts of ambient PM on climate in the U.S. (U.S. EPA, 2020, section 5.2.2.2.1) and that there is insufficient information at this time to base a national ambient standard on climate impacts.

With respect to materials effects, the Administrator notes that the evidence available in the current review continues to support the conclusion that there is a causal relationship with PM deposition (U.S. EPA, 2019, section 13.4). He recognizes that deposition of particles in the fine or coarse fractions can result in physical damage and/or impaired aesthetic qualities. Particles can contribute to materials damage by adding to the effects of natural

weathering processes and by promoting the corrosion of metals, the degradation of painted surfaces, the deterioration of building materials, and the weakening of material components. While some new evidence on materials effects of PM is available in this review, the Administrator notes that this evidence is primarily from studies conducted outside of the U.S. (U.S. EPA, 2019, section 13.4). Given the more limited amount of information on the quantitative relationships between PM and materials effects in the U.S., and uncertainties in the degree to which those effects could be adverse to the public welfare, the Administrator judges that the scientific information available in the current review remains insufficient to quantify, with confidence, the public welfare impacts of ambient PM on materials and that there is insufficient information at this time to support a distinct national ambient standard based on materials impacts.

Taken together, the Administrator concludes that the scientific and technical information for PM-related visibility impairment, climate impacts, and materials effects, with its attendant uncertainties and limitations, supports the current level of protection provided by the secondary PM standards as being requisite to protect against known and anticipated adverse effects on public welfare. For visibility impairment, this conclusion reflects his consideration of the evidence for PM-related light extinction, together with his consideration of updated analyses of the protection provided by the current secondary PM_{2.5} and PM₁₀ standards. For climate and materials effects, this conclusion reflects his judgment that, although it remains important to maintain secondary PM_{2.5} and PM₁₀ standards to provide some degree of control over long- and short-term concentrations of both fine and coarse particles, it is generally appropriate to retain the existing secondary standards and that it is not appropriate to establish any distinct secondary PM standards to address non-visibility PM-related welfare effects. His conclusions on the secondary standards are consistent with advice from the CASAC, which agrees “that the available evidence does not call into question the protection afforded by the current secondary PM standards” and recommends that the secondary standards “should be retained” (Cox, 2019a, p. 3 of letter). Thus, based on his consideration of the evidence and analyses for PM-related welfare effects, as described above, and his consideration of CASAC advice on

the secondary standards, the Administrator proposes to retain those standards (i.e., the current 24-hour and annual PM_{2.5} standards, 24-hour PM₁₀ standard), without revision.

V. Statutory and Executive Order Reviews

Additional information about these statutes and Executive Orders can be found at <http://www2.epa.gov/laws-regulations/laws-and-executive-orders>.

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

The Office of Management and Budget (OMB) determined that this action is a significant regulatory action and it was submitted to OMB for review. Any changes made in response to OMB recommendations have been documented in the docket. Because this action does not propose to change the existing NAAQS for PM, it does not impose costs or benefits relative to the baseline of continuing with the current NAAQS in effect. Thus, the EPA has not prepared a Regulatory Impact Analysis for this action.

B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs

This action is not expected to be an Executive Order 13771 regulatory action. There are no quantified cost estimates for this proposed action because EPA is proposing to retain the current standards.

C. Paperwork Reduction Act (PRA)

This action does not impose an information collection burden under the PRA. There are no information collection requirements directly associated with a decision to retain a NAAQS without any revision under section 109 of the CAA and this action proposes to retain the current PM NAAQS without any revisions.

D. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. This action will not impose any requirements on small entities. Rather, this action proposes to retain, without revision, existing national standards for allowable concentrations of PM in ambient air as required by section 109 of the CAA. See also *American Trucking Associations v. EPA*, 175 F.3d 1027, 1044–45 (D.C. Cir. 1999) (NAAQS do not have significant impacts upon small entities because NAAQS themselves impose no

regulations upon small entities), rev'd in part on other grounds, *Whitman v. American Trucking Associations*, 531 U.S. 457 (2001).

E. Unfunded Mandates Reform Act (UMRA)

This action does not contain any unfunded mandate as described in the UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. This action imposes no enforceable duty on any state, local, or tribal governments or the private sector.

F. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications, as specified in Executive Order 13175. It does not have a substantial direct effect on one or more Indian Tribes. This action does not change existing regulations; it proposes to retain the current primary NAAQS for PM, without revision. Executive Order 13175 does not apply to this action.

H. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

This action is not subject to Executive Order 13045 because it is not economically significant as defined in Executive Order 12866. The health effects evidence for this action, which includes evidence for effects in children, is summarized in section II.B above and is described in the ISA and PA, copies of which are in the public docket for this action.

I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution or Use

This action is not subject to Executive Order 13211, because it is not likely to have a significant adverse effect on the supply, distribution, or use of energy. The purpose of this document is to propose to retain the current PM NAAQS. This proposal does not change existing requirements. Thus, the EPA concludes that this proposal does not constitute a significant energy action as defined in Executive Order 13211.

J. National Technology Transfer and Advancement Act (NTTAA)

This action does not involve technical standards.

K. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

The EPA believes that this action does not have disproportionately high and adverse human health or environmental effects on minority, low-income populations and/or indigenous peoples, as specified in Executive Order 12898 (59 FR 7629, February 16, 1994). The documentation related to this is contained in sections II through IV above. The action proposed in this document is to retain, without revision, the existing NAAQS for PM based on the Administrator's conclusion that the existing standards protect public health, including the health of sensitive groups, with an adequate margin of safety and protect the public welfare. As discussed in section II, the EPA expressly considered the available information regarding health effects among at-risk populations in reaching the proposed decision that the existing standard is requisite.

L. Determination Under Section 307(d)

Section 307(d)(1)(V) of the CAA provides that the provisions of section 307(d) apply to “such other actions as the Administrator may determine.” Pursuant to section 307(d)(1)(V), the Administrator determines that this action is subject to the provisions of section 307(d).

Energy Conservation Program: Energy Conservation Standards for Small Electric Motors; Proposed Rule

DEPARTMENT OF ENERGY

10 CFR Part 431

[EERE-2019-BT-STD-0008]

RIN 1904-AD29

Energy Conservation Program: Energy Conservation Standards for Small Electric Motors

AGENCY: Office of Energy Efficiency and Renewable Energy, Department of Energy.

ACTION: Notification of proposed determination and request for comment.

SUMMARY: The Energy Policy and Conservation Act of 1975, as amended, prescribes energy conservation standards for various consumer products and certain commercial and industrial equipment, including small electric motors. EPCA also requires the Secretary of Energy to periodically determine whether more-stringent, amended standards would be technologically feasible and cost effective, and would result in significant conservation of energy. In this document, DOE has tentatively determined that more stringent small electric motors standards would not be cost effective, and, thus, is not proposing to amend its energy conservation standards for this equipment. DOE requests comment on this proposed determination and associated analyses and results.

DATES: DOE will accept comments, data, and information regarding this notification of proposed determination before, but no later than June 29, 2020. See section VII, “Public Participation,” for details.

ADDRESSES: Interested persons are encouraged to submit comments using the Federal eRulemaking Portal at <http://www.regulations.gov>. Follow the instructions for submitting comments. Alternatively, interested persons may submit comments, identified by docket number EERE-2019-BT-STD-0008, by any of the following methods:

(1) *Federal eRulemaking Portal:* <http://www.regulations.gov>. Follow the instructions for submitting comments.

(2) *Email:* SmallElecMotors2019STD0008@ee.doe.gov. Include the docket number EERE-2019-BT-STD-0008 in the subject line of the message.

(3) *Postal Mail:* Appliance and Equipment Standards Program, U.S. Department of Energy, Building Technologies Office, Mailstop EE-5B, 1000 Independence Avenue SW., Washington, DC, 20585-0121. Telephone: (202) 287-1445. If possible,

please submit all items on a compact disc (“CD”), in which case it is not necessary to include printed copies.

(4) *Hand Delivery/Courier:* Appliance and Equipment Standards Program, U.S. Department of Energy, Building Technologies Office, 950 L’Enfant Plaza SW, 6th Floor, Washington, DC, 20024. Telephone: (202) 586-6636. If possible, please submit all items on a CD, in which case it is not necessary to include printed copies.

No telefacsimilies (“faxes”) will be accepted. For detailed instructions on submitting comments and additional information on the rulemaking process, see section VII of this document.

Docket: The docket for this activity, which includes **Federal Register** notices, comments, and other supporting documents/materials, is available for review at <http://www.regulations.gov>. All documents in the docket are listed in the <http://www.regulations.gov> index. However, not all documents listed in the index may be publicly available, such as information that is exempt from public disclosure.

The docket web page can be found at: <https://www.regulations.gov/docket?D=EERE-2019-BT-STD-0008>. The docket web page contains instructions on how to access all documents, including public comments, in the docket. See section VII for information on how to submit comments through <http://www.regulations.gov>.

FOR FURTHER INFORMATION CONTACT: Mr. Jeremy Domm, U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, Building Technologies Office, EE-5B, 1000 Independence Avenue SW., Washington, DC, 20585-0121. Email: ApplianceStandardsQuestions@ee.doe.gov.

I. Synopsis of the Proposed Determination

Title III, Part C¹ of the Energy Policy and Conservation Act, as amended (“EPCA”),² established the Energy Conservation Program for Certain Industrial Equipment, (42 U.S.C. 6311–6317), which includes small electric motors, the subject of this notification of proposed determination (“NOPD”).

DOE is issuing this NOPD pursuant to EPCA’s requirement that not later than 6 years after issuance of any final rule establishing or amending a standard, DOE must publish either a notification of determination that standards for the product do not need to be amended, or a notice of proposed rulemaking (“NOPR”) including new proposed energy conservation standards (proceeding to a final rule, as appropriate). (42 U.S.C. 6316(a); 42 U.S.C. 6295(m))

For this proposed determination, DOE analyzed the small electric motors currently subject to the standards found at title 10 of the Code of Federal Regulations (“CFR”) part 431. See 10 CFR 431.446. Of these motors, DOE first analyzed the technological feasibility of more efficient small electric motors. For currently available small electric motors with efficiencies exceeding the levels of the current energy conservation standards, DOE preliminarily determined that more stringent standards would be technologically feasible. For these small electric motors, DOE evaluated whether more stringent standards would also be cost effective by conducting preliminary life-cycle cost (“LCC”) and payback period (“PBP”) analyses.

Based on these analyses, as summarized in section V of this document, DOE has preliminarily determined that more stringent energy conservation standards would not be cost effective. Therefore, DOE has tentatively determined that the current standards for small electric motors do not need to be amended.

II. Introduction

The following section briefly discusses the statutory authority underlying this proposed determination,

as well as some of the relevant historical background related to the establishment of standards for small electric motors.

A. Authority and Background

EPCA authorizes DOE to regulate the energy efficiency of a number of consumer products and certain industrial equipment. Title III, Part C of EPCA includes the small electric motors that are the subject of this proposed determination. (42 U.S.C. 6311(13)(G)) As discussed in the following paragraphs, EPCA directed DOE to establish test procedures and prescribe energy conservation standards for small electric motors. (42 U.S.C. 6317(b))

The energy conservation program under EPCA consists essentially of four parts: (1) Testing, (2) labeling, (3) Federal energy conservation standards, and (4) certification and enforcement procedures. Relevant provisions of the Act specifically include definitions (42 U.S.C. 6311), energy conservation standards (42 U.S.C. 6313), test procedures (42 U.S.C. 6314), labeling provisions (42 U.S.C. 6315), and the authority to require information and reports from manufacturers (42 U.S.C. 6316).

EPCA directed DOE to establish a test procedure for those small electric motors for which DOE determined that energy conservation standards would (1) be technologically feasible and economically justified and (2) result in significant energy savings. (42 U.S.C. 6317(b)(1)) Manufacturers of covered equipment must use the Federal test procedures as the basis for: (1) Certifying to DOE that their equipment complies with the applicable energy conservation standards adopted pursuant to EPCA (42 U.S.C. 6316(a); 42 U.S.C. 6295(s)), and (2) making representations about the efficiency of that equipment (42 U.S.C. 6314(d)). The DOE test procedures for small electric motors appear at 10 CFR part 431, subpart X.

EPCA further directed DOE to prescribe energy conservation standards for those small electric motors for which test procedures were established. (42 U.S.C. 6317(b)(2)) Additionally, EPCA prescribed that any such standards shall not apply to any small electric motor which is a component of a covered product under 42 U.S.C. 6292(a) or covered equipment under 42 U.S.C. 6311 of EPCA. (42 U.S.C. 6317(b)(3)) Federal energy efficiency requirements

for covered equipment established under EPCA generally supersede State laws and regulations concerning energy conservation testing, labeling, and standards. (See 42 U.S.C. 6316(a) and (b); 42 U.S.C. 6297(a)–(c)).

EPCA requires that, not later than 6 years after the issuance of any final rule establishing or amending a standard, DOE evaluate the energy conservation standards for each type of covered equipment, including those at issue here, and publish either a notification of determination that the standards do not need to be amended, or a NOPR that includes new proposed energy conservation standards (proceeding to a final rule, as appropriate). (42 U.S.C. 6316(a); 42 U.S.C. 6295(m)(1)). EPCA further provides that, not later than 3 years after the issuance of a final determination not to amend standards, DOE must make a new determination not to amend the standards or issue a NOPR including new proposed energy conservation standards. (42 U.S.C. 6316(a); 42 U.S.C. 6295(m)(3)(B)) DOE must make the analysis on which a determination is based publicly available and provide an opportunity for written comment. (42 U.S.C. 6316(a); 42 U.S.C. 6295(m)(2))

In making a determination that the standards do not need to be amended, DOE must evaluate under the criteria of 42 U.S.C. 6295(n)(2) whether amended standards (1) will result in significant conservation of energy, (2) are technologically feasible, and (3) are cost effective as described under 42 U.S.C. 6295(o)(2)(B)(i)(II). (42 U.S.C. 6316(a); 42 U.S.C. 6295(m)(1)(A) and 42 U.S.C. 6295 (n)(2)) Under 42 U.S.C. 6295(o)(2)(B)(i)(II), an evaluation of cost effectiveness requires DOE to consider savings in operating costs throughout the estimated average life of the covered product in the type (or class) compared to any increase in the price of, or in the initial charges for, or maintenance expenses of, the covered products which are likely to result from the imposition of the standard.

DOE is publishing this document in accordance with its authority under EPCA, and in satisfaction of its statutory requirement under EPCA.

1. Current Standards

The current energy conservation standards for small electric motors are located in title 10 CFR 431.446, and are presented in Table II–1 and Table II–2.

¹ For editorial reasons, upon codification in the U.S. Code, Part C was re-designated Part A–1.

² All references to EPCA in this document refer to the statute as amended through America’s Water Infrastructure Act of 2018, Public Law 115–270 (October 23, 2018).

TABLE II-1—FEDERAL ENERGY CONSERVATION STANDARDS FOR POLYPHASE SMALL ELECTRIC MOTORS

| Motor horsepower/standard kilowatt equivalent | Average full load efficiency | | |

| 3/2.2 | N/A | N/A | 84.1 |

2. History of Standards Rulemakings for Small Electric Motors

In 2006, DOE determined that energy conservation standards for certain single-phase, capacitor-start, induction-run, small electric motors are technologically feasible and economically justified, and would result in significant energy savings. 71 FR 38799 (July 10, 2006). Later, in 2010, DOE issued a final rule (the “March

2010 Final Rule”) establishing energy conservation standards for small electric motors manufactured starting on March 9, 2015.³ 75 FR 10874 (March 9, 2010).

In April 2019, DOE published a request for information (“April 2019 ECS RFI”) to solicit input and data from interested parties to aid in the development of the technical analyses for the determination of whether new and/or amended standards for small

electric motors are warranted. 84 FR 14027 (April 9, 2019). The comment period was re-opened in response to a request from an interested party, see NEMA, No. 4 at p. 1, until June 7, 2019. See 84 FR 25203 (May 31, 2019).

DOE received a number of comments from interested parties in response to the April 2019 ECS RFI.⁴ The commenters that provided relevant comments are listed in Table II-3.⁵

TABLE II-3—APRIL 2019 ECS RFI WRITTEN COMMENTS

| Commenter/organization(s) | Reference in this NOPD | Organization type |
|---|------------------------|--|
| ABB Motors and Mechanical Inc | ABB | Manufacturer. |
| Air-Conditioning, Heating, and Refrigeration Institute (“AHRI”) and Association of Home Appliance Manufacturers (“AHAM”). | AHRI and AHAM | Trade Associations. |
| Appliance Standards Awareness Project (“ASAP”), Alliance to Save Energy, American Council for an Energy-Efficient Economy, the California Energy Commission, the Natural Resources Defense Council, and Northwest Energy Efficiency Alliance. | ASAP, et al. | Advocacy Groups and State Governmental Agency. |
| Belanger, Zach | Belanger | Individual. |
| California Investor-Owned Utilities (“CA IOUs”)—Pacific Gas and Electric Company, San Diego Gas and Electric, and Southern California Edison. | CA IOUs | Utilities. |
| Kasimos, Anastasia | Kasimos | Individual. |
| Lennox International Inc | Lennox | Manufacturer. |
| Lenze Americas | Lenze Americas | Manufacturer. |

³ In a technical correction, DOE revised the compliance date for energy conservation standards to March 9, 2015, for each small electric motor manufactured (alone or as a component of another piece of non-covered equipment), or March 9, 2017, in the case of a small electric motor which requires

listing or certification by a nationally recognized safety testing laboratory. 75 FR 17036 (April 5, 2010).

⁴ The comments received in response to the April 2019 ECS RFI are included in the docket for this action and can be found at <https://www.regulations.gov/docket?D=EERE-2019-BT-STD-0008>.

⁵ DOE received a comment unrelated to small electric motors (*i.e.*, Sims, No. 2), which was not addressed.

TABLE II-3—APRIL 2019 ECS RFI WRITTEN COMMENTS—Continued

| Commenter/organization(s) | Reference in this NOPD | Organization type |
|---|----------------------------------|--------------------------------|
| National Electrical Manufacturers Association (“NEMA”) | NEMA | Trade Association. |
| The Institute for Policy Integrity at New York University (“NYU”) School of Law. | NYU | Non-Governmental Organization. |
| Palubin, Erin | Palubin | Individual. |
| Sierra Club & Earthjustice | Sierra Club & Earthjustice | Advocacy Groups. |

DOE also received a number of comments related to certification, compliance and enforcement issues, but these comments fell outside the scope of this rulemaking and are not addressed in this document. The remaining relevant comments and DOE’s responses are provided in the appropriate sections of this document.

III. General Discussion

A. Scope of Coverage and Equipment Classes

This document covers equipment meeting the definition of “small electric motor,” as codified in 10 CFR 431.442. “Small electric motor” means a “NEMA general purpose alternating current single-speed induction motor, built in a two-digit frame number series in accordance with NEMA Standards Publication MG1–1987, including IEC metric equivalent motors.” 10 CFR

431.442.⁶ The scope of coverage for these motors is discussed in further detail in section IV.A.1.

When evaluating and establishing energy conservation standards, DOE divides covered equipment into equipment classes by the type of energy used, or by capacity or other performance-related features that justify a different standard. (42 U.S.C. 6316(a); 42 U.S.C. 6295(q)) In determining whether capacity or another performance-related feature justifies a different standard, DOE must consider such factors as the utility of the feature to the consumer and other factors DOE deems appropriate. (*Id.*) The equipment classes for this proposed determination are discussed further in section IV.A.2.

B. Test Procedure

As noted, EPCA directed DOE to establish a test procedure for those

small electric motors for which DOE determined that energy conservation standards would (1) be technologically feasible and economically justified and (2) result in significant energy savings. (42 U.S.C. 6317(b)(1)) In a final rule published on July 7, 2009, DOE adopted test procedures for small electric motors. 74 FR 32059.

Subsequently, DOE updated the test procedures for small electric motors on May 4, 2012 (the “May 2012 test procedure final rule”). 77 FR 26608. The existing test procedures for small electric motors incorporate certain industry standards from the Institute of Electrical and Electronics Engineers (“IEEE”) and Canadian Standards Association (“CSA”), as listed in Table III–1.

TABLE III–1—INDUSTRY STANDARDS CURRENTLY INCORPORATED BY REFERENCE FOR SMALL ELECTRIC MOTORS

| Equipment description | Industry test procedure |
|--|--|
| Single-phase small electric motors | IEEE 114–2010. CSA C747–09. |
| Polyphase small electric motors less than or equal to 1 horsepower | IEEE 112–2004 Test Method A. CSA C747–09. |
| Polyphase small electric motors greater than 1 horsepower | IEEE 112–2004 Test Method B. CSA C390–10. |

In 2017, DOE solicited the public for information pertaining to the test procedures for small electric motors and electric motors. 82 FR 35468 (July 31, 2017) (the “July 2017 test procedure RFI”). In the July 2017 test procedure RFI, DOE sought public comments, data, and information on all aspects of, and any issues or problems with, the existing DOE test procedure for small electric motors, including on any needed updates or revisions. DOE also discussed electric motor categories (as defined at 10 CFR 431.12) that may be considered in a future DOE test procedure. 82 FR 35470–35474.

In April 2019, DOE proposed amending its test procedure for small electric motors. 84 FR 17004 (April 23,

2019). In that NOPR, DOE proposed harmonizing its procedure with industry practice by incorporating a new industry standard that manufacturers would be permitted to use in addition to the three industry standards currently incorporated by reference as options for use when testing small electric motor efficiency. 84 FR 17013–17014. In addition, DOE proposed to adopt industry provisions related to the test conditions to ensure the comparability of test results for small electric motors. 84 FR 17014–17018. DOE is currently evaluating the comments received on these proposals.

C. Technological Feasibility

1. General

In evaluating potential amendments to energy conservation standards, DOE conducts a screening analysis based on information gathered on all current technology options and prototype designs that could improve the efficiency of the product or equipment at issue. As the first step in such an analysis, DOE develops a list of technology options for consideration in consultation with manufacturers, design engineers, and other interested parties. DOE then determines which of those means for improving efficiency are technologically feasible. DOE considers technologies incorporated in

⁶ The term “IEC” refers to the International Electrotechnical Commission.

commercially available equipment or in working prototypes to be technologically feasible. See 10 CFR part 430, subpart C, appendix A, section 4(a)(4)(i).

After DOE has determined that particular options are technologically feasible, it further evaluates each technology option in light of the following additional screening criteria: (1) Practicability to manufacture, install, and service; (2) adverse impacts on equipment utility or availability; and (3) adverse impacts on health or safety. See 10 CFR part 430, subpart C, appendix A, section 4(a)(4)(ii)–(iv).

Additionally, it is DOE policy not to include in its analysis any proprietary technology that is a unique pathway to achieving a certain efficiency level. Section IV.B of this proposed determination discusses the results of the screening analysis for small electric motors, particularly the designs DOE considered, those it screened out, and those that are the basis for the proposed determination. In this NOPD, based on its review of the market and comments received in response to the April 2019 ECS RFI, DOE has tentatively determined that no significant technical advancements in induction motor technology have been made since publication of the March 2010 Final Rule.

2. Maximum Technologically Feasible Levels

When DOE evaluates the potential for new or amended standards, DOE must determine the maximum improvement in energy efficiency or maximum reduction in energy use that is technologically feasible for such equipment. Accordingly, in the engineering analysis, DOE determined the maximum technologically feasible (“max tech”) improvements in energy efficiency for small electric motors. DOE defines a max-tech efficiency level to represent the theoretical maximum possible efficiency if all available design options are incorporated in a model. In applying these design options, DOE would only include those that are compatible with each other such that when combined, they would represent the theoretical maximum possible efficiency. In many cases, the max-tech efficiency level is not commercially available because it is not economically feasible. The max-tech levels that DOE has determined are described in section IV.C of this proposed determination.

D. Energy Savings

In determining whether to amend the current energy conservation standards for small electric motors, DOE must

assess whether amended standards will result in significant conservation of energy. (42 U.S.C. 6316(a); 42 U.S.C. 6295(m)(1)(A). See also 42 U.S.C. 6295(n)(2).) For each considered efficiency level, DOE estimated the lifetime energy savings for small electric motors purchased in the expected compliance year for potential standards. See section IV.E for more details for the energy use analysis.

The term “significant” is not defined in EPCA. DOE notes that the meaning of this term is currently under consideration. See 84 FR 3910, 3922 (Feb. 13, 2019). DOE is also considering whether to apply a two-pronged threshold approach for determining whether significant energy savings is present in a given standards rulemaking scenario. See *id.* at 84 FR 3921–3925. In the present case, when applying the criteria of 42 U.S.C. 6295(n)(2) to determine whether to amend the current standards, DOE analyzed the available data and has tentatively determined that amended standards would not be cost-effective as required under EPCA. (42 U.S.C. 6316(a); 42 U.S.C. 6295(m)(1)(A) and 42 U.S.C. (n)(2)(C)) See also sections IV.F and V.B (discussing in greater detail DOE’s analysis of the available data in reaching this tentative determination). Based on available data, DOE’s analysis indicates that the LCC of a small electric motor would increase with more stringent standards and the payback period to recoup the relevant costs from investing in more stringent standards would, in most cases, likely exceed the expected lifetimes of the different classes of small electric motors DOE examined in its analysis—pointing to the inability of potential standards to satisfy the cost-effectiveness requirement under EPCA. Consequently, because DOE’s analysis indicates that the three mandatory prerequisites that need to be satisfied to permit DOE to move forward with a determination to amend its current standards cannot be met, DOE did not separately determine whether the potential energy savings would be significant for purposes of the statutory test that applies. See 42 U.S.C. 6295(n)(2) (requiring that amended standards must result in significant conservation energy, be technologically feasible, and be cost-effective as provided in 42 U.S.C. 6295(o)(2)(B)(i)(II)).⁷

⁷ Under 42 U.S.C. 6295(o)(2)(B)(i)(II), DOE must consider whether “the savings in operating costs throughout the estimated average life of the covered product in the type (or class) compared to any increase in the price of, or in the initial charges for, or maintenance expenses of, the covered products which are likely to result from the imposition of the standard.”

E. Cost Effectiveness

EPCA requires DOE to consider the cost effectiveness of amended standards in the context of the savings in operating costs throughout the estimated average life of the covered equipment class compared to any increase in the price of, or in the initial charges for, or maintenance expenses of, the covered equipment that are likely to result from a standard. (42 U.S.C. 6316(a); 42 U.S.C. 6295(m)(1)(A))

In considering cost effectiveness, DOE conducted LCC and PBP analyses. The LCC is the sum of the initial price of equipment (including its installation) and the operating expense (including energy, maintenance, and repair expenditures) discounted over the lifetime of the equipment. The LCC analysis requires a variety of inputs, such as equipment prices, equipment energy consumption, energy prices, maintenance and repair costs, equipment lifetime, and discount rates appropriate for consumers. To account for uncertainty and variability in specific inputs, such as equipment lifetime and discount rate, DOE uses a distribution of values, with probabilities attached to each value.

The PBP is the estimated amount of time (in years) it takes consumers to recover the increased purchase cost (including installation) of more-efficient equipment through lower operating costs. DOE calculates the PBP by dividing the change in purchase cost due to a more-stringent standard by the change in annual operating cost for the year that standards are assumed to take effect.

For its LCC and PBP analyses, DOE assumes that consumers would purchase the covered equipment in the first year of compliance with any amended standards. The LCC savings for the considered efficiency levels are calculated relative to the case that reflects projected market trends in the absence of amended standards. DOE’s LCC and PBP analysis is discussed in further detail in section IV.F of this proposed determination.

DOE’s LCC and PBP analyses indicate that the LCC would increase with more stringent standards and that the payback period to recoup the relevant costs from investing in more stringent standards would, in most cases, likely exceed the expected lifetimes of the different classes of small electric motors DOE examined in its analysis.⁸ Therefore,

⁸ For polyphase small electric motors, the PBP exceeded the lifetime of the unit at all ELs considered. For CSCR small electric motors, the PBP at EL 1 and EL 2 was comparable to and/or lower than the lifetime of the unit (PBP of 6.7; 7.0;

DOE has tentatively determined that amended standards would not be cost-effective as required under EPCA. (42 U.S.C. 6316(a); 42 U.S.C. 6295(m)(1)(A) and 42 U.S.C. 6295(n)(2)(C)) See also sections IV.F and V.B (discussing in greater detail DOE's analysis of the available data in reaching this tentative determination).

IV. Methodology and Discussion of Related Comments

This section addresses the analyses DOE performed for this proposed determination regarding small electric motors. Separate subsections address each component of DOE's analyses and responses to related comments.

Lennox commented that DOE should carefully consider and exercise caution to ensure that more stringent standards for small electric motors provide significant energy savings and are economically justified. (Lennox, No. 14 at p. 2) An individual commenter stated that small electric motors energy conservation standards should be considered a priority. (Kasimos, No. 9 at p. 1)

As discussed previously, EPCA requires that, not later than 6 years after the issuance of any final rule establishing or amending a standard, DOE evaluate the energy conservation standards for each type of covered equipment, including those at issue here, and publish either a notification of determination that the standards do not need to be amended, or a NOPR that includes new proposed energy conservation standards (proceeding to a final rule, as appropriate). (42 U.S.C.

6316(a); 42 U.S.C. 6295(m)(1)). In making a determination that the standards do not need to be amended, DOE must evaluate whether amended standards (1) will result in significant conservation of energy, (2) are technologically feasible, and (3) are cost effective as described under 42 U.S.C. 6295(o)(2)(B)(i)(II). (42 U.S.C. 6316(a); 42 U.S.C. 6295(m)(1)(A); 42 U.S.C. 6295(n)(2)) The following discussion presents DOE's evaluation and tentative determination as required under EPCA.

A. Market and Technology Assessment

DOE has conducted a preliminary market and technology assessment in support of a proposed determination for small electric motors. The goal of the market assessment is to develop a qualitative and quantitative characterization of the small electric motors industry. This assessment characterizes the market structure based on publicly available information as well as data supplied by manufacturers and other interested parties. The goal of the technology assessment is to develop a list of technology options that manufacturers can use to improve the efficiency of small electric motors.

For this proposed determination, DOE evaluated the small electric motors currently subject to standards at 10 CFR 431.446. The following section reviews the scope of coverage and the equipment classes used in the development of the current energy conservation standards for small electric motors and this proposed determination.

1. Scope of Coverage

By statute, a "small electric motor" is "a NEMA general purpose alternating-current single-speed induction motor, built in a two-digit frame number series in accordance with NEMA Standards Publication MG 1-1987." (42 U.S.C. 6311(13)(G)) DOE later clarified by regulation that this definition also includes IEC metric equivalent motors." See 10 CFR 431.442. Equipment meeting this definition are within DOE's scope of coverage but not all may be subject to DOE's current standards.

DOE's standards regulate the energy efficiency of those small electric motors that fall within three topologies (*i.e.*, arrangements of component parts): Capacitor-start induction-run ("CSIR"), capacitor-start capacitor-run ("CSCR"), and polyphase motors. See 10 CFR 431.446. EPCA prescribes that standards for small electric motors do not apply to any small electric motor which is a component of a covered product or covered equipment under EPCA. (42 U.S.C. 6317(b)(3)) DOE's current energy conservation standards only apply to small electric motors manufactured alone or as a component of another piece of non-covered equipment. 10 CFR 431.446(a).

Subpart X of 10 CFR part 431 includes energy conservation standards and test procedures for the small electric motors listed in Table IV-1. DOE is not proposing any changes to the scope of small electric motors subject to energy conservation standards (*i.e.*, "scope of applicability").

TABLE IV-1—SMALL ELECTRIC MOTORS CURRENTLY SUBJECT TO ENERGY CONSERVATION STANDARDS

[Manufactured alone or as a component of another piece of non-covered equipment]

| Motor topology | Pole configuration | Motor output power |
|-----------------|--------------------|------------------------------|
| Single-phase | | |
| CSIR | 2,4,6 | 0.25–3 hp (0.18–2.2 kW) * |
| CSCR | 2,4,6 | 0.25–3 hp (0.18–2.2 kW) |
| Polyphase | 2,4,6 | 0.25–3 hp (0.18–2.2 kW) |

Certain motor categories are not currently subject to standards. These include:

- Polyphase, 6-pole, 2 and 3 hp motors;
- CSCR and CSIR, 6-pole, 1.5, 2, and 3 hp motors;
- CSCR and CSIR, 4-pole, 3 hp motors.

* The values in parentheses are the equivalent metric ratings.

In response to the April 2019 ECS RFI, DOE received a number of comments relevant to the scope of applicability of energy conservation standards for small electric motors.

Lennox, AHRI and AHAM supported maintaining the existing standards scope for small electric motors. (Lennox, No. 14 at p. 1; AHRI and AHAM, No. 12 at p. 2) AHRI and AHAM also

specifically opposed testing and regulating special and definite purpose motors. They argued that regulating special and definite purpose motors could: (1) Increase the cost of the motor

5.9; and 6.4 years compared to an average lifetime of 6.6 years). For all equipment classes and at all

ELs considered, the LCC increased with more

stringent standards. (See results in section V.B and chapter 8 of the NOPD TSD for more details)

and of the finished product without necessarily improving its performance and (2) significantly increase burden on original equipment manufacturers (“OEMs”) if all manufacturers of products using special and definite purpose motors were required to certify compliance with standards for component parts. (AHRI and AHAM, No. 12 at p. 2–3) Lenze Americas added that the scope of applicability for small electric motor standards should not include non-continuous duty motors and motors that are combined with high-efficiency gears. (Lenze Americas, No. 4 at p. 1)

As previously stated in section III.A, this document pertains only to equipment meeting the definition of small electric motor, as codified in 10 CFR 431.442, which includes general purpose motors, but does not include special purpose and definite purpose motors because they do not meet the definition of general purpose motors.⁹ In addition, DOE notes that motors with non-continuous duty rating and integral gears are not included in the category of NEMA general purpose single-speed induction motor¹⁰ and are therefore not subject to the energy conservation standards prescribed at 10 CFR 431.446.

Sierra Club & Earthjustice commented that DOE did not explain why it is not considering standards for motors other than currently regulated small electric motors, despite considering test procedures for motors that the market considers “small” in the July 2017 test procedure RFI. (Sierra Club & Earthjustice, No. 13 at p. 1) In addition, ASAP, et al. suggested that DOE carefully consider broadening the scope to address a wide range of motors that the market considers “small”. (ASAP, et al., No. 16 at p. 2) In its filing, the CA IOUs argued that DOE should consider establishing standards for additional categories of motors considered small by

customers and the industry, including special- and definite-purpose motors, permanent split capacitor motors, and split phase induction motors. (CA IOUs, No. 10 at pp. 2–3)

In the July 2017 test procedure RFI, DOE indicated that it may consider setting test procedures for electric motors that are considered “small” by customers and the electric motors industry, but that are not currently subject to the small electric motor test procedure. 82 FR 35470. DOE specified that the motors under consideration in that test procedure RFI may have similarities to motors that are currently regulated as small electric motors (such as horsepower) and may be used in similar applications, but that despite these similarities, DOE is still determining whether these motors would be regulated as small electric motor or as electric motors under DOE regulations. *Id.* As such, this proposed determination is based on the current scope of the small electric motor definition and not on any hypothetical expanded scope that DOE may consider in the future.

As previously noted, the term “small electric motor” has a specific meaning under EPCA. See 42 U.S.C. 6311(13)(G) and 10 CFR 431.442. Special purpose and definite purpose motors are not general purpose motors and therefore are not covered under the statutory or regulatory definition of “small electric motor” and are not “small electric motors” under DOE’s statutory or regulatory framework.

Further, single-speed induction motors, as delineated and described in MG1–1987, fall into five categories: Split-phase, shaded-pole, capacitor-start (both CSIR and CSCR), permanent-split capacitor (“PSC”), and polyphase. Of these five motor categories, DOE determined in the March 2010 Final Rule that only CSIR, CSCR, and polyphase motors were able to meet the relevant performance requirements in NEMA MG1 and fell within the general purpose alternating current motor category, as shown by the listings found in manufacturers’ catalogs. 75 FR 10882. As stated previously, DOE is not proposing any changes to the scope of small electric motors subject to energy conservation standards. Therefore, for this determination, DOE only considered the currently regulated small electric motors subject to energy conservation standards.¹¹

¹¹ Moreover, even if the facts supported the expansion of the current scope for small electric motors, DOE notes that it would first need to consider the potential test methods to apply when measuring the efficiency of a motor that is not in the scope of the current DOE test procedure.

NEMA, AHRI and AHAM, and Lennox commented that DOE should apply a finished-product or system level approach to energy efficiency regulations. (NEMA, No. 11 at p. 18; AHRI and AHAM, No. 12 at pp. 2–3; Lennox, No. 14 at p. 2). NEMA, AHRI, and AHAM commented that there are greater energy savings opportunities when regulating at the finished-product level compared to component level efficiency improvements of small electric motors. (NEMA, No. 11 at p. 3; AHRI and AHAM, No. 12 at p. 3) While acknowledging that such considerations are outside the scope of a small electric motors rulemaking, NEMA commented that DOE should focus on system level efficiency for equipment where advanced technology motors can be applied. (NEMA, No. 11 at p. 18) ABB suggested that regulating systems such as power pumps, compressors, and conveyors would provide greater energy savings than requiring incremental increases in small electric motor efficiency. (ABB, No. 15 at p. 1) Lennox stated that regulating components in covered products and covered equipment undermines innovation in developing more efficient finished-product systems, inhibits OEM flexibility to design better products at lower prices, and adds significant burden. (Lennox, No. 15 at p. 2)

EPCA prescribes that energy conservation standards for small electric motors do not apply to any small electric motor that is a component of a covered product or covered equipment under EPCA. (42 U.S.C. 6317(b)(3)) Small electric motors can also be incorporated in non-covered products and equipment, and in these scenarios, DOE would be unable to regulate—without first satisfying the statutory requirements for setting regulatory coverage over these non-covered products and equipment—the final product/equipment into which these motors would fit.

The CA IOUs commented that DOE should consider motors with integrated controls to capture energy savings from part-load operation. They noted that the IEC 61800–9 Power Driven Systems Standard describes how to classify and test motors with controls and motors that are considered variable-speed systems. (CA IOUs, No. 10 at p. 4) DOE

Nothing DOE has reviewed—or that commenters have submitted—have suggested that compatibility exists between motors that fall outside of the already prescribed small electric motor scope set by Congress and the definition of small electric motor. Comments related to the scope of applicability of the DOE test procedure for small electric motors were discussed as part of DOE’s test procedure NOPR. 84 FR 17004, 17009 (April 23, 2019).

⁹ See 42 U.S.C. 6311(13)(C) (defining a definite purpose motor as a motor “designed in standard ratings with standard operating characteristics or standard mechanical construction for use under service conditions other than usual or for use on a particular type of application and which cannot be used in most general purpose application”) and 42 U.S.C. 6311(13)(D) (defining a special purpose motor as “a motor, other than a general purpose motor or definite purpose motor, which has special operating characteristics or special mechanical construction, or both, designed for a particular application”).

¹⁰ In response to questions from NEMA and various motor manufacturers, DOE issued a guidance document that identifies some key design elements that manufacturers should consider when determining whether a given individual motor meets the small electric motor definition and is subject to the energy conservation standards promulgated for small electric motors. See <https://www.regulations.gov/document?D=EERE-2017-BT-TP-0047-0082>.

notes that the statutory definition of small electric motors (42 U.S.C. 6311(13)(G)), which is reflected in the regulatory definition at 10 CFR 431.442, is limited to motors that are single-speed. Consequently, motors with integrated controls or variable-speed configurations are beyond the statutory (and regulatory) definition of small electric motors.

2. Equipment Classes

When evaluating and establishing energy conservation standards, DOE divides covered equipment into equipment classes by the type of energy used, or by capacity or other performance-related features that justify a different standard. (42 U.S.C. 6316(a); 42 U.S.C. 6295(q)) In determining whether capacity or another performance-related feature justifies a different standard, DOE must consider such factors as the utility of the feature to the consumer and other factors DOE deems appropriate. (*Id.*) For the analysis in this proposed determination, DOE considered the 62 equipment classes that it already regulates based on motor category, horsepower rating, and number of poles. This section reviews the motor characteristics used to delineate equipment classes for small electric motors under the current energy conservation standards and this proposed determination.

The first characteristic used to establish equipment classes is phase count. Polyphase and single-phase equipment classes are used to differentiate motors based on the fundamental differences in how the two types of motors operate. 10 CFR 431.446(a). For a rotor to move, the stator (*i.e.*, the stationary part of the motor) must produce a rotating magnetic field. To operate on single-phase alternating current (“AC”) power, the single-phase motor uses an auxiliary winding (or start winding) with current and voltage out of phase with the original (main) winding to produce a net rotating magnetic field. To operate on three-phase power, the polyphase motor uses windings arranged such that when supplied by three-phase alternating current, a rotating magnetic field is produced. In short, three-phase power in a polyphase motor naturally produces rotation, whereas a single-phase motor requires the auxiliary winding to “engineer” the conditions for rotation. Due to these differences, polyphase motors are inherently more efficient but

require use of a three-phase power source. Based on the differences in efficiency and consumer utility, DOE separated equipment classes based on phase count in the March 2010 Final Rule. 75 FR 10886. This proposed determination maintains this approach.

In addition to differentiating equipment classes by phase count, equipment classes are differentiated by the topology of single-phase motors. 10 CFR 431.446(a). DOE identified two topologies of single-phase motors meeting the statutory definition of small electric motors: CSIR and CSCR. CSIR and CSCR motors both utilize a capacitor (“start-capacitor”) and two windings (“start-winding” and “run-winding”). The difference between the two motors occurs when reaching operating speed; while CSIR motors run on the run-winding alone with no capacitor, CSCR motors run using an additional “run-capacitor” and both windings. While this additional capacitor can boost CSCR motor efficiency to levels higher than those exhibited by CSIR motor designs, it usually constitutes dimensional changes due to the need to mount the run-capacitor externally on the motor housing. This additional spatial requirement could potentially limit the use of CSCR motors in space-constrained applications, and would cause motor topology to directly impact consumer utility. Given that motor topology can affect motor performance and consumer utility, DOE differentiated single-phase equipment classes by topology in the March 2010 Final Rule. 75 FR 10886. DOE maintains this approach in this proposed determination.

The current energy conservation standards also differentiate classes based on the number of poles in a motor. 10 CFR 431.446(a). The number of poles in an induction motor determines the synchronous speed (*i.e.*, revolutions per minute). There is an inverse relationship between the number of poles and speed: As a motor design increases from two to eight poles, the synchronous speed drops from 3,600 to 900 revolutions per minute. The desired synchronous speed varies by end use application, making the number of poles in a motor a factor directly impacting consumer utility. By examining the efficiency ratings for 1–200 horsepower polyphase electric

motors (10 CFR 431.25),¹² motors meeting the NEMA Premium Motor standard, and manufacturer catalogs, DOE observed that full-load efficiency percentages tend to decrease with the number of poles. Therefore, DOE determined that the number of poles has a direct impact on the motor’s performance and consumer utility, and consequently, the number of poles is a further means of differentiating among equipment classes. 75 FR 10886. DOE maintains this approach in this proposed determination.

Finally, DOE employs motor horsepower as an equipment class setting factor under the current energy conservation standards. 10 CFR 431.446(a). Average full load efficiency generally correlates with motor horsepower (*e.g.*, a 3-horsepower motor is usually more efficient than a ¼-horsepower motor). DOE found that motor efficiency varies with motor horsepower by evaluating manufacturers’ catalog data, the efficiency ratings of the established small electric motor energy conservation standards (10 CFR 431.446), and the efficiency requirements of the NEMA Premium Motor program. Additionally, motor horsepower dictates the maximum load that a motor can drive, which means that a motor’s rated horsepower can influence and limit the end use applications where that motor can be used. Horsepower is a critical performance attribute of a small electric motor, and since horsepower has a direct relationship with average full load efficiency and consumer utility, DOE used this element as a criterion for distinguishing among equipment classes in the March 2010 Final Rule. 75 FR 10886. DOE maintains this approach in this proposed determination.

DOE did not identify any other performance-related features affecting consumer utility or efficiency applying to the motors falling within the scope of this proposed determination. Table IV–2 summarizes the structure of the equipment classes identified for this proposed determination and as designated by the current standards at 10 CFR 431.446.

¹² While there is no overlap between the scope of applicability for electric motor standards at 10 CFR 431.25 and small electric motors standards at 10 CFR 431.446, the pole-efficiency relationships observed in the electric motor standards from 1 to 3 horsepower can be considered when determining appropriate pole-efficiency relationships for small electric motors in this horsepower range.

TABLE IV–2—SUMMARY OF SMALL ELECTRIC MOTOR EQUIPMENT CLASSES

| Motor topology | Pole configuration | Motor output power <i>hp</i> |
|-----------------|--------------------|------------------------------|
| Single-phase | | |
| CSIR | 2,4,6 | 0.25–3 |
| CSCR | 2,4,6 | 0.25–3 |
| Polyphase | 2,4,6 | 0.25–3 |

DOE received a number of comments on the April 2019 ECS RFI regarding equipment classes. The CA IOUs, Sierra Club & Earthjustice, and ASAP, et al. supported merging the CSIR and CSCR equipment classes and noted that the market share estimates reported in the April 2019 ECS RFI¹³ indicated that CSIR motors no longer appear available in the market. (CA IOUs, No. 10 at p. 3; Sierra Club & Earthjustice, No. 13 at p. 1; ASAP, et al., No. 16 at p. 4) The Sierra Club & Earthjustice commented that the market indicates that the initial concern regarding differences in consumer utility for space-constrained applications with respect to CSIR and CSCR small electric motors was not well-founded. (Sierra Club & Earthjustice, No. 13 at p. 1)

NEMA commented that while the CSIR class is no longer a significant equipment class as a result of the March 2010 Final Rule standards, there is no reason to make changes to the CSIR and CSCR equipment classes. NEMA commented that in order for CSIR motors to meet current efficiency standards, significant design changes were made that resulted in an increase in size and a subsequent reduction in utility compared to CSCR motors. (NEMA, No. 11 at p. 4) NEMA stated that the vast majority of CSIR shipments have shifted to CSCR designs or to special and definite purpose motors except for the lowest horsepower ratings. It asserted that sales of small electric motors have decreased as a result of the standards and that it would expect to see a similar impact from amended standards (NEMA, No. 11 at p. 16) NEMA also commented that there are no new design options for small electric motors that would add consumer utility and, consequently, no need to consider any new equipment classes. (NEMA, No. 11 at p. 5)

As discussed previously, DOE has found that single-phase motor topology (CSIR vs. CSCR) can impact motor performance and consumer utility. Currently, DOE does not have

conclusive evidence indicating that CSIR small electric motors are no longer available in the market and the statements offered by NEMA suggest the opposite is the case. In the absence of compelling evidence suggesting otherwise, DOE is maintaining both classes because of the differences in utility that these different classes of small electric motors offer—*i.e.* dimensional differences. Accordingly, DOE is not proposing to modify the equipment classes from those that currently apply under 10 CFR 431.446(a). These equipment classes are summarized in Table IV–2.

The CA IOUs commented that the American Standard for Motors and Generators ANSI/NEMA MG1 (“NEMA MG–1”) does not differentiate between CSIR and CSCR motors, as they are considered by the motor industry to be equivalent motor types. The CA IOUs also commented that DOE should consider defining these terms. (CA IOUs, No. 10 at p. 3) ASAP, et al. commented that it would be helpful to provide regulatory definitions for the three topologies covered by the current regulations. (ASAP, et al., No. 16 at p. 4) NEMA commented that the current definitions for the three topologies of small electric motors are sufficient. (NEMA, No. 11 at p. 3)¹⁴

NEMA MG–1, the industry consensus standard referenced in the statutory and regulatory definition of “small electric motor,” differentiates between the CSIR and CSCR motor topologies. Specifically, the definitions listed in section 1.20.3 of NEMA MG–1 2016 identifies CSIR and CSCR as two of the three distinct types of capacitor motors (“capacitor-start, induction-run” defined in section 1.20.3.3.1 of NEMA MG–1 2016; “permanent-split”¹⁵ defined in section 1.20.3.3.2 of NEMA MG–1 2016; and “capacitor-start, capacitor-run” defined in section

1.20.3.3.3 of NEMA MG–1 2016). Given the definitions in the industry consensus standard, the terms “capacitor-start, induction-run,” “permanent-split capacitor,” or “capacitor-start, capacitor-run” are well understood and therefore DOE is not proposing to provide explicit definitions of these motor topologies.

3. Technology Options for Efficiency Improvement

The purpose of the technology assessment is to develop a preliminary list of technology options that could improve the efficiency of small electric motors. For the motors covered in this determination, energy efficiency losses are grouped into four main categories: I²R losses,¹⁶ core losses, friction and windage losses, and stray load losses. The technology options considered in this section are categorized by these four categories of losses.

The small electric motors evaluated in this proposed determination are all AC induction motors. Induction motors have two core components: a stator and a rotor. The components work together to convert electrical energy into rotational mechanical energy. This is done by creating a rotating magnetic field in the stator, which induces a current flow in the rotor. This current flow creates an opposing magnetic field in the rotor, which creates rotational forces. Because of the orientation of these fields, the rotor field follows the stator field. The rotor is connected to a shaft that also rotates and provides the mechanical energy output.

Table IV–3 summarizes the technology options discussed in this document. Details of each technology option can be found in chapter 3 of the technical support document (“TSD”) prepared as part of DOE’s evaluation, which is available in the docket at <https://www.regulations.gov/docket?D=EERE-2019-BT-STD-0008>.

¹³ Note: The CA IOU comments referenced the “2017 RFI” but points to tables and discussion that are in the 2019 SEM ECS RFI. DOE is assuming that the intent was to refer to the April 2019 ECS RFI.

¹⁴ While NEMA did not specify to which definitions it was referring, DOE understands NEMA’s comment to be referring to the definitions in industry standards.

¹⁵ Permanent-split capacitor motors do not meet the performance requirements for general purpose motors in NEMA MG 1 and fall outside the scope of the current standards and test procedures for small electric motors.

¹⁶ I²R losses refer to conductor losses. In AC circuits, these losses are computed as the square of the current (“I”) multiplied by the conductor resistance (“R”).

TABLE IV-3—SUMMARY OF TECHNOLOGY OPTIONS FOR IMPROVING EFFICIENCY

| Type of loss to reduce | Technology option applied |
|-----------------------------------|---|
| I ² R Losses | Use a copper die-cast rotor cage. Reduce skew on conductor cage. Increase cross-sectional area of rotor conductor bars. Increase end ring size. Changing gauges of copper wire in stator. Manipulate stator slot size. Decrease radial air gap. |
| Core Losses | Change run-capacitor rating. Improve grades of electrical steel. Use thinner steel laminations. Anneal steel laminations. Add stack height (<i>i.e.</i> , add electrical steel laminations). Use high-efficiency lamination materials. |
| Friction and Windage Losses | Use plastic bonded iron powder. Use better bearings and lubricant. Install a more efficient cooling system. |

The CA IOUs asserted (without providing any supporting data or information) that DOE should consider the efficiency gains from enhanced motor technologies considered in the March 2010 Final Rule because the availability and affordability of these technologies has increased since publication of the that final rule. (CA IOUs, No. 10 at p. 3) In addition, ASAP, et al. commented that DOE should evaluate and consider all of the technology options that DOE previously analyzed. (ASAP, et al., No. 16 at p. 3) NEMA commented that no technical advancements have been made in small electric motor technology since the last rulemaking. (NEMA, No. 11 at p. 3)

For this evaluation, DOE considered each of the technology options analyzed in the previous rulemaking and examined any changes to the cost or availability of these design options since the publication of the March 2010 Final Rule. In addition, DOE also researched whether there were any new technologies that could improve the efficiency of small electric motors. DOE tentatively determined that no significant technical advancements in induction motor technology have been made since publication of the March 2010 Final Rule. Details of the technology options DOE considered for this evaluation can be found in Chapter 3 of the NOPD TSD.

NEMA commented that many of the motor design options that DOE listed in Table II-5 of the April 2019 ECS RFI are interdependent with one or more design options. In other words, the deployment of one design option sometimes favors the co-dependent application of another design option, but there are cases where deploying certain combinations of design options can negatively impact energy consumption. (NEMA, No. 11 at p. 5) NEMA also commented that many

of the design options listed are already optimized in practice, and there may not be further room to pursue efficiency gains with these design options. *Id.* at 6. NEMA asserted that some of the design options listed could negatively impact utility (*e.g.*, through loss of starting torque, increased risk of motor failure, increase in motor size, etc.) or add to manufacturer production costs. (NEMA, No. 11 at pp. 11–12) ABB commented that substituting a copper rotor in a motor may require a complete redesign, and could also require significant investment for development, tooling, and manufacturing. (ABB, No. 15 at pp. 1–2) In addition, ABB commented that components in motors cannot be arbitrarily substituted without consequences to the performance and life of motors. *Id.* at 2.

DOE acknowledges that the technology options listed in Table II-5 cannot be considered individually as they are frequently interdependent (*i.e.*, methods of reducing electrical losses in motors are not completely independent of one another). This means that some technology options that decrease one type of loss may cause an increase in a different type of loss in the motor. Thus, maximizing the efficiency gains in a motor design overall requires balancing out the loss mechanisms. In this evaluation, as in the previous rulemaking, DOE has considered the interactive effects, practical limitations, and costs of applying each technology option before making a determination whether to screen-in the technology options as design options for the engineering analysis. Details of the screened-in design options considered for each motor design can be found in Chapter 4 and 5 of the NOPD TSD.

B. Screening Analysis

DOE uses the following four screening criteria to determine which technology options are suitable¹⁷ for further consideration of new or amended energy conservation standards:

(1) *Technological feasibility.* Technologies that are not incorporated in commercial products or in working prototypes will not be considered further.

(2) *Practicability to manufacture, install, and service.* If it is determined that mass production and reliable installation and servicing of a technology in commercial products could not be achieved on the scale necessary to serve the relevant market at the time of the projected compliance date of the standard, then that technology will not be considered further.

(3) *Impacts on product utility or product availability.* If it is determined that a technology would have a significant adverse impact on the utility of the product to significant subgroups of consumers or would result in the unavailability of any covered product type with performance characteristics (including reliability), features, sizes, capacities, and volumes that are substantially the same as products generally available in the United States at the time, it will not be considered further.

(4) *Adverse impacts on health or safety.* If it is determined that a technology would have significant adverse impacts on health or safety, it will not be considered further.

See 10 CFR part 430, subpart C, appendix A, 4(a)(4) and 5(b)

In sum, if DOE determines that a technology, or a combination of

¹⁷ DOE refers to the technology options that pass the screening criteria as “design options.”

technologies, fails to meet one or more of the above four criteria, it will be excluded from further consideration in the engineering analysis. Additionally, DOE notes that the four screening criteria do not directly address the propriety status of technology options. DOE only considers potential efficiency levels achieved through the use of proprietary designs in the engineering analysis if they are not part of a unique pathway to achieve that efficiency level (*i.e.*, if there are other non-proprietary technologies capable of achieving the same efficiency level). The reasons for eliminating any technology are discussed below.

Table IV–3 provides a summary of all the technology options DOE considered for improving small electric motor efficiency. For a description of how each of these technology options improves small electric motor efficiency, see NOPD TSD chapter 3. For the proposed determination, DOE screened out three of these technology options: Reducing the air gap below .0125 inches, amorphous metal laminations, and plastic bonded iron powder (“PBIP”).

Reducing the air gap between the rotor and stator can improve motor efficiency. For small electric motors, the air gap is commonly set at 15 thousandths of an inch. Although reducing this air gap can improve efficiency, there is some point at which the air gap is too tight and becomes impracticable to manufacture. In the March 2010 Final Rule DOE screened out air gaps below 12.5 thousandths of an inch because it would exceed the threshold for practicability to manufacture. 75 FR 10887. In response to the April 2019 ECS RFI, NEMA commented that DOE should continue to screen out decreasing the radial air gap below 12.5 thousandths of an inch. (NEMA, No. 11 at p. 7)

A reduction in air gaps is technologically feasible and DOE is unaware of any adverse impacts on health or safety associated with reducing the radial air gap below 12.5 thousandths of an inch. However, this technology option fails the screening criterion of being practicable to manufacture, install, and service. Such a tight air gap may cause problems in manufacturing and service, with the rotor potentially coming into contact with the stator. This technology option also fails the screening criterion of avoiding adverse impacts on consumer utility and reliability, because the motor may experience higher failure rates in service when the manufactured air gaps are less than 12.5 thousandths of an inch.

Using amorphous metals in the rotor laminations is another potential technology option to improve the efficiency of small electric motors. Amorphous metal is extremely thin, has high electrical resistivity, and has little or no magnetic domain definition. Because of amorphous steel’s high resistance, it exhibits a reduction in hysteresis and eddy current losses, which in turn reduces overall losses in small electric motors. However, amorphous steel is a very brittle material which makes it difficult to punch into motor laminations.¹⁸

Considering the four screening criteria for this technology option, DOE screened out amorphous metal laminations as a means of improving efficiency. Although amorphous metals have the potential to improve efficiency, DOE does not consider this technology option technologically feasible, because it has not been incorporated into a working prototype of a small electric motor. Furthermore, DOE is uncertain whether amorphous metals are practicable to manufacture, install, and service, because a prototype amorphous metal-based small electric motor has not been made and little information is available on the feasibility of adapting this technology for manufacturing small electric motors to reach any conclusions regarding the practicability of using this option. DOE is not aware of any adverse impacts on consumer utility, reliability, health, or safety associated with amorphous metal laminations.

Using PBIP to manufacture small electric motors could cut production costs while increasing production output. Although other researchers may be working on this technology option, DOE notes that a research team at Lund University in Sweden published a paper in 2007 about using PBIP in manufacturing. This technology option is based on an iron powder alloy that is suspended in plastic, and is used in certain motor applications such as fans, pumps, and household appliances.¹⁹ The compound is then shaped into motor components using a centrifugal mold, reducing the number of manufacturing steps. Researchers claim that this technology option could cut losses by as much as 50 percent. The Lund University study, which is the most recent research paper to address the use of PBIP in the production

context, indicated that its study team already produced inductors, transformers, and induction heating coils using PBIP, but had not yet produced a small electric motor. In addition, it appears that PBIP technology is aimed at torus, claw-pole, and transversal flux motors, none of which fit the regulatory definition of small electric motors at 10 CFR 431.442. DOE has not found evidence of any significant research or technical advancement in PBIP methodologies that could be applied to small electric motors since publication of the March 2010 Final Rule. In response to the April 2019 ECS RFI, NEMA commented that DOE should continue to screen out this technology option for the same reasons that DOE had previously cited in its TSD to the March 2010 Final Rule. (NEMA, No. 11 at p. 7)

Considering the four screening criteria for this technology option, DOE screened out PBIP as a means of improving efficiency. Although PBIP has the potential to improve efficiency while reducing manufacturing costs, DOE does not consider this technology option technologically feasible because it has not been incorporated into a working prototype of a small electric motor. Also, DOE is uncertain whether the material has the structural integrity to form into the necessary shape of a small electric motor steel frame. Specifically, properties of PBIP can differ depending on the processing. If the metal particles are too closely compacted and begin to touch, the material will gain electrical conductivity, counteracting one of its most important features of preventing electric current from developing, which is critical because this essentially eliminates losses in the core due to eddy currents. If the metal particles are not compacted closely enough, its structural integrity could be compromised because the resulting material will be very porous.

Furthermore, DOE is uncertain whether PBIP is practicable to manufacture, install, and service, because a prototype PBIP small electric motor has not yet been made and little information is available on the feasibility of adapting this option for manufacturing small electric motors. However, DOE is not aware at this time of any adverse impacts on product utility, product availability, health, or safety that may arise from the use of PBIP in small electric motors.

DOE has determined that the remaining technology options listed in Table IV–2 are technologically feasible. The evaluated technologies all have been used (or are being used) in

¹⁸ S.R. Ning, J. Gao, and Y.G. Wang. Review on Applications of Low Loss Amorphous Metals in Motors. 2010. ShanDong University. Weihai, China.

¹⁹ Horrdin, H., and E. Olsson. Technology Shifts in Power Electronics and Electric Motors for Hybrid Electric Vehicles: A Study of Silicon Carbide and Iron Powder Materials. 2007. Chalmers University of Technology. Göteborg, Sweden.

commercially available products or working prototypes. These technologies all incorporate materials and components that are commercially available in today's supply markets for the small electric motors that are the subject of this document. Therefore, DOE has screened in these technology options as design options in the engineering analysis.

C. Engineering Analysis

The engineering analysis estimates the increase in manufacturer selling price ("MSP") associated with improvements to the average full load efficiency of small electric motors. This section presents DOE's assumptions and methodology for the engineering analysis. The output from the engineering analysis is a price-efficiency relationship for each equipment class that describes how MSP changes as efficiency increases. The engineering analysis is used as an input to the LCC and PBP analyses.

DOE typically structures the engineering analysis using one of three approaches: (1) Design option, (2) efficiency level, or (3) reverse engineering (or cost assessment). The design option approach involves adding the estimated cost and associated efficiency of various efficiency-improving design changes to the baseline product to model different levels of efficiency. The efficiency level approach uses estimates of costs and efficiencies of products available on the market at distinct efficiency levels to develop the cost-efficiency relationship. The reverse engineering approach involves testing products for efficiency and determining cost from a detailed bill of materials ("BOM") derived from reverse engineering representative products. The efficiency ranges from that of the least-efficient small electric motor sold today (*i.e.*, the baseline) to the maximum technologically feasible efficiency level.

For analysis purposes, this proposed determination reflects DOE's adoption of a design option approach based on motor modeling conducted in support of the March 2010 Final Rule. In this design option approach, DOE considers efficiency levels corresponding to motor designs that meet or exceed the efficiency requirements of the current energy conservation standards at 10 CFR 431.446. DOE has tentatively determined that there are no additional technology options that pass the screening criteria that would enable the consideration of any additional efficiency levels representing higher efficiency levels than the maximum

technologically feasible level analyzed in the March 2010 Final Rule.

1. Summary of Significant Data Sources

DOE utilized two principal data sources for the engineering analysis: (1) A database of small electric motor manufacturer suggested retail price ("MSRP") and performance data based on the current market, and (2) motor modeling data, test data, and performance specifications from the March 2010 Final Rule. DOE determined that relying on the data from the March 2010 Final Rule was reasonable because a review of the catalog data and responses to the April 2019 ECS RFI suggested that there were no significant technological advancements in the motor industry that could lead to more efficient or lower cost motor designs relative to the motors modeled for the March 2010 Final Rule. Accordingly, in this determination, DOE has elected to evaluate the motor designs that were modeled for the March 2010 Final Rule analysis. To confirm this approach, DOE is again requesting comments regarding this issue.

DOE collected MSRP and performance data from product literature and catalogs distributed by four major motor manufacturers: ABB (which includes the manufacturer formerly known as Baldor Electric Company), Nidec Motor Corporation (which includes the US Motors brand), Regal-Beloit Corporation (which includes the Marathon and Leeson brands), and WEG Electric Motors Corporation.²⁰ Based on market information from the Low-Voltage Motors World Market Report,²¹ DOE estimates that the four major motor manufacturers noted above comprise the majority of the U.S. small electric motor market and are consistent with the motor brands considered in the March 2010 Final Rule. (Throughout this document this data will be referred to as the "manufacturer catalog data.")

²⁰ ABB (Baldor-Reliance): Online Manufacturer Catalog, accessed January 3, 2019. ²¹ Based on the Low-Voltage Motors, World Market Report (IHS Markit Report September 2017, Edition 2017–2018) Table 5.15: Market Share Estimates for Low-voltage Motors: Americas; Suppliers 'share of the Market in 2015 and 2016.

2. Representative Equipment Classes

Due to the large number of equipment classes, DOE did not directly analyze all 62 equipment classes of small electric motors considered under this proposed determination. Instead, DOE selected representative classes based on two factors: (1) The quantity of motor models available within an equipment class and (2) the ability to scale to other equipment classes.

DOE notes that the minimum energy conservation standards adopted in the March 2010 Final Rule correspond to the efficiency level that represented the maximum technologically feasible efficiency for CSIR motors. As discussed previously, DOE was unable to identify any additional design options that passed the screening criteria that would indicate that a motor design meeting a higher efficiency level is technologically feasible and commercially viable (see NOPD TSD chapter 3). In addition, DOE was unable to identify any CSIR motors in the manufacturer catalog data that exhibited efficiency levels exceeding the current energy conservation standards for CSIR motors. From this information, DOE tentatively concluded that more stringent energy conservation standards for CSIR motors do not appear to be technologically feasible. Consequently, DOE did not include a representative CSIR equipment class as part of the engineering analysis.

The minimum energy conservation standards adopted in the March 2010 Final Rule corresponded to efficiency levels below the maximum technologically feasible levels for the CSCR and polyphase topologies, and therefore DOE elected to analyze one representative equipment class for each of these motor topologies. Equipment classes in the both the polyphase and CSCR topologies were directly analyzed due to the fundamental differences in their starting and running electrical characteristics. These differences in operation have a direct impact on performance and indicate that polyphase motors are typically more efficient than single-phase motors. In addition, the efficiency relationships across horsepower and pole configuration are different between single-phase and polyphase motors.

DOE did not vary the pole configuration of the representative classes it analyzed because analyzing the same pole configuration provided the strongest relationship upon which to base its scaling. See section IV.C.5 for details on DOE's scaling methodology. Keeping as many design characteristics constant as possible enabled DOE to more accurately identify how design

changes affect efficiency across horsepower ratings. For each motor topology, DOE directly analyzed the most common pole-configuration. For both motor topologies analyzed, 4-pole motors constitute the largest fraction of motor models on the market.

When DOE selected its representative equipment classes, DOE chose the horsepower ratings that constitute a high volume of motor models and approximate the middle of the range of covered horsepower ratings so that DOE could develop a reasonable scaling methodology. DOE notes that the

representative equipment classes for polyphase and CSCR motors that were selected for the engineering analysis align with the representative classes that were directly analyzed in the March 2010 Final Rule. 75 FR 10874, 10888. These representative classes are outlined in Table IV–4.

TABLE IV–4—REPRESENTATIVE EQUIPMENT CLASSES

| Motor topology | Pole configuration | Motor output power <i>hp</i> |
|-------------------------|--------------------|------------------------------|
| Polyphase | 4 | 1.00 |
| Single-phase CSCR | 4 | 0.75 |

DOE seeks comment on the selection of representative equipment classes for CSCR and polyphase motors and the tentative determination that more stringent energy conservation standards for CSIR motors are not technologically feasible.

See section VII.B for a complete list of issues on which DOE seeks comments.

3. Engineering Analysis Methodology

DOE relied on a design option approach to generate incremental MSPs and establish efficiency levels, in which the relative costs of achieving increases in efficiency are determined based on the cost of various efficiency-improving design changes to the baseline motor. For each representative equipment class, DOE identified a specific motor as a fundamental design against which it would apply changes to improve the motor's efficiency. Each increase in efficiency over the baseline level that DOE analyzed was assigned an efficiency level ("EL") number.

Consistent with its usual analytical approach, DOE considered the current minimum energy conservation standards to establish the baseline efficiency levels for each representative equipment class. In response to the April 2019 ECS RFI, the CA IOUs supported using the current standards as the baseline efficiency level. (CA IOUs, No. 10 at p. 4) In addition, NEMA commented that the current energy conservation standards reasonably approximate the baseline for covered equipment. (NEMA, No. 11 at p. 7)

As discussed previously, DOE selected representative equipment classes that align with the classes analyzed in the March 2010 Final Rule. DOE identified specific motor designs from the March 2010 Final Rule engineering analysis that exhibit full-load efficiency ratings that are representative of the minimum energy conservation standards for small electric motors. DOE chose these motor designs as the baseline designs against which

design options to improve motor efficiency would be implemented as part of DOE's analysis.

For the March 2010 Final Rule engineering analysis, DOE purchased and tested motors with the lowest catalog efficiency rating available in the market for each representative equipment class. DOE's technical expert tore down each motor to obtain dimensions, a BOM, and other pertinent design information. DOE worked with a subcontractor to reproduce these motor designs using modeling software and then applied design options to a modeled motor that would increase that motor's efficiency to develop a series of motor designs spanning a range of efficiency levels. For the current evaluation, DOE continued to base its analysis on the modeled motor designs. In light of its catalog review and the responses received to the April 2019 ECS RFI indicating that there were no significant technological advancements in the motor industry that could lead to more efficient or lower cost motor designs relative to the motors modeled for the March 2010 Final Rule.²² Further information on the development of modeled motor designs from the March 2010 Final Rule is available in section 5.3 of the NOPD TSD.

NEMA commented that DOE did not adequately consider comments regarding OEM design impacts from the larger motor dimensions that would result from re-designing motors to be compliant with the energy conservation standards adopted in the March 2010 Final Rule. (NEMA, No. 11 at p. 7) NEMA added that DOE should seek input from OEMs on the impact of increased motor size that would be needed to increase motor efficiency. (NEMA, No. 11 at p. 17) AHRI and AHAM commented that more efficient motors within a particular topology are

likely to be larger and heavier, which could decrease consumer utility. AHRI and AHAM stated that replacement motors must be able to fit inside the finished product for which they are destined, and this factor must be considered when evaluating more stringent standards. (AHRI and AHAM, No. 12 at p. 3)

In developing the modeled motor designs and associated costs, DOE considered both space-constrained and non-space-constrained scenarios. DOE prepared designs of increased efficiency covering both scenarios for each representative equipment class. The design levels prepared for the space-constrained scenario included baseline and intermediate levels, a level for a design using a copper rotor, and a max-tech level with a design using a copper rotor and exotic core steel. The high-efficiency space-constrained designs incorporate copper rotors and exotic core steel in order to meet comparable levels of efficiency to the high-efficiency non-space-constrained designs while meeting the parameters for minimally increased stack length. The design levels created for the non-space-constrained scenario corresponded to the same efficiency levels created for the space-constrained scenario. Further information on the development of modeled motor designs is available in section 5.3 of the March 2010 Final Rule TSD. In addition to developing different MSPs for space-constrained and non-space-constrained scenarios, DOE developed a modified OEM markup in support of the March 2010 Final Rule to account for the costs faced by OEMs needing to redesign their products to incorporate small electric motors of different sizes.²³ In this current evaluation, DOE continues to analyze increased efficiency in both space-

²² DOE also notes that ASAP, et al. recommended that DOE conduct an analysis similar to the modeling analysis completed for the March 2010 Final Rule. (ASAP, et al., No. 16 at p. 4)

²³ For more details see chapter 7 of the 2010 small electric motors final rule TSD, at <https://www.regulations.gov/document?D=EERE-2007-BT-STD-0007-0036>.

constrained and non-space-constrained scenarios for each of the representative equipment classes, in line with the March 2010 Final Rule.

NEMA also commented that more stringent energy conservation standards would result in the design of motors with lower slip²⁴ and in turn, higher full-load speeds. NEMA stated that, as such, more stringent energy conservation standards would force manufacturers of end-use products to redesign their products to account for the higher motor speeds. (NEMA, No. 11 at p. 13) This factor, it asserted, would have the impact of increasing the speed and therefore the output power delivered to the motor's application and offset some of the improvement in motor efficiency. NEMA also commented that small businesses, including motor manufacturers and OEMs, would be required to spend more for motors that provide little additional energy savings from more stringent

energy conservation standards for the small electric motors at issue. (NEMA, No. 11 at p. 18) The designs analyzed in the engineering analysis did not show a significant (less than 2 percent) and consistent (some more efficient designs had slightly lower speeds) increase in speed with increasing efficiency across all ELs (See NOPD TSD Chapter 5). However, as discussed previously, DOE has tentatively determined that more stringent energy conservation standards would not be cost effective and therefore is not proposing to amend the current energy conservation standards for this equipment.

As discussed in section IV.A.3, DOE considered each of the design options analyzed in the previous rulemaking and also researched whether there were any new technologies that could improve the efficiency of small electric motors. Accordingly, DOE determined that there were no significant technological advancements since the

March 2010 Final Rule. In addition, comments received suggested the same. (NEMA, No. 11 at p. 3) Given that DOE was unable to identify any additional design options for improving efficiency that passed the screening criteria and were not already considered in the March 2010 Final Rule engineering analysis, DOE analyzed the same motor designs that were developed for the March 2010 Final Rule except for CSIR motors (which, as indicated earlier, did not appear to have any technologically-feasible options available to improve their efficiency). For each representative equipment class, DOE established an efficiency level for each motor design that exhibited improved efficiency over the baseline design. As discussed previously, DOE considered the current minimum energy conservation standards as the baseline efficiency levels for each representative equipment class. These efficiency levels are summarized in Table IV-5.

TABLE IV-5—SUMMARY OF EFFICIENCY LEVELS

| Representative equipment class | EL | Efficiency (%) |
|--|----|----------------|
| Single-phase CSCR, 4-pole, 0.75-hp | 0 | 81.8 |
| | 1 | 82.8 |
| | 2 | 84.0 |
| | 3 | 84.6 |
| | 4 | 86.7 |
| | 5 | 87.9 |
| Polyphase, 4-pole, 1-hp | 0 | 83.5 |
| | 1 | 85.2 |
| | 2 | 86.3 |
| | 3 | 87.8 |

In response to the April 2019 ECS RFI, ASAP, et al. commented that DOE should thoroughly investigate more stringent efficiency levels than those currently available in the market (ASAP, et al., No. 16 at p. 3) ASAP, et al. noted that DOE had found 15 percent of CSCR motor models attained efficiencies exceeding the levels adopted in the March 2010 Final Rule and stated that the prior availability of these higher levels demonstrates technological feasibility. In addition, ASAP, et al. suggested that DOE review manufacturer literature and other data sources to determine if products exceeding minimum standards are available in the market for any regulated equipment class. (ASAP, et al., No. 16 at pp. 3-4) As noted previously, DOE is

evaluating efficiency levels up to the maximum technologically feasible levels for each motor topology, including efficiency levels that represent motors that are not yet commercially available (e.g., a small electric motor design that is technologically feasible but not available on the market because of cost considerations). As part of this evaluation, DOE reviewed manufacturer literature to determine the availability of small electric motors across all equipment classes considered in this document by efficiency level. This literature includes efficiency values derived from manufacturer testing using the mandatory DOE test procedure. DOE's review of this information indicated that for CSCR motors, the

most recent manufacturer catalog data only included a single model with an efficiency above the baseline level (*i.e.* the current standard required of these motors). (See also section IV.F.8).

ASAP, et al. recommended that DOE conduct an analysis similar to the modeling analysis completed for the March 2010 Final Rule and added that while levels of maximum technological feasibility may not be commercially available today, energy conservation standards policy could provide the basis for making cost-effective improvements to motors that could not be otherwise achieved by market forces. (ASAP, et al., No. 16 at p. 4) Lenze Americas commented that DOE should consider setting standard levels at an International Efficiency ("IE")²⁵ equivalent for motors below 1 hp and an

²⁴ Motor slip is the difference between the speed of the rotor (operating speed) and the speed of the rotating magnetic field of the stator (synchronous speed). When net rotor resistance of a motor design is reduced, efficiency of the motor increases but slip decreases, resulting in higher operating speeds.

²⁵ The IE designations are efficiency levels defined by IEC standard 60034-30-1 for 50 and 60 Hz single or three-phase line motors (regardless of the technology). Motors meeting the IE1 efficiency level are designated "standard efficiency," IE2 qualifying motors are designated "high-efficiency,"

IE3 qualifying motors are designated "premium efficiency," and IE4 qualifying motors are designated "super premium efficiency."

IE3 equivalent for motors greater than or equal to 1 hp. (Lenze Americas, No. 3 at p. 1)

DOE is adopting the motor modeling approach used in support of the March 2010 Final Rule to analyze and establish efficiency levels and incremental motor MSPs. DOE did not identify any additional design options in the market for improving efficiency that were not already considered in the March 2010 Final Rule. In addition, while DOE is not specifically evaluating the IE levels in this analysis, the range of motor efficiency levels analyzed in this evaluation is inclusive of efficiencies specified in the IE2 and IE3 efficiency levels.

The CA IOUs commented that DOE should conduct independent testing to verify the efficiency performance of the motor designs considered in each representative equipment class. (CA IOUs, No. 10 at p. 3) ASAP, et al. suggested that DOE investigate whether motors rated at the standard level are more efficient than stated because DOE regulations permit manufacturers to rate their products conservatively. (ASAP, et al., No. 16 at pp. 3–4) DOE notes that the performance of the motor designs considered in this analysis were verified by conducting motor efficiency testing during the previous rulemaking. Details of this validation testing can be found in appendix 5A of the March 2010 Final Rule TSD.

DOE seeks comment on the methodologies employed in the engineering analysis, specifically regarding the adoption of the motor designs and associated efficiency levels considered in the March 2010 Final Rule analysis as the basis for this proposed determination.

See section VII.B for a complete list of issues on which DOE seeks comments.

4. Cost

For representative equipment classes, each efficiency level is based on a motor design with a distinct set of performance characteristics, production costs, and non-production costs. Full production cost is a combination of direct labor, direct materials, and overhead. Non-production costs include the cost of selling (market research, advertising, sales representatives, logistics), general and administrative costs, research and development, interest payments and profit factor.

A standard BOM was constructed for each motor design that includes direct material costs and labor time estimates along with costs. The BOM is then multiplied by a markup for overhead to obtain an MPC that is further marked up to reflect non-production costs to create

an MSP. DOE notes that the costs established for direct material costs and labor time were initially determined in terms of \$2009 for the March 2010 Final Rule. For this evaluation, DOE updated these material and labor costs to be representative of the market in 2018. DOE adjusted historical material prices to \$2018 using the historical Bureau of Labor Statistics Producer Price Indices (“PPI”) ²⁶ for each commodity’s industry. In addition, DOE updated labor costs and markups based on the most recent and complete version (*i.e.* 2012) of the Economic Census of Industry by the U.S. Census Bureau. ²⁷

In response to the April 2019 ECS RFI, NEMA commented that tariffs on steel and aluminum have caused cost increases for current motor designs which could exacerbate the cost impacts of more stringent standards. (NEMA, No. 11 at p. 13) DOE notes that changes in the cost of steel and aluminum components since 2010 have been accounted for in this proposed determination and are considered when evaluating more stringent energy conservation standards.

DOE seeks input on whether and how the costs estimated for motor designs considered in the March 2010 Final Rule have changed since the time of that analysis. DOE also requests information on the investments (including related costs) necessary to incorporate specific design options, including, but not limited to, costs related to new or modified tooling (if any), materials, engineering and development efforts to implement each design option, and manufacturing/production impacts.

See section VII.B for a complete list of issues on which DOE seeks comments.

5. Scaling Relationships

In analyzing the equipment classes, DOE developed a systematic approach to scaling efficiency across horsepower ratings and pole configurations, while retaining reasonable levels of accuracy, in a manner similar to the March 2010 Final Rule. DOE’s current energy conservation standards for small electric motors found at 10 CFR 431.446 list minimum required efficiencies over a range of horsepower and pole configurations, providing a basis for scaling efficiency across horsepower and pole configurations for polyphase and single-phase motors. The efficiency relationships in the established standards are based on a combination of NEMA recommended efficiency

standards, NEMA premium designations, catalog data, and test data for individual manufacturer motor product lines. DOE has elected to apply the same scaling methodologies used to support the March 2010 Final Rule to the engineering analysis for this proposed determination. 75 FR 10894–10895. This approach has been presented previously to stakeholders and has been updated based on stakeholder input. In DOE’s view, this approach has the added advantage of reducing the analytical complexity associated with conducting a detailed engineering analysis of the cost-efficiency relationship on all 62 equipment classes. *Id.*

For this NOPD, while the engineering analysis focuses on two representative units, the energy use and life-cycle cost analyses (see sections IV.E and IV.F) consider two additional representative units to separately analyze consumers of integral (*i.e.*, with horsepower greater than or equal to 1 hp) single-phase CSCR small electric motors and fractional (*i.e.*, with horsepower less than 1 hp) polyphase small electric motors. To scale to the equipment classes that were not directly analyzed, DOE followed several steps. First, DOE evaluated the efficiency relationships presented in the recommended standards provided by NEMA for the March 2010 Final Rule. DOE then compiled efficiency data for as many manufacturers and equipment classes as possible and filtered the data to ensure an accurate representation of the small electric motors that are covered by the statute. Next, DOE modeled all the efficiency data in terms of motor losses and used a best-fit curve to project values to fill in any potential gaps in data. Finally, DOE scaled the results of the engineering analysis based on the relationships found from the combined NEMA data and catalog data.

DOE seeks input on implementing a similar scaling methodology as that used for the March 2010 Final Rule in this NOPD.

See section VII.B for a complete list of issues on which DOE seeks comments.

D. Markups Analysis

The markups analysis develops appropriate markups (*e.g.*, retailer markups, distributor markups, contractor markups) in the distribution chain to convert the MSP estimates derived in the engineering analysis to consumer prices, which are then used in the LCC and PBP analysis. At each step in the distribution channel, companies mark up the price of the equipment to cover business costs and profit margin. For small electric motors, the main

²⁶ www.bls.gov/ppi/.

²⁷ U.S. Census Bureau, 2012 Economic Census of Industry Series Reports for Industry, U.S. Department of Commerce, 2012

parties in the distribution chain are manufacturers, distributors, contractors or installers, OEMs of equipment incorporating small electric motors, and consumers.

DOE relied on estimates provided by NEMA during the March 2010 Final Rule to establish the proportion of shipments through each distribution channel.²⁸ In response to the April 2019 ECS RFI, DOE did not receive any data to support alternative distribution channels for small electric motors. DOE used data from the U.S. Census Bureau²⁹ and the Sales Tax Clearinghouse³⁰ to develop distribution channel markups and sales tax estimates.

DOE also developed baseline and incremental markups for each actor in

the distribution chain. Baseline markups are applied to the price of equipment with baseline efficiency, while incremental markups are applied to the difference in price between baseline and higher-efficiency models (the incremental cost increase). The incremental markup is typically less than the baseline markup and is designed to maintain similar per-unit operating profit before and after new or amended standards.³¹ DOE relied on economic data from the U.S. Census Bureau to estimate average baseline and incremental markups.

Further, in the space-constrained scenario, DOE developed a modified OEM markup to account for the costs faced by those OEMs of equipment incorporating small electric motors

needing to redesign their products in order to incorporate small electric motors of different, including larger, sizes. Nationally, businesses spend about 2.7 percent of U.S. gross domestic product on research and development ("R&D").³² DOE estimates that R&D by equipment OEMs, including the design of new products, approximately represents at most 2.7 percent of company revenue. Similar to what was done in the March 2010 Final Rule, DOE accounted for the additional costs to redesign products and incorporate differently-shaped motors by adding 2 percent to the OEM markups.³³

Table IV–6 summarizes the overall baseline and incremental markups for each distribution channel considered for small electric motors.

TABLE IV–6—SMALL ELECTRIC MOTORS DISTRIBUTION CHANNEL MARKUPS

| Distribution channel (from manufacturer) | Direct to OEMs (65%) | | Via wholesalers to OEMs (30%) | | Via wholesalers to end-users (5%) | |
|---|-------------------------|-------------|----------------------------------|-------------|--------------------------------------|-------------|
| | Baseline | Incremental | Baseline | Incremental | Baseline | Incremental |
| Main Party | | | | | | |
| Motor Wholesaler | | | 1.35 | 1.19 | 1.35 | 1.19 |
| Original Equipment Manufacturer (OEM)* | 1.47/1.50 | 1.23/1.25 | 1.47/1.50 | 1.23/1.25 | | |
| Equipment Wholesaler | 1.41 | 1.19 | 1.41 | 1.19 | | |
| Retailer | | | | | 1.53 | 1.27 |
| Contractor | 1.1 | 1.1 | 1.1 | 1.1 | 1.1 | 1.1 |
| Sales Tax | 1.0721 | | 1.0721 | | 1.0721 | |
| Overall | 2.45/2.50 | 1.72/1.76 | 3.31/3.37 | 2.06/2.10 | 2.44 | 1.78 |

* Non-space-constrained scenario/space-constrained scenario.

DOE seeks comment on the methodology and data used for estimating end-user prices for small electric motors.

See section VII.B for a complete list of issues on which DOE seeks comments. Chapter 6 of the TSD provides details on the DOE's markup analysis for small electric motors.

E. Energy Use Analysis

The purpose of the energy use analysis is to determine the annual energy consumption of small electric motors at different efficiency levels and to assess the energy savings potential of

increased efficiency. The analysis estimates the range of energy use of small electric motors in the field (*i.e.*, as they are actually used by consumers). The energy use analysis provides the basis for other analyses DOE performed, particularly assessments of the energy savings and the savings in consumer operating costs that could result from adoption of amended or new standards.

The analysis focuses on the two representative units identified in the engineering analysis (see section IV.C) for which engineering analysis results were obtained at levels at and above the baseline. Two additional representative

units were included to separately analyze consumers of integral (*i.e.*, with horsepower greater than or equal to 1 hp) single-phase CSCR small electric motors and fractional (*i.e.*, with horsepower less than 1 hp) polyphase small electric motors (see Table IV–7).³⁴ For each representative unit, DOE determined the annual energy consumption value by multiplying the motor input power by the annual operating hours for a representative sample of motor consumers.

²⁸ For more details see chapter 7 of the 2010 small electric motors final rule TSD, at <https://www.regulations.gov/document?D=EERE-2007-BT-STD-0007-0036>.

³⁰ Sales Tax Clearinghouse, Inc. *State sales tax rates along with combined average city and county rates*, 2017. Available at: <http://thestic.com/STrates.stm>.

³¹ Because the projected price of standards-compliant products is typically higher than the price of baseline products, using the same markup for the incremental cost and the baseline cost would result in higher per-unit operating profit. While

such an outcome is possible, DOE maintains that in markets that are reasonably competitive it is unlikely that imposing more stringent standards would lead to a sustainable increase in profitability in the long run.

³² National Science Board. January 2018. *Science and Engineering Indicators 2018*. Figure 4–3, Ratio of U.S. R&D to gross domestic product, by roles of federal, business, and other nonfederal funding for R&D: 1953–2015. Arlington, VA: National Science Foundation (NSB–2018–1) Available at <https://www.nsf.gov/statistics/2018/nsb20181/assets/1038/research-and-development-u-s-trends-and-international-comparisons.pdf>.

³³ For more details see chapter 7 of the 2010 small electric motors final rule TSD, at <https://www.regulations.gov/document?D=EERE-2007-BT-STD-0007-0036>.

³⁴ Similar to the approach used in the engineering analysis when selecting representative units, DOE reviewed model counts from the manufacturer online catalog data to identify these additional units. DOE reviewed counts of CSCR, 4-poles small electric motors and polyphase, 4-poles, small electric motors models. For CSCR motors, the 1 horsepower value had the most counts and DOE selected a unit at 1 horsepower. For polyphase motors, the 0.33, 0.5, and 0.75 horsepower values had the most counts (and similar counts) and DOE selected a unit at 0.5 horsepower (*i.e.* the mid-range of these horsepower values).

TABLE IV–7—REPRESENTATIVE UNITS ANALYZED IN THE ENERGY USE AND LIFE-CYCLE COST ANALYSES

| Representative unit | Equipment class group | Pole configuration | Rated horsepower |
|---------------------|--------------------------|--------------------|------------------|
| 1 | Single-phase, CSCR | 4-pole | 0.75 |
| 2 | Polyphase | 4-pole | 1 |
| 3 | Single-phase, CSCR | 4-pole | 1 |
| 4 | Polyphase | 4-pole | 0.5 |

DOE seeks comments on how whether additions or changes should be made to the energy use analysis as well as any data supporting alternate inputs to characterize the variability in annual energy consumption for small electric motors.

See section VII.B for a complete list of issues on which DOE seeks comments. Chapter 7 of the TSD provides details on the DOE's energy use analysis for small electric motors.

1. Consumer Sample

For each representative unit, DOE created consumer samples for three individual sectors: Residential, commercial, and industrial. DOE used the samples to determine small electric motor annual energy consumption as well as for conducting the LCC and PBP analyses. Each consumer in the sample was assigned a sector and an application. DOE used data from the March 2010 Final Rule to establish distributions of small electric motors by sector. Five main motor applications were selected as representative applications (compressors, fans, pumps, material handling, and others). In order to characterize the distributions of small electric motors across applications in the industrial sector, DOE used data from hundreds of field assessments aggregated in two databases: (1) A database of motor nameplate and field data compiled by the Washington State University ("WSU") Extension Energy Program, Applied Proactive Technologies, and New York State Energy Research and Development Authority, and; (2) a database of motor nameplate and field data compiled by the Industrial Assessment Center at Oregon University ("field assessment data").³⁵ For the commercial and residential sectors, DOE used data from a previous DOE publication to estimate distribution of small electric motors by

application.³⁶ DOE also assumed that 20 percent of consumers had space-constraints and 80 percent were non-space-constrained based on data from the March 2010 Final Rule. In response to the April 2019 ECS RFI, DOE did not receive any data to support alternative distributions of small electric motors by sectors and applications or by space-constrained/non-space-constrained applications.

DOE seeks comment on the approach used for estimating distribution of consumers of small electric motors across applications and sectors, as well as any data supporting the use of alternate distributions.

See section VII.B for a complete list of issues on which DOE seeks comments. See chapter 7 of the TSD for more details on the resulting distribution of consumers by sector and applications.

2. Motor Input Power

DOE calculated the motor input power as the sum of the motor rated horsepower multiplied by the motor operating load (*i.e.*, the motor output power) and of the losses at the operating load (*i.e.*, part-load losses). DOE determined the part-load losses using outputs from the engineering analysis (full-load efficiency at each efficiency level) and published part-load efficiency information from manufacturer catalogs to model motor part-load losses as a function of the motor's operating load. NEMA commented that there was a range of operating motor loads for small electric motors and that there was no typical operating load by application. NEMA did not provide data to characterize operating load. (NEMA, No. 11 at p. 15) DOE estimated the operating load using operating load data specific to motors in the 0.25–3 hp range, which was based on additional field assessments data collected since the

publication of the March 2010 Final Rule.³⁷

DOE seeks comment on the methodology used for estimating the distribution of motor load for each application and sector, as well as any data supporting alternate distributions.

See section VII.B for a complete list of issues on which DOE seeks comments. See chapter 7 of the TSD for the resulting distribution of load for each application.

3. Annual Operating Hours

NEMA commented that there was a range of operating hours for small electric motors and noted that for this equipment, operating hours are generally lower compared to electric motors and stated that most small electric motors do not run continuously. NEMA did not provide data to characterize operating hours. (NEMA, No. 11 at p. 15) For the industrial sector, DOE used data specific to motors in the 0.25–3 hp range from the field assessment data to establish distributions of annual operating hours by application. For the commercial and residential sectors, DOE used operating hours data from the March 2010 Final Rule.³⁸

DOE seeks comment on the methodology used to estimate annual operating hours, as well as any data supporting alternate distribution of operating hours by application and sector.

See section VII.B for a complete list of issues on which DOE seeks comments. See chapter 7 of the TSD for more details on the distributions of annual operating hours by application and sector.

Table IV–8 shows the estimated average annual energy use at each efficiency level analyzed.

F. Life-Cycle Cost and Payback Period Analysis

DOE conducted LCC and PBP analyses to evaluate the economic impacts on individual consumers of potential energy conservation standards for small electric motors. The effect of new or amended energy conservation standards on individual consumers usually involves a reduction in operating cost and an increase in purchase price. DOE used the following two metrics to measure consumer impacts:

- The LCC is the total consumer expense of equipment over the life of that equipment, consisting of total installed cost (MSP, distribution chain markups, sales tax, and installation costs) plus operating costs (expenses for energy use, maintenance, and repair). To compute the operating costs, DOE discounts future operating costs to the time of purchase and sums them over the lifetime of the equipment.

- The simple PBP is the estimated amount of time (in years) it takes consumers to recover the increased purchase cost (including installation) of more-efficient equipment through lower operating costs. DOE calculates the simple PBP by dividing the change in purchase cost at higher efficiency levels by the change in annual operating cost for the year that amended or new standards are assumed to take effect.

For any given efficiency level, DOE measures the change in LCC relative to the LCC in the no-new-standards case, which reflects the estimated efficiency distribution of small electric motors in the absence of new or amended energy conservation standards. In contrast, the

simple PBP for a given efficiency level is measured relative to the baseline equipment. The analysis focuses on the four representative units identified in Table IV-7.

For each considered efficiency level in each equipment class, DOE calculated the LCC and PBP for a nationally representative set of consumers. As stated previously, DOE developed a sample based on distributions of consumers across sectors and applications, as well as across efficiency levels. For each sample consumer, DOE determined the unit energy consumption and appropriate energy price. By developing a representative sample of consumers, the analysis captured the variability in energy consumption and energy prices associated with the use of small electric motors.

Inputs to the calculation of total installed cost include the cost of the equipment—which includes MSPs, retailer markups, and sales taxes—and installation costs. Inputs to the calculation of operating expenses include annual energy consumption, energy prices and price projections, repair and maintenance costs, equipment lifetimes, and discount rates. DOE created distributions of values for equipment lifetime, discount rates, and sales taxes, with probabilities attached to each value, to account for their uncertainty and variability.

The computer model DOE uses to calculate the LCC and PBP relies on a Monte Carlo simulation to incorporate uncertainty and variability into the analysis. The Monte Carlo simulations randomly sample input values from the

probability distributions and consumer samples. The model calculated the LCC and PBP for equipment at each efficiency level for 10,000 consumers per representative unit per simulation run. The analytical results include a distribution of 10,000 data points showing the range of LCC savings for a given efficiency level relative to the no-new-standards case efficiency distribution. In performing an iteration of the Monte Carlo simulation for a given consumer, equipment efficiency is chosen based on its probability. If the chosen equipment efficiency is greater than or equal to the efficiency of the standard level under consideration, the LCC and PBP calculation reveals that a consumer is not impacted by the standard level. By accounting for consumers who already purchase more-efficient equipment, DOE avoids overstating the potential benefits from increasing equipment efficiency.

DOE calculated the LCC and PBP for all consumers as if each were to purchase a new motor in the expected year of compliance with amended standards. For purposes of its analysis, DOE estimated that any amended standards would apply to small electric motors manufactured 5 years after the date on which the amended standard is published. DOE estimated publication of a final rule in the first half of 2023. Therefore, for purposes of its analysis, DOE used 2028 as the first full year of compliance.

Table IV-9 summarizes the approach and data DOE used to derive inputs to the LCC and PBP calculations. The subsections that follow provide further discussion.

TABLE IV-9—SUMMARY OF INPUTS AND METHODS FOR THE LCC AND PBP ANALYSIS *

| Inputs | Source/method |
|--------------------------|---|
| Equipment Cost | Derived by multiplying MSPs by distribution channel markups and sales tax, as appropriate. |
| Installation Costs | Assumed no change with efficiency level other than shipping costs. |
| Annual Energy Use | Motor input power multiplied by annual operating hours per year. Variability: Based on plant surveys and previous DOE study. |

TABLE IV–9—SUMMARY OF INPUTS AND METHODS FOR THE LCC AND PBP ANALYSIS*—Continued

| Inputs | Source/method |
|------------------------------------|--|
| Energy Prices | Electricity: Used average and marginal prices (Coughlin and Beraki). Based on <i>AEO 2019</i> price projections. Assumed no change with efficiency level. |
| Energy Price Trends | Estimated using information from 2010 standards final rule and from DOE's Advanced Manufacturing Office. |
| Repair and Maintenance Costs | Residential: Approach involves identifying all possible debt or asset classes that might be used to purchase the considered appliances, or might be affected indirectly. Primary data source was the Federal Reserve Board's Survey of Consumer Finances. Commercial: Calculated as the weighted average cost of capital for entities purchasing small electric motors. Primary data source was Damodaran Online. |
| Equipment Lifetime | 2028 |
| Discount Rates | |
| Compliance Date | |

* References for the data sources mentioned in this table are provided in the sections following the table.

1. Equipment Cost

To calculate consumer equipment costs, DOE multiplied the MSPs developed in the engineering analysis by the distribution channel markups described in section IV.D (along with sales taxes). DOE used different markups for baseline motors and higher-efficiency motors, because DOE applies an incremental markup to the increase in MSP associated with higher-efficiency equipment. Further, in this proposed determination, DOE assumed the prices of small electric motors would remain constant over time (no decrease in price).

2. Installation Cost

Installation cost includes labor, overhead, and any miscellaneous materials and parts needed to install the equipment. In response to the April 2019 ECS RFI, DOE did not receive any information on small electric motors consumer installation costs. Based on information from the March 2010 Final Rule and installation cost data from RS Means Electrical Cost Data 2019,³⁹ DOE estimated that installation costs do not increase with equipment efficiency except in terms of shipping costs depending on the weight of the more efficient motor.⁴⁰ To arrive at total installed costs, DOE included shipping costs as part of the installation costs. These were based on weight data from the engineering analysis, which

accounted for updated manufacturer catalog data collected by DOE.

DOE seeks comment on the methodology used to estimate installation costs as well as any data supporting alternate installation cost estimates.

See section VII.B for a complete list of issues on which DOE seeks comments. See chapter 8 of the TSD for more information on the installation costs for small electric motors.

3. Annual Energy Consumption

For each sampled consumer, DOE determined the energy consumption for small electric motors in each standards case analyzed using the approach described in section IV.E of this proposed determination.

4. Energy Prices

For electricity prices, DOE used national annual marginal and average prices from Coughlin and Beraki (2019).⁴¹ To estimate energy prices in future years, DOE multiplied the energy prices by a projection of annual change in average price consistent with the projections in the *AEO 2019*, which has an end year of 2050. To estimate price trends after 2050, DOE used the average

annual rate of change in prices from 2030 to 2050.

5. Maintenance and Repair Costs

Repair costs are associated with repairing or replacing small electric motor components that have failed; maintenance costs are associated with maintaining the operation of the equipment. Small electric motors are usually not repaired. Most small motors are mass produced and are not constructed or designed to be repaired because the manufacturing process uses spot welding welds and rivets to fasten or secure the frame and assembled components, not nuts and bolts—meaning that the small electric motor cannot be readily disassembled and reassembled. During the rulemaking for the March 2010 Final Rule, DOE found no evidence that repair or maintenance costs, if any, would increase with higher motor energy efficiency.⁴² DOE reviewed more recent motor repair cost data for small electric motors and found no evidence that maintenance and repair costs increase with efficiency for small electric motors in scope.⁴³ NEMA commented that for small electric motor designs that simply added more active material to the rotors and/or stators, repair practices are unlikely to change. NEMA noted that CSCR motors have higher repair costs compared to CSIR motors due to the inclusion of a second capacitor. NEMA did not provide any

⁴³ Vaughen's (2013), Vaughen's Motor & Pump Repair Price Guide, 2013 Edition. Available at www.vaughens.com.

additional information to characterize repair costs. (NEMA, No. 11 at p. 15)

Based on information DOE reviewed, small electric motors are generally not repaired and NEMA's comments suggest that repair practices are unlikely to change within each equipment class group (*i.e.*, polyphase, CSCR, and CSIR). Accordingly, DOE assumed that more efficient small electric motors would not have greater repair or maintenance costs and therefore did not account for these costs in the LCC calculation.

DOE seeks comment on the assumptions for estimating repair and maintenance costs as well as any data supporting alternate repair and maintenance cost estimates.

See section VII.B for a complete list of issues on which DOE seeks comments. See chapter 8 of the TSD for more information on the repair and maintenance costs for small electric motors.

6. Motor Lifetime

To characterize lifetimes in a manner that would reflect the fact that this factor is dependent on its application, DOE used two Weibull distributions.⁴⁴ One characterizes the motor lifetime in total operating hours (*i.e.*, mechanical lifetime), while the other characterizes the lifetime in years of use in the application (*e.g.*, a pump). DOE used mechanical lifetime data from the 2010 small electric motors final rule analysis and from DOE's Advanced Manufacturing Office⁴⁵ and estimated an average mechanical lifetime of 30,000 hours for CSCR motors and of 40,000 hours for polyphase motors. The Weibull parameters from the March 2010 Final Rule were used to derive these lifetime distributions.⁴⁶ In the course of the life-cycle analysis, DOE's current analysis further combines these two distributions with OEM application lifetimes to estimate the distribution of small electric motor lifetimes. DOE determined the mechanical lifetime of each motor in years by dividing its mechanical lifetime in hours by its annual hours of operation. DOE then compared this mechanical lifetime (in years) with the sampled application

lifetime (also in years), and assumed that the motor would be retired at the younger of these two ages. In the March 2010 Final Rule, this approach resulted in projected average lifetimes of 7 years for single-phase CSCR motors and 9 years for polyphase motors. In the April 2019 ECS RFI, DOE presented the average lifetimes from the March 2010 Final Rule (*i.e.* 7 years for single-phase CSCR motors and 9 years for polyphase motors). NEMA commented that 8 years was a reasonable starting point to estimate lifetime for small electric motors. NEMA did not provide lifetime estimates by equipment class and noted that the actual lifetime is heavily dependent on the application. (NEMA, No. 11 at p. 15). Because of updates made to the annual operating hours (see section IV.E.3), the updated analysis for this NOPD yielded average lifetimes of 6.6 years for single-phase CSCR motors and 8.5 years for polyphase motors.

DOE seeks comment on the methodology it used for estimating small electric motor lifetimes, as well as any data supporting alternate values for these lifetimes.

See section VII.B for a complete list of issues on which DOE seeks comments. See chapter 8 of the TSD for more information on the lifetime of small electric motors.

7. Discount Rates

In calculating LCC, DOE applies discount rates appropriate to commercial, industrial, and residential consumers to estimate the present value of future operating costs. DOE estimated a distribution of discount rates for small electric motors based on the cost of capital of publicly traded firms in the sectors that purchase small electric motors.

As part of its analysis, DOE also applies weighted average discount rates calculated from consumer debt and asset data, rather than marginal or implicit discount rates.⁴⁷ DOE notes that the LCC does not analyze the equipment purchase decision, so the implicit discount rate is not relevant in this model. The LCC estimates net present value over the lifetime of the equipment, so the appropriate discount rate will reflect the general opportunity cost of household funds, taking this time scale into account. Given the long

time horizon modeled in the LCC, the application of a marginal interest rate associated with an initial source of funds is inaccurate. Regardless of the method of purchase, consumers are expected to continue to rebalance their debt and asset holdings over the LCC analysis period, based on the restrictions consumers face in their debt payment requirements and the relative size of the interest rates available on debts and assets. DOE estimates the aggregate impact of this rebalancing using the historical distribution of debts and assets.

To establish residential discount rates for the LCC analysis, DOE identified all relevant household debt or asset classes in order to approximate a consumer's opportunity cost of funds related to appliance energy cost savings. It estimated the average percentage shares of the various types of debt and equity by household income group using data from the Federal Reserve Board's Survey of Consumer Finances⁴⁸ ("SCF") for 1995, 1998, 2001, 2004, 2007, 2010, 2013, and 2016. Using the SCF and other sources, DOE developed a distribution of rates for each type of debt and asset by income group to represent the rates that may apply in the year in which amended standards would take effect.

For commercial and industrial consumers, DOE used the cost of capital to estimate the present value of cash flows to be derived from a typical company project or investment. Most companies use both debt and equity capital to fund investments, so the cost of capital is the weighted-average cost to the firm of equity and debt financing. This corporate finance approach is referred to as the weighted-average cost of capital. DOE used currently available economic data in developing discount rates. See chapter 8 of the TSD for details on the development of end-user discount rates.

8. Efficiency Distribution in the No-New-Standards Case

To accurately estimate the share of consumers that would be affected by a potential energy conservation standard at a particular efficiency level, DOE's LCC analysis considered the projected distribution (market shares) of equipment efficiencies in the "no-new-standards" case (*i.e.*, the case without amended or new energy conservation standards) in the compliance year. In its analysis for the March 2010 Final Rule,

⁴⁴ The Weibull distribution is one of the most commonly used distributions in reliability. It is commonly used to model time to fail, time to repair and material strength.

⁴⁵ U.S. Department of Energy. Advanced Manufacturing Office. *Motors Systems Tip Sheet #3. Energy Tips: Motor Systems. Extending the Operating Life of Your Motor*. 2012. https://www.energy.gov/sites/prod/files/2014/04/f15/extend_motor_operlife_motor_systems3.pdf.

⁴⁶ For more details see chapter 8 of the 2010 small electric motors final rule TSD, at <https://www.regulations.gov/document?D=EERE-2007-BT-STD-0007-0036>.

⁴⁷ The implicit discount rate is inferred from a consumer purchase decision between two otherwise identical goods with different first cost and operating cost. It is the interest rate that equates the increment of first cost to the difference in net present value of lifetime operating cost, incorporating the influence of several factors: Transaction costs; risk premiums and response to uncertainty; time preferences; interest rates at which a consumer is able to borrow or lend.

⁴⁸ Board of Governors of the Federal Reserve System. *Survey of Consumer Finances*. 1995, 1998, 2001, 2004, 2007, 2010, 2013, and 2016. Available at: <http://www.federalreserve.gov/econresdata/scf/scfindex.htm>.

DOE developed no-new standards case efficiency distributions based on the distributions of currently available models for which small electric motor efficiency is included in catalog listings. In preparation for the NOPD, DOE collected updated catalog data and analyzed the distribution of small electric motors in the manufacturer catalog data for CSCR and polyphase small electric motors.⁴⁹ In response to the April 2019 RFI, DOE did not receive any input on projected efficiency trends. DOE projected that these efficiency distributions would remain constant throughout 2028. See chapter 8 of the TSD for the estimated efficiency distributions.

9. Payback Period Analysis

The PBP is the amount of time it takes the consumer to recover the additional installed cost of more-efficient equipment, compared to baseline equipment, through energy cost savings. PBPs are expressed in years. PBPs that exceed the life of the equipment mean that the increased total installed cost is not recovered in reduced operating expenses.

The inputs to the simple PBP calculation for each efficiency level are the change in total installed cost of the equipment and the change in the first-year annual operating expenditures relative to the baseline. The simple PBP calculation uses the same inputs as the LCC analysis, except that discount rates are not needed.

G. Other Comments Received

In response to the April 2019 ECS RFI, DOE also received comments on aspects of the standards for small electric motors that do not relate to the methodologies or discussions presented in other sections of this document. This section addresses these stakeholder comments.

The Institute for Policy Integrity commented on monetizing the benefits of emissions reductions in analyzing the national impact and selecting the maximum economically justified efficiency level. (Institute for Policy Integrity, No. 5 at p. 1) DOE also received a comment from an individual questioning how DOE would ensure that GHG (*i.e.* greenhouse gas) emissions would not increase as a result of amended standards. (Zach Belanger, No. 7 at p. 1)

As discussed previously, under the periodic review of energy conservation standards required by EPCA, DOE is directed to consider whether amended standards would result in significant conservation of energy; are technologically feasible; and would be cost effective. (42 U.S.C. 6316(a); 42 U.S.C. 6295(m)(1) and 42 U.S.C. 6295(n)(2)) In evaluating the cost-effectiveness of amended standards, EPCA requires DOE to consider the savings in operating costs throughout the estimated average life of the covered equipment in the type (or class) compared to any increase in price, initial charges, or maintenance expenses of the covered equipment that are likely to result from the imposition of the standard. (See 42 U.S.C. 6295(n)(2)(C) and 42 U.S.C. 6295(o)(2)(B)(II)) DOE has tentatively determined that the potential standards would not be cost-effective as defined in EPCA. See section V.B., *infra*. DOE has not conducted an emissions analysis as would generally be performed were DOE to propose amended energy conservation standards.

The CA IOUs suggested that DOE adopt a common metric between small electric motors and electric motors. The CA IOUs commented that different metrics create confusion and represent an additional burden for the motor industry. The CA IOUs recommended consideration of a single metric for both small electric motors and electric motors or development of a new metric in consultation with industry. (CA IOUs, No. 10 at p. 4)

The energy conservation standards for small electric motors at 10 CFR 431.446 are expressed in terms of average full-load efficiency, while the standards for electric motors at 10 CFR 431.25 are expressed in terms of nominal full-load efficiency. The nominal efficiency values for electric motors are based on a sequence of discretized standard values in NEMA Standard MG 1–2016 Table 12–10, and are familiar to motor users. Under this approach, the full-load efficiency is identified on the electric motor nameplate by a nominal efficiency level selected from Table 12–10 that shall not be greater than the average efficiency of a large population of motors of the same design. However, NEMA has not adopted a comparable set of standardized values for small electric motors. Because no standardized nominal values are published for small electric motors, DOE is unable to consider at this time their appropriateness as a small electric motor performance metric. Absent standardized nominal values for small electric motors, DOE is unable to

ascertain whether existing energy conservation standards would require the same level of stringency if based on nominal values. Therefore, DOE is not proposing to amend the metric for small electric motor energy conservation standards in this document.

Finally, DOE received a comment from an individual requesting information on the RFI data collection process, specifically in reference to the privacy of manufacturers and consumers. (Palubin, No. 2 at p. 1) As provided in the April 2019 ECS RFI, DOE accepted written comments from the public on any subject within the scope of the small electric motors energy conservation standards. The confidentiality of comments submitted is addressed in section VII of this document, including requests to have comments treated as confidential under 10 CFR 1004.11.

V. Analytical Results and Conclusions

The following section addresses the results from DOE's analyses with respect to the considered energy conservation standards for small electric motors examined by DOE.

A. Energy Savings

For each standards case considered, DOE estimated the per unit lifetime energy savings for small electric motors purchased in the expected compliance year of any potential standards. DOE did not separately evaluate the significance of the potential energy conservation under the considered amended standard because it has tentatively determined that the potential standards would not be cost-effective as defined in EPCA. (42 U.S.C. 6316(a); 42 U.S.C. 6295(m)(1)(A); 42 U.S.C. 6295(n)(2))

B. Cost Effectiveness

In general, higher-efficiency equipment affects consumers in two ways: (1) Purchase price increases and (2) annual operating cost decreases. Inputs used for calculating the LCC and PBP include total installed costs (*i.e.*, equipment price plus installation costs), and operating costs (*i.e.*, annual energy and water use, energy and water prices, energy and water price trends, repair costs, and maintenance costs). The LCC calculation also uses equipment lifetime and a discount rate.

Table V–1 through Table V–7 show the LCC and PBP results for the ELs considered for each equipment class. Results for each representative unit are presented by two tables: In the first of each pair of tables, the simple payback is measured relative to the baseline equipment. In the second table, the impacts are measured relative to the

⁴⁹ DOE relied on 140 models of CSCR small electric motors and 229 models of polyphase small electric motors identified in the manufacturer catalog data. More details on the distributions of currently available models for which motor catalog list efficiency is available in Chapter 8 of the TSD.

efficiency distribution in the no-new-standards case in the expected compliance year for the potential standards considered. Because some consumers purchase equipment with higher efficiency in the no-new-

standards case, the average savings are greater than the difference between the average LCC of the baseline equipment and the average LCC at each EL. The savings refer only to consumers who are affected by a standard at a given EL.

Those who already purchase a small electric motor with efficiency at or above a given EL are not affected. Consumers for whom the LCC-increases at a given EL experience a net cost.

TABLE V-1—AVERAGE LCC AND PBP RESULTS BY EFFICIENCY LEVEL FOR REPRESENTATIVE UNIT 1: SINGLE-PHASE, CSCR, 4-POLE, 0.75 HP

| Efficiency Level | Average costs 2018\$ | | | | Simple payback years | Average lifetime years |
|------------------|----------------------|-----------------------------|-------------------------|---------|----------------------|------------------------|
| | Total installed cost | First year's operating cost | Lifetime operating cost | LCC | | |
| 0 | 465.8 | 156.2 | 600.6 | 1,066.3 | | 6.6 |
| 1 | 481.8 | 153.8 | 591.4 | 1,073.2 | 6.7 | 6.6 |
| 2 | 502.1 | 151.1 | 580.7 | 1,082.8 | 7.0 | 6.6 |
| 3 | 544.4 | 149.7 | 575.4 | 1,119.8 | 12.0 | 6.6 |
| 4 | 571.9 | 145.2 | 558.1 | 1,130.0 | 9.6 | 6.6 |
| 5 | 1,403.1 | 142.7 | 548.3 | 1,951.4 | 69.2 | 6.6 |

Note: The results for each EL represent the average value if all purchasers in the sample use equipment with that efficiency level. The PBP is measured relative to the baseline equipment.

TABLE V-2—LCC SAVINGS RELATIVE TO THE NO-NEW STANDARDS CASE EFFICIENCY DISTRIBUTION FOR REPRESENTATIVE UNIT 1: SINGLE-PHASE, CSCR, 4-POLE, 0.75 HP

| Efficiency level | Life-cycle cost savings | |
|------------------|--------------------------------------|-------------------|
| | Percent of customers that experience | Average savings * |
| | Net cost (percent) | 2018\$ |
| 1 | 78.3 | — 6.8 |
| 2 | 81.8 | — 16.3 |
| 3 | 90.7 | — 53.3 |
| 4 | 89.8 | — 63.0 |
| 5 | 100.0 | — 884.3 |

* The savings represent the average LCC for affected consumers.

TABLE V-3—AVERAGE LCC AND PBP RESULTS BY EFFICIENCY LEVEL FOR REPRESENTATIVE UNIT 2: POLYPHASE, 4-POLE, 1 HP

| Efficiency level | Average costs 2018\$ | | | | Simple payback years | Average lifetime years |
|------------------|----------------------|-----------------------------|-------------------------|---------|----------------------|------------------------|
| | Total installed cost | First year's operating cost | Lifetime operating cost | LCC | | |
| 0 | 450.4 | 192.8 | 923.1 | 1,373.5 | | 8.5 |
| 1 | 519.7 | 188.7 | 903.2 | 1,423.0 | 16.7 | 8.5 |
| 2 | 579.3 | 186.2 | 891.4 | 1,470.7 | 19.5 | 8.5 |
| 3 | 1,386.3 | 182.8 | 875.2 | 2,261.4 | 93.6 | 8.5 |

Note: The results for each EL represent the average value if all purchasers in the sample use equipment with that efficiency level. The PBP is measured relative to the baseline equipment.

TABLE V-4—LCC SAVINGS RELATIVE TO THE NO-NEW STANDARDS CASE EFFICIENCY DISTRIBUTION FOR REPRESENTATIVE UNIT 2: POLYPHASE, 4-POLE, 1 HP

| Efficiency level | Life-cycle cost savings | |
|------------------|--------------------------------------|-------------------|
| | Percent of customers that experience | Average Savings * |
| | Net cost (percent) | 2018\$ |
| 1 | 85.8 | — 49.4 |
| 2 | 98.7 | — 95.3 |
| 3 | 99.2 | — 885.4 |

* The savings represent the average LCC for affected consumers.

TABLE V-5—AVERAGE LCC AND PBP RESULTS BY EFFICIENCY LEVEL FOR REPRESENTATIVE UNIT 3: SINGLE-PHASE, CSCR, 4-POLE, 1 HP

| Efficiency level | Average costs 2018\$ | | | | Simple payback years | Average lifetime years |
|------------------|----------------------|-----------------------------|-------------------------|---------|----------------------|------------------------|
| | Total installed cost | First year's operating cost | Lifetime operating cost | LCC | | |
| 0 | 529.6 | 206.3 | 784.1 | 1,313.8 | | 6.6 |
| 1 | 547.9 | 203.3 | 772.5 | 1,320.3 | 5.9 | 6.6 |
| 2 | 570.9 | 199.9 | 759.5 | 1,330.4 | 6.4 | 6.6 |
| 3 | 619.1 | 198.1 | 752.8 | 1,371.9 | 10.9 | 6.6 |
| 4 | 650.3 | 192.4 | 731.1 | 1,381.5 | 8.7 | 6.6 |
| 5 | 1,594.9 | 189.1 | 718.6 | 2,313.5 | 61.9 | 6.6 |

Note: The results for each EL represent the average value if all purchasers in the sample use equipment with that efficiency level. The PBP is measured relative to the baseline equipment.

TABLE V-6—LCC SAVINGS RELATIVE TO THE NO-NEW STANDARDS CASE EFFICIENCY DISTRIBUTION FOR REPRESENTATIVE UNIT 3: SINGLE-PHASE, CSCR, 4-POLE, 1 HP

| Efficiency level | Life-cycle cost savings | |
|------------------|--------------------------------------|-------------------|
| | Percent of customers that experience | Average savings * |
| | Net cost (percent) | 2018\$ |
| 1 | 74.5 | – 6.5 |
| 2 | 78.8 | – 16.6 |
| 3 | 87.7 | – 58.0 |

C. Proposed Determination

For this proposed determination, DOE considered the amount of energy savings conservation, technological feasibility, and cost effectiveness of

potential amended standards for small electric motors at each considered EL. (42 U.S.C. 6316(a); 42 U.S.C. 6295(m)(1)(A) and 42 U.S.C. 6295 (n)(2)) As presented in the prior section, DOE

projects that the average customer purchasing a representative small electric motor would experience an increase in LCC at each evaluated standards case as compared to the no

new standards case. The simple PBP for the average of a representative small electric motor customer at each EL is projected to be generally longer than the mean lifetime of the equipment. Based on the above considerations, DOE has tentatively determined that more stringent amended energy conservation standards for small electric motors cannot satisfy the relevant statutory requirements because such standards would not be cost effective as required and described under EPCA. (See 42 U.S.C. 6295(n)(2) and (o)(2)(B)(II))

DOE seeks comment on its analysis indicating that increasing the stringency of the energy conservation standards for small electric motors are not cost effective.

VI. Procedural Issues and Regulatory Review

A. Review Under Executive Orders 12866

This proposed determination has been determined to be not significant for purposes of Executive Order (“E.O.”) 12866, “Regulatory Planning and Review.” 58 FR 51735 (Oct. 4, 1993). As a result, the Office of Management and Budget (“OMB”) did not review this proposed determination.

B. Review Under Executive Orders 13771 and 13777

On January 30, 2017, the President issued E.O. 13771, “Reducing Regulation and Controlling Regulatory Costs.” E.O. 13771 stated the policy of the executive branch is to be prudent and financially responsible in the expenditure of funds, from both public and private sources. E.O. 13771 stated it is essential to manage the costs associated with the governmental imposition of private expenditures required to comply with Federal regulations.

Additionally, on February 24, 2017, the President issued E.O. 13777, “Enforcing the Regulatory Reform Agenda.” See 82 FR 12285 (March 1, 2017). E.O. 13777 required the head of each agency to designate an agency official as its Regulatory Reform Officer (“RRO”). Each RRO oversees the implementation of regulatory reform initiatives and policies to ensure that agencies effectively carry out regulatory reforms, consistent with applicable law. Further, E.O. 13777 requires the establishment of a regulatory task force at each agency. The regulatory task force is required to make recommendations to the agency head regarding the repeal, replacement, or modification of existing regulations, consistent with applicable law. At a minimum, each regulatory

reform task force must attempt to identify regulations that:

- (1) Eliminate jobs, or inhibit job creation;
- (2) Are outdated, unnecessary, or ineffective;
- (3) Impose costs that exceed benefits;
- (4) Create a serious inconsistency or otherwise interfere with regulatory reform initiatives and policies;
- (5) Are inconsistent with the requirements of the Information Quality Act, or the guidance issued pursuant to that Act, particularly those regulations that rely in whole or in part on data, information, or methods that are not publicly available or that are insufficiently transparent to meet the standard for reproducibility; or
- (6) Derive from or implement Executive Orders or other Presidential directives that have been subsequently rescinded or substantially modified.

DOE initially concludes that this proposed determination is consistent with the directives set forth in these executive orders. As discussed in this document, DOE is proposing not to amend the current energy conservation standards for small electric motors and this proposal is estimated to have no cost impact. Therefore, if finalized as proposed, this determination is expected to be an E.O. 13771 other action.

C. Review Under the Regulatory Flexibility Act

The Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*) requires preparation of an initial regulatory flexibility analysis (“IRFA”) and a final regulatory flexibility analysis (“FRFA”) for any rule that by law must be proposed for public comment, unless the agency certifies that the rule, if promulgated, will not have a significant economic impact on a substantial number of small entities. As required by Executive Order 13272, “Proper Consideration of Small Entities in Agency Rulemaking,” 67 FR 53461 (Aug. 16, 2002), DOE published procedures and policies on February 19, 2003, to ensure that the potential impacts of its rules on small entities are properly considered during the rulemaking process. 68 FR 7990. DOE has made its procedures and policies available on the Office of the General Counsel’s website (<http://energy.gov/gc/office-general-counsel>).

DOE reviewed this proposed determination pursuant to the Regulatory Flexibility Act and the procedures and policies discussed above. DOE has tentatively concluded that, based on the data and available information it has been able to review, amended energy conservation standards

for small electric motors would not be cost-effective. Therefore, DOE is not proposing to amend the current energy conservation standards for small electric motors. On the basis of the foregoing, DOE certifies that this proposed determination, if adopted, will not have a significant economic impact on a substantial number of small entities. Accordingly, DOE has not prepared an IRFA for this proposed determination. DOE will transmit this certification and supporting statement of factual basis to the Chief Counsel for Advocacy of the Small Business Administration for review under 5 U.S.C. 605(b).

D. Review Under the Paperwork Reduction Act

Manufacturers of small electric motors must certify to DOE that their products comply with any applicable energy conservation standards. In certifying compliance, manufacturers must test their equipment according to the DOE test procedures, including any amendments adopted for those test procedures. DOE has established regulations for the certification and recordkeeping requirements for all covered consumer products and commercial equipment, including small electric motors. 76 FR 12422 (March 7, 2011); 80 FR 5099 (Jan. 30, 2015). The collection-of-information requirement for the certification and recordkeeping is subject to review and approval by OMB under the Paperwork Reduction Act (“PRA”). This requirement has been approved by OMB under OMB control number 1910–1400. Public reporting burden for the certification is estimated to average 30 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information.

Notwithstanding any other provision of the law, no person is required to respond to, nor shall any person be subject to a penalty for failure to comply with, a collection of information subject to the requirements of the PRA, unless that collection of information displays a currently valid OMB Control Number.

The proposed determination, which tentatively finds that amended energy conservation standards for small electric motors would not be cost effective, impose no new information or record keeping requirements. Accordingly, the Office of Management and Budget (OMB) clearance is not required under the Paperwork Reduction Act. (44 U.S.C. 3501 *et seq.*)

E. Review Under the National Environmental Policy Act of 1969

DOE is analyzing this proposed action in accordance with the National Environmental Policy Act (“NEPA”) and DOE’s NEPA implementing regulations (10 CFR part 1021). DOE’s regulations include a categorical exclusion for actions which are interpretations or rulings with respect to existing regulations. 10 CFR part 1021, subpart D, appendix A4. DOE anticipates that this action qualifies for categorical exclusion A4 because it is an interpretation or ruling in regards to an existing regulation and otherwise meets the requirements for application of a categorical exclusion. See 10 CFR 1021.410. DOE will complete its NEPA review before issuing the final action.

F. Review Under Executive Order 13132

Executive Order 13132, “Federalism,” 64 FR 43255 (Aug. 10, 1999), imposes certain requirements on Federal agencies formulating and implementing policies or regulations that preempt State law or that have federalism implications. The Executive Order requires agencies to examine the constitutional and statutory authority supporting any action that would limit the policymaking discretion of the States and to carefully assess the necessity for such actions. The Executive Order also requires agencies to have an accountable process to ensure meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications. On March 14, 2000, DOE published a statement of policy describing the intergovernmental consultation process it will follow in the development of such regulations. 65 FR 13735. As this proposed determination does not amend the standards for small electric motors, there is no impact on the policymaking discretion of the States. Therefore, no action is required by Executive Order 13132.

G. Review Under Executive Order 12988

With respect to the review of existing regulations and the promulgation of new regulations, section 3(a) of Executive Order 12988, “Civil Justice Reform,” imposes on Federal agencies the general duty to adhere to the following requirements: (1) Eliminate drafting errors and ambiguity, (2) write regulations to minimize litigation, (3) provide a clear legal standard for affected conduct rather than a general standard, and (4) promote simplification and burden reduction. 61 FR 4729 (Feb. 7, 1996). Regarding the review required by section 3(a), section 3(b) of Executive

Order 12988 specifically requires that Executive agencies make every reasonable effort to ensure that the regulation (1) clearly specifies the preemptive effect, if any, (2) clearly specifies any effect on existing Federal law or regulation, (3) provides a clear legal standard for affected conduct while promoting simplification and burden reduction, (4) specifies the retroactive effect, if any, (5) adequately defines key terms, and (6) addresses other important issues affecting clarity and general draftsmanship under any guidelines issued by the Attorney General. Section 3(c) of Executive Order 12988 requires Executive agencies to review regulations in light of applicable standards in section 3(a) and section 3(b) to determine whether they are met or it is unreasonable to meet one or more of them. DOE has completed the required review and determined that, to the extent permitted by law, this proposed determination meets the relevant standards of Executive Order 12988.

H. Review Under the Unfunded Mandates Reform Act of 1995

Title II of the Unfunded Mandates Reform Act of 1995 (“UMRA”) requires each Federal agency to assess the effects of Federal regulatory actions on State, local, and Tribal governments and the private sector. Public Law 104–4, sec. 201 (codified at 2 U.S.C. 1531). For a regulatory action likely to result in a rule that may cause the expenditure by State, local, and Tribal governments, in the aggregate, or by the private sector of \$100 million or more in any one year (adjusted annually for inflation), section 202 of UMRA requires a Federal agency to publish a written statement that estimates the resulting costs, benefits, and other effects on the national economy. (2 U.S.C. 1532(a), (b)) The UMRA also requires a Federal agency to develop an effective process to permit timely input by elected officers of State, local, and Tribal governments on a “significant intergovernmental mandate,” and requires an agency plan for giving notice and opportunity for timely input to potentially affected small governments before establishing any requirements that might significantly or uniquely affect them. On March 18, 1997, DOE published a statement of policy on its process for intergovernmental consultation under UMRA. 62 FR 12820. DOE’s policy statement is also available at http://energy.gov/sites/prod/files/gcprod/documents/umra_97.pdf. This proposed determination does not contain a Federal intergovernmental mandate, nor is it expected to require expenditures of

\$100 million or more in any one year by the private sector. As a result, the analytical requirements of UMRA do not apply.

I. Review Under the Treasury and General Government Appropriations Act, 1999

Section 654 of the Treasury and General Government Appropriations Act, 1999 (Pub. L. 105–277) requires Federal agencies to issue a Family Policymaking Assessment for any rule that may affect family well-being. This proposed determination would not have any impact on the autonomy or integrity of the family as an institution. Accordingly, DOE has concluded that it is not necessary to prepare a Family Policymaking Assessment.

J. Review Under Executive Order 12630

Pursuant to Executive Order 12630, “Governmental Actions and Interference with Constitutionally Protected Property Rights,” 53 FR 8859 (March 18, 1988), DOE has determined that this proposed determination would not result in any takings that might require compensation under the Fifth Amendment to the U.S. Constitution.

K. Review Under the Treasury and General Government Appropriations Act, 2001

Section 515 of the Treasury and General Government Appropriations Act, 2001 (44 U.S.C. 3516, note) provides for Federal agencies to review most disseminations of information to the public under information quality guidelines established by each agency pursuant to general guidelines issued by OMB. OMB’s guidelines were published at 67 FR 8452 (Feb. 22, 2002), and DOE’s guidelines were published at 67 FR 62446 (Oct. 7, 2002). DOE has reviewed this proposed determination under the OMB and DOE guidelines and has concluded that it is consistent with applicable policies in those guidelines.

L. Review Under Executive Order 13211

Executive Order 13211, “Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use,” 66 FR 28355 (May 22, 2001), requires Federal agencies to prepare and submit to the Office of Information and Regulatory Affairs (“OIRA”) at OMB, a Statement of Energy Effects for any significant energy action. A “significant energy action” is defined as any action by an agency that promulgates or is expected to lead to promulgation of a final rule, and that (1) is a significant regulatory action under Executive Order 12866, or any successor order; and (2) is likely to have a

significant adverse effect on the supply, distribution, or use of energy, or (3) is designated by the Administrator of OIRA as a significant energy action. For any significant energy action, the agency must give a detailed statement of any adverse effects on energy supply, distribution, or use should the proposal be implemented, and of reasonable alternatives to the action and their expected benefits on energy supply, distribution, and use.

Because this proposed determination would not amend the current standards for small electric motors, it is not a significant energy action, nor has it been designated as such by the Administrator at OIRA. Accordingly, DOE has not prepared a Statement of Energy Effects.

M. Review Under the Information Quality Bulletin for Peer Review

On December 16, 2004, OMB, in consultation with the Office of Science and Technology Policy (“OSTP”), issued its Final Information Quality Bulletin for Peer Review (“the Bulletin”). 70 FR 2664 (Jan. 14, 2005). The Bulletin establishes that certain scientific information shall be peer reviewed by qualified specialists before it is disseminated by the Federal Government, including influential scientific information related to agency regulatory actions. The purpose of the bulletin is to enhance the quality and credibility of the Government’s scientific information. Under the Bulletin, the energy conservation standards rulemaking analyses are “influential scientific information,” which the Bulletin defines as “scientific information the agency reasonably can determine will have, or does have, a clear and substantial impact on important public policies or private sector decisions.” 70 FR 2667.

In response to OMB’s Bulletin, DOE conducted formal in-progress peer reviews of the energy conservation standards development process and analyses and has prepared a Peer Review Report pertaining to the energy conservation standards rulemaking analyses. Generation of this report involved a rigorous, formal, and documented evaluation using objective criteria and qualified and independent reviewers to make a judgment as to the technical/scientific/business merit, the actual or anticipated results, and the productivity and management effectiveness of programs and/or projects. The “Energy Conservation Standards Rulemaking Peer Review Report” dated February 2007 has been disseminated and is available at: <http://www.energy.gov/eere/buildings/peer-review>.

VII. Public Participation

A. Submission of Comments

DOE will accept comments, data, and information regarding this proposed determination no later than the date provided in the **DATES** section at the beginning of this proposed determination. Interested parties may submit comments, data, and other information using any of the methods described in the **ADDRESSES** section at the beginning of this document.

Submitting comments via <http://www.regulations.gov>. The <http://www.regulations.gov> web page will require you to provide your name and contact information. Your contact information will be viewable to DOE Building Technologies staff only. Your contact information will not be publicly viewable except for your first and last names, organization name (if any), and submitter representative name (if any). If your comment is not processed properly because of technical difficulties, DOE will use this information to contact you. If DOE cannot read your comment due to technical difficulties and cannot contact you for clarification, DOE may not be able to consider your comment.

However, your contact information will be publicly viewable if you include it in the comment itself or in any documents attached to your comment. Any information that you do not want to be publicly viewable should not be included in your comment, nor in any document attached to your comment. Otherwise, persons viewing comments will see only first and last names, organization names, correspondence containing comments, and any documents submitted with the comments.

Do not submit to <http://www.regulations.gov> information for which disclosure is restricted by statute, such as trade secrets and commercial or financial information (hereinafter referred to as Confidential Business Information (“CBI”). Comments submitted through <http://www.regulations.gov> cannot be claimed as CBI. Comments received through the website will waive any CBI claims for the information submitted. For information on submitting CBI, see the Confidential Business Information section.

DOE processes submissions made through <http://www.regulations.gov> before posting. Normally, comments will be posted within a few days of being submitted. However, if large volumes of comments are being processed simultaneously, your comment may not be viewable for up to

several weeks. Please keep the comment tracking number that <http://www.regulations.gov> provides after you have successfully uploaded your comment.

Submitting comments via email, hand delivery/courier, or postal mail. Comments and documents submitted via email, hand delivery/courier, or postal mail also will be posted to <http://www.regulations.gov>. If you do not want your personal contact information to be publicly viewable, do not include it in your comment or any accompanying documents. Instead, provide your contact information in a cover letter. Include your first and last names, email address, telephone number, and optional mailing address. The cover letter will not be publicly viewable as long as it does not include any comments.

Include contact information each time you submit comments, data, documents, and other information to DOE. If you submit via postal mail or hand delivery/courier, please provide all items on a CD, if feasible, in which case it is not necessary to submit printed copies. No telefacsimiles (faxes) will be accepted.

Comments, data, and other information submitted to DOE electronically should be provided in PDF (preferred), Microsoft Word or Excel, WordPerfect, or text (“ASCII”) file format. Provide documents that are not secured, that are written in English, and that are free of any defects or viruses. Documents should not contain special characters or any form of encryption and, if possible, they should carry the electronic signature of the author.

Campaign form letters. Please submit campaign form letters by the originating organization in batches of between 50 to 500 form letters per PDF or as one form letter with a list of supporters’ names compiled into one or more PDFs. This reduces comment processing and posting time.

Confidential Business Information. Pursuant to 10 CFR 1004.11, any person submitting information that he or she believes to be confidential and exempt by law from public disclosure should submit via email, postal mail, or hand delivery/courier two well-marked copies: One copy of the document marked “confidential” including all the information believed to be confidential, and one copy of the document marked “non-confidential” with the information believed to be confidential deleted. Submit these documents via email or on a CD, if feasible. DOE will make its own determination about the confidential status of the information and treat it according to its determination.

It is DOE's policy that all comments may be included in the public docket, without change and as received, including any personal information provided in the comments (except information deemed to be exempt from public disclosure).

B. Issues on Which DOE Seeks Comment

Although DOE welcomes comments on any aspect of this proposal, DOE is particularly interested in receiving comments and views of interested parties concerning the following issues:

1. DOE seeks comment on the selection of representative equipment classes for CSCR and polyphase motors and the tentative determination that more stringent energy conservation standards for CSIR motors are not technologically feasible.

2. DOE seeks comment on the methodologies employed in the engineering analysis, specifically regarding the adoption of the motor designs and associated efficiency levels considered in the March 2010 Final Rule analysis as the basis for this proposed determination.

3. DOE seeks input on whether and how the costs estimated for motor designs considered in the March 2010 Final Rule have changed since the time of that analysis. DOE also requests information on the investments (including related costs) necessary to incorporate specific design options, including, but not limited to, costs

related to new or modified tooling (if any), materials, engineering and development efforts to implement each design option, and manufacturing/production impacts.

4. DOE seeks input on implementing a similar scaling methodology as that used for the March 2010 Final Rule in this NOPD.

5. DOE seeks comment on the methodology and data used for estimating end-user prices for small electric motors.

6. DOE seeks comments on how whether additions or changes should be made to the energy use analysis as well as any data supporting alternate inputs to characterize the variability in annual energy consumption for small electric motors.

7. DOE seeks comment on the approach used for estimating distribution of consumers of small electric motors across applications and sectors, as well as any data supporting the use of alternate distributions.

8. DOE seeks comment on the methodology used for estimating the distribution of motor load for each application and sector, as well as any data supporting alternate distributions.

9. DOE seeks comment on the methodology used to estimate annual operating hours, as well as any data supporting alternate distribution of operating hours by application and sector.

10. DOE seeks comment on the methodology used to estimate

installation costs as well as any data supporting alternate installation cost estimates.

11. DOE seeks comment on the assumptions for estimating repair and maintenance costs as well as any data supporting alternate repair and maintenance cost estimates.

12. DOE seeks comment on the methodology it used for estimating small electric motor lifetimes, as well as any data supporting alternate values for these lifetimes.

13. DOE seeks comment on its analysis indicating that increasing the stringency of the energy conservation standards for small electric motors are not cost effective.

14. Additionally, DOE welcomes comments on other issues relevant to the conduct of this rulemaking that may not specifically be identified in this document.

VIII. Approval of the Office of the Secretary

The Secretary of Energy has approved publication of this proposed determination.

Signed in Washington, DC, on April 6, 2020.

Daniel R Simmons,

Assistant Secretary for Energy, Efficiency and Renewable Energy.

The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years
2021–2026 Passenger Cars and Light Trucks; Final Rule

ENVIRONMENTAL PROTECTION AGENCY**40 CFR Parts 86 and 600****DEPARTMENT OF TRANSPORTATION****National Highway Traffic Safety Administration****49 CFR Parts 523, 531, 533, 536, and 537**

[NHTSA–2018–0067; EPA–HQ–OAR–2018–0283; FRL 10000–45–OAR]

RIN 2127–AL76; RIN 2060–AU09

The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021–2026 Passenger Cars and Light Trucks**AGENCY:** Environmental Protection Agency and National Highway Traffic Safety Administration.**ACTION:** Final rule.

SUMMARY: EPA and NHTSA, on behalf of the Department of Transportation, are issuing final rules to amend and establish carbon dioxide and fuel economy standards. Specifically, EPA is amending carbon dioxide standards for model years 2021 and later, and NHTSA is amending fuel economy standards for model year 2021 and setting new fuel economy standards for model years 2022–2026. The standards set by this action apply to passenger cars and light trucks, and will continue our nation's progress toward energy independence and carbon dioxide reduction, while recognizing the realities of the marketplace and consumers' interest in purchasing vehicles that meet all of their diverse needs. These final rules represent the second part of the Administration's action related to the August 24, 2018 proposed Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule. These final rules follow the agencies' actions, taken September 19, 2019, to ensure One National Program for automobile fuel economy

and carbon dioxide emissions standards, by finalizing regulatory text related to preemption under the Energy Policy and Conservation Act and withdrawing a waiver previously provided to California under the Clean Air Act.

DATES: This final rule is effective on June 29, 2020.

Judicial Review: NHTSA and EPA undertake this joint action under their respective authorities pursuant to the Energy Policy and Conservation Act and the Clean Air Act. Pursuant to CAA section 307(b), 42 U.S.C. 7607(b), any petitions for judicial review of this action must be filed in the United States Court of Appeals for the D.C. Circuit. Given the inherent relationship between the agencies' action, any challenges to NHTSA's regulation under 49 U.S.C. 32909 should also be filed in the United States Court of Appeals for the D.C. Circuit.

ADDRESSES: EPA and NHTSA have established dockets for this action under Docket ID Nos. EPA–HQ–OAR–2018–0283 and NHTSA–2018–0067, respectively. All documents in the docket are listed in the <http://www.regulations.gov> index. Although listed in the index, some information is not publicly available, *e.g.*, confidential business information (CBI) or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, will be publicly available in hard copy in EPA's docket, and electronically in NHTSA's online docket. Publicly available docket materials can be found either electronically in www.regulations.gov by searching for the dockets using the Docket ID numbers above, or in hard copy at the following locations:

EPA: EPA Docket Center, EPA/DC, EPA West, Room 3334, 1301 Constitution Ave. NW, Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The

telephone number for the Public Reading Room is (202) 566–1744.

NHTSA: Docket Management Facility, M–30, U.S. Department of Transportation (DOT), West Building, Ground Floor, Rm. W12–140, 1200 New Jersey Ave. SE, Washington, DC 20590. The DOT Docket Management Facility is open between 9 a.m. and 5 p.m. Eastern Time, Monday through Friday, except Federal holidays.

FOR FURTHER INFORMATION CONTACT:

EPA: Christopher Lieske, Office of Transportation and Air Quality, Assessment and Standards Division, Environmental Protection Agency, 2000 Traverwood Drive, Ann Arbor, MI 48105; telephone number: (734) 214–4584; fax number: (734) 214–4816; email address: lieske.christopher@epa.gov, or contact the Assessment and Standards Division, email address: otaq@epa.gov. NHTSA: James Tamm, Office of Rulemaking, Fuel Economy Division, National Highway Traffic Safety Administration, 1200 New Jersey Avenue SE, Washington, DC 20590; telephone number: (202) 493–0515.

SUPPLEMENTARY INFORMATION:**Does this action apply to me?**

This action affects companies that manufacture or sell new light-duty vehicles, light-duty trucks, and medium-duty passenger vehicles, as defined under EPA's CAA regulations,¹ and passenger automobiles (passenger cars) and non-passenger automobiles (light trucks) as defined under NHTSA's CAFE regulations.² Regulated categories and entities include:

¹ “Light-duty vehicle,” “light-duty truck,” and “medium-duty passenger vehicle” are defined in 40 CFR 86.1803–01. Generally speaking, a “light-duty vehicle” is a passenger car, a “light-duty truck” is a pick-up truck, sport-utility vehicle, or minivan up to 8,500 lbs. gross vehicle weight rating, and a “medium-duty passenger vehicle” is a sport-utility vehicle or passenger van from 8,500 to 10,000 lbs. gross vehicle weight rating.

² “Passenger car” and “light truck” are defined in 49 CFR part 523.

I. Executive Summary

NHTSA (on behalf of the Department of Transportation) and EPA are issuing final rules to adopt and modify standards regulating corporate average fuel economy and tailpipe carbon dioxide (CO₂) emissions and use/leakage of other air conditioning refrigerants for passenger cars and light trucks for MYs 2021–2026.³ These final

rules follow the proposal issued in August 2018 and respond to each agency's legal obligation to set standards based on the factors Congress directed them to consider, as well as the direction of the United States Supreme Court in *Massachusetts v. EPA*, which stated that “there is no reason to think the two agencies cannot both administer their obligations and yet avoid inconsistency.”⁴ These standards are the product of significant and ongoing work by both agencies to craft regulatory requirements for the same group of vehicles and vehicle manufacturers. This work aims to facilitate, to the extent possible within the statutory directives issued to each agency, the ability of automobile manufacturers to meet all requirements under both programs with a single national fleet under one national program of fuel economy and tailpipe CO₂ emission regulation.

The CAFE and CO₂ emissions standards established by these final rules will increase in stringency at 1.5 percent per year from MY 2020 levels over MYs 2021–2026. The “1.5 percent” regulatory alternative is new for the final rule and was not expressly analyzed in the NPRM, but it is a logical outgrowth of the NPRM analysis, being

term “CO₂” or “tailpipe CO₂” to refer broadly to EPA's suite of light duty vehicle GHG standards.

⁴ 549 U.S. 497, 532 (2007).

well within the range of alternatives then considered and consistent with discussions by both the agencies and commenters that there are benefits to having standards that increase at the same rate for all fleets. These standards apply to light-duty vehicles, which NHTSA divides for purposes of regulation into passenger cars and light trucks, and EPA divides into passenger cars, light-duty trucks, and medium-duty passenger vehicles (*i.e.*, sport utility vehicles, cross-over utility vehicles, and light trucks). Both the CAFE and CO₂ standards are vehicle-footprint-based, as are the standards currently in effect. These standards will become more stringent for each model year from 2021 to 2026, relative to the MY 2020 standards. Generally, the larger the vehicle footprint, the less numerically stringent the corresponding vehicle CO₂ and miles-per-gallon (mpg) targets. As a result of the footprint-based standards, the burden of compliance is distributed across all vehicle footprints and across all manufacturers. Each manufacturer is subject to individualized standards for passenger cars and light trucks, in each model year, based on the vehicles it produces. When standards are carefully crafted, both in terms of the footprint curves and the rate of increase in stringency of those curves, manufacturers are not

³ Throughout this document and the accompanying FRIA, the agencies will often use the

compelled to build vehicles of any particular size or type.

Knowing that many readers are accustomed to considering CAFE and CO₂ emissions standards in terms of the mpg and grams-per-mile (g/mi) values that the standards are projected to eventually require, the agencies include those projections here. EPA's standards are projected to require, on an average industry fleet-wide basis, 201 grams per mile (g/mi) of CO₂ in model year 2030, while NHTSA's standards are projected to require, on an average industry fleet-wide basis, 40.5 miles per gallon (mpg) in model year 2030. The agencies note that real-world CO₂ is typically 25 percent higher and real-world fuel economy is typically 20 percent lower than the CO₂ and CAFE compliance values discussed here, and also note that a portion of EPA's expected "CO₂" improvements will in fact be made through improvements in minimizing air conditioning leakage and through use of alternative refrigerants, which will not contribute to fuel economy but will contribute toward reductions of climate-related emissions.

In these final rules, NHTSA and EPA are reaching similar conclusions on similar grounds: even though each agency has its own distinct statutory authority and factors, the relevant considerations overlap in many ways. Both agencies recognize that they are balancing the relevant considerations in somewhat different ways from how they may have been balanced previously, as in the 2012 final rule and in EPA's Initial Determination, but the current balancing is called for in light of the facts before the agencies. The balancing in these final rules is also somewhat different from how the agencies balanced their respective considerations in the proposal, in part because of updates to analytical inputs and methodologies, previewed in the NPRM and made in response to public comments, that collectively resulted in changes to the analytical outputs. For example, between the notice and final rule, the agencies updated fuel price projections to somewhat greater values, updated the analysis fleet to MY 2017, updated estimates of the efficacy and cost of fuel-saving technologies, revised procedures for calculating impacts on vehicle sales and scrappage, updated models for estimating highway safety impacts, updated estimates of highway congestion costs, and updated estimates of annual mileage accumulation, holding VMT (before applying the rebound effect) constant between regulatory alternative. Moreover, the cost-benefit analysis conducted for these final rules has even been overtaken by

events in many ways over recent weeks. Based upon current events, and for additional reasons discussed in Section VI.D.1 the benefits of saving additional fuel through more stringent standards are potentially even smaller than estimated in this rulemaking analysis.

The standards finalized today fit the pattern of gradual, tough, but feasible stringency increases that take into account real world performance, shifts in fuel prices, and changes in consumer behavior toward crossovers and SUVs and away from more efficient sedans. This approach ensures that manufacturers are provided with sufficient lead time to achieve standards, considering the cost of compliance. The costs to both industry and automotive consumers would have been too high under the standards set forth in 2012, and by lowering the auto industry's costs to comply with the program, with a commensurate reduction in per-vehicle costs to consumers, the standards enhance the ability of the fleet to turn over to newer, cleaner and safer vehicles.

More stringent standards also have the potential for overly aggressive penetration rates for advanced technologies relative to the penetration rates seen in the final standards, especially in the face of an unknown degree of consumer acceptance of both the increased costs and of the technologies themselves—particularly given current projections of relatively low fuel prices during that timeframe. As a kind of insurance policy against future fuel price volatility, standards that increase at 1.5 percent per year for cars and trucks will help to keep fleet fuel economy higher than they would be otherwise when fuel prices are low, which is not improbable over the next several years.⁵ At the same time, the standards help to address these issues by maintaining incentives to promote broader deployment of advanced technologies, and so provides a means of encouraging their further penetration while leaving manufacturers alternative technology choices. Steady, gradual increases in stringency ensure that the benefits of reduced GHG emissions and fuel consumption are achieved without

the potential for disruption to automakers or consumers.

Standards that increase at 1.5 percent per year represent a reasonable balance of additional technology and required per-vehicle costs, consumer demand for fuel economy, fuel savings and emissions avoided given the foreseeable state of the global oil market and the minimal effect on climate between finalizing 1.5 percent standards versus more stringent standards. The final standards will also result in year-over-year improvements in fleetwide fuel economy, resulting in energy conservation that helps address environmental concerns, including criteria pollutant, air toxic pollutant, and carbon emissions.

The agencies project that under these final standards, required technology costs would be reduced by \$86 to \$126 billion over the lifetimes of vehicles through MY 2029. Equally important, purchase prices costs to U.S. consumers for new vehicles would be \$977 to \$1,083 lower, on average, than they would have been if the agencies had retained the standards set forth in the 2012 final rule and originally upheld by EPA in January 2017. While these final standards are estimated to result in 1.9 to 2.0 additional billion barrels of fuel consumed and from 867 to 923 additional million metric tons of CO₂ as compared to current estimates of what the standards set forth in 2012 would require, the agencies explain at length below why the overall benefits of the final standards outweigh these additional costs.⁶

For the CAFE program, overall (fleetwide) net benefits vary from \$16.1 billion at a 7 percent discount rate to –\$13.1 billion at a 3 percent discount rate. For the CO₂ program, overall (fleetwide) societal net benefits vary from \$6.4 billion at a 7 percent discount rate to –\$22.0 billion at a 3 percent discount rate. The net benefits straddle zero, and are very small relative to the scale of reduced required technology costs, which range from \$86.3 billion to \$126.0 billion for the CAFE and CO₂ programs across 7 percent and 3 percent discount rates. Likewise, net benefits are very small relative to the scale of reduced retail fuel savings over the full life of all vehicles manufactured during the 2021 through 2029 model years, which range from \$108.6 billion to \$185.1 billion for the CAFE and CO₂ programs across 7 percent and 3 percent discount rates. Similarly, all of the alternatives have small net benefits, ranging from \$18.4 billion to –\$31.1

⁵ For example, EIA currently expects U.S. retail gasoline prices to average \$2.14/gallon in 2020, compared to \$2.69/gallon in 2019 (see <https://www.eia.gov/outlooks/steo/archives/mar20.pdf>), and \$3.68/gallon in 2012 (see https://www.eia.gov/dnav/pet/hist/LeafHandler.ashx?n=PET&s=EMM_EPM0_PTE_NUS_DPG&f=A). While gasoline prices may foreseeably rise over the rulemaking time frame, it is also very foreseeable that they will not rise to the \$4–5/gallon that many Americans saw over the 2008–2009 time frame, that caused the largest shift seen toward smaller and higher-fuel-economy vehicles. See, e.g., Figure VIII–2 below.

⁶ 1.9 to 2.0 barrels of fuel is approximately 78 to 84 gallons of fuel.

billion for the CAFE and CO₂ programs across 7 percent and 3 percent discount rates.⁷

NHTSA and EPA believe their analysis of the final rule represents the best available science, evidence, and methodologies for assessing the impacts of changes in CAFE and CO₂ emission standards. In fact, the agencies note that today's analysis represents a marked improvement over prior rulemakings. Previously, the agencies were unable to model the impact of the standards on new vehicle sales or the retirement of older vehicles in the fleet, and, instead, were forced to assume, contrary to economic theory and empirical evidence, that the number of new vehicles sold and older vehicles scrapped remained static across regulatory alternatives. Today's analysis—as commenters to previous rulemakings and EPA's Science Advisory Board have argued is necessary⁸—quantifies the sales and scrappage impacts of the standards, including the associated safety benefits, and represents a significant step forward in agencies' ability to comprehensively analyze the impacts of CAFE and CO₂ emission standards.

However, the agencies also believe it is important to be transparent about analytical limitations. For example, EPA's Science Advisory Board stressed that the agencies account for “evolving consumer preferences for performance and other vehicle attributes,”⁹ yet due to limitations on the agencies' current ability to model buyers' choices among combinations of various attributes and their costs, the primary analysis does not account for the consumer benefits of other vehicle features that may be sacrificed for costly technologies that improve fuel economy. The agencies' analysis assumes that under these final standards, attributes of new cars and light trucks other than fuel economy would remain identical to those under the baseline standards, so that changes in sales prices and fuel economy would be the only sources of benefits or costs to new car and light truck buyers. In other words, the agencies' primary analysis does not consider that producers will likely respond to buyers' demands by reallocating some their savings in production costs due to lower technology costs to add or improve

other attributes that consumers value more highly than the increases in fuel economy the augural standards would have required. The agencies have long debated whether and how best to model the consumer benefits of other vehicle attributes, and note that they have made considerable progress.¹⁰ However, despite these potential analytical shortcomings, the agencies reaffirm that today's analysis represents the most complete and rigorous examination of CAFE and CO₂ emission standards to date, and provide decision-makers a powerful analytical tool—especially since the limitations are known, do not bias the central analysis' results, and are afforded due consideration.

In terms of the agencies' respective statutory authorities, EPA is setting national tailpipe CO₂ emissions standards for passenger cars and light trucks under section 202(a) of the Clean Air Act (CAA),¹¹ and taking other

¹⁰ In their evaluations of previous CAFE and CO₂ rules, the agencies attempted to account for this possibility by conducting sensitivity analyses that reduced the fuel savings and other benefits to vehicle buyers by a significant fraction. For example, NHTSA's analysis supporting the Final Rule establishing CAFE standards for model year 2012–16 cars and light trucks tested the sensitivity of their central estimates of social costs and benefits to the assumptions that 25 percent and 50 percent of benefits to buyers were offset by opportunity costs of foregone improvements in attributes other than fuel economy; see NHTSA, *Final Regulatory Impact Analysis: Corporate Average Fuel Economy for Model year 2012–16 Passenger Cars and Light Trucks*, March 2010, at 563–565 and Table X–9, at 566–56; see also, NHTSA, *Final Regulatory Impact Analysis: Corporate Average Fuel Economy for Model year 2017–25 Passenger Cars and Light Trucks*, August 2012, at 1087 and Tables X–18a, X–18b, and X–18c, at 1099–1104. The agencies acknowledged that this was not a completely satisfactory way to represent the sacrifices in vehicles' other attributes that car and light truck manufacturers might find it necessary to make in order to comply with the increasingly stringent standards those previous rules established. At the time, however, the agencies were unable to identify specific attributes that manufacturers were most likely to sacrifice, measure the tradeoffs between increased fuel economy and improvements in those attributes, or assess the potential losses in utility to car and light truck buyers. In an effort to improve on their previous treatment of this issue, the agencies' evaluation of this final rule includes a sensitivity case that assumes manufacturers redirect their technology cost savings from complying with less stringent standards to instead improve a combination of cars' and light trucks' other attributes that offers benefits to their buyers significantly exceeding those costs. The magnitude of these (net) benefits is interpreted as the opportunity cost of the improvements in vehicles' other attributes that would have been sacrificed if the augural standards had been enacted. The method the agencies use to approximate these benefits, together with its effect on the rule's overall benefits and costs, is discussed in detail in Section VI.D.1.b)(8). Briefly, the results of this sensitivity analysis suggest the Final Rule would generate net benefits for the CAFE and CO₂ programs ranging from \$34.9 to \$55.4 billion at 3% and 7% discount rates.

¹¹ 42 U.S.C. 7521(a).

actions under its authority to establish metrics and measure passenger car and light truck fleet fuel economy pursuant to the Energy Policy and Conservation Act (EPCA),¹² while NHTSA is setting national corporate average fuel economy (CAFE) standards under EPCA, as amended by the Energy Independence and Security Act (EISA) of 2007.¹³ As summarized above and as discussed in much greater detail below, the agencies believe that these represent appropriate levels of CO₂ emissions standards and maximum feasible CAFE standards for MYs 2021–2026, pursuant to their respective statutory authorities. Sections III and VIII below contain detailed discussions of both agencies' statutory obligations and authorities.

Section 202(a) of the CAA requires EPA to establish standards for emissions of pollutants from new motor vehicles that cause or contribute to air pollution that may reasonably be anticipated to endanger public health or welfare. Standards under section 202(a) thus take effect only “after providing such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period.”¹⁴ In establishing such standards, EPA must consider issues of technical feasibility, cost, and available lead time, among other things.

EPCA, as amended by EISA, contains a number of provisions governing how NHTSA must set CAFE standards. EPCA requires that the Department of Transportation establish separate passenger car and light truck standards¹⁵ at “the maximum feasible average fuel economy level that the Secretary decides the manufacturers can achieve in that model year,”¹⁶ based on the agency's consideration of four statutory factors: technological feasibility, economic practicability, the effect of other standards of the Government on fuel economy, and the need of the United States to conserve energy.¹⁷ EPCA does not define these terms or specify what weight to give each concern in balancing them—such considerations are left within the discretion of the Secretary of Transportation (delegated to NHTSA) based upon current information. Accordingly, NHTSA interprets these factors and determines the appropriate weighting that leads to the maximum

⁷ See Table II–12 to Table II–15 for costs, benefits and net benefits.

feasible standards given the circumstances present at the time of promulgating each CAFE standard rulemaking. While EISA, for MYs 2011–2020, additionally required that standards increase “ratably” and be set at levels to ensure that the CAFE of the industry-wide combined fleet of new passenger cars and light trucks reach at least 35 mpg by MY 2020,¹⁸ EISA requires that standards for MYs 2021–2030 simply be set at the maximum feasible level as determined by the Secretary (and by delegation, NHTSA).¹⁹

In the NPRM, the agencies sought comment on a variety of possible changes to existing compliance flexibilities that have been created over the past several years. The vast majority of the existing compliance flexibilities are not being changed, but a small number of flexibilities related to real-world fuel efficiency improvements are being finalized. In addition, EPA will continue to allow manufacturers to make improvements relating to air conditioning refrigerants and leakage and will credit those improvements toward CO₂ compliance, and EPA is making no changes in the amounts of credits available. EPA is also not making any changes to the existing CH₄ and

N₂O standards. EPA is also extending the “0 g/mi upstream” incentive for electric vehicles beyond its current sunset of MY 2021, through MY 2026. EPA is also establishing a credit multiplier for natural gas vehicles through the 2026 model year. Otherwise, compliance flexibilities in the two programs do not change significantly for the final rule. These changes should help to streamline manufacturer use of those flexibilities in certain respects. While manufacturers and suppliers sought a number of other additional compliance flexibilities, the agencies have concluded that the aforementioned existing flexibilities are reasonable and appropriate, and that additional flexibilities are not justified.

Table I–1 and Table I–2 present the total costs, benefits, and net benefits for the 2021–2026 preferred alternative CAFE and CO₂ levels, relative to the MY 2022–2025 existing/average standards (with the MY 2025 standards repeated for MY 2026) and current MY 2021 standard. The preferred alternative exhibits a stringency rate increase of 1.5 percent per year for both passenger cars and light trucks. The values in Table I–1 and Table I–2 display (in total and annualized forms) costs for all MYs 1978–2029 vehicles, and the benefits

and net benefits represent the impacts of the standards over the full lifetimes of the vehicles sold or projected to be sold during model years 1978–2029.

For this analysis, negative signs are used for changes in costs or benefits that decrease from those that would have resulted from the existing/average standards. Any changes that would increase either costs or benefits are shown as positive changes. Thus, an alternative that decreases both costs and benefits, will show declines (*i.e.*, a negative sign) in both categories. From Table I–1 and Table I–2, the preferred alternative (Alternative 3) is estimated to decrease costs relative to the baseline by \$182 to \$280 billion over the lifetime of MYs 1978–2029 passenger vehicles (range determined by discount rate across both CAFE and CO₂ programs). It will also decrease benefits from \$175 to \$294 billion over the life of these MY fleets. The net impact will be a decrease from \$22 billion to an increase of \$16 billion in total net benefits to society over this roughly 52-year timeframe. Annualized, this amounts to roughly –\$0.8 to 1.2 billion in net benefits per year.

| All Injuries (MAIS 1-5) | -388,000 |
| Property Damaged Vehicles | -1,834,000 |

BILLING CODE 4910-59-C

The agencies note that the NPRM drew more public comments (and, particularly, more pages of substantive comments) than any rulemaking in the history of the CAFE or CO₂ tailpipe emissions programs—exceeding 750,000 comments. The agencies recognized in the NPRM that the proposal was significantly different from the final rules set forth in 2012, and explained at length the reasons for those differences—namely, that new information and considerations, along with an expanded and updated analysis,

had led to different tentative conclusions. Today's final rules represent a further evolution of the work that supported the proposal, based on improved quantitative methodology and in careful consideration of the hundreds of thousands of public comments and deep reflection on the serious issues before the agencies. Simply put, the agencies have heard the comments, and today's analysis and decision reflect the agencies' grappling with the issues commenters raised, as well as all of the other information before the agencies.

These programs and issues are weighty, and the agencies believe that a reasonable balance has been struck in these final rules between the many competing national needs that these regulatory programs collectively address.

II. Overview of Final Rule**A. Summary of Proposal**

In the NPRM, the National Highway Traffic Safety Administration (NHTSA) and the Environmental Protection Agency (EPA) (collectively, "the

agencies”) proposed the “Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021–2026 Passenger Cars and Light Trucks” (SAFE Vehicles Rule). The proposed SAFE Vehicles Rule would set Corporate Average Fuel Economy (CAFE) and carbon dioxide (CO₂) emissions standards, respectively, for passenger cars and light trucks manufactured for sale in the United States in model years (MYs) 2021 through 2026.²⁰

The agencies explained that they must act to propose and finalize these standards and do not have discretion to decline to regulate. Congress requires NHTSA to set CAFE standards for each model year.²¹ Congress also requires EPA to set emissions standards for light-duty vehicles if EPA has made an “endangerment finding” that the pollutant in question—in this case, CO₂—“cause[s] or contribute[s] to air pollution which may reasonably be anticipated to endanger public health or welfare.”²² NHTSA and EPA proposed the standards concurrently because tailpipe CO₂ emissions standards are directly and inherently related to fuel economy standards,²³ and, if finalized, the rules would apply concurrently to the same fleet of vehicles. By working together to develop the proposals, the

agencies aimed to reduce regulatory burden on industry and improve administrative efficiency.

The agencies discussed some of the history leading to the proposal, including the 2012 final rule, the expectations regarding a mid-term evaluation as required by EPA regulation, and the rapid process over 2016 and early 2017 by which EPA issued its first Final Determination that the CO₂ standards set in 2012 for MYs 2022–2025 remained appropriate based on the information then before the EPA Administrator.²⁴ The agencies also discussed President Trump’s direction in March 2017 to restore the original mid-term evaluation timeline, and EPA’s subsequent information-gathering process and announcement that it would reconsider the January 2017 Determination.²⁵ EPA ultimately concluded that the standards set in 2012 for MYs 2022–2025 were no longer appropriate.²⁶ For NHTSA, in turn, the “augural” CAFE standards for MYs 2022–2025 were never final, and as explained in the 2012 final rule, NHTSA was obligated from the beginning to undertake a new rulemaking to set CAFE standards for MYs 2022–2025.

The NPRM thus began the rulemaking process for both agencies to establish new standards for MYs 2022–2025 passenger cars and light trucks. Standards were concurrently proposed for MY 2026 in order to provide regulatory stability for as many years as is legally permissible for both agencies together. The NPRM also included revised standards for MY 2021 passenger cars and light trucks, because the agencies tentatively concluded, based on the information and analysis then before them, that the CAFE standards previously set for MY 2021 were no longer maximum feasible, and the CO₂ standards previously set for MY 2021 were no longer appropriate. Agencies always have authority under the Administrative Procedure Act to revisit previous decisions in light of new facts, as long as they provide notice and an opportunity for comment, and the agencies stated that it is plainly the best practice to do so when changed circumstances so warrant.²⁷

The NPRM proposed to maintain the CAFE and CO₂ standards applicable in MY 2020 for MYs 2021–2026, and took comment on a wide range of alternatives, including different stringencies and retaining existing CO₂ standards and the augural CAFE standards.²⁸ Table II–1, Table II–2, and Table II–3 show the estimates, under the NPRM analysis, of what the MY 2020 CAFE and CO₂ curves would translate to, in terms of miles per gallon (mpg) and grams per mile (g/mi), in MYs 2021–2026, as well as the regulatory alternatives considered in the NPRM. In addition to retaining the MY 2020 CO₂ standards through MY 2026, EPA proposed and sought comment on excluding air conditioning refrigerants and leakage, and nitrous oxide and methane emissions for compliance with CO₂ standards after model year 2020, in order to improve harmonization with the CAFE program. EPA also sought comment on whether to change existing methane and nitrous oxide standards that were finalized in the 2012 rule. The proposal was accompanied by a 1,600 page Preliminary Regulatory Impact Analysis (PRIA) and, for NHTSA, a 500 page Draft Environmental Impact Statement (DEIS), with more than 800 pages of appendices and the entire CAFE model, including the software source code and documentation, all of which were also subject to comment in their entirety and all of which received significant comments.

BILLING CODE 4910–59–P

²⁸ The agencies noted that this did not mean that the miles per gallon and grams per mile levels that were estimated for the MY 2020 fleet in 2012 would be the “standards” going forward into MYs 2021–2026. Both NHTSA and EPA set CAFE and CO₂ standards, respectively, as mathematical functions based on vehicle footprint. These mathematical functions that are the actual standards are defined as “curves” that are separate for passenger cars and light trucks, under which each vehicle manufacturer’s compliance obligation varies depending on the footprints of the cars and trucks that it ultimately produces for sale in a given model year. It was the MY 2020 CAFE and CO₂ curves that the agencies proposed would continue to apply to the passenger car and light truck fleets for MYs 2021–2026. The mpg and g/mi values which those curves would eventually require of the fleets in those model years would be known for certain only at the ends of each of those model years. While it is convenient to discuss CAFE and CO₂ standards as a set “mpg,” “g/mi,” or “mpg-e” number, attempting to define those values based on the information then before the agency would necessarily end up being inaccurate.

²⁰ NHTSA sets CAFE standards under the Energy Policy and Conservation Act of 1975 (EPCA), as amended by the Energy Independence and Security Act of 2007 (EISA). EPA sets CO₂ standards under the Clean Air Act (CAA).

²³ *See, e.g.*, 75 FR 25324, at 25327 (May 7, 2010) (“The National Program is both needed and possible because the relationship between improving fuel economy and reducing tailpipe CO₂ emissions is a very direct and close one. The amount of those CO₂ emissions is essentially constant per gallon combusted of a given type of fuel. Thus, the more fuel efficient a vehicle is, the less fuel it burns to travel a given distance. The less fuel it burns, the less CO₂ it emits in traveling that distance. [citation omitted] While there are emission control technologies that reduce the pollutants (*e.g.*, carbon monoxide) produced by imperfect combustion of fuel by capturing or converting them to other compounds, there is no such technology for CO₂. Further, while some of those pollutants can also be reduced by achieving a more complete combustion of fuel, doing so only increases the tailpipe emissions of CO₂. Thus, there is a single pool of technologies for addressing these twin problems, *i.e.*, those that reduce fuel consumption and thereby reduce CO₂ emissions as well.”).

| 2026 | 37.0 | 240 |

Table II-4 – Regulatory Alternatives Considered in NPRM

| Alternative | Change in stringency | A/C efficiency and off-cycle provisions | CO ₂ Equivalent AC Refrigerant Leakage, Nitrous Oxide and Methane Emissions Included for Compliance? |
|------------------------|---|---|---|
| Baseline/ No-Action | MY 2021 standards remain in place; MYs 2022-2025 augural CAFE standards are finalized and CO ₂ standards remain unchanged; MY 2026 standards are set at MY 2025 levels | No change | Yes, for all MYs ²⁹ |
| 1 (Proposed) | Existing standards through MY 2020, then 0%/year increases for both passenger cars and light trucks, for MYs 2021-2026 | No change | No, beginning in MY 2021 ³⁰ |

²⁹ The carbon dioxide equivalents of air conditioning refrigerant leakage, nitrous oxide emissions, and methane emissions were included for compliance with the EPA standards for all MYs under the baseline/no action alternative in the

NPRM. Carbon dioxide equivalent is calculated using the Global Warming Potential (GWP) of each of the emissions.

³⁰ Beginning in MY 2021, the proposal provided that the GWP equivalents of air conditioning

refrigerant leakage, nitrous oxide emissions, and methane emissions would no longer be able to be included with the tailpipe CO₂ for compliance with tailpipe CO₂ standards.

| Alternative | Change in stringency | A/C efficiency and off-cycle provisions | CO ₂ Equivalent AC Refrigerant Leakage, Nitrous Oxide and Methane Emissions Included for Compliance? |
|-------------|---|--|---|
| 2 | Existing standards through MY 2020, then 0.5%/year increases for both passenger cars and light trucks, for MYs 2021-2026 | No change | No, beginning in MY 2021 |
| 3 | Existing standards through MY 2020, then 0.5%/year increases for both passenger cars and light trucks, for MYs 2021-2026 | Phase out these adjustments over MYs 2022-2026 | No, beginning in MY 2021 |
| 4 | Existing standards through MY 2020, then 1%/year increases for passenger cars and 2%/year increases for light trucks, for MYs 2021-2026 | No change | No, beginning in MY 2021 |
| 5 | Existing standards through MY 2021, then 1%/year increases for passenger cars and 2%/year increases for light trucks, for MYs 2022-2026 | No change | No, beginning in MY 2022 |
| 6 | Existing standards through MY 2020, then 2%/year increases for passenger cars and 3%/year increases for light trucks, for MYs 2021-2026 | No change | No, beginning in MY 2021 |
| 7 | Existing standards through MY 2020, then 2%/year increases for passenger cars and 3%/year increases for light trucks, for MYs 2021-2026 | Phase out these adjustments over MYs 2022-2026 | No, beginning in MY 2021 |
| 8 | Existing standards through MY 2021, then 2%/year increases for passenger cars and 3%/year increases for light trucks, for MYs 2022-2026 | No change | No, beginning in MY 2022 |

BILLING CODE 4910-59-C

The agencies explained in the NPRM that new information had been gathered and new analysis performed since publication of the 2012 final rule establishing CAFE and CO₂ standards for MYs 2017 and beyond and since issuance of the 2016 Draft TAR and EPA's 2016 and early 2017 "mid-term evaluation" process. This new information and analysis helped lead the agencies to the tentative conclusion that holding standards constant at MY 2020 levels through MY 2026 was maximum feasible, for CAFE purposes, and appropriate, for CO₂ purposes.

The agencies further explained that technologies had played out differently in the fleet from what the agencies previously assumed: That while there remain a wide variety of technologies available to improve fuel economy and reduce CO₂ emissions, it had become clear that there were reasons to temper previous optimism about the costs, effectiveness, and consumer acceptance of a number of technologies. In addition, over the years between the previous analyses and the NPRM, automakers

had added considerable amounts of technologies to their new vehicle fleets, meaning that the agencies were no longer free to make certain assumptions about how some of those technologies *could* be used going forward. For example, some technologies that could be used to improve fuel economy and reduce emissions had not been used entirely for that purpose, and some of the benefit of these technologies had gone instead toward improving other vehicle attributes. Other technologies had been tried, and had been met with significant customer acceptance issues. The agencies underscored the importance of reflecting the fleet as it stands today, with the technology it has and as that technology has been used, and considering what technology remains on the table at this point, whether and when it can realistically be available for widespread use in production, and how much it would cost to implement.

The agencies also acknowledged the math of diminishing returns: As CAFE and CO₂ emissions standards increase in stringency, the benefit of continuing to

increase in stringency decreases. In mpg terms, a vehicle owner who drives a light vehicle 15,000 miles per year (a typical assumption for analytical purposes)³¹ and trades in a vehicle with fuel economy of 15 mpg for one with fuel economy of 20 mpg, will reduce their annual fuel consumption from 1,000 gallons to 750 gallons—saving 250 gallons annually. If, however, that owner were to trade in a vehicle with fuel economy of 30 mpg for one with fuel economy of 40 mpg, the owner's annual gasoline consumption would drop from 500 gallons/year to 375 gallons/year—only 125 gallons even though the mpg improvement is twice as large. Going from 40 to 50 mpg would save only 75 gallons/year. Yet each additional fuel economy improvement becomes much more expensive as the easiest to achieve low-cost technological improvement options are chosen. In CO₂ terms, if a vehicle emits 300 g/mi CO₂,

³¹ A different vehicle-miles-traveled (VMT) assumption would change the absolute numbers in the example, but would not change the mathematical principles.

a 20 percent improvement is 60 g/mi, so the vehicle would emit 240 g/mi; but if the vehicle emits 180 g/mi, a 20 percent improvement is only 36 g/mi, so the vehicle would get 144 g/mi. In order to continue achieving similarly large (on an absolute basis) emissions reductions, the percentage reduction must also continue to increase.

Related, average real-world fuel economy is lower than average fuel economy required under CAFE and CO₂ standards. The 2012 **Federal Register** notice announcing augural CAFE and CO₂ standards extending through MY 2025 indicated that, if met entirely through the application of fuel-saving technology, the MY 2025 CO₂ standards would result in an average requirement equivalent to 54.5 mpg. However,

because the CO₂ standards provide credit for reducing leakage of AC refrigerants and/or switching to lower-GWP refrigerants, and these actions do not affect fuel economy, the notice explained that the corresponding fuel economy requirement (under the CAFE program) would be 49.7 mpg. These estimates were based on a market forecast grounded in the MY 2008 fleet. The notice also presented analysis using a market forecast grounded in the MY 2010 fleet, showing a 48.7 mpg average CAFE requirement.

In the real world, fuel economy is, on average, about 20% lower than as measured under regulatory test procedures. In the real world, then, these new standards were estimated to require 39.0–39.8 mpg.

Today's analysis indicates that the requirements under the baseline/augural CAFE standards would average 46.6 mpg in MY 2029. The lower value results from changes in the fleet forecast which reflects consumer preference for larger vehicles than was forecast for the 2012 rulemaking. In the real world, the requirements average about 37.1 mpg. Under the final standards issued today, the regulatory test procedure requirements average 40.5 mpg, corresponding to 33.2 mpg in the real world. Buyers of new vehicles experience real-world fuel economy, with levels varying among drivers (due to a wide range of factors). Vehicle fuel economy labels provide average real-world fuel economy information to buyers.

Table II-5 – Estimated Average Required CAFE and CO₂ Levels

| | 2012 Final Rule | | Current Analysis | |
|--|--|--|------------------|----------------|
| | Augural, MY 2025 (2008-Based Fleet) | Augural, MY 2025 (2010-Based Fleet) | Augural, MY 2029 | Final, MY 2029 |
| CO₂ Standards | | | | |
| grams/mile CO ₂ | 163 | 166 | 175 | 202 |
| equivalent mpg (if met solely with FE technology) | 54.5 | 53.5 | 50.8 | 44.1 |
| CAFE Standards | | | | |
| mpg with AC efficiency and other off-cycle adjustments | 49.7 | 48.7 | 46.6 | 40.5 |
| estimated real-world mpg | 39.8 | 39.0 | 37.1 | 33.2 |

Vehicle owners also face fuel prices at the pump. The agencies noted in the NPRM that when fuel prices are high, the value of fuel saved may be enough to offset the cost of further fuel economy/emissions reduction improvements, but the agencies recognized that then-current projections of fuel prices by the Energy Information Administration did not indicate particularly high fuel prices in the foreseeable future. The agencies explained that fundamental structural shifts had occurred in global oil markets since the 2012 final rule, largely due to the rise of U.S. production and export

of shale oil. The consequence over time of diminishing returns from more stringent fuel economy/emissions reduction standards, especially when combined with relatively low fuel prices, is greater difficulty for automakers to find a market of consumers willing to buy vehicles that meet the increasingly stringent standards. American consumers have long demonstrated that in times of relatively low fuel prices, fuel economy is not a top priority for the majority of them, even when highly fuel efficient vehicle models are available.

The NPRM analysis sought to improve how the agencies captured the effects of higher new vehicle prices on fleet composition as a whole by including an improved model for vehicle scrappage rates. As new vehicle prices increase, consumers tend to continue using older vehicles for longer, slowing fleet turnover and thus slowing improvements in fleet-wide fuel economy, reductions in CO₂ emissions, reductions in criteria pollutant emissions, and advances in safety. That aspect of the analysis was also driven by the agencies' updated estimates of average per-vehicle cost increases due to

higher standards, which were several hundred dollars higher than previously estimated. The agencies cited growing concerns about affordability and negative equity for many consumers under these circumstances, as loan amounts grow and loan terms extend.

For all of the above reasons, the agencies proposed to maintain the MY 2020 fuel economy and CO₂ emissions standards for MYs 2021–2026. The agencies explained that they estimated, relative to the standards for MYs 2021–2026 put forth in 2012, that an additional 0.5 million barrels of oil would be consumed per day (about 2 to 3 percent of projected U.S. consumption) if that proposal were finalized, but that they also expected the additional fuel costs to be outweighed by the cost savings from new vehicle purchases; that more than 12,700 on-road fatalities and significantly more injuries would be prevented over the lifetimes of vehicles through MY 2029 as compared to the standards set forth in the 2012 final rule over the lifetimes of vehicles as more new and safer vehicles are purchased than the current (and augural) standards; and that environmental impacts, on net, would be relatively minor, with criteria and toxic air pollutants not changing noticeably, and with estimated atmospheric CO₂ concentrations increasing by 0.65 ppm (a 0.08 percent increase), which the agencies estimated would translate to 0.003 degrees Celsius of additional temperature increase relative to the standards finalized in 2012.

Under the NPRM analysis, the agencies tentatively concluded that maintaining the MY 2020 curves for MYs 2021–2026 would save American auto consumers, the auto industry, and the public a considerable amount of money as compared to EPA retaining the previously-set CO₂ standards and NHTSA finalizing the augural standards. The agencies explained that this had been identified as the preferred alternative, in part, because it appeared to maximize net benefits compared to the other alternatives analyzed, and recognizing the statutory considerations for both agencies. Relative to the standards issued in 2012, under CAFE standards, the NPRM analysis estimated that costs would decrease by \$502 billion overall at a three-percent discount rate (\$335 billion at a seven-percent discount rate) and benefits were estimated to decrease by \$326 billion at a three-percent discount rate (\$204 billion at a seven-percent discount rate). Thus, net benefits were estimated to increase by \$176 billion at a three-percent discount rate and \$132 billion at

a seven-percent discount rate. The estimated impacts under CO₂ standards were estimated to be similar, with net benefits estimated to increase by \$201 billion at a three-percent discount rate and \$141 billion at a seven-percent discount rate.

The NPRM also sought comment on a variety of potential changes to NHTSA's and EPA's compliance programs for CAFE and CO₂ as well as related programs, including questions about automaker requests for additional flexibilities and agency interest in reducing market-distorting incentives and improving transparency; and on a proposal to withdraw California's CAA preemption waiver for its "Advanced Clean Car" regulations, with an accompanying discussion of preemption of State standards under EPCA.³² The agencies sought comment broadly on all aspects of the proposal.

B. Public Participation Opportunities and Summary of Comments

The NPRM was published on NHTSA's and EPA's websites on August 2, 2018, and published in the **Federal Register** on August 24, 2018, beginning a 60-day comment period. The agencies subsequently extended the official comment period for an additional three days, and left the dockets open for more than a year after the start of the comment period, considering late comments to the extent practicable. A separate **Federal Register** notice also published on August 24, 2018, which announced the locations, dates, and times of three public hearings to be held on the proposal: One in Fresno, California, on September 24, 2018; one in Dearborn, Michigan, on September 25, 2018; and one in Pittsburgh, Pennsylvania, on September 26, 2018. Each hearing started at 10 a.m. local time; the Fresno hearing ended at 5:10 p.m. and resulted in a 235 page transcript; the Dearborn hearing ran until 5:26 p.m. and resulted in a 330 page transcript; and the Pittsburgh hearing ran until 5:06 p.m. and also resulted in a 330 page transcript. Each hearing also collected several hundred pages of comments from participants, in addition to the hearing transcripts.

Besides the comments submitted as part of the public hearings, NHTSA's docket received a total of 173,359 public comments in response to the proposal as of September 18, 2019, and EPA's docket a total of 618,647 public comments, for an overall total of

792,006. NHTSA also received several hundred comments on its DEIS to the separate DEIS docket. While the majority of individual comments were form letters, the agencies received over 6,000 pages of substantive comments on the proposal.

Many commenters generally supported the proposal and many commenters opposed it. Commenters supporting the proposal tended to cite concerns about the cost of new vehicles, while commenters opposing the proposal tended to cite concerns about additional fuel expenditures and the impact on climate change. Many comments addressed the modeling used for the analysis, and specifically the inclusion, operation, and results of the sales and scrappage modules that were part of the NPRM's analysis, while many addressed the NPRM's safety findings and the role that those findings played in the proposal's justification. Many other comments addressed California's standards and role in Federal decision-making; as discussed above, those comments are further summarized and responded to in the separate **Federal Register** notice published in September 2019. Nearly every aspect of the NPRM's analysis and discussion received some level of comment by at least one commenter. The comments received, as a whole, were both broad and deep, and the agencies appreciate the level of engagement of commenters in the public comment process and the information and opinions provided.

C. Changes in Light of Public Comments and New Information

The agencies made a number of changes to the analysis between the NPRM and the final rule in response to public comments and new information that was received in those comments or otherwise became available to the agencies. While these changes, their rationales, and their effects are discussed in detail in the sections below, the following represents a high-level list of some of the most significant changes:

- Some regulatory alternatives were dropped from consideration, and one was added;
- updated analysis fleet, and changes to technologies on "baseline" vehicles within the fleet to reflect better their current properties and improve modeling precision;
- no civil penalties assumed to be paid after MY 2020 under CAFE program;
- updates and expansions in accounting for certain over-compliance

³² Agency actions relating to California's CAA waiver and EPCA preemption have since been finalized, *see* 84 FR 51310 (Sept. 27, 2019), and will not be discussed in great detail as part of this final rule.

credits, including early credits earned in EPA's program;

- updates and expansions to CAFE Model's technology paths;
- updates to inputs defining the range of manufacturer-, technology-, and product-specific constraints;
- updates to allow the model to adopt a more advanced technology if it is more cost-effective than an earlier technology on the path;
- precision improvements to the modeling of A/C efficiency and off-cycle credits;
- updates to model's "effective cost" metric;
- extended explicit simulation of technology application through MY 2050;
- expanded presentation of the results to include "calendar year" analysis;
- quantifying different types of health impacts from changes in air pollution, rather than only accounting for such impacts in aggregate estimates of the social costs of air pollution;
- updated costs to 2018 dollars;

- updated fuel costs based on the AEO 2019 version of NEMS;
- a variety of technology updates in response to comments and new information;
- updated accounting of rebound VMT between regulatory alternatives;
- updated estimates of the macroeconomic cost of petroleum dependence;
- updated response of total new vehicle sales to increases in fuel efficiency and price; and
- updated response of vehicle retirement rates to changes in new vehicle fuel efficiency and transaction price.

Sections IV and VI below discuss these updates in significant detail.

D. Final Standards—Stringency

As explained above, the agencies have chosen to set CAFE and CO₂ standards that increase in stringency by 1.5 percent year over year for MYs 2021–2026. Separately, EPA has decided to retain the A/C refrigerant and leakage and CH₄ and N₂O standards set forth in 2012 for MYs 2021 and beyond, and the

stringency of the CO₂ standards in this final rule reflect the "offset" also established in 2012 based on assumptions made at that time about anticipated HFC emissions reductions.

When the agencies state that stringency will increase at 1.5 percent per year, that means that the footprint curves which actually define the standards for CAFE and CO₂ emissions will become more stringent at 1.5 percent per year. Consistent with Congress's direction in EISA to set CAFE standards based on a mathematical formula, which EPA harmonized with for the CO₂ emissions standards, the standard curves are equations, which are slightly different for CAFE and CO₂, and within each program, slightly different for passenger cars and light trucks. Each program has a basic equation for a fleet standard, and then values that change to cause the stringency changes are the coefficients within the equations. For passenger cars, consistent with prior rulemakings, NHTSA is defining fuel economy targets as follows:

$$TARGET_{FE} = \frac{1}{MIN \left[MAX \left(c \times FOOTPRINT + d, \frac{1}{a} \right), \frac{1}{b} \right]}$$

where:

$TARGET_{FE}$ is the fuel economy target (in mpg) applicable to a specific vehicle model type with a unique footprint combination,

a is a minimum fuel economy target (in mpg),

b is a maximum fuel economy target (in mpg),

c is the slope (in gallons per mile per square foot, or gpm, per square foot) of a line relating fuel consumption (the inverse of fuel economy) to footprint, and

d is an intercept (in gpm) of the same line.

Here, MIN and MAX are functions that take the minimum and maximum

values, respectively, of the set of included values. For example, $MIN[40, 35] = 35$ and $MAX[40, 25] = 40$, such that $MIN[MAX(40, 25), 35] = 35$.

For light trucks, also consistent with prior rulemakings, NHTSA is defining fuel economy targets as follows:

$$TARGET_{FE} = MAX \left(\frac{1}{MIN \left[MAX \left(c \times FOOTPRINT + d, \frac{1}{a} \right), \frac{1}{b} \right]}, \frac{1}{MIN \left[MAX \left(g \times FOOTPRINT + h, \frac{1}{e} \right), \frac{1}{f} \right]} \right)$$

where:

$TARGET_{FE}$ is the fuel economy target (in mpg) applicable to a specific vehicle model type with a unique footprint combination,

a , b , c , and d are as for passenger cars, but taking values specific to light trucks,

e is a second minimum fuel economy target (in mpg),

f is a second maximum fuel economy target (in mpg),

g is the slope (in gpm per square foot) of a second line relating fuel consumption (the inverse of fuel economy) to footprint, and

h is an intercept (in gpm) of the same second line.

The final CAFE standards (described in terms of their footprint-based curves) are as follows, with the values for the coefficients changing over time:

Table II-6 – Final Standards – Passenger Cars

| | 2021 | 2022 | 2023 | 2024 | 2025 | 2026 |
|-----------------------------|----------|----------|----------|----------|----------|----------|
| Fuel Economy Targets | | | | | | |
| <i>a (mpg)</i> | 49.48 | 50.24 | 51.00 | 51.78 | 52.57 | 53.37 |
| <i>b (mpg)</i> | 37.02 | 37.59 | 38.16 | 38.74 | 39.33 | 39.93 |
| <i>c (gpm per s.f.)</i> | 0.000453 | 0.000447 | 0.000440 | 0.000433 | 0.000427 | 0.000420 |
| <i>d (gpm)</i> | 0.00162 | 0.00159 | 0.00157 | 0.00155 | 0.00152 | 0.00150 |

Table II-7 – Final Standards – Light Trucks

| | 2021 | 2022 | 2023 | 2024 | 2025 | 2026 |
|-----------------------------|----------|----------|----------|----------|----------|----------|
| Fuel Economy Targets | | | | | | |
| <i>a (mpg)</i> | 39.71 | 40.31 | 40.93 | 41.55 | 42.18 | 42.82 |
| <i>b (mpg)</i> | 25.63 | 26.02 | 26.42 | 26.82 | 27.23 | 27.64 |
| <i>c (gpm per s.f.)</i> | 0.000506 | 0.000499 | 0.000491 | 0.000484 | 0.000477 | 0.000469 |
| <i>d (gpm)</i> | 0.00443 | 0.00436 | 0.00429 | 0.00423 | 0.00417 | 0.00410 |

These equations are presented graphically below, where the x-axis represents vehicle footprint and the

y-axis represents fuel economy, showing that in the CAFE context, targets are higher (fuel economy) for smaller

footprint vehicles and lower for larger footprint vehicles:

BILLING CODE 4910-59-C

Figure II-1 – Passenger Car Fuel Economy Targets

Figure II-2 – Light Truck Fuel Economy Targets

BILLING CODE 4910–59–C

EPCA, as amended by EISA, requires that any manufacturer's domestically-manufactured passenger car fleet must meet the greater of either 27.5 mpg on average, or 92 percent of the average fuel economy projected by the Secretary for the combined domestic and non-

domestic passenger automobile fleets manufactured for sale in the U.S. by all manufacturers in the model year, which projection shall be published in the **Federal Register** when the standard for that model year is promulgated in accordance with 49 U.S.C. 32902(b).³³ Any time NHTSA establishes or changes

a passenger car standard for a model year, the MDPCS for that model year must also be evaluated or re-evaluated and established accordingly. Thus, this final rule establishes the applicable MDPCS for MYs 2021–2026. Table II–8 lists the minimum domestic passenger car standards.

Table II-8 – Minimum Standards for Domestic Passenger Car Fleets (mpg)

| 2021 | 2022 | 2023 | 2024 | 2025 | 2026 |
|------|------|------|------|------|------|
| 39.9 | 40.6 | 41.1 | 41.8 | 42.4 | 43.1 |

EPA CO₂ standards are as follows. Rather than expressing these standards as linear functions with accompanying minima and maxima, similar to the approach NHTSA has followed since 2005 in specifying attribute-based

standards, the following tables specify flat standards that apply below and above specified footprints, and a linear function that applies between those footprints. The two approaches are mathematically identical. For passenger

cars with a footprint of less than or equal to 41 square feet, the gram/mile CO₂ target value is selected for the appropriate model year from Table II–9:

³³ 49 U.S.C. 32902(b)(4).

Table II-9 – Final CO₂ Targets for Passenger Cars Smaller than 41 ft²

| Model year | CO₂ target value (grams/mile) |
|-------------------|---|
| 2012 | 244.0 |
| 2013 | 237.0 |
| 2014 | 228.0 |
| 2015 | 217.0 |
| 2016 | 206.0 |
| 2017 | 195.0 |
| 2018 | 185.0 |
| 2019 | 175.0 |
| 2020 | 166.0 |
| 2021 | 161.8 |
| 2022 | 159.0 |
| 2023 | 156.4 |
| 2024 | 153.7 |
| 2025 | 151.2 |
| 2026 and later | 148.6 |

For passenger cars with a footprint of greater than 56 square feet, the gram/mile CO₂ target value is selected for the

appropriate model year from Table II-10:

Table II-10 – Final CO₂ Targets for Passenger Cars Larger than 56 ft²

| Model year | CO₂ target value (grams/mile) |
|-------------------|---|
| 2012 | 315.0 |
| 2013 | 307.0 |
| 2014 | 299.0 |
| 2015 | 288.0 |
| 2016 | 277.0 |
| 2017 | 263.0 |
| 2018 | 250.0 |
| 2019 | 238.0 |
| 2020 | 226.0 |
| 2021 | 220.9 |
| 2022 | 217.3 |
| 2023 | 213.7 |
| 2024 | 210.2 |
| 2025 | 206.8 |
| 2026 and later | 203.4 |

For passenger cars with a footprint that is greater than 41 square feet and

less than or equal to 56 square feet, the gram/mile CO₂ target value is calculated

using the following equation and rounded to the nearest 0.1 grams/mile.

Target CO₂ = $[a \times f] + b$

Where f is the vehicle footprint and a and b are selected from Table II-11 for the appropriate model year:

Table II-11 – Final CO₂ Targets for Passenger Cars Between 41 and 58 ft²

| Model year | a | b |
|----------------|------|------|
| 2012 | 4.72 | 50.5 |
| 2013 | 4.72 | 43.3 |
| 2014 | 4.72 | 34.8 |
| 2015 | 4.72 | 23.4 |
| 2016 | 4.72 | 12.7 |
| 2017 | 4.53 | 8.9 |
| 2018 | 4.35 | 6.5 |
| 2019 | 4.17 | 4.2 |
| 2020 | 4.01 | 1.9 |
| 2021 | 3.94 | 0.2 |
| 2022 | 3.88 | -0.1 |
| 2023 | 3.82 | -0.4 |
| 2024 | 3.77 | -0.6 |
| 2025 | 3.71 | -0.9 |
| 2026 and later | 3.65 | -1.2 |

For light trucks with a footprint of less than or equal to 41 square feet, the gram/mile CO₂ target value is selected

for the appropriate model year from Table II-12:

Table II-12 – Final CO₂ Targets for Light Trucks Smaller than 41 ft²

| Model year | CO₂ target value (grams/mile) |
|-------------------|---|
| 2012 | 294.0 |
| 2013 | 284.0 |
| 2014 | 275.0 |
| 2015 | 261.0 |
| 2016 | 247.0 |
| 2017 | 238.0 |
| 2018 | 227.0 |
| 2019 | 220.0 |
| 2020 | 212.0 |
| 2021 | 206.5 |
| 2022 | 203.0 |
| 2023 | 199.6 |
| 2024 | 196.2 |
| 2025 | 193.2 |
| 2026 and later | 189.9 |

For light trucks with a footprint greater than the minimum value

specified in the table below for each model year, the gram/mile CO₂ target

value is selected for the appropriate model year from Table II-13:

Table II-13 – Final CO₂ Targets for Light Trucks Larger than the Indicated Minimum Footprint

| Model year | Minimum footprint | CO₂ target value (grams/mile) |
|-------------------|--------------------------|---|
| 2012 | 66.0 | 395.0 |
| 2013 | 66.0 | 385.0 |
| 2014 | 66.0 | 376.0 |
| 2015 | 66.0 | 362.0 |
| 2016 | 66.0 | 348.0 |
| 2017 | 66.0 | 347.0 |
| 2018 | 66.0 | 342.0 |
| 2019 | 66.4 | 339.0 |
| 2020 | 68.3 | 337.0 |
| 2021 | 68.3 | 329.4 |
| 2022 | 68.3 | 324.1 |
| 2023 | 68.3 | 318.9 |
| 2024 | 68.3 | 313.7 |
| 2025 | 68.3 | 308.7 |
| 2026 and later | 68.3 | 303.7 |

For light trucks with a footprint that is greater than 41 square feet and less than or equal to the maximum footprint value specified in Table II-14 below for

each model year, the gram/mile CO₂ target value is calculated using the following equation and rounded to the nearest 0.1 grams/mile.

$$\text{Target CO}_2 = (a \times f) + b$$

Where f is the footprint and a and b are selected from Table II-14 below for the appropriate model year:

Table II-14 – Final CO₂ Targets for Light Trucks Between 41 ft² and the Indicated Maximum Footprint

| Model year | Maximum footprint | a | B |
|----------------|-------------------|------|-------|
| 2012 | 66.0 | 4.04 | 128.6 |
| 2013 | 66.0 | 4.04 | 118.7 |
| 2014 | 66.0 | 4.04 | 109.4 |
| 2015 | 66.0 | 4.04 | 95.1 |
| 2016 | 66.0 | 4.04 | 81.1 |
| 2017 | 50.7 | 4.87 | 38.3 |
| 2018 | 60.2 | 4.76 | 31.6 |
| 2019 | 66.4 | 4.68 | 27.7 |
| 2020 | 68.3 | 4.57 | 24.6 |
| 2021 | 68.3 | 4.51 | 21.5 |
| 2022 | 68.3 | 4.44 | 20.6 |
| 2023 | 68.3 | 4.37 | 20.2 |
| 2024 | 68.3 | 4.31 | 19.6 |
| 2025 | 68.3 | 4.23 | 19.6 |
| 2026 and later | 68.3 | 4.17 | 19.0 |

These equations are presented graphically below, where the x-axis represents vehicle footprint and the y-

axis represents the CO₂ target. The targets are lower for smaller footprint

vehicles and higher for larger footprint vehicles:

BILLING CODE 4910-59-P

Figure II-3 – Passenger Car CO₂ Targets

Figure II-4 – Light Truck CO₂ Targets

BILLING CODE 4910-59-C

Except that EPA elected to apply a slightly different slope when defining passenger car targets, CO₂ targets may be

expressed as direct conversion of fuel economy targets, as follows:

$$TARGET_{CO_2} = \frac{8887 \text{ g/gal}}{TARGET_{FE}} + OFFSET$$

where 8887 g/gal relates grams of CO₂ emitted to gallons of fuel consumed, and *OFFSET* reflects the fact that that HFC emissions from lower-GWP A/C refrigerants and less leak-prone A/C systems are counted toward average CO₂

emissions, but EPCA provides no basis to count reduced HFC emissions toward CAFE levels.

For the reader's benefit, Table II-15, Table II-16, and Table II-17 show the estimates, under the final rule analysis,

of what the MYs 2021–2026 CAFE and CO₂ curves would translate to, in terms of miles per gallon (mpg) and grams per mile (g/mi).

BILLING CODE 4910-59-P

Table II-15 – Average of OEMs' CAFE and CO₂ Estimated Final Requirements for Passenger Cars

| Model Year | Avg. of OEMs' Est. Requirements | |
|---------------|---------------------------------------|---------------------------|
| | CAFE (mpg) | CO ₂ (g/mi) |
| 2017 | 39.0 | 219 |
| 2018 | 40.4 | 208 |
| 2019 | 41.9 | 197 |
| 2020 | 43.6 | 188 |
| 2021 | 44.2 | 183 |
| 2022 | 44.9 | 180 |
| 2023 | 45.6 | 177 |
| 2024 | 46.3 | 174 |
| 2025 | 47.0 | 171 |
| 2026 | 47.7 | 168 |

Table II-16 – Average of OEMs' CAFE and CO₂ Estimated Final Requirements for Light Trucks

| Model Year | Avg. of OEMs' Est. Requirements | |
|---------------|---------------------------------------|---------------------------|
| | CAFE (mpg) | CO ₂ (g/mi) |
| 2017 | 29.4 | 295 |
| 2018 | 30.0 | 285 |
| 2019 | 30.5 | 278 |
| 2020 | 31.1 | 270 |
| 2021 | 31.6 | 264 |
| 2022 | 32.1 | 259 |
| 2023 | 32.6 | 255 |
| 2024 | 33.1 | 251 |
| 2025 | 33.6 | 247 |
| 2026 | 34.1 | 243 |

Table II-17 – Average of OEMs' CAFE and CO₂ Estimated Final Requirements (Passenger Cars and Light Trucks)

| Model Year | Avg. of OEMs' Est. Requirements | |
|------------|---------------------------------|------------------------|
| | CAFE (mpg) | CO ₂ (g/mi) |
| 2017 | 33.8 | 255 |
| 2018 | 34.8 | 244 |
| 2019 | 35.7 | 235 |
| 2020 | 36.8 | 226 |
| 2021 | 37.3 | 220 |
| 2022 | 37.9 | 216 |
| 2023 | 38.5 | 213 |
| 2024 | 39.1 | 209 |
| 2025 | 39.8 | 206 |
| 2026 | 40.4 | 202 |

As the following tables demonstrate, averages of manufacturers' estimated

requirements are more stringent (*i.e.*, for CAFE, higher, and for CO₂, lower) under

the final standards than under the proposed standards:

Table II-18 – Average of OEMs' CAFE Estimated Final Requirements (Passenger Cars and Light Trucks) under Proposed and Final Standards

| Model Year | Avg. of OEMs' Est. Requirements | |

E. Final Standards—Impacts

This section summarizes the estimated costs and benefits of the MYs 2021–2026 CAFE and CO₂ emissions standards for passenger cars and light trucks, as compared to the regulatory alternatives considered. These estimates helped inform the agencies' choices among the regulatory alternatives considered and provide further confirmation that the final standards are maximum feasible, for NHTSA, and appropriate, for EPA. The costs and benefits estimated to result from the CAFE standards are presented first, followed by those estimated to result from the CO₂ standards. For several reasons, the estimates for costs and benefits presented for the different programs, while consistent, are not

identical. NHTSA's and EPA's standards are projected to result in slightly different fuel efficiency improvements. EPA's CO₂ standard is nominally more stringent in part due to its assumptions about manufacturers' use of air conditioning leakage/refrigerant replacement credits, which are expected to result in reduced emissions of HFCs. NHTSA's final standards are based solely on assumptions about fuel economy improvements, and do not account for emissions reductions that do not relate to fuel economy. In addition, the CAFE and CO₂ programs offer somewhat different program flexibilities and provisions, primarily because NHTSA is statutorily prohibited from considering some flexibilities when establishing CAFE standards, while EPA is not.³⁴ The analysis underlying this

final rule reflects many of those additional EPA flexibilities, which contributes to differences in how the agencies estimate manufacturers could comply with the respective sets of standards, which in turn contributes to differences in estimated impacts of the standards. These differences in compliance flexibilities are discussed in more detail in Section IX below.

Table II–20 to Table II–23 present all subcategories of costs and benefits of this final rule for all seven alternatives proposed. Costs include application of fuel economy technology to new vehicles, consumer surplus, crash costs due to changes in VMT, as well as, noise and congestion. Benefits include fuel savings, consumer surplus, refueling time, and clean air.

BILLING CODE 4910–59–P

BILLING CODE 4910-59-C

F. Other Programmatic Elements

1. Compliance and Flexibilities

Automakers seeking to comply with the CAFE and CO₂ standards are generally expected to add fuel economy-improving technologies to their new vehicles to boost their overall fleet fuel economy levels. Readers will remember that improving fuel economy directly reduces CO₂ emissions, because CO₂ is a natural and inevitable byproduct of fossil fuel combustion to power vehicles. The CAFE and CO₂ programs contain a variety of compliance provisions and flexibilities to accommodate better automakers' production cycles, to reward real-world fuel economy improvements that cannot be reflected in the 1975-developed test

procedures, and to incentivize the production of certain types of vehicles. While the agencies sought comment on a broad variety of changes and potential expansions of the programs' compliance flexibilities in the NPRM, the agencies determined, after considering the comments, to make a few changes to the flexibilities proposed in the NPRM in this final rule. The most noteworthy change is the retention, in the CO₂ program, of the flexibilities that allow automakers to continue to use HFC reductions toward their CO₂ compliance, and that extend the "0 grams/mile" assumption for electric vehicles through MY 2026 (*i.e.*, recognizing only the tailpipe emissions of full battery-electric vehicles and not recognizing the upstream emissions caused by the electricity usage of those

vehicles). In the NPRM, EPA had proposed to remove and sought comment on removing those flexibilities from the CO₂ program, but determined not to remove them in this final rule. EPA and NHTSA are also removing from the programs, starting in MY 2022, the credit/FCIV for full-size pickup trucks that are either hybrids or over-performing by a certain amount relative to their targets, and allowing technology suppliers to begin the petition process for off-cycle credits/adjustments.

Table II-24, Table II-25, Table II-26, and Table II-27 provide a summary of the various compliance provisions in the two programs; their authorities; and any changes included as part of this final rule:

BILLING CODE 4910-59-P

Table II-24 – Statutory Flexibilities for Over-Compliance with Standards

| Regulatory item | NHTSA | | | EPA | | |
|--|-----------------------|---|--|------------|---|------------|
| | Authority | Current Program | Final Rule | Authority | Current Program | Final Rule |
| Credit Earning | 49 U.S.C. 32903(a) | Yes, denominated in tenths of a mpg | No change | CAA 202(a) | Yes, denominated in megagrams | No change |
| Credit "Carry-forward" | 49 U.S.C. 32903(a)(2) | 5 MYs into the future | No change | CAA 202(a) | 5 MYs into the future (except MYs 2010-2015 = credits may be carried forward through MY 2021) | No change |

³⁵ The CAFE program uses an energy efficiency metric and standards that are expressed in miles per gallon. For PHEVs and BEVs, to determine gasoline the equivalent fuel economy for operation on electricity, a Petroleum Equivalency Factor (PEF) is applied to the measured electrical consumption. The PEF for electricity was established by the Department of Energy, as required by statute, and includes an accounting for upstream energy associated with the production and distribution for electricity relative to gasoline. Therefore, the CAFE program includes upstream accounting based on the metric that is consistent with the fuel economy

Providing a technology neutral basis by which manufacturers meet fuel economy and CO₂ emissions standards encourages an efficient and level playing field. The agencies continue to have a desire to minimize incentives that disproportionately favor one technology over another. Some of this may involve regulations established by

metric. The PEF for electricity also includes an incentive that effectively counts only 15 percent of the electrical energy consumed.

other Federal agencies. In the near future, NHTSA and EPA intend to work with other relevant Federal agencies to pursue regulatory means by which we can further ensure technology neutrality in this field.

2. Preemption/Waiver

As discussed above, the issues of Clean Air Act waivers of preemption under Section 209 and EPCA/EISA preemption under 49 U.S.C. 32919 are not addressed in today's final rule, as

they were the subject of a separate final rulemaking action by the agencies in September 2019. While many comments were received in response to the NPRM discussion of those issues, those comments have been addressed and responded to as part of that separate rulemaking action.

III. Purpose of the Rule

The Administrative Procedure Act (APA) requires agencies to incorporate in their final rules a “concise general statement of their basis and purpose.”³⁶ While the entire preamble document represents the agencies’ overall explanation of the basis and purpose for this regulatory action, this section within the preamble is intended as a direct response to that APA (and related CAA) requirements. Executive Order 12866 further states that “Federal agencies should promulgate only such regulations as are required by law, are necessary to interpret the law, or are made necessary by compelling public need, such as material failures of private markets to protect or improve the health and safety of the public, the environment, or the well-being of the American people.”³⁷ Section III.C of the FRIA accompanying this rulemaking discusses at greater length the question of whether a market failure exists that these final rules may address.

NHTSA and EPA are legally obligated to set CAFE and GHG standards, respectively, and do not have the authority to decline to regulate.³⁸ The agencies are issuing these final rules to fulfill their respective statutory obligations to provide maximum feasible fuel economy standards and limit emissions of pollutants from new motor vehicles which have been found to endanger public health and welfare (in this case, specifically carbon dioxide (CO₂); EPA has already set standards for methane (CH₄), nitrous oxide (N₂O), and hydrofluorocarbons (HFCs) and is not revising them in this rule). Continued progress in meeting these statutory obligations is both legally necessary and good for America—greater energy security and reduced emissions protect the American public. The final standards continue that progress, albeit at a slower rate than the standards finalized in 2012.

National annual gasoline consumption and CO₂ emissions currently total about 140 billion gallons and 5,300 million metric tons,

respectively. The majority of this gasoline (about 130 billion gallons) is used to fuel passenger cars and light trucks, such as will be covered by the CAFE and CO₂ standards issued today. Accounting for both tailpipe emissions and emissions from “upstream” processes (e.g., domestic refining) involved in producing and delivering fuel, passenger cars and light trucks account for about 1,500 million metric tons (mmt) of current annual CO₂ emissions. The agencies estimate that under the standards issued in 2012, passenger car and light truck annual gasoline consumption would steadily decline, reaching about 80 billion gallons by 2050. The agencies further estimate that, because of this decrease in gasoline consumption under the standards issued in 2012, passenger car and light truck annual CO₂ emissions would also steadily decline, reaching about 1,000 mmt by 2050. Under the standards issued today, the agencies estimate that, instead of declining from about 140 billion gallons annually today to about 80 billion gallons annually in 2050, passenger car and light truck gasoline consumption would decline to about 95 billion gallons. The agencies correspondingly estimate that instead of declining from about 1,500 mmt annually today to about 1,000 mmt annually in 2050, passenger car and light truck CO₂ emissions would decline to about 1,100 mmt. In short, the agencies estimate that under the standards issued today, annual passenger car and light truck gasoline consumption and CO₂ emissions will continue to steadily decline over the next three decades, even if not quite as rapidly as under the previously-issued standards.

The agencies also estimate that these impacts on passenger car and light truck gasoline consumption and CO₂ emissions will be accompanied by a range of other energy- and climate-related impacts, such as reduced electricity consumption (because today’s standards reduce the estimated rate at which the market might shift toward electric vehicles) and increased CH₄ and N₂O emissions. These estimated impacts, discussed below and in the FEIS accompanying today’s notice, are dwarfed by estimated impacts on gasoline consumption and CO₂ emissions.

As explained above, these final rules set or amend fuel economy and carbon dioxide standards for model years 2021–2026. Many commenters argued that it was not appropriate to amend previously-established CO₂ and CAFE standards, generally because those commenters believed that the

administrative record established for the 2012 final rule and EPA’s January 2017 Final Determination was superior to the record that informed the NPRM, and that that prior record led necessarily to the policy conclusion that the previously-established standards should remain in place.³⁹ Some commenters similarly argued that EPA’s Revised Final Determination—which, for EPA, preceded this regulatory action—was invalid because, they allege, it did not follow the procedures established for the mid-term evaluation that EPA codified into regulation,⁴⁰ and also because the Revised Final Determination was not based on the prior record.⁴¹

The agencies considered a range of alternatives in the proposal, including the baseline/no action alternative of retaining the existing EPA carbon dioxide standards. As the agencies explained in the proposal, the proposal was entirely *de novo*, based on an entirely new analysis reflecting the best and most up-to-date information available to the agencies.⁴² This rulemaking action is separate and distinct from EPA’s Revised Final Determination, which itself was neither a proposed nor a final decision that the standards “must” be revised. EPA retained full discretion in this rulemaking to revise the standards or not revise them. In any event, the case law is clear that agencies are free to reconsider their prior decisions.⁴³ With that legal principle in mind, the agencies agree with commenters that the amended (and new) CO₂ and CAFE standards must be consistent with the

³⁹ Comments arguing that the prior record was superior to the current record, and thus a better basis for decision-making, will be addressed throughout the balance of this preamble.

CAA and EPCA/EISA, respectively, and this preamble and the accompanying FRIA explain in detail why the agencies believe they are consistent. The section below discusses briefly the authority given to the agencies by their respective governing statutes, and the factors that Congress directed the agencies to consider as they exercise that authority in pursuit of fulfilling their statutory obligations.

A. EPA's Statutory Requirements

EPA is setting national CO₂ standards for passenger cars and light trucks under Section 202(a) of the Clean Air Act (CAA).⁴⁴ Section 202(a) of the CAA requires EPA to establish standards for emissions of pollutants from new motor vehicles which cause or contribute to air pollution which may reasonably be anticipated to endanger public health or welfare.⁴⁵ In establishing such standards, EPA considers issues of technical feasibility, cost, available lead time, and other factors. Standards under section 202(a) thus take effect only “after providing such period as the Administrator finds necessary to permit the development and application of the requisite technology, giving appropriate consideration to the cost of compliance within such period.”⁴⁶ EPA's statutory requirements are further discussed in Section VIII.A.

B. NHTSA's Statutory Requirements

NHTSA is setting national Corporate Average Fuel Economy (CAFE) standards for passenger cars and light trucks for each model year as required under EPCA, as amended by EISA.⁴⁷ EPCA mandates a motor vehicle fuel economy regulatory program that balances statutory factors in setting minimum fuel economy standards to facilitate energy conservation. EPCA allocates the responsibility for implementing the program between NHTSA and EPA as follows: NHTSA sets CAFE standards for passenger cars

and light trucks; EPA establishes the procedures for testing, tests vehicles, collects and analyzes manufacturers' data, and calculates the individual and average fuel economy of each manufacturer's passenger cars and light trucks; and NHTSA enforces the standards based on EPA's calculations.

The following sections enumerate specific statutory requirements for NHTSA in setting CAFE standards and NHTSA's interpretations of them, where applicable. Many comments were received on these requirements and interpretations. Because this is intended as an overview section, those comments will be addressed below in Section VIII rather than here, and the agencies refer readers to that part of the document for more information.

For each future model year, EPCA (as amended by EISA) requires that DOT (by delegation, NHTSA) establish separate passenger car and light truck standards at “the maximum feasible average fuel economy level that the Secretary decides the manufacturers can achieve in that model year,”⁴⁸ based on the agency's consideration of four statutory factors: “technological feasibility, economic practicability, the effect of other motor vehicle standards of the Government on fuel economy, and the need of the United States to conserve energy.”⁴⁹ The law also allows NHTSA to amend standards that are already in place, as long as doing so meets these requirements.⁵⁰ EPCA does not define these terms or specify what weight to give each concern in balancing them; thus, NHTSA defines them and determines the appropriate weighting that leads to the maximum feasible standards given the circumstances in each CAFE standard rulemaking.⁵¹

EISA added several other requirements to the setting of separate passenger car and light truck standards. Standards must be “based on 1 or more vehicle attributes related to fuel economy and express[ed] . . . in the form of a mathematical function.”⁵² New standards must also be set at least 18 months before the model year in question, as would amendments to increase standards previously set.⁵³

NHTSA*”) (“The EPCA clearly requires the agency to consider these four factors, but it gives NHTSA discretion to decide how to balance the statutory factors—as long as NHTSA's balancing does not undermine the fundamental purpose of the EPCA: Energy conservation.”)

⁵² 49 U.S.C. 32902(b)(3)(A).

⁵³ 49 U.S.C. 32902(a), (g)(2).

NHTSA must regulations prescribing average fuel economy standards for at least 1, but not more than 5, model years at a time.⁵⁴ A number of comments addressed these requirements; for the reader's reference, those comments will be summarized and responded to in Section VIII. EISA also added the requirement that NHTSA set a minimum standard for domestically-manufactured passenger cars,⁵⁵ which will also be discussed further in Section VIII below.

For MYs 2011–2020, EISA further required that the separate standards for passenger cars and for light trucks be set at levels high enough to ensure that the achieved average fuel economy for the entire industry-wide combined fleet of new passenger cars and light trucks reach at least 35 mpg not later than MY 2020, and standards for those years were also required to “increase ratably.”⁵⁶ For model years after 2020, standards must be set at the maximum feasible level.⁵⁷

1. Factors That Must Be Considered in Deciding What Levels of CAFE Standards are “Maximum Feasible”

(a) Technological Feasibility

“Technological feasibility” refers to whether a particular method of improving fuel economy can be available for commercial application in the model year for which a standard is being established. Thus, in determining the level of new standards, the agency is not limited to technology that is already being commercially applied at the time of the rulemaking. For this rulemaking, NHTSA has evaluated and considered all types of technologies that improve real-world fuel economy, although not every possible technology was expressly included in the analysis, as discussed in Section VI and also in Section VIII.

(b) Economic Practicability

“Economic practicability” refers to whether a standard is one “within the

⁵⁴ 49 U.S.C. 32902(b)(3)(B).

⁵⁵ 49 U.S.C. 32902(b)(4).

⁵⁶ 49 U.S.C. 32902(b)(2)(A) and (C). NHTSA has CAFE standards in place that are projected to result in industry-achieved fuel economy levels over 35 mpg in MY 2020. EPA typically provides verified final CAFE data from manufacturers to NHTSA several months or longer after the close of the MY in question, so the actual MY 2020 fuel economy will not be known until well after MY 2020 has ended. The standards for all MYs up to and including 2020 are known and not at issue in this regulatory action, so these provisions are noted for completeness rather than immediate relevance to this final rule. Because neither of these requirements apply after MY 2020, they are not relevant to this rulemaking and will not be discussed further.

⁵⁷ 49 U.S.C. 32902(b)(2)(B).

financial capability of the industry, but not so stringent as to” lead to “adverse economic consequences, such as a significant loss of jobs or the unreasonable elimination of consumer choice.”⁵⁸ The agency has explained in the past that this factor can be especially important during rulemakings in which the automobile industry is facing significantly adverse economic conditions (with corresponding risks to jobs). Economic practicability is a broad factor that includes considerations of the uncertainty surrounding future market conditions and consumer demand for fuel economy in addition to other vehicle attributes.⁵⁹ In an attempt to evaluate the economic practicability of different future levels of CAFE standards (*i.e.*, the regulatory alternatives considered in this rulemaking), NHTSA considers a variety of factors, including the annual rate at which manufacturers can increase the percentage of their fleet(s) that employ a particular type of fuel-saving technology, the specific fleet mixes of different manufacturers, assumptions about the cost of the standards to consumers, and consumers’ valuation of fuel economy, among other things, including, in part, safety.

It is important to note, however, that the law does not preclude a CAFE standard that poses considerable challenges to any individual manufacturer. The Conference Report for EPCA, as enacted in 1975, makes clear, and the case law affirms, “a determination of maximum feasible average fuel economy should not be keyed to the single manufacturer which might have the most difficulty achieving a given level of average fuel economy.”⁶⁰ Instead, NHTSA is compelled “to weigh the benefits to the nation of a higher fuel economy standard against the difficulties of individual automobile manufacturers.”⁶¹ Accordingly, while the law permits NHTSA to set CAFE standards that exceed the projected capability of a particular manufacturer as long as the standard is economically practicable for the industry as a whole, the agency cannot simply disregard that

impact on individual manufacturers.⁶² That said, in setting fuel economy standards, NHTSA does not seek to maintain competitive positions among the industry players, and notes that while a particular CAFE standard may pose difficulties for one manufacturer as being too high or too low, it may also present opportunities for another. NHTSA has long held that the CAFE program is not necessarily intended to maintain the competitive positioning of each particular company. Rather, it is intended to enhance the fuel economy of the vehicle fleet on American roads, while protecting motor vehicle safety and paying close attention to the economic risks.

(c) The Effect of Other Motor Vehicle Standards of the Government on Fuel Economy

“The effect of other motor vehicle standards of the Government on fuel economy” involves an analysis of the effects of compliance with emission, safety, noise, or damageability standards on fuel economy capability and thus on average fuel economy. In many past CAFE rulemakings, NHTSA has said that it considers the adverse effects of other motor vehicle standards on fuel economy. It said so because, from the CAFE program’s earliest years,⁶³ the effects of such compliance on fuel economy capability over the history of the program have been negative ones. For example, safety standards that have the effect of increasing vehicle weight lower vehicle fuel economy capability and thus decrease the level of average fuel economy that the agency can determine to be feasible. NHTSA has considered the additional weight that it estimates would be added in response to new safety standards during the rulemaking timeframe. NHTSA has also accounted for EPA’s “Tier 3” standards for criteria pollutants in its estimates of technology effectiveness.⁶⁴

The NPRM also discussed how EPA’s CO₂ standards for light-duty vehicles and California’s Advanced Clean Cars program fit into NHTSA’s consideration of “the effect of other motor vehicle standards of the Government on fuel economy.” The agencies note that on September 19, 2019, to ensure One National Program for automobile fuel economy and carbon dioxide emissions standards, the agencies finalized regulatory text related to preemption of

State tailpipe CO₂ standards and Zero Emission Vehicle (ZEV) mandates under EPCA and partial withdrawal of a waiver previously provided to California under the Clean Air Act.⁶⁵ This final rule’s impact on State programs—including California’s—will therefore be somewhat different from the NPRM’s consideration. In the interest of brevity, this preamble will hold further discussion of that point, along with responses to comments received, until Section VIII.

(d) The Need of the United States To Conserve Energy

“The need of the United States to conserve energy” means “the consumer cost, national balance of payments, environmental, and foreign policy implications of our need for large quantities of petroleum, especially imported petroleum.”⁶⁶ Environmental implications principally include changes in emissions of carbon dioxide and criteria pollutants and air toxics. Prime examples of foreign policy implications are energy independence and security concerns.

(1) Consumer Costs and Fuel Prices

Fuel for vehicles costs money for vehicle owners and operators. All else equal (and this is an important qualification), consumers benefit from vehicles that need less fuel to perform the same amount of work. Future fuel prices are a critical input into the economic analysis of potential CAFE standards because they determine the value of fuel savings both to new vehicle buyers and to society, the amount of fuel economy that the new vehicle market is likely to demand in the absence of new standards, and they inform NHTSA about the consumer cost of the nation’s need for large quantities of petroleum. In this final rule, NHTSA’s analysis relies on fuel price projections estimated using the version of NEMS used for the U.S. Energy Information Administration’s (EIA) Annual Energy Outlook for 2019.⁶⁷ Federal government agencies generally use EIA’s price projections in their assessment of future energy-related policies.

(2) National Balance of Payments

Historically, the need of the United States to conserve energy has included consideration of the “national balance of payments” because of concerns that importing large amounts of oil created a

⁶³ 42 FR 63184, 63188 (Dec. 15, 1977). See also 42 FR 33534, 33537 (Jun. 30, 1977).

⁶⁴ See Section VI, below.

⁶⁵ 84 FR 51310 (Sept. 27, 2019).

⁶⁶ 42 FR 63184, 63188 (1977).

⁶⁷ The analysis for the proposal relied on fuel price projections from AEO 2017; the difference in the projections is discussed in Section VI.

significant wealth transfer to oil-exporting countries and left the U.S. economically vulnerable.⁶⁸ As recently as 2009, nearly half of the U.S. trade deficit was driven by petroleum,⁶⁹ yet this concern has largely lain fallow in more recent CAFE actions, in part because other factors besides petroleum consumption have since played a bigger role in the U.S. trade deficit.⁷⁰ Given significant recent increases in U.S. oil production and corresponding decreases in oil imports, this concern seems likely to remain fallow for the foreseeable future.⁷¹ Increasingly, changes in the price of fuel have come to represent transfers between domestic consumers of fuel and domestic producers of petroleum rather than gains or losses to foreign entities.

As flagged in the NPRM, some commenters raised concerns about

⁶⁸ See, e.g., 42 FR 63184, 63192 (Dec. 15, 1977) (“A major reason for this need [to reduce petroleum consumption] is that the importation of large quantities of petroleum creates serious balance of payments and foreign policy problems. The United States currently spends approximately \$45 billion annually for imported petroleum. But for this large expenditure, the current large U.S. trade deficit would be a surplus.”)

⁶⁹ See “Today in Energy: Recent improvements in petroleum trade balance mitigate U.S. trade deficit,” U.S. Energy Information Administration (Jul. 21, 2014), available at <https://www.eia.gov/todayinenergy/detail.php?id=17191>.

⁷⁰ See, e.g., Nida Çakir Melek and Jun Nie, “What Could Resurging U.S. Energy Production Mean for the U.S. Trade Deficit,” Mar. 7, 2018, Federal Reserve Bank of Kansas City. Available at <https://www.kansascityfed.org/publications/research/mb/articles/2018/what-could-resurging-energy-production-mean>. The authors state that “The decline in U.S. net energy imports has prevented the total U.S. trade deficit from widening further. . . . In 2006, petroleum accounted for about 16 percent of U.S. goods imports and about 3 percent of U.S. goods exports. By the end of 2017, the share of petroleum in total goods imports declined to 8 percent, while the share in total goods exports almost tripled, shrinking the U.S. petroleum trade deficit. Had the petroleum trade deficit not improved, all else unchanged, the total U.S. trade deficit would likely have been more than 35 percent wider by the end of 2017.”

⁷¹ For an illustration of recent increases in U.S. production, see, e.g., “U.S. crude oil and liquid fuels production,” Short-Term Energy Outlook, U.S. Energy Information Administration (Aug. 2019), available at <http://www.eia.gov/outlooks/steo/images/fig16.png>. EIA noted in April 2019 that “Annual U.S. crude oil production reached a record level of 10.96 million barrels per day (b/d) in 2018, 1.6 million b/d (17%) higher than 2017 levels. In December 2018, monthly U.S. crude oil production reached 11.96 million b/d, the highest monthly level of crude oil production in U.S. history. U.S. crude oil production has increased significantly over the past 10 years, driven mainly by production from tight rock formations using horizontal drilling and hydraulic fracturing. EIA projects that U.S. crude oil production will continue to grow in 2019 and 2020, averaging 12.3 million b/d and 13.0 million b/d, respectively.” “Today in Energy: U.S. crude oil production grew 17% in 2018, surpassing the previous record in 1970,” EIA, Apr. 9, 2019. Available at <http://www.eia.gov/todayinenergy/detail.php?id=38992>.

potential economic consequences for automaker and supplier operations in the U.S. due to disparities between CAFE standards at home and their counterpart fuel economy/efficiency and CO₂ standards abroad. NHTSA finds these concerns more relevant to technological feasibility and economic practicability considerations than to the national balance of payments. The discussion in Section VIII below addresses this topic in more detail.

(3) Environmental Implications

Higher fleet fuel economy can reduce U.S. emissions of various pollutants by reducing the amount of oil that is produced and refined for the U.S. vehicle fleet, but can also increase emissions by reducing the cost of driving, which can result in more vehicle miles traveled (*i.e.*, the rebound effect). Thus, the net effect of more stringent CAFE standards on emissions of each pollutant depends on the relative magnitude of both its reduced emissions in fuel refining and distribution and increases in its emissions from vehicle use. Fuel savings from CAFE standards also necessarily results in lower emissions of CO₂, the main greenhouse gas emitted as a result of refining, distributing, and using transportation fuels. Reducing fuel consumption directly reduces CO₂ emissions because the primary source of transportation-related CO₂ emissions is fuel combustion in internal combustion engines.

NHTSA has considered environmental issues, both within the context of EPCA and the context of the National Environmental Policy Act (NEPA), in making decisions about the setting of standards since the earliest days of the CAFE program. As courts of appeal have noted in three decisions stretching over the last 20 years,⁷² NHTSA defined “the need of the United States to conserve energy” in the late 1970s as including, among other things, environmental implications. In 1988, NHTSA included climate change concepts in its CAFE notices and prepared its first environmental assessment addressing that subject.⁷³ It cited concerns about climate change as one of its reasons for limiting the extent of its reduction of the CAFE standard for MY 1989 passenger cars.⁷⁴ Since then, NHTSA has considered the effects of

⁷² CAS, 793 F.2d 1322, 1325 n. 12 (D.C. Cir. 1986); Public Citizen, 848 F.2d 256, 262–63 n. 27 (D.C. Cir. 1988) (noting that “NHTSA itself has interpreted the factors it must consider in setting CAFE standards as including environmental effects”); CBD, 538 F.3d 1172 (9th Cir. 2007).

⁷³ 53 FR 33080, 33096 (Aug. 29, 1988).

⁷⁴ 53 FR 39275, 39302 (Oct. 6, 1988).

reducing tailpipe emissions of CO₂ in its fuel economy rulemakings pursuant to the need of the United States to conserve energy by reducing petroleum consumption.

(4) Foreign Policy Implications

U.S. consumption and imports of petroleum products can impose additional costs (*i.e.*, externalities) on the domestic economy that are not reflected in the market price for crude petroleum or in the prices paid by consumers for petroleum products such as gasoline. NHTSA has said previously that these costs can include (1) higher prices for petroleum products resulting from the effect of U.S. oil demand on world oil prices, (2) the risk of disruptions to the U.S. economy caused by sudden increases in the global price of oil and its resulting impact on fuel prices faced by U.S. consumers, and (3) expenses for maintaining the strategic petroleum reserve (SPR) to provide a response option should a disruption in commercial oil supplies threaten the U.S. economy, to allow the U.S. to meet part of its International Energy Agency obligation to maintain emergency oil stocks, and to provide a national defense fuel reserve.⁷⁵ Higher U.S. consumption of crude oil or refined petroleum products increases the magnitude of these external economic costs, thus increasing the true economic cost of supplying transportation fuels above the resource costs of producing them. Conversely, reducing U.S. consumption of crude oil or refined petroleum products (by reducing motor fuel use) can reduce these external costs.

While these costs are considerations, the United States has significantly increased oil production capabilities in recent years, to the extent that the U.S. is currently producing enough oil to satisfy nearly all of its energy needs and is projected to continue to do so (or even become a net energy exporter in the near future).⁷⁶ This has added stable new supply to the global oil market, which ameliorates the U.S.’ need to

⁷⁵ While the U.S. maintains a military presence in certain parts of the world to help secure global access to petroleum supplies, that is neither the primary nor the sole mission of U.S. forces overseas. Additionally, the scale of oil consumption reductions associated with CAFE standards would be insufficient to alter any existing military missions focused on ensuring the safe and expedient production and transportation of oil around the globe. See the FRIA’s discussion on energy security for more information on this topic.

⁷⁶ See AEO 2019, at 14 (“In the Reference case, the United States becomes a net exporter of petroleum liquids after 2020 as U.S. crude oil production increases and domestic consumption of petroleum products decreases.”). Available at <https://www.eia.gov/outlooks/aeo/pdf/aeo2019.pdf>.

conserve energy from a security perspective even given that oil is a global commodity. The agencies discuss this issue in more detail in Section VIII below.

(2) Factors That NHTSA Is Prohibited From Considering

EPCA states that in determining the level at which it should set CAFE standards for a particular model year, NHTSA may not consider the ability of manufacturers to take advantage of several EPCA provisions that facilitate compliance with CAFE standards and thereby can reduce their costs of compliance.⁷⁷ As discussed further below, NHTSA cannot consider compliance credits that manufacturers earn by exceeding the CAFE standards and then use to achieve compliance in years in which their measured average fuel economy falls below the standards. NHTSA also cannot consider the use of alternative fuels by dual-fueled vehicles (such as plug-in hybrid electric vehicles) nor the availability of dedicated alternative fuel vehicles (such as battery electric or hydrogen fuel cell vehicles) in any model year. EPCA encourages the production of alternative fuel vehicles by specifying that their fuel economy is to be determined using a special calculation procedure that results in those vehicles being assigned a higher fuel economy level than they actually achieve. For non-statutory incentives that NHTSA developed by regulation, NHTSA does not consider these incentives subject to the EPCA prohibition on considering flexibilities. These topics will be addressed further in Section VIII below.

(3) Other Considerations in Determining Maximum Feasible CAFE Standards

NHTSA historically has interpreted EPCA's statutory factors as including consideration for potential adverse safety consequences in setting CAFE standards. Courts have consistently recognized that this interpretation is reasonable. As courts have recognized, "NHTSA has always examined the safety consequences of the CAFE standards in its overall consideration of relevant factors since its earliest rulemaking under the CAFE program."⁷⁸ The courts have consistently upheld NHTSA's implementation of EPCA in this manner.⁷⁹ Thus, in evaluating what

levels of stringency would result in maximum feasible standards, NHTSA assesses the potential safety impacts and considers them in balancing the statutory considerations and to determine the maximum feasible level of the standards.⁸⁰ Many commenters addressed the NPRM's analysis of safety impacts; those comments will be summarized and responded to in Section VI.D.2 and also in each agency's discussion in Section VIII.

The above sections explain what Congress thought was important enough to codify when it directed each agency to regulate, and begin to explain how the agencies have interpreted those directions over time and in this final rule. The next section looks more closely at the interplay between Congress's direction to the agencies and the aspects of the market that these regulations affect, as follows.

IV. Purpose of Analytical Approach Considered as Part of Decision-Making

A. Relationship of Analytical Approach to Governing Law

Like the NPRM, today's final rule is supported by extensive analysis of potential impacts of the regulatory alternatives under consideration. Below, Section VI reviews the analytical approach, Section VII summarizes the results of the analysis, and Section VIII explains how the final standards— informed by this analysis—fulfill the agencies' statutory obligations. Accompanying today's notice, a final Regulatory Impact Analysis (FRIA) and,

economy standard, "NHTSA has always taken passenger safety into account," citing *CEI-I*, 901 F.2d at 120 n. 11); *Competitive Enterprise Institute v. NHTSA*, 49 F.3d 481, 483–83 (D.C. Cir. 1995) (same); *Center for Biological Diversity v. NHTSA*, 538 F.3d 1172, 1203–04 (9th Cir. 2008) (upholding NHTSA's analysis of vehicle safety issues with weight in connection with the MYs 2008–2011 light truck CAFE rulemaking).

⁸⁰ NHTSA stated in the NPRM that "While we discuss safety as a separate consideration, NHTSA also considers safety as closely related to, and in some circumstances a subcomponent of, economic practicability. On a broad level, manufacturers have finite resources to invest in research and development. Investment into the development and implementation of fuel saving technology necessarily comes at the expense of investing in other areas such as safety technology. On a more direct level, when making decisions on how to equip vehicles, manufacturers must balance cost considerations to avoid pricing further consumers out of the market. As manufacturers add technology to increase fuel efficiency, they may decide against installing new safety equipment to reduce cost increases. And as the price of vehicles increase beyond the reach of more consumers, such consumers continue to drive or purchase older, less safe vehicles. In assessing practicability, NHTSA also considers the harm to the nation's economy caused by highway fatalities and injuries." 83 FR at 43209 (Aug. 24, 2018). Many comments were received on this issue, which will be discussed further in Section VIII below.

for NHTSA's consideration, a final Environmental Impact Analysis (FEIS), together provide a more extensive and detailed enumeration of related methods, estimates, assumptions, and results. The agencies' analysis has been constructed specifically to reflect various aspects of governing law applicable to CAFE and CO₂ standards, and has been expanded and improved in response to comments received to the NPRM and based on additional work by the agencies. The analysis aided the agencies in implementing their statutory obligations, including the weighing of competing considerations, by reasonably informing the agencies about the estimated effects of choosing different regulatory alternatives.

The agencies' analysis makes use of a range of data (*i.e.*, observations of things that have occurred), estimates (*i.e.*, things that may occur in the future), and models (*i.e.*, methods for making estimates). Two examples of *data* include (1) records of actual odometer readings used to estimate annual mileage accumulation at different vehicle ages and (2) CAFE compliance data used as the foundation for the "analysis fleet" containing, among other things, production volumes and fuel economy levels of specific configurations of specific vehicle models produced for sale in the U.S. Two examples of *estimates* include (1) forecasts of future GDP growth used, with other estimates, to forecast future vehicle sales volumes and (2) the "retail price equivalent" (RPE) factor used to estimate the ultimate cost to consumers of a given fuel-saving technology, given accompanying estimates of the technology's "direct cost," as adjusted to account for estimated "cost learning effects" (*i.e.*, the tendency that it will cost a manufacturer less to apply a technology as the manufacturer gains more experience doing so).

The agencies' analysis makes use of several models, some of which are actually integrated systems of multiple models. As discussed in the NPRM, the agencies' analysis of CAFE and CO₂ standards involves two basic elements: First, estimating ways each manufacturer could potentially respond to a given set of standards in a manner that considers potential consumer response; and second, estimating various impacts of those responses. Estimating manufacturers' potential responses involves simulating manufacturers' decision-making processes regarding the year-by-year application of fuel-saving technologies to specific vehicles. Estimating impacts involves calculating resultant changes in new vehicle costs, estimating a

⁷⁷ 49 U.S.C. 32902(h).

⁷⁸ *Competitive Enterprise Institute v. NHTSA*, 901 F.2d 107, 120 n. 11 (D.C. Cir. 1990) ("*CEI-I*") (citing 42 FR 33534, 33551 (Jun. 30, 1977)).

⁷⁹ See, e.g., *Competitive Enterprise Institute v. NHTSA*, 956 F.2d 321, 322 (D.C. Cir. 1992) ("*CEI-II*") (in determining the maximum feasible fuel

variety of costs (e.g., for fuel) and effects (e.g., CO₂ emissions from fuel combustion) occurring as vehicles are driven over their lifetimes before eventually being scrapped, and estimating the monetary value of these effects. Estimating impacts also involves consideration of the response of consumers—e.g., whether consumers will purchase the vehicles and in what quantities. Both of these basic analytical elements involve the application of many analytical inputs.

The agencies' analysis uses the CAFE Model to estimate manufacturers' potential responses to new CAFE and CO₂ standards and to estimate various impacts of those responses. The model may be characterized as an integrated system of models. For example, one model estimates manufacturers' responses, another estimates resultant changes in total vehicle sales, and still another estimates resultant changes in fleet turnover (*i.e.*, scrappage). The CAFE model makes use of many inputs, values of which are developed *outside* of the model and not *by* the model. For example, the model applies fuel prices; it does not estimate fuel prices. The model does not determine the form or stringency of the standards; instead, the model applies inputs specifying the form and stringency of standards to be analyzed and produces outputs showing effects of manufacturers working to meet those standards, which become the basis for comparing between different potential stringencies.

The agencies also use EPA's MOVES model to estimate "tailpipe" (a.k.a. "vehicle" or "downstream") emission factors for criteria pollutants,⁸¹ and use four DOE and DOE-sponsored models to develop inputs to the CAFE model, including three developed and maintained by DOE's Argonne National Laboratory. The agencies use the DOE Energy Information Administration's (EIA's) National Energy Modeling System (NEMS) to estimate fuel prices,⁸² and use Argonne's Greenhouse gases, Regulated Emissions, and Energy use in Transportation (GREET) model to estimate emissions rates from fuel production and distribution processes.⁸³ DOT also sponsored DOE/Argonne to

use Argonne's Autonomie full-vehicle modeling and simulation system to estimate the fuel economy impacts for roughly a million combinations of technologies and vehicle types.⁸⁴ ⁸⁵ Section VI.B.3, below, and the accompanying final RIA document details of the agencies' use of these models. In addition, as discussed in the final EIS accompanying today's notice, DOT relied on a range of climate and photochemical models to estimate impacts on climate, air quality, and public health. The EIS discusses and documents the use of these models.

As further explained in the NPRM,⁸⁶ to prepare for analysis supporting the proposal, DOT expanded the CAFE model to address EPA statutory and regulatory requirements through a year-by-year simulation of how manufacturers could comply with EPA's CO₂ standards, including:

- Calculation of vehicle models' CO₂ emission rates before and after application of fuel-saving (and, therefore, CO₂-reducing) technologies;
- Calculation of manufacturers' fleet average CO₂ emission rates;
- Calculation of manufacturers' fleet average CO₂ emission rates under attribute-based CO₂ standards;
- Accounting for adjustments to average CO₂ emission rates reflecting reduction of air conditioner refrigerant leakage;
- Accounting for the treatment of alternative fuel vehicles for CO₂ compliance;
- Accounting for production "multipliers" for PHEVs, BEVs, compressed natural gas (CNG) vehicles, and fuel cell vehicles (FCVs);
- Accounting for transfer of CO₂ credits between regulated fleets; and
- Accounting for carried-forward (a.k.a. "banked") CO₂ credits, including credits from model years earlier than modeled explicitly.

⁸⁴ As part of the Argonne simulation effort, individual technology combinations simulated in Autonomie were paired with Argonne's BatPAC model to estimate the battery cost associated with each technology combination based on characteristics of the simulated vehicle and its level of electrification. Information regarding Argonne's BatPAC model is available at <http://www.cse.anl.gov/batpac/>.

⁸⁵ In addition, the impact of engine technologies on fuel consumption, torque, and other metrics was characterized using GT POWER simulation modeling in combination with other engine modeling that was conducted by IAV Automotive Engineering, Inc. (IAV). The engine characterization "maps" resulting from this analysis were used as inputs for the Autonomie full-vehicle simulation modeling. Information regarding GT Power is available at <https://www.gtisoft.com/gt-suite-applications/propulsion-systems/gt-power-engine-simulation-software>.

⁸⁶ 83 FR 42986, 43003 (Aug. 24, 2018).

As further discussed in the NPRM, although EPA had previously developed a vehicle simulation tool ("ALPHA") and a fleet compliance model ("OMEGA"), and had applied these in prior actions, having considered the facts before the Agency in 2018, EPA determined that, "it is reasonable and appropriate to use DOE/Argonne's model for full-vehicle simulation, and to use DOT's CAFE model for analysis of regulatory alternatives."⁸⁷

As discussed below and in Section VI.B.3, some commenters—some citing deliberative EPA staff communications during NPRM development, and one submitting comments by a former EPA staff member closely involved in the origination of the above-mentioned OMEGA model—took strong exception to EPA's decision to rely on DOE/Argonne and DOT-originated models as the basis for analysis informing EPA's decisions regarding CO₂ standards. Some commenters argued that the EPA Administrator must consider exclusively models and analysis originating with EPA staff, and that to do otherwise would be arbitrary and capricious. As explained below (and as explained in the NPRM), it is reasonable for the Administrator to consider analysis and information produced from many sources, including, in this instance, the DOE/Argonne and DOT models. The Administrator has the discretion to determine what information reasonably and appropriately informs decisions regarding emissions standards. Some commenters conflated models with decisions, suggesting that the former mechanically *determine* the latter. The CAA authorizes the EPA Administrator, not a model, to make decisions about emissions standards, just as EPCA provides similar authority to the Secretary. Models produce analysis, the results of which help to inform decisions. However, in making such decisions, the Administrator may and should consider other relevant information beyond the outputs of any models—including public comment—and, in all cases, must exercise judgment in establishing appropriate standards.

Some commenters conflated models with inputs and/or with results of the modeling. All of the models mentioned above rely on inputs, including not only data (*i.e.*, facts), but also estimates (inputs about the future are estimates, not data). Given these inputs, the models produce estimates—ultimately, the agencies' reported estimates of the potential impacts of standards under

⁸¹ See <https://www.epa.gov/moves>. Today's final rule used version MOVES2014b, available at <https://www.epa.gov/moves/latest-version-motor-vehicle-emission-simulator-moves>.

⁸² See https://www.eia.gov/outlooks/aeo/info_nems_archive.php. Today's final rule uses fuel prices estimated using the Annual Energy Outlook (AEO) 2019 version of NEMS (see <https://www.eia.gov/outlooks/aeo/data/browser/#/?id=3-AEO2019&cases=ref2019&sourcekey=0>).

⁸³ Information regarding GREET is available at <https://greet.es.anl.gov/index.php>. Today's notice uses the 2018 version of GREET.

⁸⁷ 83 FR 42986, 43000 (Aug. 24, 2018).

consideration. In other words, inputs do not define models; models use inputs. Therefore, disagreements about inputs do not logically extend to disagreements about models. Similarly, while models determine resulting outputs, they do so based on inputs. Therefore, disagreements about results do not necessarily imply disagreements about models; they may merely reflect disagreements about inputs. With respect to the Administrator's decisions regarding models underlying today's analysis, comments regarding inputs, therefore, are more appropriately addressed separately, which is done so below in Section VI.

The EPA Administrator's decision to continue relying on the DOE/Argonne Autonomie tool and DOT CAFE model rather than on the corresponding tools developed by EPA staff is informed by consideration of comments on results and on technical aspects of the models themselves. As discussed below, some commenters questioned specific aspects of the CAFE model's simulation of manufacturer's potential responses to CO₂ standards. Considering these comments, the CAFE model applied in the final rule's analysis includes some revisions and updates. For example, the "effective cost" metric used to select among available opportunities to apply fuel-saving technologies now uses a "cost per credit" metric rather than the metric used for the NPRM. Also, the model's representation of sales "multipliers" EPA has included for CNG vehicles, PHEVs, BEVs, and FCVs reflects current EPA regulations or, as an input-selectable option, an alternative approach under consideration. On the other hand, some commenters questioning the CAFE model's approach to some CO₂ program features appear to ignore the fact that prior analysis by EPA (using EPA's OMEGA) model likewise did not account for the same program features. For example, some stakeholders took issue with the CAFE model's approach to accounting for banked CO₂ credits and, in particular, credits banked prior to the model years accounted for explicitly in the analysis. In the course of updating the basis for analysis fleet from model year 2016 to model year 2017, the agencies have since updated corresponding inputs. However, even though the ability to carry forward credits impacts outcomes, EPA's OMEGA model used in previous rulemakings never attempted to account for credit banking and, indeed, lacking a year-by-year structure, *cannot* account for credit banking. Therefore, at least with respect to this important CO₂

program flexibility, the CAFE model provides a more complete and realistic basis for estimating actual impacts of new CO₂ standards.

For its part, NHTSA remains confident that the combination of the Autonomie and CAFE models remains the best available for CAFE rulemaking analysis, and notes, as discussed below, that even the environmental group coalition stated that the CAFE model is aligned with EPCA requirements.⁸⁸ In late 2001, after Congress discontinued an extended series of budget "riders" prohibiting work on CAFE standards, NHTSA and the DOT Volpe Center began development of a modeling system appropriate for CAFE rulemaking analysis, because other available models were not designed with this purpose in mind, and lacked capabilities important for CAFE rulemakings. For example, although NEMS had procedures to account for CAFE standards, those procedures did not provide the ability to account for specific manufacturers, as is especially relevant to the statutory requirement that NHTSA consider the economic practicability of any new CAFE standards. Also, as early as the first rulemaking making use of this early CAFE model, commenters stressed the importance of product redesign schedules, leading developers to introduce procedures to account for product cadence. In the 2003 notice regarding light truck standards for MYs 2005–2007, NHTSA stated that "we also changed the methodology to recognize that capital costs require employment of technologies for several years, rather than a single year. . . . In our view, this makes the Volpe analysis more consistent with the [manually implemented] Stage analysis and better reflects actual conditions in the automotive industry."⁸⁹ Since that time, NHTSA and the Volpe Center have significantly refined the CAFE model with each of rulemaking. For example, for the 2006 rulemaking regarding standards for MYs 2008–2011 light trucks, NHTSA introduced the ability to account for attribute-based standards, account for the social cost of CO₂ emissions, estimate stringencies at which net benefits would be maximized, and perform probabilistic uncertainty analysis (*i.e.*, Monte Carlo simulation).⁹⁰ For the 2009 rulemaking regarding standards for MY 2011 passenger cars and light trucks, we introduced the ability to account for

attribute-based passenger car standards, and the ability to apply "synergy factors" to estimate how some technology pairings impact fuel consumption.⁹¹ For the 2010 rulemaking regarding standards for MYs 2012–2016, we introduced procedures to account for FFV credits, and to account for product planning as a multiyear consideration.⁹² For the 2012 rulemaking regarding standards for MYs 2017–2025, we introduced several new procedures, such as (1) accounting for electricity used to charge electric vehicles (EVs) and plug-in hybrid electric vehicles (PHEVs), (2) accounting for use of ethanol blends in flexible-fuel vehicles (FFVs), (3) accounting for costs (*i.e.*, "stranded capital") related to early replacement of technologies, (4) accounting for previously-applied technology when determining the extent to which a manufacturer could expand use of the technology, (5) applying technology-specific estimates of changes in consumer value, (6) simulating the extent to which manufacturers might utilize EPCA's provisions regarding generation and use of CAFE credits, (7) applying estimates of fuel economy adjustments (and accompanying costs) reflecting increases in air conditioner efficiency, (8) reporting privately-valued benefits, (9) simulating the extent to which manufacturers might voluntarily apply technology beyond levels needed for compliance with CAFE standards, and (10) estimating changes in highway fatalities attributable to any applied reductions in vehicle mass.⁹³ Also for the 2012 rulemaking, we began making use of Autonomie to estimate fuel consumption impacts of different combinations of technologies, using these estimates to specify inputs to the CAFE model.⁹⁴ In 2016, providing analyses for both the draft TAR regarding light-duty CAFE standards and the final rule regarding fuel consumption standards for heavy-duty pickup trucks and vans, we greatly expanded the agency's use of Autonomie-based full vehicle simulations and introduced the ability to simulate compliance with attribute-based standards for heavy-duty pickups and vans.⁹⁵ And, as discussed at length in the NPRM and below, for this rulemaking, we have, among other things, refined procedures to account for impacts on highway travel and safety,

added procedures to simulate compliance with CO₂ standards, refined procedures to account for compliance credits, and added procedures to account for impacts on sales, scrappage, and employment. We have also significantly revised the model's graphical user interface (GUI) in order to make the model easier to operate and understand. Like any model, both Autonomie and the CAFE model benefit from ongoing refinement. However, NHTSA is confident that this combination of models produces a more realistic characterization of the potential impacts of new standards than would another combination of available models. Some stakeholders, while commenting on specific aspects of the inputs, models, and/or results, commended the agencies' exclusive reliance on the DOE/Argonne Autonomie tool and DOT CAFE model. With respect to CO₂ standards, these stakeholders noted not only technical reasons to use these models rather than the EPA models, but also other reasons such as efficiency, transparency, and ease with which outside parties can exercise models and replicate the agencies' analysis. These comments are discussed below and in Section VI.

Nevertheless, some comments regarding the model's handling of CAFE and/or CO₂ standards, and some comments regarding the model's estimation of resultant impacts, led the agencies to make changes to specific aspects of the model. Comments on and changes to the inputs and model are discussed below and in Section VI; results are discussed in Section VII and in the accompanying RIA; and the meaning of results in the context of the applicable statutory requirements is discussed in Section VIII.

As explained, the analysis is designed to reflect a number of statutory and regulatory requirements applicable to CAFE and tailpipe CO₂ standard setting. EPCA contains a number of requirements governing the scope and nature of CAFE standard setting. Among these, some have been in place since EPCA was first signed into law in 1975, and some were added in 2007, when Congress passed EISA and amended EPCA. The CAA, as discussed elsewhere, provides EPA with very broad authority under Section 202(a), and does not contain EPCA/EISA's prescriptions. In the interest of harmonization, however, EPA has adopted some of the EPCA/EISA requirements into its tailpipe CO₂ regulations, and NHTSA, in turn, has created some additional flexibilities by regulation not expressly envisioned by EPCA/EISA in order to harmonize better

with some of EPA's programmatic decisions. EPCA/EISA requirements regarding the technical characteristics of CAFE standards and the analysis thereof include, but are not limited to, the following, and the analysis reflects these requirements as summarized:

Corporate Average Standards: 49 U.S.C. 32902 requires standards that apply to the average fuel economy levels achieved by each corporation's fleets of vehicles produced for sale in the U.S.⁹⁶ CAA Section 202(a) does not preclude the EPA Administrator from expressing CO₂ standards as *de facto* fleet average requirements, and EPA has adopted a similar approach in the interest of harmonization. The CAFE Model, used by the agencies to conduct the bulk of today's analysis, calculates the CAFE and CO₂ levels of each manufacturer's fleets based on estimated production volumes and characteristics, including fuel economy levels, of distinct vehicle models that could be produced for sale in the U.S.

Separate Standards for Passenger Cars and Light Trucks: 49 U.S.C. 32902 requires the Secretary of Transportation to set CAFE standards separately for passenger cars and light trucks. CAA Section 202(a) does not preclude the EPA Administrator from specifying CO₂ standards separately for passenger cars and light trucks, and EPA has adopted a similar approach. The CAFE Model accounts separately for passenger cars and light trucks, including differentiated standards and compliance.

Attribute-Based Standards: 49 U.S.C. 32902 requires the Secretary of Transportation to define CAFE standards as mathematical functions expressed in terms of one or more vehicle attributes related to fuel economy. This means that for a given manufacturer's fleet of vehicles produced for sale in the U.S. in a given regulatory class and model year, the applicable minimum CAFE requirement (*i.e.*, the numerical value of the requirement) is computed based on the applicable mathematical function, and the mix and attributes of vehicles in the manufacturer's fleet. In the 2012 final rule that first established CO₂ standards, EPA also adopted an attribute-based standard under its broad CAA Section

202(a) authority. The CAFE Model accounts for such functions and vehicle attributes explicitly.

Separately Defined Standards for Each Model Year: 49 U.S.C. 32902 requires the Secretary to set CAFE standards (separately for passenger cars and light trucks) at the maximum feasible levels in each model year. CAA Section 202(a) allows EPA to establish CO₂ standards separately for each model year, and EPA has chosen to do so for this final rule, similar to the approach taken in the previous light-duty vehicle CO₂ standard-setting rules. The CAFE Model represents each model year explicitly, and accounts for the production relationships between model years.⁹⁷

Separate Compliance for Domestic and Imported Passenger Car Fleets: 49 U.S.C. 32904 requires the EPA Administrator to determine CAFE compliance separately for each manufacturers' fleets of domestic passenger cars and imported passenger cars, which manufacturers must consider as they decide how to improve the fuel economy of their passenger car fleets. CAA 202(a) does not preclude the EPA Administrator from determining compliance with CO₂ standards separately for a manufacturer's domestic and imported car fleets, but EPA did not include such a distinction in either the 2010 or 2012 final rules, and EPA did not propose or ask for comment on taking such an approach in the proposal. The CAFE Model is able to account explicitly for this requirement when simulating manufacturers' potential responses to CAFE standards, but combines any given manufacturer's domestic and imported cars into a single fleet when simulating that manufacturer's potential response to CO₂ standards.

Minimum CAFE Standards for Domestic Passenger Car Fleets: 49 U.S.C. 32902 requires that domestic passenger car fleets achieve CAFE levels no less than 92 percent of the industry-wide average level required under the applicable attribute-based CAFE standard, as projected by the Secretary at the time the standard is promulgated. CAA 202(a) does not preclude the EPA Administrator from correspondingly requiring that domestic passenger car fleets achieve CO₂ levels no greater than 108.7 percent ($1/0.92 = 1.087$) of the projected industry-wide average CO₂

⁹⁶ This differs from safety standards and traditional emissions standards, which apply separately to each vehicle. For example, every vehicle produced for sale in the U.S. must, on its own, meet all applicable federal motor vehicle safety standards (FMVSS), but no vehicle produced for sale must, on its own, federal fuel economy standards. Rather, each manufacturer is required to produce a mix of vehicles that, taken together, achieve an average fuel economy level no less than the applicable minimum level.

⁹⁷ For example, a new engine first applied to given vehicle model/configuration in model year 2020 will most likely be "carried forward" to model year 2021 of that same vehicle model/configuration, in order to reflect the fact that manufacturers do not apply brand-new engines to a given vehicle model every single year.

requirement under the attribute-based standard, but the GHG program that EPA designed in the 2010 and 2012 final rules did not include such a distinction, and EPA did not propose or seek comment on such an approach in the proposal. The CAFE Model is able to account explicitly for this requirement for CAFE standards, and sets this requirement aside for CO₂ standards.

Civil Penalties for Noncompliance: 49 U.S.C. 32912 prescribes a rate (in dollars per tenth of a mpg) at which the Secretary is to levy civil penalties if a manufacturer fails to comply with a CAFE standard for a given fleet in a given model year, after considering available credits. Some manufacturers have historically demonstrated a willingness to treat CAFE noncompliance as an “economic” choice, electing to pay civil penalties rather than achieving full numerical compliance across all fleets. The CAFE Model calculates civil penalties for CAFE shortfalls and provides means to estimate that a manufacturer might stop adding fuel-saving technologies once continuing to do so would be effectively more “expensive” (after accounting for fuel prices and buyers’ willingness to pay for fuel economy) than paying civil penalties. In contrast, the CAA does not authorize the EPA Administrator to allow manufacturers to sell noncompliant fleets and instead only pay civil penalties; manufacturers who choose to pay civil penalties for CAFE compliance tend to employ EPA’s more-extensive programmatic flexibilities to meet tailpipe CO₂ emissions standards. Thus, the CAFE Model does not allow civil penalty payment as an option for CO₂ standards.

Dual-Fueled and Dedicated Alternative Fuel Vehicles: For purposes of calculating CAFE levels used to determine compliance, 49 U.S.C. 32905 and 32906 specify methods for calculating the fuel economy levels of vehicles operating on alternative fuels to gasoline or diesel through MY 2020. After MY 2020, methods for calculating alternative fuel vehicle (AFV) fuel economy are governed by regulation. The CAFE Model is able to account for these requirements explicitly for each vehicle model. However, 49 U.S.C. 32902 requires that maximum feasible CAFE standards be set in a manner that does not presume manufacturers can respond by producing new dedicated alternative fuel vehicle (AFV) models. The CAFE model can be run in a manner that excludes the additional application of dedicated AFV technologies in model years for which maximum feasible standards are under

consideration. As allowed under NEPA for analysis appearing in EISs informing decisions regarding CAFE standards, the CAFE Model can also be run without this analytical constraint. CAA 202(a) does not preclude the EPA Administrator adopting analogous provisions, but EPA has instead opted through regulation to “count” dual- and alternative fuel vehicles on a CO₂ basis (and through MY 2026, to set aside emissions from electricity generation). The CAFE model accounts for this treatment of dual- and alternative fuel vehicles when simulating manufacturers’ potential responses to CO₂ standards. For natural gas vehicles, both dedicated and dual-fueled, EPA is establishing a multiplier of 2.0 for model years 2022–2026.

Creation and Use of Compliance Credits: 49 U.S.C. 32903 provides that manufacturers may earn CAFE “credits” by achieving a CAFE level beyond that required of a given fleet in a given model year, and specifies how these credits may be used to offset the amount by which a different fleet falls short of its corresponding requirement. These provisions allow credits to be “carried forward” and “carried back” between model years, transferred between regulated classes (domestic passenger cars, imported passenger cars, and light trucks), and traded between manufacturers. However, these provisions also impose some specific statutory limits. For example, CAFE compliance credits can be carried forward a maximum of five model years and carried back a maximum of three model years. Also, EPCA/EISA caps the amount of credit that can be transferred between passenger car and light truck fleets, and prohibits manufacturers from applying traded or transferred credits to offset a failure to achieve the applicable minimum standard for domestic passenger cars. The CAFE Model explicitly simulates manufacturers’ potential use of credits carried forward from prior model years or transferred from other fleets.⁹⁸ 49 U.S.C. 32902

⁹⁸ As explained in Section VI, the CAFE Model does not explicitly simulate the potential that manufacturers would carry CAFE or CO₂ credits back (*i.e.*, borrow) from future model years, or acquire and use CAFE compliance credits from other manufacturers. At the same time, because EPA has elected to not limit credit trading, the CAFE Model can be exercised in a manner that simulates unlimited (*a.k.a.* “perfect”) CO₂ compliance credit trading throughout the industry (or, potentially, within discrete trading “blocks”). The agencies believe there is significant uncertainty in how manufacturers may choose to employ these particular flexibilities in the future: for example, while it is reasonably foreseeable that a manufacturer who over-complies in one year may “coast” through several subsequent years relying on those credits rather than continuing to make

prohibits consideration of manufacturers’ potential application of CAFE compliance credits when setting maximum feasible CAFE standards. The CAFE Model can be operated in a manner that excludes the application of CAFE credits after a given model year. CAA 202(a) does not preclude the EPA Administrator adopting analogous provisions. EPA has opted to limit the “life” of compliance credits from most model years to 5 years, and to limit borrowing to 3 years, but has not adopted any limits on transfers (between fleets) or trades (between manufacturers) of compliance credits. The CAFE Model is able to account for the absence of limits on transfers of CO₂ standards. Insofar as the CAFE model can be exercised in a manner that simulates trading of CO₂ compliance credits, such simulations treat trading as unlimited.⁹⁹ EPA has considered manufacturers’ ability to use credits as part of its decisions on these final standards, and the CAFE model is now able to account for that.

Statutory Basis for Stringency: 49 U.S.C. 32902 requires the Secretary to set CAFE standards at the maximum feasible levels, considering technological feasibility, economic practicability, the need of the Nation to conserve energy, and the impact of other government standards. EPCA/EISA authorizes the Secretary to interpret

technology improvements, it is harder to assume with confidence that manufacturers will rely on future technology investments (that may not pan out as expected, as if market demand for “target-beater” vehicles is lower than expected) to offset prior-year shortfalls, or whether/how manufacturers will trade credits with market competitors rather than making their own technology investments. Historically, carry-back and trading have been much less utilized than carry-forward, for a variety of reasons including higher risk and preference not to “pay competitors to make fuel economy improvements we should be making” (to paraphrase one manufacturer), although the agencies recognize that carry-back and trading are used more frequently when standards require more technology application than manufacturers believe their markets will bear. Given the uncertainty just discussed, and given also the fact that the agencies have yet to resolve some of analytical challenges associated with simulating use of these flexibilities, the agencies consider borrowing and trading to involve sufficient risk that it is prudent to support today’s decisions with analysis that sets aside the potential that manufacturers could come to depend widely on borrowing and trading. While compliance costs in real life may be somewhat different from what is modeled today as a result of this analytical decision, that is broadly true no matter what, and the agencies do not believe that the difference would be so great that it would change the policy outcome.

⁹⁹ To avoid making judgments (that would invariably turn out to be at least somewhat incorrect) about possible future trading activity, the model simulates trading by combining all manufacturers into a single entity, so that the most cost-effective choices are made for the fleet as a whole.

these factors, and as the Department's interpretation has evolved, NHTSA has continued to expand and refine its qualitative and quantitative analysis. For example, as discussed below in Section VI.B.3, the Autonomie simulations reflect the agencies' judgment that it would not be economically practicable for a manufacturer to "split" an engine shared among many vehicle model/configurations into a myriad of versions each optimized to a single vehicle model/configuration. Also responding to evolving interpretation of these EPCA/EISA factors, the CAFE Model has been expanded to address additional impacts in an integrated manner. For example, the CAFE Model version used for the NPRM analysis included the ability to estimate impacts on labor utilization internally, rather than as an external "off model" or "post processing" analysis. In addition, NEPA requires the Secretary to issue an EIS that documents the estimated impacts of regulatory alternatives under consideration. The EIS accompanying today's notice documents changes in emission inventories as estimated using the CAFE model, but also documents corresponding estimates—based on the application of other models documented in the EIS, of impacts on the global climate, on tropospheric air quality, and on human health. Regarding CO₂ standards, CAA 202(a) provides general authority for the establishment of motor vehicle emissions standards, and the final rule's analysis, like that accompanying the agencies' proposal, addresses impacts relevant to the EPA Administrator's decision making, such as technological feasibility, air quality impacts, costs to industry and consumers, and lead time necessary for compliance.

Other Factors: Beyond these statutory requirements applicable to DOT and/or EPA are a number of specific technical characteristics of CAFE and/or CO₂ regulations that are also relevant to the construction of today's analysis. These are discussed at greater length in Section II.F. For example, EPA has defined procedures for calculating average CO₂ levels, and has revised procedures for calculating CAFE levels, to reflect manufacturers' application of "off-cycle" technologies that increase fuel economy (and reduce CO₂ emissions) in ways not reflected by the long-standing test procedures used to measure fuel economy. Although too little information is available to account for these provisions explicitly in the same way that the agencies have accounted for other technologies, the

CAFE Model does include and makes use of inputs reflecting the agencies' expectations regarding the extent to which manufacturers may earn such credits, along with estimates of corresponding costs. Similarly, the CAFE Model includes and makes use of inputs regarding credits EPA has elected to allow manufacturers to earn toward CO₂ levels (not CAFE) based on the use of air conditioner refrigerants with lower global warming potential (GWP), or on the application of technologies to reduce refrigerant leakage. In addition, EPA has elected to provide that through model year 2021, manufacturers may apply "multipliers" to plug-in hybrid electric vehicles, dedicated electric vehicles, fuel cell vehicles, and hydrogen vehicles, such that when calculating a fleet's average CO₂ levels (not CAFE), the manufacturer may, for example, "count" each electric vehicle twice. The CAFE Model accounts for these multipliers, based on either current regulatory provisions or on alternative approaches. Although these are examples of regulatory provisions that arise from the exercise of discretion rather than specific statutory mandate, they can materially impact outcomes. Section VI.B explains in greater detail how today's analysis addresses them.

Benefits of Analytical Approach

The agencies' analysis of CAFE and CO₂ standards involves two basic elements: First, estimating ways each manufacturer could potentially respond to a given set of standards in a manner that considers potential consumer response; and second, estimating various impacts of those responses. Estimating manufacturers' potential responses involves simulating manufacturers' decision-making processes regarding the year-by-year application of fuel-saving technologies to specific vehicles. Estimating impacts involves calculating resultant changes in new vehicle costs, estimating a variety of costs (e.g., for fuel) and effects (e.g., CO₂ emissions from fuel combustion) occurring as vehicles are driven over their lifetimes before eventually being scrapped, and estimating the monetary value of these effects. Estimating impacts also involves consideration of the response of consumers—e.g., whether consumers will purchase the vehicles and in what quantities. Both of these basic analytical elements involve the application of many analytical inputs.

As mentioned above, the agencies' analysis uses the CAFE model to estimate manufacturers' potential responses to new CAFE and CO₂ standards and to estimate various

impacts of those responses. DOT's Volpe National Transportation Systems Center (often simply referred to as the "Volpe Center") develops, maintains, and applies the model for NHTSA. NHTSA has used the CAFE model to perform analyses supporting every CAFE rulemaking since 2001, and the 2016 rulemaking regarding heavy-duty pickup and van fuel consumption and CO₂ emissions also used the CAFE model for analysis.¹⁰⁰

NHTSA recently arranged for a formal peer review of the model. In general, reviewers' comments strongly supported the model's conceptual basis and implementation, and commenters provided several specific recommendations. The agency agreed with many of these recommendations and has worked to implement them wherever practicable. Implementing some of the recommendations would require considerable further research, development, and testing, and will be considered going forward. For a handful of other recommendations, the agency disagreed, often finding the recommendations involved considerations (e.g., other policies, such as those involving fuel taxation) beyond the model itself or were based on concerns with inputs rather than how the model itself functioned. A report available in the docket for this rulemaking presents peer reviewers' detailed comments and recommendations, and provides DOT's detailed responses.¹⁰¹

As also mentioned above, the agencies use EPA's MOVES model to estimate tailpipe emission factors, use DOE/EIA's NEMS to estimate fuel prices,¹⁰² and use Argonne's GREET model to estimate downstream emissions rates.¹⁰³ DOT also sponsored DOE/Argonne to use the Autonomie full-vehicle modeling and simulation tool to estimate the fuel economy impacts for roughly a million

¹⁰⁰ While both agencies used the CAFE Model to simulate manufacturers' potential responses to standards, some model inputs differed EPA's and DOT's analyses, and EPA also used the EPA MOVES model to calculate resultant changes in emissions inventories. See 81 FR 73478, 73743 (Oct. 25, 2016).

combinations of technologies and vehicle types.^{104 105}

EPA developed two models after 2009, referred to as the “ALPHA” and “OMEGA” models, which provide some of the same capabilities as the Autonomie and CAFE models. EPA applied the OMEGA model to conduct analysis of tailpipe CO₂ emissions standards promulgated in 2010 and 2012, and the ALPHA and OMEGA models to conduct analysis discussed in the above-mentioned 2016 Draft TAR and Proposed and 2017 Initial Final Determinations regarding standards beyond 2021. In an August 2017 notice, the agencies requested comments on, among other things, whether EPA should use alternative methodologies and modeling, including DOE/Argonne’s Autonomie full-vehicle modeling and simulation tool and DOT’s CAFE model.¹⁰⁶

Having reviewed comments on the subject and having considered the matter fully, the agencies have determined it is reasonable and appropriate to use DOE/Argonne’s model for full-vehicle simulation, and to use DOT’s CAFE model for analysis of regulatory alternatives. EPA interprets Section 202(a) of the CAA as giving the agency broad discretion in how it develops and sets CO₂ emissions standards for light-duty vehicles. Nothing in Section 202(a) mandates that EPA use any specific model or set of models for analysis of potential CO₂ standards for light-duty vehicles. EPA weighs many factors when determining appropriate levels for CO₂ standards, including the cost of compliance (*see* Section 202(a)(2)), lead time necessary for compliance (*id.*), safety (*see NRDC v. EPA*, 655 F.2d 318, 336 n. 31 (D.C. Cir. 1981)) and other impacts on consumers,¹⁰⁷ and energy impacts

associated with use of the technology.¹⁰⁸ Using the CAFE model allows consideration of a number of factors. The CAFE model explicitly evaluates the cost of compliance for each manufacturer, each fleet, and each model year; it accounts for lead time necessary for compliance by directly incorporating estimated manufacturer production cycles for every vehicle in the fleet, ensuring that the analysis does not assume vehicles can be redesigned to incorporate more technology without regard to lead time considerations; it provides information on safety effects associated with different levels of standards and information about many other impacts on consumers, and it calculates energy impacts (*i.e.*, fuel saved or consumed) as a primary function, besides being capable of providing information about many other factors within EPA’s broad CAA discretion to consider.

Because the CAFE model simulates a wide range of actual constraints and practices related to automotive engineering, planning, and production, such as common vehicle platforms, sharing of engines among different vehicle models, and timing of major vehicle redesigns, the analysis produced by the CAFE model provides a transparent and realistic basis to show pathways manufacturers could follow over time in applying new technologies, which helps better assess impacts of potential future standards. Furthermore, because the CAFE model also accounts fully for regulatory compliance provisions (now including CO₂ compliance provisions), such as adjustments for reduced refrigerant leakage, production “multipliers” for some specific types of vehicles (*e.g.*, PHEVs), and carried-forward (*i.e.*, banked) credits, the CAFE model provides a transparent and realistic basis to estimate how such technologies might be applied over time in response to CAFE or CO₂ standards.

There are sound reasons for the agencies to use the CAFE model going forward in this rulemaking. First, the CAFE and CO₂ fact analyses are inextricably linked. Furthermore, the analysis produced by the CAFE model and DOE/Argonne’s Autonomie addresses the agencies’ analytical needs. The CAFE model provides an explicit year-by-year simulation of manufacturers’ application of technology to their products in response to a year-by-year progression of CAFE

standards and accounts for sharing of technologies and the implications for timing, scope, and limits on the potential to optimize powertrains for fuel economy. In the real world, standards actually are specified on a year-by-year basis, not simply some single year well into the future, and manufacturers’ year-by-year plans involve some vehicles “carrying forward” technology from prior model years and some other vehicles possibly applying “extra” technology in anticipation of standards in ensuing model years, and manufacturers’ planning also involves applying credits carried forward between model years. Furthermore, manufacturers cannot optimize the powertrain for fuel economy on every vehicle model configuration—for example, a given engine shared among multiple vehicle models cannot practicably be split into different versions for each configuration of each model, each with a slightly different displacement. The CAFE model is designed to account for these real-world factors.

Considering the technological heterogeneity of manufacturers’ current product offerings, and the wide range of ways in which the many fuel economy-improving/CO₂ emissions-reducing technologies included in the analysis can be combined, the CAFE model has been designed to use inputs that provide an estimate of the fuel economy achieved for many tens of thousands of different potential combinations of fuel-saving technologies. Across the range of technology classes encompassed by the analysis fleet, today’s analysis involves more than a million such estimates. While the CAFE model requires no specific approach to developing these inputs, the National Academy of Sciences (NAS) has recommended, and stakeholders have commented, that full-vehicle simulation provides the best balance between realism and practicality. DOE/Argonne has spent several years developing, applying, and expanding means to use distributed computing to exercise its Autonomie full-vehicle modeling and simulation tool over the scale necessary for realistic analysis of CAFE or average tailpipe CO₂ emissions standards. This scalability and related flexibility (in terms of expanding the set of technologies to be simulated) makes Autonomie well-suited for developing inputs to the CAFE model.

In addition, DOE/Argonne’s Autonomie also has a long history of development and widespread application by a much wider range of users in government, academia, and industry. Many of these users apply

¹⁰⁴ As part of the Argonne simulation effort, individual technology combinations simulated in Autonomie were paired with Argonne’s BatPAC model to estimate the battery cost associated with each technology combination based on characteristics of the simulated vehicle and its level of electrification. Information regarding Argonne’s BatPAC model is available at <http://www.cse.anl.gov/batpac/>.

¹⁰⁵ Furthermore, the impact of engine technologies on fuel consumption, torque, and other metrics was characterized using GT POWER simulation modeling in combination with other engine modeling that was conducted by IAV Automotive Engineering, Inc. (IAV). The engine characterization “maps” resulting from this analysis were used as inputs for the Autonomie full-vehicle simulation modeling. Information regarding GT Power is available at <https://www.gtisoft.com/gt-suite-applications/propulsion-systems/gt-power-engine-simulation-software>.

¹⁰⁶ 82 FR 39551, 39553 (Aug. 21, 2017).

¹⁰⁷ Since its earliest Title II regulations, EPA has considered the safety of pollution control technologies. *See* 45 FR 14496, 14503 (1980).

¹⁰⁸ *See* *George E. Warren Corp. v. EPA*, 159 F.3d 616, 623–624 (D.C. Cir. 1998) (ordinarily permissible for EPA to consider factors not specifically enumerated in the Act).

Autonomie to inform funding and design decisions. These real-world exercises have contributed significantly to aspects of Autonomie important to producing realistic estimates of fuel economy levels and CO₂ emission rates, such as estimation and consideration of performance, utility, and driveability metrics (e.g., towing capability, shift business, frequency of engine on/off transitions). This steadily increasing realism has, in turn, steadily increased confidence in the appropriateness of using Autonomie to make significant investment decisions. Notably, DOE uses Autonomie for analysis supporting budget priorities and plans for programs managed by its Vehicle Technologies Office (VTO). Considering the advantages of DOE/Argonne's Autonomie model, it is reasonable and appropriate to use Autonomie to estimate fuel economy levels and CO₂ emission rates for different combinations of technologies as applied to different types of vehicles.

Commenters have also suggested that the CAFE model's graphical user interface (GUI) facilitates others' ability to use the model quickly—and without specialized knowledge or training—and to comment accordingly.¹⁰⁹ For the NPRM, NHTSA significantly expanded and refined this GUI, providing the ability to observe the model's real-time progress much more closely as it simulates year-by-year compliance with either CAFE or CO₂ standards.¹¹⁰ Although the model's ability to produce realistic results is independent of the model's GUI, the CAFE model's GUI appears to have facilitated stakeholders' meaningful review and comment during the comment period.

The question of whether EPA's actions should consider and be informed by analysis using non-EPA-staff-developed modeling tools has generated considerable debate over time. Even prior to the NPRM, certain commenters had argued that EPA could not consider, in setting tailpipe CO₂ emissions standards, any information derived from non-EPA-staff-developed modeling. Many of the pre-NPRM

concerns focused on inputs used by the CAFE model for prior rulemaking analyses.^{111 112 113} Because inputs are exogenous to any model, they do not determine whether it would be reasonable and appropriate for EPA to use NHTSA's model for analysis. Other concerns focused on certain characteristics of the CAFE model that were developed to align the model better with EPCA and EISA. The model has been revised to accommodate both EPCA/EISA and CAA analysis, as explained further below. Some commenters also argued that use of any models other than ALPHA and OMEGA for CAA analysis would constitute an arbitrary and capricious delegation of EPA's decision-making authority to NHTSA, if NHTSA models are used for analysis instead.¹¹⁴ As discussed above, the CAFE Model—as with any model—is used to provide analysis, and does not result in decisions. Decisions are made by EPA in a manner that is informed by modeling outputs, sensitivity cases, public comments, any many other pieces of information.

Comments responding to the NPRM's use of the CAFE model and Autonomie rather than also (for CO₂ standards)

¹¹¹ For example, EDF previously stated that “the data that NHTSA needs to input into its model is sensitive confidential business information that is not transparent and cannot be independently verified, . . .” and it claimed “the OMEGA model's focus on direct technological inputs and costs—as opposed to industry self-reported data—ensures the model more accurately characterizes the true feasibility and cost effectiveness of deploying greenhouse gas reducing technologies.” EDF, EPA–HQ–OAR–2015–0827–9203, at 12. These statements are not correct, as nothing about either the CAFE or OMEGA model either obviates or necessitates the use of CBI to develop inputs.

¹¹² As another example, CARB previously stated that “another promising technology entering the market was not even included in the NHTSA compliance modeling” and that EPA assumes a five-year redesign cycle, whereas NHTSA assumes a six to seven-year cycle.” CARB, EPA–HQ–OAR–2015–0827–9197, at 28. Though presented as criticisms of the models, these comments—at least with respect to the CAFE model—actually concern model inputs. NHTSA did not agree with CARB about the commercialization potential of the engine technology in question (“Atkinson 2”) and applied model inputs accordingly. Also, rather than applying a one-size-fits-all assumption regarding redesign cadence, NHTSA developed estimates specific to each vehicle model and applied these as model inputs.

¹¹³ As another example, NRDC has argued that EPA should not use the CAFE model because it “allows manufacturers to pay civil penalties in lieu of meeting the standards, an alternative compliance pathway currently allowed under EISA and EPCA.” NRDC, EPA–HQ–OAR–2015–0827–9826, at 37. While the CAFE model can simulate civil penalty payment, NRDC's comment appears to overlook the fact that this result depends on model inputs; the inputs can easily be specified such that the CAFE model will set aside civil penalty payment as an alternative to compliance.

¹¹⁴ See, e.g., CBD *et al.*, NHTSA–2018–0067–12057, at 9.

ALPHA and OMEGA were mixed. For example, the environmental group coalition stated that the CAFE model is aligned with EPCA requirements,¹¹⁵ but also argued (1) that EPA is legally prohibited from “delegat[ing] technical decision-making to NHTSA;”¹¹⁶ (2) that “EPA must exercise its technical and scientific expertise” to develop CO₂ standards and “Anything less is an unlawful abdication of EPA's statutory responsibilities;”¹¹⁷ (3) that EPA staff is much more qualified than DOT staff to conduct analysis relating to standards and has done a great deal of work to inform development of standards;¹¹⁸ (4) that “The Draft TAR and 2017 Final Determination relied extensively on use of sophisticated EPA analytic tools and methodologies,” *i.e.*, the “peer reviewed simulation model ALPHA,” “the agency's vehicle teardown studies,” and the “peer-reviewed OMEGA model to make reasonable estimates of how manufacturers could add technologies to vehicles in order to meet a fleet-wide [CO₂ emissions] standard;”¹¹⁹ (5) that NHTSA had said in the MYs 2012–2016 rulemaking that the Volpe [CAFE] model was developed to support CAFE rulemaking and incorporates features “that are not appropriate for use by EPA in setting [tailpipe CO₂] standards;”¹²⁰ (6) allegations that some EPA staff had disagreed with aspects of the NPRM analysis and had requested that “EPA's name and logo should be removed from the DOT-NHTSA Preliminary Regulatory Impact Analysis document” and stated that “EPA is relying upon the technical analysis performed by DOT-NHTSA for the [NPRM];”¹²¹ (7) that EPA had developed “a range of relevant new analysis” that the proposal “failed to consider,” including “over a dozen 2017 and 2018 EPA peer reviewed SAE articles;”¹²² (8) that EPA's OMEGA modeling undertaken during NPRM development “found costs *half* that of NHTSA's findings,” “Yet NHTSA did not correct the errors in its modeling and analysis, and the published proposal drastically overestimates the cost of complying;”¹²³ (9) that some EPA staff had requested that the technology “HCR2” be included in the NPRM analysis, “Yet NHTSA overruled

¹¹⁰ The updated GUI provides a range of graphs updated in real time as the model operates. These graphs can be used to monitor fuel economy or CO₂ ratings of vehicles in manufacturers' fleets and to monitor year-by-year CAFE (or average CO₂ ratings), costs, avoided fuel outlays, and avoided CO₂-related damages for specific manufacturers and/or specific fleets (e.g., domestic passenger car, light truck). Because these graphs update as the model progresses, they should greatly increase users' understanding of the model's approach to considerations such as multiyear planning, payment of civil penalties, and credit use.

EPA and omitted the technology;"¹²⁴ (10) that certain EPA staff had initially "rejected use of the CAFE model for development of the proposed [tailpipe CO₂] standards;"¹²⁵ (11) that there are "many specific weaknesses of the modeling results derived in this proposal through use of the Volpe and Autonomie models" and that the CAFE model is "not designed in accordance with" Section 202(a) of the CAA because (A) EPA "is not required to demonstrate that standards are set at the maximum feasible level year-by-year," (B) because EPCA "preclude[s] NHTSA] from considering vehicles powered by fuels other than gas or diesel" and EPA is not similarly bound, and (C) because the CAFE model assumed that the value of an overcompliance credit equaled \$5.50, the value of a CAFE penalty.¹²⁶ Because of all of these things, the environmental group coalition stated that the proposal was "unlawful" and that "Before proceeding with this rulemaking, EPA must consider all relevant materials including these excluded insights, perform its own analysis, and issue a reproposal to allow for public comment."¹²⁷

Some environmental organizations and States contracted for external technical analyses augmenting general comments such as those summarized above. EDF engaged a consultant, Richard Rykowski, for a detailed review of the agencies' analysis.¹²⁸ Among Mr. Rykowski's comments, a few specifically involve differences between these two models. Mr. Rykowski recommended NHTSA's CAFE model replace its existing "effective cost" metric (used to compare available options to add specific technologies to specific vehicles) with a "ranking factor" used for the same purpose. As discussed below in Section VI.A, the model for today's final rule adopts this recommendation. He also states that (1) "EPA has developed a better way to isolate and reject cost ineffective combinations of technologies . . . [and] includes only these 50 or so technology combinations in their OMEGA model runs;" (2) "NHTSA's arbitrary and rigid designation of leader-follower vehicles for engine, transmission and platform level technologies unrealistically slows the rollout of technology into the new vehicle fleet;" (3) "the Volpe Model is

not capable of reasonably simulating manufacturers' ability to utilize CO₂ credits to smooth the introduction of technology throughout their vehicle line-up;" and (4) "the Volpe Model is not designed to reflect the use of these [A/C leakage] technologies and refrigerants."¹²⁹

Mr. Rogers's analysis focuses primarily on the agencies' published analysis, but mentions that some engine "maps" (estimates—used as inputs to full vehicle simulation—of engine fuel consumption under a wide range of engine operating conditions) applied in Autonomie show greater fuel consumption benefits of turbocharging than those applied previously by EPA to EPA's ALPHA model, and these benefits could have caused NHTSA's CAFE model to estimate an unrealistically great tendency toward turbocharged engines (rather than high compression ratio engines).¹³⁰ Mr. Rogers also presents alternative examples of year-by-year technology application to specific vehicle models, contrasting these with year-by-year results from the agencies' NPRM analysis, concluding that "that the use of logical, unrestricted technology pathways, with incremental benefits supported by industry-accepted vehicle simulation and dynamic system optimization and calibration, together with publicly-defensible costs, allows cost-effective solutions to achieve target fuel economy levels which meet MY 2025 existing standards."¹³¹

Mr. Duleep's analysis also focuses primarily on the agencies' published analysis, but does mention that (1) "the Autonomie modeling assumes no engine change when drag and rolling resistance reductions are implemented, as well as no changes to the transmission gear ratios and axle ratios, . . . [but] the EPA ALPHA model adjusts for this effect;" (2) "baseline differences in fuel economy [between two manufacturers' different products using similar technologies] are carried for all future years and this exaggerates the differences in technology adoption requirements and costs between manufacturers;" (3) "assumptions [that most technology changes are best applied as part of a vehicle redesign or freshening] result in unnecessary distortion in technology paths and may bias results of costs for different manufacturers;" and (4) that for the sample results shown for the Chevrolet Equinox "the publicly available EPA

lumped parameter model (which was used to support the 2016 rulemaking) and 2016 TAR cost data . . . results in an estimate of attaining 52.2 mpg for a cost of \$2110, which is less than half the cost estimated in the PRIA."¹³²

Beyond these comments regarding differences between EPA's models and the Argonne and DOT models applied for the NPRM, these and other technical reviewers had many specific comments about the agencies' analysis for the NPRM, and these comments are discussed in detail below in Section VI.B.

Manufacturers, on the other hand, supported the agencies' use of Autonomie and the CAFE model rather than, in EPA's case, the ALPHA and OMEGA models. Expressly identifying the distinction between models and model inputs, Global Automakers stated that:

The agencies provided a new, updated analysis based on the most up-to-date data, using a proven and long-developed modeling tool, known as the Volpe model, and offering numerous options to best determine the right regulatory and policy path for ongoing fuel efficiency improvements in our nation. Now, all stakeholders have an opportunity to come to the table as part of the public process to provide input, data, and information to help shape the final rule.¹³³

This NPRM's use of a single model to evaluate alternative scenarios for both programs provides consistency in the technical analysis, and Global Automakers supports the Volpe model's use as it has proven to be a transparent and user-friendly option in this current analysis. The use of the Volpe model has allowed for a broad range of stakeholders, with varying degrees of technical expertise, to review the data inputs to provide feedback on this proposed rule. The Volpe model's accompanying documentation has historically provided a clear explanation of all sources of input and constraints critical to a transparent modeling process. Other inputs have come from modeling that is used widely by other sources, specifically the Autonomie model, allowing for a robust validation, review and reassessment.¹³⁴

The Alliance commented, similarly, that "at least at this time, NHTSA's modeling systems are superior to EPA's" and "as such, we support the Agencies' decision to use NHTSA's modeling tools for this rulemaking and recommend that both Agencies continue on this path. We encourage Agencies to work together to provide input to the single common set of tools."¹³⁵

¹³⁵ Alliance, NHTSA–2018–0067–12073, at 134.

Regarding the agencies' use of Argonne's Autonomie model rather than EPA's ALPHA model, the Alliance commented that (1) "the benefits of virtually all technologies and their synergistic effects are now determined with full vehicle simulations;" (2) "vehicle categories have been increased to 10 to better recognize the range of 0–60 performance characteristics within each of the 5 previous categories, in recognition of the fact that many vehicles in the baseline fleet significantly exceeded the previously assumed 0–60 performance metrics. This provides better resolution of the baseline fleet and more accurate estimates of the benefits of technology. . . .;" (3) "new technologies (like advanced cylinder deactivation) are included, while unproven combinations (like Atkinson engines with 14:1 compression, cooled EGR, and cylinder deactivation in combination) have been removed;" (4) "Consistent with the recommendation of the National Academy of Sciences and manufacturers, gradeability has been included as a performance metric used in engine sizing. This helps prevent the inclusion of small displacement engines that are not commercially viable and that would artificially inflate fuel savings;" (5) "the Alliance believes NHTSA's tools (Autonomie/Volpe) are superior to EPA's (APLHA[sic]/LPM/OMEGA). This is not surprising since NHTSA's tools have had a significant head start in development. . . .;" (6) "the Autonomie model was developed at Argonne National Lab with funding from the Department of Energy going back to the PNGV (Partnership for Next Generation Vehicles) program in the 1990s. Autonomie was developed from the start to address the complex task of combining 2 power sources in a hybrid powertrain. It is a physics-based, forward looking, vehicle simulator, fully documented with available training," and (7) "EPA's ALPHA model is also a physics-based, forward looking, vehicle simulator. However, it has not been validated or used to simulate hybrid powertrains. The model has not been documented with any instructions making it difficult for users outside of EPA to run and interpret the model." ¹³⁶

Regarding the use of NHTSA's CAFE model rather than EPA's OMEGA model, the Alliance stated that (1)

NHTSA's model appropriately differentiate between domestic and imported automobiles; (2) in NHTSA's model, "dynamic estimates of vehicle sales and scrappage in response to price changes replace unrealistic static sales and scrappage numbers;" (3) NHTSA's model "has new capability to perform [CO₂ emissions] analysis with [tailpipe CO₂] program flexibilities;" (4) "the baseline fleet [used in NHTSA's model] has been appropriately updated based on both public and manufacturer data to reflect the technologies already applied, particularly tire rolling resistance;" and (5) "some technologies have been appropriately restricted. For example, low rolling resistance tires are no longer allowed on performance vehicles, and aero improvements are limited to maximum levels of 15% for trucks and 10% for minivans." ¹³⁷ The Alliance continued, noting that "NHTSA's Volpe model also predates EPA's OMEGA model. More importantly, the new Volpe model considers several factors that make its results more realistic." ¹³⁸ As factors leading the Volpe model to produce results that are more realistic than those produced by OMEGA, the Alliance commented that (1) "The Volpe model includes estimates of the redesign and refresh schedules of vehicles based on historical trends, whereas the OMEGA model uses a fixed, and too short, time interval during which all vehicles are assumed to be fully redesigned. . . .;" (2) "The Volpe model allows users to phase-in technology based on year of availability, platform technology sharing, phase-in caps, and to follow logical technology paths per vehicle. . . .;" (3) "The Volpe model produces a year-by-year analysis from the baseline model year through many years in the future, whereas the OMEGA model only analyzes a fixed time interval. . . .;" (4) "The Volpe model recognizes that vehicles share platforms, engines, and transmissions, and that improvements to any one of them will likely extend to other vehicles that use them" whereas "The OMEGA model treats each vehicle as an independent entity. . . .;" (5) "The Volpe model now includes sales and scrappage effects;" and (6) "The Volpe model is now capable of analyzing for CAFE and [tailpipe CO₂] compliance, each with unique program restrictions and flexibilities." ¹³⁹ The Alliance also incorporated by reference concerns it

raised regarding EPA's OMEGA-based analysis supporting EPA's proposed and prior final determinations. ¹⁴⁰

The Alliance further stated that "For all of the above reasons and to avoid duplicate efforts, the Alliance recommends that the Agencies continue to use DOT's Volpe and Autonomie modeling system, rather than continuing to develop two separate systems. EPA has demonstrated through supporting Volpe model code revisions and by supplying engine maps for use in the Autonomie model that their expertise can be properly represented in the rulemaking process without having to develop separate or new tools." ¹⁴¹

Some individual manufacturers provided comments supporting and elaborating on the above comments by Global Automakers and the Alliance. For example, FCA commented that "the modeling performed by the agencies should illuminate the differences between the CAFE and [tailpipe CO₂ emissions] programs. This cannot be accomplished when each agency is using different tools and assumptions. Since we believe NHTSA possesses the better set of tools, we support both agencies using Autonomie for vehicle modeling and Volpe (CAFE) for fleet modeling." ¹⁴²

Honda stated that "The current version of the CAFE model is reasonably accurate in terms of technology efficiency, cost, and overall compliance considerations, and reflects a notable improvement over previous agency modeling efforts conducted over the past few years. We found the CAFE model's characterization of Honda's "baseline" fleet—critical modeling minutiae that provide a technical foundation of the agencies' analysis—to be highly accurate. We commend NHTSA and Volpe Center staff on these updates, as well as on the overall transparency of the model. The model's graphical user interface (GUI) makes it easier to run, model functionality is thoroughly documented, and the use of logical, traceable input and output files accommodates easy tracking of results." ¹⁴³ Similarly, in an earlier presentation to the agencies, Honda included the following slide comparing EPA's OMEGA model to DOT's CAFE (Volpe) model, and making recommendations regarding future improvements to the latter: ¹⁴⁴

Modeling Comparison – 2017

| Issue | EPA / OMEGA | NHTSA / Volpe |
|--------------------------|--|--|
| GUI | n/a | Helpful |
| Documentation | Difficult for users to understand (or buried in obscure docket) | Very Good |
| Technology Interactions | LPM – “Black Box” Difficult to understand | Detailed & Transparent |
| Efficiency | >10% too optimistic “significantly inaccurate” | Reasonably Accurate |
| Baseline Input Databases | Independent Analysis | Proactively confirmed inputs with each OEM |
| Suggested Improvements | | <ul style="list-style-type: none"> • Grid Emissions (upstream) • Turn-off early compliance strategy • Increase speed of runs • Learning based on cumulative volumes • Optional Turn off 30 months compliance • Add Roll05 and Roll15 as tech options |

Figure IV-1 – Honda comparison of EPA and NHTSA fleet models¹⁴⁴

Toyota, in addition to arguing that the agencies’ application of model inputs (e.g., an analysis fleet based on MY 2016 compliance data) produced more realistic results than in the draft TAR and in EPA’s former proposed and final determinations, also stressed the importance of the CAFE model’s year-by-year accounting for product redesigns, stating that this produces more realistic results than the OMEGA-based results shown previously by EPA:

The modeling now better accounts for factors that limit the rate at which new technologies enter and then diffuse through a manufacturer’s fleet. Bringing new or improved vehicles and technologies to market is a several-year, capital-intensive undertaking. Once new designs are introduced, a period of stability is required so investments can be amortized. Vehicle and technology introductions are staggered over time to manage limited resources. Agency modeling now better recognizes the inherent constraints imposed by realities that dictate product cadence. We agree with the agencies’ understanding that “the simulation of compliance actions that manufacturers might take is constrained by the pace at which new technologies can be applied in the new vehicle market,” and we are encouraged to learn that “agency modeling can now account for the fact that individual vehicle models undergo significant redesigns relatively infrequently.” The preamble correctly notes that manufacturers try to keep costs down by applying most major changes mainly during vehicle redesigns and more modest changes during product refresh, and that redesign cycles for vehicle models can

range from six to ten years, and eight to ten-years for powertrains. This appreciation for standard business practice enables the modeling to more accurately capture the way vehicles share engines, transmissions, and platforms. There are now more realistic limits placed on the number of engines and transmissions in a powertrain portfolio which better recognizes manufacturers must manage limited engineering resources and control supplier, production, and service costs. Technology sharing and inheritance between vehicle models tends to limit the rate of improvement in a manufacturer’s fleet.¹⁴⁵

These comments urging EPA to use NHTSA’s CAFE model echo comments provided in response to a 2018 peer review of the model. While identifying various opportunities for improvement, peer reviewers expressed strong overall support for the CAFE model’s technical approach and execution. For example, one reviewer, after offering many specific technical recommendations, concluded as follows:

The model is impressive in its detail, and in the completeness of the input data that it uses. Although the model is complex, the reader is given a clear account of how variables are variously divided and combined to yield appropriate granularity and efficiency within the model. The model tracks well a simplified version of the real-world and manufacturing/design decisions. The progression of technology choices and cost benefit choices is clear and logical. In a

few cases, the model simply explains a constraint, or a value assigned to a variable, without defending the choice of the value or commenting on real-world variability, but these are not substantive omissions. The model will lend itself well to future adaptation or addition of variables, technologies and pathways.¹⁴⁶

Although the peer review charge focused solely on the CAFE model, another peer reviewer separately recommended that EPA “consider opportunities for EPA to use the output from the Volpe Model in place of their OMEGA Model output”¹⁴⁷

More recently, in response to the NPRM, Dr. Julian Morris, an economist at George Washington University, commented extensively on the superiority of the agencies’ NPRM analysis to previous analyses, offering the following overall assessment:

I have assessed the plausibility of the analyses undertaken by NHTSA and EPA in relation to the proposed SAFE rule. I found that the agencies have undertaken a thorough—one might even say exemplary—analysis, improving considerably on earlier analyses undertaken by the agencies of previous rules relating to CAFE standards and [tailpipe CO₂] emission standards. Of particular note, the agencies included more realistic estimates of the rebound effect, developed a sophisticated model of the

scrapage effect, and better accounted for various factors affecting vehicle fatality rates.¹⁴⁸

The agencies carefully considered these and other comments regarding which models to apply when estimating potential impacts of each of the contemplated regulatory alternatives. For purposes of estimating the impacts of CAFE standards, even the coalition of environmental advocates observed that the CAFE model reflects EPCA's requirements. As discussed below in Section VI.A, EPCA imposes specific requirements not only on how CAFE standards are to be structured (e.g., including a minimum standard for domestic passenger cars), but also on how CAFE standards are to be evaluated (e.g., requiring that the potential to produce additional AFVs be set aside for the model years under consideration), and the CAFE model reflects these requirements, and the agencies consider the CAFE model to be the best available tool for CAFE rulemaking analysis. Regarding the use of Autonomie to construct fuel consumption (i.e., efficiency) inputs to the CAFE model, the agencies recognize that other vehicle simulation tools are available, including EPA's recently-developed ALPHA model. However, as also discussed in Section VI.B.3, Autonomie has a much longer history of development and refinement, and has been much more widely applied and validated. Moreover, Argonne experts have worked carefully for several years to develop methods for running large arrays of simulations expressly structured and calibrated for use in DOT's CAFE model. Therefore, the agencies consider Autonomie to be the best available tool for constructing such inputs to the CAFE model. While the agencies have also carefully considered potential specific model refinements, as well as the merits of potential changes to model inputs and assumptions, none of these potential refinements and input have led either agency to reconsider using the CAFE model and Autonomie for CAFE rulemaking analysis.

With respect to estimating the impacts of CO₂ standards, even though Argonne and the agencies have adapted Autonomie and the CAFE model to support the analysis of CO₂ standards, environmental groups, California, and other States would prefer that EPA use the models it developed during 2009–2018 for that purpose.¹⁴⁹ Arguments that EPA revert to its ALPHA and

OMEGA models fall within three general categories: (1) Arguments that EPA's models would have selected what commenters consider better (i.e., generally more stringent) standards, (2) arguments that EPA's models are technically superior, and (3) arguments that the law requires EPA use its own models.

The first of these arguments—that EPA's models would have selected better standards—conflates the analytical tool used to inform decision-making with the action of making the decision. As explained elsewhere in this document and as made repeatedly clear over the past several rulemakings, the CAFE model (or, for that matter, any model) neither sets standards nor dictates where and how to set standards; it simply informs as to the potential effects of setting different levels of standards. In this rulemaking, EPA has made its own decisions regarding what CO₂ standards would be appropriate under the CAA.

The third of these arguments—that EPA is legally required to use only models developed by its own staff—is also without merit. The CAA does not require the agency to create or use a specific model of its own creation in setting tailpipe CO₂ standards. The fact that EPA's decision may be informed by non-EPA-created models does not, in any way, constitute a delegation of its statutory power to set standards or decision-making authority.¹⁵⁰ Arguing to the contrary would suggest, for example, that EPA's decision would be invalid because it relied on EIA's Annual Energy Outlook for fuel prices for all of its regulatory actions rather than developing its own model for estimating future trends in fuel prices. Yet, all Federal agencies that have occasion to use forecasts of future fuel prices regularly (and appropriately) defer to EIA's expertise in this area and rely on EIA's NEMS-based analysis in the AEO, even when those same agencies are using EIA's forecasts to inform their own decision-making.

Similarly, this argument would mean that the agencies could not rely on work done by contractors or other outside consultants, which is contrary to regular agency practice across the entirety of the Federal Government.

The specific claim here that use of the CAFE model instead of ALPHA and OMEGA is somehow illegitimate is similarly unpersuasive. The CAFE and CO₂ rules have, since *Massachusetts v. EPA*, all been issued as joint rulemakings, and, thus are the result of a collaboration between the two agencies. This was true when the rulemakings used separate models for the different programs and continues to be true in today's final rule, where the agencies take the next step in their collaborative approach by now using simply one model to simulate both programs. In 2007, immediately following this Supreme Court decision, the agencies worked together toward standards for model years 2011–2015, and EPA made use of the CAFE model for its work toward possible future CO₂ standards. That the agencies would need to continue the unnecessary and inefficient process of using two separate combinations of models as the joint National Program continues to mature, therefore, runs against the idea that the agencies, over time, would best combine resources to create an efficient and robust regulatory program. For the reasons discussed throughout today's final rule, the agencies have jointly determined that Autonomie and the CAFE model have significant technical advantages, including important additional features, and are therefore the more appropriate models to use to support both analyses.

Further, the fact that Autonomie and CAFE models were initially developed by DOE/Argonne and NHTSA does not mean that EPA has no role in either these models or their inputs. That is, the development process for CAFE and CO₂ standards inherently requires technical and policy examinations and deliberations between staff experts and decision-makers in both agencies. Such engagements are a healthy and important part of any rulemaking activity—and particularly so with joint rulemakings. The Supreme Court stated in *Massachusetts v. EPA* that, “The two obligations [to set CAFE standards under EPCA and to set tailpipe CO₂ emissions standards under the CAA] may overlap, but there is no reason to think the two agencies cannot both administer their obligations and yet

¹⁴⁸ Morris, J., OAR–2018–0283–4028, at 6–11.

¹⁴⁹ The last-finalized versions of EPA's OMEGA model and ALPHA tools were published in 2016 and 2017, respectively.

¹⁵⁰ “[A] federal agency may turn to an outside entity for advice and policy recommendations, provided the agency makes the final decisions itself.” U.S. Telecom. Ass'n v. FCC, 359 F.3d 554, 565–66 (D.C. Cir. 2004). To the extent commenters meant to suggest outside parties have a reliance interest in EPA using ALPHA and OMEGA to set standards, EPA and NHTSA do not agree a reliance interest is properly placed on an analytical methodology, which consistently evolves from rule to rule. Even if it were, all parties that closely examined ALPHA and OMEGA-based analyses in the past either also simultaneously closely examined CAFE and Autonomie-based analyses in the past, or were fully capable of doing so, and thus, should face no additional difficulty now they have only one set of models and inputs/outputs to examine.

avoid inconsistency.”¹⁵¹ When agency experts consider analytical issues and agency decision-makers decide on policy, which is informed (albeit not dictated) by the outcome of that work, they are working together as the Court appears to have intended in 2007, even if legislators’ intentions have varied in the decades since EPCA and the CAA have been in place.¹⁵² Regulatory overlap necessarily involves deliberation, which can lead to a more balanced, reasonable, and improved analyses, and better regulatory outcomes. It did here. The existence of deliberation is not *per se* evidence of unreasonableness, even if some commenters believe a different or preferred policy outcome would or should have resulted.¹⁵³

Over the 44 years since EPCA established the requirement for CAFE standards, NHTSA, EPA and DOE career staff have discussed, collaborated on, and debated engineering, economic, and other aspects of CAFE regulation, through focused meetings and projects, informal exchanges, publications, conferences and workshops, and rulemakings.

Part of this expanded exchange has involved full vehicle simulation. While tools such as PSAT (the DOE-sponsored simulation tool that predated Autonomie) were in use prior to 2007, including for discrete engineering studies supporting inputs to CAFE rulemaking analyses, these tools’ information and computing requirements were such that NHTSA had determined (and DOE and EPA had concurred) that it was impractical to more fully integrate full vehicle simulation into rulemaking analyses. Since that time, computing capabilities have advanced dramatically, and the agencies now agree that such integration

of full vehicle simulation—such as the large-scale exercise of Autonomie to produce inputs to the CAFE Model—can make for more robust CAFE and CO₂ rulemaking analysis. This is not to say, though, that experts always agree on all methods and inputs involved with full vehicle simulation. Differences in approach and inputs lead to differences in results. For example, compared to other publicly available tools that can be practicably exercised at the scale relevant to fleetwide analysis needed for CAFE and CO₂ rulemaking analysis, DOE/Argonne’s Autonomie model is more advanced, spans a wider range of fuel-saving technologies, and represents them in more specific detail, leaving fewer “gaps” to be filled with other models (risking inconsistencies and accompanying errors). These differences discussed in greater detail below in Section VI.B.3. Perhaps most importantly, the CAFE model considers fuel prices in determining both which technologies are applied and the total amount of technology applied, in the case where market forces demand fuel economy levels in excess of the standards. While OMEGA can apply technology in consideration of fuel prices, OMEGA will apply technology to reach the same level of fuel economy (or CO₂ emissions) if fuel prices are 3, 5, or 20 dollars, which violates the SAB’s requirement that the analysis “account for [. . .] future fuel prices.”¹⁵⁴ Furthermore, it produces a counterintuitive result. If fuel prices become exorbitantly high, we would expect consumers to place an emphasis on additional fuel efficiency as the potential for extra fuel savings is tremendous.

Moreover, DOE has for many years used Autonomie (and its precursor model, PSAT) to produce analysis supporting fuel economy-related research and development programs involving billions of dollars of public investment, and NHTSA’s CAFE model with inputs from DOE/Argonne’s Autonomie model has produced analysis supporting rulemaking under the CAA. In 2015, EPA proposed new tailpipe CO₂ standards for MY 2021–2027 heavy-duty pickups and vans, finalizing those standards in 2016. Supporting the NPRM and final rule, EPA relied on analysis implemented by NHTSA using NHTSA’s CAFE model, and NHTSA used inputs developed by

DOE/Argonne using DOE/Argonne’s Autonomie model. CBD questioned this history, asserting that, “EPA conducted a separate analysis using a different iteration of the CAFE model rather than rely on the version which NHTSA used, again resulting and parallel but corroborative modeling results.”¹⁵⁵ CBD’s comment mischaracterizes EPA’s actual use of the CAFE Model. As explained in the final rule, EPA’s “Method B” analysis was developed as follows:

In Method B, the CAFE model from the NPRM was used to project a pathway the industry could use to comply with each regulatory alternative, along with resultant impacts on per-vehicle costs. However, the MOVES model was used to calculate corresponding changes in total fuel consumption and annual emissions for pickups and vans in Method B. Additional calculations were performed to determine corresponding monetized program costs and benefits.¹⁵⁶

In other words, a version of NHTSA’s CAFE Model was used to perform the challenging part of the analysis—that is, the part that involves accounting for manufacturers’ fleets, accounting for available fuel-saving technologies, accounting for standards under consideration, and estimating manufacturers’ potential responses to new standards—EPA’s MOVES model was used to perform “downstream” calculations of fuel consumption and tailpipe emissions, and used spreadsheets to calculate even more straightforward calculations of program costs and benefits. While some stakeholders perceive these differences as evidencing a meaningfully independent approach, in fact, the EPA staff’s analysis was, at its core, wholly dependent on NHTSA’s CAFE Model, and on that model’s use of Autonomie simulations.

Given the above, the only remaining argument for EPA to revert to its previously-developed models rather than relying on Autonomie and the CAFE model would be that the former are so technically superior to the latter that even model refinements and input changes cannot lead Autonomie and the CAFE model to produce appropriate and reasonable results for CO₂ rulemaking analysis. As discussed below, having considered a wide range of technical differences, the agencies find that the Autonomie and CAFE models currently provide the best analytical combination for CAFE and tailpipe CO₂ emissions rulemaking analysis. As discussed

¹⁵¹ *Massachusetts v. EPA*, 549 U.S. 497, 532 (2007).

¹⁵² For example, when wide-ranging amendments to the CAA were being debated, S. 1630 contained provisions that, if enacted, would have authorized automotive CO₂ emissions standards and prescribed specific average levels to be achieved by 1996 and 2000. In a letter to Senators, then-Administrator William K. Reilly noted that the Bill “requires for the first time control of emissions of carbon dioxide; this is essentially a requirement to improve fuel efficiency” and outlined four reasons the H.W. Bush Administration opposed the requirement, including that “it is inappropriate to add this very complex issue to the Clean Air Act which is already full of complicated and controversial issues.” Reilly, W., Letter to U.S. Senators (January 26, 1990). The CAA amendments ultimately signed into law did not contain these or any other provisions regarding regulation of CO₂ emissions.

¹⁵³ See, e.g., U.S. House of Representatives, Committee on Oversight and Government Reform, Staff Report, 112th Congress, “A Dismissal of Safety, Choice, and Cost: The Obama Administration’s New Auto Regulations,” August 10, 2012, at 19–21 and 33–34.

¹⁵⁴ See SAB Report 10 (“Constructing each of the scenarios is challenging and involve extensive scientific, engineering, and economic uncertainties. Projecting the baseline requires the agencies to account for a wide range of variables including: The number of new vehicles sold, future fuel prices, . . .”).

¹⁵⁵ CBD, *et al.*, 2018–0067–12000, Appendix A, at 27.

¹⁵⁶ 81 FR 73478, 73506–07 (October 25, 2016).

below in Section VI.B.3, Autonomie not only has a longer and wider history of development and application, but also DOE/Argonne's interaction with automakers, supplier and academics on continuous bases had made individual sub-models and assumptions more robust. Argonne has also been using research from DOE's Vehicle Technology Office (VTO) at the same time to make continuous improvements in Autonomie.¹⁵⁷ Also, while Autonomie uses engine maps as inputs, and EPA developed engine maps that could have been used for today's analysis, EPA declined to do so, and those engine maps were only used in a limited capacity for reasons discussed below in Section VI.C.1.

As also discussed below in Section VI.A.4, the CAFE model accounts for some important CO₂ provisions that EPA's OMEGA model cannot account for. For example, the CAFE model estimates the potential that any given manufacturer might apply CO₂ compliance credits it has carried forward from some prior model year. While one commenter, Mr. Rykowski, takes issue with how the CAFE model handles credit banking, he does not acknowledge that EPA's OMEGA model, lacking a year-by-year representation of compliance, is altogether incapable of accounting for the earning and use of banked compliance credits. Also, although Mr. Rykowski's comments regarding A/C leakage and refrigerants are partially correct insofar as the CAFE model does not account for leakage-reducing technologies explicitly, the comment is as applicable to OMEGA as it is to the CAFE model and, in any event, data regarding which vehicles have which leakage-reducing technologies was not available for the MY 2016 fleet. Nevertheless, as discussed in Section VI.A.4, NHTSA has refined the CAFE model's accounting for the cost of leakage reduction technologies.

The agencies have also considered Mr. Rykowski's comments suggesting that using OMEGA would be preferable because, rather than selecting from hundreds of thousands of potential combinations of technologies, OMEGA includes only the "50 or so" combinations that EPA has already determined to be cost-effective. The "better way" of making this determination is also effectively a model, but the separation of this model from OMEGA is, as evidenced by

manufacturers' comments, obfuscatory, especially in terms of revealing how specific vehicle model/configurations initial engineering properties are aligned with specific initial technology combinations. By using a full set of technology combinations, the CAFE model makes very clear how each vehicle model/configuration is assigned to a specific initial combination and, hence, how subsequently fuel consumption and cost changes are accounted for. Moreover, EPA's separation of "thinning" process from OMEGA's main compliance simulation makes sensitivity analysis difficult to implement, much less follow. The agencies find, therefore, that the CAFE model's approach of retaining a full set of vehicle simulation results throughout the compliance simulation to be more realistic (*e.g.*, more capable of reflecting manufacturer- and vehicle-specific factors), more responsive to changes in model inputs (*e.g.*, changes to fuel prices, which could impact the relative attractiveness of different technologies), more transparent, and more amenable to independent corroboration the agencies' analysis.

Regarding comments by Messrs. Duleep, Rogers, and Rykowski suggesting that the CAFE model, by tying most technology application to planned vehicle redesigns and freshening, is too restrictive, the agencies disagree. As illustrated by manufacturers' comments cited above, as reinforced by both extensive product planning information provided to the agencies, and as further reinforced by extensive publicly available information, manufacturers tend to not make major changes to a specific vehicle model/configuration in one model year, and then make further major changes to the same vehicle model/configuration the next model year. There is ample evidence that manufacturers strive to avoid such discontinuity, complexity, and waste, and in the agencies' view, while it is impossible to represent every manufacturer's decision-making process precisely and with certainty, the CAFE model's approach of using estimated product design schedules provides a realistic basis for estimating what manufacturers *could* practicably do. Also, the relevant inputs are simply inputs to the CAFE model, and if it is actually more realistic to assume that a manufacturer can change major technology on all of its products every year, the CAFE model can easily be operated with every model year designated as a redesign year for every product, but as discussed throughout this document, the agencies consider

this to be extremely unrealistic. While this means the CAFE model can be run without a year-by-year representation that carries forward technologies between model years, doing so would be patently unrealistic (as reflected in some stakeholders' comments in 2002 on the first version of the CAFE model). Conversely, the OMEGA model cannot be operated in a way that accounts for what the agencies consider to be very real product planning considerations.
