

this alternative would be of similar size at full build-out, would use the same net pen design, anchoring design, phased development, and operational plans as the San Diego Site Alternative.

Half-Scale Alternative

This action alternative would consider an initial projected production of 2.2 million pounds (1,000 metric tons) and a final production of 5.5 million pounds (2,500 metric tons) from 3 to 6 years after the project is constructed and operated. This production level and project spatial extent would be approximately half that described in the San Diego Site Alternative. The anchoring and mooring system for a single submerged grid would use the same engineering design as the full-scale San Diego Site Alternative. Only 1 pen grid containing 2 rows of 7 pens (14 pens total) would be installed. The half-scale alternative would be analyzed for both the San Diego and Long Beach Alternative sites.

Action Alternatives Summary

Currently, two location alternatives and a half-scale alternative are being considered for detailed analysis in the EIS. The two location alternatives in southern California—San Diego and Long Beach—are considered for the off-shore finfish aquaculture site and the landside facilities that would be used to receive, process, and distribute the harvested fish.
