

monk seal, for which a max of one seal will be studied at a time.

During psychological assessments, trained pinnipeds cooperate in behavioral stimulus detection and discrimination tasks conducted on land or in water. Stimuli are controlled sensory cues used to evaluate species-typical sensory and cognitive performance. Stimuli may be from any sensory modality, though there is an emphasis on hearing so that conservation issues related to ocean noise can be addressed. Up to three times per day, depending on the procedure, animals may participate in voluntary psychological assessment procedures such as: active acoustic playbacks, passive acoustic recording, behavioral observations, cognitive studies, incidental harassment, signal detection and discrimination, associative learning, photography and videography on land and underwater.

For physiological assessments, the same individuals, except the Hawaiian monk seal, participate in routine physical evaluations to improve understanding of their general biology, including growth and development, nutritional requirements, health status, and environmental tolerance. This research includes longitudinal measurements of growth, nutrition, health, metabolism, physiological capacities, and environmental tolerance. Data are collected from husbandry records, individuals trained to cooperate in physiological measurements, and sedated animals during routine veterinary examinations. Open-flow respirometry methods will be used to gather metabolic data from animals trained to rest and breathe under a plastic dome. Up to three times per day, depending on the procedure, animals may participate in voluntary physiological procedures such as: Passive acoustic recording, drug and sedative administration, collection of molt, scat, and urine, Evan's blue dye and serial blood samples, external and internal instrumentation, flipper tagging, measuring, metabolic chamber or hood studies, behavioral observations, oral fecal markers, collecting of shed whiskers, photogrammetry, photography and videography, flyovers from unmanned aircraft systems, restraint, blood sampling, hair clipping, transport, ultrasound, underwater photography and videography, and weighing.

The application also includes a request for the unintentional mortality of up to two pinnipeds total of any species over the duration of the permit associated with research or transport including humane euthanasia at

discretion of attending vet for medical purposes due to research, as well as necropsy and export of parts from the animals. The applicant requests a 5-year permit.

In compliance with the National Environmental Policy Act of 1969 (42 U.S.C. 4321 *et seq.*), an initial determination has been made that the activity proposed is categorically excluded from the requirement to prepare an environmental assessment or environmental impact statement.

Concurrent with the publication of this notice in the **Federal Register**, NMFS is forwarding copies of the application to the Marine Mammal Commission and its Committee of Scientific Advisors.
