

comments on the draft guidance and those comments were considered as the guidance was finalized. We considered comments on the recommended level of biotin concentration for evaluation. We decline to recommend evaluating a concentration level below 3,500 nanograms per milliliter. We believe this level is appropriate for minimizing the risk to patients from incorrect test results. Further, this level is consistent with best practices among the industry to test at three times the highest concentration levels observed, as recommended in the FDA-recognized standard published by the Clinical Laboratory Standards Institute. Other comments recommended FDA clarify or expand upon the necessity of mitigation strategies to address biotin interference other than labeling. We decline to recommend other specific mitigation strategies, but note that other mitigation strategies such as customer information letters and technical mitigations may be considered when the risk of potentially incorrect results from biotin interference could significantly affect patient or public health. Finally, we considered comments regarding additional types of information to be communicated to end-users, but we declined to provide more specific recommendations because manufacturers may not have sufficient data to provide more specific information in the labeling. In addition, editorial edits were made to improve clarity. The guidance announced in this notice finalizes the draft guidance of the same title dated June 2019.

This guidance is being issued consistent with FDA's good guidance practices regulation (21 CFR 10.115). The guidance represents the current thinking of FDA on testing for biotin interference in in vitro diagnostic devices. It does not establish any rights for any person and is not binding on FDA or the public. You can use an alternative approach if it satisfies the requirements of the applicable statutes and regulations.
