19 related impacts in 2020, the application of either an average quality score or an individual ACO's own quality score based on data from the 2020 performance year is neither feasible nor appropriate. Other commenters expressed concern that the current extreme and uncontrollable circumstances policy is insufficient to mitigate the vast impacts of the PHE for COVID-19 on ACO quality performance because many ACOs are deploying their quality improvement staff to provide clinical care and assist in triaging patients, detracting them from their more typical quality improvement and care coordination work. These commenters explained that while there is value in ACOs' reporting what data they can during this challenging time, ACOs should not be held accountable to typical quality performance standards during this highly irregular PHE for COVID-19.

Several commenters expressed concerns about whether ACOs could meet the quality reporting requirements for PY 2020 because of the shift to providing services via telemedicine. One commenter stated that while CMS has expanded telehealth coverage for Medicare beneficiaries, several quality measures cannot be properly met in a remote setting such as immunizations and mammography screening, which are services that can only be performed in person. Another commenter requested that CMS allow patient-reported information provided during telehealth visits to satisfy quality measures where applicable. The commenter explained that per the quality measure specification for HTN-2 (NQF 0018)(ACO-28): Controlling High Blood Pressure, only blood pressure readings performed by a clinician or a remote monitoring device are acceptable for numerator compliance with this measure and that CMS does not permit information reported or taken by the member. The commenter noted that Medicare beneficiaries may be reluctant to have an in-person office visit and may not have access to a remote monitoring device, as described in the measure specification, and their information may not be available for use in determining the ACO's performance on the measure.

Other commenters suggested that CMS should allow ACOs to continue quality reporting efforts when possible, but that CMS should hold the ACOs harmless for any performance changes. Several commenters explained that it would not be appropriate to compare performance during 2020 to quality benchmarks established based on performance in previous years because

the avoidance of care by patients and the postponement of certain critical services to preserve PPE will have lasting effects on quality. These commenters stated that they believe that ACOs will struggle to manage patients with chronic conditions and to provide proper preventive care during this time because patients are avoiding primary care, well visits, chronic care maintenance, and other health services. For these reasons, these commenters encouraged CMS to exclude 2020 quality performance data from future quality benchmarking. One commenter suggested that CMS mirror past Shared Savings Program performance rates and essentially grade on a curve for 2020. The commenter explained that the quality benchmarks should be adjusted so that the average Shared Savings Program quality score mirrors the average Shared Savings Program quality score in 2018. The commenter stated that this approach would keep the focus on quality and allow CMS to use quality performance to differentiate among ACOs in 2020, but would not unfairly transfer savings from ACOs to CMS due to difficulties in maintaining high rates of performance on quality measures (particularly routine preventative measures) during the PHE for COVID-19.

For PY 2021 and beyond, several commenters urged CMS to continue to study the impact of the PHE for COVID-19 on ACO quality performance in the months and years to come, as it is likely that additional policy changes will be necessary in the future. Other commenters encouraged CMS to consider how to mitigate the long-term impact of the PHE for COVID-19 on quality performance and stated that it might be necessary to modify quality measures that have narrow timelines for performance and to reset the measure targets in future years. One commenter suggested that CMS should commit to ongoing reevaluations of the Shared Savings Program and the other APMs it operates to adjust for any changes in patient risk and resource use in future financial and quality measurement methodologies. Another commenter requested that CMS collaborate closely with ACOs and health systems across the country to monitor and address the impacts of the PHE for COVID-19 on clinical quality and quality measure benchmarks in future performance years.

Response: We appreciate the feedback from commenters and we understand that there are myriad concerns related to quality reporting and quality performance for performance year 2020. However, we believe that ACOs should

be in a position to report CMS Web Interface measures for performance year 2020 beginning in January 2021. All ACOs were determined to be impacted by the PHE for COVID-19, which was declared during the quality reporting period for performance years starting in 2019. Yet, 98.7 percent of ACOs completely reported CMS Web Interface measures for 2019, including all 65 ACOs that were also impacted by a natural disaster during 2019 or the quality reporting period. We want to encourage reporting for performance year 2020 while still being cognizant of the impacts that the PHE for COVID-19 could have on quality reporting and quality performance. Accordingly, we do not believe that it is necessary to make performance year 2020 a pay-for-reporting year. Rather, we believe that maintaining our current extreme and uncontrollable circumstances policy, coupled with giving ACOs automatic full credit for the CAHPS for ACOs survey measures, offers appropriate relief to ACOs for performance year 2020, while still incentivizing ACOs to fully and completely report the remaining measures. All 10 CAHPS for ACOs survey measures are in one of the four domains used to calculate an ACO's quality performance score. This means 25 percent of an ACO's quality performance score for performance year 2020 would come from receiving full credit on the CAHPS for ACOs survey measures. In addition, each of the other three domains has at least one or more measures that is pay-for-reporting in performance year 2020, resulting in over 50 percent of the measures (14 out of 23) being assigned full points if the ACO completely and accurately reports quality data. Furthermore, because there is at least one measure in each domain for which ACOs would receive full points provided they completely report quality data, ACOs in their second or subsequent performance year would achieve the minimum attainment level on at least one measure in each domain as required under § 425.502(d)(2)(iii) to be eligible to share in any savings. We believe this may address some of the concerns expressed by stakeholders about the impact of the PHE for COVID-19 on 2020 quality performance. We also believe it is in the public interest to encourage ACOs to report quality data because ACOs could otherwise share in any savings earned without being held accountable for the quality of care that they provide to the more than 11 million beneficiaries who receive care through Shared Savings Program ACOs. In addition to incentivizing the reporting of quality of care measures, we

believe it is critical to incorporate ACO performance on those measures into quality performance scoring for performance year 2020 in a meaningful way that also considers the impact of the current PHE for COVID-19.

Although we did not propose any specific modifications to the extreme and uncontrollable circumstances policy for performance year 2020 in the CY 2021 PFS proposed rule, we did solicit comment on a potential alternative approach to scoring ACOs for performance year 2020. The potential alternative modification we considered would be similar to the current policy for scoring quality performance under the extreme and uncontrollable circumstances policy, but would use the higher of an ACO's 2020 quality performance score or its 2019 quality performance score for ACOs that completely report web interface data for 2020. For new ACOs that completely report, we would continue to score them as pay-for-reporting and assign a quality score of 100 percent. ACOs that do not complete quality reporting would receive the 2020 ACO mean quality score as provided in § 425.502(f)(2).

Specifically, we solicited comments on the following potential modifications to the extreme and uncontrollable circumstances policy for performance year 2020:

(1) If an ACO in a second or subsequent performance year completely and accurately reports the CMS Web Interface measures for performance year 2020, the ACO will receive the higher of its performance year 2020 ACO quality performance score that would include automatic full credit for the CAHPS for ACOs survey measures, or the score used in 2019 for purposes of financial reconciliation. For re-entering ACOs that terminated in their second or subsequent agreement period, the ACO would receive the higher of its most recent prior ACO quality performance score or its 2020 quality performance score.

(2) If an ACO in a second or subsequent performance year or a re-entering ACO that terminated in its second or subsequent agreement period does not completely and accurately report the CMS Web Interface measures for performance year 2020, the ACO will receive the 2020 ACO mean quality performance score.

(3) If an ACO in its first performance year in the program or a re-entering ACO that terminated in its first agreement period and is now in its first performance year of a new agreement period completely and accurately reports the CMS Web Interface

measures, it will receive a quality performance score of 100 percent that reflects automatic full credit for the CAHPS for ACO survey measures.

(4) If an ACO in its first performance year or a re-entering ACO that terminated in its first agreement period and is now in its first performance year of a new agreement period, does not completely and accurately report the CMS Web Interface measures for performance year 2020, it will receive the 2020 mean ACO quality performance score.

We received public comments on this potential alternative approach to scoring ACOs under the extreme and uncontrollable circumstances policy for performance year 2020. The following is a summary of the comments we received and our response.

Comment: While many commenters supported the alternative approach of assigning the higher of the ACO's 2019 or 2020 quality scores for ACOs that report quality, they explained that they considered this a "fallback option" and that they would prefer CMS to convert all measures to pay-for-reporting for performance year 2020 due to the impact of the PHE for COVID-19.

Response: The intent of the Shared Savings Program extreme and uncontrollable circumstances policy is to mitigate any negative impact of an extreme and uncontrollable circumstance on an ACO's quality performance or ability to report quality data to CMS and the resultant effect on financial reconciliation due to emergency circumstances outside of the ACO's control. As discussed above, given the high percentage of ACOs that completely reported CMS Web interface measures for 2019, we believe that ACOs should be in a similar position to report CMS Web Interface measures for performance year 2020 beginning in January 2021. While we understand commenters' concerns about the potential adverse impacts of the PHE for COVID-19 on quality reporting and quality performance scores, more than half of the measures in the Shared Savings Program quality measure set are pay-for-reporting for all ACOs for performance year 2020, which is higher than in previous years. We appreciate commenters' feedback on the potential alternative approach to scoring ACOs under the extreme and uncontrollable circumstances policy for performance year 2020. After careful consideration, however, we believe that our current extreme and uncontrollable circumstances policy, in addition to giving ACOs automatic full credit for the CAHPS for ACOs survey measures, will mitigate the negative effects of the

PHE for COVID-19 on quality performance for performance year 2020. Accordingly, pursuant to the current regulation at § 425.502(f)(2), ACOs will have their quality performance score set to equal the mean quality performance score for all Shared Savings Program ACOs for performance year 2020. However, if an ACO completely and accurately reports all CMS Web Interface measures during the quality reporting period, we will use the higher of the ACO's quality performance score for performance year 2020 or the mean quality performance score for performance year 2020 for all Shared Savings Program ACOs to calculate the ACO's quality performance score.

3. Change to Medicare Shared Savings Program Extreme and Uncontrollable Circumstances Policy Provision Adopted in the March 31st COVID-19 IFC

As noted previously in this section, in the March 31st COVID-19 IFC, we modified the Shared Savings Program extreme and uncontrollable circumstances policy as it applies to disasters that occur during the reporting period to eliminate the restriction that the extreme and uncontrollable circumstances policy applies only if the reporting period is not extended (85 FR 19267 through 19268). The PHE for COVID-19 was declared during the quality reporting period for performance years starting in 2019 and it applied to all counties in the United States. As we explained in the March 31st COVID-19 IFC, we believed that it was appropriate to offer relief under the Shared Savings Program extreme and uncontrollable circumstances policy to all Shared Savings Program ACOs that were unable to completely and accurately report quality for 2019 by the extended deadline due to the PHE for COVID-19. We explained that this policy needed to be effective starting with the quality reporting period for performance years starting in 2019 to provide relief for Shared Savings ACOs who needed to focus resources on patient care during the PHE for COVID-19. Further, we acknowledged that, as illustrated by the current PHE for COVID-19, there could be unanticipated situations in the future, during which extension of a quality reporting window alone would not provide sufficient relief from reporting burden at a time when ACOs and their ACO providers and suppliers need to focus on patient care. Accordingly, in the March 31st COVID-19 IFC, we amended the regulation at § 425.502(f) to remove the phrase "if the quality reporting period is not extended," effective for quality

reporting for performances years starting in 2019.

We received public comments on modifying the extreme and uncontrollable circumstances policy as it applies to disasters that occur during the reporting period for performance years starting in 2019 to eliminate the restriction that the extreme and uncontrollable circumstances policy applies only if the reporting period is not extended. The following is a summary of the comments we received and our response.

Comment: Commenters were supportive of providing relief to all ACOs during the reporting period for performance years starting in 2019 by eliminating the restriction that the extreme and uncontrollable circumstances policy applies only if the reporting period is not extended. Commenters stated that this was a thoughtful approach to addressing the quality submission challenges resulting from the PHE for COVID-19 and welcomed this change. One commenter stated that they appreciated the acknowledgment by CMS that the previously issued 30-day extension of the PY 2019 quality reporting period alone was insufficient relief from the reporting burden for ACOs and their ACO providers/suppliers during this public health emergency. Another commenter noted appreciation for this approach, explaining that a number of physicians may be unable to submit quality data in a timely manner due to the demands on their practices associated with the PHE for COVID-19.

Response: We thank commenters for their positive feedback. We are finalizing, without modification, the revisions that were made to the regulation at § 425.502(f) in the March 31st COVID-19 IFC to remove the restriction which prevented the application of the Shared Savings Program extreme and uncontrollable circumstances policy for disasters that occur during the quality reporting period if the reporting period is extended.

J. Removal of Selected National Coverage Determinations

In the CY 2021 PFS proposed rule (85 FR at 50255), we proposed to use the notice and comment rulemaking to identify and remove older NCDs that we believed no longer contained clinically pertinent and current information or no longer reflected current medical practice. We explained that eliminating an NCD changes a substantive legal standard related to Medicare coverage and payment under section 1871(a)(2) of the Act because items that were covered

nationally under Title XVIII would no longer be automatically covered by Medicare (42 CFR 405.1060). Instead, in the absence of an NCD, the coverage determinations for those items and services would be made by Medicare Administrative Contractors (MACs). We also noted that if the previous NCD barred coverage for an item or service under title XVIII (that is, national noncoverage NCD), a MAC would now be able to cover the item or service if the MAC determined that such action was appropriate under the statute. Removing a national non-coverage NCD may permit access to technologies that may be beneficial for some uses. We explained that as the scientific community continues to conduct research producing new evidence, the evidence base we previously reviewed may have evolved to support other policy conclusions. In the proposed rule, we also described the circumstances that we had used in determining whether an older NCD should be removed.

We sought public comments that may identify other reasons for proposing to remove NCDs. We also noted that we were interested in whether the time-based threshold of "older"—which had been designated as 10 years—continued to be appropriate or whether stakeholders believe a shorter period of time or some other threshold criterion unrelated to time would be more appropriate.

We also described two previous times that we used an expedited public process for removing NCDs. The proposals and final decisions related to these removals are located in the Medicare Coverage Database, available at <https://www.cms.gov/medicare-coverage-database/indexes/medicare-coverage-documents-index.aspx?MCDIndexType=7&mcdtypename=Expedited+Process+to+Remove+National+Coverage+Determinations&bc=AgAAAAAAAAAAAA%3d%3d&>.

As discussed in the proposed rule, we continue to recognize the need to periodically review our policies and processes to ensure that we remain effective and efficient as well as open and transparent. We noted that we are aware that clinical science and technology evolve and that items and services that were once considered state-of-the-art or cutting edge may be replaced by more beneficial technologies or clinical paradigms. Additionally, proactively removing obsolete broad non-coverage NCDs removes barriers to innovation and reduces burden for stakeholders and CMS. In light of the Supreme Court's decision in *Azar v. Allina Health*

Services, 587 U.S. ___, 139 S. Ct. 1804 (2019)), we have determined it would be appropriate to use the notice and comment rulemaking procedures described in section 1871(a)(2) of the Act to remove outdated or unnecessary NCDs.

In Table 37 of the proposed rule, we listed the NCDs that we proposed to

remove and described the mechanisms by which we identified NCDs for consideration. We solicited comment on the nine NCDs discussed in Table 41, as well as comments recommending other NCDs for CMS to consider for future removal. In the CY 2021 PFS proposed rule, we summarized each of the nine

NCDs and provided a rationale for removal for each one. NCDs are listed in the Medicare National Coverage Determinations Manual located at <https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/internet-Only-Manuals-IOMs-Items/CMS014961>.

TABLE 41: Proposed NCDs for Removal

NCD Manual Citation	Name of NCD
20.5	Extracorporeal Immunoadsorption (ECI) using Protein A Columns (01/01/2001)
30.4	Electrosleep Therapy
100.9	Implantation of Gastroesophageal Reflux Device (06/22/1987)
110.14	Apheresis (Therapeutic Pheresis) (7/30/1992)
110.19	Abarelix for the Treatment of Prostate Cancer (3/15/2005)
190.1	Histocompatibility Testing
190.3	Cytogenetic Studies (7/16/1998)
220.2.1	Magnetic Resonance Spectroscopy (09/10/2004)
220.6.16	FDG PET for Inflammation and Infection (03/19/2008)

In summary, we solicited comment on the proposals to remove each of the nine NCDs, as well as comments recommending other NCDs for CMS to consider for future removal. Additionally, we solicited public comments that may identify other reasons for proposing to remove NCDs. We solicited comments on whether the time-based threshold of “older” which was designated as 10 years in the 2013 notice continues to be appropriate or whether stakeholders believe a shorter period of time or some other threshold criterion unrelated to time is more appropriate. We requested commenters include a rationale to support their comments. We noted that we will use the public comments to help inform our decision to take one of three actions on the nine NCDs proposed for removal:

- Remove the NCD, as proposed, allowing for coverage to be determined by the MACs.
- Retain the current policy as an NCD.
- Reconsider the NCD. We also noted that comments suggesting that the NCD should be revised, rather than eliminated, should include previously unreviewed evidence in order to support a change in national coverage.

We received more than 100 public comments on the proposed removal of selected NCDs, the process for identifying NCDs for removal, as well as the vehicle for removing NCDs. The following is a summary of the comments we received and our responses.

Comment: Many commenters generally supported the proposal to periodically identify and remove NCDs that are no longer clinically relevant or are infrequently used and appreciated CMS seeking input from stakeholders. Commenters agreed with agency efforts to ensure that NCDs are based on current scientific evidence, are relevant to the Medicare population and some acknowledged that the Medicare coverage process is designed to provide greater contractor flexibility. Many also agreed with using rulemaking for removing outdated NCDs as a transparent way to gather input from stakeholders and ensure beneficiary access to services.

Response: We thank commenters for their support for periodically removing outdated NCDs and for their support for using rulemaking.

Comment: Several commenters noted that CMS should have other options for retirement of NCDs that do not include notice and comment rulemaking. One commenter stated that rulemaking does not provide enough flexibility for CMS to retire obsolete NCDs upon receipt of clinical data demonstrating that the NCD is no longer appropriate. Another commenter disagreed with CMS’ legal interpretation of Supreme Court’s decision in *Azar v. Allina Health Services*, 587 U.S. ___, 139 S. Ct. 1804 (2019), and suggested that the statute provides for CMS to remove outdated NCDs through an expedited administrative process such as the process we described in 2013 (78 FR

48164). The commenters also noted that CMS should have a process that is nimble and flexible and requested that CMS finalize a policy that allows retirement of NCDs through a subregulatory process similar to the 2013 expedited subregulatory administrative process.

Response: We do not agree that section 1871(a)(2) of the Act would permit the removal of multiple NCDs at one time through a subregulatory process. While not legally binding on the public, NCDs establish controlling coverage policies for particular items and services for Medicare contractors and adjudicators in the Medicare appeals process, § 405.1060, and establish substantive legal standards related to coverage and payment. Given the importance of NCDs in notifying the public when particular items or services will (or will not) be covered under Title XVIII of the Act, we believe that a public process is necessary to remove those controlling policies. We note that Congress has separately established a public comment process in section 1862(l) of the Act, to be used in making NCDs and that NCDs are expressly exempt from the rulemaking requirements in section 1871(a)(2) of the Act. While the statute does not establish a specific process for removing NCDs, using the process required by section 1871(a)(2) of the Act is appropriate when changing a substantive legal standard governing the scope of benefits or payment for services. This result is consistent with the Supreme Court’s

decision in *Azar v. Allina Health Services*, 139 S. Ct. 1804 (2019).

Comment: A few commenters questioned whether we will now be using rulemaking for NCD reconsiderations in addition to removals and whether we will create new NCDs through rulemaking. One commenter questioned if an NCD specifies coverage and non-coverage for multiple indications under the NCD, would this process be used to remove non-covered indications under the NCD. The commenter also questioned how would CMS address situations when a specific non-coverage portion of the NCD could be considered for removal.

Response: We thank commenters for their questions and the opportunity to clarify. As noted above, section 1871(a)(2) of the Act contains an exception for NCDs, and we are not required to use rulemaking procedures to establish or change a particular NCD. We will continue to use the NCD procedures established by section 1862(l) of the Act and that include an opportunity for public comment to reconsider or revise particular NCDs, as explained in the August 7, 2013 **Federal Register** notice (78 FR 48164). We proposed to use rulemaking to remove multiple old NCDs at one time, which would be more efficient than reconsidering each NCD separately.

Comment: A few commenters questioned whether CMS will use this process to remove and/or “wrap up” Coverage with Evidence Development (CEDs) as well as NCDs, given that CEDs are part of an NCD.

Response: We may consider using the removal process for CED NCDs in the future, but we note that none of the NCDs we proposed for removal at this time are CED NCDs.

Comment: Some commenters stated that CMS should rarely or never remove NCDs, but should retain and update them, optimizing appropriate use of NCDs rather than minimizing their use. Several commenters noted that CMS should only remove NCDs that provide for broad non-coverage, such as for items and services once considered experimental. These commenters noted that NCDs that provide even limited coverage for certain indications act as a floor and should be either retained or updated instead of allowing coverage determinations to be made at the local level.

Response: We believe it is in the best interests of the Medicare program and Medicare beneficiaries to regularly evaluate both coverage and broad-noncoverage NCDs because medical science may change over time. When we identify outdated NCDs or stakeholders

bring them to our attention, we use our discretion either to reconsider and update the NCD as appropriate or to propose to remove the NCD if appropriate to allow the coverage determination to be made by the local MACs. Removing outdated NCDs in some cases can remove barriers to innovation and can pave the way for a robust local determination. This flexibility will allow stakeholders to provide new evidence for our consideration to support either reconsideration or the removal of an outdated NCD. We do not agree that it is always in the best interests of beneficiaries to keep old NCDs as a coverage floor; there are instances when NCDs are outdated and the practice of medicine has changed to the extent that some covered indications are obsolete or potentially create coverage barriers if the information is no longer current.

When we evaluate particular NCDs for removal, we take into account information gathered from stakeholders, the claims data for those items and services, and factors such as whether there may be documentation requirements within the NCD that are outdated and create a barrier to coverage. The rulemaking process will provide an opportunity to consider public input before the NCD would be removed. We could decide to retain those NCDs after considering public comments.

Comment: One commenter suggested that CMS should collect quality data collected as a part of an NCD in order to evaluate and maintain quality care, particularly related to new technology, previously unstudied populations.

Response: We thank the commenter for the suggestion about incorporating quality data into NCDs, though it is outside the scope of this proposal. Because there are many different quality programs established by the Medicare Act, it is difficult to evaluate in the abstract whether data collection through NCDs would be consistent with the existing statutory and regulatory requirements.

Comment: Several commenters opposed removing NCDs, either generally, or with regard to specific NCDs in this rule, because they believed that Medicare Advantage (MA) Plans are not required to follow LCDs created by MACs. The commenters noted removing NCDs that provide for coverage or limited coverage will create access barriers for MA plan enrollees because they noted the MA plans will choose not to continue covering those services.

Response: We appreciate the commenters' concerns, but believe there are sufficient beneficiary protections in

place. Medicare Advantage plans (MA) are required to cover all Part A and Part B benefits for their enrollees, subject to limited exclusions such as for hospice care and kidney acquisition costs. The MA program regulation at 42 CFR 422.101(b) requires, and has required since the inception of the MA program, MA plans to comply with the written coverage determinations (that is, LCDs) of the local Medicare contracts (that is, the MACs) in the geographic area where the MA plan provides coverage (63 FR 34986, 35077). Section 1852(a)(1)(C) of the Act provides MA plans with the option to comply with the LCD that provides the more beneficial coverage to the plan's enrollees in cases where the MA plan service area includes more than one LCD area. All of this is further explained in the Medicare Managed Care Manual, Chapter 4, section 90, available at <https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/mc86c04.pdf>.

Comment: In response to our solicitation for public comments about other reasons that may support the removal of an NCD, a number of commenters support the continued use of the factors that CMS has used in removing outdated NCDs since 2013. Other commenters identified other factors that might be relevant for CMS to consider. One commenter stated that CMS needs to be more flexible and nimble in responding to changes in the standard of care and that the only criterion for removal should be presentation of sufficient clinical data to CMS to support retirement of an NCD irrespective of how old it is. The requestor recommended that CMS provide examples of what amount and type of information and clinical data would be “sufficient” to support removal. The commenter proposed an example of evidence-based professional society guidelines with a grade of evidence of A or B as sufficient to demonstrate whether an NCD should, and therefore could, be retired. Another commenter recommended that CMS assess and propose applying criteria similar to those under other Medicare programs, including for Medicare Part D.

Response: We appreciate the commenters that supported the use of the factors that CMS had previously used in identifying outdated NCDs. We will continue to consider those factors as modified by the additional public suggestions. We also agree with the commenter that suggested we pay attention to the changes in the standard of care, and that some NCDs may need to be removed in those circumstances regardless of age. We will consider

changes in the standard of care in making these determinations. We also agree that changes in evidence-based professional society guidelines with a high grade of evidence could be a good example of information that may support removal of an NCD in some circumstances. In order to be more flexible and nimble, we do not intend to establish an exclusive list of criteria as decisions may depend on the particular changes in medical practice at the time. We are grateful for the helpful public suggestions.

Comment: One commenter questioned whether the 10-year timeframe of “older NCDs” is tied to the last effective date or to the NCD’s original implementation date. They also questioned how CMS will consider NCDs that are greater than the 10-year timeframe, but have been updated to address clinical changes affecting the services.

Response: To determine the age of NCDs we had used the effective date of the NCD, which, for some NCDs is the same date as the final decision memorandum was released. For determining the age of an NCD that has been reconsidered since the initial NCD was published, the clock restarts whenever a NCD reconsideration is conducted. For example, if we have an NCD for a particular service that was effective February 5, 2009, but was reconsidered in 2016 with an effective date of October 30, 2016, we would consider the NCD to be 4 years old.

Comment: We received many comments and recommendations on the 10-year threshold for identifying older NCDs for further evaluation for potential removal. A number of commenters stated that a specific threshold age, like 10-years, is arbitrary and does not reflect the rapid evolution of medical care in this century, and that age of the NCD should be a rule of thumb and not a categorical restriction. Several commenters stated that in many cases, even if an NCD is less than 10 years old, other evidence will be available that strongly suggests the NCD has most likely become outdated—such as when new and innovative therapies are released that substantially undermine core assumptions of an older NCD. While some commenters generally supported a definition of age at 10-years, we also received a wide variety of recommendations for timeframes ranging from annual review with 10 years as a maximum age, to reviewing NCDs at 3 years, 5 years or 7 years. Several commenters recommended that CMS adopt a shorter threshold and add a clinical evidence exception. These commenters stated that it would be appropriate to allow for the retirement

of a NCD that is more than 5 years old, or a more recent NCD if there is new clinical evidence or FDA approval that causes the NCD to be outdated or to restrict beneficiary access to medically necessary items and services. One commenter noted that using 10 years as a look-back period may not be long enough for some items and services that have longer adoption timelines, or that may not be superseded by newer items and services.

Response: We appreciate commenters’ thoughtful recommendations.

Commenters are correct that the 10-year factor was a general guideline to identify groups of potentially outdated NCDs for further evaluation for possible removal. We also could decide to retain the NCD or reconsider the NCD if the NCD needed to be substantively changed. We acknowledge the rapid pace of medical technology development and changes in standard of care and/or clinical evidence may occur more rapidly than every 10 years, and we will consider those factors as well as we evaluate whether existing NCDs should be removed.

Comment: We received several comments supporting removal of each of the following NCDs: NCD 30.4 Electrosleep Therapy, NCD 100.9 Implantation of Gastrointestinal Reflux Devices, and NCD 220.2.1 Magnetic Resonance Spectroscopy. We also received several comments supporting removal of NCD 20.5 Extracorporeal Immunoabsorption (ECI) Using Protein A Columns, some including recommendations for corresponding changes to the claims processing instructions for this service related to removal of the NCD. We also received no comments for NCD 110.19 Abarelix for the Treatment of Prostate Cancer.

Response: We thank commenters for their support and will finalize the removal of each of the 5 NCDs identified above as proposed. We note that we received no comments opposing removal of these specific NCDs. We appreciate the recommendations for corresponding changes to the claims processing instructions and we will consider them as we implement the removal of NCDs. We note that while the change in policy will be effective on the effective date of the final rule, implementing the change for NCD 20.5 Extracorporeal Immunoabsorption (ECI) Using Protein A Columns requires changes to national coding systems. The implementing Change Request (CR) will take the time discrepancies between effective and implementation dates into consideration and ensure claims are adjudicated appropriately retroactive

back to the effective date of the NCD (in this case, the final rule).

Comment: We received a number of comments supporting removal of NCD 110.14 (Apheresis). Some commenters acknowledged that the NCD was outdated and does not currently reflect advances in apheresis medicine and patient care applications. Several commenters noted their previous support for removing the NCD when we last proposed its removal in 2015. Several expressed their intention to work together with other professional societies to educate the Medicare Administrative Contractors on the intricacies of apheresis care based on the current professional society guidelines.

We also received several comments opposing removal of the apheresis NCD because they believe the NCD—while very outdated—remains relevant and the NCD provides predictability of coverage for indications currently listed in the NCD. The commenters expressed concern that allowing MACs to determine coverage could create inconsistencies in coverage and could reduce access for beneficiaries across Medicare and other payers. Several commenters encouraged CMS to ensure that any changes to NCDs support flexibility, innovation, and patient care.

Response: We thank commenters for their thoughtful and informative feedback, both in support of removing the NCD and for maintaining it. Since commenters shared multiple viewpoints on this issue, we will take more time to consider the specific issues raised by commenters and will not finalize removal of this NCD in this final rule. We will continue to engage with stakeholders on the issue and will consider whether to propose the NCD for removal in next year’s PFS proposed rule.

Comment: One commenter supported removing NCD 190.1 (Histocompatibility Testing). The commenter noted their belief that local contractors should have the flexibility to cover not only conventional HLA cross-matching but also other techniques that have been developed and that are emerging. Several commenters did not support removing the NCD and requested that CMS retain or retain and update the NCD to expand the covered indications. While recognizing that it is very outdated, the commenters stated it provides predictability regarding coverage of histocompatibility testing for kidney and other types of transplant care, and other conditions. Several commenters requested that CMS closely monitor local contractor activity to ensure there is no disruption in access

and coverage for current critical applications if CMS decides to remove this NCD.

Response: We appreciate commenter's thoughtful responses. Since commenters shared multiple viewpoints on this issue, we will take more time to consider the specific issues raised by commenters and will not finalize removal of this NCD in this final rule. We will continue to engage with stakeholders on the issue and whether to propose the NCD for removal in the CY 2022 PFS proposed rule.

Comment: One comment supported removing NCD 190.3 (Cytogenetic Studies) stating that "the NCD is decades old, and laboratories now are able to detect and locate specific DNA sequences on a chromosome using diagnostic techniques that did not exist or were not widely available when the NCD was issued, including next generation sequencing and fluorescence in situ hybridization (FISH)."

Several commenters did not support removing the NCD and requested that CMS retain or retain and update the NCD because while recognizing that it is very outdated, they believe the NCD remains relevant as cytogenetic studies are in widespread use, and provides predictability of coverage, avoiding potentially disparate local coverage policies. Several requested that CMS update the NCD to remove outdated terminology that is now considered offensive. Commenters also stated that cytogenetic studies have not been replaced by Next Generation Sequencing (NGS), but that the tests are used in conjunction. One commenter mentioned that multiple professional guidelines and practice resources exist that support use of cytogenetic studies. Several commenters requested that CMS closely monitor local contractor activity to ensure there is no disruption in access if CMS decides to remove this NCD.

Response: We thank commenters for pointing out that genetic sequencing is commonly used in conjunction with cytogenetic studies. Since commenters shared multiple viewpoints on this issue, we will take more time to consider the specific issues raised by commenters and will not finalize removal of this NCD in this final rule. We will continue to engage with stakeholders on the issue and will consider whether to propose the NCD for removal in next year's PFS proposed rule.

Comment: We received many comments supporting removal of NCD 220.6.16 (FDG PET for Inflammation and Infection) and allowing local contractor discretion to determine

coverage for this service. A number of these comments raised a concern about language in NCD 220.6 (Positron Emission Tomography (PET) Scans) that provides for non-coverage, ". . . that a particular use is noncovered unless this manual provides that such use is covered." Commenters requested that CMS also revise NCD 220.6 to ensure that local contractors can make coverage determinations for FDG PET for Inflammation and Infection. Commenters also requested that CMS revise this language to expand coverage and allow for MAC discretion to cover PET for existing and new uses beyond inflammation and infection, to include any non-oncologic condition that falls within an FDA approval and is not currently non-covered by an NCD. A number of commenters offered drafts of revised language for the manual as well as current literature as support.

Response: We will finalize removal of the NCD as proposed, and will modify the NCD manual to ensure that contractors have the authority to make a coverage determination when claims are submitted for PET for Inflammation and Infection. We will ensure MAC discretion is available by making two revisions in the NCD manual. First, we will revise the NCD manual at section 220.6.16 (FDG PET for Inflammation and Infection) to remove the current NCD language and replace it with the following statement of local contractor discretion: "Effective January 1, 2021, CMS determined that no national coverage determination (NCD) is appropriate at this time for FDG PET for Inflammation and Infection. In the absence of an NCD, coverage determinations for FDG PET for Inflammation and Infection will be made by the Medicare Administrative Contractors (MACs)." In addition, we will also make a non-substantive conforming change to NCD 220.6 (Positron Emission Tomography (PET) Scans, to add the following sentence to the note section: "Effective for dates of service on or after January 1, 2021, local Medicare Administrative Contractors (MACs) may determine coverage within their respective jurisdictions for FDG PET for Infection and Inflammation (formerly NCD 220.6.16)." We are making the conforming change to make it abundantly clear in both sections of the manual that contractors will make the section 1862(a)(1)(A) of the Act determination for this PET indication.

While the change in policy will be effective on the effective date of this final rule (January 1, 2021), implementing this change requires changes to national coding systems and to the NCD manual. The implementing

CR will take the time discrepancies between effective and implementation dates into consideration and ensure claims are adjudicated appropriately retroactive back to the effective date of the NCD (in this case, the final rule).

With respect to the request to revise NCD 220.6 to remove the non-coverage language and expand availability of PET for non-oncologic indications at MAC discretion, that revision would require a reconsideration of the NCD that is beyond the scope of this rulemaking. We note the process for submitting a formal reconsideration request is described in the August 7, 2013 **Federal Register** notice (78 FR 48164) and are outlined on the Medicare Coverage page at <https://www.cms.gov/Medicare/Coverage/DeterminationProcess/howtorequestanNCD>. These sources include the factors for considering a request to be complete as well as the electronic and mail methods for submitting a complete, formal request.

Comment: Commenters recommended additional NCDs for future removal including: NCD 10.5 Autologous Epidural Blood Graft, NCD 90.1 Pharmacogenomic Testing for Warfarin Response, NCD 150.10 Lumbar Artificial Disc Replacement (LADR), NCD 160.22 Ambulatory EEG Monitoring, NCD 210.3 Screening Computed Tomography Colonography (CTC) for Colorectal Cancer, and NCD 240.6 Transvenous (Catheter) Pulmonary Embolectomy. We note that NCDs 10.5, 210.3, and 240.6 each were recommended for removal by a number of commenters. In addition, one commenter requested that CMS revise NCD 210.12 Intensive Behavioral Therapy for Obesity to expand the eligible providers that are able to offer IBT to patients with obesity.

Response: We thank commenters for their recommendations of NCDs for us to consider removing in the future. While we do not accept these comments as complete, formal requests, we will take the suggestions under advisement for future review and will continue to communicate with interested stakeholders. As noted above, the process for submitting a request for reconsideration is described in the 2013 **Federal Register** notice and is outlined on the Medicare Coverage page at <https://www.cms.gov/Medicare/Coverage/DeterminationProcess/howtorequestanNCD>.

With respect to the request to reconsider the eligible providers for NCD 210.12, that request is outside the scope of the proposed rule, but we note that interested parties may make a formal request for reconsideration following the process outlined at the website above.

Comment: We received a number of general comments, concerns and suggestions for reforming the NCD and LCD processes used in making coverage determinations.

Response: We thank stakeholders for their comments and suggestions, but those comments are outside the scope of the proposed rule.

After considering the comments, we are not finalizing removal of NCD 110.14 Apheresis, NCD 190.1 Histocompatibility Testing, and NCD 190.3 Cytogenetic Studies. We will take more time to consider the specific issues raised by commenters regarding these NCDs and will consider whether to propose them for removal in next year's PFS proposed rule. We are finalizing removal of six NCDs as proposed, including NCD 20.5 Extracorporeal Immunoadsorption (ECI) Using Protein A Columns, NCD 30.4 Electrosleep Therapy, NCD 100.9 Implantation of Gastrointestinal Reflux Devices, NCD 220.2.1 Magnetic Resonance Spectroscopy, and NCD 220.6.16 FDG PET for Inflammation and Infection. Local Medicare contractors will determine coverage under section 1862(a)(1) of the Act for those specific items or services previously addressed through the NCDs. We will remove all six NCDs on the effective date of the final rule. However, changes in coverage require an implementation process in order to make required changes in manual guidance as well as coding/coverage/payment system edits for the items and services. While it typically takes a number of months to implement a change in coverage, the implementing CR will take the time discrepancies between effective and implementation dates into consideration and ensure claims are adjudicated appropriately retroactive back to the effective date of the final rule.

K. Requirement for Electronic Prescribing for Controlled Substances for a Covered Part D Drug Under a Prescription Drug Plan or an MA-PD Plan

1. SUPPORT Act Requirements

Section 2003 of the SUPPORT Act generally mandates that the prescribing of a Schedule II, III, IV, or V controlled substance under Medicare Part D be done electronically in accordance with an electronic prescription drug program beginning January 1, 2021, subject to any exceptions, which HHS may specify. Section 2003 of the SUPPORT Act requires that the Secretary use rulemaking to specify circumstances and processes by which the Secretary may waive the EPCS requirement and

provides the Secretary with authority to enforce and specify appropriate penalties for non-compliance with EPCS. The SUPPORT Act specifies some circumstances under which the Secretary may waive the electronic prescribing requirement with respect to controlled substances that are covered Part D drugs and also permits HHS to develop other appropriate exceptions. The circumstances that are listed in the statute under which the Secretary may waive the EPCS requirement are at section 1860D-4(e)(7) of the Act, as added by section 2003 of the SUPPORT Act, and include:

- A prescription issued when the practitioner and dispensing pharmacy are the same entity;
- A prescription issued that cannot be transmitted electronically under the most recently implemented version of the National Council for Prescription Drug Programs SCRIPT 2017071 standard;
- A prescription issued by a practitioner who received a waiver or a renewal thereof for a period of time as determined by the Secretary, not to exceed one year, from the requirement to use electronic prescribing due to demonstrated economic hardship, technological limitations that are not reasonably within the control of the practitioner, or other exceptional circumstance demonstrated by the practitioner;
- A prescription issued by a practitioner under circumstances in which, notwithstanding the practitioner's ability to submit a prescription electronically as required by this subsection, such practitioner reasonably determines that it would be impractical for the individual involved to obtain substances prescribed by electronic prescription in a timely manner, and such delay would adversely impact the individual's medical condition involved;
- A prescription issued by a practitioner prescribing a drug under a research protocol;
- A prescription issued by a practitioner for a drug for which FDA requires a prescription to contain elements that are not able to be included in electronic prescribing, such as a drug with risk evaluation and mitigation strategies that include elements to assure safe use;
- A prescription issued by a practitioner—
 - ++ For an individual who receives hospice care under this title; and
 - ++ That is not covered under the hospice benefit under this title; and
 - A prescription issued by a practitioner for an individual who is—

++ A resident of a nursing facility (as defined in section 1919(a)); and

++ Dually eligible for benefits under this title and title XIX.

2. Current Public Health Emergency (PHE)

On January 31, 2020, the Secretary determined that a PHE existed for the United States to aid the nation's health care community in responding to COVID-19 (hereafter referred to as the PHE for COVID-19). On March 13, 2020, President Trump declared the PHE for COVID-19. Effective October 23, 2020, the Secretary renewed the January 31, 2020 determination that was previously renewed on April 21, 2020 and July 25, 2020 that a PHE exists and has existed since January 27, 2020. Because of the PHE for COVID-19, and as the nation reopens, some individuals, such as those who are at high risk, may continue to practice self-isolation and social distancing.

We have implemented many regulatory and policy actions to swiftly aid the nation's healthcare system to effectively address the PHE for COVID-19. These actions include new flexibilities for telehealth and other electronic technologies⁹⁸ to ease the burden on providers and assure appropriate care in a range of settings for beneficiaries. Also, the DEA has adopted certain new temporary flexibilities to allow DEA-registered practitioners to prescribe controlled substances without having to interact in person with patients, effective for the duration of the PHE for COVID-19.⁹⁹ For example, during the PHE for COVID-19, DEA permits DEA-registered prescribers to issue controlled substance prescriptions to telemedicine patients who they have not seen in person under certain conditions, permits early refills of controlled substances permissible under state law, and allows prescribers to issue multiple prescriptions authorizing the patient to receive a total of up to a 90-day supply of a Schedule II controlled substance. DEA's COVID-19 information page is available at <https://www.deadiversion.usdoj.gov/coronavirus.html>. The DEA has acknowledged the prevalence of paper prescribing and attempted to address some of the hardships it poses for prescribers and patients during the PHE for COVID-19.

⁹⁸ See <https://www.cms.gov/files/document/covid-19-physicians-and-practitioners.pdf>.

⁹⁹ See [https://www.deadiversion.usdoj.gov/GDP/\(DEA-DC-023\)\(DEA075\)Decision_Tree_\(Final\)_33120_2007.pdf](https://www.deadiversion.usdoj.gov/GDP/(DEA-DC-023)(DEA075)Decision_Tree_(Final)_33120_2007.pdf).

3. Electronic Prescribing of Controlled Substances (EPCS)

As discussed in the CY 2021 PFS proposed rule (85 FR 50074), we noted that social distancing is likely to be at least in part, responsible for the increase in EPCS during this PHE for COVID-19. In 2020, EPCS has increased to 50 percent of all prescription drug events (PDEs) for controlled substances being prescribed as compared to 38 percent in 2019.¹⁰⁰ With the use of electronic prescribing, once a patient and a provider have an established relationship, a medical visit can be conducted via telehealth and any necessary prescriptions can be electronically transmitted to the pharmacy without having to see each other in-person and risk transmitting COVID-19. Some insurers, including Part D plans, may be permitting medication refills, including for controlled substances, earlier than usual or for a more extended period of time than was previously allowed. Pharmacies that were not previously doing so may deliver medications, or deliver at no charge, and communities and individuals have worked together to design ways for vulnerable persons to continue to receive access to prescribed medications in tandem with these new government and private sector flexibilities.

EPCS provides multiple advantages over the traditional processing of paper

prescriptions.^{101 102 103 104 105 106} In addition to improving workflow efficiencies, electronic prescribing of controlled substances can deter and help detect prescription fraud and irregularities by requiring an extra layer of identity proofing, two-factor authentication and digital signature processes. It can also provide more timely and accurate data than paper prescriptions by avoiding data entry errors and pharmacy calls to a prescriber to clarify written instructions. By allowing for the direct transmission of electronic prescriptions between providers and pharmacies or facilities, EPCS may also reduce the burden on prescribers who need to coordinate and manage paper prescriptions between staff, patients, facilities, other care sites, and pharmacies. In addition, EPCS (dispensed medication) data is transmitted to Prescription Drug Monitoring Programs (PDMPs), which

can help inform providers of patients' medication history and can aid in clinical decision making at the time of prescribing and/or before the medication, is dispensed by a pharmacy. It is also important to continue the assurance of privacy and security in the prescribing process, such as by controlling prescriber access through improved identity controls and authentication protocols. EPCS can also assure prescribers' identity more easily and may permit a single workflow for prescribing both controlled and non-controlled drugs, improving the overall prescribing process.¹⁰⁷

From the patient standpoint, EPCS may reduce the logistical burden on patients who may otherwise be required to make multiple trips between providers and pharmacies to transport paper prescriptions when filling time-sensitive prescriptions while in pain or otherwise in need of medical treatment with controlled substances. EPCS can lessen the time needed to obtain prescriptions by minimizing trips to the physician to pick up paper prescriptions for refills and minimize transportation costs to and from the provider's office. EPCS identity and security requirements also assure prescribers, patients, and pharmacies that prescriptions are processed as intended. In addition to helping with the reduction in fraud previously described, EPCS minimizes the likelihood that prescriptions have been tampered with, since electronic prescriptions are securely transmitted directly to the pharmacy from health information technology, which minimizes the likelihood of exposure to patients or other third parties. In the Medicare Program: Electronic Prescribing for Controlled Substances; Request for Information issued on August 4, 2020 (85 FR 47151), we requested feedback on the appropriate waivers and whether CMS should impose penalties for noncompliance with the EPCS mandate in its rulemaking, and what should be the penalties. We plan to use the important public feedback we receive from the Request for Information in future standalone rulemaking.

In our proposed rule, we proposed to enact regulations requiring EPCS by January 1, 2022 to strike the balance between not placing too large of a burden on providers and helping ensure that the benefits of EPCS are leveraged expeditiously. Furthermore, we noted that requiring EPCS by January 1, 2022 would allow time to solicit and consider important feedback from the previously discussed Request for Information that is necessary for implementation of the EPCS requirements for waivers from the

¹⁰⁷ HHS Office of the National Coordinator, The Onc Doctors' Perspective: Electronic Prescribing of Controlled Substances (EPCS) Is on the Rise, and We Must Work Together to Address Barriers to Use: <https://www.healthit.gov/buzz-blog/health-it/the-onc-doctors-perspective-electronic-prescribing-of-controlled-substances-epcs-is-on-the-rise-and-we-must-work-together-to-address-barriers-to-use>.

¹⁰⁰ Based on Prescription Drug Event data processed through April 30, 2020.

requirements and penalties. This included soliciting feedback from prescribers that we do not directly regulate under MA, and/or Part D, and who are not enrolled in Medicare or Medicaid. Section 1860D–4(e)(2)(E) of the Act requires the Secretary to adopt electronic standards for mandatory use by Part D plans. As stated above, the statute provides the Secretary with the authority to develop any exceptions to EPCS that may be warranted, and to enforce and specify appropriate penalties for non-compliance with the requirement. We noted that we do not have an existing process for imposing penalties on non-compliant prescribers for EPCS. In developing an entirely new penalty process, we must make sure that it enforces the new EPCS requirement, allows for exceptions only when needed, but does not reduce beneficiaries' access to needed drugs. Separate from this rule, we noted that we intend to conduct future standalone rulemaking that would address these topics.

Based on these considerations, we proposed to amend 42 CFR 423.160(a) by adding the requirement that all prescribers conduct electronic prescribing of Schedule II, III, IV, and V controlled substances covered under the Medicare prescription drug program using the NCPDP SCRIPT 2017071 standard by January 1, 2022, except in circumstances in which the Secretary waives the requirement. We proposed that prescribers would be required to use the NCPDP SCRIPT 2017071 standard because they are already required to use this standard when conducting e-Prescribing for covered Part D drugs for Part D eligible individuals, and we noted that we believe that prescribers should use the same standard for their electronic prescribing of controlled substances.

We also solicited comments regarding the impact of the proposal on overall interoperability and the impact on medical record systems. Finally, we solicited comments on whether the change would be significant enough for a January 1 implementation date, which is required for all significant changes affecting Part D plans.

We received 57 timely public comments in response to this proposed provision. We have summarized these comments and our responses below.

Comment: A majority of commenters supported our proposal requiring that prescribers use the NCPDP SCRIPT 2017071 standard for EPCS prescription transmissions within the Part D program. Commenters echoed their support for many of the reasons set forth in our proposed rule including the

increased security of the transmission of the prescription and reduction of the number of callbacks from pharmacists seeking to clarify handwritten prescriptions.

Response: We thank commenters for their support. In light of the overwhelming majority of commenters supporting this proposal, we are finalizing the requirement that prescribers use the NCPDP SCRIPT 2017071 standard for electronic prescribing of Schedule II, III, IV, and V controlled substances covered under Medicare Part D.

Comment: A few commenters opposed e-Prescribing of controlled substances because they believed that EPCS would allow prescriptions to be written by a doctor electronically without seeing the patient. One commenter stated that such practices would lead to an increase in the opioid epidemic in our country.

Response: The assumption that electronic prescribing means inappropriate prescribing is an incorrect one. In order for a prescription to be covered under Part D, it must be a valid prescription according to applicable federal and state laws. Under DEA rules,¹⁰⁸ a prescription must be issued for a legitimate medical purpose in the usual course of professional practice by a practitioner who has conducted at least one in-person medical evaluation of the patient or a covering practitioner in general. Therefore, implementation of EPCS standard should not have an adverse impact on the appropriateness of controlled substances distributed.

Comment: Most commenters addressed our proposal to implement the EPCS requirement by January 1, 2022. A few commenters requested CMS to adhere to the January 1, 2021 date specified in the SUPPORT Act because of the many safety benefits associated with EPCS articulated in the rule. These commenters included Part D sponsors, companies involved in processing e-Prescribing transactions and most, but not all, pharmacies. A few commenters noted that there is an absolute and urgent need to implement section 2003 of the SUPPORT Act by the January 1, 2021 deadline in the statute even if the requirement is not enforced. A commenter stated that they understood that CMS does not believe it will be able to enforce this requirement on prescribers starting in January 2021, so proposed that CMS implement the requirement in mid-2021. Another option presented by the commenters

was for CMS to make the rule effective January 1, 2021 but decline to enforce it until some later date. They stated that just having the rule in force would encourage EPCS and cited evidence from state experiences to support this position.

Comments from nearly all prescribers indicate that implementation of EPCS by 2021 would not be feasible. For example, a large system commented that they had planned to implement EPCS by 2021 but were forced to reprioritize human and financial resources to support their colleagues and the patients and families impacted by, the PHE. Several other commenters stated that an EPCS mandate for a 2021 implementation date would undoubtedly cause some prescribers to simply stop prescribing controlled substances as part of their practice and this could inadvertently create patient suffering and harm.

Some prescriber groups supported the proposed January 1, 2022 date, while others requested even more time for implementation. They expressed appreciation for the flexibility that CMS has provided for providers struggling with the challenges of the current PHE and the difficulties they are facing implementing new systems or upgrades. Some commenters noted that there are both cost and implementation efforts required to install EPCS and with the COVID–19 pandemic, physicians face financial and operational hardships which create burden upon those who need to install EPCS functionality. Several commenters expressed views that the delay is prudent and will allow additional time for providers impacted by COVID, rural providers, and small practices to install and become familiar with EPCS. The specific challenges listed by these commenters include upgrading EHR software in a short timeframe, implementing dual authentication measures while social distancing, and paying the cost involved with system upgrades. One commenter noted that their software vendor was not making visits to their practice during the PHE, rendering software upgrades unfeasible.

Response: We appreciate the role that pharmacies, Part D plans and others have played in preparing for and advocating for EPCS. We understand that prescribers would prefer the proposed January 1, 2022 effective date and appreciate concerns raised by commenters about having adequate time to implement EPCS. However, as stated in our proposed rule, approximately 98 percent of pharmacies in the US are ready to accept EPCS, and Part D plans that have been reporting electronically

¹⁰⁸ See Title 21, § 1300.04(3)(f) available at https://www.dea diversion.usdoj.gov/21cfr/cfr/1300/1300_04.htm.

to CMS have no concerns about their readiness.

We also believe there are many benefits to EPCS that outweigh commenter concerns regarding readiness. EPCS can help deter and detect prescription fraud and irregularities by requiring an extra layer of identity proofing, two-factor authentication and digital signature processes. It can also help avoid data entry errors and pharmacy calls to a prescriber to clarify written instructions. By allowing for the direct transmission of electronic prescriptions between providers and pharmacies or facilities, EPCS may also reduce the burden on prescribers who need to coordinate and manage paper prescriptions between staff, patients, facilities, other care sites, and pharmacies. In addition, EPCS (dispensed medication) data is transmitted to Prescription Drug Monitoring Programs (PDMPs), which can help inform providers of patients' medication history and can aid in clinical decision making at the time of prescribing and/or before the medication is dispensed by a pharmacy. From the patient standpoint, EPCS may reduce the logistical burden on patients by lessening the time needed to obtain prescriptions, by minimizing trips to the physician to pick up paper prescriptions for refills, and by minimizing transportation costs to and from the provider's office. In addition, EPCS has important safety benefits in that it minimizes the likelihood that prescriptions have been tampered with. Because electronic prescriptions are securely transmitted directly to the pharmacy from health information technology, this minimizes the likelihood of exposure to patients or other third parties. We believe that an earlier effective date would encourage more timely implementation of EPCS in Part D, and therefore, bring these important benefits of EPCS faster to Part D prescribers, patients, and the Part D program.

Regarding the concern that the January 1, 2021 implementation date may cause prescribers to stop prescribing necessary controlled substances, we understand that this may be an issue. In light of this concern, as well as other potential implementation issues, we plan on monitoring the PDE data to look for concerning prescribing patterns, so we can adjust the program accordingly. Due to the PHE, we also seek to mitigate concerns about the impact that the January 1, 2021 deadline would cause by establishing a compliance date in addition to the effective date that would allow prescribers who do not implement the

NCPDP SCRIPT 2017071 standard for electronic prescribing of Schedule II, III, IV, and V controlled substances until January 1, 2022 to still be considered compliant.

In consideration of the benefits of EPCS and in light of the comments received, we are modifying our proposal by finalizing this provision with an effective date of January 1, 2021 and a compliance date of January 1, 2022. With a January 1, 2022 compliance date, prescribers who do not implement the NCPDP SCRIPT 2017071 standard for electronic prescribing of Schedule II, III, IV, and V controlled substances until January 1, 2022 will still be considered compliant with the requirement. We believe that this phased approach strikes a balance of adhering to the timeframe set forth in the SUPPORT Act, supporting more rapid implementation of EPCS, and giving prescribers adequate time to comply with the EPCS implementation requirement.

Comment: Several commenters mentioned the health care provider costs involved in implementing EPCS. One commenter recommended that CMS work with ONC to ensure that the cost of implementing the part D electronic prescribing standard is taken into account when EHR's are evaluated in accordance with one of ONC's EHR certification criteria, and to ensure that EHR developers cannot charge additional fees for building in this prescribing standard capability into their certified products. Accordingly, the commenter requested that HHS take steps to minimize the cost of EPCS requirements to physician practices. Another commenter stated that their practice has delayed implementing EPCS due to the need to upgrade their EHR software, which has proven to be costly. The commenter stated that given the pandemic impact that amount is now unaffordable for their small primary care practice. Another commenter acknowledged that EPCS implementation costs can be high, but that a prudent buyer of software support can find less expensive options.

Response: We share concerns about high health care provider costs associated with implementing EPCS, particularly during the PHE. However, neither ONC nor CMS have the authority to dictate EHR vendor charges for implementing electronic prescribing capabilities that would meet EPCS criteria. We encourage those who provide software solutions to support EPCS to make their products as accessible as possible. As prescribers who do not implement the NCPDP SCRIPT 2017071 standard for electronic

prescribing of Schedule II, III, IV, and V controlled substances until January 1, 2022 will still be considered compliant with the EPCS implementation requirement, software providers will have more time to review their costs, and providers will have more time to evaluate and choose among available options.

Comment: One commenter noted that even with a delayed compliance date, not all practices or providers are currently using or planning to use this technology due to practice style, size, resources, capability and willingness to adopt new technology. The commenter stated that if modernization is required, alternative options should be available, or assistance should be provided to ease the burden of cost and implementation.

Response: We recognize the difficulties that many providers may have in implementing an EHR or eRx that accommodates EPCS. However, the aforementioned benefits of EPCS, especially in light of current social distancing guidelines, outweigh the burden of implementing an EHR or eRx system for EPCS. Furthermore, based on our conversations with the industry and analysis, CMS believes that once the EHR and eRx systems are implemented, the burden of EPCS will be less than the current manual process.

Comment: Several commenters recommended CMS work with other federal entities that are involved in eRx rules including ONC and the DEA.

Response: We will continue to coordinate with our Federal partners and will continue to coordinate EPCS efforts to the extent possible based on our individual legal mandates.

Comment: One commenter suggested CMS clarify whether the EPCS requirement will apply to inpatient settings as well.

Response: Section 2003 of the SUPPORT Act mandates that the prescribing of a Schedule II, III, IV, or V controlled substance under Medicare Part D be conducted electronically in accordance with an electronic prescription drug program beginning January 1, 2021, subject to any exceptions, which HHS may specify. The proposal that we are finalizing includes all providers who prescribe medications that are Schedule II, III, IV, or V controlled substances that are covered Part D drugs. This generally includes medications dispensed in outpatient pharmacies but may also include medications dispensed to a patient who is being discharged to the home from an inpatient or emergency room setting, a long term care setting, or a Medicare hospice, or who is receiving care in a patient's home.

Comment: One commenter encouraged CMS to provide technical assistance and resources for clinicians in order to streamline this transition.

Response: As EPCS is permitted in every state, and will soon be required in 31 states, many state agency websites and state medical boards provide excellent resources for physicians to use. The DEA, on its website, has also posted frequently inquired about questions related to EPCS that can serve as a helpful resource. As a result, we do not believe that we need to provide any other resources, since they would merely duplicate the information on the websites.

Comment: A few commenters raised concerns about the impact on beneficiaries who have to receive prescriptions electronically rather than via traditional paper prescriptions. One commenter speculated that EPCS would interfere with the patient's pharmacy choice. Others voiced concern that patients may want a paper prescription in hand so they can visit multiple pharmacies and compare prices. The commenter noted that e-Prescribing may harm cancer patients who may benefit from receiving prescriptions from their physicians where the likelihood of adherence and quality improvement increases.

Response: Given that nearly all US pharmacies are ready to accept electronic prescriptions of controlled substances, this means that a prescriber can use EPCS and send the prescription where the patient instructs. We also recognize that the price of a given medication may impact a beneficiary's pharmacy choice. However, EPCS is being implemented in the Part D program at a time when patients and providers will have access to electronic real time benefit tools that can offer price transparency without requiring in person visits or calls to alternate pharmacies for price checking. As required in the May 2019 final rule (84 FR 23851), which updated the Part D e-Prescribing standards, each Part D plan is required to adopt one or more prescriber real time benefit tools that are capable of integrating with at least one prescriber's e-Prescribing system or electronic health record no later than January 1, 2021. We encourage patients and providers to use these tools. We are unaware of any evidence to indicate that the act of a physician handing a prescription to a patient has a positive impact on medication adherence.

Comment: One commenter expressed concern with the health care provider burden associated with reporting EPCS transactions to CMS.

Response: We clarify that there is no added provider burden associated with reporting EPCS transactions to CMS as the NCPDP Telecommunications standard captures the source of a prescription transaction through the prescription origin code. A value of "3" in field 419-DJ indicates that a prescription was transmitted electronically; such information is sent to the Part D plan which then conveys that information to CMS through PDE data. No additional action on the part of the prescriber is needed.

Comment: Some commenters questioned about complying with EPCS requirements when it is not reasonable or feasible. These circumstances include instances when NCPDP SCRIPT 2017071 does not support the prescription, systems downtime, lack of internet connectivity or when the patient needs a paper prescription to receive medication in advance of a vacation.

Response: There may be instances when a prescriber is unable to transmit a particular prescription electronically using the named SCRIPT standard. Under those circumstances, paper prescriptions are compliant with CMS requirements. The NCPDP SCRIPT Implementation Recommendations document provides guidance on implementing the standard. We remind commenters that we have issued electronic standards for use in Medicare Part D since the program's inception, and have withheld issuing compliance actions under circumstances such as a sporadic downtime or lack of internet access that the covered entity might experience. Consistent with this previous practice, we do not anticipate issuing compliance actions when a prescriber is unable to transmit a particular prescription electronically using the named SCRIPT standard under such circumstances.

Comment: A commenter suggested establishment of a list of mandated exemption codes and modifying existing NCPDP standards to enable tracking of paper prescriptions exemption codes. Prescribers could then handwrite the exemption code(s) on paper prescriptions and/or input the codes in the EHR in notes or in a new custom field. Pharmacies would capture the exemption code(s) through use of the NCPDP telecom standard and convey the information to the payer and on to CMS through PDE data. They noted that this would take years to implement.

Response: We thank the commenter for the suggestion. The proposed solution seems to be one way of leveraging technology to capture information about why EPCS is not

being used to transmit a given prescription. However, we would be concerned about the burden that required exemption coding might place on prescribers and pharmacies. Prescribers would have to know the appropriate code to use and enter it onto the paper prescription and pharmacies would have to look for, and enter the code into their dispensing systems in order to convey that information to Part D plans. It is also unclear how the Part D exceptions may/may not overlap with exemptions allowed under state EPCS rules, which could cause confusion. However, as the adoption of EPCS progresses, we would rely on the NCPDP to work with prescriber groups to examine the suggestion in detail. We believe some providers and pharmacies may embrace this mode of communicating why a paper prescription for controlled substances is used, while others may not. We also caution that the absence of such a code would not be a valid reason for a pharmacy not to dispense a medication nor for a Part D plan to deny payment for an otherwise valid written prescription. We look forward to hearing about any discussions about this concept as they progress.

Comment: One commenter requested CMS be specific in defining which NCPDP SCRIPT version 2017071 capabilities are expected to be used before a pharmacy or payer rejects incomplete prescriptions.

Response: Section 2003 of SUPPORT Act makes it clear that the EPCS requirement should not be construed as requiring a sponsor of a prescription drug plan under Part D or a pharmacist to verify that a practitioner, with respect to a prescription for a covered Part D drug, has a waiver from the EPCS requirement under Part D. Consistent with the statute, nothing in our rule should cause the dispensing pharmacy to reject a prescription nor the Part D plan to deny payment for an otherwise valid written, oral, or fax prescriptions that is consistent with laws and regulations. As a result, we do not believe it is our place to define which of the standard's capabilities should be used before the rejection of an incomplete prescription.

Comment: Several commenters expressed concerns that CMS' proposal assumes these functionalities to be successful, when in actuality they still require significant fixes and delayed implementation timelines. Perhaps the biggest challenge clinicians will face, commenters stated, is incorporating EPCS into their EHRs, and most clinician practices are not in a position to cover the costs and acquire the

necessary resources for technical or system upgrades required by EHR vendors—especially rural and small practices. Commenters stated that due to the COVID-19 pandemic, many practices have been forced to delay or cancel implementation altogether of EHRs that support EPCS due to the implementation cost. Commenters voiced the concern that practices that do not currently have the capability to prescribe electronically would be forced to purchase such a software. A commenter supported the intent to facilitate efficiency, convenience, and better security with the implementation of EPCS, but encouraged CMS to avoid unreasonable burden imposed upon clinicians and delay compliance until at least January 1, 2023.

Response: We are aware of the difficulties that clinicians may face when implementing EPCS. However, with potentially broad public health implications, we believe a January 1, 2021 effective date complies with the statutory intent and would enable the safety and other benefits previously discussed to be put in place during the current pandemic. However, in order to help ensure that the burden on prescribers is not unreasonable, we are finalizing a compliance date of January 1, 2022 such that prescribers who do not implement the NCPDP SCRIPT 2017071 standard for electronic prescribing of Schedule II, III, IV, and V controlled substances until January 1, 2022 will still be considered compliant with the requirement.

Comment: Many commenters stated their intent to comment on the EPCS request for information. We received a number of comments that requested CMS address the need for exceptions to the EPCS rule and to set forth an overview of the penalties to be used. Some commenters provided comments with regard to waivers, health professionals and practices and their ability to declare a hardship and to be exempt from EPCS requirements; others requested exclusions for those who are unable to electronically prescribe controlled substances by January 1, 2022 for various reasons. A few commenters suggested that CMS explicitly clarify that the current exemptions at § 423.160(a)(3)(iii) will continue to apply for prescriptions of controlled substances where the sender and the beneficiary are part of the same legal entity. Those commenters stated such an exemption would align with CMS' existing policy at § 423.160(a)(1) regarding use of the NCPDP SCRIPT Standard because the prescriptions and prescription-related information for covered Part D drugs for Part D eligible

individuals is not transmitted using electronic media, and previous clarifications CMS has issued as part of other electronic prescribing requirements. Commenters also stated that CMS should also align such an exception with CMS' existing policy at § 423.160(a)(3)(iii), which allows the use of HL7 messages for transmitting prescriptions and prescription-related information internally by clarifying that exemption's applicability to prescriptions for controlled substances.

Response: We thank the commenters for their feedback and will take all comments included in the Electronic Prescribing for Controlled Substances; Request for Information and comments received on the PFS proposed rule into account as we implement this program. The SUPPORT Act requires that CMS use rulemaking to determine any processes for enforcement, including on any prescriber waivers, penalties and appeals. CMS will continue to consider comments and recommendations received in response to both the proposed rule and the RFI and will propose any such processes in a future rule, to be effective no earlier than January 1, 2022. Based on detailed and thoughtful comments received in response to our proposed rule and the RFI, we understand that any future rulemaking may be better informed through additional inquiry, such as review of state EPCS program characteristics and insight gained from implementing the programs, consideration of the interactions between EPCS and PDMP workflows, and obtaining clarification of the implications of potential updates to the DEA's biometric standards for dual authentication on technical and workflow requirements. CMS will continue to review its own PDE data to better understand EPCS patterns across prescribers and provider groups and what this data can convey about the characteristics of Part D prescribers of controlled substances (such as geographic areas, specialties, and Part D prescribing volume and patient residence locations).

After consideration of the comments received, we are finalizing the provision with an effective date of January 1, 2021 and a compliance date of January 1, 2022 to encourage prescribers to implement EPCS as soon as possible, while helping ensure that our compliance process is conducted thoughtfully.

L. Medicare Part B Drug Payment for Drugs Approved Through the Pathway Established Under Section 505(b)(2) of the Food, Drug, and Cosmetic Act

1. Background

Medicare Part B covers drugs under a limited drug benefit that includes drugs and biologicals defined in section 1861(t) of the Act. Medicare Part B drugs and biologicals fall into three general categories: Drugs and biologicals furnished incident to a physician's services, drugs and biologicals administered via a covered item of durable medical equipment (DME), and other drugs and biologicals specified by statute. Payment amounts for most separately payable Medicare Part B drugs and biologicals are determined using the methodology in section 1847A of the Act, and in many cases, payment is based on the Average Sales Price (ASP) plus a statutorily mandated 6 percent add-on.

Drugs (not including biologicals or biosimilar biological products, as defined in section 1847A of the Act) paid using the methodology in section 1847A of the Act fall into two broad and mutually exclusive categories: Multiple source drugs and single source drugs. These terms are defined in statute and are further discussed in this section and the next section. In most cases the distinction between the multiple source drugs and single source drugs is fairly straightforward and is made as outlined in program instruction published in 2007 (https://www.cms.gov/Medicare/Coding/MedHCPCSGenInfo/Downloads/051807_coding_announcement.pdf): The payment limit under section 1847A of the Act for that biological product or single source drug is based on the pricing information for products produced or distributed under the applicable FDA approval. However, for a subset of drug products approved through the pathway established under section 505(b)(2) of the Federal Food, Drug, and Cosmetic Act (FFDCA), the distinction is less straightforward.

The drug approval pathway established under section 505(b)(2) of the FFDCA has existed since 1984, before the ASP payment methodology was established. The section 505(b)(2) pathway is provided for applications that contain full reports of investigations of safety and effectiveness, where at least some of the information for an approval comes from studies not conducted by or for the applicant and for which the applicant has not obtained a right of reference. An application submitted under section 505(b)(2) (which we refer to as a "section 505(b)(2) application") may

rely on FDA's finding of safety and/or effectiveness for a listed drug (an approved drug product) or published literature provided that such reliance is scientifically justified and the section 505(b)(2) applicant complies with the applicable statutory and regulatory requirements, including patent certification if appropriate. Unlike an Abbreviated New Drug Application (ANDA) for a generic drug, a section 505(b)(2) application is not required to have the same labeling as the listed (approved) drug(s) that the application relied upon. However, some drugs approved through the pathway established under section 505(b)(2) of the FFDCA (which we refer to as "section 505(b)(2) drug products") share significant portions of their FDA-approved labeling with the listed (approved) drug(s) that the application submitted through section 505(b)(2) relied upon, for example prescribing information on safety, efficacy, and pharmacokinetics. In some cases, the section 505(b)(2) drug product shares significant portions of labeling with generic drugs that are paid as multiple source drugs under section 1847A of the Act. Examples of situations where a section 505(b)(2) drug product shares similar labeling to listed (approved) products include a sterile injectable drug product that had been sold as a lyophilized powder in a vial and was then approved for sale as a concentrated liquid in a vial, as well as a ready-to-use IV bag.

The number of drugs approved through the pathway established under section 505(b)(2) of the FFDCA has been growing, from about 40 per year from 2011 to 2016, to about 60 in 2017, and 70 in 2018. Some of these approvals include drugs paid under Part B. Although we have assigned some section 505(b)(2) drug products to separate single source billing and payment codes, our payment approach for newly marketed section 505(b)(2) drug products, where an existing multiple source code descriptor describes the section 505(b)(2) drug product accurately, and where the active ingredient(s), the drug name, and portions of the prescribing information correspond to existing products that are assigned to and paid under a multiple source drug code, has been to assign the section 505(b)(2) drug products to the existing multiple source code. We believe that this approach, as described in more detail below, is consistent with statutory language in section 1847A of the Act. The definition of multiple source drug at section 1847A(c)(6)(C) of the Act states in part that for a multiple

source drug, there are two or more drug products which are rated as therapeutically equivalent (under the FDA's most recent publication of "Approved Drug Products with Therapeutic Equivalence Evaluations" also known as the Orange Book). For purposes of Part B drug payment under section 1847A of the Act, we interpret this to mean that if there is an existing HCPCS billing code that includes two or more drug products which are rated therapeutically equivalent and meets the remaining conditions of the definition of a multiple source drug, that billing and payment code is a multiple source drug code, and the section 505(b)(2) drug product meets the definition of a multiple source drug in section 1847A(c)(6)(C) of the Act. The statutory language in section 1847A(b)(3) and (6) of the Act provides discretion for CMS to assign additional drug products to a multiple source drug code. In other words, if a multiple source drug code exists, we are permitted to assign other multiple source drug products to that code for the purpose of payment as a multiple source drug under section 1847A of the Act. We note that if the drug product is described by a multiple source code, it meets the definition of multiple source drug at section 1847A(c)(6)(C) of the Act, and it does not meet the definition of a single source drug at section 1847A(c)(6)(D) of the Act, because the definition of a single source drug expressly excludes a multiple source drug in section 1847A(c)(6)(D)(ii) of the Act.

We assigned section 505(b)(2) drug products to existing multiple source drug codes for Part B payment under section 1847A of the Act in limited situations, that is, where an existing multiple source code descriptor describes the section 505(b)(2) drug product, the active ingredient(s) correspond to one another, the section 505(b)(2) drug product's labeling, particularly the prescribing information, includes information (such as the drug description, dosage and administration, pharmacokinetics, and indications) from other drug products that are paid under the multiple source drug code, and the section 505(b)(2) drug product can be used and prescribed in a manner similar to other products in the multiple source drug code. This information is used to determine whether the section 505(b)(2) drug product can be billed and paid using the existing multiple source drug code. The determination is based on the discussion in the previous paragraph, that is, if there is an existing HCPCS billing code that includes two or more

drug products which are rated therapeutically equivalent and meet the remaining conditions of the definition of a multiple source drug, that billing and payment code is a multiple source drug code. Consistent with the statutory language in section 1847A(b)(3) and (6) of the Act, which provides discretion for CMS to assign additional drug products to a multiple source drug code, a section 505(b)(2) drug product can be assigned to the multiple source drug code. The section 505(b)(2) product assigned to the multiple source drug code meets the definition of a multiple source drug in section 1847A(c)(6)(C) of the Act. Thus, for the purpose of payment under Medicare Part B, the section 505(b)(2) drug product can be billed and paid under that existing multiple source code. However, in situations where there is no existing multiple source drug code that describes a section 505(b)(2) drug product, the section 505(b)(2) drug product is typically assigned to its own single source code.

2. Multiple Source Drug and Single Source Drug Codes

Section 1847A of the Act uses the terms drug and drug product. Consistent with the statutory definitions discussed at section 1847A(c)(6)(C) and (D) of the Act and program instruction published in 2007 (https://www.cms.gov/Medicare/Coding/MedHCPCSGenInfo/Downloads/051807_coding_announcement.pdf), we have applied the terms multiple source drug and single source drug at the billing and payment code level, meaning that "drug" corresponds to a HCPCS or other applicable billing code and its descriptor, which typically includes the active ingredient(s) of the drug. The term "drug product" corresponds to individual packages of the drug as identified by the National Drug Code (NDC) or other applicable alternative identifier.

The terms multiple source drug and single source drug are defined, respectively, in section 1847A(c)(6)(C) and (D) of the Act. Section 1847A(c)(6)(C) of the Act states that multiple source drug means, for a calendar quarter, a drug for which there are two or more drug products which are rated as therapeutically equivalent (under the FDA's most recent publication of "Approved Drug Products with Therapeutic Equivalence Evaluations"); are pharmaceutically equivalent and bioequivalent, as determined by the FDA; and are sold or marketed in the United States during the quarter. Section 1847A(c)(6)(E) and (F) of the Act establish conditions under which pharmaceutical equivalence and

bioequivalence are met. The definition of multiple source drug in section 1847A of the Act can be interpreted to mean that once a multiple source drug code exists—that is, once there are two or more drug products that are therapeutically equivalent, pharmaceutically equivalent and bioequivalent, and CMS has assigned them to a multiple source drug code—then a subsequent product of the same drug—that is, a product that corresponds to the multiple source drug code's descriptor—can be assigned to such code even if the subsequent drug product is not, itself, therapeutically equivalent, bioequivalent or pharmaceutically equivalent. This is because in this case, the drug is multiple source, meaning that there are two or more products which are rated as therapeutically equivalent of that drug, as evidenced by the fact that the existing products are already assigned to the multiple source drug code. Once a drug product is assigned to a multiple source drug code, the product would not be assigned to a single source drug code because the definition of single source drug at section 1847A(c)(6)(D)(ii) of the Act states, in part, that a single source drug is a drug which is not a multiple source drug. Thus, when assigning drug products to multiple source and single source drug codes for the purpose of payment under section 1847A of the Act, we consider whether the product is described by an existing multiple source drug code first, and if the product is assigned to an existing multiple source drug code, its payment allowance will be determined based on the volume-weighted average ASPs of all drug products assigned to the code, rather than based solely on its own ASP (for example under a new single source code).

Section 1847A(b)(3) and (6) of the Act provide that payment for multiple source drugs is determined for all drug products included within the same multiple source drug billing and payment code. For multiple source drugs, we calculate a volume weighted average sales price across all drug products assigned to a billing and payment code. This typically means that the ASP-based payment amount for a multiple source drug code includes generic and branded drug products within an individual code.

Consistent with section 1847A(b)(3) and (6) of the Act and our interpretation of the definition of multiple source drug in section 1847A(c)(6) of the Act, we assign certain section 505(b)(2) drug products to existing multiple source drug codes. We determine whether to assign section 505(b)(2) drug products to

multiple source or single source drug codes by comparing information about the section 505(b)(2) drug product to the descriptors for existing multiple source codes to which the drug products may be assigned for the purposes of payment amount determinations under section 1847A of the Act, as well as information about products already assigned to that descriptor. This information includes the products' active ingredients and labeling, particularly the prescribing information and, if necessary, additional sources such as the FDA's Approval Summary Review, which is a part of the FDA's application review files and is available at <https://www.accessdata.fda.gov/scripts/cder/daf/>, and drug compendia. The FDA's Approval Summary Review can provide additional details about information that is found in the drug's labeling and prescribing information and other compendia can supplement the information that is found in labeling and provide information about off label use of a drug.

Our case by case determination about the assignment of certain section 505(b)(2) drug products to existing multiple source drug codes is based on the factors described in further detail in the bullet points below: First, the products' active ingredient(s), drug name and description; second, the products' labeling information; third, how they are ordered (prescribed) and used clinically. These factors are assessed as a whole, using the information (for example, active ingredient, labeling, compendia, and FDA Approval summary), to determine whether an existing multiple source drug code describes a section 505(b)(2) drug product and whether the product can be assigned to an existing multiple source drug code for the purpose of payment under section 1847A of the Act. The determination is based on the following:

- The active ingredient and drug name of the section 505(b)(2) drug product and other drug products in an existing multiple source drug code.
- The drug description and indications, particularly whether differences such as the salt form, additional ingredients, or uses exist.

The two bullet points above identify the section 505(b)(2) drug product and multiple source drug code and establish what is being compared so that the determination can proceed, if necessary. For example, if the active ingredients and drug names do not correspond, there would not be a reason to assign the section 505(b)(2) drug product to the multiple source drug code or to proceed further. We also note that the active

ingredient of a drug is often included in the HCPCS code descriptor that is used to bill a drug product and to pay for it under section 1847A of the Act. The drug description is used, if necessary, to clarify what the actual active ingredient(s) are, whether there are minor differences, such as salt forms and other inactive ingredients that may affect how the product is used. This information may be helpful when considered with the information in the next two groups of bullet points as we consider labeling and uses of the drug products.

- The labeling information (and if necessary other material from sources such as the FDA's Application Review Files, including the FDA's Approval Summary Review, and drug compendia), particularly pharmacokinetics, indications, adverse reactions, drug interactions, contraindications, warnings, precautions and clinical studies.

The bullet point above allows us to determine whether the same information, for example the same studies, were used to support the approval of the section 505(b)(2) drug product and to gauge how much of the labeling information from existing multiple source drug products appears in the section 505(b)(2) drug product's labeling. This information also supports the determination in the next bullet point. The more labeling information that a section 505(b)(2) drug product has in common with drug products in an existing multiple source drug code, the more likely it is that the existing code describes the section 505(b)(2) drug product, such that CMS will assign it to that multiple source drug code for the purpose of payment under section 1847A of the Act.

- The dosage and administration, pharmacokinetics, indications, contraindications, warnings, drug interactions, and adverse reactions.

The bullet point above allows us to determine whether the section 505(b)(2) drug product is ordered and used in patient care in the same way as products assigned to a multiple source drug billing code. The dosage and administration, pharmacokinetics, and indications are particularly important because we consider whether a prescriber writes a prescription for the section 505(b)(2) drug product in the same way as drug products assigned to a multiple source drug code and whether the products could be used for the same uses. Typically, a prescription includes the following information: The drug, dose, route of administration, and frequency. The quantity of a drug (or duration of therapy) and refills are also

a part of a prescription, but are less of a factor for Part B where most drugs are used incident to a physician's services. Typically, drugs used incident to a physician's services are administered and billed as a very limited number of doses, often just one, are administered during a service, and the drug is not dispensed for the patient for use over an extended time period beyond an office visit or outpatient hospital visit. The elements in the bullet point reflect how a drug is used and administered in the care of patients and in turn determine how billing for the drug is accomplished; that is, whether an existing code descriptor describes a section 505(b)(2) drug product and can be used to bill for it.

As a simple example of our approach, if the active ingredient, dose, route of administration and frequency of the section 505(b)(2) drug product are the same as those for drug products in a multiple source drug code, then it is likely that an existing code descriptor describes a section 505(b)(2) drug product and can be used to bill for it. The information does not have to be an exact match, for example different uses of a drug product may require different doses, routes of administration, or frequencies. However, if the section 505(b)(2) drug product and the multiple source drug products in the existing multiple source drug code could both be used for the same indication (potentially by way of off-label use), then billing for both with the existing HCPCS code would still be feasible. In such situations, similarities between labeling information such as whether the same studies were used to establish pharmacokinetic parameters may factor into the assessment. In summary, the information discussed above is used as a whole to determine whether the existing multiple source drug HCPCS code descriptor describes the section 505(b)(2) drug product or if a new HCPCS code would be needed describe the product for payment under Part B.

The information described in the bullet points above is usually sufficient for our determinations, but from time to time we may reach out to the drug manufacturer, seek post marketing data, or review literature sources for additional information to assist us with understanding the information in the bullet points above and to assist with determinations in complicated situations, for example where indications vary, but it appears that the section 505(b)(2) drug product could still be used, administered and billed in the same manner as drug products assigned to an existing multiple source drug code.

We are aware that some section 505(b)(2) drug products are very different from previously approved products that may be used to support their approval. We do not assign all section 505(b)(2) drug products to existing multiple source drug codes. In circumstances where an existing code does not describe the section 505(b)(2) drug product and use of the existing code would not be suitable for billing and payment of the section 505(b)(2) drug product under Part B based on the assessment described above, the section 505(b)(2) drug product would not be assigned to the existing multiple source drug code. The following examples illustrate how we distinguish section 505(b)(2) drug products that are assigned to an existing multiple source drug code from those that are not. If a section 505(b)(2) drug product has the same active ingredient, same dose and dosing interval, and prescribing information and includes the same clinical studies (for example, the same patient number, same response rates and same adverse reaction frequencies) as drug products assigned to an existing multiple source drug code, the section 505(b)(2) drug product would be assigned to the multiple source code. However, if the section 505(b)(2) drug product has different pharmacokinetics, for example if it is a sustained release version of a drug that permits less frequent dosing compared to drug products in an existing multiple source drug code, or if the section 505(b)(2) drug product has additional active ingredients not found in the drug products in an existing multiple source drug code, the section 505(b)(2) drug product would not be described by the existing multiple source drug code. As a result, it would not be considered a multiple source drug under section 1847A(c)(6)(C) of the Act because there would not be at least two drug products for that drug that are therapeutically equivalent, pharmaceutically equivalent and bioequivalent; thus, the section 505(b)(2) drug product would be considered a single source drug and typically assigned to a single source drug code.

3. Codifying Existing Policy for Section 505(b)(2) Drug Products

As we stated in the CY 2021 PFS proposed rule (85 FR 50264 through 50265), our approach (described in section II.L.2 of this final rule) for the payment of section 505(b)(2) drug products has been in place for at least 12 years, and it is also consistent with the concept of paying similar amounts for similar services. It is based on the definitions of multiple source drug and

single source drug in section 1847A(c)(6)(C) and (D) of the Act and authority to assign drug products to billing and payment codes in section 1847A(b)(3) and (6) of the Act as discussed in the sections above. We explained that a number of section 505(b)(2) drug products that are described by an existing multiple source drug code are priced significantly higher than comparable products. Two recently introduced section 505(b)(2) drug products that appear to be comparable to drug products in existing multiple source drug codes (using the approach described in the section earlier) have Medicare payment allowances that are approximately 10 times higher than that of the existing multiple source code. We stated that we believe that assigning section 505(b)(2) drug products that are described by existing multiple source drug HCPCS codes to those existing HCPCS codes is consistent with efforts to curb drug prices while limiting opportunities to "game the regulatory process and the patent system in order to unfairly maintain monopolies."¹⁰⁹ We stated that we believe our approach also encourages competition among products that are competitors—that is, when they are described by one billing code and share similar labeling.

We stated our concern about high payments for section 505(b)(2) drug products if they are assigned to unique separate HCPCS codes despite being described by existing multiple source drug codes. We also stated our concern about the effect of high payment amounts on individual beneficiaries' cost sharing payments for these products.

Therefore, for these reasons, in the CY 2021 PFS proposed rule (85 FR 50265) we proposed to codify our long-standing process for assigning certain section 505(b)(2) drug products to existing multiple source drug codes if the section 505(b)(2) products are described by existing multiple source drug codes consistent with our interpretation of the definition of multiple source drug in section 1847A(c)(6)(C) of the Act and the approach described above. Specifically, we proposed that where a section 505(b)(2) product is not itself therapeutically equivalent, pharmaceutically equivalent, or bioequivalent, as determined by FDA, to another drug product, we would nonetheless consider it to meet the definition of multiple source drug if, based on an assessment of its active ingredient, labeling, compendia, and

¹⁰⁹ <https://www.whitehouse.gov/briefings-statements/president-donald-j-trumps-blueprint-lower-drug-prices/>.

other information, the product is described by the code descriptor for an existing multiple source drug code. That is, we would assess the section 505(b)(2) drug product's active ingredient(s), drug name, and description, whether the section 505(b)(2) drug product's labeling, particularly the prescribing information, includes information from other drug products that are paid under the multiple source drug code, and whether the section 505(b)(2) drug product is used and prescribed in a manner similar to other products in the multiple source drug code, in order to determine whether the section 505(b)(2) drug product is described by an existing multiple source drug code. We would not assign all section 505(b)(2) drug products to multiple source codes and would not assign section 505(b)(2) drug products to a single source drug code exclusively made up of single source drug products. We stated that we would also reevaluate and potentially revise previous payment (and coding) decisions to maintain consistency with our proposed approach, if finalized. Consistent with these proposals, we also proposed to revise the definition of multiple source drug in regulation text at § 414.902 by amending the regulation text to state that multiple source drugs may include drug products described under section 505(b)(2) of the FFDCA and adding § 414.904(k) that describes the framework for our determination as discussed in this section of the preamble.

4. Summary of Comments

The following is a brief summary of comments we received on these proposals. More detailed comments and responses follow this summary. We received approximately 37 timely comments on section 505(b)(2) drug products. In general, commenters, primarily manufacturers, stated that the proposal was contrary to the statute, conflicted with FDA's therapeutic equivalence ratings, would impair access for patients, underpay providers, and dampen innovation. Several comments from beneficiary advocate and provider groups generally repeated the same points, although some comments expressed support for curbing drug prices, particularly if the proposal did not affect patient access. Several comments appeared to take a middle ground that conditionally supported the proposals, particularly if more detail could be provided and if effects on patient access were considered. Several commenters supported the proposals without conditions.

Comment: Several commenters contended that CMS lacks the statutory authority to adopt the proposals in the proposed rule, and some stated that the proposal was not consistent with subregulatory guidance from 2007. These commenters stated that the language in the statute clearly defines multiple and single source drugs, that assigning non-therapeutically equivalent drug products to a multiple source code contradicts the plain language of section 1847A of the Act, and that CMS's proposal is contrary to Congress' intent. Commenters also stated that the definition of multiple source drug in section 1847A(c)(6) of the Act requires each drug product assigned to a multiple source code to be therapeutically equivalent, pharmaceutically equivalent and bioequivalent to another product in the code, and that the only exception is a provision (sometimes referred to as the grandfathering provision) under section 1847A(c)(6)(C)(ii) of the Act.

Response: We disagree that our proposed approach is inconsistent with the statute. The statute allows CMS to assign drug products to an existing multiple source code, and does not require that the code include only products that are therapeutically equivalent, pharmaceutically equivalent and bioequivalent to one another product. As outlined in the proposed rule, the definition of multiple source drug in section 1847A(c)(6)(C) of the Act can be interpreted to mean that once a multiple source drug exists—that is, once there are two or more drug products that are therapeutically equivalent, pharmaceutically equivalent and bioequivalent, and we have assigned them to a multiple source drug code—then a subsequent product of the same drug—that is, a product that corresponds to the multiple source drug's billing code descriptor—can be assigned to such code even if the subsequent drug product is not, itself, therapeutically equivalent, bioequivalent or pharmaceutically equivalent. In this case, the drug is already multiple source, meaning that there are two or more products of that drug which are rated as therapeutically equivalent, as evidenced by the fact that the existing products are already assigned to the multiple source drug code. Once a drug product is assigned to a multiple source drug code, the product would not be assigned to a single source drug code because the definition of single source drug at section 1847A(c)(6)(D)(ii) of the Act states, in part, that a single source drug is a drug which is not a multiple source

drug. Also, we are not aware of any sources, such as Committee Reports that describe Congress' intent in detail, that conflict with our interpretation. The proposed approach focuses on assigning drug products to a drug code solely for Part B drug payment purposes and is consistent with the statutory definitions at section 1847A(c)(6)(C) and (D) of the Act. However, we do not agree that statutory language at section 1847A(c)(6)(C)(ii) of the Act about an exception is relevant to this discussion. This grandfathering provision applies only to "single source drugs or biologicals that are within the same billing and payment code as of October 1, 2003." The exception does not apply to multiple source drugs or the assignment of drug products to multiple source drug billing and payment codes.

The proposals are also consistent with the program instruction published in 2007 (https://www.cms.gov/Medicare/Coding/MedHCPCSGenInfo/Downloads/051807_coding_announcement.pdf). In the program instruction, we addressed how we would identify "single source drugs" and "biological products" using a multi-step process. We did not expressly address how we would identify multiple source drugs. The program instruction is not inconsistent with our proposal because in both cases, the determination of the "drug" is reflected at the HCPCS code level. In contrast, the term "drug product" corresponds to individual package sizes of the drug as identified by the NDC or other applicable alternative identifier. The proposals published in the CY 2021 PFS proposed rule add to, rather than conflict with, the 2007 program instructions and provide detail about how we approach Medicare Part B payment of section 505(b)(2) drug products.

Comment: A number of commenters stated that our approach is not consistent with or does not take into account FDA's ratings of therapeutic equivalency for drugs and the application of the ratings for interchangeability determinations pertaining to these products.

Response: We disagree with these comments. The therapeutic equivalence ratings published by FDA and its work associated with these ratings pertain to Part B drug payment only to the extent that they are used to define when two or more drug products are therapeutically equivalent, which is relevant to the determination of whether a drug is single source or multiple source as defined in section 1847A of the Act. FDA's therapeutic equivalence ratings do not themselves dictate payment under Medicare Part B.

Relatedly, our proposals for section 505(b)(2) drug products do not affect these ratings or this work; rather, our proposals apply only to drug payments under section 1847A of the Act. This is consistent with the different roles of FDA and CMS—the former assesses a drug product's safety and effectiveness, and the latter administers the Medicare program.

As we discussed in the previous comment response, one condition for meeting the definition of a multiple source drug at section 1847A(c)(6)(C) of the Act is that there be two or more drug products rated as therapeutically equivalent. However, a subsequent product of the same drug—that is, a product that corresponds to the multiple source drug code's descriptor—can be assigned to such code even if the subsequent drug product is not, itself, therapeutically equivalent. In other words, where there are two or more drug products that are rated as therapeutically equivalent in the Orange Book, the drug meets the definition of multiple source drug for purposes of Medicare Part B payment, and this has no bearing on any particular drug product's therapeutic equivalence rating. Where there is a multiple source drug (as defined in section 1847A(c)(6)(C)), other non-therapeutically equivalent drug products of that drug may be assigned to the HCPCS code for purposes of payment under section 1847A of the Act. Section 1847A of the Act does not mention interchangeability as a factor in determining payment for drugs, nor does it explicitly describe how multiple source drug products must be assigned to billing and payment codes or how they must be paid.

We also disagree with comments that our proposal fails to take product interchangeability into account. Payment under Medicare Part B and interchangeability are separate issues—the former pertains to when Medicare will pay for a product, and the latter pertains to drug dispensing and clinical decisions. In Medicare Part B, where most drugs are used incident to a physician's services and are not dispensed through a retail pharmacy, what a provider administers to a patient is often determined by the prescriber or where that prescriber practices. For example, due to space and inventory budget limitations, a physician's office will generally stock a limited range of drug products that are administered incident to a physician's services. Section 1847A of the Act does not specify which drug products physician must stock or provide, nor does it dictate how prescribers may utilize drug

products in patient care.

Interchangeability governs the range of products that a pharmacist may dispense to fill a prescription and also is not addressed in section 1847A of the Act. Rather, interchangeability and pharmacy substitution are typically addressed in State law and may be affected by factors such as hospital bylaws, inventory and other matters that are outside of CMS' purview. As noted previously, our proposals pertain only to payment under Medicare Part B, and do not purport to dictate which drug products a prescriber may prescribe or a pharmacy may dispense.

Comment: A few commenters noted that the assignment of section 505(b)(2) drug products to multiple source codes was new and had never been applied by CMS. However, other commenters acknowledged CMS' longstanding policy with respect to these drug products.

Response: We disagree with commenters that stated the proposals are a new policy that has not been applied to Part B drug payments. As we stated in the proposed rule, the policy has been in place for at least 12 years. For example, this process has been applied to gemcitabine injection products that were first marketed as Gemzar(R), a sterile lyophilized powder packaged in vials. The brand products were assigned to a HCPCS code (J9201), and once generic gemcitabine products were marketed, they also were assigned to J9201, making J9201 a multiple source drug code. Later, liquid concentrates of gemcitabine injection were approved through the pathway established under section 505(b)(2) of the FFDCA. These concentrated liquid products also were assigned to the existing multiple source HCPCS code, J9201, even though they were not, themselves, therapeutically equivalent to the branded products in J9201. Subsequently marketed lyophilized powder and concentrated liquid gemcitabine injections, as well as gemcitabine products approved under ANDAs also have been assigned to HCPCS code J9201.

ASP–NDC crosswalks that reflect these HCPCS assignments have been available to the public along with the quarterly ASP Drug Pricing files on the CMS website. We began including the concentrated liquid formulations in the ASP NDC crosswalks that were published for January 2012. The January 2012 Drug Pricing Files and the ASP NDC–HCPCS crosswalk are available in the Related Links section at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Part-B-Drugs/McrPartBDrugAvgSalesPrice/2012ASPFiles>. Although

we do not describe the crosswalks as a complete listing of all NDCs used in pricing determinations, the crosswalks serve as a guide to help the public understand which products are included in the weighted average calculation for a given HCPCS code. The crosswalk files are readily available to the public via the CMS website and illustrate which NDCs are assigned to HCPCS codes for payment under section 1847A of the Act.

Comment: Several commenters discussed potential effects of the proposals on manufacturers. Commenters, primarily manufacturers that seek 505(b)(2) approvals for their products, expressed concerns that the proposals would dampen innovation, result in fewer drug approvals through the pathway, and contribute to a less efficient approval process, which could result in fewer choices for patients and prescribers and a less predictable marketplace. While some commenters expressed concerns about major effects on the industry and appeared to believe that all section 505(b)(2) drug products would be affected by the proposal, others suggested identifying situations where separate payment would be available in a predictable manner. Several commenters stated that if CMS moves forward with the proposal, CMS should exclude products with “meaningful differences” from the policy. One commenter encouraged CMS to continue an approach “that allows for innovation, competition, and ultimately more therapeutic choices for Medicare beneficiaries.”

Response: As mentioned in the proposed rule, we are aware that the section 505(b)(2) pathway has been in existence since the 1980s, well before the implementation of the payment methodology in section 1847A of the Act. We are also aware of the potential advantages of seeking approval through the pathway established under section 505(b)(2) of the FFDCA compared to seeking approval under the section 505(b)(1) pathway. Under the 505(b)(1) pathway, the application contains full reports of investigations of safety and effectiveness that were conducted by or for the applicant or for which the applicant has a right of reference or use. Because the approval of a product through the section 505(b)(2) pathway relies on at least some information from studies not conducted by or for the applicant and for which the applicant has not obtained a right of reference, the use of the 505(b)(2) pathway can minimize time, effort and expense associated with bringing a product to the market, although some additional study of the product is typically

required. From experience with the crosswalking process (the assignment of NDCs to HCPCS codes for payment determinations under section 1847A of the Act), we have observed that section 505(b)(2) drug products are heterogeneous. Some of the products are very different from previously marketed products that were used to support the approval through the section 505(b)(2) pathway. For example, the section 505(b)(2) drug product may include additional active ingredients, or may incorporate formulation changes that result in significant changes to the dosing schedule (for example, changing from 3 times per day to once per day administration). However, some section 505(b)(2) drug products are very similar to drug products that are assigned to multiple source drug codes.

The application of our policy to determine assignment of section 505(b)(2) drug products to a multiple or single source drug code has resulted in the assignment of a limited number of these drug products to multiple source drug codes and under our proposal we anticipate that the number of assignments of drug products to multiple source codes would continue to be limited. Many section 505(b)(2) drug products are paid using single source drug codes under section 1847A of the Act. We have examined 23 instances associated with the assignment of section 505(b)(2) drug products to billing codes for payment under section 1847A of the Act during the years 2017 to 2019. Eighteen of the instances led to products being assigned to single source drug codes. Products associated with the remaining five instances were not priced as separately payable Part B drugs (for example, because payment is bundled with physician services). Seventeen of the 18 products that were assigned to single source drug codes are included in either the ASP Drug Pricing Files, OPPS Addendum B or both files (the exception is a product that was not yet marketed). These 17 products include an older antibiotic that was combined with a new ingredient that extended its antibiotic spectrum, a new formulation of a drug that is used in the treatment of opiate use disorder, and novel formulations of older drugs that are specifically designed for less frequent administration or are administered by a different route (such as a drug that was previously approved only as an oral drug and not paid under Part B, but was then approved as a section 505(b)(2) drug product as an injectable drug). Thus we believe that our policy has not led to the frequent assignment of section

505(b)(2) drug products with significant modifications (like an additional active ingredient) to multiple source drug codes. Further, if manufacturers continue to market products that one commenter described as having “meaningful differences” from multiple source drugs, we anticipate that section 505(b)(2) drug products approved in the future will not be assigned to multiple source drug codes frequently. For these reasons, we do not believe the commenters’ concerns that the policy would have a major negative impact on innovation, access to products or the speed and efficiency of product approval are justified, nor would the policy discourage the use of the section 505(b)(2) pathway for drug approvals.

However, we have concerns about the consistency of how the policy has been applied recently. Of the 18 recently approved section 505(b)(2) drug products discussed above, we believe that two that were mentioned in the proposed rule should be reevaluated to determine whether they should be paid as single source or multiple source drugs. For example, a diluted and ready to administer IV bag of gemcitabine injection was recently approved (https://www.accessdata.fda.gov/drugsatfda_docs/nda/2018/208313Orig1s000TOC.cfm). As discussed in a previous comment’s response in this section, gemcitabine injection was originally sold as a lyophilized powder that is reconstituted and then further diluted for intravenous administration. Then concentrated liquids (which have to be further diluted before administration) were approved through the section 505(b)(2) pathway. The lyophilized powder, concentrated liquid and generic gemcitabine products are all assigned to HCPCS code J9201. Payment limits for this HCPCS code appear in the ASP Drug Pricing files and the various products appear in the corresponding ASP NDC–HCPCS crosswalk files; the October 2020 payment limit for HCPCS code J9201 for 2 grams of the drug, a commonly used dose, is \$39.57. The newer gemcitabine injection product approved through the section 505(b)(2) pathway, which shares dosing, pharmacokinetics, adverse effect profile, and indications on labeling with the products assigned to J9201, but is packaged in a ready to administer IV bag, has a WAC (as reflected in pharmaceutical pricing compendia as of November 11, 2020) of \$760 per 2 grams, about 19 times the payment allowance of J9201. At this time the newest gemcitabine product is not paid under HCPCS code J9201, and we

believe that its assignment to a single source drug billing and payment code should be reevaluated.

Applying our proposal to all gemcitabine injection products, that is, the lyophilized powders, the concentrated injection and the newest diluted injection formulation, reveals that all products are gemcitabine injections, all products share the same labeled indications (treatment of ovarian, breast, non-small cell lung, and pancreatic cancers), product labeling is very similar (for example, the clinical studies referred to in the package insert appear to be the same, survival rates, adverse reaction rates, contraindications and warning sections of the labeling include virtually identical information), and based on dosage and administration, pharmacokinetics, indications and other sections of the product labeling, we expect these drug products to be used and prescribed in the same way. The result of the application of our proposal is that we would determine that the new gemcitabine product meets the definition of multiple source drug and assign it to the existing multiple source HCPCS code and the payment allowance for all the products in the code would be based on the volume-weighted average of the ASPs of all the NDCs of such products.

As discussed earlier in this comment response, we believe that this policy approach would not negatively affect innovation. We also believe that our approach could help prevent situations where any change to a product that distinguishes a 505(b)(2) drug product from a previous product approved under an ANDA, no matter how trivial (for the purpose of Medicare Part B drug payment), can result in very high prices and Part B payments for inexpensive, small molecule drugs that are similar to other inexpensive products in the market. Also, assigning section 505(b)(2) drug products to corresponding multiple source drug codes could encourage competition among products that are competitors—that is, when the products are described by one billing code and share similar labeling.

Comment: Several commenters expressed concerns about how grouping potentially expensive to acquire section 505(b)(2) drug products into multiple source drug codes may create situations where a provider’s Medicare payment would be less than the acquisition cost and that this situation could lead to drugs not being available through some providers. One commenter pointed out that this could be more problematic for smaller practices.

Response: As discussed in a previous comment response, we believe that the application of our proposal would result in a limited number of section 505(b)(2) drug products being assigned to multiple source drug codes. Also, when products are assigned to HCPCS codes for payment under section 1847A of the Act, the products' sales volume and averages sales price may affect the weighted average ASP-based payment limit.

Since 2005, average sales price-based payment limits described in section 1847A of the Act have been determined using sales volume weighted averages. Each calendar quarter, a product's average sales price as reported by the manufacturer and the number of units sold by the manufacturer are included in the statutorily mandated payment calculation with other products that are assigned to a given HCPCS code. The ASP-based payment limit depends on the manufacturer reported volume of sales for a given product within a code and the reported ASP. Thus, as more units of a product are sold, that product's contribution to the weighted average increases.

We understand that in some cases a payment limit that is determined based on a weighted average can result in payment amounts that are below the acquisition costs of products that are sold at prices that are much higher than the ASP-based payment allowance. However, as noted previously, our policy would apply only to those section 505(b)(2) drug products that meet the definition of multiple source drug based at section 1847A(c)(6)(C), and manufacturers remain free to develop section 505(b)(2) drug products that would not meet the definition of multiple source drugs under our proposed approach, in which case such section 505(b)(2) drug products would not be assigned to multiple source billing and payment codes, and the concern about underpayment relative to acquisition cost would be mitigated. Also, in situations where a section 505(b)(2) drug product is assigned to a multiple source code, the section 505(b)(2) drug product can significantly influence payment limit calculations for a code if it competes successfully with similar products assigned to the multiples source drug code and achieves high sales volume (relative to the other products), particularly in situations where only a few low sales volume products are assigned to the code.

We also note that other factors can also influence acquisition cost. We do not have control over factors that can affect a provider's acquisition costs, for

example, high launch prices set by manufacturers, sudden and unexpected price increases from manufacturers, markups from intermediaries such as wholesalers, lack of discounts (including volume discounts to smaller providers) and price differences for various classes of trade.

Comment: Several commenters expressed concern about the proposals' effects on patients. Most of these commenters focused on the effects on manufacturers, such as potential for less innovation by manufacturers leading to fewer drug approvals, fewer options for the treatment of patients, and impaired access. One commenter also requested that we consider the overall financial effects on patients, including effects on drug availability. This commenter expressed concerns about manufacturers' attempts to secure high payments for drugs and recognized CMS' concerns about manufacturers gaming the payment system in a manner that negatively affects consumers and results in diminished competition, but the commenter was also concerned about whether the policy may also have negative effects on patients.

Response: We have replied to concerns about the impact on manufacturers, innovation, providers and effects on access in general in previous comment responses. We do not believe that there is a strong justification for such concerns about access because of the limited scope of the proposals. That is, the proposals would result in limited number of section 505(b)(2) drug products being assigned to multiple source drug codes.

Much of our concern about negative effects on patients is related to increases in Part B drug spending that have been occurring for many years. From 2011 to 2016, Medicare FFS drug spending increased from \$17.6 billion to \$28 billion under Medicare Part B, representing a compound annual growth rate (CAGR) of 9.8 percent, with per capita spending increasing 54 percent, from \$532 to \$818. The number of Medicare Part B FFS beneficiaries and the number of these beneficiaries who received a Part B drug increased over the 5-year period (2011 through 2016). However the increase in total Medicare drug spending during this period is more fully explained by increases in the prices of drugs and mix of drugs for those beneficiaries who received them than by increases in Medicare enrollment and drug utilization. The CAGR in the number of Medicare Part B FFS beneficiaries is less than 1 percent between 2011 and 2016 (83 FR 54549 through 50).

We have concerns that if incentives to develop minimally modified products with high prices are not minimized, spending on such products will increase and contribute to increases in overall Part B drug spending. For individual patients, cost sharing amounts for section 505(b)(2) drug products, particularly for patients who do not have supplementary insurance, could increase as illustrated by the gemcitabine example discussed in a previous comment where there is a very substantial (approximately 19 times) difference between payments for a multiple source drug code and a corresponding product approved under the pathway established under section 505(b)(2) of the FFDCA. If similar situations become more common, such differences in payment amounts may contribute to increases in overall spending that in turn contribute to increases in Part B premiums that help fund Part B payments. Increases in Part B drug spending could also lead to increases in premiums for those with supplementary insurance.

Comment: A few commenters supported finalizing the proposals in order to curb drug prices and to pay similar amounts for similar services. The commenters agreed that products recently approved through the pathway established under section 505(b)(2) of the FFDCA were significantly more expensive than existing products and brought up the issue of "evergreening" (which includes actions such as securing patents or approvals for minimally modified versions of drugs to preserve high payments) and its effects on generic drug market by way of contribution to higher drug spending for products that do not improve outcome or quality. Not finalizing the proposal was characterized by a commenter as providing incentive for manufacturers to seek more section 505(b)(2) pathway approvals of higher priced products that are comparable to previously approved products. One commenter stated that the case by case determinations described in the proposed rule have been effective, have not sacrificed safety or access, and that continuing this approach would reduce opportunities for manufacturers to game FDA drug labeling in a manner that results in high, single source payments over extended periods of time for multiple source products.

Response: We agree with the commenters and the concern about the potential negative impact on innovation that could occur if all section 505(b)(2) drug products are paid as single source drugs under Part B. Permitting the payment of all section 505(b)(2) drug

products as single source drugs could continue to incentivize the development of minimally modified, high priced products, particularly injectable drug products used incident to a physician's services. This situation could shift manufacturers' focus from innovation to profit and thus contribute to high launch prices, high acquisition and inventory costs for providers, higher cost sharing and premiums in scenarios similar to the newer gemcitabine injection product approved through the section 505(b)(2) pathway that was discussed in an earlier comment response. This newer product shares dosing, pharmacokinetics, adverse effect profile, and indications on labeling with generic products but is packaged in a ready to administer IV bag, has a WAC (as reflected in pharmaceutical pricing compendia as of November 11, 2020) of \$760 per 2 grams, about 19 times the payment allowance of the multiple source gemcitabine code, J9201.

Comment: One commenter stated that the proposal will not reduce high launch prices.

Response: We disagree. Although, the effect on launch prices is likely to be limited because we do not anticipate that many section 505(b)(2) drug products will be paid under multiple source codes, in situations where payment under a multiple source drug code occurs, we believe that manufacturers would not have an incentive to set high launch prices.

Comment: Several commenters expressed conditional or partial support for the proposal. This includes commenters who objected to finalizing the proposals for reasons discussed in previous comments but also stated that if CMS nevertheless finalized the proposals, CMS should provide more detail about the framework and the determination process and also should delay finalizing the proposal.

Commenters that suggested a delay in finalizing or implementing the proposals provided a variety of reasons for doing so. Some commenters requested CMS to provide more details about the process, including more specifics on how factors described in the proposal, for example differences in the active ingredient and labeling, might be interpreted and which drug products might be affected. Several commenters also requested that CMS provide more time for assessing the proposals so that the public could better understand them and provide an opportunity, such as through future rulemaking, for public input both on the proposals and on decisions about specific drug products. The current public health emergency (PHE) for COVID-19 was also

mentioned by some commenters as an obstacle to engaging with CMS on this issue or responding fully to the proposal, and a reason for why a delay in finalizing the proposal is warranted. Other commenters who expressed concerns about rising drug prices supported the proposals on the condition the beneficiary access was not impaired and that the financial impact on patients is considered.

Response: We believe that we have proposed a clear process that includes a variety of factors such as drug names, labeling and indication to determine whether a section 505(b)(2) drug product meets the definition of multiple source drug at section 1847A(c)(6)(C) of the Act and thus should be assigned to an existing multiple source drug code. The proposals are also consistent with longstanding CMS drug payment policy.

However, we appreciate commenters' concerns about implementing the proposals and requests for additional time for further evaluation and engagement. It appears that some commenters may have misunderstood the limited scope of our proposal because they believe that many 505(b)(2) drug products would be affected. We understand that providing more detail with respect to our proposal may be helpful to a variety of stakeholders and that a better understanding of the policy will assist with planning and more efficient product procurement during a period where time and other resources may be scarce.

Comment: One commenter suggested that if finalized, the policy should be phased in, for example by changing the payment for a drug product by 25 percent increments over a 4-year time period to close the difference between a section 505(b)(2) drug product's current payment and the payment for the HCPCS code to which it would be assigned.

Response: We thank the commenter for this suggestion. However, we do not believe that there is authority under section 1847A of the Act to adjust payment allowances in the manner the commenter suggests.

Comment: Commenters also provided comments on the following issues: Payment to providers for the costs associated with the acquisition of a drug product; payments for the administration of section 505(b)(2) drug products; preferred coverage; formularies as well as the role of utilization management like step therapy and prior authorization for Part B drugs; the application of the process to biologicals; speeding up the coding process so that codes are available at

product launch; payments for new technology; and the implementation of MedPAC recommendations.

Response: These comments are considered to be out of scope of the proposed rule, and therefore, we are not addressing in this final rule.

5. Decision

As discussed in the preceding responses to comments, we continue to believe that we have authority to assign certain section 505(b)(2) drug products to existing multiple source drug codes based on an interpretation of section 1847A of the Act and that our approach does not conflict with previously published program instruction or the FDA's therapeutic equivalency ratings.

However, in response to commenters requesting more detail about our proposed approach and requests to delay finalizing a decision, we are not finalizing the section 505(b)(2) drug product proposals or the proposed corresponding regulation text changes for 2021. The delay will also provide time for CMS to further consider this issue. We thank commenters for their responses.

M. Updates To Certified Electronic Health Record Technology Due to the ONC 21st Century Cures Act Final Rule

1. Background

The American Recovery and Reinvestment Act of 2009 (ARRA) (Pub. L. 111–5, enacted February 17, 2009) authorized incentive payments to eligible professionals, eligible hospitals and critical access hospitals (CAHs), and Medicare Advantage (MA) organizations to promote the adoption and meaningful use of Certified Electronic Health Record Technology (CEHRT). In 2010, the Office of the National Coordinator for Health Information Technology (ONC) launched the Health IT Certification Program (ONC Health IT Certification Program) to provide for the certification of health IT. Requirements for certification are based on standards, implementation specifications, and certification criteria adopted by the Secretary. The ONC Health IT Certification Program supports the use of certified health IT under the programs that we administer, including, but not limited to, the Promoting Interoperability Programs (previously known as the Medicare and Medicaid EHR Incentive Programs), the Quality Payment Program (QPP), and the Hospital Inpatient Quality Reporting (IQR) Program. While these programs continue to require the use of certified health IT, the use of certified health IT

has expanded to other government and non-government programs. The Promoting Interoperability Programs and QPP require the use of CEHRT as defined at 42 CFR 495.4 and 414.1305, respectively. Since 2019, in general, this has consisted of EHR technology (which could include multiple technologies) certified under the ONC Health IT Certification Program that meets the 2015 Edition Base EHR definition (as defined at 45 CFR 170.102) and has been certified to certain other 2015 Edition health IT certification criteria as specified in the definition. Similarly, the Hospital IQR Program began requiring that hospitals use only technology certified to the 2015 Edition certification criteria beginning with the CY 2019 reporting period/FY 2021 payment determination (83 FR 41607).

The “21st Century Cures Act: Interoperability, Information Blocking, and the ONC Health IT Certification Program” final rule (hereinafter referred to as the “ONC 21st Century Cures Act final rule”), published in the May 1, 2020 **Federal Register** (85 FR 25642 through 25961), finalized a number of updates to the 2015 Edition of health IT certification criteria (hereinafter referred to as the 2015 Edition Cures Update). We believe the 2015 Edition Cures Update will enhance interoperability and patients’ access to their electronic health information, consistent with section 4006(a) of the 21st Century Cures Act (Pub. L. 114–255, enacted December 13, 2016). The ONC 21st Century Cures Act final rule revised, added new, and removed certification criteria that establish the capabilities and related standards and implementation specifications for the certification of health IT. In the CY 2021 PFS proposed rule (85 FR 50267), we proposed to require that technology used to meet the CEHRT definitions must be certified in accordance with the updated certification criteria in the ONC 21st Century Cures Act final rule.

The 2015 Edition Cures Update represents a limited set of changes relative to the overall set of health IT certification criteria currently required for the Promoting Interoperability Programs and QPP. These changes incorporate technical standards, including an e-prescribing standard required for alignment with other CMS programs, and other technical updates to existing 2015 Edition functionality used by many health care providers. For example, updates to 2015 Edition certification criteria referencing the United States Core Data for Interoperability (USCDI) standard, rather than the Common Clinical Data Set (CCDS) regulatory definition do not

require extensive changes to user-facing aspects of health IT already certified to these criteria (85 FR 25665).

For CY 2019 and subsequent years, the CEHRT definitions for the Promoting Interoperability Programs at § 495.4, and for QPP at § 414.1305, require the use of EHR technology that is certified under the ONC Health IT Certification Program and meets the 2015 Edition Base EHR definition at § 170.102. In addition, the CEHRT definitions require the technology to be certified to certain other 2015 Edition health IT certification criteria, as specified in the definitions, including criteria necessary to be a meaningful EHR user under the Promoting Interoperability Programs, and criteria necessary to report on applicable objectives and measures specified under the MIPS Promoting Interoperability performance category (previously known as the Advancing Care Information performance category). The updates finalized by ONC in the ONC 21st Century Cures Act final rule (85 FR 25642 through 25961) impact criteria in the different elements of the CEHRT definitions. This includes certification criteria included in the 2015 Edition Base EHR definition, as well as the additional certification criteria necessary to report on applicable objectives and measures to be a meaningful EHR user under the Promoting Interoperability Programs and the MIPS Promoting Interoperability performance category.

The ONC 21st Century Cures Act final rule outlines a number of timelines and compliance dates for health IT developers related to the 2015 Edition Cures Update. The final rule finalized the removal of several certification criteria from the 2015 Edition that were included in the Base EHR definition, upon the effective date of the final rule (June 30, 2020). For other certification criteria, the final rule finalized a limited period during which ONC–Authorized Certification Bodies (ONC–ACBs) may continue to issue certificates for these criteria to health IT developers, after which certification will no longer be available.

Where the ONC 21st Century Cures Act final rule finalized updates to existing 2015 Edition certification criteria, or introduced new 2015 Edition certification criteria, ONC generally finalized that health IT developers have 24 months from the publication date of the final rule (until May 2, 2022) to make technology available that is certified to the updated, or new criteria. Subsequently, on April 21, 2020, in response to the PHE for COVID–19, ONC announced additional flexibility

for health IT developers subject to the policies in the ONC 21st Century Cures Act final rule (https://www.healthit.gov/cures/sites/default/files/cures/2020-04/Enforcement_Discretion.pdf).

Specifically, ONC announced that it would exercise enforcement discretion regarding new requirements in the ONC 21st Century Cures Act final rule, until 3 months after each initial compliance date or timeline (August 2, 2022).

In response to additional calls for increased flexibility in response to the PHE for COVID–19, ONC published an interim final rule with comment period at 85 FR 70064, on November 4, 2020 entitled “Information Blocking and the ONC Health IT Certification Program: Extension of Compliance Dates and Timeframes in Response to the COVID–19 Public Health Emergency” (hereinafter the “ONC interim final rule”). In this rule, ONC finalized extended compliance dates for certain 2015 Edition certification criteria. Specifically, where the ONC 21st Century Cures Act final rule provided that developers of certified health IT have 24 months from the publication date of the final rule to make technology certified to new or updated criteria available, ONC extended the timeline until December 31, 2022 (and until December 31, 2023 for § 170.315(b)(10), “EHI export”). ONC stated that in order to reduce confusion, it has aligned these dates to the calendar year where they impact CMS program participants as aligning these compliance dates to the calendar year, also aligns them to the CMS program annual cycle. As noted in the CY 2021 PFS proposed rule, during this transition period, health IT developers are expected to continue supporting technology certified to the prior version of the certification criteria for use by their customers prior to implementing updates (85 FR 50266).

Below is an overview of the updates finalized in the ONC 21st Century Cures Act final rule that impact certification criteria included in the CEHRT definitions, as well as a discussion of associated timelines finalized in the ONC 21st Century Cures Act final rule, as revised in the ONC interim final rule.

The ONC 21st Century Cures Act final rule finalized removing the following criteria from the 2015 Edition certification criteria upon the effective date of the final rule (June 30, 2020), which included removing the following criteria from the 2015 Edition Base EHR definition (85 FR 25657 through 25660):

- “Problem list” at § 170.315(a)(6);
- “medications” at § 170.315(a)(7);
- “medication allergies” at

§ 170.315(a)(8); and

- “smoking status” at § 170.315(a)(11).

The ONC 21st Century Cures Act final rule noted that the functionality associated with these criteria is now widespread among health IT products, and is expected to remain in products absent certification. Accordingly, ONC sought to reduce burden associated with the certification program by removing these criteria (85 FR 25657 through 25660).

The ONC 21st Century Cures Act final rule also removed the “data export” criterion at § 170.315(b)(6) from the Base EHR definition, upon the effective date of the final rule (June 30, 2020) (85 FR 25668). However, this criterion will continue to be available for certification until December 31, 2023, as finalized in the ONC interim final rule (85 FR 70064). The ONC 21st Century Cures Act final rule instead established a new criterion, “electronic health information export” at § 170.315(b)(10), which requires a certified health IT module to electronically export all electronic health information (EHI), as defined in § 171.102, that can be stored at the time of certification by the product of which the health IT module is a part. A health IT developer of certified health IT products, which, at the time presented for certification electronically stores EHI, must certify such products to this new criterion and make these products available to their customers by December 31, 2023. However, the new EHI Export criterion is not included in the Base EHR definition (85 FR 25690), and it is not associated with any objectives or measures in the Promoting Interoperability Programs, or the MIPS Promoting Interoperability performance category.

In the ONC 21st Century Cures Act final rule, ONC finalized “time-limited” certification for several additional certification criteria associated with measures under the Promoting Interoperability Programs and the MIPS Promoting Interoperability performance category from the 2015 Edition:

- “Drug-formulary and preferred drug list checks” at § 170.315(a)(10);
- “secure messaging” at § 170.315(e)(2); and
- “patient-specific education resource” at § 170.315(a)(13).

In order to allow participants in the Medicaid Promoting Interoperability Program to continue to have access to technology meeting 2015 Edition certification criteria to meet the measures for that program, ONC stated in the ONC 21st Century Cures Act final rule that ONC-ACBs may continue to issue certificates for these criteria until

January 1, 2022 (85 FR 25660 through 25662).

Specifically, in the proposed rule we noted that the latter two criteria are necessary for participants to meet two of the measures in the Medicaid Promoting Interoperability Program. The “secure messaging” criterion at § 170.315(e)(2) is required to meet Objective 6 (Coordination of Care through Patient Engagement) and Measure 2 (Secure Messaging) (80 FR 62852). Similarly, the “patient-specific education resource” at § 170.315(a)(13) is necessary to fulfill the requirements of Objective 5 (Patient Electronic Access to Health Information) and Measure 2 (Patient-Specific Education) (80 FR 62846). We did not propose any changes to these measures in the CY 2021 PFS proposed rule (85 FR 50265 through 50272), as the final year of the Medicaid Promoting Interoperability Program is CY 2021. Based on the phased approach that ONC finalized, Medicaid eligible professionals may continue to use certified technology meeting those two criteria in CY 2021, which will enable them to report on these measures for the CY 2021 Medicaid Promoting Interoperability Program EHR reporting period. Health IT developers are encouraged to maintain the certified functionality for those two criteria through CY 2021, even if they move forward with updates to other criteria. Furthermore, the Secure Messaging measure is one of three measures within Objective 6, and eligible professionals need only meet two of the measures (§ 495.24(d)(6)(i)(B)). Even without the secure messaging functionality, an eligible professional could meet the other two measures and fulfill the objective. There is no similar option for the Patient-Specific Education measure, which is required to meet Objective 5.

The “drug-formulary and preferred drug list checks” criterion is also currently associated with measures under the Electronic Prescribing objective for the Promoting Interoperability Programs and the MIPS Promoting Interoperability performance category (80 FR 62882 and 83 FR 59817). As discussed below, since ONC will retire this criterion after January 1, 2022, this criterion would no longer be required for e-Prescribing measures for the Promoting Interoperability Programs and the MIPS Promoting Interoperability performance category, beginning in CY 2021 (85 FR 25678).

The ONC 21st Century Cures Act final rule also finalized updates to a number of certification criteria, which are currently associated with objectives and measures under the Promoting Interoperability Programs and the MIPS

Promoting Interoperability performance category, as well as criteria that are included in the 2015 Edition Base EHR definition. In general, ONC finalized that health IT developers have 24 months from the publication date of the final rule to make technology certified to these updated criteria available to their customers (until May 2, 2022). Subsequently, in the ONC interim final rule published on November 4, 2020, ONC further extended these compliance dates until December 31, 2022, in response to the PHE for COVID-19. During this time, developers are expected to continue supporting technology certified to the prior version of the 2015 Edition certification criteria for use by their customers.

The ONC 21st Century Cures Act final rule updated several criteria to include references to the USCDI standard, rather than the existing CCDS definition (85 FR 25670), and implemented related technical updates (85 FR 25671). These include the following criteria:

- “Transitions of care” at § 170.315(b)(1);
- “clinical information reconciliation and incorporation” at § 170.315(b)(2);
- “view, download, and transmit to 3rd party” at § 170.315(e)(1);
- “transmission to public health agencies—electronic case reporting” at § 170.315(f)(5); and
- “application access—all data request” at § 170.315(g)(9).

The USCDI standard establishes a set of data classes and constituent data elements required to support interoperability nationwide, designed to expand in an iterative and predictable way over time.¹¹⁰ In finalizing version 1 of the USCDI, the ONC 21st Century Cures Act final rule added three new data classes, “allergies and intolerances,” “clinical notes,” and “provenance;” and added several additional elements to “patient demographics” that were not defined in the CCDS (85 FR 25912).

With respect to the use of secure, standards-based application programming interface (APIs), the ONC 21st Century Cures Act final rule finalized a new standards-based API criterion at § 170.315(g)(10), “standardized API for patient and population services,” which requires the use of FHIR Release 4 and several implementation specifications (85 FR 25742). Developers must make technology certified to this criterion available by December 31, 2022, as finalized in the ONC interim final rule

¹¹⁰ For more information about the USCDI, see <https://www.healthit.gov/isa/united-states-core-data-interoperability-uscdi>.

(85 FR 70064). This criterion replaces the existing “application access—data category request” certification criterion at § 170.315(g)(8). However, ONC—ACBs may continue to issue certificates for § 170.315(g)(8) until December 31, 2022, permitting certification to either criterion during this transition period. The ONC 21st Century Cures Act final rule also added the new API criterion at § 170.315(g)(10) to the 2015 Edition Base EHR definition.

The ONC 21st Century Cures Act final rule also revised the “electronic prescribing” criterion at § 170.315(b)(3) to reference the NCPDP SCRIPT standard version 2017071 (85 FR 25678). As with the other updated criteria above, health IT developers have until December 31, 2022 to make technology certified to the updated criterion available to their customers, as finalized in the ONC interim final rule (85 FR 70064). However, we note that ONC has discontinued certification of new products to the former electronic prescribing criterion using the NCPDP SCRIPT standard version 10.6, in order to align with CMS requirements for use of the updated NCPDP SCRIPT standard under Part D, adopted as of January 1, 2020 (85 FR 25679). Products that were previously certified may maintain certification status until December 31, 2022 as developers are updating their products, and health care providers may continue to use these certified health IT modules for CMS program participation.

Finally, the ONC 21st Century Cures Act final rule updated the certification criterion for clinical quality measures “Clinical Quality Measures (CQMs)—Report” at § 170.315(c)(3), which is included in the CEHRT definitions (85 FR 25686). These updates remove the HL7 QRDA standard requirements from the criterion, and instead require support for the CMS QRDA Implementation Guides, upon the effective date of the final rule (June 30, 2020). In the ONC interim final rule, ONC issued a correction stating that health IT developers would have until December 31, 2022 to make technology available to their customers meeting the updated criterion.

For further discussion, we refer readers to the ONC 21st Century Cures Act final rule (85 FR 25642 through 25961), and section III.M.3.b. of this final rule for discussion specific to the Hospital IQR Program.

As noted above, in general, health IT developers have until the date finalized in the ONC interim final rule, December 31, 2022, to make technology certified to the updated criteria available to their customers. As described in the proposed rule (85 FR 50268), after this date,

technology that has not been updated in accordance with the 2015 Edition Cures Update will no longer be considered certified by ONC.

ONC expects and requires that developers will notify customers when technology certified to the updated criteria is available, and that developers will introduce these updates into certified health IT products in the manner most appropriate for their customers, such as through the course of normal maintenance (85 FR 25642). As discussed in the ONC 21st Century Cures Act final rule (85 FR 25666), health care providers may use the Certified Health IT Product List (CHPL) to identify the specific certification status of a product at any given time. The CHPL distinguishes certification to the existing 2015 Edition certification criteria from certification to the updated criteria adopted in the ONC 21st Century Cures Act final rule, by referring to the new and revised criteria as the 2015 Edition Cures Update, allowing health care providers to identify when a specific Health IT Module was updated. (<https://chpl.healthit.gov/>)

2. Updates to 2015 Edition Certified Electronic Health Record Technology Requirements in the Promoting Interoperability Programs and Quality Payment Program, Due to the ONC 21st Century Cures Act Final Rule

In consideration of the updates made to 2015 Edition certification criteria as described in the CY 2021 PFS proposed rule (85 FR 50265 through 50272), we proposed that the technology used by health care providers to satisfy the definitions of CEHRT at §§ 495.4 and 414.1305 must be certified under the ONC Health IT Certification Program, in accordance with the updated 2015 Edition certification criteria as finalized in the ONC 21st Century Cures Act final rule (85 FR 25642). We explained this includes technology used to meet the 2015 Edition Base EHR definition at § 170.102, technology certified to the criteria necessary to be a meaningful EHR user under the Promoting Interoperability Programs, and technology certified to the criteria necessary to report on applicable objectives and measures specified for the MIPS Promoting Interoperability performance category, as specified in the CEHRT definitions.

As discussed above, the ONC 21st Century Cures Act final rule finalized compliance dates for health IT developers, and established which versions of certification criteria meet the certification requirements under the ONC Health IT Certification Program

based on those compliance dates. In other words, the ONC 21st Century Cures Act final rule established timelines for (1) a transition period where technology certified to the prior or the updated versions of the same certification criteria would be considered certified, and (2) the date for which technology certified to only the updated version of the certification criteria would be considered certified. A health care provider must use technology certified under the ONC Health IT Certification Program to meet the CEHRT definitions. Therefore, we proposed that health care providers participating in the Promoting Interoperability Programs or QPP would be required to use only technology considered certified under the ONC Health IT Certification Program, according to the timelines finalized in the ONC 21st Century Cures Act final rule. For updated and new certification criteria included in the CEHRT definitions in §§ 495.4 and 414.1305, ONC finalized that health IT may be certified to the current 2015 Edition certification criteria or the 2015 Edition Cures Update criteria for a period of 24 months, as described in timelines finalized in the ONC 21st Century Cures Act final rule (85 FR 25670). ONC then announced an additional 3 months during which ONC stated it would exercise enforcement discretion in response to the PHE for COVID–19 and continue to allow health IT certified to either version of the criteria to be considered certified. We explained in the proposed rule that under our proposal, during that time period (up to 27 months from May 1, 2020, or until August 2, 2022), program participants would be able to use technology certified to either version, and that technology would be considered certified under the ONC Health IT Certification Program. Subsequently, in ONC’s interim final rule, ONC extended the compliance dates for certification criteria finalized in the ONC 21st Century Cures Act final rule, finalizing that health IT may be certified to either the existing 2015 Edition certification criteria or the 2015 Edition Cures Update until December 31, 2022. As the ONC interim final rule extended compliance dates for the updated certification criteria until December 31, 2022, technology certified by ONC under the ONC Health IT Certification Program to the existing 2015 Edition certification criteria, or certified to the 2015 Edition and updated to the 2015 Edition Cures Update will now be considered certified by ONC under the

ONC Health IT Certification Program until December 31, 2022.

While the ONC 21st Century Cures Act final rule did not finalize a new Edition of certification criteria, this approach is similar to the prior policy for transition periods between Editions. For example, during the transition period in which the ONC Health IT Certification Program included both the 2014 Edition and the 2015 Edition, a health IT module certified to either Edition was considered certified, and technology certified to either Edition, or a combination of the two, could be used by health care providers to meet CEHRT definitions and demonstrate meaningful use (see 82 FR 38490 for a discussion of the CY 2018 transition between 2014 and 2015 Editions for eligible hospitals and CAHs). After the end of the transition period, only health IT certified to the 2015 Edition could be used by health care providers to meet the CEHRT definitions and demonstrate meaningful use, and health IT modules certified to only the 2014 Edition were no longer considered certified under the ONC Health IT Certification Program. In the same manner, after the current transition period ends, health care providers must use technology certified to only the updated version of the certification criteria finalized by ONC for the ONC Health IT Certification Program to meet the CEHRT definitions and demonstrate meaningful use.

Health care providers should refer to the Certification Criteria and Conditions and Maintenance of Certification requirements in 45 CFR part 170 for details about the updated certification criteria and timelines for health IT developers associated with the criteria. The ONC Health IT Certification Program regulations specify the requirements for what health IT developers must make available to customers and the associated timelines.

In previous rulemaking, to assist readers in identifying the requirements of CEHRT for the Promoting Interoperability Programs and the MIPS Promoting Interoperability performance category objectives and measures, we provided tables identifying the 2015 Edition certification criteria required to meet those objectives and measures (see 83 FR 59817 for the MIPS Promoting Interoperability performance category). We noted two instances in which updates in the ONC 21st Century Cures Act final rule affect information we have provided in past rulemaking regarding

the certification criteria that support specific Promoting Interoperability objectives and measures.

First, we noted that the ONC 21st Century Cures Act final rule is retiring the “drug-formulary and preferred drug list checks” criterion at § 170.315(a)(10), which is currently identified as supporting measures under the Electronic Prescribing objective (80 FR 62882 and 83 FR 59817). ONC finalized that this criterion requires certification until January 1, 2022, before being retired (85 FR 25667). We noted that removing this criterion from the Certification Program will have negligible impact on health care providers. As discussed in prior rulemaking, health care providers have noted that formulary checks are a promising approach. However, the utility of the specific functionality that is certified is not necessarily consistently applicable for all prescriptions (80 FR 62833). In addition, as it does not remove the product from the market, any health care providers who are using the current functionality may continue to use this technology for their own purposes. Accordingly, we noted that this certification criterion would no longer be associated with the measures under the Electronic Prescribing objective for the Promoting Interoperability Programs and the MIPS Promoting Interoperability performance category, beginning with the CY 2021 reporting and performance periods.

Second, we stated that under the new API certification criterion, “standardized API for patient and population services” at § 170.315(g)(10), which requires the use of FHIR Release 4, health IT developers have 24 months from the publication date of the ONC 21st Century Cures Act final rule to make technology available that is certified to this new criterion, which is part of the 2015 Edition Base EHR definition. We stated that after 24 months, ONC will retire the current “application access—data category request” at § 170.315(g)(8), which is currently identified as supporting the “Provide Patients Electronic Access to Their Health Information” measure (80 FR 62882 and 83 FR 59817). We stated that health IT meeting either criteria are considered certified during the 24-month period. Table 42, shows that either the existing criterion at § 170.315(g)(8), or the newly finalized criterion at § 170.315(g)(10), could be used by health care providers to

complete the actions of the “Provide Patients Electronic Access to Their Health Information” measure for the Promoting Interoperability Programs and the MIPS Promoting Interoperability performance category. Allowing health care providers the flexibility of using EHR technology that is certified to either criterion during this transition period would allow early adopters of the newly finalized criterion at § 170.315(g)(10), as well as those using technology meeting the existing certification criterion, to be able to meet the requirements of the Promoting Interoperability Programs and the MIPS Promoting Interoperability performance category. As discussed above, in the ONC interim final rule, ONC updated compliance dates finalized in the ONC 21st Century Cures Act final rule to extend the 24-month period described above to December 31, 2022.

In light of the changes described above with respect to the “e-Prescribing” and “Provide Patients Electronic Access to Their Health Information” measures we included Table 42 in the CY 2021 PFS proposed rule (85 FR 50270), shown below. Table 42 provided details on the measures for the Promoting Interoperability Programs for eligible hospitals and CAHs and the MIPS Promoting Interoperability performance category, and the certification criteria that support each measure. We also included in Table 42 the certification criteria that support the reporting of eCQMs. We noted that Table 42 is only applicable for the measures under the Promoting Interoperability Programs and for the Promoting Interoperability performance category of MIPS. Table 42 does not include all of the updated certification criteria included in the CEHRT definition as discussed in the CY 2021 PFS proposed rule (85 FR 50265 through 50272). Last, Table 42 has been updated to include the Health Information Exchange (HIE)(alternative) Bi-Directional Exchange measure, as this was finalized in section IV.A.3.c.(4)(c)(ii)(B) of this final rule, under the MIPS Promoting Interoperability performance category. For further discussion of changes to criteria under the CEHRT definition, we referred readers to the ONC 21st Century Cures Act final rule (85 FR 25667).

BILLING CODE 4120-01-P

TABLE 42: Medicare Promoting Interoperability Objectives and Measures, and 2015 Edition Certification Criteria

Objective	Measure	2015 Edition
Electronic Prescribing	e-Prescribing	§ 170.315(b)(3) Electronic prescribing
	<i>Bonus:</i> Query of PDMP	§ 170.315(b)(3) Electronic prescribing
Health Information Exchange	Support electronic referral loops by sending health information	§ 170.315(b)(1) Transitions of care
	Support electronic referral loops by receiving and reconciling health information	§ 170.315(b)(1) Transitions of care § 170.315(b)(2) Clinical information reconciliation and incorporation
Health Information Exchange (alternative) ³	Health Information Exchange (HIE) Bi-Directional Exchange	Examples of certified health IT capabilities to support the actions of this measure may include but are <u>not</u> limited to technology certified to the following criteria: § 170.315(b)(1) Transitions of care § 170.315(b)(2) Clinical information reconciliation and incorporation § 170.315(g)(7) Application access — patient selection § 170.315(g)(8) Application access — data category request § 170.315(g)(9) Application access — all data request § 170.315(g)(10) Application access — standardized API for patient and population services
Provider to Patient Exchange	Provide patients electronic access to their health information	§ 170.315(e)(1) View, download, and transmit to 3rd party § 170.315(g)(7) Application access — patient selection § 170.315(g)(8) Application access — data category request § 170.315(g)(9) Application access — all data request § 170.315(g)(10) Application access — standardized API for patient and population services
Public Health and Clinical Data Exchange	Immunization registry reporting	§ 170.315(f)(1) Transmission to immunization registries
	Syndromic surveillance reporting	§ 170.315(f)(2) Transmission to public health agencies — syndromic surveillance
	Electronic case reporting	§ 170.315(f)(5) Transmission to public health agencies — electronic case reporting
	Public health registry reporting	§ 170.315(f)(4) ¹ Transmission to cancer registries § 170.315(f)(6) ² Transmission to public health agencies — antimicrobial use and resistance reporting § 170.315(f)(7) Transmission to public health agencies — health care surveys
	Clinical data registry reporting	No 2015 health IT certification criteria at this time.
	Electronic reportable laboratory result reporting ²	§ 170.315(f)(3) Transmission to public health agencies — reportable laboratory tests and value/results
Electronic Clinical Quality Measures (eCQMs)	eCQMs for eligible professionals, and eligible hospitals and CAHs	§ 170.315(c)(1) § 170.315(c)(2) § 170.315(c)(3)(i) and (ii) § 170.315(c)(4) ⁴ (optional)

¹ = Specific to Eligible Clinicians (MIPS Promoting Interoperability performance category)² = Specific to Eligible Hospitals and CAHs (Promoting Interoperability Programs)³ = Specific to Eligible Clinicians, finalized in section IV.A.3.c.(4)(c)(ii)(B) of this final rule (MIPS Promoting Interoperability performance category)⁴ = In the CY 2021 PFS proposed rule, (c)(4) was inadvertently listed as (c)(3); correction noted here**BILLING CODE 4120-01-C**

In the CY 2021 PFS proposed rule, we proposed to revise two definitions under § 414.1305 (85 FR 50270). First, under the definitions of CEHRT, we proposed to replace the reference to the

“Advancing Care Information” performance category with the “Promoting Interoperability” performance category, to reflect the performance category name change that we made previously (83 FR 59785).

Second, under the definition of Meaningful EHR user for MIPS, we proposed to replace the reference to the “Advancing Care Information” performance category with the “Promoting Interoperability”

performance category, to reflect the performance category name change that we made previously (83 FR 59785).

We sought public comments on all of these proposals.

Comment: Many commenters supported CMS' proposal that the technology used by health care providers to satisfy the definitions of CEHRT must be certified under the ONC Health IT Certification Program in accordance with the updated 2015 Edition certification criteria, as finalized in the ONC 21st Century Cures Act final rule. Commenters indicated the update would harmonize requirements, create more efficiencies, and facilitate true interoperability between EHRs. Commenters were also in favor of eliminating inconsistencies and reducing costs by having the ability to use technology certified to the existing 2015 Edition certification criteria, technology certified to the 2015 Edition Cures Update, or a combination of the two. One commenter observed that the alignment with the ONC 21st Century Cures Act final rule would reduce provider confusion.

Response: We agree that this proposal will reduce confusion for health care providers, continue with our efforts to promote interoperability, and reduce burden by streamlining efforts across programs, and components of the Department.

Comment: Several commenters expressed appreciation that, during the transition period, health care providers will have the flexibility to meet the CEHRT definition using technology certified to the existing 2015 Edition certification criteria, technology certified to the 2015 Edition Cures Update, or a combination of the two. Further, commenters stated that this alignment would reduce administrative burden, eliminate redundancies, streamline objectives and measures, ensure health care providers are using up-to-date technology, and encourage continued efforts to align reporting requirements across care settings.

Response: We agree that health care providers participating in the Promoting Interoperability Programs and QPP will have flexibility during this transition period to use EHR technology certified to the existing 2015 Edition certification criteria, technology certified to the 2015 Edition and updated to the 2015 Edition Cures Update, or a combination of EHR technologies. We also agree with commenters that this alignment will reduce administrative burden, and support our efforts to achieve alignment across programs, care settings, and components of the Department.

Comment: Several commenters stated that the August 2, 2022 compliance date discussed in the CY 2021 PFS proposed rule occurs in the middle of a program year and would create additional challenges and complexity for planning. Commenters also expressed concern that the proposed mid-year requirement would limit reporting flexibility for providers participating in the Hospital IQR Program, the Advanced-APM track within QPP, and those opting to use eCQMs under MIPS. These commenters requested guidance regarding the relationship between the deadline and annual reporting requirements.

Response: We appreciate commenters' concerns that the August 2, 2022 compliance date discussed in the CY 2021 PFS proposed rule may introduce additional complexity for stakeholders who manage technology upgrades and program reporting based on the calendar year.

As noted above, the ONC interim final rule has extended the compliance dates for health IT developers associated with the updated certification criteria finalized in the ONC 21st Century Cures Act final rule. Specifically, ONC has extended compliance dates that originally fell 24-months after the publication of the ONC 21st Century Cures Act final rule, to December 31, 2022. This means that technology meeting the existing 2015 Edition criteria will be considered certified under the ONC Health IT Certification Program through the end of 2022.

With the extension of the compliance dates in the ONC interim final rule, we believe it is appropriate to align the transition period during which health care providers participating in the Promoting Interoperability Programs or QPP may use technology certified to either the existing or updated 2015 Edition certification criteria, with the extended compliance date of December 31, 2022. We believe that this extension of the transition period to include all of 2022 will address commenter concerns regarding the complexities associated with a mid-year transition date. We are therefore finalizing a modification to our proposal, and extending the transition period to the new December 31, 2022 compliance date as finalized in the ONC interim final rule. After this date, only certified technology updated to the 2015 Edition Cures Update will be considered certified and may be used by health care providers to meet the definitions of CEHRT for the Promoting Interoperability Programs and QPP.

However, we reiterate that health care providers would not be required to demonstrate that they are using updated technology to meet the CEHRT

definitions immediately upon the transition date of December 31, 2022. In accordance with the reporting and performance period requirements of the Promoting Interoperability Programs and the MIPS Promoting Interoperability performance category, participants are only required to use technology meeting the CEHRT definitions during a self-selected reporting or performance period of a minimum of any consecutive 90 days in CY 2022 (85 FR 58966 through 58967 and section IV.A.3.c.(4)(b) of this final rule, respectively). For instance, under this final policy, a health care provider could demonstrate meaningful use for any consecutive 90-days during CY 2022 using either technology certified to the existing 2015 Edition, or certified technology that has been updated to the 2015 Edition Cures Update, or a combination of non-updated and updated certified health IT modules to meet the CEHRT definition. Under the MIPS Promoting Interoperability performance category, as described in section IV.A.3.c.(4)(b) of this final rule, a MIPS eligible clinician could then choose a performance period of any consecutive 90 days to demonstrate meaningful use during 2023, up to the final 90 days of 2023. The MIPS eligible clinician would not be required to demonstrate meaningful use of technology meeting the 2015 Edition Cures Update until the 90-day performance period they have selected. Moreover, we remind readers that a MIPS eligible clinician is not required to report on possession of certified technology for the 90-day performance period they have selected, but instead, they are required to report on how many times they used certified technology for the completion of the action defined by each measure. Although we have not yet established an EHR reporting period in 2023 for eligible hospitals and CAHs under the Promoting Interoperability Program, we may consider adopting another 90-day period for 2023 in future rulemaking.

With regard to alignment with other CMS programs that also require or reference the use of certified EHR technology, we expect to collaborate with these programs in the future to ensure alignment across CMS programs, and that the timelines for implementation discussed in this final rule are not adversely impacted by other CMS program requirements.

Comment: Many commenters did not support our proposal to require the use of technology certified to the 2015 Edition Cures Update, due to concerns with health IT vendors. Specifically, commenters are concerned with vendors

being able to complete, and providers being able to adopt and implement, the changes associated with the 2015 Edition Cures Update by August 2, 2022, when only updated technology would be considered certified under the ONC Health IT Certification Program.

Commenters specifically expressed concern that in aligning deadlines between health care providers and vendors, there would not be sufficient time for health care providers to adopt and implement the newly available technology. Some commenters requested additional time beyond the vendor deadline to select and implement certified health IT, test the new technology, customize the new technology for their specific practices, update workflows, and train staff.

A few commenters expressed concern that complications associated with transitioning between versions of certified technology could negatively affect patient care, and lead to potential patient harm. Several commenters urged CMS to extend the transition period for using technology certified to either the current 2015 Edition or the 2015 Edition Cures Update for CMS reporting and incentive-based programs. As alternatives, commenters recommended January 2023, August 2023, January 2024, and August 2024 as potential deadlines.

Response: We appreciate commenters' concerns related to the effort required for health care providers to adopt and implement updated technology to meet the CEHRT definition, after it is made available by health IT developers. However, we disagree that our proposal would not permit adequate time for implementing and using the 2015 Edition Cures Update in a manner similar to what commenters are requesting.

Under our proposed rule, we stated that a health care provider must use technology that is considered certified under the ONC Health IT Certification Program to meet the CEHRT definitions, in accordance with updates to the 2015 Edition of health IT certification criteria, as finalized in the ONC 21st Century Cures Act final rule. In our proposed rule, we stated that this proposal would allow health care providers to use either technology certified to the existing 2015 Edition certification criteria, technology certified to the 2015 Edition Cures Update, or a combination of the two, prior to the date established by ONC, regardless of the health care provider choosing to update their certified technology in a phased-in approach, or at one time. Specifically, we stated that during CY 2022, a health care provider implementing updates in a phased

approach could plan to use a combination of updated and non-updated certified health IT for any consecutive 90-day reporting or performance period prior to August 2, 2022, and then complete their first reporting or performance period using only updated health IT modules in CY 2023. Similarly, we stated that if a health care provider was planning to update all of their certified technology at one time in order to engage in a more extensive testing and implementation period during CY 2022, they could complete their 90-day reporting or performance period for CY 2022, prior to August 2, 2022 using non-updated health IT, and then complete their first reporting or performance period using only updated health IT modules in CY 2023 (85 FR 50268).

Under the revised compliance dates finalized in the ONC interim final rule, both technology certified to the existing 2015 Edition and technology certified to the 2015 Edition Cures Update would now be considered certified until December 31, 2022. As noted above, we are finalizing that health care providers may use health IT certified to the existing 2015 Edition certification criteria, certified health IT updated to the 2015 Edition Cures Update, or a combination of updated and not-yet updated health IT modules, for the full year in CY 2022. For a reporting or performance period *after* December 31, 2022, health care providers would need to use only technology certified to the 2015 Edition Cures update to meet the CEHRT definitions.

We believe the additional flexibility finalized in the ONC interim final rule as well as the performance period flexibilities permitted under the MIPS Promoting Interoperability performance category, as described in section IV.A.3.c.(4)(b) of this final rule, will allow sufficient time for health IT developers to make updated products available for health care providers to demonstrate meaningful use. This timeframe would allow developers and MIPS eligible clinicians as much as 3 years and 5 months (or, 41 months total) from the publication of ONC's 21st Century Cures Act final rule, before a MIPS eligible clinician seeking to demonstrate meaningful use would be required to use technology meeting the 2015 Edition Cures Update for their 90-day performance period in CY 2023 under the Promoting Interoperability performance category. We believe this is a sufficient amount of time for MIPS eligible clinicians to implement and use updated technology after it is made available by health IT developers. Historically, commenters have

requested a total of 36 months from the publication of a new Edition of health IT certification criteria to the time it is required for use by health care providers participating in CMS programs. As discussed in the proposed rule, updates to the certification criteria that ONC finalized in the ONC 21st Century Cures Act final rule do not constitute a full new Edition of technology (85 FR 25665), as the scope of updates did not warrant implementation of an entirely new Edition of certification criteria (85 FR 25664 through 25665). Although we have not yet established an EHR reporting period in 2023 for eligible hospitals and CAHs under the Promoting Interoperability Program, we may consider adopting another 90-day period for 2023 in future rulemaking.

The updates finalized in the ONC 21st Century Cures Act final rule are limited in scope to build on existing functionality and standards in technology certified to the 2015 Edition, which participants in CMS programs have been using as part of clinical and administrative workflows since the 2019 program year. Specifically, as described in the ONC 21st Century Cures Act final rule (85 FR 25665), updates to the technology that require additional technical development by health IT developers, and which impact participants in CMS programs, include: (1) Updating eCQM and e-prescribing criteria to align with existing CMS requirements; (2) modifying existing interoperability criteria to reference the USCDI standard; and (3) updating certification of the API functionality for patient access. For eCQMs, the updates required in the ONC 21st Century Cures Act final rule bring the criterion in line with the updates already required for CMS quality programs, which are implemented on an annual basis. For the e-prescribing criterion, the updates required in the ONC 21st Century Cures Act final rule bring the criterion in line with the requirements for the Medicare Part D program, which required use of an updated e-prescribing standard beginning on January 1, 2020 (84 FR 23832). For the USCDI updates, ONC noted that the updates to the common clinical data set (CCDS) to create the USCDI were intentionally limited to a modest expansion that most health IT developers already supported, were already working toward, or should be capable of updating their health IT to support in a timely manner (85 FR 25665). Additionally, while there may be some development burden on health IT developers to update current criteria from the CCDS to the USCDI, there would be limited burden on health care

providers to send or receive additional data types or to provide additional data points to patients using the same health IT capabilities that currently support these workflows. Similarly, since 2019, health care providers with systems certified to 2015 Edition certification criteria that participate in the Promoting Interoperability programs or the Promoting Interoperability performance category in MIPS have implemented workflows for patients to access their information using API technologies certified to the 2015 Edition for the purposes of reporting for the “Provide Patients Electronic Access to their Health Information” measure. The update to the FHIR-based API should not be a significant change to these workflows for the provider, as these changes are technical modifications within the system rather than significant changes to clinical or administrative workflows.

Therefore, while implementation and testing of updates in the 2015 Edition Cures Update will be necessary, the updates to the eCQM and e-prescribing criteria are already being implemented under existing CMS programs. In addition, we believe the updates for the USCDI and API will be largely seamless for health care providers and will not require substantial redesign of existing clinical and administrative workflows for health IT users. Instead, the majority of the burden associated with these updates falls on health IT developers of certified health IT, as discussed in the regulatory impact analysis in the ONC 21st Century Cures Act final rule (85 FR 25912).

Regarding recommendations from commenters that we establish separate deadlines for health care providers to use technology meeting the 2015 Edition Cures Update, we do not believe that such timelines would be consistent with the level of burden described above or with HHS priorities to advance interoperability in a timely fashion. For instance, if we adopted the recommendation to not require health care providers to use updated technology until 2024, as recommended by some commenters, this could mean that a health care provider would not implement and use certified technology updated to the 2015 Edition Cures Update until 4 years after the publication of updated criteria in the ONC 21st Century Cures Act final rule. Therefore, the benefits of technology updates such as FHIR-based API capabilities, which can be implemented today, would not be available to patients for over 4 years from their inclusion in the ONC Health IT Certification Program. We do not believe that such a

lengthy delay in improving patient access to their health information would be consistent with our priorities for the Promoting Interoperability Programs or QPP.

We also wish to emphasize that, under the ONC 21st Century Cures Act final rule, health IT developers may make technology meeting updated criteria available to health care providers at any time prior to the compliance dates finalized in the ONC interim final rule, and may begin to support health care providers in implementing these updates. Our policy would allow health care providers to use either technology certified to the current 2015 Edition, technology certified to the 2015 Edition and updated to 2015 Edition Cures Update, or a combination of the two, to meet the CEHRT definitions beginning with the 2020 reporting and performance periods upon the effective date of this final rule.

We declined to set an independent additional deadline for health care providers participating in the Promoting Interoperability Programs and the MIPS Promoting Interoperability performance category to use updated technology, as we believe that existing flexibility around when health care providers must demonstrate meaningful use during the calendar year will provide sufficient time for health care providers to implement and use updated certified technology. Moreover, we believe that any further extension of timeframes beyond what we have discussed in this final rule would result in unacceptable delays in making important technology updates available, which HHS has determined are critical for improving interoperability across the nation in a timely fashion and improving the quality of care for patients.

Comment: Several commenters expressed concern that updated 2015 Edition certified health IT would be cost prohibitive, and recommended that CMS allow additional time for health care providers to implement these updates, so that they would have an opportunity to recover from the financial effects of the PHE for COVID-19 before being required to implement technology meeting the 2015 Edition Cures Update. A few commenters stated that aligning deadlines between CMS and ONC could lead to significant financial burdens in an already compromised environment. Commenters expressed concern with vendors making excessive charges to clients to guarantee meeting required deadlines, or, vendors deciding not to issue an updated product thereby reducing market competition, and potentially further increasing the cost

for available products. Several commenters stated that the costs to cover such expansive EHR upgrades were not approved in this fiscal years’ budget, leaving little room for unexpected high costs.

Response: We appreciate commenters’ concerns regarding the financial impact of the PHE for COVID-19 on health care providers. We proposed that participants in the Promoting Interoperability Programs and QPP be required to use technology considered certified under the ONC Health IT Certification Program to meet the CEHRT definitions, consistent with the timelines finalized in the ONC 21st Century Cures Act final rule. As discussed above, the ONC interim final rule published in the November 4, 2020 **Federal Register** provided additional flexibility by extending compliance dates for updated certification criteria finalized in the ONC 21st Century Cures Act final rule to December 31, 2022. To align with this change, we are finalizing our proposal with a modified timeframe, as discussed in our previous responses to comments. We believe this extended timeframe will offer health care providers additional flexibility to manage the financial impacts of the PHE for COVID-19 with respect to when they implement and begin using technology updated to the 2015 Edition Cures Update.

Regarding pass through and development costs, we would like to reiterate a few points as discussed above. First, with the extended timeline, health care providers have the ability to use technology certified to the existing 2015 Edition certification criteria or updated to the 2015 Edition Cures Update to demonstrate meaningful use, starting from the effective date of this final rule. Moreover, in many cases, we believe these updates will be implemented by health IT developers as part of routine cyclical updates, such as the annual updates to CMS eCQMs. We believe the ability to implement these changes through routine service and maintenance updates will reduce the pressure on health care providers to meet an expedited timeline. Second, as discussed above, the required updates are based on existing capabilities that vendors have already deployed as part of the 2015 Edition, reducing the likelihood that developers will not pursue updates to their products. For health care providers who have concerns regarding their respective vendor, we again want to encourage the use of CHPL. As discussed above, the CHPL distinguishes certification to the existing 2015 Edition certification criteria from certification to the updated

criteria adopted in the ONC 21st Century Cures Act final rule, by referring to the new and revised criteria as the 2015 Edition Cures Update, allowing health care providers to identify when a specific health IT module was updated. (<https://chpl.healthit.gov/>) Last, to understand the impact on health IT developers associated with updating health IT products, we refer readers to the impact analysis presented in the ONC 21st Century Cures Act final rule at 85 FR 25912.

Comment: A few commenters were supportive of our proposals, but asked that CMS and ONC continue to monitor the PHE for COVID-19, and adjust compliance deadlines as appropriate. A few concerns commenters shared surrounding the PHE for COVID-19 included administrative burdens for health care providers, potential risks to patients and their safety, and the financial burden for those already struggling financially and administratively amidst the PHE for COVID-19. As an alternative, commenters suggested implementing two separate timelines, allowing additional time to recoup financial costs and recover from the PHE for COVID-19. The first timeline being for developers to make updated 2015 Edition products available as finalized under the ONC 21st Century Cures Act final rule, immediately followed by a second timeline specifically for health care providers to adopt and implement these updated products.

Response: We appreciate the concerns raised by commenters, but respectfully disagree. As mentioned above, our alignment with the additional flexibility finalized in the ONC interim final rule, coupled with the existing flexibilities permitted under the MIPS performance period requirements for the Promoting Interoperability performance category described in section IV.A.3.c.(4)(b) of this final rule, allows developers and MIPS eligible clinicians as much as 3 years and 5 months from the publication of ONC's 21st Century Cures Act final rule before they must use certified technology updated to the 2015 Edition Cures Update. Given the limited scope of the updates and the importance of supporting patient access and care coordination, we believe a single aligned timeline for developers to make updates available and for subsequent provider implementation and use is appropriate. Health care providers have the option to use either technology certified to the existing 2015 Edition, or certified technology that has been updated to the 2015 Edition Cures Update, or a combination of non-

updated and updated certified health IT modules through December 31, 2022, with the ability to choose a phased-in, or one time approach to implementing these updates. Additionally, as discussed above, MIPS eligible clinicians are only required to use technology meeting the CEHRT definition during any self-selected performance period of a minimum of any consecutive 90-days, including the last 90-days of 2023, for the Promoting Interoperability performance category in CY 2023 (see section IV.A.3.c.(4)(b) of this final rule). Although we have not yet established an EHR reporting period in 2023 for eligible hospitals and CAHs under the Promoting Interoperability Program, we may consider adopting another 90-day period for 2023 in future rulemaking.

Regarding recommendations that we establish two separate implementation deadlines (one for health IT developers, and one for health care providers), we do not believe that such timelines would be consistent with the level of burden previously discussed, with HHS priorities to advance interoperability in a timely fashion, or our efforts to maintain alignment across programs and components of the Department. We further believe that a single timeline for health care provider use of updated technologies that is aligned to the compliance timelines for health IT developers allows for the most efficient transition for health care providers in planning and executing implementation of updates in preparation for a reporting period in CY 2023.

Comment: One commenter supported the alignment between CMS and ONC, but shared concerns with the ability of all health care providers to meet the proposed deadlines. The commenter instead suggested that early adopters be rewarded with bonus points and/or counting this as an improvement activity.

Response: We will take these suggestions under consideration for future rulemaking.

Comment: Several commenters urged CMS to work with ONC to ensure that health care providers are not held accountable for delays in implementation or adoption caused by the health IT vendors. One commenter said that health care providers cannot control vendor compliance, and urged CMS to work with ONC to ensure that health care providers are not harmed, either by being penalized for vendor non-compliance or through high pass-through costs.

Response: We remind commenters that under the Promoting Interoperability Programs for eligible

hospitals and CAHs, CMS may grant, on a case-by-case basis, hardship exceptions for extreme and uncontrollable circumstances, which may include vendor issues or issues related to decertified EHR technology. Information on the hardship exception request process is available on the CMS Promoting Interoperability web page at https://www.cms.gov/Regulations-and-Guidance/Legislation/EHRIncentivePrograms/PaymentAdj_Hardship. Eligible clinicians participating in the MIPS Promoting Interoperability performance category may submit a hardship exception request through the QPP website at <https://qpp.cms.gov/login>. For more information on the hardship exception process under MIPS, please also refer to <https://qpp.cms.gov/mips/exception-applications>.

Comment: Some commenters were not supportive of CMS' proposal to require updates to 2015 Edition certified health IT in accordance with the timeline set forth in the ONC 21st Century Cures Act final rule to meet the CEHRT definitions. Commenters expressed concern with, and lack of confidence in, any presumption that technology updated in accordance with the 2015 Edition Cures Update will facilitate seamless interoperability, as these updates encompass a significant development effort. Commenters encouraged CMS to consider alternative means to the proposed timelines.

Commenters urged CMS to work in concert with federal partners that are working to address the same issues now to ensure its approach aligns with theirs, and to minimize compliance burdens on affected stakeholders. One commenter recommended that CMS engage clinicians in developing the requirements for future updates to certification criteria for health IT referenced by the CEHRT definitions.

Response: We respectfully disagree with commenters that the updates to certification criteria finalized in the ONC 21st Century Cures Act final rule will not help to improve interoperability for health care providers and patients. As discussed in the CY 2021 PFS proposed rule, the updates to 2015 Edition certification criteria are primarily focused on incorporating standards that are broadly supported across industry as important steps to improve interoperability. For instance, the USCDI version 1, which is referenced in several updated certification criteria, adds clinical notes and provenance as data elements to the existing CCDS based on significant feedback from the industry. Both the free text portion of the clinical notes

and the provenance of data have been identified by clinicians as data that is important *to clinicians* but is often missing during electronic health information exchange.

Similarly, we believe implementation and use of technology certified to the new certification criterion for a standards-based API in the 2015 Edition Cures Update will help to create an environment that promotes innovation for software developers to connect new tools and services that create efficiencies for health care providers throughout their course of care delivery. By enabling access to data through the new, standards-based API, clinicians will have increased access to applications that can help support use cases for population health analytics, clinical decision support, patient education, as well as to conduct administrative and financial tasks. For further information, we refer readers to the discussion of the benefits associated with increased interoperability enabled by APIs in the ONC 21st Century Cures Act final rule (85 FR 25922).

In response to commenters who expressed concerns that this alignment will not result in a seamless transition, we respectfully disagree and note that this approach avoids potential negative consequences of misalignment. As an example, not aligning the requirements for the use of certified technology under the Promoting Interoperability Programs and the MIPS Promoting Interoperability performance category with the updated 2015 Edition certification criteria finalized in the ONC 21st Century Cures Act final rule could lead to increased stakeholder confusion on how to meet individual program requirements, gaps in availability of essential functionality and standards, and lack of adoption of updated technology that supports patient safety and quality outcomes. This would increase burden by requiring health care providers to maintain the same health IT, but applied differently to two different program areas.

In response to commenters requesting that CMS continue to work alongside Federal partners to ensure that we approach overlapping issues similarly, we agree. CMS and ONC will continue to work together keeping HHS' priorities to advance interoperability in a timely fashion as a priority. The theme of alignment is also integral across program areas, across components of the Department, and across the care-continuum. We will continue to work together, and continue to highlight these areas of alignment for health care providers.

For commenters recommending that CMS engage clinicians in developing the requirements for future updates to CEHRT, we appreciate this suggestion. Health care providers are welcome to submit suggestions via the Promoting Interoperability Call for Measures, for eligible hospitals and CAHs, or eligible clinicians. Health care providers are also encouraged to submit comments and suggestions in responses to proposed rules including the annual IPPS and PFS proposed rules. We also encourage health care providers to listen to, participate in, and submit questions or comments through Promoting Interoperability webinars for hospitals and CAHs, and eligible clinicians.

Comment: Several commenters supported revising the two definitions referencing the "Advancing Care Information" performance category, and changing this to read the "Promoting Interoperability" performance category under § 414.1305.

Response: We would like to thank commenters for their support.

Comment: One commenter recommended that CMS remove the 45 CFR 170.315(c)(2) and (3) criteria from the CEHRT definition for MIPS and QPP, to allow more eligible clinicians to participate in A-APMs and other-Payer A-APMs that use CQM collection types without leveraging eCQM functionality. It was suggested that CMS and ONC make the CQM criteria optional for those who choose to use the eCQM collection type. The commenter stated this would allow additional eligible clinician types to use certified criteria as appropriate for their respective fields, without needing to possess and maintain technology that is not necessary.

Response: We thank commenters for their input, and note that the CEHRT definitions already provide this type of flexibility for health care providers to obtain and implement only those criteria that they need to use based on specific program measures and submission methods. The CEHRT definitions do require the 45 CFR 170.315(c)(1) criterion, which is a part of the 2015 Edition Base EHR definition. However, implementation and use of both the 45 CFR 170.315(c)(2) criterion and the 45 CFR 170.315(c)(3) criterion is contingent upon what is necessary to report on applicable objectives and measures. These two criteria are required if the health care provider is reporting eCQMs directly from their EHR for their program participation. However, the criteria are not required if they are not required by the specific CQM reporting option that the health care provider chooses.

After consideration of the public comments received, we are finalizing our proposals with a modification to align the transition period during which health care providers participating in the Promoting Interoperability Programs or QPP may use technology certified to either the existing or updated 2015 Edition certification criteria, with the December 31, 2022 date established in the ONC interim final rule for health IT developers to make updated certified health IT available.

This will allow health care providers to use either not yet-updated technology certified to the existing 2015 Edition, or certified technology that has been updated to the 2015 Edition Cures Update, or a combination of non-updated and updated certified health IT modules, starting from the effective date of this final rule through the end of CY 2022. Health care providers would then be required to use only certified technology updated to the 2015 Edition Cures Update for a performance period in CY 2023. As discussed in our responses to comments, we note that, consistent with the MIPS Promoting Interoperability performance category performance period described in section IV.A.3.c.(4)(b) of this final rule, a MIPS eligible clinician is not required to demonstrate use of updated technology beginning on January 1, 2023. Rather, a MIPS eligible clinician participating in the Promoting Interoperability performance category may select a performance period of any consecutive 90-days as late as the last 90-days in 2023 to meet the CEHRT definitions using technology meeting the 2015 Edition Cures Update. Although we have not yet established an EHR reporting period in 2023 for eligible hospitals and CAHs under the Promoting Interoperability Program, we may consider adopting another 90-day period for 2023 in future rulemaking.

3. Changes to Certification Requirements Under the Hospital IQR Program Due to the 21st Century Cures Act Final Rule

a. Background and Previously Finalized Certification Requirements

To measure the quality of hospital inpatient services, we implemented the Hospital IQR Program, previously referred to as the Reporting Hospital Quality Data for Annual Payment Update (RHQDAPU) Program. We refer readers to the FY 2010 IPPS/LTCH PPS final rule (74 FR 43860 through 43861) and the FY 2011 IPPS/LTCH PPS final rule (75 FR 50180 through 50181) for detailed discussions of the history of the Hospital IQR Program, including the

statutory history, and to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50217 through 50249), the FY 2016 IPPS/LTCH PPS final rule (80 FR 49660 through 49692), the FY 2017 IPPS/LTCH PPS final rule (81 FR 57148 through 57150), the FY 2018 IPPS/LTCH PPS final rule (82 FR 38326 through 38328 and 82 FR 38348), the FY 2019 IPPS/LTCH PPS final rule (83 FR 41538 through 41609), and the FY 2020 IPPS/LTCH PPS final rule (84 FR 42448 through 42509) for the measures we have previously adopted for the Hospital IQR Program measure set for the FY 2022 payment determination and subsequent years. We also refer readers to 42 CFR 412.140 for Hospital IQR Program regulations.

The Hospital IQR Program strives to put patients first by empowering patients to make decisions about their own healthcare along with their clinicians using information from data driven insights that are increasingly aligned with meaningful quality measures. We support technology that reduces burden and allows clinicians to focus on providing high quality healthcare for their patients. We also support innovative approaches to improve quality, accessibility, and affordability of care, while paying particular attention to improving clinicians' and beneficiaries' experiences when interacting with CMS programs. In combination with other efforts across HHS, we believe the Hospital IQR Program incentivizes hospitals to improve healthcare quality and value, while giving patients the tools and information needed to make the best decisions for themselves. The Hospital IQR Program measures assess clinical processes, patient safety and adverse events, patient experiences with care, care coordination, and clinical outcomes, as well as cost of care.

For each Hospital IQR Program payment determination, we require that hospitals submit data on each specified measure in accordance with the measure's specifications for a particular period. Hospital IQR Program file format requirements have progressed over time to support quality reporting based on data submitted from EHRs that use relevant, up-to-date, standards-based structured data capture. We updated our requirements with the adoption of health IT certified to new Editions of certification criteria referenced in the CEHRT definition, originally requiring hospitals submitting eCQM data to use technology certified to the 2014 Edition certification criteria (79 FR 50252) and evolving to the current requirement that hospitals use technology certified to the 2015 Edition certification criteria for reporting eQMs and hybrid measures

(83 FR 41604 through 41607, and 84 FR 42507). In order to ease the transition between Editions of certified health IT, the Hospital IQR Program offered flexibility in file submission requirements, allowing the use of either the 2014 Edition or the 2015 Edition for multiple reporting periods (80 FR 49705 through 49708; 81 FR 57169 through 57170; 82 FR 38397 through 38391). As we stated in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57111), our goal is to align electronic quality measure requirements of the Hospital IQR Program with various other Medicare and Medicaid programs, including those authorized by the Health Information Technology for Economic and Clinical Health (HITECH) Act, as much as feasible so that the reporting burden on healthcare providers will be reduced (82 FR 38392). In the past we noted that aligning the eCQM submission requirements of the Hospital IQR Program and the Promoting Interoperability Programs reduces burden for hospitals as they may report once and fulfill the requirements of both programs (84 FR 42599). We intend to continue to align the eCQM reporting requirements for the Hospital IQR Program and Promoting Interoperability Programs to reduce reporting burden (84 FR 42598 through 42601; 82 FR 38479).

b. Revisions to the Existing Certification Requirements

Recently, through the ONC 21st Century Cures Act final rule (85 FR 25642 through 25961) published on May 1, 2020, ONC updated the 2015 Edition of health IT certification criteria ("2015 Edition Cures Update"). Specifically, the ONC 21st Century Cures Act final rule finalized updates to existing 2015 Edition certification criteria and introduced new 2015 Edition criteria. As noted in section III.M.1. of this final rule, in general, the ONC 21st Century Cures Act final rule provided that health IT developers have up to 24 months from May 1, 2020 to make technology certified to the updated and/or new criteria available to their customers. During this period, health IT developers are expected to continue supporting technology certified to the prior version of the certification criteria for use by their customers prior to updating their products (85 FR 25642 through 25961).

In April 2020, ONC announced its intention to exercise enforcement discretion as to the compliance dates finalized in the ONC 21st Century Cures Act final rule in response to the PHE for COVID-19.¹¹¹ As a result, where the

¹¹¹ https://www.healthit.gov/cures/sites/default/files/cures/2020-04/Enforcement_Discretion.pdf.

ONC 21st Century Cures Act final rule required health IT developers to make technology meeting new and updated certification criteria available by May 2, 2022, ONC stated developers taking advantage of enforcement discretion would be permitted to delay making updated certified technology available until 3 months after each initial compliance date or timeline.

Given the Hospital IQR Program's history of updating file submission requirements, we understand that transitioning to technology certified to a new Edition, or to an updated version of the same Edition of certification criteria, can be complex. Nevertheless, we believe that there are many benefits to using relevant, up-to-date, standards-based structured data capture with an EHR to support electronic clinical quality measurement. In addition, we believe it is important to continue to align with the eCQM reporting requirements for the Promoting Interoperability Programs (82 FR 38479, 84 FR 42598).

Therefore, in the CY 2021 PFS proposed rule (85 FR 50270 through 50272), for the Hospital IQR Program beginning with the CY 2020 reporting period/FY 2022 payment determination¹¹² and for subsequent years, we proposed to expand flexibility to allow hospitals to use either: (1) Technology certified to the 2015 Edition criteria as was previously finalized in the FY 2019 IPPS/LTCH final rule (83 FR 41537 through 41608), or (2) certified technology updated consistent with the 2015 Edition Cures Update as finalized in the ONC 21st Century Cures Act final rule (85 FR 25642 through 25961). We are clarifying in this final rule that this proposed flexibility applies to all Hospital IQR Program measures which use EHR data elements to calculate measure rates, including eQMs and hybrid measures. We also refer readers to sections III.M.1. and III.M.2. of this final rule for background and more details about the 2015 Edition Cures Update. We proposed to adopt this flexible approach in order to encourage hospitals to implement the most up-to-date, standards-based structured data capture while also maintaining alignment with the Promoting Interoperability Program proposal. We noted that the proposal would allow hospitals that are early adopters of certified health IT that has

¹¹² We note that the CY 2021 PFS proposed rule stated that this proposal would begin with CY 2020 reporting period/FY 2023 payment determination (85 FR 50271). We are clarifying that this proposal will begin with the CY 2020 reporting period, which corresponds with the FY 2022 payment determination.

been updated to the 2015 Edition Cures Update to implement those changes while still meeting Hospital IQR Program requirements. We also noted that we will revisit this topic in future rulemaking as for further alignment with the ONC 21st Century Cures Act final rule. We sought public comment on our proposal.

We noted that, among other changes and of particular relevance to hospitals that participate in the Hospital IQR Program, the ONC 21st Century Cures Act final rule revises the clinical quality measurement criterion at § 170.315(c)(3) to refer to CMS QRDA Implementation Guides and removes the Health Level 7 (HL7®) QRDA standard requirements (85 FR 25645). Under the Hospital IQR Program, we previously encouraged health IT developers to test any updates on an annual basis, including any updates to the eCQMs and eCQM reporting requirements for the Hospital IQR Program, based on the CMS QRDA I Implementation Guide for Hospital Quality Reporting (CMS Implementation Guide for QRDA) (82 FR 38393). The CMS Implementation Guide for QRDA, program specific performance calculation guidance, and eCQM electronic specifications and guidance documents are available on the eCQI Resource Center website at <https://ecqi.healthit.gov/>. To be clear, the ONC 21st Century Cures Act final rule removes the HL7® QRDA standards from the relevant health IT certification criteria, which now refers directly to the CMS Implementation Guides for QRDA standards bringing their requirements into closer alignment with what we encourage under the Hospital IQR Program. Based on our data, the majority of Hospital IQR Program participants already use the CMS QRDA I Implementation Guide for Hospital Quality Reporting for submission of eCQMs to the Hospital IQR Program. We noted that we believe this update results in health IT developers no longer needing to maintain certification to the Health Level 7 (HL7®) QRDA base standards in addition to using the CMS QRDA I Implementation Guide for the Hospital IQR Reporting.

Since publication of the CY 2021 PFS proposed rule, in response to additional calls for increased flexibility in response to the PHE for COVID-19, on November 4th, 2020 ONC issued an interim final rule with comment entitled “Information Blocking and the ONC Health IT Certification Program: Extension of Compliance Dates and Timeframes in Response to the COVID-19 Public Health Emergency” (hereafter, “ONC interim final rule”) (85 FR 70066). In the ONC interim final rule,

ONC finalized extended compliance dates for certain 2015 Edition certification criteria. Specifically, where the ONC 21st Century Cures Act final rule provided that developers of certified health IT have 24 months from the publication date of the final rule to make technology certified to updated criteria available to their customers, ONC extended the timeline until December 31, 2022 (85 FR 70064). After that date, technology that has not been updated in accordance with the 2015 Edition Cures Update will no longer be considered certified.

The following is a summary of the comments we received and our responses.

Comment: Several commenters expressed support for our proposal to expand flexibility to allow hospitals to use either: (1) Technology certified to the 2015 Edition as was previously finalized in the FY 2019 IPPS/LTCH final rule (83 FR 41537 through 41608); or (2) certified technology updated consistent with the 2015 Edition Cures Update as finalized in the ONC 21st Century Cures Act final rule (85 FR 25642 through 25961) for the CY 2020 reporting period/FY 2022 payment determination and for subsequent years. A few commenters expressed their support and noted that CMS should consider the timeline for fully implementing the technology upgrades associated with the 2015 Edition Cures Update when considering requirements for future program years. One commenter noted their support for the required use of the CMS QRDA I Implementation Guide that will occur as a result of using the 2015 Edition Cures Update because it reduces burden on EHR developers.

Response: We agree that the standardization to use the QRDA I Implementation Guide will help in burden reduction for EHR developers. We will consider the timeline for fully implementing the technology upgrades associated with the 2015 Edition Cures Update when determining requirements for future program years. As noted above, in this final rule we are finalizing the proposed flexibility, which applies to all Hospital IQR Program measures, which use EHR data elements to calculate measure rates, including eCQMs and hybrid measures.

Comment: A few commenters did not support our proposal due to concerns with the timeline and effort for health IT developers to certify and for providers to adopt the changes associated with the 2015 Edition Cures Update. These commenters specifically expressed concern that aligning the deadline for providers to adopt

technology certified to the 2015 Edition Cures Update with the deadline for vendors to have this Edition available would not provide sufficient time for providers to adopt the newly available version. Some commenters noted that they require additional time beyond the vendor deadline to select and implement certified health IT, test the new technology, customize the health IT for their specific practices, and update workflows and train staff. The commenters urged CMS to extend the flexibility for using both technology certified to the current 2015 Edition and certified technology updated consistent with the 2015 Edition Cures Update as acceptable versions to be used for CMS reporting and incentive-based programs through CY 2023 or later.

Response: We emphasize that the proposal to allow hospitals to use either technology certified to the 2015 Edition or certified technology updated consistent with the 2015 Edition Cures Update beginning with the CY 2020 reporting period/FY 2022 payment determination allows for greater flexibility. We want to avoid penalizing providers participating in the Hospital IQR Program who wish to adopt the updated technology earlier than the mandated deadline for the ONC Health IT Certification Program finalized by ONC by ensuring the providers who adopt early are still in compliance with Hospital IQR Program data submission requirements. We clarify that, for the Hospital IQR Program, beginning with the CY 2020 reporting period/FY 2022 payment determination, using certified technology updated to the 2015 Edition Cures Update is an acceptable option, but so is use of technology certified to the 2015 Edition certification criteria. For those that cannot use certified technology updated to the 2015 Edition Cures Update, technology certified to the 2015 Edition continues to be acceptable.

We understand commenters' concerns related to the effort it will take for providers to customize their health IT for their specific practices and to potentially update workflows and train staff when adopting updated certified technology once it is made available by health IT developers; however, we expect the burden of updating these criteria for providers to be no greater than that already required to comply with CMS annual updates. We recommend readers review section III.M.2. of this final rule, and the ONC 21st Century Cures Act final rule (85 FR 25667) for greater understanding of the scope of these updates and how this scope was considered in establishing the timelines for developer update.

Furthermore, as noted above, since publication of the CY 2021 PFS proposed rule, in response to additional calls for increased flexibility in response to the PHE for COVID-19, on November 4, 2020 ONC issued an interim final rule with comment entitled “Information Blocking and the ONC Health IT Certification Program: Extension of Compliance Dates and Timeframes in Response to the COVID-19 Public Health Emergency” (hereafter, “ONC interim final rule”) (85 FR 70066). In the ONC interim final rule, ONC finalized extended compliance dates for certain 2015 Edition certification criteria. Specifically, where the ONC 21st Century Cures Act final rule provided that developers of certified health IT have 24 months from the publication date of the final rule to make technology certified to updated criteria available to their customers, ONC extended the timeline until December 31, 2022 (85 FR 70064).

Comment: One commenter noted that hospital and delivery systems are experiencing disruptions due to the PHE for COVID-19, which makes digital updates difficult during this time.

Response: We reiterate that our policy is intended to expand flexibility and avoid penalizing providers participating in the Hospital IQR Program who wish to adopt the updated technology earlier than the mandated deadline finalized by ONC by ensuring the providers who adopt early are still in compliance with Hospital IQR Program data submission requirements. We will accept data using either technology certified to the 2015 Edition criteria or certified technology updated consistent with the 2015 Edition Cures Update beginning with the CY2020 reporting period/FY 2022 payment determination.

In addition, if a hospital experiences an extraordinary circumstance that prevents it from reporting eCQMs they are able to submit an individual extraordinary circumstances exception (ECE) request under the Hospital IQR Program. Specifically, in the FY 2016 IPPS/LTCH PPS final rule, we finalized a policy, effective starting with the FY 2018 payment determination, to allow hospitals to utilize the existing ECE form (OMB control number 0938-1022 (expiration date December 31, 2022)) to request an exception to the Hospital IQR Program’s eCQM reporting requirement

for the applicable program year based on hardships preventing hospitals from electronically reporting (80 FR 49695, 49713). We stated that such hardships could include, but are not limited to, infrastructure challenges (hospitals must demonstrate that they are in an area without sufficient internet access or face insurmountable barriers to obtaining infrastructure) or unforeseen circumstances, such as vendor issues outside of the hospital’s control (including a vendor product losing certification (80 FR 49695, 49713)). We assess a hospital’s request on an individual basis to determine if an exception is merited (80 FR 49695, 49713). We also refer stakeholders to additional eCQM ECE resources on QualityNet.¹¹³ We also note that, in response to the PHE for COVID-19, ONC announced additional flexibility for health IT developers. Specifically, in the ONC interim final rule, ONC further extended the deadline for health IT developers to make technology certified to the updated criteria available to their customers until December 31, 2022 (85 FR 70064).

Comment: A few commenters noted that the August 2, 2022 deadline for making technology meeting new and updated certification criteria available occurs in the middle of a program year, and therefore, limits flexibility for providers, including those participating in the Hospital IQR Program. These commenters requested guidance regarding the relationship between the deadline and annual reporting requirements for various programs including the Hospital IQR Program.

Response: In the proposed rule we discussed ONC’s compliance date of August 2, 2022 for health IT developers to make updated certified health IT products available to their customers.¹¹⁴ However, as mentioned above, since publication of the CY 2021 PFS proposed rule, ONC issued an interim final rule, which extended the date for health IT developers to make technology certified to the updated criteria available to their customers until December 31st, 2022 (85 FR 70064). For the CY 2022 reporting period/FY 2024 payment determination, hospitals must

report the required number of quarters of eCQM data from the January 1, 2021 to December 31, 2022 reporting period, by 2 months following the close of the calendar year. (85 FR 58940). We refer readers to QualityNet.org for more information related to important dates and deadlines for the Hospital IQR Program.¹¹⁵ We believe the change finalized in the ONC interim final rule, which aligns the compliance date for updating certified health IT under the ONC Health IT Certification Program with the calendar year, addresses the commenters’ concern regarding misalignment with the annual reporting requirements for the Hospital IQR program.

After consideration of the public comments, we are finalizing our proposal as proposed.

N. Establishing New Code Categories

1. Background

Currently, there are four existing Level II HCPCS codes for buprenorphine/naloxone products (J0572–J0575), which describe groupings of products by different strengths as indicated on their FDA labels. When many payers assign a single payment rate to a single code, they typically do so under the expectation that the products can be substituted for one another in most clinical scenarios. As discussed in the CY 2021 PFS proposed rule (85 FR 50272), we have received feedback from stakeholders that there is variability in bioequivalence between the products within the range of strengths listed in each code descriptor, meaning that products within a current code are not necessarily substitutes for one another. Therefore, to facilitate more accurate coding and more specific reporting of the variety of buprenorphine/naloxone products on the market, we proposed an expanded series of codes to identify buprenorphine/naloxone products.

Specifically, we proposed to establish 15 new code categories for use to report all currently marketed buprenorphine/naloxone products, based on strength as well as therapeutic equivalence reflected in Table 43.

¹¹³ See <https://www.qualitynet.org/inpatient/measures/ecqm/participation#tab2>.

¹¹⁴ https://www.healthit.gov/cures/sites/default/files/cures/2020-04/Enforcement_Discretion.pdf.

¹¹⁵ QualityNet.org, Hospital IQR Program Participation. Available at <https://www.qualitynet.org/inpatient/iqr/participation>.

TABLE 43: Proposed New Code Categories

HCPCS	Description
JXXX1	Buprenorphine Hydrochloride; Naloxone Hydrochloride film; buccal, sublingual 2mg; 0.5mg
JXXX2	Buprenorphine Hydrochloride; Naloxone Hydrochloride film; buccal, sublingual 4mg; 1mg
JXXX3	Buprenorphine Hydrochloride; Naloxone Hydrochloride film; buccal, sublingual 8mg; 2mg
JXXX4	Buprenorphine Hydrochloride; Naloxone Hydrochloride film; buccal, sublingual 12mg; 3mg
JXXX5	Buprenorphine Hydrochloride; Naloxone Hydrochloride film; buccal 2.1mg; 0.3mg (Bunavail)
JXXX6	Buprenorphine Hydrochloride; Naloxone Hydrochloride film; buccal 4.2mg; 0.7mg (Bunavail)
JXXX7	Buprenorphine Hydrochloride; Naloxone Hydrochloride film; buccal 6.3mg; 1.0mg (Bunavail)
JXXX8	Buprenorphine Hydrochloride; Naloxone Hydrochloride tablet; sublingual 2mg; 0.5mg
JXXX9	Buprenorphine Hydrochloride; Naloxone Hydrochloride; tablet; sublingual 8mg; 2mg
JXX10	Buprenorphine Hydrochloride; Naloxone Hydrochloride tablet; sublingual; 0.7mg; 0.18mg (Zubsolv)
JXX11	Buprenorphine Hydrochloride; Naloxone Hydrochloride tablet; sublingual; 1.4mg; 0.36mg (Zubsolv)
JXX12	Buprenorphine Hydrochloride; Naloxone Hydrochloride tablet; sublingual; 2.9mg; 0.71mg (Zubsolv)
JXX13	Buprenorphine Hydrochloride; Naloxone Hydrochloride tablet; sublingual; 5.7mg; 1.4mg (Zubsolv)
JXX14	Buprenorphine Hydrochloride; Naloxone Hydrochloride tablet; sublingual; 8.6mg; 2.1mg (Zubsolv)
JXX15	Buprenorphine Hydrochloride; Naloxone Hydrochloride tablet; sublingual; 11.4mg; 2.9mg (Zubsolv)

As the existing 4 codes would be discontinued the existing codes in Table 44, replaced with more specific codes in the new code series, we also proposed to

TABLE 44: Codes CMS Proposed to Discontinue

HCPCS	Description
J0572	Buprenorphine/naloxone, oral, less than or equal to 3 mg buprenorphine
J0573	Buprenorphine/naloxone, oral, greater than 3 mg, but less than or equal to 6 mg buprenorphine
J0574	Buprenorphine/naloxone, oral, greater than 6 mg, but less than or equal to 10 mg buprenorphine
J0575	Buprenorphine/naloxone, oral, greater than 10 mg buprenorphine

The new code series would permit physicians and clinics to accurately bill insurers for the drug and dose utilized. For example, state Medicaid agencies would be able to more easily identify the drug dispensed, which would facilitate more efficient and accurate rebate invoicing for the Medicaid Drug Rebate Program. The expanded code series would also facilitate more specific and meaningful tracking of utilization of buprenorphine/naloxone products within and across their respective health insurance programs. We noted that these coding proposals would not change Medicare coverage or payment policies for oral or sublingual buprenorphine codes. The drug products described by these codes are

not separately payable under Medicare Part B.

We received the following comments on the proposal to establish new code categories.

Comment: Several commenters supported our proposal to establish new code categories.

Response: We appreciate the comments in support of establishing the new code categories.

Comment: A few commenters suggested retaining the existing four codes and recommended that we not establish new code categories, on the basis that the proposed, expanded list of codes may result in confusion and additional work on the part of providers.

Response: We appreciate the comment in support of retaining the existing code categories and not establishing new code categories. As discussed below, in order to further consider the effects of an expanded code series, we have decided not to finalize our proposals at this time.

As a result of our review of the comments, some in favor of more granular coding and some in favor of less granular coding, we would like to further consider the appropriate level of coding granularity for buprenorphine/naloxone products. Thus, we have decided not to finalize our proposal to establish the 15 new code categories set forth in Table 43 or our proposal to discontinue the existing four HCPCS

codes (J0572, J0573, J0574 and J0575) listed in Table 44 at this time. The existing four codes in Table 44 will remain in effect on January 1, 2021.

O. Medicare Diabetes Prevention Program (MDPP)

In the CY 2021 PFS proposed rule (85 FR 50074), we proposed to amend our regulation at § 410.79(e) to describe the policies that will apply during certain emergencies (Emergency Policy). In addition, we proposed to amend § 424.210 to modify the definition of “beneficiary engagement period” and to address beneficiary engagement incentives that are furnished to MDPP beneficiaries who are receiving MDPP services virtually pursuant to the Emergency Policy.

1. Revisions to § 410.79(b)

We proposed to amend the Medicare Diabetes Prevention Program (MDPP) expanded model to revise certain MDPP policies adopted in the March 31st COVID–19 IFC (85 FR 19230) that would apply during the remainder of the PHE for COVID–19 and/or any future emergency period, and in an emergency area, as such terms are defined in section 1135(g) of the Act, where the Secretary has authorized section 1135 waivers for such emergency area and period (hereinafter referred to as an “1135 waiver event”) where such 1135 waiver event may cause a disruption to in-person MDPP services (hereinafter referred to as an “applicable 1135 waiver event”). We proposed that we would determine that an 1135 waiver event could disrupt in-person MDPP services if MDPP suppliers would likely be unable to conduct classes in-person, or MDPP beneficiaries would likely be unable to attend in-person classes, for reasons related to health, safety, or site availability or suitability. Health and safety reasons may include avoiding the transmission of contagious diseases, compliance with laws and regulations during an 1135 waiver event, or the physical safety of MDPP beneficiaries or MDPP coaches during an 1135 waiver event. We proposed that if we determine that an 1135 waiver event may disrupt in-person MDPP services, we would notify all impacted MDPP suppliers via email and other means as appropriate. Such notice would include the effective date when flexibilities described in § 410.79(e) would be available. We proposed that the applicable 1135 waiver event would end on the earlier of the end of the emergency period (as defined in section 1135(g) of the Act) or the date we determine that the 1135 waiver event no longer disrupts in-

person MDPP services under the proposed standard described above.

We temporarily amended the MDPP expanded model to revise certain MDPP policies in the March 31st COVID–19 IFC. These changes apply only during the PHE for COVID–19. The March 31st COVID–19 IFC permits certain beneficiaries to obtain the set of MDPP services more than once per lifetime, waives the 5 percent weight loss eligibility requirements, and allows certain MDPP suppliers to either suspend the delivery of services or deliver virtual MDPP sessions on a temporary basis. We believe that establishing an Emergency Policy that applies more broadly will improve the current flexibilities for the remainder of the PHE for COVID–19 and provide MDPP suppliers and MDPP beneficiaries with flexibilities to address any future applicable 1135 waiver events.

The changes proposed in the CY 2021 PFS proposed rule would preserve the March 31st COVID–19 IFC MDPP flexibilities and apply them to future section 1135 waiver events, provide for additional flexibilities that would apply during the PHE for COVID–19 and future 1135 waiver events, clarify certain policies adopted in the IFC, and prospectively end a flexibility that would become unnecessary in light of our other proposals. We stated that the proposed flexibilities, if finalized, would supersede the flexibilities adopted in the March 31st COVID–19 IFC for the PHE for COVID–19. Thus, the proposed changes would be available for the remainder of the PHE for COVID–19 and for all future applicable 1135 waiver events, effective January 1, 2021.

We proposed these changes to address MDPP supplier and MDPP beneficiary needs in response to the PHE for COVID–19 and any future 1135 waiver events that result in an interruption to expanded model services delivered by MDPP suppliers and preventing MDPP beneficiaries from attending in-person sessions. Throughout the original rulemaking for the MDPP expanded model, we sought to ensure that the set of MDPP services would be delivered in-person, in a classroom-based setting, within an established timeline. During that rulemaking, CMS prioritized establishing a structured service that, when delivered within the confines of the rule, would create the least risk of fraud and abuse, increase the likelihood of success for beneficiaries, and maintain the integrity of the data collected for evaluation purposes. Based on lessons learned during the PHE for COVID–19, we proposed to allow

temporary flexibilities that prioritize availability and continuity of services for MDPP suppliers and beneficiaries affected by extreme and uncontrollable circumstances that CMS determines may disrupt in-person MDPP services during an applicable 1135 waiver event using the standard articulated above. The overall intent of the proposed Emergency Policy is to minimize disruption of services for MDPP suppliers and beneficiaries.

The proposed flexibilities would be applicable to MDPP beneficiaries and MDPP suppliers (as such terms are defined in § 410.79(b)) as described herein. Our Emergency Policy does not permit an MDPP supplier to furnish MDPP services virtually during the PHE for COVID–19 or an applicable 1135 waiver event unless the MDPP supplier’s preliminary or full CDC Diabetes Prevention Recognition Program (DPRP) recognition authorizes the supplier to furnish services in-person. The MDPP supplier requirements at § 424.205 set forth parameters for suppliers to enroll in Medicare, including having any preliminary recognition established by the CDC for the purposes of the DPRP or full CDC DPRP recognition. The DPRP refers to a program administered by the CDC that recognizes organizations that are able to furnish the National Diabetes Prevention Program (National DPP) services, follows a CDC-approved curriculum, and meets CDC’s performance standards and reporting requirements. The CDC assigns to each DPRP-recognized supplier an organizational code that specifies the service delivery mode (for example, in-person, online, distance learning, or combination). Because MDPP services are covered under Medicare only when they are furnished at least in part in-person, a supplier that does not have an organizational code authorizing in-person services (“virtual-only suppliers”) may not provide MDPP services, either virtually or in-person. We do not believe it is appropriate to permit virtual-only suppliers to furnish MDPP services when the proposed Emergency Policy is in effect. This is because MDPP suppliers must remain prepared to resume delivery of MDPP services in-person to start new cohorts and to serve beneficiaries who wish to return to in-person services when the proposed Emergency Policy is no longer in effect. Given the difficulty of predicting when the PHE for COVID–19 or any applicable 1135 waiver event will end, virtual-only suppliers may not have sufficient time to obtain the CDC’s authorization to furnish in-person

services. Permitting virtual-only suppliers to furnish MDPP services during the PHE for COVID-19 or an applicable 1135 waiver event could disrupt the provision of services to MDPP beneficiaries when services resume on an in-person basis. Virtual only suppliers are not permitted to provide the set of MDPP services because MDPP beneficiaries may elect to return to in-person services after the PHE for COVID-19 or other applicable 1135 waiver event ends, and MDPP suppliers need to be able to accommodate their request. In addition, we are still requiring the MDPP suppliers to resume furnishing in-person the set of MDPP services after the applicable 1135 waiver event.

We proposed to amend the MDPP regulations to provide for certain changes, including allowing MDPP suppliers to start new cohorts during the remainder of the PHE for COVID-19 or a future applicable 1135 waiver event and allowing MDPP suppliers to either deliver MDPP services virtually, or suspend in-person services and resume services at a later date during an applicable 1135 waiver event. The proposed changes would permit certain MDPP beneficiaries to obtain the set of MDPP services more than once per lifetime, for the limited purposes of allowing a suspension in service due to an applicable 1135 waiver event and to provide the flexibilities that will allow MDPP beneficiaries to maintain eligibility for MDPP services despite a break in attendance.

In the March 31st COVID-19 IFC, we stated that we would allow MDPP suppliers to either deliver MDPP services virtually or suspend in-person services and resume services at a later date. In addition, we also provided in the March 31st COVID-19 IFC that the once per lifetime requirement waiver is only applicable to MDPP beneficiaries whose sessions were suspended or cancelled due to the PHE for COVID-19 (that is, MDPP beneficiaries who were receiving the set of MDPP services as of March 1, 2020). However, we do not believe it is necessary to permit all MDPP beneficiaries to restart the set of MDPP services in all applicable 1135 waiver events. Therefore, we proposed that MDPP beneficiaries who elect to receive MDPP services virtually in accordance with the MDPP Emergency Policy are not eligible to restart the set of MDPP services at a later date. As proposed, the policy would ensure that MDPP beneficiaries who continue to receive the set of MDPP services virtually during an applicable 1135 waiver event cannot repeat the set of MDPP services at a later date, in

accordance with the general once per lifetime limitation for the set of MDPP services established in § 410.79(c)(1)(i)(B).

We proposed the following approach for permitting MDPP beneficiaries to resume or restart the set of MDPP services in the event in-person sessions are suspended, and the MDPP beneficiary does not elect to receive MDPP services virtually. MDPP beneficiaries who are in the first 12 months of the set of MDPP services as of the start of an applicable 1135 waiver event would be eligible to restart the set of MDPP services at the beginning, or resume with the most recent attendance session of record, after the applicable 1135 waiver event has ended. Beneficiaries who are in the second year of the set of MDPP services as of the start of an applicable 1135 waiver event would be eligible to restart the ongoing maintenance session interval in which they were participating at the start of the applicable 1135 waiver event or would be permitted to resume with the most recent attendance session of record. MDPP beneficiaries who are in the second year of the set of MDPP services would not be allowed to restart the set of MDPP services at the beginning.

We noted that we do not believe allowing MDPP beneficiaries who are already in the ongoing maintenance phase of MDPP to restart from the beginning aligns with the performance-based payment strategy upon which the expanded model relies to achieve savings. MDPP suppliers with beneficiaries who have successfully completed over half of the set of MDPP services have already benefited from the bulk of the permitted total performance-based payments. Allowing MDPP beneficiaries in the ongoing maintenance interval phase to restart the expanded model would result in an MDPP supplier being reimbursed for close to double the intended payment amount. Not only might this have a negative impact on the long term expanded model savings, this could result in beneficiaries being unfairly coerced into electing to start over instead of resuming the set of MDPP services where they left off. The proposal would apply prospectively only. Under the current MDPP regulations, as amended in the March 31st COVID-19 IFC, we waived the once per lifetime requirement for MDPP beneficiaries who were receiving the set of MDPP services as of March 1, 2020 and whose sessions were suspended or canceled due to the PHE for COVID-19 to obtain the set of MDPP services more than once per lifetime by electing to restart the set of MDPP services or

resume with the most recent attendance session of record. We proposed to retain that flexibility for those MDPP beneficiaries who were receiving the set of MDPP services as of March 1, 2020 (and as discussed in greater detail below, are modifying this flexibility to apply to MDPP beneficiaries who were receiving the set of MDPP services as of March 31, 2020). Finally, we proposed that beneficiaries who elect to suspend the set of MDPP services at the start of an applicable 1135 waiver event and subsequently choose to restart the MDPP set of services at the beginning or to resume with the most recent attendance session of record, may only make such an election once per applicable 1135 waiver event. The proposed policy was intended to ensure that MDPP beneficiaries may not suspend and re-start the MDPP set of services multiple times during the same applicable 1135 waiver event, which would be contrary to the overall goal of the MDPP Emergency Policy, and to the goals of the MDPP expanded model as a whole.

We proposed that the limit placed on the number of virtual make-up sessions described at § 410.79 would not apply during the remainder of the PHE for COVID-19 or during any future applicable 1135 waiver event, so long as the virtual services are furnished in a manner that is consistent with the CDC DPRP standards for virtual sessions, follow the CDC-approved National DPP curriculum requirements, and the supplier has an in-person DPRP organizational code.

We proposed to amend the regulations to clarify that all sessions, including the first core session, may be offered virtually, not as “virtual make-up sessions,” but as a virtual class consistent with the in-person class curriculum, during the remainder of the PHE for COVID-19 and any future applicable 1135 waiver event. The MDPP supplier could still only furnish a maximum of one session on the same day as a regularly scheduled session and a maximum of one virtual make-up session per week to the MDPP beneficiary. We proposed that virtual sessions may be furnished to achieve both attendance goals and achieve weight-loss goals in the event that a qualifying weight measurement was obtained by one of the methods described herein. We proposed that an MDPP supplier may offer to an MDPP beneficiary: 16 virtual sessions offered weekly during the core session period; 6 virtual sessions offered monthly during the core maintenance session interval periods; and 12 virtual sessions offered monthly during the ongoing

maintenance session interval periods. MDPP suppliers may only furnish a maximum of one regularly scheduled session virtually and a maximum of one virtual make-up session per week to an MDPP beneficiary. As proposed, the number of allowable virtual core sessions would increase from 15 to 16. This change is due to the added proposed flexibility to allow MDPP suppliers to obtain weight measurements remotely (as described below) and to deliver the first core session virtually.

Under these temporary flexibilities, we proposed that the requirement for in-person attendance at the first core-session would not apply. We proposed that during the remainder of the PHE for COVID-19 and any future applicable 1135 waiver events, MDPP suppliers may obtain weight measurements from MDPP beneficiaries through the following methods: (1) In-person, when the weight measurement can be obtained safely and in compliance with all applicable laws and regulations; (2) via digital technology, such as scales that transmit weights securely via wireless or cellular transmission (commonly referred to as “Bluetooth™ enabled”); or (3) self-reported weight measurements from a participant’s own at-home digital scale. We proposed that self-reported weights must be submitted via video, by the MDPP beneficiary to the MDPP supplier. The video must clearly document the weight of the MDPP beneficiary as it appears on his/her digital scale on the date associated with the billable MDPP session. Due to this additional flexibility, we proposed that the waiver of the minimum weight loss requirements for beneficiary eligibility in the ongoing maintenance session intervals described in § 410.79(e)(3)(iv) of the March 31st COVID-19 IFC (85 FR 19230) be ended. Thus, effective January 1, 2021, all MDPP beneficiaries would be required to achieve and maintain the required 5 percent weight loss goal in order to be eligible for the ongoing maintenance sessions, even if the PHE for COVID-19 remains in place as of that date.

We proposed to amend § 410.79(e). We sought comment on these proposals. We received public comments on the proposed changes to § 410.79(b). The following is a summary of the comments we received and our responses.

Comment: Several commenters requested clarification regarding whether beneficiaries are required to use digital scales to collect their body weights at home. Commenters expressed concern that some participants in MDPP would be unable to document their weight because they do not have either

digital scales or smart phones to capture a photograph or video of their weight on a digital scale. For example, several commenters indicated that requiring beneficiaries to capture their weights via a digital scale by video, and then sending the video in a HIPAA-compliant manner to their MDPP supplier, may prove too burdensome for patients and create additional barriers to MDPP participation. Furthermore, commenters stated that MDPP beneficiaries may have limited access or ability to use the technology required to meet this method of reporting. These commenters contended that if beneficiaries are unable to present in-person for their MDPP sessions or secure digital transmissions of their weights, this could limit them from meeting the eligibility requirements to participate. Several commenters requested that we consider other options of self-reporting such as allowing patients to take their weight at home on the date of the MDPP session and report via a telehealth visit, via a phone call to the MDPP supplier, or securely communicate the weight measurement thru the Electronic Health Record secure messaging portal.

Response: We agree with the commenters that some beneficiaries may lack access to scales and phones with photograph or video capabilities. We proposed additional methods by which MDPP suppliers may obtain weight measurements from beneficiaries and allowing MDPP suppliers to obtain weight measurement from MDPP beneficiaries either in-person or via the use of technology, such as a Bluetooth-enabled scale or self-reported weight measurements using the MDPP beneficiary’s digital scale and video technology.

After considering these comments, we are modifying the proposed § 410.79(e)(3)(iii)(C) to allow MDPP suppliers to accept self-reported MDPP beneficiary weight measurements via a photograph of their digital scale. In addition, § 424.210 allows MDPP suppliers to furnish MDPP beneficiaries with certain engagement incentives, including technological tools such as Bluetooth-enabled scales that support the goals of the expanded model and satisfy other conditions. We believe these options allow for MDPP beneficiaries with varying resources and comfort with technology to have their weight measured, and to participate in virtual MDPP services, in most circumstances. We also note that virtual participation in MDPP during an applicable 1135 event is voluntary. Beneficiaries may suspend and restart the set of MDPP services at a later date

consistent with the policies we are adopting in this rule.

Comment: Multiple commenters urged CMS to add the MDPP set of services to the Medicare telehealth list, either temporarily during the PHE for COVID-19 or permanently. Commenters stated that access to telehealth services is critical beyond the PHE for COVID-19, as it helps address barriers such as program delivery in rural areas and transportation issues. Commenters stated that research shows that Medicare beneficiaries with prediabetes are at high risk for many chronic and comorbid conditions, including COVID-19. These commenters stated that many beneficiaries will not participate in in-person prediabetes prevention programs during the PHE due to social distancing rules or stay-at-home directives. The commenters noted that access for Medicare beneficiaries to telehealth MDPP services are essential during this PHE for access to MDPP services that can increase and maintain healthy lifestyles to prevent diabetes and comorbidities.

Similarly, other commenters urged CMS to increase access to virtual MDPP generally, or to make the flexibilities finalized in the March 31st COVID-19 IFC or in this rule applicable to circumstances outside of the PHE for COVID-19 or an applicable 1135 waiver event. One commenter states that, given the length of the current public health emergency, it is likely that additional data on satisfaction and efficacy of virtual DPP options will soon be available. Another commenter urged CMS to undertake a renewed actuarial analysis of virtual MDPP. This commenter also encouraged CMS to permit Medicare Advantage (MA) plans to use virtual MDPP encounters, in addition to in-person MDPP encounters, and to permit virtual DPP programs to register as Medicare suppliers in order to meet network adequacy requirements and satisfy the requirement to provide MDPP services.

Response: We appreciate the interest in adding the set of MDPP services to the Medicare telehealth list and allowing access to virtual MDPP outside the PHE for COVID-19 or other applicable 1135 waiver event. Inclusion of MDPP services on the Medicare telehealth list is not appropriate because virtual MDPP services do not qualify as telehealth services. The provisions we are finalizing in this rule are intended to ensure that beneficiaries participating in the set of MDPP services during the PHE for COVID-19 or any future applicable 1135 waiver event can maintain consistent access to care via virtual delivery of services with

minimal disruption throughout their entire set of MDPP services. The MDPP expanded model was actuarially certified for primarily in-person delivery. We are not allowing additional virtual delivery of the set of MDPP services beyond the Emergency Policy described in this final rule. We continue to explore options for making virtual MDPP services more widely available.

Comment: In general, commenters agreed that the final rule should permit MDPP beneficiaries to continue to participate in MDPP virtually during applicable 1135 waiver events. Other commenters indicated that beneficiaries should have a choice between receiving MDPP services virtually and waiting for in-person sessions to resume. In addition, beneficiaries who initially elect to receive MDPP services virtually, but later determine that virtual services do not work for them (for example, due to technological challenges, if the MDPP supplier is unable to offer a high quality program virtually, or if virtual services are not an effective tool for the beneficiary), or unforeseeable circumstances occur that do not allow them to continue or be successful virtually, they should have the option to suspend services at that time and resume in-person sessions at a later date.

Response: We agree with the suggestions made in this comment and are modifying our policy regarding the election of virtual services and its impact on the once-per-lifetime benefit for those beneficiaries receiving the MDPP set of services on or after January

1, 2021 during an applicable 1135 event or PHE. The final rule includes modifications that support the provision of virtual MDPP services and permit new cohorts to start. We are modifying our policy in this rule to allow MDPP beneficiaries participating in the set of MDPP services during the PHE for COVID-19 or any future applicable 1135 waiver event to continue receiving the set of MDPP services virtually even after the PHE for COVID-19 or other applicable 1135 waiver event ends. Please note that MDPP beneficiaries who opt to continue to receive the set of MDPP services virtually during an applicable 1135 waiver event cannot repeat the set of MDPP services at a later date, in accordance with the general once per lifetime limitation for the set of MDPP services established in § 410.79(c)(1)(i)(B). However, MDPP beneficiaries may decide to suspend virtual MDPP services and later resume the set of in-person MDPP services with the most recent attendance session of record once in-person services are available.

In addition, this rule allows certain beneficiaries to restart the set of MDPP services at the beginning. MDPP beneficiaries who are in the first 12 months of the set of MDPP services as of the start of an applicable 1135 waiver event are eligible to restart the set of MDPP services at the beginning, or resume with the most recent attendance session of record, after the applicable 1135 waiver event has ended. MDPP beneficiaries who are in the second year of the set of MDPP services as of the

start of the applicable 1135 waiver event, are only permitted to restart the ongoing maintenance session interval in which they were participating at the start of the applicable 1135 waiver event or resume the set of MDPP services at the most recent attendance session of record. MDPP beneficiaries who are in the second year of the set of MDPP services are not allowed to restart the set of MDPP services at the beginning.

In the March 31st COVID-19 IFC, we waived the once per lifetime requirement for MDPP beneficiaries who were receiving the set of MDPP services as of March 1st, 2020 (changed in this rule to March 31st, 2020) and whose sessions were suspended or canceled due to the PHE for COVID-19. These MDPP beneficiaries may obtain the set of MDPP services more than once per lifetime by electing to restart the set of MDPP services. Alternatively, these MDPP beneficiaries can resume with the most recent attendance session of record, in which case they would not be eligible to restart thereafter. Finally, MDPP beneficiaries who suspend the set of MDPP services at the start of an applicable 1135 waiver event (or after virtual services have started) and subsequently choose to restart the MDPP set of services (to the extent they are eligible to do so) or resume with the most recent attendance session of record, may only make such an election once per applicable 1135 waiver event. Table B-N 45 summarizes the beneficiary options during an applicable 1135 waiver event.

BILLING CODE 4120-01-P

TABLE 45: Summary of MDPP Beneficiary Options during an Applicable 1135 Waiver Event

Beneficiary MDPP Status	Supplier Response to 1135 Waiver Event	During 1135 Waiver Event	1135 Waiver event ends and in-person services resume
Beneficiary is in first 12 months of MDPP set of Services when 1135 waiver event begins	Supplier Suspends MDPP set of services during 1135 waiver event	N/A	<p>Option 1: Beneficiary may restart MDPP set of services at the first core session</p> <p>OR</p> <p>Option 2: Beneficiary may resume the set of MDPP services with the most recent attendance session of record</p>
Beneficiary is in first 12 months of MDPP set of Services when 1135 waiver event begins	Supplier switches to virtual delivery of MDPP during 1135 waiver event	<p>Beneficiary opts to switch to the virtual MDPP set of services .</p> <p>Once virtual services have started, the beneficiary may suspend MDPP services at any time.</p>	<p>Option 1: Beneficiary may continue receiving services virtually until the conclusion of their services</p> <p>OR</p> <p>Option 2: Beneficiary may resume the set of in-person services with the most recent attendance session of record.</p> <p>If beneficiary received any part of the MDPP set of services virtually during an applicable 1135 waiver event, s/he cannot restart the set of MDPP services.</p>
Beneficiary is in first 12 months of MDPP set of Services when 1135 waiver event begins	Supplier switches to virtual delivery of MDPP during 1135 waiver event	Beneficiary opts to suspend in-person MDPP set of services and does not switch to the virtual MDPP set of services.	<p>Option 1: Beneficiary may restart in-person MDPP set of services at the first core session</p> <p>OR</p> <p>Option 2: Beneficiary may resume the set of in-person MDPP services with the most recent attendance session of record</p>
Beneficiary is in 2 nd Year of MDPP set of Services when 1135 waiver event begins	Supplier suspends MDPP set of services during 1135 waiver event	N/A	<p>Option 1: Beneficiary may resume the set of MDPP services with the most recent attendance session of record.</p> <p>OR</p> <p>Option 2: Beneficiary may restart the set of MDPP services at the ongoing maintenance interval in which s/he was participating at the start of the applicable 1135 waiver event.</p>

Beneficiary MDPP Status	Supplier Response to 1135 Waiver Event	During 1135 Waiver Event	1135 Waiver event ends and in-person services resume
Beneficiary is in 2 nd Year of MDPP set of Services when 1135 waiver event begins	Supplier switches to virtual delivery of MDPP during 1135 waiver event	Beneficiary opts to switch to the virtual MDPP set of services. Once virtual services have started, the beneficiary may suspend virtual MDPP services at any time.	<p>Option 1: Beneficiary may continue receiving services virtually until the conclusion of their services.</p> <p>OR</p> <p>Option 2: Beneficiary may resume the set of in-person services with the most recent attendance session of record.</p> <p>If the beneficiary received any part of the MDPP set of services virtually during an applicable 1135 waiver event, s/he cannot restart the set of MDPP services at the ongoing maintenance interval in which s/he was participating at the start of the applicable 1135 waiver event.</p>
Beneficiary is in 2 nd Year of MDPP set of Services when 1135 waiver event begins	Supplier switches to virtual delivery of MDPP during 1135 waiver event	Beneficiary opts to suspend in-person MDPP set of services and does not switch to virtual MDPP services.	<p>Option 1: Beneficiary may resume the set of MDPP services with the most recent attendance session of record.</p> <p>OR</p> <p>Option 2: Beneficiary may restart the set of MDPP services at the ongoing maintenance interval in which s/he was participating at the start of the applicable 1135 waiver event.</p>
Beneficiary starts MDPP set of Services during an 1135 Waiver Event	Supplier offers to start new cohorts using virtual delivery of MDPP during 1135 waiver event	Beneficiary enrolls in MDPP and receives virtual delivery of MDPP services. Once virtual services have started, the beneficiary may suspend virtual MDPP services at any time.	<p>Option 1: Beneficiary may continue receiving services virtually until the conclusion of their services.</p> <p>OR</p> <p>Option 2: Beneficiary may resume the set of in-person services with the most recent attendance session of record.</p> <p>If beneficiary received any part of the MDPP set of services virtually during an applicable 1135 waiver event, s/he cannot restart the set of MDPP services.</p>

a weight measurement for MDPP beneficiaries in the cohort can be obtained during the first core session. We proposed additional methods by which MDPP suppliers may obtain weight measurements from MDPP beneficiaries by allowing MDPP suppliers to obtain weight measurement from MDPP beneficiaries either in-person or via the use of technology, such as a Bluetooth-enabled scale or self-reported weight measurements using the MDPP beneficiary's digital scale and photograph or video technology.

Finally, taking into account comments concerning beneficiaries' access to scales that transmit weights securely via wireless or cellular transmission (commonly referred to as "Bluetooth™ enabled" or phones with video capabilities we are modifying proposed § 410.79(e)(3)(iii)(C) to allow MDPP suppliers to accept self-reported MDPP beneficiary weight measurements via a photograph with time stamp of their digital scale. When appropriate, in accordance with the §§ 414.84 and 410.79, MDPP suppliers may use the weight measurements obtained through any of the methods outlined in § 410.79(e)(3)(iii)(C) to submit claims to CMS for reimbursement for the first core session and any weight-loss based performance goals achieved during the set of MDPP services. Collectively, the flexibilities permitted during the PHE for COVID-19 or other applicable 1135 waiver events will allow beneficiaries with options to access the set of MDPP services in a manner that best suits their particular circumstances.

Comment: Several commenters supported our proposal to allow MDPP suppliers the option to deliver sessions virtually, or to suspend in-person services and resume in-person services at a later date. These commenters also supported the proposal that the limit placed on the number of virtual make-up sessions would not apply during the remainder of the PHE for COVID-19 or during any future applicable 1135 waiver events, and the proposed waiver of the once per lifetime limit that is applicable during the PHE for COVID-19 or an applicable 1135 waiver event. Multiple commenters urged CMS to remove the once-per-lifetime limit for MDPP services altogether and the 5 percent weight loss requirement for the ongoing maintenance period in Year 2. One commenter opposed ending the waiver of the minimum weight loss requirement for the ongoing maintenance sessions during applicable 1135 waiver events. They indicated that more individuals are struggling with weight loss/maintenance for many

reasons. For example, many are not able to attend gyms or engage in other physical activity that puts them at risk for infection. These commenters stated that during the PHE for COVID-19, beneficiaries may not have the transportation options to travel to areas with healthy food options. One commenter encouraged CMS to continue this flexibility until July 2021 at a minimum to account for the next wave of the virus, combined with uncertainty in our economy, reopening, and the availability of a vaccine. Another commenter expressed concern about the ongoing health disparities during the PHE for COVID-19 in relation to a beneficiary's ability to meet the 5 percent weight loss requirement, referencing stress and anxiety that may have significant effects on weight loss. Another commenter advocated that the final rule not require beneficiaries to meet eligibility requirements for MDPP services again, regardless of whether they restart at the beginning or resume with the most recent attendance session of record. For an example, if a beneficiary lost weight or reduced their A1C or blood glucose value from MDPP class participation prior to the PHE, then under the proposed rule, they might not be eligible to restart MDPP when the PHE ends because they no longer meet the eligibility requirements.

Response: The provisions we are finalizing in this rule are intended to ensure that MDPP services can continue to be delivered during the remainder of the PHE for COVID-19 and any future applicable 1135 waiver events. We agree that the PHE for COVID-19 presents unique challenges to beneficiaries in terms of meeting and maintaining a 5 percent weight loss. However, the provisions we are finalizing in this rule permit virtual delivery of services, the virtual collection of body weight measurements, and provide access to appropriate beneficiary incentives, which collectively provide sufficient flexibilities to give MDPP beneficiaries the skills to successfully achieve the 5 percent weight loss goal. MDPP beneficiaries receiving the set of MDPP services prior to January 1, 2021 will not need to meet the 5 percent weight loss goal to resume the set of MDPP services with the most recent attendance session of record or to continue into the second year of set of MDPP services. Beneficiary eligibility will not be impacted by any changes to the beneficiary's body mass index (BMI) or reduction in hemoglobin A1c, fasting plasma glucose, or 2-hour plasma glucose test values achieved during the set of MDPP services or the intervening

time in which a beneficiary has suspended the set of MDPP services. Beneficiaries who elect to suspend MDPP services may restart or resume services as described in the rule. Beneficiaries are eligible to restart or resume services regardless of their weight measurement or glucose level as of the date on which they elect to restart or resume services. Beneficiaries are encouraged to continue practicing the skills they have learned in the set of MDPP services to maintain a healthy lifestyle until they can restart or resume services.

Effective January 1, 2021, the 5 percent weight loss eligibility waiver described in § 410.14(g)(3)(iv) will end for MDPP beneficiaries starting after this date. However, the 5 percent weight loss eligibility waiver will remain in effect for MDPP beneficiaries who were receiving the set of MDPP services prior to January 1, 2021. MDPP beneficiaries who were receiving MDPP services prior to January 1, 2021 are not required to meet or maintain a 5 percent weight loss to maintain eligibility for the ongoing maintenance year and may resume or restart services without meeting the 5 percent weight loss requirement.

However, MDPP beneficiaries who start the set of MDPP services on or after January 1, 2021 will be required to meet and maintain the 5 percent weight loss goal to be eligible for the ongoing maintenance year described in § 410.79(c)(1)(ii)(B) and (c)(1)(iii)(B). The waiver of the requirement for beneficiaries to achieve 5 percent weight loss was intended to be a temporary flexibility to account for various state and local lock-down orders that prevented MDPP suppliers from obtaining weight measurements from beneficiaries to verify eligibility. The flexibilities we are finalizing in this final rule establish new remote and virtual methods for obtaining weight measurements. As such, the waiver of the 5 percent weight loss requirement is no longer necessary for the administration of the MDPP set of services. We are finalizing this policy as proposed.

When submitting claims to CMS for MDPP services, MDPP suppliers should use the following weight measurements as the baseline weight for purposes of determining all weight-loss achievements: For an MDPP beneficiary who began receiving the set of MDPP services before March 31, 2020, has suspended services during an applicable 1135 waiver event, and then elects to restart the set of MDPP services at the first core session, the MDPP supplier must record a new baseline weight on the date of first core session that restarts

the set of MDPP services. For an MDPP beneficiary who began receiving the set of MDPP services on or after January 1, 2021, has suspended services during an applicable 1135 waiver event, and then resumes the set of MDPP services either as the most recent attendance session of record or during the ongoing maintenance session interval in which they were participating at the start of the applicable 1135 waiver event, the MDPP supplier must use the baseline weight recorded at the beneficiary's first core session. For MDPP beneficiaries who were receiving MDPP services prior to January 1, 2021, as noted previously, the waiver of the 5 percent weight loss requirement still applies, so MDPP suppliers should submit a claim during each interval of the ongoing maintenance sessions in which the beneficiary has attended two sessions using the "Attend 2 sessions (with at least 5% WL)" HCPCS/G-codes.

Comment: One commenter stated that CMS' proposed policy of not allowing beneficiaries who elect to receive MDPP services virtually to restart the set of MDPP services at a later date is too restrictive. The commenter stated that this provision will contribute to health disparities because not all beneficiaries will be able to engage successfully in virtual MDPP sessions, such as issues with technology or internet connections. The commenter requested more flexibility in this policy and recommended that CMS allow beneficiaries who elect to receive MDPP services virtually retain eligibility to participate in in-person MDPP services after the end of the PHE for COVID-19 or applicable 1135 waiver event. The commenter also requested that CMS provide the opportunity to change an election if an applicable 1135 waiver event extends beyond a certain length (for example, greater than 6 months). Another commenter stated that there are many scenarios where an MDPP beneficiary would elect to receive virtual services but due to unforeseen circumstances those virtual session were not of a quality to impart the benefit of MDPP (for example, issues with technology, smart phone/computer availability, bandwidth). The commenter indicated many accounts from MDPP suppliers working in the field about in-person sessions that were moved to virtual sessions; some MDPP beneficiaries "stuck with it" while the barriers were too much for others and they had to drop out.

Response: We agree that prohibiting beneficiaries who elect to receive MDPP services virtually to restart the set of MDPP services at a later date is too restrictive. As such, we are amending

our policy to allow MDPP beneficiaries receiving the MDPP set of services virtually, to suspend MDPP services and later resume the set of in-person MDPP services with the most recent attendance session of record once in-person services are available. However, we note that MDPP beneficiaries who opt to receive the set of MDPP services virtually during an applicable 1135 waiver event cannot repeat the set of MDPP services at a later date, in accordance with the general once per lifetime limitation for the set of MDPP services established in § 410.79(c)(1)(i)(B).

Comment: One commenter supported our proposal to allow MDPP suppliers to suspend in-person delivery of the set of MDPP services as necessary and resume upon the effective end date of the applicable 1135 waiver event or the date that CMS determines the 1135 waiver event no longer disrupts in-person MDPP services. The commenter requested additional flexibilities to accommodate a PHE or 1135 waiver event that may affect different populations of individuals, states or regions in different ways, with different timelines. The commenter stated that when CMS makes such a determination, the consequences may not only be different across regions/communities but may affect beneficiaries at both the cohort and individual level. The commenter expressed concern that CMS's decision could be arbitrary as it applies to a specific community. For example, if an MDPP beneficiary completes two virtual sessions but then may be required to return to in-person sessions before it is safe to do so in their area. The commenter recommended that CMS allow MDPP beneficiaries engaged in a virtual cohort of MDPP beneficiaries to continue virtual sessions until the end of the cohort, and not mandate a return to in-person MDPP services for cohorts in progress. The commenter also requested more clarification of how CMS will determine an applicable 1135 waiver event no longer disrupts in-person MDPP services. Another commenter requested a grace period to allow time for MDPP suppliers to transition back into providing in-person services.

Response: We agree that the impact of an applicable 1135 waiver event on in-person MDPP services can vary by population and locations. We disagree that decisions regarding the timeline to return to in-person services would be an arbitrary decision made by CMS. The emergency period is defined in section 1135(g) of the Act and in general, the emergency period for an 1135 waiver event lasts until the affected geographic

area is substantially recovered from the event. In response to these comments, we are making one modification to the proposed provisions outlined in the proposed rule to address the concerns about the return to in-person services at the end of an applicable 1135 waiver event. During the PHE for COVID-19 or any future applicable 1135 waiver event, we will allow beneficiaries who switch to virtual MDPP or begin the set of MDPP services virtually to elect to continue receiving services virtually until the conclusion of their services. Our prior policy that MDPP is primarily an in-person service has had to be modified to accommodate the nature and length of the current PHE for COVID-19. While MDPP is still primarily an in-person service, allowing MDPP beneficiaries who switch to or begin the MDPP set of services virtually during an applicable 1135 waiver event to continue receiving the services virtually will allow the MDPP beneficiaries affected by an applicable 1135 waiver event to receive the set of services in a consistent modality. In response to the comment requesting a grace period after the end of the applicable 1135 event, we do not believe that an additional grace period would be necessary in most cases, given that the emergency period of an 1135 waiver event typically lasts for a duration that would permit affected providers to resume normal operations. However, we provided in our proposed regulation text at § 410.79(e)(3)(v) that MDPP suppliers could suspend in-person delivery of the set of MDPP services until the effective date of the 1135 waiver event (that is, the end of the emergency period under section 1135(g) of the Act) or upon a date specified by CMS. Therefore, our proposed regulation text contemplated that we could provide a grace period beyond the end of the emergency period. We anticipate that we would grant a grace period, which we would anticipate would not be longer than 90 days after the end of emergency period, if an MDPP supplier can demonstrate that it needs additional time to resume in-person services for reasons related to health, safety, or side availability or suitability. These flexibilities recognize that the effects of the PHE for COVID-19 or future applicable 1135 waiver events can vary in intensity based on location.

Comment: One commenter stated that their MDPP coaches have shared that many beneficiaries do not have video capability. Several commenters requested that beneficiaries be able to send in a photo of their weight

measurement instead. The commenter also expressed concerns with requesting a weight via email, which may not be compliant with HIPAA, and that requiring printed or faxed documentation will be a barrier for participants, because many people do not have access to printing or faxing when participating in the MDPP set of services from home.

Response: We agree that some MDPP beneficiaries may lack the technology required to provide a video or live feed of their weight measurement. In response to these comments, we are modifying the allowable weight measurement methodologies to include photo documentation. This final rule broadens the methods by which MDPP suppliers may obtain weight measurements from MDPP beneficiaries by allowing MDPP suppliers to obtain weight measurement from MDPP beneficiaries either in-person or via the use of technology, such as a Bluetooth-enabled scale or self-reported weight measurements using the MDPP beneficiary's digital scale and video technology. We are modifying proposed § 410.79(e)(3)(iii)(C) to allow MDPP suppliers to accept self-reported MDPP beneficiary weight measurements via a date stamped photograph or video recording of the beneficiary's weight with the beneficiary visible on the scale, submitted by the MDPP beneficiary to the MDPP supplier. The photo or video must clearly document the weight of the MDPP beneficiary as it appears on his/her digital scale on the date associated with the billable MDPP session. A beneficiary may communicate his/her own information to a provider without violating the Health Insurance Portability and Accountability Act (HIPAA). Beneficiaries who are not comfortable transmitting their health information in this format can choose to suspend the set of MDPP services until in-person services are available. We encourage suppliers to utilize HIPAA compliant communication platforms. However, it is the organization's responsibility to comply with any federal, state, and/or local laws governing individual-level identifiable data, including those laws related to HIPAA, data collection, data storage, data use, and disclosure.

Comment: One commenter urged CMS to reconsider the timeframe for which flexibilities under the March 31st COVID-19 IFC are available. The commenter stated that there are MDPP beneficiaries who began receiving services between March 1, 2020, and March 15, 2020 because state timelines for shelter-in-place requirements varied across the country, but that most

requirements were effective as of March 15, 2020. The commenter requested clarification that the flexibilities available under this final rule include participants who began the MDPP set of services between March 1 and March 15, 2020. This commenter also requested greater clarification between the requirements for beneficiaries who are in the ongoing maintenance phase of the MDPP set of services during the PHE for COVID-19 and any future 1135 waiver events, and questioned whether beneficiaries have until December 31, 2020 to restart the program, or if after that date, such beneficiaries will no longer have that flexibility.

Response: We agree with the commenter's recommendation. In response, we have made a modification to the regulation text at proposed § 410.79(e)(3)(v)(A) to specify that any beneficiary who began MDPP services on or before March 31, 2020—the effective date of the March 31st COVID-19 IFC—can elect to restart the set of MDPP services at the beginning or resume with the most recent attendance session of record upon the MDPP supplier's resumption of services. The modification to the date will extend the March 31st COVID-19 IFC flexibilities to all MDPP beneficiaries who started the MDPP set of services prior to the effective date of the March 31st COVID-19 IFC.

To clarify the requirements for MDPP beneficiaries who are in the ongoing maintenance phase: MDPP beneficiaries enrolled in the set of MDPP services prior to January 1, 2021 will not need to meet the 5 percent weight loss eligibility requirement to resume the set of MDPP services.

Effective January 1, 2021, the 5 percent weight loss eligibility waiver described in § 410.14(c)(3)(vi) will end for all MDPP beneficiaries starting after this date. However, the 5 percent weight loss eligibility waiver will remain in effect for MDPP beneficiaries who were receiving the set of MDPP services prior to January 1, 2021. MDPP beneficiaries who were receiving MDPP services prior to January 1, 2021 are not required to meet or maintain a 5 percent weight loss to maintain eligibility for the ongoing maintenance year and may resume or restart services without meeting the 5 percent weight loss requirement. However, MDPP beneficiaries who start the set of MDPP services on or after January 1, 2021 will be required to meet and maintain the 5 percent weight loss goal to be eligible for the ongoing maintenance year described in § 410.79(c)(1)(ii)(B) and (c)(1)(iii)(B).

The changes we are adopting in this final rule are effective January 1, 2021

and apply to the remainder of the PHE for COVID-19 and any future applicable 1135 waiver event. This means that MDPP beneficiaries who were receiving MDPP services as of March 31, 2020 may elect once to restart the set of MDPP services at the first core session, or resume in-person with their most recent session attendance of record as a result of the PHE for COVID-19 once at any time during the remainder of their set of MDPP services. However, MDPP beneficiaries who begin the set of MDPP services on or after January 1, 2021 will only be permitted to elect to restart the program at the first core session during the first 12 months of the set of MDPP services (and only if they do not switch to virtual MDPP services, if offered, during the applicable 1135 waiver event). MDPP beneficiaries who have restarted the set of MDPP services as a result of the PHE for COVID-19, and reside in an area that is subsequently impacted by a future 1135 waiver event, may elect to suspend in-person services, switch to virtual services, and restart or resume in-person services as provided in this rule.

Comment: One commenter supported the proposal to clarify that all MDPP sessions, including the first core session, may be offered virtually, not as “virtual make-up sessions,” but as virtual classes consistent with the in-person class curriculum. The commenter requested that CMS work with CDC on how MDPP suppliers should report this delivery type to the CDC, given that CDC has instructed in-person MDPP suppliers to report session delivery as virtual make-up sessions.

Response: In accordance with this rule, all MDPP sessions may be offered virtually, including the first core session, during an applicable 1135 waiver event. MDPP suppliers may also furnish virtual make-up sessions consistent with the § 410.79(d). All claims submitted to CMS for payment for MDPP services delivered virtually must include the Virtual Modifier “VM” on the claims submission form. We will work with CDC to ensure clarity and alignment for MDPP suppliers when reporting session delivery type to CDC.

Comment: One commenter suggested the following additional changes to the MDPP expanded model: (1) Address regulatory barriers to organizations becoming suppliers, including the requirement for Medicare suppliers to submit Social Security Numbers (SSN) to CMS, which raises privacy concerns for some organizations, and has resulted in some organizations choosing not to move forward with Medicare supplier enrollment; (2) revise the reimbursement structure to front-load

payments to ensure suppliers' upfront costs of serving the Medicare population, given that many MDPP suppliers are community-based organizations with scarce resources to wait for outcomes-based payments; (3) align the program model with the model test and the evidence, which would result in changing MDPP to a 1-year model that aligns with the CDC's NDPP curriculum; and (5) address special populations to avoid cherry picking, taking into account the socioeconomic barriers that prevent low-income individuals from achieving the full 5 percent weight loss required for ongoing maintenance services. The commenter requested that CMS offer modest relief from the 5 percent weight loss requirement, or provide payment adjustments to enable MDPP suppliers to address barriers beneficiaries face to participating in MDPP, such as a lack of transportation.

Response: We appreciate the commenter's recommendations but they are outside the scope of this final rule. We will consider these recommendations in the future.

After consideration of the comments received, we are finalizing our proposals with the following modifications:

- We will add allowable virtual weight measurement methods. In addition to the methods proposed, MDPP beneficiaries may self-report their weights in the following ways: By submitting a time and date-stamped photo or video of their home scale with their current weight measurement, or by using synchronous, online video technology such as video chatting or video conferencing with an MDPP coach, where the coach can clearly observe the self-recorded weight of the beneficiary. The second change is ensuring that flexibilities initially finalized in the March 31st COVID-19 IFC (85 FR 19230) are extended to all beneficiaries who were receiving MDPP services as of March 31, 2020, in order to include those beneficiaries who started MDPP services in the month of March, given that state shelter-in-place orders varied significantly.

- We will allow beneficiaries who begin the set of MDPP services virtually, or who change from in-person MDPP services to virtual during the PHE for COVID-19 or an applicable 1135 waiver event, to continue the MDPP set of services virtually, even after the PHE or 1135 waiver event has concluded.

- We added § 410.79(e)(3)(v)(B) to the rule to clarify the baseline weight measurement that must be used by an MDPP supplier when an MDPP beneficiary restarts or resumes the set of

MDPP services following a suspension in services.

- We are updating the cross reference, § 410.79(e)(4)(iii), found in the proposed rule in paragraph (e)(3)(ii) to correctly reflect the proper cross reference at paragraph (e)(3)(iii).

- We are making a few edits for technical clarity. We edited the proposed paragraph (e)(3)(v) to remove the phrase "must be furnished in compliance with the requirements in accordance with" and will replace it with "must be furnished in accordance with." We edited paragraphs (e)(3)(v)(B) and (C) to include "and who elect not to continue with MDPP services virtually." In addition, we edited paragraph (e)(3)(v)(D) to improve the clarity.

- Finally, we did not intend to eliminate the waiver as specified in paragraph (e)(3)(iii), of the minimum weight loss requirements for beneficiary eligibility in the ongoing maintenance session intervals described in paragraphs (c)(1)(ii)(B) and (c)(1)(iii)(B) for MDPP beneficiaries who were receiving the MDPP set of services prior to January 1, 2021. As such we have added the language into the final rule, redesignated as paragraph (e)(3)(vi)

2. Revisions to § 424.210

Under § 424.210(b), an MDPP supplier may furnish in-kind beneficiary engagement incentives to an MDPP beneficiary if certain requirements are satisfied. Among other requirements, the in-kind item or service must be furnished only during the "engagement incentive period." The definition of "engagement incentive period" at § 424.210(a) states that the period begins when an MDPP supplier furnishes any MDPP service to an MDPP eligible beneficiary, and it ends on the earliest of the following: (1) When the MDPP services period ends as described in § 410.79(c)(3); (2) when the MDPP supplier knows the MDPP beneficiary will no longer be receiving MDPP services from the MDPP supplier; or (3) the MDPP supplier has not had direct contact, either in-person, by telephone, or via other telecommunications technology, with the MDPP beneficiary for more than 90 consecutive calendar days during the MDPP services period. We recognize that the disruption to MDPP services caused by an applicable 1135 waiver event may cause an MDPP supplier not to have contact with an MDPP beneficiary for more than 90 consecutive calendar days. Therefore, we proposed to amend the definition of "engagement incentive period" to further qualify when the period ends in the case of the PHE for COVID-19 or an

applicable 1135 waiver event.

Specifically, we proposed to amend paragraph (iii) in the definition of "engagement incentive period" to state that the MDPP supplier has not had direct contact, either in person, by telephone, or via other telecommunications technology, with the MDPP beneficiary for more than 90 consecutive calendar days during the MDPP services period, unless the lack of direct contact is due to the suspension or cancellation of MDPP services under § 410.79(e) and the MDPP services are eventually resumed or restarted in accordance with § 410.79(e).

We solicited comments on when the engagement incentive period should end if the MDPP services are not eventually resumed. We noted that we were considering whether we should deem the incentive engagement period to end if the applicable 1135 waiver event or the PHE for COVID-19 remains in effect for a certain period of time, such as 1 year. At that point, for purposes of beneficiary engagement incentives, it may be more appropriate to terminate the engagement incentive period and permit a new engagement incentive period to begin if services are resumed or restarted in accordance with § 410.79(e). Alternatively, we noted that the engagement incentive period can also end when the MDPP supplier knows that the MDPP beneficiary will no longer be receiving services from the MDPP supplier. We solicited comments on whether that provision eliminates any need to further clarify in regulation text when the engagement incentive period ends if MDPP services are not eventually resumed or restarted.

We also proposed to amend § 424.210(b) to add a requirement governing the provision of an in-kind item or service as a beneficiary engagement incentive during the PHE for COVID-19 or during an applicable section 1135 waiver event. Specifically, we proposed that if the item or service is furnished during the PHE for COVID-19 or an applicable 1135 waiver event that CMS has determined may disrupt in-person MDPP services, and the item or service is furnished to an MDPP beneficiary who is receiving MDPP services virtually, the MDPP beneficiary must be capable of using the item or service during the PHE for COVID-19 or the applicable 1135 waiver event, as applicable. We proposed this usability requirement to deter abuse and to ensure that the incentives furnished during an applicable 1135 waiver event will achieve their intended purpose and serve the goals of the MDPP expanded model. We stated that usable beneficiary engagement incentives would include

vouchers for healthy food, wearable technology or “wearables” used to monitor an MDPP beneficiary’s health such as heart rate, calories burned, or steps walked. We also noted that gym memberships during lockdowns and stay-at-home orders would not constitute beneficiary engagement incentives that are usable during an applicable 1135 waiver event. We solicited comments on whether this additional requirement is necessary in light of other requirements set forth in § 424.210(b).

Finally, for purposes of the proposed usability requirement at § 424.210(b)(9), we proposed to define “COVID–19 Public Health Emergency” to mean the emergency period and emergency area, as such terms are defined in section 1135(g) of the Act, related to the PHE for COVID–19 declared by the Secretary on January 31, 2020. Effective October 23, 2020, the Secretary renewed the January 31, 2020 determination that was previously renewed on April 21, 2020, that a PHE exists and has existed since January 27, 2020. Similarly, we proposed to define “1135 waiver event” to mean an emergency period and emergency area, as such terms are defined in section 1135(g) of the Act, for which the Secretary has authorized waivers under section 1135 of the Act. We noted that these definitions were consistent with how we proposed to define the terms for purposes of § 410.79(e).

The following is a summary of the public comments we received and our responses.

Comment: One commenter appreciated the flexibility of the proposed change to paragraph (iii) of the definition, indicating that the engagement incentive period should not automatically end if an MDPP supplier’s failure to have direct contact with an MDPP beneficiary for more than 90 days was due to the suspension or cancellation of MDPP services during an applicable 1135 waiver event and the MDPP services were resumed during such 1135 waiver event. The commenter stated that the final rule should clarify when the engagement incentive period ends if MDPP services are not eventually resumed. The commenter supported the addition of a provision under which the engagement incentive period would be deemed to end if MDPP services are not resumed or restarted within 1 year after the PHE for COVID–19 or applicable 1135 waiver event has been in effect. The commenter also stated that, if MDPP services are thereafter resumed or restarted, CMS should permit a new engagement incentive period to begin.

Response: After further consideration, we are not finalizing the proposed changes to paragraph (iii) of the definition of engagement incentive period. That provision will continue to specify that the engagement incentive period will end if the MDPP supplier has not had direct contact with the MDPP beneficiary, whether in person, by telephone, or via other telecommunications technology, for more than 90 consecutive calendar days during the MDPP services period. Under this provision, the engagement incentive period will not end with respect to an MDPP beneficiary who begins to receive MDPP services virtually within 90 days after the occurrence of an 1135 waiver event that CMS determines is likely to disrupt the furnishing of in-person MDPP services. We are mindful of the potential for abuse with beneficiary incentives, and in the absence of any continued direct contact with the MDPP beneficiary for 90 days during an applicable 1135 waiver event, we do not believe that the MDPP supplier should be permitted to furnish additional beneficiary engagement incentives. However, we note that the existing definition of engagement incentive period specifies that the period begins “when an MDPP supplier furnishes any MDPP service to an MDPP eligible beneficiary.” Accordingly, even if an MDPP beneficiary’s engagement incentive period ends during an applicable 1135 waiver event due to lack of direct contact with the MDPP supplier, the beneficiary would begin a new engagement incentive period consistent with the existing definition when he or she resumes or restarts MDPP services in accordance with § 410.79(e).

Comment: One commenter stated that revising the definition of engagement incentive period as proposed would increase the recordkeeping and tracking burden on MDPP suppliers, who the commenter asserted will need to track the start and end dates of the PHE or 1135 waiver event, the election of the MDPP beneficiary to suspend or cancel MDPP services, the date of the resumption or restart of services, and more. The commenter requested that CMS specify the documentation and tracking requirements for this change.

Response: As noted above, we are not finalizing the proposed changes to the definition of engagement incentive period. We did not propose and are not finalizing any modifications to the documentation requirements described in § 424.210(e). However, we note that § 424.210(e) requires MDPP suppliers to maintain documentation regarding in-kind items and services furnished as

beneficiary engagement incentives, including the date on which the item or services was furnished and whether it was furnished during the engagement incentive period. In addition, it is a prudent business practice to document compliance with Medicare regulations, and the information cited by the commenter would be relevant to compliance with § 410.79 and § 424.210.

Comment: One commenter did not believe that the usability requirement at proposed § 424.210(b)(9) was necessary considering the other requirements set forth in § 424.210(b), but stated that if the requirement is retained in the final rule, it should be revised for clarity. Specifically, this commenter questioned whether a beneficiary engagement incentive that is furnished during an 1135 waiver event must be usable by the MDPP beneficiary for the remaining duration of the 1135 waiver event or only at the time the incentive is furnished. As an example, the commenter noted that an MDPP supplier might provide a gym membership voucher during an 1135 waiver event at a time when gyms are open, but the membership could become unusable at a later time during the 1135 waiver event. The commenter advocated that if the final rule includes a requirement regarding the usability of an incentive during the PHE for COVID–19 or an 1135 waiver event, the requirement should expressly state that the MDPP beneficiary must be capable of using the item or service “at the time of delivery.” Another commenter requested clarification that that a gym membership would satisfy the proposed usability requirement even if it was furnished when a lockdown or stay-at-home order was in effect, as long as the gym offered virtual fitness classes. In addition, a commenter sought clarification that in-kind items or services that may be useable in one region may not be useable in another region. The commenter expressed concern that documenting compliance with the usability requirement would place undue burden on MDPP suppliers.

Response: Upon further review, we agree that the usability requirement is not necessary in light of other requirements set forth at § 424.210(b). Specifically, under paragraph (b)(2), the in-kind beneficiary engagement incentive must be reasonably connected to the CDC-approved DPP curriculum furnished to the MDPP beneficiary during a core session, core maintenance session, or ongoing maintenance session. In addition, under paragraph (b)(3), the in-kind beneficiary engagement incentive must be a “preventive care item or service” or an

item or service that advances a clinical goal for an MDPP beneficiary by engaging him or her in better managing his or her own health. We would not consider either of these requirements to be satisfied if the MDPP beneficiary is incapable of using the item or service at the time it is furnished. Accordingly, because an unusable in-kind item or service could not satisfy all of the conditions set forth at paragraph (b), it is not necessary to finalize the additional proposed requirement for in-kind items and services furnished to an MDPP beneficiary who is receiving MDPP services virtually during the PHE for COVID-19 or an 1135 waiver event. Because we are not finalizing the proposed usability requirement, the commenters' remaining concerns are moot and need not be addressed.

Comment: One commenter supported the proposed definitions of "COVID-19 Public Health Emergency" and "1135 waiver event."

Response: We appreciate the commenter's support. However, as finalized, § 424.210 does not refer to either term. Accordingly, we are not finalizing these definitions.

After consideration of the comments received, we are not finalizing the proposed usability requirement nor the proposed definitions of "COVID-19 Public Health Emergency" and "1135 waiver event" proposed at § 424.210(b).

IV. Summary of the Quality Payment Program Proposed Provisions, Analysis of and Responses to Public Comments, and Provisions of the Final Rule

A. CY 2021 Updates to the Quality Payment Program

1. Executive Summary

a. Overview

This section of the final rule sets forth changes to the Quality Payment Program starting January 1, 2021, except as otherwise noted for specific provisions. The 2021 performance period/2023 payment year of the Quality Payment Program continues a transition as we build on the first few years of implementation of the Quality Payment Program to focus better on our measurement efforts, and to reduce barriers to entry into Advanced APMs.

Participation in the Quality Payment Program rose in the third year. We saw 99.99 percent of eligible clinicians participate in MIPS in 2019 with 954,614 eligible clinicians receiving a payment adjustment, which exceeded our 2018 participation rates. In addition, 97.6 percent of eligible clinicians participating in MIPS received a positive payment adjustment for 2021

based on 2019 performance year results. Regarding performance in Advanced APMs, for the 2019 QP Performance Period, 195,564 eligible clinicians earned Qualifying APM Participant (QP) status while another 27,995 eligible clinicians earned partial QP status.¹¹⁶ We note that due to the Public Health Emergency (PHE) for COVID-19, 65,237 (or about 6.83 percent of 954,614) MIPS eligible clinicians received reweighting for performance year 2019 of one or more MIPS performance categories due to our MIPS extreme and uncontrollable circumstances policy.

We plan to continue developing Quality Payment Program policies that more effectively reward high-quality treatment of patients and increase opportunities for Advanced APM participation. We are moving forward with MIPS Value Pathways (MVPs) policy development as MVPs allow for a more cohesive participation experience by connecting activities and measures from the 4 MIPS performance categories that are relevant to a specialty, medical condition, or a particular population. The MVPs use promoting interoperability as a foundational element and incorporate population health claims-based measures as feasible along with relevant measures and activities for the quality, cost, and improvement activities performance categories. We intended to begin transitioning to MVPs in the 2021 MIPS performance year; however, due to the PHE for COVID-19 and resultant need for clinician focus on the response, our timeline changed accordingly such that the proposal for initial MVPs is delayed until at least the 2022 performance year. In addition, we support clinicians on the front lines by providing burden relief via extreme and uncontrollable circumstances policy exceptions for 2019, 2020 and 2021.

In response to the PHE for COVID-19, a number of additional flexibilities were issued via interim final rules with comment periods (IFCs) (85 FR 19276 through 19278, 85 FR 27617, and 85 FR 54847 through 54851). We extended the deadline for applying for reweighting due to extreme and uncontrollable circumstances for the 2019 performance period from December 31, 2019 to April 30, 2020 in order to provide greater flexibility for clinicians impacted by the PHE for COVID-19 and modified our existing policy for the 2019 performance period such that MIPS data submissions would not effectively void a reweighting

application. We added a new "COVID-19 Clinical Trials" improvement activity to the CY 2020 Improvement Activities Inventory, applicable beginning January 2020 that would provide high-weighted credit in the Improvement Activities performance category and then modified the activity in the third IFC (March 31st COVID-19 IFC (85 FR 19276 through 19277)). We provided QCDRs an additional year, by 2022, to meet the QCDR measure requirements of measure testing and data collection. Due to COVID-19 we also modified our definition of primary care services used in the MIPS beneficiary assignment methodology for the CMS Web Interface and CAHPS for MIPS Survey to include online and telephone digital E/M codes, and remote evaluation of patient video/images and virtual check in codes. These included previously finalized "face-face" codes that are instead furnished using audio/video, real-time, interactive communications technology instead of in person in light of the PHE. We are finalizing all IFC policies except for the COVID-19 Clinical Trials activity for 2020, which is finalized with a modification as presented in the third IFC. See section IV.A.3.c.(3)(b) of this final rule for the modified COVID-19 Clinical Trials activity for CY 2020 as described in the September 2, 2020 IFC (85 FR 54848 through 54851).

As we make long-term improvements, evolve MIPS policies, and plan to implement MVPs in the future, we support our objectives within the Patients Over Paperwork initiative and the National Quality Roadmap.^{117 118} In carrying out these initiatives, we are removing regulatory obstacles that get in the way of health care clinicians spending time with patients. As we develop MVP policies, we look to reduce MIPS reporting burden and increase efficiencies.

On May 15, 2020 the Department of Health and Human Services published the National Quality Roadmap (<https://www.hhs.gov/sites/default/files/national-health-quality-roadmap.pdf>) as directed by E.O. 13877, Improving Price and Quality Transparency in American Healthcare to Put Patients First. The purpose of the Roadmap is to improve patient outcomes through enhanced effectiveness and efficiency of the healthcare quality system. The Roadmap is a means to accelerate change and advance the Administration's goals of "improving transparency, reducing provider burden, allowing informed

¹¹⁶ QPP Participation in 2019: Results at-a-Glance released 10/27/2020 at <https://qpp-cm-prod-content.s3.amazonaws.com/uploads/1190/QPP%202019%20Participation%20Results%20Infographic.pdf>.

¹¹⁷ <https://www.cms.gov/About-CMS/story-page/patients-over-paperwork>.

¹¹⁸ <https://www.hhs.gov/sites/default/files/national-health-quality-roadmap.pdf>.

consumer decision-making, and ultimately improving the health of all Americans". The Roadmap, which provides a public-private partnership opportunity, describes a strategy for establishing, adopting, and publishing common quality measurements, aligning inpatient and outpatient measures, and eliminating low-value or counterproductive measures. Specific actions are identified to drive change through coordinated governance and oversight, modernized data collection and reporting, and aligned measures reform in federal quality programs. One of the actions called for is a systematic review of federal quality reporting and value-based payment programs, to identify opportunities leading to recommendations to reduce burden, promote efficiency and effectiveness, and accelerate the shift to value. The Roadmap also calls for stakeholder engagement through public convening and a Request for Information. Actions will be undertaken with the underpinning of the following principles:

- Quality Information is Available and Meaningful.
- Balance Administrative Burden with the Goal of Obtaining Meaningful Information.
- Alignment of Measurement Priorities.
- Cohesive Measurement Stewardship.
- Reward Innovation and Improvement.
- Leverage What Works and Reform the Rest.

The planned implementation of MVPs is noted in the Roadmap and we look forward to recommendations resulting from other Roadmap activities for streamlining quality reporting and value-based purchasing programs that can inform the implementation of the MVPs and promote alignment of quality measures across federal programs.

As we work within MIPS to reduce barriers to clinician participation in Advanced APMs and meet CMS pay for value objectives, we are aligned with the Health Care Payment Learning & Action Network goal to accelerate the percentage of health care payments tied to quality and value in each market segment through the adoption of two-sided risk APMs.¹¹⁹ MVPs will link quality and cost performance measurement and help clinicians begin to assess their ability to take on risk as in APMs.

In the May 1, 2020 **Federal Register**, HHS published two transformative rules: The 21st Century Cures Act:

Interoperability, Information Blocking, and the ONC Health IT Certification Program final rule (85 FR 25642 through 25961); and the Medicare and Medicaid Programs; Patient Protection and Affordable Care Act; Interoperability and Patient Access for Medicare Advantage Organization and Medicaid Managed Care Plans, State Medicaid Agencies, CHIP Agencies and CHIP Managed Care Entities, Issuers of Qualified Health Plans on the Federally-facilitated Exchanges, and Health Care Providers final rule (85 FR 25510 through 25640) that will give patients unprecedented safe, secure access to their health data. The two rules implement interoperability and patient access provisions of the bipartisan 21st Century Cures Act (Cures Act) and support the MyHealthEData initiative. MyHealthEData is designed to empower patients around a common aim, giving every patient access to their medical information so they can make better healthcare decisions. We expect that these rules, once implemented, will complement our future MVPs in providing more meaningful information to clinicians and patients.

b. Summary of Major Provisions

(1) Major MIPS Provisions

The MIPS program aims to drive value through the collection, assessment, and public reporting of data that informs and rewards the delivery of high-value care. Within MIPS we intend to pay for health care services in a way that drives value by linking performance on cost, quality, and the patient's experience of care. We believe implementing the MVP framework will move MIPS along the "path to value," transforming the MIPS program by better informing and empowering patients to make decisions about their healthcare and helping clinicians to achieve better outcomes, and by promoting robust and accessible healthcare data, and interoperability. In the CY 2020 PFS proposed rule (84 FR 40732 through 40745), we offered our vision of an MVP framework for a new evolution of the MIPS program based on this concept.

As discussed in the CY 2021 PFS proposed rule at 85 FR 50277, we have built the MIPS program to provide broad flexibility for clinician choice of measures and activities, data collection and submission types, and individual or group level participation. While these flexibilities contributed to very high participation levels, we believe the flexibility has inadvertently resulted in a complex MIPS experience for clinicians that is not producing the level

of robust clinician performance information we envision that would meet patient needs and support clinician care improvements. We have heard from clinicians that MIPS requirements are confusing, burdensome, and that it is difficult to choose measures from the several hundred MIPS and QCDR quality measures that are meaningful to their practices and have a direct benefit to patients. We have also heard concerns from stakeholders that MIPS does not allow for sufficient differentiation of performance across practices due in part to clinician quality measure selection bias. These aspects detract from the program's ability to effectively measure and compare performance, provide meaningful feedback, and incentivize quality. MVPs are intended to lead to a simplified MIPS clinician experience, improve value, reduce burden, and better inform patient choice in selecting clinicians. We noted that the MVP framework would connect measures and activities across the 4 MIPS performance categories, incorporate a set of administrative claims-based quality measures that focus on population health, provide data and feedback to clinicians, and enhance information provided to patients. We intend to focus the future of MIPS on MVP implementation. We are finalizing proposed provisions as discussed in section IV.A.3. of this final rule related to:

- Developing MVPs
- Implementing the APM Performance Pathway (APP) for APM participant MIPS eligible clinicians to report to MIPS
- Updating the MIPS performance measures and activities; cost and quality category weights; and scoring policies
- Terminating the APM scoring standard.

(a) MIPS Value Pathways and APM Performance Pathway

We are finalizing the proposed MVP framework guiding principles as discussed in section IV.A.3.a.(1) of this final rule and the proposed MVP development criteria and processes as discussed in section IV.A.3.a.(2) of this final rule as we look towards the 2022 performance period to begin MVP implementation. We are finalizing in section IV.A.3.b. of this final rule each of the proposed quality measures included in the APP quality measure set effective January 1, 2021. We are also delaying the sunset of the CMS Web Interface by one year and allowing APM entities to report via the CMS Web Interface measure set for the 2021 MIPS

¹¹⁹ <https://hcp-lan.org/>.

performance period. Submitters reporting through the APP will be scored on the ACO MCC measure, Hospital-wide Readmission measure, and CAHPS for MIPS survey, if available for that submitter type. In addition, each submitter will also be required to report on either the three eCQMs/MIPS CQMs or, for APM Entities, the Web Interface. The APP will be a voluntary pathway for reporting and scoring under MIPS that allows APM participants to receive an improvement activities credit and have the cost performance category reweighted. We are finalizing proposed MIPS performance category weighting and scoring in the APP and a scoring hierarchy that recognizes the APP in section IV.A.3.e.(2) of this final rule. We are also finalizing in section IV.A.3.c.(5)(a) of this final rule the elimination of the APM scoring standard for the 2021 performance year beginning January 1, 2021. This allows APM participants to participate in MIPS as individuals, groups, Virtual Groups, or APM Entities, with reporting through any MIPS reporting and scoring pathway, see section IV.A.3.b.(3) of this final rule. We are also finalizing in section IV.A.3.c.(5)(e) of this final rule, an extreme and uncontrollable circumstances exception policy proposal that would be applicable to APM Entities beginning with the 2022 MIPS payment year.

In response to our MVP RFI in the 2020 PFS proposed rule (84 FR 40732 through 40745), we received a number of comments about the opportunity to participate in the development of MVPs and concerns about the speed of a transition to a new MVP framework. We have taken these concerns into consideration when developing the proposed MVP policies. We had stated our intent to begin the transition to MVPs in 2021 by introducing initial MVPs, however, we noted at 85 FR 50284 through 50285 that due to the PHE for COVID-19, the timeline has changed. As we move forward with the transformation of the MIPS program in a manner that does not take away from the nation's response to the PHE for COVID-19, we limited the MVP-related proposals to those necessary for the collaborative development of MVPs.

We are finalizing in section IV.A.3.a.(2) of this final rule, the proposed process for collaboration on the development of MVPs that builds on our discussions with clinician experts about developing MVPs for future MIPS rulemaking. We believe that collaboration with clinician experts will build a more cohesive and comprehensive set of MVPs. We are

finalizing the proposed process for MVP candidate submissions in section IV.A.3.a.(2)(a)(iii) of this final rule.

We recognize that the transition to MVPs will take time and we will continue to evaluate the readiness of clinicians in making this transition, while balancing our strong interest in improving measurement and making MIPS more focused on value.

(b) Other MIPS and APM Policies

We are finalizing with modification our web interface and quality measure proposals as discussed in sections IV.A.3.c.(1)(c) and IV.A.3.c.(1)(d) of this final rule, respectively, after consideration of comments. Additionally, we are finalizing in section IV.A.3.d.(1)(b) of this final rule the proposed continuation of policies for scoring quality measures based on achievement, as well as policies for measures that do not meet case minimum, data completeness requirements, or have a benchmark. For the Promoting Interoperability performance category, we are finalizing the proposed new optional Health Information Exchange (HIE) bi-directional exchange measure as discussed in section IV.A.3.c.(4)(c)(ii)B of this final rule.

Additionally, after considering public comments, we are finalizing the following provisions for MIPS beginning with the 2021 performance period in this final rule.

- As discussed in section IV.A.3.c.(1)(c) of this final rule, we are finalizing our proposal to remove the CMS Web Interface submission method under MIPS for groups and virtual groups with a one year delay. Specifically, we will sunset the Web Interface in 2022 instead of 2021.

- As discussed in section IV.A.3.c.(1)(d) of this final rule, we are finalizing the proposals to incorporate 2 new administrative claims outcome quality measures, address substantive changes to 112 existing MIPS quality measures, address changes to specialty sets, remove measures from specific specialty sets. We are finalizing a modified proposal to remove 11 instead of 14 quality measures from the MIPS program. We refer readers to Table Group C of Appendix 1 for a list of final quality measures and further information. Retaining three additional measures means that we are finalizing a modified proposed total of 209 rather than 206 quality measures starting in the 2021 performance year.

- As discussed in sections IV.A.3.c.(1)(e) and IV.A.3.c.(2)(b) of this final rule, we are finalizing the proposals to include services provided

via telehealth in quality and cost measurement.

- As discussed in section IV.A.3.c.(2)(a) of this final rule, we are finalizing the proposals that the cost performance category will make up 20 percent of a MIPS eligible clinician's final score for the 2023 MIPS payment year and 30 percent for the 2024 MIPS payment year as required by section 1848(q)(5)(E)(i)(II)(aa) of the Act, and the quality performance category weight will be 40 percent and 30 percent for each of those years, respectively (see section IV.A.3.c.(1)(b) of this final rule). For the 2023 MIPS payment year, we are finalizing the proposed performance category redistribution policies discussed in section IV.A.3.d.(2)(b)(iii) of this final rule.

- As discussed in section IV.A.3.c.(3)(b) of this final rule, we are finalizing our proposals to: (1) Allow an exception to the Annual Call for Activities nomination period timeframe during a PHE; (2) add a new criterion for nominating new improvement activities; (3) implement a process for HHS-nominated improvement activities; and (4) modify two existing improvement activities. We are also finalizing policies from IFCs and the removal of one obsolete improvement activity and policies from IFCs.

- As discussed in section IV.A.3.c.(4) of this final rule, we are finalizing the proposals that establish a performance period for the Promoting Interoperability performance category of a minimum of a continuous 90-day period within the calendar year that occurs 2 years prior to the applicable MIPS payment year, up to and including the full calendar year, for the 2024 MIPS payment year and each subsequent MIPS payment year; update two Promoting Interoperability measures; and continue reweighting the Promoting Interoperability performance category for non-physician MIPS eligible clinicians for the 2021 performance period. We are finalizing at section IV.A.3.c.(4)(c)(ii) of this final rule the proposal to add a new Promoting Interoperability performance category Health Information Exchange (HIE) bi-directional exchange measure that would allow an eligible clinician to attest to participation in bi-directional exchange through an HIE using CEHRT functionality.

- As discussed in section IV.A.3.d.(1)(b) of this final rule, we are finalizing the proposed continuation of quality category scoring and bonus policies that add flexibility for when measure specification or coding changes occur during the performance year and continue improvement scoring of the

quality performance category comparing clinicians to a 30 percent baseline score if clinicians scored 30 percent or less. We are finalizing in section IV.A.3.d.(1)(b)(iii) of this final rule the proposal for an exception to the 20-case minimum for all administrative claims-based measures. The exception states that for administrative claims-based measures, the minimum case requirement is specified in the annual list of MIPS measures.

- As discussed in section IV.A.3.d.(2)(a)(iii) of this final rule, we are finalizing the proposal to increase the maximum number of points available for the complex patient bonus for one year, the 2020 performance period/2022 MIPS payment year, due to the increase in patient complexity resulting from the PHE for COVID–19.

- As discussed in section IV.A.3.g. of this final rule, we are finalizing the proposals to modify third party intermediary requirements, remedial actions and termination policies. We are also finalizing policies issued via IFC.

- As discussed in section IV.A.4.b. and IV.A.4.c. of this final rule, we are finalizing the proposals that clarify the APM Incentive Payment amount calculation basis and implement a hierarchy for recipient TIN affiliation identification when making the APM Incentive Payment. We are also finalizing proposed provisions in section IV.A.4.c. of this final rule that provide a process for requesting updated APM Incentive Payment information in situations where a payee TIN cannot be identified, and address in section IV.A.4.d. of this final rule situations where the QP's APM Incentive Payment was determined based solely on supplemental services payments and no Medicare claims for covered professional services were submitted during the incentive payment base period.

- As discussed in section IV.A.4.e.(3) of this final rule, we are finalizing the proposed change to the methodology for addressing prospectively aligned beneficiaries for Threshold Score calculations and QP determinations and establish a targeted review process in section IV.A.4.e.(4) of this final rule for QP determinations.

After consideration of public comments, we are not finalizing the following proposals:

- As discussed in sections IV.A.3.d.(1)(b)(ii) and IV.A.3.d.(1)(b)(v) of this final rule, we are not finalizing using performance period benchmark policies for performance year 2021 and will instead continue with the existing policy to use historical benchmarks and our topped out scoring policy after

considering comments and the impact of the PHE for COVID–19.

- As discussed in section IV.A.3.e.(3) of this final rule, we are not finalizing the proposal to reduce the performance threshold for the 2021 MIPS performance period/2023 MIPS payment year from 60 points to 50 points, as we believe that we best incentivize clinician performance through retaining the previously finalized performance threshold of 60 points.

2. Definitions

At § 414.1305, we are finalizing definitions of the following terms:

- Attestation (revision).
- Certified Electronic Health Record Technology (CEHRT) (revision).
- Collection type (revision).
- Full TIN APM (deletion).
- Low volume threshold (revision).
- Meaningful EHR user for MIPS (revision).

- MIPS APM (revision).
- Physician Compare (addition).
- Primary Care Services (addition).
- Submission type (revision).

These terms and definitions are discussed in detail in the relevant sections of this final rule.

3. MIPS Program Details

a. Transforming MIPS: MIPS Value Pathways

(1) Overview

We are finalizing proposed updates to the MIPS Value Pathways (MVP) guiding principles (see 85 FR 50280 through 50281) and MVP development criteria and process (see 85 FR 50281 through 50284) that will guide MVP implementation beginning with the 2022 MIPS performance period/2024 MIPS payment year.

In the CY 2020 PFS final rule, we stated our intent to apply the MVP framework in PY 2021 (84 FR 62946); however, due to the PHE for COVID–19, our timeline has changed (see 85 FR 50284 through 50285). We want to move forward with the transformation of the MIPS program in a manner that does not take away from the nation's response to the PHE for COVID–19, and so have limited our MVP related proposals in this rule to guidance necessary for the collaborative development of MVPs. We deferred MVP implementation to a future year. In particular, we intend to propose an initial set of MVPs and implementation policies in our CY 2022 rulemaking cycle. We continue to envision a transformed MIPS program that increasingly makes MVPs available to clinicians with a burden reduction focus.

We intend to implement the MVPs while maintaining the MIPS participation options established through rulemaking for MIPS performance years 1 through 5. For purposes of this discussion, we refer to the established MIPS participation options collectively as “traditional MIPS”.

As described in earlier rulemaking (84 FR 40732 through 40734), we are moving to MVPs to improve value, reduce burden, help patients compare clinician performance to inform patient choice in selecting clinicians, and reduce barriers to movement into APMs. We refer to “value” as a measurement of quality and patient experience of care as related to cost, and intend to promote value by paying for health care services in a manner that directly links performance on cost, quality, and the patient's experience of care. The MVP framework will move MIPS forward on the path to value through connecting the MIPS performance categories and by better informing and empowering patients to make decisions about their healthcare and helping clinicians to achieve better outcomes using robust and accessible healthcare data and interoperability.

We believe that MVPs can help address previous feedback from clinicians that MIPS is too complex and burdensome. Feedback related to confusing MIPS requirements, inadequate alignment of the MIPS performance categories, need for better performance comparability across all clinicians and for more meaningful data for patients has informed development of the MVP framework. MVPs will make MIPS more meaningful by allowing a more cohesive participation experience by connecting activities and measures from the 4 MIPS performance categories that are relevant to a patient population, standardizing performance measurement of a specialty or a medical condition, and reducing the siloed nature of the traditional MIPS participation experience. We intend that MVPs help clinicians and practices prepare to take on and manage financial risk, as in Advanced APMs, as they build out their quality infrastructures that align with the MIPS performance categories and gain experience with cost measurement. Performance measure reporting for specific populations as in MVPs encourages practices to build an infrastructure with capabilities to compile and analyze population health data, a critical capability in assuming and managing risk. We believe that experience with MVPs, in which there is aligned measurement of quality (of care and of experience of care) and cost,

continuous improvement/innovation within the practice, and efficient management and transfers of information, will help remove barriers to APM participation. We refer readers to the infographic at <https://qpp.cms.gov/mips/mips-value-pathways>, which provides an overview of our vision for the MIPS path to value future state (see 85 FR 50279).

We envisioned that MVPs will be optional for clinicians when the included measures and activities within the MVP are applicable and available to their practice. Over the course of future performance periods as we transition to MVPs, the traditional MIPS participation option will continue to be available. We noted that we believe MVP reporting will reduce selection burden associated with choosing MIPS quality measures and activities to report; reduce reporting burden associated with fewer MIPS quality measures, cost measures and/or improvement activities to report than the traditional MIPS participation method; and further align across performance categories the measures and activities identified by specialists and patients as being meaningful and relevant. We noted that we intended to build a robust inventory of MVPs which are meaningful to clinicians and expect that in the future we may propose that all MIPS eligible clinicians would be required to participate in MIPS either through an MVP or an APM Performance Pathway (APP).

In the CY 2021 PFS proposed rule (85 FR 50280 through 50281), we proposed to update the MVP guiding principles from the CY 2020 PFS proposed rule (84 FR 40734) to incorporate RFI comments and the evolution of the MVP framework. We refer readers to the CY 2021 PFS proposed rule for a discussion of the RFI comments. We proposed to add a new fifth guiding principle pointing to an important Meaningful Measures element of our future vision for reducing MVP reporting burden; the use of digital performance measure data submission technologies to indicate our commitment to leveraging digital innovations that reduce MIPS related clinician burden. Digital Quality Measures (dQMs) originate from sources of health information that are captured and can be transmitted electronically and via interoperable systems. We refer readers to the CY 2021 PFS proposed rule (85 FR 50280) for a discussion of dQMs. We proposed to retain guiding principle 4 (84 FR 40734) and update guiding principles 1, 2, 3 and 5, as shown in *italics*, so that the guiding principles for MVPs reflect the following:

1. MVPs should consist of limited, *connected complementary* sets of measures and activities that are meaningful to clinicians, which will reduce clinician burden, *align* scoring, and lead to sufficient comparative data.

2. MVPs should include measures and activities that would result in providing comparative performance data that is valuable to patients and caregivers in evaluating clinician performance and making choices about their care; *MVPs will enhance this comparative performance data as they allow subgroup reporting that comprehensively reflects the services provided by multispecialty groups.*

3. MVPs should include measures *selected using the Meaningful Measures approach and, wherever possible, the patient voice must be included*, to encourage performance improvements in high priority areas.

4. MVPs should reduce barriers to APM participation by including measures that are part of APMs where feasible, and by linking cost and quality measurement.

5. *MVPs should support the transition to digital quality measures.*

We described our proposed method of creating MVPs in the CY 2020 PFS proposed rule (85 FR 50281 through 50283). We noted that we intend to grow the number of available MVPs using the processes described in that section, maximizing our opportunity for expert input on the most meaningful measures and activities.

We noted that we continue our efforts to improve the healthcare of Medicare patients by allowing clinicians to focus on providing care for their patients and the measures and activities that best reflect their care. We also noted that we look forward to continuing to work with stakeholders to improve the program and implement the vision of MVPs.

We received public comments on this proposal. The comments we received and our responses are set forth below.

Comment: Many commenters supported the MVP guiding principles as proposed with some commenters voicing support for all the guiding principles and some commenters highlighting support for subsets of the guiding principles. Commenters voiced a number of reasons for their support of the guiding principles related to moving towards MVP goals of burden reduction, meaningful performance measurement, capturing the patient voice, and/or moving to higher value care.

Response: We appreciate the commenters' support of MVP guiding principles that will move us towards our goals of improving value, reducing burden, helping patients compare

clinician performance to inform patient choice in selecting clinicians, and reducing barriers to movement into APMs. We agree with commenters that the MVP guiding principles will help realize these goals.

Comment: While agreeing with the proposed and existing MVP guiding principles, a few commenters had questions about how they would be operationalized. A few commenters supported guiding principle 4. A few commenters questioned how MVPs would help reduce barriers to APM participation and one commenter suggested that we work with specialty societies to develop implementation approaches such as an APM blueprint with guidance for clinicians and further cost measure development. A few commenters voiced a concern that many medical specialties, for example, dermatology, do not have any APMs to work towards.

Response: We appreciate the support for previously finalized guiding principle 4, MVPs should reduce barriers to APM participation by including measures that are part of APMs where feasible, and by linking cost and quality measurement. Experience with MVPs that measure quality of care and patient experience of care, cost, continuous practice improvement, and effective management and transfers of health information will help to reduce barriers to APM participation (84 FR 40732 through 40733 and 84 FR 62947). We believe that MVPs, which better align cost and quality measurement and use measures meaningful to clinician practice performance, will help clinicians develop skills and processes that increase their readiness for APM participation. This experience with MVPs may stimulate clinician care improvement processes, a growth of data handling infrastructures, and increase clinician understanding of delivery of high value care. That is, MVP experience with cost and quality measurement may help improve clinician readiness to take on financial risk in APMs. This increased clinician understanding of the quality and cost relationship and improvement approaches derived through MVP use may increase clinician confidence and capacity to engage in APMs. We intend to develop MVPs in collaboration with stakeholders that align with the guiding principles. We anticipate these low burden, meaningful MVPs will move clinicians along the value continuum and facilitate movement into APMs by leveraging APM measures where feasible, and linking cost and quality. We acknowledge, that given the number

of Advanced APMs that are now available and the large number of specialty types, some specialists do not currently have an APM they could participate in. New APMs continue to be developed both inside and external to CMS and we envision that the number of APMs will grow in the future. We encourage specialists to collaborate with CMS and within the Health Care Payment Learning Action Network (HCPLAN) to help drive progress towards value-based care. We will continue to engage with stakeholders, including specialty societies, on how MVPs may reduce barriers to APM participation in the future. We are holding a MVP Town Hall meeting on January 7, 2021 (see 85 FR 74729 through 74730) that will provide stakeholders with an opportunity to provide feedback on MVP topics, including how MVPs can help reduce barriers to APM participation.

Comment: One commenter suggested that in guiding principle 1 the term “limited” could be used to define MVPs too narrowly and exclude specialties from being assessed on relevant episodes of care and that we should balance the interests of multiple specialties under each proposed MVP.

Response: The word “limited” in this guiding principles means that the number of performance measures and activities in each MVP will be small as compared to, for example, the more than 200 MIPS quality measures a clinician may choose from, we do not use “limited” here to constrict the overall number of MVPs as the commenter suggests. While the “limited” wording was in our previously finalized guiding principle 1, we proposed adding the words “connected complementary” to describe MVP sets of measures and activities that are meaningful to clinicians including specialists. We intend to balance performance measurement standardization with measures that are meaningful to clinicians as we develop MVPs in collaboration with stakeholders.

Comment: A few commenters voiced their support for the concept of subgroup reporting as proposed in guiding principle 2, due to the flexibility it provides to specialists and the more meaningful performance data that results. A few commenters suggested that subgroup reporting be extended to traditional MIPS. A few commenters supported subgroup reporting only if it is optional for multispecialty groups and suggested that incentives be created for subgroup reporting to counter the additional reporting burden. A few commenters

expressed interest in the potential of subgroup reporting as related to their specific specialties, which include anesthesiologists, electrophysiologists, endocrinologists, occupational therapists, and otolaryngologists. One commenter provided conditional support of the subgroup reporting concept depending on how a combined final score would be calculated and whether feedback would be provided at the pathway level for subspecialties to be able to receive tailored feedback. One commenter suggested a transition period to incentivize subgroup participation.

Response: We appreciate the support of proposed guiding principle 2. We envision subgroup reporting would be implemented as an option for multispecialty groups reporting MVPs in the future. We did not propose to add a subgroup reporting option to traditional MIPS and believe that the subgroup reporting option within MVPs is sufficient as we expect that eventually the majority of MIPS clinicians will transition to MVP reporting in the future. We have not proposed the details of subgroup reporting, data feedback, scoring or incentives for subgroup reporting but will consider all comments on subgroup reporting as we develop and propose MVP subgroup reporting implementation policies in the future. In terms of a transition period, we intend to implement MVPs incrementally with voluntary participation, which we believe will allow clinicians to transition, as they are ready, into MVP and subgroup reporting.

Comment: Several commenters did not support the concept of subgroup reporting due to concerns related to added program complexity, added burden, and the need for clinicians to compare the scoring advantages of group, subgroup, and individual reporting. One commenter suggested that some specialties may not have a corresponding MVP to report and it may be unrealistic to report performance data on the entire multispecialty group. One commenter suggested that it is possible to develop or identify measures that could result in valuable comparative data comparing a few MVPs but believes that it may be challenging to identify measures that are comparable across all MVPs. One commenter had a concern that a future requirement for subgroup reporting that requires a minimum percent clinician representation would be burdensome and discourage MVP participation. One commenter suggested that testing the attribution methodology for sub-group reporting is critical. One commenter suggested that subgroup reporting

would deter team-based care, increase competition, and produce unintended consequences. This commenter suggested that applying Promoting Interoperability requirements to a subgroup rather than a group would discourage MVP selection.

Response: Multispecialty groups, especially groups with many clinicians, often provide an array of services that may not be captured in a single set of measures or in a single MVP. We proposed a modified MVP Guiding Principle 2 as we intend to propose subgroup MVP reporting in the future which would allow clinicians who want to voluntarily report measures that better represent the services they provide to do so. Regarding measure challenges related to comparable measures across all MVPs, within traditional MIPS we require performance measure and activity reporting across four categories (quality, costs, Promoting Interoperability, and improvement activities) and believe there is opportunity to improve comparative data within MVPs as we move in the direction of standardization. We agree with the commenter that it may be challenging to identify measures that are comparable across all MVPs but believe that a future state where clinicians who deliver similar services and report the same MVP will be an improvement over traditional MIPS where wide choices of performance measures and activities, produce challenges in obtaining comparative data. We intend to work with stakeholders to develop MVPs that include meaningful measures and build a portfolio of MVPs that improve comparative data within and across MVPs. We have not proposed implementation details or any minimum criteria for subgroup reporting. We acknowledge that since we plan to incrementally implement MVPs in future years, that some specialties will not initially have a respective MVP. The policies related to operational aspects of subgroup MVP reporting will be developed through future rulemaking with input from stakeholders and we will seek to mitigate concerns such as those voiced by commenters that include complexity, burden, attribution challenges, Promoting Interoperability requirements, unintended consequences, and whether subgroup reporting incentives are warranted. We are holding a MVP Town Hall meeting on January 7, 2021 (see 85 FR 74729 through 74730) that will provide stakeholders with an opportunity to provide feedback on MVP topics, including subgroup reporting.

Comment: A few commenters suggested that the group reporting option continue to be available. One commenter suggested there could be undue burden on multi-specialty groups when each specialty/clinician reported separately and this resulted in separate payment adjustments, as it would be difficult to keep up with the scoring methodology and payment adjustments and would also create confusion for consumers in determining how well a group is performing.

Response: As we implement MVPs and propose to implement subgroup reporting, we intend to continue the group reporting option. We thank the commenters for their feedback and understand their concerns around reporting, scoring, and payment adjustment. We believe that the statute requires CMS, to the extent feasible, to make group reporting comprehensive. We would balance more comprehensive reporting with concerns about complex reporting and scoring and separate payment adjustments. Though we are considering if, in a future state, it would be feasible to require multispecialty groups to report through subgroups and therefore not report as a single group, we do not believe that it would be feasible in the initial years. We are holding a MVP Town Hall meeting on January 7, 2021 (see 85 FR 74729 through 74730) that will provide stakeholders with an opportunity to provide feedback on MVP topics, including subgroup reporting.

Comment: One commenter requested that CMS place a cap on the amount of measures that any one TIN would have to report. One commenter stated their belief that it will be difficult for developers and CMS to meet the 2nd guiding principle of providing valuable information to patients and caregivers if the MVP components are not meaningful to patients and caregivers.

Response: We do not believe that the suggested cap on number of measures a TIN must report is necessary as subgroup reporting will be optional for multispecialty groups during the MVP transition years. We intend that MVP components be meaningful to patients and caregivers and refer the commenter to our MVP development criteria finalized in section IV.A.3.a.(2)(a)(i) of this final rule that ensures meaningful MVPs that are comprehensible and understandable.

Comment: One commenter voiced concern related to linking cost and quality measurement in MVPs for specialties that rarely receive attribution in the cost performance category and urged CMS to be transparent in our cost attribution methodology.

Response: Regarding the commenter concern about linkage of specialty cost and quality measurement challenges in MVPs, as referenced in guiding principle 4, we refer the commenter to MVP Development criteria, section IV.A.3.a.(2)(a)(i) where we state that in cases where there are not relevant cost measures for a specific type of care being provided, a broadly applicable cost measure should be considered for MVP inclusion. We are also interested in focused feedback on what additional cost measures should be prioritized for future development and inclusion in the MVP candidate.

Comment: One commenter recommended that CMS revise guiding principle 2 to read: MVPs should include measures and activities that would result in providing comparative performance data that is valuable to patients and caregivers in evaluating clinician performance and making choices about their care “and their overall health and well-being.”

Response: We expect the guiding principles to work together to promote our overall goals and we include a meaningful measures principle which looks to improve clinician performance. While MVP comparative data will help patients make clinician selection choices, it is not clear that the comparative data would be available at a level that explicitly helps patients’ over-all health and well-being. Therefore, we are not adding the suggested wording to guiding principle 2.

Comment: One commenter encouraged CMS to provide additional guiding principle 2 guidance on how “sufficient comparative data” will be ensured, for example, by using single or a limited set of sources to aggregate, analyze and submit data within a given domain.

Response: We proposed to update MVP guiding principle 2 to highlight the importance of more comprehensive multispecialty reporting through subgroups as a step in improving comparative performance data. The movement towards standardization of measures reported within MVPs will improve our ability to ensure comparative clinician performance data. We intend to develop policies related to ensuring comparative data and subgroup reporting with stakeholder input and plan to provide further information related to implementation of this guiding principle in the future. We believe that subgroup reporting allows increased comprehensiveness of multispecialty group performance data as more services can be represented

when more than one MVP can be reported.

Comment: Several commenters requested clarifications and details of how subgroups would work operationally. Topics listed for clarification include scoring methodology, subgroup election process, and attribution, and thresholds. One commenter suggested that we mitigate the risk of subgroup payment penalties during transition years. One commenter urged CMS to continue clarifying how MVPs will benefit multispecialty physician practices.

Response: We proposed allowing subgroup reporting as a part of our MVP guiding principles and have not developed or proposed subgroup operational processes. As stated previously in this final rule, we intend to work with stakeholders to develop subgroup reporting policies and processes and intend to make subgroup MVP reporting available in future years. Stakeholder input into scoring, subgroup election processes, attribution, and minimal thresholds (if any) will be considered as we move ahead with subgroup reporting policy proposals in the future. MVPs will benefit multispecialty physician practices in that as more MVPs become available, groups will be able to continue to participate in MIPS via subgroups to more fully reflect the breadth of services provided by the various clinician types within the group. We intend that subgroup reporting will assist in improving the meaning and robustness of the performance data used to incentivize high quality and cost-effective care and providing information that patients can use to select clinicians.

Comment: One commenter seemed to suggest that subgroup reporting was an unnecessary step towards more comprehensive performance data by suggesting that electronic health records can capture individual clinician performances that aggregate into group performance, which they believe many practices have reported to CMS these past few years. The commenter further suggested that instead of changing from group reporting to individual reporting, we should consider a mechanism to collect performance details that obtain individual performances while maintaining group reporting option and scoring. One commenter suggested an alternate to subgroup reporting saying it may be more meaningful to have cross-cutting specialty measures for reporting, and provided an example of diabetes chronic condition care, which involves expertise from ophthalmologists, endocrinologists,

primary care providers, cardiologists and nephrologists.

Response: We intend that subgroup reporting would not be restricted to a single data submission type, for example, EHRs, and would like to leverage current and developing technologies, as indicated by MVP guiding principle 5, to reduce reporting burden as MVPs and subgroup reporting is implemented. We encourage stakeholders to share with us new technologies and opportunities to further our goal of comprehensive and comparative performance data while limiting or reducing clinician MVP reporting burden. Regarding the cross-cutting specialty measures suggestion, we note that our MVP development criteria in section IV.A.3.a.(2)(a)(i) of this final rule, includes an appropriateness element related to whether the MVP is reportable by multiple specialties. Our MVP criteria state that to the extent feasible, specialty and sub-specialty specific quality measures are incorporated into the MVP and that broadly applicable (cross-cutting) quality measures may be incorporated if relevant to the clinicians being measured (refer to section IV.A.3.a.(2)(a)(i) of this final rule). While we appreciate the commenter's interest in cross cutting performance measurement, we do not believe it is an alternative to subgroup reporting, which allows multispecialty groups to voluntarily report on MVPs that have more clinical relevance to various specialties and health priorities.

Comment: One commenter, referring to guiding principle 3, requested clarification of whether each MVP developer will be required to incorporate the patient voice. Another commenter recommended that with appropriate guidance from CMS, and integration of growing patient engagement practices, the inclusion of the patient voice should be mandatory.

Response: We proposed modifying guiding principle 3 to read, MVPs should include measures selected using the Meaningful Measures approach and, wherever possible, the patient voice must be included, to encourage performance improvements in high priority areas. We emphasize in the guiding principle that the patient voice should be captured whenever possible and if not possible, the reason should be clear, for example, if for a certain non-patient facing specialty MVP, there are no relevant patient reported measures currently available. As a part of the MVP development process, we believe that it is important to develop MVPs in a manner that takes into consideration the patient's experience, satisfaction,

and outcomes and capturing the patient voice will be used as a criterion as we assess candidate MVPs.

Regarding the commenter recommendation about guiding principle 3 language, "whenever possible, the patient voice must be included" and their belief that the patient voice should be mandatory, we refer the commenter to our MVP criteria, incorporation of the patient voice, in section IV.A.3.a.(2)(a)(i) of this final rule and our capturing the patient voice in section IV.A.3.a.(2)(a)(ii) of this final rule which make clear our commitment to inclusion of the patient voice both in our MVP criteria and during MVP development. In addition to including patients as a part of the MVP development process, we encourage stakeholders to utilize several approaches to incorporate the patient perspective, such as using focus groups, in-depth interviews with patients, and informal listening sessions, to the extent feasible, for a comprehensive patient perspective. We have finalized in this rule the expectation of patient voice inclusion in MVP measurement and MVP development.

Comment: A few commenters suggested that we add language to the MVP guiding principles to recognize social determinants of health, with one commenter suggesting that the MVP guiding principles explicitly recognize that healthcare outcomes and cost are shaped by, but go beyond, physicians and the care they provide and are substantially attributable to social factors. One commenter again (85 FR 50280) recommended that we supplement guiding principle 3 by stating explicitly measurement of "high priority areas of morbidity and mortality."

Response: We aim to implement MVPs that incentivize high value care and encourage clinicians to make care improvements based on performance measurement data. The Assistant Secretary for Planning and Evaluation (ASPE) Report to Congress: Social Risk Factors and Performance in Medicare's Value-Based Purchasing Program explored how the social determinants of health impact clinician performance data and value-based programs.¹²⁰ This report was publicly released in June 2020 and builds on the analyses included in an earlier report and provides additional insight for addressing risk factors in MIPS and other value-based payment programs. As we continue to review the analyses

and findings of the report, we are considering its recommendations, along with any updated data that would become available, for future rulemaking. We plan to continue working with ASPE, the public, and other key stakeholders on this important issue to identify longer term policy solutions that achieve the goals of attaining health equity for all beneficiaries and minimizing unintended consequences. As this work progresses, we will assess whether adding any social determinants of health wording to our MVP guiding principles is appropriate. We note that in support of social factor impacts we are finalizing in section IV.A.3.a.(2)(a)(i) of this final rule the proposed MVP criteria related to MVP developer consideration of patients in rural and underserved areas.

We do not believe it is appropriate to add the recommended "morbidity and mortality" wording in guiding principle 3 as we do not want to restrict what we mean by "high priority areas" to only morbidity and mortality performance improvements (85 FR 50281); we want to encourage performance improvements in a variety of high priority areas.

Comment: A few commenters requested clarification of a definition of "digital quality measures" and the associated criteria for MVP measures. One commenter suggested that while digital measures would reduce burden for some, they would increase burden for others and another commenter suggested equity be considered in the use of eCQMs and digital measures for clinicians. One commenter would like to see digital quality measure exceptions for small practices which are not fully electronic. Another commenter suggested clinician choice in selection of dQMs to report. One commenter suggested that as we implement guiding principle 5, we expand the scope to incentivize building an infrastructure of digital systems that track patients longitudinally, inform care decisions, and support their quality improvement efforts. One commenter requested clarification as to whether our examples of dQMs suggested that eCQMs and MIPS CQMs will eventually be collapsed into a single undifferentiated collection type of dQM and that this could lead to a more optimally hybridized environment of quality measure development, collection and reporting. One commenter suggested that MVP digital measures should include all potential validated data sources, particularly patient reported outcomes and remote patient monitoring data, not just administrative data. One commenter suggested that we

¹²⁰ ASPE Second Report to Congress. <https://aspe.hhs.gov/pdf-report/second-impact-report-to-congress>.

need to better define “digital” technologies and the associated measure reporting requirements. One commenter, referring to guiding principle 5, encouraged us to more broadly recognize use of electronic data, such as MIPS credit for wearable devices initiatives. One commenter urged CMS to continue investing in further developing standards that support accurate data quality. A few commenters did not support proposed guiding principle 5 citing EHR, IT and cybersecurity burden concerns for small and rural practices. One commenter requested that we consider MVP development criteria that take into account those clinicians who may not be able to satisfy electronic reporting requirements.

Response: We proposed adding new MVP guiding principle 5, MVPs should support the transition to digital quality measures, to communicate our future vision for reducing MVP reporting burden through leveraging digital innovation. Digital Quality Measures (dQMs) originate from sources of health information that are captured and can be transmitted electronically and via interoperable systems. Examples of digital sources include electronic health records (EHR), health information exchanges (HIEs), clinical registries, case management systems, electronic administrative claims systems, electronically submitted assessment data, and wearable devices. Electronic clinical quality measures or eCQMs (data derived from electronic medical records) are a subset of dQMs (85 FR 50281). As we develop MVPs and incorporate dQMs into MVPs we will consider the operational elements, transitional factors and how movement to dQMs impacts clinician burden, office protocols, cross-MVP equity, and small practices in keeping with our intent to reduce burden. We believe including dQMs in MVPs will incentivize the building of clinician infrastructures of digital systems. We intend to continue supporting the development of dQMs and look forward to inclusion of these measures in MVPs in the future.

After consideration of public comments, we are finalizing our proposals as proposed.

(2) MVP Development

(a) Process of Developing MVPs

In the CY 2020 PFS final rule (84 FR 62948), we finalized at § 414.1305 the definition of a “MIPS Value Pathway” to mean a subset of measures and activities established through rulemaking. We also clarified our

intention to develop MVPs, to the extent feasible, in collaboration with stakeholders (84 FR 62947).

Commenters suggested us to work in tandem with clinicians and specialty societies to develop MVPs (84 FR 62948) and have supported the development of MVPs with robust stakeholder input and feedback opportunities. Stakeholders have also clearly emphasized the need for input during the design and implementation of MVPs. We believe it is important to emphasize that the transition to MVPs must occur gradually, without immediate elimination of the current MIPS program, as we continue to work collaboratively with stakeholders regarding MVP development. As MVPs are developed collaboratively and in a manner that involves dialogs with stakeholders, they must be created utilizing a consistent set of parameters and criteria, to ensure that MVPs are constructed and implemented in a uniform manner. In addition, we believe it is important to outline the methods in which collaboration and engagement may occur with stakeholders. Lastly, we intend on formulating a standardized process in which stakeholders can submit formal MVP candidates for CMS’ consideration.

(i) MVP Development Criteria

In response to the RFI in the CY 2020 PFS final rule, we have received stakeholder comments that supported the move to MVPs with considerations to departing from the traditional reporting requirements of the existing MIPS program, such as reporting 6 quality measures for the Quality performance category. We also received stakeholder comments through the RFI that supported the use of electronically available measures such as eCQMs and the use of QCDR measures to the extent feasible. Stakeholders also expressed that it is important that the collection type of quality measures be considered as MVPs are designed. As a part of the MVP development process, consideration should be given to the four performance categories in MIPS, and whether the MVP has a clearly defined intent, offers value, and opportunity for improvement. We believe that as a part of MVP development, it is important to clearly identify linkages between the measures and activities within an MVP which will demonstrate the relevancy of measures and activities to the clinicians being captured within the MVP. Furthermore, as MVPs are developed it is important to factor in the appropriateness of the measures and activities being included and the

comprehensibility of the MVP to clinicians and patients. Lastly, considerations must be given to existing criteria for measure and activity inclusion or removal, as established for each of the performance categories. For example, as described in the CY 2019 PFS final rule (83 FR 59763) for the quality performance category, quality measures that are identified as extremely topped out (reaching an average performance rate between 98 to 100 percent) will likely be removed from the program. We refer readers to the CY 2020 PFS final rule (84 FR 62949 through 63006) for discussion of previously finalized measure and activity requirements across the Quality, Cost, Improvement Activity, and Promoting Interoperability performance categories. In addition, we also referred readers to section IV.A.3.c. of the CY 2021 PFS proposed rule for updates to the respective performance categories. Therefore, beginning with the 2022 MIPS performance period, we proposed to develop and select MVPs using the following criteria:

- Utilization of Measures and Activities across Performance Categories.

(a) MVPs should include measures and activities from the Quality, Cost, and Improvement Activities performance categories.

(b) MVPs should include the entire set of Promoting Interoperability (PI) measures.

- Intent of Measurement:

(a) What is the intent of the MVP?

(b) Is the intent of the MVP the same at the individual clinician and group level?

(c) Are there opportunities to improve the quality of care and value in the area being measured?

(d) Why is the topic of measurement meaningful to clinicians?

(e) Does the MVP act as a vehicle to incrementally phase clinicians into APMs? How so?

(f) Is the MVP reportable by small and rural practices? Does the MVP consider reporting burden to those small and rural practices?

(g) Which Meaningful Measure Domain(s) does the MVP address?

- Measure and Activity Linkages with the MVP:

(a) How do the measures and activities within the proposed MVP link to one another? (For example, do the measures and activities assess different dimensions of care provided by the clinician?)

(b) Are the measures and activities related or a part of the care cycle or continuum of care offered by the clinicians?

(c) Why are the measures and activities most meaningful to the specialty?

- Appropriateness:

(a) Is the MVP reportable by multiple specialties? If so, has the MVP been developed collaboratively across specialties?

(b) Are the measures clinically appropriate for the clinicians being measured?

(c) Do the measures capture a clinically definable population of clinicians and patients?

(d) Do the measures capture the care settings of the clinicians being measured?

(e) Prior to incorporating a measure in an MVP, is the measure specification evaluated, to ensure that the measure is inclusive of the specialty or sub-specialty?

- Comprehensibility:

(a) Is the MVP comprehensive and understandable by the clinician or group?

(b) Is the MVP comprehensive and understandable by patients?

- Incorporation of the Patient Voice:

(a) Does the MVP take into consideration the patient voice? How?

(b) Does the MVP take into consideration patients in rural and underserved areas?

(c) How are patients involved in the MVP development process?

(d) To the extent feasible, does the MVP include patient-reported outcome measures, patient experience measures, and/or patient satisfaction measures?

- Measures and Improvement Activities Considerations: MIPS Quality Measures.

We were not prescriptive on the number of quality measures that are included in an MVP. In selecting quality measures, we stated that we believe that consideration should be given to the following:

(a) Do the quality measures included in the MVP meet the existing quality measure inclusion criteria? (*For example, does the measure demonstrate a performance gap?*)

(b) Have the quality measure denominators been evaluated to ensure the eligible population is consistent across the measures and activities within the MVP?

(c) Have the quality measure numerators been assessed to ensure the measure is applicable to the MVP topic?

(d) To the extent feasible, does the MVP include outcome measures, or high priority measures in instances where outcome measures are not available or applicable? We encourage stakeholders to utilize our established pre-rulemaking processes, such as the Call

for Measures, described in the CY 2020 PFS final rule (84 FR 62953 through 62955) to develop outcome measures relevant to their specialty if outcome measures currently do not exist and for eventual inclusion into an MVP.

(e) To the extent feasible, does the MVP include electronically specified clinical quality measures?

(f) To the extent feasible, does the MVP avoid including quality measures that are topped out?

(g) What collection types are the measures available through?

(h) What role does each quality measure play in driving quality care and improving value within the MVP?

Provide a rationale as to why each quality measure was selected.

(i) How do the selected quality measures relate to other measures and activities in the other performance categories?

(j) To the extent feasible, specialty and sub-specialty specific quality measures are incorporated into the MVP. Broadly applicable (cross-cutting) quality measures may be incorporated if relevant to the clinicians being measured.

- Measures and Improvement Activities Considerations: Cost Measures.

(a) What role does the cost measure(s) play in driving quality care and improving value within the MVP? Provide a rationale as to why each cost measure was selected.

(b) How does the selected cost measure(s) relate to other measures and activities in other performance categories?

(c) If there are not relevant cost measures for specific types of care being provided (for example, conditions or procedures), does the MVP include broadly applicable cost measures (that are applicable to the type of clinician)?

(d) What additional cost measures should be prioritized for future development and inclusion in the MVP?

- Measures and Improvement Activities Considerations: Improvement Activities.

(a) What role does the improvement activity play in driving quality care and improving value within the MVP? Provide a rationale as to why each improvement activity was included.

(b) Describe how the improvement activity can be used to improve the quality of performance in clinical practices for those clinicians who would report this MVP.

(c) Does the improvement activity complement and/or supplement the quality action of the measures in the MVP, rather than duplicate it?

(d) To the extent feasible, does the MVP include improvement activities

that can be conducted using CEHRT functions? The use of improvement activities that specify the use of certified health IT will help to further align with the CEHRT requirement under the Promoting Interoperability performance category.

(e) If there are not relevant specialty or sub-specialty specific improvement activities, does the MVP include broadly applicable improvement activities (that is applicable to the clinician type) are used?

- Measures and Improvement Activities Considerations: Promoting Interoperability (PI) Measures.

(a) Must include the full set of PI measures.

The MVP development criteria was developed primarily with consideration with the MVP guiding principles, discussed above. In addition, we considered the spectrum of measures and activities available for MVP development, and the criteria used to include measures and activities within each of the respective performance categories. Through the collaborative process of co-developing MVPs with stakeholders, we have realized how crucial it is to establish a set of MVP development criteria that would standardize what is expected of MVPs and provide our evaluation criteria in a transparent manner. We stated that we believe that the aforementioned criteria will lead to the development of MVPs in a manner that is consistent and reliable. We sought comment on the MVP development criteria.

We received public comments on the MVP development criteria proposal. The following is a summary of the comments we received and our responses.

Comment: A few commenters broadly supported the MVP criteria.

Response: We agree and thank the commenters for their support on the MVP criteria. We believe that the establishment of MVP development criteria will allow stakeholders to better understand of our vision for MVPs and ensure that MVPs are constructed in a consistent manner.

Comment: Several commenters broadly supported the MVP criteria. One commenter suggested CMS to continue to prioritize interoperability as a foundational requirement in the new MVP Program. One commenter agreed that MVPs should include criteria related to utilization, intent, and linkage of measures because this would help develop new MVPs. One commenter suggested CMS provide flexibility for innovative MVPs.

Response: We thank the commenters for their support on the MVP criteria,

we believe there is importance to establishing criteria in which MVPs will be developed and implemented for consistency purposes. We also agree that interoperability is an important priority, and should therefore, be included in MVPs as a foundational requirement. We also agree that criteria related to utilization, intent, and linkages would assist in the development of MVPs. Lastly, we continue to encourage stakeholders to be innovative as they partake in MVP development and collaboration with CMS while aligning with the MVP development criteria as described. We do not believe additional flexibility beyond what is described in the MVP development criteria is needed, as we emphasize that MVPs should be developed utilizing a standardized framework.

Comment: Commenters expressed that MVPs should be tailored for participating clinician specialists', such as anesthesiologists, neurosurgeons, rehabilitation medicine, occupational therapists, physical therapists, and speech-language pathologists. A few commenters stated that MVPs should be collaboratively developed by specialties before submission to CMS. One commenter expressed that MVPs could be considered condition-specific (when specialists are part of a larger core team) or specialty-specific (when specialists are treating patients with a wide range of diagnoses). One commenter expressed that specialty organizations would have difficulty contributing measures to MVPs that are not specialty specific.

Response: We agree that MVPs should be developed around specialties that participate in the MIPS program to offer clinicians a more meaningful method of reporting. We also strongly agree and would encourage that MVPs should be collaboratively developed amongst specialties, in instances where an MVP covers an episode of care that involves multiple clinician types, such as surgeons and anesthesiologists. Furthermore, we agree that MVPs could be condition-specific or specialty-specific; it will depend on the clinical topic being measured and envision the specialty organizations would suggest specialty specific measures for MVPs over broadly applicable measures. While broadly applicable measures, such as closing the referral loop, can be considered for inclusion in an MVP, because they cover quality actions that are a part of the care continuum, these are not required to be included should more meaningful and relevant specialty specific measures exist. We believe the measures included in an MVP should be

relevant and meaningful to the clinical practice of the specialties being measured. We are open to considering candidate MVPs that are created utilizing the MVP development criteria, for specialties including physical and occupational therapy.

Comment: Several commenters expressed that the proposed MVP criteria should include other elements such as the number of measures and activities required. A few commenters recommended CMS work collaboratively with MVP developers and one commenter specified that CMS's MVP approval process should be transparent with the MVP developers so that specialty societies do not invest resources without assurances of success.

Response: As described in the CY 2021 PFS proposed rule (85 FR 50282), we are not prescriptive on the number of measures or activities included in MVPs. We emphasize that the measure and activities should be relevant and meaningful to the topic being measured through the MVP. We intend to provide educational material including plans to host a public facing webinar to help stakeholders better understand and be prepared to implement the MVP development criteria. In addition, we emphasize it is our intention to work collaboratively by having dialogs with stakeholders to develop MVPs that are meaningful and relevant to their given clinical specialties. Lastly, while we intend to continue to work with stakeholders in an iterative manner that fosters transparency, CMS will ultimately determine if and when an MVP candidate is ready for implementation. We intend to follow our normal processes of notice and comment rulemaking to make stakeholders and the public aware of which MVPs we believe are ready for implementation for the upcoming performance period.

Comment: One commenter recommended CMS clearly define a pathway to phase clinicians into APMs.

Response: We intend that MVPs will assist clinicians and practices as they prepare to take on and manage financial risk, as in Advanced APMs, as they build out their quality infrastructures that align with the MIPS performance categories and gain experience with cost measurement. We believe that experience with MVPs, in which there is aligned measurement of quality (of care and of experience of care) and cost, continuous improvement/innovation within the practice, and efficient management and transfers of information, will help remove barriers to APM participation.

We refer readers to the infographic at <https://qpp.cms.gov/mips/mips-value-pathways>, which provides an overview of our vision for the MIPS path to value future state (see 85 FR 50279). We believe that MVPs, which better align cost and quality measurement and use measures meaningful to clinician practice performance, will help clinicians develop skills and processes that increase their readiness for APM participation. This experience with MVPs may stimulate clinician care improvement processes, a growth of data handling infrastructures, and increase clinician understanding of delivery of high value care. We believe another example of how MVPs may provide a pathway to phase clinicians into APMs may be to consider the inclusion of quality measures in MVPs, which are used in APMs such as the new APM Performance Pathway (APP). The familiarity of reporting those measures, may lead to a smoother glide path for clinicians into APMs.

Furthermore, MVPs should reduce barriers to APM participation by including measures that are part of APMs where feasible, and by linking cost and quality measurement. Experience with MVPs that measure quality of care and patient experience of care, cost, continuous practice improvement, and effective management and transfers of health information will help to reduce barriers to APM participation (84 FR 40732 through 40733 and 84 FR 62947). We anticipate these low burden, meaningful MVPs will move clinicians along the value continuum and facilitate movement into APMs by leveraging APM measures where feasible, and linking cost and quality. We will continue to engage with stakeholders on how MVPs may reduce barriers to APM participation in the future. We are holding a MVP Town Hall meeting on January 7, 2021 that will provide stakeholders with an opportunity to provide feedback on MVP topics, including how MVPs can help reduce barriers to APM participation. (See the November 23, 2020 **Federal Register** (85 FR 74729 through 74730) for additional information on the January 7, 2021 meeting.)

Comment: One commenter requested that CMS define an MVP governance structure that would include a central point of contact and responsibility to prevent the removal of a measure or an improvement activity that would negatively affect stakeholders and specialties.

Response: All MVPs are subject to notice and comment rulemaking with regards to the proposal of new MVPs,

changes to existing MVPs (in the future), and removal of MVPs or components of an MVP (such as a quality measure or improvement activity). CMS is the central point of contact with regards to MVPs. If there are potential changes to an established MVP, we will consider the potential impacts on all stakeholders prior to proposing the changes. Stakeholders will be able to provide comments on the proposed changes through the public comment period for CMS to consider prior to finalizing the MVPs or changes to the MVPs.

Comment: One commenter requested that CMS clarify if it would withhold MVP approval for a specialty specific MVP if patient reported outcome measures for the specialty specific MVP are not available.

Response: While it is our preference to include outcome and patient reported outcome measures in MVPs, we have stated we would do so to the extent feasible, as we understand that there may be limited availability of patient reported outcome measures for all specialties. Therefore, we encourage the use of other measures that consider the patient voice in MVPs, such as patient surveys, patient satisfaction, or patient experience measures in the interim. It is our vision that MVPs will be made up of a majority of outcome measures and will include a patient reported outcome measure that would represent the patient voice. We continue to encourage stakeholders to use their innovative means to develop and submit through our established pre-rulemakings processes patient reported outcome measures that are meaningful to their specialties, and consider the incorporation of tools such as the PROMIS tool into their measure development.

Comment: One commenter requested that CMS clarify how MVPs will incorporate new technology, such as FHIR (Fast Healthcare Interoperability Resource), into data collection.

Response: As mentioned in the previous section of this final rule, within our MVP guiding principles, we indicate that MVPs should support the transition to digital measures to the extent feasible. The inclusion of digital measures within MVPs may facilitate future use of new technologies such as FHIR, in an effort to provide reporting options that reduce reporting burden for clinicians and groups.

Comment: A few commenters opposed including the full set of promoting interoperability (PI) measures in MVPs and recommended CMS emphasize that improvement activities must utilize certified electronic health record technology (CEHRT). One

commenter noted that hospitalists or clinicians who do not interact with patients would not be able to collect and report PI data and that MVPs should be designed to reflect this at the outset by allowing groups to attest to using CEHRT. One commenter suggested CMS maintain the existing PI hardship exceptions as a proxy for the PI measurement requirement.

Response: We believe that interoperability is a foundational element of MVPs. In the CY 2020 PFS final rule (84 FR 62948) we stated that we envision an initial uniform set of Promoting Interoperability measures in each MVP and will consider customizing MVP Promoting Interoperability measures in future years. We believe that eligible clinicians could benefit from more targeted approaches that assess the meaningful use of health IT in alignment with clinically relevant MVPs. As we gain additional years of experience with MVPs, we may be able to consider MVP Promoting Interoperability measures in each MVP, but we want to spend some time assessing what criteria should be used in determining which Promoting Interoperability measures fit or do not fit within a given MVP and why. Furthermore, we agree that the establishment and inclusion of improvement activities (IAs) that require the utilization of certified health IT in MVPs would create a stronger linkage between the PI and IA performance categories. Lastly, the existing bases for reweighting the PI performance category under traditional MIPS also will be available through MVPs.

Comment: A few commenters expressed that many small and rural practices cannot afford implementing electronic health records (EHRs), including the information technology and cybersecurity staff required to maintain EHR security and recommended CMS maintain the Promoting Interoperability performance category small practice hardship exception.

Response: We understand that there may be some barriers for small and rural practices in implementing CEHRT, and do intend on maintaining the hardship exception for small practices as we establish the MVP reporting option. In addition, we intend on applying the existing Promoting Interoperability performance category reweighting policies under § 414.1380(c)(2) as we establish MVPs, with any revisions addressed through future notice and comment rulemaking.

Comment: Several commenters suggested overall measure requirements

regarding the number of measures and requested measure clarification. A few commenters requested that MVPs include a limited number of measures. One commenter suggested that clinicians report six quality measures and one outcome measure or high-priority measure. One commenter suggested that specialties and subspecialties with less than six quality measures should be required to report on all cross-cutting measures.

Response: As mentioned in the CY 2021 PFS proposed rule (85 FR 50282), to date, we have not been prescriptive on the number of quality measures that are included in a given MVP. The measures that are being considered for inclusion of the MVP should meet the standards of the MIPS quality measures and QCDR measures inclusion criteria. Measures incorporated into an MVP should be clinically relevant to the topic being measured. Through the gradual transition to MVPs, we intend on allowing for clinicians to report on smaller but more meaningful sets of measures and activities. We appreciate the feedback regarding MVP reporting requirements, and encourage stakeholders to participate in our MVP Town Hall meeting to provide additional feedback with regards to the number of measures clinicians should be required to report in an MVP. As noted previously in this section, we are holding a MVP Town Hall meeting on January 7, 2021 (85 FR 74729 through 74730) that will provide stakeholders with an opportunity to provide feedback on this amongst other MVP topics. We thank the commenters on their suggestions in regards to reporting requirements for specialties and subspecialties with less than six quality measures, and will take the comment into consideration for future rulemaking.

Comment: One commenter requested clarification on whether every MVP measure and improvement activity should have the same denominator.

Response: To clarify, every measure and improvement activity does not have to have the same denominator. However, we encourage stakeholders to consider the denominator eligible population across the measures being considered for inclusion in the quality and cost component of the MVP. In addition, we also encourage stakeholders to review the measure specifications to validate that the places of service they would like reflected within the MVP, for example, inpatient or outpatient are included. We encourage this review, so that stakeholders are cognizant of incorporating measures that are widely

applicable to the clinicians they intend to measure through the MVP. Furthermore, improvement activities do not utilize numerators and denominators like measures do. Therefore, we encourage stakeholders to utilize improvement activities that are complementary to the quality actions captured by the quality measures and cost measures included within the MVP candidate.

Comment: One commenter stated CMS should ensure there are enough measures to create MVPs applicable for the more than 1 million eligible clinicians that currently participate in the MIPS program, specifically specialists.

Response: In the MIPS program, we have implemented two inventories of measures, which include MIPS quality measures that are submitted through the Call for Measures following the pre-rulemaking process that are eventually proposed and finalized through notice and comment rulemaking. The other inventory of available measures are developed by CMS approved Qualified Clinical Data Registries (QCDRs). We refer readers to the Quality Payment Program (QPP) resource library: <https://qpp.cms.gov/about/resource-library> for details on the available inventories of quality measures and QCDR measures for the 2020 performance period. The measure inventories for the 2021 MIPS performance period will be posted to the prior to the start of the performance period in the QPP resource library. We believe the existing inventories of measures are enough to start creating applicable MVP candidates. Moreover, we continue to encourage measure stewards and QCDRs to innovatively develop measures and keep in mind our desire to transition our inventory of measures to be largely based on outcome measures and develop measures that are outcome, intermediate outcome, or patient reported outcome based.

Comment: Another commenter recommended allowing specialties to rapidly test and replace obsolete measures.

Response: We agree and highly encourage stakeholders, such as specialty groups and measure developers to participate in measure development and submit measures through the Call for Measures as soon as possible to replace retired measures with measures that are more robust and outcomes based. In following the pre-rulemaking guidelines to ensure their measures can be considered, the process also includes measure testing amongst other requirements. We refer readers to the pre-rulemaking website for a

comprehensive list of measure development requirements and resources at <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/Pre-Rulemaking-MUC>.

Comment: Commenters recommended that CMS incorporate patient-reported outcomes measures (PROMs) into MVPs and expressed that these measures not only improve the quality of care but also help patients make more informed decisions. Commenters also recommended that PRO tools such as PROMIS, SDM-Q-9, and CollaboRATE be incorporated into the MVP quality score.

Response: We agree with the commenters that patient reported outcome measures provide value and improve the quality of care, and to the extent feasible, should be included in MVPs. We also agree that PRO tools are valuable, but need to be incorporated into a measure or activity in order to contribute to the MVP quality score per statutory requirements.

Comment: One commenter requested CMS to clarify the number of MVPs per specialty and a few commenters recommended sub-specialty MVPs. For example, one commenter recommended CMS support the development of multiple surgical and procedural MVPs to represent anesthesia practice settings to provide sufficient MVP choices for ECs and groups.

Response: To date we have not been specific as to the maximum number of MVPs a given specialty should have. We are cognizant of the potential need for MVPs that are sub specialized and that the number of MVPs available per specialty may vary. We believe discussions with the specialties will help to determine the best path forward, while keeping in mind our desire to avoid creating large volumes of MVPs per specialty, which may create more complexity and may lead to overwhelmed clinicians unsure of which MVP to report. After consideration of the public comments received, we are finalizing our proposals as proposed.

(ii) Capturing the Patient Voice

As a part of the MVP development process, we believe that it is important to develop MVPs in a manner that takes into consideration the patient's experience, satisfaction, and outcomes. We believe that MVPs should be constructed in a manner that should not only be understood by clinicians, but by patients who may use the ascertained information to make informed decisions regarding their health care providers. Therefore, beginning with the 2022

performance period, we proposed that stakeholders that are developing MVPs to submit to CMS as candidate MVPs should include patients as a part of the MVP development process. We stated that stakeholders should incorporate patients and/or patient representatives through means that may include, but are not limited to technical expert panels or an advisory committee as they work to construct their candidate MVPs prior to reaching out to CMS with a candidate submission. The process of involving patients as a part of the stakeholder's MVP development would be considered a pre-requisite for CMS to consider the candidate MVP for the upcoming performance period. By including patients and/or patient representatives in the MVP development process, we stated we believe that patients will be able to voice how to make the outcomes of measurement meaningful to them. In addition to including patients as a part of the MVP development process, we encouraged stakeholders to utilize several approaches to incorporate the patient perspective, such as using focus groups, in-depth interviews with patients, and informal listening sessions, to the extent feasible, for a comprehensive patient perspective. We sought comments on the proposal.

We received public comments on the capturing the patient voice proposal. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the inclusion of the patient voice in the MVP development process.

Response: We thank the commenters for their support, and agree that there is importance in including the patient voice in the MVP development process. We believe that including patients as a part of the MVP development process will allow for the development of MVPs that provide data that is meaningful to patients as they select providers.

Comment: One commenter opposed the addition of MVP development criteria, citing concern that these will delay MVP development. The commenter suggests that CMS subject each MVP candidate to a robust screening process that includes patient perspective, rather than putting the onus on developers to do so.

Response: We disagree that the establishment of MVP development criteria will delay MVP development. We believe that the creation of MVP development criteria will allow for the implementation of MVPs that are created in a consistent manner that aligns with our vision of MIPS Value Pathways moving clinicians to more meaningful measurement that creates

better opportunities for quality improvement. Furthermore, we disagree with the commenter's suggestion that CMS alone subject each MVP candidate to a screening process that includes patients. We believe that stakeholders who choose to create a MVP candidate around a clinical topic should consider the patient perspective as a part of the development process rather than waiting until the candidate MVP has completed development to obtain patient feedback. The consideration of the patient perspective in the midst of the development process allows stakeholders to consider the feedback and make changes to their development process that will help to result in a better quality MVP candidate.

Comment: A few commenters recommended that CMS delay implementing the criteria that the MVP is comprehensive and understandable by patients. A few commenters requested a delay until the 2023 performance year so that a technical expert panel could be convened.

Response: We disagree that this criteria should be delayed until the 2023 performance period. We believe all MVP candidates need to be developed with this criteria in mind to ensure that the data collected from MVPs are meaningful for patients to make informed decisions regarding their patient care. Furthermore, it is not a requirement that stakeholders convene technical expert panels, therefore, we disagree that there be a delay until the 2023 performance period. While we have established criteria to develop MVPs, it is to the discretion of the stakeholder to determine how elaborate of a development process they would like to undertake and when their MVP candidate is ready for CMS review and consideration.

Comment: Several commenters recommended approaches for CMS to engage patients. One commenter expressed concern about how CMS will evaluate patient engagement during the MVP development process.

Response: We thank the commenters for their recommendations; however, we note that the requirement is for stakeholders who wish to submit an MVP candidate to CMS. Those stakeholders must engage with patients as a part of their MVP development process prior to submitting the MVP candidate for CMS review and consideration. While we are not prescriptive that patient engagement occur using a single approach, we plan to recommend stakeholders to describe how they engaged patients in the MVP development process through the MVP candidate submission template to help

us understand how the patient's perspective was considered in the development process.

Comment: One commenter requested that CMS make exceptions for the inclusion of patient representatives in MVP development in cases where organizations are able to demonstrate that patient reported outcomes cannot be used. Another commenter requested clarity on whether each contributor or specialist to an MVP must include patient testing or interviews. The commenter also requested detail on how CMS will verify the inclusion of the patient voice.

Response: We disagree with the commenter request that we make exceptions for the inclusion of patient representatives in the MVP development process in instances where organizations are unable to utilize patient reported outcome measures. We want to clarify that the requirements around the patient voice are complimentary. We are looking for stakeholders to involve patients or patient representatives as a part of the MVP development process, to ensure that patients are able to understand what the MVP is trying to measure. In addition, to the extent feasible, we suggested that patient reported outcome measures be included in MVPs. While it is our preference to include patient reported outcome measures in MVPs, we understand that there may be limited availability of patient reported outcome measures for all specialties. Therefore, we encourage the use of other measures that consider the patient in MVPs, such as patient surveys, patient satisfaction, patient experience, or patient safety measures. We continue to encourage stakeholders to use their innovative means to develop and submit through our established pre-rulemakings processes patient reported outcome measures that are meaningful to their specialties, and consider the incorporation of tools such as the PROMIS tool into their measure development.

Comment: One commenter recommended that CMS develop patient-facing materials describing MVPs and requested that CMS lead education of patient groups on the goals and quality measurement of the MVP.

Response: We thank the commenter for their recommendation. As a part of our education and outreach efforts we intend on developing educational materials and hosting webinars that are meaningful to all stakeholders, including patients. However, we also believe that stakeholders who choose to partake in MVP development should also educate and involve patients

regarding quality care in a given area of clinical care improvement.

Comment: One commenter requested CMS to provide equal focus on patient outcomes as patient experience and satisfaction. Another commenter stated that treating and reversing certain chronic conditions and achieving optimal health outcomes. One commenter recommended that MVPs include the Hospital-Wide 30-day All Cause Unplanned Readmission (HWR) Rate measure.

Response: We agree and continue to emphasize our focus on outcomes, including patient reported outcomes, and our desire to move away from process measures. We also agree that attaining optimal health outcomes by treating, managing, and possibly overcoming chronic conditions should be captured in a future MVP. Furthermore, we agree that there is importance in including population health measures in the foundational layer of all MVPs as described below, and we do intend on finalizing the inclusion of the Hospital-Wide 30-day All Cause Unplanned Readmission (HWR) Rate for the Merit-Based Incentive Payment System Program (MIPS) Eligible Clinician Groups measure.

After consideration of the public comments, we are finalizing our proposals as proposed.

(iii) Candidate MVP Co-Development, Solicitation Process, and Evaluation

Through the Request for Information (RFI) on transforming MIPS in the CY 2020 PFS final rule we have learned of stakeholders interests in participating in the MVP development process. In summer 2019, we held numerous focus groups with front-line clinicians, specialty societies, advocacy groups, QCDRs, registries, and health IT vendors to listen to what stakeholders were looking for in regards to program simplification, burden reduction, and the intent of MVPs. In response to the CY 2020 PFS final rule, we received several requests from stakeholders who wanted to discuss their perspectives on MVPs and in some cases, walk us through potential MVP candidates from their specialty. Based on continuous stakeholder interest, we believe that a process must be implemented to ensure that stakeholder engagement and collaboration in the development of MVPs is consistent from an overall perspective.

To consider MVP candidates developed by stakeholders, we believe it is important to implement a streamlined approach to receive and evaluate potential MVPs. Therefore, beginning

with the 2022 performance period, we proposed that stakeholders should formally submit their MVP candidates utilizing a standardized template, which will be published in the QPP resource library for our consideration for future implementation. Stakeholders should submit all information including a description of how their MVP abides by the MVP development criteria as described in the CY 2021 PFS proposed rule (85 FR 50281 through 50283), and provide rationales as to why specific measures and activities were chosen to construct the MVP. We believe the utilization of a standardized template would help stakeholders understand what information is needed to evaluate the feasibility of the candidate MVP.

On an annual basis, we intend on hosting a public facing MVP development webinar, to remind stakeholders of MVP development criteria, the timeline, and process in which to submit a candidate MVP. While we believe that engagement with stakeholders regarding MVP candidates may occur on a rolling basis throughout the year, at CMS' discretion we will determine if an MVP is ready for inclusion in the upcoming performance period. As MVP candidates are received, they will be reviewed, vetted, and evaluated by CMS and our contractors. We intend on utilizing the MVP development criteria (discussed above) to determine if the candidate MVP is feasible. In addition to the MVP development criteria listed above, we will also vet the quality and cost measures from a technical perspective to validate that the coding in the quality measures and cost measure(s) include the clinician type being measured, and whether all potential specialty specific quality measures or cost measures were considered, with the most appropriate included. We may reach out to the stakeholder on an as-needed basis, should questions arise as we review. In addition, once we complete our internal evaluation, we will reach out to select stakeholders whose candidate MVP may be feasible for the upcoming performance period, to schedule a feedback loop meeting to have a dialog regarding our feedback, and next steps that may include recommended modifications to the MVP candidate. Since MVPs must be established through rulemaking, as described at § 414.1305, CMS will not communicate to the stakeholder whether an MVP candidate has been approved, disapproved, or is being considered for a future year, prior to the publication of the proposed rule. We sought comment

on the proposed process to solicit MVP candidates.

The following is a summary of the comments we received and our responses.

Comment: A few commenters supported the use of an MVP candidate template with one believing it is as a way to reduce administrative burden. Another commenter requested that we release the MVP candidate template far in advance of MVP implementation.

Response: We plan to release the MVP candidate template as soon as possible, and potentially in coordination with the publication of this final rule so it can be immediately available for use by stakeholders.

Comment: One commenter voiced their appreciation for our MVP development discussions and feedback to date and supported the idea of a feedback loop on submitted MVPs and greater transparency in the process.

Response: We thank the commenter for their support; we believe establishing a feedback loop with stakeholders will help to strengthen communications regarding MVP candidates that may be iteratively revised based on our review. While we intend to continue to work with stakeholders in an iterative manner that fosters transparency, CMS will ultimately determine if and when an MVP candidate is ready for implementation. We intend to follow our normal processes of notice and comment rulemaking to make stakeholders and the public aware of which MVPs we believe are ready for implementation for the upcoming performance period. If there are potential changes to an established MVP, we will consider the potential impacts on all stakeholders prior to proposing the changes. Stakeholders will be able to provide comments on the proposed changes through the public comment period for CMS to consider prior to finalizing the MVPs or changes to the MVPs.

Comment: A few commenters objected to the idea that CMS would not communicate to the stakeholder developing a candidate MVP whether an MVP candidate has been approved, disapproved, or is being considered for a future year, prior to the publication of the annual QPP proposed rule. A few commenters suggested an interactive dialogue between the stakeholder who has submitted the candidate MVP and CMS would be helpful throughout the development process. One commenter suggested that CMS should provide feedback regardless of whether the MVP will be proposed for implementation and another requested feedback be

provided throughout the MVP development process. One commenter believes a clear process and timeline for approving MVPs and new measures should be clearly delineated prior to implementation.

Response: We agree that a dialog between the stakeholder who has developed the candidate MVP and CMS would be meaningful, to ensure that the MVP aligns with program goals and MVP criteria and that CMS provides meaningful feedback on how an MVP may be revised to better align with the aforementioned criteria before being considered for implementation. In some instances, discussions regarding a given MVP candidate may be iterative, and may call for a few meetings to discuss changes. Some MVP candidates may be identified as ready for implementation in the upcoming year, while others may require additional work. That is the reason why we would review MVPs on a rolling basis. In instances where an MVP may not be ready for implementation in the upcoming performance period, it may be ready by the following performance period. The timing in which an MVP may be ready for implementation will be dependent of the MVP's readiness and ability to meet the aforementioned MVP criteria. New measures will need to follow the existing pre-rulemaking processes or QCDR measure requirements to be considered for inclusion in an MVP. While we intend to continue to work with stakeholders in an iterative manner that fosters transparency, CMS will ultimately determine if and when an MVP candidate is ready for implementation. We intend to follow our normal processes of notice and comment rulemaking to make stakeholders and the public aware of which MVPs we believe are ready for implementation for the upcoming performance period.

Comment: A few commenters requested more guidance around expectations, MVP candidate assessment processes and communications. One commenter requested CMS publish MVP development status updates while another commenter requested a CMS website that would provide information on MVPs under development and CMS' initial assessment data.

Response: We intend on hosting a MVP development webinar that will provide additional clarity on expectations, the assessment process and communications between CMS and stakeholders who develop candidate MVPs. We thank stakeholders for their recommendations of how we can make the MVP development process more

transparent, and will take these suggestions under consideration for future implementation, as operationally feasible.

After consideration of the public comments, we are finalizing our proposals as proposed.

(b) Implementing Meaningful Measures in MVPs

(i) Incorporating Population Health Measures Into MVPs

In the CY 2020 PFS proposed rule (84 FR 40742 through 40743), we expressed our interest in incorporating population health measures calculated from administrative claims-based data as a part of the foundational layer within MVPs, in an effort to improve patient outcomes, reduce reporting burden and costs, better align clinician quality improvement efforts, and increase alignment with APMs and other payer performance measurement. Through the RFI, stakeholders expressed concerns with including population health measures due to concerns with reliability, validity, attribution, unintended consequences and/or risk adjustment of claims-based population health measures. We understand stakeholder concerns around the population health measures that were previously considered, and are looking into ways to address and mitigate those concerns. We also received some support from stakeholders who agreed that population health measures will reduce administrative burden with the belief that these measures are not any less relevant to specialists. In MIPS, we currently have one administrative-claims based measure, the All-cause Hospital Readmission measure, which is calculated and scored for groups with 16 or more clinicians that meet a 200-patient case minimum, as described in the CY 2017 Quality Payment Program final rule (81 FR 77300). As described in Appendix 1 of the CY 2021 PFS proposed rule, we proposed to replace the All-cause Hospital Readmission measure with a Hospital-Wide, 30-day, All-Cause Unplanned Readmission (HWR) Rate for the Merit-Based Incentive Payment System Program (MIPS) Eligible Clinician Groups because the re-specified measure promotes a system level approach by clinicians, with a focus on high risk conditions such as COPD and heart failure. We referred readers to Appendix 1 of the proposed rule for detailed discussion of the newly proposed measure.

The following is a summary of the comments we received and our responses.

Comment: A few commenters support the use of population health measures in MVPs that are relevant to the population and clinical discipline and focus on preventive measures and early detection.

Response: We thank the commenters for their support, and agree that population health measures should be relevant to the population and the clinical topic being measured. We encourage stakeholders to utilize our pre-rulemaking processes to develop additional clinically relevant population health measures. We also agree that prevention and early detection are two areas where population health measures can be focused on.

Comment: Several commenters voiced their opposition to use of population health administrative claims-based measures in MVPs with some listing concerns about the applicability of MVP population health measures to physician groups or specialists, such as anesthesiologists, pathologists and ophthalmologists. A few commenters suggest that population health measures are not actionable with one commenter listing an example of the hospital-wide readmission measure as not actionable for surgeons. One commenter expressed that MVPs should include measures that are meaningful to group practices and their clinicians rather than administrative claims or population health measures, listing the following concerns: Attribution; retrospective analysis; inability to measure individual physicians; and reliability. A few commenters voiced a concern about performance comparison inequities in applying population health measures across different specialties. One commenter provided an alternative to population health measures that require a large sample that we work with specialty societies to explore “better” ways to tie claims data to more robust clinical data collected by registries.

Response: We disagree with commenters who oppose the use of population health administrative claims-based measures in MVPs. Measures such as MIPS hospital wide readmission (HWR) should be used within MVPs. The HWR measure is not a traditional population health measure but is designed to incentivize shared responsibility for clinical outcomes.

This measure is a re-specification of the All-Cause Readmission (ACR) measure currently within the MIPS program, which attributes outcomes solely to the primary care physician that provides the plurality of care during the measurement period, regardless of whether this care was provided before, during or after the inpatient stay. The

primary care physician may not be the only clinician with opportunity to impact readmissions. The intent of this measure is to improve upon the attribution of the current ACR measure and incentivize collaboration of care across inpatient and outpatient settings by considering shared attribution to up to three eligible clinician groups that provide care for patients inside and outside of the hospital, and therefore are in position to influence patient risk of readmission.

Our contractor convened a Technical Expert Panel (TEP) to seek detailed input from clinicians and patients to attribute the unplanned 30-day readmission outcome to multiple clinicians with the ability to impact readmission risk through their care and communication. The TEP and clinical consultants, most of whom are clinicians themselves and include representatives from anesthesia and surgery, strongly supported the attribution model. They identified the primary inpatient clinician, discharge clinician, and primary outpatient clinician as important roles in providing appropriate care, practical recommendations, and care transitions and with ability to influence readmission risk.

As such, we disagree with the commenter that the HWR measure is not actionable for these clinicians. Specifically, the primary inpatient clinician is responsible for the medical care provided during the admission, referring patients to inpatient specialists and prescribing medications; the delivery of their care during the hospital admission can influence whether the patient returns with unresolved medical issues or side effects from inappropriate medication or dosage. The discharge clinician is responsible for preparing the patient for discharge, including determining the patient is well enough to leave the hospital, understands their condition and treatments, and has been referred to outpatient specialists or therapy, as needed. Providing clear instructions and arrangements help ensure that the patient adheres to care, medication, and lifestyle changes outside of the hospital (Bowles et al, 2014, Philips et al, 2004, DeCaporale-Ryan et al, 2017, and Verhaegh et al, 2014). The primary outpatient clinician is responsible for the care of the patient outside of the hospital and can prevent readmissions by ensuring accessibility to care and availability for consultations within 30 days after discharge. Through their individual roles and together through coordinated care, these clinicians can reduce the risk of readmission.

NQF panel and committee members have voted on this measure several times, all of which concluded in favor of endorsing the measure. Final endorsement of the measure was deferred to the Spring 2020 Consensus Standards Approval Committee (CSAC) due to efforts to reduce burden for committee members who may need to prioritize COVID-19 in their communities.

Regarding the concern that the HWR measure cannot measure individual physicians, the intent of the HWR measure is to measure performance at the clinician group level where the group can assess and improve the performance across their practice. Regarding reliability, the HWR measure was found to have substantial signal to noise reliability, ranging from 0.82 for surgical to 0.92 for neurology specialty cohorts, when clinician groups were measured on at least 200 patients, the minimum threshold for the current ACR measure. While it is true that clinician groups representing different specialties may have different baseline outcome rates because of different patient condition or procedure cohorts, the use of standardized outcome rates for measurement ensures comparability of measure scores across these different cohorts.

After consideration of public comments, we are finalizing our proposal as proposed.

(ii) Incorporating QCDR Measures Into MVPs

In the CY 2020 PFS final rule, we sought comments from stakeholders as to whether QCDR measures should be considered for integration within MVPs. Stakeholders were generally supportive of including QCDR measures within MVPs, but others expressed concern that including QCDR measures within MVPs would require clinicians to use certain third party intermediaries which may cause additional burden for clinicians who may need to change their current reporting method and undertake additional costs associated with reporting through QCDRs. Under the existing MIPS program and as described at § 414.1330(a)(2), for a MIPS payment year, we can use approved QCDR measures as described under § 414.1400 to assess performance in the quality performance category. We continue to believe that the development of QCDR measures by QCDRs is important as it provides measures that are relevant, applicable, and meaningful to clinicians, and addresses gaps that are not addressed by measures available through the MIPS quality measure inventory. In envisioning MVP

development for the 2022 performance period and future years, we believe it is important to consider the opportunity to include QCDR measures within MVPs. Prior to consideration of including the QCDR measure within a candidate MVP, QCDR measures must meet all existing criteria under § 414.1400(b)(3) and the criteria described at § 414.1400(b)(3)(v)(C)(4) that QCDR measures should be fully tested at the clinician level prior to the QCDR measure being included in an MVP. We referred readers to section IV.A.3.g.(2)(b)(iv) of the CY 2021 PFS proposed rule for additional discussion of this requirement.

Regarding the timeline to which MVPs and QCDR measures may be established, we have identified differences with the timelines that each of these processes follow. As described in the CY 2020 PFS final rule (84 FR 62948), we finalized the definition of an MVP at § 414.1305 to mean a MIPS Value Pathway is a subset of measures and activities established through rulemaking. Furthermore, as described in the CY 2019 PFS final rule (83 FR 59900) and at § 414.1400(b)(1), entities that wish to self-nominate as a QCDR and submit QCDR measures for CMS consideration must do so within the 60-day self-nomination period that begins on July 1 of the calendar year prior to the applicable performance period and ending on September 1 of the same year. QCDR measures are typically reviewed and approved in the preceding months after the close of the self-nomination period. Therefore, we proposed that beginning with the 2022 performance period, only QCDR measures that were approved in the previous year may be considered for inclusion within a candidate MVP. Furthermore, we proposed that the QCDR measures included within a candidate MVP must meet the existing criteria that are currently established at § 414.1400(b)(3). In the traditional MIPS program, we stated that entities that meet the QCDR definition can develop QCDR measures to fulfill the quality performance category reporting requirements. We stated that we believe that QCDR measures can continue to fulfill the reporting requirements of the quality performance category within MVPs. Candidate MVPs should be submitted utilizing the process as described in section IV.A.3.a.(2)(a) of the CY 2021 PFS proposed rule. Candidate MVPs that are approved for inclusion in the upcoming performance period must be proposed and finalized through notice-and-comment rulemaking. Candidate MVPs that

include QCDR measures will also need to be proposed and finalized through notice-and-comment rulemaking in order to be available for reporting in the upcoming performance period. Therefore, in instances where MVPs are finalized through notice-and-comment rulemaking with QCDR measures, we proposed that those QCDR measures would be eligible for 2-year QCDR measure approval as described at § 414.1400(b)(3)(vi).

In the CY 2018 PFS final rule (82 FR 53813), we finalized that beginning with the 2018 performance period and for future program years, that QCDRs may seek permission from another QCDR to use an existing QCDR measure that is owned by another QCDR.

The following is a summary of the comments we received and our responses.

Comment: Several commenters supported inclusion of QCDR measures in MVPs.

Response: We thank the commenters for their support; we believe that expanding the availability of QCDR measures that could be included into MVPs will allow for the development of more innovative and meaningful MVPs that are relevant to specialties and subspecialties.

Comment: One commenter suggested that we consider separating dates for QCDR self-nomination and MVP candidate submission due to the amount of developer financial and administrative resources required.

Response: To clarify, as described in the CY 2019 PFS final rule (83 FR 59898) the QCDR self-nomination starts on July 1st to Sept 1st of the year prior to the performance period. As described in the CY 2021 PFS proposed rule (85 FR 50284), beginning with the 2022 performance period, only QCDR measures that were approved in the previous year may be considered for inclusion in a candidate MVP. As stakeholders develop their MVP candidates, and consider the inclusion of their QCDR measures, only those that were approved for the 2022 performance period could be considered for inclusion. We believe the existing differences in the timeline will help to alleviate some of the administrative resources required for both processes. For example, a QCDR will self-nominate a QCDR measure for the 2022 performance period sometime between July 1, 2021 and September 1, 2021. The 2022 performance period QCDR measure approval decisions will be shared with the QCDRs in late Fall of 2021, with finalization of the QCDR measure specifications by the end of 2021. QCDR measures that are approved

for the 2022 performance period, and have been fully tested, may be considered for inclusion in MVPs for the 2023 performance period through the rulemaking process that will occur throughout CY 2022. MVPs that include QCDR measures, which are finalized through the CY 2023 PFS final rule, will be tracked to, and those QCDR measures will be given multi-year approval, so that the QCDR will not have to self-nominate that measure during self-nomination for the 2024 performance period.

Comment: A few commenters supported approval of Qualified Clinical Data Registry (QCDR) measures for 2 years or longer to promote burden reduction and continuity. One commenter supported maintaining MVP QCDR measure approval for 2 years unless the measure steward agrees with a change in approval status. The commenter voiced support for removing a measure if it reflects an outdated clinical deadline or if the QCDR that nominated the measure is no longer in good standing but does not support CMS removing a measure before its second year for it being topped out or duplicative of a more robust measure.

Response: We thank the commenters for their support, but note that a change in a QCDR measure's approval status will be left at the discretion of CMS, and as long as the QCDR measure continues to meet the criteria described at § 414.1400(b)(3)(vi). We disagree that QCDR measures that are identified as topped out or duplicative of a more robust measure should not be removed as it is contradictory to the Meaningful Measure Framework. Measures that are topped out provide limited to no value to quality improvement, and duplicative measures serve no purpose in quality measurement.

Comment: A few commenters did not support our proposal to require QCDR measures be approved for use in MIPS for a year prior to being included in an MVP voicing a concern that this will delay use of meaningful QCDRs measures in MVPs. Another commenter suggested that instead of the proposed 1-year period prior to measure inclusion in MVPs, that QCDR measures be tested entirely before inclusion in an MVP.

Response: We disagree and believe that in order for a QCDR measure to be considered a QCDR measure, it must be approved as such through the Self-Nomination process prior to being proposed through notice and comment rulemaking as a part of an MVP. Measures that do not undergo this process are not considered QCDR measures until they are formally approved as such. Furthermore, to

provide clarity, we proposed in the CY 2021 PFS proposed rule (85 FR 50284) that any QCDR measure that is being considered for inclusion in an MVP, must be fully tested before it can be included, as we want to ensure that the measures included in MVPs are a reliable subset of the MIPS measure inventory.

Comment: One commenter suggested, as a way to shorten the timeline, that we consider allowing stakeholders to submit MVPs that include QCDR measures that are simultaneously undergoing approval with final inclusion in an MVP pending their meeting full testing and reliability requirements and receiving final approval.

Response: We disagree, as the differences in the timelines between QCDR measure approvals through the Self-Nomination process and the timeline for notice and comment rulemaking differ, and would not allow for sufficient time to review the results to determine whether a QCDR measure is reliable, feasible, and valid enough for inclusion in an MVP. We are concerned with the unintended consequences of simultaneously including QCDR measures within MVPs before they are approved. If the QCDR measure is not approved through self-nomination, we would not be able to finalize the inclusion of the QCDR measure within the MVP. Time will be needed to determine the implications of the QCDR measure not being finalized in the MVP, and whether there are sufficient number of measures available in the MVP in the event that the QCDR measure cannot be included. Since MVPs will allow for the creation of focused subsets of measures and activities on a given clinical topic, thereby focusing the choices available to clinicians, we believe that all measures included in MVPs should have to meet and pass full measure testing criteria inclusive of reliability, validity, and feasibility. QCDR measures that pass measure testing are considered to be more reliable, we are concerned that incomplete testing will have downstream impacts to clinicians who may not be able to successfully report on measures, or that it may result in skewed results that may impact payment adjustments. Therefore, it would be appropriate to wait until the QCDR measure is officially approved through the self-nomination process before it is considered and finalized for inclusion in an MVP through notice and comment rulemaking.

Comment: One commenter suggested that we use the 2020 performance year QCDR measure approval standards for MVP QCDR measures, and stated that

data for reliability and performance rates are often more robust after the QCDR measure has been available for MIPS reporting for at least 1 year.

Response: We disagree. The 2020 performance period QCDR measure approval standards do not currently include QCDR measure testing requirements. Our preference is to include QCDR measures in MVPs only after they have been fully tested and are comparable in standard to the measures within the MIPS quality measure inventory that have undergone vigorous testing.

Comment: One commenter requested further clarification related to how QCDR measures will be selected for MVPs to ensure measures are most relevant, applicable and meaningful to clinicians. The commenter requested that CMS clarify the impact to an MVP if CMS revokes the QCDR measure's second year of approval. The commenter voiced concerns related to the lack of incentives for clinicians to use new QCDR measures that require significant financial and administrative resources to develop and requested support for inclusion of these new QCDR measures.

Response: QCDR measures can be included in MVPs at the discretion of the stakeholder developing the MVP candidate. We refer readers to our previously established policies in the CY 2018 PFS final rule (82 FR 53813), where we finalized that beginning with the 2018 performance period and for future program years, that QCDRs may seek permission from another QCDR to use an existing QCDR measure that is owned by another QCDR. If a QCDR measure approval is revoked for an upcoming performance period, the QCDR measure will be simultaneously proposed for removal from the MVP. As a part of the MVP maintenance process, there may be consideration of including another measure in the QCDR measure's place. To clarify, new QCDR measures can be considered for inclusion in an MVP so long as the measure has met all requirements.

Comment: One commenter voiced concerns regarding burden associated with completing the third party intermediary self-nomination application prior to publication of the QPP final rule and then selecting which MVPs to support after publication of the final rule. To address this concern, the commenter suggested a 1-year delay between selecting the MVPs that QCDRs and qualified registries can support and beginning the reporting for an MVP, and separating the dates for completion of the QCDR self-nomination and the MVP self-nomination.

Response: We disagree that there would be additional burden associated with the process of having approved QCDRs and qualified registries indicate whether they are supporting any of the finalized MVPs once the final rule is published. We believe a 1-year delay would be a disadvantage, because it delays the timing in which a third party intermediary can support an MVP. The timing of when QCDRs would approve their qualified postings typically aligns with the timing of the posting of the final rule; therefore, QCDRs would be able to select the MVPs they wish to support for the upcoming performance period based on the final rule publication, and have those MVPs included in their qualified posting before it is published by January 1st of the performance period.

After consideration of the public comments, we are finalizing our proposals as proposed.

(c) Reporting of MVPs Through Third Party Intermediaries

Through the MIPS program, QCDRs, qualified registries, and Health IT vendors support the reporting of the Quality, Promoting Interoperability, and Improvement Activity performance categories, as proposed and codified at § 414.1400(a)(2). We believe that third party intermediaries who support the aforementioned performance categories are able to support MVPs, since they will be comprised of measures and activities from these performance categories, as well as cost measures that are calculated by CMS (thereby requiring no additional effort by third party intermediaries). We believe allowing third party intermediaries to support MVPs will offer eligible clinicians and groups additional methods to report an MVP. We refer readers to section IV.A.3.g. of this final rule for additional discussion of the proposals.

Since QCDR and qualified registry applicants would be submitting their self-nomination application prior to the publication of the final rule, we will work to establish a process to allow QCDRs and qualified registries to identify and select which MVPs they can support following the publication of the final rule. We sought comments on the proposal.

The following is a summary of the comments we received and our responses.

Comment: A few commenters agreed that third party intermediaries should be allowed to support MVP reporting.

Response: We thank the commenters for their support, and agree that third party intermediaries should be allowed

to support the reporting of MVPs. Clinicians and groups may find it beneficial to utilize a third party intermediary to report an MVP for the additional support they may provide.

Comment: One commenter cautioned that the use of third party intermediaries for MVPs could result in financial burden for practices required to purchase additional measure submission services.

Response: We understand that there may be some financial burden associated with utilizing a third party intermediary to report MVPs; however, we note that clinicians and groups are not required to utilize a third party intermediary to report an MVP. Clinicians and groups may use existing reporting options to report on the measures and activities within an MVP without utilizing a third party intermediary.

After consideration of the public comments, we are finalizing our proposals as proposed.

(3) Transition to MVPs

(a) Timeline for MVP implementation

In response to the RFI in the CY 2020 PFS final rule, we have received comments from stakeholders that indicated a gradual implementation of MVPs. Through the MVP development process, we seek to collaborate with stakeholders in the development of MVPs that are meaningful and applicable to clinicians and groups. Therefore, we understand the need for an incremental approach as we transition eligible clinicians and groups to MVP reporting as they are implemented. In light of the PHE of COVID-19, we have decided to delay the implementation of MVPs, and revisit potential MVP implementation through future rulemaking, possibly beginning with the 2022 performance period. Although we believe in the importance of transforming the MIPS program to create greater meaning for clinicians, we understand that there are clinicians who are on the frontlines taking care of COVID-19 patients that should not be burdened with having to learn a new method of reporting for the MIPS program at this time. Overall, our goal is to gradually implement MVPs for all MIPS eligible clinicians and groups overtime, to ensure that MVPs are designed and available in a manner relevant to clinicians. We stated that we intend to continue to work closely with stakeholders to develop MVPs that are relevant to various specialties, and understand that a level of flexibility is needed to allow for meaningful reporting.

The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the proposal to delay MVP Implementation as a result of the PHE for COVID-19, and recommended that CMS introduce MVPs gradually.

Response: We thank commenters for their support, as described in the CY 2021 PFS proposed rule (85 FR 50279), we have delayed our timeline for MVP implementation in light of the PHE for COVID-19. We want to move forward with the transformation of the MIPS program in a manner that does not take away from the nation's response to the COVID-19 pandemic. Furthermore, as described in the CY 2021 PFS proposed rule (85 FR 50284 through 50285), we understand the need for an incremental approach as we transition clinicians and groups to MVP reporting as they are implemented.

Comment: A few commenters recommended that MVPs be delayed beyond 2022 as well, yet did not cite specific reasons why.

Response: While we appreciate the commenters concerns, we believe that further delay is not needed as we have emphasized the need for an incremental approach to transition clinicians and groups to MVP reporting.

After consideration of public comments, we are finalizing our proposals as proposed.

b. APM Performance Pathway

(1) Overview

In the CY 2020 PFS final rule (84 FR 62568), we finalized the MIPS Value Pathway framework as a means of reducing reporting burden, increasing meaningful measurement, and continuing to encourage movement through MIPS away from fee-for-service (FFS) payments and towards APMs. Burden reduction and meaningful measurement are important goals in relation to all eligible clinicians, and we recognize that the best means for achieving these goals may be different for MIPS eligible clinicians that have not yet joined an APM than for those MIPS eligible clinicians who already are participating in APMs, and therefore, have different reporting obligations. This is particularly true for eligible clinicians in Advanced APMs who are subject to MIPS either because they are Partial QPs for a year and elect to participate in MIPS or because they fall below the applicable Partial QP threshold for a performance year.

We proposed at § 414.1367 to establish an APM Performance Pathway (APP) under MIPS beginning in the

2021 MIPS performance year, designed to provide a predictable and consistent MIPS reporting standard to reduce reporting burden and encourage continued APM participation (85 FR 50285).

(2) Applicability

We proposed that the APP will be in effect beginning January 1, 2021, and would be an optional MIPS reporting and scoring pathway for MIPS eligible clinicians identified on the Participation List or Affiliated Practitioner List of any APM Entity participating in any MIPS APM on any of the four snapshot dates (March 31, June 30, August 31, and December 31) during a performance period, beginning in the 2021 MIPS performance period.

(a) Reporting Through the APM Performance Pathway

We proposed that individual MIPS eligible clinicians who are participants in MIPS APMs may report through the APP at the individual level. Groups and APM Entities may report through the APP on behalf of their constituent MIPS eligible clinicians; however, the final score earned by the group through the APP would be applied only to those MIPS eligible clinicians who appear on a MIPS APM's Participation List or Affiliated Practitioner List on one or more snapshot dates. The final score applied to each individual MIPS eligible clinician would be the highest available final score for that clinician (TIN/NPI), or a Virtual Group score, if applicable, as discussed in the CY 2021 PFS proposed rule (85 FR 50315).

As described further in the CY 2021 PFS proposed rule (85 FR 50231), ACOs participating in the Medicare Shared Savings Program would be required to report through the APP for purposes of assessing their quality performance for that program, but MIPS eligible clinicians participating in these ACOs also would have the option of reporting outside the APP, or within it at an individual or group level, for purposes of being scored under MIPS, like all other MIPS APM participants. As the

APP would be optional for purposes of MIPS scoring, under the proposal MIPS APM participants would be able to report through the APP or through any other available MIPS reporting mechanism they chose.

We refer readers to the CY 2021 PFS proposed rule (85 FR 50315) for information concerning our proposed changes to the hierarchy that will apply when more than one final score is associated with a TIN/NPI.

We received the following comments on these proposals.

Comment: A few commenters supported the opportunity for individual MIPS eligible clinicians and groups that participate in MIPS APMs to report through the APP or through any other available MIPS reporting mechanism they choose. They believe this approach would enable them to earn a higher score where they perform above the APM Entity average.

Response: We thank commenters for their support of this proposal. We agree that this approach should enable MIPS eligible clinicians and groups that strive to improve their performance to be rewarded with the MIPS score that reflects those efforts. We also believe that this policy approach will create more flexibility for multispecialty practices to report on measures that are the most meaningful to their clinicians.

After considering public comment, we are finalizing this policy as proposed.

(b) MIPS APMs

In the CY 2021 PFS proposed rule (85 FR 50285), we proposed to amend our definition of MIPS APM at § 414.1305 as an APM that meets the criteria in § 414.1367(b). We also proposed to codify the following MIPS APM criteria at the new § 414.1367(b). We proposed to maintain two criteria for MIPS APMs that currently are included at § 414.1370(b)(1) and (3) respectively, namely that: (1) An APM Entity participates in the APM under an agreement with CMS or through a law or regulation; and (2) the APM bases payment on quality measures and cost/utilization. However, under the

proposed policy, for purposes of the MIPS performance period we would not depend on the availability of quality measure data reported directly to the APM, and we did not propose to continue requiring that MIPS APMs be in operation, and therefore, collecting quality data for the entirety of the performance period. We also noted that currently, to be a MIPS APM, § 414.1370(b)(2) requires that an APM must be designed such that its APM Entities include at least one MIPS eligible clinician on a Participation List, and does not include APMs that use only Affiliated Practitioner Lists. However, we believe that because we did not propose to require reporting through the APP be done exclusively at the APM Entity level, it is not necessary to limit use of the APP to APM Entities alone. Therefore, we proposed to expand the definition of MIPS APM to include those APMs in which there is only an Affiliated Practitioner List and that otherwise meet the proposed MIPS APM criteria.

We did not receive any comments on these proposals and are finalizing as proposed.

(3) MIPS Performance Category Scoring in the APM Performance Pathway

In general, MIPS reporting and scoring requirements are applicable to all MIPS eligible clinicians, including those reporting through the proposed APP. However, the following reporting and scoring rules would apply only to those MIPS eligible clinicians, groups, or APM entities reporting through the APP.

(a) Quality Performance Category

We proposed that, beginning in the 2021 performance period, MIPS eligible clinicians scored under the APP would be scored on the quality measure set finalized for such MIPS performance period (85 FR 50285 through 50286).

For PY 2021, we proposed to use the measures listed in Table 46 for purposes of quality performance category scoring for the APP.

TABLE 46: APM Performance Pathway Quality Measure Set

Measure #	Measure Title	Collection Type	Submitter Type	Meaningful Measure Area
Quality ID: 321	CAHPS for MIPS	CAHPS for MIPS Survey	Third Party Intermediary	Patient's Experience
Quality ID:001	Diabetes: Hemoglobin A1c (HbA1c) Poor Control	eCQM/MIPS CQM	APM Entity/Third Party Intermediary	Mgt. of Chronic Conditions
Quality ID: 134	Preventive Care and Screening: Screening for Depression and Follow-up Plan	eCQM/MIPS CQM	APM Entity/Third Party Intermediary	Treatment of Mental Health
Quality ID: 236	Controlling High Blood Pressure	eCQM/MIPS CQM	APM Entity/Third Party Intermediary	Mgt. of Chronic Conditions
Measure # TBD	Hospital-Wide, 30-day, All-Cause Unplanned Readmission (HWR) Rate for MIPS Eligible Clinician Groups	Administrative Claims	N/A	Admissions & Readmissions
Measure # TBD	Risk Standardized, All-Cause Unplanned Admissions for Multiple Chronic Conditions for ACOs	Administrative Claims	N/A	Admissions & Readmissions

For those MIPS eligible clinicians, groups, or APM Entities for whom a given measure is unavailable due to the size of the available patient population or who are otherwise unable to meet the minimum case threshold for a measure, we proposed to remove such measure from the quality performance category score for such MIPS eligible clinician, group, or APM Entity.

For MIPS eligible clinicians, groups, or APM Entities reporting through the APP, we proposed not to apply the quality measure scoring cap at § 414.1380(b)(1)(iv) in the event that a measure in the APP measure set is determined to be topped out. Because the measure set is fixed, we noted that we do not believe it is appropriate to limit the maximum quality performance category score available to them. Should an APP measure be determined to be topped out, we would at that time consider amending the APP quality measure set through future rulemaking, if appropriate.

In the CY 2020 PFS proposed rule, we sought comment on aligning the Shared Savings Program version of the Multiple Chronic Conditions (MCC) measure (that is, the ACO MCC) with the MIPS version of the MCC measure (see 84 FR 40711 and 40712). We noted that the MIPS MCC claims-based measure is similar to the ACO MCC currently used to assess ACO quality under the Shared Savings Program. The MIPS MCC and ACO MCC measures are similar because they both target patients with multiple chronic conditions, but the cohort, outcome, and risk model for the MIPS MCC measure varies from the ACO MCC

measure. The cohort for the ACO MCC measure includes eight conditions whereas the MIPS MCC measure includes nine conditions, with the additional condition being diabetes. The ACO MCC measure does not adjust for social risk factors whereas the MIPS MCC measure adjusts for two area-level social risk factors: (1) AHRQ socioeconomic status (SES) index; and (2) specialist density. In 2019, we added a revised ACO MCC measure to the 2019 Measure under Consideration list for the Shared Savings Program for consideration by the Measure Applications Partnership (MAP) Clinician Workgroup. The revised MCC measure specifications aligned with the MIPS MCC measure by: (1) Adding a diabetes cohort; (2) excluding any admissions within 10 days of discharge from a hospital, skilled nursing facility, or acute rehabilitation facility; and (3) adjusting for the AHRQ SES index and specialist density social risk factors. The only remaining difference between the MIPS and Shared Savings Program versions of the measure would be attribution, which is program-specific. Attribution for Shared Savings Program ACOs uses the Shared Savings Program beneficiary assignment methodology, which emphasizes primary care. During the MAP discussion, it was noted that the original ACO MCC measure has been in use in the Shared Savings Program since 2015, and the MAP expressed no concerns with respect to feasibility and implementation of the revised MCC measure. A measure has high reliability if it produces consistent results from multiple measurements, in

other words, it reflects a signal, rather than random error associated with measurement. Reliability values range between zero (all error, little signal) to 1.0 (no error, all signal).¹²¹ The median signal-to-noise reliability for all Shared Savings Program ACOs in 2018 was 0.96 ranging from 0.12 to 1.00 (IQR: 0.94–0.98), indicating an overall excellent reliability of the measure.¹²²

The MAP final recommendation for this measure was “conditional support for rulemaking.”¹²³ We intended to take the revised measure through the National Quality Forum (NQF) endorsement process in 2020, but as a result of delays caused by the PHE for COVID–19, we will defer seeking NQF endorsement until 2021. Because the revisions would make the ACO MCC measure more aligned with the MIPS version and given the support received from the MAP, we proposed to include the revised All-Cause Unplanned Admissions for Patients with Multiple Chronic Conditions measure in the APP measure set to be reported on by any Medicare ACO.

We received the following comments on the proposal.

Comment: Some commenters requested clarification as to what would

¹²¹ Adams, John L., Ateev Mehrotra, and Elizabeth A. McGlynn, Estimating Reliability and Misclassification in Physician Profiling. Santa Monica, CA: RAND Corporation, 2010. https://www.rand.org/pubs/technical_reports/TR863.html.

¹²² CMS used the 2018 Shared Savings Program ACO beneficiary assignment data to test the revised MCC measure. Here, reliability refers to measure score reliability of the revised MCC measure.

¹²³ <https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdIdentifier=id&ItemID=91911>.

happen if they were unable to report on one or more measures due to submitter type or case size limitations.

Response: Individual MIPS eligible clinicians, groups, and APM Entities reporting through the APP will be scored only on those quality measures on which they are able to report. For example, an APM Entity that is not an ACO will not be scored on the ACO MCC measure; similarly a group that did not meet the minimum beneficiary sample size for the CAHPS for MIPS survey would not be required to report on this measure. In these cases that measure would be removed from the quality performance category score calculation entirely.

Comment: Some commenters expressed concern that the proposed measures do not adequately reflect the scope of practice of all clinicians, particularly specialists, and suggested that we consider expanding the quality measure set to include specialty-specific quality measures, or retaining the use of the quality measures from their APMs, as was done under the APM scoring standard.

Response: We recognize that there are limitations in the ability of the proposed APP quality measure set to fully represent the scope of practice of all specialties and clinicians. However, the goal of the APP quality measure set is not necessarily to reflect the specific quality measure work being done by these clinicians within their respective APMs, but rather to reduce the burden of reporting on quality measures twice: once to MIPS and once to their APMs. We believe by using this broadly applicable population health based measure set, we will enable MIPS APM participants to focus more of their energy and attention on the quality measures being reported through their APMs, while relying on a consistent measure set within the APP from one year to the next. We further refer readers to CY 2020 PFS final rule (84 FR 63007) for a discussion around the operational infeasibility of continuing to use quality measure data reported directly to APMs.

Comment: Some commenters noted confusion about which submission types would be permitted under the APP.

Response: As defined at § 414.1305, submission type refers to the mechanism by which the submitter type submits data to CMS, including, but not limited to: Direct, log in and upload, log in and attest, Medicare Part B claims and the CMS Web Interface. In Table 41 of the CY 2021 PFS proposed rule (85 FR 50286) we proposed a list of quality measures that would be included in the APP. For those measures in this list that

are already included in the MIPS quality measure inventory (Quality IDs 001, 134, and 236) the previously established submission types for each measure would continue to be accepted, including by the APM Entity, as applicable, which we proposed to add as a submitter type. We note that the CAHPS for MIPS survey may only be reported by a Third Party Intermediary. For those measures that are not already included in the MIPS quality measure inventory (Quality IDs TBD), the proposed measures are administrative claims-based and do not require data submission.

Comment: A few comments supported the proposed APP quality measure set for reducing burden on MIPS eligible clinicians who are also participating in MIPS APMs. Commenters noted that the measures selected represent a broad sampling of practice areas, and should be applicable to nearly any practice group.

Response: We thank the commenters for their support.

Comment: A few commenters objected to the use of two administrative claims measures, relative to the number of non-claims measures. These commenters noted a preference for more performance-based measurement that would be reported by the MIPS eligible clinician, group, or APM Entity.

Response: We understand the concern about the use of more administrative claims measures in the APP quality set, in light of the fact that, historically, these measures produce somewhat lower scores than measures such as those in the CMS Web Interface which are largely topped-out. It is our intent to balance the goals of reducing reporting burden while incentivizing increased quality performance by including in the APP measure set measures that will represent quality performance without creating additional reporting burden. We believe the proposed measure set, and the relative weight of the different submission types, helps to strike that balance.

Comment: Some commenters expressed support for the move to all-payer data for scoring MIPS quality measures for ACOs. These commenters believe that the all-payer data will more accurately reflect the efforts they have made to improve quality performance across their practice.

Response: We agree that by incorporating all-payer data into both the numerator and the denominator, we will be getting a better picture of each MIPS eligible clinician's quality performance across care settings, and incentivizing quality improvement for all patients.

Comment: Commenters recommended that CMS seek NQF and MAP endorsement of any measure to be included in the APP before the measure is included in the APP. Additionally, commenters suggested that CMS seek additional stakeholder input and were concerned that the Measure Applications Partnership did not review these proposed changes.

Response: With regard to the commenters' recommendations that we use measures that are NQF endorsed and have been reviewed by the AMP, we note that where possible CMS uses measures that have been NQF endorsed. In the APP measure set, the three eCQM/CQM measures are NQF endorsed and we plan to take the revised MCC measure that was reviewed by the MAP in December 2019 through the NQF endorsement process in 2021.

Comment: Several commenters have concerns with the Screening for Depression and Follow-up plan measure and recommended that CMS work with stakeholders to improve the measure specifications before this measure is used as part of a limited quality measure set. One commenter did not support the measure because it was not an outcome measure, and shared concerns that it had previous measurement challenges. Additionally, one commenter noted that depression screening can be difficult to achieve with the limited access that the PHE for COVID-19 has created and suggested that measures be viewed through the lens of the current environment.

Several commenters expressed concerns that this measure determines performance based on a single reading and that there are limitations in accepting patient reported home readings. The commenters also recommended that CMS work with stakeholders to improve the measure specifications before this measure is used as part of a limited quality measure set. Another commenter recommended that CMS consider including home visits in its measure sets. One commenter supported the Controlling High Blood Pressure measure, noting that successfully treating high blood pressure can save lives.

One commenter was concerned that the Diabetes: Hemoglobin A1c (CbA1c) Poor Control measure is not appropriate for frail, seriously ill, or home limited patient populations. Another commenter supported this measure, citing the fact that uncontrolled diabetes leads to comorbidities.

Response: We appreciate the commenters' feedback on these eCQM/CQM MIPS measures. This measure set was developed using stakeholder

feedback and in conjunction with CMS leadership to help achieve the goals of the APP. Each of the eCQM/CQM quality measures in the APP measure set is MIPS quality measures that has been in use for several MIPS performance years and have a track record of reliability that was taken into consideration when choosing the APP measure set. We believe that this particular set of measures best achieves our goal of reducing reporting burden while providing a quality measure set with measures that are meaningful and widely applicable to various provider types. As with all MIPS quality measures, we encourage continued stakeholder engagement in developing and improving upon measure use and specifications.

Comment: One commenter provided general support for the concept of measuring outcomes for patients with multiple chronic conditions at the group practice level or higher and provided support for the specific methodological changes proposed, including incorporating additional risk factors related to socioeconomic status and social risk factors. Several commenters expressed concerns related to the Risk Standardized, All-Cause Unplanned Admissions for Multiple Chronic Conditions for ACOs measure. One commenter did not support using this measure to assess the quality performance of ACOs because they noted the Core Quality Measures Collaborative (CQMC) ACO/Patient-Centered Medical Home (PCMH) core measure set would be less burdensome and would align the measures across public and private payers, making it a better measure set for ACOs. Some commenters stated that this measure does not meet the $\geq .8$ reliability threshold because the measure score reliability ranged from 0.12 to 1.00 using data from the 2018 performance year. Therefore, this commenter recommended that CMS increase testing for risk adjustment, increase case minimums, and demonstrate face validity (whether these measures appear to measure what they claim to measure) and that the results are valid when attributed to an ACO. The commenter also recommended that CMS work with stakeholders to improve the measure specifications before this measure is used as part of a limited quality measure set. Another commenter opposed inclusion of this measure in the quality measure set under the APP due to limited information on how the measure performs and because it has not been endorsed by the NQF. The same

commenter recommended that CMS increase the minimum sample size to produce a minimum reliability threshold of sufficient magnitude and encouraged CMS to validate the measure through additional testing, such as predictive and construct validity, to ensure that application of the measure to assess the quality performance of ACOs is appropriate and yields scores that are valid and useful.

Another commenter was encouraged to see that the Agency for Healthcare Research and Quality (AHRQ) Socioeconomic Status (SES) index and density of physician specialists were included in the risk adjustment for the measure in the 2018–2019 Measures Application Partnership (MAP) review. This commenter emphasized that CMS should ensure that social risk factors are tested and included in the risk adjustment for the measure and that CMS should also consider including additional variables, such as dual eligibility, frailty, and age, prior to implementing the measure in the APP.

Response: The All-Cause Unplanned Admissions for Patients with Multiple Chronic Conditions for ACOs—the “ACO MCC” measure is currently being used to assess ACOs’ quality performance under the Shared Savings Program. The proposed MCC measure was created by aligning the current ACO MCC measure with the current MIPS MCC measure by (1) adding a diabetes cohort; (2) excluding any admissions within 10 days of discharge from a hospital, skilled nursing facility, or acute rehabilitation facility; and (3) adjusting for the AHRQ SES index and specialist density social risk factors. The MAP expressed no concerns with respect to implementing this measure and, as discussed in the CY 2021 PFS proposed rule (85 FR 50286), the median signal-to-noise reliability for all ACOs scored on this measure in 2018 was 0.96 ranging from 0.12 to 1.0 (IQR: 0.94–0.98), indicating an overall excellent reliability of the measure. This measure is currently under NQF review.

We believe that this measure will provide a meaningful assessment of ACO quality performance with limited additional reporting burden.

Comment: Many commenters were opposed to sun-setting the CMS Web Interface and its use under the APM scoring standard. Several commenters expressed concern about the timeline for preparing to report APM Entity level data for the 3 eCQM/MIPS CQMs in time for the 2021 performance year. Specifically, ACOs may face difficulty in aggregating the data needed for

reporting, particularly in light of the PHE for COVID–19.

Response: We understand that implementing a new reporting system will require administrative time and coordination in order to be prepared not only for reporting APM Entity level data, but for collecting these data as early as January 1, 2021. Particularly in light of the circumstances surrounding the PHE for COVID–19, we believe that it is in the public interest to finalize our proposed quality measure set with a few modifications to include the CMS Web Interface for one year.

After considering public comment, we are finalizing each of the quality measures included in the quality measure set listed in Table 41 of the CY 2021 PFS proposed rule (85 FR 50286).

In addition, we refer readers to section IV.A.3.c.(1)(c) of this final rule, where we are finalizing our proposal to remove the CMS Web Interface with a 1 year delay. As a result, the CMS Web Interface measure set will not be removed until the CY 2022 MIPS performance period. In response to public comments, we are finalizing the addition of the CMS Web Interface measure set to the proposed APP quality measure set for the CY 2021 MIPS performance period for ACOs only. We are limiting the extension of the CMS/ Web Interface to those Entity types which, in the past, have used the CMS Web Interface for purposes of MIPS reporting, and may therefore benefit from a transitional year before reporting via a new submission type. Groups and other APM Entity types that have in the past been scored using different submission types do not face the same obstacles, and therefore do not require a transition year.

Each individual MIPS eligible clinician, group, and APM Entity reporting through the APP will be scored on the ACO MCC measure, Hospital-wide Readmission measure, and CAHPS for MIPS survey, as applicable. In addition, individual MIPS eligible clinicians and groups reporting through the APP will be required to report on the three eCQMs/MIPS CQMs included in the APP quality measure set. APM Entities reporting through the APP will be required to report on either the three eCQMs/MIPS CQMs included in the APP quality measure set or on the CMS Web Interface measure set. We refer readers to Appendix 1 for additional measure specification information.

BILLING CODE 4120–01–P

TABLE 47: Measures included in the Final APM Performance Pathway Measure Set⁺

Measure #	Measure Title	Collection Type	Submitter Type	Meaningful Measure Area
Quality ID#: 321	CAHPS for MIPS	CAHPS for MIPS Survey	Third Party Intermediary	Patient's Experience
Measure # 479	Hospital-Wide, 30-day, All-Cause Unplanned Readmission (HWR) Rate for MIPS Eligible Clinician Groups	Administrative Claims	N/A	Admissions & Readmissions
Measure # TBD	Risk Standardized, All-Cause Unplanned Admissions for Multiple Chronic Conditions for ACOs	Administrative Claims	N/A	Admissions & Readmissions
Quality ID#: 001	Diabetes: Hemoglobin A1c (HbA1c) Poor Control	eCQM/MIPS CQM/CMS Web Interface*	APM Entity/Third Party Intermediary	Mgt. of Chronic Conditions
Quality ID#: 134	Preventive Care and Screening: Screening for Depression and Follow-up Plan	eCQM/MIPS CQM/CMS Web Interface*	APM Entity/Third Party Intermediary	Treatment of Mental Health
Quality ID#:236	Controlling High Blood Pressure	eCQM/MIPS CQM/CMS Web Interface*	APM Entity/Third Party Intermediary	Mgt. of Chronic Conditions
Quality ID#: 318	Falls: Screening for Future Fall Risk	CMS Web Interface*	APM Entity/Third Party Intermediary	Preventable Healthcare Harm
Quality ID#: 110	Preventive Care and Screening: Influenza Immunization	CMS Web Interface*	APM Entity/Third Party Intermediary	Preventive Care
Quality ID#: 226	Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention	CMS Web Interface*	APM Entity/Third Party Intermediary	Prevention and Treatment of Opioid and Substance Use Disorders
Quality ID#: 113	Colorectal Cancer Screening	CMS Web Interface*	APM Entity/Third Party Intermediary	Preventive Care
Quality ID#: 112	Breast Cancer Screening	CMS Web Interface*	APM Entity/Third Party Intermediary	Preventive Care
Quality ID#: 438	Statin Therapy for the Prevention and Treatment of Cardiovascular Disease	CMS Web Interface*	APM Entity/Third Party Intermediary	Mgt. of Chronic Conditions
Quality ID#: 370	Depression Remission at Twelve Months	CMS Web Interface*	APM Entity/Third Party Intermediary	Treatment of Mental Health

⁺ We note that Statin Therapy for the Prevention and Treatment of Cardiovascular Disease (Quality ID# 438); Depression Remission at Twelve Months (Quality ID# 370), and Preventive Care and Screening: Screening for Depression and Follow-up Plan (Quality ID# 134) do not have benchmarks and are therefore not scored; they are, however, required to be reported in order to complete the Web Interface dataset.

* ACOs will have the option to report via Web Interface for the 2021 MIPS Performance year only.

BILLING CODE 4120-01-C

We are finalizing at § 414.1367(c)(1) the quality measure set for the APP, and are adding the option for ACOs to report on the CMS Web Interface for the 2021 performance year only.

(b) Cost

In the CY 2017 Quality Payment Program final rule (81 FR 77256, 77265), we finalized at § 414.1370(g)(2) to waive the cost performance category under waiver authority at section 1115A(d)(1)

of the Act for CMS Innovation Center APMs, and at section 1899(f) of the Act for the Medicare Shared Savings Program. We proposed to continue to waive the cost performance category under the same authorities for three reasons. First APM entities in MIPS APMs already are subject to cost performance assessment under their APMs, as the MIPS APM criteria would continue to include the assessment of participants based on cost. Second, MIPS APMs may measure cost

performance in different ways than MIPS, for example, by basing cost on total cost of care, which measures a broader scope of cost or resource use than would necessarily be reflected in the narrower claims-based accountability standard under MIPS. Finally, MIPS APMs may attribute beneficiaries differently from MIPS for purposes of measuring cost, leading to an unpredictable degree of overlap between the sets of beneficiaries for whom the MIPS eligible clinicians

would be responsible under their APM and under MIPS. We noted that we believe that with an APM Entity's finite resources for engaging in efforts to improve quality and lower costs for a specified beneficiary population under the APM, it is necessary to give the APM Entity the ability to identify a single beneficiary population to prioritize in its cost-saving efforts. This is necessary so that the goals and evaluation associated with the APM are as clear and free of confounding factors as possible. With this flexibility, we noted that MIPS eligible clinicians who are attempting to strategically transform their respective practices would not jeopardize their ability to succeed in either MIPS or under the terms of their APM. Therefore, by participating through the APP, the APM participant may indicate their intent to focus their resources on the beneficiary population and services identified by the terms of the APM rather than the population and services they would have been responsible for under the MIPS cost performance category.

We received the following comments on this proposals.

Comment: Commenters supported the proposal, noting that as APM participants they are already being assessed on cost performance under the terms of participation in their APM.

Response: We thank commenters for their support. We refer readers to section IV.A.3.e. of this final rule, for additional discussion around the reweighting of the cost performance category for APM Entities that choose to report to MIPS outside of the APP.

After considering public comments, we are finalizing this policy as proposed.

(c) Improvement Activities

We proposed to assign a score for the Improvement Activities performance category for each MIPS APM, and that score will be applied to participant MIPS eligible clinicians reporting through the APP. In an effort to further reduce reporting burden for MIPS eligible clinicians in MIPS APMs and to better recognize improvement activities work performed through participation in MIPS APMs, we proposed to assign a baseline score for each MIPS APM based on the improvement activity requirements of the particular MIPS APM. CMS would review the MIPS APM's requirements in relationship to activities specified under the generally applicable MIPS improvement activities performance category and assign for each MIPS APM an improvement activities performance category score that is applicable to all MIPS eligible

clinicians reporting through the APP who are participants in the MIPS APM. To develop the improvement activities score for MIPS APMs, we would compare requirements of the APM with the list of Improvement Activities, described in § 414.1355(a), for the applicable year, and score those improvement activities as they would otherwise be scored according to § 414.1380(b)(3). Thus, as proposed, points assigned to an APM participant MIPS eligible clinician participating in MIPS through the APP would be based, at least in part, on the documented terms and requirements of participation in the MIPS APM, such as under a participation agreement or regulation. In the event a MIPS APM participant does not actually perform an activity for which Improvement Activities credit would otherwise be assigned under the proposal, the MIPS APM participant would not receive credit for the associated Improvement Activity.

We noted that we would publish the assigned improvement activities scores for each MIPS APM on the CMS website prior to the beginning of the MIPS performance period. In the event that the assigned score for a MIPS APM does not represent the maximum improvement activities score, we proposed that MIPS eligible clinicians reporting through the APP would have the opportunity to report additional improvement activities that then would be applied towards their scores.

We noted that under section 1848(q)(5)(c)(ii) of the Act, a MIPS eligible clinician in an APM for a performance period automatically earns a minimum score of one half of the highest potential score for the improvement activities category for their participation in an APM for the performance period. Additionally, under section 1848(q)(5)(c)(i) of the Act, MIPS eligible clinicians participating in a patient-centered medical home model or comparable specialty practice, as determined by the Secretary for a performance period, automatically earn the highest potential score for the improvement activities category. These baseline scores would be automatically applied for all MIPS eligible clinicians who participate in an APM in accordance with § 414.1380(b)(3)(i) and (ii), respectively.

We sought comment on the proposal.

Comment: One commenter expressed confusion about the improvement activities reporting requirements for MIPS eligible clinicians reporting through the APP. Specifically, how participants of a MIPS APM would know when they are required to report

additional improvement activities for MIPS scoring.

Response: In past years, and in the 2021 performance year, we have identified all MIPS APMs as having met the improvement activity threshold score requirement to receive a score of 100 percent for that performance category. In the event that in the future an APM does not meet this threshold, we would allow participants in that APM to report additional quality measures in order to earn a score of up to 100 percent for that performance category.

Similarly, should we learn that a MIPS eligible clinician or group has reported through the APP, but we discovered that their APM Entity has failed to complete the required improvement activities and any CAP developed as a result of this discovery, participants in that APM Entity may be subject to an audit wherein they would have the opportunity to produce evidence that they have completed sufficient improvement activities to maintain their performance category score of up to 100 percent. If it is determined that participants in such APM Entity did not complete enough improvement activities to earn a score of 100 percent, their performance category score will be recalculated. We note that the statute assigns a minimum improvement activities performance category score of 50 percent to all APM participants.

After considering public comments, we are finalizing the policy as proposed.

(d) Promoting Interoperability

We proposed that the Promoting Interoperability performance category score would be reported and calculated in the same manner described at § 414.1375. We sought comment on the proposal.

Comment: One commenter suggested that we enable ACOs to report the PI performance category.

Response: As in past years, it is not currently operationally feasible for CMS to accept PI performance category reporting at the APM Entity level in cases where an APM Entity is comprised of more than one TIN. However, we continue to reassess this issue annually, and we welcome stakeholder input on how we might implement changes of this sort in future program years.

After considering public comment, we are finalizing the policy as proposed.

(4) APP Performance Category Weights

We proposed to continue to waive the requirement to weight each MIPS performance category as described in

section 1848(q)(5)(E) of the Act using the waiver authority in sections 1115A(d)(1) and 1899(f) of the Act for CMS Innovation Center APMs and the Medicare Shared Savings Program, respectively. For reasons described in the CY 2021 PFS proposed rule (85 FR 50287), we stated that we believe it is necessary to waive the cost performance category for MIPS eligible clinicians reporting to MIPS through the APP. As a result, we stated that it also would be necessary to waive the requirement to weight each MIPS performance category as described in section 1848(q)(5)(E) of the Act and to redistribute the cost performance category weight to the remaining performance categories to be scored for APM participants reporting through the APP.

We proposed to reweight the performance categories for APM participants reporting through the APP to:

- *Quality*: 50 percent
- *Cost*: 0 percent
- *Promoting Interoperability*: 30 percent
- *Improvement Activities*: 20 percent

We noted that we believe these weights are appropriate as they generally align with the relative performance category weights under MIPS and MVPs in circumstances where the cost performance category has been reweighted to zero percent of the final score, and the cost performance category weight has been distributed proportionately among the remaining performance categories.

We proposed to codify these proposals at § 414.1367(d)(1). We did not receive any comments on these proposals, and we are finalizing them as proposed.

(a) Reweighting a Performance Category

We recognize that there are certain circumstances when a MIPS eligible clinician, group, or APM Entity may be unable to complete reporting to MIPS due to, for example, extreme and uncontrollable circumstances, hardship, or the unavailability or inapplicability of measures due to practice size or other data limitations. Therefore, under the authority provided in section 1848(q)(5)(F) of the Act, it may become necessary to reweight one or more performance categories.

In a case where the Promoting Interoperability performance category is reweighted to zero percent, we proposed to reweight the quality performance category to 75 percent and the Improvement Activities performance category to 25 percent.

In a situation where the quality performance category is reweighted to

zero percent, we proposed to reweight the Promoting interoperability performance category to 75 percent and the improvement activities performance category to 25 percent.

We noted that we believe that the distributions appropriately value performance categories that require reporting on measures and measuring improvement, without disproportionately emphasizing one performance category over another. Furthermore, the performance category weights will contribute to a unified performance category reweighting policy throughout MIPS in the event of an Extreme and uncontrollable circumstance that requires the reweighting of cost and any other MIPS performance category.

We proposed to codify this policy at § 414.1367(d)(2). We did not receive any comments on this proposal, and therefore, we are finalizing as proposed.

(5) Scoring for APM Participants Reporting Through the APP

We proposed that final scoring for APM participants reporting to MIPS through the APP would follow the same methodology as established for MIPS generally at § 414.1380. Specifically, we noted that we would continue to score each performance category and multiply each performance category score by the applicable performance category weight, and then calculate the sum of each weighted performance category score and apply any applicable adjustments.

We proposed to codify this policy at § 414.1367(e). We did not receive any comments on this proposal, and therefore, we are finalizing as proposed.

(6) Performance Feedback for APM Participants Reporting Through the APP

We proposed to make performance feedback available to MIPS eligible clinicians reporting through the APP according to the methods applicable to all MIPS eligible clinicians, as described in the 2017 QPP final rule (81 FR 77347). We did not receive any comments on this proposal, and therefore, we are finalizing as proposed.

c. MIPS Performance Category Measures and Activities

(1) Quality Performance Category

(a) Background

We refer readers to §§ 414.1330 through 414.1340 and the CY 2018 Quality Payment Program final rule (82 FR 53626 through 53641) for our previously established policies regarding the quality performance category.

In the CY 2021 PFS proposed rule (85 FR 50288), we proposed to:

- Weight the quality performance category at 40 percent for the 2023 MIPS payment year and 30 percent for the 2024 MIPS payment year, at § 414.1330(b)(4) and (5), respectively.
- Sunset the CMS Web Interface measures as a collection type for groups and virtual groups with 25 or more eligible clinicians starting with the 2021 performance period.
- Make changes to the MIPS quality measure set as described in Appendix 1 of the CY 2021 PFS proposed rule (85 FR 50413 through 50665), including addition of new measures, updates to specialty sets, removal of existing measures, and substantive changes to existing measures.
- Establish separate performance periods specific to administrative claims measures at § 414.1320(d)(1).
- Make changes to the CAHPS for MIPS Survey to address the increased use of telehealth care.
- Expand telehealth codes used in beneficiary assignment for the CAHPS for MIPS Survey beginning with the performance year 2021 survey.

(b) Weight in the Final Score

Section 1848(q)(5)(E)(i)(I) of the Act, provides that 30 percent of the final score shall be based on performance for the quality performance category, in which the percentage points attributed to the final score for the quality and cost performance categories will both be equivalent at 30 percent, totaling 60 percent of the final score. The percentage points attributed to both the quality and cost performance categories are in tandem. For each year within the first 5 years of the MIPS program, the quality performance category performance percentage can be increased to more than 30 percent of the final score. The percentage increase of the quality performance category is equivalent to the decrease of the cost performance category.

As discussed in the CY 2021 PFS proposed rule (85 FR 50293 through 50294), we proposed to weight the cost performance category at 20 percent for the 2023 MIPS payment year and 30 percent for the 2024 MIPS payment year and each subsequent MIPS payment year. Accordingly, we proposed to establish the weight of the quality performance category for the 2023 and 2024 MIPS payment years. At § 414.1330(b)(4), the percentage points attributed to performance in the quality performance category would comprise 40 percent of a MIPS eligible clinician's final score for the 2023 MIPS payment year and at § 414.1330(b)(5), the

percentage points attributed to performance in the quality performance category would comprise 30 percent of a MIPS eligible clinician's final score for the 2024 MIPS payment year and future years.

We noted our belief that being transparent in how both the quality and cost performance category weights would be modified over the next 2 years of the program will allow stakeholders to better plan and anticipate how the performance category scores would be calculated in future for MIPS eligible clinicians, groups, and virtual groups as we incrementally adjust the final score weights for the quality and cost performance categories.

We solicited public comment on the proposals to incrementally reduce the weight of the quality performance category as we incrementally increase the weight of the cost performance category, specifically our proposal to adjust the percentage points attributed to the final score in the quality performance category to be comprised of 40 percent for the 2023 MIPS payment year and 30 percent for the 2024 MIPS payment year and future years. The following is a summary of public comments received regarding the proposals.

Comment: A few commenters supported our proposal to incrementally reduce the weight of the quality performance category while increasing the weight of the cost performance category in order to achieve the weights established by Congress under the Act.

Response: We appreciate the support from commenters.

Comment: Many commenters did not support our proposal to incrementally reduce the weight of the quality performance category in order to increase the weight of the cost performance category during the PHE for COVID-19 because clinicians are burdened in new ways and trying to navigate through various challenges brought on by the PHE. The commenters recommended that CMS maintain the weight of the quality performance category at 45 percent until the PHE for COVID-19 has ended in order for clinicians to focus on serving patients safely. A few commenters recommended that CMS maintain the weight of 45 percent for the quality performance category for the 2023 MIPS payment year in order for the commenters' concerns regarding the cost measures to be addressed. In particular, the commenters noted that there are not many cost measures to select, particularly for specialties, which has significant implications for not accurately measuring cost performance.

One commenter requested that CMS work with Congress on an extension for the timeframe to increase the weight for the cost performance category.

Response: Section 1848(q)(5)(E)(i) of the Act provides that by the sixth year of the program, 30 percent of the final score shall be based on performance for the quality performance category and 30 percent of the final score shall be based on the cost performance category. Prior to the sixth year, section 1848(q)(5)(E)(II)(bb) of the Act states that the cost performance category may be weighted at not less than 10 percent and not more than 30 percent of the total score. If less than 30 percent, the percentage by which it is less than 30 percent is to be shifted to the quality performance category. Given that the percentage points attributed to both the quality and cost performance categories are in tandem, and we are required to achieve equal weighting at 30 percent for each of the two performance categories by payment year 2024, we believe that it is important to meet the statutory requirement while balancing the impact of simultaneously reducing the weight of the quality performance category and increasing the weight of the cost performance category. We are providing a gradual transition over a 2-year period subject to the limitations imposed by the statute. In section IV.A.3.c.(2)(a) of this final rule, we finalized our proposal to increase the weight of the cost performance category to 20 percent for the 2023 MIPS payment year and 30 percent for the 2024 MIPS payment year and each subsequent MIPS payment year. Thus, the weight of the quality performance category will be reduced to 40 percent for the 2023 MIPS payment year and 30 percent for the 2024 MIPS payment year and each subsequent years.

Regarding concerns that the weight of the quality performance category should not be reduced until there are additional cost measures applicable to specialties in order to adequately measure cost performance for specialties, we note that there are two broad-based cost measures (Medicare Spending Per Beneficiary Clinician and Total Per Capita Cost) that generally apply to all clinician types, including specialties. There are a total of 20 cost measures, including 18 episode-based cost measures. In the event that there are not any applicable cost measures to measure performance, the cost performance category would be re-weighted to zero. Also, we previously established facility-based measurement. Facility-based measurement provides certain clinicians and groups that primarily work within an inpatient setting with the opportunity to receive

MIPS quality and cost performance category scores based on their assigned facility's hospital value-based purchasing program score in lieu of receiving scores based on quality and cost measures. We do not believe that maintaining the weight of the quality performance category at 45 percent until there are additional cost measures is necessary to assess cost performance. We will consider the inclusion of additional cost measures in future rulemaking, as available and appropriate. Regarding the comment requesting that CMS work with the Congress to extend the timeframe for increasing the weight of the cost performance category, we will take the comment into consideration.

After consideration of the public comments, we are finalizing our proposal, which is as follows: At § 414.1330(b)(4), the percentage points attributed to performance in the quality performance category will comprise 40 percent of a MIPS eligible clinician's final score for the 2023 MIPS payment year and at § 414.1330(b)(5), the percentage points attributed to performance in the quality performance category will comprise 30 percent of a MIPS eligible clinician's final score for the 2024 MIPS payment year and each subsequent year.

(c) Groups and Virtual Groups Reporting via the CMS Web Interface

At § 414.1335(a)(2), the CMS Web Interface measures is a collection type in which groups and virtual groups with 25 or more eligible clinicians are able to report data on a set of pre-determined quality measures. For the 2020 performance periods, the total number of CMS Web Interface measures required to complete reporting on is 10 CMS Web Interface measures (83 FR 59713 through 79715 and 59756). Each CMS Web Interface measure must have complete reporting (no partial reporting) on all 10 measures while quality measures in other collection types require the reporting of fewer measures. The reporting requirements for the CMS Web Interface measures are more stringent than other collection types for the quality performance category, which include reporting on a larger set of measures and a higher data completeness rate. At § 414.1335(a)(1)(i), it is established that groups and virtual groups reporting quality measures using non-CMS Web Interface measures collection types (such as Qualified Registries, Qualified Clinical Data Registries (QCDRs), electronic health records (EHRs), and Medicare Part B claims) are required to report on a minimum of 6 quality

measures, including at least one outcome measure. The data completeness criteria for reporting quality measures for Qualified Registry measures, QCDR measures, EHR measures, and Medicare Part B claims measures has a lower threshold compared to the CMS Web Interface measures. The data completeness criteria for the CMS Web Interface measures requires groups and virtual groups to report on the first 248 consecutively ranked beneficiaries in the sample for each measure (and if the sample of eligible assigned beneficiaries is less than 248, then the group or virtual group must report on 100 percent of assigned beneficiaries), and at least one measure for which there is Medicare patient data (at §§ 414.1335(a)(2) and 414.1340(c)). For the 2020 performance period, the data completeness criteria threshold for Qualified Registry measures, QCDR measures, EHR measures, and Medicare Part B claims measures is 70 percent of the MIPS eligible clinician, group, or virtual group's patients (and applicable Medicare Part B patients for Medicare Part B claims measures) that meet the measure's denominator criteria (at §§ 414.1340(a)(3) and 414.1340(b)(3)). Thus, groups and virtual groups submitting quality data through the CMS Web Interface measures report on a significantly larger number of patients compared to other collection types and such patients are identified in a sample by us (at § 414.1340(c)).

In sections III.G.1.b. and III.G.1.c. of the CY 2021 PFS proposed rule (85 FR 50231 and 50234 through 50235), we discussed the proposal to revise the quality reporting requirements for the Medicare Shared Savings Program to align with the APP framework and make corresponding revisions to the quality performance standard that ACOs must meet in order to be eligible to share in savings under the program. In conjunction with the proposed modifications to the Medicare Shared Savings Program quality reporting requirements, which included a proposal to transition to an APP for ACOs starting with the 2021 performance period, we conducted an assessment of the utilization of the CMS Web Interface measures as a collection type for groups and virtual groups participating in MIPS. As noted above, we recognize that the CMS Web Interface reporting requirements, which include reporting on a larger set of measures and a higher data completeness rate, are more stringent than other collection types available under MIPS.

In assessing the utilization of the CMS Web Interface by groups and virtual groups, there has been a substantial decrease in participation each year since the inception of MIPS in the 2017 performance year. From the 2017 to 2019 performance years, the number of groups eligible to report quality measures via the CMS Web Interface (groups registered to utilize the CMS Web Interface) decreased by approximately 45 percent. Similarly, the number of groups utilizing the CMS Web Interface as a collection type has decreased by approximately 40 percent from the 2017 to 2019 performance years. It is not clear as to why groups and virtual groups are not seeking to participate in MIPS by submitting quality data for CMS Web Interface Measures. There could be various reasons explaining the decrease in CMS Web Interface participation such as MIPS offering several collection types that can be utilized by any individual MIPS eligible clinician, group, or virtual group to meet program requirements; the CMS Web Interface measure reporting requirements may be burdensome compared to other collection types/submission types; the measure set is limited to primary care; groups and virtual groups may have a preference to select their own measures to have performance assessed instead of a pre-determined measure set; or as a result of the CMS Web Interface measures being topped out, it may deter groups and virtual groups from participating because they would not fiscally benefit to be compared and assessed when there is little or no data variation in performance across ACOs, groups, and virtual groups.

Given the above factors, we considered the following two options in our assessment: Continue the utilization of the CMS Web Interface measures solely for groups and virtual groups while ACOs transition to APP participation; or sunset the utilization for the CMS Web Interface measures as a collection type for groups and virtual groups. Groups and virtual groups account for less than 20 percent of organizations utilizing the CMS Web Interface measures while ACOs participating in the Medicare Shared Savings Program or Next Generation ACO Model account for more than 80 percent. With an expected 80 percent reduction if our proposed revisions to the quality performance standard under the Shared Savings Program are finalized and a continued decrease in groups and virtual groups seeking to report quality data on CMS Web Interface measures, we explained that it

is not fiscally viable, feasible, or sustainable for MIPS to continue to make available the CMS Web Interface measures as a collection type/submission type. A reduction in the number of organizations submitting quality data on CMS Web Interface measures does not equate to the reduction in direct costs associated with operating and maintaining the CMS Web Interface measures. To operate and maintain the CMS Web Interface measures solely for groups and virtual groups, there would be an increase in cost and needed resources under MIPS associated with the items such as the establishment and maintenance of CMS Web Interface benchmarks, assignment and sampling, technical support, and education and outreach; thus, there would be proportionally higher costs associated with the operationalization and maintenance of the CMS Web Interface with a significantly smaller number of groups and virtual groups utilizing the CMS Web Interface measures as a collection type/submission type.

In assessing the second option to sunset the CMS Web Interface measures as a collection type starting with the 2021 performance year, we would be aligning with the proposal under the Medicare Shared Savings Program to no longer utilize the CMS Web Interface as a means for assessing and scoring the quality performance of ACOs. For purposes of MIPS, groups and virtual groups would transition to meeting requirements under the quality performance category using other collect and submission types. We recognized that the sunset of the CMS Web Interface for groups and virtual groups may be burdensome to current groups and virtual groups submitting quality data on CMS Web Interface measures. Such groups and virtual groups would need to select a different collection type/submission type and redesign their systems to be able to interact with the new collection type/submission type. The timeframe for groups and virtual groups to select a new collection type/submission type and redesign their systems may be perceived as burdensome.

We noted that groups and virtual groups would be able to select a different collection type/submission type, including at least six quality measures that are similar to previously established CMS Web Interface measures and reflect their specialty, and prepare for the 2021 reporting period in advance of the reporting period starting in January of 2022. While there may be an initial increase in burden for current groups and virtual groups utilizing the

CMS Web Interface measures having to transition to the utilization of a different collection type/submission type, we recognized that we would also be reducing reporting requirements by no longer requiring groups and virtual groups to have to completely report on all pre-determined 10 CMS Web Interface measures; groups and virtual groups would be able to select their own measures to report, would be reporting data on at least six measures, and data completeness threshold would be 70 percent for each measure, which is a reduction in program requirements compared to completed reporting required for all CMS Web Interface measures. We noted our belief that groups and virtual groups would be able to transition to the utilization of an available alternative collection type for the 2021 performance period. The type of data collected by groups and virtual groups for the 2020 performance period would be able to be captured by one of the available collection types such as an eCQM or MIPS CQM for the 2021 performance period. The 10 CMS Web Interface measures that are required for reporting under the 2020 performance period have an eCQM and MIPS CQM equivalent measure. For the 2021 performance period, there are 10 eCQMs and 9 CQMs that are equivalent to the 10 CMS Web Interface measures. Also, we noted our belief that groups and virtual groups would be able to identify at least 6 equivalent eCQMs or MIPS CQMs (or a combination) that capture the same type of data collected for the measures used in the CMS Web Interface. Also, such transition for groups and virtual groups could potentially be more beneficial. For example, if a measure from a different collection type (for example, MIPS CQMs) meets data completeness but may not meet case minimum, the measure would receive a score of 3; whereas, under the CMS Web Interface, any measure that did not meet reporting requirements would receive a score of 0.

The sunset of the CMS Web Interface measures would reduce burden on groups and virtual groups while aligning program requirements and scoring policies for MIPS and the Medicare Shared Savings Program, and removing CMS Web Interface measures that do not provide a meaningful means of assessing performance across groups, virtual groups, and ACOs. With the CMS Web Interface measures being topped out as noted above, we strive to remove measures that are topped out and establish a set of robust and meaningful measure sets that are available under the other collection

types. We noted our belief that the benefits groups and virtual groups would reap from transitioning to the utilization of other collection types starting with the 2021 performance year outweigh the initial disruption that would be experienced when the CMS Web Interface measures would be sunset. Based on our assessment, we proposed at § 414.1325(c)(1) and (2) to sunset the CMS Web Interface measures as a collection type/submission type starting with the 2021 performance period. Specifically, at § 414.1305, we proposed to modify the definition of the terms collection type and submission type to remove the CMS Web Interface measures as an available option starting with the 2023 MIPS payment year. We proposed to modify the definition of collection type to mean a set of quality measures with comparable specifications and data completeness criteria, as applicable, including, but not limited to: Electronic clinical quality measures (eCQMs); MIPS Clinical Quality Measures (MIPS CQMs); QCDR measures; Medicare Part B claims measures; for the 2019 through 2022 MIPS payment years, CMS Web Interface measures; the CAHPS for MIPS Survey; and administrative claims measures. We proposed to revise the definition of “submission type” to mean the mechanism by which the submitter type submits data to CMS, including, but not limited to: Direct; log in and upload; log in and attest; Medicare Part B claims; and for the 2019 through 2022 MIPS payment years, the CMS Web Interface.

We solicited public comment on the proposal to sunset the CMS Web Interface as a collection and submission type under MIPS starting with the 2021 performance period. The following is a summary of public comments received regarding the proposal.

Comment: Several commenters generally supported the proposal to sunset the CMS Web Interface as a collection and submission type (with a few commenters expressing support of the proposal based on the condition of having a transition period of at least 1 year) and noted that the removal of the CMS Web Interface would reduce the quantity of quality measures reported, allow groups and virtual groups to select specialty measures, and encourage the use of electronically reported measures rather than the manual abstraction of data using a CMS-created Excel template for uploading quality data.

Response: We appreciate the support from commenters and note that we are finalizing our proposal to remove the CMS Web Interface as a collection and

submission type with a 1-year delay. Also, we note that the CMS Web Interface not only has the function of providing for a manual abstraction of data using a CMS-created Excel template for uploading quality data, but allows for the use of an application programming interface (API), which encourages the use of enhanced EHR technology.

Comment: Most commenters did not support the proposal to sunset the CMS Web Interface as a collection and submission type starting with the 2021 performance period, indicating that CMS did not provide adequate notice of the CMS Web Interface being under consideration for elimination and noting that the lack of adequate notice would create a burden for users to be able to successfully transition to the use of a different collection and submission type, which would require a significant amount of time and fiscal resources to build a new health IT infrastructure and workflows, and train staff on the new system. A few commenters indicated that organizations elect to utilize the CMS Web Interface as a cost-effective option for TINs using multiple, disparate EHR systems and the removal of the CMS Web Interface would make it particularly burdensome for such organization to change collection and submission types. One commenter indicated that not all organizations have the resources to transition to a different collection and submission type and doing so would be difficult for small community practices to implement. Most commenters recommended that CMS delay the sunset of CMS Web Interface by one or more years, particularly as clinicians are responding to the PHE for COVID-19 and CMS continues to define the MVP framework, which may necessitate program participants to change collection and submission types again in a few years.

Response: We recognize that the general sentiment of most commenters was not in opposition to the proposal to remove the CMS Web Interface as a collection type and submission, but rather the proposed timeframe for removal, which would be burdensome due to insufficient time to build and integrate new health IT infrastructures and systems, implement workflows, and train staff on new health IT systems while mitigating and responding to the PHE for COVID-19 that has further strained limited fiscal resources. To reduce the burden of transitioning to a new collection and submission type, we are extending the availability of the CMS Web Interface as a collection and submission type for one additional performance period. Thus, we are

modifying our proposal to sunset the CMS Web Interface starting with the 2022 performance period.

Comment: Some commenters indicated that the removal of the CMS Web Interface as a collection and submission type may limit the ability of clinicians to achieve the maximum possible score under the quality performance category. One commenter expressed concern that as APMs migrate to other collection types, the performance rates for benchmarks of other collection types would increase and the performance of non-APM participants may be disadvantaged when compared to the increased benchmarks.

Response: We disagree that the removal of the CMS Web Interface as a collection type would inhibit APM Entities, groups, or virtual groups that formerly utilized the CMS Web Interface from being able to achieve the maximum possible score allotted under the quality performance category or pose a potential disadvantage for non-APM participants that had not previously reported quality data via the CMS Web Interface as APMs that migrate from utilizing the CMS Web Interface to other collection types. It should be noted that the way in which APM Entities (ACOs participating in the Medicare Shared Savings Program or Next Generation ACO Model), groups, and virtual groups are scored relative to the benchmarks established for the CMS Web Interface measures differ from the way in which MIPS eligible clinicians, groups, virtual groups, and APM Entities are scored relative to the benchmarks established for all other quality measures. The deciles for the CMS Web Interface benchmarks are flat (meaning that each decile is stagnant and equally distributed increments equating 100 percent; for example, if a CMS Web Interface user had a performance score of 92 percent, the points achieved would be 9 points) while the deciles for other quality measure benchmarks are based on the distribution of performance (meaning that each decile reflects a specific range of performance distribution in incremental percentages equating to 100; for example, the decile representing the 10 percent of highest performance could have a range of performance from 98 percent to 100 percent, so in order to achieve the maximum points, a MIPS eligible clinician, group, or virtual group would need to have a performance within such range). Performance rates pertaining to the CMS Web Interface measures are not comparable to performance rates pertaining to other quality measures for

other collection types and do not provide an indication of how performance would be distributed across the performance curve outside of the CMS Web Interface. In order to achieve the maximum possible score for the quality performance category, a MIPS eligible clinician, group, virtual group, or APM Entity would need to have better performance compared to other clinicians along the distribution curve of performance for a particular measure.

Comment: One commenter suggested that CMS provide CMS Web Interface users with an option to file a hardship exception for transitioning to a new EHR as a collection type, which would reweight the quality and promoting interoperability performance categories to zero to ensure that such clinicians would not be penalized while transitioning to new collection types.

Response: We disagree with the commenter's suggestion that a hardship exception be established for groups or virtual groups utilizing the CMS Web Interface as such users transition to a different collection type. The hardship exemption is a policy established pertaining to specific circumstances such as using decertified EHR technology, insufficient internet connectivity, extreme and uncontrollable circumstances, and the lack of control over CEHRT. We do not believe that the transition to utilizing a different collection type would warrant the establishment of a new hardship exception. The CMS Web Interface will remain as a collection type for the 2021 performance period to provide sufficient time for CMS Web Interface users to prepare to utilize a different collection type starting with the 2022 performance period as the CMS Web Interface will sunset starting with the 2022 performance period.

Comment: One commenter recommended CMS to provide tools to assist with the transition from the CMS Web Interface to other collection types by providing a simple tool for aggregating QRDAIII files from multiple EHR systems into a single QRDAIII or JSON format file for MIPS submission. The commenter acknowledged that CMS has provided open source software for such purpose, but requested that CMS embed the file aggregation process in the MIPS quality submission workflow in order to allow an authorized submitter to choose an upload and submission method for the quality performance category that automatically aggregates multiple QRDAIII files.

Response: We note that groups and virtual groups are required to aggregate data across the group or virtual group in

order to meet reporting requirements established at §§ 414.1310(e)(3) and 414.1315(d)(3). We are unable to provide the embedded aggregation tool the commenter is requesting, but will take this into consideration for future enhancements.

After consideration of the public comments, we are finalizing our proposal to remove the CMS Web Interface as a collection and submission type with a 1-year delay. In order to address the potential burden that groups and virtual groups would experience by the removal of the CMS Web Interface as a collection and submission type during the PHE for COVID-19, we believe it is critical to reduce the burden of groups and virtual groups at this juncture and postpone the sunset of the CMS Web Interface to the 2022 performance period. Thus, we are finalizing at § 414.1325(c)(1) and (2) to sunset the CMS Web Interface measures as a collection type/submission type starting with the 2022 performance period. Specifically, at § 414.1305, we are finalizing our proposal with modification to define the terms collection type and submission type to remove the CMS Web Interface measures as an available option starting with the 2024 MIPS payment year. We are finalizing our proposal with modification to revise the definition of collection type to mean a set of quality measures with comparable specifications and data completeness criteria, as applicable, including, but not limited to: Electronic clinical quality measures (eCQMs); MIPS Clinical Quality Measures (MIPS CQMs); QCDR measures; Medicare Part B claims measures; for the 2019 through 2023 MIPS payment years, CMS Web Interface measures; the CAHPS for MIPS Survey; and administrative claims measures. We are finalizing our proposal with modification to revise the definition of "submission type" to mean the mechanism by which the submitter type submits data to CMS, including, but not limited to: Direct; log in and upload; log in and attest; Medicare Part B claims; and for the 2019 through 2023 MIPS payment years, the CMS Web Interface.

(d) Selection of MIPS Quality Measures

Previously finalized MIPS quality measures can be found in the CY 2020 PFS final rule (84 FR 63205 through 63513); CY 2019 PFS final rule (83 FR 60097 through 60285); CY 2018 Quality Payment Program final rule (82 FR 53966 through 54174); and in the CY 2017 Quality Payment Program final rule (81 FR 77558 through 77816). Proposed changes to the MIPS quality

measure set as described in Appendix 1 of the CY 2021 PFS proposed rule (85 FR 50412 through 50663) include the following: Addition of new measures; updates to specialty sets; removal of existing measures, and substantive changes to existing measures. For the 2021 performance period, we proposed a measure set of 206 MIPS quality measures.

The new MIPS quality measures proposed for inclusion in MIPS for the 2021 performance period and future years were found in Table Group A of Appendix 1 of the proposed rule (85 FR 50413 through 50414). For the 2021 performance year, we proposed 2 new administrative claims outcome measures. In addition to the establishment of new individual MIPS quality measures, we also develop and maintain specialty measure sets to assist MIPS eligible clinicians with selecting quality measures that are most relevant to their scope of practice. The proposed modifications to existing specialty sets and new specialty sets were outlined in Table Group B of Appendix 1 of the proposed rule (85 FR 50415 through 50580). Specialty sets may include: New measures; previously finalized measures with modifications; previously finalized measures with no modifications; the removal of certain previously finalized quality measures; or the addition of existing MIPS quality measures. Note that the specialty and subspecialty sets are not inclusive of every specialty or subspecialty.

On January 6, 2020,¹²⁴ we announced that we would be accepting recommendations for potential new specialty measure sets or revisions to existing specialty measure sets for year 5 of MIPS under the Quality Payment Program. These recommendations were based on the MIPS quality measures finalized in the CY 2019 PFS final rule, the 2019 Measures Under Consideration list, and provides recommendations to add or remove the current MIPS quality measures from existing specialty sets, or provides recommendations for the creation of new specialty sets. All specialty set recommendations submitted for consideration were assessed and vetted, and as a result, the recommendations with which we agreed were proposed in the CY 2021 PFS proposed rule.

In addition to establishing new individual MIPS quality measures and modifying existing specialty sets and new specialty sets as outlined in Tables Group A and Group B of Appendix 1 of the CY 2021 PFS proposed rule, we refer readers to Table Group C of Appendix 1 of the CY 2021 PFS proposed rule for a list of quality measures and rationales for removal (85 FR 50580 through 50585). For the 2021 performance period, we proposed to remove 14 MIPS quality measures: 2 MIPS quality measures that are extremely topped out; 1 MIPS quality measure that is duplicative to another current quality measure; 1 MIPS quality measure that is duplicative to one of the new proposed MIPS quality measures; 2 MIPS quality measures that do not align with the Meaningful Measures Initiative; 5 MIPS quality measures that are no longer stewarded or maintained; 1 MIPS quality measure that does not meet current clinical guidelines; and 2 MIPS quality measures that are under the topped out lifecycle. We noted that we have continuously communicated to stakeholders our desire to reduce the number of process measures within the MIPS quality measure set. Also, we noted our belief that the proposal to remove the quality measures outlined in Table Group C would lead to a more parsimonious inventory of meaningful, robust measures in the program, and that our approach to remove measures should occur through an iterative process that will include an annual review of the quality measures to determine whether they meet our removal criteria.

Lastly, MIPS quality measures with proposed substantive changes can be found in Table Group D of Appendix 1 of the CY 2021 PFS proposed rule. We proposed substantive changes to 112 MIPS quality measures. On an annual basis, we review the established MIPS quality measure inventory to consider updates to the measures. Possible updates to measures may be minor or substantive. Section 1848(q)(2)(D)(i)(II)(cc) of the Act requires all substantive measure changes to be proposed and identified through notice-and-comment rulemaking. In the CY 2017 Quality Payment Program final rule (81 FR 77137), we determined that substantive changes to measures (that is, measure specifications, measure title, and domain modifications) would be identified during the rulemaking process while maintenance changes that do not substantively change the intent of the measure (that is, updated diagnosis and procedure codes,

definitions, and changes to patient population exclusions) would not be included in the rulemaking process.

We note that changes to measure Q134, Prevention Care and Screening: Screening for Depression and Follow-Up Plan (eCQM Specifications and CMS Web Interface Measure Specifications collection types), specifically the removal of SNOMED codes, were published in the eCQI Resource Center and the Value Set Authority Center (in May of 2018 for the eCQM Specifications) and on the CMS website (in December of 2018 for the CMS Web Interface Measure Specifications). While the current cycle of measure updates to MIPS quality measures is separate from the eCQM annual update process, we inadvertently recognized such update allowed MIPS eligible clinicians to meet performance of a follow-up plan by rescreening the patient who has a positive depression screen with an additional standardized depression screening tool. The change to the measure was continued for CY 2020. As a result, such changes were not identified during the CY 2019 PFS or CY 2020 PFS rulemaking cycles. The changes to measure Q134 (eCQM Specifications and CMS Web Interface Measure Specifications collection types) impact performance periods starting with 2019. For the 2019 and 2020 performance periods, measure Q134 applicable to the eCQM Specifications and CMS Web Interface Measures Specifications will be suppressed from scoring. To adequately capture the substantive changes to measure Q134 (eCQM Specifications and CMS Web Interface Measure Specifications collection types) through rulemaking for the 2021 performance period, we are identifying the substantive changes for this MIPS quality measure as outlined in Table Group D of Appendix 1 of the CY 2021 PFS proposed rule (85 FR 50586 through 50663).

We refer readers to Table Groups A through D of Appendix 1 of this final rule for a summary of public comments received regarding the proposed changes to the MIPS quality measure set for the 2021 performance period and our final decisions.

(e) MIPS Performance Period

(i) Establishing Separate Performance Periods for Administrative Claims Measures Under the Quality Performance Category Beginning With the 2023 MIPS Payment Year

In the CY 2019 PFS final rule (83 FR 59745), we established at § 414.1320(d)(1) that beginning with the 2022 MIPS payment year, the

¹²⁴ Listserv messaging was distributed through the Quality Payment Program listserv on January 6, 2020, titled: "CMS is Soliciting Stakeholder Recommendations for Potential Consideration of New Specialty Measure and/or Revisions to the Existing Specialty Measure Sets for the 2021 Program Year of Merit-based Incentive Payment System (MIPS)."

performance period for the quality and cost performance categories is the full calendar year (January 1 through December 31) that occurs 2 years prior to the applicable MIPS payment year. We noted that we established a 1-year performance period for measures in the quality performance category because a 1-year performance period would provide statistically larger sample sizes and more accurate and actionable information. As discussed in Table Group A of Appendix 1 of the CY 2021 PFS proposed rule, we proposed to add a new administrative claims measure of risk-standardized complication rate following elective primary total hip arthroplasty and/or total knee arthroplasty. As discussed, this measure was developed and tested using a performance period that was longer than a full calendar year in order to provide larger sample sizes, and more accurate and actionable information. Beginning with the 2021 performance year, this measure would have a 3-year performance period (consecutive 36-month timeframe) that would start on October 1 of the calendar year 3 years prior to the applicable performance year and conclude on September 30 of the calendar year of the applicable performance year, and proceeding with a 3-month numerator assessment period (capturing complication outcomes) followed by a 2-month claims run-out period. For example, the 3-year (36 consecutive months) performance period for this measure would span from October 1, 2018 to September 30, 2021 with a 90-day numerator assessment period followed by a 60-day claims run-out period.

To account for this measure and other future administrative claims measures that may have a performance period differing from 1 full calendar year, we proposed to modify the definition of the performance period for the quality and cost performance categories at § 414.1320(d)(1) to be as follows: Beginning with the 2023 MIPS payment year, the performance period for the quality and cost performance categories is the full calendar year (January 1 through December 31) that occurs 2 years prior to the applicable MIPS payment year, except as otherwise specified for administrative claims-based measures in the MIPS final list of quality measures described in § 414.1330(a)(1). We noted that while we have established a single performance period for measures and activities within each performance category in the MIPS program, we have established measure-specific performance periods in other programs,

such as in the hospital value-based purchasing program, which includes measures of various performance periods (84 FR 42394 through 42395). We continue to believe that establishing a single performance period for measures requiring the submission of data optimizes operational efficiency for MIPS eligible clinicians, groups, and virtual groups that submit data on such measures. However, administrative claims measures (proposal to add 2 new administrative claims measures found in Table Group A of Appendix 1 of the CY 2021 PFS proposed rule: Hospital-Wide, 30-Day, All-Cause Unplanned Readmission (HWR) Rate, and Risk-standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA)); and the proposal to remove the All-Cause Readmission measure found in Table Group C of Appendix 1 (was the only administrative claims-based measure) do not require the submission of data and are calculated by CMS based on administrative data. Thus, we noted our belief that a different performance period should be considered on a measure-by-measure level for administrative claims measures.

We solicited public comment on the proposal to modify the definition of performance period for the quality and cost performance categories that would establish a separate performance period for administrative claims measures under the quality performance category. The following is a summary of the public comments received regarding the proposal.

Comment: One commenter supported the incorporation of a 3-year timeframe for the RSCR following elective primary THA and/or TKA measure because the measure evaluates individuals and groups over a longer timeframe for increased reliability and aligns with the HWR measure. The commenter recommended that CMS allow for a longer performance period for other MIPS measures, where appropriate.

Response: We appreciate the support from the commenter.

Comment: Several commenters expressed concern about the proposal to establish a separate performance period for administrative claims measures under the quality performance category and recommended that the performance period for administrative claims measures under the quality performance category retain a 1-year performance period. The commenters understood the issue surrounding the basis for larger sample sizes, and more accurate and actionable information needed for reliable measurement, but indicated that

a 3-year performance period is too long to provide timely, meaningful feedback for MIPS eligible clinicians. The commenters expressed concern that the performance is not representative of the changes in data over 3 consecutive years. One commenter indicated that many small and independent practices would not be able to retroactively report quality measures that require a 3-year performance window. One commenter stated that differing performance periods under the same performance category would cause confusion for clinicians.

Response: We believe that it is important for measures to be developed based on larger sample sizes, and more accurate and actionable information in order to reliably measure quality performance. We disagree with commenters that a 3-year performance period for administrative claims measures under the quality performance category would inhibit timely and meaningful feedback for MIPS eligible clinicians, groups, and virtual groups; MIPS eligible clinicians, groups, and virtual groups will continue to receive annual, confidential performance feedback reports that reflect prior performance. MIPS eligible clinicians, groups, and virtual groups can compare their performance provided in performance feedback to better understand their performance relative to their peers, identify care coordination and quality of care opportunities, and streamline resource use for their attributed patients. The performance period for administrative claims measures would span a 3-year period, in which 2 years of the 3-year period would overlap with the prior measurement period and 1 year would represent new data. While this approach may not capture small improvements in the quality of care, it ensures statistical reliability and therefore, a valid measure result. For example, the proposed new administrative claims measure of risk-standardized complication rate following elective primary total hip arthroplasty and/or total knee arthroplasty would have a 3-year (36 consecutive months) performance period, including elective primary total hip/knee arthroplasty procedures performed between October 1, 2018 to September 30, 2021.

We do not believe that establishing different performance periods specific to administrative claims measures under the quality performance category would cause confusion within the quality performance category while all other quality measures have a full calendar year as a performance period given that differing performance periods only

pertain to administrative claims measures and the submission of data is not required for such measures due to CMS conducting the calculations based on administrative claims data. The introduction of measure-specific performance periods is a concept established in other CMS programs, such as in the hospital value-based purchasing program, which includes measures of various performance periods (84 FR 42393 through 42395). We continue to believe that establishing a single performance period for measures requiring the submission of data optimizes operational efficiency for MIPS eligible clinicians, groups, and virtual groups that submit data on such measures.

After consideration of the public comments, we are finalizing our proposal to define the performance period for the quality and cost performance categories at § 414.1320(d)(1) as follows: Beginning with the 2023 MIPS payment year, the performance period for the quality and cost performance categories is the full calendar year (January 1 through December 31) that occurs 2 years prior to the applicable MIPS payment year, except as otherwise specified for administrative claims-based measures in the MIPS final list of quality measures described in § 414.1330(a)(1).

(f) Quality Data Submission Criteria

(i) Performance Criteria for Quality Measures for Groups Electing To Report Consumer Assessment of Healthcare Providers and Systems (CAHPS) for MIPS Survey

We refer readers to the CY 2018 Quality Payment Program final rule (82 FR 53629 through 53632) for previous finalized policies for the CAHPS for MIPS Survey, specifically regarding the Summary Survey Measures (SSMs).

To address the PHE for COVID-19 and the increased use of telehealth care, we proposed the following changes to our policies related to the CAHPS for MIPS Survey:

- We proposed to integrate one telehealth item into the CAHPS for MIPS Survey. Specifically, we proposed to add a survey-based measure on telehealth that assesses patient-reported usage of telehealth services (for example, phone or video visit) to the PY 2021 CAHPS for MIPS Survey.

- We also proposed revisions to the CAHPS for MIPS Survey cover page to include a reference to care received in telehealth settings. This may help to ensure that patients who respond to the survey are reflecting on experiences of the care they received via telehealth in

their responses. We noted that we are considering such changes for the PY 2021 CAHPS for MIPS Survey administration.

To clarify the instructions in the CAHPS for MIPS Survey, we proposed revisions to the instructions in the “Your Care From Specialists in the Last 6 Months” section of the CAHPS for MIPS Survey to clarify the inclusion of the provider named in Question 1 of the survey. We noted that we are considering such changes for the PY 2021 CAHPS for MIPS Survey administration.

We refer readers to section VII of this rule the Collection of Information Requirements for additional information.

We received public comments on the performance criteria for quality measures for groups electing to report CAHPS for MIPS Survey proposals. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported adding a survey-based measure in the CAHPS for MIPS Survey that reflects the increased use of telehealth services, and helps clinicians understand utilization patterns, consumer satisfaction and outcomes of telehealth. One commenter indicated support for a survey question related to the use of telehealth services only, but not a question or measure to evaluate a clinician’s performance during the telehealth visit.

Response: We clarify that the item on use of telehealth would be a single question that collects self-reported information from CAHPS for MIPS Survey respondents on the modalities of care they received over the prior 6 months (in-person, by phone, or video visit). We clarify here that this survey item would be for informational purposes only (similar to the existing CAHPS for MIPS Survey item that assesses internet use at home), and would not be used for quality scoring or payment purposes.

Comment: One commenter did not support the inclusion of a new measure assessing telehealth services until there is clarification on the intent of the questions, descriptions of what information will be collected, robust testing of the usefulness of the new measure and impact on response rates and performance, and NQF endorsement of the new CAHPS for MIPS survey question. One commenter wanted clarification on whether the purpose of adding a telehealth measure is to assess digital literacy of patients or to allow patients to assess the degree to which services provided remotely were appropriate and met their needs.

Response: We note that in 85 FR 50292, we proposed to integrate a single item into the CAHPS for MIPS Survey to collect respondents’ self-reported data on use of telehealth services (for example, by phone or video visit) during the prior 6 months. We clarify here that this survey item would be for informational purposes only (similar to the existing CAHPS for MIPS Survey item that assesses internet use at home). That is, this item would not be used for quality scoring or payment purposes. Rather, the purpose of this question would be to provide CMS and participating groups with useful information about utilization of telehealth by their assigned patients, specifically, self-reported data on mode of telehealth delivery (phone vs. video). The item will also capture whether any in-person visits occurred and will allow CMS and participating groups to examine the reports and ratings of care for patients receiving telehealth visits and will allow CMS to examine resulting CAHPS scores for groups whose patients used telehealth. It may promote comparison of the experiences of patients using telehealth with those who have not used telehealth, which could inform quality improvement efforts for individual groups and allow CMS to monitor the experiences of assigned patients (both those utilizing telehealth and those who do not). The proposed item has not been field tested. As with existing CAHPS for MIPS Survey items, the proposed item has been tested in one-on-one interviews with patients to assess whether patients correctly understand the terms and phrases used in the question and are able to recall experiences relevant to the question. Testing was conducted in English and Spanish. CAHPS for MIPS Survey items are not a candidate for NQF review. We do not anticipate the addition of a single telehealth question will affect the survey response rate. Given the rapidly evolving use of telehealth services as a result of the COVID-19 pandemic, we believe the addition of an item to capture the use of telehealth should be added to the performance year 2021 CAHPS for MIPS Survey.

Comment: A few commenters supported the proposed revisions to the CAHPS for MIPS Survey cover page to include a reference to care received in telehealth settings.

Response: We appreciate the commenters for their support.

After consideration of public comments, we are finalizing our proposal to integrate one telehealth item and update the cover page to reference to care received in telehealth settings

starting in the PY 2021 CAHPS for MIPS Survey administration. Additionally, while no public comments were received, as a result of the qualitative testing we are not making any changes regarding the instructions in the “Your Care From Specialists in the Last 6 Months” section of the CAHPS for MIPS Survey in Question 1 of the survey.

(ii) CAHPS for MIPS Patient Assignment

Section 1834(m) of the Act specifies the payment amounts and circumstances under which Medicare makes payment for a discrete set of services, all of which must ordinarily be furnished in-person, when they are instead furnished using interactive, real-time telecommunication technology. When furnished under the telehealth rules, these specified Medicare telehealth services are reported using the same codes used for the “face-to-face” services, but are furnished using audio/video, real-time, interactive communications technology instead of in person. As such, the majority of the codes for primary care services included in the additional telehealth services added in the March 31st COVID-19 IFC for purposes of the PHE for COVID-19 are already included in the definition of primary care services for purposes of the MIPS assignment methodology for the CAHPS for MIPS Survey (82 FR 77168 through 77169; and 82 FR 53646 through 53647). At § 414.1305, we proposed to codify the definition of primary care services for purposes of MIPS assignment methodology for the CAHPS for MIPS Survey as follows:

- CPT codes:

- ++ 99201 through 99215 (codes for office or other outpatient visit for the E/M of a patient); 99304 through 99318 (codes for professional services furnished in a nursing facility, excluding professional services furnished in a SNF for claims identified by place of service (POS) modifier 31); 99319 through 99340 (codes for patient domiciliary, rest home, or custodial care visit); 99341 through 99350 (codes for E/M services furnished in a patient’s home for claims identified by POS modifier 12); 99487, 99489, and 99490 (codes for chronic care management); and 99495 and 99496 (codes for transitional care management services); and

- ++ Beginning with the 2023 MIPS payment year, 99421, 99422, and 99423 (codes for online digital E/M services (e-visit)); 99441, 99442, and 99443 (codes for telephone E/M services); and 96160 and 96161 (codes for Administration of Health Risk Assessment).

- HCPCS codes:

- ++ G0402 (code for the Welcome to Medicare visit); and G0438 and G0439

(codes for the annual wellness visits); and

- ++ Beginning with the 2023 MIPS payment year, G2010 (code for remote evaluation of patient video/images); and G2012 (code for virtual check-in).

In the March 31st COVID-19 IFC, we also established flexibilities for certain services that are furnished virtually using communication technologies, but that are not considered Medicare telehealth services such as virtual check-ins and e-visits (separate payments for such services had previously been established in the CY 2019 PFS final rule). We also established separate payment for telephone E/M services codes during the PHE. The communications technology-based services (CTBS) and the telephone E/M services are not currently included in the MIPS assignment methodology for the CAHPS for MIPS survey.

We believe it is critical to include codes for CTBS and telephone E/M services, as identified and discussed later in this section, in the definition of primary care services to ensure these services are included in our determination of where beneficiaries receive the plurality of their primary care for purposes of beneficiary assignment. Such inclusion ensures that the assignment methodology appropriately reflects the expanded use of technology that is helping people who need routine care during the PHE for COVID-19 and allowing vulnerable beneficiaries and beneficiaries with mild symptoms to remain in their homes, while maintaining access to the care they need. By including services provided virtually, either through telehealth or other uses of communications technology, we would ensure that this care is appropriately reflected in our consideration of the plurality of care used to assign beneficiaries to groups and virtual groups.

We have added new services to the separately billable CTBS under the Physician Fee Schedule over the past several years and a result of the PHE, we expect that the utilization of communications technology-based services will substantially increase during the PHE for COVID-19 and thereafter. We believe that clinicians are increasingly using such services as a key component of their ongoing primary care. In an effort to address the increased use of telehealth during the PHE and use of telehealth, and to maintain alignment with the Shared Savings Program, we proposed to integrate the same telehealth CPT and HCPCS codes that are used for purposes of assigning beneficiaries to Shared

Savings Program ACOs into the set of primary care service codes that are used for patient assignment to MIPS groups. We proposed to revise the definition of primary care services used in the MIPS assignment methodology for the 2021 CAHPS for MIPS Survey, and for any subsequent performance year, to include the following additions: (1) CPT codes: 99421, 99422, and 99423 (codes for online digital E/M services (e-visits)); 99441, 99442, and 99443 (codes for telephone E/M services); and 96160 and 96161 (codes for administration of health risk assessment); and (2) HCPCS codes: G2010 (code for remote evaluation of patient video/images) and G2012 (code for virtual check-in). It should be noted that the proposed inclusion of such codes in the MIPS assignment methodology for the CAHPS for MIPS Survey would align with the definition of primary care services used for purposes of beneficiary assignment under the Medicare Shared Savings Program, which was amended in the May 8th COVID-19 IFC to ensure that these codes for e-visits, telephone E/M services, remote evaluation of patient video/images, and virtual check-ins would be included in determining beneficiary assignment for the 2020 performance year and any subsequent performance year that starts during the PHE for COVID-19 (85 FR 27583). We referred readers to the May 8th COVID-19 IFC (85 FR 27582 through 27586) for a detailed description of the codes that were added to the definition of primary care services under the Medicare Shared Savings Program. We also referred readers to the 2018 PFS final rule (82 FR 53007 through 53011) for a detailed description of the primary care services codes for Administration of Health Risk Assessment.

The services represented by the codes listed above are being used in place of similar E/M services, the codes for which are already included in the list of codes used for assignment. We noted that as a result, we believe these services are an important component of primary care and it is appropriate to include these codes in the definition of primary care services used for assignment for the CAHPS for MIPS Survey. The only codes that are newly billable during the PHE for COVID-19 pertain to the telephone E/M services. It should be noted that these services as well as the remote evaluation of patient video/images and virtual check-in codes, and the online digital E/M service (e-visit) codes are not separately billable by a clinician if they are related to a visit within the past 7 days or lead

to a visit within the following 24 hours or next available appointment.

We believe that clinicians are increasingly using CTBS as a key component of their ongoing primary care. We noted that we expect that the utilization of such services will substantially increase not only during the PHE for COVID-19, but also thereafter. Accordingly, we proposed to include virtual primary care visits and telehealth visits to determine patient assignment to groups for purposes of the CAHPS for MIPS Survey for PY 2021 and subsequent performance years.

We did not receive public comments on this proposal, and therefore, we are finalizing it as proposed.

(g) Quality Performance Category: Expansion of Telehealth Codes Used in Beneficiary Assignment for the CMS Web Interface and CAHPS for MIPS Survey

(i) Background

In conjunction with this final rule and the ongoing impact of the PHE for COVID-19, we published the “Medicare and Medicaid Programs, Clinical Laboratory Improvement Amendments (CLIA), and Patient Protection and Affordable Care Act; Additional Policy and Regulatory Revisions in Response to the COVID-19 Public Health Emergency” IFC in the September 2, 2020 **Federal Register**, (hereinafter referred to as the September 2nd COVID-19 IFC), in which we adopted on an interim final basis a policy to include codes for CTBS and telephone E/M services in the definition of primary care services to ensure these services are included in our determination of where beneficiaries receive the plurality of their primary care for purposes of beneficiary assignment.

As discussed in the IFC, on March 17, 2020, we announced (<https://www.cms.gov/newsroom/fact-sheets/medicare-telemedicine-health-care-provider-fact-sheet>) the expansion of payment for telehealth services on a temporary and emergency basis pursuant to waiver authority added under section 1135(b)(8) of the Act by the Coronavirus Preparedness and Response Supplemental Appropriations Act, 2020 such that Medicare can pay for telehealth services, including office, hospital, and other visits furnished by physicians and other practitioners to patients located anywhere in the country, including in a patient's place of residence, starting March 6, 2020. In the context of the PHE for COVID-19, we recognize that physicians and other health care professionals are faced with

new challenges regarding potential exposure risks, including for Medicare beneficiaries, for health care providers, and for members of the community at large. For example, the CDC has recommended health care professionals to make every effort to interview persons under investigation for infection by telephone, text messaging system, or video conference instead of in-person. In the March 31st COVID-19 IFC, to facilitate the use of telecommunications technology as a safe substitute for in-person services, we added on an interim basis many services to the list of eligible Medicare telehealth services, eliminating frequency limitations and other requirements associated with particular services furnished via telehealth, and clarifying several payment rules that apply to other services that are furnished using telecommunications technologies that can reduce exposure risks (85 FR 19232).

Section 1834(m) of the Act specifies the payment amounts and circumstances under which Medicare makes payment for a discrete set of services, all of which must ordinarily be furnished in-person, when they are instead furnished using interactive, real-time telecommunication technology. When furnished under the telehealth rules, these specified Medicare telehealth services are reported using the same codes used for the “face-to-face” services, but are furnished using audio/video, real-time, interactive communications technology instead of in person. As such, the majority of the codes for primary care services included in the additional telehealth services added in the March 31st COVID-19 IFC for purposes of the PHE for COVID-19 are already included in the definition of primary care services for purposes of the MIPS beneficiary assignment methodology for the CMS Web Interface and CAHPS for MIPS Survey (81 FR 77168 through 77169; and 82 FR 53646 through 53647).

In the March 31st COVID-19 IFC, we also established flexibilities and separate payment for certain services that are furnished virtually using communication technologies, but that are not considered Medicare telehealth services such as virtual check-ins, e-visits. Additionally, we established separate payment for telephone E/M services codes during the PHE. The CTBS and the telephone E/M services are not currently included in the MIPS beneficiary assignment methodology for the CMS Web Interface and CAHPS for MIPS Survey.

We believe it is critical to include codes for CTBS and telephone E/M

services, as identified and discussed later in this section, in the definition of primary care services to ensure these services are included in our determination of where beneficiaries receive the plurality of their primary care for purposes of beneficiary assignment. Such inclusion ensures that the assignment methodology appropriately reflects the expanded use of technology that is helping people who need routine care during the PHE for COVID-19 and allowing vulnerable beneficiaries and beneficiaries with mild symptoms to remain in their homes, while maintaining access to the care they need. By including services provided virtually, either through telehealth, or other uses of communications technology, we ensure that this care is appropriately reflected in our consideration of the plurality of care used to assign beneficiaries to groups and virtual groups.

(ii) Use of Codes for Virtual Check-ins, Remote Evaluations E-Visits, and Telephone E/M Services in MIPS Beneficiary Assignment for the CMS Web Interface and CAHPS for MIPS Survey

We added new services to the separately billable CTBS under the PFS over the past several years and a result of the PHE for COVID-19, we expect that the utilization of CTBS will substantially increase during the PHE for the COVID-19 pandemic and thereafter. We believe that clinicians are increasingly using such services as a key component of their ongoing primary care. In the September 2nd COVID-19 IFC (85 FR 54820), we codified the definition of primary care services used in the MIPS beneficiary assignment methodology for the CMS Web Interface and CAHPS for MIPS Survey. The included codes consisted of previously finalized codes that were already considered primary care services and additional codes that we will be treating as primary care services for the duration of the PHE for COVID-19. The previously finalized codes were as follows: (1) CPT codes: 99201 through 99215 (codes for office or other outpatient visit for the E/M of a patient); 99304 through 99318 (codes for professional services furnished in a nursing facility, excluding professional services furnished in a SNF for claims identified by place of service (POS) modifier 31) (81 FR 77168); 99319 through 99340 (codes for patient domiciliary, rest home, or custodial care visit); 99341 through 99350 (codes for E/M services furnished in a patients' home for claims identified by POS modifier 12); 99487, 99489, and 99490 (codes for

chronic care management); and 99495 and 99496 (codes for transitional care management services); and (2) HCPCS codes: G0402 (code for the Welcome to Medicare visit); and G0438 and G0439 (codes for the annual wellness visits). The additional codes we added through the September 2nd COVID-19 IFC are as follows: (1) CPT codes: 99421, 99422, and 99423 (codes for online digital E/M service (e-visit)), and 99441, 99442, and 99443 (codes for telephone E/M services); and (2) HCPCS codes: G2010 (code for remote evaluation of patient video/images) and G2012 (code for virtual check-in). It should be noted that the inclusion of such codes for the MIPS beneficiary assignment methodology for the CMS Web Interface and CAHPS for MIPS Survey aligns with the revision that was made to the definition of primary care services used for purposes of beneficiary assignment under the Medicare Shared Savings Program to include the same codes in determining beneficiary assignment for performance year 2020 and any subsequent performance year that starts during the PHE for COVID-19 (85 FR 27583 through 27586).

The services listed above are an important component of primary care and as a result, we believe it is appropriate to include these codes in the definition of primary care services used for assignment for the CMS Web Interface and CAHPS for MIPS Survey because the services represented by these codes are being used in place of similar E/M services, the codes for which are already included in the list of codes used for assignment. It should be noted that the remote evaluation of patient video/images and virtual check-in codes, and the online digital E/M service (e-visit) codes are not separately billable by a clinician if they are related to a visit within the past 7 days or lead to a visit within the following 24 hours or next available appointment. The only codes that are newly billable during the PHE for COVID-19 pertain to the telephone E/M services.

We included the codes in the definition of primary care services for the 2020 performance year and any subsequent performance year that starts during the PHE for COVID-19. We recognized that the application of this policy for the 2020 MIPS performance period is retroactive. Section 1871(e)(1)(A)(ii) of the Act provides for retroactive application of a substantive change to an existing policy when the Secretary determines that failure to apply the policy change retroactively would be contrary to the public interest. Without the inclusion of these codes for purposes of the MIPS beneficiary

assignment methodology for the CMS Web Interface and CAHPS for MIPS Survey for the 2020 performance year during the PHE for COVID-19, we would not be able to adequately account for the ways in which beneficiaries are receiving primary care services during the PHE for COVID-19 and as a result, the process to derive assignment and sampling of beneficiaries for the CMS Web Interface and CAHPS for MIPS Survey would not be able to comprehensively capture how primary care services are being furnished to beneficiaries, which may cause many groups and virtual groups to have insufficient sample sizes to be able to administer the 2020 CAHPS for MIPS Survey or report data for the quality performance category using the CMS Web Interface measures. In regard to the CMS Web Interface, such groups and virtual groups may not have sufficient time to select an alternate collection type and prepare their systems to report on measures from a different collection type before the submission period begins for the 2020 performance period and as a result, they would not be able to meet the quality performance category reporting requirements, which could negatively impact their MIPS final score and MIPS payment adjustment. We believe it is important to include the above codes in our assignment methodology because we determine assignment based upon where beneficiaries receive the plurality of their primary care services and whether beneficiaries have designated a MIPS eligible clinician as their primary clinician, responsible for their overall care, and hold groups and virtual groups accountable for the resulting assigned beneficiary population. Including such codes in the definition of primary care services used in MIPS beneficiary assignment during the PHE for COVID-19 will result in a more accurate identification of where beneficiaries have received the plurality of their primary care services.

We received the following comments on the codified definition of primary care services used in the MIPS beneficiary assignment methodology for the CMS Web Interface and CAHPS for MIPS Survey.

Comment: Several commenters supported the proposal to expand the use of telehealth codes to the definition of primary care services that is used in the beneficiary assignment for purposes of MIPS for the CMS Web Interface and CAHPS for MIPS Survey. The commenters indicated that the inclusion of CTBS and telephone E/M services in the primary care definition appropriately reflects the reality of the

care being provided during the PHE for COVID-19 and allows patients with mild symptoms to remain in their homes while maintaining access to care. Some commenters stated that the expansion of CTBS and telephone E/M services codes may incentivize clinical data registry reporting. A few commenters recommended that CMS continue this policy on a permanent basis.

Response: We appreciate the support from commenters. In regard to the comment about the applicability of including the added CTBS and telephone E/M services codes for purposes of the assignment methodology on a permanent basis, we note that for purposes of the CMS Web Interface, the addition of such codes would be included for the 2020 performance year and any subsequent performance year that starts during the PHE for COVID-19. The CMS Web Interface will be removed as a collection and submission type starting with the 2022 performance period. For purposes of the CAHPS for MIPS Survey, in section IV.A.3.c.(1)(f)(ii) of this final rule, we note that the inclusion of the added CTBS and telephone E/M services codes in the assignment methodology would be applicable for PY 2021 and subsequent performance years.

Comment: One commenter requested that CMS consider the inclusion of audio-only services.

Response: We will take into consideration the inclusion of other additional service codes pertaining to telehealth services for future rulemaking.

After consideration of the public comments, we are finalizing the provisions of the September 2nd COVID-19 IFC without any modifications. We are finalizing the codified definition of primary care services used in the MIPS beneficiary assignment methodology for the CMS Web Interface and CAHPS for MIPS Survey for the 2020 performance year due to the PHE for COVID-19 as defined in § 400.200, to include the following additions: (1) CPT codes: 99201 through 99215 (codes for office or other outpatient visit for the E/M of a patient); 99304 through 99318 (codes for professional services furnished in a nursing facility, excluding professional services furnished in a SNF for claims identified by place of service (POS) modifier 31) (81 FR 77168); 99319 through 99340 (codes for patient domiciliary, rest home, or custodial care visit); 99341 through 99350 (codes for E/M services furnished in a patients' home for claims identified by POS modifier

12); 99421, 99422, and 99423 (codes for online digital E/M service (e-visit)), and 99441, 99442, and 99443 (codes for telephone E/M services); 99487, 99489, and 99490 (codes for chronic care management); and 99495 and 99496 (codes for transitional care management services); and (2) HCPCS codes: G0402 (code for the Welcome to Medicare visit); G0438 and G0439 (codes for the annual wellness visits); G2010 (code for remote evaluation of patient video/images); and G2012 (code for virtual check-in).

(2) Cost Performance Category

We refer readers to the CY 2017 and CY 2018 Quality Payment Program final rules, and the CY 2019 and CY 2020 PFS final rules (81 FR 77162 through 77177, 82 FR 53641 through 53648, 83 FR 59765 through 59776, and 84 FR 62959 through 62968, respectively) for a description of the statutory basis and existing policies pertaining to the cost performance category.

In the CY 2021 PFS proposed rule (85 FR 50293), we proposed to weight the cost performance category at 20 percent for MIPS payment year 2023 and 30 percent for MIPS payment year 2024 and all subsequent MIPS payment years.

(a) Weight in the Final Score

Under section 1848(q)(5)(E)(i)(II)(aa) of the Act, in general, 30 percent of the MIPS final score shall be based on the cost performance category. However, section 1848(q)(5)(E)(i)(II)(bb) of the Act gives the Secretary discretion with respect to the weight of the cost performance category for the first 5 years of MIPS. Specifically, under that section, for the first year for which the MIPS applies to payments (the 2019 MIPS payment year), not more than 10 percent of the MIPS final score shall be based on the cost performance category; and for each of the second, third, fourth, and fifth years for which the MIPS applies to payments (the 2020, 2021, 2022, and 2023 MIPS payment years, respectively), not less than 10 percent and not more than 30 percent of the MIPS final score shall be based on the cost performance category.

Additionally, section 1848(q)(5)(E)(i)(II)(bb) of the Act states that it shall not be construed as preventing the Secretary from adopting a 30 percent weight for the second, third, fourth, or fifth year if the Secretary determines, based on information posted under section 1848(r)(2)(I) of the Act, that sufficient cost measures are ready for adoption for use under the cost performance category for the relevant performance period. The weights adopted in prior rulemaking for

the cost performance category are codified under § 414.1350(d).

In the CY 2020 PFS proposed rule (84 FR 40752), we proposed to incrementally increase the weight of the cost performance category from the existing weight of 15 percent for the 2021 MIPS payment year to 30 percent beginning with the 2024 MIPS payment year as required by section 1848(q)(5)(E)(i)(II)(aa) of the Act. We proposed to incrementally increase the weight of the cost performance category by 5 standard increments each year through the 2024 MIPS payment year, reflecting a weight of 20 percent for the 2022 MIPS payment year, 25 percent for the 2023 MIPS payment year, and 30 percent for the 2024 MIPS payment year and each subsequent MIPS payment year (84 FR 40752 through 40753).

As cost measures are still being developed, we recognized that clinicians may not have the same level of familiarity or understanding of cost measures as they do with the comparable quality measures. To implement a gradual and predictable approach of increasing the weight of the cost performance category each year would provide clinicians with adequate time to prepare for a 30 percent weight and enable clinicians to gain experience with the cost measures while they represent a smaller portion of the MIPS final score. We recognized that there may be greater understanding of the measures in the cost performance category as clinicians obtain more experience with the measures (84 FR 62959).

After considering the comments we received, we did not finalize our proposals, and instead established at § 414.1350(d)(3) that the weight of the cost performance category will remain at 15 percent of the MIPS final score for MIPS payment years 2021 and 2022 (84 FR 62961). We stated that we expected to propose a weight for the cost performance category for the 2023 MIPS payment year in the CY 2021 PFS proposed rule.

In developing the proposals in the CY 2021 PFS proposed rule, we considered a range of numerical options for the weight of the cost performance category for the 2023 MIPS payment year, with the intention of reaching a weight of 30 percent no later than the 2024 MIPS payment year as required by the statute. The first option we considered was to maintain the cost performance category weight at the status quo for an additional year, in which it would remain at 15 percent for the 2023 MIPS payment year and then increase to 30 percent beginning with the 2024 MIPS payment year, which would be a 100

percent increase (an increase of 15 percentage points) in the weight from 2023 to 2024. We considered such option as a result of the PHE for COVID-19 in order to not increase the weight of the cost performance category during an unprecedented time. However, by maintaining the weight at 15 percent for the 2023 MIPS payment year, the weight would increase two-fold to 30 percent beginning with the 2024 MIPS payment year, which we believe would pose a significant burden to stakeholders and would eliminate any transition of an incremental increase in the cost performance category weight. We believe that the first option would be more burdensome than beneficial to clinicians as they continue to gain more experience with the cost measures and confront the PHE for COVID-19.

The second option we considered was to increase the weight from 15 percent for MIPS payment years 2021 and 2022 to 20 percent for the 2023 MIPS payment year in order to provide a minimal transition that would enable clinicians to continue to become familiar with the cost measures and be prepared for the final increase in the weight of the cost performance category from 20 percent to 30 percent beginning with the 2024 MIPS payment year. We believe that such approach would allow us to reach the statutorily required weight of 30 percent by the 2024 MIPS payment year while providing clinicians with an eased incremental transition starting with the 2023 MIPS payment year and accounting for the consequential impact of the increased clinical costs associated with the PHE for COVID-19. For the 2023 MIPS payment year, we sought to identify a smaller increase in weight while enabling clinicians to gain more experience and familiarity with the cost measures amidst the mitigation of the PHE for COVID-19.

After considering these options, we proposed to establish at § 414.1350(d)(4) the weight of the cost performance category to be 20 percent of the MIPS final score for the 2023 MIPS payment year and at § 414.1350(d)(5) the weight of the cost performance category to be 30 percent for the 2024 MIPS payment year and each subsequent MIPS payment year.

We solicited public comment on the proposal, the other options we considered, and any additional options for the weight of the cost performance category that commenters believe we should consider, such as a 22.5 percent weight for the 2023 MIPS payment year and a 30 percent weight beginning with the 2024 MIPS payment year (a 7.5 percent increase for each year). In

general, we noted that we prefer to consider whole numbers for performance category weights, but were interested in obtaining feedback from commenters on the weighing of the cost performance category to have an increase of 7.5 percent for 2 consecutive years for the 2023 and 2024 MIPS payment years.

The following is a summary of the public comments received regarding the proposal to establish the weight of the cost performance category to be 20 percent of the MIPS final score for the 2023 MIPS payment year and 30 percent of the MIPS final score for the 2024 MIPS payment year and each subsequent MIPS payment year and other options for weighing the cost performance category.

Comment: Several commenters supported the proposal to reduce the weight of the quality performance category while simultaneously increasing the weight of the cost performance category. Some commenters supported a gradual and incremental weight increase of the cost performance category from 20 percent for the 2023 MIPS payment year to 30 percent for the 2024 MIPS payment year as a means to balance short-term scoring changes with long-term statutory requirements, which would enable MIPS eligible clinicians, groups, and virtual groups to continue to become familiar with cost measures and be prepared for the final weight increase to 30 percent for the 2024 MIPS payment year. One commenter indicated that such increases to the weight of the cost performance category have been anticipated and is statutorily mandated. Another commenter indicated that the changes to the weight of the cost performance category would heighten the importance of efficiency and cost control for clinicians remaining in FFS and encourage more clinicians to consider migrating to APMs. Another commenter stated that the gradual and incremental increase in weighting for the cost performance category would help compensate for the impact of increased clinical costs associated with the PHE for COVID-19.

Response: We appreciate the support from commenters and agree that providing a 2-year timeframe for the cost performance category to gradually increase would allow us to meet the statutory requirement for weighing the cost performance category at 30 percent by the 2024 MIPS payment year. We also agree that this approach of gradually and incrementally increasing the weight of cost enables MIPS eligible clinicians, groups, and virtual groups to continue to become familiar with the

cost measures during the PHE for COVID-19.

Comment: In regard to other options for weighing the cost performance category, one commenter indicated that a 7.5 percent increase in weight each year over a 2-year period (22.5 percent for the 2023 MIPS payment year and 30 percent for 2024 MIPS payment year) may be the most equal option, but that a 5-percentage point weight increase from 15 percent to 20 percent for the 2023 MIPS payment year and a 10-percentage point weight increase from 20 percent to 30 percent for the 2024 MIPS payment year would not be any more of a burden. Another commenter recommended that the weight of the cost performance category be weighted in whole numbers.

Response: We recognize that any increase in weight for the cost performance category could potentially pose varying levels of burden; however, we sought to decrease burden by establishing a gradual and incremental transition over a 2-year period while allowing clinicians to gain more experience with the cost measures and confront the challenges brought forth by the PHE for COVID-19. We believe that increasing the weight of the cost performance category from 15 percent to 20 percent for the 2023 MIPS payment year in order to provide a minimal transition would enable clinicians to continue to become familiar with the cost measures and be prepared for the final increase in the weight of the cost performance category from 20 percent to 30 percent beginning with the 2024 MIPS payment year, which allows clinicians to become familiar with cost measures and accounts for the consequential impact of the increased clinical costs associated with the PHE for COVID-19. In regard to the comment pertaining to the weight of the cost performance category to be in whole numbers, we agree with the commenter that weighting the cost performance category in whole numbers may reduce added confusion and complexity within our scoring system.

Comment: A few commenters suggested that as the weight of the cost category increases, CMS should help clinicians understand their performance throughout the performance period by creating an application programming interface (API) or another mechanism to provide MIPS eligible clinicians, groups, and virtual groups with real-time information about their cost score in order for them to understand their performance during the performance year and identify areas for improvement.

Response: We appreciate the recommendation from the commenters. We strive to provide performance feedback reports on the MIPS performance categories as soon as we are able to technically and feasibly do so. In order to further assist MIPS eligible clinicians, groups, and virtual groups in understanding their performance under the cost performance category, we provide additional feedback on cost measures that is at the patient level. With the submission and analysis of all data, including the assessment and calculation of cost data occurring after the conclusion of the applicable performance year, it would be impossible to provide real-time scores and feedback reports when the cost performance category has a performance period of a full calendar year, in which performance is based on 12 months of data. We believe that MIPS eligible clinicians, groups, and virtual groups are able to benefit and effectively utilize the performance feedback reports that are typically available around July 1 after the close of the submission period for an applicable performance period. Information provided in the feedback reports are applicable and can be used by MIPS eligible clinicians, groups, and virtual groups to identify areas for improvement for the cost performance category.

Comment: Many commenters did not support the proposal to reduce the weight of the quality performance category to increase the weight of the cost performance category during the PHE for COVID-19 given clinicians are burdened in new ways and trying to navigate through various challenges brought on by the PHE. Several commenters indicated that the PHE for COVID-19 has caused major disruptions in practice, prompting the need to adjust to unusual and unpredictable patient volumes, and indicated that the PHE would impact performance data and therefore, the ability of CMS to accurately assess quality and cost. One commenter indicated that practices in COVID-19 hotspots that are testing for and treating patients with the virus, and fighting the pandemic would be unfairly penalized. Several commenters urged CMS to defer changes to the weight of the cost performance category and maintain the weight at 15 percent of the final MIPS score for the 2023 MIPS payment year while a few commenters recommended that the cost performance category be reweighted to zero percent for the 2023 MIPS payment year to provide clinicians with more time to care for patients through the pandemic, as well as familiarize themselves with

their resource use, including telehealth visits.

Other commenters expressed concern regarding the appropriateness of the cost measures, specifically indicating that there are not many cost measures available to assess cost performance, particularly for specialties. These commenters indicated that a limited number of cost measures would have significant implications for not accurately measuring cost performance and requested that we add new cost episodic-based measures for specialties. One commenter expressed concern that the outcome measures for many specialties are still in the testing phase and indicated that there continues to be confusion surrounding their use and reliability. These commenters did not support any increases to the weight of the cost performance category until more cost measures are available and concerns regarding the validity and accuracy of existing cost measures are addressed (for example, attributing costs at the group level (not attributing the same costs to both individual clinicians and groups), adjusting for risk of social determinants of health, publishing detailed testing results, and holding all measures to strict standards for reliability, statistical significance, actionability, and impact on health outcomes).

Response: Under section 1848(q)(5)(E)(i)(I) and (II) of the Act, for each of the first 5 years of MIPS, the weight of the quality performance category in the final score is determined based on the weight of the cost performance category. The statute requires that by the sixth year of MIPS, the quality performance category and the cost performance category each will make up 30 percent of the final score. Given that the percentage points attributed to the quality and cost performance categories are in tandem, we believe that it is important to meet the statutory requirements while balancing the impact of simultaneously reducing the weight of the quality performance category and increasing the weight of the cost performance category. We believe that increasing the weight of the cost performance category to 20 percent for the 2023 MIPS payment year and 30 percent for the 2024 MIPS payment year and each subsequent MIPS payment year provides a transition that eases the impact of experiencing an increase in the weight of the cost performance category by enabling a gradual and incremental transition over a 2-year period while clinicians confront the challenges brought forth by the PHE for COVID-19

and become familiar with cost measures and feedback reports.

In regard to concerns regarding an insufficient number of cost measures for specialties, and the appropriateness, actionability, validity, and accuracy of available cost measures, we recognize that measures focusing on specific clinical areas and specialties allow for clinicians to receive more actionable and meaningful feedback. To date, we have developed and implemented 18 episode-based cost measures, which are intended to capture the nuances of costs associated with procedures and conditions spanning different types of specialties and clinical areas. We revised the total per capita cost measure to focus on specialties that provide primary care and the Medicare spending per beneficiary clinician measure to focus on costs associated with an inpatient hospitalization. We anticipate that future measures may apply to a greater range of specialties and clinical areas, including areas suggested by stakeholders. We believe that we are able to continue to accurately assess performance for the cost performance category with the available cost measures; in the event that we cannot calculate a score for a given cost measure (for example, if we cannot calculate a benchmark for the measure, or a clinician does not meet the minimum case volume), the measure will not be scored and thus will not affect a clinician's overall cost performance category score. It should be noted that we are not able to address concerns with the existing cost measures during this rulemaking cycle for 2021 performance year given that any new cost measure or modifications to the existing cost measures for the 2021 performance period would have had to be proposed in the CY 2021 PFS proposed rule. The next opportunity for us to introduce new cost measures or modify existing measures would be for the 2022 performance year rulemaking cycle. We do not believe that maintaining the weight of the cost performance category at 15 percent until there are additional cost measures or modifications made to cost measures would be appropriate as we are statutorily required to increase the weight of the cost performance category to 30 percent by the 2024 MIPS payment year and want to ease the impact of experiencing the increase in the weight of the cost performance category by providing a gradual and incremental transition over a 2-year period. We believe it would be significantly more burdensome for MIPS eligible clinicians, groups, and virtual groups to

experience a two-fold increase from 15 percent to 30 percent beginning with the 2024 MIPS payment year.

In regard to the concerns about inaccurately assessing cost performance amidst the PHE for COVID-19 and unfairly penalizing practices in COVID-19 hotspots that are testing for and treating patients with the virus, and fighting the pandemic, we note that service assignment allows the episode-based cost measures to capture only the cost of services that are clinically related to the triggering event for the episode (for example, a knee replacement procedure or a hospitalization for stroke). This means that costs resulting from high volumes of COVID-19 treatment services are less likely to be captured in the episode-based costs measures. In addition, all cost measures, including total per capita cost measure and Medicare spending per beneficiary clinician measure are adjusted for clinical risk to account for different levels of care beneficiaries may require due to comorbidities, disability, age, and other risk factors. The risk adjustment model includes variables for clinical factors based on the patient's recent medical history that are outside the influence of the attributed condition to ensure that clinicians who treat higher risk populations, are not penalized. Also, cost measures use standardized claims payments to account for differences in Medicare payments for the same services across health care providers, removing the effect of regional differences in health care provider costs measured by the hospital wage indexes and geographic price cost indexes (GPCIs) or other payment adjustments such as those for teaching hospitals. The payment standardization process also removes the 20 percent increase in the IPPS relative weight under the CARES Act for individuals diagnosed with COVID-19. Furthermore, we have policies in place to account for scenarios when we cannot calculate a score for a given cost measure that does not meet our reliability and benchmark requirements. We believe that the measures in place will allow us to continue to accurately assess cost performance.

In regard to the comment expressing concern about outcome measures for specialties, we note that we have not adopted any such measures in the cost performance category, as these are quality measures. The episode-based cost measures pertaining to specialties that we have adopted are procedural and acute inpatient medical condition measures. These measures focus on the clinicians performing particular procedures or managing particular acute

inpatient medical conditions. These clinicians may often come from one specialty, but not necessarily.

After consideration of the public comments, we are finalizing our proposal to establish at § 414.1350(d)(4) the weight of the cost performance category to be 20 percent of the MIPS final score for the 2023 MIPS payment year and at § 414.1350(d)(5) the weight of the cost performance category to be 30 percent of the MIPS final score for the 2024 MIPS payment year and each subsequent MIPS payment year. We believe that such approach allows us to reach the statutorily required weight of 30 percent by the 2024 MIPS payment year while reducing the impact of experiencing an increase in the weight of the cost performance category too much in any one year, and providing clinicians with an eased gradual and incremental transition starting with the 2023 MIPS payment year.

(b) Addition of New Codes for Telehealth Services to Previously Established Measures for the Cost Performance Category Beginning With the 2021 Performance Period

For the 2021 performance period and future performance periods, we proposed to add costs associated with certain telehealth services to the previously established cost measures. For each cost measure, the telehealth services we proposed to add are directly relevant to the intent of the measure. We referred readers to Table 47 in the CY 2020 PFS final rule (84 FR 62979) for a summary list of the cost measures that have been established for the 2021 performance period and future performance periods, as well as the related discussions in the CY 2019 PFS final rule (83 FR 59767 through 83 FR 59774) and the CY 2020 PFS final rule (84 FR 62962 through 62979). Many services included on the Medicare telehealth service list are billed as telehealth services through the use of a modifier appended to the same code that is used when the service is furnished in person. These codes are already included in the cost measures; however, the additional codes we proposed to add are not currently included for a few reasons. First, some of the codes we proposed to add to the cost measures were newly included on the Medicare telehealth services list through the March 31st COVID-19 IFC (85 FR 19230) and subsequent subregulatory process established in the May 8th COVID-19 IFC (85 FR 27550). Second, some of the codes we proposed to add were not previously considered for inclusion because they were not billed widely enough to be found in

empirical claims-based data. This is because our approach for determining clinically related services to include in cost measures, which we established in the CY 2019 PFS final rule (83 PFS 59767 through 59771), relies on empirical data to examine existing practice patterns, in addition to clinical expertise. Having observed an increase in the use of these codes, including those that existed before the PHE for COVID-19, we proposed to add them to adapt the measures to this change in practice patterns. The codes we proposed to add to the cost measures represent service categories already captured in the measures (for example, E/M, follow up consultation following hospital discharge); thus, we do not consider their addition to alter the intent of the measures or capture a new category of costs. Updated measure specifications with the added telehealth codes are available on the CMS website at <http://www.cms.gov/Medicare/Quality-Payment-Program/Quality-Payment-Program/Give-Feedback>.

We solicited public comment on the proposal. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported our proposal to add costs associated with certain telehealth services to the previously established cost measures beginning with the 2021 performance period. Other commenters requested that CMS release updated measure specifications that include the additional telehealth services as soon as possible.

Response: We appreciate the support of our proposal to add costs associated with certain telehealth services to the cost measures. We posted the measure codes list files, which include the telehealth codes that we proposed to add for each cost measure, at the link specified in the proposed rule (<http://www.cms.gov/Medicare/Quality-Payment-Program/Quality-Payment-Program/Give-Feedback>) (85 FR 50294) for the duration of the public comment period.

Comment: One commenter suggested that CMS explore options for separately identifying telehealth services on episode cost performance feedback reports provided to clinicians to help guide clinicians' assessment of optimal telehealth use from the cost perspective.

Response: We thank the commenter for their suggestion. We will explore the possibility of including information on telehealth use when producing future performance feedback reports.

Comment: A few commenters suggested that CMS conduct and publicly share testing on the inclusion

of telehealth services in the existing cost measures so that clinicians can become more familiar with how these services will affect the measures and to allow CMS to implement any necessary changes based on input from physician specialty societies regarding the impact of the addition of these services. One commenter indicated that the codes CMS proposed to add within the cost measures represent service categories already captured in the measures and requested that CMS clarify whether they plan to alter the intent of the cost measures. Another commenter requested more information on how telehealth services would be identified, whether the inclusion of these services could penalize physicians practicing in areas with COVID-19 outbreaks, and whether there will be downstream effects from adding codes that are only temporarily covered by Medicare during the PHE.

Response: The addition of the proposed telehealth services and corresponding codes to the measures beginning with the 2021 performance period will ensure that the cost measures adapt to the changes in care provision and service utilization caused by the PHE. As we explained in the proposed rule (85 FR 50294), we do not consider the addition of the proposed codes for telehealth services to be a substantive change as they do not represent a new category of costs or change the intent of the measure and so we do not believe it is necessary to conduct specific testing on their inclusion for public feedback. Our intent is only to update the list of codes in the service categories already captured in the measures. For this reason, we do not anticipate that these services will have an impact on the measures' ability to accurately capture cost of care or clinician performance on measures in a way that is different from other similarly appropriate services that are currently included in the measures.

Furthermore, not all telehealth services billed by a clinician will be automatically included in all of the cost measures. Specific telehealth services will be included in a given measure if they are clinically relevant (for example, contain a relevant diagnosis code) to the trigger event of the measure (for example, a knee arthroplasty). For this reason, clinicians in areas with COVID-19 outbreaks would not be adversely affected by the addition of these services to the cost measures; only telehealth services they bill in relation to the care provided for the trigger event would be included in the cost measure. The service assignment logic and the specific telehealth codes that we

proposed to include for each cost measure are available in the measure codes list files on the CMS website (<http://www.cms.gov/Medicare/Quality-Payment-Program/Quality-Payment-Program/Give-Feedback>).

Upon the expiration of the PHE, Medicare will no longer include on the Medicare telehealth list the services that were added on an interim basis during the PHE for COVID-19, which we expect will result in the reduction of telehealth utilization in place of the corresponding in-person services already included in the cost measures. As the cost measures include the costs of services found empirically in the Medicare claims data, only services actually billed by clinicians, whether furnished in-person or via telehealth, would be included in service assignment for the measure. For this reason, we do not anticipate any downstream effects of adding to the cost measures codes that may be temporarily billed as telehealth services. As we anticipate that telehealth will continue to occupy an important role in care delivery, we do not plan to remove the proposed telehealth codes from the cost measures unless they are no longer applicable or payable by Medicare. We will continue to monitor the telehealth services for potential updates, if necessary, as part of ongoing measure maintenance for the cost measures.

Comment: One commenter indicated that the rationale for including telehealth costs within the cost performance category measures was understood, but urged CMS to consider developing hardship exemptions from such telehealth cost attribution and/or providing bonus points for cost measures that include telehealth services to help adjust for the upfront investments that solo practitioners and small practices would need to put forth to upstand and scale telehealth platforms during the PHE for COVID-19.

Response: We appreciate the commenter's feedback. The proposed telehealth codes would be added to the cost measures to capture costs of services clinicians have continued to provide via telehealth and not in person during the PHE and that are related to the trigger event for a given measure. There is no separate telehealth cost attribution for which these codes would be used. Performance under the cost measures will be assessed according to existing MIPS scoring policies and any new policies we are finalizing in this rule. With regard to hardship exemptions, we provide the option for clinicians to submit applications requesting reweighting for one or more

MIPS performance categories based on extreme and uncontrollable circumstance.

After consideration of the public comments, we are finalizing our proposal to add costs associated with certain telehealth services and their corresponding codes to the previously established cost measures as proposed, beginning with the 2021 performance period.

(3) Improvement Activities Performance Category

(a) Background

For previous discussions on the background of the improvement activities performance category, we refer readers to the CY 2017 Quality Payment Program final rule (81 FR 77177 through 77178), the CY 2018 Quality Payment Program final rule (82 FR 53648 through 53661), the CY 2019 PFS final rule (83 FR 59776 through 59777), and the CY 2020 PFS final rule (84 FR 62980 through 62990). We also refer readers to § 414.1305 for the definition of improvement activities and attestation, § 414.1320 for the performance period, § 414.1325 for the data submission requirements, § 414.1355 for the improvement activity performance category generally, § 414.1360 for data submission criteria, and § 414.1380(b)(3) for improvement activities performance category scoring.

In the CY 2021 PFS proposed rule (85 FR 50294), beginning with the CY 2021 performance period and future years, we proposed: (1) Changes to the Annual Call for Activities: An exception to the nomination period timeframe during a PHE; and a new criterion for nominating new improvement activities; (2) a process for HHS-nominated improvement activities; and (3) to modify two existing improvement activities. In addition, in the March 31st COVID-19 IFC (85 FR 19276 through 19277), we adopted, on an interim final basis, a policy to add one new improvement activity to the Inventory for the CY 2020 performance period in response to the PHE titled "COVID-19 Clinical Trials." The activity required that a clinician must attest to participation in a COVID-19 clinical trial utilizing a drug or biological product to treat a patient with a COVID-19 infection and report their findings through a clinical data repository or clinical data registry. Following the publication of March 31st COVID-19 IFC, we received several inquiries from stakeholders requesting further information on whether a clinician working with COVID-19 patients who provides their data to a clinical data

registry, without participating in a clinical trial, may get credit for this activity. In our efforts to provide clarification we realized that we needed to codify changes in the regulation for this improvement activity to apply in the manner that was intended. Therefore, in the September 2nd COVID-19 IFC (85 FR 54848 through 52851), we issued an IFC in which we adopted a modification, on an interim final basis, to the COVID-19 improvement activity that for CY 2020 continuing into CY 2021, the improvement activity IA_ERP_3 titled "COVID-19 Clinical Data Reporting with or without Clinical Trial" would include: (1) Clinicians participating in a COVID-19 clinical trial utilizing a drug or biological product to treat a patient with a COVID-19 infection who report their findings through a clinical data registry for the duration of their study; or (2) clinicians participating in the care of a patient diagnosed with COVID-19 who simultaneously submit their clinical patient data to a clinical data registry for research.

(b) Improvement Activities Inventory

(i) Annual Call for Activities

In the CY 2017 Quality Payment Program final rule (81 FR 77190), for the transition year of MIPS, we implemented the initial improvement activities Inventory and took several steps to ensure it was inclusive of activities in line with statutory and program requirements. For Year 2, we provided an informal process for submitting new improvement activities or modifications for potential inclusion in the comprehensive improvement activities Inventory for the Quality Payment Program Year 2 and future years through subregulatory guidance (https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/Downloads/Annual-Call-for-Measures-and-Activities-for-MIPS_Overview-Factsheet.pdf). In the CY 2018 Quality Payment Program final rule (82 FR 53656 through 53659), for Year 3 and future years, we finalized a formal Annual Call for Activities process for adding possible new activities or providing modifications to the current activities in the improvement activities Inventory, including information required to submit a nomination form similar to the one we utilized for Year 2 (82 FR 53656 through 53659). It is important to note that in order to submit a request for a new activity or a modification to an existing improvement activity the stakeholder must submit a nomination

form available at www.qpp.cms.gov during the Annual Call for Activities.

(A) Timeframe for the Annual Call for Activities

(aa) Currently Adopted Timeframe

In the CY 2017 Quality Payment Program final rule (81 FR 77190), for the transition year of MIPS, we implemented the initial improvement activities Inventory and took several steps to ensure it was inclusive of activities in line with statutory and program requirements. For Year 2, we provided an informal process for submitting new improvement activities or modifications for potential inclusion in the comprehensive improvement activities Inventory for the Quality Payment Program Year 2 and future years through subregulatory guidance (https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/Downloads/Annual-Call-for-Measures-and-Activities-for-MIPS_Overview-Factsheet.pdf). In the CY 2018 Quality Payment Program final rule (82 FR 53656 through 53659), for Year 3 and future years, we finalized a formal Annual Call for Activities process for adding possible new activities or providing modifications to the current activities in the improvement activities Inventory, including information required to submit a nomination form similar to the one we utilized for Year 2 (82 FR 53656 through 53659). It is important to note that in order to submit a request for a new activity or a modification to an existing improvement activity the stakeholder must submit a nomination form available at www.qpp.cms.gov during the Annual Call for Activities.

In the CY 2019 PFS final rule (83 FR 59781 through 59782), we finalized to change the performance year for which nominations of prospective new and modified improvement activities would apply, such that beginning with the CY 2019 performance period and for future years, improvement activities nominations received in a particular year will be vetted and considered for the next year's rulemaking cycle for possible implementation in a future year. In addition, we finalized to change the submission timeframe for the Annual Call for Activities from February 1st through March 1st to February 1st through June 30th, providing approximately 4 additional months for stakeholders to submit nominations beginning with the CY 2019 performance period.

(bb) Exception During Public Health Emergencies

The unprecedented PHE¹²⁵ for COVID-19 has brought to our attention the necessity of having the flexibility to consider nominations of new improvement activities to the Inventory outside the established Annual Call for Activities nomination period. We believe having the flexibility to consider nominations during a PHE is important because of the nature of a PHE; we want the ability to consider relevant improvement activities while the emergency is ongoing. We refer readers to the CY 2019 PFS final rule (83 FR 59779) for a complete definition of PHE and its application to inclusion criteria for new improvement activities.

As a result, beginning with the CY 2021 performance period, we proposed to make an exception to the established timeframe, such that during a PHE, stakeholders can nominate improvement activities outside of the established Annual Call for Activities timeframe. Instead of only accepting nominations and modifications submitted February 1st through June 30th each year, we would accept nominations for the duration of the PHE as long as the improvement activity is still relevant. No other aspects of the Annual Call for Activities process would be affected (for example, criteria for nominating improvement activities, considerations for selection of improvement activities, or weighting policies would all still apply). We noted that we continue to believe it is important for stakeholders to be able to comment on improvement activities. Therefore, any improvement activity considered for inclusion in the Inventory would be finalized through a future rulemaking. We invited public comments on the proposal.

We received public comments on the proposal to make an exception to the established Annual Call for Activities timeframe, such that during a PHE, stakeholders can nominate improvement activities outside of the established Annual Call for Activities timeframe. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported adding flexibility to consider nominations of new improvement activities outside the established Annual Call for Activities nomination period during a PHE, noting that it will allow new improvement activities to reflect real-world events, spur

innovation, and allow for timely responses to a PHE.

Response: We appreciate the support for establishing the flexibility to consider nominations of new improvement activities outside the established Annual Call for Activities nomination period during a PHE. We believe that this flexibility will allow us to be responsive to the needs of clinicians during PHEs.

Comment: A few commenters supported adding this flexibility, but recommended that data validation and other guidance for how to receive credit be provided when activities were introduced, that new additions allow for a 90-day performance period with a "ramp-up" period, and that feedback be provided on why certain submitted improvement activities were not accepted.

Response: We appreciate the additional comments related to data validation, a "ramp-up" period, and feedback for submitted activities that are not accepted. No other aspects of the Annual Call for Activities process would be affected (for example, criteria for nominating improvement activities, considerations for selection of improvement activities, or weighting policies would all still apply). We noted that we continue to believe it is important for stakeholders to be able to comment on improvement activities. Therefore, any improvement activity considered for inclusion in the Inventory would be finalized through a future rulemaking. For improvement activities related to a PHE, we plan to issue subregulatory guidance as soon as feasible following adoption of the new improvement activity. Improvement activities added during a PHE will be subject to the same 90-day performance period requirement as all improvement activities and will be available for reporting as stated in the regulation that the new activity is finalized. There will not be an added "ramp-up" or trial period as the goal of this added flexibility is to encourage clinicians to begin addressing the PHE as soon as possible and get credit for early efforts.

Comment: We received a few comments stating that the improvement activity submission and acceptance process through the Annual Call for Activities is unclear. Commenters stated that they are uncertain what types of improvement activities we are looking for, and the reasons improvement activities are not accepted are not explicitly provided. A few commenters recommended that we should better incorporate the suggestions of physicians and specialty societies and allow more time for providers to adjust

¹²⁵ <https://www.phe.gov/emergency/news/healthactions/phe/Pages/default.aspx>.

to changes to improvement activities before they take effect.

Response: We understand the need for feedback on why certain submitted improvement activities were not accepted during the Call for Activities and will do our best to provide clear responses when not accepting suggested activities in the future. In the CY 2018 Quality Payment Program final rule (85 FR 53656 through 53660), we provide details regarding adding new activities through the Annual Call for Activities, the criteria for nominating new improvement activities, and the submission timeline for nominating new improvement activities. In addition, each year we provide subregulatory guidance that contains comprehensive information regarding the Annual Call for Activities. We refer readers to these documents on the Quality Payment Program website in the resource library at <https://qpp.cms.gov/about/resource-library>. After consideration of the public comments, we are finalizing this policy as proposed.

(B) Criteria for Nominating New Improvement Activities

In the CY 2019 PFS final rule (83 FR 59778 through 59779), we adopted one new criterion and removed a criterion from the improvement activities nomination criteria. We also clarified our considerations in selecting improvement activities.

(aa) Currently Adopted Criteria

In the CY 2017 Quality Payment Program final rule (81 FR 77190 through 77195), we discussed guidelines for the selection of improvement activities. In the CY 2018 Quality Payment Program final rule, we formalized the Annual Call for Activities process for Year 3 and future years and added additional criteria; stakeholders should apply one or more of the below criteria when submitting nominations for improvement activities (82 FR 53660). In addition, in the CY 2019 PFS final rule (83 FR 59779) we finalized to add a “public health emergency as determined by the Secretary” to the criterion below.

- Relevance to an existing improvement activities subcategory (or a proposed new subcategory);
- Importance of an activity toward achieving improved beneficiary health outcomes;
- Importance of an activity that could lead to improvement in practice to reduce health care disparities;
- Aligned with patient-centered medical homes;
- Focus on meaningful actions from the person and family’s point of view;

- Support the patient’s family or personal caregiver;
- Representative of activities that multiple individual MIPS eligible clinicians or groups could perform (for example, primary care, specialty care);
- Feasible to implement, recognizing importance in minimizing burden, especially for small practices, practices in rural areas, or in areas designated as geographic HPSAs by HRSA;
- Evidence supports that an activity has a high probability of contributing to improved beneficiary health outcomes;
- Include a public health emergency as determined by the Secretary; or
- CMS is able to validate the activity.

(bb) New Criteria

In addition to the aforementioned considerations, when considering improvement activities for possible inclusion in MIPS, we proposed that beginning with the 2021 Call for Activities, MIPS improvement activities submitted should be linked to existing and related quality and cost measures, as applicable and feasible. Stakeholders that select this criteria would be required to provide a rationale describing how they believe their improvement activity correlates to other performance category measures as a part of the Call for Activities. We noted that we believe that when possible, it is important to establish a strong linkage between quality, cost, and improvement activities.

Therefore, we proposed to adopt an additional criterion entitled “Include activities which can be linked to existing and related MIPS quality and cost measures, as applicable and feasible” to the criteria for nominating new improvement activities beginning with the CY 2021 performance period and future years. We noted that if the proposal to add one criterion is adopted as proposed, stakeholders should apply one or more of the below criteria when submitting nominations for improvement activities beginning with the CY 2021 performance period and future years:

- Relevance to an existing improvement activities subcategory (or a proposed new subcategory);
- Importance of an activity toward achieving improved beneficiary health outcomes;
- Importance of an activity that could lead to improvement in practice to reduce health care disparities;
- Aligned with patient-centered medical homes;
- Focus on meaningful actions from the person and family’s point of view;
- Support the patient’s family or personal caregiver;

- Representative of activities that multiple individual MIPS eligible clinicians or groups could perform (for example, primary care, specialty care);
- Feasible to implement, recognizing importance in minimizing burden, especially for small practices, practices in rural areas, or in areas designated as geographic HPSAs by HRSA;
- Evidence supports that an activity has a high probability of contributing to improved beneficiary health outcomes;
- Include a public health emergency as determined by the Secretary;
- Include activities which can be linked to existing and related MIPS quality and cost measures, as applicable and feasible; or
- CMS is able to validate the activity.

We received public comments on the proposal to adopt an additional criterion entitled “Include activities which can be linked to existing and related MIPS quality and cost measures, as applicable and feasible” to the criteria for nominating new improvement activities. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the proposal for improvement activities to be linked to existing and related MIPS quality and cost measures, noting that it could offer more visibility for cost measures, synchronize cost and quality measures, and help reduce reporting burden.

Response: We appreciate commenters’ support for this policy. We believe these policies will also facilitate cohesive MVPs in the future.

Comment: A few commenters supported linking improvement activities to MIPS quality and cost measures but recommended deferring the requirement until the MIPS MVPs have been implemented and assessed. Commenters also recommended linking new improvement activities to existing MIPS QCDR measures, adding more improvement activities that are focused on specific specialties and clinician types and can be more easily linked to quality and cost measures, and allowing new improvement activities to be added even when they cannot be linked to existing quality and cost measures.

Response: We appreciate the support for linking improvement activities to MIPS quality and cost measures. To clarify, linking nominated improvement activities to existing and related MIPS quality and cost measures is not a stand-alone requirement. In the proposed rule, we proposed that beginning with the 2021 Call for Activities, MIPS improvement activities submitted should be linked to existing and related MIPS quality and cost measures, as

applicable and feasible. Stakeholders should apply one or more of the listed criteria when submitting nominations for improvement activities. The quality and cost performance categories are two of the four performance categories required by statute in MIPS. We believe that the improvement activities should be linked to existing and related quality and cost measures rooted in statute. We applied a similar criterion for the quality measures as finalized in the CY 2020 PFS final rule (84 FR 62954) such that beginning with the 2020 Call for Measures process, MIPS quality measure stewards will be required to link their MIPS quality measures to existing and related cost measures and improvement activities, as applicable and feasible. MIPS quality measure stewards will be required to provide a rationale as to how they believe their measure correlates to other performance category measures and activities as a part of the Call for Measures process. In addition, we have finalized in the CY 2020 PFS final rule (84 FR 63063 through 63065) that QCDRs will be required to link their QCDR measures to existing and related cost measures and improvement activities, as applicable and feasible.

Comment: Several commenters supported making changes to how MIPS improvement activities are developed and added to the Improvement Activity Inventory, including selecting improvement activities that promote modern connected technologies, incent clinicians who participate in COVID-19 efforts, encourage clinicians who serve as preceptors for students, promote integration of registered dietitians on population management care teams, incent bone health, and expand the list of health equity-related improvement activities.

Response: We encourage stakeholders to submit nominations for activities through the Call for Activities period where nominations may include promoting modern connected technologies, incenting clinicians who participate in COVID-19 efforts, encouraging clinicians who serve as preceptors for students, promoting integration of registered dietitians on care teams, incenting bone health, and increasing the number of health equity-related improvement activities. Regarding the latter, we currently have an improvement activity in the Inventory, IA_AHE_6, titled “Provide Education Opportunities for New Clinicians” that is weighted high for participation as a preceptor for clinicians in-training that encourage clinical rotation in community practices in small underserved, or rural areas. If

the commenter believes an additional improvement activity for preceptors should be included in the Inventory, we encourage them to submit a nomination through the Call for Activities. In addition, in the September 2nd COVID-19 IFC (85 FR 54848 through 52851), we adopted, on an interim final basis, a policy to add an additional improvement activity to the Inventory for CY 2020 and CY 2021. We also refer readers to Appendix 2 of the CY 2021 PFS proposed rule (85 FR 50664 through 50665) for further details and Appendix 2 of this final rule for responses to comments received and finalization of the COVID-19 improvement activity, IA_ERP_3, titled “COVID-19 Clinical Data Reporting with or without Clinical Trial.” Furthermore, in section IV.A.3.c.(3)(b)(i) of this final rule, we are finalizing an exception to the established Annual Call for Activities timeframe, such that during a PHE, stakeholders can nominate improvement activities outside of the established Annual Call for Activities timeframe. In section IV.A.3.c.(3)(b)(ii) of this final rule, we are also finalizing a process for HHS-nominated improvement activities. Combined, we believe these two new policies will help streamline efforts to create MIPS policies in a timely manner in response to PHEs.

After consideration of the public comments, we are finalizing this policy as proposed.

(ii) HHS-Nominated Improvement Activities

(A) Background

As stated in the CY 2021 PFS proposed rule (85 FR 50295), this unprecedented PHE for COVID-19 has brought to our attention the necessity of having the flexibility to consider nominations of new improvement activities to the Inventory outside the Annual Call for Activities nomination period and process.” We noted that we believe that we should have the flexibility to nominate activities from within HHS. We noted that the federal government is uniquely positioned to quickly address administration goals versus the public sector in pertinent areas that may have national impact to improve the health care system. For example, CMS has established the CMS Strategic Initiatives which provides 16 distinct focus areas including Patients over Paperwork. The CMS Strategic Initiatives focus areas aim to empower patients and unleash innovation while transforming the health care system. We also noted that we believe that goals such as the CMS Strategic Initiatives

deliver better value and results for patients through competition and innovation. To accomplish goals included in agency-wide plans, such as the CMS Strategic Initiatives, there are instances when it is necessary to accept HHS-nominated improvement activities outside of the Call to advance these type of goals in an expedited manner. We referred readers to <https://www.cms.gov/About-CMS/Story-Page/our-16-strategic-initiatives> for more information about CMS strategic initiatives and to <https://www.cms.gov/About-CMS/story-page/patients-over-paperwork> for more information about Patients over Paperwork.

(B) HHS-Nominated Improvement Activities Process

Beginning with the CY 2021 performance period and future years, we proposed that we would consider HHS-nominated improvement activities all year long in order to address HHS initiatives in an expedited manner. These HHS-nominated improvement activities would be subject to the same criteria for nominating new improvement activities as discussed in the CY 2021 PFS proposed rule (85 FR 50295 through 50296) titled “Criteria for Nominating New Improvement Activities.” In addition, the HHS-nominated activity would need to apply the criteria of: “aligned with at least one of the HHS goals, when feasible and appropriate” to the nominated activity. Further, the HHS-nominated improvement activity would be assessed for the most appropriate subcategory; we refer readers to § 414.1355(c).

We noted that we continue to believe it is important for stakeholders to be able to comment on these HHS-nominated improvement activities. Thus, we would propose any HHS-nominated improvement activities through rulemaking. In such proposal, we would specifically request comment on whether stakeholders agree the activities improve clinical practice or care delivery.

We received public comments on the proposal that we would consider HHS-nominated improvement activities all year long to address HHS initiatives in an expedited manner. The following is a summary of the comments we received and our responses.

Comment: A few commenters supported the proposal to allow for HHS-nominated improvement activities all year long.

Response: We appreciated the support for allowing HHS-nominated improvement activities all year long. This will allow us to be responsive to HHS initiatives.

After consideration of the public comments, we are finalizing this policy as proposed.

(iii) Changes to the Improvement Activities Inventory

In the CY 2018 Quality Payment Program final rule (82 FR 53660), we finalized that we would establish improvement activities through notice-and-comment rulemaking. We refer readers to Table H in the Appendix of the CY 2017 Quality Payment Program final rule (81 FR 77177 through 77199), Tables F and G in the Appendix of the CY 2018 Quality Payment Program final rule (82 FR 54175 through 54229), Tables A and B in the Appendix 2 of the CY 2019 PFS final rule (83 FR 60286 through 60303), and Tables A, B, and C in the Appendix 2 of the CY 2020 PFS final rule (84 FR 63514 through 63538) for our previously finalized improvement activities Inventory. We also refer readers to the Quality Payment Program website under Explore Measures and Activities at <https://qpp.cms.gov/mips/explore-measures?tab=improvementActivities&py=2020> for a complete list of the most current list of improvement activities. In the CY 2021 PFS proposed rule, we did not propose to remove any previously adopted improvement activities. We also proposed to modify two existing improvement activities for the CY 2021 performance period and future years. In this final rule, we are finalizing the modification of two existing improvement activities, removal of one obsolete improvement activity, and adoption of the COVID-19 improvement activity added via IFC. We refer readers to the below and Appendix 2 of this final rule for more details.

(A) Removal of IA_CC_5

Subsequent to publication of the proposed rule, we became aware that one underlying program, which forms the basis for one improvement activity, has expired. The improvement activity is: IA_CC_5, titled “Partner in Patients Hospital Engagement Network.” The Partner in Patients Hospital Engagement Network activity description requires membership and participation in a CMS Partnership for Patients Hospital Engagement Network which ended March 31, 2020, and may be found at <https://innovation.cms.gov/innovation-models/partnership-for-patients>. Because the Partnership for Patients Hospital Engagement Network has ended and performance of this activity will no longer be possible starting with the CY 2021 performance year, this improvement activity is obsolete; therefore, we are finalizing removal of

this improvement activity beginning with the CY 2021 performance year/2023 MIPS payment year to avoid any potential confusion. We refer readers to Appendix 2 of this final rule for more details.

(B) Finalization of COVID-19 Improvement Activity Added via IFC

The COVID-19 pandemic was deemed a PHEby the Secretary of the Department of HHS. In response, in the March 31st COVID-19 IFC (85 FR 19276 through 19277), we added one new improvement activity to the Improvement Activities Inventory for the CY 2020 performance period in response to the PHE titled “COVID-19 Clinical Trials.” As described in the March 31st COVID-19 IFC, this improvement activity promotes clinician participation in a COVID-19 clinical trial utilizing a drug or biological product to treat a patient with a COVID-19 infection. We stated that to receive credit for this improvement activity, a clinician must attest to participation in a COVID-19 clinical trial utilizing a drug or biological product to treat a patient with a COVID-19 infection and report their findings through a clinical data repository or clinical data registry (85 FR 19276). In that IFC, we also stated that we believe that participation in this activity would likely result in improved outcomes by improving the collection of data clinicians use for the care of their patients as they monitor and manage COVID-19 and drive care improvements (85 FR 19277). We stated that we believe that encouraging clinicians to utilize an open source clinical data repository or clinical data registry for data reporting will bring the results of their research to the forefront of healthcare far quicker than if it goes through the cycle of peer review and publishing (85 FR 19277). In addition, we stated that we believe that centralized data could improve clinical practice and care delivery (85 FR 19277). As stated in the September 2nd COVID-19 IFC (85 FR 54848 through 52851), following the publication of the March 31st COVID-19 IFC, we received several inquiries through meetings, email correspondence, and Quality Payment Program help desk requesting further information on whether a clinician working with COVID-19 patients who provides their data to a clinical data registry, without participating in a clinical trial, may get credit for this activity. The Quality Payment Program help desk tracks, documents, and resolves inquiries submitted by MIPS eligible clinicians and groups. Stakeholders may submit inquiries to the help desk via 1-866-

288-8292 (Monday–Friday 8 a.m.–8 p.m. ET) or email QPP@cms.hhs.gov. Some stakeholders believed that clinicians providing care to patients with COVID-19 outside of a clinical trial that report those data through a clinical data registry should receive credit for this activity. It came to our attention that clinical data registries not only collect data as part of clinical trials, but also collect data from clinicians not participating in clinical trials. The improvement activity as written was causing confusion for clinicians and groups attempting to meet the needs of patients and address gaps in research. Since IA_ERP_3 titled “COVID-19 Clinical Trials” was established, this improvement activity has been the subject of approximately 30 percent of the inquiries to the Quality Payment Program help desk, demonstrating the desire for clinicians to improve clinical care and overall outcomes for patients diagnosed with COVID-19 by conducting this improvement activity, but also indicating the need for further clarity in its activity description.

As a result, we expanded the improvement activity to include clinicians participating in the care of a patient diagnosed with COVID-19 who simultaneously submit their clinical patient data to a clinical data registry for research. Thus, in order to receive credit for this improvement activity, a MIPS eligible clinician or group must: (1) Participate in a COVID-19 clinical trial utilizing a drug or biological product to treat a patient with a COVID-19 infection and report their findings through a clinical data repository or clinical data registry for the duration of their study; or (2) participate in the care of patients diagnosed with COVID-19 and simultaneously submit relevant clinical data to a clinical data registry for ongoing or future COVID-19 research. Data would be submitted to the extent permitted by applicable privacy and security laws. We also modified the improvement activity title to reflect this change.

For purposes of this improvement activity, clinical data registries must meet the following requirements: (1) The receiving entity must declare that they are ready to accept data as a clinical registry; and (2) be using the data to improve population health outcomes.

Most public health agencies and clinical data registries declare readiness to accept data from clinicians via a public online posting. Clinical data registries should make publicly available specific information on what data the registry gathers, technical

requirements or specifications for how the registry can receive the data, and how the registry may use, re-use, or disclose individually identifiable data it receives. For purposes of credit toward this improvement activity, any data should be sent to the clinical data registry in a structured format, which the registry is capable of receiving. A MIPS eligible clinician may submit the data using any standard or format that is supported by the clinician's health IT systems, including but not limited to, certified functions within those systems. Such methods may include, but are not limited to, a secure upload function on a web portal, or submission via an intermediary, such as a health information exchange. To ensure interoperability and versatility of the data submitted, any electronic data should be submitted to the clinical data registry using appropriate vocabulary standards for the specific data elements, such as those identified in the United States Core Data for Interoperability (USCDI) standard adopted in 45 CFR 170.213.

As stated in the March 31st COVID-19 IFC, we continue to believe that participation in this activity is likely to result in improved outcomes by improving the collection of data clinicians use for the care of their patients. We believe that all clinical data gathered in the treatment of patients diagnosed with COVID-19 may be helpful in finding a solution to end this pandemic. We believe encouraging clinicians collectively to utilize a clinical data registry for data reporting could facilitate sharing of data for use in additional clinical studies with larger sample sizes. These additional and larger clinical studies are likely to identify efficacy of certain treatments, which in turn could result in wider improvements in health outcomes, including reduced severity and mortality due to COVID-19 across the nation. This could benefit patients nationwide as well as improve clinical practice and care delivery for the patients of the clinician attesting to this improvement activity. We would like to encourage all clinicians to provide data through an open source clinical data repository or clinical data registry, meaning that the results of research are made public, including via publications and scientific data sources, which enables reuse, increases transparency, and facilitates reproducibility of research results. Furthermore, a clinical data registry may allow such data to be publicly available which may be used for research.

As stated above, we previously added the improvement activity to the

Inventory for the CY 2020 performance period only in response to the PHE for COVID-19. In the IFC, we extended the newly modified COVID-19 Clinical Data Reporting with or without Clinical Trial improvement activity through the CY 2021 performance period due to the increased rate of COVID-19 infection we were experiencing nationwide. We anticipated the need for COVID-19 clinical trials and data collection/sharing through registries to continue through CY 2021 at which time we would reassess whether there remains a need for additional data sharing or if preventive measures and clinical treatments have advanced to the point where these type of data are not needed. We wanted eligible clinicians to be able to attest to this improvement activity if it is still pertinent. We believed that participation in this improvement activity was likely to result in improved outcomes by improving the collection of data clinicians use for the care of their patients as they monitor and manage COVID-19.

In this final rule, we are providing summary of public comments and our responses as well as finalizing the addition of this COVID-19 improvement activity and its subsequent modification and continuation. We refer readers to Appendix 2 of this final rule for more details.

(4) Promoting Interoperability

(a) Background

Section 1848(q)(2)(A) of the Act includes the meaningful use of certified electronic health record technology (CEHRT) as a performance category under the MIPS. As required by sections 1848(q)(2) and (5) of the Act, the four performance categories of the MIPS shall be used in determining the MIPS final score for each MIPS eligible clinician. In general, MIPS eligible clinicians will be evaluated under all four of the MIPS performance categories, including the Promoting Interoperability performance category.

(b) Promoting Interoperability Performance Category Performance Period

As finalized in the CY 2020 PFS final rule at § 414.1320(f)(1) (84 FR 62992), for purposes of the 2023 MIPS payment year, the performance period for the Promoting Interoperability performance category is a minimum of a continuous 90-day period within the calendar year that occurs 2 years prior to the applicable MIPS payment year, up to and including the full calendar year. Thus, for the 2023 MIPS payment year, the performance period for the

Promoting Interoperability performance category is a minimum of a continuous 90-day period within CY 2021, up to and including the full CY 2021 (January 1, 2021 through December 31, 2021).

For the 2024 MIPS payment year and each subsequent MIPS payment year, we proposed to add § 414.1320(g)(1), which would establish a performance period for the Promoting Interoperability performance category of a minimum of a continuous 90-day period within the calendar year that occurs 2 years prior to the applicable MIPS payment year, up to and including the full calendar year. As discussed in the CY 2021 PFS proposed rule (85 FR 50297), the proposal aligns with what we proposed (and subsequently finalized) for the EHR reporting period in CY 2022 for the Medicare Promoting Interoperability Program for eligible hospitals and critical access hospitals (CAHs) (85 FR 58966 through 58967). We stated that we believe this would be an appropriate performance period because it would offer stability and consistency for eligible clinicians reporting for the Promoting Interoperability performance category.

We requested comments on the proposal and the following is a summary of the comments we received and our responses.

Comment: Many commenters appreciated the continuation of the flexibility of being able to choose a 90-day performance period, which allows more eligible clinicians to successfully participate in the Promoting Interoperability performance category. A few commenters believe that 90 days is a sufficient amount of time to capture the necessary information required for the Promoting Interoperability performance category and allows the opportunity to update or implement new and innovative technology through the course of the CY without fear of negatively impacting performance data. Several commenters supported our proposal because it aligns with the EHR reporting period for eligible hospitals and CAHs adopted for the Medicare Promoting Interoperability Program.

Response: We agree that keeping the performance period to a minimum of 90 consecutive days affords MIPS eligible clinicians the flexibility they may need to develop and update their evolving EHRs. We believe aligning the length of the Promoting Interoperability Performance category performance period with the EHR reporting period for the Medicare Promoting Interoperability Program for eligible hospitals and CAHs will reduce health IT burden across EHR systems in the clinician and hospital settings.

Comment: Several commenters suggested that we make the Promoting Interoperability Performance category performance period any continuous 90-day period for the remainder of the Quality Payment Program. One stated that by providing continued program stability, CMS allows clinicians and groups to focus more on caring for patients and improving interoperability and less on prescriptive reporting requirements.

Response: We agree and proposed that the performance period for the 2024 MIPS payment year and each subsequent MIPS payment year would be a minimum of a continuous 90-day period within the calendar year.

After consideration of the comments we received, we are finalizing the proposal for the 2024 MIPS payment year and each subsequent MIPS payment year to establish a performance period for the Promoting Interoperability performance category of a minimum of a continuous 90-day period within the calendar year that occurs 2 years prior to the applicable MIPS payment year, up to and including the full calendar year. We codified this policy at § 414.1320(g)(1).

(c) Promoting Interoperability Performance Category Measures for MIPS Eligible Clinicians

(i) Changes to the Query of Prescription Drug Monitoring Program (PDMP) Measure Under the Electronic Prescribing Objective

As discussed in the CY 2021 PFS proposed rule (85 FR 50297 through 50298), stakeholders have continued to express concern that it is still too premature to require the Query of PDMP measure because PDMPs are still maturing in their development, use and integration with EHRs. We proposed to make the Query of PDMP measure under the Electronic Prescribing objective optional and eligible for 10 bonus points in CY 2021. This would represent an increase in the amount of the bonus points for the Query of PDMP measure from 5 points to 10 points to reflect the importance of this measure and to further incentivize clinicians to perform queries of PDMPs.

We solicited comments on these proposals.

The following is a summary of the comments we received and our responses.

Comment: Many commenters stated that CMS should maintain the Query of the Prescription Drug Monitoring Program (PDMP) measure as optional. One commenter stated that many clinicians will not be able to fulfill this

measure because not all clinicians prescribe controlled substances.

Response: We appreciate commenters for their support for maintaining the Query of PDMP measure as optional for the performance period in CY 2021 and allowing time for further progress around EHR–PDMP integration efforts minimizing the burden on MIPS eligible clinicians. We believe this will provide an opportunity for capable implementers to report on and earn bonus points for fulfilling the optional measure. Additionally, eligible clinicians who choose not to report on the Query of PDMP measure or are unable to report on this optional measure may still earn a full score for the Promoting Interoperability performance category.

Comment: Commenters indicated that clinicians have made great strides in their adoption of PDMPs despite a continuing lack of interoperability across many systems; therefore, they supported the measure remaining optional. Some commenters stated that it should not be required because it is challenging to electronically report due to the additional documentation and verification requirements with an external system, which creates unnecessary burden for clinicians. Another commenter expressed concern that until the information found within PDMPs is easily and seamlessly integrated into health IT systems that this type of EHR functional-use measure will be burdensome and require multiple actions outside of the clinical workflow. One commenter noted concerns that separate sign-in to a non-integrated PDMP requires hand entry of demographic data elements to search for a specific patient, which may increase the probability of erroneously matching a patient to another individual's health information, which in turn raises patient safety concerns. For those reasons, the commenters support CMS' proposal to maintain the Query of PDMP measure as optional for the performance period in CY 2021.

Response: We agree with the commenters' concerns and the importance of working towards improved EHR–PDMP integration. Keeping the Query of PDMP measure as optional for CY 2021 would allow states and other stakeholders an additional year to make further progress on developing functionality to support better integration of PDMPs within clinical workflows.

Comment: One commenter stated that the use of PDMPs is a proven means to increase accountability in opioid prescribing practices by providing information directly to the clinician that

facilitates the coordination of multiple medications. Also, it has been proven to help prevent adverse drug interactions. The commenter concurred that PDMPs increase patient safety by assisting prescribers in the identification of patients who have multiple prescriptions for controlled substances or may be misusing or overusing them. Expanding the use of PDMPs is a component of a broader strategy to prevent opioid abuse and ensure the safe, legal, and responsible prescribing of opioids for those who need them. The commenter also agreed that improving prescribing practices by use of PDMPs should reduce hospitalizations, emergency room visits, and the social challenges associated with the opioid epidemic. They believe that this not only demonstrates the importance of the measure, but also signals it will likely become a required Promoting Interoperability performance category measure in the future.

Response: We agree that PDMPs are an important tool to support clinicians' efforts to coordinate multiple medications, and increase patient safety by ensuring safe, legal and responsible prescribing. With the many benefits of clinicians querying PDMPs, we are finalizing the policy as proposed for the 2021 performance period. We plan on reevaluating this measure in future years to determine whether integration efforts have enabled improvements in PDMP querying.

Comment: A commenter stated that while they understand that CMS wants to limit burden regarding the implementation and integration of PDMP queries, the commenter is concerned about the potentially negative effect on patient outcomes occurring due to insufficient querying of PDMPs amid the current opioid epidemic. Thus, the commenter suggested CMS move this measure from optional to required as soon as possible.

Response: We understand the importance of implementation and integration of PDMP queries and effects on patient outcomes for the opioid crisis and during the PHE. We also recognize that various state programs are still maturing toward the development of robust EHR–PDMP integration. We will continue to collaborate with our partners in ONC on how to advance standards surrounding PDMP functionality and integration. Keeping the Query of PDMP measure as optional for the performance period in 2021 would allow states and other stakeholders an additional year to make further progress on developing functionality to support better integration of PDMP use within clinical

workflows, which is necessary before we will propose to require this measure.

Comment: Many commenters appreciated and supported increasing the bonus from 5 to 10 points for this measure to reflect the importance of this measure and to further incentivize clinicians to perform queries of PDMPs. A commenter agreed with the proposed increase because it emphasizes the importance of the measure as it relates to improved patient safety and incentivizes clinicians to expand the use of PDMPs. Another commenter stated that the increase of the bonus points for the Query of PDMP measure from 5 to 10 points, not only demonstrates the importance of the measure, but also signals it will likely become a required Promoting Interoperability measure in the future.

Response: We appreciate the overwhelming support and agree that our proposed approach emphasizes the importance of the measure as it relates to improved patient safety and incentivizes clinicians to expand the use of PDMPs.

Comment: One commenter did not support increasing the value of this measure from 5 points to 10 points. Instead, they suggested that CMS keep the bonus at the current 5 points, because they believe most vendors who plan on implementing functionality for this measure have done it, and that groups are currently attesting for it.

Response: We disagree and believe that increasing the points from 5 to 10 points emphasizes the importance of conducting PDMP queries and the importance of this activity for patient outcomes during the PHE and for the opioid crisis. Solo and small practices may have more difficulties incorporating PDMP into practice than larger groups; therefore, we want to incentivize all clinicians to adopt this measure.

After consideration of the comments received, we are finalizing the proposal to maintain the Electronic Prescribing objective's Query of PDMP measure as optional for the performance period in CY 2021. We are also finalizing the proposal to increase the amount of the bonus points for the Query of PDMP measure from 5 points to 10 points for performance periods in CY 2021.

2. Health Information Exchange Objective

a. Support Electronic Referral Loops by Receiving and Incorporating Health Information Measure

In the CY 2019 PFS final rule (83 FR 59807 through 59812), we established a new Support Electronic Referral Loops

by Receiving and Incorporating Health Information measure by combining the Request/Accept Summary of Care measure and the Clinical Information Reconciliation measure. To better reflect specific actions required by the measure's numerator and denominator, we proposed to replace the word "incorporating" with the word "reconciling" in the name of the measure (85 FR 50299). The new name would read: Support Electronic Referral Loops by Receiving and Reconciling Health Information measure.

We requested comments on the proposal and the following is a summary of the comments we received and our responses.

Comment: Several commenters agreed that the use of the word "incorporating" was confusing to clinicians and supported our proposal. Some stated that the new name better reflects the workflow associated with the measure.

Response: We appreciate the commenters support and agree that modifying the name to Support Electronic Referral Loops by Receiving and Reconciling Health Information measure reduces confusion for clinicians and is a more accurate representation of the measures.

Comment: Several commenters opposed the nomenclature change because it is confusing for clinicians when measure names are changed.

Response: We received significant stakeholder feedback that the proposed name change would more clearly reflect the existing policy. The measure is not requiring clinicians to input redundant information, but rather to review and reconcile what is received with what is already in the patient record.

Comment: A commenter supported the change to the name, but noted that "reconciling" may be impossible with certain patient data, so "attempting to reconcile" would be preferable.

Response: While we understand the commenter concern, the measure only requires reconciling the available data. Thus, we believe the new name accurately reflects the measure.

Comment: A commenter suggested CMS to maintain this name in future years, as this is the third change in 5 years.

Response: We believe that we are adopting a name that is reflective of the intent of the measure, which should result in no need to revise it in the near future.

After consideration of the comments received, we are finalizing the proposed change to the name of the measure as proposed. The new name is: Support Electronic Referral Loops by Receiving

and Reconciling Health Information measure.

b. Engagement in Bi-Directional Exchange Through Health Information Exchange (HIE)

As discussed in the CY 2021 PFS proposed rule (85 FR 50299 through 50302), we proposed an alternative measure for bi-directional exchange through an HIE under the Health Information Exchange objective.

We proposed to add the following new measure under the HIE objective beginning with the performance period in 2021: Health Information Exchange (HIE) Bi-Directional Exchange measure. We proposed to add this new HIE Bi-Directional Exchange measure to the HIE objective as an optional alternative to the two existing measures: The Support Electronic Referral Loops by Sending Health Information measure and the Support Electronic Referral Loops by Receiving and Incorporating Health Information measure. We proposed that clinicians either may report the two existing measures and associated exclusions OR may choose to report the new measure. We proposed that the HIE Bi-Directional Exchange measure would be worth 40 points. We also proposed the HIE Bi-Directional Exchange measure would be reported by attestation and would require a yes/no response. We proposed that clinicians would attest to the following:

++ I participate in an HIE in order to enable secure, bi-directional exchange to occur for every patient encounter, transition or referral, and record stored or maintained in the EHR during the performance period.

++ The HIE that I participate in is capable of exchanging information across a broad network of unaffiliated exchange partners including those using disparate EHRs, and does not engage in exclusionary behavior when determining exchange partners.

++ I use the functions of CEHRT for this measure, which may include technology certified to criteria at 45 CFR 170.315(b)(1), (b)(2), (g)(8), or (g)(10).

We requested comments on our proposals and the following is a summary of the comments we received and our responses.

Comment: The overwhelming majority of commenters supported the addition of the HIE Bi-Directional Exchange measure. Several stated that incentivizing participation in HIEs that support bi-directional exchange would contribute to a longitudinal care record for the patient and facilitate enhanced care coordination across settings. Several commenters supported the increased use and integration of HIEs

into the clinical workflow and applauded CMS for taking steps to incentivize bi-directional exchange with these systems. One commenter supported the measure because it removes the barrier of not having access to another clinician's "Direct address" to send transition of care information manually. The commenter stated that this is not only a step in the right direction both to promote increased HIE adoption and use, but also to move away from the existing Send/Receive Transitions of Care measures, which can be convoluted and onerous to optimize within EHR documentation and reporting workflows.

Response: We appreciate all the support for this new measure as we agree that there are many benefits to HIE participation.

Comment: Some commenters appreciated that the attestation statements require information exchange for all patients and all patient records without exclusion, or allowances for partial credit to ensure all patients will benefit from bi-directional exchange.

Response: We appreciate commenters' support and agree that an important feature of this measure is that it emphasizes enabling bi-directional exchange for all of an eligible clinician's patients.

Comment: A commenter worries the proposed new HIE Bi-Directional Exchange measure is unworkable in real-world practice settings and is likely to be cumbersome. The commenter stated that the proposed attestations assume clinicians know what HIEs their hospital uses, and its particular usage. The commenter noted that this generally is not the case and puts the clinician in a position of having to defer to others with this knowledge—an unnecessary and onerous task that increases burden.

Response: We understand that not all eligible clinicians are currently aware of the HIE arrangements utilized by the hospitals and other institutions in which they practice. However, we believe that in many cases eligible clinicians' institutions may be submitting data for MIPS on behalf of clinicians and will be able to assist clinicians with further information about the HIEs in which they participate. Furthermore, we encourage the HIEs whose services qualify to support clinicians in meeting this measure to reach out to participants in order to make them aware of how they can satisfy the measure.

Comment: Another commenter stated that the inclusion of this measure is premature because there are numerous ways that HIEs connect to EHRs. The

commenter recommended that CMS partner with ONC to develop certification criteria as there is great variability among HIE connection requirements currently.

Response: We recognize that there is significant variation in the technology arrangements used by HIEs currently. Accordingly, in the third proposed attestation statement, we sought to allow for use of different CEHRT functions, which may support robust HIE connections. Moreover, we believe that HIEs are likely to continue to leverage different technology capabilities to connect to EHRs in accordance with local variations in technology implementation. While we believe it is important to move forward now with incentivizing eligible clinicians to establish robust connections with HIEs, we will continue to work with ONC to explore how the ONC Health IT certification program can further support integration between HIEs and EHRs.

As we stated in the proposed rule, we believe there are numerous certified health IT capabilities which can support bi-directional exchange with a qualifying HIE. For instance, participants may interact with an HIE by using technology certified to the criterion at § 170.315(b)(1) to transmit patient summary care records in the form of a C-CDA to the HIE, or using the technology certified to the criterion at § 170.315(b)(2) to receive and reconcile information received from the HIE into an EHR. Participants could also utilize API technology certified to either the criterion at §§ 170.315(g)(8) or (10) as finalized in the 21st Century Cures Act final rule (85 FR 25742), to enable an HIE to obtain data from a participant's EHR. We note that certified health IT modules meeting certification criteria beyond those mentioned in the proposed rule may also support exchange of information with an HIE for transitions of care, including: Certification criteria at § 170.315(g)(7), "Design and performance—Application access—patient selection," and (g)(9), "Design and performance—Application access—all data request," which support information exchange via API; the certification criterion at § 170.315(e)(1) "View, download, and transmit to 3rd party" which supports patient access to their information; and the certification criterion at § 170.315(g)(6) "Consolidated CDA creation performance" which supports creation of a summary of care record.

However, we believe that we can provide more clarity in the third attestation statement regarding our intent to allow flexibility for clinicians

to use different functions of CEHRT as appropriate to enable bi-directional exchange with an HIE that meets the requirements of the measure. While there are many certified technology capabilities which may support connections with HIEs, as described above, we wish to emphasize that clinicians are only required to use the certified functionality appropriate to their connection with an HIE necessary to support the measure actions. Accordingly, we are finalizing modifications to the third attestation statement, to read: "I use the functions of CEHRT to support bi-directional exchange with an HIE." We believe that this revised statement will provide more clarity to stakeholders regarding the requirements of the measure.

Comment: Several commenters requested that this measure be added to the Medicare Promoting Interoperability Program for eligible hospitals and CAHs. CMS should maintain program alignment by including the HIE Bi-Directional Exchange measure starting in the 2022 reporting year, only after the measure is finalized for inclusion in the program for eligible hospitals and CAHs.

Response: We appreciate the commenters' suggestion to include the HIE Bi-Directional Exchange measure in the Medicare Promoting Interoperability Program for eligible hospitals and CAHs. We may consider adding this measure in future rulemaking. We believe that the benefits that could be reaped by implementing the measure for the 2021 performance period for MIPS eligible clinicians do not warrant a delay of a year for alignment. We disagree that CMS should maintain program alignment with the Promoting Interoperability Program and delay implementing this measure by starting in the 2022 performance period. Due to the PHE and the importance of HIE's enabling enhanced use of telehealth and telemedicine for obtaining and aggregating patient information it is important to implement for the 2021 performance period.

Comment: A commenter stated that the measure fails to account for the significant expense to clinicians who wish to report this new measure. HIEs are expensive, often requiring monthly or yearly subscription fees. Many operational hurdles exist for bi-directional exchange for "every patient encounter, transition or referral, and record stored or maintained in the EHR" (section IV.A.3.c.(4)(c)(ii)). These hurdles include but are not limited to: The cost of HIE agreements and implementation, the ability of an HIE to implement interfaces capable of meeting

the standards of the measure, and the difficulty of logistics for healthcare organizations that exist across the jurisdictions of multiple HIE agencies. A commenter recommended that the measure requirements be relaxed for the first year in order to implement the processes through the EHRs and to educate clinicians on utilization and workflows. A suggestion would be to treat this like the measures of the Public Health and Clinical Data Exchange objective thus allowing “credit” for being in the process of implementation and/or testing to be compliant with the new measure.

Response: We recognize that there may be additional costs related to establishing a connection with an HIE. Accordingly, we proposed to make this measure optional, and understand that many eligible clinicians may wish to use the capabilities of their CEHRT which represent investments which eligible clinicians have already made. However, we understand that many eligible clinicians are also seeking to take advantage of robust HIE connections which can enable information exchange in an advanced fashion, and we are seeking to incentivize these investments as part of the Promoting Interoperability performance category.

As this measure is optional and attestation-based, we also do not believe it is necessary to provide a “phase-in” period for this measure, or to provide credit for eligible clinicians that are in the process of establishing these connections. These clinicians may continue to report on the existing numerator-denominator measures for the HIE objective and switch to reporting on the optional HIE Bi-Directional exchange measure at a future date when they are prepared to do so.

Comment: Several commenters stated that the attestation statements for this measure appropriately reflect the expectations for information exchange capabilities. The commenters believed that the attestation statements are sufficiently broad and allow for the different ways health care providers connect with HIEs.

Response: We appreciate the commenters support.

Comment: A commenter encourages CMS to expand the measure to include “HIEs, exchange frameworks, or other organizations focused on bi-directional health information exchange” since participation in a single HIE might not meet the measure’s requirement to support HIE for “every patient encounter, transition or referral.”

Response: We appreciate the commenters’ concerns. The term “HIE” is intended to broadly refer to arrangements that facilitate the exchange of health information, and may include arrangements commonly denoted as exchange “frameworks,” “networks,” or using other terms. To qualify for the measure, an HIE or other exchange network may qualify to support clinicians in meeting the measure provided it qualifies under the attestation statements including providing the capabilities specified under attestation statement 1 to allow a clinician to enable bi-directional exchange for all of an eligible clinician’s patient records and meeting the standard specified under attestation statement 2 related to facilitating non-exclusionary exchange.

Comment: A commenter suggested the first attestation statement be modified by replacing “enable” with “attempt”. Another commenter stated that the second part of the first attestation is confusing: “and record stored or maintained in the EHR during the performance period.” EHRs interact with HIEs in different ways and clarification is requested.

Response: We appreciate the commenters’ concerns. As we are offering a significant amount of points for this measure, we believe that “enable” more accurately reflects the high level of performance and the specific action we are expecting clinicians to take. Also, we understand that there is wide variation in HIE arrangements which may result in different modes of information exchange. The description of services in the first attestation statement would only require enabling of bi-directional functionality for the specified patient population and information. Eligible clinicians would not be required to adhere to specific guidance regarding what data is stored locally by the eligible clinicians EHR and what data is stored within the HIE, if any.

Comment: A commenter suggested that until there is more widespread connectivity and available information in the HIE space that CMS should remove the second attestation statement. Another commenter requested that to minimize burden, CMS remove the second attestation statement.

Response: We disagree that we should remove the second attestation statement, and believe that removing the attestation statement would not be consistent with the exchange behavior we are seeking to encourage through this measure, which is focused on the use of an HIE to exchange with any other clinician who may be involved in

the care of any of an eligible clinician’s patients. The second attestation statement is intended to ensure that an HIE which supports a clinician in attesting to this measure has the capacity to enable widespread exchange across a given health care market. We also believe that prioritizing those HIEs capable of exchanging information across a broad network of unaffiliated exchange partners including those using disparate EHRs, and which do not engage in exclusionary behavior when determining exchange partners, will encourage HIE networks to adopt wider connectivity.

Comment: A commenter stated that the requirement that “bi-directional engagement occurs for all patients and all records” is naïve. Newborn babies, for example, do not have information in an HIE, and it is a waste of resources for the system to send a query regarding them.

Response: The first attestation statement as proposed would require clinicians to attest that they have enabled bi-directional exchange for every patient record in their EHR. Enabling bi-directional exchange does not mean that an eligible clinician would be required to conduct information transactions that are not clinically necessary. Rather, it means that an eligible clinician has established the capabilities necessary to complete exchanges of information for their patients at the appropriate time.

Comment: One commenter was encouraged by CMS’ proposal and supported CMS relying on yes/no measure attestations for this category as much as possible, which would minimize clinician reporting burden and aligns with how clinicians attest to the improvement activity performance category.

Response: We agree that this measure will provide an optional path for qualifying clinicians to earn credit under the HIE objective while reducing administrative burden associated with reporting on the current measures.

Comment: The definition of an HIE is broad and could apply to many existing entities across the country. A commenter requested that CMS provide some examples of HIEs that they consider to meet the definition of the measure. They added that it would be helpful if CMS could provide examples of the types of evidence that an organization might preserve and provide in case of an audit due to the broad nature of the attestation measure, and multiple sub-statements in which an organization must attest.

Response: We decline to provide a list of HIEs that meet the attributes specified

in the measure. We believe there are a wide number of organizations providing HIE services around the country which could effectively support clinicians who wish to attest to the measure, and we do not want to appear to endorse particular HIEs over others. We also recognize that the HIE space is rapidly changing, and additional organizations may emerge or evolve to meet the attributes described in the attestation statements following the publication of this final rule. In regards to audit documentation, eligible clinicians who choose to attest to this optional measure could support their attestation statements using a variety of materials, including: Agreements with the organization providing them with health information exchange services; materials from the organization that provides their HIE services describing their services in a manner consistent with the attestation statements; or systems documentation from their EHR vendor describing their connection to the HIE.

Comment: Several commenters suggested that CMS implement this new ‘bi-directional engagement’ replacement option immediately. However, the commenters stated that the threshold should not be every patient encounter. Instead, to make the measure reasonable, the threshold should be set at 50 percent of all eligible encounters. Another commenter suggested that CMS impose a lower threshold for performance. A commenter stated that, as this measure is new and robust connections with HIEs are still rare, they contend that this is an unreasonable requirement and recommend for the CY 2021 reporting year that it be modified to be “a minimum of 10 percent of patient encounters and for a minimum of 10 percent of patient records transmitted during the performance period.” Another commenter recommended that CMS consider partial credit for eligible clinicians and new sites being on-boarded to an HIE during the performance period.

Response: We appreciate the commenter’s support. However, we disagree with the recommendation to set a threshold for the measure. The goal of this measure is to incentivize connections with HIEs that enable bi-directional functionality for all of the patient records in an eligible clinician’s EHR. For clinicians with a robust connection available to an HIE, we do not believe that it would make sense to only enable this functionality for a subset of patients. Therefore, we decline to apply a threshold percentage to this measure. We understand that all eligible clinicians may not have a connection

with an HIE that is capable of enabling bi-directional exchange for all of the patient records in an eligible clinician’s EHR. However, in recognizing that this functionality is not available for all eligible clinicians, we have proposed that this measure would be optional. We also decline to provide partial credit for this measure as partial performance would not meet the goals of the measure. Our goal in proposing this measure is to incentivize the high standard of performance on health information exchange which can be achieved by establishing robust, bi-directional exchange capabilities facilitated by an HIE. We do not believe that allowing eligible clinicians to satisfy the measure based on a partial threshold would be consistent with incentivizing a high performance standard for the exchange of health information.

Comment: A commenter applauded CMS’ desire to incentivize eligible clinicians to participate in HIEs while establishing a high performance standard for sharing information with other clinicians. Like many other practices, the commenter struggles with the “Sending Health Information” measure because many receiving health care providers and facilities have not implemented the technology necessary to receive and acknowledge the summary of care.

Response: We appreciate the commenter for their support.

Comment: Commenters suggested that CMS ensure that clinicians continue to have multiple options to meet the Health Information Exchange objective, as not all clinicians will have access to an HIE. The other issue facing practices is the cost of connecting with their local exchanges. High connectivity fees imposed by the HIE and/or the practice’s EHR vendor can act as a significant deterrent to connectivity.

Response: We are only finalizing this measure as optional at this time, and recognize that many clinicians may prefer to continue to report using the existing HIE objective measures. We also agree and understand that there are costs associated with utilizing the capabilities of an HIE, and that all clinicians may not choose to assume these costs in addition to existing EHR investments.

Comment: A commenter recommended that CMS limit its HIE Bi-Directional measure conditions to that of exchange between unaffiliated health care provider entities regardless of whether they are using the same EHR product or participating in the same EHR-run HIE. Another commenter stated that more should be done to

promote bi-directional exchange between unaffiliated entities and between disparate EHRs.

Response: While we believe that HIE arrangements which only permit exchange between the clinicians using the same EHR product may be useful for increasing interoperability among specific groups of clinicians, our goal with this measure is to incentivize exchange arrangements that allow for advanced interoperability across users of different vendor products. We agree that it is important to continue to encourage HIE arrangements that are capable of supporting exchange between different EHR systems. We note that there are a number of promising initiatives currently seeking to address this issue, and believe that incorporation of the HIE Bi-Directional Exchange measure will contribute to furthering these initiatives and making such services more widely available.

Comment: A commenter stated that while they support incentivizing interoperability of EHRs and the bi-directional flow of health information, the commenter did not believe it is appropriate or timely to introduce this new measure. Clinicians and EHR vendors, in particular, need additional time to comply with 21st Century Cures and subsequent rulemaking requirements regarding interoperability before this measure is added.

Response: We recognize that eligible clinicians participating in the Promoting Interoperability performance category are also impacted by the recently finalized provisions in the 21st Century Cures Act final rule. Our goal in finalizing this measure is to provide eligible clinicians with additional options to earn credit under the Promoting Interoperability performance category. We believe that the flexibility associated with this attestation-based measure can contribute to reducing administrative burden for eligible clinicians.

Comment: A commenter required clarification from CMS of whether an attestation response of “yes” could mean that the eligible clinician is prepared to implement the measure but their vendor is not yet capable of supporting the measure. Analogous to the public health measure with a similar attestation, the commenter suggested confirmation that an eligible clinician can attest “yes” to the proposed new measure when the clinician is ready and able to participate in the bi-directional exchange but for a limitation of the vendor.

Response: No. To earn the 40 points, the clinician must be connected to an HIE. If their vendor does not support

that connection, they do not fulfill the measure and would earn zero points.

Comment: A commenter stated that given that greater use of HIEs for bi-directional exchange will immediately contribute to enhanced care coordination across settings, this measure should not be optional for 2021, it should be required. Additionally, the commenter recommended that CMS continue to include this as a required measure in the MVPs.

Response: We appreciate commenters' support for this measure. However, at this time we do not believe it is appropriate to require clinicians to report this measure. For instance, we understand that some clinicians may not yet have access to an HIE that is capable of the functions reflected in the attestation statements. As the Promoting Interoperability performance category measures are considered foundational under the MVP framework, all Promoting Interoperability performance category measures would be available to those clinicians choosing to participate in MVPs.

Comment: A commenter requested CMS clarify the HIE being measured through the Promoting Interoperability performance category relates to *any* exchange of health information between HIE entities, meaning the measure does not restrict the exchange to only information sent and received from state HIEs or local health authority HIEs. Another commenter inquired as to whether national HIE networks would qualify.

Response: Nothing in the proposed requirements for this measure would limit qualifying HIE services to those entities managed by states or local health authorities. Moreover, we note that networks providing HIE services which are national in scope could also support eligible clinicians' successful attestation, provided they satisfy the finalized attestation statements.

Comment: A commenter questioned if there are requirements that dictate which HIE clinicians are expected to connect to. The commenter also noted that CMS should clarify whether clinicians are expected to connect to more than one (one in each state) HIE if they practice near a state border. The commenter also requested clarification surrounding a clinician's ability to fulfill this measure if there are no HIEs available for them to connect to.

Response: We did not propose any requirements for HIEs beyond those specified in the attestation statements for eligible clinicians, specifically, that the HIE permits a clinician to enable bi-directional exchange for all of the

patient records within their EHR, and that the HIE meets the attributes described around exchanging information across unaffiliated health care providers and disparate EHR systems. We recognize that an organization providing HIE services could meet the conditions in the attestation statements while not facilitating a connection to every clinician or maintaining information on every patient in a given health care market, for instance, in cases where a health care market crosses a state line and the HIEs in each state do not yet share records. However, an eligible clinician may successfully attest to the measure statements as long as they are connected to at least one HIE in a manner consistent with the statements. We also understand that there may be some eligible clinicians who do not have access to any organizations providing HIE services at this time. While clinicians who do not participate in an HIE would not be able to attest for this measure, they would continue to be able to attest to the existing HIE objective measures.

Comment: Other commenters expressed concerns with the attestation statements as proposed. One commenter interprets the statements as meaning that clinicians are attesting that they have the *functional capability* to conduct bi-directional exchange for all patients during the performance period, not that physicians *must conduct* bi-directional exchange for all patients during the performance period. Another commenter recommended that CMS revise the attestation language proposed to ensure that the attesting clinician is not being held accountable for some features of his/her HIE that she might not know about or have control over.

Response: The first attestation statement for this measure requires eligible clinicians to attest that they participate in an HIE to enable bi-directional exchange for transactions for all of their patients. Enabling this functionality to occur for all of the patient records in an eligible clinician's HIE does not mean that clinicians would be required to share or request information when it is not clinically appropriate.

Comment: A commenter appreciated CMS' reference to CEHRT in the third attestation statement and suggested that CMS clarify that the minimum set of data needed to meet this measure's requirement for bi-directional exchange align with the Common Clinical Data Set (CCDS) soon to be the US Core Data for Interoperability (USCDI). The CCDS/USCDI serves as the baseline set of data required for interoperability and is what

EHRs are commonly exchanging with HIEs today.

Response: The third attestation statement requires clinicians to attest that they use the functions of CEHRT to engage in bi-directional exchange. Similar to the guidance for the existing measures under the HIE objective, we are not defining a data set as part of the measure, but note that functions of CEHRT include technology certified to criteria which ensure a health IT module is capable of exchanging data contained in the CCDS, and subsequently the USCDI. As finalized in the 21st Century Cures Act final rule, existing references to the CCDS in these criteria will be updated to refer to USCDI consistent with the certification criteria in 45 CFR part 170.

Comment: A commenter requested clarification from CMS regarding the points a clinician is eligible for under this alternative measure. The proposed rule states that a clinician cannot earn more than 40 points, yet under the redistribution policy for exclusions, if a clinician can exclude the eRx measure, the 10 points for that measure are redistributed to the HIE measure, which would make it worth 50 points. The commenter requested that CMS clarify if this is still true if eligible clinicians choose this measure.

Response: The 40 points reflects the number of points available for the new HIE measure. It does not reflect the redistribution of points for the E-prescribing measure. If an exclusion is claimed for the E-Prescribing measure, the 10 points associated with that measure would be redistributed to the HIE objective resulting in 50 points available for the two existing HIE measures or the new HIE Bi-Directional exchange measure.

Comment: A commenter stated that clinicians should not have to attest to the capabilities of their HIE. There are great variances within HIE capabilities, and clinicians have no way of knowing all of them when selecting an HIE. Several commenters requested that HHS publish a list of common, widely known entities that would meet the definition of an HIE for the purposes of this measure.

Response: As discussed above, we decline to name specific entities who represent the attributes described in the second attestation statement, as we do not want to endorse specific organizations. Specifically, the second attestation statement specifies that clinicians attesting to the measure must participate in an HIE that is capable of exchanging information across a broad network of unaffiliated exchange partners including those using disparate

EHRs, and does not engage in exclusionary behavior when determining exchange partners.

However, we believe that qualifying HIEs that can support eligible clinicians in attesting to this measure will have an interest in clearly communicating this fact to participants and potential participants. We encourage those HIEs that meet the description in the second attestation statement to publicly announce their availability to support this measure, both on their public website and through other communications methods. While a public announcement of availability to support this measure would not be required for an eligible clinician to leverage an HIE in order to attest to the measure, we believe that such activities will help to address commenters' concerns regarding how to determine whether an HIE meets the attributes described in the second attestation statement.

Comment: One commenter suggested CMS to allow for exclusions based on an individual patient's privacy request and potential state laws that would restrict information from being sent through an HIE.

Response: The first attestation statement requires eligible clinicians to attest that they participate in an HIE to enable bi-directional exchange for all of the patient records in their EHR. This is not intended to conflict with or supersede any applicable law including state, federal or tribal law governing access, exchange or use of electronic health information, the information blocking rules finalized at 45 CFR part 171, or any other patient privacy rules adopted by a specific HIE implementation such as policies permitting patients to opt out of sharing their health information through the HIE. Since attesting to this statement would not requiring sharing of

information that is prohibited under existing laws, regulations and other policies, we do not believe it is necessary to specify additional exclusions. However, for additional clarity, we are revising the first attestation statement to specify that the bi-directional exchange is conducted "in accordance with applicable law and policy."

Comment: A commenter suggested phasing in language for every patient encounter beginning with transitions or referrals for new patients only. This is more reflective of where clinicians currently are with HIE integration and will encourage more robust future participation. In developing this new requirement, CMS should clarify that none of the language in the attestation statements conflict with applicable state law and guidance.

Response: We decline to phase in the measure requirement to enable bi-directional exchange based on subsets of patients as suggested by the commenter. We do not believe that there would be an appropriate reason to limit bi-directional exchange capabilities via an HIE to a subset of patients, such as new patients. Moreover, our goal in establishing this optional measure is to incentivize eligible clinicians to engage in HIE arrangements which enable bi-directional exchange for all of an eligible clinician's patient records, providing robust support for coordinated patient care. None of the requirements for this measure are intended to conflict with applicable federal, state, or tribal law or guidance. While eligible clinicians attesting to the first attestation statement attest that they have enabled bi-directional exchange for all of their patient records, enabling this functionality would not require clinicians to share information when sharing that information is prohibited

by law or policy. We have revised the first attestation statement accordingly.

Comment: A commenter requested clarification on the content of information included in bi-directional exchange. It is unclear if, for example, portal messages must be included in the information exchanged with the HIE. The commenter requested guidance on how this can be implemented for practices on a portal that does not connect to an HIE.

Response: To successfully attest to this measure, the eligible clinician must use the capabilities defined for CEHRT to engage in bi-directional exchange via the HIE, which includes exchanging clinical data represented by the CCDS or included in the USCDI. Portal messages that are outside the CEHRT would not be included.

After consideration of the comments we received, we are adopting our proposals with the following modifications. Attestation statement 1 is as follows: "I participate in an HIE in order to enable secure, bi-directional exchange to occur for every patient encounter, transition, or referral, and record stored or maintained in the EHR during the performance period in accordance with applicable law and policy."

Attestation statement 3 is as follows: "I use the functions of CEHRT to support bi-directional exchange with an HIE."

(d) Scoring Methodology

(1) Changes to the Scoring Methodology for the 2021 Performance Period

Table 48 summarizes the Promoting Interoperability performance category objectives and measures for CY 2021, including the changes adopted as final in the preceding sections of this final rule.

TABLE 48: Scoring Methodology for the Performance Period in CY 2021

Objective	Measure	Maximum Points
Electronic Prescribing	e-Prescribing	10 points
	<i>Bonus:</i> Query of PDMP	10 points (<i>bonus</i>)
Health Information Exchange OR	Support Electronic Referral Loops by Sending Health Information	20 points
	Support Electronic Referral Loops by Receiving and Reconciling Health Information	20 points
Health Information Exchange (alternative)	HIE Bi-Directional Exchange	40 points
Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information	40 points
Public Health and Clinical Data Exchange	Report to two different public health agencies or clinical data registries for any of the following: <ul style="list-style-type: none"> • Syndromic Surveillance Reporting • Immunization Registry Reporting • Electronic Case Reporting • Public Health Registry Reporting • Clinical Data Registry Reporting 	10 Points

Notes: The Security Risk Analysis measure is required, but will not be scored.

Comment: A commenter supported the modified scoring methodology for the Promoting Interoperability performance category, which was initially finalized beginning with the 2019 performance year. The scoring methodology is less cumbersome and easier to understand, and is effective in highlighting important objectives of the category. We are pleased that the scoring methodology will continue in 2021.

Response: We appreciate the commenter for their support of the modified scoring methodology and agree that the approach is less cumbersome and easy to understand.

(e) Additional Considerations

(1) Nurse Practitioners, Physician Assistants, Clinical Nurse Specialists, and Certified Registered Nurse Anesthetists

We established a policy at § 414.1380(c)(2)(i)(A)(5) for the performance periods in 2017 through 2020 under section 1848(q)(5)(F) of the Act to assign a weight of zero to the Promoting Interoperability performance category in the MIPS final score if there are not sufficient measures applicable and available to NPs, PAs, CRNAs, and CNSs. We will assign a weight of zero only in the event that an NP, PA, CRNA, or CNS does not submit any data for any of the measures specified for the Promoting Interoperability performance category, but if they choose to report, they will be scored on the Promoting Interoperability performance category like all other MIPS eligible clinicians

and the performance category will be given the weighting prescribed by section 1848(q)(5)(E) of the Act.

As in past years, we intend to use data from prior performance periods to further evaluate the participation of NPs, PAs, CRNAs, and CNSs in the Promoting Interoperability performance category and consider for subsequent years whether the measures specified for this category are applicable and available to these MIPS eligible clinicians. We have analyzed the data submitted for the 2017 performance period for the Promoting Interoperability performance category and have discovered that the vast majority of MIPS eligible clinicians submitted data as part of a group. Although we are pleased that MIPS eligible clinicians utilized the option to submit data as a group, it does limit our ability to analyze data at the individual NPI level. For the 2017 performance period, approximately 4 percent of MIPS eligible clinicians who are NPs, PAs, CRNAs, or CNSs submitted data individually for MIPS, and more than two-thirds of them did not submit data for the Promoting Interoperability performance category. For the 2018 performance period, approximately 34 percent of MIPS eligible clinicians who are NPs, PAs, CRNAs, or CNSs submitted data individually for the Promoting Interoperability performance category. In addition, the majority of MIPS eligible clinicians reported data for the Promoting Interoperability performance category for the 2017 and 2018 performance periods using the

transition measure set. This set is unavailable for the 2019 performance period, which could have contributed to the decrease of MIPS eligible clinicians reporting data for Promoting Interoperability performance category. For the 2019 performance period, approximately 30 percent of MIPS eligible clinicians who are NPs, PAs, CRNAs, or CNSs submitted data individually for the Promoting Interoperability performance category, a reduction of 4 percent from the previous year.

For these reasons, we proposed at 85 FR 50302 through 50303 to continue the existing policy of reweighting the Promoting Interoperability performance category for NPs, PAs, CRNAs, and CNSs for the performance period in 2021, and to revise § 414.1380(c)(2)(i)(A)(5) to reflect the proposal.

The following is a summary of the comments we received and our responses.

Comment: A commenter supports this proposal until CMS can obtain more robust data. We continue to encourage the agency to provide technical assistance to clinicians with the goal of increasing EHR adoption and familiarity with the Promoting Interoperability performance category reporting requirements for all clinicians.

Response: We appreciate the commenter for their support in continuing the existing reweighting policy for NPs, PAs, CRNAs, and CNSs for the performance period in 2021 until we can obtain more robust data and

plan on continuing our support of stakeholders to increase EHR adoption and familiarity with the Promoting Interoperability performance category reporting requirements for all clinicians.

Comment: Another commenter appreciated the continued flexibility provided as CMS works to further assess the use of CEHRT by PAs and NPs. The commenter stated PAs are fully ready and capable to participate under the Promoting Interoperability performance category, with possible exception of small PA-owned practices that are unable to afford CEHRT systems that are fully compliant with current requirements. PAs in most practice settings have been using EHR systems for a number of years, often being the health profession who leads a practice's EHR system implementation and should be held to the same standards as physicians.

Response: We are pleased to hear that many PAs have the ability to participate in the Promoting Interoperability performance category and we hope those that are ready will submit data. For those who cannot, we will reweight the Promoting Interoperability performance category.

After consideration of the comments we received, we are finalizing our policy as proposed: We are continuing the existing policy of reweighting the Promoting Interoperability performance category for NPs, PAs, CRNAs, and CNSs for the performance period in 2021, and revising § 414.1380(c)(2)(i)(A)(5) to reflect this policy.

(2) Physical Therapists, Occupational Therapists, Qualified Speech-Language Pathologists, Qualified Audiologists, Clinical Psychologists, and Registered Dietitians or Nutrition Professionals

In the CY 2020 PFS final rule (84 FR 63003 through 63004), we adopted a policy at § 414.1380(c)(2)(i)(A)(4) to apply the same policy we adopted for NPs, PAs, CNSs, and CRNAs to other types of MIPS eligible clinicians who are NPPs (physical therapists, occupational therapists, qualified speech-language pathologist, qualified audiologists, clinical psychologists, and registered dietitians or nutrition professionals) for the performance period in 2020. We stated that because many of these clinician types were or are not eligible to participate in the Medicare or Medicaid Promoting Interoperability Program, we have little evidence as to whether there are sufficient measures applicable and available to them under the Promoting Interoperability performance category.

For the reasons discussed in the proposed rule (85 FR 50302–50303), we proposed to continue the existing policy of reweighting the Promoting Interoperability performance category for physical therapists, occupational therapists, qualified speech-language pathologist, qualified audiologists, clinical psychologists, and registered dietitians or nutrition professionals for the performance period in 2021, and to revise § 414.1380(c)(2)(i)(A)(4) to reflect the proposal. We invited comments on the proposal.

We received public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: One commenter thanked CMS for continuing to reweight the Promoting Interoperability performance category for therapists as they have not received any financial incentives or support for implementing EHRs.

Response: We appreciate the commenter for their support.

Comment: One commenter supports the proposal to continue reweighting the Promoting Interoperability performance category to zero for certain NPPs and psychologists reporting under MIPS. The commenter stated that psychologists have never been eligible for the financial incentives offered to physicians to promote the use of CEHRT and because many do not utilize CEHRT in their private practices, most psychologists would not have enough Promoting Interoperability performance category measures to successfully report. The commenter supports the proposal to continue to reweight the Promoting Interoperability performance category to zero as it will protect psychologist and certain other NPPs from being unfairly penalized.

Response: We appreciate the commenter's support and are finalizing our proposal to continue the existing policy of reweighting the Promoting Interoperability performance category for physical therapists, occupational therapists, qualified speech-language pathologist, qualified audiologists, clinical psychologists, and registered dietitians or nutrition professionals.

After consideration of the comments, we are finalizing our proposals for the 2021 performance period to continue the existing policy of reweighting the Promoting Interoperability performance category for physical therapists, occupational therapists, qualified speech-language pathologist, qualified audiologists, clinical psychologists, and registered dietitians or nutrition professionals, and are revising § 414.1380(c)(2)(i)(A)(4) to reflect our policy.

(5) APM Entity Groups and APM Scoring Standard for MIPS Eligible Clinicians Participating in MIPS APMs

(a) Overview

The APM scoring standard, codified at § 414.1370, is the MIPS scoring methodology applicable for MIPS eligible clinicians participating in a MIPS APM for the applicable MIPS performance period. As discussed in the CY 2017 Quality Payment Program final rule (81 FR 77246), the APM scoring standard was designed to reduce reporting burden for participants in MIPS APMs by eliminating the need for such MIPS eligible clinicians to submit data for both MIPS and their respective APMs, and to ensure that these eligible clinicians were not assessed in multiple ways on the same performance activities. We also believed that the APM scoring standard would encourage APM participation and support the goal of encouraging APM participants to better manage care for patients within their respective APM Entities by tying their MIPS performance scores together.

As we have gained experience in implementing the APM scoring standard, we have learned that it is infeasible to fully implement it as it was originally designed, as was discussed in the CY 2020 PFS final rule (84 FR 63007). Public comments on the CY 2020 revised APM scoring standard finalized in the CY 2020 PFS final rule (84 FR 63010), and most comments in response to the request for comments on APM scoring beyond 2020, made clear that the complexity of the APM scoring standard and its inflexibility in adapting to changes in APM participation and design have resulted in confusion and unintended additional burden for APM Entities and their participant MIPS eligible clinicians.

With this insight in mind, and with the goal of better aligning MIPS reporting rules for all MIPS eligible clinicians, including those in MIPS APMs, we proposed to terminate the APM scoring standard as described at § 414.1370, effective January 1 of the 2021 performance year, by amending that regulation accordingly.

We further proposed in the CY 2021 PFS proposed rule (85 FR 50285), effective January 1, 2021, to establish an APM Performance Pathway and scoring rules that would be available for MIPS reporting for MIPS eligible clinicians in MIPS APMs.

(b) APM Entity Groups

We proposed to terminate the APM scoring standard effective January 1, 2021, however, beginning with the 2021 performance period, we proposed to

retain certain APM Entity group reporting policies that were established and finalized for reporting and scoring under MIPS beginning with the 2021 performance period (85 FR 50303 through 50304). Therefore, we proposed to redesignate in part the regulation that describes APM Entity group determinations, from § 414.1370(e) to § 414.1317, and to title that section “APM Entity Groups.”

We received the following comments on these proposals.

Comment: A few commenters stated support for allowing MIPS quality reporting at an individual or group level as well as the APM Entity level. Commenters believe that this approach would reward high performers within APM Entities and enable specialists to be scored on quality measures that reflect their area of practice.

Response: We thank commenters for their support and will continue to consider additional ways in which we can continue to support and encourage APM participation.

Comment: A few commenters supported the proposal but requested that we extend the waiver of the cost performance category to all APM participants in MIPS, as the cost-containment requirements of the APMs are equally applicable to all APM Entities, regardless of how they chose to participate in MIPS.

Response: In the CY 2017 Quality Payment Program final rule (81 FR 77256, 77265), for the APM scoring standard, we finalized at § 414.1370(g)(2) a policy to waive the cost performance category under the waiver authority at section 1115A(d)(1) of the Act for CMS Innovation Center APMs, and at section 1899(f) of the Act for the Medicare Shared Savings Program. In the CY 2021 PFS proposed rule (85 FR 50287), for the APP, we proposed to continue to waive the cost performance category under the same authorities, and we are finalizing this proposal in section IV.A.3.b. of this final rule. Upon further consideration, we recognize that the policy rationale for waiving the cost performance category is equally applicable to all APM Entities in MIPS APMs, regardless of whether an APM Entity chooses to participate in MIPS through the APP or through traditional MIPS reporting options. As we described in the CY 2017 Quality Payment Program final rule (81 FR 77256, 77265), and reiterated in the CY 2021 PFS proposed rule (85 FR 50287), we believe this use of waiver authority is justified for three reasons. First, APM Entities in MIPS APMs already are subject to cost performance assessment under their APMs, as the MIPS APM

criteria would continue to include the assessment of participants based on cost. Second, MIPS APMs may measure cost performance in different ways than MIPS, for example, by basing cost on total cost of care, which measures a broader scope of cost or resource use than would necessarily be reflected in the narrower claims-based accountability standard under MIPS. Finally, MIPS APMs may attribute beneficiaries differently from MIPS for purposes of measuring cost, leading to an unpredictable degree of overlap between the sets of beneficiaries for whom the MIPS eligible clinicians would be responsible under their APM and under MIPS. We continue to believe that with an APM Entity's finite resources for engaging in efforts to improve quality and lower costs for a specified beneficiary population under the APM, it is necessary to give the APM Entity the ability to identify a single beneficiary population to prioritize in its cost-saving efforts so that the goals and evaluation associated with the APM are as clear and free of confounding factors as possible. With this flexibility, MIPS eligible clinicians who are attempting to strategically transform their respective practices would not jeopardize their ability to succeed in either MIPS or under the terms of their APM.

We believe the potentially conflicting or confounding incentives between the MIPS APMs and the MIPS cost performance category would still exist for APM Entities in MIPS APMs, regardless of which MIPS participation option an APM Entity chooses. Therefore, we will continue to waive the cost performance category for APM Entities in MIPS APMs under the waiver authority at section 1115A(d)(1) of the Act for CMS Innovation Center APMs, and at section 1899(f) of the Act for the Medicare Shared Savings Program, and weight the cost performance category at zero percent of an APM Entity's final score.

In addition, because we proposed to no longer rely on quality measures reported to an APM, as is required under the existing APM scoring standard, we no longer believe that there is substantial risk of the MIPS final scores being inappropriately influenced by MIPS eligible clinicians moving into or out of APM Entities late in the performance year, which was the impetus for the full-TIN APM policy. Therefore, we proposed to end the full-TIN APM policy currently codified at § 414.1370(e)(1), which allows for an APM Entity group to include eligible clinicians on the Participation List in a full-TIN APM on December 31 of the

MIPS Performance Period only if the APM is a full-TIN APM as defined at § 414.1305. We also proposed that MIPS eligible clinicians identified on the Participation List or Affiliated Practitioner List of any APM Entity participating in any MIPS APM on any of the three snapshot dates (March 31, June 30, August 31), as well as December 31 during a performance period, beginning in the 2021 MIPS performance period, would be considered participants in an APM Entity group. As the proposals would eliminate the need for the term “full TIN APM,” we also proposed to delete the defined term “full TIN APM” from § 414.1305.

We did not receive any comments on this proposal.

After consideration of the comments we received, we are finalizing the proposed policy as proposed. In addition, for the reasons discussed in our response to comments above, we are adopting a final policy at § 414.1317(b)(2) to weight the cost performance category at zero percent for APM Entities in MIPS APMs.

(c) APM Entity Group Eligibility

In the absence of the APM scoring standard and mandatory reporting to MIPS through the APM Entity group, it would no longer be necessary to conduct low-volume threshold determinations at the APM Entity group level. Therefore, along with the termination of the APM scoring standard under § 414.1370, we also proposed to terminate, effective January 1, 2021, the use of APM Entity level low-volume threshold determinations and remove the term APM Entity group from the definition of the low-volume threshold at § 414.1305, with corresponding changes to applicability at § 414.1310(b)(1).

Going forward, we would apply the same rules for MIPS eligibility to APM participants as to other MIPS eligible clinicians. For example, if an eligible clinician who is a participant in a MIPS APM is below the low-volume threshold he or she would not be required to report to MIPS as an individual; however, if the group TIN of which that eligible clinician is a part is MIPS eligible and does report to MIPS, that eligible clinician would be treated as a MIPS eligible clinician for purposes of MIPS scoring and payment adjustments, and would receive the higher of the group score and any available APM Entity group score. Being a participant in an APM Entity that reports to MIPS would not confer MIPS eligibility to an eligible clinician who would otherwise be excluded from MIPS.

We did not receive public comments on this proposal and we are finalizing it as proposed.

(d) APM Entity Group Scoring

Consistent with our past approach under the APM scoring standard at § 414.1370(f), we proposed at § 414.1317(b) that the MIPS final score calculated for the APM Entity would be applied to each MIPS eligible clinician in the APM Entity group. The MIPS payment adjustment would be applied at the TIN/NPI level for each of the MIPS eligible clinicians in the APM Entity group.

Similar to our past approach under the APM scoring standard at § 414.1370(g)(4)(ii) and (iii), as originally discussed and finalized in the CY 2017 Quality Payment Program final rule (81 FR 77268), we proposed at § 414.1317(b)(1) that in all cases where an APM Entity reports to MIPS, but a performance category's data submission cannot be made at the APM Entity level, each MIPS eligible clinician in the APM Entity group would be assigned the highest available score for that performance category (either the individual or TIN-level score), and the scores for all MIPS eligible clinicians in the APM Entity group would be averaged in order to calculate the APM Entity level performance category score. In the event that a MIPS eligible clinician in an APM Entity receives an exception from the reporting requirements, such eligible clinician would be assigned a null score when we calculate the APM Entity's performance category score.

Similar to our past approach under the APM scoring standard at § 414.1370(g)(1)(iv), we proposed at § 414.1317(b)(2) that for an APM Entity for which we calculated a total performance category score for one or more participants in the APM Entity for the preceding MIPS performance period, we would calculate an improvement score for each performance category for which a previous year's total performance category score is available as specified in § 414.1380(b). Note that unlike § 414.1370(g)(1)(iv), proposed § 414.1317(b)(2) would not be limited to the quality performance category, but will apply to any performance category.

We did not receive public comments on these proposals and are finalizing as proposed.

(e) Reweighting Based on Extreme and Uncontrollable Circumstances for APM Entity Groups

Section 414.1380(c)(2)(i) allows for the submission of an application to CMS to request reweighting of one or more

MIPS performance categories due to extreme and uncontrollable circumstances. We proposed that an APM Entity may submit such an application beginning with the 2020 performance period/2022 MIPS payment year, at § 414.1317(b)(3). The request for reweighting in the application would apply for all four MIPS performance categories and all MIPS eligible clinicians in the APM Entity group. If the request for reweighting is approved by CMS, this would result in MIPS eligible clinicians participating in the APM Entity being excepted from MIPS reporting requirements for the applicable performance period, and the APM Entity would receive a final score equal to the performance threshold. Such request for reweighting would be approved or denied in its entirety.

We considered allowing an APM Entity to submit an application to request reweighting for individual performance categories, but rejected this approach. As discussed in the CY 2021 PFS proposed rule (85 FR 50304, we believe the amount of complexity at the intersection of the various performance category submission and scoring requirements, submitter types, and exception applications for MIPS eligible clinicians could place a burden on these clinicians and their representatives to continually invest in understanding their shifting obligations under such an approach. Furthermore, operationalizing a policy where an APM Entity would have the ability to request and receive reweighting for one or more, but not all, performance categories would be prone to error. In addition, such a piecemeal approach to addressing extreme and uncontrollable circumstances likely would cause scoring delays that could result in CMS being unable to timely provide performance feedback and payment adjustment information to all MIPS eligible clinicians.

We also proposed at § 414.1317(b)(3)(i) that an APM Entity must demonstrate in its application to CMS that greater than 75 percent of its participant MIPS eligible clinicians would be eligible for reweighting the Promoting Interoperability performance category for the applicable performance period.

Due to the unique and complex relationship between an APM Entity and its individual participant MIPS eligible clinicians, we noted that we believe it is appropriate to offer an APM Entity the opportunity to apply for reweighting based on extreme and uncontrollable circumstances for all performance categories, including the Promoting Interoperability performance

category, rather than collecting Promoting Interoperability hardship exception applications from each MIPS eligible clinician in the APM Entity group as is currently required. However, we believe that setting a 75 percent threshold for the Promoting Interoperability performance category is appropriate as a means of assuring that the request for reweighting is only granted in cases where absent the reweighting, it would be impossible to calculate a score for that performance category that is truly representative of the APM Entity group's performance. We proposed a 75 percent threshold because such threshold is consistent with the Promoting Interoperability performance category reweighting policy for groups of hospital-based MIPS eligible clinicians and non-patient facing MIPS eligible clinicians, which similarly could face an administrative burden in attempting to secure approvals for individual reweighting requests for each MIPS eligible clinician in such groups. We noted that we recognize that as a result of the variety of participation requirements of different APMs, APM Entity groups may be composed of a wide range of health care provider types and sites of service. We stated that we believe scoring an entire APM Entity as the result of a single MIPS eligible clinician's submission of data for the Promoting Interoperability performance category could place an extreme administrative burden on APM Entity groups, and could potentially create unintended consequences for APM participation decisions among MIPS eligible clinicians.

In addition, we proposed at § 414.1317(b)(3)(ii) that if CMS approves the request for reweighting based on an APM Entity's application, and if MIPS data are submitted for the APM Entity for the applicable performance period, all four of the MIPS performance categories still would be reweighted for the APM Entity group notwithstanding the data submission. The data submission would not effectively void the request for reweighting and its approval. We proposed this policy because we do not believe it would be appropriate or desirable for an individual MIPS eligible clinician or for a group TIN with no direct affiliation with an APM Entity to accidentally override an APM Entity's application. This could happen if the MIPS eligible clinician or group TIN reports to MIPS either out of an abundance of caution or on behalf of a MIPS eligible clinician who is not in the APM Entity, but happens to share a billing TIN with an

eligible clinician who is in the APM Entity. We also recognized that there may be circumstances where an APM may require some form of quality reporting for purposes of the APM itself, such as is required for Shared Savings Program ACOs as described in the CY 2021 PFS proposed rule (85 FR 50233), but that in complying with such requirement an APM Entity may also be submitting quality performance category data that would result in scoring for purposes of MIPS when that APM Entity group would otherwise have been excepted from MIPS reporting.

We noted that under the proposal and the proposed changes to the MIPS scoring hierarchy, described in the CY 2021 PFS proposed rule (85 FR 50315), reporting done by a MIPS eligible clinician or group would result in a MIPS final score for only that MIPS eligible clinician or group, which may be used to determine a MIPS eligible clinician's payment adjustment.

To the extent that the proposed policies would constitute a change to the MIPS scoring or payment methodology for the 2022 MIPS payment adjustment after the start of the 2020 performance period, we noted that we believe that, consistent with section 1871(e)(1)(A)(ii) of the Act, it would be contrary to the public interest not to establish these policies because of the PHE for COVID-19. We noted that we believe that the intersection of the 2020 APM scoring standard rules and the extreme and uncontrollable circumstances policies being put in place by APMs themselves in response to the PHE for COVID-19, such as the changes being proposed for participants in the Shared Savings Program, would make obtaining reweighting under MIPS based on extreme and uncontrollable circumstances unusually burdensome absent these proposed changes. For instance, the Shared Savings Program (85 FR 50239) will continue to require the submission of quality performance data by participating ACOs, and that data would be eligible to be used for MIPS quality scoring absent the proposal, which would have the result of not allowing Shared Savings Participants the option to take advantage of extreme and uncontrollable circumstances policies that are available to other MIPS eligible clinicians. This policy change is necessary to give participants in the Shared Savings Program the opportunity to request reweighting of the MIPS performance categories in the event that they believe the data reported for purposes of the Shared Savings Program do not adequately reflect the performance of the ACO Entity for

purposes of MIPS quality performance category scoring.

The following is a summary of the comments we received and our responses.

Comment: Several commenters support our proposal to introduce APM Entity level requests for reweighting due to extreme and uncontrollable circumstances in light of the PHE for COVID-19.

Response: We appreciate the commenters for their support.

After consideration of the comments we received, we are finalizing this policy as proposed.

d. MIPS Final Score Methodology

(1) Performance Category Scores

(a) Background

For the 2023 MIPS payment year, we intend to continue to build on the scoring methodology we finalized for prior years. The scoring methodology allows for accountability and alignment across the performance categories and minimizes burden on MIPS eligible clinicians. We are maintaining many of our scoring policies, focusing on only making proposals to maintain stability. Specifically, in the CY 2021 PFS proposed rule (85 FR 50305 through 50310), we proposed the following:

- To implement scoring flexibility for quality measures with specification or coding changes during the performance year.
- To implement benchmark and topped out scoring policies that are responsive to potential low reporting rates for the 2019 performance year due to the national PHE for COVID-19.
- To implement scoring for all administrative claims-based measures.
- To continue policies for scoring quality measures based on achievement as well as policies for measures that do not meet case minimum, data completeness requirements, or have a benchmark.
- To continue bonuses in the quality performance category.
- To continue improvement scoring of the quality performance category comparing clinicians to a 30 percent baseline score if clinicians scored 30 percent or less.

We did not propose changes to scoring policies for the cost, improvement activities and Promoting Interoperability performance categories.

We have maintained our approach that MIPS eligible clinicians are scored against performance standards for each performance category and receive a final score, comprised of their performance category scores, and calculated according to the final score

methodology. We refer readers to § 414.1380 for general policies on scoring. We refer readers to section IV.A.3.c.(5) of this rule for the discussion to remove the APM scoring standard and to section IV.A.3.b. of this rule for information on the APM Performance Pathway scoring.

(b) Scoring the Quality Performance Category for the Following Collection Types: Medicare Part B Claims Measures, eCQMs, MIPS CQMs, QCQR Measures, CMS Web Interface Measures, the CAHPS for MIPS Survey Measure and Administrative Claims Measures

We referred readers to § 414.1380(b)(1) for our policies regarding quality measure benchmarks, calculating total measure achievement and measure bonus points, calculating the quality performance category percent score, including achievement and improvement points, and the small practice bonus (81 FR 77276 through 77308, 82 FR 53716 through 53748, 83 FR 59841 through 59855, and 84 FR 63011 through 63018). We proposed to maintain many policies finalized in prior years to retain stable scoring in MIPS with minimal new proposals as we transition to MVPs.

Please refer to section IV.A.3.c.(1)(c) of this rule for more information about our proposal to sunset the CMS Web Interface measures as a collection type for groups and virtual groups with 25 or more eligible clinicians, which we are finalizing with implementation delayed until the 2022 performance period. Scoring policies applicable to CMS Web Interface as a collection type will be in effect in the 2021 performance period. In the 2022 performance period CMS Web Interface will be removed as a collection type.

(i) Scoring Flexibility for Changes That Impact Quality Measures During the Performance Period

We proposed to expand the list of reasons that a quality measure may be impacted during the performance period in addition to revising when we would allow scoring of the measure with a performance period truncation (to 9 months of data) or the complete suppression of the measure if 9 months of data are not available. We noted that we previously established policies to provide scoring flexibilities in instances in which changes to measures during the performance period have impacted clinicians' ability to submit the quality measures for the entire 12-month performance period because of an ICD-10 coding change or when there are clinical guideline changes when we believe continued adherence to the

guideline in the existing measure could result in patient harm, or otherwise provide misleading results and render the measure no longer comparable to the historic benchmark. Specifically, in the CY 2018 Quality Payment Program Final rule (82 FR 53714 through 53716), we finalized that, beginning with the 2018 MIPS performance period, we will assess performance on measures considered significantly impacted by ICD-10 coding changes during the performance period based only on the first 9 months of the 12-month performance period. We noted that we believe that 9 months of data is sufficient to assess performance when 12 months of data is not available. We finalized that we would publish a list of measures requiring a 9 months of data on the CMS website by October 1st of the performance period if technically feasible, but no later than the beginning of the data submission period (for example, January 2, 2021 for the 2020 performance period). We refer readers to § 414.1380(b)(1)(viii) for more on our policy for scoring flexibility for ICD-10 changes.

In the CY 2019 Quality Payment final rule (83 FR 59845 through 59847), we finalized policies beginning with the 2021 MIPS payment year to reduce the total available measure achievement points from the quality performance category by 10 points for MIPS eligible clinicians for each measure submitted that is significantly impacted by clinical guideline changes or other changes when we believe adherence to the guidelines in the existing measures could result in patient harm or otherwise no longer be comparable to a historic benchmark. We refer readers to § 414.1380(b)(1)(vii)(A) for more information on the scoring flexibility policy.

We proposed, beginning with the 2021 performance period, a policy to truncate the performance period or suppress a quality measure if CMS determines that revised clinical guidelines, measure specifications or codes impact clinician's ability to submit information on the measure or may lead to potentially misleading results. Based on the timing of the changes to clinical guidelines, measure specifications or codes, we would assess the measure on 9 months of data, and if 9 consecutive months of data are not available, we would suppress the measure by reducing the total available measure achievement points from the quality performance category by 10 points for each measure submitted that is impacted.

In addition to ICD-10 and clinical guideline changes, we noted that we

believe that there may be instances when there are changes after the final approval of quality measures including changes to the measure specification, or updates to coding that may lead to misleading results. If there are no concerns with potential patient harm, we would like the ability to assess performance on the quality measure (not including the change) if we have sufficient data. Depending on the timing of the change during the performance period we would like to assess performance on the quality measure; we believe we can assess performance if we have 9 months of data and should suppress the measure if we have less than 9 months of data.

We will examine quality measures that are impacted by changes during the performance period to determine how the change may impact our ability to assess performance on the measure. Potential changes that may impact quality measures during the performance period include updates to clinical guidelines or measure specifications, such as revisions to medication lists, codes and clinical actions. For example, the introduction of a new drug class after the performance period began, would not be captured as numerator compliant by an existing measure specification but may meet the intent of the measure and its associated clinical actions. Assessment of clinician's performance on the measure would be hampered by the fact that the measure specification would not be able to be updated to collect information and assess performance related to use of the medication from the new drug class. As reflected at sections 1848(q)(2)(D)(1) and 1848(q)(2)(D)(1)(II)(cc) of the Act, quality measures adopted under MIPS, including substantive updates must be made through notice and comment rulemaking.

Additionally, we may examine a quality measure to determine if the change impacts the ability of clinicians to submit the measure, including the number of encounters a clinician may be able to submit, the number of clinicians who may be able to submit the measure, and the proportion of clinicians from a specialty who may be able to submit the measure. We would also assess if the change to a code would potentially lead to misleading results. For example, changes that impact the clinicians' ability to report a measure include changes to Common Procedural Technology (CPT) codes and the Healthcare Common Procedure Coding System (HCPCS) codes during the performance period, which may potentially produce misleading results.

We believe that code changes that impact a clinician's ability to report a measure will be rare events, however, mid-year changes to CPT and HCPCS codes can be unanticipated when a clinician selects a quality measure and may introduce an additional burden if the clinician is unable to submit the quality measure.

When possible, we want an approach that allows us to score a quality measure even when there has been a change to the measure outside of the clinician's control during the performance period. We have finalized a policy that allows scoring on the first 9 months of data for a 12-month performance period data when there are ICD-10 code changes (82 FR 53714 through 53716). We assess performance on the first 9 months of data in the case of ICD-10 changes, which happen predictably in October on an annual basis, allowing us to truncate and remove the last quarter of the performance period from our assessment. However, as discussed in the CY 2021 PFS proposed rule (85 FR 50306 through 50307), we cannot anticipate when there will be a change to clinical guidelines, measure specifications, an inadvertent deletion, or revision of a code. These types of changes do not occur on an annual basis, and do not follow a predictable, consistent timeline. We become aware of changes to measures from feedback from clinicians, third parties and measure stewards. Updates to codes, which may not happen at a predictable time, may significantly impact how many cases a clinician can report and how a clinician performs on a measure. We want to account for instances such as coding changes during the performance period, in which scoring should be applied to the first 9 months of data from the performance period. If 9 consecutive months of data from the performance period is not available, we would have the ability to suppress the measure by reducing the total available measure achievement points from the quality performance category by 10 points for MIPS eligible clinicians for each measure submitted that is significantly impacted.

Therefore, as noted in the CY 2021 PFS proposed rule (85 FR 50307 through 50308), we proposed beginning with the 2021 performance period, a policy to truncate the performance period or suppress a quality measure if CMS determines revised clinical guidelines, measure specifications or codes impact the clinician's ability to submit the measure or may lead to potentially misleading results. As proposed, we would maintain the flexibility to assess the measure on 9

consecutive months of data when available and would suppress the measure if 9 consecutive months of data are not available. We proposed that we would publish a list of measures requiring 9 months of data on the CMS website as soon as technically feasible, but no later than the beginning of the data submission period (for example, January 2, 2021 for the 2020 performance period).

Accordingly, we proposed to consolidate § 414.1380(b)(1)(vii)(A) and (b)(1)(viii) at § 414.1380(b)(1)(vii)(A). The consolidated paragraph would provide that for each submitted measure that is impacted by significant changes that CMS determines may result in patient harm or misleading results, performance on the measure is assessed based on data for 9 consecutive months of the applicable CY performance period. If such data are not available, the total available measure achievement points are reduced by 10 points. For purposes of this paragraph (b)(1)(vii)(A), “significant changes” means changes to codes (including ICD–10, CPT, and HCPCS), clinical guidelines, or measure specifications. We noted that we will publish a list of all measures scored under this paragraph (b)(1)(vii)(A) on the CMS website as soon as technically feasible, but by no later than the beginning of the data submission period at § 414.1325(e)(1).

We invited public comments on our proposal to truncate the performance period or suppress a quality measures if CMS determines that there are significant changes that occurred during the performance period. The following is a summary of the comments we received and our responses.

Comment: A few commenters supported expanding policies for scoring measures with significant changes during the performance period that did not allow comparison to historical benchmarks.

Response: We thank commenters for their support.

Comment: One commenter recommended that CMS consider extending the scoring policies for measures with significant changes to include instances in which clinicians have difficulty obtaining 12 months of data, because a contract with a facility is modified during the performance period.

Response: The policies address instances in which there are significant changes to measures specifications or coding that do not permit any clinicians that selected the measure to submit data or other circumstances where a measure may result in patient harm or misleading results. It is not intended to

address instances in which individual clinicians have difficulty obtaining and submitting data, while other clinicians are able to be measured accurately on the measure. The policy relates to changes to the measure, measure specifications or other changes that are outside of the clinicians’ control and is applied to all clinicians. For individual clinicians, we have other scoring flexibilities for individuals unable to submit data, such as the ability to apply for reweighting of the quality performance category based on extreme and uncontrollable circumstances as described in section IV.A.3.d.(2)(b)(iv) of this final rule.

Comment: One commenter expressed concerns that depending on how CMS identifies substantive changes, the policy may result in the lack of scorable measures for some clinicians for a performance period and recommended working with measure stewards to determine the most appropriate course of action in each case to ensure the most accurate data is used. The commenter asked for clarification on the expected scale of the impact of this change, including how many measures are expected to be impacted, and how performance may shift for clinicians.

Response: The proposal was built on previously established policies in which CMS identifies the rare instances in which measures had significant changes during the performance period where adherence to the guideline of the existing measure or calculating the measure could result in patient harm or misleading results. The policy allows us to identify changes to measures that are outside of the control of clinicians. We often become aware of the changes from feedback from clinicians, third parties and measure stewards. We will continue to work with measure stewards on how the changes during the performance period impact measures. For example, we are concerned that due to changes in health care processes and use of hospital services during the PHE for COVID–19, there are significant changes to administrative claims data used to calculate measures, which may lead to misleading results. For purposes of § 414.1380(b)(1)(vii)(A), we would like to expand our definition so that “significant changes” means changes to a measure that are outside the control of the clinician and its agents and that CMS determines may result in patient harm or misleading results. Significant changes include, but are not limited to, changes to codes (such as ICD–10, CPT, or HCPCS codes), clinical guidelines, or measure specifications. We do not anticipate that the proposed policy to identify mid-year changes to measures

that require special scoring will result in no available and applicable measures for some clinicians.

Comment: One commenter did not support the suppression of scores for quality measures with significant changes during the performance period because they believed the policy added complexity to the program and recommended removing the quality measure and informing clinicians that they should select another measure. One commenter cautioned that allowing measures to be suppressed may inflate quality performance category scores and permit gaming because there was an incentive to submit measures that would be suppressed.

Response: We are concerned about program complexity but also realize that often clinicians select their measures in advance and establish workflows for the collection and reporting of data. We believe that expanding a previously finalized policy that truncates measures considered significantly impacted by ICD–10 coding changes during the performance period (82 FR 53714 through 53716) to include additional, significant changes to the measure outside of a clinician’s control, will allow us to continue to use data that clinicians collected and reported. If data is available and does not cause patient harm or misleading results, our first priority is to utilize 9 months of data for scoring. We will attempt to make information available on a rolling basis about measures with significant changes; however, depending upon the timing, this might not allow sufficient time for clinicians to select another measure. When significant changes occur during the performance period, we believe that suppression of the measure or use of a truncated 9 months of data is appropriate, because clinicians are unaware of which measures will require the special scoring policies until after the performance period begins and all other submitted measures will be scored, we do not believe this will result in gaming or inflation of quality performance category scores.

Comment: A few commenters requested additional information about the approach to truncating the performance period of measures to 9 months of data. One commenter recommended that for measures that could only be scored on 9 months of data, that clinicians have the flexibility to select their 9-month reporting period. A few commenters asked if clinicians were able to submit 12 months of data for measures using a truncated 9 months of data, to be consistent with their reporting of other measures.

Commenters indicated that third party vendors would need to restructure reporting systems to limit reporting to 9 months of data.

Response: The policy to truncate the performance period to 9 months has been used when there are changes to measure coding, such as ICD–10 updates, in the final quarter of the performance period that are substantial enough to significantly impact the measure. We believe it is important to use data in these instances if there are no concerns that the 9 months of data could result in patient harm or misleading results. We would not allow clinicians to elect which 9 months of data to report because the truncation of the performance period occurs only if there is a change during the performance period that allows for 9 months of consecutive data; if there is a change during the performance period that does not allow for 9 months of data the measure will be suppressed. We believe that it is appropriate for clinicians to submit 9 months of data and recommend that clinicians work with third party intermediaries to allow submission of data.

Comment: One commenter indicated that the policy to truncate the performance period to 9 months of data would not be appropriate for quality measures affected by the increases of telehealth visits from March to August of 2020 because of the national PHE for COVID–19 and recommended greater flexibility in adjusting benchmarks for quality measures impacted by changes in patient access due to the national PHE in the 2020 performance year.

Response: We agree with the commenter that the policy to truncate the performance period can only be used if we have 9 consecutive months of data to assess performance. We will continue to monitor the impact of the use of telehealth and changes to clinical processes because of the national PHE for COVID–19, and work with measure stewards if they believe changes to clinical processes are significant enough to update clinical guidelines or trigger our scoring policies to suppress a measure. We continue to believe we should suppress a measure if the measure is impacted by significant changes that we determine may result in patient harm or misleading results. In section IV.A.3.d.(1)(b)(ii) of this final rule, we discuss our preference to use historical benchmarks when they are complete and reliable. If clinicians believe they are unable to submit quality measures for the 2020 performance period because of the national PHE for COVID–19, clinicians are allowed to submit an application for

the reweighting of the quality performance category based on extreme and uncontrollable circumstances as described in section IV.A.3.d.(2)(b)(iv) of this final rule.

Comment: A few commenters urged caution in using less than a full year of measurement data. One commenter believes using only 9 months of data could potentially skew results. One commenter urged CMS to offer a review period and to work with measure stewards to determine the most appropriate course of action in each case to yield the most accurate data.

Response: We will continue to monitor how many measures are impacted by the scoring flexibility policies. Changes to measures specifications and coding often do not allow time for a public review period, however, we will continue to work with measure stewards when we believe that scoring flexibility policies are needed. As stated previously, we believe it is important to use data in these instances if there are no concerns that the 9 months of data could result in patient harm or misleading results.

Comment: One commenter requested clarification if policies to suppress or truncate data would be applied to all measures for the 2021 performance period.

Response: The policy will be applied to the 2021 performance period and beyond for each measure impacted by significant changes that CMS determines may result in patient harm or misleading results. To ensure that this includes all collection types, including administrative claims measures as well as all measures submitted by clinicians, we are modifying the proposal to update the finalized regulation text and consolidate § 414.1380(b)(1)(vii)(A) and (b)(1)(viii) at § 414.1380(b)(1)(vii)(A) to provide that for each measure that is submitted, if applicable, and impacted by significant changes that CMS determines may result in patient harm or misleading results, performance on the measure is assessed based on data for 9 consecutive months of the applicable CY performance period. If 9 months of data is not available, the measure will be suppressed.

After consideration of the public comments, we are finalizing our proposal with modification: We are finalizing the consolidation of § 414.1380(b)(1)(vii)(A) and (b)(1)(viii) at § 414.1380(b)(1)(vii)(A) to provide that for each measure that is submitted, if applicable, and impacted by significant changes, performance is based on data for 9 consecutive months of the applicable CY performance

period. If such data are not available or may result in patient harm or misleading results, the measure is excluded from a MIPS eligible clinician's total measure achievement points and total available measure achievement points. For purposes of this paragraph (b)(1)(vii)(A), "significant changes" means changes to a measure that are outside the control of the clinician and its agents and that CMS determines may result in patient harm or misleading results. Significant changes include, but are not limited to, changes to codes (such as ICD–10, CPT, or HCPCS codes), clinical guidelines, or measure specifications. CMS will publish on the CMS website a list of all measures scored under this paragraph (b)(1)(vii)(A) as soon as technically feasible, but by no later than the beginning of the data submission period at § 414.1325(e)(1).

(ii) Quality Measure Benchmarks

We refer readers to the CY 2017, CY 2018, CY 2019, and CY 2020 Quality Payment Program final rules (81 FR 77277 through 77282, 82 FR 53699 through 53718, 83 FR 59841 through 59842, and 84 FR 63014 through 63016, respectively) for our previously established benchmarking policies.

In the CY 2017 QPP final rule (81 FR 77277 through 77282), we finalized that we would use performance in the baseline period to set benchmarks for the quality performance category, with the exception of new quality measures, quality measures that lack historical data, or where we do not have comparable data from the baseline period, for which we would set the benchmarks using performance in the performance period. We defined the baseline period to be the 12-month CY that is 2 years prior to the performance period for the MIPS payment year. For example, for CY 2021 performance period, the baseline period would be CY 2019 which is 2 years prior to the CY 2021 performance period (81 FR 77277). Additionally, we further clarified that CMS can establish benchmarks either by the applicable baseline or performance period in the CY 2019 PFS final rule (83 FR 59842), where we finalized the terminology change amending § 414.1380(b)(1)(ii) to remove the mention of each individual benchmark and instead state that benchmarks will be based on collection type, from all available sources, including MIPS eligible clinicians and APMs, to the extent feasible, during the applicable baseline or performance period.

Because of the flexibility provided to MIPS eligible clinicians to allow for no data submission for the 2019

performance period (see 85 FR 19277 through 19278), we may not have had as representative of a sample of data as we would have had without the national PHE for COVID-19. Therefore, we revisited our benchmarking policy for the 2021 performance period. We anticipated that we may have a gap in our data due to potentially receiving fewer submissions for CY 2019 which could skew the benchmarking results, as the triggering of this policy no longer requires clinicians to submit data. We believed this gap in data could result in different distributions of scores from what we normally see, thus skewing the benchmarks when using CY 2019 baseline period for the CY 2021 performance period. As a result, we considered two benchmarking options for CY 2021 performance period.

We intended to use performance period benchmarks for the CY 2021 performance period in accordance with § 414.1380(b)(1)(ii). As discussed in the CY 2021 PFS proposed rule (85 FR 50307), this would mean that benchmarks for the CY 2021 performance period are based on the actual data submitted during the CY 2021 performance period. We noted that we believed that using performance period benchmarks for the year where we are facing gaps in baseline data will allow us to ensure that we continue to have reliable and accurate data. We recognized that this methodology would not allow clinicians to know the benchmarks ahead of the performance period, but we believe that using the most current information has the potential to provide more accurate results for benchmarking purposes for CY 2021 performance period and could capture any changes in care that have occurred as a result of the national PHE for COVID-19.

We sought feedback on the criteria for using data from the 2019 MIPS performance period to calculate CY 2021 benchmarks. As an alternative to performance period benchmarks we considered and requested stakeholder comments and feedback on utilizing the historic benchmarks from the 2020 MIPS performance period (which are based on submissions for CY 2018 MIPS performance period) for the CY 2021 performance period. We noted that we believe that this option would allow clinicians to continue to receive advance notice for quality performance category measures so that MIPS eligible clinicians can set a clear performance goal for these measures for CY 2021 performance period. However, we remained concerned that utilizing outdated data could also potentially result in distributions of scores used for

benchmarks that no longer reflect the standard of care.

We invited public comments on our intent to use performance period benchmarks for the CY 2021 performance period. The following is a summary of the comments we received and our responses.

Comment: Several commenters recommended that CMS monitor and analyze to determine if the 2019 data is a representative sample based on the number of submissions for 2019 before deciding and finalizing which benchmarks should be used. A few commenters suggested that we see if there are statistically significant fewer submissions for CY 2019 than were received in previous performance periods that constitutes the need to use performance period benchmarks.

Response: Based on our analysis of 2019 submissions, we believe that we have sufficient data to calculate historical benchmarks and do not believe it is necessary to use performance period benchmarks. The analysis showed minimal to no impact due to the national PHE for COVID-19 policies for the eCQM and Part B claims collection types. Overall, we generally saw an increase in eCQM submissions. In addition, we know we have complete data from Part B claims collection types because that submission ended before the PHE. For the other collection types for 2021, the MIPS CQM and QCDR measures, we generally saw decreases in submissions, but the decreased submissions appear to have a modest distributional effect for most measures and is likely due to an increase in group reporting and the increase in eCQM submissions. The national PHE for COVID-19 E/U circumstances policy led to only a slight increase in the number of clinicians not engaged with MIPS in 2019 compared to 2018 submission data.

Comment: Several commenters opposed the use of 2021 performance period benchmarks as this would not allow clinicians to have referenceable benchmarks as a guide to predict their scores or set performance goals or priorities, making it difficult to determine performance improvement opportunities and preferred the use of historical benchmarks from 2019 data. Several commenters did not support holding clinicians accountable for performance against a benchmark that would not be set until after the performance period is closed as the use of performance period benchmarks would burden clinicians by not providing time to understand how performance compares to benchmarks and could lead to lower performance

and MIPS scores. Several commenters encouraged CMS to publish a benchmark file to provide guidance to evaluate and strategize reporting. A few clinicians stated that the use of performance period benchmarks would burden clinicians by not providing time to understand how performance compares to benchmarks and could lead to a decrease in performance and MIPS scores. A few commenters specifically supported using historical benchmarks from the 2019 MIPS performance period data over utilizing 2018 data for benchmarks because the 2019 performance period provides more recent data.

Additionally, one commenter stated that using performance period benchmarks would limit EHR vendors' ability to provide timely scoring feedback and insight into performance. One commenter suggested that CMS use 2019 benchmarks for 2021 performance and to limit the performance period to the months at the end of 2021 not impacted by the national PHE for COVID-19 to allow for comparison of data not influenced by the national PHE for COVID-19 in 2019 to 2021.

Response: We agree that providing a historical benchmark for the quality performance category allows MIPS eligible clinicians to know quality performance category benchmarks in advance. We believe there is value in the advance notice for quality performance measures so that MIPS eligible clinicians can benchmark themselves for quality measures when historical data is available. We agree with commenters that quality benchmarks should be made public and should be known in advance when possible so that MIPS eligible clinicians can understand how they will be measured and to not limit vendors from providing timely feedback and insight into performance. We will continue to rely on historical benchmarks for CY 2021 since data from CY 2019 has become available and is representative and comparable. We will continue to monitor the impact of the national PHE for COVID-19 on data in CY 2020 and CY 2021. The historical benchmarks based on CY 2019 data will be available prior to the CY 2021 performance period at [qpp.cms.gov](https://www.cms.gov/qpp).

Comment: Many commenters supported the use of 2021 performance period benchmarks since they are based on current information that can provide accurate benchmarks from data that are reliable, accurate, complete, and representative of performance in 2021. The commenters expressed support given that performance period benchmarks capture any changes in care

due to the national PHE for COVID-19 and avoid unfairly penalizing practices for variations in performance compared to data from prior to the national PHE for COVID-19.

Response: Based on our analysis of the 2019 data, we believe that the data is reliable, complete, or representative and no longer believe we need to rely on performance period benchmarks. We realize there may be a risk for some measures that performance in CY 2021 might differ from CY 2019 given the automatic extreme and uncontrollable circumstances policy for CY 2019 quality performance category in response to the national PHE for COVID-19 (85 FR 19277 through 19278). We are continuing to evaluate the effects of the national PHE for COVID-19 on clinicians and will take this comment into consideration for the future, but we also understand and have previously stated, that there are benefits to knowing the benchmark target in advance and believe there is value to clinicians in having historical benchmarks. We believe there is more value in providing advance notice for quality performance category measures so that MIPS eligible clinicians can set a clear performance goal for these measures, provided that historical data is available.

Comment: Several commenters opposed the use of performance period benchmarks and supported the alternative to use historical benchmarks based on 2018 MIPS performance data to continue to receive advance notice of benchmarking targets, allow clinicians to understand how they are performing in real-time compared to the 2018 benchmarks, provide a degree of certainty, and help clinicians prepare in advance for selecting measures based on data that is not impacted by the national PHE for COVID-19. A few commenters recommended using historical benchmarks from 2018 data for the 2021 performance year if the participation rate dropped significantly from 2018 to 2019. A few commenters stated that CEHRT vendors rely on benchmarks to set dashboards and reports and having benchmarks from 2018 would allow developers to provide accurate information to clinicians. A few commenters stated that the data from 2019 might not be inclusive because of the extreme and uncontrollable circumstance policy for the national PHE for COVID-19 and performance period benchmarks will make it difficult for clinicians to predict how they will score. One commenter suggested the use of CY 2020 quality data as a baseline for benchmarking for CY 2021. One commenter suggested calculating

benchmarks by combining 2017, 2018, and 2019 data to provide a larger sample to address concerns around skewed data while still providing target information.

Response: Based on our 2019 data analysis, we believe we have sufficient data to reliably generate historical benchmarks for CY 2021 and we will not need to rely on 2018 benchmarks to provide a known target for benchmarking. Using historical benchmarks based on the reliable and complete data from 2019 will allow us to provide benchmarks based on more recent data in advance for clinicians to prepare and since the data from 2019 is usable, representative, and more recent, we do not believe it necessary to use data from 2018 to create benchmarks for CY 2021, as it would be more out of data than data from 2019. Using the data from 2019, CEHRT vendors remain able to rely on the benchmarks for CY 2021 to set dashboards and reports to provide accurate information to clinicians. Additionally, we do not believe we need to combine benchmarks across years to create a reliable benchmark.

Comment: Several commenters suggested that we calculate two benchmarks, one historical and one performance period, and then have CMS use the more favorable of the two benchmarks for each measure. The commenters suggested this approach to provide baseline information to guide measure selection and advance notice to clinicians on possible benchmarks while considering the impact of the national PHE for COVID-19 and having complete, reliable data. One commenter suggested calculating both 2019 and 2020 performance year measure benchmarks and using the lower benchmark for each quality measure since CMS already calculated this data and will allow for comparing scores given the impact of the national PHE for COVID-19. One commenter recommended that CMS use CY 2019 data to publish a benchmark file and then score measures based on the average of 2021 and 2019 data. One commenter suggested setting a threshold to assess change in benchmarks and if the change threshold is not exceeded, a performance period benchmark would be appropriate. If change above the set threshold occurred, the historical benchmark would be used.

Response: Based on our 2019 data analysis, we can use historical benchmarks for CY 2021 that are complete and reliable and do not believe that we need to create two benchmarks or use an average of 2 years of data to create a benchmark. The data we received for CY 2019 is robust as we only saw a slight increase in the number

of clinicians not engaged with MIPS in CY 2019 compared to CY 2018 submission data. This allows us to provide benchmarks in advance for clinicians to have baseline information to guide measure selection and gives advance notice to clinicians on benchmarks. The benchmarks based on CY 2019 data will be available prior to the CY 2021 performance period at qpp.cms.gov.

Comment: Several commenters recommended that CMS consider the impacts that the PHE for COVID-19 will have on participation and data from 2019, 2020, and potentially 2021 when setting future benchmarks. Commenters stated that the national PHE for COVID-19 will continue to disrupt patient volume, case mix, and patient outcomes, making data incomparable when comparing years impacted by the national PHE for COVID-19 to prior years without impact. A few commenters requested CMS to take major changes in care, including disruptions in the delivery of medical services, into account when comparing data from year to year. A few commenters suggested that CMS compute benchmarks with 2018, 2019, and 2020 data separately to understand the impact of the PHE on quality measures. One commenter stated that due to the removal of telehealth exclusion language from select measure specifications, data will not be comparable and will no longer be reliable for measures in the future.

Response: For performance year 2020, we continue to offer the extreme and uncontrollable circumstances policy in response to the national PHE for COVID-19, allowing clinicians to submit an application for the reweighting of the quality performance category based as described in section IV.A.3.d.(2)(b)(iv) of this final rule. We will continue to monitor the impacts of the national PHE for COVID-19 on data comparability, including due to the removal of telehealth exclusion language from select measure specifications, and will incorporate changes and offer flexibilities through future rulemaking cycles, as necessary, to account for changes in care delivery. Benchmarks from CY 2018 data have already been released publicly and benchmarks from CY 2019 data will be released prior to the start of CY 2021. Benchmarks from CY 2020 data will be released once the data is available. Those benchmarks will be available at qpp.cms.gov.

After consideration of the public comments, we are not finalizing our intent to use performance period benchmarks for the CY 2021

performance period and will use historical benchmarks for CY 2021 based on the 2019 data.

(iii) Minimum Case Requirements

In the CY 2017 Quality Payment program final rule (81 FR 77287 to 77289), we finalized that we will use 20 cases as the case minimum for all quality measures, with the exception of the hospital-wide readmission measure which has a minimum of 200 cases. As proposed in Table Group A within Appendix 1, the hospital-wide readmission measure is replacing the all-cause readmission measure and an additional administrative claims-based measure for hip/knee complications is being added to the program. In the case of the hospital-wide readmission measure, the case minimum will remain the same at 200 cases and will only apply to groups. For the new hip/knee complications measure, a case minimum of 25 is proposed and is applicable for individuals and groups. As noted in the CY 2021 PFS proposed rule (85 FR 50308), we proposed to amend § 414.1380(b)(1)(i) to clarify how administrative claims measures are scored. We proposed to amend § 414.1380(b)(1)(iii) to reflect that, except for administrative claims measures, the minimum case requirement is 20 cases. For each administrative claims-based measure, the minimum case requirement is specified in the annual list of MIPS measures.

We invited public comments on our proposal to amend § 414.1380(b)(1)(i) to clarify how administrative claims measures are scored and amend § 414.1380(b)(1)(iii) to reflect that, except for administrative claims measures, the minimum case requirement is 20 cases. The following is a summary of the comments we received and our responses.

Comment: One commenter did not support the proposal to define the minimum case requirement for administrative claims measures in the annual list of MIPS measures. One commenter recommends that CMS maintain the current regulatory process of limiting such requirements to amounts specifically listed in regulation (for example, for non-administrative claims measures, the minimum case requirement is 20 cases) to minimize negative impact in program compliance and to limit additional changes in an already nuanced quality reporting program.

Response: While we understand the commenter's concern regarding additional annual updates, we believe providing the specific minimum case

requirements for administrative claims measures in the annual list of MIPS measures allows these measures to be reliably scored based on the case minimum specific to each measure. Based on the specifications, administrative claims measures may require a case minimum that is an exception to the 20 cases otherwise required. Any further changes in the case minimum requirement would be considered substantial and would go through rule making. Additionally, this exception is for administrative claims measures, which do not require reporting and are based on claims data we receive.

Comment: One commenter stated that a sample of 25 cases is insufficient to provide meaningful data for the newly added hip/knee complications measure.

Response: While we understand the commenter's concern about the proposed case minimum for the new hip/knee complications measure, we selected a minimum case count of 25 to ensure a measure result is available for most eligible clinicians and eligible clinician groups while maintaining measure reliability. We believe that for this measure, a minimum case count of 25 cases demonstrates reliability results consistent with standards of other measures within MIPS. We refer readers to Table Group A of Appendix 1 of this rule for discussion on new individual MIPS quality measures proposed for the 2023 MIPS payment year and future years.

After consideration of the public comments, we are finalizing our proposal as proposed.

(iv) Assigning Quality Measure Achievement Points

We refer readers to § 414.1380(b)(1)(i) for more details on our policies for scoring performance on quality measures (81 FR 77276 through 77307, 82 FR 53694 through 53701, 83 FR 59841 through 59856, and 84 FR 63011 through 63019).

(A) Scoring Measures Based on Achievement

We previously established at § 414.1380(b)(1)(i) a global 3-point floor for each scored quality measure, as well as for the hospital readmission measure (if applicable) for the 2019 through 2022 MIPS payment years. MIPS eligible clinicians receive between 3 and 10 measure achievement points for each submitted measure that can be reliably scored against a benchmark, which requires meeting the case minimum and data completeness requirements. In the CY 2017 Quality Payment Program final rule (81 FR 77282), we established that

measures with a benchmark based on the performance period (rather than on the baseline period) would continue to receive between 3 and 10 measure achievement points for performance periods after the first transition year. For measures with benchmarks based on the baseline period, we stated that we would revisit the 3-point floor in future years.

For the 2023 MIPS payment year, we proposed to again apply a 3-point floor for each measure that can be reliably scored against the benchmark. As we move towards the MVP framework discussed the CY 2021 PFS proposed rule (85 FR 50308), we anticipated we will be able to score quality measures from 1 to 10 for measures in MVPs and as such will revisit and possibly remove the 3-point floor for traditional MIPS in future years. As a result, we discussed that we would wait until there is further policy development under the MVP framework before proposing to remove the 3-point floor. Accordingly, in the CY 2021 PFS proposed rule (85 FR 50308), we proposed to revise § 414.1380(b)(1)(i) to remove the years 2019 through 2022 and adding in its place the years 2019 through 2023 to provide that for the 2019 through 2023 MIPS payment years, MIPS eligible clinicians receive between 3 and 10 measure achievement points (including partial points) for each measure required under § 414.1335 on which data is submitted in accordance with § 414.1325 that has a benchmark at paragraph (b)(1)(ii) of this section, meets the case minimum requirement at paragraph (b)(1)(iii) of this section, and meets the data completeness requirement at § 414.1340.

We invited public comments on our proposal to again apply a 3-point floor for each measure that can be reliably scored against a benchmark for the MIPS 2023 payment year. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the proposal to continue the 3-point floor for each measure that can be reliably scored against a benchmark.

Response: We thank the commenters for their support.

Comment: One commenter recommended adopting a 5-point floor for each measure that can be reliably scored against a benchmark to help mitigate the disruptive effects of the PHE and to provide incentives for clinicians to report measures. A few commenters recommended adopting a universal scoring floor of 5 points to mitigate the disruptive effects of the national PHE for COVID-19 on benchmarks while incentivizing clinicians to report measures that

historically lack a benchmark and would increase use of under-reported measures and incentivize clinicians to report instead of opting out.

Response: We appreciate the commenter's concern. We do not want to mask performance with a floor above 3 points. Clinicians will know in advance what the benchmarks are, and we believe that the 3-point floor provides protection for clinicians.

After consideration of the public comments, we are finalizing our proposal as proposed.

(B) Scoring Measures That Do Not Meet Case Minimum, Data Completeness, and Benchmark Requirements

We refer readers to § 414.1380(b)(1)(i)(A) and (B) for more on our scoring policies for a measure that is submitted but is unable to be scored because it does not meet the required case minimum, does not have a benchmark, or does not meet the data completeness requirement (84 FR 63012).

In the 2017 QPP final rule (81 FR 77288) and the 2018 QPP final rule (82 FR 53727), we identified "classes of measures" which were intended to characterize measures for the ease of discussion. Class 1 measures are measures that can be scored based on performance because they have a benchmark, meet the case minimum and data completeness requirements. Class 2 measures are measures that cannot be scored based on performance because they do not have a benchmark or do not

meet the case minimum which is generally 20 cases. Class 3 measures are measures that do not meet the data completeness requirement. We also noted that policies for Class 2 and Class 3 measures would not apply to measures submitted with the CMS Web Interface or administrative claims-based measures.

We did not propose to modify how we score these measures within MIPS, as we consider policies for transitioning to MVPs. For class 2 measures, for the 2023 MIPS payment year, we proposed to again apply the special scoring policies for measures that meet the data completeness requirement but do not have a benchmark, due to fewer than 20 individual clinicians or groups adequately reporting the measure, or meet the case minimum requirement. Accordingly, in the CY 2021 PFS proposed rule (85 FR 50308 through 50309), we proposed to revise § 414.1380(b)(1)(i)(A)(1) to remove the years 2019 through 2022 and add in its place the years 2019 through 2023 to provide that except as provided in paragraph (b)(1)(i)(A)(2) (which relates to CMS Web Interface measures and administrative claims-based measures), for the 2019 through 2023 MIPS payment years, MIPS eligible clinicians would receive 3 measure achievement points for each submitted measure that meets the data completeness requirement, but does not have a benchmark or meet the case minimum requirement.

We invited public comments on our proposal to again apply the special scoring policies for measures that meet the data completeness requirement but do not have a benchmark or meet the case minimum requirement for the MIPS 2023 payment year. The following is a summary of the comments we received and our responses.

Comment: One commenter supported the continuation of the policies as proposed.

Response: We appreciate the commenter for their support.

Comment: A few commenters did not support the proposal to continue the 3 measure achievement points for measures without a benchmark because the commenters believed that the policy provides a disincentive to submit more specialized measures and recommended that CMS provide bonus points for submitting measures without a benchmark.

Response: We recognize the commenters' concerns regarding the assignment of 3 points to measures without a benchmark. We are continuing to evaluate our approach to scoring measures without a benchmark and will take these comments into consideration for the future.

After consideration of the public comments, we are finalizing our proposal as proposed.

A summary of the policies for the CY 2021 MIPS performance period is provided in Table 49.

TABLE 49: Quality Performance Category: Scoring Policies for the CY 2021 MIPS Performance Period*

Measure type	Description	Scoring rule for Traditional MIPS
Class 1	Measures that can be scored based on performance. Measures that are submitted or calculated that meet all the following criteria: (1) Has a benchmark; (2) Meets case minimum; and (3) Meets the data completeness standard (generally 70 percent for 2021.)**	For the 2021 MIPS performance period: 3 to 10 measure achievement points based on performance compared to the benchmark.
Class 2	For the 2020 MIPS performance period: Measures that are submitted and meet data completeness, but do not have either of the following: (1) A benchmark; and (2) Meets case minimum.	For the 2021 MIPS performance period: 3 measure achievement points.
Class 3	Measures that are submitted, but do not meet data completeness threshold, even if they have a measure benchmark and/or meet the case minimum.	Beginning with the 2020 MIPS performance period: MIPS eligible clinicians other than small practices will receive zero points for this measure. Small practices will continue to receive 3 points.

*The Class 2 and 3 measure scoring policies are not applicable to CMS Web Interface measures or administrative claims-based measures.

**We refer readers to § 414.1335(a)(3) for our policy on data completeness.

(v) Assigning Measure Achievement Points for Topped Out Measures

We refer readers to § 414.1380(b)(1)(iv) for our previously finalized policies regarding the identification of topped out measures and § 414.1380(b)(1)(iv)(B) for our finalized policies regarding the scoring of topped out measures. Under § 414.1380(b)(1)(iv), we will identify topped out measures in the benchmarks published for each Quality Payment Program year. Under § 414.1380(b)(1)(iv)(B), beginning with the 2021 MIPS payment year, measure benchmarks (except for measures in the CMS Web Interface) that are identified as topped out for 2 or more consecutive years will receive a maximum of 7 measure achievement points beginning in the second year the measure is identified as topped out (82 FR 53726 through 53727).

We noted in the CY 2021 PFS proposed rule (85 FR 50307) that we intended to use performance period benchmarks for the 2021 MIPS performance period, which would mean we would not be able to publish measures that are topped out prior to the 2021 MIPS performance period. As discussed in that proposed rule (85 FR 50309), this also means we would not be able to identify those that have been

topped-out for 2 or more consecutive years for purposes of the topped out scoring of 7 measure achievement points. We noted that we believe it is still important to retain a topped-out scoring cap of 7 measure achievement points so that clinicians have incentives to pick alternate measures that are not topped out. We also noted that a measure may not always be topped out and we believe that if a measure is not topped out in the 2021 performance period benchmark, then it should have the ability to achieve up to 10 measure achievement points.

Therefore, for the 2021 MIPS performance period, as an exception from the general rule at § 414.1380(b)(1)(iv)(B), we proposed at § 414.1380(b)(1)(iv)(B)(1) to apply the 7 measures achievement point cap to measures that meet the following two criteria. The first criterion would be that the measures have been topped out for 2 or more periods based on the published 2020 MIPS performance period historical benchmarks (which are based on submissions for the 2018 MIPS performance period). The second criterion would be the measures remain topped out after the 2021 MIPS performance period benchmarks have been calculated. We noted that we believe these two criteria collectively would provide clinicians the

information to know prior to the 2021 MIPS performance period which measures would have the topped-out scoring applied but would also account for the scenario where a measure is no longer topped out. We would not limit the number of measure achievement points for measures that have not been topped out for at least 2 years as published in the 2020 MIPS performance period historical benchmarks.

We invited public comments on our proposal to apply the 7 measures achievement point cap to measures that meet the two criteria. The following is a summary of the comments we received and our responses.

Comment: Several commenters do not support the proposal to apply the scoring cap of 7 achievement points for the 2021 performance period for measures that are found to be topped out and based this rationale on the thinking that the cap would apply to topped out measures for 2 or more consecutive years, including the 2021 MIPS performance period benchmarks. A few commenters discussed concerns over not knowing which measures will have the cap prior to the 2021 performance period and could put clinicians at risk of inadvertently reporting on measures with topped out

benchmarks, resulting in a capped score for the measure.

Response: We appreciate the commenters' responses for this proposal. As discussed in section IV.A.3.d.(1)(b)(ii) of this rule, we no longer intend to use performance period benchmarks and will use historical benchmarks for CY 2021. This allows us to provide benchmarks in advance for clinicians to have baseline information to guide measure selection. Because we are using historical benchmarks, we no longer need an exception to identify topped out measures, instead we will follow our normal topped out lifecycle process.

Comment: A few commenters requested that CMS suspend the topped-out measure scoring cap for the 2021 MIPS performance period due to the national PHE for COVID-19 and since many topped-out measures remain the most meaningful measures on which certain clinicians can report.

Response: We appreciate the commenters' concern about the scoring cap for topped out measures. As MIPS is a performance-based program, we do not believe that MIPS eligible clinicians electing to report topped out measures should be able to receive the same maximum score as other measures that demonstrate variations in performance and room for improvement. We therefore continue to believe it necessary to maintain the 7-point cap for measures identified as topped out. Additionally, please refer to qpp.cms.gov/about/covid19 for our national PHE for COVID-19 response and flexibilities provided within QPP.

Comment: Several commenters supported the proposed criteria for determining which measures should have the 7-point cap applied in 2021 performance year based on the use of performance period benchmarks as it provides important protections for clinicians given the impact of the national PHE for COVID-19.

Response: We appreciated the commenters for their support for this policy based on the intended use of the performance period benchmarks, but note that we are not finalizing the use of performance period benchmarks policy as discussed in section IV.A.3.d.(1)(b)(ii) of this rule.

After consideration of public comments, we are not finalizing our proposal to create an exception from the general rule at § 414.1380(b)(1)(iv)(B) that we had proposed at § 414.1380(b)(1)(iv)(B)(1). Instead, we will continue our policy that the 7-point cap will be applied to measures (except for measures in the CMS Web Interface) that are identified as topped out for 2 or

more consecutive years, beginning in the second year the measure is identified to be topped out.

(vi) Incentives To Report High-Priority Measures

We refer readers to § 414.1380(b)(1)(v)(A) for our previously finalized policies regarding incentives to report high priority measures. In the CY 2017 Quality Payment Program final rule (81 FR 77293), we established the scoring policies for high priority measure bonus points to encourage the selection of additional high-priority and outcome measures that impact beneficiaries and were closely aligned to our measurement goals. In the CY 2019 PFS final rule (83 FR 59850), we discontinued awarding measure bonus points to CMS Web Interface reporters for reporting high priority measures since CMS Web Interface reporters have no choice in measures.

We stated in the CY 2019 PFS proposed and final rules (83 FR 35950, 59851) that as part of our move towards fully implementing high value measures, we believe that bonus points for high priority measures for all collection types may no longer be needed, and as a result, we intended to consider in future rulemaking whether to modify our scoring policy to no longer offer high priority bonus points after the 2021 MIPS payment year. We noted in the CY 2019 PFS final rule (83 FR 59851) that measure bonus points were created as transition policies which were not meant to continue through the life of the program. We believe with the finalized framework for transforming MIPS through MVPs (84 FR 62948), we will find ways in the future to emphasize high priority measures without needing to incentivize with bonus points. As a result, we noted that we would wait until there is further policy development under the MVP framework before proposing to remove our policy of assigning bonus points for high priority measures.

As noted in the CY 2021 PFS proposed rule (85 FR 50309 through 50310), we proposed to maintain the cap on measure points for reporting high priority measures for the 2023 MIPS payment year. Accordingly, we proposed to revise § 414.1380(b)(1)(v)(A)(1)(ii) to remove the years 2019 through 2022 and adding in its place the years 2019 through 2023 to provide that through the 2023 MIPS payment year, the total measure bonus points for high priority measures cannot exceed 10 percent of the total available measure achievement points.

We invited public comments on our proposal to maintain the cap on

measure points for reporting high priority measures for the 2023 MIPS payment year. The following is a summary of the comments we received and our responses.

Comment: A few commenters supported our proposal to continue the high priority bonus. Commenters expressed the belief that these bonuses can help clinicians meet the performance threshold.

Response: We thank the commenters for their support.

Comment: One commenter did not support our stated intention to phase out high priority measure bonus points in the future because commenter believes these bonuses are important to ensure benchmarks are established for these high priority measures through incentivizing reporting.

Response: We appreciate the commenter's concerns and will take their recommendations into consideration for the future. We envision that the progression of the MIPS program under the MVP framework will allow us to remove some of the scoring complexity associated with the MIPS program. We anticipate that removing bonuses would be part of this framework. We also understand the interest in being as flexible as possible in awarding clinicians for supporting the goals of the program such as reporting high priority measures and creating benchmarks. While bonuses do not directly affect the calculation of benchmarks, we will continue to consider the best ways to support our goals in future rulemaking.

After consideration of the public comments, we are finalizing our proposal as proposed.

(vii) Incentives To Use CEHRT To Support Quality Performance Category Submissions

Section 1848(q)(5)(B)(ii) of the Act requires the Secretary to encourage MIPS eligible clinicians to report on applicable quality measures through the use of CEHRT. In the CY 2017 Quality Payment Program final rule (81 FR 77297), we established the measure bonus point and bonus cap for using CEHRT for end-to-end reporting. We refer readers to § 414.1380(b)(1)(v)(B) for our previously finalized policies regarding measure bonus points for end-to-end electronic reporting. We believe that with the framework for transforming MIPS through MVPs discussed in the CY 2020 PFS proposed rule (84 FR 40739) and the CY 2021 PFS proposed rule (85 FR 50279 through 50285), we will find ways to incorporate digital measures without needing to incentivize end-to-end reporting with

bonus points. In the CY 2018 Quality Payment Program final rule (82 FR 53636), we encouraged stakeholders to consider electronically specifying their quality measures as eQMs, to encourage clinicians and groups to move towards the utilization of electronic reporting. As noted in the CY 2019 PFS final rule (83 FR 59851), bonus points were created as transition policies which were not meant to continue through the life of the program. As a result, we noted that we would wait until there is further policy development under the finalized MVP framework (84 FR 62948) before proposing to remove our policy of assigning bonus points for end-to-end electronic reporting.

As noted in the CY 2021 PFS proposed rule (85 FR 50310), we proposed to continue to assign and maintain the cap on measure bonus points for end-to-end electronic reporting for the 2023 MIPS payment year. Accordingly, we proposed to revise § 414.1380(b)(1)(v)(B)(1)(i) to remove the years 2019 through 2022 and add in its place the years 2019 through 2023 to provide that for the 2019 through 2023 MIPS payment years, the total measure bonus points for measures submitted with end-to-end electronic reporting cannot exceed 10 percent of the total available measure achievement points.

We invited public comments on our proposal to maintain the cap on measure bonus points for end-to-end electronic reporting for the 2023 MIPS payment year. The following is a summary of the comments we received and our responses.

Comment: A few commenters supported and urged CMS to continue the bonus for end-to-end reporting using CEHRT because it would drive electronic reporting and maintain stability in the program.

Response: We thank the commenters for their support.

After consideration of the public comments, we are finalizing our proposal as proposed.

(viii) Improvement Scoring for the MIPS Quality Performance Category Percent Score

We refer readers to § 414.1380(b)(1)(vi)(C)(4) for more on our policy stating that for the 2020 through 2022 payment years, for the purpose of improvement scoring, we will assume a quality performance category achievement percent score of 30 percent in the previous year if a MIPS eligible clinician earned a quality performance category score less than or equal to 30 percent in the previous year.

As noted in the CY 2021 PFS proposed rule (85 FR 50310), we proposed to continue our previously established policy for improvement scoring for the 2023 MIPS payment years and to revise § 414.1380(b)(1)(vi)(C)(4) to remove the phrase “2020 through 2022 MIPS payment year” and adding in its place the phrase “2020 through 2023 MIPS payment years” to indicate that for each MIPS payment year through 2023, we will assume a quality performance category achievement percent score of 30 percent in the previous year if a MIPS eligible clinician earned a quality performance category score less than or equal to 30 percent in the previous year. Specifically, for the 2023 MIPS payment year, we would compare the MIPS eligible clinician’s quality performance category achievement percent score for the 2021 MIPS performance period to an assumed quality performance category achievement percent score of 30 percent if the MIPS eligible clinician earned a quality performance score less than or equal to 30 percent for the 2020 MIPS performance period.

We invited public comments on our proposal to assume a quality performance category achievement percent score of 30 percent in the previous year if a MIPS eligible clinician earned a quality performance category score less than or equal to 30 percent in the previous year for the 2023 MIPS payment year. The following is a summary of the comments we received and our responses.

Comment: A few commenters expressed support for improvement scoring for the quality performance category because it better rewards high quality performers and promotes strategic priorities of CMS.

Response: We thank the commenters for their support.

After consideration of the public comments, we are finalizing our proposal as proposed.

(2) Calculating the Final Score

For a description of the statutory basis and our policies for calculating the final score for MIPS eligible clinicians, we refer readers to § 414.1380(c) and the discussion in the CY 2017 and CY 2018 Quality Payment Program final rules, and the CY 2019 and CY 2020 PFS final rules (81 FR 77319 through 77329, 82 FR 53769 through 53785, 83 FR 59868 through 59878, 84 FR 63020 through 63031, respectively). In the CY 2021 PFS proposed rule (85 FR 50310 through 50315), we proposed to continue the complex patient bonus for the 2023 MIPS payment year, and we also proposed to modify the complex

patient bonus for the 2022 MIPS payment year as established in prior rulemaking due to the PHE for COVID-19. In addition, we proposed performance category redistribution policies for the 2023, 2024, and future MIPS payment years.

(a) Complex Patient Bonus

(i) Background

Section 1848(q)(1)(G) of the Act requires us to consider risk factors in our MIPS scoring methodology. Specifically, it provides that the Secretary, on an ongoing basis, shall, as the Secretary determines appropriate and based on an individual’s health status and other risk factors, assess appropriate adjustments to quality measures, cost measures, and other measures used under MIPS; and assess and implement appropriate adjustments to payment adjustments, final scores, scores for performance categories, or scores for measures or activities under MIPS. In doing so, the Secretary is required to take into account the relevant studies conducted under section 2(d) of the Improving Medicare Post-Acute Care Transformation Act of 2014 (IMPACT Act)) (Pub. L. 113–185, enacted on October 6, 2014) and, as appropriate, other information, including information collected before completion of such studies and recommendations. In the CY 2018 Quality Payment Program final rule, under the authority in section 1848(q)(1)(G) of the Act, we established at § 414.1380(c)(3) a complex patient bonus of up to 5 points to be added to the final score for the 2020 MIPS payment year (82 FR 53771 through 53776). In subsequent rulemaking, we continued the complex patient bonus at § 414.1380(c)(3) for the 2021 and 2022 MIPS payment years (83 FR 59870 and 84 FR 63023). We refer readers to these final rules for additional details on the background, statutory authority, policy rationale, and calculation of the complex patient bonus.

We intended for this bonus to serve as a short-term strategy to address the impact patient complexity may have on MIPS scoring while we continue to work with stakeholders on methods to account for patient risk factors. The overall goal, when considering a bonus for complex patients, is two-fold: (1) To protect access to care for complex patients and provide them with excellent care; and (2) to avoid placing MIPS eligible clinicians who care for complex patients at a potential disadvantage while we review the completed studies and research to address the underlying issues. We used

the term “patient complexity” to take into account a multitude of factors that describe and have an impact on patient health outcomes; such factors include the health status and medical conditions of patients, as well as social risk factors. We believe that as the number and intensity of these factors increase for a single patient, the patient may require more services, more clinician focus, and more resources in order to achieve health outcomes that are similar to those who have fewer factors. In developing the policy for the complex patient bonus, we assessed whether there was a MIPS performance discrepancy by patient complexity using two well-established indicators in the Medicare program: Medical complexity as measured through Hierarchical Condition Category (HCC) risk scores, and social risk as measured through the proportion of patients that are dually eligible for Medicare and Medicaid (82 FR 53771 through 53776).

(ii) Complex Patient Bonus for the 2023 MIPS Payment Year

As discussed in the CY 2021 PFS proposed rule (85 FR 50310), we intended the complex patient bonus as a short-term solution to address the impact patient complexity may have on MIPS scoring. However, we noted that we currently do not believe we have sufficient information available to develop a long-term solution to account for patient risk factors in MIPS that we could include as a proposal for the 2023 MIPS payment year. In the CY 2020 PFS proposed and final rules, we considered whether newly available data from the Quality Payment Program still supported the complex patient bonus at the final score level. More specifically, within the data analysis, we did not observe a consistent linear relationship for any reporting type or complexity measure, HCC risk score or dual eligible status (84 FR 40793 through 40795 and 84 FR 63021 through 63023). However, we only have a few years of data and believe that more recent data may bring different results than the findings we explained in detail in the CY 2020 PFS final rule. We refer readers to the CY 2020 PFS final rule for further details on the methodology and findings (84 FR 63021 through 63023).

As stated previously in this final rule, section 1848(q)(1)(G) of the Act requires us to take into account the relevant studies conducted under section 2(d) of the IMPACT Act and, as appropriate, other information, including information collected before completion of such studies and recommendations. ASPE completed its first report in December 2016, which examined the

effect of individuals’ socioeconomic status on quality, resource use, and other measures under the Medicare program, and included analyses of the effects of Medicare’s current value-based payment programs on clinicians serving socially at-risk beneficiaries and simulations of potential policy options to address these issues. We also noted, in the CY 2020 PFS final rule, that a second ASPE report on social risk factors within CMS value-based purchasing programs was expected. This second report, Social Risk and Performance in Medicare’s Value-Based Purchasing Programs, was publicly released in June 2020, which builds on the analyses included in the initial report and provides additional insight for addressing risk factors in MIPS and other value-based payment programs.¹²⁶ More specifically, the report has a 3-pronged strategy approach to measure and report quality; to set high, fair quality standards; and to reward and support better outcomes for beneficiaries with social risk. As a part of this 3-pronged strategy, the report supports the use of the complex patient bonus in MIPS, explaining that it is well supported because this policy gives additional points to clinicians who treat patients with high social risk factors and does not lower the standard of care. Further, the report suggested that CMS should not include the complex patient bonus within the final score that is publicly reported to ensure that patients can see the true clinician performance. As we continue to review the findings from the report, we intend to consider its recommendations, along with any updated data that would become available, for future rulemaking. Hence, based on our data analysis from the CY 2020 PFS final rule (84 FR 63022) and the lack of currently available additional data sources, for the 2021 MIPS performance period/2023 MIPS payment year, we proposed to continue the complex patient bonus without any modifications (as finalized for the 2020 MIPS performance period/2022 MIPS payment year) and to revise § 414.1380(c)(3) accordingly. We noted that we plan to continue working with ASPE, the public, and other key stakeholders on this important issue to identify longer term policy solutions that achieve the goals of attaining health equity for all beneficiaries, minimizing unintended consequences, and would propose modifications to the complex

patient bonus in future rulemaking as appropriate.

We invited public comments on our proposal to continue the complex patient bonus for the 2021 MIPS performance period/2023 MIPS payment year. The following is a summary of the comments we received and our responses.

Comment: A few commenters supported our proposal to continue the complex patient bonus of up to 5 points for the 2021 MIPS performance period/2023 MIPS payment year. Another commenter supported the complex patient bonus but requested that we increase the complex patient bonus.

Response: We thank the commenters for their support to maintain the complex patient bonus for the 2021 MIPS performance period/2023 MIPS payment year. We plan to review available information, including any updated data, in future years to determine if it is appropriate to modify our approach to adjusting for social risk factors.

Comment: Many commenters encouraged CMS to finalize the proposed policy, discussed in the CY 2021 PFS proposed rule (85 FR 50311), of doubling the complex patient bonus for the CY 2020 performance period, and to continue doubling the complex patient bonus into the CY 2021 performance period, because the impact of the national PHE for COVID-19 will likely continue, as well as the associated increased complexity due to COVID-19.

Response: We understand that both direct and indirect impacts of the PHE for COVID-19 will likely continue into CY 2021. We will continue to assess and better understand the implications of the national PHE of COVID-19 on care delivery and complex patient care during 2021 and will consider whether to make any policy changes in future rulemaking. At this time, we continue to offer the application-based extreme and uncontrollable circumstances policy for CY 2021, as referenced in section IV.A.3.d.(2)(b)(iv)(B) of this final rule, and we believe we do not need to continue to double the complex patient bonus for the 2021 performance period/2023 MIPS payment year, although we intend to reevaluate after we gather more data and learn more about both the direct and indirect impacts of the PHE for COVID-19. We will continue to assess our complex patient bonus policy regarding both the value of the points and the calculation methodology and ensure that we do not risk artificially increasing MIPS final scores while providing enough flexibility to clinicians to account for increased patient complexity.

¹²⁶ ASPE. Second Report to Congress on Social Risk and Medicare’s Value-Based Purchasing Programs. June 29 2020. <https://aspe.hhs.gov/pdf-report/second-impact-report-to-congress>.

Comment: A few commenters pointed out perceived limitations in the use of the HCC risk score in calculating the complex patient bonus. More specifically, they believed that the existing methodology does not fully and appropriately capture the clinical and social complexity of patients and encouraged CMS to find more appropriate and long-term solutions. A few commenters suggested that CMS consider other medical and social risk factors outside of what is already captured in the HCC and dual-eligible status, when determining patient complexity. Another commenter requested that CMS develop an alternative applicable to all clinician types. One commenter suggested that CMS include ICD–10 Z codes, such as Z590.0 homelessness, Z65.0 unemployed, or Z59.5 extreme poverty to capture additional social risk factors.

Response: We thank the commenters for their suggestions and will take them into consideration as we consider options for updating the complex patient bonus in future years. Further, while the ASPE's second report is supportive of the complex patient bonus, they have specific recommendations as to how to further incorporate risk adjustment at the MIPS program level which we plan to address in future rulemaking. Additionally, although the ASPE report found dual eligibility to be a reliable indicator of social risk, we understand there may be some limitations. However, we are not aware of data sources and/or methodologies to account for other social indicators such as income and education that are readily available for all Medicare beneficiaries that would be more complete indices of a patient's complexity. Further, we continue to believe that average HCC risk scores are a valid proxy for medical complexity that are also used by other CMS programs. Therefore, we have decided to continue to pair the HCC risk score with the proportion of dually eligible patients to create a more complete complex patient indicator than can be captured using HCC risk scores alone. We will evaluate additional, more comprehensive options, such as the utilization of ICD–10 Z codes, in future years based on any updated data or additional information, including to better account for social risk factors while minimizing unintended consequences and consider these as we move forward.

Comment: One commenter expressed concerns with calculating the complex patient bonus points given the substantial disruptions to patient care due to the national PHE for COVID–19,

which could cause data, used for the lookback period, to be either compromised or unreliable.

Response: When we calculate the complex patient bonus points, we rely on dual eligibility status and the HCC risk score, which should not be impacted by potential coding modifications or disruptions for the CY 2020 performance period. Pursuant to § 414.1380(c)(3)(i), in order to calculate an average HCC risk score, CMS uses the model adopted under section 1853 of the Act for Medicare Advantage risk adjustment purposes, for each MIPS eligible clinician or group; that average HCC risk score is used as a part of the complex patient bonus calculation. We refer readers to the CY 2018 QPP final rule (82 FR 53771) for more details on how we calculate the average HCC risk score for a MIPS eligible clinician or group. Specifically, we average HCC risk scores for beneficiaries cared for by the MIPS eligible clinician or clinicians in the group during the second 12-month segment of the eligibility period during the prior performance period. HCC risk scores for beneficiaries would be calculated based on the calendar year immediately prior to the performance period. For example, for the 2020 MIPS performance period, the HCC risk scores would be calculated based on beneficiary services from CY 2019, which is prior to the year in which the PHE occurred. Additionally, as the claims coding for the HCC occurred prior to this proposal, we believe this approach mitigates the risk of potential coding modifications or disruptions to get higher expected costs, which could happen if concurrent risk adjustments were incorporated. However, we acknowledge some of the policy flexibilities we established for the national PHE for COVID–19 potentially could have an effect on data for CY 2020. Given that this is the primary source of data available to us to calculate the complex patient bonus for CY 2021, for now, we plan to utilize this data, and we will monitor and consider making additional adjustments, as necessary.

After consideration of the public comments, we are finalizing the proposal to continue the complex patient bonus for the 2021 performance period/2023 MIPS payment year as proposed and to revise § 414.1380(c)(3) accordingly.

(iii) Complex Patient Bonus for the 2022 MIPS Payment Year

In this section of the final rule, we discuss the proposed policy to modify the complex patient bonus for the 2022 MIPS payment year in response to the

PHE for COVID–19 (85 FR 50311). In the CY 2020 PFS final rule, we continued the complex patient bonus for the 2020 performance period/2022 MIPS payment year (84 FR 63021 through 63023). More specifically, we continued to utilize our two established complexity indicators, HCC risk scores and dual eligible status, because we believed that they continued to account for the multitude of factors that describe and have an impact on patient health outcomes. Further, risk scores are based on a beneficiary's age and sex; whether the beneficiary is eligible for Medicaid, first qualified for Medicare on the basis of disability, or lives in an institution (usually a nursing home); and the beneficiary's diagnoses from the previous year.¹²⁷ Additionally, the HCC model also accounts for the number of conditions a beneficiary has, making an adjustment as the number of diseases or conditions increases, and includes additional diagnosis codes related to mental health and substance use disorders, and chronic kidney disease.¹²⁸ However, due to the national PHE for COVID–19 during performance period 2020, we noted that we need to re-evaluate the previously established policy for the complex patient bonus for the 2022 MIPS payment year. We acknowledged that there are direct effects of COVID–19 for those patients who have the disease and indirect effects of COVID–19 for other patients, including increased complexity and barriers such as postponing care, accessing care in a different way (for example, via telecommunications), and disruptions to lab results and medications, which are not accounted for in our existing final score calculations using these complexity indicators. We noted that we realize that the first year of the novel virus may add complexity that we have not already captured via the complex patient bonus. This complexity includes patients who have gotten sick, as well as patients who may now have complications or other factors because of delayed care or disruptions to lab services or medications due to COVID–19. Government guidelines, such as the Centers for Disease Control and Prevention (CDC) guidance on "Groups

¹²⁸ CMS, "Report to Congress: Risk Adjustment in Medicare Advantage": <https://www.cms.gov/Medicare/Health-Plans/MedicareAdvtg-SpecRateStats/Downloads/RTC-Dec2018.pdf>.

at Higher Risk for Severe Illness”, indicate that COVID-19 patients who are already high-risk due to pre-existing medical conditions are at further risks of increased COVID-19 related hospitalizations and mortality.¹²⁹ Further, literature also indicates that those patients who are already high-risk due to social factors are also at further risk of serious illness related to COVID-19.¹³⁰

Further, during this time, hospitals reported that medical systems delayed and canceled care, resulting in reduced utilization of healthcare services and a changing care delivery system.¹³¹ Although access to Medicare telehealth services was expanded so that beneficiaries could receive a wider range of services from clinicians without having to travel to a healthcare facility,¹³² this only partially filled the gap in services from the reduction in delivery of care, as not all specialties can utilize telehealth. We recognized the increased challenges of providing care to complex patients in the context of the national PHE for COVID-19. Patients with comorbidities (as measured by HCC risk score) and social risk (measured by dual eligible status) are disproportionately likely to be severely affected by COVID-19.^{133 134 135} More specifically, findings from our recently released data reinforces previous findings by the CDC that older

Americans and those with chronic health conditions are at the highest risk for COVID-19. The data also show that COVID-19 has disproportionately impacted lower income adults, further confirming longstanding healthcare disparities in dually eligible populations.¹³⁶ Additionally, in light of the care delivery changes, we noted that clinicians may see patients in 2020, with medical or social risk factors, whose health conditions may have been exacerbated due to delayed care. Patients with comorbidities and social risk are likely to suffer adverse outcomes due to delaying or not receiving care.^{137 138 139} Given that the limited available literature and data on COVID-19 suggests that patients with social risk factors or underlying conditions have increased complexity, we believe that our existing complexity indicators, HCC risk score and dual eligibility, could serve as a proxy for capturing increased complexity due to the PHE for COVID-19.

Currently, the complex patient bonus is worth up to 5 points. However, given the anticipated increase in complexity due to the national PHE for COVID-19, we proposed at § 414.1380(c)(3)(iv) that for the CY 2020 performance period/2022 MIPS payment year, the complex patient bonus would be calculated pursuant to the existing formulas in § 414.1380(c)(3)(i) and (ii), and the resulting numerical value would then be multiplied by 2, but the complex patient bonus cannot exceed 10. The doubled numerical value (subject to the 10-point cap) would be added to the final score. Additionally, we proposed to revise § 414.1380(c)(3)(iii) to state that the complex patient bonus cannot exceed 5.0 except as provided in § 414.1380(c)(3)(iv). As proposed, clinicians could receive up to 10 complex patient bonus points added to their final score. For example, if a MIPS eligible clinician were to receive 4 complex patient bonus points under the existing formulas, the MIPS eligible clinician would receive 8 complex patient bonus points (doubling the

bonus points) under our proposal for the CY 2020 performance period/2022 MIPS payment year. In instances where clinicians would have received the maximum of 5 complex patient bonus points, they would receive the maximum of 10 complex patient bonus points under our proposal for the CY 2020 performance period/2022 MIPS payment year. To the extent that the proposed change constitutes a change to the MIPS scoring or payment methodology for the 2022 MIPS payment adjustment after the start of the 2020 performance period, we noted that we believe that, consistent with section 1871(e)(1)(A)(ii) of the Act, it would be contrary to the public interest not to account for increased patient complexity due to the national PHE for COVID-19. We believe it would be contrary to the public interest if MIPS scores do not adequately recognize this increased patient complexity that could not have been accounted for during the CY 2020 rulemaking. More specifically, as discussed in the CY 2021 PFS proposed rule, we are unable to measure the magnitude of the direct and indirect effects of the PHE for COVID-19 on MIPS scores, and we remain concerned about potentially misidentifying poor performance with regard to the care delivered in CY 2020 due to the PHE for COVID-19 (85 FR 50312). Hence, we believe this approach of doubling the complex patient bonus recognizes the difficulty of managing complex patients during the PHE for COVID-19 and lowers the risk of inaccurately identifying a clinician as a “poor performer” when the underlying issue is caring for increasingly complex patients due to both direct and indirect effects of COVID-19.

Due to limited data available related to the PHE for COVID-19, we noted that it is difficult to gauge whether the proposal would be artificially increasing MIPS final scores or not providing enough flexibility to clinicians to account for increased patient complexity during the CY 2020 performance period. Given the challenges we assumed clinicians may be facing, we noted that doubling the complex patient bonus would be a reasonable and operationally feasible approach. In developing our proposal, we considered several alternatives, including maintaining the complex patient bonus as it currently is (up to 5 points), as well as whether it would be appropriate to triple (up to 15 points) the complex patient bonus. However, due to the limited data available, we did not propose those options as we were concerned that an approach of tripling

the bonus could artificially increase final scores and maintaining the current bonus (up to 5 points) may not be sufficient to account for the increased patient complexity during the CY 2020 performance period. Additionally, we noted that we believe that by doubling the complex patient bonus, clinicians whose MIPS performance may be negatively affected by the challenges of caring for a complex patient population during a PHE will be less likely to have the maximum negative adjustment due to circumstance beyond their control.

We also considered whether we should add a new indicator of patient complexity, such as establishing a threshold for the percentage of patients with COVID-19. We expressed concern about this alternative approach for two reasons. First, we did not believe the effects of COVID-19 are limited to those patients who are experiencing the illness. Second, there was uncertainty of the consistency of diagnosis coding for both patients who are experiencing the illness or who are being treated for the sequelae of the illness.

We requested comments on our proposal, the alternatives we considered, and any other approaches to account for patient complexity during the PHE for COVID-19 that commenters believe we should consider, as well as alternative data sources for patient complexity. We invited public comments on our proposal to double the complex patient bonus for the CY 2020 performance period/2022 MIPS payment year. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported our proposal to double the complex patient bonus for the CY 2020 performance period/2022 MIPS payment year. One commenter appreciated CMS' proposal to double the complex patient bonus points but suggested that CMS provide additional flexibility, including further modifying the complex patient bonus policy to create accountability for achieving equity for all Medicare beneficiaries, both within and outside the context of the PHE for COVID-19.

Response: We will continue to assess and expand our understanding of both the direct and indirect impact of the PHE for COVID-19 and will incorporate additional data and findings in future rulemaking. We want to note that in addition to the complex patient bonus proposal, we also announced that clinicians and practices affected by the PHE for COVID-19 could apply for reweighting of the MIPS performance categories due to extreme and uncontrollable circumstances. We refer

readers to <https://qpp.cms.gov/about/covid19> for the flexibilities provided during the PHE for COVID-19.

Comment: A few commenters agreed that the complex patient bonus for the CY 2020 performance period should be increased but recommended CMS to consider alternatives. One commenter suggested that CMS consider providing more than 10 complex patient bonus points in areas of the country that are most impacted by COVID-19. For example, the commenter suggested that CMS look at areas that are among the top ranking in positive cases. Another commenter suggested that doubling the complex patient bonus is fair but suggested CMS to consider increasing the complex patient bonus points by more than double. A few commenters encouraged CMS to make this increase permanent and one specifically recommended a permanent increase until more clinically appropriate quality measures are developed. Another commenter suggested that CMS increase the complex patient bonus points for CY 2020 to 15 points and then 10 points for CY 2021 to recognize the ongoing effects of the national PHE.

Response: We thank the commenters for their support and their suggestions to further revise the complex patient bonus policy. With regard to assessing which areas of the country are more impacted by COVID-19, we believe it is difficult to assess the true impact in certain areas. More specifically, it could be possible that the impacted areas may change throughout the year, making it difficult to assess which areas are treating more complex patients. For example, back in spring of 2020, New York faced an initial surge of COVID-19 cases.¹⁴⁰ However, overtime, data is indicating that certain areas in the Midwest region are now seeing an influx of COVID-19 cases as cases in New York are decreasing.¹⁴¹ Furthermore, we have identified the PHE for COVID-19 as a national event, and therefore, we believe it is appropriate to apply one policy for the national event as opposed to establishing different policies for varying geographic areas. However, we will continue to assess the impact of the PHE and consider whether to further modify the policy in future rulemaking. Additionally, as indicated in the comment summary above, a few

¹⁴⁰ John Hopkins University & Medicine, "Coronavirus Resource Center" <https://coronavirus.jhu.edu/data/state-timeline/new-confirmed-cases/new-york>.

¹⁴¹ Modern Healthcare, "Hospitals feel squeeze as coronavirus spikes in Midwest": <https://www.modernhealthcare.com/hospitals/hospitals-feel-squeeze-coronavirus-spikes-midwest>.

commenters suggested that we consider further increasing the complex patient bonus points beyond 10 points. As noted in the CY 2021 PFS proposed rule (85 FR 50312), we considered several alternatives, including maintaining the complex patient bonus as it currently is (up to 5 points), as well as whether it would be appropriate to triple (up to 15 points) the complex patient bonus. However, due to the limited data available, we decided not to propose those options because we were concerned that tripling the bonus could artificially increase final scores and maintaining the current bonus (up to 5 points) may be insufficient to account for the increased patient complexity during the CY 2020 performance period. We acknowledge that the impact of the national PHE for COVID-19 may affect CY 2021 and intend to continue to offer the application-based extreme and uncontrollable circumstances policy for CY 2021, as referenced in section IV.A.3.d.(2)(b)(iv)(B) of this final rule, while we continue to assess the impact and our established related policies. Hence, we continue to believe this one-time adjustment of doubling the complex patient bonus is important and believe that an increase of up to 10 points is appropriate.

Comment: A few commenters stated concerns with doubling the complex patient bonus points for the CY 2020 performance period/CY 2022 MIPS payment year. One commenter stated that offering up to 10 complex patient bonus points could potentially mask poor performance and reward clinicians who did not treat significant numbers of complex COVID-19 patients. The commenter also stated concerns with clinicians potentially upcoding due to this policy change. Another commenter stated concerns with potentially diluting the overall MIPS score for groups and potentially skewing the national average. Another commenter said it would be inappropriate to have complex patient bonus points tied to the number of COVID-19 cases a particular clinician sees.

Response: We thank the commenters for their responses. We acknowledge that doubling the complex patient bonus could potentially mask poor performance or skew the national average, but we are weighing these potential effects against the unforeseen complexity of caring for complex patients during the national PHE for COVID-19. We disagree that doubling the complex patient bonus would dilute the overall score. As discussed above, we considered a complex patient bonus of up to 15 points but believe that a bonus of up to 10 appropriately

balances our desire to account for the PHE without artificially increasing scores. Additionally, we rely on dual eligibility status and the HCC risk score, in order to calculate the complex patient bonus for the performance period. We believe this methodology would continue to appropriately account for the increased complexity we are seeing in light of the PHE while balancing the impact of caring for patients with both medical and social risks. We also acknowledge that doubling the complex patient bonus could potentially reward clinicians who did not treat significant number of complex COVID-19 patients. We intend to provide this one-time adjustment of doubling the complex patient bonus because we recognize that there are both direct and indirect effects of the national PHE for COVID-19. For example, clinicians who have not cared for COVID-19 patients are, nevertheless, dealing with the indirect impact of delayed care for complex patients. Alternatively, for clinicians who have cared for COVID-19 patients, we believe this adjustment would account for the medical complexity the clinician directly faces in treating these patients. Hence, we continue to believe that an adjustment of up to 10 points is appropriate to account for both direct and indirect potential impacts on clinicians and care delivery due to the PHE. Finally, we disagree that this policy proposal could encourage upcoding. As we explained in a previous response to comments, when we calculate the complex patient bonus points, we rely on dual eligibility status and the HCC risk score, which should not be impacted by potential coding modifications or disruptions for the CY 2020 performance period. The HCC risk score for CY 2020 is calculated based on data from CY 2019, the year prior to the national PHE for COVID-19.

Finally, the proposed policy would be calculated pursuant to the existing formulas in § 414.1380(c)(3)(i) and (ii), and we do not intend to alter the

formula based on the number of COVID-19 cases a clinician sees. As we noted in the CY 2021 PFS proposed rule (85 FR 50313), we considered whether we should add a new indicator of patient complexity, such as establishing a threshold for the percentage of patients with COVID-19, and we continue to be concerned about this alternative approach for two reasons including: (1) The effects of COVID-19 are not limited to those patients who are experiencing the illness; and (2) we are still uncertain of the consistency of diagnosis coding for both patients who are experiencing the illness or who are being treated for the sequelae of the illness.

Comment: One commenter stated concerns with doubling the complex patient bonus points given that the additional resources utilized to treat COVID-19 patients are already being accounted for through Part A and Part B reimbursement, such as lab tests and medically necessary hospitalizations, and should not be additionally funded by the Quality Payment Program.

Response: We disagree that doubling the complex patient bonus points would be redundant of Part A and Part B reimbursement. The purpose of the complex patient bonus is to account for risk factors through appropriate adjustments to MIPS scoring. The policy is not intended to reimburse clinicians for costs associated with treating more complex patients.

After consideration of the public comments, we are finalizing our proposal for the complex patient bonus for the CY 2020 performance period/ 2022 MIPS payment year as proposed. We are finalizing § 414.1380(c)(3)(iv), under which the complex patient bonus will be calculated pursuant to the existing formulas in paragraphs (c)(3)(i) and (ii), and the resulting numerical value will then be multiplied by 2, but cannot exceed 10.0. The doubled numerical value (subject to the 10-point cap) will be added to the final score. Additionally, we finalize our proposal

to revise paragraph (c)(3)(iii) to state that the complex patient bonus cannot exceed 5.0 except as provided in paragraph (c)(3)(iv).

(b) Final Score Performance Category Weights

(i) General Weights

Section 1848(q)(5)(E)(i) of the Act specifies weights for the performance categories included in the MIPS final score: In general, 30 percent for the quality performance category; 30 percent for the cost performance category; 25 percent for the Promoting Interoperability performance category; and 15 percent for the improvement activities performance category. For more of the statutory background and descriptions of our current policies, we refer readers to the CY 2017 through CY 2018 Quality Payment Program final rules, and CY 2019 through CY 2020 PFS final rules (81 FR 77320 through 77329, 82 FR 53779 through 53785, 83 FR 59870 through 59878, and 84 FR 62950 through 84 FR 62959, respectively). In section IV.A.3.c.(2)(a) of the CY 2021 PFS proposed rule, we proposed that the cost performance category would make up 20 percent of a MIPS eligible clinician's final score for the 2023 MIPS payment year and 30 percent for the 2024 MIPS payment year and each subsequent MIPS payment year. In section IV.A.3.c.(1) of that proposed rule, we proposed the quality performance category would thus make up 40 percent of a MIPS eligible clinician's final score for the 2023 MIPS payment year and 30 percent for the 2024 MIPS payment year and each subsequent MIPS payment year. In sections III.K.3.c.(1)(b) and III.K.3.c.(2)(a) of this final rule, we finalized these proposed weights for the quality and cost performance categories for the 2023, 2024, and subsequent MIPS payment years as proposed. Table 50 summarizes the weights for each performance category.

TABLE 50: Weights by MIPS Performance Category for the 2023, 2024, and Future MIPS Payment Years

Performance Category	2023 MIPS Payment Year	2024 and Future MIPS Payment Years
Quality	40%	30%
Cost	20%	30%
Improvement Activities	15%	15%
Promoting Interoperability	25%	25%

(ii) Flexibility for Weighting Performance Categories

Under section 1848(q)(5)(F) of the Act, if there are not sufficient measures and activities applicable and available to each type of MIPS eligible clinician involved, the Secretary shall assign different scoring weights (including a weight of zero) for each performance category based on the extent to which the category is applicable to the type of MIPS eligible clinician involved and for each measure and activity with respect to each performance category based on the extent to which the measure or activity is applicable and available to the type of MIPS eligible clinician involved. Under section 1848(q)(5)(B)(i) of the Act, in the case of a MIPS eligible clinician who fails to report on an applicable measure or activity that is required to be reported by the clinician, the clinician must be treated as achieving the lowest potential score applicable to such measure or activity. In this scenario of failing to report, the MIPS eligible clinician generally would receive a score of zero for the measure or activity, which would contribute to the final score for that MIPS eligible clinician. Under certain circumstances, however, a MIPS eligible clinician who fails to report could be eligible for an assigned scoring weight of zero percent and a redistribution of the performance category weights. For a description of our existing policies for reweighting performance categories, please refer to § 414.1380(c)(2) and the CY 2020 PFS final rule (84 FR 63023 through 63027).

(iii) Redistributing Performance Category Weights

In the CY 2017 through CY 2018 Quality Payment Program final rules, and CY 2019 through CY 2020 PFS final rules (81 FR 77325 through 77329, 82 FR 53783 through 53785, 83 FR 59876 through 59878, and 84 FR 63027 through 63031), and at § 414.1380(c)(2)(ii), we established policies for redistributing the weights of performance categories in the event that a scoring weight different from the generally applicable weight is assigned to a category or categories. Under these policies, we generally redistribute the weight of a performance category or categories to the quality performance category because of the experience MIPS eligible clinicians have had reporting on quality measures under other CMS programs. For the 2020 MIPS performance period and 2022 MIPS payment year, we did not redistribute performance category weights to improvement activities, except for the scenario where the only two

performance categories being scored are improvement activities and cost (84 FR 63028). Also for that year in scenarios when the cost performance category weight is redistributed while the Promoting Interoperability performance category weight is not, we redistributed a portion of the cost performance category weight to the Promoting Interoperability performance category, as well as to the quality performance category (84 FR 63027). As stated in CY 2020 PFS final rule, we continue to believe this redistribution policy is appropriate given our focus on working with the Office of the National Coordinator for Health IT (ONC) on implementation of the interoperability provisions of the 21st Century Cures Act (the Cures Act) (Pub. L. 114–255, enacted on December 13, 2016) to ensure seamless but secure exchange of health information for clinicians and patients and emphasize the importance of interoperability without overwhelming the contribution of the quality performance category to the final score (84 FR 63027).

In the CY 2021 PFS proposed rule (85 FR 50293), we proposed a weight for the cost performance category of 20 percent for the 2023 MIPS payment year. For the 2023 MIPS payment year, we proposed similar redistribution policies as finalized for the 2022 MIPS payment year, with minor modifications to account for the cost performance category being 20 percent. As proposed, we would once again only redistribute weight to the cost performance category in cases when the cost and improvement activities performance categories are the only categories scored (each of these performance categories would be 50 percent in this scenario). We noted that we do not believe it is appropriate to redistribute more weight to the cost performance category, because cost would not yet be at the maximum weight specified by the statute (30 percent), and because clinicians still have relatively limited experience being scored on and receiving feedback on cost measures compared with quality measures. Our proposed redistribution policies for the 2023 MIPS payment year, which we proposed to codify at § 414.1380(c)(2)(ii)(E), are included in Table 45 of CY 2021 PFS proposed rule (85 FR 50314).

In the CY 2021 PFS proposed rule (85 FR 50294), we proposed to weight the cost performance category at 30 percent for the 2024 MIPS payment year and each subsequent MIPS payment year, as required by section 1848(q)(5)(E)(i)(II)(aa) of the Act. Given that 2024 would be the first year that

cost would be set at the maximum weight prescribed by the statute, we noted that we did not believe it would be prudent to begin redistributing more weight to cost for the 2024 MIPS payment year, except in cases when only the cost and improvement activities performance categories are scored. For the improvement activities performance category, we are only assessing whether a MIPS eligible clinician completed certain activities (83 FR 59876 through 59878). Because MIPS eligible clinicians will have had several years of experience reporting under MIPS, we noted that it is important to prioritize performance on measures that show a variation in performance, rather than the activities under the improvement activities performance category, which are based on attestation of completion. We also noted that we believe this helps to reduce incentives to not report measures for the quality performance category in circumstances when a clinician may be able to report but chooses not to do so. For example, when a clinician may be able to report on quality measures, but chooses not to report because they are located in an area affected by extreme and uncontrollable circumstances as identified by CMS and qualify for reweighting under § 414.1380(c)(2)(i)(A)(8). Therefore, we noted that we continue to believe that weighting the cost and improvement activities performance categories each at 50 percent would be an appropriate balance (84 FR 63027). As for the other reweighting scenarios, we plan to revisit our redistribution policies in future rulemaking and may consider redistributing more weight to the cost performance category after clinicians have more experience with cost being weighted at 30 percent. Our proposed redistribution policies for the 2024 MIPS payment year, which we proposed to codify at § 414.1380(c)(2)(ii)(F), are included in Table 46 of CY 2021 PFS proposed rule (85 FR 50315).

We invited public comments on our proposed redistribution policies for the 2023 and 2024 MIPS payment years. The following is a summary of the comments we received and our responses.

Comment: A few commenters were supportive of CMS' proposal to redistribute the category weights. One commenter specifically agreed with CMS' reweighting proposals in instances when only the quality performance category and the improvement activities performance category are scored. A few commenters specifically supported CMS' proposal to not redistribute weight to the cost

performance category except in cases when only cost and improvement activities performance categories are scored. One commenter stated that the reweighting policies builds confidence in the program and demonstrates transparency.

Response: We thank the commenters for their support. We agree that our reweighting policies allow for flexibility, leading to confidence and transparency within the program. We also appreciate commenters' support in our policy rationale for not redistributing weight to the cost performance category except in cases when only cost and improvement performance categories are scored.

Comment: One commenter requested that CMS should not redistribute weights to the cost performance category until that performance category has more relevant and applicable cost measures available across all specialties.

Response: We agree with the commenter that there is currently a limited set of cost measures within the cost performance category. However, we do have concerns with redistributing a substantial portion of the performance category weights to the improvement activities performance category for several reasons. Specifically, through our redistribution policies, we aim to prioritize interoperability, performance on measures that show a variation in performance, and performance categories that have some or all measures that focus on performance, as compared to the activities under the improvement activities performance category, which are solely based on attestation of completion. We continue to believe that we should not redistribute weight to the improvement activities performance category. We also note that, given that 2024 would be the

first year that cost would be set at the maximum weight prescribed by the statute, we continue to believe it would not be prudent to begin redistributing more weight to cost for the 2024 MIPS payment year, except in cases when only the cost and improvement activities performance categories are scored. We should give clinicians more time to adjust to new and revised cost measures before redistributing more weight to the cost performance category. However, similar to all performance categories of MIPS, there are continued opportunities to improve the measures and activities used to assess performance. We also continue to provide detailed performance feedback on the cost measures to clinicians and expect to provide detailed feedback on any new and revised cost measures in the future, providing clinicians a further opportunity to improve their performance within cost measures. Hence, we continue to believe that reweighting the cost and improvement activities performance categories each at 50 percent would appropriately continue to balance our concerns with redistributing weight to the improvement activities performance category.

Comment: One commenter requested that if CMS finalizes the proposal to increase the cost performance category weight, then CMS take the Promoting Interoperability and improvement activities performance category weights and further redistribute them within the cost performance category due to a concern that these two performance categories do not reward the actual results on improvement in quality of care.

Response: As is reflected in our proposals, we do not intend to

redistribute a substantial portion of the performance category weight to the improvement activities performance category given that we intend to prioritize performance on measures that show a variation in performance, rather than the activities under the improvement activities performance category, which are based on attestation of completion. However, we believe that both the Promoting Interoperability and improvement activities performance categories reflect important aspects of quality improvement performance. More specifically, over time, we want to redistribute more weight to the cost and Promoting Interoperability performance categories, and less to the quality performance category, to have better alignment between the cost and quality performance categories and due to our focus on interoperability. We also disagree that we should redistribute more weight within the cost performance category than we have proposed, as clinicians are still adjusting to newly developed cost measures. As noted in our previous response, we do not believe that the cost performance category weight should be minimized but should also remain at the proposed 50 percent weight in instances of where only the cost and improvement activities performance categories are scored.

After consideration of the public comments, we are finalizing our proposed redistribution policies for the 2023 and 2024 MIPS payment years as proposed, and the codification of those policies at § 414.1380(c)(2)(ii)(E) and (F). Our finalized redistribution policies for both the 2023 and 2024 MIPS payment years are included in Table 51 and 52.

TABLE 51: Performance Category Redistribution Policies Finalized for the 2023 MIPS Payment Year

Reweighting Scenario	Quality	Cost	Improvement Activities	Promoting Interoperability
No Reweighting Needed				
- Scores for all four performance categories	40%	20%	15%	25%
Reweight One Performance Category				
-No Cost	55%	0%	15%	30%
-No Promoting Interoperability	65%	20%	15%	0%
-No Quality	0%	20%	15%	65%
-No Improvement Activities	55%	20%	0%	25%
Reweight Two Performance Categories				
-No Cost and no Promoting Interoperability	85%	0%	15%	0%
-No Cost and no Quality	0%	0%	15%	85%
-No Cost and no Improvement Activities	70%	0%	0%	30%
-No Promoting Interoperability and no Quality	0%	50%	50%	0%
-No Promoting Interoperability and no Improvement Activities	80%	20%	0%	0%
-No Quality and no Improvement Activities	0%	20%	0%	80%

TABLE 52: Performance Category Redistribution Policies Finalized for the 2024 MIPS Payment Year

Reweighting Scenario	Quality	Cost	Improvement Activities	Promoting Interoperability
No Reweighting Needed				
- Scores for all four performance categories	30%	30%	15%	25%
Reweight One Performance Category				
-No Cost	55%	0%	15%	30%
-No Promoting Interoperability	55%	30%	15%	0%
-No Quality	0%	30%	15%	55%
-No Improvement Activities	45%	30%	0%	25%
Reweight Two Performance Categories				
-No Cost and no Promoting Interoperability	85%	0%	15%	0%
-No Cost and no Quality	0%	0%	15%	85%
-No Cost and no Improvement Activities	70%	0%	0%	30%
-No Promoting Interoperability and no Quality	0%	50%	50%	0%
-No Promoting Interoperability and no Improvement Activities	70%	30%	0%	0%
-No Quality and no Improvement Activities	0%	30%	0%	70%

(iv) MIPS Applications for Reweighting for the 2021 and 2023 MIPS Payment Years Based on Extreme and Uncontrollable Circumstances

(A) MIPS Applications for Reweighting for the 2021 MIPS Payment Year Based on Extreme and Uncontrollable Circumstances

Recognizing the urgency of the PHE for COVID-19, we published the March 31st COVID-19 IFC modifying Medicare rules, including the PFS, so that physicians and other practitioners and clinicians are allowed added flexibilities due to the PHE for COVID-19. To provide relief to individual clinicians, groups, and virtual groups for whom sufficient MIPS measures and

activities may not be available for the 2019 MIPS performance period due to the PHE for the COVID-19, we extended the deadline to submit an application for reweighting the quality, cost, and improvement activities performance categories (§ 414.1380(c)(2)(i)(A)(6)), as well as the Promoting Interoperability performance category (§ 414.1380(c)(2)(i)(C)(2)) based on extreme and uncontrollable circumstances from December 31, 2019 to April 30, 2020, or a later date that we may specify (85 FR 19278). The extended deadline is available only for applications that demonstrate the clinician has been adversely affected by the PHE for the COVID-19. We also

modified the policy at § 414.1380(c)(2)(i)(A)(6) to create an exception for the 2019 performance period/2021 MIPS payment year only, such that if a MIPS eligible clinician demonstrates through an application submitted to CMS that they have been adversely affected by the PHE for the COVID-19, but also submits data for the quality, cost, or improvement activities performance categories, the performance categories for which data are submitted would still be reweighted (subject to CMS' approval of the application), and the data submission would not effectively void the application for reweighting (85 FR 19278). We also modified the policy at

§ 414.1380(c)(2)(i)(C) to create a similar exception for the Promoting Interoperability performance category for the 2019 performance period/2021 MIPS payment year only (85 FR 19278).

We invited public comments on these interim final policies. The following is a summary of the comments we received and our responses.

Comment: Several commenters expressed support for CMS' efforts to reduce administrative burden for physicians through increased availability of the extreme and uncontrollable circumstances policies. Commenters expressed their belief that these changes are necessary because it may be difficult for clinicians to meet data submission requirements for the Quality Payment Program due to circumstances beyond their control.

Response: We thank commenters for their support of our policies.

Comment: A few commenters requested that we modify our extreme and uncontrollable circumstances policies so that if clinicians do not submit an application for extreme and uncontrollable circumstances and submit data and achieve a score above the performance threshold, we use that score for payment purposes. However, in cases where clinicians achieve a score below the performance threshold, we will not use that score for payment purposes.

Response: We do not believe the approach requested by the commenters would be consistent with the statute. We do not believe the statute gives us discretion to disregard scores below the performance threshold and only apply the MIPS payment adjustments based on scores above the performance threshold.

Comment: One commenter stated that we should not require clinicians to demonstrate that they are impacted by the PHE for COVID-19 in order to receive reweighting under our extreme and uncontrollable circumstances policies.

Response: We note that we assume most clinicians are impacted by the PHE for COVID-19. However, we recognize that not all clinicians and practices have

been impacted to the same extent, and therefore, may not all need reweighting. We requested that clinicians select COVID-19 as the reason for requesting reweighting and provide a brief narrative describing how they have been impacted. More information is available at <https://qpp.cms.gov/about/covid19?py=2020>.

Comment: One commenter expressed the belief that we should provide reweighting automatically under our extreme and uncontrollable circumstances policies unless clinicians opt in for participation in the Quality Payment Program.

Response: We believe that requiring clinicians to opt in to be scored within the Quality Payment Program would place undue burden on clinicians who submitted information intending to participate in the program.

After consideration of the public comments, we are adopting these interim final policies as final without any modifications. We are finalizing the regulation text at § 414.1380(c)(2)(i)(A)(6) and (c)(2)(i)(C).

(B) MIPS Applications for Reweighting for the 2023 MIPS Payment Year Based on Extreme and Uncontrollable Circumstances

We anticipate that the national PHE for COVID-19 will continue into and through CY2021. Therefore, we remind clinicians that the application-based extreme and uncontrollable circumstances policy, as described in § 414.1380(c)(2)(i)(A)(6) and (c)(2)(i)(C)(2), will be available for the 2021 performance period/2023 MIPS payment year (please refer to <https://qpp.cms.gov/about/covid19?py=2020> for details). The application allows clinicians, groups, and virtual groups significantly impacted by the PHE for COVID-19 to request reweighting for any or all MIPS performance categories. Under this policy, however, if a clinician, group, or virtual group decides to submit data for the 2021 performance period, the data submission will override the application, and the clinician, group, or

virtual group will be scored on the data submitted. We believe this approach maintains a balance of encouraging participation in the Quality Payment Program while still providing for flexibility in weighting the performance categories for those who have been affected by the COVID-19 pandemic. Please refer to <https://qpp.cms.gov/about/covid19?py=2021> for more information.

e. MIPS Payment Adjustments

(1) Background

For our previously established policies regarding the final score hierarchy used to determine MIPS payment adjustments, we refer readers to the CY 2020 PFS final rule (84 FR 63031 through 63045), CY 2019 PFS final rule (83 FR 59878 through 59894), CY 2018 Quality Payment Program final rule (82 FR 53785 through 53799) and CY 2017 Quality Payment Program final rule (81 FR 77329 through 77343). In the CY 2021 PFS proposed rule (85 FR 50315 through 50321), we proposed to modify these policies: (1) To reflect the discontinuation of the APM scoring standard and the addition of the APM Performance Pathway (APP), both as proposed in the CY 2021 PFS proposed rule (85 FR 50303); (2) to set the performance threshold at 50 points for the 2023 MIPS payment year, instead of 60 points as previously finalized; and (3) to potentially revisit and revise the prior estimate of the performance threshold for the 2024 MIPS payment year.

(2) Final Score Hierarchy Used in Payment Adjustment Calculation

In some cases, a TIN/NPI could have more than one final score associated with it from a performance period, if the MIPS eligible clinician submitted multiple data sets. In the CY 2018 Quality Payment Program final rule (82 FR 53785 through 53787), we established the following final score hierarchy that applies as displayed in Table 53 when more than one final score is associated with a TIN/NPI.

TABLE 53: Hierarchy for Final Score When More than One Final Score Is Associated with a TIN/NPI

Example	Final Score Used to Determine Payment Adjustments
TIN/NPI has more than one APM Entity final score.	The highest of the APM Entity final scores.
TIN/NPI has an APM Entity final score and also has an individual score.	APM Entity final score.
TIN/NPI has an APM Entity final score that is not a virtual group score and also has a group final score.	APM Entity final score.
TIN/NPI has an APM Entity final score and also has a virtual group score.	APM Entity final score.
TIN/NPI has a virtual group score and an individual final score.	Virtual group score.
TIN/NPI has a group final score and an individual final score, but no APM Entity final score and is not in a virtual group.	The highest of the group or individual final score.

With the proposed discontinuation of the APM scoring standard and addition of the APP in section IV.A.2.b.(5) of the CY 2021 PFS proposed rule, we proposed to modify the existing final score hierarchy beginning with the 2021 performance period/2023 MIPS payment year. In the CY 2018 Quality Payment Program final rule (82 FR 53785 through 53787), we finalized prioritizing the APM Entity final score over any other score for a TIN/NPI by using the waiver authority for Innovation Center models under section 1115A(d)(1) of the Act and the Shared Savings Program waiver authority under section 1899(f) of the Act to waive section 1848(q)(5)(I)(i)(I) and (II) of the Act so that we could use the APM Entity final score instead of the virtual group final score for a TIN/NPI. This hierarchy was intended to incentivize APM participation; however, we proposed to terminate the APM scoring standard in section IV.A.2.b.(5) of the CY 2021 PFS proposed rule, and while we believe it is important to still encourage movement to APMs, we stated that we do not believe that prioritizing an APM Entity score over other reported MIPS

data would necessarily further our goal of increasing APM participation. The proposed modifications to the final score hierarchy would include MIPS eligible clinicians who are reporting through the APP, which is designed to provide a predictable and consistent MIPS reporting standard to reduce reporting burden and encourage continued APM participation. MIPS eligible clinicians who are already participating in APMs, and therefore, have different reporting obligations than MIPS eligible clinicians, who have not already taken that step, can opt to report through the APP and receive an APP final score that may be used in the MIPS payment adjustment calculation. Beginning with the 2021 performance period/2023 MIPS payment year, if a TIN/NPI has a virtual group final score associated with it, we proposed to use the virtual group final score to determine the MIPS payment adjustment. If a TIN/NPI does not have a virtual group final score associated with it, we proposed to use the highest available final score associated with the TIN/NPI to determine the MIPS payment adjustment. We stated that the

proposal was consistent with section 1848(q)(5)(I)(i) of the Act, which requires us to prioritize a virtual group final score over other final scores such as individual and group scores (82 FR 53786). We stated that we believe that using the highest final score available regardless of how the clinician chose to submit data to MIPS would benefit all MIPS eligible clinicians. For example, we have noticed some instances where prioritizing the APM Entity final score over other final scores has resulted in some clinicians not receiving the highest final score associated with their TIN/NPI, which may have the unintended consequence of moving clinicians away from APM participation. As we seek to move more clinicians into APMs, we believe using their highest score regardless of participation method would benefit all MIPS eligible clinicians. With the establishment of MVPs, we intend to revisit policies regarding the final score hierarchy used for payment adjustment determinations in future rulemaking.

Table 54 illustrates the proposed modified final score hierarchy.

TABLE 54: Hierarchy for Final Score When More than One Final Score Is Associated with a TIN/NPI

Scenario	Final Score Used to Determine Payment Adjustments
TIN/NPI has a virtual group final score, an APM Entity final score, an APP final score, a group final score, and/or an individual final score.	Virtual group final score.
TIN/NPI has an APM Entity final score, an APP final score, a group final score, and/or an individual final score, but is not in a virtual group.	The highest of the available final scores.

The following is a summary of the comments we received on the proposal regarding the final score hierarchy used in payment adjustment calculation.

Comment: A few commenters did not support CMS's proposal to modify the scoring hierarchy because of their belief that it may de-emphasize the role of ACOs and may create additional complexity and confusion, urging CMS to minimize the year-to-year changes to scoring policies. One commenter believed that the previous scoring hierarchy, where ACO entities scores took precedent over all other scores, worked well for ACOs and also urged CMS to not make year-to-year changes.

Response: We disagree that the modified scoring hierarchy would de-emphasize the role of ACOs, as we believe it is still important to encourage movement to APMs as we have demonstrated through our policies for the APP and MVPs. As described further in section II.E.1. of this final rule, ACOs participating in the Medicare Shared Savings Program would be required to report through the APP for purposes of determining shared savings under that program; but MIPS eligible clinicians participating in these ACOs also would have the option of reporting outside the APP for purposes of being scored under MIPS, like all other MIPS APM participants, if they should choose to do so. As the APP is optional for purposes of MIPS scoring, MIPS APM participants may report through the APP or through any other available MIPS reporting mechanism they choose. We do not intend to create additional confusion or complexity with our annual policy modifications, but rather provide a predictable and consistent MIPS reporting standard to reduce reporting burden and encourage continued APM participation.

Comment: A few commenters supported CMS's proposal to modify the final score hierarchy because of their belief that the final score hierarchy allows for flexibility that rewards high performing clinicians, encourages clinicians to continue to participate in the program, simplifies the MIPS final score determination, and benefits all MIPS eligible clinicians. One commenter stated that the modified final score hierarchy may also prevent MIPS APM participants from getting a lower payment adjustment that is based on their APM Entity final score.

Response: We agree that the modified final score hierarchy incentivizes MIPS program participation, simplifies final score determinations and provides beneficial flexibilities for all MIPS eligible clinicians. Although it is not our intent to shield clinicians from payment consequences through our policy changes, it is our intent to encourage continued participation in MIPS, to include APM participants, as well as to provide pathways for participating clinicians to be successful in the program.

Comment: Commenters supported the proposal to modify the existing final score hierarchy and understand that there is a statutory requirement to prioritize the virtual group score, if applicable. The commenters appreciate, that otherwise, CMS would allow use of the best score attributable through individual, group, or APM entity scoring.

Response: We agree that using the highest final score available, regardless of how a MIPS eligible clinician submits data to CMS, would benefit all MIPS eligible clinicians.

After consideration of the public comments received, we are finalizing our proposal, as proposed, to modify the existing final score hierarchy beginning with the 2021 performance period/2023 MIPS payment year.

(3) Establishing the Performance Threshold

Under section 1848(q)(6)(D)(i) of the Act, for each year of MIPS, the Secretary shall compute a performance threshold with respect to which the final scores of MIPS eligible clinicians are compared for purposes of determining the MIPS payment adjustment factors under section 1848(q)(6)(A) of the Act for a year. The performance threshold for a year must be either the mean or median (as selected by the Secretary, and which may be reassessed every 3 years) of the final scores for all MIPS eligible clinicians for a prior period specified by the Secretary.

Section 1848(q)(6)(D)(iii) of the Act included a special rule for the initial 2 years of MIPS, which requires the Secretary, prior to the performance period for such years, to establish a performance threshold for purposes of determining the MIPS payment adjustment factors under section 1848(q)(6)(A) of the Act and an

additional performance threshold for purposes of determining the additional MIPS payment adjustment factors under section 1848(q)(6)(C) of the Act, each of which shall be based on a period prior to the performance period and take into account data available for performance on measures and activities that may be used under the performance categories and other factors determined appropriate by the Secretary. Section 51003(a)(1)(D) of the Bipartisan Budget Act of 2018 (Pub. L. 115–123, February 9, 2018) amended section 1848(q)(6)(D)(iii) of the Act to extend the special rule to apply for the initial 5 years of MIPS instead of only the initial 2 years of MIPS.

In addition, section 51003(a)(1)(D) of the Bipartisan Budget Act of 2018 added a new clause (iv) to section 1848(q)(6)(D) of the Act, which includes an additional special rule for the third, fourth, and fifth years of MIPS (the 2021 through 2023 MIPS payment years). This additional special rule provides, for purposes of determining the MIPS payment adjustment factors under section 1848(q)(6)(A) of the Act, in addition to the requirements specified in section 1848(q)(6)(D)(iii) of the Act, the Secretary shall increase the performance threshold for each of the third, fourth, and fifth years to ensure a gradual and incremental transition to the performance threshold described in section 1848(q)(6)(D)(i) of the Act (as estimated by the Secretary) with respect to the sixth year (the 2024 MIPS payment year) to which the MIPS applies.

In the CY 2020 PFS final rule (84 FR 63031 through 63037) at § 414.1405(b)(7) and (8), we finalized the performance thresholds for the 2022 and 2023 MIPS payment years at 45 and 60 points, respectively, an increase of 15 points each year until the 2024 MIPS payment year, where we estimated the performance threshold would be 74.01 points (based on actual year 1 performance data and estimates for the third and fourth years) as depicted in Table 55. However, we also stated that we may revisit the performance threshold for the 2023 MIPS payment year in future rulemaking, if we receive additional data that changes our estimate of the performance threshold for the 2024 MIPS payment year.

TABLE 55: Performance Thresholds for the 2019 MIPS Payment Year through 2024 MIPS Payment Year

	2019 MIPS Payment Year	2020 MIPS Payment Year	2021 MIPS Payment Year	2022 MIPS Payment Year	2023 MIPS Payment Year	*Estimated 2024 MIPS Payment Year
	Year 1	Year 2	Year 3	Year 4	Year 5	*Year 6
Performance Threshold	3 points	15 points	30 points	45 points	60 points	*74.01 points
Difference in PT (year n minus (year n-1))	N/A	12 points	15 points	15 points	15 points	*14.01 points

* Prior estimate for the 2024 MIPS payment year (84 FR 63031-63037). This is the estimated performance threshold for year 6 based on modeling projections and is not the finalized performance threshold for year 6.

In the CY 2021 PFS proposed rule (85 FR 50317), we stated that we believe that we should reexamine the performance threshold for year 5 (2021 performance period/2023 MIPS payment year) due to the disruptions caused by the PHE for COVID-19. We anticipated some clinicians not having sufficient measures and activities available to participate for the fourth year (2020 performance period/2022 MIPS payment year) and opting to use flexibilities provided for MIPS participation through the extreme and uncontrollable circumstances and hardship exception policies. Furthermore, in considering the effect of the PHE for COVID-19 on clinicians, we stated that we believe that this is enough of a disruption to revisit the performance threshold for year 5, especially for clinicians who are unable to participate in year 4 due to the PHE for COVID-19.

We stated that clinicians who are unable to participate in the fourth year of MIPS due to the PHE for COVID-19, would face an abrupt and large increase in the performance threshold if they return to full participation in the fifth year, lacking the opportunity to work to improve performance. We considered a range of performance threshold values for the fifth year, from 50 to 60 points, and believe that a performance

threshold above 50 could be challenging for clinicians affected by the PHE for COVID-19, especially those with small practices. We stated that preliminary analysis has shown that when applying a performance threshold of 50 points to the data we received from the 2021 regulatory impact analysis as summarized in the CY 2021 PFS proposed rule (85 FR 50383), around 31,376 TIN/NPIs (or 5.6 percent of MIPS eligible clinicians) would have payments adjustments that go from negative to positive with a performance threshold of 50 points compared to 60 points. For example, the analysis showed with the previously finalized performance threshold of 60 points, 24.4 percent of engaged small practices would receive a negative payment adjustment, whereas with a performance threshold of 50 points, 18.8 percent of engaged small practices would receive a negative payment adjustment. In analyzing the range of performance threshold values and the impact on high performers as detailed in the CY 2021 PFS proposed rule (85 FR 50383), we saw that in setting the performance threshold at 50 points, the maximum payment adjustment is 6.89 percent whereas when setting the performance threshold at 60 points, the maximum payment adjustment is 7.36 percent, a decrease in percentage by 0.47. To

continue to incentivize high performers, we did not revisit the additional performance threshold in the proposed rule, which is set at 85 points for year 5. We proposed to set the performance threshold at 50 points for the 2023 MIPS payment year, instead of 60 points as previously finalized at § 414.1405(b)(8). The performance threshold would remain at 30 points in the third year, increase to 45 points in the fourth year, and increase to 50 points in the fifth year. The increase between the third and fifth year would total 20 points. Additionally, and as discussed in more detail below in our discussion of revising the prior estimate of the performance threshold for the 2024 MIPS payment year, we stated that we are open to considering alternatives for the performance threshold for the 2023 MIPS payment year. We solicited comments on the proposed performance threshold of 50 points, the range of values we considered, and any alternatives that commenters believe we should consider for the performance threshold for the 2023 MIPS payment year.

Table 56 depicts the performance threshold for the 2019 MIPS payment year through 2024 MIPS payment year, including the potential change to the performance threshold for the fifth year.

TABLE 56: Performance Thresholds for the 2019 MIPS Payment Year through 2024 MIPS Payment Year

	2019 MIPS Payment Year	2020 MIPS Payment Year	2021 MIPS Payment Year	*2022 MIPS Payment Year	**2023 MIPS Payment Year	2024 MIPS Payment Year
	Year 1	Year 2	Year 3	*Year 4	**Year 5	Year 6
Performance Threshold	3 points	15 points	30 points	*45 points *N/A for those who do not participate in year 4	**50 points	74.01 points
Difference in PT (year n minus (year n-1))	N/A	12 points	15 points	*15 points *N/A for those who do not participate in year 4	**5 points for those who participate in year 4 **20 points for those who do not participate in year 4	24.01 points

*Assumed affected payment year due to PHE for COVID-19 resulting in measures not being available for reporting for MIPS participants.

** Proposed new performance threshold for the fifth year.

At the time of publication of the CY 2021 PFS proposed rule, we did not have actual performance scores and other data for year 3 (2019 performance period/2021 MIPS payment year). Since the publication of the CY 2021 PFS proposed rule, we now have the CY 2019 performance year data, where the mean final score is 79.8 and the median final score is 85.27. We note these values are estimates and that the mean and median may change as we finish the targeted review process for the 2021 MIPS payment year. We stated that in the event this information becomes available with sufficient time to inform our policy decisions for the final rule, we proposed to revisit and potentially revise in the final rule our prior estimate of 74.01 points for the performance threshold for the 2024 MIPS payment year. We stated that we anticipated that the actual performance scores for the 2019 performance period/2021 MIPS payment year may be different than the estimates that we published in our regulatory impact analysis estimate (84 FR 63033) because the PHE for COVID-19 occurred during the data submission period. We also expected that the 2019 performance period data may be unusual due to the PHE for COVID-19 occurring during the submission period. We requested comments on our proposal to revisit and potentially revise our prior estimate of the performance threshold for year 6. In particular, we sought comment on what indicators (for example, if the distribution of scores is skewed due to the PHE for COVID-19), if any, should be used to evaluate

whether or not the 2019 performance period data are appropriate to use to revise our prior estimate.

Lastly, in the event that we decide to revise our prior estimate of the performance threshold for the 2024 MIPS payment year (either higher or lower) in the final rule, we proposed to consider the revised estimate when we decide on an appropriate numerical value for the performance threshold for the 2023 MIPS payment year. We gave the example that, if we believe that the estimate for the 2024 MIPS payment year performance threshold should be higher than 74.01 (say 80 or 85 points), then we anticipate the performance threshold for the 2023 MIPS payment year would be higher than 50 (likely 55 points, 60 points) to reflect the change in the estimate. We seek to ensure a gradual and incremental transition to the estimated performance threshold for the 2024 MIPS payment year, and thus, we stated that we believe that we should take into account the revised estimate when determining the performance threshold for the 2023 MIPS payment year. We solicited comments on the proposal to consider the revised estimate for the 2024 MIPS payment year when we select a performance threshold for the 2023 MIPS payment year.

The following is a summary of the comments we received on the proposal to set the performance threshold at 50 points for the 2023 MIPS payment year, instead of 60 points as previously finalized.

Comment: One commenter did not support lowering the performance threshold to 50 points from the previously finalized performance threshold of 60 points for the CY 2023 MIPS payment year, and asked CMS to maintain the performance threshold at 60 points. They referenced the statutory requirement to set the performance threshold to the mean or median of the final scores for a prior period by the CY 2024 MIPS payment year, sharing their concern that lowering the performance threshold for the CY 2023 MIPS payment year may result in a drastic increase when the performance threshold is established for the CY 2024 MIPS payment year. They indicated that this may put undue stress on clinicians who participate in MIPS. A few commenters did not support the change in the performance threshold because MIPS is budget neutral, and thus, decreasing the performance threshold provides little incentive to participate in the program, especially for practices which have made efforts to implement technology, workflows, and improve patient care. One commenter also believed that because of the increase in the complex patient bonus, practices will already be provided relief from the PHE for COVID-19.

Response: We acknowledge the commenter's concern. We agree and believe that maintaining the previously finalized performance threshold of 60 points for the CY 2023 payment year could help to ensure a more consistent increase in the performance threshold from year to year and avoid a potentially

drastic increase between the 2023 and 2024 MIPS payment years. Although we acknowledge that a performance threshold above 50 points could be challenging for clinicians affected by the PHE for COVID-19, we believe it still necessary to incentivize clinicians who are able to participate in MIPS and perform highly despite the PHE. We agree that because the statute includes a budget neutrality requirement for MIPS, decreasing the performance threshold could discourage high performance by decreasing the magnitude of the positive payment adjustments. We want to ensure that there are appropriate incentives for clinicians to continue their participation in MIPS for the 2021 performance period despite the PHE for COVID-19, hence our proposed increase in the complex patient bonus for the 2020 performance period. While we remain concerned with the impact of the PHE for COVID-19 on clinicians, we also want to continue to motivate clinicians to participate in MIPS and strive for high performance on the measures and activities.

Comment: A few commenters supported setting the performance threshold at 50 points for the CY 2021 MIPS performance period/2023 MIPS payment year instead of 60 points as was previously finalized. They believe reducing the performance threshold by 10 points is an appropriate reduction, allows for a small but gradual increase in the performance threshold from year-to-year, and addresses the difficult circumstances practices are facing during the PHE for COVID-19. One commenter also expressed that given uncertainties with the quality benchmarks, they believed a 10-point reduction would be prudent. A few commenters believed that the 10-point reduction in the performance threshold may help small practices in particular, viewing this policy change as consistent with the statute, as well as helping to maintain programmatic stability within MIPS.

Response: We thank the commenters for their recommendations and acknowledge concerns regarding potential challenges for clinicians associated with the PHE for COVID-19. While there are continued uncertainties regarding the impact of the PHE on MIPS eligible clinicians' ability to report for 2020 and 2021 performance period, we cannot ignore that the vast majority of clinicians have been able to successfully report for the 2019 performance period despite the PHE. Data analysis for the 2019 performance period showed fewer requests for reweighting the MIPS performance

categories based on extreme and uncontrollable circumstances than previously expected; however, clinicians impacted by the PHE for COVID-19 may submit an application for reweighting for the 2021 performance period, as discussed in section IV.A.3.d.(2)(b)(iv)(B) of this final rule. We want to ensure that there are appropriate incentives for clinicians, including those with small practices, to continue their participation in MIPS for the 2021 performance period even if the PHE for COVID-19 continues. It is also our intent to prepare clinicians for participation in the MIPS program beyond the PHE for COVID-19 and believe maintaining the performance threshold at 60 points for the 2023 MIPS payment year would align with increasing standards for performance necessary for successfully participating in MIPS in future years.

Comment: One commenter did not support lowering the performance threshold to 50 points from the previously finalized performance threshold of 60 points for the CY 2023 MIPS payment year because of their concerns around performance category weights and reweighting policies. They stated the performance threshold for the CY 2023 MIPS payment year should be lowered to 45 points because they believe it would be hard for some clinicians to meet the performance threshold if the cost and Promoting Interoperability performance categories are reweighted to zero percent due to clinician type, as well as a lack of applicable measures.

Response: We acknowledge the commenters concerns and recommendation to set the performance threshold at 45 points for the CY 2023 MIPS payment year. However, we believe that setting the performance threshold at 45 points for the CY 2023 MIPS payment year would create a larger and more abrupt increase in the performance threshold for clinicians who are unable to participate for the 2021 performance period due to the PHE for COVID-19 but choose to participate for the 2022 performance period. Those clinicians would be subject to a minimum of a 29.01 point increase in the performance threshold for the 2022 performance period/2024 MIPS payment year, based on our estimated performance threshold for the 2024 MIPS payment year. Under the policy we are adopting in section XXX of this final rule, if the cost and Promoting Interoperability performance categories are reweighted to zero percent, the quality and improvement activities performance categories will be reweighted to 85% and 15%,

respectively. This could provide a scenario that creates greater ease of reaching the performance threshold for clinicians participating in MIPS.

Comment: Several commenters did not support lowering the performance threshold to 50 points from the previously finalized performance threshold of 60 points for the CY 2023 MIPS payment year because they believed the performance threshold should be further reduced due to the PHE for COVID-19, limiting regulatory burden for clinicians during that time. Several commenters suggested lowering the performance threshold to 45 points, the same threshold as the CY 2022 MIPS payment year, while one commenter suggested lowering the performance threshold to 30 points, which is the same as the 2021 MIPS payment year. One commenter expressed their belief that further decreasing the performance threshold to 45 points may especially help small and rural practices. Some commenters stated that clinicians who received reweighting of the MIPS performance categories based on extreme and uncontrollable circumstances for the CY 2019 and CY 2020 MIPS performance periods would experience a significant increase in the performance threshold. Another commenter stated that since the final rule may not be published until December 1, 2020, CMS should set the performance threshold to 45 points for the CY 2022 MIPS payment year to provide clinicians with more time to familiarize themselves with the policy changes and decrease the risk of receiving a negative adjustment.

Response: We thank the commenters for their recommendations and acknowledge concerns regarding potential challenges for clinicians due to the PHE for COVID-19. Although small and rural practices may benefit from a lower performance threshold, we believe that it is important to ensure that there are appropriate incentives for clinicians, including small and rural practices, to continue their participation in MIPS for the 2021 performance period and future years, even if the PHE for COVID-19 continues. As discussed in section IV.A.3.d.(2)(b)(iv)(B) of this final rule, the extreme and uncontrollable circumstances application is an available flexibility for clinicians impacted by the PHE for COVID-19. Clinicians who receive reweighting based on extreme and uncontrollable circumstances for the CY 2019, CY 2020, and CY 2021 MIPS performance periods would experience a larger jump in the performance threshold for the CY 2022 MIPS performance period than those who

participated in MIPS for the CY 2019, CY 2020, and CY 2021 MIPS performance periods. However, we believe that maintaining the previously finalized performance threshold of 60 points for the CY 2023 MIPS payment year lends consistency to the program, which may be especially important during this challenging time.

The following is a summary of the comments we received on the proposal to revisit and potentially revise in the final rule our prior estimate of 74.01 points for the performance threshold for the 2024 MIPS payment year.

Comment: One commenter expressed their appreciation and belief that CMS has worked to create a smooth transition in increasing the performance threshold in accordance with the statute for the CY 2024 MIPS payment year.

Response: We appreciate the support and acknowledgement of our efforts to provide an ease of transition to the performance threshold for the CY 2024 MIPS payment year.

Comment: One commenter urged CMS to work with Congress on developing a legislative fix to change the statutory requirements for the CY 2024 MIPS payment year performance threshold, believing that because of the PHE for COVID-19, a change may be needed to ease the transition of increasing the performance threshold over time.

Response: We acknowledge the commenter's concern and recommendation. Given that we do not know the magnitude of impact that the PHE for COVID-19 will have on clinician participation in MIPS for the CY 2023 payment year, we believe it would be premature to seek a legislative change at this time. However, we intend to consider these concerns and potentially address them in the future.

Comment: A few commenters expressed their concern with the estimated performance threshold of 74.01 points for the CY 2024 MIPS payment year. One commenter recommended that the performance threshold increase no more than 10 percent year-over-year beginning with the CY 2024 payment year, while another commenter recommended setting the year 6 performance threshold at 75 points, since it is a round number. Commenters stated that the PHE for COVID-19 will continue into the CY 2021 performance period and may cause

unforeseen consequences. They urged CMS to use any flexibilities available in setting the performance threshold for the CY 2024 MIPS payment year.

Response: We understand the commenters concern. We understand that both direct and indirect impacts of the PHE for COVID-19 will likely continue into CY 2021. We stated in the CY 2021 PFS proposed rule (85 FR 50318) that in the event that the CY 2019 MIPS performance year data becomes available, with sufficient time to inform our policy decisions for the final rule, we proposed to revisit and potentially revise our prior estimate of 74.01 points for the performance threshold for the 2024 MIPS payment year. However, after analyzing the data for the CY 2019 performance period, we have decided not to revise our prior estimate of the performance threshold for the 2024 MIPS payment year. The statute requires that, beginning with the 2024 MIPS payment year, the performance threshold for a year must be either the mean or median (as selected by the Secretary, and which may be reassessed every 3 years) of the final scores for all MIPS eligible clinicians for a prior period specified by the Secretary. The data for the CY 2019 MIPS performance period estimates the mean final score as 79.8 and the median final score as 85.27, which are significantly higher than our prior estimate of 74.01 points for the 2024 MIPS payment year performance threshold. We plan to continue utilizing performance data, as it becomes available, to inform policy decisions in future rulemaking.

After consideration of the public comments received, we are not finalizing our proposal to set the performance threshold at 50 points for the 2023 MIPS payment year, instead of 60 points as previously finalized at § 414.1405(b)(8). We are maintaining the performance threshold at 60 points, as previously finalized, at § 414.1405(b)(8). We are also not finalizing our proposal to revisit and potentially revise our prior estimate of 74.01 points for the performance threshold for the 2024 MIPS payment year.

(4) Example of Adjustment Factors

Figure A provides an illustrative example of how various final scores would be converted to a MIPS payment

adjustment factor and potentially an additional MIPS payment adjustment factor, using the statutory formula and based on our policies for the 2023 MIPS payment year. In Figure A, the performance threshold is set at 60 points. The applicable percentage is 9 percent for the 2023 MIPS payment year. The MIPS payment adjustment factor is determined on a linear sliding scale from zero to 100, with zero being the lowest possible score which receives the negative applicable percentage (negative 9 percent for the 2023 MIPS payment year) and resulting in the lowest payment adjustment, and 100 being the highest possible score which receives the highest positive applicable percentage and resulting in the highest payment adjustment. However, there are two modifications to this linear sliding scale. First there is an exception for a final score between zero and one-fourth of the performance threshold (zero and 15 points based on the finalized performance threshold of 60 points for the 2023 MIPS payment year). All MIPS eligible clinicians with a final score in this range would receive the lowest negative applicable percentage (negative 9 percent for the 2023 MIPS payment year). Second, the linear sliding scale line for the positive MIPS payment adjustment factor is adjusted by the scaling factor, which cannot be higher than 3.0.

If the scaling factor is greater than zero and less than or equal to 1.0, then the MIPS payment adjustment factor for a final score of 100 would be less than or equal to 9 percent. If the scaling factor is above 1.0 but is less than or equal to 3.0, then the MIPS payment adjustment factor for a final score of 100 would be greater than 9 percent.

Only those MIPS eligible clinicians with a final score equal to 60 points (which is the finalized performance threshold) would receive a neutral MIPS payment adjustment. Because the performance threshold is 60 points, we anticipate that more clinicians will receive a positive adjustment than a negative adjustment and that the scaling factor would be less than 1 and the MIPS payment adjustment factor for each MIPS eligible clinician with a final score of 100 points would be less than 9 percent.

BILLING CODE 4120-01-P

Figure A: Illustrative Example of MIPS Payment Adjustment Factors Based on Final Scores and Performance Threshold and Additional Performance Threshold for the 2023 MIPS Payment Year

Note: The adjustment factor for final score values above the performance threshold is illustrative. For MIPS eligible clinicians with a final score of 100, the adjustment factor would be 9 percent times a scaling factor greater than zero and less than or equal to 3.0. The scaling factor is intended to ensure budget neutrality, but cannot be higher than 3.0. MIPS eligible clinicians with a final score of at least 85 points would also receive an additional adjustment factor for exceptional performance. The additional adjustment factor starts at 0.5 percent, cannot exceed 10 percent, and is also multiplied by a scaling factor that is greater than zero and less than or equal to 1. MIPS eligible clinicians at or above the additional performance threshold will receive the amount of the adjustment factor plus the additional adjustment factor. This example is illustrative as the actual payment adjustments may vary based on the distribution of final scores for MIPS eligible clinicians.

Table 57 illustrates the changes in payment adjustment based on the final policies from the CY 2020 PFS final rule

(84 FR 63031 through 63045) for the 2022 and 2023 MIPS payment year, as

well as the applicable percent required by section 1848(q)(6)(B) of the Act.

TABLE 57: Illustration of Point System and Associated Adjustments Comparison between the Finalized 2022 MIPS Payment Year and the Finalized 2023 MIPS Payment Year

2022 MIPS Payment Year		Previously Finalized 2023 MIPS Payment Year	
Final Score Points	MIPS Adjustment	Final Score Points	MIPS Adjustment
0.0-11.25	Negative 9%	0.0-15.0	Negative 9%
11.26-44.99	Negative MIPS payment adjustment greater than negative 9% and less than 0% on a linear sliding scale	15.01-59.99	Negative MIPS payment adjustment greater than negative 9% and less than 0% on a linear sliding scale
45.0	0% adjustment	60.0	0% adjustment
45.01-84.99.	Positive MIPS payment adjustment greater than 0% on a linear sliding scale. The linear sliding scale ranges from 0 to 9% for scores from 45.00 to 100.00. This sliding scale is multiplied by a scaling factor greater than zero but not exceeding 3.0 to preserve budget neutrality	60.01-84.99	Positive MIPS payment adjustment greater than 0% on a linear sliding scale. The linear sliding scale ranges from 0 to 9% for scores from 60.00 to 100.00. This sliding scale is multiplied by a scaling factor greater than zero but not exceeding 3.0 to preserve budget neutrality
85.0-100	Positive MIPS payment adjustment greater than 0% on a linear sliding scale. The linear sliding scale ranges from 0 to 9% for final scores from 45.00 to 100.00. This sliding scale is multiplied by a scaling factor greater than zero but not exceeding 3.0 to preserve budget neutrality. PLUS An additional MIPS payment adjustment for exceptional performance. The additional MIPS payment adjustment starts at 0.5% and increases on a linear sliding scale. The linear sliding scale ranges from 0.5 to 10% for scores from 85.00 to 100.00. This sliding scale is multiplied by a scaling factor not greater than 1.0 in order to proportionately distribute the available funds for exceptional performance.	85.0-100	Positive MIPS payment adjustment greater than 0% on a linear sliding scale. The linear sliding scale ranges from 0 to 9% for final scores from 60.00 to 100.00. This sliding scale is multiplied by a scaling factor greater than zero but not exceeding 3.0 to preserve budget neutrality. PLUS An additional MIPS payment adjustment for exceptional performance. The additional MIPS payment adjustment starts at 0.5% and increases on a linear sliding scale. The linear sliding scale ranges from 0.5 to 10% for scores from 85.00 to 100.00. This sliding scale is multiplied by a scaling factor not greater than 1.0 in order to proportionately distribute the available funds for exceptional performance

BILLING CODE 4120-01-C**f. Review and Correction of MIPS Final Score****(1) Feedback and Information To Improve Performance**

Under section 1848(q)(12)(A)(i) of the Act, we are at a minimum required to provide MIPS eligible clinicians with timely (such as quarterly) confidential feedback on their performance under the quality and cost performance categories beginning July 1, 2017, and we have discretion to provide such feedback regarding the improvement activities and Promoting Interoperability performance categories. In the CY 2018 Quality Payment Program final rule (82 FR 53799 through 53801), we finalized that on an annual basis, beginning July 1, 2018, performance feedback will be

provided to MIPS eligible clinicians and groups for the quality and cost performance categories, and if technically feasible, for the improvement activities and advancing care information (now called the Promoting Interoperability) performance categories.

On July 1, 2018, we provided the first performance feedback for the Quality Payment Program. The second performance feedback was provided on July 1, 2019. However, for this year due to the PHE for COVID-19, we stated in the proposed rule (85 FR 50321) that we may provide performance feedback after July 1, 2020 (that is, performance feedback based on data submitted for the performance period in 2019). We stated that although we aim to provide performance feedback on or around July

1 of each year, it is possible that the release date could be later than July 1 depending on the circumstances. We estimated that we would provide performance feedback in late July or early August, although we noted this timeframe could be subject to change. We directed readers to qpp.cms.gov for more information.

On August 5, 2020, we released the third performance feedback for the Quality Payment Program, which was for the 2019 performance period. Additional information is available at <https://qpp.cms.gov/about/deadlines?py=2019>. We received public comments on our expected timeframe for providing performance feedback.

Comment: One commenter noted their appreciation for the updates on the PHE delaying the release of performance year

2019 feedback reports but expressed concern that the online portal for QPP feedback reports is confusing and difficult to navigate. The commenter recommended sharing additional scoring information with MIPS eligible clinicians.

Response: We appreciated the commenters for their feedback and support. We refer readers to qpp.cms.gov Resource Library where the 2019 MIPS Performance Feedback Resources user guide details how to access and how CMS scores these reports.

g. Third Party Intermediaries

We refer readers to §§ 414.1305 and 414.1400, the CY 2017 Quality Payment Program final rule (81 FR 77362 through 77390), the CY 2018 Quality Payment Program final rule (82 FR 53806 through 53819), the CY 2019 PFS final rule (83 FR 59894 through 59910), the CY 2020 PFS final rule (84 FR 63049 through 63080), and the May 8th COVID-19 IFC (85 FR 27594 through 27595) for our previously established policies regarding third party intermediaries.

In the CY 2021 PFS proposed rule (85 FR 50321 through 50331), we proposed to make several changes to requirements for (1) third party intermediaries generally, (2) QCDRs, (3) qualified registries, and (4) remedial action.

(1) Generally

(a) Requirements for MIPS Performance Categories That Must Be Supported by Third Party Intermediaries

We refer readers to § 414.1400(a)(2) and the CY 2017 Quality Payment Program final rule (81 FR 77363 through 77364), and as further revised in the CY 2019 PFS final rule (83 FR 60088) and CY 2020 PFS final rule (84 FR 63049 through 63052) at § 414.1400(a)(2) for our current policy regarding the types of MIPS data that third party intermediaries may submit. Through the CY 2021 PFS proposed rule (85 FR 50321 through 50322), we intended to clarify our requirements of QCDRs, qualified registries, and health IT vendors with regards to submitting data for purposes of the MIPS program through revisions to our regulation codified at § 414.1400(a)(2), particularly for those third party intermediaries who are interested in supporting MVPs in the future. Therefore, we proposed to revise § 414.1400(a)(2) as follows:

Except as provided under § 414.1400(a)(2)(ii), QCDRs, qualified registries, and health IT vendors must be able to submit data for all of the following MIPS performance categories:

- Quality, except:

- ++ The CAHPS for MIPS survey; and
- ++ For qualified registries and health IT vendors, QCDR measures;

- Improvement activities; and
- Promoting Interoperability, if the eligible clinician, group, or virtual group is using CEHRT; however, a third party intermediary may be excepted from this requirement if its MIPS eligible clinicians, groups or virtual groups fall under the reweighting policies at § 414.1380(c)(2)(i)(A)(4) or (5) or (c)(2)(i)(C)(1) through (7) or (c)(2)(i)(C)(9).

Health IT vendors that do not support MVPs, must be able to submit data for at least one of the MIPS performance categories described above. We requested comments on the proposals.

We received public comments on the proposed requirements for MIPS performance categories that must be supported by third party intermediaries. The following is a summary of the comments we received and our responses.

Comment: One commenter agreed with the requirement that health IT vendors who do not support MVPs must submit data for at least one of the MIPS performance categories. The commenter stated submitting data is necessary for at least the quality category as all vendors need to be certified for submitting the QRDA file.

Response: We thank commenters for their support.

Comment: One commenter supported the reporting exception for QCDRs and qualified registries whose clinicians fall under reweighting policies.

Response: We thank the commenter for their support. For the Promoting Interoperability performance category, we currently reweight clinicians that are non-patient facing, hospital-based or who are one of the NPP types eligible for reweighting. We refer readers to review our reweighting policies at § 414.1380(c)(2).

After consideration of public comments, we are finalizing our policy as proposed at § 414.1400(a)(2).

(i) Reporting MVPs Through Third Party Intermediaries

We refer readers to section IV.A.3.a. of this final rule where we discuss reporting MVPs through third party intermediaries and summarized our proposal that QCDRs, qualified registries, and health IT vendors who support the Quality, Promoting Interoperability, and Improvement Activities performance categories may also support the reporting of MVPs.

(ii) Reporting APM Performance Pathway (APP) Through Third Party Intermediaries

We refer readers to section IV.A.3.b. of this final rule where we reiterate our proposal and include responses to public comments that beginning with the CY MIPS 2023 payment year, MIPS eligible clinicians scored under the APP would be scored on the quality measure set finalized for that MIPS performance period. Three quality measures (Quality ID# 001: Diabetes: Hemoglobin A1c (HbA1c) Poor Control (>9%), Quality ID#: 134: Preventive Care and Screening: Screening for Depression and Follow-Up Plan, and Quality ID# 236: Controlling High Blood Pressure) were proposed to be reported using the MIPS CQM and eCQM collection types.

(b) Approval Criteria for Third Party Intermediaries

(i) Background

We refer readers to § 414.1400(a)(4), the CY 2019 PFS final rule (83 FR 59894 through 59895, 60088), the CY 2020 PFS final rule (84 FR 63052 through 63053), and the May 8th COVID-19 IFC (85 FR 27594 through 27595) for previously finalized policies related to the approval criteria for third party intermediaries.

(ii) New Approval Considerations—Past Performance and Conduct

During past years of the MIPS program we have encountered third party intermediaries failing to meet program requirements and engaging in other conduct that could harm the integrity of the MIPS program. Some examples of third party intermediaries failing to meet program requirements include, but are not limited to: Failing to meet requirements to submit data for a performance category; failing to provide services throughout the entire performance period and applicable data submission period; and providing data that is not true, accurate, or complete. Additionally, we have also encountered third party intermediaries who have provided inaccurate information to the clinicians and groups they support regarding the obligation to submit data to CMS that are true, accurate and complete. For example, we are aware of third party intermediaries offering services and tools to eligible clinicians that encouraged the selection of misrepresentative data to maximize scores, commonly referred to as “cherry-picking,” that would result in the submission of data that did not accurately represent of the clinician’s or group’s performance.

In preparation for future years of the program, we believe it is important to

disapprove third party intermediaries that have demonstrated their failure to comply with program requirements or have provided inaccurate information regarding MIPS program requirements to clinicians. In the CY 2021 PFS proposed rule (85 FR 50322), we discussed that we are concerned with the potential adverse program effect of this conduct, such as delayed and erratic reporting if third party intermediaries fail to support MIPS reporting for the entire performance period and reporting period, and the possibility of inaccurate data submissions. As a result, we noted that we believe it is important to consider these factors when making determination regarding whether to approve a third party intermediary for future participation in the MIPS program.

Therefore, we proposed to amend the current § 414.1400(a)(4) to add paragraph (a)(4)(ii):

The determination of whether to approve an entity as a third party intermediary for a MIPS performance period may take into account: (1) Whether the entity failed to comply with the requirements of this section for any prior MIPS payment year for which it was approved as third party intermediary; and (2) whether the entity provided inaccurate information regarding the requirements of this subpart to any eligible clinician. We noted that we intend on utilizing all available information to make these approval determinations, including without limitation, information collected through compliance audits under our existing audit authority as described in § 414.1400(g). Third party intermediaries may be selected during the performance period to be audited for a given requirement. As a part of our outreach to a selected third party intermediary, we intend on providing additional direction with regard to the timeline and information needed for the audit. The results of the audit will be reviewed to inform future approval of a third party intermediary, and if remedial action is warranted, we noted that we will utilize our existing authority as described in § 414.1400(f). We believe use of this information in approval determinations will help reduce the risk of third party intermediaries that are unreliable, thereby avoiding a possible increase in burden to clinicians who may inadvertently select an unreliable third party intermediary for purposes of reporting for the MIPS program. We requested comments on the proposals; specifically, on whether there are other factors that should inform our

considerations when approving third party intermediaries.

The following is a summary of the comments we received and our responses.

Comment: A few commenters agreed with the proposal to take into account past performance and conduct when determining whether to approve an entity as a third party intermediary for a MIPS performance period. However, commenters requested that CMS clarify that an entity which may have failed to comply with a requirement of the MIPS program will not result in automatic disqualification as a third party intermediary for a future MIPS performance period if that entity has entered into an CMS approved Corrective Action Plan.

Response: We thank commenters for their support.

We also clarify that this policy does not establish that particular conduct or the existence of a Corrective Action Plan would automatically disqualify a third party intermediary from approval in a future performance year. Rather, this policy establishes that failure to comply with the requirements of this section for any prior MIPS payment year is a factor the agency may take into account when making a determination of whether to approve an entity as a third party intermediary for a MIPS performance period. We generally do not anticipate that conduct for which CMS has approved a Corrective Action Plan standing alone would be the basis for CMS not approving the TPI for participation in a future MIPS Performance period.

After consideration of public comments, we are finalizing our policy as proposed at § 414.1400(a)(4).

(iii) Third Party Intermediary Training and Support

In the CY 2017 Quality Payment Program final rule (81 FR 77367 through 77374) and (81 FR 77384 through 77386), we established our expectation that QCDRs and qualified registries perform certain functions related to data submission. One of those expectations is participation in ongoing support conference calls hosted by CMS (approximately one call per month) and an in-person kick-off meeting (if held) at our headquarters in Baltimore, MD. (81 FR 77368) and (81 FR 77384). The purpose of these meetings is to provide approved QCDRs and qualified registries program updates from subject matter experts who work across the Quality Payment Program. At these meetings, CMS subject matter experts and our contractors provide approved QCDRs and qualified registries with

updates, answer questions, and provide technological demonstrations. In light of the PHE for COVID-19 and consistent with the goal of infection control, we reevaluated our expectations and have decided to adopt a policy allowing for flexibility moving forward. With the health and safety of our stakeholders in mind, we noted that we believe virtual meetings would be sufficient when in-person meetings are not possible. We proposed to codify these expectations in a proposed requirement at § 414.1400(a)(4)(iii) that third parties intermediaries participate in an annual meeting and training calls as deemed necessary by CMS.

In the CY 2017 Quality Payment Program final rule (81 FR 77377 through 77382), we stated our expectations for health IT vendors that serve as third party intermediaries by obtaining data from the CEHRT of a MIPS eligible clinician and submitting such data to CMS for participation in MIPS. For further discussion of CEHRT, we refer readers to sections III.M.3 and IV.A.3.g.(1)(iv) of this final rule. Because the submission requirements and policies that may be added or modified from year to year have the potential to alter expectations for all third party intermediaries, we believe that mandatory meetings and training calls would also be appropriate for health IT vendors that will serve as third party intermediaries. Hosting training calls for health IT vendors would give us an opportunity to provide a review of requirements, answer questions, and explain updates to the annual submission process and other policies as applicable. Thus, we proposed the requirement that third party intermediaries participate in an annual meeting and training calls as deemed necessary by CMS including those third party intermediaries that are health IT vendors. We solicited comments on the best method to reach health IT vendors so that we can invite them to required meetings and share additional information. We noted that we are considering listserv communications through the QPP listserv but would welcome suggestions for other communication mechanisms.

We previously finalized the CMS-approved survey vendor approval criteria in § 414.1400(e) as discussed in the CY 2018 PFS final rule (83 FR 59907 through 59908). Among the approval criteria, § 414.1400(e)(3) established the requirement that the entity has successfully completed, and has required its subcontractors to successfully complete, vendor training(s) administered by CMS or its contractors. In the CY 2021 PFS

proposed rule, (85 FR 50323), we noted that we continue to believe these previously finalized requirements are of importance to CMS-approved survey vendors, such as CAHPS for MIPS vendors. In addition, because the submission requirements and policies that may be added or modified from year to year have the potential to alter expectations for all third party intermediaries, we noted that we believe that the proposed requirement that third parties intermediaries participate in an annual meeting and training calls as deemed necessary by CMS should also be applicable to CMS-approved survey vendors.

In summary, we believe making support calls and trainings mandatory for all third-party intermediaries will provide an abundance of value to all approved third party intermediaries themselves, as well as to the MIPS program and the clinicians who rely on third party intermediaries to make complete, accurate, usable and timely data on their behalf. We believe uniformly codifying this language is appropriate to hold all third party intermediaries accountable for the training and support. Therefore, we proposed to codify at § 414.1400(a)(4)(iii) that beginning with the 2023 MIPS payment year, third party intermediaries must attend and complete training and support sessions in the form and manner, and at the times, specified by CMS. We affirmed that, in addition to the obligations under this policy, CMS-approved survey vendors must also continue to meet the requirements at § 414.1400(e)(3).

The following is a summary of the comments we received and our responses.

Comment: One commenter supported the proposal for health IT vendors to be required to attend monthly training and support calls and requested additional opportunities to attend trainings and ask questions.

Response: We thank the commenter for their support for Health IT vendor training. We believe participation in training and support sessions will be very beneficial and educational for health IT vendors. CMS agrees that regular dialogue is an important element to help vendors receive the latest information and reminders and to give third party intermediaries the best opportunity for success of the vendor and their clinician participants. For clarification, the requirement, which applies beginning with the 2021 MIPS performance year/2023 MIPS payment year does not specifically establish mandatory monthly calls for health IT vendors but rather establishes that

attendance and completion of training and support sessions will be “in the form and manner, and at the times, specified by CMS”. We will take into account the commenter’s suggestion that training opportunities for health IT vendors should be more frequent than monthly when developing these training and support sessions.

Additionally, we did not receive comments on our proposal to message health IT vendors the same way that that we message to other third party intermediaries by utilizing our listserv communications through the QPP listserv. We are adopting this approach to communication with health IT vendors and encourage health IT vendors, if they have not already, to sign up for listserv messages at <https://qpp.cms.gov/>.

Comment: One commenter supported the proposal to require QCDRs and qualified registries to attend training and support calls.

Response: We thank the commenter for their support.

After consideration of public comments, we are finalizing our proposals as proposed.

(iv) Future Safeguards for All Third Party Intermediaries

We understand our obligation to ensure the integrity of the MIPS program and will continue to assess opportunities to strengthen program safeguards. Certain safeguards apply to all third party intermediaries, including those described in § 414.1400(a), (f), and (g). In sections IV.A.3.g.(2)(a) and IV.A.3.g.(3) of the CY 2021 PFS proposed rule, we proposed additional program safeguards in regard to data validation audit and targeted audit requirements that would apply specifically to QCDRs and qualified registries. As discussed there, the proposals would require QCDRs and qualified registries to conduct validation on data prior to the data being submitted to CMS for purposes of the MIPS program. We limited those proposals to QCDRs and qualified registries, but we solicited feedback on expanding the proposed requirements to all third party intermediaries through future rulemaking. We refer readers to sections IV.A.3.g.(2)(a) and IV.A.3.g.(3) in this final rule for a discussion of our finalized policies.

The Office of the National Coordinator for Health Information Technology’s (ONC) Health IT Certification Program provides for the certification of certain health IT. The requirements for ONC certification are based on standards, implementation specifications, and certification criteria

adopted by the Secretary. The Quality Payment Program adopted a definition of certified electronic health record technology (CEHRT) at § 414.1305.

For a discussion of the updates to 2015 Edition certification criteria referenced in the CEHRT definition adopted for the Quality Payment Program, we refer readers to section III.M. of the CY 2021 PFS proposed rule (85 FR 50323) and section IV.A.3.c.(4) of this final rule.

It is important to note that a health IT vendor which acts as a third party intermediary for purposes of the MIPS program may or may not be the same entity as a health IT developer which certifies health IT products as part of the certification program. While health IT developers may act as third party intermediaries for their customers, other service providers who do not develop health IT products may also assist MIPS eligible clinicians by submitting data obtained from CEHRT on their behalf and thereby function as a health IT vendor for purposes of the MIPS program. Furthermore, the entities that are not health IT developers must only submit data on behalf of eligible clinicians that has already been captured and calculated using the functions of CEHRT. Unlike QCDRs and qualified registries, third party intermediaries that are health IT vendors may or may not also possess expertise related to quality improvement and analysis/validation of clinical quality data, and we do not currently require these organizations to attest that they possess these capabilities.

We are increasingly aware of data integrity issues that have impacted data submitted by health IT vendors that obtain data from MIPS eligible clinician’s CEHRT and serve as third party intermediaries to submit this data on behalf of MIPS eligible clinicians. We are aware of instances in which health IT vendors have submitted data that are inaccurate and unusable. These data issues may result in improper payments or otherwise undercut the integrity of the MIPS program. In some instances, data issues caused by health IT vendors may have downstream negative impacts to the clinicians whose data the health IT vendor is submitting, such as negative payment adjustments and inaccurate data publically posted on the Physician Compare internet website of the Centers for Medicare & Medicaid Services (or a successor website).

Although we did not propose to add data validation requirements for health IT vendors in the proposed rule, we noted that we were considering ways to

impose such requirements in the future. We solicited comment on whether we should impose data validation requirements on health IT vendors as part of the third party intermediary approval process and if so, how the data validation requirements for health IT vendors should differ, if at all, from those we proposed for QCDRs and qualified registries. We noted that we believe that potentially requiring health IT vendors to validate the data they submit to us for purposes of the MIPS program will lead to the submission of data that can be considered more reliable and accurate. Therefore, we sought comment on the future application of such requirements on health IT vendors and if there are factors unique to health IT vendors that should be considered when developing such a policy. We also sought comments on: Whether health IT vendors currently submitting data on behalf of MIPS eligible clinicians possess the capabilities to engage in the data validation processes we proposed for QCDRs and Qualified Registries; the burden on health IT vendors of adopting the data validation requirements as proposed for QCDRs and qualified registries and whether the imposition of these requirements on health IT vendors would discourage health IT vendors from serving as third party intermediaries; whether alternative requirements for health IT vendors would impose less burden on these third parties' intermediaries while still ensuring that the data submitted is accurate and complete; and how any future data validation processes should impact certification under the ONC Health IT Certification Program for health IT developers who also serve as a health IT vendor third party intermediary for the purposes of MIPS.

For CMS-approved survey vendors, such as CAHPS for MIPS vendors, we did also not propose any new data validation requirements. In the CY 2018 PFS final rule (83 FR 59907 through 59908) we previously finalized requirements at § 414.1400(e) that address the validity of data submitted to CMS for CMS-approved survey vendors. Specifically, we previously finalized at § 414.1400(e)(4) that as a condition of approval the entity must have submitted a quality assurance plan and other materials relevant to survey administration, as determined by CMS, including cover letters, questionnaires and telephone scripts. We noted that we believe this previously finalized requirement at § 414.1400(e) is sufficient to address potential concerns about the accuracy of data submitted by

survey vendors; however, we solicited feedback on whether the audit requirements in the proposal should be expanded to include survey vendors.

The following is a summary of the comments we received on potential future notice-and-comment to impose new data validation requirements on health IT vendors and CMS-approved survey vendors and our responses to those comments. We refer readers to sections IV.A.3.g.(2)(a) and IV.A.3.g.(3) in this final rule for a discussion of comments and responses to our current proposed policies for data validation by QCDRs and qualified registries, respectively.

Comment: Several commenters supported future requirements for health IT vendors to perform data validation. One commenter believes that it is the responsibility of the health IT developer to ensure the validity of the data their CEHRT is producing, and that a health IT developer's certification should be tied to its ability to capture and calculate data accurately. Another commenter believes that any entity that is submitting data on behalf of a clinician to CMS (for example, QCDR or health IT vendor) should be held to the same data validation requirements of a QCDR and without these requirements, the two different standards for registries and health IT vendors would undermine the goal of standard data integrity and place increased financial burden on non-profit QCDRs above that of health IT vendors.

Response: We appreciate the support and believe additional data validation could help to promote health IT vendor accountability for the accuracy of the data they submit to CMS. We have shared with ONC the commenter's support for any future data validation process impacting certification under the ONC Health IT Certification Program for health IT developers who also serve as a health IT vendor third party intermediary for the purposes of MIPS.

Comment: Several commenters did not support health IT vendors being required to perform data validation. These commenters believe CMS requirements for data validation by health IT vendor third party intermediary for the purposes of MIPS would be costly and burdensome and duplicative and unnecessary in light of the oversight these health IT vendors receive under the ONC regulatory framework, including the recently adopted Real World Testing requirement under the 21st Century Cures Act. One commenter requested that CMS monitor results of the Condition and Maintenance of Certification Real World Testing

requirement prior to proposing requirements in MIPS. Another commenter requested that if CMS undertakes imposes additional requirements in MIPS for health IT vendors to validate data submitted on quality measures, the CMS requirements should replace work already required by ONC through the ONC certification program and real world testing, to avoid duplicative efforts.

One commenter stated that health IT developers already have to certify to each measure they offer as an eCQM and will soon be required to meet real-world testing requirements under the new Conditions and Maintenance of Certification provisions which should include testing based on current year measure specifications for the eCQM criteria. The commenter further believes that centrally validating eCQM data can be difficult because eCQM data collection can vary between each health IT developer and potentially between every provider organization depending on how a system is implemented by the provider organization. The commenter also expressed its concern with who would need to meet the eCQM data validation requirements, when they would need to meet the requirements, and for what measures the validation would need to be performed. The commenter requested that CMS work with the Electronic Health Record Association (EHRA) and its members to outline potential options for validation of measures as it relates to HIT Developers and encouraged CMS to consider means by which these requirements may be met by other activities the health IT developer is engaged in for meeting the Conditions and Maintenance of Certification such as by real-world testing. Another commenter requested CMS differentiate between developers of certified health IT and other health IT vendors due to their belief that that developers of certified health IT inherently already performs data validation.

Response: We appreciate the commenters' concerns regarding potential overlap between potential CMS data validation requirements for a health IT vendor third party intermediary for the purposes of MIPS and existing policies for oversight of health IT developers. We agree that any new data validation requirements for health IT vendors that submit data to CMS as third party intermediaries should take into account existing requirements designed to ensure these entities enable accurate reporting of data. As part of this effort, we plan to consider the real world testing Condition of Certification finalized

under ONC's 21st Century Cures Act final rule (85 FR 25765), which focuses on how certified health IT functionality is deployed in real-world settings and could potentially include activities related to validation of data reported using certified health IT. We understand that ONC's requirement does not necessarily require validation of data reported to CMS using certified health IT. Rather, we understand that the ONC condition of certification allows developers the flexibility to select measures to demonstrate how their certified health IT products function in real world environments. While data validation of eCQMs could conceivably be used as part of those real-world testing measures, we do not believe it is not a requirement to meet the Condition of Certification. We also appreciate the suggestion that CMS work with stakeholders, and plan to reach out to both health IT vendors and other interested parties prior to further action on new requirements to identify ways to minimize burden and align with existing programs.

As noted above, we will continue to work with ONC going forward as we consider any future rulemaking in this area.

Comment: One commenter did not support future requirements for CAHPS survey vendors to conduct data audits due to its belief that it would be burdensome and potentially duplicative given that CAHPS vendors are currently required to adhere to established quality control processes as outlined in the Quality Assurance Guidelines (QAGs) for each survey administration which include the requirement to maintain and submit a Quality Assurance Plan to CMS' subcontractor on an annual basis; keep records of CAHPS for MIPS quality assurance activities; and participate in other CAHPS Survey oversight activities, which can include auditing of submitted data, on-site visits and/or conference calls, and other activities as instructed by CMS.

Response: We agree with the commenter. We believe our previously finalized requirement at § 414.1400(e) is sufficient to address potential concerns about the accuracy of data submitted by survey vendors, and do not anticipate adding any new data validation requirements for CAHPS for MIPS vendors.

(2) Qualified Clinical Data Registries (QCDRs)

We generally refer readers to section 1848(m)(3)(E) of the Act, as added by section 601(b)(1)(B) of the American Taxpayer Relief Act of 2012 (ATRA) (Pub. L. 112-240, enacted January 2,

2013), which requires the Secretary to establish requirements for an entity to be considered a QCDR and a process to determine whether or not an entity meets such requirements. We refer readers to section 1848(m)(3)(E)(i)(v) of the Act, the CY 2019 PFS final rule (83 FR 60088), the CY 2020 PFS final rule (84 FR 63053 through 63058), May 8th COVID-19 IFC (85 FR 27594 through 27595) and § 414.1400(a)(4) through (b) for previously finalized policies about third party intermediaries generally and QCDRs specifically. In the CY 2021 PFS proposed rule (85 FR 50324), we proposed a technical update to § 414.1400(b) title to rename it from "QCDR approval criteria" to "QCDRs", to better align the title with the content of the regulation. In addition, we proposed policies related to QCDR: (1) Data validation audits and targeted audits; and (2) measure requirements.

(a) Data Validation Audit and Targeted Audit Requirements

In the CY 2017 Quality Payment Program final rule, we discussed our expectation that QCDRs and qualified registries would conduct validation on the data they intend on submitting for the MIPS performance period (81 FR 77366 through 77367) and provide the results of the data validation to CMS in the form of a data validation execution report by May 31st of the year following the performance period. Our intention was to establish our expectation that QCDRs would establish a process to assess whether the data are true, accurate, and complete prior to submitting them to CMS for purposes of the MIPS program. We noted that we believe it is important to establish a requirement that QCDRs conduct data validation to ensure they are actively monitoring the data they submit to CMS for purposes of a pay-for-performance program. In instances where a QCDR discovers data are inaccurate or incomplete, the entity must correct the issue prior to submitting the data to CMS in order to provide accurate certification in accordance with § 414.1400(a)(5). A QCDR that submits a false certification submits data that is inaccurate, unusable or otherwise compromised to CMS for purposes of the MIPS program may be subject to remedial action or termination under § 414.1400(f). We also noted that we believe requiring QCDRs to validate the accuracy of the data they are submitting is an important safeguard to promote accurate payments under the MIPS program. Therefore, we proposed to codify at § 414.1400(b)(2)(iv) and (v) requirements beginning with the 2023 MIPS payment year as condition of

approval each QCDR must conduct annual data validation audits and if one or more deficiencies or data errors are identified the QCDR must also conduct targeted audits. We also proposed specific obligations for those audits as discussed below.

- We proposed to codify at § 414.1400(b)(2)(iv)(A), that the QCDR must conduct data validation for the payment year prior to submitting any data for that payment year to CMS for purposes of the MIPS program. We believe it is important for QCDRs to conduct validation audits to identify and fix concerns regarding data accuracy prior to submitting data to us, including potential issues related to data aggregation and calculation. Conducting the data validation prior to data submission will lead to data being more reliable and promote compliance with the requirement of data being true, accurate, and complete. In the CY 2017 Quality Payment Program final rule, we described this auditing using the term randomized audit (81 FR 77366). We proposed instead to refer to this audit as the data validation audit in an effort to be abundantly clear regarding our expectations that the QCDR will purposefully construct a sample and conduct an audit that complies with specific regulatory requirements and also to distinguish these audits from the targeted audits discussed below and proposed at § 414.1400(b)(2)(v).

- We proposed to codify at § 414.1400(b)(2)(iv)(B), the QCDR must conduct data validation on data for each performance category for which it will submit data, including if applicable the Quality, Improvement Activities, and Promoting Interoperability performance categories. We believe that it is important that data validation is performed across all performance categories for which the QCDR submits data since QCDRs must attest that data submitted to CMS is true, accurate, and complete and data for each of these performance categories can influence score calculation and payment adjustments.

- We proposed to codify at § 414.1400(b)(2)(iv)(C), that the QCDR must conduct data validation on data for each submitter type for which it will submit data, including if applicable MIPS eligible clinicians, groups, virtual groups, voluntary participants, and opt-in participants. We believe it is important for the data submitted to CMS be accurate for all clinicians and groups for which the QCDR intends on submitting data to the MIPS program, regardless of whether they are required to participate, have opted in, or have chosen to voluntarily participate.

Therefore, we proposed to require that the data validation audits should account for all types of submitters that are utilizing the QCDR to submit data to CMS for purposes of the MIPS program. We noted the importance of validating data for all submitter types regardless of its use for payment or public reporting. Even clinicians who voluntarily report to MIPS and whose data are not used for payment purposes could have their data publically posted on the Physician Compare website. We noted that we believe all data the QCDR submits, regardless of its use for payment or public reporting, should be true, accurate, and complete.

- We proposed to codify at § 414.1400(b)(2)(iv)(D) that the QCDR must use clinical documentation (provided by the clinicians they are submitting data for) to validate that the action or outcome measured actually occurred or was performed. If the data a QCDR intends to submit to CMS for purposes with the MIPS program are to demonstrate that a clinician did a particular clinical activity or achieved a particular clinical outcome, we noted that we believe meaningful validation of such data requires the QCDR to use clinical documentation to confirm that the activity occurred or was performed.

- We proposed to codify at § 414.1400(b)(2)(iv)(E) that the QCDR shall conduct each data validation audit using a sampling methodology that meets the following requirements:

- ++ Uses a sample size of at least 3 percent of the TIN/NPIs for which the QCDR will submit data to CMS, except that if a 3 percent sample size would result in fewer than 10 TIN/NPIs, the QCDR must use a sample size of at least 10 TIN/NPIs, and if a 3 percent sample size would result in more than 50 TIN/NPIs, the QCDR may use a sample size of 50 TIN/NPIs.

- ++ Uses a sample that includes at least 25 percent of the patients of each TIN/NPI in the sample, except that the sample for each TIN/NPI must include a minimum of 5 patients and does not need to include more than 50 patients.

We believe the aforementioned sampling methodology is appropriate for multiple reasons. First, the sampling methodology criteria are consistent with the methodology established under the legacy Physician Quality Reporting System (PQRS) program and as described in the CY 2017 Quality Payment Program final rule (81 FR 77366 through 77367). As this methodology has been used for many years under the legacy program, we believe stakeholders are well versed in executing data validation audits using this sampling methodology. Second, the

proposed methodology accounts for QCDRs and qualified registries of varying sizes. Data validation requires a level of effort on the part of the QCDR to execute a data validation plan, identify a sample, and collect information for purposes of chart review; therefore, we are cognizant that requiring a larger sample size would create additional burden on QCDRs and clinicians to account for a larger volume in TIN/NPIs and medical records for review.

- We proposed to codify at § 414.1400(b)(2)(iv)(F) that each QCDR data validation audit must include the following:

- ++ Verification of the eligibility status of each eligible clinician, group, virtual group, opt-in participant, and voluntary participant. We believe that it is important for the QCDR to track the eligibility status of each clinician and group that wishes to use a third party intermediary to report, because accurate information regarding eligibility is important to ensuring payment adjustments are properly applied. Furthermore, verification of eligibility status is consistent with the requirement for QCDRs to track opt-in participants, as described at § 414.1400(a)(4)(iv) and in the context of clinicians who voluntarily report to MIPS helps ensure the accuracy of data publically posted on the Physician Compare internet website of the Centers for Medicare & Medicaid Services (or a successor website).

- ++ Verification of the accuracy of Tax Identification Numbers (TINs) or National Provider Identifiers (NPIs). Correct TINs and NPIs are critical to ensure data submitted by the QCDR are attributed to the correct clinicians and groups. Inaccurate NPIs or TINs may lead to inadvertent downstream impacts to the way clinicians and groups are scored, and assigned a payment adjustment.

- ++ Calculation of reporting and performance rates (for example, formulas included in the quality measure specifications). QCDRs must follow the measure specifications when calculating reporting and performance rates. Calculations that deviate the formulas included in the quality measure specifications undercut efforts to ensure data are consistent, reliable, and have been calculated in a uniform manner.

- ++ Verification that only MIPS quality measures and QCDR measures that are relevant to the performance period will be utilized for MIPS submission. Measure specifications for the MIPS quality measures and QCDR measures go through maintenance on an annual

basis. Use of outdated measure specifications would likely result in the QCDR submitting inaccurate or compromised data for the clinicians and groups they support. While not all measures go through substantive changes on an annual basis, there are changes to codes that do occur annually that should be accounted for when programming measures. Therefore, we noted that we believe it is important that QCDRs are utilizing the most current version of the measure specification, relevant to the performance period in which they are participating.

- We proposed to codify at § 414.1400(b)(2)(iv)(G), that in a form and manner and by a deadline specified by CMS, the QCDR must report the results of each data validation audit, including the overall deficiency or data error rate, the types of deficiencies or data errors discovered, the percentage of clinicians impacted by any deficiency or data error, and how and when each deficiency or data error type was corrected. We noted that we believe it is important that the results of the data validation be shared with us in order for us to understand the types of issues the QCDRs have encountered and what resolutions were executed to fix the issues. The information provided will help us track frequently occurring issues which may be identified as an area to provide further education. It is our belief that the report will be largely comprised of issues that were identified and resolved. However, if an issue has been identified and could not be resolved, we would want to understand what the issue is and why it could not be resolved. We emphasized that all data submitted to CMS by a QCDR on behalf of a MIPS eligible clinician, group or virtual group must be certified by the third party intermediary as true, accurate, and complete to the best of its knowledge as described in § 414.1400(a)(5). If a QCDR submits a false certification or data that are data that are inaccurate, unusable, or otherwise compromised, the QCDR may be subject to remedial action or termination as described at § 414.1400(f).

- We proposed to codify at § 414.1400(b)(2)(v)(A), that if a data validation audit under § 414.1400(b)(2)(iv) identifies one or more deficiency or data error, the QCDR must conduct a targeted audit into the impact and root cause of each such deficiency or data error for that MIPS payment year. We noted that we believe targeted audits are important to further evaluate the impact of deficiencies or data errors to the cohort of clinicians

and groups that the QCDR intends to submit data for, and for QCDRs to determine the reason the deficiency or data error occurred.

- We proposed to codify at § 414.1400(b)(2)(v)(B), that the QCDR must conduct any required targeted audits for the MIPS payment year and correct any deficiencies or data errors identified through such audit prior to the submission of data for that MIPS payment year. To promote the accuracy of the data submitted to the MIPS program for the payment year and to reduce the risk that the agency initiates payment calculations in reliance on inaccurate data, it is important for the QCDR to conduct required targeted audits and correct any deficiencies and data errors identified through those audits prior to submitting the data to CMS.

- We proposed to codify at § 414.1400(b)(2)(v)(C), the QCDR must conduct the targeted audit using the sampling methodology that meets the requirements described in paragraph (b)(2)(iv)(E). The sample for the targeted audit must not include data from the sample used for the data validation audit in which the deficiency or data error was identified.

We noted that we believe the sampling methodology we proposed for data validation audits is equally appropriate for the conduct of targeted audits. We believe that adopting the same methodology for both audit types would be less burdensome on QCDRs than requiring these entities to apply a separate sampling methodology for their targeted audits. Provided that data in the sample for the targeted audit does not overlap with the data that was reviewed in the data validation audit, we believe the targeted audit would provide the QCDR with a reasonable perspective into impact and root cause of deficiencies and data errors across the data to be submitted without imposing the burden that would result from maintaining a separate sampling methodology for targeted audits.

- We proposed to codify at § 414.1400(b)(2)(v)(D), in a form and manner and by a deadline specified by CMS, the QCDR must report the results of each targeted audit, including the overall deficiency or data error rate, the types of deficiencies or data errors discovered, the percentage of clinicians impacted by each deficiency or data error, and how and when each deficiency or data error type was corrected. As is the case with the results of data validation audits, we noted that we believe it is important that the results of the targeted audits be shared with us in order for us to understand the

types of issues the QCDRs have encountered and what resolutions were executed to fix the issues. The information provided will help us track frequently occurring issues which may be identified as an area to provide further education.

We requested comments on the aforementioned proposals, including whether stakeholders are concerned with implementing the policies for the 2023 MIPS payment year, and if so, what barriers do they believe they would face in implementing these requirements.

The following is a summary of the comments we received and our responses.

Comment: Several commenters agreed with the proposal to require data validation audits and targeted audits.

Response: We thank the commenters for their support.

Comment: A few commenters supported the proposal to require QCDRs to be held accountable to report on and correct QCDR measure logic issues or other errors generated by the QCDR.

Response: We clarify that the proposed data validation requirements for QCDRs is not targeted specifically to errors generated by the QCDR but rather to more broadly help ensure the data submitted to CMS by QCDRs is true, accurate and complete.

Comment: Some commenters stated that while they can advise the eligible clinician or group to correct their documentation practices or workflow errors, they cannot hold them accountable to act and at the point in the performance year at which this audit occurs, the QCDR will already be contractually bound to report for the eligible clinician or group based on CMS required agreements. Other commenters believe that CMS should take responsibility for disciplining eligible clinicians that refuse to make data corrections or participate in focused reviews and implement a proposal regarding such clinicians which would allow registries to submit their data, along with notification of their refusal(s).

Response: We disagree with the commenter's suggestion that CMS requires third party intermediaries to enter into agreements that would contractually bind the third party intermediary to submit data to CMS for the eligible clinician or group that the third party intermediary knows the data are not true, accurate and complete. All data submitted to CMS by a third party intermediary on behalf of a MIPS eligible clinician, group or virtual group must be certified by the third party

intermediary as true, accurate, and complete to the best of its knowledge. Therefore, in instances where a QCDR determines there is no documentation to support that a given quality action or activity was completed, the QCDR should advise the eligible clinician or group to correct their documentation practices and workflows, and the QCDR must also refrain from submitting inaccurate data to CMS. If a third party intermediary determines that the data it received for a clinician is not true, accurate or complete, and the clinicians refuse to correct the error, then the a third party intermediary should not submit the inaccurate data on their behalf. We emphasize that we do not want inaccurate data submitted to us, and we do not want a third party intermediary to submit incorrect data on behalf of non-compliant clinicians. Furthermore, as described in the CY 2020 PFS final rule (84 FR 63023 through 63027), if we determine a MIPS eligible clinician has knowingly submitted compromised data for a performance category the clinician's performance category score would be zero and the scoring weight for the category will not be redistributed. A third party intermediary that submits inaccurate data to CMS, may be subjected to the remedial action and termination under § 414.1400(f) even in instances where clinicians refuse to correct the data.

Comment: One commenter requested CMS provide a standardized process for third party intermediaries to disclose of issues prior to and after data submission.

Response: While we appreciate the commenter's request for a standardized process for third party intermediaries to disclose data issues, we believe some flexibility is needed to accommodate the range of scenarios that arise. We will issue guidance on how QCDRs and qualified registries should operationalize the required reporting on the results of each data validation audit and targeted audit in which identified data issues that have arisen prior to submission and have been corrected should be described. To disclose data issues identified in other contexts, a third party intermediary should submit a ticket to the Quality Payment Program Service Center by phone: 1-866-288-8292 (TRS: 711) from Monday–Friday, 8 a.m.–8 p.m. eastern standard time, or may contact the QPP Service Center by email: QPP@cms.hhs.gov.

QCDRs must disclose of data issues as a part of their data validation execution report. Furthermore, QCDRs are required to conduct this validation prior to submitting the data to CMS, so that

data issues may be identified and corrected. As a reminder, all QCDRs must follow the data validation audit and targeted audit requirements at § 414.1400(b)(2)(iv) and (v).

Comment: Several commenters believe that CMS should not require collection of more protected health information (PHI) than is necessary to achieve its purpose due to their concern that the codification of multiple auditing requirements related to clinical documentation and patient information could jeopardize their business models and trust with clinicians. The commenters also expressed their belief that CMS should narrowly define what should be collected via an audit, with such criteria preserving the confidentiality of patient information and not subjecting QCDRs to additional risks that they would not otherwise assume. One commenter believes that many QCDRs do not receive PHI from their participants; rather, the participants submit PHI to vendors engaged by the registry and vendors subsequently submit de-identified data to the QCDR for MIPS reporting.

Response: We do not believe that the requirement proposed at § 414.1400(b)(2)(iv)(D) would improperly increase risk to the confidentiality of patient information. Collection standards established for QCDRs are consistent with program audit requirements already established and there is no indication that this creates additional risks. CMS respects patient privacy and will not use or disclose PHI except as permitted by applicable privacy and security laws, including, but not limited to, the HIPAA Privacy Rule. Third party intermediaries are generally required to have HIPAA compliant business associate agreements with any HIPAA covered entities for which they create, receive, maintain, or transmit PHI. This should help mitigate concerns regarding receiving or viewing provider's patient's PHI during an audit.

Comment: A few commenters believe that the requirement to audit a 3 percent sample, and, if an error is found, the requirement to audit an additional 3 percent sample that excludes any TINs/NPIs from the original sample to ensure the error is corrected creates undue burden and the sample size of NPIs and TINs and number of patients per measure required for an audit should be reduced. One commenter believes that since the nature of an error can vary widely and not all types of errors require such an intensive and resource-heavy re-sampling in order to ensure that data is error free, QCDRs should be allowed to determine the most effective

and efficient manner through which they can determine the scope and root cause of any errors found in the data validation audit. Another commenter believes that either the random sample/percentage of overall users methodology or the proposal to require data validation for each submitter type be included in the data validation and audit requirements, but not both.

Response: While we understand the level of effort associated with data validation, we disagree that this causes undue burden. We believe that it is critically important that all data submitted is true, accurate and complete and all data submitted to CMS by a third party intermediary on behalf of a MIPS eligible clinician, group or virtual group must be certified by the third party intermediary as true, accurate, and complete to the best of its knowledge (§ 414.1400(a)(5)). To help ensure that the data is true, accurate and complete we believe it is important to have data validation and as appropriate audits. Ensuring data integrity and accuracy is critical for the QPP feedback, payments and public display of the data. The sampling requirements reflect our effort to minimize the burden while ensuring a meaningful assessment of the data. We believe it is appropriate for the sampling requirements for the targeted audit to include data from the sample used for the data validation audit in order to determine the scope of the impact of the data errors on those that are choosing to use the QCDR to report. Despite the commenter's suggestion that the size of the targeted audit sample be left to the discretion of the QCDR based on the nature of the error identified in data validation, we do not believe the sample size for the targeted audit should be different from the sample size for the data validation audit. Furthermore, we do not believe it should be at the QCDR's discretion which performance categories of the data submission should be audited. If a clinician is selected for auditing through the sampling methodology, they should be audited in a manner that is objective and considerate to all performance categories in which they have submitted data. As described in the CY 2021 PFS proposed rule (85 FR 50325), the aforementioned sampling methodology has been used for many years under the legacy program, and in the first few years of the MIPS program. We do not believe a smaller sample size for the targeted audit would provide us with an understanding of the impact of the error. In addition, we disagree with the commenter who suggested that the samples used for data validation and

targeting audits should not include both a minimum number of users and users of each submitter type. We believe that the samples should account for both of volume and user type in order to promote data accuracy across both these factors. We note, however, that the sample size requirements do include flexibility to reduce burden, including for example establishing that the sample size for each data validation and targeted audit does not need to include more than 50 TIN/NPIs. Therefore, we believe these sampling thresholds strike the right balance of being reliable for both large and small QCDRs and do not impose an undue burden on QCDRs.

Comment: A few commenters requested clarification regarding the calculation of sample sizes for the data validation audits and targeted data audits including: Whether "TIN/NPI" is referencing TIN-NPI combinations or is meant to be read as "TIN or NPI". Commenters also requested clarification on whether separate sample universes are required for the total number of NPIs and the total number of TINs that the QCDR submits data for; whether the sample universe can simply be based on 3 percent of the total number of TINs that a QCDR submits data for, or is the intention that the 3 percent sample size should be calculated based on the total number of unique TIN/NPI combinations, while also taking into account the minimum and maximum range requirements (for example, a minimum of 10 TIN/NPIs and a maximum of 50 TIN/NPIs); and whether the sample size of 25 percent of patients audited must be based on the total patient population for each TIN selected in the 3 percent sample or is the intention that the 25 percent of patients should be calculated based on the total number of unique TIN/NPI combinations, while also taking into account the minimum and maximum range requirements (for example, a minimum of 5 patients and a maximum of 50 patients). One commenter requested clarification and guidance on the requirement to use a 3 percent sample for targeted data audits separate from the original 3 percent sample used for data validation when an error is found.

Response: To clarify our sample sizes for data validation, the sampling methodology described in our proposal and above requires the use of at least 3 percent of the TIN/NPIs for which the QCDR will submit data to CMS, unless that 3 percent sample would result in fewer than 10 TIN/NPIs, which would require the QCDR to use at least 10 TIN/NPIs. The three percent sample size requirements is based on the QCDR's

total number of unique TIN/NPI combinations; we are not requiring two separate samples based on the number of TINs or NPIs separately. If the 3 percent sample would result in more than 50 TIN/NPIs, the QCDR may limit their sample size to 50 TIN/NPIs. For each TIN/NPI selected as a part of the auditing sample, the QCDR must audit 25 percent of the patients, with a minimum of 5 patients and a maximum of 50 patients. For example, if under a unique TIN/NPI combination a clinician has 1000 patients for a particular measure, the QCDR will only need to audit a maximum of 50 charts for this TIN/NPI for this measure. If they only have 10 patients for the given measure, the QCDR would need to review the minimum of 5 charts. In the case of 100 patients reported for a specific measure, the QCDR would need to review 25 charts.

To address what we mean by unique TIN/NPI combinations, unique combinations are how we refer the combination of identifiers used when a specific clinician (that is, NPI) is in a specific practice (that is, TIN). For example, a clinician could work under Group X for 2 days in a week and for Group Y for the remaining days in the week, this would likely result in 2 different unique TIN/NPI combinations, due to the NPI being unique to the clinician and the TIN being unique to the respective group.

The sampling methodology must be used to derive a sample for data validation. If an error was identified through the data validation audit, it would trigger the third party intermediary to conduct a targeted audit. The third party intermediary must use a sample for the targeted audit that does not include data that was used for the data validation process audit in which the error was identified. The third party intermediary must use the sampling methodology to ensure their sample size meets the requirements for the targeted audit.

Comment: One commenter stated that the proposals regarding data validation audits would be especially cumbersome and burdensome with regard to the data of anesthesiologists due to the nature of how the specialty is practiced. The commenter stated that quality measures for anesthesiologists may be derived from data from multiple sources and some practices may collect quality data on paper or practice in numerous locations. Several commenters expressed their concerns with the proposal to require auditing of the Improvement Activities and Promoting Interoperability performance categories and that meaningful validation of what

constitutes compliance may vary from one group to another. The commenters suggested that CMS provide additional guidance, as well as allow flexibility to account for the difficulty in validating information often tracked outside of a clinician's EHR, varying practice conditions and constraints that may be present when completing an audit, and the large percent of clinicians who manually enter data late in the fourth quarter.

Response: We thank commenters for their feedback. We understand that data to support the performance of a quality action within a measure may rely on multiple data sources, and the need to for clinicians, such as anesthesiologists, to consistently document the clinical action during each patient encounter, to demonstrate the quality action has been completed. However, we believe that data validation is important to ensure that the quality actions have been truly completed by the clinicians. In light of this, we plan to devote one of the upcoming support conference calls to data validation for the Promoting Interoperability and Improvement Activities performance categories. We will provide guidelines and give participants the opportunity to ask questions.

While recognizing that underlying data submission for performance categories may differ among the clinicians and groups for whom the QCDRs and qualified registries submit data, compliance by a QCDR or qualified registry with its obligation to validate the data should not vary significantly from one group to another. As it relates to the validation of information potentially tracked outside of a clinician's EHR, practice conditions, or systemic constraints due to manual data entry, we believe the required parameters for data validation and targeted audits allow sufficient flexibility to account for this data variation.

Comment: One commenter expressed concern regarding the validation of electronic measures citing its belief that the process for calculating and auditing these measures is different from manually abstracted measures because electronic measures do not consider clinician notes, audio, images, videos, and other non-computable aspects of the chart in their calculation and therefore, could fail an audit if the chart review included areas of the chart not included in the eQCM specification. The commenter also requested additional clarity regarding the term "chart review." The commenter stated that chart review should be defined as a review of the chart data which applies

to the measure specification and is available in the manner necessary for the measure calculation process (electronic or human abstraction). The commenter also cited examples of errors (such as a clinician incorrectly documenting a case by entering conflicting information in the clinical note from the discrete, electronic data fields which make up the measure specification, or the EHR storing data in an incomprehensible manner) as areas of a chart that the commenter stated should not be considered in the chart review.

Response: We agree that the measure specification and associated data source are useful guides for implementing audits that meet the data validation requirements. The QCDR must use clinical documentation (provided by the clinicians they are submitting data for) to validate that the action or outcome measured actually occurred or was performed. The eQCM specifications define the data elements in the measure logic and "calculations that deviate the formulas included in the quality measure specifications undercut efforts to ensure data are consistent, reliable, and have been calculated in a uniform manner." We remind the commenter that QCDRs and qualified registries must perform a data validation audit to identify data errors prior to data submission to CMS, such as conflicting documentation within the medical chart. QCDRs and qualified registries must correct any deficiencies or data errors identified through targeted audits prior to the submission of data for that MIPS payment year. In addition, we would like to remind the commenter that third party intermediaries must certify that all data submitted to CMS by the third party intermediary is true, accurate, and complete to the best of their knowledge. This certification applies to all data the third party intermediary submits to CMS on behalf of a MIPS eligible clinician, group or virtual group, and does not exclude data exports directly from an EHR or other data sources. You may refer to the 2021 QCDR and Qualified Registry self-nomination fact sheets for additional information. These resources are available at <https://qpp.cms.gov/about/resource-library>.

Comment: One commenter noted that the auditing of Improvement Activities has been and will continue to be a source of validation difficulty during auditing. The commenter also noted because improvement activities are not necessarily tracked within the EHR and that these items often consist of narrative information recorded and tracked elsewhere by the provider, they

should not be considered an auditable item for the third party intermediary. One commenter requested that if these requirements are finalized in the future, CMS provide discrete data points for improvement activities that do not require collection of data points.

Response: We disagree that data regarding improvement activities should be excluded from the data validation and audit requirements for QCDRs and qualified registries. We appreciate the commenter's concern that some current clinicians and groups may have current practices for documenting and tracking improvement activities that may make validating this information more challenging. However, we do not believe these operational concerns should result in improvement activities being excluded from data validation and targeted audit requirements. Within the data validation and targeted audit requirements, QCDRs and qualified registries must submit to CMS the results of each data validation audit and targeted audit, including, among other information, how and when each deficiency or data error type was corrected. In addition, QCDRs and qualified registries must correct any deficiencies or data errors identified through targeted audits prior to the submission of data for that MIPS payment year. Regarding discrete data points for improvement activities, we interpret the commenter to be requesting future guidance on how to validate improvement activities if the activity does not require collection of data. However, we clarify that completion of each improvement activity involves some form of underlying documentation, for example, in order to complete the CDC training for IA_PSPA_23—Completion of CDC Training on Antibiotic Stewardship the module requires the MIPS eligible clinician to receive a certificate of completion and per the MIPS Data Validation Criteria document would be required to maintain this certificate for a period of up to 6 years in the event of a CMS audit. Therefore, we believe it is reasonable to require data validation for improvement activities.

Comment: A few commenters stated that while a QCDR can support eligibility verification, CMS should support this process by creating scalable and secure access to this information by either pulling data for QCDRs or having an application programming interface that communicates such information. One commenter also requested that CMS include language in the final rule emphasizing that eligibility verification is ultimately the clinician's responsibility, and not the QCDR's.

Response: As the submitter of data on behalf of the clinicians, we believe QCDR should check on clinician eligibility so that the clinician can make an informed decision regarding participation.

While we understand the commenters' recommendation may relieve some burden on the QCDRs from verifying eligibility, it is not operationally feasible to depend on CMS to conduct this verification on behalf of the QCDRs. QCDRs should verify and track the eligibility of the clinicians and groups they intend to support for purposes of MIPS reporting. This becomes particularly important for tracking purposes, in case issues arise with regard to final scores and payment adjustments, as it is necessary for the QCDR to delineate MIPS eligible clinicians from voluntary participants and opt-ins.

We provide the public, including QCDRs participating in the Quality Payment Program, with an Application Programming Interface (API) that can assist with determining eligibility for clinicians and groups which can be found at <https://cms.gov.github.io/qpp-eligibility-docs/>. Information can be obtained primarily by the Clinician type, by searching by NPI. The information contained in these endpoints includes basic enrollment information, associated organizations, information about those organizations, individual and group special status information.

Comment: One commenter stated that verifying the accuracy of TINs and NPIs is burdensome for some QCDRs and requested that CMS provide clarification regarding this verification as well as allow flexibility in how such data are verified.

Response: We continue to receive data that cannot be attributed to a specific clinician due to an inaccurate TIN, NPI, or TIN/NPI combination. While we understand there is a level of effort on the part of the QCDR that is required to verify the accuracy of TINs and NPIs, we believe this is an important requirement for QCDRs to track. We have provided suggested methods in the CY 2017 Quality Payment Program final rule of verifying the accuracy of TINs and NPIs (81 FR 77366), but we have not required QCDRs to use this approach. Any alternative process used by the QCDR should be reliable, valid, and capable of being repeated in a manner that is consistent for all verification attempts.

Comment: One commenter requested confirmation as to how random human errors should be treated under the targeted data audit requirement when

identified during the randomized audit process. Specifically, the commenter requested clarification on whether a targeted audit needs to be conducted on a separate sample universe (for example, on a sample that does not include any data from the sample used for the data validation audit in which the error was identified) if, for example, the only errors identified during the randomized audit were attributed to random human error, such as a human medical coding error. The commenter also requested for clarification on whether it is sufficient to document that a detailed review was conducted as part of the randomized audit process to identify the root cause of the error (for example, that the root cause was, in fact, attributable to random human error) and to establish and implement a plan for correcting any such random human errors that were identified.

Response: We reiterate for QCDRs all policies regarding data validation audit and targeted audit requirements at § 414.1400(b)(2)(iv) and (v) must be followed. All errors, regardless of whether they are human-based or systems-based must be identified as a part of the data validation efforts. If an error is identified through data validation, regardless of whether the error is human-based or systems-based, that would then trigger the QCDR to conduct a targeted audit utilizing a sample that is unique to the sample that was used for the data validation audit. It is not sufficient to document a detailed review or root cause analysis that was done as a part of the data validation audit (previously referred to as the randomized audit). We believe that QCDRs should utilize a structured data validation methodology, inclusive or a targeted audit in instances where the data validation audit results in the discovery of errors. An audit process provides a level of structure that will lead to consistency in the type of findings discovered. Furthermore, we are concerned with allowing QCDRs discretion to conduct their root cause analysis using an undefined variety of methods may lead to arbitrary and incomplete findings. The QCDR must separately conduct the targeted audit in accordance with regulatory requirements in each instance in which data validation audit identifies one or more deficiency or data error. An alternative approach to the targeted audit will not be accepted. We will maintain our structured validation process, in which the results of the audit are shared in a manner that is standardized across all participating QCDRs and qualified registries.

Comment: A few commenters stated that this requirement of data validation audits would create additional burden and operational challenges because QCDRs have no official role, delegated authority, or guidance from CMS as a CMS auditor. Commenters also stated that if a practice disagrees with the decision of a QCDR audit, there is no clear path as to how a QCDR could respond and be supported in their decision by CMS. One commenter also stated that CMS should allow Improvement Activities submissions that QCDRs receive be sent to CMS's QPP service center so that the service center can provide guidance to QCDRs on whether each submission can be accepted/approved.

Response: While we understand data validation requires a level of effort by the QCDR, we want to note the importance of QCDRs validating the data they intend to submit to us for purposes of the MIPS program. It is our expectation that QCDRs will ensure that the data submitted is true, accurate, and complete. To be clear, QCDRs are not designated to be auditors on behalf of CMS. QCDRs are required to conduct validation to promote the accuracy of their own submissions. We encourage the QCDR to keep documentation of instances in which a clinician does not provide the data requested for validation, and suggest that the QCDR consider annotating the report with the results of their data validation audits to outline instances where clinicians refuse to cooperate. The inclusion of information of these occurrences will help bring such issues to our attention, and may lead to the non-compliant clinician's selection for auditing as described in § 414.1390. While QCDRs are required to conduct data validation regardless of the clinician type and performance category; we clarify that clinicians who fail to submit accurate data to us, regardless of whether they use a third party intermediary or submits their data directly to us, will also be held responsible. We disagree that the QPP Service Center should be involved in determining data for an improvement activity are valid. QCDRs are expected to utilize the existing improvement activity guidance that may be found in the resource library at www.qpp.cms.gov to validate that the clinician or group has successfully completed the activity before it is attested to.

Comment: Many commenters disagreed with the proposal to require data validation specific to performance category, submission mechanism, and submitter type. Commenters believe the proposal is duplicative of internal

quality data controls and external audits already conducted; and data validation for clients who are manually entering data may be difficult to audit, as many clinicians and practices do not complete data entry until late in the fourth quarter of the performance period.

Response: We disagree with the commenters objecting to the scope of data validation. As described in the CY 2021 PFS proposed rule (85 FR 50324), the data validation requirements including validation specific to performance category, submission mechanism, and submitter type align with current practices currently utilized by QCDRs that have been in place since the 2017 performance period of the MIPS program, and therefore, pose no additional burden. We acknowledge that QCDRs in previous years of the MIPS program have performed data validation audits utilizing internal resources or hiring external contractors and have been able to share the results of their data validation with CMS. By establishing these data validation requirements in regulation, it is our intent to ensure minimum validation efforts are robust and consist across all QCDRs. We understand that some clinicians and practices may not complete data entry until late in the fourth quarter of the performance period, but we disagree that should be a deterring reason as to why QCDRs could not validate data. We encourage QCDRs to advise their participants to submit data throughout the year. By receiving data earlier in the year, not only will the QCDR be able to validate their data earlier, but they will be able to provide more timely performance feedback to their clinicians and groups in accordance with § 414.1400(b)(2)(ii), which would allow the clinician to take action on the data and improve the quality of care their patients receive—which is one of the main goals of the program.

Comment: One commenter disagreed with the proposal to apply this requirement to voluntary submitters since they would be required to agree to the audit requirements and their incentive to participate may be hampered by the additional work associated with the audit.

Response: We appreciate the commenter's concern that data validation may be a disincentive to some voluntary submitters; however, we believe this concern is outweighed by the need to promote the accuracy of the data we receive. We want to note that all data submitted may be subjected to display on Physician Compare internet website of CMS (or a successor website), and that data would be subjected to the

requirements at § 414.1395.

Accordingly, all data submitted to us will face the data validation audit and targeted audit requirements at § 414.1400(b)(2)(iv) and (v).

Comment: Another commenter suggested CMS may consider having QCDRs prepared to provide such documentation upon request, as it does for other audits in order to minimize burden on behalf of the vendors, practices they contract with, and CMS, while upholding the integrity of these audits. One commenter stated that the requirement to use clinical documentation may not be feasible for all QCDRs to complete. The commenter stated the QCDR may not have access to the medical record because they do not always have business associate agreements (BAAs) set up that allow for data access, and that without this access to the medical charts, the data validation and audit will be unable to occur.

Response: As described at § 414.1400(g)(2), all third party intermediaries must retain all data submitted to CMS for purposes of MIPS for 6 years from the end of the MIPS performance period. However, these documentation retention requirements are distinct from the data validation requirements. To be clear, QCDRs should have access to clinician documentation in order to complete the data validation requirements, and the access should be readily provided by clinicians who are selected through the sampling methodology. It is not sufficient to merely have this documentation available upon CMS request in meeting these data validation and targeted audit requirements since the validation and auditing must be completed prior to data submission.

Comment: One commenter requested that CMS provide a template and/or guideline for the data validation process and report.

Response: On an annual basis, we have provided QCDRs with data validation execution report templates, so they could share information about their data validation process and results with CMS. We refer readers to the Quality Payment Program resource library website at <https://qpp.cms.gov/about/resource-library> where we have published these in the past. At § 414.1400(b)(2)(iv) and (v) we are finalizing regulatory requirements for annual reports to regarding data validation and targeting audits for the 2023 MIPS payment year and beyond. We intend to publish updated report templates in the QPP Resource Library: <https://qpp.cms.gov/about/resource-library>.

Comment: One commenter requested that CMS publish minimum data accuracy requirements due to its belief that performance data is never 100 percent accurate and since QCDRs do all that is within their power to ensure data accuracy, they should not incur fines or other disciplinary action for data accuracy issues outside their control.

Response: Ensuring data is correct and suppressing inaccurate data is the responsibility of the QCDR. Accurate data is critical to calculate any payment differentials for clinicians in addition to displaying performance results on one of our compare websites. It is anticipated that the accuracy of data should improve over time and thus setting a specific reliability threshold does not allow the flexibility needed to preclude poorly performing vendors.

Comment: A few commenters noted that in order to facilitate data validation, CMS should provide a mechanism to identify and verify the clinicians that are associated with a group by TIN and NPI. The commenters believed that QCDRs could more successfully serve clinicians if this information was readily available within the QPP Portal early in the performance year rather than requiring QCDRs to access the CMS Developer or Submissions API, which is not available until the third or fourth quarter of a reporting year.

Response: For the provider eligibility, CMS provides the public, including QCDRs participating in the Quality Payment Program, with API that can assist with determining eligibility for clinicians and groups which can be found at <https://cms.gov.github.io/qpp-eligibility-docs/>. Information can be obtained primarily by the Clinician type. You can query the Clinician type by passing in an National Provider Identifier, or NPI. The information contained in these endpoints includes basic enrollment information, associated organizations, information about those organizations, individual and group special status information. QCDRs do have access to the public API. The API is updated when our eligibility data is updated for the public. Therefore, QCDRs have the availability to pull the data at the same time as clinicians to go into the QPP look up tool to check their eligibility. The final eligibility runs are not complete until the second eligibility determination period concludes, which falls on the close of the Fiscal Year. We do not allow TIN lookup, as this information is viewed as PII, but all data can be viewed by group name or NPI. In addition, we do offer third party intermediaries, excluding the CAHPS for MIPS vendors, the ability to utilize OAuth integration to allow for more

robust set of access and integration. Please refer to sections VII. and VIII. of this final rule where this process is discussed in greater detail.

After consideration of public comments, we are finalizing the proposed data validation requirements and targeted audit requirements at § 414.1400(b)(2)(iv) and (v) as proposed.

(b) QCDR Measures

We refer readers to § 414.1400(b), the CY 2017 Quality Payment Program final rule (81 FR 77374 through 77375), the CY 2018 Quality Payment Program final rule (82 FR 53813 through 53814), the CY 2019 PFS final rule (83 FR 59900 through 59906), the CY 2020 PFS final rule (84 FR 63058 through 63074), and the May 8th COVID–19 IFC (85 FR 27594 through 27595) for where we previously finalized standards and criteria for QCDR measures. In the CY 2021 PFS proposed rule (85 FR 50326), we proposed modifications to previously finalized QCDR measure requirements. While we understand the level of time and work needed to meet these requirements, we would not be grandfathering in previously approved QCDR measures.

(i) QCDR Measure Considerations and Requirements for Approval or Rejection

We refer readers to § 414.1400(b)(3), the CY 2020 PFS final rule (84 FR 63059 through 63073) for our previously finalized policies related to the QCDR measure considerations and requirements for approval or rejection. Through education and outreach, we have heard stakeholders' concerns about the complexity of reporting when there is a large inventory of QCDR measures to choose from, and we noted that we believe the proposals would help to refocus measures to those most meaningful to a clinician's scope of practice.

In the 2021 PFS proposed rule, we proposed to modify a few QCDR measure requirements: Measures in MVPs; measure testing; duplicative QCDR measures; and collection of data as discussed below.

(A) QCDR Measures in MVPs

We refer readers to section IV.A.3.a. of this final rule, where we discuss QCDR measures in MVPs. While we acknowledged the level of innovation that QCDRs have put forward as they have developed and implemented QCDR measures, we noted the differences between the QCDR measures utilized in the existing MIPS reporting method versus that of MVP reporting. In the current MIPS program, clinicians and groups may select to report on

measures from a large library of what is available through the MIPS quality measure inventory and that of the QCDR measures available, if they choose to report through a QCDR. In our gradual transition to MVPs, we move to subsets of measures and activities, where clinicians may have a more focused selection of items to report on.

For that reason, it is important that the measures included in an MVP are reliable, feasible, and valid as to not inadvertently cause a clinician or group an issue with submission, calculation, and scoring of a given measure. We refer readers to our discussion below about measure testing requirements for QCDR measures in MVPs.

(B) Measure Testing Requirements

In the CMS Blueprint,¹⁴² measure testing enables a measure developer to assess the suitability of the quality measure's technical specifications and acquire empirical evidence to help assess the strengths and weaknesses of a measure with respect to the NQF Measure Evaluation Criteria and Guidance for Evaluating Measures for Endorsement. Information gathered through measure testing is part of full measure development, and this information can be used in conjunction with expert judgment to evaluate a measure. For Blueprint purposes, measure testing refers to testing quality measures, including the components of the quality measures, such as the data elements, the instruments, and the performance score.

We refer readers to the CY 2019 PFS final rule, where we gave notice to the public that we were considering proposing to require reliability and feasibility testing as an added criterion for a QCDR measure to be considered for MIPS in future rulemaking (83 FR 59901 through 59902). After consideration of the previous public comments received, and our priority to ensure that all measures available in MIPS are reliable and valid thereby reducing reporting burden on eligible clinicians and groups, we finalized a requirement to require all QCDR measures to be fully developed and tested, with complete testing results at the clinician level, beginning with the CY 2023 payment year in the CY 2020 PFS final rule (84 FR 40816).

(aa) Measure Testing Requirements in IFC

In response to the PHE, we issued changes in the May 8th COVID–19 IFC

¹⁴² <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/Downloads/Blueprint.pdf>.

(85 FR 27594 through 27595). We had heard from third party intermediaries, specifically QCDRs, that due to the COVID-19 pandemic they anticipated being unable to complete QCDR measure testing or collect data on QCDR measures for the 2021 MIPS performance period as specified at § 414.1400(b)(3)(v)(C) and (D). Both QCDR measure approval criteria necessitate QCDRs collecting data from clinicians in order to assess the measure. Over 50 percent of the QCDRs approved for the 2020 performance period are supported by specialty societies that represent and support clinicians on the front lines of the COVID-19 pandemic, or are hospitals that are directly impacted by the pandemic. We also anticipated that there will be a lack of available data for some QCDR measures because clinicians who work in specialties that are not primarily caring for COVID-19 patients may have their cases or elective procedures canceled or delayed so that resources can be redistributed. As a result, we anticipated that QCDRs may be unable to collect, and clinicians unable to submit, data on QCDR measures due to prioritizing the care of COVID-19 patients.

We believed that clinicians who are on the frontlines taking care of COVID-19 cases should not be burdened with having to submit data to a QCDR for purposes of QCDR measure assessment (testing and data collection). In consideration of clinicians' limited resources and in an effort to reduce burden on clinicians and health care organizations that are responding to the COVID-19 pandemic, we are amending the QCDR measure approval criteria previously finalized in the CY 2020 PFS final rule (84 FR 63065 through 63068), specifically the completion of QCDR measure testing at § 414.1400(b)(3)(v)(C) as discussed in section II.R.1. of the May 8th COVID-19 IFC (85 FR 27594 through 27595).

In the CY 2020 PFS final rule (84 FR 63065 through 63067), we finalized at § 414.1400(b)(3)(v)(C) that beginning with the 2021 performance period, all QCDR measures must be fully developed and tested, with complete testing results at the clinician level, prior to submitting the QCDR measure at the time of self-nomination. For the reasons discussed in May 8th COVID-19 IFC (85 FR 27594 through 27595), we delayed the implementation of this policy by 1 year. Specifically, we amended § 414.1400(b)(3)(v)(C) to state that beginning with the 2022 performance period, all QCDR measures must be fully developed and tested, with complete testing results at the

clinician level, prior to submitting the QCDR measure at the time of self-nomination.

During this 1 year delay, we will continue to review QCDR measures as in past years to ensure they are valid, reliable, and align with the goals of the Meaningful Measure initiative. This process includes review by quality measure experts; QCDR policy subject matter experts; clinicians, including physicians, nurses, and PTs/OTs, who work on our support contractor team; and CMS Medical Officers. We will continue to review QCDR measures for potential risk of patient harm (for example, QCDR measures that promote clinical practices related to overuse). We also will continue to review QCDR measures for feasibility and accuracy and reliability of results. For more information, we refer readers to the 2020 QCDR Measure Development Handbook.

The following is a summary of the comments we received and our responses.

Comment: A few commenters supported the proposed delay of QCDR measure data collection requirements such that developers will have until the 2022 performance period to collect complete testing results at the clinician level prior to submitting new measures for consideration.

Response: We thank commenters for their support.

Comment: One commenter recommended that CMS gradually implement the requirements and continue to monitor the impact COVID-19 may have on QCDR testing. The commenter expressed concern that it can take a developer months to execute a QCDR testing contract with a testing vendor and that the current number of vendors available will not be able to meet the increased demand. The commenter recommended that CMS allow a grace period for the new requirements for existing measures, with an initial focus on testing measures reported by the majority of QCDR participants. For new or modified measures, the commenter recommended that CMS provide provisional approval and require testing in a future year when more data is available for testing.

Response: We refer readers to the CY 2018 Quality Payment Program proposed rule (82 FR 30160) where we described our goal and sought comment on having fully tested QCDR measures within the MIPS program. Furthermore in the CY 2019 PFS final rule, we gave notice to the public that we were considering proposing to require reliability and feasibility testing as an added criteria in order for a QCDR

measure to be considered for MIPS in future rulemaking (83 FR 59901 through 59902). Furthermore, as we have signaled through previous rulemaking cycles (83 FR 59901 through 59902), we have intended to raise the bar for QCDR measures that are available for reporting within the MIPS program.

After consideration of the public comments received in the CY 2019 PFS final rule, and our priority to ensure that all measures available in MIPS are reliable and valid thereby reducing reporting burden on eligible clinicians and groups, we moved forward with our proposal in the CY 2020 PFS proposed rule. Consequently, in the CY 2020 PFS final rule (84 FR 63065 through 63067), we finalized at § 414.1400(b)(3)(v)(C) that beginning with the 2021 performance period, all QCDR measures must be fully developed and tested, with complete testing results at the clinician level, prior to submitting the QCDR measure at the time of self-nomination. For the reasons discussed in May 8th COVID-19 IFC (85 FR 27594 through 27595), we delayed the implementation of this policy by 1 year, until the 2022 performance period. Even before the publication of the May 8th COVID-19 IFC, QCDRs should have already been preparing for this measure testing to occur as part of the finalized policies in the CY 2020 PFS final rule. We believe stakeholders have had adequate notice of this requirement in order to prepare. Furthermore, as described in section IV.A.3.g.(2)(b)(i)(B) of this final rule, we are finalizing the proposed updates to the QCDR measure testing requirement to implement the measure testing requirement in an incremental manner.

Based off experience in past performance periods of the MIPS program, there have been several situations where QCDRs have flagged for us mid performance period that they had issues collecting data on a QCDR measure, had trouble implementing the QCDR measure, or had technical issues with the measure specifications. These issues, identified mid performance period have led to QCDRs informing us that they could no longer successfully support the reporting of the impacted QCDR measure. Such issues have had downstream impacts on clinicians who have to scramble at the last minute to quickly find an alternative measure to report to satisfy the quality reporting requirements of the MIPS program. It is evident that such issues demonstrated that these measures lacked reliability, validity, and feasibility and should not have been utilized in the program. Therefore, we believe it is critical to implement measure-testing standards

that will ensure that the QCDR measures in the MIPS program are reliable, valid, and feasible. This requirement will avoid the inadvertent burden to clinicians, particularly small practices and rural practices, that is associated with issues that occur with QCDR measure during the performance period. We understand that it is difficult to determine how the PHE for COVID-19 will impact QCDRs, but believe it is imperative that QCDR measures that are available in the program are reliable because of the associated scoring calculations that are connected to payment adjustments in the MIPS program. Furthermore, as described in the CY 2020 PFS final rule (84 FR 63066), while we understand the increased time and cost burdens associated with measure testing, we believe the benefits of completed measure testing far outweigh the burdens of it. We want all measures available in the MIPS program to be reliable, feasible, valid, and implementable within the program. We want to avoid scenarios that would arise by allowing measures that do not meet these standards, which then may lead to issues with the measure mid performance period. We do not believe it is appropriate to have untested measures within the MIPS program since clinician's performance on measures have impacts on their payments. We acknowledge that not all QCDR measures currently approved would continue in the program due to business decisions by each QCDR.

After consideration of public comments, in this final rule we are finalizing the delay of this policy by 1 year, such that § 414.1400(b)(3)(v)(C) states that beginning with the 2022 performance period, all QCDR measures must be fully developed and tested, with complete testing results at the clinician level, prior to submitting the QCDR measure at the time of self-nomination. To clarify, this policy is effective from May 8, 2020 through the end of the MIPS 2022 performance period since we are finalizing further changes to this policy below as described in section A.3.g.(2)(b)(i)(B) of this final rule, where we discuss the finalization of the proposed updates to the QCDR measure testing requirement to implement the measure testing requirement in an incremental manner beginning with the 2022 performance period.

(bb) Overview

With this delay in mind and based on stakeholder feedback on the level of burden, the limited amount of time, and costs associated with measure testing

after the CY 2020 PFS final rule published, in the 2021 PFS proposed rule, we proposed to both further modify our QCDR measure testing policy generally and add testing policies for QCDR measures that are being considered for inclusion in MVPs. In that rule, we noted that we continue to believe that reliable, valid measures with robust testing with empirical data should be used in quality evaluation and payment programs. However, we discussed that we want to balance those interests with stakeholders' concerns. Therefore, we proposed a gradual approach to have fully tested QCDR measures within the MIPS program. We emphasized that we still believe that all QCDR measures should be fully tested, particularly as we rely on the data from these measures to score clinicians which impact their final score and associated MIPS payment adjustments, and as we seek to utilize QCDR measures in MVPs, as summarized in section IV.A.3.a of this final rule. In the 2021 PFS proposed rule, we proposed at § 414.1400(b)(3)(v)(C)(1) that, generally, to be approved for the 2024 MIPS payment year, a QCDR measure must be face valid. To be approved for the 2025 MIPS payment year and future years, a QCDR measure must be face valid for the initial MIPS payment year for which it is approved and fully tested for any subsequent MIPS payment year for which it is approved. Therefore, we proposed to revise § 414.1400(b)(3)(v)(C) to account for an incremental approach to require fully tested QCDR measures. We discussed requirements for QCDR measures considered for inclusion in an MVP separately. These policies are discussed in more detail further below.

(cc) Requirements for Existing QCDR Measures

In the 2021 PFS proposed rule, we proposed that QCDR measures that were previously approved for the CY 2022 MIPS payment year, would be required to, at a minimum, be face valid prior to being self-nominated for the CY 2024 MIPS payment year. Face validity is defined in the CMS Measures Blueprint¹⁴³ as the following: The extent to which a test appears to cover the concept it purports to measure "at face value." It is a subjective assessment by experts of whether the measure reflects the quality of care (for example, the utilization of a current clinical guideline to frame the measure, such as

using the blood pressure guideline of < 140/90 is a marker of quality).

In addition, we proposed that these measures, which were approved for the preceding MIPS performance year with face validity (that is, CY 2024 MIPS payment year), would be required to be fully tested prior to being self-nominated for any subsequent performance periods (that is, CY 2025 MIPS payment year and beyond) in order to be considered for inclusion in the MIPS program.

In the CY 2019 PFS final rule, we referred readers to the CMS Blueprint for the CMS Measures Management System (available at <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/Downloads/Blueprint.pdf>) for a definition of "fully developed with completed testing results at the clinician level" (84 FR 40817). Our Blueprint discusses both alpha and beta testing (Blueprint 15.0 September 2019 Page 207–208). To avoid any potential confusion, we clarified in the CY 2021 PFS proposed rule that for purposes of QCDR measures, we would expect QCDR measures to complete beta testing to be considered fully tested. Beta testing is defined in the CMS Measures Blueprint¹⁴⁴ as the following: Beta testing (that is, field testing) generally occurs after initial technical specifications have been developed and is usually larger in scope than alpha testing. In addition to gathering further information about feasibility, beta tests serve as the primary means to assess scientific acceptability and usability of a measure. For example, beta testing allows for an enhanced evaluation of a measure's importance, including evaluation of performance thresholds, disparities analysis, and outcome variation. It helps in looking for opportunities for improvement in the population, which aids in measuring the QCDR measure's importance for reasons that include evidence collection to measure variability among comparison groups, to demonstrate the measure is not topped-out where most groups achieve similarly high performance levels approaching the measure's maximum possible value. We referred readers to the CMS Blueprint for the CMS Measures Management System at <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/Downloads/Blueprint.pdf>.

¹⁴³ <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/Downloads/Blueprint.pdf>.

¹⁴⁴ <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/Downloads/Blueprint.pdf>.

Blueprint.pdf for additional details regarding beta testing.

The following is a summary of the comments we received and our responses.

Comment: Several commenters agreed with the proposal to delay the requirement for QCDR measures to be fully tested by 1 year and only require face validity for the 2021 performance period.

Response: We thank commenters for their support. In the 2021 PFS proposed rule, we proposed that QCDR measures that were previously approved for the CY 2022 MIPS payment year, would be required to, at a minimum, be face valid prior to being self-nominated for the CY 2024 MIPS payment year. We want to clarify for commenters that this policy would affect the 2022 performance year.

Comment: A few commenters recommended that the requirement for full measure testing should be further delayed until at least 1 year after the PHE for COVID-19 ends. One commenter cited its preference for an approach where a potential measure is tested and peer reviewed by a committee for inclusion in the program.

Response: In the May 8th COVID-19 IFC (85 FR 27594 through 27595), we already delayed the requirement due to the PHE, such that beginning with the 2022 performance period, all QCDR measures must be fully developed and tested, with complete testing results at the clinician level, prior to submitting the QCDR measure at the time of self-nomination. However, in the 2021 PFS proposed rule, we proposed further changes, such that QCDR measures that were previously approved for the CY 2022 MIPS payment year, would be required to, at a minimum, be face valid prior to being self-nominated for the CY 2024 MIPS payment year. In addition, we proposed that these measures, which were approved for the preceding MIPS performance year with face validity (that is, CY 2024 MIPS payment year), would be required to be fully tested prior to being self-nominated for any subsequent performance periods (that is, CY 2025 MIPS payment year and beyond) in order to be considered for inclusion in the MIPS program. Therefore, fully tested measures are not required until the CY 2025 payment year and subsequent years (CY 2023 performance year). We believe this is a reasonable amount of time to prepare and balances the need to have fully tested, valid, and reliable measures in the MIPS program, which bases payment on quality metrics such as QCDR measures. While we do not specifically require QCDRs to utilize a process that involves peer review by a

committee, we support those QCDRs that wish to do so.

Comment: A few commenters requested additional clarification on the required process and evaluation criteria for QCDR measure testing. Commenters requested detailed requirements and specific targets to enable greater understanding of how testing should be completed, as well as clarification on how CMS will evaluate the measures to determine if they “pass” and whether full measure testing will undergo the same, similar, or a different rigor as the National Quality Forum’s measure testing. Commenters also requested clarification on the likelihood of QCDRs having their measures accepted if they are not fully tested; how the level of testing affects the measure review process in the future; who is conducting the measure review process; and what format is being used. Other commenters suggested that CMS empanel specialty specific committees of knowledgeable clinicians to evaluate self-nominated quality measures and should a QCDR measure not be approved, CMS should provide specific information on what criteria were not met and enable the QCDR to correct the deficiencies in time for the measure reconsideration meeting. One commenter provided the following recommendations regarding QCDR measure testing requirements: When assessing face validity, CMS should allow for a clear and direct association with a clinical guideline to be sufficient to fulfill face validity for a measure, especially when the guidelines are released by organizations with a strong record of high-quality clinical guideline development; if a QCDR measure has been endorsed by the NQF and is submitted to CMS, the requirement to document measure testing information for CMS should be waived, as long as the NQF measure ID is provided; and once a thoroughly tested QCDR measure has been approved by CMS, the testing requirement should be waived for subsequent years unless CMS identifies a significant substantive change to the measure that would necessitate new testing.

Response: As discussed in the proposed rule and above, in the CY 2019 PFS final rule, we referred readers to the CMS Blueprint for the CMS Measures Management System (available at <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/Downloads/Blueprint.pdf>) for a definition of “fully developed with completed testing results at the clinician level” (84 FR 40817). Our Blueprint discusses both alpha and beta testing

(Blueprint 15.0 September 2019 Page 207–208). To avoid any potential confusion, we clarified in the CY 2021 PFS proposed rule that for purposes of QCDR measures, we would expect QCDR measures to complete beta testing to be considered fully tested. Beta testing is defined in the CMS Measures Blueprint¹⁴⁵ as the following: Beta testing (that is, field testing) generally occurs after initial technical specifications have been developed and is usually larger in scope than alpha testing. In addition to gathering further information about feasibility, beta tests serve as the primary means to assess scientific acceptability and usability of a measure. For example, beta testing allows for an enhanced evaluation of a measure’s importance, including evaluation of performance thresholds, disparities analysis, and outcome variation. It helps in looking for opportunities for improvement in the population, which aids in measuring the QCDR measure’s importance for reasons that include evidence collection to measure variability among comparison groups, to demonstrate the measure is not topped-out where most groups achieve similarly high performance levels approaching the measure’s maximum possible value. We referred readers to the CMS Blueprint for the CMS Measures Management System at <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/Downloads/Blueprint.pdf> for additional details regarding beta testing.

We understand the NQF’s measure testing guidelines are described at http://www.qualityforum.org/Masuring_Performance/Submitting_Standards.aspx. While our QCDR measure testing policies provide an incremental approach to measure testing while being available in the program, we believe our measure testing policies are similar. Thus, we anticipate that many measures that have received NQF endorsement would also be easily approved for this program; however, we are not waiving measure testing requirements. We note that QCDRs must self-nominate their measures each year unless the QCDR measure was approved for a 2-year period. We refer readers to the CY 2020 PFS final rule (84 FR 63073) where we discuss this process in more detail.

QCDR measures that do not meet the incremental requirements of measure testing over the 2-year period as described further above, will not be

¹⁴⁵ <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/Downloads/Blueprint.pdf>.

approved for use in the program for not meeting requirements. If a QCDR measure is not fully tested by the self-nomination period, the QCDR should delay self-nomination of the QCDR measure until a future year once it has been fully tested.

Comment: Several commenters disagreed with the requirement for QCDR measures to be fully tested. Commenters expressed concerns that validity testing beyond face validity is not feasible for most quality measures and due to the time and expense involved may cause some registries to no longer invest in measure development and potentially leave the program. One commenter noted that full measure testing fails to account for the significant investments that QCDRs already make when developing measures to ensure the accuracy of their measures, including vetting by clinical subject matter experts and reliance on clinical practice guidelines, the medical literature, and preliminary data. A few commenters encouraged CMS to consider alternatives to the measure testing process such as opening the measures for public comment.

Response: We believe that measures should be reliable and valid with robust testing using empirical data prior to inclusion in a national pay-for-performance CMS program. Quality measurement should ensure measures are reliable, valid, and feasible, and this is supported by literature.¹⁴⁶ We disagree that validity testing beyond face validity is not feasible, since the quality measures available in the MIPS quality measure inventory are fully tested. We understand there is time, effort, and resources involved with measure testing but we believe that this must be a requirement in order to ensure we have reliable, valid, and feasible measures in a pay-for-performance program such as MIPS. We do not believe that an alternative approach such as face validity or public comment alone would meet the same rigor of validity. Furthermore, QCDRs should be held to the same standards of requirements as other measure developers. QCDRs should be developing measures utilizing measure development standards that are universally accepted by measure developers, inclusive of standardized testing procedures. The utilization of clinical experts, reliance on clinical guidelines, medical literature, and preliminary data are common practices amongst measure developers to ensure

measures are developed in a relevant manner. However, these criteria that are used to develop a measure, do not replace the need for measure testing which goes beyond measure development and ensures the measure is reliable, valid, and feasible.

After consideration of public comments, we are finalizing our proposals as proposed.

(dd) Requirements for New QCDR Measures

We proposed that for a new QCDR measure to be approved for the 2024 MIPS payment year, a QCDR measure must be face valid; to be approved for the 2025 MIPS payment year and future years, a QCDR measure must be face valid for the initial MIPS payment year for which it is approved and fully tested for any subsequent MIPS payment year for which it is approved.

For example, for the CY 2026 MIPS payment year (the 2024 performance period), the self-nomination application period would open on July 1, 2023 and close on September 1, 2023. A QCDR that self-nominates a new QCDR measure by September 1, 2023 would need to complete face validity measure testing prior to submission in order for the measure to be considered for the CY 2026 MIPS payment year. If that new QCDR measure is approved for the CY 2026 MIPS payment year, it would need to be fully tested by the next self-nomination date for the CY 2027 MIPS payment year (by no later than September 1, 2024 for the 2025 performance period). QCDR measures that are not fully tested by the second year of the measure's life in MIPS (that is, second self-nomination date), would not be considered for approval for the second year.

We recognized that not all QCDR measures currently approved would continue in the program due to business decisions by each QCDR. We acknowledged that there is a cost involved with full testing of quality measures (see 84 FR 63173); however, we noted that we believe it is important that all measures used within the MIPS program are fully tested and reliable. We also noted that we believe this incremental approach in testing would allow QCDRs time to plan appropriately to complete measure testing in a timely, efficient, and effective manner. However, we encouraged QCDRs to submit fully-tested QCDR measures to the extent possible, as we have a strong preference for QCDR measures that are fully tested versus those that have only completed face validity testing.

The following is a summary of the comments we received and our responses.

Comment: A few commenters agreed with the proposal to require new QCDR measures to be face valid for the 2024 MIPS payment year and to be approved for the 2025 MIPS payment year and future years. A few commenters also agreed that a QCDR measure must be face valid for the initial MIPS payment year for which it is approved and fully tested for any subsequent MIPS payment year for which it is approved.

Response: We thank the commenters for their support.

Comment: Several commenters disagreed with the requirement that new QCDR measures must be fully tested by the subsequent performance period after initial approval due to their belief that the requirement is costly, burdensome, and arduous. A few commenters further stated that QCDR measures are created by subject matter experts; undergo significant expert vetting; are supported by literature, guidelines, and preliminary data, providing rigorous face validity for each measure; and QCDRs typically review performance data before and after implementing a measure in the registry. One commenter stated that these requirements may lead to the costs of measure development outweighing the benefit of operating QCDRs and that CMS is inherently making it impossible for small organizations to run QCDRs and develop new measures.

Response: We disagree with the commenters. While we understand the level of effort, time, and finances involved with measure testing, we believe it is important that all measures in a national pay-for-performance program such as MIPS are fully tested, as they are relied upon to make performance determinations and thereby corresponding payment adjustments. CMS is holding measures used in the QPP program to the same standards—whether they be measures generally available or measures solely submitted by QCDRs. We do acknowledge and appreciate the efforts and participation of QCDRs that are run by organizations of varying sizes, but believe it is important to hold all measures to the same standard, to ensure that we have reliable, valid, and feasible measures in the MIPS program for clinician use. We understand that measure testing requires a level of effort, resources, finances, and time in order to be completed. However, we believe that all measures should meet such rigorous standards in a pay-for-performance quality reporting program. QCDRs that require more time to test their measures,

¹⁴⁶ <https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/Downloads/Blueprint.pdf>.

may do so outside of the MIPS program, and can delay self-nominating a QCDR measure until the testing is appropriately completed.

Comment: A few commenters requested that CMS modify the proposed requirement that testing data for new QCDR measures must be submitted by the next self-nomination period and change it to the second self-nomination period due to its belief that many QCDRs rely on prospective data collection to generate the data needed for testing and therefore, will not have 12 months of data available and analyzed by the next self-nomination deadline (September 1). Another commenter stated that it would be impossible to explore and develop testing options and complete the testing process by the September 1, 2020 self-nomination deadline for the 2021 performance period.

Response: We refer readers to the CY 2020 PFS final rule (84 FR 63065 through 63067 and § 414.1400(b)(3)(v)(C), where we first finalized a requirement to fully test measures beginning with the 2022 performance period. Due to the PHE, we delayed this requirement in the May 8th COVID-19 IFC (85 FR 27594 through 27595), such that beginning with the 2022 performance period, all QCDR measures must be fully developed and tested, with complete testing results at the clinician level, prior to submitting the QCDR measure at the time of self-nomination. In this final rule, we are further changing our requirements to finalize that for a new QCDR measure to be approved for the 2024 MIPS payment year, a QCDR measure must be face valid; to be approved for the 2025 MIPS payment year and future years, a QCDR measure must be face valid for the initial MIPS payment year for which it is approved and fully tested for any subsequent MIPS payment year for which it is approved. We believe stakeholders have had adequate advanced notice of this requirement. This incremental approach in testing would allow QCDRs time to plan appropriately to complete measure testing in a timely, efficient, and effective manner. While we understand the level of effort, time, and finances involved with measure testing, we believe it is important that all measures in a pay-for-performance quality program such as MIPS are fully tested, as they are relied upon to make performance determinations and thereby corresponding payment adjustments.

After consideration of public comments, we are finalizing our proposal as proposed.

(ee) Requirements for QCDR Measures Considered for MVP

As an additional layer, we proposed at § 414.1400(b)(3)(v)(C)(2) that in order for a QCDR measure to be considered for inclusion in an MVP for the 2024 MIPS payment year and future years, a QCDR measure must be fully tested. We noted that we believe it is imperative to ensure that QCDR measures are fully tested before being included in an MVP. Unlike traditional MIPS, where clinicians and groups may choose from a large inventory of measures to report on for purposes of the quality performance category, the MVPs seek to create a focused selection of measures and activities relevant to a specific clinical topic. Since clinicians and groups who choose to report on MVPs will be reporting on a subset of measures and activities, there will be heavy reliance on the QCDR measures being reliable, valid, and feasible for reporting purposes. For a detailed discussion of MVPs, we refer readers to section IV.A.3.a. of this final rule.

The following is a summary of the comments we received and our responses.

Comment: Several commenters agreed with the proposal to require that QCDR measures that will be included in an MVP be fully tested.

Response: We thank commenters for their support.

Comment: One commenter stated that QCDR measures that are only undergoing testing should be considered for inclusion in MVPs and that Improvement Activity credit be given to practices involved in measure testing.

Response: We disagree that measures in the testing phase should be considered for MVPs; inclusion should be limited to only those that are fully tested due to this being a pay-for-performance national program. With regards to improvement activity credit, we would encourage stakeholders to submit recommendations for improvement activities during the Call for Improvement Activities that occurs on an annual basis for consideration and potential inclusion in the program for future years.

Comment: One commenter requested that CMS further delay full testing of QCDR measures and subsequently QCDR MVPs. A few commenters disagreed with the proposal to require QCDR measures to be fully tested at the clinician level prior to being considered for inclusion in an MVP due to the expense. The commenters also believe that it is inconsistent with the proposed timeline for QCDR measures under MIPS which requires face validity for

performance year 2022 and full testing for performance year 2023.

Response: We disagree with commenters. We believe that in order for QCDR measures to be considered reliable metrics in a pay-for-performance program such as MIPS, the measures must be fully tested. Any delay in fully tested QCDR measures will have downstream impacts with regards to the timing in which these measures can be considered for inclusion in MVPs in future years. We also want to clarify that QCDR measures that were fully tested at the time of self-nomination (July 1, 2020 through September 1, 2020) for the 2021 performance period, would be eligible for inclusion in MVPs for the 2022 performance period. We are aware that full testing of QCDR measures was not a requirement for the 2021 performance period, but have come across instances where some QCDRs have been diligently working to test or have completed testing their QCDR measures that are currently in the program and believe those fully tested QCDR measures are potentially ready to be considered for inclusion within an MVP. QCDR measures that are not fully tested will not be considered for inclusion in an MVP.

After consideration of public comments, we are finalizing our proposal as proposed.

(C) Duplicative QCDR Measures

Throughout previous rulemaking cycles, we have communicated our desire to eliminate duplicative QCDR measures in the MIPS program, as it is counterintuitive to the Meaningful Measure Initiative (84 FR 63068). One of the methods we previously suggested to address duplicative measures is measure harmonization, as discussed in the CY 2020 PFS final rule (84 FR 63068 through 63070). We have received comments and questions from stakeholders, requesting clarification for us to define what we mean by measure harmonization.

In this rule, we intend on clarifying that measure harmonization means “measures for which previously identified areas of duplication with other approved QCDR measures or MIPS quality measures have been addressed.” We proposed to revise previously codified policies that refer to measure harmonization with this updated terminology.

Therefore, we proposed to revise § 414.1400(b)(3)(v)(E), to state, beginning with the 2022 MIPS payment year, CMS may provisionally approve the individual QCDR measures for 1 year with the condition that QCDRs

address certain areas of duplication with other approved QCDR measures or MIPS quality measures in order to be considered for the program in subsequent years. If such areas of duplication are not addressed, CMS may reject the duplicative QCDR measure.

In addition, we proposed to revise § 414.1400(b)(3)(vi) to state, beginning with the 2023 MIPS payment year, QCDR measures may be approved for 2 years, at CMS discretion by attaining approval status by meeting QCDR measure considerations and requirements. Upon annual review, CMS may revoke a QCDR measure's second year approval, if the QCDR measure is found to be: Topped out; duplicative of a more robust measure; reflects an outdated clinical guideline; or if the QCDR self-nominating the QCDR measure is no longer in good standing.

Furthermore, we proposed to remove two previously codified policies that we have identified as areas of redundancy. We proposed to remove § 414.1400(b)(3)(vii)(H), which states whether the previously identified areas of duplication have been addressed as requested, and to remove § 414.1400(b)(3)(vii)(L), which states whether the existing approved QCDR measure is no longer considered robust, in instances where new QCDR measures are considered to have a more vigorous quality actions, where CMS preference is to include the new QCDR measure rather than requesting QCDR measure harmonization. We noted that we believe the previously finalized regulatory text under § 414.1400(b)(3)(vii)(A), which states QCDR measures that are duplicative, or identical to other QCDR measures or MIPS quality measures currently in the program will address instances where areas of duplication amongst QCDR measures are not addressed or where a QCDR measure approved for a previous year is duplicative with a QCDR measure approved for the current year.

As a result of the proposed removals of two previously codified policies, we proposed technical updates to re-number the regulation text to reflect the removals. Therefore, in § 414.1400, we proposed to redesignate paragraphs (b)(3)(vii)(I), (J), (K), (M), and (N) as paragraphs (b)(3)(vii)(H), (I), (J), (K), and (L), respectively.

The following is a summary of the comments we received and our responses.

Comment: One commenter expressed its support for removing QCDR measures that reflect outdated clinical guidelines or if the QCDR that nominated the measure is no longer in

good standing. A few commenters agreed with CMS' proposals to revise QCDR measure harmonization policies and remove previously codified policies that it has identified as redundant due to its belief that it supports standardization of measures across providers and settings.

Response: We agree that measures that reflect outdated clinical guidelines no longer provide accurate clinical measurement that can lead to quality improvement. In addition, we agree with commenters that a QCDR's standing in the program should impact the availability of their QCDR measures in the program. Furthermore, we thank commenters for agreeing with some of the criteria we use to retire measures from the program as well as our need to harmonize measures and the benefit it conveys to the program. Some of these benefits include fewer measures for clinicians to have to read through (burden reduction) as well as better direct comparison between providers reporting on the same measure as opposed to a similar measure.

Comment: One commenter encouraged CMS to continue to encourage measure development programs to identify commonalities and gaps in existing systems rather than create new programs to identify new measures. Another commenter urged CMS to implement adequate safeguards to ensure that measure harmonization occurs only when it is clinically appropriate to do so.

Response: We continue to encourage QCDRs and measure developers to address measurement gaps identified in the MIPS program. To clarify, we are not creating new programs to identify new measures but are utilizing our existing processes to identify measurement gaps. On an annual basis, we publish our CMS Quality Measure Development Plan (MDP) and the MDP annual report. The MDP helps us build and improve quality measures clinicians can report under the MIPS program. The MDP includes environmental scans, gap analyses, and work with stakeholders. This report is published on an annual basis to help us get expert input about the measures we need, prioritize areas of measure development, evaluate existing quality measures, to meet our goal value-based measures to support the Quality Payment Program. We refer readers to the Quality Payment Program Measure Development website where we have published the 2020 MDP Annual Report at <https://www.cms.gov/Medicare/Quality-Payment-Program/Measure-Development/Measure-development>. We encourage QCDRs to utilize the MDP as they work through

the measure development-planning phase to determine which identified gaps they would like to address through measure development.

With respect to safeguards, when measures are reviewed for areas of duplication, all of the similar measures are evaluated. We would encourage QCDRs address certain areas of duplication with other approved QCDR measures or MIPS quality measures in order to be considered for the program in subsequent years. If such areas of duplication are not addressed, CMS may reject the duplicative QCDR measure.

Comment: One commenter disagreed with the policies to remove a QCDR measure before its second year for it being topped out or duplicative of a more robust measure.

Response: We continue to believe that duplicative QCDR measures should not be in the MIPS program, as that is contradictory to the Meaningful Measure Initiative. Including duplicative or topped-out measures in the program adds to burden without meaningfully improving care or quality.

Comment: A few commenters requested CMS consider certain priorities when identifying duplicative QCDR measures and encouraging harmonization, such as: Prioritizing the original measure until subsequent measures are proven to have surpassed it, prioritizing the more scientifically rigorous measure, and identifying the measure that best advances the goals of the program. One commenter also requested that CMS consider providing measure stewards specific reasons when new measures are identified as duplicative and provide an opportunity to improve or replace the existing measure.

Response: We continue to encourage QCDRs to work collaboratively amongst each other to address areas of duplication within their QCDR measures. In this final rule, we are finalizing at § 414.1400(b)(3)(v)(E) that beginning with the 2022 MIPS payment year, we may provisionally approve the individual QCDR measures for 1 year with the condition that QCDRs address certain areas of duplication with other approved QCDR measures or MIPS quality measures in order to be considered for the program in subsequent years. If such areas of duplication are not addressed, we will not approve the duplicative QCDR measure. In our review of measures, we do try to identify new measures that might be duplicative and reasons why, inform QCDRs submitting duplicative measures, and encourage the QCDRs to address the duplication in a timely manner.

After consideration of the public comments, we are finalizing our proposals as proposed.

(D) Collection of Data on QCDR Measure

In the CY 2020 PFS final rule (84 FR 63067 through 63068), we finalized at § 414.1400(b)(3)(v)(D) that beginning with the 2021 performance period, QCDRs are required to collect data on a QCDR measure, appropriate to the measure type, prior to submitting the QCDR measure for CMS consideration during the self-nomination period.

(i) Delay of Data Collection in IFC

As mentioned previously in this section of the final rule, due to the PHE we delayed certain requirements in the May 8th COVID-19 IFC (85 FR 27594 through 27595). In the CY 2020 PFS final rule (84 FR 63067 through 63068), we finalized at § 414.1400(b)(3)(v)(D) that beginning with the 2021 performance period, QCDRs are required to collect data on a QCDR measure, appropriate to the measure type, prior to submitting the QCDR measure for CMS consideration during the self-nomination period. For the reasons discussed in section II.R.2. of the May 8th COVID-19 IFC (85 FR 27594 through 27595), we delayed the implementation of this policy by 1 year. Specifically, we amended § 414.1400(b)(3)(v)(D) to state that beginning with the 2022 performance period, QCDRs are required to collect data on a QCDR measure, appropriate to the measure type, prior to submitting the QCDR measure for CMS consideration during the self-nomination period.

During this 1-year delay, we will continue to review QCDR measures as in past years to ensure they are valid and identify performance gaps in the area of measurement. As described in the 2020 QCDR Measure Development Handbook, this process includes vetting the measures to ensure they are implementable and collectible, which includes an evaluation of the measure and coding constructs (for example, whether the measure is constructed as a ratio, proportional, or inverse measure). Additionally, we will review the evidence provided by the QCDR (for example, clinical studies and/or scientific journals) that would support the need for measurement in lieu of insufficient data collection to demonstrate that there is a measurement gap.

The following is a summary of the comments we received and our responses.

Comment: Commenters supported the delay of QCDR data collection

requirements on count of concerns due to burden and likely delays in the development of new measures, problems that would only be exacerbated by the current PHE for COVID-19. Another commenter urged CMS to continue to monitor the PHE for the viability of this requirement for CY 2021.

Response: We thank commenters for their support. We are continuing to monitor the PHE.

After consideration of public comments, we are adopting our policy as finalized in the May 8th COVID-19 IFC (85 FR 27594 through 27595).

(3) Qualified Registries

We refer readers to §§ 414.1305 and 414.1400, the CY 2018 Quality Payment Program final rule (82 FR 53815 through 53818), CY 2019 PFS final rule proposed rule (83 FR 59906), and the CY 2020 PFS final rule (84 FR 40819 through 40820) for our previously finalized policies regarding qualified registries. In the CY 2021 PFS proposed rule (85 FR 50328), we proposed a technical update to the title at § 414.1400(c) to rename it from “qualified registry approval criteria” to “qualified registries”, to better align the title with the content of the regulation. In addition, we proposed requirements related to data validation audits and targeted audits.

In the CY 2017 Quality Payment Program final rule, we discussed our expectation related to QCDRs and qualified registries would conduct validation on the data they intend on submitting for the MIPS performance period (81 FR 77384 through 77386) and provide the results of the data validation to CMS in the form of a data validation execution report by May 31st of the year following the performance period. Our intention was to establish our expectation that qualified registries would establish a process to assess whether the data are true, accurate, and complete prior to submitting them to CMS for purposes of the MIPS program. We believe it is important to establish a requirement that qualified registries conduct data validation to ensure they are actively monitoring the data they submit to CMS for purposes of a pay-for-performance program. In instances where a qualified registry discovers data are inaccurate or incomplete, the entity must correct the issue prior to submitting the data to CMS in order to provide accurate certification in accordance with § 414.1400(a)(5). A qualified registry that submits a false certification submits data that is inaccurate, unusable or otherwise compromised to CMS for purposes of

the MIPS program may be subject to remedial action or termination under § 414.1400(f). We believe requiring qualified registries to validate the accuracy of the data they are submitting is an important safeguard to promote accurate payments under the MIPS program. Therefore, we proposed at § 414.1400(c)(2)(iii) and (iv) requirements beginning with the 2023 MIPS payment year as condition of approval each qualified registry must conduct annual data validation audits and if one or more deficiencies or data errors are identified the qualified registry must also conduct targeted audits. We also proposed specific obligations for those audits as discussed below.

- We proposed to codify at § 414.1400(c)(2)(iii)(A), the qualified registry must conduct their data validation audits prior to submitting any data to CMS for purposes of the MIPS program. We noted that we believe it is important for qualified registries to conduct validation audits to identify and fix concerns regarding data accuracy prior to submitting data to us, including potential issues related to data aggregation and calculation. Conducting the data validation prior to data submission will lead to data being more reliable and promote compliance with the requirement of data being true, accurate, and complete. In the CY 2017 Quality Payment Program final rule, we described this auditing using the term randomized audit (81 FR 77384). We proposed instead to refer to this audit as the data validation audit in an effort to be abundantly clear regarding our expectations that the qualified registry will purposefully construct a sample and conduct an audit that complies with specific regulatory requirements and also to distinguish these audits from the targeted audits discussed below and proposed at § 414.1400(c)(2)(v).

- We proposed to codify at § 414.1400(c)(2)(iii)(B), the qualified registry must conduct data validation on data for each performance category for which it will submit data, including if applicable the Quality, Improvement Activities, and Promoting Interoperability performance categories. We believe that it is important that data validation be done across all performance categories for which the qualified registry submits data since qualified registries must attest that data submitted to CMS is true, accurate, and complete and data for each of these performance categories can influence score calculation and payment adjustments.

- We proposed to codify at § 414.1400(c)(2)(iii)(C), that the

qualified registry must conduct data validation on data for each submitter type for which it will submit data, including if applicable MIPS eligible clinicians, groups, virtual groups, voluntary participants, and opt-in participants. We noted that we believe it is important for the data submitted to CMS be accurate for all clinicians and groups for which the qualified registry intends on submitting data to the MIPS program, regardless of whether they are required to participate, have opted in, or have chosen to voluntarily participate. Therefore, we proposed to require that the data validation audits should account for all types of submitters that are utilizing the qualified registry to submit data to CMS for purposes of the MIPS program. We noted the importance of validating data for all submitter types regardless of its use for payment or public reporting. Even clinicians who voluntarily report to MIPS and whose data are not used for payment purposes could have their data publically posted on the Physician Compare website. We noted that we believe all data the qualified registry submits, regardless of its use for payment or public reporting, should be true, accurate, and complete.

- We proposed to codify at § 414.1400(c)(2)(iii)(D) that the qualified registry must use clinical documentation (provided by the clinicians they are submitting data for) to validate that the action or outcome measured actually occurred or was performed. If the data a qualified registry intends to submit to CMS for purposes with the MIPS program are to demonstrate that a clinician did a particular clinical activity or achieved a particular clinical outcome, we noted that we believe meaningful validation of such data requires the qualified registry to use clinical documentation to confirm that the activity occurred or was performed.

- We proposed to codify at § 414.1400(c)(2)(iii)(E), the qualified registry shall conduct each data validation audit using a sampling methodology that meets the following requirements:

- ++ Uses a sample size of at least 3 percent of the TIN/NPIs for which the qualified registry will submit data to CMS, except that if a 3 percent sample size would result in fewer than 10 TIN/NPIs, the qualified registry must use a sample size of at least 10 TIN/NPIs, and if a 3 percent sample size would result in more than 50 TIN/NPIs, the qualified registry may use a sample size of 50 TIN/NPIs.

- ++ Uses a sample that includes at least 25 percent of the patients of each

TIN/NPI in the sample, except that the sample for each TIN/NPI must include a minimum of 5 patients and does not need to include more than 50 patients.

We believe the aforementioned sampling methodology is appropriate for multiple reasons. First, the sampling methodology criteria are consistent with the methodology established under the legacy Physician Quality Reporting System (PQRS) program and as described in the CY 2017 Quality Payment Program final rule (81 FR 77366 through 77367). As this methodology has been used for many years under the legacy program, we believe stakeholders are well versed in executing data validation audits using this sampling methodology. Second, the proposed methodology accounts for QCDRs and qualified registries of varying sizes. Data validation requires a level of effort on the part of the qualified registry to execute a data validation plan, identify a sample, and collect information for purposes of chart review; therefore, we are cognizant that requiring a larger sample size would create additional burden on qualified registries and clinicians to account for a larger volume in TIN/NPIs and medical records for review.

- We proposed to codify at § 414.1400(c)(2)(iii)(F) that each qualified registry data validation audit must include the following:

- ++ Verification of the eligibility status of each eligible clinician, group, virtual group, opt-in participant, and voluntary participant. We believe that it is important for the qualified registry to track the eligibility status of each clinician and group that wishes to use a third party intermediary to report, because accurate information regarding eligibility is important to ensuring payment adjustments are properly applied. Furthermore, verification of eligibility status is consistent with the requirement for qualified registries to track opt-in participants, as described at § 414.1400(a)(4)(iv) and in the context of clinicians who voluntarily report to MIPS helps ensure the accuracy of data publically posted on the Physician Compare website (or a successor website) of the CMS website.

- ++ Verification of the accuracy of Tax Identification Numbers (TINs) or National Provider Identifiers (NPIs). Correct TINs and NPIs are critical to ensure data submitted by the qualified registry are attributed to the correct clinicians and groups. Inaccurate NPIs or TINs may lead to inadvertent downstream impacts to the way clinicians and groups are scored, and assigned a payment adjustment.

- ++ Calculation of reporting and performance rates (for example, formulas included in the quality measure specifications). Qualified registries must follow the measure specifications when calculating reporting and performance rates. Calculations that deviate the formulas included in the quality measure specifications undercut efforts to ensure data are consistent, reliable, and have been calculated in a uniform manner.

- ++ Verification that only MIPS quality measures and qualified registry measures that are relevant to the performance period will be utilized for MIPS submission. Measure specifications for the MIPS quality measures and qualified registry measures go through maintenance on an annual basis. Use of outdated measure specifications would likely result in the qualified registry submitting inaccurate or compromised data for the clinicians and groups they support. While not all measures go through substantive changes on an annual basis, there are changes to codes that do occur annually that should be accounted for when programing measures. Therefore, we believe it is important that qualified registries are utilizing the most current version of the measure specification, relevant to the performance period in which they are participating.

- We proposed to codify at § 414.1400(c)(2)(iii)(G), that in a form and manner and by a deadline specified by CMS, the qualified registry must report data validation results, including the overall deficiency or data error rate, the types of deficiencies or data errors discovered, the percentage of clinicians impacted by any deficiency or data error, and how and when each deficiency or data error type was corrected. We believe it is important that the results of the data validation be shared with us in order for us to understand the types of issues the qualified registries have encountered and what resolutions were executed to fix the issues. The information provided will help us track frequently occurring issues which may be identified as an area to provide further education. It is our belief that the report will be largely comprised of issues that were identified and resolved. However, if an issue has been identified and could not be resolved, we would want to understand what the issue is and why it could not be resolved. We emphasized that all data submitted to CMS by a qualified registry on behalf of a MIPS eligible clinician, group or virtual group must be certified by the third party intermediary as true, accurate, and complete to the best of its knowledge as described in

§ 414.1400(a)(5). If a qualified registry submits a false certification or data that are data that are inaccurate, unusable, or otherwise compromised, the qualified registry may be subject to remedial action or termination as described at § 414.1400(f).

- We proposed to codify at § 414.1400(c)(2)(iv)(A) that if a data validation audit under § 414.1400(c)(2)(iii) identifies one or more deficiency or data error, the qualified registry must conduct a targeted audit into the impact and root cause of each such deficiency or data error for that MIPS payment year. We believe targeted audits are important to further evaluate the impact of deficiencies or data errors to the cohort of clinicians and groups that the qualified registry intends to submit data for, and for qualified registries to determine the reason the deficiency or data error occurred.

- We proposed to codify at § 414.1400(c)(2)(iv)(B), that the qualified registry must conduct any required targeted audits for the MIPS payment year and correct any deficiencies or data errors identified through such audit prior to the submission of data for that MIPS payment year. To promote the accuracy of the data submitted to the MIPS program for the payment year and to reduce the risk that the agency initiates payment calculations in reliance on inaccurate data, it is important for the qualified registry to conduct required targeted audits and correct any deficiencies and data errors identified through those audits prior to submitting the data to CMS.

- We proposed to codify at § 414.1400(c)(2)(iv)(C), the qualified registry must conduct the targeted audit using the sampling methodology that meets the requirements described in paragraph (c)(2)(iii)(E). The sample for the targeted audit must not include data from the sample used for the data validation audit in which the deficiency or data error was identified. We believe the sampling methodology we proposed for data validation audits is equally appropriate for the conduct of targeted audits. We believe that adopting the same methodology for both audit types would be less burdensome on qualified registries than requiring these entities to apply a separate sampling methodology for their targeted audits. Provided that data in the sample for the targeted audit does not overlap with the data that was reviewed in the data validation audit, we believe the targeted audit would provide the qualified registry with a reasonable perspective into impact and root cause of deficiencies and data errors across the data to be submitted

without imposing the burden that would result from maintaining a separate sampling methodology for targeted audits.

- We proposed to codify at § 414.1400(c)(2)(iv)(D), in a form and manner and by a deadline specified by CMS, the qualified registry must report the results of each targeted audit, including the overall deficiency or data error rate, the types of deficiencies or data errors discovered, the percentage of clinicians impacted by each deficiency or data error, and how and when each error type was corrected. As is the case with the results of data validation audits, we believe it is important that the results of the targeted audits be shared with us in order for us to understand the types of issues the qualified registries have encountered and what resolutions were executed to fix the issues. The information provided will help us track frequently occurring issues which may be identified as an area to provide further education.

We requested comments on the proposals, including whether stakeholders are concerned with implementing the policies for the 2023 MIPS payment year, and if so, what barriers do they believe they would face in implementing the requirements.

The following is a summary of the comments we received and our responses. We also refer readers to the QCDR section of this final rule (section IV.A.3.g.(2)) where qualified registries can view applicable comments and responses.

Comment: A few commenters disagreed with the proposal to require qualified registries to conduct data validation due to their belief that it will unnecessarily increase burden for qualified registries who are already validating data prior to submission to CMS. One commenter disagreed with the requirement to perform data validation for each submitter type because of the low number of participants reporting via the qualified registry as individuals and stated that the randomized auditing on a small sample would result in the unintended consequence of increasing the burden of these clinicians without necessarily improving the quality of data submitted and that such a policy change would result in some practices being audited multiple times, sometimes within the same year, based on their submission category. Several commenters disagreed with the proposal to require data validation specific to performance category, submission mechanism, and submitter type due to their belief that the proposal creates unreasonable burdens for clinicians, qualified

registries; would result in some individuals or groups being audited more often and less randomly in circumstances where the number of individuals/groups for a specific submitter type is lower; will impose a substantial financial burden on small, specialty society registries; is duplicative of internal quality data controls and external audits already conducted; and data validation for clients who are manually entering data may be difficult to audit, as many clinicians and practices do not complete data entry until late in the fourth quarter of the performance year.

Response: We continue to believe it is important to establish a requirement that qualified registries conduct data validation to ensure they are actively monitoring the data they submit to CMS for purposes of a pay-for-performance program. Furthermore, at § 414.1400(c)(2)(iii) and (iv) requirements beginning with the 2023 MIPS payment year as condition of approval each qualified registry must conduct annual data validation audits and if one or more deficiencies or data errors are identified the qualified registry must also conduct targeted audits. We understand that some qualified registries may have a small number of clients that are submitting data through their registry for purposes of MIPS reporting, but believe that data integrity is a high priority, and believe that data validation should occur regardless of the size of the clinician population the third party intermediary supports. As a point of clarification, we do not require multiple data validation audits to occur within the same year. Our data validation sampling methodology allows qualified registries to select a percentage of their clients. As noted above, correct data is vital to inform clinicians of their quality performance—let alone determining payment differentials that affect all participants in the program.

Comment: Another commenter stated that while they can perform a randomized audit requesting documentation from the EHR on Promoting Interoperability measure data to ensure accurate transposition and monitoring of errors and clinical documentation to ensure the Improvement Activities was attested to correctly, any errors discovered will be errors on the part of the practice or physician, not the registry.

Response: We appreciate the commenter's observation that in some instances the data validation conducted by a qualified registry may identify errors that stem from inaccuracies in the data supplied by the practice or

physician. Data validation requirements are intended to help ensure the qualified registry's data submissions to CMS are true, accurate, and complete. Therefore, if a qualified registry identifies errors in data on a Promoting Interoperability measure or Improvement Activity that it attributes to a practice or physician, the registry has shared responsibility to ensure the registry's submissions to CMS do not include that inaccurate data.

After consideration of the comments received, we are finalizing our proposals as proposed.

(4) Remedial Action and Termination of Third Party Intermediaries

We refer readers to § 414.1400(f), the CY 2017 Quality Payment Program final rule (81 FR 77548), CY 2019 PFS final rule (83 FR 59908 through 59910), and the CY 2020 PFS final rule (84 FR 63077 through 63080) for previously finalized policies for remedial action and termination of third party intermediaries.

As described in § 414.1400(f)(1)(i), the remedial actions CMS may take against a third party intermediary include requiring the third party intermediary to submit to CMS by a date specified by the agency a corrective action plan (CAP) to address the identified deficiencies or data issue, including that actions it will take to prevent the deficiencies or data issues from recurring. To clarify expectations and create consistency in the content of the CAPs provided by third party intermediaries, we proposed to revise and elaborate on the obligations for a CAP. Specifically, we proposed to modify § 414.1400(f)(1)(i) such that, unless different or additional information is specified by CMS, the CAP submitted by the third party intermediary must address four issues: (1) The issues that contributed to the non-compliance; (2) the impact to individual clinicians, groups, or virtual groups, regardless of whether they are participating in the program because they are MIPS eligible, voluntary participating, or opting in to participating in the MIPS program; (3) the corrective actions to be implemented by the third party intermediary to ensure that the non-compliance has been resolved will not recur in the future and (4) the detailed timeline for achieving compliance with the applicable requirements.

We noted that we believe the four elements are generally warranted in each instance in which a CAP is required. First, any meaningful efforts at corrective action necessitate an understanding of what needs to be

corrected. Therefore, we proposed at § 414.1400(f)(1)(i)(A) to require that each third party intermediary be required to articulate the issues that contributed to the non-compliance. The third party intermediary must articulate what factors cause it to fail in its obligation to meet program requirements. For example, a survey vendor subject to remedial action for not completing vendor trainings would be required to explain what factors lead to its failure to complete training. We noted that we believe this analysis will allow third party intermediary to improve their processes to better meet existing requirements and will allow CMS to better understand what operational and other challenges third party intermediaries face in meeting program requirements. Second, depending on the circumstances, non-compliance by a third party intermediary may affect an uncertain number of clinicians and groups and has the potential to implicate substantial program dollars. Accordingly, we proposed at § 414.1400(f)(1)(i)(B) to require that a third party intermediary subject to a CAP disclose to CMS the impact to individual clinicians, groups, or virtual groups, regardless of whether they are participating in the program because they are MIPS eligible, voluntary participating, or opting in to participating in the MIPS program. We noted that we believe this information regarding the scope of harms is necessary for the agency to assess the full program impact of the non-compliance. Furthermore, we believe it is important for the CAP to include this impact information regardless of the clinician's participation status, because non-compliance may have programmatic implications even if it does not affect payment, such as for data posted on the Physician Compare website. Third, meaningful remedial action requires the identification of specific action steps both to address prior harm but to protect against future harms. Therefore, we proposed at § 414.1400(f)(1)(i)(C) that a third party intermediary subject to a CAP must address the corrective actions to be implemented by the third party intermediary to ensure that the non-compliance has been resolved and will not recur in the future. The third party intermediary will be expected to follow through with the implementation of the corrective actions and to see that the issue has been corrected permanently. It is important for us to understand in detail what actions the third party intermediary will take to resolve the

issue and to evaluate the effectiveness of the proposed solution for long-term sustainability. Fourth, non-compliance must be resolved methodically and timely. Therefore, we proposed at § 414.1400(f)(1)(i)(D) that each CAP must include the detailed timeline for achieving compliance with the applicable requirements. We solicited public comments on the proposed revisions to our requirements for correction action plans.

We received one public comment on the remedial action and termination of third party intermediary proposals. The following is a summary of the comment we received and our response.

Comment: One commenter requested more information on the proposed new criteria for corrective action plans and how they would be quantified, particularly scope of clinician impact and/or harms.

Response: The new criteria in the regulation text at § 414.1400(f)(1)(i) clarify the content the CAPs provided by the third party intermediaries must include. The obligation for the CAP to identify impacts of the non-compliance on clinicians, groups and virtual groups establishes that the third party intermediary must supply information as to the volume and identity of clinicians, groups and virtual groups that are negatively impacted by the non-compliance of the third party intermediary. The appropriate method for quantifying impact will vary depending on the nature of the non-compliance. For example, if a third party intermediary submitted compromised data to CMS because it used a flawed TIN/NPI crosswalk, we would expect the CAP to include the total number and identifying information for the clinicians and groups whose data were inaccurate. The identification of impacts to clinicians would also help us understand the volume of clinicians who may look to find a different method of reporting. Please refer to qpp.cms.gov for more information.

After consideration of the comment received, we are finalizing our proposal as proposed.

h. Public Reporting on Physician Compare

For previous discussions on the background of Physician Compare, we refer readers to the CY 2016 PFS final rule (80 FR 71116 through 71123), the CY 2017 Quality Payment Program final rule (81 FR 77390 through 77399), the CY 2018 Quality Payment Program final rule (82 FR 53819 through 53832), the CY 2019 PFS final rule (83 FR 59910 through 59915), the CY 2020 PFS final

rule (84 FR 63080 through 63083), and the Physician Compare Initiative website at <https://www.cms.gov/medicare/quality-initiatives-patient-assessment-instruments/physician-compare-initiative/>.

(1) Definitions & Proposed Regulation Text Changes

Physician Compare (<http://www.medicare.gov/physiciancompare>) draws its operating authority from section 10331(a)(1) of the Affordable Care Act, which defines the term “Physician Compare” to mean the internet website developed under this section of the statute. Physician Compare has continued to pursue a phased approach to public reporting under the Medicare Access and CHIP Reauthorization Act (MACRA) of 2015. Section 104(f)(2) of the MACRA defines the term “Physician Compare” to mean the Physician Compare internet website of the Centers for Medicare & Medicaid Services (or a successor website). To more completely and accurately reference the website for which CMS will post information available for public reporting, in accordance with section 104(f)(2) of the MACRA, we proposed to define Physician Compare at § 414.1305 to mean the Physician Compare internet website of the Centers for Medicare & Medicaid Services (or a successor website). We sought comment on the proposal. For ease of reference, we use the term “Physician Compare” in this final rule.

We did not receive any public comments on defining the term “Physician Compare” to mean the Physician Compare internet website of the Centers for Medicare & Medicaid Services (or a successor website). Therefore, we are finalizing the “Physician Compare” definition at § 414.1305 as proposed.

4. APM Incentive Payment

(a) Overview

Under the Quality Payment Program, Qualifying APM Participants (QPs) receive a 5 percent APM Incentive Payment in payment years 2019 through 2024. In the CY 2017 Quality Payment Program final rule (81 FR 77480 through 77489), we finalized at § 414.1450(d) that this payment is made based on the clinician’s QP status in the QP Performance Period that is 2 years prior (for example, the 2021 payment will correspond to the 2019 performance year), and at § 414.1450(b)(1) that the payment is equal to 5 percent of the estimated aggregate payments for covered professional services in the base period (the year between the QP

performance and payment years). We finalized at § 414.1450(c)(1) that the APM Incentive Payment amount is made to the TIN associated with the Advanced APM Entity through which an eligible clinician becomes a QP during the QP Performance Period. Under § 414.1450(c)(3), if an eligible clinician becomes a QP through participation in multiple Advanced APMs, CMS divides the APM Incentive Payment proportionally between the TINs associated with the QP’s participation in each Advanced APM based on payments for covered professional services during the QP Performance Period. In addition, under § 414.1450(c)(2), we finalized that if the QP is no longer affiliated with the TIN associated with the QP’s participation in the APM Entity, the APM Incentive Payment is made to the TIN listed on the QP’s CMS–588 Electronic Funds Transfer (EFT) Application form.

In our first year making the APM Incentive Payment, we experienced operational limitations that made it difficult in certain cases to distribute the payment to a current billing organization associated with the QP according to the current regulations. In particular, we encountered challenges when QPs are no longer affiliated with the TIN associated with the QP’s participation in the APM Entity through which they attained QP status, and when we were unable to make the APM Incentive Payment to the TIN listed on the eligible clinician’s CMS–588 EFT Application form. In certain circumstances, it has been challenging to locate accurate billing organizations for some QPs 2 years after they earned QP status. For example, we have encountered situations such as inaccurate or missing billing associations for the QP because the QP has changed their primary billing TIN between the performance and the payment year, or the billing TIN through which the QP attained QP status is not the TIN through which CMS payments are processed, and so it is not possible for CMS to know that the two are in fact connected.

(b) APM Incentive Payment Amount

In the first Quality Payment Program final rule (81 FR 77480), we finalized at § 414.1450(b)(1) through (3) how we calculate the amount of the APM Incentive Payment. Specifically, we finalized that: (1) The amount of the APM Incentive Payment is equal to 5 percent of the estimated aggregate payments for covered professional services as defined in section 1848(k)(3)(A) of the Act furnished during the incentive payment base

period (that is, the calendar year immediately preceding the payment year); (2) the estimated aggregate payment amount for covered professional services includes all such payments to the QP (NPI) via any and all of their TIN/NPI combinations; and (3) in calculating the estimated aggregate payment for a QP, CMS uses claims submitted for covered professional services with dates of service from January 1 through December 31 of the incentive payment base period.

In the CY 2021 PFS proposed rule (85 FR 50332), we are clarifying that the APM Incentive Payment amount is calculated based on the paid amount of the applicable claims for covered professional services that are subsequently aggregated to calculate the estimated aggregate payments. We proposed to amend our regulation at § 414.1450(b)(1) to reflect that clarification.

Section 1833(z)(1)(A) of the Act specifies that the APM Incentive Payment is equal to 5 percent of the estimated aggregate payments for covered professional services as defined in section 1848(k)(3) of the Act. Because the APM Incentive Payment is a percentage of the estimated aggregate payments made, it would not be appropriate to calculate the APM Incentive Payment based on amounts that were allowed, but not actually paid by Medicare, for such covered professional services.

We also noted that, as provided in § 414.1450(b)(4) and (5), we exclude certain payments and adjustments, including the MIPS payment adjustments, when calculating the APM Incentive Payment amount.

We sought comment on the proposal. The following is a summary of the comments we received in response to our proposal regarding the amount of the APM Incentive Payment.

Comment: One commenter recommended CMS aggregate the APM Incentive Payment on the allowed amount instead of the paid amount and the difference should be retroactive. The commenter noted that calculating on the allowed amount would produce a higher bonus for eligible clinicians.

Response: We appreciate the commenter feedback, however, as noted in the proposed rule, such an approach would be inconsistent with the plain language of the statute which requires that the APM Incentive Payment is equal to 5 percent of the estimated aggregate payments for covered professional services as defined in section 1848(k)(3) of the Act.

Therefore, we are finalizing our proposal to amend the language at § 414.1450(b)(1) to clarify our use of paid amounts in calculating “payments”.

(c) APM Incentive Payment Recipient

Under our current policy as finalized at § 414.1450(c), CMS first seeks to disburse the APM Incentive Payment to the TIN associated with the QP's participation with the APM Entity in the Advanced APM through which they earned QP status. If the QP is no longer affiliated with that TIN, we seek to disburse the APM Incentive Payment to the TIN listed on the eligible clinician's CMS-588 EFT form on the date that we make the payment. And if the eligible clinician becomes a QP through participation in multiple Advanced APMs, we seek to divide the APM Incentive Payment proportionally, based on payments for covered professional services during the QP Performance Period, and to make proportional payment to each of the TINs associated with the QP's participation with the APM Entity or APM Entities in the Advanced APMs.

It is still our intention to reward achievement of QP status through participation in Advanced APMs by seeking to disburse APM Incentive Payments to TINs that are affiliated with an APM Entity through which the QP has achieved QP status, as is described in the CY 2017 Quality Payment Program final rule (81 FR 77847). However, after our first year of making APM Incentive Payments, we have learned that the amount of time between when an eligible clinician earns QP status and when APM Incentive Payments are made makes it difficult to ensure that payments can be made for these QPs in a routine and efficient manner. For example, in the space of 2 years between making QP determinations and APM Incentive Payments, eligible clinicians may change TINs, join new TINs, join new APM Entities, remain in the same APM Entity under a new billing TIN, leave Medicare altogether, or make other potential changes impacting their relationship with the Medicare program. CMS receives updated records of the changes when APM participants update their payment information through the internet based Provider Enrollment, Chain and Ownership system (PECOS) or a CMS-588 EFT Application, and subsequent updates to APM Participation Lists and Affiliated Practitioner Lists, although we note that such updates are not consistently and timely made across APM participants, as we originally believed, and therefore

such lists have variable reliability. Further, on our own end, if we limit our initial search for the party or parties to which we should make the APM Incentive Payment to only the TIN or TINs through which the eligible clinician earned QP status, as is specified in our regulations at § 414.1450(c)(1) and (3), when the QP has made changes to their TIN affiliations, we might limit our opportunities to make the APM Incentive Payment to a more current TIN with which the QP is affiliated at the time we make the APM Incentive Payment. If we limit the TINs to which we will make the APM Incentive Payment to only those through which a QP was billing at the time they achieved QP status, we might be unable to identify any TIN to which we would make a payment for that QP during the payment year, or payments may be significantly delayed as a result, even in cases where a current payee TIN is available.

Therefore, we proposed to establish in our regulation at § 414.1450(c) a revised approach to identifying the TIN(s) to which we make the APM Incentive Payment. We noted that this approach would involve looking at a QP's relationship with their TIN(s) over time, as well as considering the relationship the TIN(s) have with the APM Entity or Entities through which the eligible clinician earned QP status, or other APM Entities the QP may have joined in the interim. We stated that we believe that this revised approach will enable CMS accurately identify TINs with which QPs are currently receiving other Medicare payments, and through which they would likely anticipate receiving their APM Incentive Payment. We also noted that this approach would also prioritize, when the QP is no longer affiliated with the original TIN through which they achieved QP status, identifying and paying TINs with which QPs are affiliated at the time the APM Incentive Payment is made, thereby reducing the potential burden on payee TINs to find QPs no longer affiliated with them in order to disburse the APM Incentive Payment amount, as well as reducing uncertainty and delays for the QPs themselves as they anticipate their APM Incentive Payment.

We also proposed to introduce a cutoff date of November 1 of each payment year, or 60 days from the day on which we make the initial round of APM Incentive Payments, whichever is later, as a point in time after which CMS will no longer accept new helpdesk requests from QPs or their representatives who have not received their payments. We discussed that there

may be scenarios where we are unable to identify any appropriate TIN to which the APM Incentive Payment should be made, such as when the QP is no longer participating in Medicare, the QP has recently reassigned his or her billing rights, or where a payment TIN may be undergoing business transformations such that payment information changes during the payment year. In these cases, it is our goal to make correct payments for the relevant QPs as soon as feasible. To do so, it is necessary to establish a date after which we will not consider additional inquiries or additional information from QPs or their representatives for purposes of disbursing remaining APM Incentive Payments for the payment year.

To improve and expand the ways we identify the TIN(s) to which we would make the APM Incentive Payment for a QP in a timelier and efficient manner, we proposed to sequentially apply the hierarchy in the following paragraph and to amend § 414.1450(c) of our regulations to reflect such hierarchy. We proposed to begin at the first step in the hierarchy, and if we are unable to identify one or more TINs with which the QP has a current affiliation at this step, we move to the next and successive steps of the hierarchy until we do identify one or more TINs with which the QP is currently affiliated at the time we are distributing APM Incentive Payments. When we identify one or more TINs with which the QP is affiliated at a step, we would make the APM Incentive Payment to those TINs. We further proposed that if we identify more than one TIN at the applicable step in the hierarchy, we will divide the APM Incentive Payment proportionally between such TINs based on the relative paid amount for Part B covered professional services that are billed through each such TINs. We proposed the hierarchy to be:

(1) Any TIN associated with the QP that, during the QP Performance Period, is associated with an APM Entity through which the eligible clinician achieved QP status;

(2) Any TIN associated with the QP that, during the APM Incentive Payment base period, is associated with an APM Entity through which the eligible clinician achieved QP status;

(3) Any TIN associated with the QP that, during the APM Incentive Payment base period, is associated with an APM Entity participating in an Advanced APM through which the eligible clinician had achieved QP status;

(4) Any TIN associated with the QP that, during the APM Incentive Payment

base period, participated in an APM Entity in an Advanced APM;

(5) Any TIN associated with the QP that, during the APM Incentive Payment base period, participated with an APM Entity in any track of the APM through which the eligible clinician achieved QP status;

(6) Any TIN associated with the QP that, during the APM Incentive Payment base period, participated with an APM Entity in an APM other than an Advanced APM;

(7) Any TIN associated with the QP that submitted a claim for covered professional services furnished by the QP during the APM Incentive Payment base period, even if such TIN has no relationship to any APM Entity or APM; then

(8) If we have not identified any TIN associated with the QP to which we can make the APM Incentive Payment, we will attempt to contact the QP via a public notice to request their Medicare payment information. The QPs identified in the public notice, or any other eligible clinicians who believe that they are entitled to an APM Incentive Payment must then notify CMS of their claim as directed in the public notice by November 1 of the payment year, or 60 days after CMS announces that initial payments for the year have been made, whichever is later. After that time, any claims by a QP to an APM Incentive Payment will be forfeited for such payment year.

We sought comment on the proposals. The following is a summary of the comments we received and our responses.

Comment: Several commenters opposed our proposed hierarchy to make the APM Incentive Payment to the QP stating the process is too complex and confusing. Those commenters stated CMS should identify a more streamlined approach where the APM Incentive Payment would be paid directly to the APM Entity.

Response: Under section 1833(z)(1)(A) of the Act, the statute provides that the APM Incentive payment is to be paid to the eligible clinician who is a QP for the year. As we explained in the CY 2017 Quality Payment Program final rule (81 FR 77487), we make the APM Incentive Payment to a TIN rather than to an individual eligible clinician. We do not believe it would be consistent with statutory intent to make the APM Incentive Payment to the APM Entity or Entities in which the QP may have participated. Rather, we believe that it would be most consistent with statutory intent to locate and make the APM Incentive Payment to the solvent TIN with the closest and most current

relationship to the QP. We believe that the proposed policy provides us with the opportunity to accurately identify as many appropriate payee TINs as possible prior to making the first round of payments, and that the proposed hierarchy will allow us to identify the most appropriate TIN to which to make payment. We understand that this process is complex, but we believe that application of the hierarchy will identify an appropriate payee TIN early in the process in most cases, and therefore, be better situated to disburse APM Incentive Payments earlier in the year than was possible under our current methodology.

It has also come to our attention that there may be situations where a TIN associated with a QP may be in bankruptcy status; we would not consider this an appropriate payee TIN and would move to the next step in the hierarchy to identify another TIN to which to make the APM Incentive Payment.

Comment: Another commenter opposed our proposal that, in the event we have not identified any TIN associated with a QP to which we can make the APM Incentive Payment, we would establish a 60-day public notice process to allow QPs or other eligible clinicians who believe they are entitled to an APM Incentive Payment to notify us of their claim and provide billing information or otherwise, forfeit their claim to payment. The commenter expressed concern that because there is no official date on which future APM Incentive Payments will be made, the proposed policy is not transparent.

Response: We understand commenters' concerns about the need for CMS to complete APM Incentive Payments as quickly and predictably as possible. We proposed to introduce a cutoff date of November 1 of each payment year, or 60 days from the day on which we make the initial round of APM Incentive Payments, whichever is later; and to provide a public notice to identify the deadline by which we must receive requests from QPs or their representatives who have not received their payments. We believe establishing the cutoff date as the later of November 1 or 60 days after the initial round of payments are made creates a more predictable and finite time table for when clinicians could expect to receive their APM Incentive Payments. It is our goal to accurately make payments for all QPs as soon in the payment year as feasible. To do so, it is necessary to establish a date after which we will not consider additional inquiries or additional information from QPs or their representatives for purposes of

disbursing any remaining APM Incentive Payments for the payment year.

We are finalizing without modification our proposal to adopt and use the hierarchy to identify an appropriate TIN to which to make the APM Incentive Payment for a QP. We are also finalizing our proposal that, in the event we do not identify an appropriate TIN at levels one through seven of the hierarchy, we will publish a public notice requiring the remaining QPs to come forward with their claims and provide payment information by the specified date that is the later of a 60-day deadline or November 1st of the payment year, or forfeit their claim to an APM Incentive Payment for the year.

(d) Eligible Clinicians With No Covered Professional Services in the Incentive Payment Base Period

In our experience calculating the APM Incentive Payments, it has come to our attention that there is a cohort of eligible clinicians who have been determined to be QPs for a year, and for whom an APM Incentive Payment has been calculated and in some cases paid, despite the fact that these eligible clinicians did not bill for any Part B covered professional services during the incentive payment base period. This situation arises in cases where an APM Entity is paid under the terms of the APM for supplemental services on behalf of an eligible clinician who is on their Participation List. This can occur because, for purposes of calculating the APM Incentive Payment, such supplemental service payments as described in § 414.1450(b)(7) of our regulations are considered covered professional services for purposes of calculating the APM Incentive Payment.

This scenario creates difficulty when we attempt to make the APM Incentive Payment for the QP because there are no relevant claims in our database indicating a TIN to which we should make the APM Incentive Payment. We noted in the CY 2021 PFS proposed rule (85 FR 50033 that we believe this situation is largely the result of clerical errors or delays, either in updates to the APM's Participation List that is submitted to CMS by APM participants, or through more general processes used to update an eligible clinician's Medicare enrollment information. We reminded our enrolled physicians, practitioners, group practices and other suppliers that it is their responsibility, in accordance with their APM participation and their Medicare enrollment agreement, to routinely update their APM participation lists that they submit directly to their APMs, as

well as their lists of enrolled providers assigned to their organization and associated TINs, either through the internet-based PECOS or using a CMS–855F Form. We reiterate that any payments resulting from a failure to make such updates may be considered fraud, waste, or abuse.

However, in the event that a QP's APM Incentive Payment was calculated based solely on supplemental services payments and no Medicare claims for covered professional services furnished by the QP were submitted during the incentive payment base period, we proposed to categorically assign these QPs to the list of QPs that will be given public notice requesting updated payment information within 60 day deadline or November 1st of the payment year, as described in the proposed regulation at § 414.1450(c)(8). We noted that we believe that in many if not most of these cases, such individuals have retired or otherwise ceased participation in Medicare; however, we recognized that there may be scenarios under which such individuals remain active, and noted that the proposal was meant to provide an opportunity for such clinicians to identify their current billing affiliation(s) or otherwise identify a TIN to which the APM Incentive Payment should be made.

We did not receive public comments on this provision, and therefore, we are finalizing as proposed.

d. Qualifying APM Participant (QP) and Partial QP Determinations

(1) Overview

In the CY 2017 Quality Payment Program final rule (81 FR 77433 through 77450), we finalized policies relating to QP and Partial QP determinations. In the CY 2019 PFS final rule (83 FR 59923 through 59925), we finalized additional policies relating to QP determinations and the Partial QP election to report to MIPS.

In the CY 2021 PFS proposed rule (85 FR 50333), we proposed to:

- Update the methodology for addressing prospectively aligned beneficiaries for Threshold Score calculations and QP determinations.
- Establish a Targeted Review process for QP Determinations.

Additionally, we clarified our policies on Advanced APM determinations and QP determinations in light of questions that may arise based on the effects of the PHE for COVID–19.

We solicited comment on whether to allow an APM Entity to make the Partial QP election on behalf of all of the APM Entity's participating eligible clinicians.

(2) Background

In the CY 2017 Quality Payment Program final rule (81 FR 77439 through 77440), we finalized that QP determinations would first be made at the APM Entity level, after which we would make further QP determinations at the individual level for eligible clinicians who are either: (1) Participating in multiple Advanced APM Entities, none of which meet the QP threshold as a group; or (2) on an Affiliated Practitioner List that is the list used for the QP determination when there are no eligible clinicians on a Participation List for the APM Entity (81 FR 77439 through 77443). As such, the QP determination at the APM Entity level generally applies to all the individual eligible clinicians who are on a Participation List of the Advanced APM. The QP determination Threshold Score calculations are aggregated using data for all eligible clinicians participating in the APM Entity on each snapshot date (March 31, June 30, August 31) during the QP Performance Period. If the APM Entity's Threshold Score meets the relevant QP threshold, all individual eligible clinicians in that APM Entity would receive the same QP determination, applied at the NPI level, for the relevant performance year (PY).

(3) Attribution of Prospectively Attributed Beneficiaries in QP Threshold Score Calculations

When making QP determinations, we include information for all attribution-eligible beneficiaries in the denominator of the patient count and payment amount methods used to calculate QP Threshold Scores as set forth in § 414.1435. "Attribution-eligible beneficiary" is a term defined in our regulation at § 414.1305, and the definition is generally based on the attribution methodology and rules for the particular Advanced APM. We have specified at § 414.1435(b)(3) that a beneficiary may be counted only once in the numerator and denominator for a single APM Entity group, and at § 414.1435(b)(4) that a beneficiary may be counted multiple times in the numerator and denominator for multiple different APM Entity groups.

When making QP determinations, at the APM Entity or individual eligible clinician level, we begin by calculating Threshold Scores, which are the ratio of the payment amounts or patient counts for "attributed beneficiaries" to the payment amounts or patient counts for "attribution eligible beneficiaries." If this ratio (the Threshold Score) for the eligible clinician or APM Entity level, as applicable, meets or exceeds the

relevant QP thresholds described at § 414.1430(a), the relevant eligible clinicians will have attained QP status for a year. It has come to our attention that under our current methodology for calculating Threshold Scores, we include attribution-eligible beneficiaries in the denominator of the calculation for some APM Entities for whom those same beneficiaries could never be included in the numerator. This may happen in a scenario where a beneficiary is attributed to an APM Entity and as a result is precluded by the applicable rules for one or more APMs from attribution to other APM Entities in certain other APMs.

For example, the Shared Savings Program offers the option for ACOs to select prospective beneficiary assignment, and prospective beneficiary alignment is used in the Direct Contracting Model and Next Generation ACO Model. When beneficiaries are prospectively attributed to an ACO in one of these APMs, under the rules of precedence within the APMs themselves, those beneficiaries are generally not available for attribution to participants in some other APMs, including other ACOs, regardless of attribution methodologies. However, the population of attribution-eligible beneficiaries for APM Entities in these other APMs still includes those prospectively aligned beneficiaries. This could have the effect of disadvantaging the APM Entities to which the beneficiaries may never be attributed, because their ratio of attributed beneficiaries to attribution-eligible beneficiaries will be lower, for reasons entirely outside the control of the relevant eligible clinicians and APM Entities.

Therefore, we proposed to amend § 414.1435(c)(1) of our regulations and add a new paragraph (c)(1)(i) to specify that beneficiaries who have been prospectively attributed to an APM Entity for a QP Performance Period will be excluded from the attribution-eligible beneficiary count for any other APM Entity that is participating in an APM where that beneficiary would be ineligible to be added to the APM Entity's attributed beneficiary list. We noted that the effect of the proposed policy would be to remove such prospectively attributed beneficiaries from the denominators when calculating Threshold Scores for APM Entities or individual eligible clinicians in Advanced APMs that align beneficiaries retrospectively, thereby preventing dilution of the Threshold Score for the APM Entity or individual eligible clinician in an Advanced APM that uses retrospective attribution.

We sought comment on the proposals. We received public comments on the removal of prospectively aligned beneficiaries. The following is a summary of the comments we received and our responses.

Comment: We received several of comments in support of our proposal for the removal of prospectively attributed beneficiaries. Commenters requested that we clarify the impact of the policy where beneficiaries are attribution eligible for more than one APM Entity, but the rules of one or more of the APMs would make it so that the beneficiary could only be attributed to one of the APM Entities.

Response: We appreciate the commenters support for the proposed change. The policy as proposed at § 414.1435(c)(1)(i) would have the effect of removing those beneficiaries that are prospectively attributed to an APM entity from the attribution eligible population for all other APM entities where the beneficiary would be excluded from attribution.

For example, when calculating QP determinations for a Shared Savings Program ACO, any attribution eligible beneficiaries who are prospectively assigned to another ACO, and thus have been precluded from assignment to the ACO in question, would be removed from the attribution eligible population for the ACO in our calculation. This policy will apply to cases where beneficiaries could not be attributed to multiple APM entities in a single APM or across multiple APMs.

We are finalizing this policy as proposed.

(3) Targeted Review of QP Determinations

(i) Overview

We proposed at § 414.1455(b) to establish a targeted review process for limited circumstances surrounding QP determinations. As discussed in the CY 2021 PFS proposed rule (85 FR 50334), this targeted review process would provide a systematic opportunity for eligible clinicians to bring to our attention potential clerical errors we may have made, and for us to review and make corrections if warranted. We also proposed that, after the conclusion of the time period for targeted review, there would be no further review of our QP determination with respect to an eligible clinician for the QP Performance Period.

We noted that, consistent with section 1833(z)(4) of the Act and under § 414.1455(a) of our regulations, there is no administrative or judicial review under sections 1869 or 1878 of the Act

or otherwise, of the determination that an eligible clinician is a QP or Partial QP under § 414.1425, that an APM Entity is an Advanced APM Entity under § 414.1410, or of the determination of the amount of the APM Incentive Payment under § 414.1450.

(ii) Scope of Targeted Review

We proposed at § 414.1455(b)(1) that an eligible clinician or APM Entity may request targeted review of a QP or Partial QP determination only if they believe in good faith that, due to a CMS clerical error, an eligible clinician was omitted from a Participation List used for purposes of QP determinations. We noted that if we made such a clerical error, we believe that it would be appropriate, and we proposed, to assign to the erroneously omitted eligible clinician the most favorable QP status that was determined at the APM Entity level. This would be done on any snapshot dates for the relevant QP Performance Period on which the eligible clinician participated in the APM Entity. We believe that this policy is appropriate in these circumstances because, as a result of a CMS clerical error, the eligible clinician was not provided the opportunity to become a QP based on the level of payment amounts or patient counts through an Advanced APM for an APM Entity with which they were associated.

Alternatively, if we were to recalculate an APM Entity's Threshold Scores for one or more of the snapshot dates in the relevant QP Performance Period, and the Threshold Scores no longer met the applicable QP threshold(s), that outcome could affect all of the eligible clinicians in the APM Entity group, removing their QP status. However, the affected eligible clinicians in the APM Entity group are likely to have acted in accordance with our notification of their prior QP determination, and may not have prepared for or reported to MIPS. In correcting our own clerical error with respect to some eligible clinicians, we do not believe it would be appropriate to revisit our prior QP determinations for a broader set of eligible clinicians, thereby potentially disadvantaging those eligible clinicians in MIPS scoring through no fault of their own.

We did not propose to conduct targeted review of potential omissions from Affiliated Practitioner Lists, as QP determinations for eligible clinicians on an Affiliated Practitioner List is made at the individual eligible clinician level for each of the QP Performance Period snapshots. As such, we would not have completed a QP determination for the QP Performance Period in question for

the individual eligible clinician who has been identified prior to the targeted review if that eligible clinician was indeed omitted due to CMS clerical error. We recognize that this circumstance may occur; however, we believe this to be an infrequent occurrence. Additionally, such calculations would not be operationally feasible in order to make the APM Incentive Payment in a timely manner.

We did not propose to accept targeted review requests to correct omissions from Participation Lists of Other Payer Advanced APMs, as those lists are provided to us directly by eligible clinicians and Other Payer Advanced APMs. As such, any clerical error would not be the fault of CMS.

(iii) Targeted Review Process

In general, we proposed to align this targeted review process with the MIPS targeted review process as codified at § 414.1385. We noted this alignment would reduce the likelihood of confusion and burden on eligible clinicians and APM Entities. We proposed to redesignate our regulation that reflects the statutory preclusion of administrative or judicial review under § 414.1455(a) and (b) to § 414.1455(a)(1) and (2) and to codify our targeted review policy at § 414.1455(b).

We proposed to specify at § 414.1455(b) that either an eligible clinician or APM Entity may submit a request for targeted review. We also proposed that all requests for targeted review must be submitted during the targeted review request submission period, which is a 60-day period that begins on the day CMS makes available the MIPS payment adjustment factors for the MIPS payment year as described at § 414.1385(a)(2) of our regulations. The targeted review request submission period may be extended as specified by CMS. We also proposed that all requests for targeted review must be submitted in accordance with the form and manner specified by CMS.

We proposed that a request for targeted review may be denied if the request is duplicative of another request for a targeted review; the request for targeted review is not submitted during the targeted review request submission period; or the request is outside the scope of the targeted review, as specified in § 414.1455(b)(1). We noted that, if the targeted review request is denied, there would be no change to either the QP or Partial QP determination. If the targeted review request is approved, we will assign the most favorable Threshold Score and corresponding QP status determined for

the APM Entity in which such eligible clinician participates.

We proposed that we would respond to each timely submitted request for targeted review and determine whether a targeted review is warranted.

We proposed that a request for targeted review may include additional information in support of the request at the time it is submitted. We noted that in cases where CMS requests additional information from the eligible clinician or the APM Entity group that is the subject of a request for targeted review, the information must be provided and received by CMS within 30 days of our request. Non-responsiveness to a CMS request for additional information may result in a final decision based on the information available, although another non-duplicative request for a targeted review may be submitted before the end of the targeted review request submission period.

We proposed that if targeted review requests reveal a pattern of CMS error with impacts that extend beyond the eligible clinician or clinicians who submitted such targeted review requests, we would correct any additional errors that we identify regardless of whether a targeted review was submitted for the other eligible clinicians affected.

We proposed that decisions based on the targeted review are final, and there is no further administrative review or appeal or judicial review.

We sought comment on the proposals.

We received public comments on the proposed targeted review process for QP determinations. The following is a summary of the comments we received and our responses.

Comment: We received several of comments seeking an expanded scope of Targeted Review that would include the recalculation of individual eligible clinician QP determinations.

Response: Based on past experience, our proposed targeted review process would address the vast majority of cases where a review has been necessary. Additionally, as explained in our proposal at (85 FR 50336), performing additional individual-level QP determination calculations, under our current methodology, would not be operationally feasible given statutorily determined timelines for making the APM Incentive Payment. We may consider recalculation of individual eligible clinician QP determinations in future rulemaking.

Comment: We received a comment stating that our proposed targeted review request submission period of 60 days was too short.

Response: We recognize that participants in the Quality Payment Program must meet a number of deadlines. In an effort to maximize the efficiency of the program, we believe that the benefits of aligning with the MIPS targeted review process outweigh the potential benefit of a longer timeline for the targeted review process. Additionally, any further delay of the targeted review process could further delay the process of making timely APM incentive payments.

Comment: We received several comments in support of our proposed targeted review process for QP determinations.

Response: We appreciate the support for this proposal.

We are finalizing this policy as proposed.

(4) PHE for COVID–19 Advanced APM Determination and QP Determinations (i) Advanced APM Determinations

In the CY 2021 PFS proposed rule (85 FR 50335), we noted that due to the PHE for COVID–19 and the urgent need to address changes to certain APMs during CY 2020 to respond to the extreme shifts in the healthcare delivery system, we are exercising its enforcement discretion in connection with Advanced APM determinations. Specifically, we will not reconsider the Advanced APM determinations of APMs which have already been evaluated and determined to meet the Advanced APM criteria for CY 2019 and CY 2020 even in the event that the APMs make changes to their governing documents or operations in such a way that, if there were a redetermination, they would no longer meet the criteria to be an Advanced APM. Furthermore, we will evaluate all APMs in future years with the understanding that any provisions of the Participation Agreement or governing regulation designed in response to the PHE for COVID–19 will not be considered to the extent they would prevent the APM from meeting the Advanced APM criteria for a year.

We noted that the following APMs are considered Advanced APMs for 2020:

- Bundled Payments for Care Improvement Advanced Model;
- Comprehensive Care for Joint Replacement Payment Model (CEHRT Track);
- Comprehensive Primary Care Plus Model;
- Comprehensive ESRD Care Model (LDO arrangement and Non LDO Two Sided Risk Arrangement);
- Maryland Total Cost of Care Model (Care Redesign Program; Maryland Primary Care Program);

- Medicare Shared Savings Program (Track 2, Track 3, Basic Track Level E, and the ENHANCED Track);

- Medicare Accountable Care Organization (ACO) Track 1+ Model;
- Next Generation ACO Model;
- Oncology Care Model (Two-Sided Risk Arrangements);

- Vermont All-Payer ACO Model (Vermont Medicare ACO Initiative).

We note that the following APMs are considered Advanced APMs for 2019:

- Bundled Payments for Care Improvement Advanced Model;
- Comprehensive Care for Joint Replacement Payment Model (CEHRT Track);
- Comprehensive Primary Care Plus Model;

- Comprehensive ESRD Care Model (LDO arrangement and Non LDO Two Sided Risk Arrangement);

- Maryland Total Cost of Care Model (Care Redesign Program; Maryland Primary Care Program);

- Medicare Shared Savings Program (Track 2, Track 3, Basic Track Level E, and the ENHANCED Track);

- Medicare Accountable Care Organization (ACO) Track 1+ Model;
- Next Generation ACO Model;
- Oncology Care Model (Two-Sided Risk Arrangements);

- Vermont All-Payer ACO Model (Vermont Medicare ACO Initiative).

(ii) QP Determinations

As discussed in the CY 2021 PFS proposed rule (85 FR 50336), we also understand that the PHE for COVID–19 may lead to the adoption of an earlier end date for certain APMs based on amendments to the APM's governing documentation, such as a Participation Agreement. For example, an Advanced APM governed by a Participation Agreement was originally scheduled to end on December 31, 2020, and the amended Participation Agreement may revise the ending date to July 1, 2020. In the event that such changes are made to a Participation Agreement to modify the end date of an Advanced APM in response to the PHE for COVID–19, we would not consider this to be a termination from an Advanced APM under § 414.1425(c)(5) or (6) of our regulations. As such, we would not revoke the QP status of eligible clinician participants in the Advanced APM on that basis.

We noted that we are aware that circumstances resulting from the PHE for COVID–19 could affect the results of QP and Partial QP determinations for the 2020 QP Performance Period, as compared to what those determinations would otherwise be in absence of the PHE for COVID–19.

However, after considering whether changes in our methodology to address the PHE for COVID-19 were warranted, we determined that any change to the QP determination methodology could have unintended negative consequences for Advanced APM participants as practice patterns have shifted even in areas with a low volume of COVID-19 cases. We noted that with the duration, scope, and severity of the PHE for COVID-19 being unknown, it is impossible to predict the potential impact both in terms of scale and which providers may be most likely to be affected. As such, we noted that we are concerned that making changes to the QP determination methodology would be more likely to inadvertently pick winners (those who would benefit from the change in methodology by achieving higher scores) and losers (those who would score better under our normal methodology than under a changed one) than it would be to generate relief from the PHE for COVID-19 across the board. We also noted that we anticipate that there would be significant challenges resulting from modifying QP calculations with so many unknown variables at play, and are concerned that any changes to our methodology could result in delays in the timing of our announcing QP status.

We discussed our belief that Advanced APM participants benefit from timely and predictable QP determinations. With all of these considerations in mind, we clarified that, apart from the exercise of enforcement discretion explained above, we would continue to perform QP determinations as established in our regulations at §§ 414.1305, 414.1425, 414.1430, 414.1435, and 414.1440 for the 2020 QP Performance Period, without modifications to address the PHE for COVID-19.

V. Physician Self-Referral Law: Annual Update to the List of CPT/HCPCS Codes

A. General

Section 1877 of the Act prohibits a physician from referring a Medicare beneficiary for certain designated health services to an entity with which the physician (or a member of the physician's immediate family) has a financial relationship, unless the financial relationship satisfies all requirements of an applicable exception. Section 1877 of the Act also prohibits the entity from submitting claims to Medicare or billing the beneficiary or any other individual or entity for designated health services that are furnished as a result of a prohibited referral.

Section 1877(h)(6) of the Act and § 411.351 of our regulations specify that the following items and services are designated health services:

- Clinical laboratory services.
- Physical therapy, occupational therapy, and outpatient speech-language pathology services.
- Radiology and certain other imaging services.
- Radiation therapy services and supplies.
- Durable medical equipment and supplies.
- Parenteral and enteral nutrients, equipment, and supplies.
- Prosthetics, orthotics, and prosthetic devices and supplies.
- Home health services.
- Outpatient prescription drugs.
- Inpatient and outpatient hospital services.

B. Annual Update to the Code List

1. Background

In § 411.351, we specify that the entire scope of four categories of designated health services is defined in a list of CPT/HCPCS codes (the Code List), which is updated annually to account for changes in the most recent CPT and HCPCS Level II publications. The categories defined and updated in this manner are:

- Clinical laboratory services.
- Physical therapy, occupational therapy, and outpatient speech-language pathology services.
- Radiology and certain other imaging services.
- Radiation therapy services and supplies.

The Code List also identifies those items and services that may qualify for either of the following two exceptions to the physician self-referral prohibitions:

- EPO and other dialysis-related drugs (§ 411.355(g)).
- Preventive screening tests, immunizations, and vaccines (§ 411.355(h)).

The definition of “designated health services” at § 411.351 excludes services for which payment is made by Medicare as part of a composite rate (unless the services are specifically included in the statutory or regulatory lists of items and services that are designated health services and are themselves payable through a composite rate, such as home health and inpatient and outpatient hospital services). Effective January 1, 2011, EPO and dialysis-related drugs furnished in or by an ESRD facility (except drugs for which there are no injectable equivalents or other forms of administration), have been reimbursed under a composite rate known as the

ESRD prospective payment system (ESRD PPS) (75 FR 49030). Accordingly, EPO and any dialysis-related drugs that are paid for under ESRD PPS are not designated health services and are not listed among the drugs that could qualify for the exception at § 411.355(g) for EPO and other dialysis-related drugs furnished by an ESRD facility.

ESRD-related oral-only drugs, which are drugs or biologicals with no injectable equivalents or other forms of administration other than an oral form, were scheduled to be paid under ESRD PPS beginning January 1, 2014 (75 FR 49044). However, there have been several delays of the implementation of payment of these drugs under ESRD PPS. On December 19, 2014, section 204 of the Stephen Beck, Jr., Achieving a Better Life Experience Act of 2014 (ABLE) (Pub. L. 113-295) was enacted and delayed the inclusion of these oral-only drugs under the ESRD PPS until 2025. Until that time, such drugs furnished in or by an ESRD facility are not paid as part of a composite rate and, thus, are designated health services.

The United States is responding to an outbreak of respiratory disease caused by a novel coronavirus. The virus has been named “severe acute respiratory syndrome coronavirus 2” (“SARS-CoV-2”) and the disease it causes has been named “coronavirus disease 2019” (“COVID-19”). In response to the COVID-19 outbreak, the American Medical Association (AMA) has established and published new CPT codes on its website to identify currently available SARS-CoV-2 tests (see <https://www.ama-assn.org/practice-management/cpt/covid-19-cpt-coding-and-guidance>). As of the effective date of this rule, tests for COVID-19 are designated health services, as they fall within the category of “clinical laboratory services.”

The AMA has also established and published two new CPT codes to identify each of two COVID-19 vaccines under development, both of which are included on the Code List as qualifying for the exception at § 411.355(h). There are additional COVID-19 vaccines still under development, and we anticipate that new CPT or HCPCS codes will be established to identify those vaccines as they become available. As noted above, in order to qualify for the exception at § 411.355(h), a vaccine must be included on the Code List. Therefore, in order to ensure that any COVID-19 vaccine to which a CPT or HCPCS code applies prior to the publication of the CY 2022 Code List qualifies for the exception at § 411.355(h), we are including language in the CY 2021 Code List to address such vaccines. Under

this final regulation, the physician self-referral prohibitions do not apply to CPT code 90749 (unlisted vaccine/toxoid) *when it is used to identify a COVID-19 vaccine* or to any future CPT or HCPCS code designated for a COVID-19 vaccine. This is in addition to the other codes listed on the Code List that relate to the application of § 411.355(h). The inclusion of CPT code 90749 on the Code List is not intended and should not be considered to direct or approve the use of CPT code 90749 for the identification and billing of any COVID-19 vaccine. Coding and billing guidance is expected as COVID-19 vaccines become available and coverage and billing policies are developed. We are making this revision to the Code List to ensure that the physician self-referral law does not impede the availability of

COVID-19 vaccines, when they are available, for Medicare (and other) patients. CPT and HCPCS codes assigned to any COVID-19 vaccine(s) will be posted on *CMS.gov* as they become available.

The Code List was last updated in Tables 67 and 68 of the CY 2020 PFS final rule (84 FR 63100).

2. Response to Comments

We received no comments relating to the Code List that became effective January 1, 2020.

3. Revisions Effective for CY 2021

The updated, comprehensive Code List effective January 1, 2021, is available on our website at https://www.cms.gov/Medicare/Fraud-and-Abuse/PhysicianSelfReferral/List_of_Codes.

Additions and deletions to the Code List conform it to the most recent publications of CPT and HCPCS Level II and to changes in Medicare coverage policy and payment status.

Tables 58 and 59 identify the additions and deletions, respectively, to the comprehensive Code List that become effective January 1, 2021. Tables 58 and 59 also identify the additions and deletions to the list of codes used to identify the items and services that may qualify for the exception in § 411.355(g) (regarding dialysis-related outpatient prescription drugs furnished in or by an ESRD facility) and in § 411.355(h) (regarding preventive screening tests, immunizations, and vaccines).

BILLING CODE 4120-01-C

VI. Waiver of Delay in Effective Date for This Final Rule

We are committed to ensuring that we fulfill our statutory obligation to update the PFS as required by law and have worked diligently in that regard. We ordinarily provide a 60-day delay in the effective date of final rules after the date they are issued in accordance with the Congressional Review Act (CRA) (5 U.S.C. 801(a)(3)). However, 5 U.S.C. 808(2) provides that, if an agency finds good cause that notice and public procedures are impracticable, unnecessary, or contrary to the public interest, the rule shall take effect at such time as the agency determines.

As discussed in the CY 2021 PFS proposed rule (85 FR 50074, 50336), the United States is responding to an outbreak of respiratory disease caused by a novel (new) coronavirus that has now been detected in more than 190 locations internationally, including in all 50 States and the District of Columbia. The virus has been named “SARS CoV 2” and the disease it causes has been named “coronavirus disease 2019” (abbreviated “COVID 19”).

On January 30, 2020, the International Health Regulations Emergency Committee of the World Health Organization (WHO) declared the outbreak a “Public Health Emergency of International Concern” (PHEIC). On January 31, 2020, Health and Human Services Secretary, Alex M. Azar II, declared a PHE for the United States to

aid the nation’s healthcare community in responding to COVID-19. On March 11, 2020, the WHO publicly characterized COVID-19 as a pandemic. On March 13, 2020 the President of the United States declared the COVID-19 outbreak a national emergency.

The PFS payment rule is necessary to annually review and update the payment systems, and it is critical to ensure that the payment policies for these systems are effective on the first day of the year to which they are intended to apply. Due to CMS prioritizing efforts in support of containing and combatting the PHE for COVID-19, and devoting significant resources to that end, we announced in the proposed rule that this CY 2021 PFS final rule would not be completed in accordance with our usual schedule for this rulemaking, which aims for a publication date of at least 60 days before the start of the year to which it applies. We announced that we may need up to an additional 30 days to complete the work needed on this final rule.

Therefore, in light of the PHE for COVID-19, and the resulting strain on CMS’s resources to that end, it was impracticable for CMS to publish this final rule 60 days prior to the beginning of the upcoming year, and CMS has determined that, for good cause, it would be contrary to the public interest to delay the effective date of this final rule beyond January 1, 2021; and we are waiving the 60-day delay in effective

date, pursuant to 5 U.S.C. 808(2), and this CY 2021 PFS final rule will be effective 30 days after publication. Accordingly, we are providing a 30-day delay in the effective date of the final rule in accordance with the Administrative Procedure Act (5 U.S.C. 553(d)), which ordinarily requires a 30-day delay in the effective date of a final rule from the date of its public availability in the **Federal Register**, and section 1871(e)(1)(B)(i) of the Act, which generally prohibits a substantive rule from taking effect before the end of the 30-day period beginning on the date of its public availability.

VII. Collection of Information Requirements

Under the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3501 *et seq.*), we are required to publish a 60-day notice in the **Federal Register** and solicit public comment before a “collection of information” requirement is submitted to the Office of Management and Budget (OMB) for review and approval. For the purposes of the PRA and this section of the preamble, collection of information is defined under 5 CFR 1320.3(c) of OMB’s implementing regulations.

To fairly evaluate whether an information collection should be approved by OMB, PRA section 3506(c)(2)(A) requires that we solicit comment on the following issues:

- The need for the information collection and its usefulness in carrying out the proper functions of our agency.
- The accuracy of our burden estimates.
- The quality, utility, and clarity of the information to be collected.
- Our effort to minimize the information collection burden on the

affected public, including the use of automated collection techniques.

We solicited public comment on each of the required issues under section 3506(c)(2)(A) of the PRA for the following information collection requirements.

A. Wage Estimates

To derive average costs, we used data from the U.S. Bureau of Labor Statistics'

May 2019 National Occupational Employment and Wage Estimates for all salary estimates (http://www.bls.gov/oes/current/oes_nat.htm). In this regard, Table 60 presents the mean hourly wage, the cost of fringe benefits and overhead (calculated at 100 percent of salary), and the adjusted hourly wage.

TABLE 60: National Occupational Employment and Wage Estimates

Occupation title	Occupation code	Mean hourly wage (\$/hr)	Fringe benefits and overhead (\$/hr)	Adjusted hourly wage (\$/hr)
Anesthesiologists	29-1211	125.83	125.83	251.66
Billing and Posting Clerks	43-3021	19.53	19.53	39.06
Computer Systems Analyst	15-1211	46.23	46.23	92.46
Family Medicine Physicians	29-1215	102.53	102.53	205.06
General Internal Medicine Physicians	29-1216	96.85	96.85	193.70
Health Diagnosing and Treating Practitioners	29-1000	49.26	49.26	98.52
Licensed Practical Nurse (LPN)	29-2061	23.32	23.32	46.64
Medical and Health Services Managers	11-9111	55.37	55.37	110.74
Medical Secretary	43-6013	18.31	18.31	36.62
Obstetricians and Gynecologists	29-1218	112.31	112.31	224.62
Pediatricians, General	29-1221	88.66	88.66	177.32
Physicians, All Other; and Ophthalmologists, Except Pediatric	29-1228	97.81	97.81	195.62
Psychiatrists	29-1223	105.98	105.98	211.96
Surgeons, Except Ophthalmologists	29-1248	121.17	121.17	242.34

As indicated, we adjusted our employee hourly wage estimates by a factor of 100 percent. This is necessarily a rough adjustment, both because fringe benefits and overhead costs vary significantly from employer to employer, and because methods of estimating these costs vary widely from study to study. Nonetheless, we believe that doubling the hourly wage to estimate total cost is a reasonably accurate estimation method.

For the CY 2019 and CY 2020 PFS final rules, we used the BLS wage rate for "Physicians and Surgeons" (occupation code 29-1060) to estimate the burden for Physicians. In BLS' most recent set of occupational wage rates dated May 2019, they have discontinued this occupation in their wage data. As a result, in order to estimate the burden for Physicians, we are using a rate of \$212.78/hr which is the average of the mean wage rates for Anesthesiologists; Family Medicine Physicians; General Internal Medicine Physicians; Obstetricians and Gynecologists;

Pediatricians, General; Physicians, All Other; and Ophthalmologists, Except Pediatric; Psychiatrists; and Surgeons, Except Ophthalmologists [(251.66/hr + \$205.06/hr + \$193.70/hr + \$224.62/hr + \$177.32/hr + \$195.62/hr + \$211.96/hr + \$242.34/hr) ÷ 8].

B. Information Collection Requirements (ICRs)

1. ICRs Regarding Modifications to OTP Enrollment Process (§ 424.67)

The following requirement and burden changes will be submitted to OMB for approval under control numbers 0938-0685 and 0938-1377 (respectively, CMS-855A and CMS-855B).

a. Form CMS-855B Completion—Estimates in November 15, 2019 Final Rule

In the aforementioned November 15, 2019 final rule (84 FR 62568), we prepared estimates of the hour and cost burdens to OTPs in completing the Form CMS-855B (Medicare Enrollment

Application Clinics/Group Practices and Certain Other Suppliers). We are restating them in the current rule to help stakeholders better understand the burdens associated with our changes to § 424.67.

Based on SAMHSA statistics and our internal data, we estimated in the November 15, 2019 final rule that: (1) About 1,700 certified and accredited OTPs were eligible for Medicare enrollment; and (2) 200 OTPs would become certified by SAMHSA in the next 3 years (or roughly 67 per year). This brought the total number of OTPs eligible to enroll during this 3-year period to approximately 1,900.

We projected that it would take each OTP an average of 3 hours to obtain and furnish the required information on the Form CMS-855B and a new supplement thereto designed to capture data unique to OTPs. Per our experience, we believed that the OTP's medical secretary would secure and report the data on the Form CMS-855B and supplement. We estimated that this task

would take approximately 2.5 hours, of which about 30 minutes would involve completion of the supplement. In addition, a health diagnosing and treating practitioner of the OTP would review and sign the form, a process we estimated would take 30 minutes.

Using BLS' May 2018 wage estimates, we consequently projected a first-year burden of 5,301 hours (1,767 entities \times 3 hr) at a cost of \$244,146 [1,767 entities ((2.5 hr \times \$35.66/hr) + (0.5 hr \times \$98.04/hr))]; a second-year burden of 201 hours (67 entities \times 3 hr) at a cost of \$9,257 [67 entities \times ((2.5 hr \times \$35.66/hr) + (0.5 hr \times \$98.04/hr))]; and a third-year burden of 198 hours [66 entities \times 3 hr) at a cost of \$9,119 (66 entities \times ((2.5 hr \times \$35.66/hr) + (0.5 hr \times \$98.04/hr))]. In aggregate, we estimated a total 3-year burden of 5,700 hours (5,301 hr + 201 hr + 198 hr) at a cost of \$262,522 (\$244,146 + \$9,257 + \$9,119). When averaged over the typical 3-year OMB approval period, we estimated an annual burden of 1,900 hours (5,700 hr/3) at a cost of \$87,507 (\$262,522/3).

b. Revisions to § 424.67

(1) Completion of Form CMS-855A

We foresee three main implications associated with our changes to § 424.67. First, newly enrolling OTPs would be able to complete and submit a Form CMS-855A (Medicare Enrollment Application—Institutional Providers) instead of a Form CMS-855B. Second, we anticipate that numerous OTPs that are currently enrolled via the Form CMS-855B would terminate the latter enrollments and complete/submit a Form CMS-855A application in order to bill for OTP services via the 837I. (As stated in revised § 424.67(c), an OTP cannot be enrolled via both the Form CMS-855A and Form CMS-855B; it must choose one of these two enrollment mechanisms.) Third, it is possible that some OTPs that enroll using the Form CMS-855A (pursuant to revised § 424.67(b)) would later change their enrollment to a Form CMS-855B.

In preparing the following OTP enrollment estimates, we: (1) Reviewed internal PECOS and billing data concerning existing OTP Form CMS-855 enrollments and claim submissions; and (2) considered feedback recently received from the OTP community regarding potential billing and enrollment options. Based on this, we project that over the first 3 years of our changes to § 424.67:

- Roughly one-half (or 33) of the previously estimated 67 annually enrolling OTPs (that is, in Years 2 and 3 and beyond) would elect to complete

a Form CMS-855A rather than a Form CMS-855B.

- Approximately 300 currently enrolled OTPs would change their enrollment from a Form CMS-855B to a Form CMS-855A.
- About 10 OTPs that enroll using the Form CMS-855A would later change their enrollment to a Form CMS-855B.

(a) New OTPs Enrolling Via the Form CMS-855A

We estimate that it would take each OTP approximately 4 hours to secure and provide the relevant data on the Form CMS-855A and the new supplement thereto (which would capture OTP-specific information). Consistent with our experience, the OTP's medical secretary would obtain and report information on the Form CMS-855A and supplement, a task that would take roughly 3.5 hours (about 30 minutes of which would involve completion of the supplement). A health diagnosing and treating practitioner of the OTP would spend 30 minutes reviewing and signing the form.

Given the preceding data, we project an annual burden for new OTPs seeking to complete a Form CMS-855A of 132 hours (4 hr \times 33 OTPs) at a cost of \$5,855 (33 OTPs \times ((3.5 hr \times \$36.62/hr) + (0.5 hr \times \$98.52/hr)). Since these OTPs would not be completing the Form CMS-855B as originally anticipated in the November 15, 2019 final rule and approved by OMB in that rule's collection of information request, we must revise the Form CMS-855B estimates identified therein. Using the hour and wage burdens from that rule, we project a Form CMS-855B annual burden reduction of 99 hours (33 OTPs \times 3 hr) at a cost of \$4,560 (33 OTPs \times (2.5 hr \times \$35.66/hr) + (0.5 hr \times \$98.04/hr)).

(b) Enrolled OTPs Transitioning to Form CMS-855A or Form CMS-855B Enrollment

As already mentioned, we believe that roughly:

- ++ 300 currently enrolled OTPs would change their enrollment from a Form CMS-855B to a Form CMS-855A.
- ++ 10 OTPs that enroll using the Form CMS-855A would later change their enrollment to a Form CMS-855B.

This would involve the OTP's completion of a Form CMS-855A or Form CMS-855B application as a new enrollment. We note that in our proposed estimates, we had stated that these OTPs would also need to report the voluntary termination of their existing Form CMS-855 enrollment via the latter form (that is, if the OTP is ceasing its Form CMS-855B enrollment,

it would report this via a Form CMS-855B voluntary termination submission). Upon further analysis and reflection, this step will not be necessary; termination of the prior enrollment will be done by the Medicare contractor systematically. Accordingly, we are not finalizing our estimates of the burden associated with completing a Form CMS-855 voluntary termination application.

(i) Transition to Form CMS-855A Enrollment

Under our previously mentioned Form CMS-855A hour and wage estimates, we project a total burden for new Form CMS-855A enrollments pursuant to revised § 424.67(b) of 1,200 hours (300 OTPs \times 4 hr) at a cost of \$53,229 (300 OTPs \times ((3.5 hr \times \$36.62/hr) + (0.5 hr \times \$98.52/hr)). We believe this burden would be incurred exclusively in the first year following our changes; it is very likely these OTPs would wish to pursue Form CMS-855A enrollment as soon as possible in order to bill via the 837I. Over the first 3 years, the average annual burden would be 400 hours (1,200 hr/3) at a cost of \$17,743 (\$53,229/3).

(ii) Transition to Form CMS-855B Enrollment

In line with our hour and wage estimates previously referenced in this section VII.B.1. of this final rule, we project a total burden for new Form CMS-855B enrollments under § 424.67(c)(2) of 30 hours (10 OTPs \times 3 hr) at a cost of \$1,480 (10 OTPs \times ((2.5 hr \times \$36.62/hr) + (0.5 hr \times \$98.52/hr)). We anticipate that changes to a Form CMS-855B enrollment would occur in the second and third years following the effective date of our revisions. This is because Year 1 would mostly involve these new OTPs enrolling for the first time via the Form-855A; only in the succeeding 2 years would they switch to a Form CMS-855B enrollment. We thus project that the average annual burden in the first 3 years would be 10 hours (30 hr/3) at a cost of \$469 (\$1,408/3).

(2) Total Annual Burden

In light of foregoing estimates, and when averaged over the typical 3-year OMB approval period, we estimate the following:

- Form CMS-855A—The total annual increased burden would be 532 hours (132 hr + 400 hr) at a cost of \$23,598 (\$5,855 + \$17,743).
- Form CMS-855B—We project a reduction in annual burden of –89 hours (–99 hr – 10 hr) and \$4,091 (–\$4,560 – \$469).

(3) Application Fee

Under § 424.67(b)(2), an enrolling OTP must comply with the application fee requirements in § 424.514. This means, in short, that an OTP must pay the required application fee as part of the enrollment process. The application fee does not meet the definition of a “collection of information” and, as such, is not subject to the requirements of the PRA. Although we did not set out such burden under this section of the preamble, the cost is included under the Regulatory Impact Analysis section.

(4) Fingerprinting

We discussed in section III.B. of this final rule that certain OTPs are subject to the high-risk level of categorical screening under § 424.518. Said screening includes the submission of a set of fingerprints (via FBI Applicant Fingerprint Card FD-258) for a national background check from all individuals who maintain a 5 percent or greater direct or indirect ownership interest in the provider or supplier. In the November 15, 2019 final rule, we calculated the hour and cost burden associated with this activity, basing our estimates on an anticipated 1,900 total OTP enrollees over the 3-year period following publication of that rule.

We do not believe our revisions to § 424.67 would involve any additional or reduced fingerprinting burden for two reasons. First, we specify in revised § 424.67(b)(3)(ii) that, in effect, Form CMS-855B-enrolled OTPs that are changing to a Form CMS-855A enrollment need only undergo the limited level of categorical screening (§ 424.518) if they have (as part of their Form CMS-855 enrollment) already successfully completed the moderate or high level of categorical screening under that same regulatory section. Since completion of moderate or high level screening (as applicable) would have been required for Form CMS-855B OTP enrollment, these OTPs (previously estimated at 300 total) would not have to again undergo fingerprinting as part of their Form CMS-855A enrollment. Second, and with the exception of the 300 new enrollments mentioned in the previous sentence, we do not foresee additional enrolling OTPs beyond: (1) The 1,900 which we estimated in the November 15, 2019 final rule; and (2) the roughly 67 newly enrolling OTPs in Year 2 and Year 3 and annually thereafter. In other words, the only change we project would be in the type of Form CMS-855 application these OTPs may complete, not the number of anticipated enrollees. As such, the total

fingerprinting burden would not change.

We received no comments regarding our ICR estimates pertaining to OTP provider enrollment.

2. ICRs Regarding the Medicare Shared Savings Program (42 CFR Part 425)

Section 1899(e) of the Act provides that chapter 35 of title 44 U.S.C., which includes such provisions as the PRA, shall not apply to the Shared Savings Program. Accordingly, we are not setting out burden under the authority of the PRA. Please refer to sections VIII.H.7.a., VIII.H.7.b., VIII.H.7.c., and VIII.H.8. of this final rule for a discussion of the impacts associated with this rule's changes to the Shared Savings Program's quality reporting requirements, beneficiary assignment methodology, and repayment mechanism requirements, and section VIII.H.7.c. of this final rule for a discussion of the impacts associated with finalization of Shared Savings Program policies established in the May 8th COVID-19 IFC.

3. ICRs Regarding the Requirement for Electronic Prescribing for Controlled Substances for a Covered Part D Drug Under a Prescription Drug Plan or an MA-PD Plan § 423.160(a)

When ready, the following changes will be submitted to OMB through the standard PRA process for approval under control number 0938-TBD (CMS-10755). The standard PRA process includes the publication of 60- and 30-day **Federal Register** notices, which we expect to publish shortly after the publication of this final rule. Please note that the proposed rule indicated (85 FR 50340) that the changes would be submitted under control number 0938-0763 (CMS-R-262). However, based on internal review we have since determined that the changes should be set out under a new collection of information request. Importantly, the new collection of information request (0938-TBD; CMS-10755) has no effect on our proposed and final requirements and burden estimates. Rather, we are simply changing the location of those requirements and burden estimates. Please note that OMB will issue the new control number when ready. In the meantime it is to be determined (or “TBD”). The new collection of information request's CMS identification number (CMS-10755) is not subject to change.

We are implementing section 2003 of the SUPPORT for Patients and Communities Act, which requires that the prescribing of a Schedule II, III, IV, or V controlled substance under

Medicare Part D be done electronically in accordance with an electronic prescription drug program beginning January 1, 2021, subject to any exceptions, which HHS may specify. We are requiring prescribers to use the NCPDP SCRIPT 2017071 standard for Electronic Prescription for Controlled Substances (EPCS) prescription transmissions beginning January 1, 2021.

In the first year of implementation, we expect that prescribers would have to revise their policies and procedures and train staff on this new requirement. Based on our conversations with providers, EHR vendors, and Part D plans, we understand that because electronic prescribing is so widespread and vendors train the staff directly and set-up their systems, we estimate that this transition could be completed with a one-time burden of 5 hours at \$36.62/hr by an Administrative Assistant or Medical Secretary. We solicited comments on this assumption and, we received several public comments related to the numbers used for this burden estimate assumption for the Electronic Prescribing for Controlled Substances for a Covered Part D Drug Under a Prescription Drug Plan or an MA-PD Plan.

Comment: Several commenters expressed concerns that CMS' proposal assumes these functionalities to be successful, when in actuality they still require significant fixes and delayed implementation timelines. Perhaps the biggest challenge clinicians will face, commenters stated, is incorporating EPCS into their EHRs, and most clinician practices are not in a position to cover the costs and acquire the necessary resources for technical or system upgrades required by EHR vendors—especially rural and small practices. Commenters stated that due to the PHE for COVID-19, many practices have been forced to delay or cancel implementation altogether of EHRs that support EPCS due to the implementation cost. Commenters expressed concern that practices that do not currently even have the capability to prescribe electronically would be forced to purchase such a software. A commenter supported the intent to facilitate efficiency, convenience, and better security with the implementation of EPCS, but encourages CMS to avoid unreasonable burden imposed upon clinicians and delay compliance until at least January 1, 2023.

Response: We are aware of the difficulties that many clinicians may face when implementing EPCS. Given that the mandate is statutory with potentially broad public health

implications, we believe a January 1, 2021 effective date complies with the statutory intent and would enable the safety and other benefits previously discussed to be put in place during the current pandemic. However, to help ensure that the burden on prescribers is not unreasonable, we will be finalizing a compliance date of January 1, 2022 such that prescribers who do not implement the NCPDP SCRIPT 2017071 standard for electronic prescribing of Schedule II, III, IV, and V controlled substances until January 1, 2022 will still be considered compliant with the requirement. We have also adjusted the estimate of the provider burden to accurately reflect fixing any issues that may arise.

Comment: One commenter expressed concern with the health care provider burden associated with reporting EPCS transactions to CMS.

Response: Based on internal CMS data, there are 425,000 Part D prescribing practices. Based on the increasing rate of doctors conducting e-prescribing thus far in light of the current social distancing guidelines, currently, 61 percent of Part D prescribers have electronic prescribing capabilities absent the requirement. Therefore, the one-time burden to implement this provision is 828,750 hours (165,750 prescribers * 5 hr) at a cost of \$30,348,825 (828,750 hr * \$36.62/hr). Based on the modeling that we have seen, we have found that EHR companies provide the initial set-up of e-prescribing software free of charge, provided the prescribers pay the per transaction cost of \$1.88 mentioned previously. Based on the comments received, we understand that implementing EPCS can lead to technological glitches, and then fixing those issues. We understand that the EHR companies remedy the issues free of charge. However, we understand that such fixes take time away from the medical office staff. We estimate that such fixes would take the staff approximately 1 extra hour when averaged across all prescribers. As a result, we have changed our one-time burden estimate from 5 hours to 6 hours per provider, which means a total of 994,500 hours (165,750 * 6 hr) at a cost of \$36,418,590 (994,500 hr * 36.62).

4. ICRs Regarding the Medicare Diabetes Prevention Program (MDPP) Expanded Model

In section III.P. of this final rule, we finalize policies necessary to allow certain flexibilities for Medicare enrolled MDPP suppliers and eligible beneficiaries in the MDPP Expanded Model during a PHE. Section

1115A(d)(3) of the Act exempts Innovation Center model tests and expansions, which include the MDPP expanded model, from the provisions of the PRA.

5. The Quality Payment Program (42 CFR Part 414 and Section IV. of This Final Rule)

The following QPP-specific ICRs reflect this rule's finalized policy changes and policies that have been finalized in our CY 2017 and 2018 Quality Payment Program final rules (81 FR 77008 and 82 FR 53568, respectively), and our CY 2019 and CY 2020 PFS final rules (83 FR 59452 and 84 FR 62568, respectively).

a. Background

(1) ICRs Associated With MIPS and Advanced APMs

The Quality Payment Program is comprised of a series of ICRs associated with MIPS and Advanced APMs. The MIPS ICRs consist of: Registration for virtual groups (see section VII.B.5.b of this final rule); QCDR self-nomination applications and other requirements (see section VII.B.5.c.(2) of this final rule); qualified registry self-nomination applications and other requirements (see section VII.B.5.c.(3) of this final rule); CAHPS survey vendor applications (see section VII.B.5.c.(4) of this final rule); Open Authorization credentialing and token request process (see section VII.B.5.d of this final rule); Quality Payment Program Identity Management Application Process (see section VII.B.5.e.(3) of this final rule); quality performance category data submission by Medicare Part B claims collection type (see section VII.B.5.e.(4) of this final rule), QCDR and MIPS CQM collection type (see section VII.B.5.e.(5) of this final rule), eCQM collection type (see section VII.B.5.e.(6) of this final rule), and CMS Web Interface collection type (see section VII.B.5.e.(7) of this final rule); CAHPS for MIPS survey beneficiary participation (see section VII.B.5.e.(8) of this final rule); group registration for CMS Web Interface (see section VII.B.5.e.(9) of this final rule); group registration for CAHPS for MIPS survey (see section VII.B.5.e.(10) of this final rule); call for quality measures (see section VII.B.5.f of this final rule); reweighting applications for Promoting Interoperability and other performance categories (see section VII.B.5.g.(2) of this final rule); Promoting Interoperability performance category data submission (see section VII.B.5.g.(3) of this final rule); call for Promoting Interoperability measures (see section VII.B.5.h of this final rule);

improvement activities performance category data submission (see section VII.B.5.i of this final rule); nomination of improvement activities (see section VII.B.5.j of this final rule); nomination of MVPs (see section VII.B.5.k of this final rule); and opt-out of Physician Compare for voluntary participants (see section VII.B.5.o of this final rule).

The ICRs for Advanced APMs consist of: Partial Qualifying APM Participant (QP) election (section VII.B.5.m of this final rule); Other Payer Advanced APM identification: Payer Initiated and Eligible Clinician Initiated Processes (sections VII.B.5.n.(1) and (2) of this final rule); and submission of data for QP determinations under the All-Payer Combination Option (section VII.B.5.n.(3) of this final rule).

(2) Summary of Quality Payment Program Changes: MIPS

Nine MIPS ICRs [(1) QCDR self-nomination applications, (2) Qualified Registry self-nomination applications, (3) quality performance category data submission by QCDR and MIPS CQM collection type, (4) quality performance category data submission by eCQM collection type, (5) quality performance category data submission by CMS Web Interface collection type, (6) group registration for the CMS Web Interface, (7) CAHPS for MIPS survey beneficiary participation, (8) nomination of improvement activities, and (9) reweighting applications for Promoting Interoperability and other performance categories] show changes in burden due to finalized policies. In aggregate, we estimate the policies will result in a net increase in burden of +1,163 hours and +\$120,391 for the 2021 MIPS performance period and -4,763 hours and -\$421,117 for the 2022 MIPS performance period. The provisions discussed in section VII.A.3.g. to require QCDRs and qualified registries to conduct targeted audits if one or more deficiencies or data errors are identified in an annual data validation audit will increase the annual burden hours for both QCDRs and qualified registries by a range of 5 to 10 hours per audit. The provision discussed in section IV.A.3.c.(1)(c) of this final rule to sunset the CMS Web Interface measures as a collection type/submission type starting with the 2022 MIPS performance period will result in removal of the quality performance category data submission by CMS Web Interface collection type and group registration for the CMS Web Interface ICRs beginning with the 2022 MIPS performance period. The same provision will increase the number of respondents for both the MIPS CQM and QCDR and eCQM collection types for

the quality performance category beginning with the 2022 MIPS performance period as we assume respondents who previously submitted via the CMS Web Interface collection type will alternatively utilize one of these collection types to submit quality data in the 2022 MIPS performance period. The provision discussed in section IV.A.3.c.(1)(f)(i) of this final rule to add a survey-based measure on telehealth that assesses patient-reported usage of telehealth services to the CAHPS for MIPS Survey will increase the time required for beneficiaries to respond to the survey by 0.2 minutes (0.0033 hours) per beneficiary. The provision discussed in section IV.A.3.c.(3)(b)(i)(B)(bb) of this final rule to require nominated improvement activities to be linked to existing and related quality and cost measures, as applicable and feasible will increase the time by 1 hour per improvement activity nominated. Finally, the provision discussed in section IV.A.3.c.(5)(e) of this final rule to allow APM Entities the ability to submit an extreme and uncontrollable circumstances exception application will increase our estimated number of respondents by 7 APM Entities. The remaining changes to our currently approved burden estimates are adjustments due to the use of updated data sources available at the time of publication of this final rule.

We have also added two new ICRs (Open Authorization (OAuth) Credentialing and Token Request Process (see section VII.B.5.d of this final rule) and the Nomination of MVPs (see section VII.B.5.k of this final rule). The Open Authorization (OAuth) Credentialing and Token Request Process ICR reflects the burden associated with the availability of a new process for all submitter types to request approval to submit data via direct upload to CMS. The Nomination of MVPs reflects the burden associated with a new process available for all stakeholders to nominate MVPs for inclusion in the Quality Payment Program.

We are not making any changes or adjustments to the following ICRs: Registration for virtual groups, CAHPS survey vendor applications, Quality Payment Program Identity Management Application Process, group registration for CAHPS for MIPS survey; call for MIPS quality measures; and call for Promoting Interoperability measures. See section VII.B.5. of this final rule for a summary of the ICRs, the overall burden estimates, and a summary of the assumption and data changes affecting each ICR.

The accuracy of our estimates of the total burden for data submission under the quality, Promoting Interoperability, and improvement activities performance categories may be impacted due to two primary reasons. First, we are unable to predict with 100 percent certainty who will be a QP. New eligible clinician participants in Advanced APMs who become QPs would be excluded from MIPS reporting requirements and payment adjustments, and as such, unlikely to report under MIPS; while some current Advanced APM participants may end participation such that the APM Entity's eligible clinicians would not be QPs for a year based on § 414.1425(c)(5), and thus be required to report under MIPS. Second, it is difficult to predict what Partial QPs, who can elect whether to report to MIPS, will do in the 2021 MIPS performance period compared to the 2019 MIPS performance period, and therefore, the actual number of Advanced APM participants and how they elect to submit data may be different than our estimates. However, we believe our estimates are the most appropriate given the available data.

(3) Summary of Quality Payment Program Changes: Advanced APMs

For these ICRs (identified above under, "ICRs Associated with MIPS and Advanced APMs"), the changes to currently approved burden estimates are adjustments based on updated projections for the 2021 MIPS performance period. We are not making any changes to the Other Payer Advanced APM identification: Eligible Clinician Initiated Process and submission of Data for QP determinations under the All-Payer Combination Option ICRs.

(4) Framework for Understanding the Burden of MIPS Data Submission

Because of the wide range of information collection requirements under MIPS, Table 61 presents a framework for understanding how the organizations permitted or required to submit data on behalf of clinicians vary across the types of data, and whether the clinician is a MIPS eligible clinician or other eligible clinician voluntarily submitting data, MIPS APM participant, or an Advanced APM participant. As shown in the first row of Table 61, MIPS eligible clinicians that are not in MIPS APMs and other clinicians voluntarily submitting data will submit data either as individuals, groups, or virtual groups for the quality, Promoting Interoperability, and improvement activities performance categories. Note that virtual groups are subject to the

same data submission requirements as groups, and therefore, we will refer only to groups for the remainder of this section unless otherwise noted. Because MIPS eligible clinicians are not required to submit any additional information for assessment under the cost performance category, the administrative claims data used for the cost performance category is not represented in Table 61.

For MIPS eligible clinicians participating in MIPS APMs, the organizations submitting data on behalf of MIPS eligible clinicians will vary between performance categories and, in some instances, between MIPS APMs. As discussed in section IV.A.3.b. of this final rule, for clinicians in APM Entities, the APM Performance Pathway is available for both ACO and non ACOs to submit quality data. Due to data limitations and our inability to determine who would use the APM Performance Pathway versus the traditional MIPS submission mechanism for the 2021 MIPS performance period, we assume ACO APM Entities will submit data through the APM Performance Pathway, using the CMS Web Interface option, and non-ACO APM Entities would participate through traditional MIPS, thereby submitting as an individual or group rather than as an entity.

For the Promoting Interoperability performance category, group TINs may submit data on behalf of eligible clinicians in MIPS APMs, or eligible clinicians in MIPS APMs may submit data individually. For the improvement activities performance category, we will assume no reporting burden for MIPS APM participants. In the CY 2017 Quality Payment Program final rule, we described that for MIPS APMs, we compare the requirements of the specific MIPS APM with the list of activities in the Improvement Activities Inventory and score those activities in the same manner that they are otherwise scored for MIPS eligible clinicians (81 FR 77185). Although the policy allows for the submission of additional improvement activities if a MIPS APM receives less than the maximum improvement activities performance category score, to date all MIPS APM have qualified for the maximum improvement activities score. Therefore, we assume that no additional submission will be needed.

Eligible clinicians who attain Partial QP status may incur additional burden if they elect to participate in MIPS, which is discussed in more detail in the CY 2018 Quality Payment Program final rule (82 FR 53841 through 53844).

BILLING CODE 4120-01-P

TABLE 61: Clinicians or Organizations Submitting MIPS Data on Behalf of Clinicians, by Type of Data and Category of Clinician*

Category of Clinician	Type of Data Submitted			
	Quality Performance Category	Promoting Interoperability Performance Category	Improvement Activities Performance Category	Other Data Submitted on Behalf of MIPS Eligible Clinicians
MIPS Eligible Clinicians and Other Eligible Clinicians Voluntarily Submitting MIPS Data, Participating in Shared Savings Program, and other MIPS APMs that use the APM Performance Pathway for model measures	As virtual group, group, individual clinicians, or APM Entity. ^a	<p>As virtual group, group, individual clinicians, or APM Entity.</p> <p>Certain types of MIPS eligible clinicians are automatically eligible for a zero percent weighting for the Promoting Interoperability performance category.</p> <p>Clinicians who submit an application and are approved for significant hardship or other exceptions are also eligible for a zero percent weighting.</p> <p>Each MIPS eligible clinician in the APM Entity reports data for the Promoting Interoperability performance category through either group TIN or individual reporting. [The burden estimates for this final rule assume group TIN-level reporting].^b</p>	<p>As virtual group, group, or individual clinicians.</p> <p>MIPS APMs do not submit information.</p> <p>CMS will assign the same improvement activities performance category score to each APM Entity based on the activities involved in participation in the MIPS APM.^c</p>	<p>Groups electing to use a CMS-approved survey vendor to administer CAHPS must register.</p> <p>Groups electing to submit via CMS Web Interface for the first time must register.</p> <p>MIPS APMs electing the APM Performance Pathway.</p> <p>APM Entities will make Partial QP election for participating eligible clinicians.</p> <p>Virtual groups must register via email.^d</p>

* Because the cost performance category relies on administrative claims data, MIPS eligible clinicians are not required to provide any additional information, and therefore, the cost performance category is not represented in this table.

^a Submissions by the ACO are not included in burden estimates for this final rule because quality data submissions to fulfill requirements of the Shared Savings Program and for purposes of testing and evaluating the Next Generation ACO Model are not subject to the PRA. Sections 1899 and 1115A of the Act (42 U.S.C. 1395jjj and 42 U.S.C. 1315a, respectively) state that the Shared Savings Program and the testing, evaluation, and expansion of Innovation Center models are not subject to the PRA.

^b Both group TIN and individual clinician Promoting Interoperability data will be accepted. If both group TIN and individual scores are available for the same APM Entity, CMS will use the higher score for each TIN/NPI. The TIN/NPI scores are then aggregated for purposes of calculating the APM Entity score.

^c The burden estimates for this final rule assume no improvement activities performance category reporting burden for APM participants because we assume the MIPS APM model provides a maximum improvement activity score. APM Entities participating in MIPS APMs receive an improvement activities performance category score of at least 50 percent (§ 414.1380) and do not need to submit improvement activities data unless the CMS-assigned improvement activities scores are below the maximum improvement activities score.

^d Virtual group participation is limited to MIPS eligible clinicians, specifically, solo practitioners and groups consisting of 10 eligible clinicians or fewer.

final rule create some additional data collection requirements not listed in Table 61. These additional data collections, some of which are currently approved by OMB under the control numbers 0938–1314 (Quality Payment Program, CMS–10621) and 0938–1222 (CAHPS for MIPS, CMS–10450), are as follows:

Additional ICRs Related to MIPS Third-Party Intermediaries (See Section VII.B.5.c)

- Self-nomination of new and returning QCDRs (81 FR 77507 through 77508, 82 FR 53906 through 53908, and 83 FR 59998 through 60000) (OMB 0938–1314).
- Self-nomination of new and returning registries (81 FR 77507 through 77508, 82 FR 53906 through 53908, and 83 FR 59997 through 59998) (OMB 0938–1314).
- Approval process for new and returning CAHPS for MIPS survey vendors (82 FR 53908) (OMB 0938–1222).
- Open Authorization Credentialing and Token Request Process (New) (OMB 0938–1314) (see section VII.B.5.d).

Additional ICRs Related to the Data Submission and the Quality Performance Category (See Section VII.B.5.e)

- CAHPS for MIPS survey completion by beneficiaries (81 FR 77509, 82 FR 53916 through 53917, and 83 FR 60008 through 60009) (OMB 0938–1222).
- Quality Payment Program Identity Management Application Process (82 FR 53914 and 83 FR 60003 through 60004) (OMB 0938–1314).

Additional ICRs Related to the Promoting Interoperability Performance Category (See Section VII.B.5.g)

- Reweighting Applications for Promoting Interoperability and other performance categories (82 FR 53918 and 83 FR 60011 through 60012) (OMB 0938–1314).

Additional ICRs Related To Call for New MIPS Measures and Activities (See Sections VII.B.5.f, VII.B.5.h, VII.B.5.j, and VII.B.5.k)

- Nomination of improvement activities (82 FR 53922 and 83 FR 60017 through 60018) (OMB 0938–1314).
- Call for new Promoting Interoperability measures (83 FR 60014 through 60015) (OMB 0938–1314).
- Call for MIPS quality measures (83 FR 60010 through 60011) (OMB 0938–1314).
- Nomination of MVPs (OMB 0938–1314).

Additional ICRs Related to MIPS (See Section VII.B.5.o)

- Opt out of performance data display on Physician Compare for voluntary reporters under MIPS (82 FR 53924 through 53925 and 83 FR 60022) (OMB 0938–1314).

Additional ICRs Related to APMs (See Sections VII.B.5.m and VII.B.5.n)

- Partial QP Election (81 FR 77512 through 77513, 82 FR 53922 through 53923, and 83 FR 60018 through 60019) (OMB 0938–1314).
- Other Payer Advanced APM determinations: Payer Initiated Process (82 FR 53923 through 53924 and 83 FR 60019 through 60020) (OMB 0938–1314).
- Other Payer Advanced APM determinations: Eligible Clinician Initiated Process (82 FR 53924 and 83 FR 60020) (OMB 0938–1314).
- Submission of Data for All-Payer QP Determinations (83 FR 60021) (OMB 0938–1314).

b. ICRs Regarding the Virtual Group Election (§ 414.1315)

This rule is not implementing any new or revised collection of information requirements or burden related to the virtual group election. The virtual group election requirements and burden are currently approved by OMB under control number 0938–1343 (CMS–10652). Consequently, we are not making any virtual group election changes under that control number.

c. ICRs Regarding Third-Party Intermediaries (§ 414.1400)

In section IV.A.3.g. of this rule, we discuss multiple changes to the third party intermediary regulations at § 414.1400. Specifically, we are: (1) Amending current requirements for approval of third party intermediaries to take into account past performance and provision of inaccurate information regarding MIPS program requirements to eligible clinicians; (2) requiring attendance by all third party intermediaries for training and support sessions; (3) requiring that QCDRs and qualified registries must conduct an annual data validation audit and if one or more deficiencies or data errors are identified also conduct targeted audits; (4) incrementally increasing requirements for QCDR measure testing and clarify what is meant by full testing; and (5) requiring third party intermediaries to submit a CAP to address identified deficiencies and data issues, as well as actions to prevent recurrence. The collection of information burdens associated with each of these topics are discussed

separately below for qualified registries, QCDRs, and survey vendors.

(1) Background

Under MIPS, the quality, Promoting Interoperability, and improvement activities performance category data may be submitted via relevant third-party intermediaries, such as qualified registries, QCDRs, and health IT vendors. Data on the CAHPS for MIPS survey, which counts as either one quality performance category measure, or towards an improvement activity, can be submitted via CMS-approved survey vendors. Entities seeking approval to submit data on behalf of clinicians as a qualified registry, QCDR, or survey vendor must complete a self-nominate process annually.¹⁴⁷ The processes for self-nomination for entities seeking approval as qualified registries and QCDRs are similar with the exception that QCDRs have the option to nominate QCDR measures for approval for the reporting of quality performance category data. Therefore, differences between QCDRs and qualified registry self-nomination are associated with the preparation of QCDR measures for approval.

(2) QCDR Self-Nomination Applications

The requirements and burden associated with this rule's data submission changes related to QCDRs will be submitted to OMB for approval under control number 0938–1314 (CMS–10621). For simplicity and due to limitations in data available, the changes in burden for QCDRs and qualified registries associated with the finalized policies regarding CAPs have been incorporated into the discussion of burden for qualified registries.

(a) Self-Nomination Process and Other Requirements

We refer readers to § 414.1400(a)(4) which states that QCDRs interested in submitting MIPS data to us on behalf of a MIPS eligible clinician, group, or virtual group will need to complete a self-nomination process to be considered for approval to do so. We also refer readers to § 414.1400(b) and the CY 2017 Quality Payment Program final rule (81 FR 77507 through 77508), CY 2018 Quality Payment Program final rule (82 FR 53906 through 53908), CY 2019 PFS final rule (83 FR 59998 through 60000), and the CY 2020 PFS final rule (84 FR 63116 through 63121) for our previously finalized requirements and burden for self-

¹⁴⁷ As stated in the CY 2019 PFS final rule (83 FR 59998), health IT vendors are not included in the burden estimates for MIPS.

nomination of QCDRs and nomination of QCDR measures.

In section VII.A.3.g.(2)(a) of this rule, we are codifying that beginning with the 2023 payment year as a condition of approval each QCDR must conduct annual data validation audits that conform to the requirements in § 414.1400(b)(2)(iv), including specific obligations discussed in detail in those sections, and if one or more deficiencies or data errors are identified the QCDR must also conduct targeted audits that conform to the § 414.1400(b)(2)(v) including specific obligations discussed in detail in those sections. In particular, we are codifying at § 414.1400(b)(2)(iv)(G), that in a form and manner and by a deadline specified by CMS, the QCDR must report the results of each data validation audit, including the overall deficiency or data error rate, the types of deficiencies or data errors discovered, the percentage of clinicians impacted by any deficiency or data error, and how and when each deficiency or data error type was corrected. In addition, we are codifying at § 414.1400(b)(2)(v)(D), that in a form and manner and by a deadline specified by CMS, the QCDR must report the results of each targeted audit, including the overall deficiency or data error rate, the types of deficiencies or data errors discovered, the percentage of clinicians impacted by each deficiency or data error, and how and when each deficiency or data error type was corrected. We are not revising our burden estimates as a result of the provision to codify that QCDRs must conduct particular data validation audits and report data validation results because we believe the burdens of the data validation requirements are not greater than existing expectations for which we have already accounted the associated burden as stated in the CY 2017 Quality Payment Program final rule (81 FR 77383 through 77384) and the CY 2019 PFS final rule (83 FR 59998 through 59999) and previously submitted to OMB for approval under control number 0938–1314 (CMS–10621).

With regard to the provision to require QCDRs to conduct targeted audits if one or more data errors are identified during data validation audits, we solicited comment on the burdens associated with the requirements for data validation audits and targeted audits, including expected frequency of targeted audits and the anticipated scope of effort related to submitting results to assist in estimating the burden associated with this provision, but received no comments. However, we are including burden estimates associated

with this finalized requirement based on our best available analysis. Due to the unknown scope of patient records that may need to be audited, we estimate a range of effort to complete a targeted data audit from a minimum of 5 hours to a maximum of 10 hours at a cost ranging from \$462.30 (\$92.46/hr × 5 hrs) to \$924.60 (\$92.46/hr × 10 hrs) per targeted audit. In the 2019 MIPS performance period, 23 of the 77 QCDRs (30%) that submitted 2019 MIPS quality data were required to complete a targeted audit. Based on the results of the 2020 self-nomination period, 58 QCDRs have been approved for the 2021 MIPS performance period; assuming the same percentage, we estimate 17 QCDRs (58 × 30%) will be required to complete targeted audits. Therefore we estimate the total impact associated with QCDRs completing targeted audits will range from 85 hours (17 audits × 5 hrs/audit) at a cost of \$7,859 (17 audits × \$462.30/audit) to 170 hours (17 audits × 10 hrs/audit) at a cost of \$15,718 (17 audits × \$924.60/audit). We also discuss additional impacts of this provision in section VIII.H.15.e.(4)(d) of the Regulatory Impact Analysis.

In section VII.A.3.g.(1)(b)(iii) of this rule, we are codifying that beginning with the 2023 MIPS payment year, third party intermediaries must attend and complete training and support sessions in the form and manner and at the times, specified by CMS. Due to the nature of the information provided during these calls and because the training requirements as applied to qualified registries and QDCRs are similar to existing expectations for these entities, we are not revising our burden estimates as a result of the provisions. However, we refer readers to section VIII.H.15.e.(4)(d) of this final rule for discussion of our estimates of overall impact.

In section VII.A.3.g.(1)(b)(ii) of this rule, we discussed that the determination of whether to approve as entity as a third party intermediary for a MIPS performance period may take into account: (1) Whether the entity failed to comply with requirements of third party intermediaries for any prior MIPS payment year for which it was approved as third party intermediary; and (2) whether the entity provided inaccurate information regarding the requirements of this subpart to any eligible clinician. Because this provision does not require any additional effort for affected entities but instead allows CMS to utilize already available information to make approval decisions, collection of information burden is unaffected for all entities. In addition, we do not anticipate this provision will result in

any QCDRs electing not to self-nominate during the 2021 MIPS performance period, but believe it is possible this may occur. However, we have neither any data nor knowledge of intent from previously approved QCDRs with which to support making any changes to our burden estimates as a result of this policy. We solicited public feedback to help us determine if there are any burden implications. We did not receive comments related to this provision.

For this rule, we are adjusting the number of QCDRs we assume will self-nominate for the CY 2022 performance period from the currently approved estimate of 76 to 82, an increase of 6 from the currently approved estimate based on the number of self-nominations received during the CY 2020 nomination period which was ongoing at the time the CY 2021 PFS proposed rule was published. As discussed in section IV.A.3.g, some commenters expressed their opinion that specific requirements as well as the totality of requirements imposed on QCDRs may result in some QCDRs electing to no longer participate in QPP. Without specific information regarding the intent of each QCDR, we are unable to determine if a future decrease in QCDR participation will occur. We note that additional requirements for QCDRs were finalized in the CY 2020 PFS final rule and there was an increase in QCDRs self-nominating during the subsequent CY 2020 self-nomination period. We continue to update our burden estimates annually as we receive updated data; if QCDRs elect to end their participation in the future, we will adjust our burden estimates when the corresponding data is available.

(b) QCDR Measure Requirements

Previously, we finalized a requirement to require all QCDR measures to be fully developed and tested, with complete testing results at the clinician level, beginning with the CY 2021 performance period in the CY 2020 PFS final rule (84 FR 40816). In the May 8th COVID–19 IFC–2 (85 FR 27594 through 27595), we delayed this requirement such that beginning with the CY 2022 performance period, all QCDR measures must be fully developed and tested, with complete testing results at the clinician level, prior to submitting the QCDR measure at the time of self-nomination. In section VII.A.3.g.(2)(b)(i)(B) of this rule, we discussed an incremental approach to require fully tested QCDR measures. Specifically, at § 414.1400(b)(3)(v)(C)(1) we are finalizing that QCDR measures that were previously approved for the CY 2020

performance period, would be required to, at a minimum, be face valid prior to being self-nominated for the CY 2022 performance period/CY 2024 payment year. To be approved for the 2025 MIPS payment year and future years, a QCDR measure must be face valid for the initial MIPS payment year for which it is approved and fully tested for any subsequent MIPS payment year for which it is approved. In order for the QCDR measure to be considered for approval, testing must be completed at the clinician level by the time the measure is self-nominated. However, to be included in an MVP for the 2024 MIPS payment year and future years, a QCDR measure must be fully tested. QCDR measures that were previously approved for the 2020 performance period, will be required to, at a minimum, be face valid prior to being self-nominated for the CY 2022 performance period, and would be required to be fully tested prior to being self-nominated for any subsequent performance periods in order to be considered for inclusion in the MIPS

program. Because these provisions are not modifying the final testing requirements for QCDR measures but are instead are making modifications to the phasing and timeline for implementation of previously finalized requirements for QCDR measures other than those which will be included in an MVP, we are not making any changes to our currently approved burden estimates; however, we refer readers to section VIII.H.15.e.(4)(d) of this final rule for discussion of impacts associated with this provision. Such burden estimates and requirements are currently approved by OMB under control number 0938–1314 (CMS–10621). We solicited comment on our burden estimates and assumptions associated with these provisions regarding the testing of QCDR measures including those which will be included in an MVP. We did not receive comments related to our burden estimates and assumptions regarding the testing of QCDR measures.

We assume that the staff involved in the QCDR self-nomination process will

continue to be computer systems analysts or their equivalent, who have an average labor rate of \$92.46/hr. Considering that the time per QCDR associated with the self-nomination process range from a minimum of 5.5 hours to a maximum of 8 hours, we estimate that the annual burden will range from 451 hours (82 QCDRs × 5.5 hr) to 656 hours (82 QCDRs × 8 hr) at a cost ranging from \$41,699 (451 hr × \$92.46/hr) and \$60,654 (656 hr × \$92.46/hr), respectively. Combined with our estimate of annual burden for targeted audits, the total burden estimate ranging from 536 hours (451 + 85) at a cost of \$49,559 (\$41,699 + \$7,859) to 826 hours (656 + 170) at a cost of \$76,372 (\$60,654 + \$15,718) (see Table 62).

Based on the assumptions discussed in this section, we provide an estimate of the total annual burden associated with a QCDR self-nominating to be considered “qualified” to submit quality measures results and numerator and denominator data on MIPS eligible clinicians.

TABLE 62: Estimated Burden for QCDR Self-Nomination and QCDR Measure Submission

	Minimum	Maximum
# of QCDR Simplified Self-Nomination Applications submitted (a)	82	0
# of QCDR Full Self-Nomination Applications submitted (b)	0	82
Total Applications	82	82
Total Annual Hours Per QCDR for Simplified Process (c)	5.5	5.5
Total Annual Hours Per QCDR for Full Process (d)	8	8
Total Annual Hours (e) = (a)*(c) + (b)*(d)	451	656
Cost Per Simplified Process Per QCDR (@ computer systems analyst’s labor rate of \$92.46/hr) (f)	\$508.53	\$508.53
Cost Per Full Process Per QCDR (@ computer systems analyst’s labor rate of \$92.46/hr) (g)	\$739.68	\$739.68
Total Annual Cost (h) = (a)*(f)+(b)*(g)	\$41,699	\$60,654

As shown in Table 63, using the unchanged currently approved per respondent burden estimate, the increase in respondents from 76 to 82 results in an increase of between +33 (+6 respondents × 5.5 hr/respondent) and +48 hours (+6 respondents × 8 hr/respondent) at a cost of between

+\$3,051 (6 respondents × \$508.53/respondent) and +\$4,438 (6 respondents × \$739.68/respondent). The finalized policy to require targeted audits as necessary results in an increase of between +85 (17 audits × 5hrs/audit) and +170 (17 audits × 10 hrs/audit) at a cost of between \$7,859 (17 audits ×

\$462.30/audit) and \$15,718 (17 audits × \$924.60/audit). In aggregate, we estimate a total increase in burden of between +118 hours (33 + 85) at a cost \$10,911 (\$3,051 + \$7,859) and +218 hours (48 + 170) at a cost of \$20,156 (\$4,438 + \$15,718).

TABLE 63: Change in Estimated Burden for QCDR Self-Nomination and QCDR Measure Submission

	Minimum Burden Estimate	Maximum Burden Estimate
Total Annual Hours for Respondents in CY 2020 Final Rule (a)	418	608
Total Annual Hours for Respondents in CY 2021 Final Rule (b)	536	826
Difference (c) = (b)-(a)	+118	+218
Total Annual Cost for Respondents in CY 2020 Final Rule (d)	\$38,648	\$56,216
Total Annual Cost for Respondents in CY 2021 Final Rule (e)	\$49,559	\$76,372
Difference (f) = (e)-(d)	+\$10,911	+20,156

(3) Qualified Registry Self-Nomination Process and Other Requirements

The requirements and burden associated with this rule's data submission changes related to qualified registries and QCDRs will be submitted to OMB for approval under control number 0938–1314 (CMS–10621).

We refer readers to § 414.1400(a)(4) which states that qualified registries interested in submitting MIPS data to us on behalf of MIPS eligible clinicians, groups, or virtual groups need to complete a self-nomination process to be considered for approval to do so. We also refer readers to § 414.1400 (c) and the CY 2017 Quality Payment Program final rule (81 FR 77507 through 77508), CY 2018 Quality Payment Program final rule (82 FR 53906 through 53908), CY 2019 PFS final rule (83 FR 59997 through 59998), and the CY 2020 PFS final rule (84 FR 63114 through 63116) for our previously finalized requirements and burden for self-nomination of qualified registries.

In section IV.A.3.g.(3) of this rule, we are codifying that beginning with the 2023 payment year as a condition of approval each qualified registry must conduct annual data validation audits that conform to the requirements in § 414.1400(b)(2)(iv), including specific obligations discussed in detail in those sections and if one or more deficiencies or data errors are identified the qualified registry must also conduct targeted audits that conform to the § 414.1400(b)(2)(v) including specific obligations discussed in detail in those sections. In particular, we are codifying at § 414.1400(c)(2)(iii)(G), that in a form and manner and by a deadline specified by CMS, the qualified registry must report data validation results, including the overall deficiency or data error rate, the types of deficiencies or data errors discovered, the percentage of clinicians impacted by any deficiency or data error, and how and when each deficiency or data error type was corrected. In addition, we are codifying

at § 414.1400(c)(2)(iv)(D), in a form and manner and by a deadline specified by CMS, the qualified registry must report the results of each targeted audit, including the overall deficiency or data error rate, the types of deficiencies or data errors discovered, the percentage of clinicians impacted by each deficiency or data error, and how and when each error type was corrected. We are not revising our burden estimates as a result of the provision to codify that qualified registries must conduct particular data validation audits and report data validation results because we believe the burdens of the data validation requirements are not greater than existing expectations for which we have already accounted for the associated burden as stated in the CY 2017 Quality Payment Program final rule (81 FR 77383 through 77384) and the CY 2019 PFS final rule (83 FR 59998 through 59999) and previously submitted to OMB for approval under control number 0938–1314 (CMS–10621).

With regard to the provision to require qualified registries conduct targeted audits if one or more data errors are identified during data validation audits, we solicited comment on the burdens associated with the requirements for data validation audits and targeted audits, including expected frequency of targeted audits and the anticipated scope of effort related to submitting results to assist in estimating the burden associated with this provision, but did not receive any. However, we are including burden estimates associated with this finalized requirement based on our best available analysis. Due to the unknown scope of patient records that may need to be audited, we estimate a range of effort to complete a targeted data audit from a minimum of 5 hours to a maximum of 10 hours at a cost ranging from \$462.30 (\$92.46/hr × 5 hrs) to \$924.60 (\$92.46/hr × 10 hrs) per targeted audit. In the 2019 MIPS performance period, 37 of the 84 QCDRs (44%) that submitted 2019 MIPS quality data were required to

complete a targeted audit. Based on the results of the 2020 self-nomination period, 127 qualified registries have been approved for the 2021 MIPS performance period; assuming the same percentage, we estimate 56 qualified registries (127 × 44%) will be required to complete targeted audits. Therefore we estimate the total impact associated with qualified registries completing targeted audits will range from 280 hours (56 audits × 5 hrs/audit) at a cost of \$25,889 (56 audits × \$462.30/audit) to 560 hours (56 audits × 10 hrs/audit) at a cost of \$51,778 (56 audits × \$924.60/audit). We also discuss additional impacts of this provision in section VIII.H.15.e.(4)(d) of the Regulatory Impact Analysis.

In sections VII.A.3.g.(1)(b)(iii) of this rule, we are codifying that beginning with the 2023 MIPS payment year, third party intermediaries must attend and complete training and support sessions in the form and manner, and at the times specified, by CMS. Due to the nature of the information provided during these calls and because the training requirements as applied to qualified registries and QCDRs are similar to existing expectations for these entities, we are not revising our burden estimates as a result of these provisions. However, we do refer readers to section VIII.H.15.e.(4)(d) of this final rule for discussion of our estimates of the overall impact of this provision for all third party intermediaries.

In section VII.A.3.g.(1)(b)(ii) of this rule, we discussed that the determination of whether to approve an entity as a third party intermediary for a MIPS performance period may take into account: (1) Whether the entity failed to comply with requirements of third party intermediaries for any prior MIPS payment year for which it was approved as third party intermediary; and (2) whether the entity provided inaccurate information regarding the requirements of the subpart to any eligible clinician. Because this provision does not require any additional effort for

affected entities but instead allows CMS to utilize already available information to make approval decisions, collection of information burden is unaffected for all entities. We also do not anticipate this provision will result in any qualified registries or other third party intermediaries electing not to self-nominate during the 2021 MIPS performance period, but believe it is possible this may occur. However, we have neither any data nor knowledge of intent from previously approved qualified registries or other third party intermediaries with which to support making any changes to our burden estimates as a result of this provision. We are solicited public feedback to help us determine if there are any burden implications. We did not receive comments related to burden implications of this provision.

In section VII.A.3.g.(4) of this final rule, we are modifying the existing requirement at § 1400(f)(1)(i) requiring third party intermediaries to submit to CMS by a date specified by the agency a Corrective Action Plan (CAP) to address the identified deficiencies or data issue, including the actions it will take to prevent the deficiencies or data issues from recurring. While the requirement for third party intermediaries to submit a CAP was finalized in our CY 2017 Quality Payment Program final rule (81 FR 77389), we did not specify the information that must be included to be included in the CAP and neglected to identify the burden associated with the required information. We are correcting that oversight in this final rule. In addition, to clarify expectations and create consistency in the content of the CAPs provide by third party intermediaries, we are revising and elaborating on the obligations for a CAP in this final rule. Specifically, we are modifying § 414.1400(f)(1)(i) such that, unless different or additional information is specified by CMS, the CAP submitted by the third party intermediary must address four issues: (1) The issues that contributed to the non-compliance; (2) the impact to individual clinicians, groups, or virtual groups, regardless of whether they are participating in the program because

they are MIPS eligible, voluntary participating, or opting in to participating in the MIPS program; (3) the corrective actions to be implemented by the third party intermediary to ensure that the non-compliance has been resolved will not recur in the future and (4) the detailed timeline for achieving compliance with the applicable requirements. We have historically received a total of 34 CAPs over the 3-year period of CY 2017–2019 (an average of 11.3 per year). As third party intermediaries become increasingly effective at identifying data issues and discrepancies prior to submitting data to CMS and accounting for the estimated decrease in number of QCDRs and qualified registries self-nominating in the 2020 MIPS performance period compared to the 2019 MIPS performance period (from 350 to 229), we anticipate the annual number of CAPs received to decrease to fewer than 10 per year (83 FR 59997 through 60000 and 84 FR 63114 through 63121). The effort involved in developing a CAP including the detail specified in this final rule and submitting it to CMS is likely to be no more than 3 hours for a computer systems analyst at a rate of \$92.46/hr. In aggregate we estimate an annual burden of no more than 30 hours (3 hr × 10 CAPs) at a cost of \$2,774 (30 hr × \$92.46/hr) for third party intermediaries to develop and submit a CAP. Because we are unable to predict how many of the estimated 10 third party intermediaries submitting CAPs will be qualified registries, QCDRs, survey vendors, or health IT vendors; for simplicity we are adding the burden to the currently approved burden for qualified registries.

For this final rule, we are adjusting the number of qualified registries we assume will self-nominate for the CY 2022 performance period from the currently approved estimate of 153 to 183, an increase of 30 from the currently approved estimate and CY 2021 PFS proposed rule (85 FR 50347) based on the number of self-nominations received during the CY 2020 nomination period which was ongoing at the time the CY 2021 PFS proposed rule was published.

As discussed in section IV.A.3.g, some commenters expressed their opinion that specific requirements as well as the totality of requirements imposed on qualified registries may result in some qualified registries electing to no longer participate in QPP. Without specific information regarding the intent of each qualified registry, we are unable to determine if a future decrease in qualified registry participation will occur. We note that additional requirements for qualified registries were finalized in the CY 2020 PFS final rule and there was an increase in qualified registries self-nominating during the subsequent CY 2020 self-nomination period. We continue to update our burden estimates annually as we receive updated data; if qualified registries elect to end their participation in the future, we will adjust our burden estimates when the corresponding data is available.

We assume that the staff involved in the qualified registry self-nomination process will continue to be computer systems analysts or their equivalent, who have an average labor rate of \$92.46/hr. Considering that the time per qualified registry associated with the self-nomination process range from a minimum of 0.5 hours to a maximum of 3 hours, we estimate that the annual burden will range from 91.5 hours (183 qualified registries × 0.5 hr) to 549 hours (183 qualified registries × 3 hr) at a cost ranging from \$8,460 (91.5 hr × \$92.46/hr) and \$50,760 (549 hr × \$92.46/hr), respectively (see Table 64). Combined with our estimates of burden associated with completing targeted audits and developing and submitting a CAP, our total burden estimate ranges from 401.5 hours (91.5 + 30 + 280) to 1,139 (549 + 30 + 560) at a cost between \$37,123 (\$8,460 + \$2,774 + \$25,889) and \$105,312 (\$50,760 + \$2,774 + \$51,778).

Based on the assumptions discussed in this section, we provide an estimate of the total annual burden associated with a qualified registry self-nominating to be considered “qualified” to submit quality measures results and numerator and denominator data on MIPS eligible clinicians.

TABLE 64: Estimated Burden for Qualified Registry Self-Nomination

	Minimum	Maximum
# of Qualified Registry Simplified Self-Nomination Applications submitted (a)	183	0
# of Qualified Registry Full Self-Nomination Applications submitted (b)	0	183
Total Applications	183	183
Total Annual Hours Per Qualified Registry for Simplified Process (c)	0.5	0.5
Total Annual Hours Per Qualified Registry for Full Process (d)	3	3
Total Annual Hours for Self-Nomination (e) = (a)*(c) + (b)*(d)	91.5	549
Total Annual Hours for Completion of 56 Targeted Audits (f)	280	560
Total Annual Hours for development and submittal of 30 CAPs (g)	30	30
Cost Per Simplified Process Per Qualified Registry (@ computer systems analyst's labor rate of \$92.46/hr) (h)	\$46.23	\$46.23
Cost Per Full Process Per Qualified Registry (@ computer systems analyst's labor rate of \$92.46/hr) (i)	\$277.38	\$277.38
Cost Per Targeted Audit (@ computer systems analyst's labor rate of \$92.46/hr) (j)	\$462.30	\$924.60
Cost Per CAP (@ computer systems analyst's labor rate of \$92.46/hr) (k)	\$277.38	\$277.38
Total Annual Cost (j) = (a)*(f)+(b)*(g)+(j)*56+(k)*10	\$37,123	\$105,312

As shown in Table 65, using the unchanged currently approved per respondent burden estimate, the increase in respondents from 153 to 183 results in an increase of between +15 hours (+30 respondents × 0.5 hr/respondent) and +90 hours (+30 respondents × 3 hr/respondent) at a cost of between +\$1,387 (+30 respondents ×

\$46.23/respondent) and +\$8,321 (+30 respondents × \$277.38/respondent). The finalized policy to require targeted audits as necessary results in an increase of between +280 (56 audits × 5 hrs/audit) and +560 (56 audits × 10 hrs/audit) at a cost of between \$25,889 (56 audits × \$462.30/audit) and \$51,778 (56 audits × \$924.60/audit). When

combined with our estimate of +30 hours at a cost of +\$2,774 for developing and submitting CAPs, the total aggregate change ranges from +325 hours (15 + 30 + 280) to +680 hours (90 + 30 + 560) at a cost ranging from +\$30,050 (\$1,387 + \$2,774 + \$25,889) to +\$62,873 (\$8,321 + \$2,774 + \$51,778).

TABLE 65: Change in Estimated Burden for Qualified Registry Self-Nomination

	Minimum Burden Estimate	Maximum Burden Estimate
Total Annual Hours for Respondents in CY 2020 Final Rule (a)	76.5	459
Total Annual Hours for Respondents in CY 2021 Final Rule (b)	401.5	1,139
Difference (c) = (b)-(a)	+325	+680
Total Annual Cost for Respondents in CY 2020 Final Rule (d)	\$7,073	\$42,439
Total Annual Cost for Respondents in CY 2021 Final Rule (e)	\$37,123	\$105,312
Difference (f) = (e)-(d)	+\$30,050	+\$62,873

(4) Survey Vendor Requirements

This rule is not implementing any new or revised collection of information requirements or burden related to CMS-approved CAHPS for MIPS survey vendors. The requirements and burden are currently approved by OMB under control number 0938–1222 (CMS–10450). Consequently, we are not making any MIPS survey vendor changes under that control number.

(5) Health IT Vendors

This rule is not implementing any new or revised collection of information requirements or burden related to health IT vendors and we do not anticipate any

changes to the CEHRT process as a result of provisions promulgated in this final rule. Consequently, we are not setting out burden or making any changes under the 0938–1314 (CMS–10621) control number.

d. Open Authorization (OAuth) Credentialing and Token Request Process

In the CY 2017 Quality Payment Program final rule (81 FR 77035), we finalized the initial MIPS data submission terminology at § 414.1305 and requirements at § 414.1325, as well as the associated burden estimates. As discussed in the CY 2019 PFS final rule (83 FR 59747 through 59748), it

subsequently came to our attention that the way we had previously described data submission did not precisely reflect the experience users have when submitting data to us. To ensure clarity and precision for all users, we amended the terminology at § 414.1305 to more precisely reflect this experience and made conforming amendments to § 414.1325 and other MIPS regulations. Among the newly defined terms was “submission type”, which we defined at § 414.1305 as the mechanism by which a submitter type submits data to CMS, including, as applicable: Direct, log in and upload, log in and attest, Medicare Part B claims and the CMS Web

Interface. We stated in the CY 2019 PFS final rule that the direct submission type allows users to transmit data through a computer-to-computer interaction, such as an Application Programming Interface (API).

Beginning in the 2021 MIPS performance period, CMS will offer the Open Authorization (OAuth) Credentialing and Token Request Process. This process utilizes an API to allow users to transmit data through a computer-to-computer interaction. As such, it is an alternate means of operationalizing the previously established direct submission type. The process first requires software developers to apply for production OAuth credentials to the submissions API by registering their application so that it can interact with the system providing OAuth capabilities. Next, the developer must request a meeting with the Quality Payment Program development team. During this meeting, the requesting organization will demonstrate their application's use of OAuth to successfully submit data in the Submissions API test environment. The requesting organization will also provide documentation about their terms of service, privacy policy, and related information for review by the Quality Payment Program team. If further clarification is required about any of the documentation or application, the Quality Payment Program team will follow up with the requesting organization. Once approved, the Quality Payment Program development team will issue production OAuth credentials to the requesting organization's point of contact. Detailed instructions for the authentication process and application for organizations to request OAuth credentials are available at <https://>

cmsgov.github.io/qpp-submissions-docs/.

The following burden estimates are associated with the first year of data collection for the OAuth Credentialing and Token Request Process. This process is available to all submitter types to be approved to submit data via the direct submission type. However, we assume the only parties that will elect to undergo the process will be health IT vendors or other third party intermediaries, as we believe these are the most likely parties to be developing applications. The burden associated with this ICR belongs only to the application developer; QPP participants will not be required to do anything additional to submit their data. For third party intermediaries, OAuth Credentialing will allow QPP participants to use their own QPP credentials to login through the third party intermediary's application to submit their data and view performance feedback from QPP. The burden associated with the OAuth Credentialing and Token Request Process will be submitted to OMB for approval under control number 0938–1314 (CMS–10621). We refer readers to § 414.1400(a)(2) and the CY 2017 Quality Payment Program final rule (81 FR 77363 through 77364) and as further revised in the CY 2019 and CY 2020 PFS final rules at § 414.1400(a)(2) (83 FR 60088 and 84 FR 63052) for our current policy regarding the types of MIPS data third party intermediaries may submit.

As stated in the CY 2020 PFS final rule (84 FR 63049) we are aware of stakeholders' desire to have a more cohesive participation experience across all performance categories under MIPS. We are offering this process in support of our current requirements for QCDRs and qualified registries to be able to

submit data for all MIPS performance categories and health IT vendors to be able to submit data for at least one MIPS performance category (84 FR 63052 and 84 FR 63076) as well as our desire to further reduce administrative burden for clinicians to participate in MIPS. As we discuss in sections VII.B.5.e.(5), VII.B.5.e.(6), VII.B.5.e.(7), VII.B.5.g, and VII.B.5.i of this final rule individual clinicians or groups may submit their quality measures using the direct submission type via the MIPS CQM and QCDR, eCQM, or CMS Web Interface (only for the 2021 MIPS performance period) collection types as well as their Promoting Interoperability measures and improvement activities through the same direct submission type. Entities that receive approval for their applications through this process will be able to provide QPP participants a more comprehensive and less administratively burdensome experience using the direct submission type.

We estimate it would take approximately 1 hour at \$92.46/hr for a computer systems analyst (or their equivalent) to provide documentation and any follow-up communication via email. We estimate that for during the 2021 MIPS performance period, 15 submitter types, consisting of third party intermediaries will complete this process to be approved for the CY 2022 submission period. We expect health IT vendors to adopt this method initially, with limited further adoption by QCDRs and Qualified Registries in future years. As shown in Table 66, we estimate it would take 1 hour at \$92.46/hr for a computer systems analyst (or their equivalent) to complete the process. We estimate an annual burden of 15 hours (15 vendors × 1 hr) at a cost of \$1,387 (15 hr × \$92.46/hr) or \$92.46 per organization (\$1,387/15 vendors).

TABLE 66: Estimated Burden for the OAuth Credentialing and Token Request Process

Burden Estimate	
# of Organizations (a)	15
Total Annual Hours Per Organization to Submit (b)	1
Total Annual Hours (c) = (a)*(b)	15
Cost Per Organization (@ computer systems analyst's labor rate of \$92.46/hr.) (d)	\$92.46/hr
Total Annual Cost (e) = (a)*(d)	\$1,387

e. ICRs Regarding Quality Data Submission (§§ 414.1325 and 414.1335)
(1) Background

We refer readers to the CY 2017 Quality Payment Program final rule (81

FR 77502 through 77503), CY 2018 Quality Payment Program final rule (82 FR 53908 through 53912), CY 2019 PFS final rule (83 FR 60000 through 60003), and the CY 2020 PFS final rule (84 FR 63121 through 63124) for our previously

finalized requirements for data submission for the quality performance category.

Under our current policies, two groups of clinicians must submit quality data under MIPS: Those who submit as

MIPS eligible clinicians and those who opt to submit data voluntarily but are not subject to MIPS payment adjustments. Clinicians are ineligible for MIPS payment adjustments if they are newly enrolled to Medicare; are QPs; are partial QPs who elect to not participate in MIPS; are not one of the clinician types included in the definition for MIPS eligible clinician; or do not exceed the low-volume threshold as an individual or as a group.

(2) Changes and Adjustments to Quality Performance Category Respondents

To determine which QPs should be excluded from MIPS, we used the first snapshot of the QP List for CY 2020 that contains participation in Advanced APMs as of March 31, 2020, that could be connected into our respondent data and are the best estimate of future expected QPs. From this data, we calculated the QP determinations as described in the Qualifying APM Participant (QP) definition at § 414.1305 for the 2021 QP Performance Period. We assumed that all Partial QPs will participate in MIPS data collections. Due to data limitations, we could not identify specific clinicians who have not yet enrolled in APMs, but who may become QPs in the future 2021 QP Performance Period (and therefore will no longer need to submit data to MIPS); hence, our model may underestimate or overestimate the number of respondents.

In the CY 2019 PFS final rule, we finalized limiting the Medicare Part B claims collection type to small practices beginning with the 2021 MIPS payment year and allowing clinicians in small practices to report Medicare Part B claims as a group or as individuals (83 FR 59752). In the CY 2020 PFS final rule, we provided a set of assumptions and an approach to account for the clinicians not in small practices for whom the Medicare Part B claims collection type will no longer be available as an option for collecting and reporting quality data (84 FR 63121 through 63122). Because we continued to use 2018 MIPS performance period data to estimate the number of respondents in the CY 2021 PFS proposed rule, we used the same methodology. For this final rule, we are using 2019 MIPS performance period respondent data which inherently includes the impacts of the aforementioned policies finalized in the CY 2019 PFS final rule; therefore, we no longer need to make any further adjustments to account for them.

There may be an undercount in submissions because of the extreme and uncontrollable circumstances policy

due to the PHE for COVID-19, that allowed clinicians to elect not to submit during the submission period for the 2019 MIPS performance period that we are using to inform our burden estimates. Despite this limitation, we believe the data from the 2019 MIPS performance period is still the best data source available as it most accurately reflects the impacts of policies finalized in previous rules and trend toward increased group reporting.

In section IV.A.3.c.(1)(c) of this rule, we are finalizing to sunset the CMS Web Interface measures as a collection type/submission type starting with the 2022 performance period. As a result, groups of 25 or more clinicians that previously submitted quality performance data via the CMS Web Interface will be required to use an alternate collection type beginning with the 2022 performance period, which will have to be either the MIPS CQM and QCDR or eCQM collection type. While we know that 111 groups submitted quality performance data via the CMS Web Interface in the 2019 MIPS performance period, we are not able to ascertain what alternative collection type(s) the groups would elect. In order to estimate the number of groups that will select each of these collection types, we first clustered the number of groups which submitted data via the CMS Web Interface collection type during the 2019 MIPS performance period by practice size (between 25 and 49 clinicians, between 50 and 99 clinicians, etc.). Then, for each cluster, we allocated these groups to each of the MIPS CQM and QCDR and eCQM collection types based on the percent of TINs that submitted MIPS data via these two collection types. For example, of the 1,638 TINs with a practice size of 25 to 49 clinicians which submitted data for the 2019 MIPS performance period, 1,086 (66 percent) submitted data via the MIPS CQM and QCDR collection type and 552 (34 percent) submitted data via the eCQM collection type. We applied these percentages to the 11 TINs with a practice size of 25 to 49 clinicians which submitted data via the CMS Web Interface collection type for the 2019 MIPS performance period to estimate that 7 (11 TINs \times 0.73) would elect to submit data via the MIPS CQM and QCDR collection type and the remaining 4 (11 TINs \times 0.27) would elect to submit data via the eCQM collection type. In total, beginning with the 2022 performance period, we estimate that 45 of the 111 groups that submitted data via the CMS Web Interface collection type for the 2019 MIPS performance period will submit quality data via the MIPS CQM and

QCDR collection type and 66 groups will now submit quality data via the eCQM collection type. Note that the 111 groups is an increase of 7 from our currently approved estimate of 104 groups due to updated data (84 FR 63123) (111 groups – 104 groups). We also performed this analysis to determine the number of clinicians that would be affected and would need to submit quality data via an alternate collection type beginning with the 2022 performance period. In total, of the estimated 45,599 individual clinicians affected by this provision, we estimate that 11,432 would submit quality data as part of a group via the MIPS CQM and QCDR collection type and 34,167 would submit quality data as part of a group via the eCQM collection type. These estimates are reflected in Tables 66 and 68 and the associated changes in burden are reflected in Tables 72, 74, and 76. In aggregate, as discussed in sections VII.B.5.e.(5), (6), (7), and (9) of this final rule, we estimate the provision to sunset the CMS Web Interface measures as a collection type/submission type will result in a net decrease in quality performance data reporting burden while acknowledging the additional financial impacts on clinicians as discussed in section VIII.H.15.e.(4)(b)(i) of the Regulatory Impact Analysis.

We assume that 100 percent of ACO APM Entities will submit quality data to CMS as required under their models. While we do not believe there is additional reporting for ACO APM entities, consistent with assumptions used in the CY 2019 and CY 2020 PFS final rules (83 FR 60000 through 60001 and 84 FR 63122), we include all quality data voluntarily submitted by MIPS APM participants made at the individual or TIN-level in our respondent estimates. As stated in section VII.5.a.(4) of this final rule, we assume non-ACO APM Entities will participate through traditional MIPS and submit as an individual or group rather than as an entity. To estimate who will be a MIPS APM participant in the 2021 MIPS performance period, we used the latest QP List for the first snapshot data of the 2020 QP performance period and supplemented with clinicians who are in an APM in 2020 but not in the 2020 snapshot. This file was selected to better reflect the expected increase in the number of MIPS APMs in future years compared to previous APM eligibility files. Based on this information, if we determine that a MIPS eligible clinician will not be scored as a MIPS APM, then their reporting assumption is based on their

reporting as a group or individual for the CY 2019 MIPS performance period.

Our burden estimates for the quality performance category do not include the burden for the quality data that APM Entities submit to fulfill the requirements of their APMs. The burden is excluded as sections 1899(e) and 1115A(d)(3) of the Act (42 U.S.C. 1395jjj(e) and 1315a(d)(3), respectively) state that the Shared Savings Program and the testing, evaluation, and expansion of Innovation Center models tested under section 1115A of the Act (or section 3021 of the Affordable Care Act) are not subject to the PRA.¹⁴⁸ Tables 66, 67, and 68 explain our revised estimates of the number of organizations (including groups, virtual groups, and individual MIPS eligible clinicians) submitting data on behalf of clinicians segregated by collection type.

Table 66 provides our estimated counts of clinicians that will submit quality performance category data as MIPS individual clinicians or groups in the 2021 and 2022 MIPS performance periods based on data from the 2019 MIPS performance period.

For the 2021 MIPS performance period, respondents will have the option to submit quality performance category data via Medicare Part B claims, direct, and log in and upload submission types, and Web Interface. For the 2022 MIPS performance period, respondents will no longer have the option to submit quality performance

category data via the Web Interface. We estimate the burden for collecting data via collection type: Medicare Part B claims, QCDR and MIPS CQMs, eCQMs, and the CMS Web Interface. We believe that, while estimating burden by submission type may be better aligned with the way clinicians participate with the Quality Payment Program, it is more important to reduce confusion and enable greater transparency by maintain consistency with previous rulemaking.

As shown in Table 66, using participation data from the 2019 MIPS performance period combined with the estimate of QPs for the 2021 performance period, we estimate a total of 651,514 clinicians will submit quality data as individuals or groups in each of the 2021 and 2022 MIPS performance periods, a decrease of 129,091 clinicians when compared to our estimate of 780,605 clinicians in the CY 2020 PFS final rule (84 FR 63122) and a decrease of 140,547 from the estimate of 792,061 in the CY 2021 PFS proposed rule due to availability of updated data from the 2019 MIPS performance period (85 FR 50350). For the 2021 performance period, we estimate 29,273 clinicians will submit data as individuals for the Medicare Part B claims collection type; 284,509 clinicians will submit data as individuals or as part of groups for the MIPS CQM and QCDR collection type; 292,133 clinicians will submit data as individuals or as part of groups via eCQM collection types; and 45,599

clinicians will submit as part of groups via the CMS Web Interface. Compared to the CY 2021 PFS proposed rule (85 FR 50350), these are decreases from the estimates of 94,587 and 410,518 for Medicare Part B claims and MIPS CQM and QCDR collection types, respectively; and increases from the estimates of 286,956 and 0 for the eCQM and CMS Web Interface collection types, respectively. These adjustments are due to the availability of updated data from the 2019 MIPS performance period and the delay in sunseting the CMS Web Interface from the 2021 performance period to the 2022 performance period. For the 2022 performance period, we estimate 29,273 clinicians will submit data as individuals for the Medicare Part B claims collection type; 295,941 clinicians will submit data as individuals or as part of groups for the MIPS CQM and QCDR collection type; 326,300 clinicians will submit data as individuals or as part of groups via the eCQM collection type.

Table 67 provides estimates of the number of clinicians to collect quality measures data via each collection type, regardless of whether they decide to submit as individual clinicians or as part of groups. Because our burden estimates for quality data submission assume that burden is reduced when clinicians elect to submit as part of a group, we also separately estimate the expected number of clinicians to submit as individuals or part of groups.

TABLE 67: Estimated Number of Clinicians Submitting Quality Performance Category Data by Collection Type (as Individual Clinicians or as Part of Groups)

	Medicare Part B Claims	QCDR/ MIPS CQM	eCQM	CMS Web Interface	Total
2021 MIPS performance period (excludes QPs) (a)	29,273	284,509	292,133	45,599	651,514
* 2020 MIPS performance period (excludes QPs) (b)	94,846	391,430	247,856	46,473	780,605
Difference (c)=(a)-(b)	-65,573	-106,921	+44,277	-874	-129,091
2022 MIPS performance period (excludes QPs) (d)	29,273	295,941	326,300	0	651,514
* 2020 MIPS performance period (excludes QPs) (e)	94,846	391,430	247,856	46,473	780,605
Difference (f)=(d)-(e)	-65,573	-95,489	+78,444	-46,473	-129,091

*Currently approved by OMB under control number 0938-1314 (CMS-10621).

Because MIPS eligible clinicians may submit data for multiple collection types for a single performance category, the estimated numbers of individual clinicians and groups to collect via the various collection types are not mutually exclusive and reflect the

occurrence of individual clinicians or groups that collected data via multiple collection types during the 2019 MIPS performance period. We captured the burden of any eligible clinician that may have historically collected via multiple collection types, as we assume they will

continue to collect via multiple collection types and that our MIPS scoring methodology will take the highest score where the same measure is submitted via multiple collection types.

Table 68 uses methods similar to those described to estimate the number of clinicians that will submit data as

¹⁴⁸ Our estimates do reflect the burden on MIPS APM participants of submitting Promoting

Interoperability performance category data, which is outside the requirements of their APMs.

individual clinicians via each collection type in the 2021 and 2022 MIPS performance periods. For both the 2021 and 2022 performance periods, we estimate that approximately 29,273 clinicians will submit data as individuals using the Medicare Part B claims collection type; approximately

41,340 clinicians will submit data as individuals using MIPS CQM and QCDR collection type; and approximately 42,255 clinicians will submit data as individuals using eCQMs collection type. Based on availability of updated data from the 2019 MIPS performance period, these are decreases from the

currently approved estimates of 94,846 and 100,269 for the Medicare Part B claims and MIPS CQM and QCDR collection types, respectively; and an increase from the currently approved estimate of 38,935 for the eCQM collection type.

TABLE 68: Estimated Number of Clinicians Submitting Quality Performance Category Data as Individuals by Collection Type

	Medicare Part B Claims	QCDR/ MIPS CQM	eCQM	CMS Web Interface	Total
2021 MIPS Performance Period (excludes QPs) (a)	29,273	41,340	42,255	0	112,868
* 2020 MIPS Performance Period (excludes QPs) (b)	94,846	100,269	38,935	0	234,050
Difference (c)=(a)-(b)	-65,573	-58,929	+3,320	0	-121,182
2022 MIPS Performance Period (excludes QPs) (d)	29,273	41,340	42,255	0	112,868
* 2020 MIPS Performance Period (excludes QPs) (e)	94,846	100,269	38,935	0	234,050
Difference (f)=(d)-(e)	-65,573	-58,929	+3,320	0	-121,182

*Currently approved by OMB under control number 0938-1314 (CMS-10621).

Consistent with the policy finalized in the CY 2018 Quality Payment Program final rule that for MIPS eligible clinicians who collect measures via Medicare Part B claims, MIPS CQM, eCQM, or QCDR collection types and submit more than the required number of measures (82 FR 53735 through 54736), we will score the clinician on the required measures with the highest assigned measure achievement points and thus, the same clinician may be counted as a respondent for more than one collection type. Therefore, our columns in Table 68 are not mutually exclusive.

Table 69 provides our estimated counts of groups or virtual groups that will submit quality data on behalf of clinicians for each collection type in the 2021 and 2022 MIPS performance periods. We assume that groups that submitted quality data as groups in the 2019 MIPS performance period will

continue to submit quality data either as groups or virtual groups for the same collection types as they did as a group or TIN within a virtual group for the 2021 and 2022 MIPS performance periods. Specifically, for the 2021 performance period we estimate that 11,559 groups and virtual groups will submit data for the MIPS CQM and QCDR collection type on behalf of 243,169 clinicians; 8,154 groups and virtual groups will submit for eCQM collection types on behalf of 249,878 eligible clinicians; and 111 groups will submit data via the CMS Web Interface on behalf of 45,599 clinicians. These are increases from the currently approved estimates of 10,949, 4,398, and 104 groups and virtual groups for the MIPS CQM and QCDR, eCQM, and CMS Web Interface collection types, respectively; due to the availability of updated data from the 2019 MIPS performance period. For the 2022 performance period

we estimate that 11,604 groups and virtual groups will submit data for the MIPS CQM and QCDR collection type on behalf of 254,601 clinicians and 8,220 groups and virtual groups will submit for eCQM collection types on behalf of 284,045 eligible clinicians. In section IV.A.3.(b) of this rule, we discuss the APM Performance Pathway for clinicians in APM Entities. The APM Performance Pathway is available for APM entities and as discussed in section IV.A.3.(b).(3)(a) we are finalizing an alternate measure set consisting of the CMS Web Interface measures for the 2021 MIPS performance period. However, as the data does not exist for APM performance pathway or MIPS quality measures for non-ACO APM entities, we assume non-ACO APM Entities would participate through traditional MIPS and base our estimates on submissions received in the 2019 MIPS performance period.

TABLE 69: Estimated Number of Groups and Virtual Groups Submitting Quality Performance Category Data by Collection Type on Behalf of Clinicians

	Medicare Part B Claims	QCDR/ MIPS CQM	eCQM	CMS Web Interface	Total
2021 MIPS performance period (excludes QPs) (a)	0	11,559	8,154	111	19,824
*2020 MIPS performance period (b)	0	10,949	4,398	104	15,451
Difference (c)=(a)-(b)	0	+610	+3,756	+7	+4,373
2022 MIPS performance period (excludes QPs) (d)	0	11,604	8,220	0	19,824
*2020 MIPS performance period (e)	0	10,949	4,398	104	15,451
Difference (f)=(d)-(e)	0	+655	+3,822	-104	+4,373

*Currently approved by OMB under control number 0938-1314 (CMS-10621).

The burden associated with the submission of quality performance category data have some limitations. We believe it is difficult to quantify the burden accurately because clinicians and groups may have different processes for integrating quality data submission into their practices' workflows. Moreover, the time needed for a clinician to review quality measures and other information, select measures applicable to their patients and the services they furnish, and incorporate the use of quality measures into the practice workflows is expected to vary along with the number of measures that are potentially applicable to a given clinician's practice and by the collection type. For example, clinicians submitting

data via the Medicare Part B claims collection type need to integrate the capture of quality data codes for each encounter whereas clinicians submitting via the eCQM collection types may have quality measures automated as part of their EHR implementation.

We believe the burden associated with submitting quality measures data will vary depending on the collection type selected by the clinician, group, or third-party. As such, we separately estimated the burden for clinicians, groups, and third parties to submit quality measures data by the collection type used. For the purposes of our burden estimates for the Medicare Part B claims, MIPS CQM and QCDR, and eCQM collection types, we also assume

that, on average, each clinician or group will submit 6 quality measures. In terms of the quality measures available for clinicians and groups to report for the 2021 MIPS performance period, the total number of quality measures will be 209. The new MIPS quality measures finalized for inclusion in MIPS for the 2021 MIPS performance period and future years are found in Table Group A of Appendix 1; MIPS quality measures with finalized substantive changes can be found in Table Group D of Appendix 1; and MIPS quality measures finalized for removal can be found in Table Group C of Appendix 1. These measures are stratified by collection type in Table 70, as well as counts of new, removed, and substantively changed measures.

TABLE 70: Summary of Quality Measures for the 2021 MIPS Performance Period

Collection Type	# Measures Finalized as New	# Measures Finalized for Removal	# Measures Finalized with a Substantive Change	# Measures Remaining for CY 2021*
Medicare Part B Claims Specifications	0	-9	+24	+46
MIPS CQMs Specifications	0	-11	+101	+185
eCQM Specifications	0	0	+36	+47
Survey – CSV	0	0	0	+1
CMS Web Interface Measure Specifications	0	0	+10	+10
Administrative Claims	+2	-1	0	+2
Total	+2	-14	+113	209

*A measure may be specified under multiple collection types but will only be counted once in the total.

For the 2021 MIPS performance period, there is a net reduction of 9 quality measures across all collection types compared to the 218 measures finalized for the 2020 MIPS performance period (84 FR 63124). Specifically, as discussed in section IV.A.3.c.(1)(d), we are adding 2 new administrative claims outcome measures, removing 14 quality measures, and make substantive updates

to 113 quality measures. We do not anticipate that removing these measures will increase or decrease the reporting burden on clinicians and groups as respondents generally are still required to submit quality data for 6 measures.

(3) Quality Payment Program Identity Management Application Process

This rule is not implementing any new or revised collection of information requirements or burden related to the identity management application process. The requirements and burden are currently approved by OMB under control number 0938–1314 (CMS–10621). Consequently, we are not

making any identity management application process changes under that control number.

(4) Quality Data Submission by Clinicians: Medicare Part B Claims-Based Collection Type

This rule is not implementing any new or revised collection of information requirements related to the submission of Medicare Part B claims data for the quality performance category. However, we are adjusting our currently approved burden estimates based on more recent data. The following burden will be submitted to OMB for approval under control number 0938–1314 (CMS–10621).

We refer readers to the CY 2017 Quality Payment Program final rule (81 FR 77501 through 77504), CY 2018 Quality Payment Program final rule (82 FR 53912), CY 2019 PFS final rule (83 FR 60004 through 60005), and the CY 2020 PFS final rule (84 FR 63124 through 63126) for our previously finalized requirements and burden for quality data submission via the Medicare Part B claims collection type.

As noted in Table 67, based on 2019 MIPS performance period data, we

assume that 29,273 individual clinicians will collect and submit quality data via the Medicare Part B claims collection type. This rule is adjusting the number of Medicare Part B claims respondents from the currently approved estimate of 94,846 to 29,273 (a decrease of 65,573) based on more recent data. This is an increase/decrease of 65,314 from the estimate of 94,587 provided in the CY 2021 PFS proposed rule (85 FR 50352).

As shown in Table 71, consistent with our currently approved per response time figures, we estimate that the burden of quality data submission using Medicare Part B claims will range from 0.15 hours (9 minutes) at a cost of \$13.87 (0.15 hr × \$92.46/hr) to 7.2 hours at a cost of \$665.71 (7.2 hr × \$92.46/hr). The burden will involve becoming familiar with MIPS quality measure specifications. We believe that the start-up cost for a clinician's practice to review measure specifications is 7 hours, consisting of 3 hours at \$110.74/hr for a medical and health services manager, 1 hour at \$212.78/hr for a physician, 1 hour at \$46.64/hr for an LPN, 1 hour at \$92.46/hr for a computer systems analyst, and 1 hour at \$39.06/

hr for a billing and posting clerk. We are not revising our currently approved per response time estimates.

Considering both data submission and start-up requirements, the estimated time (per clinician) ranges from a minimum of 7.15 hours (0.15 hr + 7 hr) to a maximum of 14.2 hours (7.2 hr + 7 hr). In this regard the total annual time ranges from 209,302 hours (7.15 hr × 29,273 clinicians) to 415,677 hours (14.2 hr × 29,273 clinicians). The estimated annual cost (per clinician) ranges from \$737.03 [(0.15 hr × \$92.46/hr) + (3 hr × \$110.74/hr) + (1 hr × \$92.46/hr) + (1 hr × \$46.64/hr) + (1 hr × \$39.06/hr) + (1 hr × \$212.78/hr)] to a maximum of \$1,388.87 [(7.2 hr × \$92.46/hr) + (3 hr × \$110.74/hr) + (1 hr × \$92.46/hr) + (1 hr × \$46.64/hr) + (1 hr × \$39.06/hr) + (1 hr × \$212.78/hr)]. The total annual cost ranges from a minimum of \$21,575,050 (29,273 clinicians × \$737.03) to a maximum of \$40,656,450 (29,273 clinicians × \$1,388.87).

Table 71 summarizes the range of total annual burden associated with clinicians submitting quality data via Medicare Part B claims.

TABLE 71: Estimated Burden for Quality Performance Category: Clinicians Using the Medicare Part B Claims Collection Type

	Minimum Burden	Median Burden	Maximum Burden
# of Clinicians (a)	29,273	29,273	29,273
Hours Per Clinician to Submit Quality Data (b)	0.15	1.05	7.2
# of Hours Medical and Health Services Manager Review Measure Specifications (c)	3	3	3
# of Hours Computer Systems Analyst Review Measure Specifications (d)	1	1	1
# of Hours LPN Review Measure Specifications (e)	1	1	1
# of Hours Billing Clerk Review Measure Specifications (f)	1	1	1
# of Hours Physician Review Measure Specifications (g)	1	1	1
Annual Hours per Clinician (h) = (b)+(c)+(d)+(e)+(f)+(g)	7.15	8.05	14.2
Total Annual Hours (i) = (a)*(h)	209,302	235,648	415,677
Cost to Submit Quality Data (@ computer systems analyst's labor rate of \$92.46/hr @ varying times) (j)	\$13.87	\$97.08	\$665.71
Cost to Review Measure Specifications (@ medical and health services manager's labor rate of \$110.74/hr @ 3 hr) (k)	\$332.22	\$332.22	\$332.22
Cost to Review Measure Specifications (@ computer systems analyst's labor rate of \$92.46/hr @ 1 hr) (l)	\$92.46	\$92.46	\$92.46
Cost to Review Measure Specifications (@ LPN's labor rate of \$46.64/hr @ 1 hr) (m)	\$46.64	\$46.64	\$46.64
Cost to Review Measure Specifications (@ billing clerk's labor rate of \$39.06/hr @ 1 hr) (n)	\$39.06	\$39.06	\$39.06
Cost to Review Measure Specifications (@ physician's labor rate of \$212.78/hr @ 1 hr) (o)	\$212.78	\$212.78	\$212.78
Total Annual Cost Per Clinician (p) = (j)+(k)+(l)+(m)+(n)+(o)	\$737.03	\$820.24	\$1,388.87
Total Annual Cost (q) = (a)*(p)	\$21,575,050	\$24,010,973	\$40,656,450

*Due to burden for certain activities being estimated in fractions of hours, totals may not reflect the sum of individual rows due to rounding.

As shown in Table 72, using the unchanged currently approved per respondent burden estimates which range from \$737.03 to \$1,388.87, the decrease in number of respondents from 94,846 to 29,273 results in a total

adjustment of between – 468,847 hours (– 65,573 respondents × 7.15 hr/ respondent) at a cost of – \$48,329,203 (– 65,573 respondents × \$737.03/ respondent) and – 931,136 hours (– 65,573 respondents × 14.2 hr/

respondent) at a cost of – \$91,072,504 (– 65,573 respondents × \$1,388.87/ respondent). For purposes of calculating total burden associated with the final rule as shown in Tables 100, 101, and 103, only the maximum burden is used.

TABLE 72: Adjusted Burden for Quality Performance Category: Clinicians Using the Medicare Part B Claims Collection Type

	Minimum Burden	Median Burden	Maximum Burden
Total Annual Hours for Respondents in CY 2020 Final Rule (a)	678,149	763,510	1,346,813

Difference (f) = (e)-(d)	-\$48,329,203	-\$53,785,795	-\$91,072,504

(5) Quality Data Submission by Individuals and Groups Using MIPS CQM and QCDR Collection Types

The following requirement and burden will be submitted to OMB for approval under control number 0938–1314 (CMS–10621).

We refer readers to the CY 2017 Quality Payment Program final rule (81 FR 77504 through 77505), CY 2018 Quality Payment Program final rule (82 FR 53912 through 53914), CY 2019 PFS final rule (83 FR 60005 through 60006), and the CY 2020 PFS final rule (84 FR 63127 through 63128) for our previously finalized requirements and burden for quality data submission via the MIPS CQM and QCDR collection types.

In the CY 2021 PFS proposed rule (85 FR 50290), we proposed to sunset the CMS Web Interface measures as a collection type/submission type starting with the 2021 MIPS performance period. As discussed in section IV.A.3.c.(1)(c) of this final rule, we are finalizing to sunset the CMS Web Interface measures as a collection type/submission type starting with the 2022 MIPS performance period. Using the methodology discussed in section VII.B.5.e.(1) of this final rule, for the 2022 MIPS performance period, we estimate 45 additional groups will submit quality data via the MIPS CQM and QCDR collection type due to the sunset of the CMS Web Interface measures as a collection type/submission type after the 2021 MIPS performance period.

As noted in Tables 67, 68, and 69, and based on 2019 MIPS performance period data, for the 2021 performance period, we assume that 284,509 clinicians will submit quality data as individuals or groups using MIPS CQM or QCDR collection types; 41,340 clinicians will submit as individuals and the remaining 243,169 clinicians will submit as

members of 11,559 groups and virtual groups. This is a decrease of 63,496 individuals and increase of 488 groups from the estimates of 104,836 individuals and 11,071 groups provided in the CY 2021 PFS proposed rule due to availability of updated data (85 FR 50353). For the 2022 performance period, we assume that 295,957 clinicians will submit quality data as individuals or groups using MIPS CQM or QCDR collection types; 41,340 clinicians will submit as individuals and the remaining 254,601 clinicians will submit as members of 11,604 groups and virtual groups. Given that the number of measures required is the same for clinicians and groups, we expect the burden to be the same for each respondent collecting data via MIPS CQM or QCDR, whether the clinician is participating in MIPS as an individual or group.

Under the MIPS CQM and QCDR collection types, the individual clinician or group may either submit the quality measures data directly to us, log in and upload a file, or utilize a third-party intermediary to submit the data to us on the clinician's or group's behalf.

We estimate that the burden associated with the QCDR collection type is similar to the burden associated with the MIPS CQM collection type; therefore, we discuss the burden for both together below. For MIPS CQM and QCDR collection types, we estimate an additional time for respondents (individual clinicians and groups) to become familiar with MIPS quality measure specifications and, in some cases, specialty measure sets and QCDR measures. Therefore, we believe that the burden for an individual clinician or group to review measure specifications and submit quality data total 9.083 hours at \$891.13. This consists of 3 hours at \$92.46/hr for a computer

systems analyst (or their equivalent) to submit quality data along with 2 hours at \$110.74/hr for a medical and health services manager, 1 hour at \$92.46/hr for a computer systems analyst, 1 hour at \$46.64/hr for a LPN, 1 hour at \$39.06/hr for a billing clerk, and 1 hour at \$212.78/hr for a physician to review measure specifications. Additionally, clinicians and groups who do not submit data directly will need to authorize or instruct the qualified registry or QCDR to submit quality measures' results and numerator and denominator data on quality measures to us on their behalf. We estimate that the time and effort associated with authorizing or instructing the quality registry or QCDR to submit this data will be approximately 5 minutes (0.083 hours) at \$92.46/hr for a computer systems analyst at a cost of \$7.70 (0.083 hr × \$92.46/hr). Overall we estimate a cost of \$897.47/response [(3 hr × \$92.46/hr) + (2 hr × \$110.74/hr) + (1 hr × \$212.78/hr) + (1 hr × \$92.46/hr) + (1 hr × \$46.64/hr) + (1 hr × \$39.06/hr) + (0.083 hr × \$92.46/hr)].

In aggregate, we estimate a burden of 480,482 hours [9.083 hr/response × (41,340 clinicians submitting as individuals + 11,559 groups submitting via QCDR or MIPS CQM on behalf of individual clinicians or 52,899 responses)] at a cost of \$47,475,487 (52,899 responses × \$897.47/response) for the 2021 performance period. For the 2022 performance period, we estimate a burden of 480,890 hours [9.083 hr/response × (41,340 clinicians submitting as individuals + 11,604 groups submitting via QCDR or MIPS CQM on behalf of individual clinicians or 52,944 responses)] at a cost of \$47,515,873 (52,944 responses × \$897.47/response). Based on these assumptions, we have estimated in Table 73 the burden for these submissions.

TABLE 73: Estimated Burden for Quality Performance Category: Clinicians (Participating Individually or as Part of a Group) Using the MIPS CQM and QCDR Collection Type

	2021 Performance Period Burden Estimate	2022 Performance Period Burden Estimate
# of clinicians submitting as individuals (a)	41,340	41,340
# of groups submitting via QCDR or MIPS CQM on behalf of individual clinicians (b)	11,559	11,604
# of Respondents (groups plus clinicians submitting as individuals) (c)=(a)+(b)	52,899	52,944
Hours Per Respondent to Report Quality Data (d)	3	3
# of Hours Medical and Health Services Manager Review Measure Specifications (e)	2	2
# of Hours Computer Systems Analyst Review Measure Specifications (f)	1	1
# of Hours LPN Review Measure Specifications (g)	1	1
# of Hours Billing Clerk Review Measure Specifications (h)	1	1
# of Hours Physician Review Measure Specifications (i)	1	1
# of Hours Per Respondent to Authorize Qualified Registry to Report on Respondent's Behalf (j)	0.083	0.083
Annual Hours Per Respondent (k)= (d)+(e)+(f)+(g)+(h)+(i)+(j)	9.083	9.083
Total Annual Hours (l) = (c)*(k)	480,482	480,890
Cost Per Respondent to Submit Quality Data (@ computer systems analyst's labor rate of \$92.46/hr) (m)	\$277.38	\$277.38
Cost to Review Measure Specifications (@ medical and health services manager's labor rate of \$110.74/hr) (n)	\$221.48	\$221.48
Cost Computer System's Analyst Review Measure Specifications (@ computer systems analyst's labor rate of \$92.46/hr) (o)	\$92.46	\$92.46
Cost LPN Review Measure Specifications (@ LPN's labor rate of \$46.64/hr) (p)	\$46.64	\$46.64
Cost Billing Clerk Review Measure Specifications (@ clerk's labor rate of \$39.06/hr) (q)	\$39.06	\$39.06
Cost Physician Review Measure Specifications (@ physician's labor rate of \$212.78/hr) (r)	\$212.78	\$212.78
Cost for Respondent to Authorize Qualified Registry/QCDR to Report on Respondent's Behalf (@ computer systems analyst's labor rate of \$92.46/hr) (s)	\$7.70	\$7.70
Total Annual Cost Per Respondent (t) = (m)+(n)+(o)+(p)+(q)+(r)+(s)	\$897.47	\$897.47
Total Annual Cost (u) = (c)*(t)	\$47,475,487	\$47,515,873

*Due to burden for certain activities being estimated in fractions of hours, totals may not reflect the sum of individual rows due to rounding.

As shown in Table 74, using the unchanged currently approved per respondent burden estimate, the decrease of 58,319 respondents from 111,218 to 52,899 for the 2021 performance period results in a decrease

of – 529,711 hours (– 58,319 respondents × 9.083 hr/respondent) and – \$52,339,796 (– 58,319 respondents × \$897.47/respondent). For the 2022 performance period, the decrease of 58,274 respondents from 111,218 to

52,944 results in a decrease of – 529,303 hours (– 58,264 respondents × 9.083 hr/respondent) and – \$52,299,410 (– 58,274 respondents × \$897.47/respondent).

TABLE 74: Change in Estimated Burden for Quality Performance Category: Clinicians (Participating Individually or as Part of a Group) Using the MIPS CQM and QCDR Collection Type

	2021 Performance Period Burden Estimate	2022 Performance Period Burden Estimate
Total Annual Hours for Respondents in CY 2020 Final Rule (a)	1,010,193	1,010,193

Difference (c) = (b)-(a)	-529,711	-529,303
Total Annual Cost for Respondents in CY 2020 Final Rule (d)	\$99,815,283	\$99,815,283
Total Annual Cost for Respondents in CY 2021 Final Rule (e)	\$47,475,487	\$47,515,873
Difference (f) = (e)-(d)	-\$52,339,796	-\$52,299,410

(6) Quality Data Submission by Clinicians and Groups: eCQM Collection Type

The following requirement and burden will be submitted to OMB for approval under control number 0938–1314 (CMS–10621).

We refer readers to the CY 2017 Quality Payment Program final rule (81 FR 77505 through 77506), CY 2018 Quality Payment Program final rule (82 FR 53914 through 53915), CY 2019 PFS final rule (83 FR 60006 through 60007), and the CY 2020 PFS final rule (84 FR 63128 through 63130) for our previously finalized requirements and burden for quality data submission via the eCQM collection types.

In the CY 2021 PFS proposed rule (85 FR 50290), we proposed to sunset the CMS Web Interface measures as a collection type/submission type starting with the 2021 MIPS performance period. As discussed in section IV.A.3.c.(1)(c) of this final rule, we are finalizing to sunset the CMS Web Interface measures as a collection type/submission type starting with the 2022 MIPS performance period. Using the methodology discussed in section VII.B.5.e.(1) of this final rule, for the 2022 MIPS performance period, we estimate 66 additional groups will submit quality data via the eCQM collection type due to the sunset of the CMS Web Interface measures as a collection type/submission type after the 2021 MIPS performance period.

Based on 2019 MIPS performance period data, for the 2021 performance period, we assume that 292,133 clinicians will elect to use the eCQM collection type; 42,255 clinicians are

expected to submit eCQMs as individuals; and 8,154 groups and virtual groups are expected to submit eCQMs on behalf of the remaining 249,878 clinicians. This is an increase of 778 individuals and 3,680 groups from the estimates of 41,477 individuals and 4,474 groups provided in the CY 2021 PFS proposed rule due to availability of updated data (85 FR 50355). For the 2022 performance period, we assume that 320,003 clinicians will elect to use the eCQM collection type; 42,255 clinicians are expected to submit eCQMs as individuals; and 8,220 groups and virtual groups are expected to submit eCQMs on behalf of the remaining 284,045 clinicians. We expect the burden to be the same for each respondent using the eCQM collection type, whether the clinician is participating in MIPS as an individual or group.

Under the eCQM collection type, the individual clinician or group may either submit the quality measures data directly to us from their eCQM, log in and upload a file, or utilize a third-party intermediary to derive data from their CEHRT and submit it to us on the clinician's or group's behalf.

To prepare for the eCQM collection type, the clinician or group must review the quality measures on which we will be accepting MIPS data extracted from eCQMs, select the appropriate quality measures, extract the necessary clinical data from their CEHRT, and submit the necessary data to a QCDR/qualified registry or use a health IT vendor to submit the data on behalf of the clinician or group. We assume the burden for collecting quality measures

data via eCQM is similar for clinicians and groups who submit their data directly to us from their CEHRT and clinicians and groups who use a health IT vendor to submit the data on their behalf. This includes extracting the necessary clinical data from their CEHRT and submitting the necessary data to a QCDR/qualified registry.

We estimate that it will take no more than 2 hours at \$92.46/hr for a computer systems analyst to submit the actual data file. The burden will also involve becoming familiar with MIPS quality measure specifications. In this regard, we estimate it will take 6 hours for a clinician or group to review measure specifications. Of that time, we estimate 2 hours at \$110.74/hr for a medical and health services manager, 1 hour at \$212.78/hr for a physician, 1 hour at \$92.46/hr for a computer systems analyst, 1 hour at \$46.64/hr for an LPN, and 1 hour at \$39.06/hr for a billing clerk. Overall we estimate a cost of \$797.34/response [(2 hr × \$92.46/hr) + (2 hr × \$110.74/hr) + (1 hr × \$212.78/hr) + (1 hr × \$92.46/hr) + (1 hr × \$46.64/hr) + (1 hr × \$39.06/hr)].

In aggregate, for the 2021 performance period, we estimate a burden of 403,272 hours (8 hr × 50,409 groups and clinicians submitting as individuals) at a cost of \$40,193,112 (50,409 responses × \$797.34/response). For the 2022 performance period, we estimate a burden of 403,800 hours (8 hr × 50,475 groups and clinicians submitting as individuals) at a cost of \$40,245,737 (50,475 responses × \$797.34/response). Based on these assumptions, we have estimated in Table 75 the burden for these submissions.

TABLE 75: Estimated Burden for Quality Performance Category: Clinicians (Submitting Individually or as Part of a Group) Using the eCQM Collection Type

	2021 Performance Period Burden estimate	2022 Performance Period Burden estimate
# of clinicians submitting as individuals (a)	42,255	42,255
# of Groups submitting via EHR on behalf of individual clinicians (b)	8,154	8,220
# of Respondents (groups and clinicians submitting as individuals) (c)=(a)+(b)	50,409	50,475
Hours Per Respondent to Submit MIPS Quality Data File to CMS (d)	2	2
# of Hours Medical and Health Services Manager Review Measure Specifications (e)	2	2
# of Hours Computer Systems Analyst Review Measure Specifications (f)	1	1
# of Hours LPN Review Measure Specifications (g)	1	1
# of Hours Billing Clerk Review Measure Specifications (h)	1	1
# of Hours Physicians Review Measure Specifications (i)	1	1
Annual Hours Per Respondent (j)=(d)+(e)+(f)+(g)+(h)+(i)	8	8
Total Annual Hours (k)=(c)*(j)	403,272	403,800
Cost Per Respondent to Submit Quality Data (@ computer systems analyst's labor rate of \$92.46/hr) (l)	\$184.92	\$184.92
Cost to Review Measure Specifications (@ medical and health services manager's labor rate of \$110.74/hr) (m)	\$221.48	\$221.48
Cost to Review Measure Specifications (@ computer systems analyst's labor rate of \$92.46/hr) (n)	\$92.46	\$92.46
Cost to Review Measure Specifications (@ LPN's labor rate of \$46.64/hr) (o)	\$46.64	\$46.64
Cost to Review Measure Specifications (@ clerk's labor rate of \$39.06/hr) (p)	\$39.06	\$39.06
Cost to D21 Review Measure Specifications (@ physician's labor rate of \$212.78/hr) (q)	\$212.78	\$212.78
Total Cost Per Respondent (r)=(l)+(m)+(n)+(o)+(p)+(q)	\$797.34	\$797.34
Total Annual Cost (s) = (c)*(r)	\$40,193,112	\$40,245,737

As shown in Table 76, using the unchanged currently approved per respondent burden estimate, the increase of 7,076 respondents from 43,333 to 50,409 for the 2021 performance period results in a total

difference of +56,608 hours (+7,076 respondents × 8 hr/respondent) at a cost of +\$5,641,978 (+7,076 respondents × \$797.34/respondent). For the 2022 performance period, the increase of 7,142 respondents from 43,333 to 50,475

results in a total difference of +57,136 hours (+7,142 respondents × 8 hr/respondent) at a cost of +\$5,694,603 (+7,142 respondents × \$797.34/respondent).

TABLE 76: Change in Estimated Burden for Quality Performance Category: Clinicians (Participating Individually or as Part of a Group) Using the eCQM Collection Type

	2021 Performance Period Burden Estimate	2022 Performance Period Burden Estimate
Total Annual Hours for Respondents in CY 2020 Final Rule (a)	346,664	346,664
Total Annual Hours for Respondents in CY 2021 Final Rule (b)	403,272	403,800
Difference (c) = (b)-(a)	+56,608	+57,136
Total Annual Cost for Respondents in CY 2020 Final Rule (d)	\$34,551,134	\$34,551,134
Total Annual Cost for Respondents in CY 2021 Final Rule (e)	\$40,193,112	\$40,245,737
Difference (f) = (e)-(d)	+\$5,641,978	+\$5,694,603

(7) Quality Data Submission via CMS Web Interface

The requirements and burden will be submitted to OMB for approval under control number 0938–1314 (CMS–10621).

In the CY 2021 PFS proposed rule, we proposed to sunset the CMS Web Interface measures as a collection type/submission type starting with the 2021 MIPS performance period (85 FR 50290). As a result, we did not provide a burden estimate for quality data submission via the CMS Web Interface for the 2021 performance period. As discussed in section IV.A.3.c.(1)(c) of this final rule, we are finalizing to sunset the CMS Web Interface measures as a collection type/submission type starting with the 2022 MIPS performance period; therefore, we are now providing a burden estimate for the 2021 MIPS performance period.

We assume that 111 groups will submit quality data via the CMS Web Interface based on the number of groups

who completed 100 percent of reporting quality data via the Web Interface in the 2019 MIPS performance period. This is an increase of 7 groups from the currently approved number of 104 groups provided in the CY 2020 PFS final rule (84 FR 63130) due to receipt of more current data. We estimate that 45,599 clinicians will submit as part of groups via this method, a decrease of 874 from our currently approved estimate of 46,473 clinicians.

The burden associated with the group submission requirements is the time and effort associated with submitting data on a sample of the organization's beneficiaries that is prepopulated in the CMS Web Interface. Our burden estimate for submission includes the time (61.67 hours) needed for each group to populate data fields in the web interface with information on approximately 248 eligible assigned Medicare beneficiaries and submit the data (we will partially pre-populate the CMS Web Interface with claims data

from their Medicare Part A and B beneficiaries). The patient data either can be manually entered, uploaded into the CMS Web Interface via a standard file format, which can be populated by CEHRT, or submitted directly. Each group must provide data on 248 eligible assigned Medicare beneficiaries (or all eligible assigned Medicare beneficiaries if the pool of eligible assigned beneficiaries is less than 248) for each measure. In aggregate, we estimate a burden for the 2021 performance period of 6,845 hours (111 groups × 61.67 hr) at a cost of \$632,923 (6,845 hr × \$92.46/hr). For the 2022 performance period, we estimate a burden of zero due to our assumption that all Web Interface respondents will alternately utilize either the MIPS CQM and QCDR or eCQM collection types. Based on the assumptions discussed in this section, Table 77 summarizes the burden for groups submitting to MIPS via the CMS Web Interface.

TABLE 77: Estimated Burden for Quality Data Submission via the CMS Web Interface

	2021 Performance Period Burden Estimate	2022 Performance Period Burden Estimate
# of Eligible Group Practices (a)	111	0
Total Annual Hours Per Group to Submit (b)	61.67	61.67
Total Annual Hours (c) = (a)*(b)	6,845	0
Cost Per Group to Report (@ computer systems analyst's labor rate of \$90.02/hr.) (d)	\$5,701.70	\$5,701.70
Total Annual Cost (e) = (a)*(d)	\$632,923	\$0

As shown in Table 78, using our unchanged currently approved per respondent burden estimate, the increase in number of respondents

results in a total adjustment of +432 hours (+7 respondents × 61.67 hr) at \$39,914 (+431.7 hr × \$92.46/hr) for the 2021 MIPS Performance Period. For the

2022 MIPS performance period, our burden estimate is 0 hours and \$0.

TABLE 78: Change in Estimated Burden for Quality Data Submission via the CMS Web Interface

	2021 Performance Period Burden Estimate	2022 Performance Period Burden Estimate
Total Annual Hours for Respondents in CY 2020 Final Rule (a)	6,413	6,413
Total Annual Hours for Respondents in CY 2021 Final Rule (b)	6,845	0
Difference (c) = (b)-(a)	+432	-6,413
Total Annual Cost for Respondents in CY 2020 Final Rule (d)	\$593,009	\$592,977
Total Annual Cost for Respondents in CY 2021 Final Rule (e)	\$632,923	\$0
Difference (f) = (e)-(d)	+\$39,914	-\$592,977

(8) Beneficiary Responses to CAHPS for MIPS Survey

In this final rule, we are revising the requirements for the CAHPS for MIPS survey which will result in updates to the CAHPS for MIPS survey instrument which is currently approved by OMB under control number 0938–1222 (CMS–10450). The survey instrument is not ready at this time, therefore we will make the updated survey instrument and burden available for public review through a stand-alone non-rule **Federal Register** notice that is expected to publish in early CY 2021.

We refer readers to the CY 2017 Quality Payment Program final rule (81 FR 77509), CY 2018 Quality Payment Program final rule (82 FR 53916 through 53917), and CY 2019 PFS final rule (83 FR 60009 through 60010 for our previously finalized requirements and burden for beneficiary responses to the CAHPS for MIPS survey.

In section IV.A.3.c.(1)(f)(ii), we are: (1) Revising and codifying at § 414.1305 the definition of primary care services used in the MIPS assignment methodology to

include virtual primary care visits and telehealth visits to determine patient assignment to groups starting in the 2021 CAHPS for MIPS survey; and (2) revising the CAHPS for MIPS Survey cover page to include a reference to care received in telehealth settings. We do not believe any of these provisions will impact the number of groups electing to have the CAHPS for MIPS survey administered on their behalf, the number of beneficiaries who complete the survey, or the time required for a beneficiary to complete the survey. In the future, if additional data becomes available, we may revise our assumptions at that time.

Additionally, in IV.A.2.c.(1)(e)(i), we are adding a survey-based measure on telehealth that assesses patient-reported usage of telehealth services to the performance year 2021 CAHPS for MIPS Survey. Currently, the CAHPS for MIPS survey instrument contains 58 questions and we estimate it requires a beneficiary 12.9 minutes on average to complete it, or approximately 0.2 minutes per question. We assume this provision will

result in 1 additional question being added to the survey which would result in the total time to complete the survey increasing from 12.9 minutes (0.215 hr) to 13.1 minutes (0.2183 hr) per beneficiary, or an increase of 0.2 minutes (0.0033 hr).

Based on the number of beneficiaries who completely or partially responded to the survey in the 2019 MIPS performance period, we assume that 29,952 beneficiaries will respond to the survey during the 2021 MIPS performance period. This is a decrease of 9,087 from our currently approved estimate of 39,039 beneficiaries and a decrease of 37 beneficiaries from the CY 2020 PFS proposed rule due to updated data. Using this updated number of respondents and our revised estimate of burden per respondent, we estimate an annual burden of 6,540 hours (29,952 respondents \times 0.2183 hr/respondent) at a cost of \$168,196 (6,540 hr \times \$25.72/hr). Table 79 shows the estimated annual burden for beneficiaries to participate in the CAHPS for MIPS Survey.

TABLE 79: Estimated Burden for Beneficiary Responses to CAHPS for MIPS Survey

Burden Estimate	
Number of beneficiaries who will respond to the survey (a)	29,952
Number of hours per beneficiary respondent (b)	0.2183
Total Annual Hours (c) = (a)*(b)	6,540
Labor rate for a beneficiary (d)	\$25.72/hr
Total Annual Cost (e) = (a)*(d)	\$168,196

*Due to burden being estimated in fractions of minutes and hours, totals may reflect impact of rounding.

Independent of the change in burden per respondent, the decrease of – 9,087 respondents from 39,039 to 29,952 results in a difference of – 1,954 hours (– 9,087 respondents \times 0.215 hr/respondent) at a cost of – \$50,250

(– 9,087 hrs \times \$25.72/hr). Accounting for the change in number of respondents, the increase in burden per respondent from 0.215 hours to 0.2183 hours results in a difference of +100 hours (29,952 respondents \times 0.0033 hr/

respondent) at a cost of \$2,568 (100 hrs \times \$25.72/hr). As shown in Table 80, the aggregate change in burden is – 1,854 hours (100 hours–1,954 hours) at a cost of – \$47,682 (\$2,568 – \$50,250).

TABLE 80: Change in Estimated Burden for Beneficiary Responses to CAHPS for MIPS Survey

Burden Estimate	
Total Annual Hours for Respondents in CY 2020 Final Rule (a)	8,393
Total Annual Hours for Respondents in CY 2021 Final Rule (b)	6,540
Difference (c) = (b)-(a)	-1,854
Total Annual Cost for Respondents in CY 2020 Final Rule (d)	\$215,878
Total Annual Cost for Respondents in CY 2021 Final Rule (e)	\$168,196
Difference (f) = (e)-(d)	-\$47,682

The revised survey and burden will be released to the public via the standard non-rule PRA process which includes the publication of 60- and 30-day **Federal Register** notices.

(9) Group Registration for CMS Web Interface

The requirements and burden will be submitted to OMB for approval under control number 0938–1314 (CMS–10621).

In the CY 2021 PFS proposed rule, we proposed to sunset the CMS Web Interface measures as a collection type/submission type starting with the 2021 MIPS performance period (85 FR 50290). As a result, we did not provide a burden estimate for group registration for the CMS Web Interface for the 2021 performance period. As discussed in section IV.A.3.c.(1)(c) of this final rule, we are finalizing to sunset the CMS Web Interface measures as a collection type/

submission type starting with the 2022 MIPS performance period; therefore, are now providing a burden estimate for both the 2021 and 2022 MIPS performance period.

Groups interested in participating in MIPS using the CMS Web Interface for the first time must complete an online registration process. After first time registration, groups will only need to opt out if they are not going to continue to submit via the CMS Web Interface. In Table 81, we estimate that the registration process for groups under MIPS involves approximately 0.25 hours at \$92.46/hr for a computer systems analyst (or their equivalent) to register the group.

In this rule, we are adjusting the number of respondents from 69 to 90 based on more recent data; an increase of 21 from the 69 groups currently approved by OMB and our estimate in

the CY 2021 PFS proposed rule (85 FR 50358). Because we are finalizing to sunset the CMS Web Interface beginning with the 2022 MIPS performance period, it is possible that fewer groups will elect to register to submit quality data for the first time in the performance year prior to the collection type/submission type no longer being available; however, we currently have no data with which to estimate what the associated reduction may be. Therefore, we continue to assume that approximately 90 groups will elect to use the CMS Web Interface for the first time during the 2020 MIPS performance period based on the number of new registrations received during the CY 2020 registration period. As shown in Table 81, we estimate a burden of 22.5 hours (90 new registrations × 0.25 hr/registration) at a cost of \$2,080 (22.5 hr × \$92.46/hr).

TABLE 81: Estimated Burden for Group Registration for CMS Web Interface

	2021 Performance Period Burden Estimate	2022 Performance Period Burden Estimate
Number of New Groups Registering for CMS Web Interface (a)	90	0
Annual Hours Per Group (b)	0.25	0.25
Total Annual Hours (c) = (a)*(b)	22.5	0
Labor rate for a computer systems analyst (d)	\$92.46/hr	\$92.46/hr
Total Annual Cost (e) = (a)*(d)	\$2,080	\$0

As shown in Table 82 using our unchanged currently approved per respondent burden estimates, the increase in the number of groups registering to submit MIPS data via the

CMS Web Interface results in an adjustment to the total time burden of +5.25 hours (+21 respondents × 0.25 hours/respondent) at a cost of \$485 (+21 groups × 0.25 hr × \$92.46/hr) for the

2021 MIPS performance period. For the 2022 MIPS performance period, our burden estimate is 0 hours and \$0.

TABLE 82: Change in Estimated Burden for Group Registrations for the CMS Web Interface

	2021 Performance Period Burden Estimate	2022 Performance Period Burden Estimate
Total Annual Hours for Respondents in CY 2020 Final Rule (a)	17.25	17.25
Total Annual Hours for Respondents in CY 2021 Final Rule (b)	22.5	0
Difference (c) = (b)-(a)	+5.25	-17.25
Total Annual Cost for Respondents in CY 2020 Final Rule (d)	\$1,595	\$1,595
Total Annual Cost for Respondents in CY 2021 Final Rule (e)	\$2,080	\$0
Difference (f) = (e)-(d)	+\$485	-\$1,595

(10) Group Registration for CAHPS for MIPS Survey

This rule is not implementing any new or revised collection of information requirements or burden related to the

group registration for the CAHPS for MIPS Survey. The CAHPS for MIPS survey requirements and burden are currently approved by OMB under control number 0938–1222 (CMS–

10450). Consequently, we are not making any changes to burden for CAHPS for MIPS survey group registration under that control number.

f. ICRs Regarding the Call for MIPS Quality Measures

This rule is not implementing any new or revised collection of information requirements or burden related to the call for MIPS quality measures. The requirements and burden are currently approved by OMB under control number 0938–1314 (CMS–10621). Consequently, we are not making any call for MIPS quality measure changes under that control number.

g. ICRs Regarding Promoting Interoperability Data (§§ 414.1375 and 414.1380)

(1) Background

For the 2021 MIPS performance period, clinicians and groups can submit Promoting Interoperability data through direct, log in and upload, or log in and attest submission types. With the exception of submitters who elect to use the log in and attest submission type for the Promoting Interoperability performance category, which is not available for the quality performance category, we anticipate that individuals and groups will use the same data submission type for the both of these performance categories and that the clinicians, practice managers, and computer systems analysts involved in supporting the quality data submission will also support the Promoting Interoperability data submission process. The following burden estimates show only incremental hours required above and beyond the time already accounted for in the quality data submission process. Although this analysis assesses burden by performance category and submission type, we emphasize that MIPS is a consolidated program and submission analysis and decisions are expected to be made for the program as a whole.

(2) Reweighting Applications for Promoting Interoperability and Other Performance Categories

The requirements and burden associated with this rule's data submission will be submitted to OMB for approval under control number 0938–1314 (CMS–10621).

We refer readers to the CY 2018 Quality Payment Program final rule (82 FR 53918 through 53919), CY 2019 PFS final rule (83 FR 60011 through 60012), and the CY 2020 PFS final rule (84 FR 63134 through 63135) for our previously finalized requirements and burden for reweighting applications for Promoting Interoperability and other performance categories.

As established in the CY 2017 and CY 2018 Quality Payment Program final

rules, MIPS eligible clinicians who meet the criteria for a significant hardship or other type of exception may submit an application requesting a zero percent weighting for the Promoting Interoperability, quality, cost, and/or improvement activities performance categories under specific circumstances (81 FR 77240 through 77243, 82 FR 53680 through 53686, and 82 FR 53783 through 53785). Respondents who apply for a reweighting for the quality, cost, and/or improvement activities performance categories have the option of applying for reweighting for the Promoting Interoperability performance category on the same online form. We assume that respondents applying for a reweighting of the Promoting Interoperability performance category due to extreme and uncontrollable circumstances will also request a reweighting of at least one of the other performance categories simultaneously and not submit multiple reweighting applications.

Table 83 summarizes the burden for clinicians to apply for reweighting the Promoting Interoperability performance category to zero percent due to a significant hardship exception (including a significant hardship exception for small practices) or as a result of a decertification of an EHR. Based on the number of reweighting applications received by December 31, 2019 for the 2019 MIPS performance period, we assume 51,098 respondents (eligible clinicians or groups) will submit a request to reweight the Promoting Interoperability performance category to zero percent due to a significant hardship (including clinicians in small practices) or EHR decertification and an additional 994 respondents will submit a request to reweight one or more of the quality, cost, Promoting Interoperability, or improvement activity performance categories due to an extreme or uncontrollable circumstance, for a total of 52,092 reweighting applications submitted. This is an increase of 21,472 respondents compared to our currently approved estimate of 30,620 respondents (84 FR 63134). Similar to the data used to estimate the number of respondents in the CY 2020 PFS final rule, our respondent estimate includes a significant number of applications submitted as a result of a data issue CMS was made aware of and is specific to a single third-party intermediary. While we do not anticipate similar data issues to occur in each performance period, we do believe future similar incidents may occur and are electing to use this data without adjustment to

reflect this belief. Our respondent estimate is also based on data that does not include applications submitted during the extended period ending April 30, 2020 due to the PHE for COVID–19, as we do not believe it would be an accurate basis for future estimates of application submissions. Of our total respondent estimate of 52,092, we estimate that 35,986 respondents (eligible clinicians or groups) will submit a request for reweighting the Promoting Interoperability performance category to zero percent due to extreme and uncontrollable circumstances, insufficient internet connectivity, lack of control over the availability of CEHRT, or as a result of a decertification of an EHR. An additional 16,106 respondents will submit a request for reweighting the Promoting Interoperability performance category to zero percent as a small practice experiencing a significant hardship.

In section IV.A.3.c.(5)(e), we discussed that, beginning with the 2022 MIPS payment year (2020 performance year), APM Entities may submit an extreme and uncontrollable circumstances exception application for all four performance categories and applicable to all MIPS eligible clinicians in the APM Entity group. As previously discussed in section VII.B.5.a.(4) of this final rule, due to data limitations and our inability to determine who would use the APM Performance Pathway versus the traditional MIPS submission mechanism for the 2021 MIPS performance period, we assume ACO APM Entities will submit data through the APM Performance Pathway and non-ACO APM Entities would participate through traditional MIPS, thereby submitting as an individual or group rather than as an entity. Therefore, we limited our analysis to ACOs that were eligible for an exception due to extreme and uncontrollable circumstances during the 2019 MIPS performance period and elected not to report quality data. Based on this data, we estimate 7 APM Entities will submit an extreme and uncontrollable circumstances exception application for the 2021 MIPS performance period. Combined with our aforementioned estimate of 52,092 eligible clinicians and groups, the total estimated number of respondents for the 2021 MIPS performance period is 52,099.

The application to request a reweighting to zero percent only for the Promoting Interoperability performance category is a short online form that requires identifying the type of hardship experienced or whether decertification of an EHR has occurred and a description of how the circumstances

impair the clinician or group's ability to submit Promoting Interoperability data, as well as some proof of circumstances beyond the clinician's control. The application for reweighting of the quality, cost, Promoting Interoperability, and/or improvement activities

performance categories due to extreme and uncontrollable circumstances requires the same information with the exception of there being only one option for the type of hardship experienced. We continue to estimate it will take 0.25 hours at \$92.46/hr for a computer

system analyst to complete and submit the application. As shown in Table 83, we estimate an annual burden of 13,025 hours (52,099 applications \times 0.25 hr/application) and \$1,204,268 (13,025 hr \times \$92.46/hr).

TABLE 83: Estimated Burden for Reweighting Applications for Promoting Interoperability and Other Performance Categories

	Burden estimate
# of Eligible Clinicians or Groups Applying Due to Significant Hardship and Other Exceptions or Extreme and Uncontrollable Circumstances (a)	35,986
# of Eligible Clinicians or Groups Applying Due to Significant Hardship for Small Practice (b)	16,106
# APM Entities requesting Extreme and Uncontrollable Circumstances exception	7
Total Applications Submitted (c)	52,099
Hours Per Applicant per Application Submission (d)	0.25
Total Annual Hours (e)=(a)*(c)	13,025
Labor Rate for a computer systems analyst (f)	\$92.46/hr
Total Annual Cost (g)=(e)*(f)	\$1,204,268

As shown in Table 84, using our unchanged currently approved per respondent burden estimate, the

increased number of respondents results in a total adjustment of 5,370 hours (21,479 respondents \times 0.25 hr/

respondent) and \$496,487 (5,370 hr \times \$92.46/hr).

TABLE 84: Adjusted Burden for Reweighting Applications for Promoting Interoperability and Other Performance Categories

	Burden Estimate
Total Annual Hours for Respondents in CY 2020 Final Rule (a)	7,655
Total Annual Hours for Respondents in CY 2021 Final Rule (b)	13,025
Difference (c) = (b)-(a)	+5,370
Total Annual Cost for Respondents in CY 2020 Final Rule (d)	\$707,781
Total Annual Cost for Respondents in CY 2021 Final Rule (e)	\$1,204,268
Difference (f) = (e)-(d)	+\$496,487

(3) Submitting Promoting Interoperability Data

We did not propose any new or revised collection of information requirements related to the submission of data for the Promoting Interoperability performance category. However, we are adjusting our currently approved burden estimates based on more recent data. The burden will be submitted to OMB for approval under control number 0938-1314 (CMS-10621).

We refer readers to the CY 2017 Quality Payment Program final rule (81 FR 77509 through 77511), CY 2018 Quality Payment Program final rule (82 FR 53919 through 53920), CY 2019 PFS

final rule (83 FR 60013 through 60014), and the CY 2020 PFS final rule (84 FR 63135 through 63137) for our previously finalized requirements and burden for submission of data for the Promoting Interoperability performance category.

In this final rule, we did not propose any changes to our current criteria for automatic reweighting of the Promoting Interoperability performance category for certain MIPS eligible clinicians or MIPS eligible clinicians who have experienced a significant hardship or decertification of an EHR.

In section IV.A.3.c.(4)(b) of this rule, we are adding § 414.1320(g)(1), which would establish a performance period for the Promoting Interoperability performance category of a minimum of

a continuous 90-day period within the calendar year that occurs 2 years prior to the applicable MIPS payment year, up to and including the full calendar year. Because this does not change the number of required Promoting Interoperability measures that must be reported, we are not making any changes to our burden assumptions.

In section IV.3.c.(4)(c)(ii)(b) we are adding the HIE bi-directional exchange measure for the 2021 performance period and subsequent years as an optional alternative to the two existing measures: The Support Electronic Referral Loops by Sending Health Information measure and the Support Electronic Referral Loops by Receiving and Incorporating Health Information

measure. This provision provides clinicians the option of either reporting the new measure or the two existing measures. Because the new HIE measure is an optional alternative instead of a new requirement and the provision does not change the number of required Promoting Interoperability measures that must be reported, we are not making any changes to our burden assumptions.

A variety of organizations will submit Promoting Interoperability data on behalf of clinicians. Clinicians not participating in a MIPS APM may submit data as individuals or as part of a group. In the CY 2017 Quality Payment Program final rule (81 FR 77258 through 77260, 77262 through 77264) and CY 2019 PFS final rule (83 FR 59822–59823), we established that eligible clinicians in MIPS APMs (including the Shared Savings Program) may report for the Promoting Interoperability performance category as an APM Entity group, individuals, or a group. Because we are not making changes at § 414.1375 to the scoring for APM entities as a result of our provision in section IV.A.3.(b) of this final rule to establish an APM Performance Pathway,

our reporting assumptions for clinician in MIPS APMs remains unchanged. As shown in Table 85, based on data from the 2019 MIPS performance period, we estimate that a total of 53,636 respondents consisting of 42,110 individual MIPS eligible clinicians and 11,526 groups and virtual groups will submit Promoting Interoperability data. Since our CY 2020 PFS final rule estimated 74,281 respondents, this represents a decrease of 20,645 respondents (53,636 respondents – 74,281 active respondents). This is a decrease of 20,636 individuals and 3,227 groups from the estimates of 62,746 individuals and 14,753 groups provided in the CY 2021 PFS proposed rule due to availability of updated data (85 FR 50360). We assume that MIPS eligible clinicians previously scored under the APM scoring standard, as described in the CY 2020 PFS final rule, will continue to submit Promoting Interoperability data (84 FR 63006) in a similar way through the APM Performance Pathway. As a result, we do not anticipate any change in burden. Each MIPS eligible clinician in an APM

Entity reports data for the Promoting Interoperability performance category through either their group TIN or individual reporting. Sections 1899 and 1115A of the Act (42 U.S.C. 1395jjj and 42 U.S.C. 1315a, respectively) state that the Shared Savings Program and the testing, evaluation, and expansion of Innovation Center models are not subject to the PRA. However, in the CY 2019 PFS final rule, we established that MIPS eligible clinicians who participate in the Shared Savings Program are no longer limited to reporting for the Promoting Interoperability performance category through their ACO participant TIN (83 FR 59822 through 59823). Burden estimates for this final rule assume group TIN-level reporting as we believe this is the most reasonable assumption for the Shared Savings Program, which requires that ACOs include full TINs as ACO participants. As we receive updated information which reflects the actual number of Promoting Interoperability data submissions submitted by Shared Savings Program ACO participants, we will update our burden estimates accordingly.

TABLE 85: Estimated Number of Respondents to Submit Promoting Interoperability Performance Data on Behalf of Clinicians

	# of Respondents
Number of individual clinicians to submit Promoting Interoperability (a)	42,110
Number of groups to submit Promoting Interoperability (b)	11,526
Total Respondents in 2021 MIPS performance period (CY 2021 Final Rule) (c) = (a) + (b)	53,636
*Total Respondents in 2020 MIPS performance period (CY 2020 Final Rule) (d)	74,281
Difference (e) = (c) – (d)	-20,645

We continue to estimate the time required for an individual or group to submit Promoting Interoperability data to be 2.67 hours. As shown in Table 86, the total burden estimate for submitting

data on the specified Promoting Interoperability objectives and measures is estimated to be 143,029 hours (53,636 respondents × 2.67 incremental hours for a computer analyst’s time above and

beyond the physician, medical and health services manager, and computer system’s analyst time required to submit quality data) and \$13,224,492 (143,029 hr × \$92.46/hr)).

TABLE 86: Estimated Burden for Promoting Interoperability Performance Category Data Submission

	Burden Estimate
Number of individual clinicians to submit Promoting Interoperability (a)	42,110
Number of groups to submit Promoting Interoperability (b)	11,526
Total (c) = (a) + (b)	53,636
Total Annual Hours Per Respondent (b)	2.67
Total Annual Hours (c) = (a)*(b)	143,029
Labor rate for a computer systems analyst to submit Promoting Interoperability data (d)	\$92.46/hr
Total Annual Cost (e) = (a)*(d)	\$13,224,492

*Due to burden being estimated in fractions of hours, totals may reflect impact of rounding.

As shown in Table 87, using our unchanged currently approved per respondent burden estimate, the

decrease in number of respondents results in a total adjustment of – 55,054 hours (– 20,645 respondents × 2.67 hr/

respondent) at a cost of – \$5,090,231 (– 55,054 hr × \$92.46/hr).

TABLE 87: Adjusted Burden for Promoting Interoperability Performance Category Data Submission

	Burden Estimate
Total Annual Hours for Respondents in CY 2020 Final Rule (a)	198,083
Total Annual Hours for Respondents in CY 2021 Final Rule (b)	143,029
Difference (c) = (b)-(a)	-55,054
Total Annual Cost for Respondents in CY 2020 Final Rule (d)	\$18,314,723
Total Annual Cost for Respondents in CY 2021 Final Rule (e)	\$13,224,492
Difference (f) = (e)-(d)	-\$5,090,231

h. ICRs Regarding the Nomination of Promoting Interoperability (PI) Measures

This rule is not implementing any new or revised collection of information requirements or burden related to the nomination of Promoting Interoperability measures. The requirements and burden are currently approved by OMB under control number 0938–1314 (CMS–10621). Consequently, we are not making any changes under that control number.

i. ICRs Regarding Improvement Activities Submission (§§ 414.1305, 414.1355, 414.1360, and 414.1365)

We are adjusting our currently approved burden estimates based on more recent data. The adjusted burden will be submitted to OMB for approval under control number 0938–1314 (CMS–10621).

We refer readers to the CY 2017 Quality Payment Program final rule (81 FR 77511 through 77512), CY 2018 Quality Payment Program final rule (82 FR 53920 through 53922), CY 2019 PFS final rule (83 FR 60015 through 60017),

and the CY 2020 PFS final rule (84 FR 63138 through 63140) for our previously finalized requirements and burden for submission of data for the Improvement Activities performance category.

In this final rule, we did not make any changes to our requirements associated with criteria for attesting to specific improvement activities.

As discussed in section IV.A.3.c.(3)(b)(iii) of this rule, we are finalizing the removal of one obsolete improvement activity, modification of two existing improvement activities, and adoption of the COVID–19 improvement activity added via IFC. We refer readers to Appendix 2 of this final rule for further details. Because MIPS eligible clinicians are still required to submit the same number of activities and the per response time for each activity is uniform, we do not expect these provisions to affect our currently approved information collection burden estimates.

In section IV.A.3.b.(3)(c) of this rule, we outline how we would assign a score for the Improvement Activities performance category for MIPS APMs.

We will assign Improvement Activities scores to APM participants in the APP based on the requirements of participation in APMs. To develop the Improvement Activities score for MIPS APMs, we will compare requirements of the APM with the list of Improvement Activities measures for the applicable year, and score those measures as they would otherwise be scored according to § 414.1355. In the event a MIPS APM participant does not actually perform an activity for which Improvement Activities credit would otherwise be assigned under this provision, the MIPS APM participant would not receive credit for the associated Improvement Activity. In the event that the assigned score does not represent the maximum improvement activities score, we specify that MIPS eligible clinicians reporting through the APP would have the opportunity to report additional improvement activities that then would be applied towards their scores. Our burden estimates assume there will be no improvement activities burden for MIPS APM participants electing the APP. We will assign the improvement

activities performance category score at the APM Entity level.

A variety of organizations and in some cases, individual clinicians, will submit improvement activity performance category data. For clinicians who are not part of APMs, we assume that clinicians submitting quality data as part of a group through direct, log in and upload submission types, and CMS Web Interface will also submit improvement activities data. In the 2020 and prior MIPS performance periods, individuals and groups submitting data for the quality performance category through a MIPS CQM or QCDR that did not also support reporting of data for the Promoting Interoperability or improvement activity performance categories would be required to submit data for these performance categories using an alternate submission type, the policies requiring qualified registries and QCDRs to be able to submit data for all three of the MIPS performance categories

identified in § 414.1400(a)(2) will help to alleviate this issue. As finalized in the CY 2017 Quality Payment Program final rule (81 FR 77264), APM Entities only need to report improvement activities data if the CMS-assigned improvement activities score is below the maximum improvement activities score. Similar to our assumption in the CY 2018 Quality Payment Program final rule, our burden estimates assume that the MIPS APM models for the 2021 MIPS performance period will qualify for the maximum improvement activities performance category score and, as such, APM Entities will not submit any additional improvement activities. (82 FR 53921 through 53922).

As represented in Table 88, based on 2019 MIPS performance period data, we estimate that a total of 79,927 respondents consisting of 62,603 individual clinicians and 17,324 groups will submit improvement activities during the 2021 MIPS performance period. Since our currently approved

burden sets out 103,813 respondents, this represents a decrease of –23,886 respondents (79,927 respondents—103,813 active respondents). This is a decrease of 23,157 individuals and an increase of 610 groups from the estimates of 85,760 individuals and 16,714 groups provided in the CY 2021 PFS proposed rule due to availability of updated data (85 FR 50362).

As discussed in sections VII.B.5.e.(2) and VII.B.5.g.(3) of this final rule regarding our estimate of clinicians and groups submitting data for the quality and Promoting Interoperability performance categories, we have updated our estimates for the number of clinicians and groups that will submit improvement activities data based on projections of the number of eligible clinicians that were not QPs or members of an ACO in the 2019 MIPS performance period but will be in the 2021 MIPS performance period, and will therefore not be required to submit improvement activities data.

TABLE 88: Estimated Number of Organizations Submitting Improvement Activities Performance Category Data on Behalf of Clinicians

	Count
# of clinicians to participate in improvement activities data submission as individuals during the 2021 MIPS performance period (a)	62,603
# of Groups to submit improvement activities on behalf of clinicians during the 2021 MIPS performance period (b)	17,324
Total # of Respondents (Groups, Virtual Groups, and Individual Clinicians) to submit improvement activities data on behalf of clinicians during the 2020 MIPS performance period (CY 2021 Final Rule) (c) = (a) + (b)	79,927
*Total # of Respondents (Groups, Virtual Groups, and Individual Clinicians) to submit improvement activities data on behalf of clinicians during the 2019 MIPS performance period (CY 2020 Final Rule) (d)	103,813
Difference (e)=(c)-(d)	-23,886

*Currently approved by OMB under control number 0938-1314 (CMS-10621).

Consistent with the CY 2020 PFS final rule, we continue to estimate that the per response time required per individual or group is 5 minutes for a computer system analyst to submit by

logging in and manually attesting that certain activities were performed in the form and manner specified by CMS with a set of authenticated credentials (84 FR 63140).

As shown in Table 89, we estimate an annual burden of 6,661 hours (79,927 responses × 5 minutes/60) and \$615,838 (6,661 hr × \$92.46/hr)).

TABLE 89: Estimated Burden for Improvement Activities Submission

Burden Estimate	
Total # of Respondents (Groups, Virtual Groups, and Individual Clinicians) to submit improvement activities data on behalf of clinicians during the 2019 MIPS performance period (a)	79,927
Total Annual Hours Per Respondent (b)	5 minutes
Total Annual Hours (c) = (a)*(b)	6,661
Labor rate for a computer systems analyst to submit improvement activities (d)	\$92.46/hr
Total Annual Cost (e) = (c)*(d)	\$615,838

*Due to burden being estimated in fractions of hours, totals may reflect impact of rounding.

As shown in Table 90, using our unchanged currently approved per respondent burden estimate, the

decrease of – 23,886 in the number of respondents results in an adjustment of – 1,990 hours (– 23,886 responses × 5

minutes/60) at a cost of –\$184,041 (– 1,990 hr × \$92.46/hr).

TABLE 90: Adjusted Burden for Improvement Activities Submission

Burden Estimate	
Total Annual Hours for Respondents in CY 2020 Final Rule (a)	8,651
Total Annual Hours for Respondents in CY 2021 Final Rule (b)	6,661
Difference (c) = (b)-(a)	-1,990
Total Annual Cost for Respondents in CY 2020 Final Rule (d)	\$799,879
Total Annual Cost for Respondents in CY 2021 Final Rule (e)	\$615,838
Difference (f) = (e)-(d)	-\$184,041

j. ICRs Regarding the Nomination of Improvement Activities (§ 414.1360)

The requirements and burden associated with this rule's data submission will be submitted to OMB for approval under control number 0938–1314 (CMS–10621).

We refer readers to the CY 2018 Quality Payment Program final rule (82 FR 53922), CY 2019 PFS final rule (83 FR 60017 through 60018), and the CY 2020 PFS final rule (84 FR 63141) for our previously finalized requirements and information collection burden for the nomination of improvement activities.

In the CY 2018 Quality Payment Program final rule, for the 2018 and future MIPS performance periods, stakeholders were provided an opportunity to propose new activities formally via the Annual Call for Activities nomination form that was posted on the CMS website (82 FR 53657). In section IV.A.3.c.(3)(b)(i)(B)(bb) of this rule, we are requiring nominated improvement activities to be linked to existing and related quality and cost measures, as applicable and feasible. Similar to the burden assumptions finalized in the CY

2020 PFS final rule for the nomination of quality measures, we believe this will require approximately 0.6 hours at \$110.74/hr for a medical and health services manager and 0.4 hours at \$212.78/hr for a physician to research existing measures and provide a rationale for the linkage (84 FR 63132). We previously estimated it would require 1.2 hours for a medical and health services manager or equivalent and 0.8 hours for a physician to nominate an improvement activity (84 FR 63141). Combined with our currently approved burden estimate, we now estimate 1.8 hours at \$110.74/hr for a medical and health services manager or equivalent and 1.2 hours at \$212.78/hr for a physician to nominate an improvement activity. This represents a change of +0.6 hours (1.8 hr—1.2 hr) for a medical and health services manager or equivalent and +0.4 hours (1.2 hr—0.8 hr) for a physician and an overall increase of 1 hour.

In section IV.A.3.c.(3)(b)(i)(A)(bb), we are making an exception to the established timeframe for nomination of improvement activities, such that during a PHE, stakeholders can nominate improvement activities

outside of the established Annual Call for Activities timeframe. Instead of only accepting nominations and modifications submitted February 1st through June 30th each year, we would accept nominations for the duration of the PHE as long as the improvement activity is still relevant. No other aspects of the Annual Call for Activities process would be affected (for example, criteria for nominating improvement activities, considerations for selection of improvement activities, or weighting policies would all still apply). While we expect additional nominations may be received as a result of this change, we do not have any data with which to estimate what the additional number may be. As a result, our burden estimate remains unchanged due to this provision. Additionally, in section IV.A.3.c.(3)(b)(ii)(B), beginning with the CY 2021 performance period and future years, we will consider agency-nominated improvement activities. Because these nominations would be submitted by federal agencies, the associated time is exempt from the PRA, and therefore, not included in our estimates. We also refer readers to

section VIII.H.15.e.(4)(c) where we discuss our impact analysis.

Due to the PHE for COVID-19, we continue to use our currently approved assumption that we will receive 31 nominations of new or modified activities which will be evaluated for the Improvement Activities Under

Consideration (IAUC) list for possible inclusion in the CY 2022 Improvement Activities Inventory as we believe this estimate is more realistic than basing our estimate on the number of nominations received during the 2020 Annual Call for Activities.

As shown in Table 91, we estimate an annual information collection burden of 93 hours (31 nominations \times 3 hr/nomination) at a cost of \$14,095 (31 \times [(1.8 hr \times \$110.74/hr) + (1.2 hr \times \$212.78/hr)]).

TABLE 91: Estimated Burden for Nomination of Improvement Activities

	Burden Estimate
# of Nominations of New Improvement Activities (a)	31
# of Hours Per Medical and Health Services Manager to Identify and Nominate Activity (b)	1.8
# of Hours Per Physician to Identify Activity (c)	1.2
Annual Hours Per Respondent (d)=(b) + (c)	3.0
Total Annual Hours (e) = (a)*(d)	93
Cost to Identify and Submit Activity (@ medical and health services manager's labor rate of \$110.74/hr) (f)	\$199.33
Cost to Identify Improvement Activity (@ physician's labor rate of \$212.78/hr) (g)	\$255.34
Total Annual Cost Per Respondent (h)=(f)+(g)	\$454.67
Total Annual Cost (i)=(a)*(h)	\$14,095

As shown in Table 92, using our unchanged estimate of the number of activities nominated, the increase in the

burden per nomination results in a change of 31 hours (31 nominations \times 1 hr/nomination) at a cost of \$4,698 (31

activities \times [(0.6 hr \times \$110.74/hr) + (0.4 hr \times \$212.78/hr)]).

TABLE 92: Change in Estimated Burden for Nomination of Improvement Activities

	Burden Estimate
Total Annual Hours for Respondents in CY 2020 Final Rule (a)	62
Total Annual Hours for Respondents in CY 2021 Final Rule (b)	93
Difference (c) = (b)-(a)	+31
Total Annual Cost for Respondents in CY 2020 Final Rule (d)	\$9,396
Total Annual Cost for Respondents in CY 2021 Final Rule (e)	\$14,095
Difference (f) = (e)-(d)	+\$4,698

k. Nomination of MVPs

The following reflects the burden associated with the first year of data collection associated with a new process available for all clinicians/third party intermediaries to nominate MVPs for inclusion in the Quality Payment Program. The requirements and burden associated with the Nomination of MVPs will be submitted to OMB for approval under control number 0938-1314 (CMS-10621).

Beginning with the 2022 performance period, we are requiring stakeholders to formally submit their MVP candidates utilizing a standardized template, which will be published in the QPP resource library for future implementation. Stakeholders should submit all

information including a description of how their MVP abides by the MVP development criteria as described in section IV.A.3.a.(2)(a)(i) of this final rule, and provide rationales as to why specific measures and activities were chosen to construct the MVP. As MVP candidates are received, they will be reviewed, vetted, and evaluated by CMS and our contractors to determine if the MVP is feasible and ready for inclusion in the upcoming performance period. For the 2021 MIPS performance period, we assume 25 MVP nominations will be received and the estimated time required to submit all required information is 12 hours per nomination. We solicited comment on our estimate of the time required to nominate an MVP. We did not receive comments

related to the estimate of time required to nominate an MVP.

Similar to the call for quality measures, nomination of Promoting Interoperability measures, and the nomination of improvement activities, we assume MVP nomination will be performed by both practice administration staff or their equivalents and clinicians. We estimate 7.2 hours at \$110.74/hr for a medical and health services manager or equivalent and 4.8 hours at \$212.78/hr for a physician to nominate an MVP. As shown in Table 93, we estimate an annual burden of 300 hours (25 nominations \times 12 hr/nomination) at a cost of \$45,467 (25 \times [(7.2 hr \times \$110.74/hr) + (4.8 hr \times \$212.78/hr)]).

TABLE 93: Estimated Burden for Nomination of MVPs

	Burden Estimate
# of Nominations of New Improvement Activities (a)	25
# of Hours Per Medical and Health Services Manager (b)	7.2
# of Hours Per Physician (c)	4.8
Annual Hours Per Respondent (d)=(b) + (c)	12
Total Annual Hours (e) = (a)*(d)	300
Cost to Nominate an MVP (@ medical and health services manager's labor rate of \$110.74/hr) (f)	\$797.33
Cost to Nominate an MVP (@ physician's labor rate of \$212.78/hr) (g)	\$1,021.34
Total Annual Cost Per Respondent (h)=(f)+(g)	\$1,818.67
Total Annual Cost (i)=(a)*(h)	\$45,467

l. ICRs Regarding the Cost Performance Category (§ 414.1350)

The cost performance category relies on administrative claims data. The Medicare Parts A and B claims submission process (OMB control number 0938–1197; CMS–1500 and CMS–1490S) is used to collect data on cost measures from MIPS eligible clinicians. MIPS eligible clinicians are not required to provide any documentation by CD or hardcopy. Moreover, the provisions of this final rule do not result in the need to add or revise or delete any claims data fields. Consequently, we are not setting out burden or making any changes under the 0938–1197 control number.

m. ICRs Regarding Partial QP Elections (§§ 414.1310(b) and 414.1430)

This rule did not propose any new or revised collection of information requirements related to the Partial QP Elections to participate in MIPS as a MIPS eligible clinician. However, we are adjusting our currently approved burden estimates based on updated projections for the 2021 MIPS performance period. The burden will be submitted to OMB for approval under control number 0938–1314 (CMS–10621).

As shown in Table 94, based on our predictive QP analysis for the 2021 QP performance period, which accounts for historical response rates in performance

year 2019, we estimate that 100 APM Entities and 200 eligible clinicians (representing approximately 2,500 Partial QPs) will make the election to participate as a Partial QP in MIPS, a total of 300 elections which is a decrease of 1,722 from the 2,022 elections that are currently approved by OMB under the aforementioned control number. We continue to estimate it will take the APM Entity representative or eligible clinician 15 minutes (0.25 hr) to make this election. In aggregate, we estimate an annual burden of 75 hours (300 respondents × 0.25 hr/election) and \$6,935 (75 hr × \$92.46/hr).

TABLE 94: Estimated Burden for Partial QP Election

	Burden Estimate
# of respondents making Partial QP election (100 APM Entities, 200 eligible clinicians) (a)	300
Total Hours Per Respondent to Elect to Participate as Partial QP (b)	0.25
Total Annual Hours (c) = (a)*(b)	75
Labor rate for computer systems analyst (d)	\$92.46/hr
Total Annual Cost (e) = (c)*(d)	\$6,935

As shown in Table 95, using our unchanged currently approved per respondent burden estimate, the

decrease in the number of Partial QP elections results in an adjustment of – 430.5 hours (– 1,722 elections × 0.25

hr) from our currently approved burden of 505.5 hours at a cost of – \$39,804 (– 430.5 hr × \$92.46/hr) (84 FR 63142).

TABLE 95: Adjusted Burden for Partial QP Election

	Burden Estimate
Total Annual Hours for Respondents in CY 2020 Final Rule (a)	505.5
Total Annual Hours for Respondents in CY 2021 Final Rule (b)	75
Difference (c) = (b)-(a)	-430.5
Total Annual Cost for Respondents in CY 2020 Final Rule (d)	\$46,739
Total Annual Cost for Respondents in CY 2021 Final Rule (e)	\$6,935
Difference (f) = (e)-(d)	-\$39,804

n. ICRs Regarding Other Payer Advanced APM Determinations: Payer-Initiated Process (§ 414.1445) and Eligible Clinician Initiated Process (§ 414.1445)

The following burden will be submitted to OMB for approval under control number 0938-1314 (CMS-10621).

(1) Payer Initiated Process (§ 414.1445)

This rule is not implementing any new or revised collection of information

requirements related to the Payer-Initiated Process. However, we are adjusting our currently approved burden estimates based on updated projections for the 2021 MIPS performance period. As mentioned above, the adjusted burden will be submitted to OMB for approval.

As shown in Table 96, based on the actual number of requests received in the 2019 QP performance period, we estimate that in CY 2021 for the 2022 QP performance period 80 payer-initiated requests for Other Payer

Advanced APM determinations will be submitted (10 Medicaid payers, 50 Medicare Advantage Organizations, and 20 remaining other payers), a decrease of 30 from the 110 total requests currently approved by OMB under the aforementioned control number. We continue to estimate it will take 10 hours for a computer system analyst per arrangement submission. We estimate an annual burden of 800 hours (80 submissions × 10 hr/submission) and \$73,968 (800 hr × \$92.46/hr).

TABLE 96: Estimated Burden for Other Payer Advanced APM Identification Determinations: Payer-Initiated Process

	Burden Estimate
# of other payer payment arrangements (10 Medicaid, 50 Medicare Advantage Organizations, 20 remaining other payers) (a)	80
Total Annual Hours Per other payer payment arrangement (b)	10
Total Annual Hours (c) = (a)*(b)	800
Labor rate for a computer systems analyst (d)	\$92.46/hr
Total Annual Cost (e) = (c)*(d)	\$73,968

As shown in Table 97, using our unchanged currently approved per respondent burden estimate, the decrease in the number of payer-

initiated requests from 110 to 80 results in an adjustment of -300 hours (-30 requests × 10 hr) from our currently approved burden of 1,100 hours at a

cost of -\$27,738 (-300 hr × \$92.46/hr) (84 FR 63143).

TABLE 97: Adjusted Burden for Other Payer Advanced APM Identification Determinations: Payer-Initiated Process

	Burden Estimate
Total Annual Hours for Respondents in CY 2020 Final Rule (a)	1,100
Total Annual Hours for Respondents in CY 2021 Final Rule (b)	800
Difference (c) = (b)-(a)	-300
Total Annual Cost for Respondents in CY 2020 Final Rule (d)	\$101,706
Total Annual Cost for Respondents in CY 2021 Final Rule (e)	\$73,968
Difference (f) = (e)-(d)	-\$27,738

(2) Eligible Clinician Initiated Process (§ 414.1445)

This rule is not implementing any new or revised collection of information requirements or burden related to the Eligible-Clinician Initiated Process. The requirements and burden are currently approved by OMB under control number 0938–1314 (CMS–10621). Consequently, we are not making any changes to the eligible clinician initiated process under that control number.

(3) Submission of Data for QP Determinations Under the All-Payer Combination Option (§ 414.1440)

This rule is not implementing any new or revised collection of information requirements related to the Submission of Data for QP Determinations under the All-Payer Combination Option. The requirements and burden are currently approved by OMB under control number 0938–1314 (CMS–10621). Consequently, we are not making any changes to the QP Determinations under the All-Payer Combination Option under that control number.

o. ICRs Regarding Voluntary Participants Election To Opt-Out of Performance Data Display on Physician Compare (§ 414.1395)

This rule is not implementing any new or revised collection of information requirements related to the election by voluntary participants to opt-out of public reporting on Physician Compare. However, we are adjusting our currently approved burden estimates based on data from the 2019 MIPS performance period. The burden will be submitted to OMB for approval under control number 0938–1314 (CMS–10621).

We refer readers to the CY 2018 Quality Payment Program final rule (82 FR 53924 through 53925), CY 2019 PFS final rule (83 FR 60022), and the CY 2020 PFS final rule (84 FR 63145 through 63146) for our previously finalized requirements and burden for voluntary participants to opt-out of public reporting on Physician Compare.

We estimate that 10 percent of the total clinicians and groups who will voluntarily participate in MIPS will also elect not to participate in public reporting. This results in a total of 3,486

($0.10 \times 34,860$ voluntary MIPS participants) clinicians and groups, a decrease of –6,556 from the currently approved estimate of 10,042 and a decrease of 6,418 from the estimate of 9,904 provided in the CY 2021 PFS proposed rule due to availability of updated data (85 FR 50367). Voluntary MIPS participants are clinicians that are not QPs and are expected to be excluded from MIPS after applying the eligibility requirements set out in the CY 2019 PFS final rule but have elected to submit data to MIPS. As discussed in the RIA section of the CY 2019 PFS final rule, we estimate that 33 percent of clinicians that exceed one (1) of the low-volume criteria, but not all three (3), will elect to opt-in to MIPS, become MIPS eligible, and no longer be considered a voluntary reporter (83 FR 60050).

Table 98 shows that for these voluntary participants, we continue to estimate it will take 0.25 hours for a computer system analyst to submit a request to opt-out. In aggregate, we estimate an annual burden of 871.5 hours ($3,486 \text{ requests} \times 0.25 \text{ hr/request}$) and \$80,579 ($871.5 \text{ hr} \times \$92.46/\text{hr}$).

TABLE 98: Estimated Burden for Voluntary Participants to Elect Opt Out of Performance Data Display on Physician Compare

	Burden Estimate
# of Voluntary Participants Opting Out of Physician Compare (a)	3,486
Total Annual Hours Per Opt-out Requester (b)	0.25
Total Annual Hours (c) = (a)*(b)	871.5
Labor rate for a computer systems analyst (d)	\$92.46/hr
Total Annual Cost (e) = (a)*(d)	\$80,579

As shown in Table 99, using our unchanged currently approved per respondent burden estimate, the

decrease of –6,556 opt outs by voluntary participants results in an adjustment of –1,639 hours (–6,556

requests \times 0.25 hr) at a cost of –\$151,542 (–1,639 hr \times \$92.46/hr).

TABLE 99: Adjusted Burden for Voluntary Participants to Elect Opt Out of Performance Data Display on Physician Compare

	Burden Estimate
Total Annual Hours for Respondents in CY 2020 Final Rule (a)	2,510.5
Total Annual Hours for Respondents in CY 2021 Final Rule (b)	871.5
Difference (c) = (b)-(a)	-1,639
Total Annual Cost for Respondents in CY 2020 Final Rule (d)	\$232,121
Total Annual Cost for Respondents in CY 2021 Final Rule (e)	\$80,579
Difference (f) = (e)-(d)	-\$151,542

p. Summary of Annual Quality Payment Program Burden Estimates

Table 100 summarizes this final rule's burden estimates for the Quality Payment Program for both the 2021 and 2022 performance periods. In the CY 2020 PFS final rule, the total estimated burden was 2,932,649 hours at a cost of \$279,550,490 (\$279,573,747—\$23,257) (84 FR 63146). Accounting for updated wage rates and the subset of all Quality Payment Program ICRs discussed in this rule compared to the CY 2020 PFS final rule, the total estimated annual burden of continuing policies and information set forth in the CY 2020 PFS final rule into the 2021 and 2022 MIPS performance periods is 2,938,128 hours at a cost of \$287,216,853; an increase of 5,479 hours and \$7,666,363. To understand the burden implications of the policies in this rule, we provide an estimate of the total burden associated with continuing the policies and information collections set forth in the CY 2020 PFS final rule into the 2021 and 2022 MIPS performance periods.

This burden estimate of 1,478,504 hours at a cost of \$144,456,084 reflects the availability of more accurate data to account for all potential respondents and submissions across all the performance categories and more accurately reflect the exclusion of QPs from all MIPS performance categories, a difference of –1,459,624 hours and –\$142,760,769. This burden estimate is lower than the burden approved for information collection related to the CY 2020 PFS final rule due to updated data and assumptions as well as the addition of the Open Authorization Credentialing and Token Request Process information collection, which is not a result of any new or revised policies in this rule or finalized in any previous final rule, but rather an operational improvement. The difference of –4,763 hours (1,459,624 hours – 1,462,534 hours – 1,854 hours) and –\$421,117 (\$142,760,769 – \$143,134,204 – \$47,681) between this estimate and the total burden shown in Table 103 is the reduction in burden associated with impacts of the policy to sunset the CMS

Web Interface measures as a collection type/submission type; partially offset by an increase in burden due to a new information collection for nomination of MVPs, the policies to require QCDRs and qualified registries to conduct targeted audits as necessary, the policy to add a survey-based measure on telehealth that assesses patient-reported usage of telehealth services to the CAHPS for MIPS Survey, the policy to allow APM Entities to submit an extreme and uncontrollable circumstances exception application, and the policy to require nominated improvement activities to be linked to existing and related quality and cost measures, as applicable and feasible. We have included Table 100 to assist in understanding these differences. Note that the difference between the burden estimates for the 2021 and 2022 MIPS performance periods is entirely due to the finalized policy to sunset the CMS Web Interface measures as a collection type/submission type beginning in the 2022 MIPS performance period.

*Total Responses is equal to the number of self-nomination applications plus the number of Corrective Action Plans submitted.

Table 102 provides the reasons for changes in the estimated burden for information collections in the Quality Payment Program segment of this final

rule. We have divided the reasons for our change in burden into those related to new policies and those related to adjustments in burden from continued

Quality Payment Program Year 4 policies that reflect updated data and revised methods.

**TABLE 102: Reasons for Change in Burden Compared to the Currently Approved
CY 2020 Information Collection Burden**

Quality Payment Program Table	Changes in burden due to CY 2021 Final Rule policies	Adjustments in burden from continued CY 2020 Final Rule policies due to revised methods or updated data
Section VII.B.5.c.(2): QCDR Self-Nomination and other Requirements	Increase in burden due to policy requiring targeted audits, as necessary (+5 to +10 hours per audit).	Increase in number of respondents due to use of updated data from the 2020 MIPS performance period.
Section VII.B.5.c.(3): Qualified Registry Self-Nomination and other Requirements	Increase in number of responses (+10) and burden (+ 3 hrs per response) due to current policies not previously having a burden estimate as well as the provision to require additional information in Corrective Action Plans. Increase in burden due to policy requiring targeted audits, as necessary (+5 to +10 hours per audit).	Increase in number of respondents due to use of updated data from the 2020 MIPS performance period.
Section VII.B.5.d: Open Authorization Credentialing and Token Request Process	New information collection request.	Not applicable.
Section VII.B.5.e.(4): Quality Performance Category Medicare Part B Claims Collection Type	None.	Decrease in number of respondents due to use of updated data from the 2019 MIPS performance period and updated QP projections for the 2021 MIPS performance period.
Section VII.B.5.e.(5): Quality Performance Category QCDR/ MIPS CQM Collection Type	(2022 Performance Period) Increase in number of respondents (+7) due to the provision to sunset the CMS Web Interface measures as a collection type/submission type.	Decrease in number of respondents due to use of updated data from the 2019 MIPS performance period and updated QP projections for the 2021 MIPS performance period.
Section VII.B.5.e.(6): Quality Performance Category eCQM Collection Type	(2022 Performance Period) Increase in number of respondents due to the provision to sunset the CMS Web Interface measures as a collection type/submission type.	Increase in number of respondents due to use of updated data from the 2019 MIPS performance period and updated QP projections for the 2021 MIPS performance period.
Section VII.B.5.e.(7): Quality Performance Category CMS Web Interface Collection Type	(2022 Performance Period) Removal of information collection due to the provision to sunset the CMS Web Interface measures as a collection type/submission type.	(2021 Performance Period) Increase in number of respondents due to use of updated data from the 2019 MIPS performance period.
Section VII.B.5.e.(8): Beneficiary Responses to CAHPS for MIPS Survey	Increase in per response burden (+ 0.2 hrs) due to the provision to add a survey-based measure on telehealth.	Decrease in number of respondents due to updated data from 2019 MIPS performance period.
Section VII.B.5.e.(9): Registration for CMS Web Interface	(2022 Performance Period) Removal of information collection due to the provision to sunset the CMS Web Interface measures as a collection type/submission type.	(2021 Performance Period) Increase in number of respondents due to use of updated data from the 2020 MIPS performance period.
Section VII.B.5.g.(2): Reweighting Applications for Promoting Interoperability and Other Performance Categories	Increase in number of respondents due to the provision to allow APM Entities to submit an extreme and uncontrollable circumstances exception application.	Increase in number of applications submitted due to updated data from the 2019 MIPS performance period.

Quality Payment Program Table	Changes in burden due to CY 2021 Final Rule policies	Adjustments in burden from continued CY 2020 Final Rule policies due to revised methods or updated data
Section VII.B.5.g.(3): Promoting Interoperability Performance Category Data Submission	None.	Decrease in number of respondents due to use of updated data from the 2019 MIPS performance period and updated QP projections for the 2021 MIPS performance period.
Section VII.B.5.i: Improvement Activities Submission	None.	Decrease in number of respondents due to use of updated data from the 2019 MIPS performance period.
Section VII.B.5.j: Nomination of Improvement Activities	Increase in per response burden (+1 hour) due to the provision to require nominated improvement activities to be linked to existing and related quality and cost measures, as applicable and feasible.	None.
Section VII.B.5.k: Nomination of MVPs	New information collection request.	Not applicable.
Section VII.B.5.m: Partial QP Election	None	Decrease in number of respondents due to updated projections for the 2021 MIPS performance period.
Section VII.B.5.n.(1): Other Payer Advanced APM Identification: Other Payer Initiated Process	None.	Decrease in number of respondents due to updated projections for the 2021 MIPS performance period.
Section VII.B.5.o: Voluntary Participants to Elect to Opt Out of Performance Data Display on Physician Compare	None.	Decrease in the number of respondents due to use of updated data from the 2019 MIPS performance period.

C. Summary of Annual Burden Estimates for Requirements

BILLING CODE 4120-01-C

VIII. Regulatory Impact Analysis

A. Statement of Need

This final rule would make payment and policy changes under the Medicare PFS and implements required statutory changes under the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA), the Achieving a Better Life Experience Act (ABLE), the Protecting Access to Medicare Act of 2014 (PAMA), section 603 of the Bipartisan Budget Act of 2015, the Consolidated Appropriations Act of 2016, the Bipartisan Budget Act of 2018, and sections 2005, 6063, and 6111 of the SUPPORT for Patients and Communities Act of 2018. This final rule would also make changes to payment policy and other related policies for Medicare Part B.

This final rule is necessary to make policy changes under Medicare fee-for-service. Therefore, we included a detailed Regulatory Impact Analysis (RIA) to assess all costs and benefits of available regulatory alternatives and explained the selection of these regulatory approaches that we believe adhere to statutory requirements and, to the extent feasible, maximize net benefits.

B. Overall Impact

We examined the impact of this rule as required by Executive Order 12866 on Regulatory Planning and Review (September 30, 1993), Executive Order 13563 on Improving Regulation and Regulatory Review (February 2, 2013), the Regulatory Flexibility Act (RFA) (September 19, 1980, Pub. L. 96-354), section 1102(b) of the Social Security Act, section 202 of the Unfunded Mandates Reform Act of 1995 (March 22, 1995; Pub. L. 104-4), Executive Order 13132 on Federalism (August 4, 1999), the Congressional Review Act (5 U.S.C. 804(2)), and Executive Order 13771 on Reducing Regulation and Controlling Regulatory Costs (January 30, 2017).

Executive Orders 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). An RIA must be prepared for major rules with economically significant effects (\$100 million or more in any 1 year). We estimated, as discussed in this section, that the PFS provisions included in this final rule would redistribute more than \$100

million in 1 year. Therefore, we estimate that this rulemaking is “economically significant” as measured by the \$100 million threshold, and hence also a major rule under the Congressional Review Act. Accordingly, we prepared an RIA that, to the best of our ability, presents the costs and benefits of the rulemaking. The RFA requires agencies to analyze options for regulatory relief of small entities. For purposes of the RFA, small entities include small businesses, nonprofit organizations, and small governmental jurisdictions. Most hospitals, practitioners and most other providers and suppliers are small entities, either by nonprofit status or by having annual revenues that qualify for small business status under the Small Business Administration standards. (For details, see the SBA’s website at <http://www.sba.gov/content/table-small-business-size-standards> (refer to the 620000 series)). Individuals and states are not included in the definition of a small entity.

The RFA requires that we analyze regulatory options for small businesses and other entities. We prepare a regulatory flexibility analysis unless we certify that a rule would not have a significant economic impact on a substantial number of small entities. The analysis must include a justification concerning the reason action is being taken, the kinds and number of small entities the rule affects, and an explanation of any meaningful options that achieve the objectives with less significant adverse economic impact on the small entities.

Approximately 95 percent of practitioners, other providers, and suppliers are considered to be small entities, based upon the SBA standards. There are over 1 million physicians, other practitioners, and medical suppliers that receive Medicare payment under the PFS. Because many of the affected entities are small entities, the analysis and discussion provided in this section, as well as elsewhere in this final rule is intended to comply with the RFA requirements regarding significant impact on a substantial number of small entities.

In addition, section 1102(b) of the Act requires us to prepare an RIA if a rule may have a significant impact on the operations of a substantial number of small rural hospitals. This analysis must conform to the provisions of section 604 of the RFA. For purposes of section 1102(b) of the Act, we define a small rural hospital as a hospital that is located outside of a Metropolitan Statistical Area for Medicare payment regulations and has fewer than 100 beds. The PFS does not reimburse for

services provided by rural hospitals; the PFS pays for physicians’ services, which can be furnished by physicians and NPPs in a variety of settings, including rural hospitals. We did not prepare an analysis for section 1102(b) of the Act because we determined, and the Secretary certified, that this final rule will not have a significant impact on the operations of a substantial number of small rural hospitals.

Section 202 of the Unfunded Mandates Reform Act of 1995 also requires that agencies assess anticipated costs and benefits on state, local, or tribal governments or on the private sector before issuing any rule whose mandates require spending in any 1 year of \$100 million in 1995 dollars, updated annually for inflation. In 2020, that threshold is approximately \$156 million. This final rule will impose no mandates on state, local, or tribal governments or on the private sector.

Executive Order 13132 establishes certain requirements that an agency must meet when it issues a proposed rule (and subsequent final rule) that imposes substantial direct requirement costs on state and local governments, preempts state law, or otherwise has Federalism implications. Since this final rule does not impose any costs on state or local governments, the requirements of Executive Order 13132 are not applicable.

Executive Order 13771, entitled “Reducing Regulation and Controlling Regulatory Costs,” was issued on January 30, 2017. This final rule is expected to be an E.O. 13771 regulatory action. We estimate the rule generates \$1.23 million in annualized costs in 2016 dollars, discounted at 7 percent relative to year 2016 over a perpetual time horizon. Details on the estimated costs of this rule can be found in the preceding and subsequent analyses.

We prepared the following analysis, which together with the information provided in the rest of this preamble, meets all assessment requirements. The analysis explains the rationale for and purposes of this final rule; details the costs and benefits of the rule; analyzes alternatives; and presents the measures we would use to minimize the burden on small entities. As indicated elsewhere in this final rule, we discussed a variety of changes to our regulations, payments, or payment policies to ensure that our payment systems reflect changes in medical practice and the relative value of services, and implementing statutory provisions. We provide information for each of the policy changes in the relevant sections of this final rule. We are unaware of any relevant federal

rules that duplicate, overlap, or conflict with this final rule. The relevant sections of this final rule contain a description of significant alternatives if applicable.

C. Changes in Relative Value Unit (RVU) Impacts

1. Resource-Based Work, PE, and MP RVUs

Section 1848(c)(2)(B)(ii)(II) of the Act requires that increases or decreases in RVUs may not cause the amount of expenditures for the year to differ by more than \$20 million from what expenditures would have been in the absence of these changes. If this threshold is exceeded, we make adjustments to preserve budget neutrality.

Our estimates of changes in Medicare expenditures for PFS services compared payment rates for CY 2020 with

payment rates for CY 2021 using CY 2019 Medicare utilization. The payment impacts in this final rule reflect averages by specialty based on Medicare utilization. The payment impact for an individual practitioner could vary from the average and would depend on the mix of services he or she furnishes. The average percentage change in total revenues will be less than the impact displayed here because practitioners and other entities generally furnish services to both Medicare and non-Medicare patients. In addition, practitioners and other entities may receive substantial Medicare revenues for services under other Medicare payment systems. For instance, independent laboratories receive approximately 83 percent of their Medicare revenues from clinical laboratory services that are paid under the Clinical Laboratory Fee Schedule (CLFS).

The PFS update adjustment factor for CY 2021, as required by section 1848(d)(19) of the Act, is 0.00 percent before applying other adjustments.

To calculate the CY 2021 PFS conversion factor (CF), we multiplied the product of the current year CF and the update adjustment factor by the budget neutrality adjustment described in the preceding paragraphs. We estimate the CY 2021 PFS CF to be 32.4085 which reflects the budget neutrality adjustment under section 1848(c)(2)(B)(ii)(II) of the Act and the 0.00 percent update adjustment factor specified under section 1848(d)(19) of the Act. We estimate the CY 2021 anesthesia CF to be 20.0547 which reflects the same overall PFS adjustments with the addition of anesthesia-specific PE and MP adjustments.

TABLE 104: Calculation of the CY 2021 PFS Conversion Factor

CY 2020 Conversion Factor		36.0896
Statutory Update Factor	0.00 percent (1.0000)	
CY 2021 RVU Budget Neutrality Adjustment	-10.20 percent (0.8980)	
CY 2021 Conversion Factor		32.4085

TABLE 105: Calculation of the CY 2021 Anesthesia Conversion Factor

CY 2020 National Average Anesthesia Conversion Factor		22.2016
Statutory Update Factor	0.00 percent (1.0000)	
CY 2021 RVU Budget Neutrality Adjustment	-10.20 percent (0.8980)	
CY 2021 Anesthesia Fee Schedule Practice Expense and Malpractice Adjustment	0.59 percent (1.0059)	
CY 2021 Conversion Factor		20.0547

Table 106 shows the payment impact on PFS services of the policies contained final rule. To the extent that there are year-to-year changes in the volume and mix of services provided by practitioners, the actual impact on total Medicare revenues will be different from those shown in Table 106 (CY 2021 PFS Estimated Impact on Total Allowed Charges by Specialty). The following is an explanation of the information represented in Table 106.

- *Column A (Specialty)*: Identifies the specialty for which data are shown.
- *Column B (Allowed Charges)*: The aggregate estimated PFS allowed charges for the specialty based on CY 2019 utilization and CY 2020 rates. That

is, allowed charges are the PFS amounts for covered services and include coinsurance and deductibles (which are the financial responsibility of the beneficiary). These amounts have been summed across all services furnished by physicians, practitioners, and suppliers within a specialty to arrive at the total allowed charges for the specialty.

- *Column C (Impact of Work RVU Changes)*: This column shows the estimated CY 2021 impact on total allowed charges of the changes in the work RVUs, including the impact of changes due to potentially misvalued codes.
- *Column D (Impact of PE RVU Changes)*: This column shows the

estimated CY 2021 impact on total allowed charges of the changes in the PE RVUs.

- *Column E (Impact of MP RVU Changes)*: This column shows the estimated CY 2021 impact on total allowed charges of the changes in the MP RVUs.
- *Column F (Combined Impact)*: This column shows the estimated CY 2021 combined impact on total allowed charges of all the changes in the previous columns. Column F may not equal the sum of columns C, D, and E due to rounding.

BILLING CODE 4120-01-C

2. CY 2021 PFS Impact Discussion

a. Changes in RVUs

The most widespread specialty impacts of the RVU changes are generally related to the changes to RVUs for specific services resulting from the misvalued code initiative, including RVUs for new and revised codes. The estimated impacts for some specialties, including endocrinology, rheumatology, family practice, and hematology/oncology reflect increases relative to other physician specialties. These increases can largely be attributed to previously finalized policies for increases in valuation for office/outpatient E/M visits which constitute nearly 20 percent of total spending under the PFS. These increases are also due to increases in value for particular services following the recommendations from the American Medical Association (AMA)'s Relative Value Scale Update Committee (RUC) and CMS review, increased payments as a result of finalized updates to supply and equipment pricing, and the continuing implementation of the adjustment to indirect PE allocation for some office-based services. For nephrologists, the increase in the valuations of the ESRD monthly capitation payments that have office/outpatient E/M visits explicitly included in their valuations result in estimated impacts of +6 percent. For clinical social workers and clinical psychologists, to the increase in the valuations for certain behavioral health services that are analogous to office/outpatient E/M visits result in estimated impacts of 0 to 1 percent.

The estimated impacts for several specialties, including radiology, nurse anesthetists, pathology, and cardiac surgery reflect decreases in payments relative to payment to other physician specialties which are largely the result of the redistributive effects of previously finalized changes to the office/

outpatient E/M visits taking effect in 2021. These decreases are also due to the revaluation of individual procedures reviewed by the AMA's RUC and CMS, as well as decreased payments as a result of continuing implementation of the previously finalized updates to supply and equipment pricing. The estimated impacts also reflect decreased payments due to continued implementation of previously finalized code-level reductions that are being phased in over several years. For the physical/occupational therapy specialty, estimated impacts of -9 percent reflect increased valuations for therapy evaluation services that are analogous to office/outpatient E/M visits. However, therapy evaluation services do not account for a large portion of allowed charges for these specialties.

For emergency medicine practitioners, estimated impacts of -6 percent reflect a 2 percent gain as a result of increased valuations to emergency department visits using specialty society recommendations to maintain relativity with office/outpatient E/M visits. However, the magnitude of the office/outpatient E/M visit valuations are dampening the effect of increased valuations for the emergency department (ED) visits. For independent laboratories, it is important to note that these entities receive approximately 83 percent of their Medicare revenues from services that are paid under the CLFS. As a result, the estimated 5 percent decrease for CY 2021 is only applicable to approximately 17 percent of the Medicare payment to these entities.

We often receive comments regarding the changes in RVUs displayed on the specialty impact table (Table 106), including comments received in response to the rates. We remind stakeholders that although the estimated impacts are displayed at the specialty level, typically the changes are driven by the valuation of a relatively small

number of new and/or potentially misvalued codes. The percentages in Table 106 are based upon aggregate estimated PFS allowed charges summed across all services furnished by physicians, practitioners, and suppliers within a specialty to arrive at the total allowed charges for the specialty, and compared to the same summed total from the previous calendar year. Therefore, they are averages, and may not necessarily be representative of what is happening to the particular services furnished by a single practitioner within any given specialty.

b. Impact

Column F of Table 106 displays the estimated CY 2021 impact on total allowed charges, by specialty, of all the RVU changes. A table showing the estimated impact of all of the changes on total payments for selected high volume procedures is available under "downloads" on the CY 2021 PFS final rule website at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/>. We selected these procedures for sake of illustration from among the procedures most commonly furnished by a broad spectrum of specialties. The change in both facility rates and the nonfacility rates are shown. For an explanation of facility and nonfacility PE, we refer readers to Addendum A on the CMS website at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/>.

We received public comments about the impacts of this provision. The following is a summary of the comments we received and our response.

Comment: In general, commenters from physician specialties who saw projected increases related to our previously finalized revaluation of the office/outpatient E/M code set, our implementation of HCPCS code G2211, and our revaluations of services analogous to office/outpatient E/Ms

were supportive, while those commenters from physician specialties who projected decreases objected. Many commenters expressed concern with the budget neutrality adjustments associated with implementing our previously finalized revaluation of the office/outpatient E/M codes, particularly for those specialties who do not bill for office/outpatient E/M visits.

Response: While we understand the concerns articulated by commenters, our approach to making the required budget neutrality adjustment to account for changes in expenditures resulting from changes to RVUs, including those for the office/outpatient E/M code set and other similar services, is consistent with the approach we have applied to achieve budget neutrality in the past in accordance with the requirements of the statute. The statutory waiver authorities available to the Secretary following a public health emergency declaration, which are largely established in section 1135 of the Act, do not include waiver authority that would allow for implementation of changes to the PFS outside of the budget neutrality requirements in statute. The changes we make to RVUs are directed at setting appropriate resource-based relative values in accordance with section 1848 of the Act, and any increases or decreases in estimated payments associated with our finalized policies are purely a result of our longstanding budget neutrality process.

Comment: Several commenters suggested that the Secretary use waiver authority in response to the PHE for COVID-19 to implement the revaluations to the office/outpatient E/M visits, analogous services, and HCPCS code G2211 without application of the budget neutrality adjustment. Several other commenters requested that CMS exempt specialties that do not predominantly bill for office/outpatient E/M services from the budget neutrality adjustment.

Response: While we understand the concerns articulated by the commenters, we reiterate that section 1848(c)(2)(B)(ii)(II) of the Act requires that increases or decreases in RVUs may not cause the amount of expenditures for the year to differ by more than \$20 million from what expenditures would have been in the absence of these changes. If this threshold is exceeded, we make adjustments to preserve budget neutrality. The Secretary's waiver authority pursuant to the public health emergency declaration for COVID-19 does not extend to authorize changes to the PFS outside of budget neutrality. Additionally, section 1848 of the Act does not grant the Secretary the

authority to exempt categories of physicians or practitioners from the budget neutrality adjustments.

Comment: Some commenters requested that CMS provide additional analysis on the potential impact of our finalized policies on small businesses.

Response: We appreciate the interest from commenters and the request that we provide additional analysis on the potential impact of our finalized policies on small businesses. Our discussion of the potential impacts complies with RFA requirements regarding significant impact on a substantial number of small entities. Our longstanding policy for our impacts discussion is to provide analysis at the level of certain specialties, as identified in the specialty information captured in our Medicare provider enrollment files. We would note that the lack of granular, national and publicly available data that could be used to identify variability between localities, business types, and the specific mixture of Medicare/non-Medicare payment for a given business makes it difficult to project impacts on small businesses using our standard process.

D. Effect of Changes Related to Telehealth Services

As discussed in section II.F. of this final rule, we are adding nine new codes to the list of Medicare telehealth services list for CY 2021. These codes are:

- Group Psychotherapy (CPT 90853)
- Domiciliary, Rest Home, or Custodial Care services, Established patients (CPT 99334–99335)
- Home Visits, Established Patient (CPT 99347–99348)
- Cognitive Assessment and Care Planning Services (CPT 99483)
- Visit Complexity Inherent to Certain Office/Outpatient E/Ms (HCPCS G2211)
- Prolonged Services (HCPCS G2212)
- Psychological and Neuropsychological Testing (CPT 96121)

We are also adding the following services to the list of Medicare telehealth services provisionally on a category 3 basis:

- Domiciliary, Rest Home, or Custodial Care services, Established patients (CPT 99336–99337)
- Home Visits, Established Patient (CPT 99349–99350)
- Emergency Department Visits, Levels 1–5 (CPT 99281–99285)
- Nursing facilities discharge day management (CPT 99315–99316)
- Psychological and Neuropsychological Testing (CPT 96130–96133; CPT 96136–96139)

- Therapy Services, Physical and Occupational Therapy, All levels (CPT 97161–97168; CPT 97110, 97112, 97116, 97535, 97750, 97755, 97760, 97761, 92521–92524, 92507)
- Hospital discharge day management (CPT 99238–99239)
- Inpatient Neonatal and Pediatric Critical Care, Subsequent (CPT 99469, 99472, 99476)
- Continuing Neonatal Intensive Care Services (CPT 99478–99480)
- Critical Care Services (CPT 99291–99292)
- End-Stage Renal Disease Monthly Capitation Payment codes (CPT 90952, 90953, 90956, 90959, and 90962)
- Subsequent Observation and Observation Discharge Day Management (CPT 99217; CPT 99224–99226)

Although we expect these changes to have the potential to increase access to care in rural areas, based on recent telehealth utilization of services already on the list, including services similar to the additions, we estimate there will only be a negligible impact on PFS expenditures from these additions. For example, services already on the list of permanent telehealth services are furnished via telehealth, on average, less than 0.1 percent of the time they are reported overall. The statutory payment requirements for Medicare telehealth services under section 1834(m) of the Act, such as the originating site requirements related to geographic location and site of service, limit increases in utilization outside of the PHE for the COVID-19 pandemic; however, we believe there is value in allowing physicians to furnish these additional services via telehealth, and for patients to receive broader access to this care through telehealth. Additionally, for services added to the Medicare telehealth list on a Category 3 basis, outside of the circumstances of the PHE for COVID-19, all of the statutory restrictions will also apply to these services. Even with the addition of the category 3 services for an additional year, we do not anticipate any significant increase in utilization after the PHE for COVID-ends. We note that due to flexibilities implemented during the PHE for the COVID-19 pandemic, particularly waivers of the statutory geographic and site-of-service restrictions, has led to increased utilization of telehealth services;¹⁴⁹

¹⁴⁹ <https://aspe.hhs.gov/pdf-report/medicare-beneficiary-use-telehealth>, <https://aspe.hhs.gov/system/files/pdf/264071/Medicare-FFS-Spending-Utilization.pdf>.

however, we do not believe we have sufficient data to draw any further conclusions. CMS will need to conduct additional analyses once there are sufficient data such as a full year's worth of claims that will allow us to consider the effects of the PHE on utilization in the context of the annual/seasonal variations observed in the claims data that exist from one year to the next. Such analysis would inform CMS options for adopting any flexibilities on a permanent basis, as allowed by Medicare statute outside of the circumstances of the PHE. This information would also be taken into consideration for future ratesetting under the PFS.

E. Effect of Changes Related to Scopes of Practice

As discussed in section II.G. Scopes of Practice for PFS Services, of this final rule, we will allow certain NPPs to supervise diagnostic tests, which would authorize NPs, CNSs, PAs, CNMs, and CRNAs to provide the appropriate level of supervision assigned to diagnostic tests, to the extent authorized under State law and scope of practice. As for all services they furnish, in accordance with statute, the NP, CNS or PA necessarily would be working either under physician supervision or in collaboration with a physician. This flexibility may increase the capacity and availability of practitioners who can supervise diagnostic tests, which would alleviate some of the demand on physicians as the only source to perform this particular function.

We solicited comment on state scope of practice rules and they extent to which they specified supervision requirements for the supervision of diagnostic tests. Some commenters provided information on specific tests and thoughts on what practitioners could supervise such tests, these commenters provided information indicating that psychological and neuropsychological diagnostic tests are not within the scope of practice of the proposed NPPs, and require special training only available to psychologists and physicians. While this information provides some context to our policy discussion, overall, we have not located national detailed information indicating the degree to which NPP scope of practice includes supervision of auxiliary staff, especially for the subset of services that are diagnostic tests and note that here is a wide range of diagnostic tests, from a simple strep throat swab to more sophisticated and/or invasive tests such as X-rays and cardiology procedures. We would need to understand the scope of practice for

many types of auxiliary staff (some of whom are not licensed) who could potentially provide these tests under the supervision of an NPP, including RNs, LPNs, medical assistants, radiologic technicians, and many others. However, as discussed earlier in this rule, our intent regarding this supervision flexibility is to allow NPPs with separate benefit categories under Medicare law to supervise the performance of diagnostic tests, regardless of the specific category of diagnostic tests, only to the extent their scope of practice and State laws authorize them to do so.

To the extent practice patterns change, there could be induced utilization that would increase costs, but this might be offset by reduced payment rates because direct payment to NPPs is at a lower rate than payment to physicians.

An alternative in the case of the provision concerning supervision of diagnostic tests was to maintain the status quo. That is, we noted that we could maintain the basic rule under § 410.32(b)(1) that allows only physicians as defined under Medicare law to supervise the performance of diagnostic tests. In that case, the pool of practitioners who could supervise diagnostic tests would remain at current levels and certain NPPs would be limited under Medicare from practicing to the full extent allowed by their state license and scope of practice.

We are finalizing the proposal to allow a physical therapist (PT) or occupational therapist (OT)—whether they are an enrolled private practice PT or OT or a therapist working for an institutional provider—who establishes a therapy maintenance program to assign the duties to a PTA or OTA, as clinically appropriate, to perform maintenance therapy services. We added this as a flexibility under the May 8th COVID-19 IFC for the duration of the PHE for COVID-19 based on respondents' feedback on scope of practice following the President's E.O. 13890. Our current requirements for maintenance therapy services restrict a PT's/OT's ability to delegate the performance of maintenance therapy services to PTAs and OTAs which is counter to the therapist's ability to use PTAs/OTAs in furnishing rehabilitative outpatient physical or occupational therapy services. In the CY 2021 PFS proposed rule (85 FR 50147), we proposed to allow PTs/OTs to oversee and delegate to a PTA or OTA the performance of physical and occupational therapy services in the same way, whether the therapy services are part of a plan of care geared toward

rehabilitative or maintenance therapy. While therapy services furnished by PTs/OTs and their PTAs/OTAs are separately payable when they occur in different time slots (that is, if the PT/PTA or OT/OTA work together at the same time in furnishing a service to the patient, only one service is payable), we noted that we did not believe that there would be an increase in utilization since it is of no consequence whether the PTA/OTA is furnishing the service as rehabilitative or maintenance therapy. Additionally, we note that beginning January 1, 2022, payment for services furnished in whole or in part by a PTA/OTA (when the part by the PTA/OTA separate from the part of furnished by the PT/OT exceeds 10 percent of the service) will be paid at a lower rate (85 percent of the PFS fee schedule amount) which could offset any nominal increase in service volume. The alternative option—maintaining the status quo to require the PT/OT to personally furnish all maintenance therapy services, would not address the mandates established in E.O. 13890. Currently, in SNF and home health settings when payment for therapy is made under Part A, maintenance therapy can be furnished by a PT/OT or delegated to be performed by a PTA/OTA, and this provision would permit this to occur in all settings when therapy is paid under Part B.

F. Effect of Changes to Bundled Payments Under the PFS for Substance Use Disorders (HCPCS Codes G2086, G2087, and G2088)

As discussed in section II.H. of this final rule, Valuation of Specific Codes, we are expanding the bundled payments described by HCPCS codes G2086, G2087, and G2088, finalized in the CY 2020 PFS final rule (84 FR 62673) to be inclusive of all SUDs. As noted in the CY 2020 PFS final rule (84 FR 62673), if a patient's treatment involves MAT, this bundled payment would not include payment for the medication itself. Billing and payment for medications under Medicare Part B or Part D would remain unchanged. We note that payment for the codes would be budget neutral under the PFS and therefore have no cost impact on PFS spending; however, this policy may have impacts on billing practices and services provided.

Currently, the codes most frequently used when billing for treatment of SUD include the E/M visit codes, psychotherapy codes, SBIRT codes, and potentially the Behavioral Health Integration codes. HCPCS codes G2086–G2088 offer a bundled payment that would allow a more streamlined

approach to billing in cases where all of the services described in the code descriptors are furnished. We note that these codes provide an option for billing, but are not required; therefore, in cases where only select services are being furnished, practitioners may continue to bill for the code that most accurately describes the service that was furnished, which could be, for example, an E/M visit code.

G. Effect of Modifications to Medicare Coverage for Opioid Use Disorder (OUD) Treatment Services Furnished by Opioid Treatment Programs (OTPs)

Section 2005 of the Substance Use-Disorder Prevention That Promotes Opioid Recovery and Treatment for Patients and Communities (SUPPORT) Act established a new Medicare Part B benefit for OUD treatment services furnished by OTPs on or after January 1, 2020. As part of CY 2020 PFS rulemaking, we implemented coverage requirements, created new coding to describe bundled episodes of care for the treatment of OUD, and established payment methodologies to determine the payment amounts for the drug and non-drug components of an episode of care.

For CY 2021, we are creating two new add-on codes, one add-on code for nasal naloxone and another add-on code for injectable naloxone. Both add-on codes include a non-drug component for overdose education furnished in conjunction with naloxone. We are pricing nasal naloxone based upon the methodology set forth in section 1847A of the Act, except that the payment amount shall be ASP + 0. The price being finalized for the nasal naloxone add-on code is \$92.13, which includes a payment of \$2.53 for overdose education. We are contractor-pricing the injectable naloxone and will also include a payment of \$2.53 for overdose education. We are limiting Medicare payment to OTPs for naloxone to one add-on code (HCPCS code G2215 or G2216) every 30 days, however, we will allow exceptions to this limit in the case where the beneficiary overdoses and uses the initial supply of naloxone dispensed by the OTP, to the extent that it is medically reasonable and necessary to furnish additional naloxone.

The estimated net Part B cost impact of the add-on codes for naloxone for CY 2021 is \$0.5 million. The estimated net Part B 10-year impact is \$5.6 million. This estimate is based on several assumptions. First, commenters noted that nasal naloxone is the most common formulation given to patients in an OTP and the price is being finalized is \$92.13. This cost is to be updated to

reflect changes in the average sales price (ASP); however, since future ASP updates are not available, the Medicare Economic Index (MEI) was used as a proxy. Based on partial 2020 utilization of the OTP benefit through September, roughly 20,000 beneficiaries received treatment at an OTP at some point during that time. We assumed that this would reach 25,000 by the end of 2020, and growth in future years would be consistent with projected growth in Part B fee-for-service enrollment. We assumed that beneficiaries who are provided naloxone would receive at least one supply of nasal naloxone as a standard part of the program because they are likely to be at risk for an overdose. A much smaller portion would receive a second supply, since it would only be provided if the first supply has been used. We assumed that approximately 1.1 doses would be provided per beneficiary. This figure is based on an August 2020 OIG report regarding opioid use under Medicare Part D, and it represents the average number of prescriptions per person receiving naloxone between 2016 and 2019 (see Exhibit B–2 on page 14).¹⁵⁰ We assumed that roughly 25 percent of beneficiaries receiving treatment OTPs would be provided with naloxone, because they may already have it from another source, and some OTPs may not have it available. The estimate also took into account that this benefit is not subject to beneficiary cost sharing. Additionally, any change to FFS benefits has an associated impact on payments to Medicare Advantage (MA) plans, so an adjustment was made to reflect this based on the projected distribution of spending in each year. Based on current projections, payments to MA plans represent roughly 46 percent of total Part B spending in 2022 this share and is expected to grow to almost 50 percent by 2030. This estimate also takes into account a premium offset which represents the impact on the Medicare program due to the change in the Part B premium as a result of the new add-on payment to OTPs for naloxone. In other words, since benefit spending is higher, the Part B premium will also be higher, which partially offsets the impact on benefit spending. The Part B FFS enrollment projections and MEI assumptions are based on the President's Fiscal Year 2021 Budget baseline that was released in February of 2020.

We believe that the benefits associated with establishing payment

for naloxone and overdose education in the OTP setting justify the cost of the provision. As noted in section II.I. of this final rule, Modifications Related to Medicare Coverage for Opioid Use Disorder (OUD) Treatment Services Furnished by Opioid Treatment Programs (OTPs), U.S. Surgeon General Jerome M. Adams, M.D., M.P.H. released a public health advisory stating that, "Research shows that when naloxone and overdose education are available to community members, overdose deaths decrease in those communities. Therefore, increasing the availability and targeted distribution of naloxone is a critical component of our efforts to reduce opioid-related overdose deaths and, when combined with the availability of effective treatment, to ending the opioid epidemic."¹⁵¹ We are adding naloxone and overdose education furnished in conjunction with naloxone to the definition of OUD treatment services in order to increase access to this important emergency treatment and to allow OTPs to be paid under Medicare for dispensing naloxone to Medicare beneficiaries who are receiving other OUD treatment services from the OTP. We believe allowing beneficiaries to access this important emergency treatment at the OTP may help decrease barriers to access because there are no copayments for services furnished by OTPs and beneficiaries will not need to visit a separate provider to access naloxone.

H. Other Provisions of the Regulation

1. Clinical Laboratory Fee Schedule: Revised Data Reporting Period and Phase-In of Payment Reductions

In section III.A. of this final rule, we discuss statutory revisions to the data reporting period and phase-in of payment reductions. In accordance with section 105(a) of the FCAA and section 3718 of the CARES Act, we are making certain conforming changes to the data reporting and payment requirements in our regulations at part 414, subpart G. Specifically, for clinical diagnostic laboratory tests (CDLTs) that are not advanced diagnostic laboratory tests (ADLTs), we are revising § 414.504(a)(1) to indicate that initially, data reporting begins January 1, 2017 and is required every 3 years beginning January 2022. This revision delays the next data reporting period under the CLFS by 2 years, that is, it will require the next data reporting during the period of January 1, 2022 through March 31, 2022. Subsequently, the next private payor

¹⁵⁰ <https://oig.hhs.gov/oei/reports/OEI-02-20-00320.pdf>.

¹⁵¹ <https://www.hhs.gov/surgeongeneral/priorities/opioids-and-addiction/naloxone-advisory/index.html>.

rate-based CLFS update will be effective January 1, 2023 instead of January 1, 2021. In addition, we are making conforming changes to our requirements for the phase-in of payment reductions to reflect the CARES Act amendments. Specifically, we are revising § 414.507(d) to indicate that for CY 2021, payment may not be reduced by more than 0.0 percent as compared to the amount established for CY 2020, and for CYs 2022 through 2024, payment may not be reduced by more than 15 percent as compared to the amount established for the preceding year.

We recognize that private payor rates for CDLTs paid on the CLFS and the volumes paid at each rate for each test, which are used to determine the weighted medians of private payor rates, have changed since the first data collection period (January 1, 2016 through June 30, 2016) and data reporting period (January 1, 2017 through March 31, 2017). In addition, as discussed in section III.A. of this final rule, in the CY 2019 PFS final rule (83 FR 59671 through 59676), we amended the definition of applicable laboratory to include hospital outreach laboratories that bill Medicare Part B using the CMS-1450 14x Type of Bill. As such, the conforming regulatory changes to the data reporting period would delay using updated private payor rate data and data reported by hospital outreach laboratories to set revised CLFS payment rates.

Due to the unforeseen changes in private payor rates, inclusion of hospital outreach laboratory data, and unpredictable nature of test volumes and their impact on calculating updated weighted medians private payor rates, we are uncertain as to whether the delay in data reporting would result in a measurable budgetary impact. In other words, in order to comprehend the impact of delayed reporting and subsequent implementation of updated CLFS rates, we would need to calculate weighted medians of private payor rates based on new data and compare the revised rates to the current rates. As such, we believe that we will only know the impact of the delay in data reporting after collecting actual updated applicable information from applicable laboratories, including the collection of private payor rate data from applicable hospital outreach laboratories, and calculate the updated weighted medians of private payor rates.

With regard to the conforming changes to our requirements for the phase-in of payment reductions, we note that this revision shifts the 15 percent limitation on payment reductions from CYs 2021 through 2023,

to CYs 2022 through 2024. Therefore, we believe this conforming regulatory amendment to the phase-in of payment reductions in § 414.507(d) is budget neutral for scoring purposes.

2. OTP Provider Enrollment Regulation Updates for Institutional Claim Submissions

We stated in section VII. of this final rule that:

- Section 424.67(b)(2) requires newly enrolling OTPs to pay an application fee at the time of enrollment under § 424.514.
- 300 currently enrolled OTPs would change their enrollment from a Form CMS-855B to a Form CMS-855A. We project that all such changes will occur in CY 2021.
- 10 OTPs that enroll using the Form CMS-855A would later change their enrollment to a Form CMS-855B. We project that these changes will occur in CY 2022 and CY 2023 (roughly 5 changes per year).

These 310 OTPs would be required to pay an application fee because said change to a Form CMS-855A or Form CMS-855B enrollment would constitute a new/initial enrollment.

The application fees for each of the past 3 calendar years (CY) were or are \$569 (CY 2018), \$586, (CY 2019), and \$595 (CY 2020). Consistent with § 424.514, the differing fee amounts are predicated on changes/increases in the Consumer Price Index (CPI) for all urban consumers (all items; United State city average, CPI-U) for the 12-month period ending on June 30 of the previous year. As stated in a notice published in the November 23, 2020 **Federal Register** titled “Medicare, Medicaid, and Children’s Health Insurance Programs; Provider Enrollment Application Fee Amount for Calendar Year 2021” (85 FR 74724), the fee amount for CY 2021 will be \$599. This results in a total application fee cost for OTP changes to a Form CMS-855A enrollment of \$179,700 (\$599 × 300 OTPs).

Although we cannot predict changes to the CPI beyond CY 2021, the fee amounts between 2019 and 2021 increased by an average of \$6 per year. We believe this is a reasonable barometer with which to estimate (strictly for projecting the total application fee costs for the 10 OTPs that we believe will switch to a Form CMS-855B enrollment) the fees for CY 2022 and CY 2023. Accordingly, we project a fee of \$605 in CY 2022 and \$611 in CY 2023. This results in a total application fee cost of \$3,025 (\$605 × 5 OTPs) in CY 2022 and \$3,055 in CY 2023 (\$611 × 5 OTPs). Over the next 3 years, therefore, the total application fee

cost will be \$185,780 (\$179,700 + \$3,025 + \$3,055).

We received no comments on our application fee estimates.

3. Payment for Principal Care Management (PCM) Services in Rural Health Clinics (RHCs) and Federally Qualified Health Centers (FQHCs)

After reviewing the PFS, FQHC, and RHC historical spending, including the first quarter of calendar year 2020 spending for the new principal care management codes under the PFS, we estimate the addition of these codes (G2064 and G2065) to G0511 would have a negligible impact on Medicare spending.

4. Changes to the Federally Qualified Health Center Prospective Payment System (FQHC PPS) for CY 2021: Rebasing and Revising of the FQHC Market Basket

The CY 2021 FQHC market basket and multi-factor productivity adjustment is 0.1 percentage point higher under the 2017-based FQHC market basket (1.7 percent) compared to under the 2013-based market basket (1.6 percent). Therefore, the economic impact of finalizing the FQHC market basket rebasing and revising for CY 2021 is approximately \$1M and we consider this impact to be negligible. We determined this amount by applying a factor of 0.001 to the FQHC baseline, which was approximately \$1,100 million in calendar year 2019. Over the next 10 years the rebasing methodology results in, at most, a difference of 0.1 percent compared to the prior methodology but it is not always higher. The difference in the payment updates is projected to be higher in the next 2 years but then lower or the same beyond that. Therefore, this initial negligible cost decreases over time and overall estimated spending will likely be unaffected.

5. Comprehensive Screenings for Seniors: Section 2002 of the Substance Use-Disorder Prevention That Promote Opioid Recovery and Treatment for Patients and Communities Act (SUPPORT Act)

We are implementing section 2002 of the Support Act by adding regulatory language to the existing Initial Preventive Physical Examination (IPPE) and Annual Wellness Visit (AWV) regulations to explicitly include elements regarding screening for potential substance use disorders and a review of current opioid prescriptions. We expect the new regulatory elements to add minimal burden since review of medical and social history, risk factor

identification, education, counseling, and referrals are already fundamental parts of the IPPE and AWW. Standard documentation in the medical record that these services were furnished would not change based on these new requirements. We note that in section VIII.C.2.a. of this RIA, we discuss the increase in payment for E/M visits in general. Accordingly, the increase in payment for E/M visits applies to the IPPE and AWW and the impact to 2021 expenditures is included in section VIII.C.2.a. of this RIA.

6. Medicaid Promoting Interoperability Program Requirements for Eligible Professionals (EPs)

In the Medicaid Promoting Interoperability Program, to keep electronic clinical quality measure (eCQM) specifications current and minimize complexity, we are aligning the eCQMs available for Medicaid EPs in 2021 with those available for MIPS eligible clinicians for the CY 2021 performance period. We anticipate that this alignment will reduce burden for Medicaid EPs by aligning the requirements for multiple reporting programs, and that the system changes required for EPs to implement this change will not be significant, as many EPs are expected to report eCQMs to meet the quality performance category of MIPS, and therefore, should be prepared to report on those eCQMs for 2021. Not implementing this alignment could lead to increased burden because EPs might have to report on different eCQMs for the Medicaid Promoting Interoperability Program, if they opt to report on newly added eCQMs for MIPS. We expect that this policy will have only a minimal impact on states, by requiring minor adjustments to state systems for 2021 to maintain current eCQM lists and specifications. Based on a sampling of funding requests, each state typically spends, on average, approximately \$670,000 per year to operate its Medicaid Promoting Interoperability Program attestation system for EPs. Only a small fraction of those costs is typically attributable to updating eCQM specifications. We estimate that the costs for updating eCQM specifications under the policy will be approximately \$100,000 per state. State expenditures to make any systems changes that will be required as a result of the provision will most likely be eligible for 90 percent federal financial participation.

For 2021, we are requiring that Medicaid EPs report on any six eCQMs that are relevant to the EP's scope of practice, including at least one outcome measure, or if no applicable outcome

measure is available or relevant, at least one high priority measure, regardless of whether they report via attestation or electronically. This policy will generally align with the MIPS data submission requirement for eligible clinicians using the eCQM collection type for the quality performance category, which is established in § 414.1335(a)(1). If no outcome or high priority measure is relevant to a Medicaid EP's scope of practice, he or she could report on any six eCQMs that are relevant. This policy will be a continuation of our policy for 2020 and we believe it will not create new burden for EPs or states.

7. Medicare Shared Savings Program

a. Modifications to the Shared Savings Program Quality Reporting Requirements and Quality Performance Standard for Performance Year 2021 and Subsequent Performance Years

In section III.G.1.c. of this final rule, we are finalizing a modified version of our original proposal to allow for a gradual phase-in of the increase in the level of quality performance that would be required for all ACOs to meet the Shared Savings Program quality performance standard and the retention of the CMS Web Interface collection type for performance year 2021. The quality performance standard is the minimum performance level ACOs must achieve in order to share in any savings earned, avoid maximum losses under certain payment tracks, and avoid quality-related compliance actions.

Specifically, we are finalizing that an ACO would meet the quality performance standard if:

- For performance years 2021 and 2022, the ACO achieves a quality performance score that is equivalent to or higher than the 30th percentile across all MIPS Quality performance category scores; and
- For performance year 2023 and subsequent performance years, the ACO achieves a quality performance score that is equivalent to or higher than the 40th percentile across all MIPS Quality performance category scores.

We are also finalizing our proposal to exclude entities/providers eligible for facility-based scoring from the determination of the overall MIPS Quality performance category score because facility-based scoring is determined using the Hospital Value Based Purchasing (HVBP) Total Performance Score (TPS), which includes quality and cost. Please refer to section III.G.1.c. of this final rule for a detailed discussion of the policies used to inform the impacts for the change to the quality performance standard.

Our analysis of quality performance data reported by ACOs for performance years starting during 2019 indicates that the methodological changes in ACO quality scoring will reduce the mean ACO quality score relative to recent historical performance years where ACO quality performance scores have averaged 90 percent or more. Despite an expectation for a decreasing score for most ACOs and potentially a slight increase in the fraction of ACOs failing to achieve the minimum threshold for qualifying for potential shared savings, the provision is estimated to marginally increase overall shared savings payments to ACOs initially because ACOs that meet the quality performance standard will be eligible to share in savings at the maximum sharing rate, rather than subject to variable sharing rates based on their quality performance score. Our best estimate is that shared savings payments to ACOs will increase by \$60 million for the 2021 performance year because of these changes, representing an increase in shared savings payments of only about 3 percent of projected total gross measured savings for ACOs earning shared savings for that year. The corresponding estimated increase in payments to ACOs would slightly decrease to \$40 million in 2022 because, beginning that year, ACOs would no longer have the option of utilizing the Web Interface reporting option, which is projected to be favorable for most ACOs. Then for 2023 when the quality performance standard will increase to the 40th percentile across all MIPS Quality performance category scores, assuming the distribution of ACO quality performance scores remains static from the 2019 base data, we project roughly 1-in-5 ACOs could fall below the 40th percentile and therefore shared savings payments to ACOs would decrease by approximately \$100 million for that performance year. In total, these estimates sum to roughly a budget neutral outcome across the 3-year performance years covering 2021–2023.

These estimates (and in particular the estimated \$100 million reduction in shared savings payments in 2023) could differ if the universe of MIPS Quality performance category scores improves relative to ACOs' quality performance scores, or alternatively if ACOs, particularly ACOs at risk of failing, respond to the methodology change by boosting their performance, especially by 2023 when the quality performance standard is to be increased from the 30th to the 40th percentile. Taking into account such possibilities indicates the

combined 3-year impact of the changes to the quality performance standard could differ from the budget neutral projection by up to +/- \$200 million. Recognizing the uncertainty regarding these estimates, we will continue to monitor emerging performance to determine the impact of a measured increase to the quality performance standard and may revisit the policy in a future rulemaking in order to promote an attainable standard and degree of improvement based on initial performance under the new methodology.

b. Modifications to the Shared Savings Program Beneficiary Assignment Methodology and Repayment Mechanism Requirements

We do not anticipate a material aggregate impact for the other changes we are finalizing related to the Shared Savings Program, specifically the changes related to repayment mechanism requirements (section III.G.3. of this final rule) and the assignment methodology (section III.G.2. of this final rule); however, the assignment methodology provisions may have differing effects on a subset of participating ACOs, for example by changing the competing ACO to which a beneficiary ultimately is assigned, for a small subset of beneficiaries.

c. Finalization of Shared Savings Program Policies Established in the May 8th COVID-19 IFC

As discussed in section III.G.5 of this final rule, in the May 8th COVID-19 IFC we modified Shared Savings Program policies including to forgo the 2021 application cycle and allow eligible ACOs to elect a 1-year extension of their agreement period; allow eligible ACOs to temporarily freeze their position along the BASIC track's glide path for PY 2021; and adjust certain program calculations to remove Parts A and B expenditures for episodes of care for treatment of COVID-19; and expand the definition of primary care services used in determining beneficiary assignment to include telehealth codes for virtual check-ins, e-visits, and telephonic communication. We also clarified the applicability of the program's extreme and uncontrollable circumstances policy to mitigate shared losses for the period of the PHE for COVID-19, beginning in January 2020 and for duration of the PHE for COVID-19. We are finalizing the Shared Savings Program's May 8th COVID-19 IFC provisions through this final rule with the following modifications. As discussed in section III.G.5.d. of this final rule, we are revising the regulation

at § 425.611(b)(1)(ii) to align the timeframe for identifying discharges for acute care inpatient services for treatment of COVID-19 furnished by non-IPPS providers with the timeframe for the 20 percent adjustment to payments under the IPPS for individuals diagnosed with COVID-19 (which applies to discharges occurring during the PHE for COVID-19), for purposes of identifying episodes of care for treatment of COVID-19. As discussed in section III.G.5.e.(3) of this final rule, we are revising the regulation at § 425.400(c)(2) to specify that the additional primary care service codes will be used in conducting beneficiary assignment when the assignment window (as defined in § 425.20) for a benchmark or performance year includes any month(s) during the PHE for COVID-19 defined in § 400.200. We are also adding a new provision at § 425.400(c)(2)(ii) to specify that we will apply the additional primary care service codes, specified in § 425.400(c)(2)(i) (as renumbered), to all months of the assignment window (as defined in § 425.20), when the assignment window includes any month(s) of the PHE for COVID-19 as defined in § 400.200.

In total, the changes to the Shared Savings Program described in the May 8th COVID-19 IFC were estimated to reduce program spending by \$1.43 billion over the 2020 to 2025 period (ranging from a reduction of \$790 million to \$2.12 billion), with most of the reduction (\$1.11 billion) attributable to performance year 2020. We do not anticipate a material aggregate impact from the aforementioned revisions to § 425.611(b)(1)(ii), specified in section III.G.5.d. of this final rule, and § 425.400(c)(2), specified in section III.G.5.e.(3) of this final rule.

8. Modifications to Medicare Shared Savings Program Quality Reporting Requirements for Performance Year 2020 and Finalization of Shared Savings Program Policies Established in the March 31st COVID-19 IFC

As discussed in section III.I.1. of this final rule, we are finalizing our proposal to waive the CAHPS for ACOs reporting requirement for performance year 2020 and will assign automatic full credit to all ACOs for the CAHPS for ACOs survey measures. Based on recent ACO performance on the CAHPS measures, we estimate moving to a 100 percent score for the CAHPS measures will increase the final quality score for the group of all non-new ACOs by roughly 2 percentage points. This would translate to an estimated increase in

total shared savings payments to ACOs of approximately \$20 million.

As discussed in section III.I.3. of this final rule, in the March 31st COVID-19 IFC, we modified the extreme and uncontrollable circumstances policy to eliminate the restriction that the policy applies only if the quality reporting period is not extended. We are finalizing this change without modification in this final rule. The total impact of extending the extreme and uncontrollable circumstances policy despite the extension of the quality reporting period for 2019 is estimated to be \$20 million with a range of uncertainty in such estimate spanning \$15 million to \$25 million.

9. Removal of Selected National Coverage Determinations

We proposed to remove nine older NCDs that no longer contain clinically pertinent and current information or that involve items or services that are used infrequently by beneficiaries. We are removing six of the nine proposed. Generally, proactively removing obsolete or unnecessary NCDs removes barriers to innovation and reduces burden for stakeholders and CMS. The NCDs fall into two impact categories. First, eliminating an NCD for items and services that were previously covered means that the item or service will no longer be automatically covered by Medicare. Instead, the coverage determinations for those items and services will be made by Medicare Administrative Contractors (MACs). Second, if the previous NCD barred coverage for an item or service under title XVIII, MACs would now be able to cover the item or service if the MAC determines that such action is appropriate under the statute. We believe that allowing local contractor flexibility in these cases better serves the needs of the Medicare program and its beneficiaries since we believe the future utilization for items and services within these policies will be limited, each affecting less than one percent of the Medicare FFS population.

For the three NCDs that are going from limited coverage to MAC discretion, claims data from 2019 show that less than one percent of the Medicare population are affected. Specifically, CMS provides limited coverage for specific conditions under NCD 20.5, Extracorporeal Immunoabsorption (ECI) using Protein A Columns, where CMS paid 1,918 Medicare FFS claims for 118 beneficiaries for a total expenditure of \$3,757,178.36. Under NCD 100.9, Implantation of Gastroesophageal Reflux Device, CMS received no claims in

2019. CMS provides coverage for FDA approved labeled indications under NCD 110.19, Abarelix, and no claims were submitted in 2019 because the device is no longer marketed. If under MAC discretion, these items and services continue to be covered, we estimate there will be de minimis change to 2021 expenditures, compared to 2019. However, we note that MAC discretion may result in the MACs determining that in particular instances of these items and services, a noncoverage decision may be appropriate for the patient, which could result in a decrease in 2021 expenditures, compared to 2019. The three NCDs that we are not removing in this final rule, were also in this limited coverage category explained above. The current NCDs will continue to apply and we estimate there will be little significant difference in expenditures from 2019 to 2021. NCD 110.14, Apheresis (Therapeutic Pheresis), CMS paid 84,539 Medicare FFS claims for 10,641 beneficiaries for a total expenditure of \$77,486,916.37. Under NCD 190.1, Histocompatibility Testing, CMS paid 4,986 Medicare FFS claims for 2,525 beneficiaries for a total expenditure of \$206,085.04. For NCD 190.3, Cytogenetic Studies, CMS paid 163,522 Medicare FFS claims for 145,212 beneficiaries for a total expenditure of \$18,997,807.17.

For the three non-coverage NCDs we are removing, we would not expect to find historical claims data. We broadly noncover both Electrosleep Therapy (NCD 30.4) and Magnetic Resonance Imaging (NCD 220.2.1) for all indications. We noncover FDG PET (NCD 220.6.16) for three specific conditions. Because these NCDs provide for noncoverage, we do not have accurate claims data to estimate total impact. However, based on the diagnoses and services, we expect future claims to affect less than one percent of Medicare FFS beneficiaries. Furthermore, removing a national noncoverage NCD may reduce burden for stakeholders and CMS. It may also remove barriers to innovations and increase patient access to technologies that may now be beneficial for some uses.

10. Requirement for Electronic Prescribing for Controlled Substances for a Covered Part D Drug Under a Prescription Drug Plan or an MA-PD Plan

This provision does not have any cost to stakeholders other than what is reflected in the Collection of Information section of this final rule, including cost to Medicare. We expect

this to be a one-time burden estimate of 994,500 hours (165,750 * 6 hr) at a cost of \$36,418,590 (994,500 hr * 36.62) to prescribers.

We received public comments about the impacts of this policy. The following is a summary of the comments we received and our responses.

Comment: Several commenters noted the health care provider costs involved in implementing EPCS. One commenter recommended that CMS work with ONC to ensure that the cost of acquiring the electronic prescribing standard is part of the EHR certification criteria and to ensure that EHR developers cannot charge additional fees for building in this prescribing standard. Accordingly, the commenter requested that HHS take steps to minimize the cost of EPCS requirements to physician practices. Another commenter stated that their practice has delayed implementing EPCS due to the need to upgrade their EHR software, which has proven to be costly. The commenter stated that given the pandemic impact that amount is now unaffordable for their small primary care practice. Another commenter acknowledged that EPCS implementation costs can be high but that a prudent buyer of software support can find less expensive options.

Response: We share concerns about high health care provider costs associated with implementing EPCS, particularly during the PHE. An article in the Journal of the American Medical Association states that physicians in small private practices around the country have reported steep declines in revenues. Declining revenues have been so significant that some of practices have turned to GoFundMe.¹⁵² However, neither ONC nor CMS have the authority to reduce EHR vendor charges for upgrades. We encourage those who provide software solutions to support EPCS make their products as accessible as possible and, as prescribers who do not implement the standard until 2022 will still be considered compliant, software providers will have more time to review their costs and for providers time to evaluate and chose among available options.

We have reflected these costs in our burden estimate in the Collection of Information section of this rule.

11. Medicare Part B Drug Payment for Drugs Approved Through the Pathway Established Under Section 505(b)(2) of the Food, Drug, and Cosmetic Act

As discussed in section III.L. of this final rule, we are not finalizing the

section 505(b)(2) drug product proposals or the proposed corresponding regulation text changes for 2021. Thus, there are no impacts for CY 2021.

12. Updates to Certified Electronic Health Record Technology Due to the 21st Century Cures Act

In section III.M. of this final rule, we are updating the definitions of CEHRT for the Promoting Interoperability Programs and for the MIPS Promoting Interoperability performance category. We are finalizing that health care providers may use technology certified to either the existing or updated 2015 Edition certification criteria, with the extended compliance date of December 31, 2022, as described in timelines finalized in the 21st Century Cures Act final rule (85 FR 25670) and the ONC interim final rule (85 FR 70064). After that time, when ONC only allows certification under the 2015 Edition Cures Update, health care providers must use only technology certified to the 2015 Edition Cures Update. Additionally, in section III.M.3.b, we are also implementing flexibility such that participants in the Hospital IQR Program may use either the 2015 Edition certification criteria, or the 2015 Edition Cures update for CEHRT beginning in the CY 2020 reporting period/FY 2022 payment determination.

With the final policies, eligible hospitals and clinicians, and eligible clinicians will be required to update their EHR technology to meet the CEHRT definition under the 2015 Edition Cures Update. It is important to note that the regulatory impacts of the ONC 21st Century Cures Act final rule account for the quantified and unquantified costs and benefits to hospitals and clinicians associated with acquiring technology certified to the 2015 Edition Cures Update (85 FR 25905 through 25938). Specifically, ONC based their analysis regarding the number of hospitals, CAHs, and eligible clinicians that would be impacted by their regulatory action on the number of hospitals, CAHs, and eligible professionals that have historically participated in the CMS EHR Incentive Programs (now called the Promoting Interoperability Programs and the MIPS Promoting Interoperability performance category) (85 FR 25908). Because we expect that the eligibility criteria proposed under this rule will be a subset of those who participated in the EHR Incentive Programs (for example, the MIPS program has eligibility criteria for low-volume that the EHR Incentive program did not have), this regulatory impact analysis assumes that the cost to program participants to acquire the

¹⁵² <https://jamanetwork.com/journals/jama/fullarticle/2767633>.

upgraded technology has been accounted for under the ONC 21st Century Cures Act final rule. However, we acknowledged ambiguity in attributing impacts from the ONC 21st Century Cures Act final rule and this policy and requested comment that would help with identification of effects that are dependent on these new regulatory provisions. (We further noted that if the ambiguity is ultimately resolved such that all the costs are attributed to the ONC 21st Century Cures Act final rule, leaving no costs associated with this final rule's certified EHR provisions, then these provisions would also yield no benefits.) We did not receive comments on the additional effects of these regulatory provisions and therefore finalize that there is not additional burden or benefit beyond what is captured in the ONC 21st Century Cures act final rule.

13. Proposal To Establish New Code Categories

In section III.N. of this final rule, we maintain the existing 4 Level II HCPCS codes (J0572 through and including J0575), to identify the current array of buprenorphine/naloxone products available on the U.S. market. The number of codes available for health care providers and coders to identify and report on claims remains constant, and therefore no additional burden is placed on coders or health care providers.

14. Medicare Diabetes Prevention Program Expanded Model Emergency Policy

a. Effects on Beneficiaries

In section III.O. of this final rule, we are finalizing certain Medicare Diabetes Prevention Program (MDPP) expanded model policies to allow CMS to remove the once per life time benefit for some MDPP beneficiaries, increase the number of virtual sessions, allow MDPP suppliers to start new cohorts, and allow certain MDPP suppliers to deliver time-limited virtual MDPP sessions in the event of extreme and uncontrollable circumstances that would adversely affect access to MDPP services. These changes would apply during the PHE for COVID-19 and any future 1135 waiver event, in the emergency area during the emergency period, as defined under section 1135(g) of the Act, when the Secretary has authorized waivers under section 1135 for such emergency area and period and CMS has determined that the 1135 waiver event may disrupt in-person MDPP services.

Throughout the rulemaking for the MDPP expanded model, we sought to

ensure that the set of MDPP services would be delivered in-person, in a classroom-based setting, within an established interval timeline. At the time, the priority was placed on establishing a structured service that, when delivered within the confines of the rule, would create the least risk of fraud and abuse, increase the likelihood of success, and maintain the integrity of the data collected for evaluation purposes. However, circumstances such as the PHE for COVID-19 have led CMS to make changes to the MDPP expanded model, and to implement an Emergency Policy for MDPP that allows for temporary flexibilities and that prioritizes availability and continuity of services for MDPP suppliers and MDPP beneficiaries impacted by section 1135 waiver events.

In the March 31st COVID-19 IFC, we sought to ensure that the set of MDPP services that had already started when the PHE for COVID-19 began could continue given the guidance from CDC that Medicare age beneficiaries stay home. The priority was to allow for temporary flexibilities that prioritize availability and continuity of services for MDPP suppliers and MDPP beneficiaries impacted by the PHE for COVID-19. Given the extended duration of the PHE for COVID-19, we are finalizing the regulations in the March 31st COVID-19 IFC, amend the MDPP expanded model to revise certain MDPP policies during the PHE for COVID-19 and any future 1135 waiver event where such 1135 waiver event may cause a disruption to in-person MDPP services. These temporary flexibilities allow beneficiaries to either continue to have access to set of MDPP services through virtual sessions, pause in-person set of MDPP services and resume with the most recent attendance session of record, or restart MDPP from the beginning in accordance with the March 31st COVID-19 IFC (85 FR 19230). Under the current MDPP regulations, as implemented in the IFC, and for future section 1135 events, should MDPP suppliers deliver set of MDPP services virtually and beneficiaries opt to continue with the set of MDPP services virtually during the 1135 waiver event, those beneficiaries are not eligible to restart the set of MDPP services at a later date.

b. Effects on the Market

At this point, we cannot make clear estimates of the true costs of the MDPP Emergency Policy costs given the current Medicare enrollment. For an example, as part of the COVID-19 flexibilities, we are using authority under section 1135 of the Act to waive

the supplier enrollment application fee for any applications submitted on or after March 1, 2020 in response to COVID-19. This, along with CDC's promotion of the temporary application fee waiver to its DPRP registered organizations, have led to an increase in MDPP supplier enrollment applications and approved suppliers. Currently, more than 266 organizations nationally are enrolled as MDPP suppliers, representing 966 locations across the US and its territories.

For the current PHE for COVID-19, we anticipated in the March 31st COVID-19 IFC that of the 1,818 beneficiaries identified through our monitoring data and the CDC's Diabetes Prevention Recognition Program (DPRP) data, 1,358 beneficiaries may be impacted by allowing both the once-per-lifetime benefit and the minimum weight loss requirement to be waived for those beneficiaries in the first 12 months of MDPP. Of those, we assumed that roughly half of the beneficiaries will want to restart their set of MDPP services after the PHE for COVID-19 ends, with a \$279,748 cost impact of our waiving the once-per-lifetime benefit as part of the COVID-19 flexibilities, assuming that the estimated cost of year 1 of MDPP is \$412.

For this MDPP Emergency Policy, we are updating our assumptions, based on subsequent data from the CDC regarding DPRP organizations' plans for managing their existing cohorts during the PHE for COVID-19, which include either continuing with their cohorts virtually, pausing set of MDPP services and restarting them virtually, or restarting at a later date after the emergency event ends. Based on these data, we assume that 20 percent of MDPP suppliers and 20 percent of beneficiaries will want to restart the set of MDPP services at the first core session after the emergency event ends, taking advantage of the once-per-lifetime requirement removal. We assume that future emergencies will be more geographic-specific, resulting from a natural disaster versus the national-level PHE for COVID-19. For future emergencies, we assume that 2,500 beneficiaries will be enrolled in MDPP in the impacted geographic region. We note that this number is currently an overestimate, and over time, it will likely be an underestimate. We also note that these assumptions are incorrect in cases where a geographic region suffers widespread damage, including to electrical and/or telecommunications systems. This assumption is based on number of suppliers who have reported to the CDC that they are pausing their services during the current PHE for COVID-19.

For the current 1135 event, we are assuming 20 percent of 2,500 beneficiaries will want to take advantage of the waiver in 2020. In this scenario, we assume there would be no virtual or physical access to set of MDPP services for some time, and the supplier will need to either pause or restart classes altogether until such infrastructure systems are back in place. We also assume that beneficiaries who

opt to continue with the set of MDPP services virtually are within the first 12 months of the MDPP core service period, and will not be eligible to take advantage of the waived once-per-lifetime limit; and beneficiaries who are in year 2 of the set of MDPP services, as demonstrated by the effective date of the first core session, are not eligible to restart MDPP at the beginning. The cost per impacted geographic area of the

removal of the once-per-lifetime limit is estimated to be \$209,000. This assumes that MDPP suppliers are paid an estimated \$418 due to beneficiaries reaching the following performance milestones: Beneficiary attended 9 sessions, and reached the 5 percent weight loss during interval 2 of the core maintenance session, and attended the required core maintenance sessions.

TABLE 107: Cost of MDPP Emergency Policy per Geographic Area Impacted by the Emergency

Recommended Waivers	Cost impact
Adjust the limit to the # Virtual sessions	\$ 0
Remove the once per lifetime requirement	\$ 209
Remove the MDPP services time periods and intervals	\$ 0
Average Y1 MDPP Payments (Y1) with no action	\$ 0
Total cost of MDPP Emergency Policy per PHE	\$ 209

Units of Measurement in thousands

Assumptions: Estimated MDPP payments in Year 1: \$418, assuming that beneficiaries attended 9 sessions, and reached the 5 percent weight loss during interval 2 of the core maintenance session. For future emergencies we assume that 2,500 beneficiaries in any geographic area will be impacted by a public health emergency, or 500 beneficiaries per geographic area.

15. Changes Due to Updates to the Quality Payment Program

In section IV.A. of this final rule, we included our finalized policies for the Quality Payment Program. In this section of the final rule, we present the overall and incremental impacts to the number of expected QPs and associated APM Incentive Payments. In MIPS, we estimate the total MIPS eligible population and the payment impacts by practice size for the 2021 MIPS performance period based on various finalized policies to modify the MIPS final score and the performance threshold discussed in section IV.A.3.e.(3) of this final rule and additional performance threshold finalized in the CY 2020 PFS final rule (84 FR 63040). For this RIA, we updated performance period and eligibility data to reflect information submitted in the 2019 MIPS performance period.

a. Estimated APM Incentive Payments to QPs in Advanced APMs and Other Payer Advanced APMs

From 2019 through 2024, through the Medicare Option, eligible clinicians receiving a sufficient portion of Medicare Part B payments for covered professional services or seeing a sufficient number of Medicare patients through Advanced APMs as required to become QPs, for the applicable performance period, will receive a lump-sum APM Incentive Payment

equal to 5 percent of their estimated aggregate payment amounts for Medicare covered professional services furnished during the calendar year immediately preceding the payment year. Beginning in payment year 2021, in addition to the Medicare Option, eligible clinicians may become QPs through the All-Payer Combination Option. The All-Payer Combination Option allows eligible clinicians to become QPs by meeting the QP payment amount or patient count threshold through a pair of calculations that assess a combination of both Medicare Part B covered professional services furnished through Advanced APMs and services furnished through Other Payer Advanced APMs.

The APM Incentive Payment is separate from and in addition to the payments for covered professional services furnished by an eligible clinician during that year. Eligible clinicians who become QPs for a year are not subject to MIPS reporting requirements and payment adjustments. Eligible clinicians who do not become QPs, but meet a lower threshold to become Partial QPs for the year, may elect to report to MIPS and, if they elect to report, would then be scored under MIPS and receive a MIPS payment adjustment. Partial QPs are not eligible to receive the APM Incentive Payment. For the 2021 QP Performance Period, as set forth in § 414.1430(a)(2), Partial QPs

are eligible clinicians in Advanced APMs who have at least 50 percent, but less than 75 percent, of their payments for Part B covered professional services through an APM Entity, or furnish Part B covered professional services to at least 35 percent, but less than 50 percent, of their Medicare beneficiaries through an APM Entity. This MIPS payment adjustment may be positive, negative, or neutral. If an eligible clinician does not attain either QP or Partial QP status, and does not meet any other exemption category, the eligible clinician would be subject to MIPS, would report to MIPS, and would receive the corresponding MIPS payment adjustment.

Beginning in payment year 2026, the Conversion Factor (CF) used to calculate payment rates for services furnished by clinicians who achieve QP status for a year would be increased each year by 0.75 percent for the year, while the CF used to calculate payment rates for services furnished by clinicians who do not achieve QP status for the year would be increased by 0.25 percent. In addition, MIPS eligible clinicians would receive positive, neutral, or negative MIPS payment adjustments to payment for their Part B PFS services in a payment year based on performance during a prior performance period. Although the statute establishes overall payment rate and procedure parameters until 2026 and beyond, this impact

analysis covers only the fifth payment year (2023 payment year) of the Quality Payment Program.

Overall, we estimate that for the 2021 QP Performance Period between 196,000 and 252,000 eligible clinicians will become QPs, therefore be excluded from MIPS, and qualify for the lump sum APM incentive payment in Payment Year 2023 based on 5 percent of their Part B paid amounts for covered professional services in the preceding year. These paid amounts for QPs are estimated to be between approximately \$14,000 million and \$18,500 million in total for the 2021 performance year. The analysis for this final rule used the 2019 third snapshot participation file. We based APM Incentive Payment Amounts on paid amounts with service dates of January 1, through September 30, 2019. We multiplied the calculated amounts by 1.5 to approximate payment amounts for the full calendar year. We estimate that the total lump sum APM Incentive Payments will be approximately \$700–900 million for the 2023 Quality Payment Program payment year.

In section IV.F.10.b. of this final rule, we projected the number of eligible clinicians that will be QPs, and thus excluded from MIPS, using several sources of information. First, the projections are anchored in the most recently available public information on Advanced APMs. The projections reflect Advanced APMs that will be operating during the 2021 QP Performance Period, as well as some Advanced APMs anticipated to be operational during the 2021 QP Performance Period. The projections also reflect an estimated number of eligible clinicians that would attain QP status through the All-Payer Combination Option. We note that the Next Generation ACO Model, previously scheduled to conclude December 2020, the Comprehensive Care for Joint Replacement Payment Model (CEHRT Track), currently scheduled to conclude March 31, 2021, have been included in our analysis as we anticipate that these models will be Advanced APMs in 2021. The following APMs are expected to be Advanced APMs for the 2021 QP Performance Period:

- Bundled Payments for Care Improvement Advanced Model;
- Comprehensive Care for Joint Replacement Payment Model (CEHRT Track), if extended;
- Comprehensive Primary Care Plus (CPC+) Model;
- Direct Contracting Model;
- Kidney Care Choices Model;
- Maryland Total Cost of Care Model (Care Redesign Program; Maryland Primary Care Program);

- Medicare Shared Savings Program (Track 2, Track 3, Basic Track Level E, and the ENHANCED Track);

- Medicare ACO Track 1+ Model;
- Next Generation ACO Model, if extended;
- Oncology Care Model (Two-Sided Risk Arrangements);
- Primary Care First (PCF) Model; and
- Vermont All-Payer ACO Model (Vermont Medicare ACO Initiative).

We used the Participation Lists and Affiliated Practitioner Lists, as applicable, (*see* 81 FR 77444 through 77445 for information on the APM Participant Lists and QP determinations) for the Predictive QP determination file for 2019 to estimate the number of QPs, total Part B paid amounts for covered professional services, and the aggregate total of APM Incentive Payments for the 2021 QP Performance Period. We examined the extent to which Advanced APM participants would meet the QP Thresholds of having at least 75 percent of their Part B covered professional services or at least 50 percent of their Medicare beneficiaries furnished Part B covered professional services through the APM Entity.

b. Impact for the 2022 MIPS Payment Year

In section IV.A.3.d.(2)(a) of this final rule, we finalized the proposal to double the total points available for the complex patient bonus to up to 10 points. We expect this finalized policy to result in the median bonus to increase by 3 points, thus increasing MIPS final scores at the median by 3 points. We do not know the effects of the PHE for COVID–19 and its effect on MIPS performance in 2020, so we did not recreate the analysis and payment distributions with the updated bonus for the 2020 MIPS performance period. We expect the higher MIPS final scores would result in smaller payment adjustments for two reasons. First, we expect reductions to the budget neutral pool due to the higher scores. Second, for clinicians above the performance threshold or additional performance threshold, an increased score would mean more clinicians sharing the budget neutral pool and additional \$500 million for exceptional performance and potentially lowering the scaling factor that is applied to the MIPS payment adjustment and additional payment adjustment.

c. Impact of the PHE for COVID–19 on CY 2019 QPP Performance Period Submissions Data

The PHE for COVID–19 overlapped with the CY 2019 submissions period and led us to trigger our automatic extreme and uncontrollable circumstances policy for the entire U.S. for the 2019 MIPS performance period. This policy means that clinicians who did not submit any information to MIPS or for certain performance categories could have the performance category scores reweighted (instead of receiving a performance category score of 0). We also published in the March 31st COVID–19 IFC in which we updated our application-based extreme and uncontrollable circumstances policy to provide more flexibility for clinicians impacted by the PHE for COVID–19. Specifically, we extended the application deadline from December 31, 2019 to April 30, 2020, and also modified the policy at § 414.1380(c)(2)(i)(A)(6) to create an exception for the 2019 performance period/2021 MIPS payment year only, such that if a MIPS eligible clinician demonstrates through an application submitted to CMS that they have been adversely affected by the PHE for the COVID–19 pandemic, but also submits data for the quality, Promoting Interoperability, or improvement activities performance categories, the performance categories for which data are submitted would still be reweighted and the data submission would not effectively void the application for reweighting (85 FR 19278).

As a result of these policies, we needed to assess whether it would be appropriate to use CY 2019 QPP submissions data to assess CY 2021 MIPS performance and whether adjustments would need to be made to the data because clinicians did not submit information. To do so, we examined the distribution of final scores for clinicians who submitted data to MIPS for the CY 2019 performance period, irrespective of if they applied for the application-based extreme and uncontrollable circumstances policy we established in the March 31st COVID–19 IFC, and compared the levels of non-engagement in MIPS to the CY 2018 performance period. When we considered whether we should remove clinicians who received reweighting due to our triggering of the automatic extreme and uncontrollable circumstances policy due to the PHE for COVID–19, we found excluding clinicians under this policy led to an increase in the number of clinicians not engaged with MIPS compared to the CY

2021 PFS proposed rule RIA, which uses CY 2018 MIPS submissions data. These clinicians who did not submit data for the CY 2019 submissions period did not have shared characteristics that would warrant adjustment for their missing data. Therefore, we selected to only exclude clinicians who qualified for automatic E&U prior to COVID-19 to be consistent with the RIA methodology in previous years. When we considered clinicians impacted by updates to the application-based COVID-19 extreme and uncontrollable circumstances policy as finalized (85 FR 19278) on the CY 2019 submissions data, we found that including clinicians affected by the application-based extreme and uncontrollable circumstances policy in our CY 2021 PFS final rule RIA model did not lead to a meaningful difference in the distribution scores compared to when we used CY 2018 Quality Payment Program submissions data. Given these findings, we decided to use the CY 2019 submissions data and continued to exclude clinicians who were affected by the automatic extreme and uncontrollable circumstances prior to the PHE for COVID-19 as finalized (82 FR 53895 through 53900).

To avoid overestimating the positive payment adjustments for the 2021 MIPS performance period due to the increased number of MIPS eligible clinicians who are not engaged, we adjusted the paid amount of non-engaged clinicians for the CY 2021 MIPS performance period to equal their proportion of paid amount prior to the PHE for COVID-19. We conducted a sensitivity analysis to examine the expected payment adjustment for the CY 2021 MIPS performance period in the absence of an adjustment to the paid amount. The results from this sensitivity analysis are presented in section VIII.H.15.e.(3) of this final rule.

d. Estimated Number of Clinicians Eligible for MIPS Eligibility for the 2023 MIPS Payment Year

(1) Methodology To Assess MIPS Eligibility

(a) Clinicians Included in the Model Prior To Applying the Low-Volume Threshold Exclusion

To estimate the number of MIPS eligible clinicians for the 2021 MIPS performance period in this final rule, our scoring model used a combination of the first determination period from the 2020 MIPS performance period (from October 1, 2018 to September 30, 2019) and data from the end of calendar year 2019 (from October 1, 2019 to December 31, 2019). The first determination period from the 2020

MIPS performance period eligibility file was selected as it was the most recent eligibility file available. We included 1.6 million clinicians (see Table 108) who had PFS claims from October 1, 2018 to December 31, 2019. As discussed in section VIII.H.15.c. of this final rule, we excluded from our analysis individual clinicians who were affected by the automatic extreme and uncontrollable circumstances policy finalized for the 2018 MIPS performance period/2020 MIPS payment year in the CY 2019 PFS final rule (83 FR 59876) prior to the PHE for COVID-19 as we are unable to predict how these clinicians would perform in a year where there was no extreme and uncontrollable event. We also excluded from our analysis submissions from clinicians that are CPC+ practitioners due to data limitations and an inability to model their behavior within the APM Performance Pathway. Finally, we did not exclude submitters with one or more categories identified as being suppressed as a result of bad data for the CY 2019 performance period because we did not receive the list of CY 2019 submissions considered as bad data in time for this final rule.

Clinicians are ineligible for MIPS (and are excluded from MIPS payment adjustment) if they are newly enrolled to Medicare; are QPs; are partial QPs who elect to not participate in MIPS; are not one of the clinician types included in the definition for MIPS eligible clinician; or do not exceed the low-volume threshold as an individual or as a group. Therefore, we excluded these clinicians when calculating the estimate of clinicians eligible for MIPS.

For the estimated MIPS eligible population for the 2023 MIPS payment year, we restricted our analysis to clinicians who are a physician (as defined in section 1861(r) of the Act), a physician assistant, nurse practitioner, and clinical nurse specialist (as such terms are defined in section 1861(aa)(5) of the Act); a certified registered nurse anesthetist (as defined in section 1861(bb)(2) of the Act); a physical therapist, occupational therapist, speech-language pathologist, audiologist, clinical psychologist, and registered dietitian or nutrition professional as finalized in the CY 2019 PFS final rule (83 FR 60076).

As noted previously, we excluded QPs from our scoring model since these clinicians are not MIPS eligible clinicians. To determine which clinicians in the initial population of 1.6 million should be excluded as QPs, we used Advanced APM payment and patient percentages from the APM Participant List for the first snapshot

date for the 2020 QP performance period, supplemented by the most recent 2019 performance period APM participation data for those clinicians not on the 2020 first snapshot list. From this data, we calculated the QP determinations as described in the Qualifying APM Participant definition at § 414.1305 for the 2021 QP performance period. We assumed that all Partial QPs would elect to participate in MIPS and included them in our scoring model and eligibility counts. The projected number of QPs excluded from our model is 172,530. Due to data limitations, we could not identify specific clinicians who may become QPs in the 2021 Medicare QP Performance Period; hence, our model may underestimate or overestimate the fraction of clinicians and allowed charges for covered professional services that will remain subject to MIPS after the exclusions.

We also excluded newly enrolled Medicare clinicians from our model. To identify newly enrolled Medicare clinicians, we used the enrollment date from the 2019 Quality Payment Program performance period data.

(b) Assumptions Related To Applying the Low-Volume Threshold Exclusion

The low-volume threshold policy may be applied at the individual (that is, TIN/NPI) or group (that is, TIN) levels based on how data are submitted or at the APM Entity level if the clinician is part of an APM Entity in a MIPS APM (hereafter, a MIPS APM Entity) that elects to submit to MIPS. A clinician or group that exceeds at least one but not all three low-volume threshold criteria may become MIPS eligible by electing to opt-in and subsequently submitting data to MIPS, thereby getting measured on performance and receiving a MIPS payment adjustment. Our method of modeling opt-in participation is described later in this section.

Table 108 presents the estimated MIPS eligibility status and the associated PFS allowed charges of clinicians in the initial population of 1.6 million clinicians in the analysis of the 2021 MIPS performance period after using 2019 MIPS performance period data and applying the finalized policies for the 2021 MIPS performance period.

To apply the low-volume threshold, we need to understand whether clinicians participate as a group, virtual group, APM entity, or as individuals. For the purposes of this regulatory impact analysis, we made assumptions as to which clinicians would elect group reporting, virtual group or APM Entity reporting. One extreme and unlikely assumption is that no practices elect

group reporting, virtual group reporting, or participate in an APM Entity that elects MIPS reporting and the low-volume threshold is applied at the individual level. Although we believe a scenario in which clinicians would only participate as individuals is unlikely, this assumption is important because it quantifies the minimum number of MIPS eligible clinicians. For this final rule model, we estimate approximately 228,000 clinicians¹⁵³ would be MIPS eligible because they exceed the low volume threshold as individuals and are not otherwise excluded. In Table 108, we identify these clinicians as having “required eligibility.”

For this RIA, we assume the following participation requirements for virtual groups and MIPS APM Entities that elect to participate in MIPS. We assume that TINs that registered as a virtual group for the CY 2019 MIPS performance period will continue to do so for the CY 2021 MIPS performance period. Due to data limitations and our inability to determine who would use

the APM Performance Pathway versus the traditional MIPS submission mechanism for the 2021 MIPS performance period, our model assumes ACO APM Entities would elect to submit data to MIPS through the APM Performance Pathway and that participants in non-ACO APM Entities would participate in MIPS as an individual or group rather than as an APM Entity. We included those who are in MIPS APM ACOs in the 2019 performance period as well as the additional clinicians in the first snapshot date of the 2020 QP performance period.

Finally, we assume that groups that submitted to MIPS as a group will continue to do so for the CY 2021 MIPS performance period. Using CY 2019 MIPS performance period data, we can identify group reporting through the submission of improvement activities, Promoting Interoperability, or quality performance category data. Using these assumptions, we identified approximately 661,000 MIPS eligible clinicians who are eligible because they had the low-volume threshold applied to an identified group, APM entity, or virtual groups. In Table 108, we identify these clinicians who do not meet the

low-volume threshold individually but are assumed to submit to MIPS as a group, virtual group or MIPS APM as having “group eligibility.”

To model the opt-in policy finalized in the CY 2019 PFS final rule (83 FR 59735), we updated our methodology from the CY 2021 PFS proposed rule (85 FR 50384 through 50387) because actual opt-in participation data became available with the transition to the use of CY 2019 performance period data. We assumed clinicians who exceeded at least one but not all low-volume threshold criteria and who elected to opt-in to MIPS and submitted data for the CY 2019 MIPS performance period would also elect to opt-in to MIPS for the CY 2021 MIPS performance period.

These clinicians who met this opt-in participation assumption are identified in Table 108 as “Opt-In eligibility”. In this final rule analysis, we estimate an additional 2,300 clinicians would be eligible through this “opt-in” policy for a total MIPS eligible clinician population of approximately 891,000. The leads to an associated \$72 billion allowed PFS charges estimated to be included in the 2021 MIPS performance period.

¹⁵³ The count of 227,488 MIPS eligible clinicians for required eligibility includes those who participated in MIPS (200,373 MIPS eligible clinicians), as well as those who did not participate (27,115 MIPS eligible clinicians).

**TABLE 108: Description of MIPS Eligibility Status for CY 2023 MIPS Payment Year
Using the CY 2021 PFS Final Rule Assumptions****

Eligibility Status	Predicted Participation Status in MIPS Among Clinicians*	CY 2021 PFS Final Rule estimates	
		Number of Clinicians	PFS allowed charges (\$ in mil)*
Required eligibility (always subject to a MIPS payment adjustment because individual clinicians exceed the low-volume threshold in all 3 criteria)	Participate in MIPS	200,372	\$48,461
	Do not participate in MIPS	27,115	\$6,345
Group eligibility (only subject to payment adjustment because clinicians' groups exceed low-volume threshold in all 3 criteria and submit as a group)	Submit data as a group	660,909	\$17,061
Opt-In eligibility assumptions (only subject to a positive, neutral, or negative adjustment because the individual or group exceeds the low-volume threshold in at least 1 criterion but not all 3, and they elect to opt-in to MIPS and submit data)	Elect to opt-in and submit data	2,346	\$51
Total Number of MIPS Eligible Clinicians and the associated PFS allowed charges		890,742	\$71,918
Not MIPS Eligible			
Potentially MIPS Eligible (not subject to payment adjustment for non-participation; could be eligible for one of two reasons: (1) meet group eligibility; or (2) opt-in eligibility criteria)	Do not opt-in; or Do not submit as a group	381,771	\$9,979
Below the low-volume threshold (never subject to payment adjustment; both individual and group is below all 3 low-volume threshold criteria)	Not applicable	83,039	\$460
Excluded for other reasons (Non-eligible clinician type, newly enrolled, QP)	Not applicable	269,905	\$10,225
Total Number of Clinicians Not MIPS Eligible		734,715	\$20,664
Total Number of Clinicians (MIPS and Not MIPS Eligible)		1,625,457	\$92,582

* Estimated MIPS Eligible Clinician Population

** Table 108 does not include clinicians impacted by the automatic extreme and uncontrollable policy prior to PHE for COVID-19 (approximately 5,000 clinicians and \$530 million in PFS allowed charges). It also does not include eligible clinicians in CPC+ APMs who otherwise would have been MIPS eligible.

*** Allowed charges estimated using 2018 and 2019 dollars. Low-volume threshold is calculated using allowed charges. MIPS payment adjustments are applied to the paid amount.

There are approximately 382,000 clinicians who are not MIPS eligible, but could be if their practice decides to participate or they elect to opt-in. We describe this group as "Potentially MIPS eligible". These clinicians would be included as MIPS eligible in the

unlikely scenario in which all group practices elect to submit data as a group and all clinicians that could elect to opt-into MIPS do elect to opt-in. This assumption is important because it quantifies the maximum number of MIPS eligible clinicians. When this

unlikely scenario is modeled, we estimate the MIPS eligible clinician population could be as high as 1.3 million clinicians.

Finally, there are some clinicians who would not be MIPS eligible either because they and their group are below

the low-volume threshold on all three criteria (approximately 83,000) or because they are excluded for other reasons (approximately 270,000).

Since eligibility among many clinicians is contingent on submission to MIPS as a group, virtual group, APM participation in a MIPS APM Entity that elects to report to MIPS, or election to opt-in, we will not know the number of MIPS eligible clinicians until the submission period for the 2021 MIPS performance period is closed. For this impact analysis, we used the estimated population of 890,742 MIPS eligible clinicians described above.

e. Estimated Impacts on Payments to MIPS Eligible Clinicians for the 2023 MIPS Payment Year

(1) Summary of Approach

In sections IV.A.3.c., IV.A.3.d. and IV.A.3.e. of this final rule, we present several provisions which impact the measures and activities that impact the performance category scores, final score calculation, and the MIPS payment adjustment. We discuss these changes in more detail in section VIII.H.15.e.(2) of this RIA as we describe our methodology to estimate MIPS payments for the 2023 MIPS payment year. We note that some of the MIPS policies in the CY 2020 PFS final rule were only defined for the 2020 MIPS performance period and 2022 MIPS payment year and did not continue to future years, such as the quality and cost performance category weights. Because we did not have category weights for the 2021 MIPS performance period, we could not calculate a final score for the 2021 MIPS performance period and 2023 MIPS payment year. Therefore, we could not create a baseline for the 2021 performance period that would allow us to fully distinguish between the impact of the previously finalized policies for the 2021 performance period and the finalized policies for the 2021 performance period. Our impact analysis looks at the total effect of the previously finalized and newly finalized MIPS policies on the MIPS final score and payment adjustment for the CY 2021 MIPS performance period/CY 2023 MIPS payment year.

The payment impact for a MIPS eligible clinician is based on the clinician's final score, which is a value determined by their performance (as an individual, group, virtual group, or APM Entity) in the four MIPS performance categories: Quality, cost, improvement activities, and Promoting Interoperability. As discussed in section VIII.H.15.e.(2) of this final rule, we

generally used the most recently available data from the Quality Payment Program which is data submitted for the 2019 MIPS performance period.

The estimated payment impacts presented in this final rule reflect averages by practice size based on Medicare utilization. The payment impact for a MIPS eligible clinician could vary from the average and would depend on the combination of services that the MIPS eligible clinician furnishes. The average percentage change in total revenues that clinicians earn would be less than the impact displayed here because MIPS eligible clinicians generally furnish services to both Medicare and non-Medicare patients; this program does not impact payment from non-Medicare patients. In addition, MIPS eligible clinicians may receive Medicare revenues for services under other Medicare payment systems, such as the Medicare Federally Qualified Health Center Prospective Payment System, that would not be affected by MIPS payment adjustment factors.

(2) Methodology To Assess Impact

To estimate participation in MIPS for the CY 2021 Quality Payment Program for this final rule, we generally used 2019 MIPS performance period data. Our scoring model included the 890,742 estimated MIPS eligible clinicians as described in section VIII.H.15.b of this RIA.

To estimate the impact of MIPS policies on MIPS eligible clinicians, we generally used the 2019 MIPS performance period data, including data submitted for the quality, improvement activities, and Promoting Interoperability performance categories. We supplemented this information with CAHPS for MIPS and CAHPS for ACOs, the revised total per capita cost measure and Medicare Spending Per Beneficiary (MSPB) clinician measures that were finalized in the CY 2020 PFS final rule (84 FR 62969 through 62977), and other data sets.¹⁵⁴ We calculated a hypothetical final score for the 2021 MIPS performance period/2023 MIPS payment year for each MIPS eligible clinician using score estimates described in this section for quality, cost, Promoting Interoperability, and improvement activities performance categories.

¹⁵⁴ Data submitted to MIPS for the 2018 MIPS performance period data was used for the improvement score for the quality performance category. We also incorporated some additional data sources when available to represent more current data.

(a) Methodology To Estimate the Quality Performance Category Score

We estimated the quality performance category score using a similar methodology described in the CY 2020 PFS final rule (84 FR 63168 through 63169) with the following modifications that reflect the newly finalized policies for the 2021 MIPS performance period. As discussed in section IV.A.3.c.(1)(e)(i) of this final rule, we finalized as proposed to replace the All-Cause Readmission measure with the Hospital Wide Readmission measure and add the hip-knee complications measure for those for whom it is applicable. We used testing data for these new administrative claims measures.

As discussed in section IV.A.3.d.(1)(b) of this final rule, we are not finalizing our intent to use a performance period benchmark as opposed to a historical benchmark. Therefore, we used the 2019 MIPS performance period benchmarks because the performance data for this analysis came primarily from the 2019 MIPS performance period. The one exception where we used the 2019 MIPS performance period benchmarks was when we identified measures subject to the topped out scoring cap that was finalized (82 FR 53721 through 53727) using the 2020 MIPS performance period benchmark file. As discussed in section IV.A.3.c.(1) of this final rule, we applied the finalized quality performance category weight of 40 percent for the 2021 MIPS performance period.

Finally, we finalized the APM Performance Pathway policies as described in section IV.A.3.b. of this final rule. The APM Performance Pathway is available for APM entities and as discussed in section IV.A.3.(b).(3).(a) we are finalizing an alternate measure set consisting of the Web Interface measures for the CY 2021 performance period. For our RIA model, we assumed clinicians in APM Entities would continue to use the Web Interface collection type, if available, over the APM Performance Pathway. Due to data limitations, our analysis only applied Web Interface and the APM Performance Pathway scoring policies to ACO APM Entities. For ACOs, quality performance under the finalized APM Performance Pathway was modeled using Web Interface data for 2019 from the 2019 performance period submissions data. For the multiple chronic condition unplanned admissions measure under the APM Performance Pathway, the 2019 Shared Savings Program and the 2018 Next Generation ACO Model public use files

were used.¹⁵⁵ To estimate the Hospital Wide Readmission measure as finalized in section IV.A.3.c.(1)(e)(i), we aggregated the score for APM Entities. Data does not exist for APM performance pathway or MIPS quality measures for non-ACO APM Entities. Therefore, we assumed due to data limitations these non-ACO APM entities would not participate in the APP although they can participate in APP, either through the APP measures or Web Interface for the CY 2021 performance period. For the purposes of modeling, we assumed that their participating clinicians (or their groups) would participate in regular MIPS, and scored those clinicians using the available MIPS submissions of the clinician or its group. Therefore, because of data limitations our results may overestimate or underestimate the number of APM Entities that elect to participate in MIPS as an APM Entity and how they elect to participate.

(b) Methodology To Estimate the Cost Performance Category Score

In section IV.A.3.c.(2) of this final rule, we finalized as proposed a cost performance category weight of 20 percent for the 2021 MIPS performance period. We estimated the cost performance category score using the methodology described in the CY 2020 PFS final rule (84 FR 63169).

(c) Methodology To Estimate the Facility-Based Measurement Scoring

As finalized in the CY 2019 PFS final rule (83 FR 59856), we determine the eligible clinician's MIPS cost and quality performance category score in facility-based measurement based on Hospital VBP Program Total Performance Score for eligible clinicians or groups who meet the eligibility criteria, which we designed to identify those who primarily furnish services within a hospital. We estimated the facility-based score using the scoring policies finalized in the CY2018 Quality Payment Program final rule (82 FR 53763) and the methodology described in the CY 2020 PFS final rule (84 FR 63169).

(d) Methodology To Estimate the Promoting Interoperability Performance Category Score

In section IV.3.c.(4)(c)(ii)(B), we are finalizing as proposed to add the HIE bi-

directional exchange measure for the 2021 performance period and subsequent years as an optional alternative to the two existing measures: The Support Electronic Referral Loops by Sending Health Information measure and the Support Electronic Referral Loops by Receiving and Incorporating Health Information measure. This provision provides clinicians the option of either reporting the new measure or the two existing measures. In section IV.3.c.(4)(c)(i) of this final rule, we finalized as proposed for the PDMP measure to remain optional and to double the bonus points from 5 to 10 points.

We used the CY 2019 MIPS Promoting Interoperability performance period data submissions data to estimate CY 2021 MIPS performance for the Promoting Interoperability performance category. Due to technical limitations, the data used do not capture the following policy changes between the CY 2019 and CY 2021 performance periods: (1) The doubling of the bonus points for clinicians who submitted the PDMP measure, (2) the removal of the Verify Opioid Treatment Agreement measure data, a measure that was finalized in the CY 2019 performance period (83 FR 59806) but removed in the CY 2020 performance period (84 FR 62994), and (3) the adoption of the finalized Health Information Exchange bi-directional exchange measure for the CY 2021 performance period. As a result, the estimated Promoting Interoperability performance category scores for the CY 2021 performance period may be a slight over- or underestimate of performance in the Promoting Interoperability performance category.

(e) Methodology To Estimate the Improvement Activities Performance Category Score

We modeled the improvement activities performance category score based on CY 2019 MIPS performance period data and APM participation identified in section VIII.H.15.b of this final rule. We continued to apply the methodology described in the CY 2020 PFS final rule (84 FR 63170) to assign an improvement activities performance category score. For the APM participants identified in section IV.A.3.b.(2) of this final rule, as there was no APM performance pathway score in the previous final rule, we assigned an improvement activity performance category score of 100 percent.

(f) Methodology To Estimate the Complex Patient Bonus

In section IV.A.3.d.(2)(a) of this final rule, we finalized as proposed to continue the complex patient bonus for the 2021 MIPS performance period. Consistent with the policy to define complex patients as those with high medical risk or with dual eligibility, our scoring model used the complex patient bonus information calculated for the 2019 performance period data.

(g) Methodology To Estimate the Final Score

As discussed in sections IV.A.3.c.(1)(b), IV.A.3.c.(2)(a), and summarized in section IV.A.3.d.(2)(b) of this final rule, our model assigned a final score for each TIN/NPI by multiplying each performance category score by the corresponding performance category weight, adding the products together, multiplying the sum by 100 points, and adding the complex patient bonus. After adding any applicable bonus for complex patients, we reset any final scores that exceeded 100 points equal to 100 points. For MIPS eligible clinicians who were assigned a weight of zero percent for any performance category, we redistributed the weights according to section IV.A.3.d.(2)(b)(iii) of this final rule.

(h) Methodology To Estimate the MIPS Payment Adjustment

As described in section IV.A.3.e.(2) of this final rule, we applied the finalized hierarchy to determine which final score should be used for the payment adjustment for each MIPS eligible clinician when more than one final score is available.

We then calculated the parameters of an exchange function in accordance with the statutory requirements related to the linear sliding scale, budget neutrality, minimum and maximum adjustment percentages and additional payment adjustment for exceptional performance (as finalized under § 414.1405), using the performance threshold of 60 points previously finalized in the CY 2020 PFS final rule (84 FR 63037) and the previously finalized additional performance threshold of 85 points (84 FR 63039 through 63040). In the alternatives considered discussed in section VIII.I.2. of this rule, we include the key statistics if the performance threshold was 50 as proposed in the CY 2021 PFS proposed rule (85 FR 50318). We used these resulting parameters to estimate the positive or negative MIPS payment adjustment based on the estimated final score and the paid amount for covered

¹⁵⁵ The public use files for the 2019 Medicare Shared Savings Program and 2018 Next Generation ACO Model can be accessed at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/sharesavingsprogram/program-data-and-innovation-models/>

professional services furnished by the MIPS eligible clinician. As discussed in section VIII.H.15.c. of this final rule, we adjusted the paid amount of non-engaged clinicians to equal their proportion of paid amount prior to the PHE for COVID-19.

(3) Impact of Payments by Practice Size

Using the assumptions provided above, our model estimates that \$458 million would be redistributed through budget neutrality and that \$500 million would be distributed to MIPS eligible clinicians that meet or exceed the additional performance threshold. The mean final score is 79.80 and the median is 85.27.

The model further estimates that the maximum positive payment adjustments are 5.3 percent after considering the MIPS payment adjustment and the additional MIPS payment adjustment for exceptional performance. In the alternatives considered discussed in section VIII.I.2. of this rule, we include the details of the model in which the performance threshold was set to 50, which had been proposed in the 2021 PFS proposed rule. In this alternate model, \$388 million would be redistributed through budget neutrality and the maximum positive payment adjustments would be 4.9 percent.

Table 109 shows the impact of the payment adjustments by practice size and based on whether clinicians are expected to submit data to MIPS. We estimate that a smaller proportion of clinicians in small practices (1–15

clinicians) who participate in MIPS will receive a positive or neutral payment adjustment compared to larger sized practices. Table 109 also shows that 93.0 percent of MIPS eligible clinicians that participate in MIPS are expected to receive positive or neutral payment adjustments. We want to highlight that we are using 2019 MIPS performance period submissions data to simulate a 2021 MIPS performance period final score, and it is likely that there will be changes that we cannot account for at this time, including services and payments disrupted by the PHE for COVID-19 or clinicians changing behavior because of the performance thresholds increased for the 2021 MIPS performance period to avoid a negative payment adjustment. In particular, we have not accounted for potential clinicians who might elect to apply for the extreme and uncontrollable circumstances policies for the CY 2021 performance period that we discuss in section IV.A.3.d.(2)(b)(iv)(B) of this final rule.

The combined impact of negative and positive adjustments and the additional positive adjustments for exceptional performance as a percent of paid amount among those that do not submit data to MIPS was not the maximum negative payment adjustment of 9 percent possible because some MIPS eligible clinicians that do not submit data to MIPS receive a non-zero score for the cost performance category, which utilizes administrative claims data and does not require separate data submission to MIPS. Among those who

we estimate would not submit data to MIPS, 85 percent are in small practices (22,956 out of 27,115 clinicians who do not submit data). To address participation concerns, we have policies targeted towards small practices including technical assistance and special scoring policies to minimize burden and facilitate small practice participation in MIPS or APMs, which we describe in section H.15.e.(4)(b)(iv) of this final rule. We intend to continue working with stakeholders to improve engagement in MIPS among clinicians in small practices. It should also be noted that the estimated number of clinicians who do not submit data to MIPS may be an overestimate of non-engagement in MIPS for the CY 2021 MIPS performance period. This is because the PHE for COVID-19 may have resulted in fewer clinicians submitting data to MIPS or more clinicians may elect to apply for the extreme and uncontrollable circumstances policies due to the PHE for COVID-19 for 2021 MIPS performance period. Therefore, engagement levels in MIPS for the CY 2021 MIPS performance period may be differ from these reported estimates. We also note this participation data is generally based off participation for the 2019 performance period, which is associated with the 2021 MIPS payment year and had a performance threshold of 30 points, and that participation may change for the 2021 performance period when the performance threshold is 60 points.

TABLE 109: MIPS Estimated Payment Year 2023 Impact on Total Estimated Paid Amount by Participation Status and Practice Size^a

Practice Size*	Number of MIPS eligible clinicians	Percent MIPS Eligible Clinicians with Positive or Neutral Payment Adjustment	Percent MIPS Eligible Clinicians with a Positive Adjustment with Exceptional Payment Adjustment	Percent MIPS Eligible Clinicians with Negative Payment Adjustment	Combined Impact of Negative and Positive Adjustments and Exceptional Performance Payment as Percent of Paid Amount**
Among those submitting data***					
1) 1-15	123,536	81.7%	46.9%	18.3%	1.0%
2) 16-24	40,688	87.5%	46.6%	12.5%	1.3%
3) 25-99	189,346	90.5%	50.6%	9.5%	1.5%
4) 100+	510,057	97.0%	55.6%	3.0%	1.7%
Overall	863,627	93.0%	52.9%	7.0%	1.4%
Among those not submitting data					
1) 1-15	22,956	0.0%	0.0%	100.0%	-8.6%
2) 16-24	1,225	0.0%	0.0%	100.0%	-8.7%
3) 25-99	2,212	0.0%	0.0%	100.0%	-8.7%
4) 100+	722	0.0%	0.0%	100.0%	-8.8%
Overall	27,115	0.0%	0.0%	100.0%	-8.6%

NOTE: Results of this model may change significantly if more clinicians apply for the application-based extreme and uncontrollable circumstances policy exception in CY 2021 because of the PHE for COVID-19.

*Practice size is the total number of TIN/NPIs in a TIN.

** 2019 data used to estimate 2021 performance period payment adjustments. Payments estimated using 2019 dollars trended to 2023. The percentage represents the total adjustments after taking all the positive adjustments and subtracting the negative adjustments for all MIPS eligible clinicians in the same respective practice size.

***Includes facility-based clinicians whose quality data is submitted through hospital programs.

As a sensitivity analysis of our COVID-19 adjustment on paid amount, we ran a model that did not adjust the paid amount of non-engaged clinicians to equal their proportion of paid amount prior to the PHE for COVID-19, our model estimates that \$601 million would be redistributed through budget neutrality. The model further estimates that the maximum positive payment adjustments are 5.9 percent after considering the MIPS payment

adjustment and the additional MIPS payment adjustment for exceptional performance.

(4) Additional Impacts From Outside Payment Adjustments

(a) Burden Overall

In addition to the payment adjustments, we are finalizing several policies that have an impact on burden in the CY 2021 and CY 2022 MIPS

performance periods. In section VII.B.5 of this final rule, we outline the costs of data collection that includes both policy updates and adjustments due to the use of updated data sources. For each finalized proposal included in this regulation which impacts our estimate of collection burden, the incremental burden for each is summarized in Table 110. We also provide additional burden discussions that we are not able to quantify.

TABLE 110: Incremental Burden from Associated Finalized Policies

Burden Description and associated finalized proposals	Burden Hours	Burden Dollars
Total burden associated with continuing the policies and ICRs set forth in the CY 2020 PFS final rule into the 2021 and 2022 MIPS performance periods (as discussed in section VII.B.5.p)	1,478,504	\$ 144,456,084
Burden change due to finalized policy to sunset the CMS Web Interface measures as a collection type/submission type for CY 2022*	-5,926	-\$ 541,507
Burden change due to finalized policy to require QCDRs and qualified registries to conduct targeted data audits, if necessary	730	\$ 67,496
Burden change due to new ICR for Nomination of MVPs	300	\$ 45,467
Burden change due to finalized policy to add a survey-based measure on telehealth to the CAHPS for MIPS Survey	100	\$ 2,565
Burden change due to finalized policy to allow APM Entities to submit an extreme and uncontrollable circumstances exception application	1.75	\$ 162
Burden change due to finalized policy to require nominated improvement activities to be linked to existing and related quality and cost measures, as applicable and feasible	31	\$ 4,698
Total change in burden due to policy	-4,763	-\$ 421,117
Total burden set forth in the CY 2021 PFS final rule	1,473,741	\$ 144,034,968

* The total change in burden due to this policy includes a decrease in burden due to elimination of the “Quality Data Submission: CMS Web Interface collection type” ICR beginning with the 2022 MIPS performance period and “Group Registration for CMS Web Interface” ICR beginning with the 2022 MIPS performance period as well as an increase in burden for the “Quality Data Submission: MIPS CQM and QCDR collection type” and “Quality Data Submission: eCQM collection type” ICRs beginning with the 2022 MIPS performance period for respondents who previously submitted via the CMS Web Interface submitting data via an alternate collection type. See section VII.B.5. of this final rule.

(b) Additional Impacts to Clinicians

(i) Web Interface

As discussed in section IV.A.3.c.(1)(c) of this final rule, we are finalizing to sunset the CMS Web Interface measures as a collection type for groups and virtual groups with 25 or more eligible clinicians starting with the 2022 performance period. We recognize that the sunset of the CMS Web Interface for groups and virtual groups may be burdensome to current groups and virtual groups submitting quality data on CMS Web Interface measures. Such groups and virtual groups will need to select a different collection type/submission type and redesign their systems to be able to interact with the new collection type/submission type. Given that the Medicare Part B claims collection type is limited to small practices, the alternatives for these groups and virtual groups will be either the MIPS CQM, QCDR or eCQM collection types. Given the size of the affected groups and virtual groups, we believe the majority are likely to already be using a QCDR, qualified registry, or EHR as part of their practice workflow. Of the 3,613 TINs comprised of 25 or more clinicians who submitted MIPS data via a collection type other than the

CMS Web Interface, 57 percent reported via the MIPS CQM and QCDR collection type and 43 percent reported via the eCQM collection type. For groups converting from Web Interface, there will be some non-recurring costs associated with modifying clinical and MIPS data reporting workflows to utilize an alternate collection type. For any remaining groups and virtual groups there will also be registry fees paid to a QCDR or qualified registry or the financial expense of purchasing/licensing and deploying an EHR system. Because we are unable to assess either the existing workflows of each individual group and virtual group or the decisions each group and virtual group will make in response to this finalized proposal, we cannot quantify the resulting economic impact. While there may be an initial increase in burden for current groups and virtual groups utilizing the CMS Web Interface measures having to transition to the utilization of a different collection type/submission type, we recognize that we will also be reducing reporting requirements. Groups and virtual groups will no longer have to completely report on all pre-determined CMS Web Interface measures and will be able to

select their own measures (at least 6) to report.

Groups and virtual groups account for less than 20 percent of organizations utilizing the CMS Web Interface measures while ACOs participating in the Medicare Shared Savings Program and Next Generation ACO Model account for more than 80 percent. With an 80 percent reduction and a continued decrease interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures, it is not fiscally viable, feasible, or sustainable for MIPS to continue to make available the CMS Web Interface measures as a collection type/submission type. There would be proportionally higher costs associated with the operationalization and maintenance of the CMS Web Interface with a significantly smaller number of groups and virtual groups utilizing the CMS Web Interface. In assessing the utilization of the CMS Web Interface by groups and virtual groups, there has been a substantial decrease in participation each year since the inception of MIPS in the 2017 performance period. From 2017 to 2019, the number of groups eligible to report quality measures via the CMS Web Interface (groups registered to utilize the

CMS Web Interface) decreased by approximately 45 percent. Similarly, the number of groups utilizing the CMS Web Interface as a collection type decreased by approximately 40 percent from 2017 to 2019. In our cost analysis, operating and maintaining the CMS Web Interface for significantly smaller number of groups and virtual groups would not be cost-effective. To operate and maintain the CMS Web Interface measures solely for groups and virtual groups, there would be an increase in cost and needed resources under MIPS associated with the items such as the establishment and maintenance of CMS Web Interface benchmarks, assignment and sampling, technical support, and education and outreach; thus, there would be proportionally higher costs associated with the operationalization and maintenance of the CMS Web Interface with a significantly smaller number of groups and virtual groups utilizing the CMS Web Interface measures as a collection type/submission type.

(ii) Administrative Claims Measure

As discussed in section IV.A.3.c.(1)(d), we are finalizing as proposed to add two new administrative claims measures beginning in the 2021 MIPS performance period and for future performance periods. We acknowledge there are administrative burdens and related financial costs associated with each administrative claims measure that clinicians, groups, and organizations may choose to monitor. However, because these costs can vary significantly due to organizational size, number of administrative claims measures being reported, volume of clinicians reporting each measure, and the specific methods employed to improve performance, we are unable to provide an estimate of the financial impact each clinician, group, or organization may experience. In summary, we are acknowledging that while there is no data submission requirements per § 414.1325(a)(2)(i) for administrative claim measures, there may be associated costs for clinicians and group practices to monitor new administrative claim measures; however, we are unable to quantify that impact.

(iii) Modifications to the Improvement Activities Inventory

As discussed in section IV.A.3.c.(3)(b)(iii) of this final rule, we are finalizing the removal of one obsolete improvement activity, modification of two existing improvement activities, and adoption of the COVID-19 improvement activity

added via IFC. We refer readers to Appendix 2 of this final rule for further details. We do not believe these finalized changes to the inventory will impact time or financial burden on stakeholders because MIPS eligible clinicians are still required to submit the same number of activities and the per response time for each activity is uniform. We do not expect these finalized changes to the inventory to affect our currently approved information collection burden estimates in terms of neither the number of estimated respondents nor the burden per response. We anticipate that the vast majority of clinicians performing improvement activities, to comply with existing MIPS policies, will continue to perform the same activities under the policies established in this final rule because previously finalized improvement activities continue to apply for the current and future years unless otherwise modified per rulemaking (82 FR 54175). Most of the improvement activities in the Inventory remain unchanged for the 2020 MIPS performance period.

(c) Stakeholders Nominating Improvement Activities

In section IV.A.3.c.(3)(b)(i)(A)(bb) of this final rule, we are finalizing as proposed to make an exception to the established timeframe for nomination of improvement activities, such that during a PHE, stakeholders can nominate improvement activities outside of the established Annual Call for Activities timeframe. While we expect additional nominations may be received as a result of this exception, we do not have any data with which to estimate what the additional number may be but we assume the additional costs associated with nominating new improvement activities are unchanged. Additionally, in section IV.A.3.c.(3)(b)(ii)(B) of this rule, we are finalizing as proposed beginning with the CY 2021 performance period and future years to consider agency-nominated improvement activities. We are unable to estimate the number of improvement activity nominations we will receive, but similar to the per respondent estimate we have provided in section VII.B.5.j. of this final rule, we assume it will require 3 hours at \$55.75/hr for a GS-13 Step 5 to nominate an improvement activity for a total cost of \$167.25 (3 hrs × \$55.75/hr) per activity.

(iv) Impact on Small Practices

As described in section VIII.H.15.e.(3) of this final rule RIA, we found 85 percent of clinicians who did not submit data to MIPS were in small

practices. However, the estimated number of MIPS eligible clinicians who do not submit data and receive a negative payment adjustment, including those in small practices, may be smaller in the CY 2021 performance period due to the PHE for COVID-19. For example, clinicians in small practices may avoid a negative payment adjustment due to non-engagement if they apply for the application-based extreme and uncontrollable circumstances policy exception for the CY 2021 performance period. Furthermore, CMS is committed to identifying flexibilities and options to help clinicians in small practices participate meaningfully and successfully in MIPS. Specifically, CMS excludes individual MIPS eligible clinicians or groups with less than or equal to \$90,000 in allowed charges for covered professional services under the Medicare PFS, fewer than or equal to 200 Medicare Part B patients who are furnished covered professional services under the Medicare PFS, or fewer than or equal to 200 covered professional services under the Medicare PFS. We continue to give solo practitioners and practices with 10 or fewer clinicians the choice to form a virtual group to participate with other practices. For the quality performance category, we continue to: (1) Allow clinicians in small practices to continue submitting quality data for covered professional services at both the individual and group level through the Medicare Part B claims submission type; (2) award small practices 3 points for quality measures that don't meet data completeness requirements; and (3) award 6 bonus points to small practices, as long as one measure is submitted. For the Promoting Interoperability performance category, we continue to allow clinicians to apply to have this category reweighted to zero (if not qualified for automatic reweighting) for: (1) Small practices; (2) clinicians with insufficient internet connectivity; (3) clinicians with extreme and uncontrollable circumstances; (4) lack of control over availability of certified EHR technology (CEHRT); and (5) use of decertified EHR technology. For the improvement activities performance category, small practices and those in rural locations and in health professional shortage areas (or HPSAs) have reduced reporting requirements. For small practices or those located in a rural or HPSAs: (1) Medium-weighted activities are worth 20 points of the total category score; and (2) High-weighted activities are worth 40 points of the total category score. Finally, in terms of technical assistance, we launched the Small, Underserved,

and Rural Support initiative to provide free, customized technical assistance to clinicians in small practices. This 5-year program was funded by the Medicare Access and CHIP Reauthorization Act (MACRA). The Quality Payment Program technical assistance initiative in 2017 was part of our comprehensive education and outreach effort to help clinicians successfully participate in the Quality Payment Program. Our technical assistance achieved notable success during the first 2 years of the program, including receiving customer satisfaction ratings of 99.8 percent in 2017 and 98.7 percent in 2018. We also recognize that our technical assistance initiative led to a 95 percent participation rate in 2017.

(d) Impact on Third Party Intermediaries

In section IV.A.3.g. of this rule, we finalized as proposed multiple changes to the third party intermediary regulations at § 414.1400. Specifically, we are: (1) Amending current requirements for approval of third party intermediaries to take into account past performance and provision of inaccurate information regarding MIPS program requirements to eligible clinicians; (2) requiring attendance by all third party intermediaries for training and support sessions; (3) requiring that QCDRs and qualified registries must conduct an annual data validation audit and if one or more deficiencies or data errors are identified also conduct targeted audits; (4) incrementally increasing requirements for QCDR measure testing and clarify what is meant by full testing; and (5) requiring third party intermediaries to submit a CAP to address identified deficiencies and data issues as well as actions to prevent recurrence.

With regard to the amendments to current requirements for approval of third party intermediaries, we do not anticipate this to require any additional effort for affected entities as the revision is to allow CMS to utilize already available information to make approval decisions.

The finalized requirement for attendance at training and support sessions and the associated burdens on third parties closely aligns to expectations previously established in the CY 2017 Quality Payment Program final rule (81 FR 77367 through 77374) and (81 FR 77384 through 77386). With regard to survey vendors, we previously finalized the CMS-approved survey vendor approval criteria in § 414.1400(e) as discussed in the CY 2018 PFS final rule (83 FR 59907 through 59908). Among the approval criteria, § 414.1400(e)(3) established the

requirement that the entity has successfully completed, and has required its subcontractors to successfully complete, vendor training(s) administered by CMS or its contractors. Therefore, we assume no additional impact for survey vendors as a result of this finalized proposal. We do not have data on the number of health IT vendors that missed training and support sessions, but the most recent data cites 684 health IT developers through program year 2016 of the Medicare EHR Incentive Program.¹⁵⁶ In CY 2019, 16 total training and support sessions were missed by 14 QCDRs and 33 total sessions were missed by 27 qualified registries. Based on historical frequency and duration, we expect future training and support sessions to continue occurring monthly for approximately 2 hours each. For QCDRs and qualified registries, we estimate an impact of 98 hours [(16 sessions by QCDRs + 33 sessions by qualified registries) × 2 hours]. We lack insight into the exact occupation of session attendees, but for estimating purposes we assume a Physician labor rate of \$212.78/hr and estimate a total burden of \$20,852 (\$212.78/hr × 98 hours).

We do not anticipate a significant impact to QCDRs and qualified registries resulting from the finalized proposal to require QCDRs and qualified registries to conduct an annual data validation audit and if one or more deficiencies or data errors are identified also conduct targeted audits. First, we are not revising our burden estimates because the finalized data validation requirements are similar to existing expectations which we have already accounted for the associated burden as stated in the CY 2017 Quality Payment Program final rule (81 FR 77383 through 77384) and the CY 2019 PFS final rule (83 FR 59998 through 59999). Second, we believe that the finalized requirements for conduct of the data validation audits are aligned with methods and procedures which stakeholders currently utilize.

With regard to the proposal to require QCDRs and qualified registries to conduct targeted audits if one or more data errors are identified during data validation audits, we sought comment on the expected frequency of targeted audits and the anticipated scope of effort. We did not receive comments related to the expected frequency of targeted audits and the anticipated scope of the effort. However, we are including burden estimates associated

with this finalized requirement in section VII.B.5.c.(2) and (3) of the Collection of Information for this rule. Due to the unknown scope of patient records that may need to be audited, we estimate a range of effort to complete a targeted data audit from a minimum of 5 hours to a maximum of 10 hours at a cost ranging from \$462.30 (\$92.46/hr × 5 hrs) to \$924.60 (\$92.46/hr × 10 hrs) per targeted audit. In the 2019 MIPS performance period, 37 of the 84 qualified registries (44%) and 23 of the 77 QCDRs (30%) that submitted 2019 MIPS quality data were required to complete a targeted audit. Based on the results of the 2020 self-nomination period, 58 QCDRs and 127 qualified registries have been approved for the 2021 MIPS performance period; assuming the same percentages, we estimate a total of 73 QCDRs and qualified registries (58 × 30% + 127 × 44%) will be required to complete targeted audits. Per these assumptions, we estimate the total impact associated with completing targeted audits will range from 365 hours (73 audits × 5 hrs/audit) at a cost of \$33,748 (73 audits × \$462.30/audit) to 730 hours (73 audits × 10 hrs/audit) at a cost of \$67,496 (73 audits × \$924.60/audit).

Because the finalized proposal to incrementally increase requirements for QCDR measure testing is not changing the requirements for fully testing measures, but is instead implementing an incremental approach to achieve previously finalized requirements, we do not anticipate any additional impact as a result of the finalized policy.

As discussed in section VII.B.5.c.(3) of this rule, we estimate the total burden impact associated with the provision to require CAPs to be 30 hours (10 respondents × 3 hr/respondent) at a cost of \$2,774 for all respondents (10 respondents × \$277.38/respondent).

f. Assumptions & Limitations

We note several limitations to our estimates of clinicians' MIPS eligibility and participation, negative MIPS payment adjustments, and positive payment adjustments for the 2023 MIPS payment year. Due to the PHE for COVID-19, we are aware that there may be changes in health care delivery and billing patterns that will impact results for the 2023 MIPS payment year that we were not able to model with our historic data sources. The scoring model results presented in this final rule assume that CY 2019 Quality Payment Program data submissions and performance are representative of CY 2021 Quality Payment Program data submissions and performance. The estimated performance for CY 2021 MIPS

¹⁵⁶ <https://dashboard.healthit.gov/quickstats/pages/FIG-Vendors-of-EHRs-to-Participating-Professionals.php>.

performance period using CY 2019 Quality Payment Program data may be underestimated because the performance threshold to avoid a negative payment adjustment for the 2019 MIPS performance period/2021 MIPS payment year was significantly lower (30 out of 100 points) than the performance threshold for the 2021 MIPS performance period/2023 MIPS payment year (60 out of 100). We anticipate clinicians may submit more performance categories to meet the higher performance threshold to avoid a negative payment adjustment. Finally, with the PHE for COVID-19 continuing in the 2021 MIPS performance period, we are uncertain of how many clinicians will apply for extreme and uncontrollable circumstances policy and not be required to submit data to MIPS.

In our MIPS eligible clinician assumptions, we assumed that clinicians who elected to opt-in in the CY 2019 Quality Payment Program and submitted data would continue to elect to opt-in in the CY 2020 performance period. It is difficult to predict whether clinicians will elect to opt-in to participate in MIPS with the finalized policies.

There are additional limitations to our estimates: (1) To the extent that there are year-to-year changes in the data submission, volume and mix of services provided by MIPS eligible clinicians, the actual impact on total Medicare revenues will be different from those shown in Table 109; and (2) our cost data does not overlap with CY 2019 so we may not be capturing performance for all clinicians. Due to the limitations described, there is considerable uncertainty around our estimates that is difficult to quantify.

I. Alternatives Considered

This final rule contains a range of policies, including some provisions related to specific statutory provisions. The preceding preamble provides descriptions of the statutory provisions that are addressed, identifies those policies when discretion has been exercised, presents rationale for our policies and, where relevant, alternatives that were considered. For purposes of the payment impact on PFS services of the policies contained in this final rule, we presented the estimated impact on total allowed charges by specialty.

1. Alternatives Considered for the MDPP Expanded Model Emergency Policy

For the MDPP Expanded Model Emergency Policy, no alternatives were considered. If we do not take action it

will have an extremely negative impact to MDPP supplier and beneficiaries; which would threaten the success of the entire expanded model; as beneficiaries would become ineligible and not be able to finish the program, MDPP suppliers would not be paid for services rendered, and no new cohorts of set of MDPP services could be started, effectively ending the expanded model test.

2. Alternatives Considered for the Quality Payment Program

For purposes of the payment impact on the Quality Payment Program, we view the performance threshold as a critical factor affecting the distribution of payment adjustments. We ran a separate model with a performance threshold of 50 which was previously proposed in the CY 2021 PFS proposed rule (85 FR 50318) as an alternative to the finalized performance threshold of 60. The model with a performance threshold of 50 has the same mean and median final score as our model of finalized policies since the performance threshold does not change the final score. We estimate that \$388 million would be redistributed through budget neutrality. There would be a maximum payment adjustment of 4.9 percent after considering the MIPS payment adjustment and the additional MIPS payment adjustment for exceptional performance. In addition, 4.5 percent of MIPS eligible clinicians would receive a negative payment adjustment among those that submit data.

In addition, we view the cost performance category weight as a critical factor affecting final scores. We ran two separate models with cost performance category weights of 15 and 30, with corresponding quality performance category weights of 45 and 30, respectively (as an alternative to the finalized cost performance category weight of 20 and quality performance category weight of 40) to estimate the impact of keeping the weights consistent with the CY 2020 PFS final rule and a more aggressive increase in the cost performance category weight. The model with a cost performance category weight of 15 has a mean score of 80.21 and a median score of 86.07. The model with a cost performance category weight of 30 has a mean score of 78.38 and a median score 83.18. We refer readers to section IV.A.3.c.(2)(a) for additional discussion on the selection of the cost performance category weight.

Finally, we report the findings if Web Interface were removed as a collection type in the CY 2021 performance period. The model with the removal of Web Interface as a collection type has a final score mean of 78.36 and median of

83.05. We estimate that \$459 million would be redistributed through budget neutrality. There would be a maximum payment adjustment of 6.6 percent after considering the MIPS payment adjustment and the additional MIPS payment adjustment for exceptional performance. In addition, 7.2 percent of MIPS eligible clinicians would receive a negative payment adjustment among those that submit data.

3. Alternatives Considered for Changes Related to Scopes of Practice

With regard to the proposal concerning supervision of diagnostic tests by certain NPPs, an alternative would be to maintain the status quo. That is, we could maintain the basic rule under § 410.32(b)(1) that allows only physicians as defined under Medicare law to supervise the performance of diagnostic tests. In that case, the pool of practitioners who could supervise diagnostic tests would remain at current levels and certain NPPs would be limited under Medicare from practicing to the full extent allowed by their state license and scope of practice. However, this alternative would fail to address the mandates established in E.O. 13890.

With regard to the provision to allow a PTA/OTA to furnish maintenance therapy services, an alternative would be maintaining the status quo to require the PT/OT to personally furnish all maintenance therapy services. However, this alternative would not address the mandates established in E.O. 13890. It would also be inconsistent with our policy in SNF and home health settings when payment for therapy is made under Part A, maintenance therapy can be furnished by a PT/OT or delegated to be performed by a PTA/OTA.

4. Alternatives Considered for Refinements to Values for Certain Services To Reflect Revisions to Payment for Office/Outpatient Evaluation and Management (E/M) Visits and Promote Payment Stability During the PHE for COVID-19

As we noted in section II.F. of this final rule, we sought comment on how we might refine the utilization assumptions for HCPCS add on code G2211. In the proposed rule, we assumed that HCPCS add on code G2211 would be reported with all office/outpatient visits for the specialties listed in the following public use file at <https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/Downloads/CY2020-PFS-FR-EM-Add-on-Code.zip>.

As we discussed in section II.F. of this final rule, we considered alternative assumptions regarding utilization for HCPCS add-on code G2211. Several commenters suggested that CMS reduce its utilization assumptions to between 10 percent and 25 percent of reported office/outpatient E/M visits and could range as high as 25 percent of reported office/outpatient E/M visits. These commenters cited that it would take time for medical societies to educate their members about appropriate use, ongoing implementation of the office/outpatient E/M visit codes, electronic health records integration, and the persistence of the COVID-19 pandemic in many parts of the country. Thus, one alternative was to assume that HCPCS add-on code G2211 would be reported for 25 percent of office/outpatient E/M visits listed in the public use file. As we noted in section II.F. of this final rule, while we generally agree with commenters that practitioners will not report HCPCS add-on code G2211 with every visit, we disagree that it will be as low as 25 percent of all reported visits.

We also considered an alternative where these specialties would report HCPCS add-on code G2211 with their office/outpatient E/M visits 90 percent of the time. As we noted in section II.F. of this final rule, because we are not implementing any additional policies that restrict the billing of this code, we are assuming that utilization will be 90 percent of office/outpatient E/M visits for these specialties.

J. Impact on Beneficiaries

We do not believe these provisions will have a negative impact on beneficiaries given overall PFS budget neutrality.

1. Medicare Diabetes Prevention Program Expanded Model Emergency Policy

This change would have a positive impact on affected MDPP beneficiaries, as it would allow them to maintain eligibility for the program, and request virtual sessions if needed for successful completion of attendance and weight

loss milestones. It would also allow them to start set of MDPP services virtually, allowing remote digital technology to capture body weight measurement or self-reported weight measurements from a participant's personal home digital scale. Finally, if continuing with set of MDPP services is not an option for beneficiaries during the PHE for COVID-19, the Emergency Policy allows beneficiaries to restart their set of MDPP services, maximizing beneficiary options and access to MDPP both during the PHE for COVID-19 and after it ends.

2. Quality Payment Program

There are several changes in this rule that would have an effect on beneficiaries. In general, we believe that many of these changes, including those intended to improve accuracy in payment through regular updates to the inputs used to calculate payments under the PFS, would have a positive impact and improve the quality and value of care provided to Medicare beneficiaries. For example, several of the new measures include patient-reported outcomes, which may be used to help patients make more informed decisions about treatment options. Patient-reported outcome measures provide information on a patient's health status from the patient's point of view and may also provide valuable insights on factors such as quality of life, functional status, and overall disease experience, which may not otherwise be available through routine clinical data collection. Patient-reported outcomes are factors frequently of interest to patients when making decisions about treatment.

K. Estimating Regulatory Familiarization Costs

If regulations impose administrative costs on private entities, such as the time needed to read and interpret this rule, we should estimate the cost associated with regulatory review. Due to the uncertainty involved with accurately quantifying the number of entities that will review the rule, we assumed that the total number of unique

commenters on this year's proposed rule will be the number of reviewers of this rule. We acknowledge that this assumption may understate or overstate the costs of reviewing this rule. It is possible that not all commenters reviewed this year's rule in detail, and it is also possible that some reviewers chose not to comment on the rule. For these reasons we thought that the number of commenters would be a fair estimate of the number of reviewers of this rule. We welcomed any comments on the approach in estimating the number of entities which will review this rule.

We also recognized that different types of entities are in many cases affected by mutually exclusive sections of this rule, and therefore for the purposes of our estimate we assume that each reviewer reads approximately 50 percent of the rule. We sought comments on this assumption.

Using the wage information from the BLS for medical and health service managers (Code 11-9111), we estimate that the cost of reviewing this rule is \$110.74 per hour, including overhead and fringe benefits https://www.bls.gov/oes/current/oes_nat.htm. Assuming an average reading speed, we estimate that it would take approximately 8.0 hours for the staff to review half of this rule. For each facility that reviews the rule, the estimated cost is \$885.92 (8.0 hours × \$110.74). Therefore, we estimated that the total cost of reviewing this regulation is \$35,637,904 (\$885.92 × 40,227 reviewers on this year's proposed rule).

L. Accounting Statement

As required by OMB Circular A-4 (available at <http://www.whitehouse.gov/omb/circulars/a004/a-4.pdf>), in Tables 111 and 112 (Accounting Statements), we have prepared an accounting statement. This estimate includes growth in incurred benefits from CY 2020 to CY 2021 based on the FY 2021 President's Budget baseline.

TABLE 111: Accounting Statement: Classification of Estimated Expenditures

CATEGORY	TRANSFERS
CY 2021 Annualized Monetized Transfers	Estimated increase in expenditures of \$0.0 billion for PFS CF update.
From Whom To Whom?	Federal Government to physicians, other practitioners and providers and suppliers who receive payment under Medicare.

TABLE 112: Accounting Statement: Classification of Estimated Costs, Transfer, and Savings

CATEGORY	TRANSFER
CY 2021 Annualized Monetized Transfers of beneficiary cost coinsurance.	\$0.0 billion
From Whom to Whom?	Beneficiaries to Federal Government.

M. Conclusion

The analysis in the previous sections, together with the remainder of this preamble, provided an initial Regulatory Flexibility Analysis. The previous analysis, together with the preceding portion of this preamble, provides an RIA. In accordance with the provisions of Executive Order 12866, this regulation was reviewed by the Office of Management and Budget.

List of Subjects*42 CFR Part 400*

Grant programs—health, Health facilities, Health maintenance organizations (HMO), Medicaid, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 410

Diseases, Health facilities, Health professions, Laboratories, Medicare, Reporting and recordkeeping requirements, Rural areas, X-rays.

42 CFR Part 414

Administrative practice and procedure, Biologics, Diseases, Drugs, Health facilities, Health professions, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 415

Health facilities, Health professions, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 423

Administrative practice and procedure, Emergency medical services, Health facilities, Health maintenance organizations (HMO), Health professionals, Medicare, Penalties, Privacy, Reporting and recordkeeping requirements.

42 CFR Part 424

Emergency medical services, Health facilities, Health professions, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 425

Administrative practice and procedure, Health facilities, Health

professions, Medicare, Reporting and recordkeeping requirements.

For the reasons set forth in the preamble, the Centers for Medicare & Medicaid Services amends 42 CFR chapter IV as set forth below:

PART 400—INTRODUCTION; DEFINITIONS

- 1. The authority citation for part 400 continues to read as follows:

Authority: 42 U.S.C. 1302 and 1395hh, and 44 U.S.C. Chapter 35.

- 2. Section 400.200 is amended by revising the definition of “Public Health Emergency” to read as follows:

§ 400.200 General definitions.

* * * * *

Public Health Emergency (PHE) means the Public Health Emergency determined to exist nationwide as of January 27, 2020, by the Secretary pursuant to section 319 of the Public Health Service Act on January 31, 2020, as a result of confirmed cases of COVID-19, including any subsequent renewals.

* * * * *

PART 410—SUPPLEMENTARY MEDICAL INSURANCE (SMI) BENEFITS

- 3. The authority citation for part 410 continues to read as follows:

Authority: 42 U.S.C. 1302, 1395m, 1395hh, 1395rr, and 1395ddd.

- 4. Section 410.15 is amended in paragraph (a)—

■ a. By adding a definition for “A review of any current opioid prescriptions” in alphabetical order;

■ b. In the definition of “First annual wellness visit providing personalized prevention plan services” by revising paragraph (xi) and adding paragraphs (xii) and (xiii);

■ c. In the definition of “Subsequent annual wellness visit providing personalized prevention plan services” by revising paragraph (ix) and adding paragraphs (x) and (xi).

The additions and revisions read as follows:

§ 410.15 Annual wellness visits providing Personalized Prevention Plan Services: Conditions for and limitations on coverage.

(a) * * *

A review of any current opioid prescriptions means, with respect to the individual determined to have a current prescription for opioids, all of the following:

- (i) A review of the potential risk factors to the individual for opioid use disorder;
- (ii) An evaluation of the individual’s severity of pain and current treatment plan;
- (iii) The provision of information on non-opioid treatment options; and
- (iv) A referral to a specialist, as appropriate.

* * * * *

First annual wellness visit providing personalized prevention plan services

* * *

(xi) Furnishing of a review of any current opioid prescriptions as that term is defined in this section.

(xii) Screening for potential substance use disorders including a review of the individual’s potential risk factors for substance use disorder and referral for treatment as appropriate.

(xiii) Any other element determined appropriate through the national coverage determination process.

* * * * *

Subsequent annual wellness visit providing personalized prevention plan services * * *

(ix) Furnishing of a review of any current opioid prescriptions as that term is defined in this section.

(x) Screening for potential substance use disorders including a review of the individual’s potential risk factors for substance use disorder and referral for treatment as appropriate.

(xi) Any other element determined appropriate through the national coverage determination process.

* * * * *

- 5. Section 410.16 is amended in paragraph (a)—

■ a. By adding the definition for “A review of any current opioid prescriptions” in alphabetical order;

■ b. In the definition of “Initial preventive physical examination” by revising paragraphs (6) and (7) and adding paragraphs (8) and (9).

The additions and revisions read as follows:

§ 410.16 Initial preventive physical examination: Conditions for and limitations on coverage.

(a) * * *

A review of any current opioid prescriptions means, with respect to the individual determined to have a current prescription for opioids, all of the following:

(i) A review of the potential risk factors to the individual for opioid use disorder;

(ii) An evaluation of the individual’s severity of pain and current treatment plan;

(iii) The provision of information on non-opioid treatment options; and

(iv) A referral to a specialist, as appropriate.

* * * * *

Initial preventive physical examination * * *

(6) A review of any current opioid prescriptions as defined in this section.

(7) Screening for potential substance use disorders to include a review of the individual’s potential risk factors for substance use disorder and referral for treatment as appropriate.

(8) Education, counseling, and referral, as deemed appropriate by the physician or qualified nonphysician practitioner, based on the results of the review and evaluation services described in this section.

(9) Education, counseling, and referral, including a brief written plan such as a checklist provided to the individual for obtaining an electrocardiogram, as appropriate, and the appropriate screening and other preventive services that are covered as separate Medicare Part B benefits as described in sections 1861(s)(10), (jj), (nn), (oo), (pp), (qq)(1), (rr), (uu), (vv), (xx)(1), (yy), (bbb), and (ddd) of the Act.

* * * * *

■ 6. Section 410.32 is amended by—

■ a. Revising paragraphs (b)(1) and (b)(2)(iii)(B);

■ b. Adding paragraph (b)(2)(ix); and

■ c. Revising paragraph (b)(3)(ii).

The revisions and addition read as follows:

§ 410.32 Diagnostic x-ray tests, diagnostic laboratory tests, and other diagnostic tests: Conditions.

* * * * *

(b) * * *

(1) *Basic rule.* Except as indicated in paragraph (b)(2) of this section, all

diagnostic x-ray and other diagnostic tests covered under section 1861(s)(3) of the Act and payable under the physician fee schedule must be furnished under the appropriate level of supervision by a physician as defined in section 1861(r) of the Act or, to the extent that they are authorized to do so under their scope of practice and applicable State law, by a nurse practitioner, clinical nurse specialist, physician assistant, certified registered nurse anesthetist, or a certified nurse-midwife. Services furnished without the required level of supervision are not reasonable and necessary (see § 411.15(k)(1) of this chapter).

(2) * * *

(iii) * * *

(B) Furnished under the general supervision of a physician or clinical psychologist; or under the general supervision of a nurse practitioner, clinical nurse specialist, physician assistant, certified registered nurse anesthetist or certified nurse-midwife, to the extent they are authorized to perform the tests under their scope of practice and applicable State laws.

* * * * *

(ix) Diagnostic tests performed by a physician assistant authorized to perform the tests under their scope of practice and applicable State laws.

(3) * * *

(ii) *Direct supervision* in the office setting means the physician (or other supervising practitioner) must be present in the office suite and immediately available to furnish assistance and direction throughout the performance of the procedure. It does not mean that the physician (or other supervising practitioner) must be present in the room when the procedure is performed. Until the later of the end of the calendar year in which the PHE as defined in § 400.200 of this chapter ends or, December 31, 2021, the presence of the physician (or other practitioner) includes virtual presence through audio/video real-time communications technology (excluding audio-only).

* * * * *

■ 7. Section 410.67 is amended—

■ a. In paragraph (b), by revising paragraph (7) and adding paragraph (8) in the definition of “Opioid use disorder treatment service”;

■ b. By revising paragraph (d)(2)(i)(A); and

■ c. By adding paragraph (d)(4)(i)(E).

The additions and revision read as follows:

§ 410.67 Medicare coverage and payment of Opioid use disorder treatment services furnished by Opioid treatment programs.

* * * * *

(b) * * *

Opioid use disorder treatment service * * *

(7) Periodic assessment services required under § 8.12(f)(4) of this title, that are furnished during a face-to-face encounter, including services furnished via two-way interactive audio-video communication technology, as clinically appropriate, and in compliance with all applicable requirements. During the Public Health Emergency, as defined in § 400.200 of this chapter, in cases where a beneficiary does not have access to two-way audio-video communications technology, periodic assessments can be furnished using audio-only telephone calls if all other applicable requirements are met.

(8) Opioid antagonist medications that are approved by the Food and Drug Administration under section 505 of the Federal Food, Drug, and Cosmetic Act for the emergency treatment of known or suspected opioid overdose and overdose education furnished in conjunction with opioid antagonist medication.

* * * * *

(d) * * *

(2) * * *

(i) * * *

(A) *Implantable and injectable medications.* For implantable and injectable medications, the payment is determined using the methodology set forth in section 1847A of the Act, except that the payment amount must be 100 percent of the ASP, if ASP is used; and the payment must be 100 percent of the wholesale acquisition cost (WAC), if WAC is used.

* * * * *

(4) * * *

(i) * * *

(E) Take-home supply of opioid antagonist medications that are approved by the Food and Drug Administration under section 505 of the Federal, Food, Drug and Cosmetic Act for the emergency treatment of known or suspected opioid overdose and overdose education furnished in conjunction with opioid antagonist medication, an adjustment will be made when these medications are dispensed. This adjustment will be limited to once every 30 days, except when a further take home supply of these medications is medically reasonable and necessary. The opioid treatment program must document in the medical record the reason(s) for the exception. The amount of the drug component of the

adjustment will be determined using the methodology in paragraph (d)(2)(i) of this section. The amount of the non-drug component of the adjustment will be determined based on the CY 2020 Medicare payment rate for CPT code 96161.

* * * * *

■ 8. Section 410.78 is amended by revising paragraph (a)(3) and (f) to read as follows:

§ 410.78 Telehealth services.

(a) * * *

(3) *Interactive telecommunications system* means multimedia communications equipment that includes, at a minimum, audio and video equipment permitting two-way, real-time interactive communication between the patient and distant site physician or practitioner.

* * * * *

(f) *Process for adding or deleting services.* Except as otherwise provided in this paragraph (f), changes to the list of Medicare telehealth services are made through the annual physician fee schedule rulemaking process. During the Public Health Emergency, as defined in § 400.200 of this chapter, we will use a subregulatory process to modify the services included on the Medicare telehealth list during the Public Health Emergency, taking into consideration infection control, patient safety, and other public health concerns resulting from the emergency. CMS maintains the list of services that are Medicare telehealth services under this section, including the current HCPCS codes that describe the services on the CMS website.

■ 9. Section 410.79 is amended by revising paragraphs (c)(3)(i) and (ii) and (e) to read as follows:

§ 410.79 Medicare Diabetes Prevention Program expanded model: Conditions of coverage.

* * * * *

(c) * * *

(3) * * *

(i) Except as set forth in paragraph (c)(3)(ii) of this section—

(A) The MDPP services period ends upon completion of the core services period described in paragraph (c)(2)(i) of this section, unless the MDPP beneficiary qualifies for the first ongoing maintenance session interval, in accordance with paragraph (c)(1)(ii) of this section.

(B) If the MDPP beneficiary qualifies for the first ongoing maintenance session interval as described in paragraph (c)(1)(ii) of this section, the MDPP services period ends upon

completion of that maintenance session interval, unless the MDPP beneficiary qualifies for a subsequent ongoing maintenance session interval, in accordance with paragraph (c)(1)(iii) of this section, in which case the MDPP service period ends upon completion of the last ongoing maintenance session interval for which the beneficiary qualified.

(ii) In the case of an applicable 1135 waiver event as defined in paragraph (e) of this section, the MDPP services period may be suspended and resumed or restarted in accordance with paragraph (e) of this section.

* * * * *

(e) *MDPP expanded model emergency policy.* (1) Notwithstanding paragraphs (a) through (d) of this section, the policies described in this paragraph (e) apply during the Public Health Emergency (PHE) as defined in § 400.200 of this chapter and during any future 1135 waiver event that CMS determines may disrupt in-person MDPP services (an “applicable 1135 waiver event”). For purposes of this paragraph (e), “1135 waiver event” means an emergency period and emergency area, as such terms are defined in section 1135(g) of the Act, for which the Secretary has authorized one or more waivers under section 1135 of the Act.

(2)(i) CMS determines that an 1135 waiver event may disrupt in-person MDPP services if MDPP suppliers would likely be unable to conduct classes in-person, or MDPP beneficiaries would likely be unable to attend in-person classes, for reasons related to health, safety, or site availability or suitability. Health and safety reasons may include, but are not limited to, the avoidance of transmission of contagious diseases, compliance with laws and regulations during an 1135 waiver event, or the physical safety of MDPP beneficiaries and MDPP coaches, as defined in § 424.205(a) of this chapter, during an 1135 waiver event.

(ii) If CMS determines that an 1135 waiver event may disrupt in-person MDPP services, CMS will communicate such determination for purposes of the policies described in this paragraph (e), to all affected MDPP suppliers.

(3) The following changes apply under this paragraph (e), when CMS has determined that an 1135 waiver event may disrupt in-person MDPP services:

(i) The in-person attendance requirements of paragraphs (c)(1)(ii)(A) and (c)(1)(iii)(A) of this section do not apply.

(ii) MDPP suppliers may start new cohorts during the PHE as defined in

§ 400.200 of this chapter or an applicable 1135 waiver event only if a baseline weight measurement can be obtained as described in paragraph (e)(3)(iii) of this section.

(iii) MDPP suppliers can obtain weight measurements for MDPP beneficiaries for the baseline weight and any weight loss based performance achievement goals in the following manner:

(A) In-person, when the weight measurement can be obtained safely and in compliance with all applicable laws and regulations;

(B) Via digital technology, such as scales that transmit weights securely via wireless or cellular transmission; or

(C) Self-reported weight measurements from the at-home digital scale of the MDPP beneficiary. Self-reported weights must be obtained during live, synchronous online video technology, such as video chatting or video conferencing, wherein the MDPP coach observes the beneficiary weighing themselves and views the weight indicated on the at-home digital scale, a date-stamped photo or video recording of the beneficiary's weight with the beneficiary visible on the scale, or a recording of the beneficiary's weight, with the beneficiary visible on the scale, submitted by the MDPP beneficiary to the MDPP supplier. The photo or video must clearly document the weight of the MDPP beneficiary as it appears on his/her digital scale on the date associated with the billable MDPP session.

(iv) The virtual session limits described in paragraphs (d)(2) and (d)(3)(i) and (ii) of this section do not apply, and MDPP suppliers may provide all MDPP sessions virtually during the PHE as defined in § 400.200 of this chapter or applicable 1135 waiver event. If the beneficiary began the MDPP services period virtually, or changed from in-person to virtual services during the PHE as defined in § 400.200 of this chapter or applicable 1135 waiver event, he/she may continue to receive the MDPP set of services virtually even after the PHE or 1135 waiver event has concluded, until the end of the beneficiary's MDPP services period, so long as the provision of virtual services complies with all of the following requirements:

(A) The curriculum furnished during the virtual session addresses the same CDC-approved DPP curriculum topic as the regularly scheduled session.

(B) The MDPP supplier furnishes to the MDPP beneficiary a maximum of one virtual make-up session on the same day as a regularly scheduled session.

(C) The MDPP supplier furnishes to the MDPP beneficiary a maximum of one virtual make-up session per week.

(D) Virtual sessions are furnished in a manner consistent with the DPRP standards for virtual sessions.

(E) The MDPP supplier offers virtual sessions only upon an individual MDPP beneficiary's request or agreement to receive services virtually.

(F) The MDPP supplier offers to an MDPP beneficiary:

(1) No more than 16 virtual sessions offered weekly during the core session period, months 1 through 6 of the MDPP services period;

(2) No more than 6 virtual sessions offered monthly during the core maintenance session interval periods, months 7 through 12 of the MDPP services period; and

(3) No more than 12 virtual sessions offered monthly during the ongoing maintenance session intervals, months 13 through 24.

(v) MDPP suppliers may suspend the in-person delivery of the set of MDPP services, when necessary due to the applicable 1135 waiver event, and subsequently resume in-person services either upon the end date of the 1135 waiver event emergency period or an effective date specified by CMS. Upon resumption of the set of MDPP services on an in-person basis, the following paragraphs apply:

(A) Beneficiaries who were receiving MDPP services as of March 31, 2020 whose in-person sessions are suspended due to the PHE as defined in § 400.200 of this chapter may elect to restart the set of MDPP services at the beginning or resume with the most recent attendance session of record.

(B) Beneficiaries who begin the set of MDPP services on or after January 1, 2021 who are in the first 12 months of the set of MDPP services as of the start of an applicable 1135 waiver event, whose in-person sessions are suspended due to the applicable 1135 waiver event, and who elect not to continue with MDPP services virtually, may elect to restart the set of MDPP services at the beginning or may resume with the most recent attendance session of record.

(C) Beneficiaries who began the set of MDPP services on or after January 1, 2021 who are in the second year of the set of MDPP services as of the start of an applicable 1135 waiver event, whose in-person sessions are suspended due to the applicable 1135 waiver event, and who elect not to continue with MDPP services virtually, may restart the ongoing maintenance session interval in which they were participating at the start of the applicable 1135 waiver event

or may resume with the most recent attendance session of record.

(D) Beneficiaries whose in-person sessions are suspended due to the applicable 1135 waiver event who elect to continue with MDPP services virtually, as described in paragraph (e)(2)(i) of this section, are not eligible to restart the set of MDPP services at a later date, but may elect to suspend the virtual set of MDPP services and resume the set of in-person MDPP services with the most recent attendance session of record.

(E) Beneficiaries may make an election as described in paragraph (e)(3)(v)(A), (B), (C), or (D) of this section, as applicable, only one time per applicable 1135 waiver event.

(F) Beneficiary eligibility, as described in paragraph (c)(1)(i) of this section, will not be impacted by any changes to the beneficiary's body mass index (BMI) or reduction in hemoglobin A1c, fasting plasma glucose, or 2-hour plasma glucose test values achieved during the set of MDPP services or any intervening time in which a beneficiary has suspended the set of MDPP services. MDPP suppliers will utilize the following weight measurements as the baseline weight for purposes of determining all weight-loss achievements:

(1) For an MDPP beneficiary who began receiving the set of MDPP services before March 31, 2020, has suspended services during an applicable 1135 waiver event, and then elects to restart the set of MDPP services at the first core session, the MDPP supplier must record a new baseline weight on the date of first core session that restarts the set of MDPP services.

(2) For an MDPP beneficiary who began receiving the set of MDPP services on or after January 1, 2021, has suspended services during an applicable 1135 waiver event, and then resumes the set of MDPP services either at the most recent attendance session of record or restarts the ongoing maintenance session interval in which they were participating at the start of the applicable 1135 waiver event, the MDPP supplier must use the baseline weight recorded at the beneficiary's first core session.

(vi) The minimum weight loss requirements for beneficiary eligibility in the ongoing maintenance session intervals described in paragraphs (c)(1)(ii)(B) and (c)(1)(iii)(B) of this section are waived only for MDPP beneficiaries who were receiving the MDPP set of services prior to January 1, 2021.

PART 414—PAYMENT FOR PART B MEDICAL AND OTHER HEALTH SERVICES

■ 10. The authority citation for part 414 continues to read as follows:

Authority: 42 U.S.C. 1302, 1395hh, and 1395rr(b)(l).

■ 11. Section 414.502 is amended by revising the definitions of “Data collection period” and “Data reporting period” to read as follows:

§ 414.502 Definitions.

* * * * *

Data collection period is the 6 months from January 1 through June 30 during which applicable information is collected and that precedes the data reporting period, except that for the data reporting period of January 1, 2022 through March 31, 2022, the data collection period is January 1, 2019 through June 30, 2019.

Data reporting period is the 3-month period, January 1 through March 31, during which a reporting entity reports applicable information to CMS and that follows the preceding data collection period, except that for the data collection period of January 1, 2019 through June 30, 2019, the data reporting period is January 1, 2022 through March 31, 2022.

* * * * *

■ 12. Section 414.504 is amended by revising paragraph (a)(1) to read as follows:

§ 414.504 Data reporting requirements.

(a) * * *

(1) For CDLTs that are not ADLTs, initially January 1, 2017 and every 3 years beginning January 1, 2022.

* * * * *

■ 13. Section 414.507 is amended by revising paragraphs (d) introductory text and (d)(4) and adding paragraph (d)(7) to read as follows:

§ 414.507 Payment for clinical diagnostic laboratory tests.

* * * * *

(d) *Phase-in of payment reductions.*

For years 2018 through 2024, the payment rates established under this section for each CDLT that is not a new ADLT or new CDLT, may not be reduced by more than the following amounts for—

* * * * *

(4) 2021—0.0 percent of the payment rate established in 2020.

* * * * *

(7) 2024—15 percent of the payment rate established in 2023.

* * * * *

■ 14. Section 414.1305 is amended—

- a. By revising the definition of “Attestation”;
- b. In the definition of “Certified Electronic Health Record Technology (CEHRT)” by revising paragraphs (1)(ii)(D) and (2)(ii) introductory text;
- c. By revising the definition of “Collection type”;
- d. By removing the definition of “Full TIN APM”;
- e. By revising the definitions of “Low-volume threshold”, “Meaningful EHR user for MIPS”, and “MIPS APM”;
- f. By adding definition for “Physician Compare” in alphabetical order; and
- g. By revising the definitions of “Primary care services”, “Submission type”, and “Submitter type”.

The revisions and addition read as follows:

§ 414.1305 Definitions.

* * * * *

Attestation means a secure mechanism, specified by CMS, with respect to a particular performance period, whereby a MIPS eligible clinician or group may submit the required data for the Promoting Interoperability or the improvement activities performance categories of MIPS in a manner specified by CMS.

* * * * *

Certified Electronic Health Record Technology (CEHRT) * * *

(1) * * *

(ii) * * *

(D) The certification criteria that are necessary to report on applicable objectives and measures specified for the MIPS Promoting Interoperability performance category, including the applicable measure calculation certification criterion at 45 CFR 170.314(g)(1) or (2) or 45 CFR 170.315(g)(1) or (2) for all certification criteria that support an objective with a percentage-based measure.

* * * * *

(2) * * *

(ii) Necessary to report on applicable objectives and measures specified for the MIPS Promoting Interoperability performance category including the following:

* * * * *

Collection type means a set of quality measures with comparable specifications and data completeness criteria, as applicable, including, but not limited to: Electronic clinical quality measures (eCQMs); MIPS Clinical Quality Measures (MIPS CQMs); QCDR measures; Medicare Part B claims measures; for the 2019 through 2023 MIPS payment years, CMS Web Interface measures; the CAHPS for MIPS

survey; and administrative claims measures.

* * * * *

Low-volume threshold means:

(1) For the 2019 MIPS payment year, the low-volume threshold that applies to an individual eligible clinician, group, or APM Entity group that, during the low-volume threshold determination period described in paragraph (4) of this definition, has Medicare Part B allowed charges less than or equal to \$30,000 or provides care for 100 or fewer Medicare Part B-enrolled individuals.

(2) For the 2020 MIPS payment year, the low-volume threshold that applies to an individual eligible clinician, group, or APM Entity group that, during the low-volume threshold determination period described in paragraph (4) of this definition, has allowed charges for covered professional services less than or equal to \$90,000 or furnishes covered professional services to 200 or fewer Medicare Part B-enrolled individuals.

(3) For the 2021 and 2022 MIPS payment years, the low-volume threshold that applies to an individual eligible clinician, group, or APM Entity group that, during the MIPS determination period, has allowed charges for covered professional services less than or equal to \$90,000, furnishes covered professional services to 200 or fewer Medicare Part B-enrolled individuals, or furnishes 200 or fewer covered professional services to Medicare Part B-enrolled individuals.

(4) For the 2019 and 2020 MIPS payment years, the low-volume threshold determination period is a 24-month assessment period consisting of:

- (i) An initial 12-month segment that spans from the last 4 months of the calendar year 2 years prior to the performance period through the first 8 months of the calendar year preceding to the performance period; and
- (ii) A second 12-month segment that spans from the last 4 months of the calendar year 1 year prior to the performance period through the first 8 months of the calendar year performance period. An individual eligible clinician, group, or APM Entity group that is identified as not exceeding the low-volume threshold during the initial 12-month segment will continue to be excluded under

§ 414.1310(b)(1)(iii) for the applicable year regardless of the results of the second 12-month segment analysis. For the 2019 MIPS payment year, each segment of the low-volume threshold determination period includes a 60-day claims run out. For the 2020 MIPS payment year, each segment of the low-volume threshold determination period includes a 30-day claims run out.

(5) Beginning with the 2023 MIPS payment year, the low-volume threshold that applies to an individual eligible clinician, or group that, during the MIPS determination period, has allowed charges for covered professional services less than or equal to \$90,000, furnishes covered professional services to 200 or fewer Medicare Part B-enrolled individuals, or furnishes 200 or fewer covered professional services to Medicare Part B-enrolled individuals.

Meaningful EHR user for MIPS means a MIPS eligible clinician who possesses CEHRT, uses the functionality of CEHRT, and reports on applicable objectives and measures specified for the Promoting Interoperability performance category for a performance period in the form and manner specified by CMS, supports information exchange and the prevention of health information blocking, and engages in activities related to supporting providers with the performance of CEHRT.

* * * * *

MIPS APM means:

(1) For the 2019 through 2022 MIPS payment years, an APM that meets the criteria specified under § 414.1370(b).

(2) Beginning with the 2023 MIPS payment year, an APM that meets the criteria as set forth in § 414.1367(b).

* * * * *

Physician Compare means the Physician Compare internet website of the Centers for Medicare & Medicaid Services (or a successor website).

Primary care services for purposes of CMS Web Interface and CAHPS for MIPS survey beneficiary assignment means the set of services identified by the following:

(1) CPT codes:

(i) 99201 through 99215 (codes for office or other outpatient visit for the evaluation and management of a patient); 99304 through 99318 (codes for professional services furnished in a nursing facility, excluding professional services furnished in a SNF for claims identified by place of service (POS) modifier 31); 99319 through 99340 (codes for patient domiciliary, rest home, or custodial care visit); 99341 through 99350 (codes for evaluation and management services furnished in a patient's home for claims identified by POS modifier 12); 99487, 99489, and 99490 (codes for chronic care management); and 99495 and 99496 (codes for transitional care management services); and

(ii) Beginning with the 2023 MIPS payment year, 99421, 99422, and 99423 (codes for online digital evaluation and management services (e-visit)); 99441,

99442, and 99443 (codes for telephone evaluation and management services); and 96160 and 96161 (codes for administration of health risk assessment).

(2) HCPCS codes:

(i) G0402 (code for the Welcome to Medicare visit); and G0438 and G0439 (codes for the annual wellness visits); and

(ii) Beginning with the 2023 MIPS payment year, G2010 (code for remote evaluation of patient video/images); and G2012 (code for virtual check-in).

Submission type means the mechanism by which the submitter type submits data to CMS, including, but not limited to:

- (1) Direct;
- (2) Log in and upload;
- (3) Log in and attest;
- (4) Medicare Part B claims; and
- (5) For the 2019 through 2023 MIPS payment years, the CMS Web Interface.

Submitter type means the MIPS eligible clinician, group, Virtual Group, APM Entity, or third party intermediary acting on behalf of a MIPS eligible clinician, group, Virtual Group, or APM Entity, as applicable, that submits data on measures and activities under MIPS.

■ 15. Section 414.1310 is amended by revising paragraphs (b)(1)(iii) and (e)(1) to read as follows:

§ 414.1310 Applicability.

* * * * *

(b) * * *

(1) * * *

(iii) Does not exceed the low volume threshold.

(A) Beginning with the 2021 MIPS payment year, if an individual eligible clinician or group exceeds at least one, but not all, of the low-volume threshold criteria and elects to participate in MIPS as a MIPS eligible clinician, the individual eligible clinician or group is treated as a MIPS eligible clinician for the applicable MIPS payment year. For such solo practitioners and groups that elect to participate in MIPS as a virtual group (except for APM Entity groups in MIPS APMs), the virtual group election under § 414.1315 constitutes an election under this paragraph (b)(1)(iii)(A) and results in the solo practitioners and groups being treated as MIPS eligible clinicians for the applicable MIPS payment year.

(B) For the 2021 and 2022 MIPS payment years, if an APM Entity group in a MIPS APM exceeds at least one, but not all, of the low-volume threshold criteria and elects to participate in MIPS as a MIPS eligible clinician, the APM

Entity group is treated as a MIPS eligible clinician for the applicable MIPS payment year. For such APM Entity groups in MIPS APMs, only the APM Entity group election can result in the APM Entity group being treated as MIPS eligible clinicians for the applicable MIPS payment year.

* * * * *

(e) * * *

(1) Except as provided under §§ 414.1317(b) and 414.1370(f)(2), each MIPS eligible clinician in the group will receive a MIPS payment adjustment factor (or additional MIPS payment adjustment factor) based on the group's combined performance assessment.

* * * * *

■ 16. Section 414.1317 is added to read as follows:

§ 414.1317 APM Entity groups.

(a) *APM entity group determination.* The APM Entity group will be determined according to the requirements set forth in § 414.1425(b)(1).

(1) In addition to the dates set forth in § 414.1425(b)(1), for purposes of MIPS, the APM Entity group includes an eligible clinician who is on a Participation List on December 31 of the MIPS performance period.

(2) For purposes of MIPS scoring, the APM Entity group will be comprised only of those eligible clinicians within the APM Entity group who are determined to be MIPS eligible at the individual or group level.

(3) For purposes of calculating the APM Entity group score, MIPS scores submitted by virtual groups will not be included.

(b) *APM Entity group scoring.* The MIPS final score calculated for the APM Entity is applied to each MIPS eligible clinician in the APM Entity group. The MIPS payment adjustment is applied at the TIN/NPI level for each of the MIPS eligible clinicians in the APM Entity group.

(1) *Determination of performance category score for each MIPS eligible clinician in an APM Entity.* For APM Entities, where a performance category is not reported by the APM Entity, CMS uses one score for each MIPS eligible clinician in an APM Entity group to derive a single average APM Entity score for the performance category. The applicable score for each MIPS eligible clinician is the higher of either:

(i) A group score based on the measure data for the performance category reported by a TIN for the MIPS eligible clinician according to MIPS submission and reporting requirements for groups.

(ii) An individual score based on the measure data for the performance category reported by the MIPS eligible clinician according to MIPS submission and reporting requirements for individuals.

(iii) In the event that a MIPS eligible clinician in an APM Entity receives an exception from the reporting requirements, such eligible clinician will be assigned a null score when CMS calculates the APM Entity's performance category score.

(2) *Cost scoring for APM Entity groups.* The cost performance category weight is zero percent for APM Entities in MIPS APMs.

(3) *Improvement scoring for APM Entity groups.* For an APM Entity for which CMS calculated a total performance category score for one or more participants in the APM Entity for the preceding MIPS performance period, CMS calculates an improvement score for each performance category for which a previous year's total performance category score is available as specified in § 414.1380(b).

(4) *Extreme and uncontrollable circumstances.* Beginning with the 2022 MIPS payment year, an APM Entity may submit to CMS an application described at § 414.1380(c)(2)(i)(A)(6) and (c)(2)(i)(C)(2) requesting reweighting of all four MIPS performance categories and for all MIPS eligible clinicians in the APM Entity group, based on extreme and uncontrollable circumstances.

(i) An APM Entity must demonstrate in its application to CMS that greater than 75 percent of its participant MIPS eligible clinicians would be eligible for reweighting the Promoting Interoperability performance category for the applicable performance period.

(ii) If CMS approves the request for reweighting based on an APM Entity's application, and if MIPS data are submitted for the APM Entity for the applicable performance period, all four of the MIPS performance categories will be reweighted for the APM Entity group notwithstanding the data submission.

■ 17. Section 414.1320 is amended by revising paragraphs (d) introductory text and (d)(1) and adding paragraph (g) to read as follows:

§ 414.1320 MIPS performance period.

* * * * *

(d) Beginning with the 2023 MIPS payment year, the performance period for:

(1) The quality and cost performance categories is the full calendar year (January 1 through December 31) that occurs 2 years prior to the applicable MIPS payment year, except as otherwise specified for administrative claims-

based measures in the MIPS final list of quality measures described in § 414.1330(a)(1).

* * * *

(g) For purposes of the 2024 MIPS payment year and each subsequent MIPS payment year, the performance period for:

(1) The Promoting Interoperability performance category is a minimum of a continuous 90-day period within the calendar year that occurs 2 years prior to the applicable MIPS payment year, up to and including the full calendar year.

(2) [Reserved]

■ 18. Section 414.1325 is amended by revising paragraph (c)(1) to read as follows:

§ 414.1325 Data submission requirements.

* * * *

(c) * * *

(1) For the quality performance category, the direct; login and upload; Medicare Part B claims (beginning with the 2021 MIPS payment year, for small practices only); and for the 2019 through 2023 MIPS payment years, CMS Web Interface (for groups consisting of 25 or more eligible clinicians or a third party intermediary submitting on behalf of a group) submission types.

* * * *

■ 19. Section 414.1330 is amended by adding paragraphs (b)(4) and (5) to read as follows:

§ 414.1330 Quality performance category.

* * * *

(b) * * *

(4) 40 percent of a MIPS eligible clinician's final score for the MIPS payment year 2023.

(5) 30 percent of a MIPS eligible clinician's final score for the MIPS payment year 2024 and future years.

■ 20. Section 414.1350 is amended by adding paragraphs (d)(4) and (5) to read as follows:

§ 414.1350 Cost performance category.

* * * *

(d) * * *

(4) 20 percent of the MIPS final score for MIPS payment year 2023.

(5) 30 percent of the MIPS final score for MIPS payment year 2024 and each subsequent MIPS payment year.

■ 21. Section 414.1367 is added to read as follows:

§ 414.1367 APM performance pathway.

(a) *General.* Beginning with the 2023 MIPS payment year, the APM Performance Pathway is a MIPS scoring methodology available to MIPS eligible clinicians identified on the Participation

List or Affiliated Practitioner List of an APM Entity participating in a MIPS APM.

(b) *Criteria for MIPS APMs.* MIPS APMs are those in which:

(1) APM Entities participate in the APM under an agreement with CMS or through a law or regulation; and

(2) The APM bases payment on quality measures and cost/utilization.

(c) *MIPS performance category scoring in the APM Performance Pathway—*(1) *Quality.* Except as provided in paragraphs (c)(1)(i) and (ii) of this section, the quality performance category score is calculated for a MIPS eligible clinician, group, or APM Entity group in accordance with § 414.1380(b)(1) based on the APM Performance Pathway quality measure set established by CMS through rulemaking for a MIPS payment year.

(i) Each submitted measure that does not have a benchmark or meet the case minimum requirement is excluded from the MIPS eligible clinician, group, or APM Entity group's total measure achievement points and total available measure achievement points.

(ii) Any measure that is identified as topped out is not subject to the scoring cap described at § 414.1380(b)(1)(iv).

(2) *Cost.* The cost performance category weight is zero percent for MIPS eligible clinicians who are scored through the APM Performance Pathway.

(3) *Improvement activities.* The improvement activities performance category score is calculated for a MIPS eligible clinician, group, or APM Entity group in accordance with § 414.1380(b)(3) based on the activities required by the MIPS APM that are included in the MIPS final inventory of improvement activities described in § 414.1355(a) (excluding any such activities that the MIPS eligible clinician, group, or APM Entity group does not perform). MIPS eligible clinicians, groups, or APM Entities may report additional improvement activities in accordance with § 414.1360.

(4) *Promoting interoperability.* The promoting interoperability performance category will be scored for the MIPS eligible clinician, group, or APM Entity as described in § 414.1375.

(d) *APM Performance Pathway performance category weights—*(1) *Performance category weights.* Subject to paragraph (d)(2) of this section, the performance category weights used to calculate the final score for a MIPS eligible clinician, group, or APM Entity reporting through the APM performance Pathway are:

(i) Quality: 50 percent.

(ii) Cost: 0 percent.

(iii) Improvement Activities: 20 percent.

(iv) Promoting Interoperability: 30 percent.

(2) *Reweight MIPS performance categories.* If CMS determines, in accordance with § 414.1380(c)(2), that a different scoring weight should be assigned to the quality or promoting interoperability performance category, CMS will redistribute the performance category weights as follows:

(i) If CMS reweights the quality performance category to 0 percent: Promoting Interoperability performance category is reweighted to 75 percent, and Improvement Activities performance category is reweighted to 25 percent.

(ii) If CMS reweights the Promoting Interoperability performance category to 0 percent: Quality performance category is reweighted to 75 percent, and Improvement Activities performance category is reweighted to 25 percent.

(e) *Final score.* The final score is calculated for a MIPS eligible clinician, group, or APM Entity in accordance with § 414.1380(c).

■ 22. Section 414.1370 is amended by revising paragraph (a) to read as follows:

§ 414.1370 APM scoring standard under MIPS.

(a) *General.* For the 2019 through 2022 MIPS payment years, the APM scoring standard is the MIPS scoring methodology applicable for MIPS eligible clinicians identified on the Participation List for the performance period of an APM Entity participating in a MIPS APM.

* * * *

■ 23. Section 414.1380 is amended—

■ a. By revising paragraph (b)(1)(i) introductory text;

■ b. In paragraph (b)(1)(i)(A)(1) by removing “for the 2019 through 2022 MIPS payment years” and adding in its place “for the 2019 through 2023 MIPS payment years”;

■ c. By revising paragraphs (b)(1)(iii);

■ d. In paragraph (b)(1)(v)(A)(1)(ii) by removing “For the 2019 through 2022 MIPS payment years” and adding in its place “For the 2019 through 2023 MIPS payments years”;

■ e. In paragraph (b)(1)(v)(B)(1)(i) by removing “For the 2019 through 2022 MIPS payment years” and adding in its place “For the 2019 through 2023 MIPS payment years”;

■ f. In paragraph (b)(1)(vi)(C)(4) by removing “For the 2020 through 2022 MIPS payment years” and adding in its place “For the 2020 through 2023 MIPS payment years”;

■ g. By revising paragraph (b)(1)(vii)(A);

- h. By removing paragraph (b)(1)(viii);
 - i. By revising paragraphs (c)(2)(i)(A)(4) and (5);
 - j. By adding paragraphs (c)(2)(ii)(E) and (F);
 - k. By revising paragraph (c)(3) introductory text and (c)(3)(iii); and
 - l. By adding paragraph (c)(3)(iv).
- The revisions and additions read as follows:

§ 414.1380 Scoring.

* * * * *

(b) * * *

(1) * * *

(i) *Measure achievement points.* For the 2019 through 2023 MIPS payment years, MIPS eligible clinicians receive between 3 and 10 measure achievement points (including partial points) for each measure required under § 414.1335 on which data is submitted in accordance with § 414.1325 that has a benchmark at paragraph (b)(1)(ii) of this section, meets the case minimum requirement at paragraph (b)(1)(iii) of this section, and meets the data completeness requirement at § 414.1340 and for each administrative claims-based measure that has a benchmark at paragraph (b)(1)(ii) of this section and meets the case minimum requirement at paragraph (b)(1)(iii) of this section. The number of measure achievement points received for each such measure is determined based on the applicable benchmark decile category and the percentile distribution. MIPS eligible clinicians receive zero measure achievement points for each measure required under § 414.1335 on which no data is submitted in accordance with § 414.1325. MIPS eligible clinicians that submit data in accordance with § 414.1325 on a greater number of

measures than required under § 414.1335 are scored only on the required measures with the greatest number of measure achievement points. Beginning with the 2021 MIPS payment year, MIPS eligible clinicians that submit data in accordance with § 414.1325 on a single measure via multiple collection types are scored only on the data submission with the greatest number of measure achievement points.

* * * * *

(iii) *Minimum case requirements.*

Except as otherwise specified for administrative claims-based measures in the MIPS final list of quality measures described in § 414.1330(a)(1), the minimum case requirement is 20 cases.

* * * * *

(vii) * * *

(A) For each measure that is submitted, if applicable, and impacted by significant changes, performance is based on data for 9 consecutive months of the applicable CY performance period. If such data are not available or may result in patient harm or misleading results, the measure is excluded from a MIPS eligible clinician's total measure achievement points and total available measure achievement points. For purposes of this paragraph (b)(1)(vii)(A), "significant changes" means changes to a measure that are outside the control of the clinician and its agents and that CMS determines may result in patient harm or misleading results. Significant changes include, but are not limited to, changes to codes (such as ICD-10, CPT, or HCPCS codes), clinical guidelines, or measure specifications. CMS will publish on the CMS website a list of all

measures scored under this paragraph (b)(1)(vii)(A) as soon as technically feasible, but by no later than the beginning of the data submission period at § 414.1325(e)(1).

* * * * *

(c) * * *

(2) * * *

(i) * * *

(A) * * *

(4) For the Promoting Interoperability performance category for the 2021, 2022 and 2023 MIPS payment years, the MIPS eligible clinician is a physical therapist, occupational therapist, clinical psychologist, qualified audiologist, qualified speech-language pathologist, or a registered dietitian or nutrition professional. In the event that a MIPS eligible clinician submits data for the Promoting Interoperability performance category, the scoring weight specified in paragraph (c)(1) of this section will be applied and its weight will not be redistributed.

(5) For the Promoting Interoperability performance category for the 2019, 2020, 2021, 2022, and 2023 MIPS payment years, the MIPS eligible clinician is a nurse practitioner, physician assistant, clinical nurse specialist, or certified registered nurse anesthetist. In the event that a MIPS eligible clinician submits data for the Promoting Interoperability performance category, the scoring weight specified in paragraph (c)(1) of this section will be applied and its weight will not be redistributed.

* * * * *

(ii) * * *

(E) For the 2023 MIPS payment year:

TABLE 6 TO PARAGRAPH (c)(2)(ii)(E)

Reweighting scenario	Quality (%)	Cost (%)	Improvement activities (%)	Promoting Interoperability (%)
No Reweighting Needed:				
Scores for all four performance categories	40	20	15	25
No Cost	55	0	15	30
No Promoting Interoperability	65	20	15	0
No Quality	0	20	15	65
No Improvement Activities	55	20	0	25
No Cost and no Promoting Interoperability	85	0	15	0
No Cost and no Quality	0	0	15	85
No Cost and no Improvement Activities	70	0	0	30
No Promoting Interoperability and no Quality	0	50	50	0
No Promoting Interoperability and no Improvement Activities	80	20	0	0
No Quality and no Improvement Activities	0	20	0	80

(F) For the 2024 MIPS payment year:

TABLE 7 TO PARAGRAPH (c)(2)(ii)(F)

Reweighting scenario	Quality (%)	Cost (%)	Improvement activities (%)	Promoting Interoperability (%)
No Reweighting Needed:				
Scores for all four performance categories	30	30	15	25
No Cost	55	0	15	30
No Promoting Interoperability	55	30	15	0
No Quality	0	30	15	55
No Improvement Activities	45	30	0	25
No Cost and no Promoting Interoperability	85	0	15	0
No Cost and no Quality	0	0	15	85
No Cost and no Improvement Activities	70	0	0	30
No Promoting Interoperability and no Quality	0	50	50	0
No Promoting Interoperability and no Improvement Activities	70	30	0	0
No Quality and no Improvement Activities	0	30	0	70

* * * * *

(3) *Complex patient bonus.* For the 2020, 2021, 2022, and 2023 MIPS payment years, provided that a MIPS eligible clinician, group, virtual group or APM entity submits data for at least one MIPS performance category for the applicable performance period for the MIPS payment year, a complex patient bonus will be added to the final score for the MIPS payment year, as follows:

* * * * *

(iii) The complex patient bonus cannot exceed 5.0 except as provided in paragraph (c)(3)(iv) of this section.

(iv) For the 2022 MIPS payment year, the complex patient bonus is calculated pursuant to paragraphs (c)(3)(i) and (ii) of this section, and the resulting numerical value is then multiplied by 2.0. The complex patient bonus cannot exceed 10.0.

* * * * *

■ 24. Section 414.1400 is amended—

■ a. By revising paragraphs (a)(2)(i) and (ii) and (a)(4);

■ b. By revising paragraph (b) heading and paragraph (b)(2) introductory text;

■ c. By adding paragraphs (b)(2)(iv) and (v);

■ d. By adding paragraphs (b)(3)(v)(C)(1) and (2);

■ e. By revising paragraphs (b)(3)(v)(E) and (b)(3)(vi);

■ f. By removing paragraphs (b)(3)(vii)(H) and (L);

■ g. By redesignating paragraphs (b)(3)(vii)(I), (J), (K), (M), and (N) as paragraphs (b)(3)(vii)(H), (I), (J), (K), and (L), respectively;

■ h. By revising paragraph (c) heading;

■ i. By adding paragraphs (c)(2)(iii) and (iv); and

■ j. By revising paragraph (f)(1)(i).

The additions and revisions read as follows:

§ 414.1400 Third party intermediaries.

(a) * * *

(2) * * *

(i) Except as provided under paragraph (a)(2)(ii) of this section, QCDRs, qualified registries, and Health IT vendors must be able to submit data for all of the following MIPS performance categories:

(A) Quality, except:

(1) The CAHPS for MIPS survey; and

(2) For qualified registries and Health IT vendors, QCDR measures;

(B) Improvement activities; and

(C) Promoting Interoperability, if the eligible clinician, group, or virtual group is using CEHRT; however, a third party intermediary may be excepted from this requirement if its MIPS eligible clinicians, groups or virtual groups fall under the reweighting policies at § 414.1380(c)(2)(i)(A)(4) or (5) or (c)(2)(i)(C)(1) through (7) or (c)(2)(i)(C)(9).

(ii) Health IT vendors that do not support MIPS Value Pathways must be able to submit data for at least one of the MIPS performance categories described in paragraphs (a)(2)(i)(A) through (C) of this section.

* * * * *

(4) Third party intermediary approval criteria—

(i) To be approved as a third party intermediary, an entity must agree to meet the applicable requirements of this section, including, but not limited to, the following:

(A) A third party intermediary's principle place of business and retention of any data must be based in the U.S.

(B) If the data is derived from CEHRT, a QCDR, qualified registry, or health IT vendor must be able to indicate its data source.

(C) All data must be submitted in the form and manner specified by CMS.

(D) If the clinician chooses to opt-in in accordance with § 414.1310, the third party intermediary must be able to transmit that decision to CMS.

(E) The third party intermediary must provide services throughout the entire performance period and applicable data submission period.

(F) Prior to discontinuing services to any MIPS eligible clinician, group, or virtual group during a performance period, the third party intermediary must support the transition of such MIPS eligible clinician, group, or virtual group to an alternate third party intermediary, submitter type, or, for any measure on which data has been collected, collection type according to a CMS approved a transition plan.

(ii) The determination of whether to approve an entity as a third party intermediary for a MIPS payment year may take into account:

(A) Whether the entity failed to comply with the requirements of this section for any prior MIPS payment year for which it was approved as third party intermediary; and

(B) Whether the entity provided inaccurate information regarding the requirements of this subpart to any eligible clinician.

(iii) Beginning with the 2023 MIPS payment year, third party intermediaries must attend and complete training and support sessions in the form and manner, and at the times, specified by CMS.

* * * * *

(b) *QCDRs.* * * *

(2) *QCDR conditions for approval.* In addition to the other requirements in this section, the criteria for an entity to be approved as a QCDR include the following:

* * * * *

(iv) Beginning with the 2023 payment year, the QCDR must conduct annual data validation audits in accordance with this paragraph (b)(2)(iv).

(A) The QCDR must conduct data validation for the payment year prior to submitting any data for that payment

year to CMS for purposes of the MIPS program.

(B) The QCDR must conduct data validation on data for each performance category for which it will submit data, including if applicable the Quality, Improvement Activities, and Promoting Interoperability performance categories.

(C) The QCDR must conduct data validation on data for each submitter type for which it will submit data, including if applicable MIPS eligible clinicians, groups, virtual groups, voluntary participants, and opt-in participants.

(D) The QCDR must use clinical documentation (provided by the clinicians they are submitting data for) to validate that the action or outcome measured actually occurred or was performed.

(E) The QCDR shall conduct each data validation audit using a sampling methodology that meets the following requirements:

(1) Uses a sample size of at least 3 percent of the TIN/NPIs for which the QCDR will submit data to CMS, except that if a 3 percent sample size would result in fewer than 10 TIN/NPIs, the QCDR must use a sample size of at least 10 TIN/NPIs, and if a 3 percent sample size would result in more than 50 TIN/NPIs, the QCDR may use a sample size of 50 TIN/NPIs.

(2) Uses a sample that includes at least 25 percent of the patients of each TIN/NPI in the sample, except that the sample for each TIN/NPI must include a minimum of 5 patients and does not need to include more than 50 patients.

(F) Each QCDR data validation audit must include the following:

(1) Verification of the eligibility status of each eligible clinician, group, virtual group, opt-in participant, and voluntary participant.

(2) Verification of the accuracy of TINs and NPIs.

(3) Calculation of reporting and performance rates.

(4) Verification that only the MIPS quality measures and QCDR measures, as applicable, that are relevant to the performance period will be used for MIPS submission.

(G) In a form and manner and by a deadline specified by CMS, the QCDR must report the results of each data validation audit, including the overall data deficiencies or data error rate, the types of deficiencies or data errors discovered, the percentage of clinicians impacted by any deficiency or error, and, how and when each deficiency or data error type was corrected.

(v) Beginning with the 2023 MIPS payment year, the QCDR must conduct

targeted audits in accordance with this paragraph (b)(2)(v).

(A) If a data validation audit under paragraph (b)(2)(iv) of this section identifies one or more deficiency or data error, the QCDR must conduct a targeted audit into the impact and root cause of each such deficiency or data error for that MIPS payment year.

(B) The QCDR must conduct any required targeted audits for the MIPS payment year and correct any deficiencies or data errors identified through such audit prior to the submission of data for that MIPS payment year.

(C) The QCDR must conduct the targeted audit using the sampling methodology that meets the requirements described in paragraph (b)(2)(iv)(E) of this section. The sample for the targeted audit must not include data from the sample used for the data validation audit in which the deficiency or data error was identified.

(D) In a form and manner and by a deadline specified by CMS, the QCDR must report the results of each targeted audit, including the overall deficiency or data error rate, the types of deficiencies or data errors discovered, the percentage of clinicians impacted by each deficiency or data error, and how and when each deficiency or data error type was corrected.

(3) * * *

(v) * * *

(C) * * *

(1) To be approved for the 2024 MIPS payment year, a QCDR measure must be face valid. To be approved for the 2025 MIPS payment year and future years, a QCDR measure must be face valid for the initial MIPS payment year for which it is approved and fully tested for any subsequent MIPS payment year for which it is approved.

(2) To be included in an MIPS Value Pathway for the 2024 MIPS payment year and future years, a QCDR measure must be fully tested.

* * * * *

(E) Beginning with the 2022 MIPS payment year, CMS may provisionally approve the individual QCDR measures for 1 year with the condition that QCDRs address certain areas of duplication with other approved QCDR measures or MIPS quality measures in order to be considered for the program in subsequent years. If such areas of duplication are not addressed, CMS may reject the duplicative QCDR measure.

(vi) Beginning with the 2023 MIPS payment year, QCDR measures may be approved for 2 years, at CMS discretion by attaining approval status by meeting QCDR measure considerations and

requirements. Upon annual review, CMS may revoke a QCDR measure's second year approval, if the QCDR measure is found to be: Topped out; duplicative of a more robust measure; reflects an outdated clinical guideline; or if the QCDR self-nominating the QCDR measure is no longer in good standing.

* * * * *
(c) *Qualified registries.* * * *
(2) * * *

(iii) Beginning with the 2023 payment year, the qualified registry must conduct annual data validation audits in accordance with this paragraph (c)(2)(iii).

(A) The qualified registry must conduct their data validation audits prior to submitting any data to CMS for purposes of the MIPS program.

(B) The qualified registry must conduct data validation on data for each performance category for which it will submit data, including if applicable the Quality, Improvement Activities, and Promoting Interoperability performance categories.

(C) The qualified registry must conduct data validation on data for each submitter type for which it will submit data, including if applicable MIPS eligible clinicians, groups, virtual groups, voluntary participants, and opt-in participants.

(D) The qualified registry must use clinical documentation (provided by the clinicians they are submitting data for) to validate that the action or outcome measured actually occurred or was performed.

(E) The qualified registry shall conduct each data validation audit using a sampling methodology that meets the following:

(1) Uses a sample size of at least 3 percent of the TIN/NPIs for which the qualified registry will submit data to CMS, except that if a 3 percent sample size would result in fewer than 10 TIN/NPIs, the qualified registry must use a sample size of at least 10 TIN/NPIs, and if a 3 percent sample size would result in more than 50 TIN/NPIs, the qualified registry may use a sample size of 50 TIN/NPIs.

(2) Uses a sample that includes at least 25 percent of the patients of each TIN/NPI in the sample, except that the sample for each TIN/NPI must include a minimum of 5 patients and does not need to include more than 50 patients.

(F) Each qualified registry data validation audit must include the following:

(1) Verification of the eligibility status of each eligible clinician, group, virtual group, opt-in participant, and voluntary participant.

(2) Verification of the accuracy of TINs and NPIs.

(3) Calculation of reporting and performance rates.

(4) Verification that only MIPS quality measures and qualified registry measures that are relevant to the performance period will be utilized for MIPS submission.

(G) In a form and manner and by a deadline specified by CMS, the qualified registry must report data validation results, including the overall deficiency or data error rate, the types of deficiencies or data errors discovered, the percentage of clinicians impacted by any deficiency or data error, how and when each deficiency or data error type was corrected.

(iv) Beginning with the 2023 MIPS payment year, the qualified registry must conduct targeted audits in accordance with this paragraph (c)(2)(iv).

(A) If a data validation audit under paragraph (c)(2)(iii) of this section identifies one or more deficiency or data error, the qualified registry must conduct a targeted audit into the impact and root cause of each such deficiency or data error for that MIPS payment year.

(B) The qualified registry must conduct any required targeted audits for the MIPS payment year and correct any deficiencies or data errors identified through such audit prior to the submission of data for that MIPS payment year.

(C) The qualified registry must conduct the targeted audit using the sampling methodology that meets the requirements described in paragraphs (c)(2)(iii)(E)(1) and (2) of this section. The sample for the targeted audit must not include data from the sample used for the data validation audit in which the deficiency or data error was identified.

(D) In a form and manner and by a deadline specified by CMS, the qualified registry must report the results of each targeted audit, including the overall deficiency or data error rate, the types of deficiencies or data errors discovered, the percentage of clinicians impacted by each deficiency or data error, how and when each deficiency or data error type was corrected.

* * * * *

(f) * * *

(1) * * *

(i) Require the third party intermediary to submit a corrective action plan (CAP) by a date specified by CMS. The CAP must address the following issues, unless different or additional information is specified by CMS:

(A) The issues that contributed to the non-compliance.

(B) The impact to individual clinicians, groups, or virtual groups, regardless of whether they are participating in the program because they are MIPS eligible, voluntary participating, or opting in to participating in the MIPS program.

(C) The corrective actions to be implemented by the third party intermediary to ensure that the non-compliance has been resolved and will not recur in the future.

(D) The detailed timeline for achieving compliance with the applicable requirements.

* * * * *

■ 25. Section 414.1435 is amended by revising paragraph (c)(1) to read as follows:

§ 414.1435 Qualifying APM participant determination: Medicare option.

* * * * *

(c) * * *

(1) Attributed beneficiaries are determined from each Advanced APM Entity's attributed beneficiary lists generated by each Advanced APM's specific attribution methodology except as set forth in this paragraph (c)(1).

(i) Beneficiaries who have been prospectively attributed to an APM Entity for a QP Performance Period will be excluded from the attribution-eligible beneficiary count for any other APM Entity that is participating in an APM where that beneficiary would be ineligible to be added to the APM Entity's attributed beneficiary list.

(ii) [Reserved]

* * * * *

■ 26. Section 414.1450 is amended by revising paragraphs (b)(1) and (c) to read as follows:

§ 414.1450 APM incentive payment.

* * * * *

(b) * * *

(1) The amount of the APM Incentive Payment is equal to 5 percent of the estimated aggregate payments for covered professional services as defined in section 1848(k)(3)(A) of the Act furnished during the calendar year immediately preceding the payment year. CMS uses the paid amounts on claims for covered professional services to calculate the estimated aggregate payments on which CMS will calculate the APM Incentive Payment.

* * * * *

(c) *APM Incentive Payment recipient.* CMS will pay the APM Incentive Payment amount for a payment year to a solvent TIN or TINs associated with the QP identified at a specific step in

the following hierarchy. If no TIN or TINs with which the QP has an association can be identified at a step, CMS will move to the next and successive steps listed in paragraphs (c)(1) through (8) of this section until CMS identifies a TIN or TINs with which the QP is associated, and to which CMS will make the APM Incentive Payment.

(1) Any TIN associated with the QP that, during the QP Performance Period, is associated with an APM Entity through which the eligible clinician achieved QP status;

(2) Any TIN associated with the QP that, during the APM Incentive Payment base period, is associated with an APM Entity through which the eligible clinician achieved QP status;

(3) Any TIN associated with the QP that, during the APM Incentive Payment base period, is associated with an APM Entity participating in an Advanced APM through which the eligible clinician had achieved QP status;

(4) Any TIN associated with the QP that, during the APM Incentive Payment base period, participated in an APM Entity in an Advanced APM;

(5) Any TIN associated with the QP that, during the APM Incentive Payment base period, participated with an APM Entity in any track of the APM through which the eligible clinician achieved QP status;

(6) Any TIN associated with the QP that, during the APM Incentive Payment base period, participated with an APM Entity in an APM other than an Advanced APM;

(7) Any TIN associated with the QP that submitted a claim for covered professional services furnished by the QP during the APM Incentive Payment base period, even if such TIN has no relationship to any APM Entity or APM; then

(8) If we have not identified any TIN associated with the QP to which we can make the APM Incentive Payment, we will attempt to contact the QP via a public notice to request their Medicare payment information. The QPs identified in the public notice, or any other eligible clinicians who believe that they are entitled to an APM Incentive Payment must then notify CMS of their claim as directed in the public notice by November 1 of the payment year, or 60 days after CMS announces that initial payments for the year have been made, whichever is later. After that time, any claims by a QP to an APM Incentive Payment will be forfeited for such payment year.

* * * * *

■ 27. Section 414.1455 is revised to read as follows:

§ 414.1455 Limitation on review.

(a) There is no right to administrative or judicial review under sections 1869, 1878, or otherwise, of the Act of the following:

(1) The determination that an eligible clinician is a QP or Partial QP under § 414.1425.

(2) The determination of the amount of the APM Incentive Payment under § 414.1450, including any estimation as part of such determination.

(b)(1) An eligible clinician or APM Entity may request targeted review of a QP or Partial QP determination only if they believe in good faith that, due to a CMS clerical error, an eligible clinician was omitted from a Participation List.

(2) If CMS determines that there was such a clerical error, if the QP determination for the eligible clinician would have been made at the APM Entity level under § 414.1425(b)(1), CMS will assign to the eligible clinician the most favorable QP status that was determined at the APM Entity level on any snapshot dates for the relevant QP Performance Period on which the eligible clinician participated in the APM Entity.

(3) The process for targeted review is as follows:

(i) An eligible clinician or APM Entity may submit a request for targeted review.

(ii) All requests for targeted review must be submitted during the targeted review request submission period, which is a 60-day period that begins with the publication of MIPS performance feedback as described at § 414.1385(a)(2). The targeted review request submission period may be extended as specified by CMS.

(iii) All requests for targeted review must be submitted in accordance with the form and manner specified by CMS.

(iv) A request for targeted review may be denied if the request is duplicative of another request for a targeted review; the request is not submitted during the targeted review request submission period; or the request is outside the scope of targeted review specified in this section. If the targeted review request is denied, CMS will make no changes to the QP status of the eligible clinician for whom targeted review was requested.

(v) CMS will respond to each timely submitted request for targeted review.

(vi) A request for targeted review may include additional information in support of the request at the time it is submitted. CMS may also request additional information from the requestor. If CMS requests additional information relating to the eligible

clinician or the APM Entity group that is the subject of a request for targeted review, responsive information must be provided and received by CMS within 30 days of the request. If CMS does not receive a timely response to a request for additional information, CMS may make a final decision on the targeted review request based on the information available.

(vii) If targeted review requests reveal a pattern of CMS error with impacts that extend beyond the scope of eligible clinicians or APM Entities that submitted such targeted review requests, CMS may adjust the QP status of other affected eligible clinicians as provided in paragraph (b)(2) of this section.

(viii) Decisions on a targeted review request are final, and not subject to any further administrative or judicial review in accordance with paragraph (a) of this section.

PART 415—SERVICES FURNISHED BY PHYSICIANS IN PROVIDERS, SUPERVISING PHYSICIANS IN TEACHING SETTINGS, AND RESIDENTS IN CERTAIN SETTINGS

■ 28. The authority citation for part 415 continues to read as follows:

Authority: 42 U.S.C. 1302 and 1395hh.

■ 29. Section 415.172 is amended by revising paragraph (a) introductory text, (a)(2), and (b) to read as follows:

§ 415.172 Physician fee schedule payment for services of teaching physicians.

(a) *General rule.* If a resident participates in a service furnished in a teaching setting, physician fee schedule payment is made only if a teaching physician is present during the key portion of any service or procedure for which payment is sought. In residency training sites that are located outside a metropolitan statistical area, physician fee schedule payment may also be made if a teaching physician is present during the key portion of the service, including for Medicare telehealth services, through audio/video real-time communications technology for any service or procedure for which payment is sought. For all teaching settings during the Public Health Emergency, as defined in § 400.200 of this chapter, for the COVID-19 pandemic, if a resident participates in a service furnished in a teaching setting, physician fee schedule payment is made if a teaching physician is present during the key portion of the service including for Medicare telehealth services, through audio/video real-time communications technology

for any service or procedure for which payment is sought.

* * * * *

(2) In the case of evaluation and management services, except as otherwise provided in this paragraph (a)(2), the teaching physician must be present in person during the portion of the service that determines the level of service billed. (However, in the case of evaluation and management services furnished in hospital outpatient departments and certain other ambulatory settings, the requirements of § 415.174 apply.)

(i) In residency training sites that are located outside of a metropolitan statistical area, the teaching physician may be present through audio/video real-time communications technology during the portion of the service that determines the level of service billed. (However, in the case of evaluation and management services furnished in hospital outpatient departments and certain other ambulatory settings, the requirements of § 415.174 apply.)

(ii) For all teaching settings during the Public Health Emergency, as defined in § 400.200 of this chapter, for the COVID-19 pandemic, the teaching physician may be present through audio/video real-time communications technology during the portion of the service that determines the level of service billed. (However, in the case of evaluation and management services furnished in hospital outpatient departments and certain other ambulatory settings, the requirements of § 415.174 apply.)

(b) *Documentation.* Except as otherwise provided in this paragraph (b), except for services furnished as set forth in §§ 415.174 (concerning an exception for services furnished in hospital outpatient and certain other ambulatory settings), §§ 415.176 (concerning renal dialysis services), and 415.184 (concerning psychiatric services), the medical records must document that the teaching physician was present at the time the service (including a Medicare telehealth service) is furnished. The presence of the teaching physician during procedures and evaluation and management services may be demonstrated by the notes in the medical records made by the physician or as provided in § 410.20(e) of this chapter.

(1) In residency training sites that are located outside of a metropolitan statistical area only, except for services furnished as set forth in §§ 415.174 (concerning an exception for services furnished in hospital outpatient and

certain other ambulatory settings), 415.176 (concerning renal dialysis services), and 415.184 (concerning psychiatric services), the medical records must document whether the teaching physician was physically present or present through audio/video real-time communications technology at the time the service (including a Medicare telehealth service) is furnished. The medical records must contain a notation describing the specific portion(s) of the service for which the teaching physician was present through audio/video real-time communications technology. The presence of the teaching physician during procedures and evaluation and management services may be demonstrated by the notes in the medical records made by the physician or as provided in § 410.20(e) of this chapter.

(2) For all teaching settings during the Public Health Emergency, as defined in § 400.200 of this chapter, for the COVID-19 pandemic, except for services furnished as set forth in §§ 415.174 (concerning an exception for services furnished in hospital outpatient and certain other ambulatory settings), 415.176 (concerning renal dialysis services), and 415.184 (concerning psychiatric services), the medical records must document whether the teaching physician was physically present or present through audio/video real-time communications technology at the time the service (including a Medicare telehealth service) is furnished. The medical records must contain a notation describing the specific portion(s) of the service for which the teaching physician was present through audio/video real-time communications technology. The presence of the teaching physician during procedures and evaluation and management services may be demonstrated by the notes in the medical records made by the physician or as provided in § 410.20(e) of this chapter.

* * * * *

■ 30. Section 415.174 is amended by revising paragraph (c) and adding paragraph (d) to read as follows:

§ 415.174 Exception: Evaluation and management services furnished in certain centers.

* * * * *

(c) For all teaching settings during the Public Health Emergency, as defined in § 400.200 of this chapter, for the COVID-19 pandemic, the requirements in paragraph (a)(3) of this section for a teaching physician to direct the care and then to review the services furnished by

each resident during or immediately after each visit may be met through audio/video real-time communications technology.

(d) In residency training sites that are located outside of a metropolitan statistical area only, the requirements in paragraph (a)(3) of this section for a teaching physician to direct the care and then to review the services furnished by each resident during or immediately after each visit may be met through audio/video real-time communications technology.

■ 31. Section 415.180 is revised to read as follows:

§ 415.180 Teaching setting requirements for the interpretation of diagnostic radiology and other diagnostic tests.

(a) *General rule.* Physician fee schedule payment is made for the interpretation of diagnostic radiology and other diagnostic tests if the interpretation is performed or reviewed by a physician other than a resident.

(1) In residency training sites that are located outside of a metropolitan statistical area only, physician fee schedule payment may also be made for the interpretation of diagnostic radiology and other diagnostic tests if the interpretation is performed by a resident when the teaching physician is present through audio/video real-time communications technology. The medical records must document the extent of the teaching physician's participation in the interpretation of review of the diagnostic radiology test.

(2) For all teaching settings during the Public Health Emergency, as defined in § 400.200 of this chapter, for the COVID-19 pandemic, physician fee schedule payment may also be made for the interpretation of diagnostic radiology and other diagnostic tests if the interpretation is performed by a resident when the teaching physician is present through audio/video real-time communications technology. The medical records must document the extent of the teaching physician's participation in the interpretation or review of the diagnostic radiology or diagnostic test.

(b) [Reserved]

■ 32. Section 415.184 is revised to read as follows:

§ 415.184 Psychiatric services.

(a) Physician fee schedule payment is made for psychiatric services furnished under an approved GME program if the requirements of §§ 415.170 and 415.172 are met, including documentation, except that the requirement for the presence of the teaching physician during the service in which a resident

is involved may be met by observation of the service by use of a one-way mirror, video equipment, or similar device.

(b) In residency training sites that are located outside of a metropolitan statistical area, the requirement for the presence of the teaching physician during the service in which a resident is involved may be met through audio/video real-time communications technology. The medical records must document the extent of the teaching physician's participation in the service.

(c) For all teaching settings during the Public Health Emergency, as defined in § 400.200 of this chapter, for the COVID-19 pandemic, the requirement for the presence of the teaching physician during the service in which a resident is involved may also be met through audio/video real-time communications technology. The medical records must document the extent of the teaching physician's participation in the service.

■ 33. Section 415.208 is amended by revising paragraph (b) heading and paragraph (b)(2) introductory text to read as follows:

§ 415.208 Services of moonlighting residents.

* * * * *

(b) *Services in teaching hospitals.*

* * *

(2) Services of residents that are not related to their approved GME programs and are performed in an outpatient department or emergency department of a hospital in which they have their training program are covered as physician services and payable under the physician fee schedule if criteria in paragraphs (b)(2)(i) through (iii) of this section are met. The services of residents that are not related to their approved GME programs and are furnished to inpatients of a hospital in which they have their training program are covered as physician services and payable under the physician fee schedule if criteria in paragraphs (b)(2)(i) through (iii) of this section are met. The medical record must include documentation to demonstrate in each case that these criteria are satisfied.

* * * * *

PART 423—VOLUNTARY MEDICARE PRESCRIPTION DRUG BENEFIT

■ 34. The authority citation for part 423 continues to read as follows:

Authority: 42 U.S.C. 1302, 1306, 1395w–101 through 1395w–152, and 1395hh.

■ 35. Section 423.160 is amended by adding paragraph (a)(5) to read as follows:

§ 423.160 Standards for electronic prescribing.

(a) * * *

(5) On January 1, 2021, prescribers must, except in circumstances in which the Secretary waives the requirement, conduct all prescribing for all Schedule II, III, IV, and V controlled substances electronically using the applicable standards in paragraph (b) of this section. Compliance actions against those not in compliance with this requirement will commence January 1, 2022.

* * * *

PART 424—CONDITIONS FOR MEDICARE PAYMENT

■ 36. The authority citation for part 424 continues to read as follows:

Authority: 42 U.S.C. 1302 and 1395hh.

■ 37. Section 424.67 is amended by—

- a. Revising paragraphs (b)(1) introductory text, (b)(1)(ii), (b)(2) and (3), and (b)(5) introductory text;
- b. Redesignating paragraphs (c) through (f) as paragraphs (d) through (g), respectively;
- c. Adding new paragraph (c); and
- d. Revising newly redesignated paragraph (e)(2)(i).

The revisions and additions read as follows:

§ 424.67 Enrollment requirements for opioid treatment programs (OTP).

* * * *

(b) * * *

(1) Fully complete and submit, as applicable, the Form CMS–855A or Form CMS–855B application (or their successor applications) and any applicable supplement or attachment thereto to its applicable Medicare contractor. This includes, but is not limited to, the following:

* * * *

(ii) Certifying via the Form CMS–855A or Form CMS–855B (as applicable) and/or the applicable supplement or attachment thereto that the OTP meets and will continue to meet the specific requirements and standards for enrollment described in paragraphs (b) and (e) of this section.

(2) Comply with the application fee requirements in § 424.514. (This includes OTPs enrolling under the circumstances described in paragraph (c)(2) of this section.)

(3)(i) Except as stated in paragraph (b)(3)(ii) of this section, successfully complete the assigned categorical risk level screening required under, as applicable, § 424.518(b) and (c).

(ii) For currently enrolled OTPs that are changing their OTP enrollment from

a Form CMS–855B enrollment to a Form CMS–855A enrollment, or vice versa, successfully complete the limited level of categorical screening under § 424.518(a) if the OTP has already completed, as applicable, the moderate or high level of categorical screening under § 424.518(b) or (c), respectively.

* * * *

(5) Report on the Form CMS–855A or Form CMS–855B (as applicable) and/or any applicable supplement all OTP staff who meet the definition of “managing employee” in § 424.502. Such individuals include, but are not limited to, the following:

* * * *

(c) *Clarification of required enrollment forms.* (1) An OTP may only be enrolled as an OTP via the Form CMS–855A or Form CMS–855B but not both.

(2) If a currently enrolled OTP is changing its OTP enrollment from a Form CMS–855B enrollment to a Form CMS–855A enrollment, or vice versa, the effective date of billing that was established for the OTP’s prior enrollment under §§ 424.520(d) and 424.521(a) is applied to the OTP’s new enrollment.

* * * *

(e) * * *

(2) * * *

(i) The provider does not have a current, valid certification by SAMHSA as required under paragraph (b)(4)(i) of this section or fails to meet any other applicable requirement or standard in this section, including, but not limited to, the OTP standards in paragraphs (b)(6) and (e)(1) of this section.

* * * *

■ 38. Section 424.518 is amended by redesignating paragraphs (a)(1)(xii) through (xvii) as paragraphs (a)(1)(xiii) through (xviii) and adding a new paragraph (a)(1)(xii) to read as follows:

§ 424.518 Screening levels for Medicare providers and suppliers.

* * * *

(a) * * *

(1) * * *

(xii) Opioid treatment programs (if § 424.67(b)(3)(ii) applies).

* * * *

PART 425—MEDICARE SHARED SAVINGS PROGRAM

■ 39. The authority citation for part 425 continues to read as follows:

Authority: 42 U.S.C. 1302, 1306, 1395hh, and 1395jjj.

■ 40. Section 425.100 is amended by revising paragraph (b) to read as follows:

§ 425.100 General.

* * * *

(b) An ACO is eligible to receive payments for shared savings under subpart G of this part if all of the following conditions are met:

(1) The ACO meets or exceeds the applicable minimum savings rate established under § 425.604, § 425.605, § 425.606, § 425.609, or § 425.610.

(2) The ACO meets the minimum quality performance standards established under § 425.500 (for performance years or a performance period beginning on or before January 1, 2020), or under the quality performance standard established under § 425.512 (for performance years beginning on or after January 1, 2021).

(3) The ACO otherwise maintains its eligibility to participate in the Shared Savings Program under this part.

* * * *

§ 425.112 [Amended]

■ 41. Section 425.112 is amended in paragraph (b)(2)(i) by removing the reference “§ 425.500” and adding in its place the references “§ 425.500 or § 425.510, as applicable”.

§ 425.200 [Amended]

■ 42. Section 425.200 is amended in paragraph (d) by removing the reference “§ 425.500(c)” and adding in its place the references “§ 425.500(c) or § 425.510, as applicable”.

■ 43. Section 425.204 is amended by—

- a. Revising paragraphs (f)(3)(i) through (iv);
- b. Adding paragraph (f)(3)(v); and
- c. Revising paragraphs (f)(4)(iv), (f)(5), and (f)(6)(ii) introductory text.

The revisions and addition read as follows:

§ 425.204 Content of the application.

* * * *

(f) * * *

(3) * * *

(i) An ACO participating in Track 2 must demonstrate the adequacy of its repayment mechanism prior to any change in the terms and type of the repayment mechanism, and at such other times as requested by CMS.

(ii) An ACO entering an agreement period in Levels C, D, or E of the BASIC track or the ENHANCED track must demonstrate the adequacy of its repayment mechanism prior to the start of its agreement period, prior to any change in the terms and type of the repayment mechanism, and at such other times as requested by CMS.

(iii) An ACO entering an agreement period in Level A or Level B of the BASIC track must demonstrate the

adequacy of its repayment mechanism prior to the start of any performance year in which it either elects to participate in, or is automatically transitioned to, a two-sided model, Level C, Level D, or Level E of the BASIC track, prior to any change in the terms and type of the repayment mechanism, and at such other times as requested by CMS.

(iv) An ACO that has submitted a request to renew its participation agreement must submit as part of the renewal request documentation demonstrating the adequacy of the repayment mechanism that could be used to repay any shared losses incurred for performance years in the next agreement period. The repayment mechanism applicable to the new agreement period may be the same repayment mechanism currently used by the ACO, provided that the ACO submits documentation establishing that the duration of the existing repayment mechanism has been revised to comply with paragraph (f)(6)(ii) of this section, and the amount of the repayment mechanism complies with paragraph (f)(4) of this section.

(v) As part of its application, a re-entering ACO must submit documentation demonstrating the adequacy of the repayment mechanism that could be used to repay any shared losses incurred for performance years in the next agreement period. The repayment mechanism applicable to the new agreement period may be the same repayment mechanism currently used by the re-entering ACO, provided that the ACO is the same legal entity as an ACO that previously participated in the program, and the ACO submits documentation establishing that the duration of the existing repayment mechanism has been revised to comply with paragraph (f)(6)(ii) of this section and the amount of the repayment mechanism complies with paragraph (f)(4) of this section.

(4) * * *

(iv)(A) In the case of an ACO that has submitted a request to enter a new participation agreement for an agreement period starting on or after January 1, 2022 and is a renewing ACO or a re-entering ACO that is the same legal entity as an ACO that previously participated in the program: If the ACO wishes to use its existing repayment mechanism to establish its ability to repay any shared losses incurred for performance years in the new agreement period, the amount of the repayment mechanism must be equal to at least the amount calculated by CMS in accordance with paragraph (f)(4)(ii) of this section.

(B) Under the following circumstances, an ACO that renewed its participation agreement for an agreement period beginning on July 1, 2019, or January 1, 2020, may elect to decrease the amount of its repayment mechanism.

(1) The ACO elected to continue to use its existing repayment mechanism for the agreement period beginning on July 1, 2019, or January 1, 2020, and the amount of that repayment mechanism was greater than the repayment mechanism amount estimated at the time of renewal application according to paragraph (f)(4)(ii) of this section.

(2) The repayment mechanism amount for performance year 2021, as recalculated pursuant to paragraph (f)(4)(iii) of this section, is less than the existing repayment mechanism amount.

(3) CMS will notify the ACO in writing if the ACO may elect to decrease the amount of its repayment mechanism pursuant to this paragraph (f)(4)(iv)(B). The ACO must submit such election, together with revised repayment mechanism documentation, in a form and manner and by a deadline specified by CMS. CMS will review the revised repayment mechanism documentation and may reject the election if the repayment mechanism documentation does not comply with the requirements of this paragraph (f).

(5) After the repayment mechanism has been used to repay any portion of shared losses owed to CMS, the ACO must replenish the amount of funds available through the repayment mechanism within 90 days. The resulting amount available through the repayment mechanism must be at least the amount specified by CMS in accordance with paragraph (f)(4) of this section.

(6) * * *

(ii) For a renewing ACO, or a re-entering ACO that is the same legal entity as an ACO that previously participated in the program, that wishes to use its existing repayment mechanism to establish its ability to repay any shared losses incurred for performance years in the new agreement period, the existing repayment mechanism must be amended to meet one of the following criteria.

* * * * *

■ 44. Section 425.224 is amended by revising paragraph (b)(1)(ii)(A) to read as follows:

§ 425.224 Application procedures for renewing ACOs and re-entering ACOs.

* * * * *

(b) * * *

(1) * * *

(ii) * * *

(A) Whether the ACO demonstrated a pattern of failure to meet the quality performance standards or met any of the criteria for termination under § 425.316(c)(1)(ii) or (c)(2)(ii).

* * * * *

§ 425.302 [Amended]

■ 45. Section 425.302 is amended in paragraph (a)(1) by removing the reference “§ 425.500” and adding in its place the references “§ 425.500 or § 425.510, as applicable”.

■ 46. Section 425.316 is amended by revising paragraph (c) to read as follows:

§ 425.316 Monitoring of ACOs.

* * * * *

(c) *Monitoring ACO compliance with quality performance standards.* To identify ACOs that are not meeting the quality performance standards, CMS will review an ACO's submission of quality measurement data under § 425.500 or § 425.512. CMS may request additional documentation from an ACO, ACO participants, or ACO providers/suppliers, as appropriate. If an ACO does not meet quality performance standards or fails to report on one or more quality measures, CMS will take the following actions:

(1) *For performance years (or a performance period) beginning on or before January 1, 2020.* (i) The ACO may be given a warning for the first time it fails to meet the minimum attainment level on at least 70 percent of the measures, as determined under § 425.502, in one or more domains and may be subject to a CAP. CMS may forgo the issuance of the warning letter depending on the nature and severity of the noncompliance and instead subject the ACO to actions set forth at § 425.216 or immediately terminate the ACO's participation agreement under § 425.218.

(ii) The ACO's compliance with the quality performance standards will be re-evaluated the following year. If the ACO continues to fail to meet the quality performance standard in the following year, the agreement will be terminated.

(iii) An ACO will not qualify to share in savings in any year it fails to report accurately, completely, and timely on the quality performance measures.

(2) *For performance years beginning on or after January 1, 2021.* (i) If the ACO fails to meet the quality performance standard, CMS may take one or more of the actions prior to termination specified in § 425.216. Depending on the nature and severity of the noncompliance, CMS may forgo pre-termination actions and may

immediately terminate the ACO's participation agreement under § 425.218.

(ii) CMS will terminate an ACO's participation agreement under any of the following circumstances:

(A) The ACO fails to meet the quality performance standard for 2 consecutive performance years within an agreement period.

(B) The ACO fails to meet the quality performance standard for any 3 performance years within an agreement period, regardless of whether the years are in consecutive order.

(C) A renewing ACO or re-entering ACO fails to meet the quality performance standard for the last performance year of the ACO's previous agreement period and this occurrence was either the second consecutive performance year of failed quality performance or the third nonconsecutive performance year of failed quality performance during the previous agreement period.

(D) A renewing ACO or re-entering ACO fails to meet the quality performance standard for 2 consecutive performance years across 2 agreement periods, specifically the last performance year of the ACO's previous agreement period and the first performance year of the ACO's new agreement period.

* * * * *

■ 47. Section 425.400 is amended by—

■ a. Revising paragraph (c)(1)(iv) introductory text;

■ b. Adding paragraph (c)(1)(v); and

■ c. Revising paragraph (c)(2).

The revisions and addition read as follows:

§ 425.400 General.

* * * * *

(c) * * *

(1) * * *

(iv) For performance years (or a performance period) during 2019, and performance year 2020 as follows:

* * * * *

(v) For the performance year starting on January 1, 2021, and subsequent performance years as follows:

(A) CPT codes:

(1) 96160 and 96161 (codes for administration of health risk assessment).

(2) 99201 through 99215 (codes for office or other outpatient visit for the evaluation and management of a patient).

(3) 99304 through 99318 (codes for professional services furnished in a nursing facility; professional services or services reported on an FQHC or RHC claim identified by these codes are excluded when furnished in a SNF).

(4) 99319 through 99340 (codes for patient domiciliary, rest home, or custodial care visit).

(5) 99341 through 99350 (codes for evaluation and management services furnished in a patient's home for claims identified by place of service modifier 12).

(6) 99354 and 99355 (add-on codes, for prolonged evaluation and management or psychotherapy services beyond the typical service time of the primary procedure; when the base code is also a primary care service code under this paragraph (c)(1)(v)).

(7) 99421, 99422, and 99423 (codes for online digital evaluation and management).

(8) 99439 (code for non-complex chronic care management).

(9) 99483 (code for assessment of and care planning for patients with cognitive impairment).

(10) 99484, 99492, 99493 and 99494 (codes for behavioral health integration services).

(11) 99487, 99489, 99490 and 99491 (codes for chronic care management).

(12) 99495 and 99496 (codes for transitional care management services).

(13) 99497 and 99498 (codes for advance care planning; services identified by these codes furnished in an inpatient setting are excluded).

(B) HCPCS codes:

(1) G0402 (code for the Welcome to Medicare visit).

(2) G0438 and G0439 (codes for the annual wellness visits).

(3) G0442 (code for alcohol misuse screening service).

(4) G0443 (code for alcohol misuse counseling service).

(5) G0444 (code for annual depression screening service).

(6) G0463 (code for services furnished in ETA hospitals).

(7) G0506 (code for chronic care management).

(8) G2010 (code for the remote evaluation of patient video/images).

(9) G2012 (code for virtual check-in).

(10) G2058 (code for non-complex chronic care management).

(11) G2064 and G2065 (codes for principal care management services).

(12) G2214 (code for psychiatric collaborative care model).

(2)(i) When the assignment window (as defined in § 425.20) for a benchmark or performance year includes any month(s) during the COVID-19 Public Health Emergency defined in § 400.200 of this chapter, in determining beneficiary assignment, we use the primary care service codes identified in paragraph (c)(1) of this section, and additional primary care service codes as follows:

(A) CPT codes:

(1) 99421, 99422, and 99423 (codes for online digital evaluation and management services).

(2) 99441, 99442, and 99443 (codes for telephone evaluation and management services).

(B) HCPCS codes:

(1) G2010 (code for the remote evaluation of patient video/images).

(2) G2012 (code for virtual check-in).

(ii) The additional primary care service codes specified in paragraph (c)(2)(i) of this section are applicable to all months of the assignment window (as defined in § 425.20), when the assignment window includes any month(s) during the COVID-19 Public Health Emergency defined in § 400.200 of this chapter.

■ 48. Section 425.500 is amended by revising the section heading and paragraph (d) to read as follows:

§ 425.500 Measures to assess the quality of care furnished by an ACO for performance years (or a performance period) beginning on or before January 1, 2020.

* * * * *

(d) *Patient experience of care survey.*

(1) For performance years (or a performance period) beginning in 2014 through 2019, ACOs must select a CMS-certified vendor to administer the survey and report the results accordingly.

(2) For performance year 2020, CMS waives the CAHPS for ACOs reporting requirement and will assign all ACOs automatic credit for the CAHPS for ACOs survey measures.

* * * * *

■ 49. Section 425.502 is amended by revising the section heading to read as follows:

§ 425.502 Calculating the ACO quality performance score for performance years (or a performance period) beginning on or before January 1, 2020.

* * * * *

■ 50. Section 425.508 is amended by revising the paragraph (a) heading and adding paragraph (b) to read as follows:

§ 425.508 Incorporating quality reporting requirements related to the Quality Payment Program.

(a) *For performance years (or a performance period) beginning in 2017–2020.* * * *

(b) *For performance years beginning on or after January 1, 2021.* ACOs must submit the quality data via the Alternative Payment Model Performance Pathway (APP) established under § 414.1367 of this chapter, to satisfactorily report on behalf of the

eligible clinicians who bill under the TIN of an ACO participant for purposes of the MIPS Quality performance category of the Quality Payment Program.

■ 51. Section 425.510 is added to subpart F to read as follows:

§ 425.510 Application of the Alternative Payment Model Performance Pathway (APP) to Shared Savings Program ACOs for performance years beginning on or after January 1, 2021.

(a) *General.* (1) CMS establishes quality performance measures to assess the quality of care furnished by the ACO. If the ACO demonstrates to CMS that it has satisfied the quality performance requirements in this subpart, and the ACO meets all other applicable requirements, the ACO is eligible to receive shared savings.

(2) CMS seeks to improve the quality of care furnished by ACOs over time by specifying higher standards, new measures, or both.

(b) *Quality reporting.* ACOs must report quality data via the APP established under § 414.1367 of this chapter, according to the method of submission established by CMS.

(c) *Audit and validation of data.* CMS retains the right to audit and validate quality data reported by an ACO under paragraph (b) of this section according to § 414.1390 of this chapter.

■ 52. Section 425.512 is added to subpart F to read as follows:

§ 425.512 Determining the ACO quality performance standard for performance years beginning on or after January 1, 2021.

(a) *Establishing a quality performance standard—(1) Overall standard.* The quality performance standard is the overall standard the ACO must meet in order to be eligible to receive shared savings for a performance year. An ACO will not qualify to share in savings in any year it fails to meet the quality performance standard.

(2) *For performance year 2022 and subsequent performance years.* For the first performance year of an ACO's first agreement period under the Shared Savings Program, if the ACO meets the data completeness requirement at § 414.1340 of this chapter and case minimum requirement at § 414.1380 of this chapter on the three measures it is actively required to report and fields a CAHPS for MIPS survey via the APP, the ACO will meet the quality performance standard.

(3) *For performance years 2021 and 2022—(i) Designation of quality performance standard.* For all ACOs, except as specified in paragraph (a)(2) of this section, CMS designates the quality

performance standard as the ACO reporting quality data via the APP established under § 414.1367 of this chapter, according to the method of submission established by CMS and achieving a quality performance score that is equivalent to or higher than the 30th percentile across all MIPS Quality performance category scores, excluding entities/providers eligible for facility-based scoring.

(ii) *For performance year 2021.* If an ACO does not report any of the ten CMS Web Interface measures or any of the three measures it is actively required to report and does not field a CAHPS for MIPS survey via the APP, the ACO will not meet the quality performance standard.

(iii) *For performance year 2022.* If an ACO does not report any of the three measures it is actively required to report and does not field a CAHPS for MIPS survey via the APP, the ACO will not meet the quality performance standard.

(4) *For performance years 2023 and subsequent performance years.* (i) For all ACOs, except as specified in paragraph (a)(2) of this section, CMS designates the quality performance standard as the ACO reporting quality data via the APP established under § 414.1367 of this chapter, according to the method of submission established by CMS and achieving a quality performance score that is equivalent to or higher than the 40th percentile across all MIPS Quality performance category scores, excluding entities/providers eligible for facility-based scoring.

(ii) If an ACO does not report any of the three measures it is actively required to report and does not field a CAHPS for MIPS survey via the APP, the ACO will not meet the quality performance standard.

(b) *Extreme and uncontrollable circumstances.* For performance year 2021 and subsequent performance years, including the applicable quality data reporting period for the performance year, CMS uses an alternative approach to calculating the quality score for ACOs affected by extreme and uncontrollable circumstances instead of the methodology specified in paragraph (a) of this section as follows:

(1) CMS determines the ACO was affected by an extreme and uncontrollable circumstance based on either of the following:

(i) Twenty percent or more of the ACO's assigned beneficiaries reside in an area identified under the Quality Payment Program as being affected by an extreme and uncontrollable circumstance.

(A) Assignment is determined under subpart E of this part.

(B) In making this determination, CMS uses the quarter four list of assigned beneficiaries.

(ii) The ACO's legal entity is located in an area identified under the Quality Payment Program as being affected by an extreme and uncontrollable circumstance. An ACO's legal entity location is based on the address on file for the ACO in CMS' ACO application and management system.

(2) If CMS determines the ACO meets the requirements of paragraph (b)(1) of this section, CMS calculates the ACO's quality score as follows:

(i) For performance years 2021 and 2022, the ACO's minimum quality performance score is set to the equivalent of the 30th percentile MIPS Quality performance category score for the relevant performance year as determined under paragraph (a)(3) of this section.

(ii) For performance year 2023 and subsequent performance years, the ACO's minimum quality performance score is set to the equivalent of the 40th percentile MIPS Quality performance category score for the relevant performance year as determined under paragraph (a)(4) of this section.

(3) If the ACO reports quality data via the APP and meets data completeness and case minimum requirements:

(i) For performance years 2021 and 2022, CMS will use the higher of the ACO's quality performance score or the equivalent of the 30th percentile MIPS Quality performance category score for the relevant performance year.

(ii) For performance year 2023 and subsequent performance years, CMS will use the higher of the ACO's quality performance score or the equivalent of the 40th percentile MIPS Quality performance category score for the relevant performance year.

(4) CMS applies determinations made under the Quality Payment Program with respect to—

(i) Whether an extreme and uncontrollable circumstance has occurred; and

(ii) The affected areas.

(5) CMS has sole discretion to determine the time period during which an extreme and uncontrollable circumstance occurred, the percentage of the ACO's assigned beneficiaries residing in the affected areas, and the location of the ACO legal entity.

■ 53. Section 425.600 is amended by revising paragraph (f)(4)(i) to read as follows:

§ 425.600 Selection of risk model.

* * * * *

(f) * * *

(4) * * *

(i) The quality performance standard as described in § 425.502(a) or § 425.512(a), as applicable.

* * * *

■ 54. Section 425.601 is amended by revising paragraphs (a)(9) and (f)(5)(iv) to read as follows:

§ 425.601 Establishing, adjusting, and updating the benchmark for agreement periods beginning on July 1, 2019, and in subsequent years.

(a) * * *

(9) For the second and each subsequent performance year during the term of the agreement period, the ACO's benchmark is adjusted for the following, as applicable: For the addition and removal of ACO participants or ACO providers/suppliers in accordance with § 425.118(b), for a change to the ACO's beneficiary assignment methodology selection under § 425.226(a)(1), and for a change to the beneficiary assignment methodology specified in subpart E of this part. To adjust the benchmark, CMS does the following:

(i) Takes into account the expenditures of beneficiaries who would have been assigned to the ACO in any of the 3 most recent years prior to the start of the agreement period.

(ii) Redetermines the regional adjustment amount under paragraph (a)(8) of this section, according to the ACO's assigned beneficiaries for BY3.

* * * *

(f) * * *

(5) * * *

(iv) If during the term of the agreement period CMS adjusts the ACO's benchmark, as specified in paragraph (a)(9) of this section, CMS redetermines whether the ACO is considered to have lower spending or higher spending compared to the ACO's regional service area for purposes of determining the percentage in paragraphs (f)(1) and (2) of this section used in calculating the adjustment under either paragraph (a)(8) or (e) of this section.

* * * *

■ 55. Section 425.602 is amended by revising paragraph (a)(8) to read as follows:

§ 425.602 Establishing, adjusting, and updating the benchmark for an ACO's first agreement period beginning on or before January 1, 2018.

(a) * * *

(8) The ACO's benchmark is adjusted for the addition and removal of ACO participants or ACO providers/suppliers in accordance with § 425.118(b) and for a change to the beneficiary assignment methodology specified in subpart E of this part, as applicable, to take into

account the expenditures for beneficiaries who would have been assigned to the ACO in any of the 3 most recent years prior to the start of the agreement period.

* * * *

■ 56. Section 425.603 is amended by revising paragraphs (c)(8) and (c)(9)(ii)(B)(4)(iv) to read as follows:

§ 425.603 Resetting, adjusting, and updating the benchmark for a subsequent agreement period beginning on or before January 1, 2019.

* * * *

(c) * * *

(8) The ACO's benchmark is adjusted for the following, as applicable: For the addition and removal of ACO participants or ACO providers/suppliers in accordance with § 425.118(b), and for a change to the beneficiary assignment methodology specified in subpart E of this part. To adjust the benchmark, CMS does the following:

(i) Takes into account the expenditures for beneficiaries who would have been assigned to the ACO in any of the 3 most recent years prior to the start of the agreement period.

(ii) Redetermines the regional adjustment amount under paragraph (c)(9) of this section, according to the ACO's assigned beneficiaries for BY3.

(9) * * *

(ii) * * *

(B) * * *

(4) * * *

(iv) If CMS adjusts the ACO's benchmark, as specified in paragraph (c)(8) of this section, CMS redetermines whether the ACO is considered to have lower spending or higher spending compared to the ACO's regional service area for purposes of determining the percentage used in calculating the adjustment in paragraphs (c)(9)(ii)(B)(1) and (2) of this section.

* * * *

■ 57. Section 425.604 is amended by revising paragraphs (c) and (d) to read as follows:

§ 425.604 Calculation of savings under the one-sided model.

* * * *

(c) *Qualification for shared savings payment*—(1) *For performance years (or a performance period) beginning on or before January 1, 2020.* In order to qualify for shared savings, an ACO must meet or exceed its minimum savings rate determined under paragraph (b) of this section, meet the minimum quality performance standards established under § 425.502, and otherwise maintain its eligibility to participate in the Shared Savings Program under this part.

(2) *For the performance year beginning on January 1, 2021.* To qualify for shared savings, an ACO must meet or exceed its minimum savings rate determined under paragraph (b) of this section, meet the quality performance standard established under § 425.512, and otherwise maintain its eligibility to participate in the Shared Savings Program under this part.

(d) *Final sharing rate*—(1) *For performance years (or a performance period) beginning on or before January 1, 2020.* An ACO that meets all the requirements for receiving shared savings payments under the one-sided model will receive a shared savings payment of up to 50 percent of all savings under the updated benchmark, as determined on the basis of its quality performance under § 425.502 (up to the performance payment limit described in paragraph (e)(2) of this section).

(2) *For the performance year beginning on January 1, 2021.* An ACO that meets all the requirements for receiving shared savings payments under Track 1 will receive a shared savings payment of 50 percent of all the savings under the updated benchmark (up to the performance payment limit described in paragraph (e)(2) of this section).

* * * *

■ 58. Section 425.605 is amended by revising paragraphs (c), (d)(1)(i)(A), (d)(1)(ii)(A), (d)(1)(iii)(A), (d)(1)(iv)(A), and (d)(1)(v)(A) to read as follows:

§ 425.605 Calculation of shared savings and losses under the BASIC track.

* * * *

(c) *Qualification for shared savings payment*—(1) *For performance years beginning on or before January 1, 2020.* To qualify for shared savings, an ACO must meet the minimum savings rate requirement established under paragraph (b) of this section, meet the minimum quality performance standards established under § 425.502, and otherwise maintain its eligibility to participate in the Shared Savings Program under this part.

(2) *For performance years beginning on or after January 1, 2021.* To qualify for shared savings, an ACO must meet the minimum savings rate requirement established under paragraph (b) of this section, meet the quality performance standard established under § 425.512, and otherwise maintain its eligibility to participate in the Shared Savings Program under this part.

(d) * * *

(1) * * *

(i) * * *

(A) *Final sharing rate*—(1) *For performance years beginning on or*

before January 1, 2020. An ACO that meets all the requirements for receiving shared savings payments under the BASIC track, Level A, receives a shared savings payment of up to 40 percent of all the savings under the updated benchmark, as determined on the basis of its quality performance under § 425.502 (up to the performance payment limit described in paragraph (d)(1)(i)(B) of this section).

(2) *For performance years beginning on or after January 1, 2021.* An ACO that meets all the requirements for receiving shared savings payments under the BASIC track, Level A, receives a shared savings payment of 40 percent of all the savings under the updated benchmark (up to the performance payment limit described in paragraph (d)(1)(i)(B) of this section).

* * * * *

(ii) * * *

(A) *Final sharing rate—(1) For performance years beginning on or before January 1, 2020.* An ACO that meets all the requirements for receiving shared savings payments under the BASIC track, Level B, receives a shared savings payment of up to 40 percent of all the savings under the updated benchmark, as determined on the basis of its quality performance under § 425.502 (up to the performance payment limit described in paragraph (d)(1)(ii)(B) of this section).

(2) *For performance years beginning on or after January 1, 2021.* An ACO that meets all the requirements for receiving shared savings payments under the BASIC track, Level B, receives a shared savings payment of 40 percent of all the savings under the updated benchmark (up to the performance payment limit described in paragraph (d)(1)(ii)(B) of this section).

* * * * *

(iii) * * *

(A) *Final sharing rate—(1) For performance years beginning on or before January 1, 2020.* An ACO that meets all the requirements for receiving shared savings payments under the BASIC track, Level C, receives a shared savings payment of up to 50 percent of all the savings under the updated benchmark, as determined on the basis of its quality performance under § 425.502 (up to the performance payment limit described in paragraph (d)(1)(iii)(B) of this section).

(2) *For performance years beginning on or after January 1, 2021.* An ACO that meets all the requirements for receiving shared savings payments under the BASIC track, Level C, receives a shared savings payment of 50 percent of all the savings under the updated

benchmark (up to the performance payment limit described in paragraph (d)(1)(iii)(B) of this section).

* * * * *

(iv) * * *

(A) *Final sharing rate—(1) For performance years beginning on or before January 1, 2020.* An ACO that meets all the requirements for receiving shared savings payments under the BASIC track, Level D, receives a shared savings payment of up to 50 percent of all the savings under the updated benchmark, as determined on the basis of its quality performance under § 425.502 (up to the performance payment limit described in paragraph (d)(1)(iv)(B) of this section).

(2) *For performance years beginning on or after January 1, 2021.* An ACO that meets all the requirements for receiving shared savings payments under the BASIC track, Level D, receives a shared savings payment of 50 percent of all the savings under the updated benchmark (up to the performance payment limit described in paragraph (d)(1)(iv)(B) of this section).

* * * * *

(v) * * *

(A) *Final sharing rate—(1) For performance years beginning on or before January 1, 2020.* An ACO that meets all the requirements for receiving shared savings payments under the BASIC track, Level E, receives a shared savings payment of up to 50 percent of all the savings under the updated benchmark, as determined on the basis of its quality performance under § 425.502 (up to the performance payment limit described in paragraph (d)(1)(v)(B) of this section).

(2) *For performance years beginning on or after January 1, 2021.* An ACO that meets all the requirements for receiving shared savings payments under the BASIC track, Level E, receives a shared savings payment of 50 percent of all the savings under the updated benchmark (up to the performance payment limit described in paragraph (d)(1)(v)(B) of this section).

* * * * *

■ 59. Section 425.606 is amended by revising paragraphs (c), (d), and (f) to read as follows:

§ 425.606 Calculation of shared savings and losses under Track 2.

* * * * *

(c) *Qualification for shared savings payment—(1) For performance years (or a performance period) beginning on or before January 1, 2020.* To qualify for shared savings, an ACO must meet the minimum savings rate requirement established under paragraph (b) of this

section, meet the minimum quality performance standards established under § 425.502, and otherwise maintain its eligibility to participate in the Shared Savings Program under this part.

(2) *For the performance year beginning on January 1, 2021.* To qualify for shared savings, an ACO must meet the minimum savings rate requirement established under paragraph (b) of this section, meet the quality performance standard established under § 425.512, and otherwise maintain its eligibility to participate in the Shared Savings Program under this part.

(d) *Final sharing rate—(1) For performance years (or a performance period) beginning on or before January 1, 2020.* An ACO that meets all the requirements for receiving shared savings payments under Track 2 will receive a shared savings payment of up to 60 percent of all the savings under the updated benchmark, as determined on the basis of its quality performance under § 425.502 (up to the performance payment limit described in paragraph (e)(2) of this section).

(2) *For the performance year beginning on January 1, 2021.* An ACO that meets all the requirements for receiving shared savings payments under Track 2 will receive a shared savings payment of 60 percent of all the savings under the updated benchmark (up to the performance payment limit described in paragraph (e)(2) of this section).

* * * * *

(f) *Shared loss rate—(1) For performance years (or a performance period) beginning on or before January 1, 2020.* For an ACO that is required to share losses with the Medicare program for expenditures over the updated benchmark, the amount of shared losses is determined based on the inverse of its final sharing rate described in paragraph (d)(1) of this section (that is, 1 minus the final shared savings rate determined under paragraph (d)(1) of this section). The shared loss rate—

- (i) May not exceed 60 percent; and
- (ii) May not be less than 40 percent.

(2) *For the performance year beginning on January 1, 2021.* For an ACO that is required to share losses with the Medicare program for expenditures over the updated benchmark, the amount of shared losses is determined as follows:

(i) If the ACO meets the quality performance standard established in § 425.512, CMS determines the shared loss rate as follows:

(A) Calculate the quotient of the MIPS Quality performance category points

earned divided by the total MIPS Quality performance category points available.

(B) Calculate the product of the quotient determined in paragraph (f)(2)(i)(A) of this section and 60 percent.

(C) Calculate the shared loss rate as 1 minus the product determined in paragraph (f)(2)(i)(B) of this section. The shared loss rate—

(1) May not exceed 60 percent; and

(2) May not be less than 40 percent.

(ii) If the ACO fails to meet the quality performance standard established in § 425.512, the shared loss rate is 60 percent.

* * * * *

■ 60. Section 425.610 is amended by revising paragraphs (c), (d), and (f) to read as follows:

§ 425.610 Calculation of shared savings and losses under the ENHANCED track.

* * * * *

(c) *Qualification for shared savings payment*—(1) *For performance years (or a performance period) beginning on or before January 1, 2020.* To qualify for shared savings, an ACO must meet the minimum savings rate requirement established under paragraph (b) of this section, meet the minimum quality performance standards established under § 425.502, and otherwise maintain its eligibility to participate in the Shared Savings Program under this part.

(2) *For performance years beginning on or after January 1, 2021.* To qualify for shared savings, an ACO must meet the minimum savings rate requirement established under paragraph (b) of this section, meet the quality performance standard established under § 425.512, and otherwise maintain its eligibility to participate in the Shared Savings Program under this part.

(d) *Final sharing rate*—(1) *For performance years (or a performance period) beginning on or before January 1, 2020.* An ACO that meets all the requirements for receiving shared savings payments under the

ENHANCED track will receive a shared savings payment of up to 75 percent of all the savings under the updated benchmark, as determined on the basis of its quality performance under § 425.502 (up to the performance payment limit described in paragraph (e)(2) of this section).

(2) *For performance years beginning on or after January 1, 2021.* An ACO that meets all the requirements for receiving shared savings payments under the ENHANCED track will receive a shared savings payment of 75 percent of all the savings under the updated benchmark (up to the performance payment limit described in paragraph (e)(2) of this section).

* * * * *

(f) *Shared loss rate*—(1) *For performance years (or a performance period) beginning on or before January 1, 2020.* For an ACO that is required to share losses with the Medicare program for expenditures over the updated benchmark, the amount of shared losses is determined based on the inverse of its final sharing rate described in paragraph (d)(1) of this section (that is, 1 minus the final shared savings rate determined under paragraph (d)(1) of this section). The shared loss rate—

(i) May not exceed 75 percent; and

(ii) May not be less than 40 percent.

(2) *For performance years beginning on or after January 1, 2021.* For an ACO that is required to share losses with the Medicare program for expenditures over the updated benchmark, the amount of shared losses is determined as follows:

(i) If the ACO meets the quality performance standard established in § 425.512, CMS determines the shared loss rate as follows:

(A) Calculate the quotient of the MIPS Quality performance category points earned divided by the total MIPS Quality performance category points available.

(B) Calculate the product of the quotient determined in paragraph (f)(2)(i)(A) of this section, and 75 percent.

(C) Calculate the shared loss rate as 1 minus the product determined in

paragraph (f)(2)(i)(B) of this section. The shared loss rate—

(1) May not exceed 75 percent; and

(2) May not be less than 40 percent.

(ii) If the ACO fails to meet the quality performance standard established in § 425.512, the shared loss rate is 75 percent.

* * * * *

■ 61. Section 425.611 is amended by revising paragraph (b)(1)(ii) to read as follows:

§ 425.611 Adjustments to Shared Savings Program calculations to address the COVID-19 pandemic.

* * * * *

(b) * * *

(1) * * *

(ii) Discharges for acute care inpatient services for treatment of COVID-19 from facilities that are not paid under the inpatient prospective payment system, such as CAHs, when the date of discharge occurs within the Public Health Emergency as defined in § 400.200 of this chapter.

* * * * *

§ 425.800 [Amended]

■ 62. Section 425.800 is amended—

■ a. In paragraph (a)(1) by removing the references “§ 425.500 and § 425.502” and adding in its place the references “§§ 425.500, 425.502, 425.510, and 425.512;”

■ b. In paragraph (a)(2) by removing the reference “§ 425.502” and adding in its place the references “§ 425.502 or § 425.512, as applicable”; and

■ c. In paragraph (a)(6) by removing the reference “§ 425.502” and adding in its place the references “§ 425.502 or § 425.512, as applicable”.

Dated: November 18, 2020.

Seema Verma,

Administrator, Centers for Medicare & Medicaid Services.

Dated: November 23, 2020.

Alex M. Azar II,

Secretary, Department of Health and Human Services.

BILLING CODE 4120-01-P

APPENDIX 1: MIPS QUALITY MEASURES

NOTE: Except as otherwise noted in this final rule, previously finalized measures and specialty measure sets will continue to apply for the 2023 MIPS payment year and future years. In addition, electronic Clinical Quality Measures (eQCMs) that are National Quality Forum (NQF) endorsed are shown in Table A as follows: NQF # / eQCM NQF #.

TABLE Group A: New Quality Measures Finalized for the 2023 MIPS Payment Year and Future Years

A.1. Hospital-Wide, 30-Day, All-Cause Unplanned Readmission (HWR) Rate for the Merit-Based Incentive Payment System (MIPS) Groups

Category	Description
NQF # / eQCM NQF #:	N/A / N/A
Quality #:	479
Description:	This measure is a re-specified version of the measure, “Risk-adjusted readmission rate (RARR) of unplanned readmission within 30 days of hospital discharge for any condition” (NQF 1789), which was developed for patients 65 years and older using Medicare claims. This re-specified measure attributes outcomes to MIPS participating clinician groups and assesses each group’s readmission rate. The measure comprises a single summary score, derived from the results of five models, one for each of the following specialty cohorts (groups of discharge condition categories or procedure categories): medicine, surgery/gynecology, cardio-respiratory, cardiovascular, and neurology.
Measure Steward:	Centers for Medicare & Medicaid Services
Numerator:	The outcome for this measure is unplanned all-cause 30-day readmission. Readmission is defined as a subsequent inpatient admission to any acute care facility which occurs within 30 days of the discharge date of an eligible index admission. Any readmission is eligible to be counted as an outcome, except those that are considered planned. To align with data years used, the planned readmission algorithm version 4.0 was used to classify readmissions as planned or unplanned.
Denominator:	Patients eligible for inclusion in the measure have an index admission hospitalization to which the readmission outcome is attributed and includes admissions for patients: Enrolled in Medicare Fee-For-Service (FFS) Part A for the 12 months prior to the date of admission; Aged 65 or over; Discharged alive from a non-federal short-term acute care hospital; and, Not transferred to another acute care facility.
Exclusions:	1. Patients discharged against medical advice (AMA) are excluded. 2. Admissions for patients to a PPS-exempt cancer hospital are excluded. 3. Admissions primarily for medical treatment of cancer are excluded. 4. Admissions primarily for psychiatric disease are excluded. 5. Admissions for “rehabilitation care; fitting of prostheses and adjustment devices” (CCS 254) are excluded. 6. Admissions where patient cannot be attributed to a clinician group.
Measure Type:	Outcome
Measure Domain:	Communication and Care Coordination (section 1848(s)(1)(B)(iii) of the Act)
High Priority Measure:	Yes (Outcome)
Collection Type:	Administrative Claims
Measure Implementation:	MIPS eligible groups with at least 16 clinicians / 200 case minimum / 1 year performance period (January 1 st – December 31 st)
Rationale:	<p>This risk-adjusted administrative claims measure was proposed to address unplanned readmissions at the physician group level of Medicare aged > 65 patients. This measure is a re-specified version of the hospital-level measure, “Hospital-Wide All-Cause, Unplanned Readmission Measure” (NQF #1789), which has been in the MIPS program since 2017. In the event we did not finalize this measure, we would have maintained the current measure Q458: All-Cause Hospital Readmission. The re-specification of this measure promotes a systems-level approach by clinicians and focus on high-risk conditions, such as COPD and heart failure. The measure was evaluated by the MAP and was conditionally supported pending NQF endorsement. While we agreed with the MAP that NQF endorsement of measures is preferred, NQF endorsement is not a requirement for measures to be considered for MIPS if the measure has an evidence-based focus as required in section 1848(q)(2)(D)(v) of the Act. A risk-adjusted readmission rate of 15.3 percent at the physician group level was provided by the measure developer. The readmission rate indicates a substantial need to reduce the expected rate and variation of rates across eligible physician groups. Physician groups have the capability to influence unplanned readmission outcomes by appropriate medication reconciliation at discharge, reduction of infection risk, and ensuring proper outpatient follow-up. As an administrative claims measure, there is no separate reporting burden. To maintain continuity with the existing measure Q458: All-Cause Hospital Readmission, the case minimum will remain at 200 cases for consistency in implementation. For 2023 payment determination, the performance period will include administrative claims from January 1, 2021 to December 31, 2021. For further information regarding the implementation of this measure, please see section IV.A.3.c.(1)(e)(i) of this final rule.</p> <p>Note: Refer to the MAP Spreadsheet of Final Recommendations to CMS and HHS at http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=91911.</p>
Comment:	One commenter appreciated this measure as a change to the All-Cause Readmissions measure (Q458) to better align with a system-level approach so that patient care can be focused more on high risk conditions. A second commenter supported this new measure, stating that it improves upon the existing readmissions measure as it targets unplanned readmissions to the hospital.

Category	Description
	<p>Response: We thank the commenters for supporting the new HWR measure in the MIPS program.</p> <p>Comment: One commenter appreciated the measure steward's efforts to provide additional justification for attribution of the Hospital-Wide, 30-Day, All-Cause Unplanned Readmission (HWR) measure to the three types of clinician groups, but believed the evidence falls short of demonstrating clear attribution to decreased readmission rates. In addition, the commenter believed the reliability levels for the cardiorespiratory and cardiovascular cohorts continue to be too low for acceptable use. In addition, prior attempts to reduce readmission rates for the heart failure population was associated with a reduction in the rate of readmissions, but also an increase in the rate of death among Medicare patients hospitalized with heart failure. The commenter requested that CMS ensure these issues are considered as the measure continues through development and the endorsement process at NQF.</p> <p>Response: While the existing literature on the association between clinicians and patient outcomes may be sparse, the Technical Expert Panel (TEP) and clinical consultants, most of whom are clinicians themselves, strongly supported the attribution model and identified the primary inpatient clinician, discharge clinician, and primary outpatient clinician as important roles in providing appropriate care, practical recommendations, and care transitions; and therefore, together, can reduce the risk of readmission. Clinicians are critical contributors to quality improvement, whether as change agents and influencers of health systems or key stakeholders whose acceptance is required for successful or long-lasting improvements. The case minimum will align with that of measure Q458 for consistency in implementation so that only eligible clinician groups with at least 200 cases will receive a measure score. This aligns with feedback received from the public and NQF Admissions/Readmissions committee as well as empiric analyses demonstrating that the minimum case count of 200 cases produces exceptionally reliable measure scores for eligible clinician groups. Using a minimum case count of 200 cases, measure reliability testing conducted by the developers indicated substantial signal to noise reliability across all five specialty cohorts, ranging from 0.82 for surgical to 0.92 for neurology (Adams et al. 2010). Specifically, when limiting to clinician groups with at least 200 cases, the cardiorespiratory and cardiovascular specialty cohorts in question had mean signal to noise reliability scores of 0.89 and 0.88, respectively, indicating substantial reliability (Adams et al. 2010).</p> <p>We are aware of the literature that suggested an inverse association between 30-day readmission and 30-day mortality for heart failure admissions (Gupta et al. 2018). However, the paper was based on 416 hospitals, which is a small proportion of hospitals participating in the Hospital Readmission Reduction Program (HRRP), and focuses on the temporal association between the HRRP's introduction and an increase in 30-day and one-year mortality rates for heart failure discharges. We continuously monitor the literature related to the impact and unintended consequences of measurement and CMS programs and found the evidence that readmission measurement has increased heart failure mortality as inconclusive. The Medicare Payment Advisory Commission (MedPAC 2018) completed an analysis on readmission measurement within the HRRP and found no negative effect on mortality. Furthermore, literature using the complete sample of over 4,000 hospitals participating in HRRP found that the decline in readmission was not associated with an increase in heart failure mortality and that lowering readmissions actually tends to also lower mortality (Kera et al. 2018 and Dharmarajan et al. 2017). The observed increase in mortality in Gupta et al. (2018) may be due to a decline in admission rates, resulting in patients that are admitted presenting with complex comorbidities and a higher risk of death (Dharmarajan et al. 2017, Krumholz et al. 2015, MedPAC 2018). Given the importance of this potential issue on patient outcomes, we also commissioned an independent group to investigate whether there have been increases in mortality rates after HRRP implementation. We found through this investigation that no sufficient evidence exists to suggest that mortality has increased because of HRRP measurement. We are committed to continuing to monitor trends in readmission and mortality rates through annual measure reevaluation and surveillance tasks.</p> <p>Comment: One commenter stated that though unlikely, based on the case minimum, this new measure could apply to large radiation oncology or multidisciplinary groups. However, the commenter worried that the attribution methodology will unfairly target radiation oncologists, who do not perform primary care services. CMS finalized specialty exclusions under the Total Per Capita Cost (TPCC) Measure in the 2020 PFS final rule that the TPCC measure is more accurately applied to clinicians who provide primary care services. Under the TPCC, attributed episodes of care are excluded if they are performed by clinicians who (i) frequently perform non-primary care services (for example, global surgery, chemotherapy, anesthesia, radiation therapy) or (ii) are in specialties unlikely to be responsible for providing primary care to a beneficiary (for example, podiatry, dermatology, optometry, ophthalmology). The commenter recommended that CMS apply the same specialty exclusions to the Hospital-Wide, All-Cause Unplanned Readmission claims measure.</p> <p>Response: There are several exclusion criteria applied to the measure population ("starting cohort"), which include: (1) Admissions for patients to a PPS-exempt cancer hospital; (2) Admissions primarily for medical treatment of cancer; (3) Admissions for "rehabilitation care; fitting of prostheses and adjustment devices;" and (4) Admissions where patient cannot be attributed to a clinician group. Additionally, the measure is risk adjusted to account for differences in patient demographics and clinical characteristics across hospitals. These clinical characteristics may not be related to the quality of care; however, they could impact outcomes for patients. Given the wide variety of discharge diagnosis condition categories, the measure is adjusted for both case mix differences (clinical status of the patient, accounted for by adjusting for comorbidities), as well as service mix differences (the types of conditions/procedures, accounted for by adjusting for the principal discharge diagnosis condition category). Adjustments for case mix differences among clinicians are made by risk-adjusting for patients' comorbid conditions that are identified during inpatient episodes of care for the 12 months prior to the index admission in addition to those present at the index admission. Finally, the intent of the measure is to incentivize coordinated and collaborative care across specialties for a wide variety of patients to reduce unplanned readmissions; radiation oncologists may be able to contribute to optimal care. We encourage the commenter to reach out to the measure steward to discuss revisions for possible implementation in future years.</p> <p>Comment: One commenter opposed inclusion of this measure in MIPS, citing their primary concern is the risk of unintended consequences because it does not adequately consider the competing risk of mortality. Providers with higher mortality rates for more severely ill patients could appear to be providing better quality care. Concerns have been raised in multiple peer reviewed publications about the possible association between incentives to reduce admission and increased mortality rates. It is also unclear whether hospital readmission rates truly reflect the quality of care for all patient populations and whether incentivizing lower readmissions could potentially exacerbate disparities in care.</p> <p>The commenter suggested that CMS consider a measure such as risk-adjusted home time, which, if carefully designed, might better balance the competing risks of readmission and mortality, and mitigate some of these concerns. CMS may also want to consider the additional recommendations for improving on readmission measures and reducing the risk of potential inequities and unintended consequences. Lastly, the commenter noted this measure was more appropriate to attribute at the ACO level only due to better oversight and care coordination to influence performance.</p> <p>Response: Researchers have conducted considerable investigation of potential unintended consequences since the implementation of the readmission measures within HRRP. More specifically, the relationship between the implementation of the AMI, heart failure, and pneumonia readmission measures in the HRRP and subsequent trends in their respective AMI, heart failure, and pneumonia mortality rates has been studied. We continuously monitor the literature related to the impact and unintended consequences of measurement and CMS programs and found the evidence that readmission measurement has increased mortality rates as inconclusive. The Medicare Payment Advisory Commission (MedPAC 2018) completed an analysis on readmission measurement within the HRRP and found no negative effect on mortality. MedPAC's 2018 report confirms that the readmission declines have occurred without clear adverse consequences and concluded that mortality rates do not seem to be increasing in relation to HRRP. In fact, for most HRRP conditions, observed mortality declined after HRRP was implemented, while mortality increased for non-HRRP measured conditions. Risk-adjusted mortality rates</p>

Category	Description
	<p>declined for AMI, pneumonia, and heart failure from 2010 to 2016. Furthermore, the literature demonstrates that there is no evidence for increased inpatient or post-discharge mortality that is directly associated with the timing of the HRRP. In one study, authors examined the rates of readmission and mortality for Medicare patients with heart failure and found that the decline in readmission associated with HRRP was not associated with increase in mortality (Khera et al, 2018). In a second study, the authors found that hospitals lowering readmissions tended to lower mortality (Dharmarajan et al, 2017). Given the importance of this potential issue on patient outcomes, we also commissioned an independent group to investigate whether there have been increases in mortality rates after HRRP implementation. We found through this investigation that no sufficient evidence exists to suggest that mortality has increased because of HRRP measurement. We are committed to continuing to monitor trends in readmission and mortality rates through annual measure reevaluation and surveillance tasks.</p> <p>The measure is risk adjusted to account for differences in patient demographics and clinical characteristics across hospitals. These clinical characteristics may not be related to the quality of care; however, they could impact outcomes for patients. Given the wide variety of discharge diagnosis condition categories, the measure is adjusted for both case mix differences (clinical status of the patient, accounted for by adjusting for comorbidities), as well as service mix differences (the types of conditions/procedures, accounted for by adjusting for the principal discharge diagnosis condition category). Adjustments for case mix differences among clinicians are made by risk-adjusting for patients' comorbid conditions that are identified during inpatient episodes of care for the 12 months prior to the index admission in addition to those present at the index admission. The measure is not risk-adjusted for social risk factors. Measure testing that evaluated the effects of adjusting for social risk factors revealed, after adjustment for clinical factors, a high correlation of 0.99 between unadjusted and adjusted scores as well as a minimal impact on measure scores.</p> <p>There is, in fact, a risk-standardized all-condition readmission measure for accountable care organizations (ACOs) with specifications that are also re-specified from and harmonized with the Hospital-Wide All-Condition 30-Day Risk-Standardized Readmission measure within the Inpatient Quality Reporting (IQR) Program. Introducing hospital-wide readmission measurement within MIPS fills an important gap by creating a mechanism for shared accountability across health providers for readmitted patients and the testing demonstrated meaningful variation in performance across MIPS eligible clinician groups. Additionally, this measure provides greater information and transparency for clinicians and patients to continue to drive improved patient care quality and positive outcomes.</p> <p>Comment: Several commenters opposed the addition of this measure for the 2021 performance year. Clinicians and group practices need stability now more than ever, and noted this is not the time to add new metrics, particularly to a category that groups are familiar with already. The commenter expressed significant concerns around administrative claims measures. While CMS asserts these measures do not increase reporting burden since they are calculated on clinicians' behalf, it takes time to study the measures themselves, understand how clinicians are evaluated, and determine how (or if) clinicians can influence performance. With registry or EHR reporting, clinicians can receive real time feedback on measure performance and evaluate whether changes are needed to facilitate improvement. Claims-based measures do not offer the same opportunity, which makes it difficult to improve performance or drive meaningful change.</p> <p>Response: For over a decade, readmission after discharge has been a concern both from an aspect of quality and resources, culminating in a national effort to address rates of readmissions for all patients, regardless of age and condition. While we can appreciate the desire for stability, we believe that the Hospital-Wide Readmission measure is a more robust measure as it is based upon the original hospital-level measure has been most rigorously tested and vetted. As an Administrative Claims measure, there is no burden to the clinician regarding collection and scoring. Real-time feedback is not a guaranteed aspect of the eCQMs Specifications or the MIPS CQMs Specifications collection type, but may be a service provided, for example, by a vendor. While this collection type does not provide real-time feedback, CMS supplies eligible clinicians and eligible clinician groups with confidential reports that provide information on measure performance, including patient-level data, to help drive quality improvement. In addition, since they utilize claims data submitted for payment purposes, they provide data elements that are validated through our monitoring and auditing processes and introduce no burden collection of vital information to help drive quality care.</p> <p>Comment: One commenter did not support the All-Cause Readmission measure, Q458, because it said it was not suitable for attribution at the clinician or group level. When the newer version of the measure was submitted for NQF consideration (HWR measure), a number of professional organizations disapproved of applying the measure at either the individual clinician level or group practice level.</p> <p>Response: This measure is a re-specification of measure Q458 currently within the MIPS program, which attributes outcomes solely to the primary care physician that provides the plurality of care during the measurement period. However, the primary care physician may not be the clinician with opportunity to impact readmissions. The intent of this measure is to improve upon the attribution of the current ACR measure and incentivize collaboration of care across inpatient and outpatient settings by considering shared attribution to up to three eligible clinician groups that provide care for patients inside and outside of the hospital and are therefore in position to influence patient risk of readmission. The TEP and clinical consultants, most of whom are clinicians themselves, supported the attribution model and identified the primary inpatient clinician, discharge clinician, and primary outpatient clinician as important roles in providing appropriate care, practical recommendations, and care transitions. The primary inpatient clinician is responsible for the medical care provided during the admission, referring patients to inpatient specialists and prescribing medications. The delivery of their care during the hospital admission can influence whether the patient returns with unresolved medical issues or side effects from inappropriate medication or dosage. The discharge clinician is responsible for preparing the patient for discharge, including determining the patient is well enough to leave the hospital, understands their condition and treatments, and has been referred to outpatient specialists or therapy, as needed. Providing clear instructions and arrangements help ensure that the patient adheres to care, medication, and lifestyle changes outside of the hospital (Bowles et al, 2014, Philips et al, 2004, DeCaporale-Ryan et al, 2017, and Verhaegh et al, 2014). The primary outpatient clinician is responsible for the care of the patient outside of the hospital and can prevent readmissions by ensuring accessibility to care and availability for consultations within 30 days after discharge. Through their individual roles and together through coordinated care, these clinicians can reduce the risk of readmission.</p> <p>NQF panel and committee members have voted on this measure several times, all of which concluded in favor of endorsing the measure. Final endorsement of the measure was deferred to the Spring 2020 Consensus Standards Approval Committee (CSAC) due to efforts to reduce burden for committee members who may need to prioritize COVID-19 in their communities.</p> <p>Comment: One commenter stated that HWR measure lacks transparent evaluation on whether it is appropriate to apply the readmission of one patient to multiple physicians since no evidence or testing was provided to support the attribution of this measure to the three distinct groups (discharge physician, primary inpatient care provider, and outpatient primary care provider) during NQF endorsement review. In addition, most of the evidence used to support attribution to physicians involves multiple partners and clinicians such as the health system, hospital, nurse, and/or pharmacist, and there was insufficient evidence provided to support that physicians and practices using the proposed attribution approach. The commenter questioned the ability of the HWR to meaningfully distinguish better or worse performers based on the available benchmarks from the 2017 performance period.</p>

Category	Description
	<p>Commenters noted there is also a need to determine if additional reductions in scores can be made because readmission rates now somewhat stable. The commenter stated that they did not believe that assignment of responsibility of the reduction of readmissions to multiple physicians and practices in MIPS is appropriate. Lastly, the impact that social risk factors in the risk adjustment model on performance rates has not been fully explored. Due to all of these concerns, the commenter stated that physicians should not be held accountable for the HWR measure and the measure should be removed from the program.</p>
Response:	<p>While the existing literature on the association between clinicians and patient outcomes may be sparse, the TEP and clinical consultants, most of whom are clinicians themselves, supported the attribution model and identified the primary inpatient clinician, discharge clinician, and primary outpatient clinician as important roles in providing appropriate care, practical recommendations, and care transitions; and therefore, together, can reduce the risk of readmission. Clinicians are critical contributors to quality improvement, whether as change agents and influencers of health systems or key stakeholders whose acceptance is required for successful or long-lasting improvements.</p>
	<p>The measure is intended to improve upon the current ACR measure within MIPS, which unduly attributes readmissions to the clinician that provide the plurality of care during the measurement period, to more appropriately attribute readmissions to up to three clinician groups with the ability to influence the risk of readmission. The shared attribution is meant to reflect the reality that multiple factors and clinicians contribute to patient care and influence outcomes as well as promote a system change towards coordination of care for the benefit of patients. Implementation and reporting of the measure will provide further data and inform the practicality of the attribution model. As done with all measures publicly reported as part of payment programs, we will monitor use of the measure and test the measure on an annual basis.</p>
	<p>Using data from July 2015 to June 2016, the median risk-standardized readmission rate was 15.3 percent and range was 7.0 percent to 25.1 percent. In other words, patients can expect to have a readmission within 30 days of discharge on an average of 15.3 percent of the time. The best performing clinician groups (7.0 percent) are performing 54.2 percent better than an average performer, while the worse performing clinician groups (25.1 percent) are performing 64.1 percent worse than an average performer. This variation in performance indicates a clear quality gap in which some clinician groups are able to achieve substantially lower than average rates, while up to a quarter of patients for other clinician groups are being readmitted, possibly without clinician group awareness. Recent studies examining trends in readmissions following specific conditions and procedures indicate that similar quality measures and policies have effectively decreased readmission rates and remain important metrics (Blecker et al, 2019, Carey et al, 2015, Mellor et al, 2017, Wasfy et al, 2017).</p>
	<p>The developer conducted social risk factor testing using two variables that are available and reliably measured, including dual-eligible status and Agency for Healthcare Research and Quality (AHRQ) SES index score. For both social risk factors, the correlation between the adjusted and unadjusted scores was 0.99, indicating extremely high agreement. In addition, they also tested the absolute change in risk-adjusted readmission rates. When incorporating the dual eligible risk factor, the largest change in a hospital-level risk-adjusted readmission rate was 1.74 percent for clinician groups. When incorporating low AHRQ SES, the largest change in a hospital-level risk-adjusted readmission rate was 2.45 percent. Both analyses support the notion that adding these social risk factors would have minimal impact on measure scores. Ongoing research aims to identify valid patient-level social risk factors and highlight disparities related to social risk, and as additional variables become available, they will be considered for testing and inclusion within the measure.</p>
Comment:	<p>One commenter opposed this measure, citing broad-based concerns about the 30-day window for readmissions in CMS measures. Those concerns are heightened with the re-specification of the measure to apply to physician groups in the MIPS. There are numerous social, economic and logistical hurdles that can occur during a 30-day readmission window, many of which are independent of a physician's or group's behavior. If the measure window were shortened to 7 days, attribution would improve.</p>
Response:	<p>We thank the commenter for their comment. The measure is a re-specified version of the hospital-level measure, "Hospital-Wide All-Cause, Unplanned Readmission Measure" (NQF #1789), which is currently reported within IQR, and the "All-Cause Readmission" measure, Q458, which has been in the MIPS program since 2017, both of which also use a 30-day outcome timeframe. The 30-day timeframe is consistent with other CMS readmission measures endorsed by NQF and publicly reported. The literature demonstrates that older adults are more vulnerable to adverse health outcomes for 30 days post discharge, readmissions occurring within 30 days of discharge can be influenced by care and early transition to the non-acute care setting, and that the 30-day timeframe is a clinically meaningful period for providers to communicate with each other and their patients to reduce readmissions. Furthermore, during development of the hospital-level HWR measure, the developer reviewed time to readmission curves over time, which illustrated that rapid early accrual of readmissions, followed by a stable readmission rate, eventually stabilizing by 30 days. The 30-day readmission timeframe is based upon numerous studies that have been completed assessing the association between quality of inpatient or transitional care and early readmission rates (typically 30 days). We believe that a 7-day readmission timeframe may not provide a complete representation of post-discharge observation and follow-up periods that may influence readmissions. As the measure steward, we will take this feedback into consideration during the annual revisions for possible implementation in future years.</p>
Comment:	<p>One commenter stated that comparing to the 30-Day All-Cause Hospital Readmission measure, many exclusions have been dropped from the measure, thereby increasing the denominator.</p>
Response:	<p>We thank the commenter for their comment. The goal is not to compare the data from the All-Cause Hospital Readmission measure to the Hospital-Wide, 30 Day, All-Cause Unplanned Readmission (HWR), but to replace the All-Cause Hospital Readmission measure with a more robust measure as it is based upon the original hospital-level measure has been most rigorously tested and vetted. The measure is intended to improve upon the current ACR measure within MIPS, which unduly attributes readmissions to the clinician that provide the plurality of care during the measurement period, to more appropriately attribute readmissions to up to three clinician groups with the ability to influence the risk of readmission. There are several exclusion criteria applied to the measure population ("starting cohort"), in order to identify the appropriate denominator patient population. Additionally, the measure is risk adjusted to account for differences in patient demographics and clinical characteristics across hospitals.</p>
	<p>After consideration of public comments, we are finalizing the <i>Hospital-Wide, 30-Day, All-Cause Unplanned Readmission (HWR) Rate for the Merit-Based Incentive Payment System (MIPS) Groups</i> measure as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>

A.2. Risk-standardized complication rate (RSCR) following elective primary total hip arthroplasty (THA) and/or total knee arthroplasty (TKA) for Merit-based Incentive Payment System (MIPS)

Category	Description
NQF #: / eCQM NQF #:	3493 / N/A
Quality #:	480
Description:	This measure is a re-specified version of the measure, "Hospital-level Risk-standardized Complication rate (RSCR) following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA)" (National Quality Forum 1550), which was developed for patients 65 years and older using Medicare claims. This re-specified measure attributes outcomes to Merit-based Incentive Payment System participating clinicians and/or clinician groups ("provider") and assesses each provider's complication rate, defined as any one of the specified complications occurring from the date of index admission to up to 90 days post date of the index procedure.
Measure Steward:	Centers for Medicare & Medicaid Services
Numerator:	The outcome for this measure is complication defined as acute myocardial infarction (AMI), pneumonia, and sepsis/septicemia/shock complications within seven days from the index admission date; death, surgical site bleeding, and pulmonary embolism within 30 days from the index admission; mechanical complications and periprosthetic joint infection/wound infection within 90 days of the index admission. The complication outcome is a dichotomous (yes/no) outcome. If a patient experiences one or more of these complications in the applicable time period, the complication outcome for that patient is counted in the measure as a "yes".
Denominator:	Patients eligible for inclusion in the measure are those age 65 years and older admitted to non-federal acute care hospitals. An index admission is the hospitalization during which an elective Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) procedure was performed and to which the complication outcome is attributed. Eligible index admissions are identified using International Classification of Diseases-Tenth Revision-Procedure Coding System (ICD-10-PCS) procedure codes in Medicare inpatient claims data. For risk adjustment and outcome assessment, patients must have continuous enrollment in Medicare fee-for-service (FFS) for 12 months prior to the procedure and 90 days after it. The measure cohort is fully harmonized with the existing hospital-level measure.
Exclusions:	This measure excludes from the denominator admissions for patients: 1. With a femur, hip or pelvic fracture coded in the principal discharge diagnosis field for the index admission. 2. Undergoing partial hip arthroplasty (PHA) procedures (with a concurrent Total Hip Arthroplasty or Total Knee Arthroplasty [THA/TKA]). 3. Undergoing revision procedures (with a concurrent THA/TKA). 4. Undergoing resurfacing procedures (with a concurrent THA/TKA). 5. With a mechanical complication coded in the principal discharge diagnosis field for the index admission. 6. With a malignant neoplasm of the pelvis, sacrum, coccyx, lower limbs, or bone/bone marrow or a disseminated malignant neoplasm coded in the principal discharge diagnosis field for the index admission. 7. With a procedure code for removal of implanted devices/prostheses. After excluding the above admissions to identify elective primary THA/TKA procedures, the measure also excludes admissions for patients: 8. Who were transferred to the index hospital. 9. Who leave the hospital against medical advice (AMA). 10. With more than two THA/TKA procedure codes during the index hospitalization. Note: The measure does not count complications that occur in the outpatient setting and do not require a readmission.
Measure Type:	Outcome
Measure Domain:	Patient Safety (section 1848(s)(1)(B)(ii) of the Act)
High Priority Measure:	Yes (Outcome)
Collection Type:	Administrative Claims
Measure Implementation:	MIPS eligible clinicians and groups / 25 case minimum / 3 year performance period (October 1 st – September 30 th)
Rationale:	<p>This risk-standardized complication rate administrative claims measure was proposed to incentivize improved coordination of care, thereby reducing the number of hospitalizations and days hospitalized for patients, reducing rates of complications, and promoting cost savings resulting from fewer hospitalizations. This measure can improve the quality of surgical care delivery and follow-up care for a common and costly surgical procedure performed for Medicare patients. This measure is a re-specified version of an existing, publicly reported hospital measure, NQF #1550, located at https://innovation.cms.gov/files/fact-sheet/bpciadvanced-fs-nqf1550.pdf. Additionally, as an administrative claims measure, there is no separate reporting burden. The measure was evaluated by the MAP and is supported for rulemaking and is NQF endorsed (NQF #3493). The measure steward indicated variability among providers and groups with the risk standardized complication rates (RSCR) ranging from 1.2 percent to 7.2 percent across the groups. In adapting the measure for MIPS eligible clinicians, it will assess the same cohort of patients as the hospital measure, but attribute complications to a larger number of entities with a typically lower volume. Thus, we anticipate that the MIPS THA/TKA complication measure will reflect meaningful variation across MIPS eligible clinicians. The median RSCR for MIPS eligible clinicians with more than 25 cases was 2.7 percent with a minimum interquartile range (IQR) of 2.4 percent - 3.2 percent. The median RSCR for MIPS eligible clinician groups with more than 25 cases was 2.8 percent, with a minimum IQR of 2.4 percent - 3.1 percent. This indicates that 50 percent of clinicians have a complication rate of 2.7 percent or more after adjusting for patient age and comorbidities. The best performing clinicians (1.2 percent) are performing 55.6 percent better than an average performer, while the worst performing clinicians (7.2 percent) are performing 166.7 percent worse than an average performer. The best performing clinician groups (1.4 percent) are performing 50 percent better than an average performer, while the worst performing clinicians (5.7 percent) are performing 103.6 percent worse than an average performer. The measure steward believes these results support meaningful variation in rates across clinician and clinician groups with room for improvement.</p> <p>This measure is a re-specification of the existing, publicly reported hospital-level total hip/knee arthroplasty (THA/TKA) 90-day complication measure and has been designed to align with the cohort and methods of that measure. This measure uses 36 months of administrative claims data to calculate risk-standardized complication rates (RSCRs) for MIPS eligible clinicians and MIPS eligible clinician groups with 25 or more cases within the 3-year performance period. This approach balances measure reliability with maximizing the number of clinicians or clinician groups measured. For 2023 payment determination, the performance period will include administrative claims from October 1, 2018 to September 30, 2021. The measure's numerator assesses the occurrence of complications in the 90 days following the index admission date; therefore, ending the 3-year performance period on September 30th of the calendar year will allow time for numerator assessment.</p> <p>Based on the information provided by the measures steward, we believe this measure is evidence-based and represents an important clinical outcome. For further information regarding the implementation of this measure, please see IV.A.3.c.(1)(e)(i) of this final rule.</p> <p>Note: Refer to the MAP Spreadsheet of Final Recommendations to CMS and HHS at http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=91911.</p>

Category	Description
	<p>Comment: One commenter supported this new measure, citing that there is no data submission requirement from clinicians. The commenter requested that consideration be given to fast-tracking this measure for reporting on Physician Compare, as a complement to measure already available on Hospital Compare, so that beneficiaries potentially could access information about the quality and clinical outcomes of joint replacement surgeons. A second commenter stated that orthopedic surgeons would choose to report this measure and also asked for the measure to be included on Physician Compare, or other CMS site.</p> <p>Response: We thank the commenter for supporting this new measure for inclusion in the MIPS program.</p> <p>Comment: One commenter indicated that it has urged CMS to consider measure reliability on a measure-by-measure basis and applauds CMS for incorporating a 3-year window to increase the integrity of this measure. The commenter has expressed concerns to CMS about the difficulty of calculating a high level of reliability and validity with 12 months of data for an individual clinician, and has urged CMS to measure surgical care at the group or facility level in order to increase statistical power. This is especially important for procedures with a low complication rate. The commenter supported the direction of this measure since it evaluates individuals and groups over a longer time period for increased reliability, and also aligns with the hospital measure. The commenter recommended that CMS allow for a longer look back period for other MIPS measures, where appropriate. Although risk-adjusted clinical data from a high-fidelity registry is often preferred to claims data, a 36-month collection period of claims data can be used as a proxy for quality outcomes with low event rates.</p> <p>Response: We thank the commenter for supporting this new measure for inclusion in the MIPS program.</p> <p>Comment: Several commenters opposed the addition of this measure for the 2021 performance year. Clinicians and group practices need stability now more than ever, and this is not the time to add new metrics, particularly to a category that groups are familiar with already. The commenter expressed significant concerns around administrative claims measures. While CMS asserts these measures do not increase reporting burden since they are calculated on clinicians' behalf, it takes time to study the measures themselves, understand how clinicians are evaluated, and determine how (or if) clinicians can influence performance. With registry or EHR reporting, clinicians can receive real time feedback on measure performance and evaluate whether changes are needed to facilitate improvement. Claims-based measures do not offer the same opportunity, which makes it difficult to improve performance or drive meaningful change. Another commenter said this measure should be delayed and implemented as part of an Orthopedic MVP instead of being implemented as a category-wide population health measure.</p> <p>Response: We believe that it is important to capture patient outcomes, that is, complication rates, for these procedures to allow for a more comprehensive view of quality of care, patient safety, prevention of and response to complications, and coordination of care. We believe this measure has the potential to illustrate variations seen in quality, help to inform patient choice, be a driver of quality improvement while enhancing care coordination. While we can appreciate the desire for stability, we believe the addition of an Administrative Claims based measure has low burden on clinicians, covers a gap within MIPS, and is important in driving quality care. Real-time feedback is not a guaranteed aspect of the eCQMs Specifications or the MIPS CQMs Specifications collection type, but may be a service provided, for example, by a vendor. While the administrative claims does not provide real-time feedback, CMS supplies eligible clinicians and eligible clinician groups with confidential reports that provide information on measure performance, including patient-level data, to help drive quality improvement. In addition, since they utilize claims data submitted for payment purposes, they provide data elements that are validated through CMS monitoring and auditing processes and introduce no burden collection of vital information related to decreasing complications from elective primary THA and/or TKA therefore improving patient outcomes.</p> <p>Comment: One commenter did not support including this new measure and requested that if CMS finalizes the measure, it must delay implementation of the measure, not include 2020 data, and provide advance notice given the measure utilizes retrospective data. The commenter was concerned that there is insufficient evidence on how an individual physician or practice could reduce complication rates in these patients and the scientific acceptability of this measure is questionable. In addition, the reliability scores when applying this measure to eligible clinicians with more than 25 admissions was below the minimum acceptable threshold. The commenter was also concerned about the impact COVID-19 may have on volume and outcomes, and did not believe any physician should be evaluated on outcomes that includes 2020 data. Finally, information on how the measure would perform using the MIPS benchmark methodology and Physician Compare Star Ratings has not been provided. In addition, two commenters opposed having a 3-year performance period for this measure. The commenter thought that it would be operationally difficult and would delay actionable feedback and payment adjustments for years. The data received and scored across two years would not reflect true performance during the performance year and would impact scoring on an episode that they treat fewer than 25 times per year. Two commenters thought that a 3-year performance period is far too long to provide meaningful, timely data that would help to inform quality improvement activities and convert it to a data reporting exercise.</p> <p>Response: THA/TKA elective procedures dramatically improve quality of life and function but can result in serious complications. The associated risk and performance of surgeons are important factors for patients to consider when deciding whether to undergo the elective operation. Current clinician-level THA/TKA quality improvement measures are generally limited to evidence-based processes of care. Measurement of patient outcomes, such as complications, allows for a more comprehensive view of quality of care, capturing complex and critical aspects of care, such as communication between providers, prevention of and response to complications, patient safety, and coordinated transitions to the outpatient environment.</p> <p>During the NQF initial endorsement review process, the measure specifications and testing was reviewed by a scientific methods panel, which concluded that the measure was scientifically acceptable, contributing to the ultimate endorsement of the measure. Measure reliability testing conducted by the developer consisted of two approaches, one of which demonstrated acceptable reliability with mean signal to noise reliability scores of 0.786 and 0.769 for eligible clinicians and eligible clinician groups, respectively (Adams et al, 2010). While the other approach, test-retest reliability, yielded lower but still fair reliability scores of 0.35 and 0.47 for eligible clinicians and eligible clinician groups, respectively, the reliability results are consistent with MIPS requirements (Landis and Koch, 1977). During TEP meetings and the NQF initial endorsement review process, stakeholders argued that eligible clinicians and eligible clinician groups with less than 25 cases should also be measured since those surgeons perform fewer procedures and may benefit from quality measurement. A minimum case count of 25 ensures that a measure result is available for most eligible clinicians and eligible clinician groups while maintaining measure reliability. This ensures that we are capturing a more complete patient population by including a broadened performance period. With regard to the 3-year performance period, specifically the COVID-19 Public Health Emergency (PHE) impact, this approach supports clinicians or clinician groups by assuring an adequately sized cohort of THA/TKA elective procedures for the assessment of complications post procedure. An adequate cohort is necessary to demonstrate reliability of results. We expect a decline in elective procedures during the PHE; however, the threshold will protect those clinicians or clinician groups that did not meet the 25 case requirement to ensure reliability. This reporting period approach balances measure reliability with maximizing the number of clinicians or clinician groups measured and quantifies the outcome derived from the data. For 2023 payment determination, the performance period will include administrative claims from October 1, 2018 to September 30, 2021. Though the performance period will span three years, performance data will be provided each year to reflect the corresponding performance period. This will ensure meaningful and timely data is available.</p> <p>Comment: One commenter stated it would be beneficial to understand why the claims-based measures differ between the two programs as the ACO has a Risk Standardized, All-Cause Unplanned Admissions for Multiple Chronic Conditions measure rather than the Risk-Standardized measure proposed here. The commenter asked that measures be aligned between programs where it makes sense to do so.</p> <p>Response: We thank the commenter for their comment. The "Risk-Standardized Acute Admission Rates for Patients with Multiple Chronic Conditions" measure was specifically developed to fulfill a measurement gap, as identified by NQF, for the ambulatory setting, which the literature demonstrates may lower readmissions for</p>

Category	Description
	<p>patients with multiple chronic conditions through improving access to care, supporting self-care at home, coordinating care across providers, and integrating social work, nursing, and medical services. We previously proposed but did not finalize the All-Cause Unplanned Admissions for Multiple Chronic Conditions measure for the 2021 MIPS performance period/2023 MIPS payment year to allow more time for considering feedback from the MAP on the measure (84 FR 62956). We endeavor to align with other reporting programs when able and will consider inclusion of All-Cause Unplanned Admissions for Multiple Chronic Conditions for future program years through future rulemaking.</p> <p>After consideration of public comments, we are finalizing the <i>Risk-standardized complication rate (RSCR) following elective primary total hip arthroplasty (THA) and/or total knee arthroplasty (TKA) for Merit-based Incentive Payment System (MIPS)</i> measure as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>

TABLE Group B: New Specialty Measures Sets and Modifications to Previously Finalized Specialty Measure Sets Finalized for the 2023 MIPS Payment Year and Future Years

We proposed to modify the previously finalized specialty measures sets below based upon review of updates made to existing quality measure specifications, proposed the addition of new measures for inclusion in MIPS, and considered the feedback provided by specialty societies. There may be instances where the quality measures within a specialty set remained static, but the individual measures had proposed substantive changes in Table Group D. In the first column, existing measures with substantive changes described in Table Group D are noted with an asterisk (*), core measures that align with Core Quality Measure Collaborative (CQMC) core measure set(s) are noted with the symbol (§), and high priority measures are noted with an exclamation point (!). In addition, the Indicator column includes a “high priority type” in parentheses after each high priority indicator (!) to represent fully the regulatory definition of high priority measures. In addition, electronic Clinical Quality Measures (eCQMs) that are National Quality Forum (NQF) endorsed are shown in Table B as follows: NQF # / eCQM NQF #.

NOTE:

- In the instance a title and/or measure description had a substantive change finalized in Table Group D, the revised title and/or measure description is reflected in the specialty measure sets located in Table Group B.
- Under Table Group B, we respond to comments that are related to new measures that were proposed for addition to measure sets, and measures that were proposed for removal. Any comments received on previously finalized measures are out of scope and not included in this final rule.
- Measures that were not finalized for removal in this final rule have been added back into the applicable previously finalized specialty set(s) under Table Group B and the reason for their retention is addressed under Table Group C.

The definition of high priority at § 414.1305 includes an outcome (including intermediate-outcome and patient-reported outcome), appropriate use, patient safety, efficiency, patient experience, care coordination, or opioid-related quality measure.

The following specialty measure set was excluded from this group because we did not propose any changes to this specialty measure set: Anesthesiology. Therefore, we refer readers to the CY 2020 Quality Payment Program final rule for the previously finalized Anesthesiology specialty measure set (84 FR 63218 through 63219).

B.1. Allergy/Immunology

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Allergy/Immunology specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

* ! (Efficiency)	N/A / N/A	444	N/A	MIPS CQMs Specifications	Process	Efficiency and Cost Reduction	Medication Management for People with Asthma: The percentage of patients 5-64 years of age during the performance period who were identified as having persistent asthma and were dispensed appropriate medications that they remained on for at least 75% of their treatment period.	National Committee for Quality Assurance	This measure was proposed for inclusion into the Allergy/Immunology specialty set based on previous stakeholder feedback during previous comment period. Allergists/Immunologists treat and frequently manage asthma. As such, we agreed with the stakeholder and proposed to add to the Allergy/Immunology specialty set.
<p>Comment: One commenter thanked CMS for the addition of measures Q331, Q332, Q398, and Q444 to the Allergy/Immunology set that it had requested in prior years comments.</p> <p>Response: We thank the commenter for supporting the addition of the four measures to this specialty set.</p> <p>After consideration of public comments, we are finalizing the measures for addition to the <i>Allergy/Immunology Specialty Measure Set</i> as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>									

B.2. Audiology

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Audiology specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

The measure contains four goals. All four goals within a measure must be reached in order to meet that measure. The numerator for the all-or-none measure should be collected from the organization's total IVD denominator. All-or- None Outcome Measure (Optimal Control) - Using the IVD denominator optimal results include: <input type="checkbox"/> Most recent blood pressure (BP) measurement is less than or equal to 140/90 mm Hg -- And <input type="checkbox"/> Most recent tobacco status is Tobacco Free - - And <input type="checkbox"/> Daily Aspirin or Other Antiplatelet Unless Contraindicated -- And <input type="checkbox"/> Statin Use Unless Contraindicated	Wisconsin Collaborativ e for Healthcare Quality (WCHQ)

B.3b. Electrophysiology Cardiac Specialist

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Electrophysiology Cardiac Specialist specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

B.5. Clinical Social Work

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Clinical Social Work specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

Centers for Medicare & Medicaid Services

B.5. Clinical Social Work

MEASURES FINALIZED FOR ADDITION TO THE CLINICAL SOCIAL WORK SET									
Indicator	NQF # / eCQM NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title And Description	Measure Steward	Rationale for Inclusion
* ! (Care Coordination)	0326 / N/A	047	N/A	Medicare Part B Claims, MIPS CQMs Specifications	Process	Communication and Care Coordination	Advance Care Plan: Percentage of patients aged 65 years and older who have an advance care plan or surrogate decision maker documented in the medical record or documentation in the medical record that an advance care plan was discussed but the patient did not wish or was not able to name a surrogate decision maker or provide an advance care plan.	National Committee for Quality Assurance	We proposed in Table D.9 to expand the measure's applicability to include coding that would include clinical social worker clinician type. With the expanded patient population and the clinical relevance to this clinician type, we proposed to add to the Clinical Social Work specialty set.
<p>Comment: One commenter stated that in the palliative care setting, clinical social workers are trained to provide counseling services and play an important role in goals of care discussions, naming a surrogate decision maker and developing an advance care plan. The commenter's members regularly hold these discussions with patients and families during the course of care. As this measure is added to the Clinical Social Work set, the commenter strongly recommended that clinical social workers be added to the list of providers who can use CPT code 99497 and the add-on code 99498 and bill for advance care planning services. A second commenter supported the addition of measure Q047 to the Clinical Social Work set.</p> <p>Response: We thank the commenters for their support of the addition of clinical social worker clinician type. In regards to the comment requesting updates to CPT codes 99497 and 99498, these codes are not necessary for the utilization of measure Q047, as they are included within the measure to show examples as to what services would typically satisfy the quality action. As noted in the measure specification, the quality-data codes listed do not need to be submitted by MIPS eligible clinicians, groups, or third party intermediaries that utilize this modality for submissions; however, these codes may be submitted for those third party intermediaries that utilize Medicare Part B claims data and submit data to CMS on the clinicians behalf. However, for Medicare Part B claims, adding these codes to the numerator could potentially skew performance calculations and not allow proper distribution of numerator outcomes that reflect accurate performance.</p> <p>After consideration of public comments, we are finalizing the measures for addition to the <i>Clinical Social Work Specialty Measure Set</i> as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>

B.8. Diagnostic Radiology

PREVIOUSLY FINALIZED MEASURES FINALIZED FOR REMOVAL FROM THE DIAGNOSTIC RADIOLOGY SET

Note: In this final rule, we are removing the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.

NQF # / eCQM NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
0508 / N/A	146	N/A	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications	Process	Efficiency and Cost Reduction	Radiology: Inappropriate Use of “Probably Benign” Assessment Category in Screening Mammograms: Percentage of final reports for screening mammograms that are classified as “probably benign”.	American College of Radiology	This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.

After consideration of public comments as shown in Table C, we are finalizing the measures for removal from the *Diagnostic Radiology Specialty Measure Set* as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years. Note: Where applicable, see Table C for any comments and responses pertaining to measures that were proposed for removal from the MIPS program.

B.9. Emergency Medicine

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Emergency Medicine specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

B.9. Emergency Medicine

MEASURES NOT FINALIZED FOR ADDITION TO THE EMERGENCY MEDICINE SET									
Indicator	NQF # / eCQM NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title And Description	Measure Steward	Rationale for Inclusion
*	0053 / N/A	418	N/A	Medicare Part B Claims Specification s, MIPS CQM Specification s	Process	Effective Clinical Care	Osteoporosis Management in Women Who Had a Fracture: The percentage of women age 50-85 who suffered a fracture in the six months prior to the performance period through June 30 of the performance period and who either had a bone mineral density test or received a prescription for a drug to treat osteoporosis in the six months after the fracture.	National Committee for Quality Assurance	We proposed in Table D.89 to expand the clinical setting to include Emergency Medicine. With the expanded patient population and the clinical relevance to this clinician type, we proposed to add to the Emergency Medicine specialty set.
<p>Comment: One commenter opposed the addition of measure Q418 to the emergency department as an appropriate setting for this measure, stating that emergency department physicians do not manage these types of services. Furthermore, bone density tests often require a prior authorization, which would make this measure infeasible for an emergency medicine physician who does not oversee the ongoing care of a patient outside of the emergency department. A second commenter was also in opposition, stating that osteoporosis management is a chronic condition measure that requires longitudinal care and retrospective data. It is not an accurate reflection of emergency care and should not be attributable to the emergency physician, who only provides acute care management.</p> <p>Response: We agree that this measure may not fit into the emergency department workflow and that these quality actions may not be feasible for the emergency medicine clinician. We will not finalize the addition of measure Q418 to the Emergency Medicine set.</p> <p>After consideration of public comments, we are not finalizing measure Q418 for addition to the <i>Emergency Medicine Specialty Measure Set</i> as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>									

B.9. Emergency Medicine

PREVIOUSLY FINALIZED MEASURES FINALIZED FOR REMOVAL FROM THE EMERGENCY MEDICINE SET

Note: In this final rule, we are removing the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.

NQF # / eCQM NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
N/A / N/A	333	N/A	MIPS CQM Specifications	Efficiency	Efficiency and Cost Reduction	Adult Sinusitis: Computerized Tomography (CT) for Acute Sinusitis (Overuse): Percentage of patients aged 18 years and older, with a diagnosis of acute sinusitis who had a computerized tomography (CT) scan of the paranasal sinuses ordered at the time of diagnosis or received within 28 days after date of diagnosis.	American Academy of Otolaryngology – Head and Neck Surgery Foundation	This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.

After consideration of public comments as shown in Table C, we are finalizing the measures for removal from the *Emergency Medicine Specialty Measure Set* as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years. Note: Where applicable, see Table C for any comments and responses pertaining to measures that were proposed for removal from the MIPS program.

B.10. Endocrinology

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Endocrinology specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

MEASURES NOT FINALIZED FOR ADDITION TO THE FAMILY MEDICINE SET									
Indicator	NQF # / eCQM NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title And Description	Measure Steward	Rationale for Inclusion
* ! (Care Coordination)	0576 / N/A	391	N/A	MIPS CQM Specifications	Process	Communication and Care Coordination	Follow-Up After Hospitalization for Mental Illness (FUH): The percentage of discharges for patients 6 years of age and older who were hospitalized for treatment of selected mental illness or intentional self-harm diagnoses and who had a follow-up visit with a mental health practitioner. Two rates are submitted: • The percentage of discharges for which the patient received follow-up within 30 days after discharge. • The percentage of discharges for which the patient received follow-up within 7 days after discharge.	National Committee for Quality Assurance	We proposed to add this measure to the Family Medicine specialty set. Stakeholders commented, as we agreed, that the Family Medicine set includes several quality measures that address mental health and substance use disorders. Given the high rates that patients are assessed or treated for these conditions within this specialty, they recommended the inclusion of this measure within the Family Medicine specialty set.
<p>Comment: Two commenters opposed the addition of measure Q391 to the Family Medicine set, and noted that the measure specifications require a visit with a mental health professional to satisfy the measure (i.e., a visit with a family physician does not satisfy the measure); therefore application to family medicine is inappropriate.</p> <p>Response: We thank the commenters for their comments. We believe that measure Q391 supports the facilitation of follow up care for patients that have been hospitalized with mental illness and represents a meaningful measure within MIPS. However, we understand the concern provided by the commenters and recognize that the quality action of the measure indicates the follow up is with a mental health practitioner. Therefore, we agree that this measure should not be added to the Family Medicine set.</p> <p>After consideration of public comments, we are not finalizing measure Q391 for addition to the <i>Family Medicine Specialty Measure Set</i> as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>									

B.11. Family Medicine

PREVIOUSLY FINALIZED MEASURES FINALIZED FOR REMOVAL FROM THE FAMILY MEDICINE SET

Note: In this final rule, we are removing the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.

NQF # / eCQM NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
N/A / N/A	333	N/A	MIPS CQMs Specifications	Efficiency	Efficiency and Cost Reduction	Adult Sinusitis: Computerized Tomography (CT) for Acute Sinusitis (Overuse): Percentage of patients aged 18 years and older, with a diagnosis of acute sinusitis who had a computerized tomography (CT) scan of the paranasal sinuses ordered at the time of diagnosis or received within 28 days after date of diagnosis.	American Academy of Otolaryngology - Head and Neck Surgery Foundation	This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.
N/A / N/A	408	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Opioid Therapy Follow-up Evaluation: All patients 18 and older prescribed opiates for longer than six weeks duration who had a follow-up evaluation conducted at least every three months during Opioid Therapy documented in the medical record.	American Academy of Neurology	This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.
N/A / N/A	412	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Documentation of Signed Opioid Treatment Agreement: All patients 18 and older prescribed opiates for longer than six weeks duration who signed an opioid treatment agreement at least once during Opioid Therapy documented in the medical record.	American Academy of Neurology	This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.
N/A / N/A	414	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Evaluation or Interview for Risk of Opioid Misuse: All patients 18 and older prescribed opiates for longer than six weeks duration evaluated for risk of opioid misuse using a brief validated instrument (e.g. Opioid Risk Tool, Screener and Opioid Assessment for Patients with Pain, revised (SOAPP-R)) or patient interview documented at least once during Opioid Therapy in the medical record.	American Academy of Neurology	This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.

After consideration of public comments as shown in Table C, we are finalizing the measures for removal from the *Family Medicine Specialty Measure Set* as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years. Note: Where applicable, see Table C for any comments and responses pertaining to measures that were proposed for removal from the MIPS program.

B.12. Gastroenterology

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Gastroenterology specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

American College of Surgeons
! (Outcome)	N/A / N/A	357	N/A	MIPS CQMs Specifications	Outcome	Effective Clinical Care	Surgical Site Infection (SSI): Percentage of patients aged 18 years and older who had a surgical site infection (SSI).	American College of Surgeons
! (Patient Experience)	N/A / N/A	358	N/A	MIPS CQMs Specifications	Process	Person and Caregiver-Centered Experience and Outcomes	Patient-Centered Surgical Risk Assessment and Communication: Percentage of patients who underwent a non-emergency surgery who had their personalized risks of postoperative complications assessed by their surgical team prior to surgery using a clinical data-based, patient-specific risk calculator and who received personal discussion of those risks with the surgeon.	American College of Surgeons
* ! (Care Coordination)	N/A / N/A	374	CMS50v9	eCQM Specifications, MIPS CQMs Specifications	Process	Communication and Care Coordination	Closing the Referral Loop: Receipt of Specialist Report: Percentage of patients with referrals, regardless of age, for which the referring provider receives a report from the provider to whom the patient was referred.	Centers for Medicare & Medicaid Services

B.13. General Surgery

PREVIOUSLY FINALIZED MEASURES IN THE GENERAL SURGERY SET								
Indicator	NQ F # / eCQM NQ F #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward
	2803 / N/A	402	N/A	MIPS CQMs Specifications	Process	Community/ Population Health	Tobacco Use and Help with Quitting Among Adolescents: The percentage of adolescents 12 to 20 years of age with a primary care visit during the measurement year for whom tobacco use status was documented and received help with quitting if identified as a tobacco user.	National Committee for Quality Assurance
Comment: One commenter indicated that measures Q047, Q128, Q130, Q226, Q317, and Q374, included in the General Surgery set, have substantive changes proposed under the applicable D Tables (D.9, D.24, D.25, D.46, D.64, and D.73) that measure preventive care services, which do not directly align with most surgical workflows. The commenter believes that administering and measuring population health and preventive care activities are important, but these measures should not make up the majority of the General Surgery set as they offer little support in understanding the quality of surgical care.								
Response: We did not propose any changes to the General Surgery set. Of note, the substantive changes finalized for the aforementioned measures do not change the intent of the measures. We encourage the commenter to submit this comment during the Solicitation for Specialty Sets for potential implementation in future years.								

B.14. Geriatrics

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Geriatrics specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

Large Urology Group Practice Association and Oregon Urology Institute

B.14. Geriatrics

PREVIOUSLY FINALIZED MEASURES FINALIZED FOR REMOVAL FROM THE GERIATRICS SET								
Note: In this final rule, we are removing the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.								
NQF # / eCQM NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
N/A / N/A	412	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Documentation of Signed Opioid Treatment Agreement: All patients 18 and older prescribed opiates for longer than 6 weeks duration who signed an opioid treatment agreement at least once during Opioid Therapy documented in the medical record.	American Academy of Neurology	This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.
N/A / N/A	414	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Evaluation or Interview for Risk of Opioid Misuse: All patients 18 and older prescribed opiates for longer than six weeks duration evaluated for risk of opioid misuse using a brief validated instrument (e.g. Opioid Risk Tool, Screener and Opioid Assessment for Patients with Pain, revised (SOAPP-R)) or patient interview documented at least once during Opioid Therapy in the medical record.	American Academy of Neurology	This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.

B.15. Hospitalists

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Hospitalists specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

MEASURES FINALIZED FOR ADDITION TO THE INTERNAL MEDICINE SET									
Indicator	NQF # / eCQM NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title And Description	Measure Steward	Rationale for Inclusion
*	N/A / 0104e	107	CMS161 v9	eCQM Measure Specifications	Process	Effective Clinical Care	Adult Major Depressive Disorder (MDD): Suicide Risk Assessment: All patient visits during which a new diagnosis of MDD or a new diagnosis of recurrent MDD was identified for patients aged 18 years and older with a suicide risk assessment completed during the visit.	Mathematica	We proposed to add this measure to the Internal Medicine specialty set. Stakeholders commented, and we agreed, that the Internal Medicine set include several quality measures that address mental health and substance use disorders. Given the high rates that patients are assessed or treated for these conditions within this specialty, they recommended the inclusion of this measure within the Internal Medicine specialty set.
* ! (Care Coordination)	0576 / N/A	391	N/A	MIPS CQM Specifications	Process	Communication and Care Coordination	Follow-Up After Hospitalization for Mental Illness (FUH): The percentage of discharges for patients 6 years of age and older who were hospitalized for treatment of selected mental illness or intentional self-harm diagnoses and who had a follow-up visit with a mental health practitioner. Two rates are submitted: • The percentage of discharges for which the patient received follow-up within 30 days after discharge. • The percentage of discharges for which the patient received follow-up within 7 days after discharge.	National Committee for Quality Assurance	We proposed to add this measure to the Internal Medicine specialty set. Stakeholders commented, and we agreed, that the Family Medicine set include several quality measures that address mental health and substance use disorders. Given the high rates that patients are assessed or treated for these conditions within this specialty, they recommended the inclusion of this measure within the Internal Medicine specialty set.

We received no comments on the measures for proposed for addition to this specialty set; therefore, we are finalizing the measures for addition to the *Internal Medicine Specialty Measure Set* as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.

B.17. Internal Medicine

PREVIOUSLY FINALIZED MEASURES FINALIZED FOR REMOVAL FROM THE INTERNAL MEDICINE SET

Note: In this final rule, we are removing the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.

NQF # / eCQM NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
N/A / N/A	333	N/A	MIPS CQMs Specifications	Efficiency	Efficiency and Cost Reduction	Adult Sinusitis: Computerized Tomography (CT) for Acute Sinusitis (Overuse): Percentage of patients aged 18 years and older, with a diagnosis of acute sinusitis who had a computerized tomography (CT) scan of the paranasal sinuses ordered at the time of diagnosis or received within 28 days after date of diagnosis.	American Academy of Otolaryngology - Head and Neck Surgery Foundation	This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.
N/A / N/A	408	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Opioid Therapy Follow-up Evaluation: All patients 18 and older prescribed opiates for longer than six weeks duration who had a follow-up evaluation conducted at least every three months during Opioid Therapy documented in the medical record.	American Academy of Neurology	This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.
N/A / N/A	412	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Documentation of Signed Opioid Treatment Agreement: All patients 18 and older prescribed opiates for longer than six weeks duration who signed an opioid treatment agreement at least once during Opioid Therapy documented in the medical record.	American Academy of Neurology	This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.
N/A / N/A	414	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Evaluation or Interview for Risk of Opioid Misuse: All patients 18 and older prescribed opiates for longer than six weeks duration evaluated for risk of opioid misuse using a brief validated instrument (e.g. Opioid Risk Tool, Screener and Opioid Assessment for Patients with Pain, revised (SOAPP-R)) or patient interview documented at least once during Opioid Therapy in the medical record.	American Academy of Neurology	This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.

After consideration of public comments as shown in Table C, we are finalizing the measures for removal from the *Internal Medicine Specialty Measure Set* as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years. Note: Where applicable, see Table C for any comments and responses pertaining to measures that were proposed for removal from the MIPS program.

B.18. Interventional Radiology

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Interventional Radiology specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

B.21. Neurology

PREVIOUSLY FINALIZED MEASURES FINALIZED FOR REMOVAL FROM THE NEUROLOGY SET								
Note: In this final, we proposed the removal of the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.								
NQF # / eCQM M NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
N/A / N/A	408	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Opioid Therapy Follow-up Evaluation: All patients 18 and older prescribed opiates for longer than six weeks duration who had a follow-up evaluation conducted at least every three months during Opioid Therapy documented in the medical record.	American Academy of Neurology	This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.
N/A / N/A	412	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Documentation of Signed Opioid Treatment Agreement: All patients 18 and older prescribed opiates for longer than six weeks duration who signed an opioid treatment agreement at least once during Opioid Therapy documented in the medical record.	American Academy of Neurology	This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.
N/A / N/A	414	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Evaluation or Interview for Risk of Opioid Misuse: All patients 18 and older prescribed opiates for longer than six weeks duration evaluated for risk of opioid misuse using a brief validated instrument (e.g. Opioid Risk Tool, Screener and Opioid Assessment for Patients with Pain, revised (SOAPP-R)) or patient interview documented at least once during Opioid Therapy in the medical record.	American Academy of Neurology	This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.
N/A / N/A	435	N/A	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications	Patient Reported Outcome	Effective Clinical Care	Quality Of Life Assessment For Patients With Primary Headache Disorders: Percentage of patients with a diagnosis of primary headache disorder whose health related quality of life (HRQoL) was assessed with a tool(s) during at least two visits during the 12-month measurement period AND whose health related quality of life score stayed the same or improved.	American Academy of Neurology	This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.
<p>Comment: One commenter supported the removal of the three retired opioid measures, Q408, Q412, and Q414 from the Neurology set.</p> <p>Response: We thank the commenter for supporting the removal of measures Q408, Q412, and Q414 from the Neurology set, as they are being removed from the MIPS program.</p> <p>After consideration of public comments, we are finalizing the measures for removal from the <i>Neurology Specialty Measure Set</i> as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years. Note: Where applicable, see Table C for any comments and responses pertaining to measures that were proposed for removal from the MIPS program.</p>								

B.22. Neurosurgical

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Neurosurgical specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

B.23. Nutrition/Dietician

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Nutrition/Dietician specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

The bone density evaluation must be prior to the start of ADT or within 3 months of the start of ADT.	Oregon Urology Institute

B.25a. Oncology/Hematology

PREVIOUSLY FINALIZED MEASURES FINALIZED FOR REMOVAL FROM THE ONCOLOGY/HEMATOLOGY SET

Note: In this final rule, we are removing the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.

NQF # / eCQM NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
N/A / N/A	069	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Hematology: Multiple Myeloma: Treatment with Bisphosphonates: Percentage of patients aged 18 years and older with a diagnosis of multiple myeloma, not in remission, who were prescribed or received intravenous bisphosphonate therapy within the 12-month reporting period.	American Society of Hematology	This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.

After consideration of public comments as shown in Table C, we are finalizing the measures for removal from the *Oncology/Hematology Specialty Measure Set* as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years. Note: Where applicable, see Table C for any comments and responses pertaining to measures that were proposed for removal from the MIPS program.

B.25b. Radiation Oncology

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Radiation Oncology specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

* ! (Outcome)	N/A / N/A	478	N/A	MIPS CQMs Specifications	Patient Reported Outcome	Person and Caregiver- Centered Experience and Outcomes	Functional Status Change for Patients with Neck Impairments: This is a patient-reported outcome measure of risk-adjusted change in functional status for patients aged 14 years+ with neck impairments. The change in functional status (FS) is assessed using the FOTO Neck FS patient-reported outcome measure (PROM). The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk-adjusted) and used as a performance measure at the patient level, at the individual clinician level, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static/paper-pencil).	Focus on Therapeutic Outcomes, Inc.

B.28. Otolaryngology

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Otolaryngology specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

B.31. Physical Medicine

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Physical Medicine specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

B.31. Physical Medicine

PREVIOUSLY FINALIZED MEASURES FINALIZED FOR REMOVAL FROM THE PHYSICAL MEDICINE SET								
Note: In this final rule, we are removing the following measure(s) below from this specific specialty measure set based upon review of updates made to existing quality measure specifications, the addition of new measures for inclusion in MIPS, and the feedback provided by specialty societies.								
NQF # / eCQM NQF #	Quality #	CMS eCQM ID	Collection Type	Measure Type	National Quality Strategy Domain	Measure Title and Description	Measure Steward	Rationale for Removal
N/A / N/A	408	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Opioid Therapy Follow-up Evaluation: All patients 18 and older prescribed opiates for longer than six weeks duration who had a follow-up evaluation conducted at least every three months during Opioid Therapy documented in the medical record.	American Academy of Neurology	This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.
N/A / N/A	412	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Documentation of Signed Opioid Treatment Agreement: All patients 18 and older prescribed opiates for longer than six weeks duration who signed an opioid treatment agreement at least once during Opioid Therapy documented in the medical record.	American Academy of Neurology	This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.
N/A / N/A	414	N/A	MIPS CQMs Specifications	Process	Effective Clinical Care	Evaluation or Interview for Risk of Opioid Misuse: All patients 18 and older prescribed opiates for longer than six weeks duration evaluated for risk of opioid misuse using a brief validated instrument (e.g. Opioid Risk Tool, Screener and Opioid Assessment for Patients with Pain, revised (SOAPP-R)) or patient interview documented at least once during Opioid Therapy in the medical record.		This measure was proposed for removal beginning with the 2023 MIPS payment year. See Table C for rationale.

After consideration of public comments as shown in Table C, we are finalizing the measures for removal from the *Physical Medicine Specialty Measure Set* as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years. Note: Where applicable, see Table C for any comments and responses pertaining to measures that were proposed for removal from the MIPS program.

B.32. Physical Therapy/Occupational Therapy

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Physical Therapy/Occupational Therapy specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

B.36. Pulmonology

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Pulmonology specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

American Heart Association

B.39. Speech Language Pathology

In addition to the considerations discussed in the introductory language of Table B of the appendix of this final rule, the Speech Language Pathology specialty set takes additional criteria into consideration, which includes, but is not limited to: whether the measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. Measure tables in this set include previously finalized measures that we are maintaining within the set, measures that were proposed to be added, and measures that were proposed for removal, as applicable.

The measure contains four goals. All four goals within a measure must be reached in order to meet that measure. The numerator for the all-or-none measure should be collected from the organization's total IVD denominator. All-or-None Outcome Measure (Optimal Control) - Using the IVD denominator optimal results include: <input type="checkbox"/> Most recent blood pressure (BP) measurement is less than or equal to 140/90 mm Hg -- AND <input type="checkbox"/> Most recent tobacco status is Tobacco Free -- AND <input type="checkbox"/> Daily Aspirin or Other Antiplatelet Unless Contraindicated -- AND <input type="checkbox"/> Statin Use Unless Contraindicated.	Wisconsin Collaborative for Healthcare Quality (WCHQ)

TABLE Group C: Previously Finalized Quality Measures Finalized for Removal in the 2023 MIPS Payment Year and Future Years

In this final rule, we are removing 11 previously finalized quality measures from the MIPS Program for the 2021 MIPS performance period/2023 MIPS payment year and future years. These measures are discussed in detail below. Our measure removal criteria was discussed in the CY 2019 PFS final rule (83 FR 59763 through 59765).

Further considerations are given in the evaluation of the measure's performance data, to determine whether there is or no longer is variation in performance. As discussed in the CY 2019 PFS final rule (83 FR 59761 through 59763), additional criteria that we use for the removal of measures also includes extremely topped out measures, which means measures that are topped out with an average (mean) performance rate between 98-100 percent. Beginning with the 2020 MIPS performance period/2022 MIPS payment year, we also refer readers to the CY 2020 PFS final rule (84 FR 62957 through 62959) for additional quality measure removal criteria.

NOTE: Since publication of the measures in Table C in CY 2021 PFS proposed rule, we have determined the following measures will be retained in the 2021 MIPS performance period/2023 MIPS payment year: Q024, Q048 (MIPS CQMs Specifications collection type only), and Q337. As such, these measures have been removed from Table C and integrated back into the relevant previously finalized measure sets under Table B in this final rule. Our decisions not to finalize these measures for removal in this final rule are detailed in our responses to the public comments for these measures in Table Group C.

TABLE Group C: Previously Finalized Quality Measures Finalized and Not Finalized for Removal in the 2023 MIPS Payment Year and Future Years

C.1. Communication with the Physician or Other Clinician Managing On-Going Care Post-Fracture for Men and Women Aged 50 Years and Older

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality #:	024
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Measure Description:	Percentage of patients aged 50 years and older treated for a fracture with documentation of communication, between the physician treating the fracture and the physician or other clinician managing the patient's on-going care, that a fracture occurred and that the patient was or should be considered for osteoporosis treatment or testing. This measure is submitted by the physician who treats the fracture and who therefore is held accountable for the communication.
Measure Steward:	National Committee for Quality Assurance
High Priority Measure:	Yes
Measure Type:	Process
Rationale for Removal	We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program because the measure supports communication between the physician treating the fracture and the clinician managing the patient's on-going care, but does not ensure that the patient receives the appropriate treatment or testing for osteoporosis. We believe measure Q418: Osteoporosis Management in Women Who Had a Fracture represents a more robust quality outcome in the management of patients with osteoporosis who experience a fracture since the clinical focus of this measure is the care of the patient rather than just the communication of the care plan for on-going post fracture care.
In the Circumstance the Measure is Retained	There are no substantive changes or specialty set movement finalized for this measure.
<p>Comment: One commenter opposed the removal of measure Q024, stating that it does not believe this measure is duplicative of measure Q418 as that measure only focuses on women, and not the entire population of possible concern. While the commenter appreciated the measure is a process measure that does not address appropriate treatment or testing, this measure captures an important aspect of care continuity for a large proportion of Medicare beneficiaries with fractures that is not addressed in any other MIPS quality measures.</p> <p>Response: We agree that treatment of osteoporosis is important, however, measure Q024 does not ensure treatment of the patient only that the fracture was communicated to the clinician managing the patient's on-going care. Measure Q418 is more robust in that it requires a bone mineral density test or pharmacologic therapy. After careful consideration, we will maintain this measure for consistency and stability as it is not topped out and still in alignment with guidelines, but may consider removal in the future.</p> <p>After consideration of public comments, we are not finalizing the removal of measure Q024 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

C.2. Urinary Incontinence: Assessment of Presence or Absence of Urinary Incontinence in Women Aged 65 Years and Older

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality #:	048
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Measure Description:	Percentage of female patients aged 65 years and older who were assessed for the presence or absence of urinary incontinence within 12 months.
Measure Steward:	National Committee for Quality Assurance
High Priority Measure:	No
Measure Type:	Process
Rationale for Removal	We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program because this measure does not align with the meaningful measures initiative. This is a process measure that only requires an assessment for the presence or absence of urinary incontinence, which by itself may not have a meaningful direct impact on patient care as the screening itself does not indicate a plan of care was implemented. Additionally, the Medicare Part B Claims Measure Specifications collection type has reached the end of the topped out lifecycle (82 53640).
In the Circumstance the Measure is Retained	There are no substantive changes or specialty set movement finalized for this measure.
<p>Comment: One commenter opposed removal of measure Q048, stating that according to the Women's Preventive Services Initiative, screening for urinary incontinence is important as this condition is underdiagnosed and undertreated in the United States. This practice screens for urinary incontinence in order to provide the appropriate diagnosis and ultimately the plan of care, and screens all women over 65 as it is clinically relevant for its practice.</p> <p>Response: While we agree that this is an important concept, the measure for assessment alone is low-bar and may not drive quality outcomes meaning completion of a screening does not indicate appropriate treatment was provided to the patient. We believe that measure Q050 allows clinicians to support patients screened positive for urinary incontinence and support the needs of these patients with quality being captured upon providing the patient with a plan of care. After careful consideration, we will maintain the MIPS CQMs Specifications collection type for consistency and stability as it is not topped out and still in alignment with guidelines, but may consider removal in the future. The Medicare Part B Claims Measure Specifications collection type has reached the end of the topped out life cycle, which does not allow meaningful benchmarks to be established. Additionally, by removing measures with high performance rates, we are attempting to reduce reporting burden where there is little room for improvement. Removal allows eligible clinicians to maximize their potential quality performance score as this measure's topped out status would limit the score awarded per the 2020 Benchmark File.</p> <p>Comment: Two commenters opposed removal of measure Q048 from the MIPS program and therefore the Obstetrics/Gynecology and Geriatrics specialty sets because evaluation of incontinence is an important initial evaluative process for female patients 65 or older. While sensible to remove the measure due to the topped out status, it seems reasonable to consider modification to transition this measure to an outcomes measure. The commenter received requests to delay removing this measure until MVPs are implemented and because many TINs using this measure are short of their required six measures for MIPS reporting.</p> <p>Response: Measure Q048 does not require a quality action (follow up, plan of care, etc.) that links to improved outcomes. The measure does not assess a clinical outcome nor one of the defined MIPS high priority areas. Measure Q050 is a more robust measure that requires a quality action (plan of care) for the appropriate patient population screened and diagnosed with urinary incontinence. We would encourage the commenter to collaborate with the measure to expand the population of Q050 to include all women to be screened for urinary incontinence and if positive, develop a plan of care to create a single comprehensive quality measure. After careful consideration, we will maintain the MIPS CQMs Specifications collection type for consistency and stability as it is not topped out and still in alignment with guidelines, but may consider removal in the future. The Medicare Part B Claims Measure Specifications collection type has reached the end of the topped out life cycle, which does not allow meaningful benchmarks to be established. Additionally, by removing measures with high performance rates, we are attempting to reduce reporting burden where there is little room for improvement. Removal allows eligible clinicians to maximize their potential quality performance score as this measure's topped out status would limit the score awarded per the 2020 Benchmark File.</p> <p>After consideration of public comments, we are finalizing the removal of measure Q048 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years for the Medicare Part B Claims Specifications collection type only (see Table D.113). Measure Q048 will remain in the MIPS program for 2021 for the MIPS CQMs Specifications collection type.</p>	

C.3. Hematology: Multiple Myeloma: Treatment with Bisphosphonates

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality #:	069
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Collection Type:	MIPS CQMs Specifications
Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of multiple myeloma, not in remission, who were prescribed or received intravenous bisphosphonate therapy within the 12-month reporting period.
Measure Steward:	American Society of Hematology
High Priority Measure:	No
Measure Type:	Process
Rationale for Removal	We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program because the measure does not align with current treatment guidelines and could inadvertently penalize eligible clinicians who are treating patients appropriately (i.e., Prolia), by excluding those patients instead of being numerator compliant. As currently constructed, the measure may produce misleading results.
In the Circumstance the Measure is Retained	There are no substantive changes or specialty set movement finalized for this measure.
<p>Comment: One commenter was supportive of removing measure Q069 from the MIPS program.</p> <p>Response: We thank the commenter for supporting the removal of this measure.</p> <p>After consideration of public comments, we are finalizing the removal of measure Q069 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

C.4. Radiology: Inappropriate Use of “Probably Benign” Assessment Category in Screening Mammograms

Category	Description
NQF # / eCQM NQF #:	0508 / N/A
Quality #:	146
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Efficiency and Cost Reduction
Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Measure Description:	Percentage of final reports for screening mammograms that are classified as “probably benign”.
Measure Steward:	American College of Radiology
High Priority Measure:	Yes
Measure Type:	Process
Rationale for Removal	<p>We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program because it is considered a standard of care that has limited opportunity to improve clinical outcomes. Performance on this measure is extremely high and unvarying, making this measure extremely topped out as discussed in the CY 2019 PFS final rule (83 FR 59761 through 59763). The average performance for this inverse measure is 0.428 percent for the MIPS CQMs Specifications collection type and 0.253 percent for the Medicare Part B Claims Measure Specifications collection type. For an inverse measure, a lower calculated performance rate indicates better clinical care or control. As such, the MIPS CQMs Specifications collection type and the Medicare Part B Claims Measure Specifications collection type are considered extremely topped out. The average performance rate is based on the current MIPS benchmarking data located at https://qpp-cm-prod-content.s3.amazonaws.com/uploads/824/2020%20MIPS%20Quality%20Benchmarks.zip</p>
In the Circumstance the Measure is Retained	There are no substantive changes or specialty set movement finalized for this measure.
<p>Comment: One commenter did not support the removal of measure Q146 since reporting difficulties created by the COVID-19 pandemic may limit relevancy of some measures due to reduced services provided. The use of performance period benchmarks for the 2021 performance year introduces uncertainty in measure selection. The removal of this measure would also limit the pool of measures available for breast imagers, and many groups carve out mammography services into separate TINs, thus group reporting does not broaden the list of available measures for these specialists. In addition, the measure could be useful as part of a measure set for a breast imaging MVP. A second commenter urged CMS to temporarily halt the removal of topped out measures for the 2021 performance year to provide clinicians with consistency as they recover from the COVID-19 PHE, particularly those that may be aligned with future MVPs. A third commenter said removal of this measure would limit the number of measures for radiologists and wanted this topped out measure to remain. A fourth commenter acknowledged the topped out data but suggested retaining the measure with an increase in the data completeness threshold to 90-95 percent since there have been no new radiology measures since 2017. A fifth commenter recommended maintaining the existing MIPS quality measures to ensure consistency, reduce a burden, and allow options in the future for MVPs.</p> <p>Response: While we acknowledge the hardships faced due to the COVID-19 PHE and the specializations found within diagnostic radiation, the performance for measure Q146 has an extremely high and unvarying performance rate. This does not allow meaningful benchmarks to be established. Additionally, by removing measures with high performance rates, we are attempting to reduce reporting burden where there is little room for improvement. Removal allows eligible clinicians to maximize their potential quality performance score as this measure’s topped out status would limit the score awarded per the 2020 Benchmark File. The policy for data completeness is established for all measures and is not varied between measures. We encourage the commenter to reach out to measure developers/stewards to develop new outcome/high-priority measures for submission to the Call for Measures for possible future implementation. We understand that ensuring there are measure available for future use in MVPs is important, however, we strive to ensure that all measures align with the Meaningful Measures Initiative, including removal of measures that are extremely topped out.</p> <p>After consideration of public comments, we are finalizing the removal of measure Q146 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

C.5. Adult Sinusitis: Computerized Tomography (CT) for Acute Sinusitis (Overuse)

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality #:	333
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Efficiency and Cost Reduction
Collection Type:	MIPS CQMs Specifications
Measure Description:	Percentage of patients aged 18 years and older, with a diagnosis of acute sinusitis who had a computerized tomography (CT) scan of the paranasal sinuses ordered at the time of diagnosis or received within 28 days after date of diagnosis.
Measure Steward:	American Academy of Otolaryngology – Head and Neck Surgery Foundation
High Priority Measure:	Yes
Measure Type:	Efficiency
Rationale for Removal	We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program because this measure has reached the end of the topped out lifecycle and has a high performance rate of 2.834 percent for the MIPS CQMs Specifications collection type. For an inverse measure, a lower calculated performance rate indicates better clinical care or control. Given this measure's continued topped out status, we believe it has a limited opportunity to improve clinical outcomes. The average performance rate is based on the current MIPS benchmarking data located at https://qpp-cm-prod-content.s3.amazonaws.com/uploads/824/2020%20MIPS%20Quality%20Benchmarks.zip
In the Circumstance the Measure is Retained	We proposed to update the denominator eligible encounters to include telehealth encounters as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.
<p>Comment: One commenter opposed removal of measure Q333, stating that while performance on this measure has historically been high, it is still possible to further improve clinical outcomes. Patients who undergo CT scans are exposed to radiation, which is correlated with an increased risk of cancer. This measure disincentivizes CT scans when diagnosing uncomplicated cases of adult sinusitis, which leads to better clinical outcomes. Removing this measure also reduces wasteful spending incurred by ordering CT scans.</p> <p>A second commenter stated that the removal of measure Q333 would impact the Emergency Medicine and Urgent Care sets. The commenter recognizes that it is not necessarily productive to keep measures that have demonstrated consistently high performance over time. At the same time, measure removal policies limiting the number of measures available to emergency medicine impact the ability of emergency medicine physicians to participate in the MIPS program. The commenter indicated that CMS must adopt a process that allows specialties to more rapidly test and replace obsolete measures. CMS should also work with clinical experts to consider ways to encourage the long-term tracking of topped out measures and allow for the reintroduction of previously topped out measures if a performance gap is later identified.</p> <p>A third commenter urged CMS to temporarily halt the removal of topped out measures for the 2021 performance year to provide clinicians with consistency as they recover from the COVID-19 PHE, particularly those that may be aligned with future MVPs. A fourth commenter recommended maintaining the existing MIPS quality measures to ensure consistency, reduce a burden, and allow options in the future for MVPs. A fifth commenter requested that CMS consider extending the life of this measure with an updated denominator that adds telehealth as an eligible encounter, and the commenter also thought this would be an excellent measure to include in a future MVP.</p> <p>Response: We agree that this is an important concept and we can appreciate the difficulties of the COVID-19 PHE. We understand that ensuring there are measures available for future use in MVPs is important, however, we strive to ensure that all measures align with the Meaningful Measures Initiative, including the removal of measures that are at the end of the topped out lifecycle. Additionally, by removing measures at the end of the topped out lifecycle, we are attempting to reduce reporting burden where there is little room for improvement. Removal allows eligible clinicians to maximize their potential quality performance score as this measure's topped out status would limit the score awarded per the 2020 Benchmark File. The policy for data completeness is established for all measures and is not varied between measures. We appreciate the comment regarding inclusion of telehealth as an eligible encounter of the measure and encourage the commenter to communicate their request to the measure steward for consideration in future years.</p> <p>We ensure there is an annual review of quality measures with measure stewards to ensure we maintain measures that reflect meaningful measurement. We believe that measures that are submitted to Call for Measures, vetted by CMS, and reviewed by Measure Applicability Partnership ensure that included MIPS measures are robust and fulfill our goal of incorporating meaningful measurement.</p> <p>After consideration of public comments, we are finalizing the removal of measure Q333 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

C.6. Psoriasis: Tuberculosis (TB) Prevention for Patients with Psoriasis, Psoriatic Arthritis and Rheumatoid Arthritis on a Biological Immune Response Modifier

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality #:	337
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Collection Type:	MIPS CQMs Specifications
Measure Description:	Percentage of patients, regardless of age, with psoriasis, psoriatic arthritis and/or rheumatoid arthritis on a biological immune response modifier whose providers are ensuring active tuberculosis prevention either through negative standard tuberculosis screening tests or are reviewing the patient's history to determine if they have had appropriate management for a recent or prior positive test.
Measure Steward:	American Academy of Dermatology
High Priority Measure:	No
Measure Type:	Process
Rationale for Removal	We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program because this measure is duplicative to measure Q176: Rheumatoid Arthritis (RA): Tuberculosis Screening because we are proposing in Table D.33 substantive changes to measure Q176 that would broaden the denominator by removing the disease specificity criteria. Therefore, the patient population will overlap between these measures; however, measure Q176 has a broader eligible patient population. In the event the proposed substantive change to measure Q176 was not finalized, we considered maintaining this measure to ensure this patient population is being assessed for appropriate tuberculosis screening.
In the Circumstance the Measure is Retained	There are no substantive changes or specialty set movement finalized for this measure.
<p>Comment: One specialty dermatology practice said it does not have a broad selection of measures to choose from and opposed the removal of measure Q337, stating that the measure is not duplicative to measure Q176. The practice does not diagnosis rheumatoid arthritis, and there is no mention of psoriasis in measure Q176. The commenter suggested that psoriasis be added to measure Q176, or as an alternative, that measure Q176 be eliminated instead since rheumatoid arthritis is mentioned in measure Q337.</p> <p>A second commenter opposed the removal of measure Q337, citing that the rationale for removal is the proposed substantive changes under Table D.33 to measure Q176, where the measure population would then overlap with measure Q337. However, if changes to measure Q176 are not finalized, measure Q337 would be retained. The commenter stated that the revision to measure Q176 does not sufficiently cover the patients that dermatologist treat or the medications that are used, as are currently reported under measure Q337. See comments under Table D.33 for further recommendations from this commenter.</p> <p>Response: We proposed a substantive change to measure Q176 in Table D.33 to broaden the denominator by removing the disease specificity criteria. The denominator will now include all patients aged 18 years and older receiving their first course of therapy using a biologic DMARD, regardless of diagnosis. We encourage the commenter to reach out to the measure stewards for measures Q176 and/or Q337 to discuss revisions for possible implementation of a single all-encompassing measure in future years. However, we agree the changes to measure Q176 do not adequately cover all dermatologic medications seen within measure Q337. For this reason, we will maintain measure Q337 for PY2021.</p> <p>After consideration of public comments, we are not finalizing the removal of measure Q337 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

C.7. Implantable Cardioverter-Defibrillator (ICD) Complications Rate

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality #:	348
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Patient Safety
Collection Type:	MIPS CQMs Specifications
Measure Description:	Patients with physician-specific risk-standardized rates of procedural complications following the first time implantation of an ICD.
Measure Steward:	American College of Cardiology Foundation
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale for Removal	We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program because this measure does not align with the meaningful measures initiative. The limited patient population and adoption of the quality measure does not allow for the creation of benchmarks to provide a meaningful impact to quality improvement. The limited adoption over multiple performance periods suggests this is not an important clinical topic for MIPS eligible clinicians.
In the Circumstance the Measure is Retained	There are no substantive changes or specialty set movement finalized for this measure.
<p>Comment: One commenter opposed removal of measure Q348, citing the removal rationale that there is limited patient population and adoption of the quality measure does not allow for the creation of benchmarks. The commenter indicated that MIPS policies prevent this measure from being used, such as scoring policies that cap the number of performance achievement points that can be earned on measures that lack a benchmark. It also leaves cardiac electrophysiology with only two relevant measures to report and discourages specialty societies from developing new MIPS measures. The commenter discouraged the removal of highly specialized measures that fill an important clinical gap.</p> <p>Response: We would encourage the commenter to submit comments regarding the MIPS scoring policies. As shown by the continued low adoption rates, measure Q348 is not being implemented by clinicians and a meaningful benchmark cannot be created, meaning this measure is not driving quality care and positive outcomes and is not in alignment with the Meaningful Measure Initiative. Removal allows eligible clinicians to maximize their potential quality performance score as this measure's inability to create a benchmark would limit the score awarded per the 2020 Benchmark File.</p> <p>After consideration of public comments, we are finalizing the removal of measure Q348 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

C.8. Hepatitis C: Discussion and Shared Decision Making Surrounding Treatment Options

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality #:	390
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Person and Caregiver-Centered Experience and Outcomes
Collection Type:	MIPS CQMs Specifications
Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of hepatitis C with whom a physician or other qualified healthcare professional reviewed the range of treatment options appropriate to their genotype and demonstrated a shared decision making approach with the patient. To meet the measure, there must be documentation in the patient record of a discussion between the physician or other qualified healthcare professional and the patient that includes all of the following: treatment choices appropriate to genotype, risks and benefits, evidence of effectiveness, and patient preferences toward treatment.
Measure Steward:	American Gastroenterological Association
High Priority Measure:	Yes
Measure Type:	Process
Rationale for Removal	We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program at the request of the measure steward because this measure does not align with the advancements in hepatitis C treatments. There are now curative treatments over an 8-12-week period with few side effects. Additionally, the measure is at risk of capturing "chronic HCV" patients who are no longer viremic, which would not necessitate HCV shared decision making.
In the Circumstance the Measure is Retained	There are no substantive changes or specialty set movement finalized for this measure.
<p>Comment: One commenter supported the removal of measure Q390 from the MIPS program.</p> <p>Response: We thank the commenter for supporting the removal of measure Q390.</p> <p>After consideration of public comments, we are finalizing the removal of measure Q390 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

C.9.Opioid Therapy Follow-up Evaluation

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality #:	408
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Collection Type:	MIPS CQMs Specifications
Measure Description:	All patients 18 and older prescribed opiates for longer than six weeks duration who had a follow-up evaluation conducted at least every three months during Opioid Therapy documented in the medical record.
Measure Steward:	American Academy of Neurology
High Priority Measure:	Yes
Measure Type:	Process
Rationale for Removal	We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program at the request of the measure steward because this measure does not align with the most recent guidelines. The measure steward will not be further reviewing or updating the measure specifications, citing the measure is topped out and there are newer opioid measures to report that are not topped out.
In the Circumstance the Measure is Retained	There are no substantive changes or specialty set movement finalized for this measure.
<p>Comment: One commenter opposed removal of measure Q408, stating that opioid treatment agreements ensure that patients have important information regarding potential risks, benefits, and expectations for patient responsibility before using these medications. It is important that clinicians regularly engage patients during opioid treatment, and there are no other measures to achieve this goal. Providers need to continue to educate and follow up with patients regarding their opioid regimens to help combat the opioid crisis. The commenter recommended that this measure be developed further in future rulemaking to include robust evaluation methods.</p> <p>Several commenters opposed the removal of measure Q408 and stated that following discussion with the measure steward, there are not newer opioid measures to replace the three measures proposed for removal: Q408, Q412, and Q414. The commenters did not agree that these measures do not align with the most recent guidelines and that the measures related to relevant clinical quality activities. Also, without a pain management specialty measure set it is an administrative burden, as there are not an adequate number of quality measures that apply to the specialty of pain management. A commenter cautioned against actions that may limit the current list of quality measures addressing opioid misuse and related issues. Opioid misuse, and substance use disorders more broadly, have become more prevalent during the COVID-19 PHE. CMS must consider additional quality measures that address opioid misuse and related issues to help acknowledge the invaluable work of physicians in addressing such issues among the most vulnerable Medicare beneficiaries.</p> <p>Response: We thank the commenters for their comments opposing the removal of measure Q408. We agree that this is an important topic and would encourage the commenter to reach out to measure developers to collaborate/work towards a more comprehensive measure with robust evaluation methods for future consideration for implementation into MIPS. The measure steward believed the measure was no longer aligned with current guidelines and is currently topped out. Given the measure steward is no longer supporting the measure, we are unable to continue implementation within MIPS.</p> <p>After consideration of public comments, we are finalizing the removal of measure Q408 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

C.10.Documentation of Signed Opioid Treatment Agreement

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality #:	412
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Collection Type:	MIPS CQMs Specifications
Measure Description:	All patients 18 and older prescribed opiates for longer than six weeks duration who signed an opioid treatment agreement at least once during Opioid Therapy documented in the medical record.
Measure Steward:	American Academy of Neurology
High Priority Measure:	Yes
Measure Type:	Process
Rationale for Removal	We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program at the request of the measure steward because this measure does not align with the most recent guidelines. The measure steward will not be further reviewing or updating the measure specifications, citing the measure is topped out and there are newer opioid measures to report that are not topped out.
In the Circumstance the Measure is Retained	There are no substantive changes or specialty set movement finalized for this measure.
<p>Comment: One commenter supported the removal of retired measure Q412 from the MIPS program. as indicated in comments on the Neurology and Geriatrics sets..</p> <p>Response: We thank the commenter for supporting the removal of measure Q412.</p> <p>Comment: One commenter opposed removal of measure Q412, stating that opioid treatment agreements ensure that patients have important information regarding potential risks, benefits, and expectations for patient responsibility before using these medications. There are no other measures to achieve this goal. The commenter recommended that this measure be further developed in future rulemaking to include robust evaluation methods.</p> <p>Several commenters opposed the removal of measure Q412 and stated that following discussion with the measure steward, there are not newer opioid measures to replace the three measures proposed for removal: Q408, Q412, and Q414. The commenters did not agree that these measures do not align with the most recent guidelines and that the measures related to relevant clinical quality activities. Also, without a pain management specialty measure set it is an administrative burden, as there are not an adequate number of quality measures that apply to the specialty of pain management. A commenter cautioned against actions that may limit the current list of quality measures addressing opioid misuse and related issues. Opioid misuse, and substance use disorders more broadly, have become more prevalent during the COVID-19 PHE. CMS must consider additional Quality measures that address opioid misuse and related issues to help acknowledge the invaluable work of physicians in addressing such issues among the most vulnerable Medicare beneficiaries.</p> <p>Response: We thank the commenters for their comments opposing the removal of measure Q412. We agree that this is an important topic and would encourage the commenter to reach out to measure developers to collaborate/work towards a more comprehensive measure with robust evaluation methods for future consideration for implementation into MIPS. The measure steward believed the measure was no longer aligned with current guidelines and are currently topped out. Given the measure steward is no longer supporting the measure, we are unable to continue implementation within MIPS.</p> <p>After consideration of public comments, we are finalizing the removal of measure Q412 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

C.11.Evaluation or Interview for Risk of Opioid Misuse

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality #:	414
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Collection Type:	MIPS CQMs Specifications
Measure Description:	All patients 18 and older prescribed opiates for longer than six weeks duration evaluated for risk of opioid misuse using a brief validated instrument (e.g. Opioid Risk Tool, Screener and Opioid Assessment for Patients with Pain, revised (SOAPP-R)) or patient interview documented at least once during Opioid Therapy in the medical record.
Measure Steward:	American Academy of Neurology
High Priority Measure:	Yes
Measure Type:	Process
Rationale for Removal	We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program at the request of the measure steward because this measure does not align with the most recent guidelines. The measure steward will not be further reviewing or updating the measure specifications, citing the measure is topped out and there are newer opioid measures to report that are not topped out.
In the Circumstance the Measure is Retained	There are no substantive changes or specialty set movement finalized for this measure.
<p>Comment: One commenter supported the removal of retired measure Q414 as indicated in comments on the Neurology and Geriatrics sets. A second commenter was supportive of the proposal to remove 14 quality measures that do not add value to the quality of care, and instead add more meaningful measurements.</p> <p>Response: We thank the commenters for supporting the removal of measure Q414.</p> <p>Comment: Several commenters opposed the removal of measure Q414 and stated that following discussion with the measure steward, there are not newer opioid measures to replace the three measures proposed for removal: Q408, Q412, and Q414. The commenters did not agree that these measures do not align with the most recent guidelines and that the measures related to relevant clinical quality activities. Also, without a pain management specialty measure set it is an administrative burden, as there are not an adequate number of quality measures that apply to the specialty of pain management. Another commenter cautioned against actions that may limit the current list of quality measures addressing opioid misuse and related issues. Opioid misuse, and substance use disorders more broadly, have become more prevalent during the COVID-19 PHE. CMS must consider additional Quality measures that address opioid misuse and related issues to help acknowledge the invaluable work of physicians in addressing such issues among the most vulnerable Medicare beneficiaries.</p> <p>Response: We thank the commenters for their comments opposing the removal of measure Q414. We agree that this is an important topic and would encourage the commenter to reach out to measure developers to collaborate/work towards a more comprehensive measure with robust evaluation methods for future consideration for implementation into MIPS. The measure steward believed the measure was no longer aligned with current guidelines and are currently topped out. Given the measure steward is no longer supporting the measure, we are unable to continue implementation within MIPS.</p> <p>After consideration of public comments, we are finalizing the removal of measure Q414 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

C.12. Quality of Life Assessment for Patients With Primary Headache Disorders

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality #:	435
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Collection Type:	Medicare Part B Claims Specifications, MIPS CQMs Specifications
Measure Description:	Percentage of patients with a diagnosis of primary headache disorder whose health related quality of life (HRQoL) was assessed with a tool(s) during at least two visits during the 12-month measurement period AND whose health related quality of life score stayed the same or improved.
Measure Steward:	American Academy of Neurology
High Priority Measure:	Yes
Measure Type:	Patient Reported Outcome
Rationale for Removal	We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program at the measure steward's request as it is no longer being maintained for inclusion. As there are various tools that providers may choose to use, it difficult to compare measure performance across MIPS eligible clinicians. Additionally, the scores are difficult to capture within the EHR leading to difficulties in determining whether the QoL is being maintained or improving over time.
In the Circumstance the Measure is Retained	There are no substantive changes or specialty set movement finalized for this measure.
We received no public comments on the removal of this measure; therefore, we are finalizing the removal of measure Q435 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

C.13. Rate of Surgical Conversion from Lower Extremity Endovascular Revascularization Procedure

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality #:	437
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Patient Safety
Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Measure Description:	Inpatients assigned to endovascular treatment for obstructive arterial disease, the percent of patients who undergo unplanned major amputation or surgical bypass within 48 hours of the index procedure.
Measure Steward:	Society of Interventional Radiology
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale for Removal	<p>We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program because it is considered a standard of care that has limited opportunity to improve clinical outcomes. Performance on this measure is extremely high and unvarying, making this measure extremely topped out as discussed in the CY 2019 PFS final rule (83 FR 59761 through 59763). The average performance for this inverse measure is 1.854 percent for the MIPS CQMs Specifications collection type and 1.031 percent for the Medicare Part B Claims Measure Specifications collection type. For an inverse measure, a lower calculated performance rate indicates better clinical care or control. As such, the MIPS CQMs Specifications collection type and the Medicare Part B Claims Measure Specifications collection type are considered extremely topped out. The average performance rate is based on the current MIPS benchmarking data located at https://qpp-cm-prod-content.s3.amazonaws.com/uploads/824/2020%20MIPS%20Quality%20Benchmarks.zip</p>
In the Circumstance the Measure is Retained	There are no substantive changes or specialty set movement finalized for this measure.
<p>Comment: One commenter did not support the removal of measure Q437 since reporting difficulties created by the COVID-19 pandemic may limit relevancy of some measures due to reduced services provided. The use of performance period benchmarks for the 2021 performance year introduces uncertainty in measure selection. The removal of this measure would also limit the pool of measures available for radiologists. A second commenter urged CMS to temporarily halt the removal of topped out measures for the 2021 performance year to provide clinicians with consistency as they recover from the COVID-19 PHE, particularly those that may be aligned with future MVPs. A third commenter said removal of this measure would limit the number of measures for radiologists and wanted this topped out measure to remain.</p> <p>Response: While we acknowledge the hardships faced due to the COVID-19 PHE and the specializations found within radiology the performance for measure Q437 has an extremely high and unvarying performance rate. This does not allow meaningful benchmarks to be established. Additionally, by removing measures with high performance rates, we are attempting to reduce reporting burden where there is little room for improvement. Removal allows eligible clinicians to maximize their potential quality performance score as this measure's topped out status would limit the score awarded per the 2020 Benchmark File.</p> <p>After consideration of public comments, we are finalizing the removal of measure Q437 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

C.14. All-Cause Hospital Readmission

Category	Description
NQF # / eCQM NQF #:	1789 / N/A
Quality #:	458
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Collection Type:	Administrative Claims
Measure Description:	The 30-day All-Cause Hospital Readmission measure is a risk-standardized readmission rate for beneficiaries age 65 or older who were hospitalized at a short-stay acute care hospital and experienced an unplanned readmission for any cause to an acute care hospital within 30 days of discharge.
Measure Steward:	Yale University
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale for Removal	We proposed the removal of this measure (finalized in 81 FR 77558 through 77675) as a quality measure from the MIPS program because it is duplicative to the new measure being proposed in Table A.1. for the 2021 performance period: Table A.1: Hospital-Wide, 30-Day, All-Cause Unplanned Readmission (HWR) Rate for the Merit-Based Incentive Payment Program (MIPS) Eligible Clinician Groups. This proposed new measure is a re-specification of the hospital-level measure and promotes a systems level approach by clinicians, making it a more applicable measure to MIPS eligible clinicians. In the event we did not finalize the proposed new measure: Hospital-Wide, 30-Day, All-Cause Unplanned Readmission (HWR) Rate for the Merit-Based Incentive Payment Program (MIPS) Eligible Clinician Groups, we would have maintained this current measure Q458: All-Cause Hospital Readmission.
In the Circumstance the Measure is Retained	There are no substantive changes or specialty set movement finalized for this measure.
We received no public comments on this measure proposed for removal; therefore, we are finalizing the removal of measure Q458 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years	
Comments citing measure Q458, due to the replacement of this measure with new measure Q479, Hospital-Wide, 30-Day, All-Cause Unplanned Readmission (HWR) Rate for the Merit-Based Incentive Payment System (MIPS) Groups, are addressed under Table A.1.	

**TABLE Group D: Previously Finalized Quality Measures with Substantive Changes
Finalized and Not Finalized for the 2023 MIPS Payment Year and Future Years**

NOTE: Electronic Clinical Quality Measures (eCQMs) that are National Quality Forum (NQF) endorsed are shown in Table D as follows: NQF # / eCQM NQF #.

The D Tables within this final rule provide the substantive changes finalized for the quality measures in CY 2021. The changes that are made to the denominator codes sets are generalizations of the revisions communicated from the measure stewards to CMS. Additionally, International Classification of Diseases Tenth Edition (ICD-10) and Current Procedural Terminology (CPT) codes that are identified as invalid for CY 2021 may not be identified within the NPRM due to the availability of these changes to the public. If coding revisions to the denominator are impacted due to the timing of 2021 CPT and ICD-10 updates and assessment of these codes inclusion by the Measure Steward, these changes may be postponed until CY 2022. The 2021 Quality Measure Release Notes provide a comprehensive, detailed reference of exact codes changes to the denominators of the quality measures. The Quality Measure Release Notes are available for each of the collection types in the [Quality Payment Program Resource Library](https://qpp.cms.gov/about/resource-library) at <https://qpp.cms.gov/about/resource-library> under the measure specifications. For eCQM Release Notes, see the eCQI Resource Center at <https://ecqi.healthit.gov/ep-ec?globalyearfilter=2020>.

In addition to the finalized substantive changes, there may be changes to the coding utilized within the denominator that are not considered substantive in nature but we believe are important to communicate to stakeholders. These changes align with the scope of the current coding, however, this will expand or contract the current eligible population, therefore, review the current year measure specification and the 2021 Quality Measure Release Notes or the eCQM Technical Release Notes once posted to review all coding changes. Language has also been added, to all applicable 2021 quality measure specifications, in the form of an 'Instructions Note', to clarify that telehealth encounters are allowed for determination of denominator eligibility. Only in the instance telehealth encounters have not been previously allowed as denominator eligible, will the D table corresponding to that measure reflect an update to the denominator allowing for telehealth encounters in the 'Substantive Change' cell.

D.1 Diabetes: Hemoglobin A1c (HbA1c) Poor Control (>9%)

Category	Description
NQF # / eCQM NQF #:	0059 / N/A
Quality#:	001
CMS eCQM ID:	CMS122v9
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	Medicare Part B Claims Measure Specifications, eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients 18-75 years of age with diabetes who had hemoglobin A1c > 9.0% during the measurement period.
Substantive Change:	<p>Modified collection type: Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQMs Specifications.</p> <p>Updated denominator exclusion: For the eCQM Specification collection type: Revised: Exclude patients 66 and older who are living long term in an institution for more than 90 consecutive days during the measurement period.</p> <p>Updated denominator exclusion logic: For the eCQM Specifications collection type: Updated encounters so they are "on or" before the end of the measurement period. Updated the LTI exclusion to be 90 consecutive days. Changed the name of the under 81 exclusion definition to "FrailtyLTI.Advanced Illness and Frailty Exclusion Not Including Over Age 80".</p> <p>Updated denominator exclusion: For Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications collection types: Revised: Patients age 66 and older in Institutional Special Needs Plans (SNP) or residing in long-term care with a POS code 32, 33, 34, 54 or 56 for more than 90 consecutive days during the measurement period.</p> <p>Updated denominator exclusion: For the MIPS CQMs Specifications and Medicare Part B Claims Measure Specification collection type: Added coding to identify patients with advanced illness and frailty</p> <p>Updated numerator options: For the MIPS CQM Specifications and Medicare Part B Claims Measure Specifications collection type: Stratified the Performance Not Met numerator option into three: Performance Not Met: Most recent hemoglobin A1c (HbA1c) level < 7.0% Performance Not Met: Most recent hemoglobin A1c (HbA1c) level greater than or equal to 7.0% and less than 8.0% Performance Not Met: Most recent hemoglobin A1c (HbA1c) level greater than or equal to 8.0% and less than or equal to 9.0%</p> <p>Updated numerator instructions: For the MIPS CQM Specifications and Medicare Part B Claims Measure Specifications collection type: Added: Do not include HbA1c levels reported by the patient. Added: Only patients with a diagnosis of Type 1 or Type 2 diabetes should be included in the denominator of this measure; patients with a diagnosis of secondary diabetes due to another condition should not be included.</p>
Steward:	National Committee for Quality Assurance
High Priority Measure:	Yes
Measure Type:	Intermediate Outcome
Rationale:	<p>We proposed to update the denominator exclusion language and logic to clarify that, for the measure, long-term care will be defined as patients staying 90 consecutive days at the long-term care facility versus any 90 days within the performance period.</p> <p>Additionally, for the MIPS CQMs Specifications and Medicare Part B Claims Measure Specifications collection types, we proposed adding applicable coding to better define the advanced illness and frailty patient population for the purposes of this measure. The numerator options for Performance Not Met were stratified to have the ability to better assess hemoglobin A1c levels within the patient population that showed better control. Instructions have been added to ensure the correct patient population as the measure intent is to assess hemoglobin A1c control in Type 1 or Type 2 diabetics and not those patients who have diabetes due to another condition.</p> <p>We proposed to remove the CMS Web Interface Measure Specifications collection type. This collection type was proposed to be sunset for the purposes of MIPS starting with the 2021 performance year. We have determined it is not fiscally viable, feasible, or sustainable for MIPS to continue this collection type/submission type due to an 80 percent reduction and a continued decrease in interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures. For further rationale, please see section IV.A.3.c.(1)(c) of this final rule.</p>
<p>Comment: One commenter opposed the proposed changes to the numerator for measure Q001. The removal of patient-reported HbA1cs could increase unnecessary testing for measure compliance. In addition, further clarification on acceptable sources is necessary.</p> <p>Two commenters did not agree with the proposal to add a third level of stratification to the "Performance Not Met" numerator option <i>only for the manual MIPS CQM and Medicare Part B Claims collection types</i>. The commenters stated that by dividing the latter option into two – Most recent hemoglobin A1c (HbA1c) level greater than or equal to 7.0 percent and less than 8.0 percent; and Most recent hemoglobin A1c (HbA1c) level greater than or equal to 8.0 percent and less than or equal to 9.0 percent, CMS is creating additional burden and additional time required to report for administrative staff, particularly those in small and rural practices without an EHR. The commenter is concerned that CMS is making this measure more difficult to complete and report, but only for manual collection types. This creates burden for small and rural practices. In addition, ophthalmology practices have seen a significant reduction in visits due to COVID-19. The commenter urged CMS not to finalize either of these changes. A second commenter stated that having new stratifications means that CMS may not have sufficient data to establish reliable benchmark for this measure for each stratification. In addition, given the fact that CMS proposed to keep this measure in the APP quality measure list, we believe that CMS should keep the measures as are to reduce any further complication already caused by the transition from the current MIPS APM reporting standard to APP reporting. If CMS finalizes this measure with 3 stratifications, the commenter asked that CMS clarify which stratification will be pay-for performance and which will be pay-for reporting measure, and that CMS identify the benchmark for the pay-for performance stratification early in the performance year.</p> <p>Response: While we understand the desire to ensure there is not unnecessary testing, the measure only requires the assessment of one hemoglobin A1c</p>	

Category	Description
	<p>measurement each performance period and it is important to ensure accurate results are documented. The measure steward believes, and we agree, that it is important to have a more granular picture of hemoglobin A1c levels to ascertain the level of control currently being achieved as diabetes is a leading cause of death in the United States. Additionally, there is ongoing discussions regarding acceptable levels of hemoglobin A1c, it is important to obtain this granular information to continue these discussions and drive quality outcomes. With regard to the benchmark, all 'performance not met' numerator options will be combined and removed from the performance rate calculation. The addition of these stratifications will have no bearing on the ability to create a reliable benchmark for the measure. We encourage the commenter to communicate this request to the measure steward for consideration in future years.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q001 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of the CMS Web Interface Specifications collection type. At § 414.1305, we proposed to modify the definition of the terms collection type and submission type by removing the CMS Web Interface Specifications as an available option starting with the 2023 payment year (85 FR 50290); however, the CMS Web Interface Measure Specifications collection type will be an available option for an extension of one additional year (2021 MIPS performance period/2023 MIPS payment year) and will be removed as a collection and submission type starting with the 2022 MIPS performance period/2024 MIPS payment year. None of the substantive changes above will be applied to the CMS Web Interface Measure Specifications for the 2021 MIPS performance period. The CMS Web Interface Specifications for the 2021 MIPS performance period will reflect the 2020 CMS Web Interface Specifications.</p>

D.2 Heart Failure (HF): Angiotensin-Converting Enzyme (ACE) Inhibitor or Angiotensin Receptor Blocker (ARB) or Angiotensin Receptor-Neprilysin Inhibitor (ARNI) Therapy for Left Ventricular Systolic Dysfunction (LVSD)

Category	Description
NQF # / eCQM NQF #:	0081 / 0081e
Quality#:	005
CMS eCQM ID:	CMS135v9
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	eCQM Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of heart failure (HF) with a current or prior left ventricular ejection fraction (LVEF) < 40% who were prescribed ACE inhibitor or ARB or ARNI therapy either within a 12-month period when seen in the outpatient setting OR at each hospital discharge.
Substantive Change:	<p>Updated the denominator exception logic: For the eCQM Specifications collection type: Added sacubitril in the Allergy/Intolerance logic.</p> <p>Updated denominator: For all collection types: Submission Criteria 1: Added telehealth as eligible for all encounters.</p>
Steward:	
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed to include sacubitril in the Allergy/Intolerance logic as this is one of the components of ARNI and an allergy to this ingredient would be a clinically appropriate reason for allowing a denominator exception for this patient population.</p> <p>We proposed to add telehealth encounters as denominator eligible for submission criteria 1 as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</p>
<p>Comment: Several commenters supported the addition of telehealth reporting for measure Q005.</p> <p>Response: We thank the commenters for supporting the addition of telehealth reporting for this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q005 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of additional telehealth encounter eligibility for eCQM Specifications collection type as this is already in the current measure.</p>	

D.3 Coronary Artery Disease (CAD): Antiplatelet Therapy

Category	Description
NQF # / eCQM NQF #:	0067 / N/A
Quality#:	006
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of coronary artery disease (CAD) seen within a 12-month period who were prescribed aspirin or clopidogrel.
Substantive Change:	Updated denominator: Added telehealth as eligible encounter.
Steward:	American Heart Association
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.
Comment: One commenter supported the addition of telehealth reporting for measure Q006.	
Response: We thank the commenter for supporting the addition of telehealth reporting for this measure.	
After consideration of public comments, we are finalizing the changes to measure Q006 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.4 Coronary Artery Disease (CAD): Beta-Blocker Therapy – Prior Myocardial Infarction (MI) or Left Ventricular Systolic Dysfunction (LVEF < 40%)

Category	Description
NQF # / eCQM NQF #:	0070 / 0070e
Quality#:	007
CMS eCQM ID:	CMS145v9
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	eCQM Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of coronary artery disease seen within a 12-month period who also have a prior MI or a current or prior LVEF < 40% who were prescribed beta-blocker therapy.
Substantive Change:	<p>Updated logic: For the eCQM Specifications collection type: Added constraint to measure logic in instances when the patient has both prior (within the past 3 years) MI and LVEF < 40%.</p> <p>The guidance is revised to read: For the eCQM Specifications collection type: Beta-blocker therapy: - For patients with prior MI, beta-blocker therapy includes any agent within the beta-blocker drug class. As of 2015, no recommendations or evidence are cited in current stable ischemic heart disease guidelines for preferential use of specific agents - For patients with prior LVEF <40%, beta-blocker therapy includes the following: bisoprolol, carvedilol, or sustained release metoprolol succinate. The requirement of two or more visits is to establish that the eligible professional or eligible clinician has an existing relationship with the patient. A range value should satisfy the logic requirement for 'Ejection Fraction' as long as the ranged observation value clearly meets the less than 40% threshold noted in the denominator logic. A range that is inclusive of or greater than 40% would not meet the measure requirement. If a patient has had a myocardial infarction (MI) within the past 3 years and a current or prior LVEF < 40% (or moderate or severe LVSD), the patient should only be counted in Population Criteria 1. This eCQM is a patient-based measure. This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM. Beta-blocker therapy:</p> <p>The instructions are revised to read: For the MIPS CQMs Specifications collection type: This measure is to be submitted a minimum of once per performance period for all patients with a diagnosis of CAD seen during the performance period. Only patients who had at least two denominator-eligible visits during the performance period will be counted for Submission Criteria 1 and Submission Criteria 2 of this measure. This measure may be submitted by Merit-based Incentive Payment System (MIPS) eligible clinicians who perform the quality actions described in the measure for the primary management of patients with CAD based on the services provided and the measure-specific denominator coding. The MIPS eligible clinician should submit data on one of the submission criteria, depending on the clinical findings. If the patient has CAD or history of cardiac surgery and a current or prior LVEF < 40% (or moderate or severe LVSD), use Submission Criteria 1. If the patient has CAD or history of cardiac surgery and has a prior (within the past 3 years) MI, use Submission Criteria 2. The 3-year lookback period for the prior MI should be from the time of the encounter that is used to qualify for the denominator and evaluate the numerator. If the patient has had an MI within the past 3 years and has a current or prior LVEF < 40% (or moderate or severe LVSD), the MIPS eligible clinician should submit quality-data codes for Submission Criteria 1 and this will count as appropriate submission for this patient.</p> <p>Updated denominator criteria: For all collection type: Added telehealth as eligible for all encounters.</p> <p>Updated denominator criteria: For the MIPS CQMs Specifications collection type: Denominator Criteria One: Revised: Left ventricular ejection fraction (LVEF) < 40% or documentation of moderate or severe LVSD.</p> <p>Updated denominator exception: For eCQM Specifications collection type: Removed coding from the 'Medical Reason' value set for concepts not indicating medical contraindication.</p>
Steward:	
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed to update the eCQM Specifications collection type logic to improvement alignment with measure intent as it will add constraints to help prevent double counting of patients who had both a myocardial infarction and LVEF < 40% within the past 3 years. Additionally, the guidance was revised to help clarify which population eligible patients should be included for the purposes of this measure. We also proposed to revise the 'Medical Reason' value set based upon expert and stakeholder feedback to remove codes based upon intent of concepts, which do not indicate a medical contraindication, but rather a provider decision to discontinue or adjust a course of treatment. These codes do not meet the intent of the denominator exception.</p> <p>For both the eCQM Specifications and MIPS CQMs Specifications collection types, the guidance and instructions have been updated, respectively, to add moderate or severe LVSD as a proxy for LVEF < 40%. The measure steward's Technical Expert Panel (TEP) determined that moderate or severe LVSD is an appropriate proxy and aligns with the intent of the measure. We agreed with this addition as LVSD can be "defined as a left ventricular ejection fraction less than 40 percent or a narrative description consistent with moderate or severe systolic dysfunction." (Per the Joint Commission Specifications Manual (v2018A)). Additionally, we proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</p>
Comment: Several commenters supported the addition of telehealth reporting for measure Q007.	
Response: We thank the commenters for supporting the addition of telehealth reporting for this measure.	

Category	Description
	After consideration of public comments, we are finalizing the changes to measure Q007 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.

D.5 Heart Failure (HF): Beta-Blocker Therapy for Left Ventricular Systolic Dysfunction (LSVD)

Category	Description
NQF # / eCQM NQF #:	0083 / 0083e
Quality#:	008
CMS eCQM ID:	CMS144v9
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	eCQM Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of heart failure (HF) with a current or prior left ventricular ejection fraction (LVEF) < 40% who were prescribed beta-blocker therapy either within a 12-month period when seen in the outpatient setting OR at each hospital discharge.
Substantive Change:	Updated denominator: For all collection types: Submission Criteria 1: Added telehealth as eligible for all encounters. Updated denominator exception: For eCQM Specifications collection type: Removed coding from the 'Medical Reason' value set for concepts not indicating medical contraindication.
Steward:	American Heart Association
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured. We proposed to revise the 'Medical Reason' value set for the eCQM Specifications collection type based upon expert and stakeholder feedback to remove codes based upon intent of concepts, which do not indicate a medical contraindication, but rather a provider decision to discontinue or adjust a course of treatment. These codes do not meet the intent of the denominator exception.
Comment: Several commenters supported the addition of telehealth reporting for measure Q008.	
Response: We thank the commenters for supporting the addition of telehealth reporting for this measure.	
After consideration of public comments, we are finalizing the changes to measure Q008 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of additional telehealth encounter eligibility for eCQM Specifications collection type as this is already in the current measure.	

D.6 Primary Open-Angle Glaucoma (POAG): Optic Nerve Evaluation

Category	Description
NQF # / eCQM NQF #:	0086 / 0086e
Quality#:	012
CMS eCQM ID:	CMS143v9
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of primary open-angle glaucoma (POAG) who have an optic nerve head evaluation during one or more office visits within 12 months.
Substantive Change:	<p>Modified collection type: eCQM Specifications</p> <p>Updated denominator exception: For eCQM Specifications collection type: Removed coding from the 'Medical Reason' value set for concepts not indicating medical contraindication.</p> <p>Per the 'Telehealth Guidance for Electronic Clinical Quality Measures (eCQMs) for Eligible Professional/Eligible Clinician 2021 Quality Reporting': Medicare telehealth eligible codes found in any encounter value set must only be used for in-person encounters for the following eCQMs.</p>
Steward:	American Academy of Ophthalmology
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed to remove the Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications collection types as they have reached the end of the topped out lifecycle as finalized in 82 FR 53640. However, the benchmarking data continues to show a gap for the eCQM Specifications collection type, as such, the measure will be retained for this collection type.</p> <p>We also proposed to revise the 'Medical Reason' value set based upon expert and stakeholder feedback to remove codes based upon intent of concepts, which do not indicate a medical contraindication, but rather a provider decision to discontinue or adjust a course of treatment. These codes do not meet the intent of the denominator exception.</p> <p>We proposed to remove telehealth encounters from the denominator of the eCQM Specifications collection type as telehealth is not an appropriate setting for this measure, as well as to align with the other collection types. This guidance can be found in a separate document that will be published on the eCQI Resource Center.</p>
<p>Comment: One commenter opposed CMS's proposal to remove the Medicare Part B Claims Measure Specifications collection type for measure Q012 because it would adversely impact ophthalmologists, particularly those in small and rural practices who must rely on the claims reporting collection type because they cannot afford to adopt CEHRT. The commenter recognized the topped out status under the claims and MIPS CQM collection types, but removing this measure entirely from the claims collection type will result in even fewer measures relevant to ophthalmologists' scope of practice.</p> <p>Response: We strive to ensure that all measures align with the Meaningful Measures Initiative, including the removal of measures that are at the end of the topped out lifecycle. Additionally, by removing collection types at the end of the topped out lifecycle, we are attempting to reduce reporting burden where there is little room for improvement. Removal allows eligible clinicians to maximize their potential quality performance score as this measure's topped out status would limit the score awarded per the 2020 Benchmark File.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q012 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.7 Age-Related Macular Degeneration (AMD): Dilated Macular Examination

Category	Description
NQF # / eCQM NQF #:	0087 / N/A
Quality#:	014
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 50 years and older with a diagnosis of age-related macular degeneration (AMD) who had a dilated macular examination performed which included documentation of the presence or absence of macular thickening or geographic atrophy or hemorrhage AND the level of macular degeneration severity during one or more office visits within the 12-month performance period.
Substantive Change:	Updated numerator definition: For all collection types: Revised: Severity of Macular Degeneration – Early, intermediate and advanced; or active choroidal neovascularization, inactive choroidal neovascularization, or with inactive scar.
Steward:	American Academy of Ophthalmology
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to update the definition referencing the clinical stages for the ‘Severity of Macular Degeneration’ to clarify and align the concept with ICD-10 terminology. Adding clarity that these codes are clinically relevant and applicable.
<p>Comment: One commenter supported updating the definition referencing the clinical stages for the ‘Severity of Macular Degeneration’ to clarify and align the concept with ICD-10 terminology.</p> <p>Response: We thank the commenter for supporting the change to this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q014 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.8 Diabetic Retinopathy: Communication with the Physician Managing Ongoing Diabetes Care

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	019
CMS eCQM ID:	CMS142v9
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	eCQM Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of diabetic retinopathy who had a dilated macular or fundus exam performed with documented communication to the physician who manages the ongoing care of the patient with diabetes mellitus regarding the findings of the macular or fundus exam at least once within 12 months.
Substantive Change:	<p>Update numerator logic: For the eCQM Specifications collection type: Removed “sender” and “recipient” attributes.</p> <p>Updated value set/coding: For the eCQM Specifications collection type: Removed “sender” and “recipient” attributes.</p> <p>Updated denominator exception: For eCQM Specifications collection type: Removed coding from the ‘Medical Reason’ value set for concepts not indicating medical contraindication.</p> <p>Per the ‘Telehealth Guidance for Electronic Clinical Quality Measures (eCQMs) for Eligible Professional/Eligible Clinician 2021 Quality Reporting’: Medicare telehealth eligible codes found in any encounter value set must only be used for in-person encounters for the following eCQMs.</p>
Steward:	American Academy of Ophthalmology
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	<p>We proposed to remove the “sender” and “recipient” attributes from the numerator logic and the value set/coding of the eCQM Specifications collection type and reverted to the numerator logic from performance year 2019. These attributes increased burden and were difficult to implement. We also proposed to revise the ‘Medical Reason’ value set based upon expert and stakeholder feedback to remove codes based upon intent of concepts, which do not indicate a medical contraindication, but rather a provider decision to discontinue or adjust a course of treatment. These codes do not meet the intent of the denominator exception.</p> <p>We proposed to remove telehealth encounters from the denominator of the eCQM Specifications collection type as telehealth is not an appropriate setting for this measure, as well as to align with the other collection types. This guidance can be found in a separate document that will be published on the eCQI Resource Center.</p>
<p>Comment: One commenter supported CMS’s proposed removal of “sender” and “recipient” attributes. This will decrease burden and make the measure technically easier to report. The commenter also supported the proposed removal of denominator exception “Medical Reason” codes as they are inappropriate for this measure.</p> <p>Response: We thank the commenter for supporting the changes to this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q019 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.9 Advance Care Plan

Category	Description
NQF # / eCQM NQF #:	0326 / N/A
Quality#:	047
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 65 years and older who have an advance care plan or surrogate decision maker documented in the medical record or documentation in the medical record that an advance care plan was discussed but the patient did not wish or was not able to name a surrogate decision maker or provide an advance care plan.
Substantive Change:	Updated denominator: For all collection types: Added clinical social worker clinician type.
Steward:	National Committee for Quality Assurance
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to add the clinical social worker clinician type to the denominator eligible encounters as this clinical concept is applicable to their scope of practice since these clinicians are integral to ensuring patients have up to date advance care plans and/or surrogate decision makers documented within the medical record.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q047 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.10 Chronic Obstructive Pulmonary Disease (COPD): Long-Acting Inhaled Bronchodilator Therapy

Category	Description
NQF # / eCQM NQF #:	0102 / N/A
Quality#:	052
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of COPD (FEV1/FVC < 70%) and who have an FEV1 less than 60% predicted and have symptoms who were prescribed a long-acting inhaled bronchodilator.
Substantive Change:	Modified collection type: MIPS CQMs Specifications
Steward:	American Thoracic Society
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to remove the Medicare Part B Claims Measure Specifications collection type as it has reached the end of the topped out lifecycle as finalized in 82 FR 53640. As captured in the 2020 Benchmark File, this collection type also has high performance rate. However, the benchmarking data continues to show a gap for the MIPS CQMs Specifications collection type, as such, the measure will be retained for this collection type.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q052 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.11 Appropriate Treatment for Children with Upper Respiratory Infection (URI)

Category	Description
NQF # / eCQM NQF #:	0069 / N/A
Quality#:	065
CMS eCQM ID:	CMS154v9
National Quality Strategy Domain:	Efficiency and Cost Reduction
Current Collection Type:	eCQM Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of children 3 months - 18 years of age who were diagnosed with upper respiratory infection (URI) and were not dispensed an antibiotic prescription on or 3 days after the episode.
Substantive Change:	<p>The title is revised from 'Appropriate Treatment for Children with Upper Respiratory Infection (URI)' to: Appropriate Treatment for Upper Respiratory Infection (URI)</p> <p>The description is revised to read: Percentage of episodes for patients 3 months of age and older with a diagnosis of upper respiratory infection (URI) that did not result in an antibiotic dispensing event.</p> <p>The initial patient population is revised to read: For the eCQM Specifications collection type: Outpatient visits, telephone visits, online assessments, observation stays or emergency department visits with a diagnosis of URI during the measurement period among patients 3 months of age and older.</p> <p>Updated stratification: For the eCQM Specifications collection type: 3 months-17 years, 18-64 years, 65 years and older.</p> <p>The guidance is revised to read: For the eCQM Specifications collection type: This is an episode of care measure that examines all eligible episodes for the patient during the measurement period This eCQM is an episode-based measure. This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM.</p> <p>The denominator is revised to read: For the MIPS CQMs Specifications collection type: Outpatient visits, telephone visits, online assessments, observation stays or emergency department visits with a diagnosis of upper respiratory infection (URI) during the measurement period among patients 3 months of age and older.</p> <p>Updated denominator criteria: For the MIPS CQMs Specifications collection type: Revised: Patients aged 3 months of age and older on date of encounter. Revised denominator eligible coding to include telehealth with qualified nonphysician health care professional.</p> <p>The denominator instruction is revised to read: For the MIPS CQMs Specifications collection type: This is an episode of care measure that examines all eligible episodes for the patient during the measurement period. If the patient has more than one episode in a 31-day period, include only the first episode.</p> <p>Updated denominator exclusion: For the eCQMs Specifications collection type: Added: 1. Exclude URI episodes when the patient had a competing comorbid condition during the 12 months prior to or on the episode date. Revised: 1. Exclude URI episodes when the patient had a new or refill prescription of antibiotics in the 30 days prior to or on the episode date. 2. Exclude URI episodes when the patient had competing diagnosis on or 3 days after the episode date. 3. Exclude URI episodes when the patient had hospice care overlapping with the measurement period. For MIPS CQMs Specifications collection type: Added: 1. URI episodes where the patient had a competing comorbid condition during the 12 months prior to or on the episode date (e.g., tuberculosis, neutropenia, cystic fibrosis, chronic bronchitis, pulmonary edema, respiratory failure, rheumatoid lung disease). 2. URI episodes when the patient had a new or refill prescription of antibiotics (Table 1) in the 30 days prior to or on the episode date. Revised: 1. URI episodes when the patient had competing diagnoses on or 3 days after the episode date (e.g., intestinal infection, pertussis, bacterial infection, Lyme disease, otitis media, acute sinusitis, acute pharyngitis, acute tonsillitis, chronic sinusitis, infection of the pharynx/larynx/tonsils/adenoids, prostatitis, cellulitis, mastoiditis, or bone infections, acute lymphadenitis, impetigo, skin staph infections, pneumonia/gonococcal infections, venereal disease (syphilis, chlamydia, inflammatory diseases [female reproductive organs]), infections of the kidney, cystitis or UTI, and acne). Removed: 1. Children who are taking antibiotics in the 30 days prior to the date of the encounter during which the diagnosis was established.</p> <p>The numerator is revised to read: For the eCQMs Specifications collection type: URI episodes without a prescription for antibiotic medication on or 3 days after the outpatient visit, telephone visit, online assessment, observation stay or emergency department visit for an upper respiratory infection.</p> <p>For the MIPS CQMs Specifications collection type: URI episodes without a prescription for antibiotic medication (from Table 1) on or 3 days after the outpatient visit, telephone visit, online assessment, observation stay or emergency department visit for an upper respiratory infection.</p> <p>The numerator instruction is revised to read: For the MIPS CQMs Specifications collection type: For performance, the measure will be calculated as the number of patient's encounter(s) where antibiotics from Table 1 were neither prescribed nor</p>

Category	Description
	<p>dispensed on or within 3 days of the episode for URI over the total number of encounters in the denominator. A higher score indicates appropriate treatment of patients with URI (e.g., the proportion for whom antibiotics were not prescribed or dispensed following the episode). Delayed prescriptions (where an antibiotic was prescribed and patient was instructed to delay taking the antibiotic) are considered "Performance Not Met".</p> <p>Table 1 - Antibiotic Medications</p> <p>Note: This list should be used when assessing antibiotic prescriptions for the denominator exclusion and numerator components.</p> <p>Revised:</p> <p>Table 1 – Antibiotic Medication: Added Penicillin G benzathine and removed 'Miscellaneous Antibiotics Category' (Erythromycin-sulfisoxazole)</p> <p>Updated value set: For the eCQM Specifications collection type: Added 'Aggressive periodontitis' to the value set for competing diagnosis. Added telehealth services value set to eligible encounters.</p>
Steward:	National Committee for Quality Assurance
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	<p>We proposed the measure language be updated to reflect a broader denominator eligible population by revising the age to include all patients over 3 months of age as concerns regarding overuse of antibiotics are not limited to the pediatric population. This will allow for clinicians to report on both pediatric and adult patients. The denominator instructions and guidance are revised to clarify that only the first episode should be included if a patient has multiple episodes in a 31-day period. The denominator exclusions have been updated to reflect the change in age range and to align language with the measure submission frequency. Additionally, a denominator exclusion has been added to remove patients with competing comorbid conditions from the denominator population as it may be clinically appropriate and warranted to treat them with antibiotics in accordance with appropriate care.</p> <p>The numerator note for the MIPS CQMs Specifications collection type was updated to clarify use of delayed prescriptions and the antibiotic medication table. Given the intent of the measure is to assess appropriate antibiotic use, delayed prescriptions will be considered numerator non-compliant as this would still constitute prescribing an antibiotic. The antibiotic medication table was also updated to be clinically relevant.</p> <p>The eCQM Specifications collection type value set for competing diagnosis was updated to include aggressive periodontitis as it is clinically relevant to the denominator exclusion intent. Additionally, a telehealth services value set was added to the eligible encounters for a more complete patient population.</p>
<p>We proposed a substantive change to the Numerator for the MIPS CQMs Specifications collection type: however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state: URI episodes without a prescription for antibiotic medication (Table 1) on or 3 days after the outpatient visit, telephone visit, online assessment, observation stay or emergency department visit for an upper respiratory infection.</p> <p>This additional refinement of revising '(from Table 1)' to '(Table 1)' does not affect the intent of the proposed substantive change.</p> <p>Comment: One commenter stated that placing an acute and transient diagnosis on the patient problem list has the potential to inappropriately identify URI encounters because problem lists do not have expiration dates. The commenter recommended that a URI is an acute diagnosis that should only be captured as a visit diagnosis. The commenter also stated that antibiotics ordered without an end date have the potential to be included in the measure even if the antibiotic order was placed months prior to the URI encounter. The commenter recommended that the logic should not look at any antibiotics outside of the 30 day window.</p> <p>Response: We thank the commenter for their comment. We encourage the commenter to reach out to the measure steward to discuss revisions for possible implementation in future years.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q065 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.12 Appropriate Testing for Children with Pharyngitis

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	066
CMS eCQM ID:	CMS146v9
National Quality Strategy Domain:	Efficiency and Cost Reduction
Current Collection Type:	eCQM Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of children 3-18 years of age who were diagnosed with pharyngitis, ordered an antibiotic and received a group A streptococcus (strep) test for the episode.
Substantive Change:	<p>The title is revised from ‘Appropriate Testing for Children with Pharyngitis’ to: Appropriate Testing for Pharyngitis</p> <p>The description is revised to read: The percentage of episodes for patients 3 years and older with a diagnosis of pharyngitis that resulted in an antibiotic dispensing event and a group A streptococcus (strep) test.</p> <p>The guidance is revised to read: For the eCQM Specifications collection type: This is an episode of care measure that examines all eligible episodes for the patient during the measurement period. This eCQM is an episode-based measure. This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM.</p> <p>The initial patient population is revised to read: For the eCQM Specifications collection type: Outpatient, telephone, online assessment, observation, or emergency department (ED) visits with a diagnosis of pharyngitis and an antibiotic dispensing event among patients 3 years or older.</p> <p>The denominator is revised to read: For the MIPS CQMs Specifications collection type: Outpatient, telephone, online assessment, observation, or emergency department (ED) visits with a diagnosis of pharyngitis and an antibiotic dispensing event among patients 3 years or older.</p> <p>Updated denominator criteria: For the MIPS CQMs Specifications collection type: Revised denominator eligible coding to include telehealth with qualified nonphysician health care professional.</p> <p>The denominator instructions are revised to read: For the MIPS CQMs Specifications collection type: This is an episode of care measure that examines all eligible episodes for the patient during the measurement period. If a patient has more than one eligible episode in a 31-day period, include only the first eligible episode.</p> <p>Updated denominator exclusion: For the eCQMs Specifications collection type: Added: 1. Exclude episodes where the patient had a competing comorbid condition during the 12 months prior to or on the episode date. Revised: 1. Exclude episodes where the patient is taking antibiotics in the 30 days prior to the episode date. 2. Exclude episodes when the patient had hospice care overlapping with the measurement period. 3. Exclude episodes where the patient had a competing diagnosis within 3 days after the episode date. For MIPS CQMs Specifications collection type: Added: 1. Episodes where the patient had a competing comorbid condition during the 12 months prior to or on the episode date (e.g., tuberculosis, neutropenia, cystic fibrosis, chronic bronchitis, pulmonary edema, respiratory failure, rheumatoid lung disease). Revised: 1. Episodes where the patient is taking antibiotics (Table 1) in the 30 days prior to the episode date. 2. Episodes where the patient had a competing diagnosis within 3 days after the episode date (e.g., intestinal infection, pertussis, bacterial infection, Lyme disease, otitis media, acute sinusitis, chronic sinusitis, infection of the pharynx/larynx/tonsils/adenoids, prostatitis, cellulitis, mastoiditis, or bone infections, acute lymphadenitis, impetigo, skin staph infections, pneumonia/gonococcal infections, venereal disease (syphilis, chlamydia, inflammatory diseases [female reproductive organs]), infections of the kidney, cystitis or UTI).</p> <p>Updated Table 1: For the MIPS CQMs Specifications collection type: Added: Note: This list should be used when assessing antibiotic prescriptions for the denominator and denominator exclusion components. Revised: Table 1 – Antibiotic Medication: Added Penicillin G benzathine and removed ‘Miscellaneous Antibiotics Category’ (Erythromycin-sulfisoxazole)</p> <p>The numerator is revised to read: For all collection types: A group A streptococcus test in the 7-day period from 3 days prior to the episode date through 3 days after the episode date.</p> <p>Updated stratification: For the eCQM Specifications collection type: 3-17 years, 18-64 years, 65 years and older.</p> <p>Updated value set: For the eCQM Specifications collection type: Added telehealth services value set to eligible encounters.</p>
Steward:	National Committee for Quality Assurance
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed the measure language be updated to reflect a broader denominator eligible population by revising the age to include all patients over 3 months of age as concerns regarding appropriate testing are not limited to the pediatric population. This will allow for clinicians to report on both pediatric and adult patients. The denominator instructions and guidance are revised to clarify that only the first episode should be included if a patient has multiple episodes in a 31-day period. The denominator exclusions have been updated to reflect the change in age range and to align language with the measure submission frequency. Additionally,

Category	Description
	<p>a denominator exclusion has been added to remove patients with competing comorbid conditions from the denominator population as it may be clinically appropriate and warranted to treat them with antibiotics in accordance with appropriate care. For the MIPS CQMs Specifications collection type, Table 1 was updated to remain clinically relevant and a note was added to clarify usage of Table 1 for the purposes of this measure.</p> <p>The eCQM Specifications collection type value set for competing diagnosis was updated to include aggressive periodontitis as it is clinically relevant to the denominator exclusion intent. Additionally, a telehealth services value set was added to the eligible encounters for a more complete patient population.</p>
	<p>We proposed a substantive change to the denominator exclusion for the MIPS CQMs Specifications collection type; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state:</p> <p>Added:</p> <ol style="list-style-type: none"> 1. Episodes where the patient had a competing comorbid condition during the 12 months prior to or on the episode date (e.g., tuberculosis, neutropenia, cystic fibrosis, chronic bronchitis, pulmonary edema, respiratory failure, rheumatoid lung disease). <p>Revised:</p> <ol style="list-style-type: none"> 1. Episodes where the patient is taking antibiotics (Table 1) in the 30 days prior to the episode date. 2. Episodes where the patient had a competing diagnosis within three days after the episode date (e.g., intestinal infection, pertussis, bacterial infection, Lyme disease, otitis media, acute sinusitis, chronic sinusitis, infection of the adenoids, prostatitis, cellulitis, mastoiditis, or bone infections, acute lymphadenitis, impetigo, skin staph infections, pneumonia/gonococcal infections, venereal disease (syphilis, chlamydia, inflammatory diseases [female reproductive organs]), infections of the kidney, cystitis or UTI) <p>This additional refinement of language within the competing diagnosis exclusion does not affect the intent of the proposed substantive change, but removes the duplication in denominator eligible clinical encounters that present with a bacterial infection therefore allowing reporting eligible clinicians to report a denominator exclusion for these patients would not influence overall performance of the measure.</p> <p>We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q066 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>

D.13 Acute Otitis Externa (AOE): Systemic Antimicrobial Therapy – Avoidance of Inappropriate Use

Category	Description
NQF # / eCQM NQF #:	654/N/A
Quality#:	093
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Efficiency and Cost Reduction
Current Collection Type:	Medicare Part B Claims Measure Specifications MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 2 years and older with a diagnosis of AOE who were not prescribed systemic antimicrobial therapy.
Substantive Change:	Updated denominator: For all collection types: Added telehealth as eligible encounter.
Steward:	American Academy of Otolaryngology – Head and Neck Surgery
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.
<p>Comment: Two commenters supported the addition of telehealth reporting for measure Q093.</p> <p>Response: We thank the commenters for supporting the addition of telehealth reporting for this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q093 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.14 Adult Major Depressive Disorder (MDD): Suicide Risk Assessment

Category	Description
NQF # / eCQM NQF #:	N/A / 0104e
Quality#:	107
CMS eCQM ID:	CMS161v9
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	eCQM Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of major depressive disorder (MDD) with a suicide risk assessment completed during the visit in which a new diagnosis or recurrent episode was identified.
Substantive Change:	<p>The description is revised to read: All patient visits during which a new diagnosis of MDD or a new diagnosis of recurrent MDD was identified for patients aged 18 years and older with a suicide risk assessment completed during the visit.</p> <p>Updated guidance: Added: In recognition of the growing use of integrated and team-based care, the diagnosis of dementia and the assessment of cognitive function need not be performed by the same provider or clinician.</p> <p>The initial patient population is revised to read: Patient visits during which a new diagnosis of MDD, single or recurrent episode, was identified.</p> <p>The numerator is revised to read: Patient visits during which a new diagnosis of MDD, single or recurrent episode, was identified and a suicide risk assessment was completed during the visit.</p>
Steward:	Mathematica
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to update the description, initial patient population, and numerator language to better align with the measure intent and clarify that the measure is episodic in nature. The measure steward updated the guidance statement based upon technical expert feedback to reflect that team-based care would be appropriate for this measure. We agreed that this guidance update is clinically appropriate and aligns better with clinical care workflows.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q107 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.15 Preventive Care and Screening: Influenza Immunization

Category	Description
NQF # / eCQM NQF #:	0041 / 0041c
Quality#:	110
CMS eCQM ID:	CMS147v10
National Quality Strategy Domain:	Community/Population Health
Current Collection Type:	Medicare Part B Claims Measure Specifications, eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 6 months and older seen for a visit between October 1 and March 31 who received an influenza immunization OR who reported previous receipt of an influenza immunization.
Substantive Change:	<p>Modified collection type: Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQMs Specifications</p> <p>Updated guidance: For the eCQM Specifications collection type: Revised: Due to the changing stance of the CDC/ACIP recommendations regarding the live attenuated influenza vaccine (LAIV) for a particular flu season, this measure will not include the administration of this specific formulation of the flu vaccination. Given the variance of the timeframes for the annual update cycles, program implementation, and publication of revised recommendations from the CDC/ACIP, it has been determined that the coding for this measure will specifically exclude this formulation, so as not to inappropriately include this form of the vaccine for flu seasons when CDC/ACIP explicitly advise against it. However, it is recommended that all eligible professionals or eligible clinicians to review the guidelines for each flu season to determine appropriateness of the LAIV and other formulations of the flu vaccine. Should the LAIV be recommended for administration for a particular flu season, eligible professional or clinician may consider one of the following options: 1) satisfy the numerator by reporting either previous receipt or using the CVX 88 for unspecified formulation, 2) report a denominator exception, either as a patient reason (e.g., for patient preference) or a system reason (e.g., the institution only carries LAIV). This is a patient-based measure.</p> <p>Updated denominator note: For the Medicare Part B Claims Measure Specifications collection type: Added: For the purposes of the program, to submit on the flu season 2020-2021, the patient must have a qualifying encounter between January 1 and March 31, 2021. to submit on the flu season 2021-2022, the patient must have a qualifying encounter between October 1 and December 31, 2021. A qualifying encounter needs to occur within the flu season that is being submitted; any additional encounter(s) may occur at any time within the measurement period.</p> <p>Updated denominator exception: For the eCQM Specifications collection type: Removed coding from the 'Medical Reason' value set for concepts not indicating medical contraindication.</p> <p>Updated denominator: For all collection types: Added telehealth as eligible encounter.</p>
Steward:	National Committee for Quality Assurance
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed to update the denominator note for the Medicare Part B Claims Measure Specifications collection type to add clarity and align the language with the MIPS CQMs Specifications collection type.</p> <p>We proposed to update the guidance for the eCQM Specifications collection type to better align with the updated CDC/ACIP clinical guidelines and to clarify the intent of the measure. We also proposed to revise the 'Medical Reason' value set based upon expert and stakeholder feedback to remove codes based upon intent of concepts, which do not indicate a medical contraindication, but rather a provider decision to discontinue or adjust a course of treatment. These codes do not meet the intent of the denominator exception.</p> <p>We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</p> <p>We proposed to remove the CMS Web Interface Measure Specifications collection type. This collection type was proposed to be sunset for the purposes of MIPS starting with the 2021 performance year. We have determined it is not fiscally viable, feasible, or sustainable for MIPS to continue this collection type/submission type due to an 80 percent reduction and a continued decrease in interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures. For further rationale, please see section IV.A.3.c.(1)(c) of this final rule.</p>
<p>We proposed a substantive change to the Denominator Note for the Medicare Part B Claims Measure Specifications collection type; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state: For the purposes of the program, in order to submit on the flu season 2020-2021, the patient must have a qualifying encounter between January 1 and March 31, 2021. In order to submit on the flu season 2021-2022, the patient must have a qualifying encounter between October 1 and December 31, 2021. A qualifying encounter needs to occur within the flu season that is being submitted; any additional encounter(s) may occur at any time within the measurement period.</p> <p>This additional refinement of including the language 'in order' preceding the instance of 'to submit' within the proposed language does not affect the intent of the proposed substantive change.</p> <p>Comment: One commenter supported the addition of telehealth reporting for measure Q110.</p> <p>Response: We thank the commenter for supporting the addition of telehealth reporting for this measure.</p> <p>Comment: One commenter did not support the addition of telehealth reporting for measure Q110.</p> <p>Response: We believe that it is important to ensure all patients have received an influenza vaccine as this is critical to the community and population health. It is important to have a complete denominator patient population to assess numerator compliance, which should include those encounters that occur via telehealth.</p>	

Category	Description
	<p>After consideration of public comments, we are finalizing the changes to measure Q110 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of the CMS Web Interface Specifications collection type. At § 414.1305, we proposed to modify the definition of the terms collection type and submission type by removing the CMS Web Interface Specifications as an available option starting with the 2023 payment year (85 FR 50290); however, the CMS Web Interface Measure Specifications collection type will be an available option for an extension of one additional year (2021 MIPS performance period/2023 MIPS payment year) and will be removed as a collection and submission type starting with the 2022 MIPS performance period/2024 MIPS payment year. None of the substantive changes above will be applied to the CMS Web Interface Measure Specifications for the 2021 MIPS performance period. The CMS Web Interface Specifications for the 2021 MIPS performance period will reflect the 2020 CMS Web Interface Specifications. In addition, we are not finalizing the proposed additional telehealth encounter eligibility substantive change for the eQCM Specifications collection type because this is already specified in the current measure.</p>

D.16 Breast Cancer Screening

Category	Description
NQF # / eCQM NQF #:	2372 / N/A
Quality#:	112
CMS eCQM ID:	CMS125v9
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	Medicare Part B Claims Measure Specifications, eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of women 50 - 74 years of age who had a mammogram to screen for breast cancer in the 27 months prior to the end of the measurement period.
Substantive Change:	<p>Modified collection type: Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQMs Specifications</p> <p>Updated denominator exclusion: For the eCQM Specifications collection type: Removed logic and value set related to unilateral mastectomy.</p> <p>Updated denominator exclusion: For the eCQM Specifications collection type: Revised: Exclude patients 66 and older who are living long term in an institution for more than 90 consecutive days during the measurement period.</p> <p>Updated denominator exclusion logic: For the eCQM Specifications collection type: Updated encounters so they are "on or" before the end of the measurement period. Updated the LTI exclusion to be 90 consecutive days. Changed the name of the under 81 exclusion definition to "FrailtyLTI.Advanced Illness and Frailty Exclusion Not Including Over Age 80".</p> <p>Updated denominator exclusion: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Revised: Patients age 66 or older in Institutional Special Needs Plans (SNP) or residing in long-term care with POS code, 32, 33, 34, 54, or 56 for more than 90 consecutive days during the measurement period</p> <p>Updated denominator exclusion: For the Medicare Part B Claims Measure Specifications collection type and the MIPS CQMs Specifications collection type: Added coding to identify patients with advanced illness and frailty</p>
Steward:	National Committee for Quality Assurance
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed that the denominator exclusion language and logic be updated to clarify that, for the measure, long-term care will be defined as patients staying 90 consecutive days at the long-term care facility versus any 90 days within the performance period. For the eCQM Specifications collection, we proposed removing the logic and value set related to unilateral mastectomy to ensure that all patients with existing breast tissue are included in the initial patient population as it is important they receive screening for breast cancer on remaining breast tissue.</p> <p>Additionally, for the MIPS CQMs Specifications and Medicare Part B Claims Measure Specifications collection types, we proposed adding applicable coding to better define the advanced illness and frailty patient population for the purposes of this measure</p> <p>We proposed to remove the CMS Web Interface Measure Specifications collection type. This collection type was proposed to be sunset for the purposes of MIPS starting with the 2021 performance year. We have determined it is not fiscally viable, feasible, or sustainable for MIPS to continue this collection type/submission type due to an 80 percent reduction and a continued decrease in interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures. For further rationale, please see section IV.A.3.c.(1)(c) of this final rule.</p>
<p>Comment: One commenter had concerns about removing unilateral mastectomy from the mammogram quality measure. Current specifications clarify that both a right and left unilateral must be completed to count as an exclusion. The commenter saw no reason to remove that logic, as it still accomplishes what CMS is asking for by ensuring that, "all patients with existing breast tissue are included in the initial patient population as it is important they receive screening for breast cancer on remaining breast tissue." A second commenter requested that CMS provide clarification on the statement "Removed logic and value set related to unilateral mastectomy," as the commenter believed the intent of this statement is unclear.</p> <p>Response: This revision was made to ensure that the logic is in alignment with the measure intent. As the logic is currently, a patient would be excluded if they had two unilateral mastectomy codes. However, it is possible for a patient to have two partial mastectomies on the same breast. Therefore, instances of mastectomies without indication of right or left side are being removed to increase specificity and ensure only those patients with total mastectomies are excluded. This will capture a more complete patient population for the assessment of the quality action and ensure patients with existing breast tissue are screened for breast cancer.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q112 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of the CMS Web Interface Specifications collection type. At § 414.1305, we proposed to modify the definition of the terms collection type and submission type by removing the CMS Web Interface Specifications as an available option starting with the 2023 payment year (85 FR 50290); however, the CMS Web Interface Measure Specifications collection type will be an available option for an extension of one additional year (2021 MIPS performance period/2023 MIPS payment year) and will be removed as a collection and submission type starting with the 2022 MIPS performance period/2024 MIPS payment year. None of the substantive changes above will be applied to the CMS Web Interface Measure Specifications for the 2021 MIPS performance period. The CMS Web Interface Specifications for the 2021 MIPS performance period will reflect the 2020 CMS Web Interface Specifications.</p>	

D.17 Colorectal Cancer Screening

Category	Description
NQF # / eCQM NQF #:	0034 / N/A
Quality#:	113
CMS eCQM ID:	CMS130v9
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	Medicare Part B Claims Measure Specifications, eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients 50-75 years of age who had appropriate screening for colorectal cancer.
Substantive Change:	<p>Modified collection type: Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQMs Specifications.</p> <p>Updated denominator exclusion: For the eCQM Specifications collection type: Revised:</p> <ol style="list-style-type: none"> 1. Exclude patients 66 and older who are living long term in an institution for more than 90 consecutive days during the measurement period. 2. Exclude patients with a diagnosis or past history of total colectomy or colorectal cancer. <p>Updated denominator exclusion logic: For the eCQM Specifications collection type: Updated encounters so they are "on or" before the end of the measurement period. Updated the LTI exclusion to be 90 consecutive days. Changed the name of the under 81 exclusion definition to "FrailtyLTI.Advanced Illness and Frailty Exclusion Not Including Over Age 80".</p> <p>Updated denominator criteria: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Removed coding not applicable to preventive value sets.</p> <p>Updated denominator exclusion: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Revised: Patients age 66 or older in Institutional Special Needs Plans (SNP) or residing in long-term care with POS code, 32, 33, 34, 54, or 56 for more than 90 consecutive days during the measurement period.</p> <p>Updated denominator exclusion: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Added coding to identify patients with advanced illness and frailty.</p>
Steward:	National Committee for Quality Assurance
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed that the denominator exclusion language and logic be updated to clarify that, for the measure, long-term care will be defined as patients staying 90 consecutive days at the long-term care facility versus any 90 days within the performance period. For the eCQM Specifications collection type We also proposed to revise the language for the exclusion for diagnosis or past history of total colectomy or colorectal cancer for clarity and to align with the other denominator exclusions.</p> <p>Additionally, for the MIPS CQMs Specifications and Medicare Part B Claims Measure Specifications collection types, we proposed adding applicable coding to better define the advanced illness and frailty patient population for the purposes of this measure. We proposed to remove denominator eligible coding that is not applicable to a preventive value set and may not be appropriate for inclusion in the measure's denominator eligible patient population.</p> <p>We proposed to remove the CMS Web Interface Measure Specifications collection type. This collection type was proposed to be sunset for the purposes of MIPS starting with the 2021 performance year. We have determined it is not fiscally viable, feasible, or sustainable for MIPS to continue this collection type/submission type due to an 80 percent reduction and a continued decrease in interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures. For further rationale, please see section IV.A.3.c.(1)(c) of this final rule.</p>
<p>We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q113 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of the CMS Web Interface Specifications collection type. At § 414.1305, we proposed to modify the definition of the terms collection type and submission type by removing the CMS Web Interface Specifications as an available option starting with the 2023 payment year (85 FR 50290); however, the CMS Web Interface Measure Specifications collection type will be an available option for an extension of one additional year (2021 MIPS performance period/2023 MIPS payment year) and will be removed as a collection and submission type starting with the 2022 MIPS performance period/2024 MIPS payment year. None of the substantive changes above will be applied to the CMS Web Interface Measure Specifications for the 2021 MIPS performance period. The CMS Web Interface Specifications for the 2021 MIPS performance period will reflect the 2020 CMS Web Interface Specifications.</p>	

D.18 Avoidance of Antibiotic Treatment in Adults With Acute Bronchitis

Category	Description
NQF # / eCQM NQF #:	0058 / N/A
Quality#:	116
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Efficiency and Cost Reduction
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	The percentage of adults 18–64 years of age with a diagnosis of acute bronchitis who were not prescribed or dispensed an antibiotic prescription.
Substantive Change:	<p>The title is revised from ‘Avoidance of Antibiotic Treatment in Adults With Acute Bronchitis’ to: Avoidance of Antibiotic Treatment for Acute Bronchitis/Bronchiolitis.</p> <p>The description is revised to read: The percentage of episodes for patients ages 3 months and older with a diagnosis of acute bronchitis/bronchiolitis that did not result in an antibiotic dispensing event.</p> <p>The instructions are revised to read: This measure is to be submitted at each occurrence of acute bronchitis/bronchiolitis during the performance period. This measure may be submitted by Merit-based Incentive Payment System (MIPS) eligible clinicians who perform the quality actions described in the measure based on the services provided and the measure-specific denominator coding.</p> <p>The denominator is revised to read: All patients aged 3 months or older with an outpatient, telephone visit, online assessment, observation visit or emergency department (ED) visit with a diagnosis of acute bronchitis/bronchiolitis during the measurement period.</p> <p>Updated denominator criteria: Revised: Patients 3 months of age and older on date of encounter. Added: Diagnosis for bronchiolitis.</p> <p>Updated denominator exclusion: Revised: 1. Outpatient, ED or Observation visits that result in an inpatient admission. Added: 2. Acute bronchitis/bronchiolitis episodes when the patient had a new or refill prescription of antibiotics (Table 1) in the 30 days prior to or on the episode date.</p> <p>The denominator note is revised to read: Do not include outpatient, ED or observation visits that result in an inpatient admission. When an outpatient, ED or observation visit and an inpatient stay are billed on separate claims, the visit results in an inpatient stay when the outpatient/ED/observation date of service occurs on the day prior to the admission date or any time during the admission (admission date through discharge date). An outpatient, ED or observation visit billed on the same claim as an inpatient stay is considered a visit that resulted in an inpatient stay.</p> <p>The numerator instructions are revised to read: For performance, the measure will be calculated as the number of patient encounters where antibiotics were neither prescribed nor dispensed on or within 3 days of the episode for acute bronchitis/bronchiolitis over the total number of encounters in the denominator (patients aged 3 months and older with an outpatient, telephone, online assessment, observation or ED visit for acute bronchitis/bronchiolitis). A higher score indicates appropriate treatment of patients with acute bronchitis/bronchiolitis (e.g., the proportion for whom antibiotics were not prescribed or dispensed on or 3 days after the encounter). Delayed prescriptions (where an antibiotic was prescribed and patient was instructed to delay taking the antibiotic) are considered “Performance Not Met”.</p> <p>Updated numerator instructions: Added: Note: This list should be used when assessing antibiotic prescriptions for the denominator exclusion and numerator components. Removed "Norfloxacin" from Table 1 – Antibiotic Medications.</p>
Steward:	National Committee for Quality Assurance
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	<p>We proposed the measure language be updated to reflect a broader denominator eligible population by revising the age to include all patients over 3 months of age as concerns regarding appropriate use of antibiotics are not limited to the adult population. This will allow for clinicians to report on both pediatric and adult patients. The title, description, instructions, and denominator are also being revised to include the diagnosis of bronchiolitis as denominator eligible to better align with the broadened age range as bronchiolitis is more commonly seen in babies and children. The diagnosis is clinically relevant to the intent of this measure. The denominator exclusion and denominator note are revised to better clarify that all visits resulting in an inpatient admission should be excluded as it may be clinically appropriate and warranted to treat them with antibiotics in accordance with appropriate care. The numerator instructions have been updated to align language with the denominator patient population updates, as well as to clarify that delayed prescriptions are still considered to be a “Performance Not Met” as the clinician is still prescribing or dispensing a prescription, which does not align with the measure’s intent.</p>
<p>We proposed a substantive change to the denominator; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state: All patients aged 3 months or older with an outpatient visit, telephone visit, online assessment, observation visit or emergency department (ED) visit with a diagnosis of acute bronchitis/bronchiolitis during the measurement period.</p> <p>This additional refinement of ‘outpatient’ to ‘outpatient visit’ does not affect the intent of the proposed substantive change.</p> <p>We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q116 as indicated for</p>	

Category	Description
the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.19 Diabetes: Eye Exam

Category	Description
NQF # / eCQM NQF #:	0055 / N/A
Quality#:	117
CMS eCQM ID:	CMS131v9
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients 18-75 years of age with diabetes and an active diagnosis of retinopathy overlapping the measurement period who had a retinal or dilated eye exam by an eye care professional during the measurement period or diabetes with no diagnosis of retinopathy overlapping the measurement period who had a retinal or dilated eye exam by an eye care professional during the measurement period or in the 12 months prior to the measurement period.
Substantive Change:	<p>Updated denominator exclusion: For the eCQM Specifications collection type: Revised: Exclude patients 66 and older who are living long term in an institution for more than 90 consecutive days during the measurement period.</p> <p>Updated denominator exclusion logic: For the eCQM Specifications collection type: Updated encounters so they are "on or" before the end of the measurement period. Updated the LTI exclusion to be 90 consecutive days. Changed the name of the under 81 exclusion definition to "FrailtyLTI.Advanced Illness and Frailty Exclusion Not Including Over Age 80".</p> <p>Updated denominator exclusion: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications: Revised: Patients age 66 and older in Institutional Special Needs Plans (SNP) or residing in long-term care with a POS code 32, 33, 34, 54 or 56 for more than 90 consecutive days during the measurement period.</p> <p>Updated denominator exclusion: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Added coding to identify patients with advanced illness and frailty.</p> <p>The numerator options are revised to read: For the MIPS CQM Specifications and Medicare Part B Claims Measure Specifications collection type:</p> <p>Performance Met:</p> <ul style="list-style-type: none"> • Dilated retinal eye exam with interpretation by an ophthalmologist or optometrist documented and reviewed. • Dilated retinal eye exam with interpretation by an ophthalmologist or optometrist documented and reviewed; without evidence of retinopathy. • 7 standard field stereoscopic photos with interpretation by an ophthalmologist or optometrist documented and reviewed. • 7 standard field stereoscopic photos with interpretation by an ophthalmologist or optometrist documented and reviewed; without evidence of retinopathy. • Eye imaging validated to match diagnosis from 7 standard field stereoscopic photos results documented and reviewed. • Eye imaging validated to match diagnosis from 7 standard field stereoscopic photos results documented and reviewed, without evidence of retinopathy. • Low risk for retinopathy (no evidence of retinopathy in the prior year)*. <p>Performance Not Met:</p> <ul style="list-style-type: none"> • Dilated eye exam was not performed, reason not otherwise specified. <p>Updated numerator options note: For the MIPS CQM Specifications and Medicare Part B Claims Measure Specifications collection type: Removed. **Note: For Performance Year 2020 reporting, the Centers for Medicare & Medicaid Services and the American Medical Association have approved the use of the 8P modifier with HCPCS codes to report the Performance Not Met numerator option for Quality ID #117.</p>
Steward:	National Committee for Quality Assurance
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed that the denominator exclusion language and logic be updated to clarify that, for the measure, long-term care will be defined as patients staying 90 consecutive days at the long-term care facility versus any 90 days within the performance period.</p> <p>Additionally, for the MIPS CQMs Specifications and Medicare Part B Claims Measure Specifications collection types, we proposed adding applicable coding to better define the advanced illness and frailty patient population for the purposes of this measure. The numerator options are being updated to stratify numerator compliant patients into those who are complaint and those who are compliant with evidence of retinopathy. This granularity will give a better picture of the patient population and the percentage of those patients who did not have evidence of retinopathy, and may fall into low risk for retinopathy, for the purposes of this measure. The numerator option note associated with the "Performance Not Met" option is being removed as it will not be applicable as the numerator options are being updated.</p>
<p>Comment: One commenter supported the inclusion of this measure for 2021 MIPS participants, but urged CMS to ensure that application of the measure is consistent with NCQA's update to this measure in its 2021 measure set, namely, NCQA's clarification that "eye exam results read by a system that provides an artificial intelligence (AI) interpretation meet criteria," as stated in NCQA's changes to HEDIS MY 2020 and MY 2021. The commenter is concerned that, absent this clarification, there will be confusion for practitioners who participate in MIPS and read the measure to require an eye exam by an "eye care professional," as indicated in CMS' table of Previously Finalized Measures in the Family Medicine Set for MIPS measure Q117. Such a clarification would also be consistent with the American Diabetes Association (ADA) 2020 standards for diabetes care, which provide, "Artificial intelligence systems that detect more than mild diabetic retinopathy and diabetic macular edema authorized for use by the FDA represent an alternative to traditional screening approaches."</p> <p>Response: We support technology that enhances a clinician's ability to diagnosis and treat patients safely and efficiently. Annually, we collaborate with measure stewards to gather revisions and incorporate them into the MIPS quality measures to ensure the program reflects the most recent version of the specification. We are not responsible to ensure the revisions provided by the measure steward align with specifications outside of MIPS. Additionally, there may be timing considerations for revisions to be updated within MIPS that did not allow the measure steward to align the MIPS version of the specification to the HEDIS specification. We believe that we captured the measure steward's intent for this measure for this performance period. We believe by stratifying the numerator options, more granular data can be captured to discern between patients with and without evidence of retinopathy. This information may give insight into those patients with controlled blood sugar and those with uncontrolled blood sugar. We encourage the commenters to collaborate with the measure steward regarding the request of further stratification of the numerator for this measure to be considered for future years.</p>	

Category	Description
	<p>Comment: One commenter opposed the changes to the numerator for measure Q117. CMS proposed to add stratification to the “Performance Met” numerator option <i>only for the manual MIPS CQM and Medicare Part B Claims collection types</i>. The commenter stated that currently, “Performance Met” includes the following four options: G2102 Dilated retinal eye exam with interpretation by an ophthalmologist or optometrist documented and reviewed Or; G2103 Seven standard field stereoscopic photos with interpretation by an ophthalmologist or optometrist documented and reviewed Or; G2104 Eye imaging validated to match diagnosis from seven standard field stereoscopic photos results documented and reviewed; Or 3072F Low risk for retinopathy (no evidence of retinopathy in the prior year).</p> <p>CMS is proposing to add further stratification by dividing the first three of these current options into two each – one as currently written and a second with “; without evidence of retinopathy” addended to the end of the option description. The commenter stated that not only is this information irrelevant to the measure, but CMS is also creating significant additional burden by nearly doubling the number of classifications that manual reporters must organize patients into in order to report the measure. This created burden on small and rural practices without an EHR, which also concerning due to COVID-19. The commenter urged CMS not to finalize this additional stratification of the numerator options for measure Q117.</p> <p>Response: We support technology that enhances a clinician’s ability to diagnosis and treat patients safely and efficiently. Annually, we collaborate with measure stewards to gather revisions and incorporate them into the MIPS quality measures to ensure the program reflects the most recent version of the specification. We believe that we captured the measure steward’s intent for this measure for this performance period. We believe by stratifying the numerator options, more granular data can be captured to discern between patients with and without evidence of retinopathy. This information may give insight into those patients with controlled blood sugar and those with uncontrolled blood sugar. We encourage the commenters to collaborate with the measure steward regarding the request of further stratification of the numerator for this measure to be considered for future years.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q117 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>

D.20 Coronary Artery Disease (CAD): Angiotensin-Converting Enzyme (ACE) Inhibitor or Angiotensin Receptor Blocker (ARB) Therapy - Diabetes or Left Ventricular Systolic Dysfunction (LVEF < 40%)

Category	Description
NQF # / eCQM NQF #:	0066 / N/A
Quality#:	118
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of coronary artery disease seen within a 12-month period who also have diabetes OR a current or prior Left Ventricular Ejection Fraction (LVEF) < 40% who were prescribed ACE inhibitor or ARB therapy.
Substantive Change:	<p>Updated denominator criteria: Added: Eligible coding for the additional patient encounter is identical to 'Patient encounter during the performance period' criteria.</p> <p>Updated denominator: Added telehealth as eligible for all encounters.</p>
Steward:	American Heart Association
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured. Additionally, we proposed to clarify the denominator eligible coding for the two visits necessary for denominator eligibility.
<p>Comment: One commenter supported the addition of telehealth reporting for measure Q118.</p> <p>Response: We thank the commenter for supporting the addition of telehealth reporting for this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q118 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.21 Diabetes: Medical Attention for Nephropathy

Category	Description
NQF # / eCQM NQF #:	0062 / N/A
Quality#:	119
CMS eCQM ID:	CMS134v9
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	eCQM Specifications, MIPS CQMs Specifications
Current Measure Description:	The percentage of patients 18-75 years of age with diabetes who had a nephropathy screening test or evidence of nephropathy during the measurement period.
Substantive Change:	<p>Updated denominator: For the eCQM Specifications collection type: Revised: Exclude patients 66 and older who are living long term in an institution for more than 90 consecutive days during the measurement period.</p> <p>Updated denominator exclusion logic: For the eCQM Specifications collection type: Updated encounters so they are "on or" before the end of the measurement period. Updated the LTI exclusion to be 90 consecutive days. Changed the name of the under 81 exclusion definition to "Frailty.LTI.Advanced Illness and Frailty Exclusion Not Including Over Age 80".</p> <p>Updated denominator exclusion: For the MIPS CQMs Specifications collection type: Revised: Patients age 66 and older in Institutional Special Needs Plans (SNP) or residing in long-term care with a POS code 32, 33, 34, 54 or 56 for more than 90 consecutive days during the measurement period</p> <p>Updated denominator exclusion: For the MIPS CQMs Specifications collection type: Added coding to identify patients with advanced illness and frailty.</p>
Steward:	National Committee for Quality Assurance
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed that the denominator exclusion language and logic be updated to clarify that, for the measure, long-term care will be defined as patients staying 90 consecutive days at the long-term care facility versus any 90 days within the performance period.</p> <p>Additionally, for the MIPS CQMs Specifications and Medicare Part B Claims Measure Specifications collection types, we proposed adding applicable coding to better define the advanced illness and frailty patient population for the purposes of this measure.</p>
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q119 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.22 Diabetes Mellitus: Diabetic Foot and Ankle Care, Peripheral Neuropathy – Neurological Evaluation

Category	Description
NQF # / eCQM NQF #:	0417 / N/A
Quality#:	126
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of diabetes mellitus who had a neurological examination of their lower extremities within 12 months.
Substantive Change:	Updated denominator exception: Added: Clinician documented that patient had medical reason for not performing lower extremity neurological exam.
Steward:	American Podiatric Medical Association
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to add a denominator exception for patients with medical reasons for not performing a lower extremity neurological exam. As there may be instances where a patient is denominator eligible, however, a lower extremity neurological exam would not be reasonably performed due the presence of a burn, ulceration, or infection, for example. Adding this denominator exception allows the MIPS eligible clinician to exercise their clinical judgement as to when it is not feasible to perform a lower extremity neurological exam.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q126 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.23 Diabetes Mellitus: Diabetic Foot and Ankle Care, Ulcer Prevention – Evaluation of Footwear

Category	Description
NQF # / eCQM NQF #:	0416 / N/A
Quality#:	127
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of diabetes mellitus who were evaluated for proper footwear and sizing.
Substantive Change:	Updated denominator exclusion: Added: Clinician documented that patient was not an eligible candidate for evaluation of footwear as patient is bilateral lower extremity amputee.
Steward:	American Podiatric Medical Association
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to add a denominator exclusion for bilateral lower extremity amputee as this patient population is not applicable to this measure and should not be included in the denominator eligible patient population.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q127 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.24 Preventive Care and Screening: Body Mass Index (BMI) Screening and Follow-Up Plan

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	128
CMS eCQM ID:	CMS69v9
National Quality Strategy Domain:	Community/Population Health
Current Collection Type:	Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a BMI documented during the current encounter or during the previous 12 months AND with a BMI outside of normal parameters, a follow-up plan is documented during the encounter or during the previous 12 months of the current encounter. Normal Parameters: Age 18 years and older BMI ≥ 18.5 and < 25 kg/m ² .
Substantive Change:	<p>The description is revised to read: Percentage of patients aged 18 years and older with a BMI documented during the current encounter or within the previous 12 months AND who had a follow-up plan documented if most recent BMI was outside of normal parameters.</p> <p>Updated guidance: For the eCQM Specifications collection type: Removed: Review the following to apply the Medical Reason exception criteria: The Medical Reason exception could include, but is not limited to, the following patients as deemed appropriate by the health care provider: * Elderly patients (65 or older) for whom weight reduction/weight gain would complicate other underlying health conditions such as the following examples: * Illness or physical disability * Mental illness, dementia, confusion * Nutritional deficiency such as Vitamin/mineral deficiency * Patients in an urgent or emergent medical situation where time is of the essence and to delay treatment would jeopardize the patient's health status Revised: See denominator exception section for examples.</p> <p>Updated definition: For all collection types: Added: Normal BMI Parameters – Age 18 years and older BMI ≥ 18.5 and < 25 kg/m² For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Revised: Not Eligible for BMI Calculation or Follow-Up Plan (Denominator Exclusion) – A patient is not eligible if one or more of the following reasons are documented: • Patients receiving palliative or hospice care on the date of the current encounter or any time prior to the current encounter • Patients who are pregnant on the date of the current encounter or any time during the measurement period prior to the current encounter</p> <p>Patients with no documented BMI or a documented BMI outside normal parameters and a documented reason for not completing BMI follow-up plan during the current encounter or within the previous 12 months of the current encounter (Denominator Exception) – • Patients with a documented medical reason for not documenting BMI or for not documenting a follow-up plan for a BMI outside normal parameters (e.g., elderly patients (65 or older) for whom weight reduction/weight gain would complicate other underlying health conditions such as illness or physical disability, mental illness, dementia, confusion, or nutritional deficiency such as vitamin/mineral deficiency; patients in an urgent or emergent medical situation where time is of the essence and to delay treatment would jeopardize the patient's health status) • Patients who refuse measurement of height and/or weight on the date of the current encounter or any time during the measurement period prior to the current encounter</p> <p>Updated denominator exclusion: For the eCQM Specifications collection type: Removed: Patients who refuse measurement of height and/or weight. Added: Hospice care value sets</p> <p>Updated denominator exception: For the eCQM Specifications collection type: Added: Patients who refuse measurement of height and/or weight. Revised: Patients with a documented medical reason for not documenting BMI or for not documenting a follow-up plan for a BMI outside normal parameters (e.g., elderly patients (65 or older) for whom weight reduction/weight gain would complicate other underlying health conditions such as illness or physical disability, mental illness, dementia, confusion, or nutritional deficiency such as vitamin/mineral deficiency; patients in an urgent or emergent medical situation where time is of the essence and to delay treatment would jeopardize the patient's health status). For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection type: Added: BMI not documented due to medical reason OR patient refusal of height or weight measurement.</p> <p>Per the 'Telehealth Guidance for Electronic Clinical Quality Measures (eCQMs) for Eligible Professional/Eligible Clinician 2021 Quality Reporting': Medicare telehealth eligible codes found in any encounter value set must only be used for in-person encounters for the following eCQMs.</p>
Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	No
Measure Type:	Process

Category	Description
Rationale:	<p>We proposed to update the measure description language to reduce redundancy throughout the specification and clarify the intent. The guidance for the eCQM Specifications collection type was updated to move the medical reason exception language to the denominator exceptions header as this language is more suitable for this field. The definition for “Normal BMI Parameters” was moved to the definition section as it is more applicable here and helps readability. During the change review process, the patient refusal denominator exclusion was moved to the denominator exception. We agreed that patient refusal is more appropriately classified as a denominator exception as the patient would still be denominator eligible. For the MIPS CQMs Specifications and the Medicare Part B Claims Measure Specifications collection type, the definitions for the denominator exclusion and denominator exception were updated to reflect the changes and to align language across collection types. Additionally, a denominator exception was added to reflect the definition revisions and capture patients for whom BMI was not documented due to medical reasons or patient refusal.</p> <p>We proposed to remove telehealth encounters from the denominator of the eCQM Specifications collection type as telehealth is not an appropriate setting for this measure, as well as to align with the other collection types. This guidance can be found in a separate document that will be published on the eCQI Resource Center.</p>
	<p>We proposed a substantive change to the description; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state: Percentage of patients aged 18 years and older with a BMI documented during the current encounter or within the previous twelve months AND who had a follow-up plan documented if most recent BMI was outside of normal parameters.</p> <p>This additional refinement of spelling out of the number 12 does not affect the intent of the proposed substantive change.</p> <p>Comment: One commenter indicated that the BMI range is too narrow (60 percent US adults is above 25) and is not practical as many practitioners do not begin to discuss weight management with patients until the BMI is around 29. Widening the BMI range will begin to capture the a more targeted population. The commenter asked stated that higher BMI ranges get consumed with other conditions so weight is not addressed for the BMI alone but for co-existing conditions (diabetes, GI etc.). The commenter recommended that an exclusion be provided for other conditions involving weight management.</p> <p>Response: We thank the commenter for their comment. As the measure steward, we will take this feedback into consideration during the annual revisions for possible implementation in future years. Part of the Meaningful Measures Initiative is to align with current medical guidelines and implementing measures the drive quality care, reduce risk factors, and promote positive patient outcomes.</p> <p>Comment: One commenter stated that measure Q128 requires clinicians to measure patients’ height and weight and establish a goal. However, significant weight loss is unreasonable during the relatively short length of stay for patients requiring rehabilitation services. The collection of this information therefore serves no role for the patient during their course of care and in the calculation of Medicare’s payment for therapy services.</p> <p>Response: We thank the commenter for their comment. We agree that a patient may not have enough time to experience significant weight loss while receiving rehabilitation services. Although, the intent of the measure is provide a follow-up plan for patients that have a body mass index (BMI) outside normal parameters. The follow-up may include a referral to, for example, a Registered Dietitian Nutritionist (RDN), occupational therapist, physical therapist, primary care provider, exercise physiologist, mental health professional, or surgeon), for lifestyle/behavioral therapy and/or exercise counseling which could support the patient after discharge from rehabilitation services.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q128 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>

D.25 Documentation of Current Medications in the Medical Record

Category	Description
NQF # / eCQM NQF #:	0419 / 0419e
Quality#:	130
CMS eCQM ID:	CMS68v10
National Quality Strategy Domain:	Patient Safety
Current Collection Type:	Medicare Part B Claims Measure Specifications, eCQM Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of visits for patients aged 18 years and older for which the MIPS eligible clinician attests to documenting a list of current medications using all immediate resources available on the date of the encounter. This list must include ALL known prescriptions, over-the-counters, herbals, and vitamin/mineral/dietary (nutritional) supplements AND must contain the medications' name, dosage, frequency and route of administration.
Substantive Change:	<p>The description is revised to read: For all collection types: Percentage of visits for patients aged 18 years and older for which the eligible professional or eligible clinician attests to documenting a list of current medications using all immediate resources available on the date of the encounter.</p> <p>The guidance is revised to read: For the eCQM Specifications collection type: This eCQM is an episode-based measure. This measure is to be reported for every encounter during the measurement period. Eligible professionals or eligible clinicians reporting this measure may document medication information received from the patient, authorized representative(s), caregiver(s) or other available healthcare resources. This list must include all known prescriptions, over-the-counter (OTC) products, herbals, vitamins, minerals, dietary (nutritional) supplements AND must contain the medications' name, dosage, frequency and route of administration. This measure should also be reported if the eligible professional or eligible clinician documented the patient is not currently taking any medications. By reporting the action described in this measure, the provider attests to having documented a list of current medications utilizing all immediate resources available at the time of the encounter. This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM.</p> <p>The denominator exception is revised to read: For the eCQM Specifications collection type: Documentation of a medical reason(s) for not documenting, updating, or reviewing the patient's current medications list (e.g., patient is in an urgent or emergent medical situation where time is of the essence and to delay treatment would jeopardize the patient's health status).</p> <p>The numerator is revised to read: For all collection types: Eligible professional or eligible clinician attests to documenting, updating or reviewing the patient's current medications using all immediate resources available on the date of the encounter.</p> <p>Updated numerator note: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Added: This list must include ALL known prescriptions, over-the-counter (OTC) products, herbals, vitamins, minerals, dietary (nutritional) supplements AND must contain the medications' name, dosage, frequency and route of administration.</p> <p>Updated denominator exception: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection type: Revised: Documentation of a medical reason(s) for not documenting, updating, or reviewing the patient's current medications list (e.g., patient is in an urgent or emergent medical situation).</p>
Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to update the measure description to remove language that is more appropriate for the guidance/notes sections of the measure specification. This will help with measure intent, clarity, and readability. The guidance for the eCQM Specifications collection type has been updated to clarify the intent of the measure. The intent is to document all known prescriptions, since the measure steward believes that MIPS eligible clinician should not be held accountable for information that is not available utilizing all immediate resources. The denominator exception was updated in all collection types to add clarity regarding use of the denominator exception and to align the language throughout the specification. The numerator notes for the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types was updated with information removed from the description. This information outlines what is necessary for numerator compliance and is better suited for the numerator notes section for ease of use.
<p>Comment: One commenter supported CMS's proposal to update the measure description to clarify that clinicians must only document all known medications and that clinicians should not be held accountable for information that is not available utilizing all immediate resources. This clarification will decrease burden on MIPS eligible clinicians reporting this measure.</p> <p>Response: We thank the commenter for supporting the change to this measure.</p> <p>Comment: One commenter stated that inclusion of the Dialysis SNOMED code creates a burden for Nephrology providers who report this measure. The commenter urged CMS to consider creating a denominator exclusion for measure Q130 (CMS 68v10) for patients who are undergoing dialysis, OR remove the current dialysis SNOMED code from the measure's value set.</p> <p>The 2020 eCQM Specification for this measure states that the initial population for this measure includes "All visits occurring during the 12-month measurement period for patients aged 18 years and older" (a). Additionally, the "Encounter to Document Medications" Value Set currently included in the measure includes SNOMED code 385973000 - Dialysis care management (procedure). The consequence of using this SNOMED code is that any patients who are undergoing dialysis are eligible for the measure each time they have a Dialysis visit. Clinically, dialysis patients have eligible encounters multiple times a week and it is unnecessary to reconcile a dialysis patient's medication mere days after their previous encounter, as no significant changes are likely to have occurred. The frequency that providers are required to reconcile medications discourages Nephrology TIN's from using this measure.</p>	

Category	Description
	<p>Response: As the measure steward, we will take this feedback into consideration during the annual revisions for possible implementation in future years. Part of the Meaningful Measures Initiative is to align with current medical guidelines and implementing measures the drive quality care, reduce risk factors, and promote positive patient outcomes.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q130 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>

D.26 Preventive Care and Screening: Screening for Depression and Follow-Up Plan

Category	Description
NQF # / eCQM NQF #:	0418 / 0418e
Quality#:	134
CMS eCQM ID:	CMS2v10
National Quality Strategy Domain:	Community/Population Health
Current Collection Type:	Medicare Part B Claims Measure Specifications, eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 12 years and older screened for depression on the date of the encounter or 14 days prior to the date of the encounter using an age appropriate standardized depression screening tool AND if positive, a follow-up plan is documented on the date of the eligible encounter.
Substantive Change:	<p>Modified collection type: Medicare Part B Claims Measure Specifications, eCQM Specifications, and MIPS CQMs Specifications.</p> <p>The description is revised to read: For all collection types: Percentage of patients aged 12 years and older screened for depression on the date of the encounter or up to 14 days prior to the date of the encounter using an age-appropriate standardized depression screening tool AND if positive, a follow-up plan is documented on the date of the eligible encounter.</p> <p>The definition is revised to read: For all collection types: Screening: Completion of a clinical or diagnostic tool used to identify people at risk of developing or having a certain disease or condition, even in the absence of symptoms. Standardized Depression Screening Tool: A normalized and validated depression screening tool developed for the patient population in which it is being utilized Examples of standardized depression screening tools include but are not limited to:</p> <ul style="list-style-type: none"> * Adolescent Screening Tools (12-17 years) <ul style="list-style-type: none"> * Patient Health Questionnaire for Adolescents (PHQ-A) * Beck Depression Inventory-Primary Care Version (BDI-PC) * Mood Feeling Questionnaire (MFQ) * Center for Epidemiologic Studies Depression Scale (CES-D) * Patient Health Questionnaire (PHQ-9) * Pediatric Symptom Checklist (PSC-17) * PRIME MD-PHQ2 * Adult Screening Tools (18 years and older) <ul style="list-style-type: none"> * Patient Health Questionnaire (PHQ9) * Beck Depression Inventory (BDI or BDI-II) * Center for Epidemiologic Studies Depression Scale (CES-D) * Depression Scale (DEPS) * Duke Anxiety-Depression Scale (DADS) * Geriatric Depression Scale (GDS) * Cornell Scale for Depression in Dementia (CSDD) * PRIME MD-PHQ2 * Hamilton Rating Scale for Depression (HAM-D) * Quick Inventory of Depressive Symptomatology Self-Report (QID-SR) * Computerized Adaptive Testing Depression Inventory (CAT-DI) * Computerized Adaptive Diagnostic Screener (CAD-MDD) * Perinatal Screening Tools <ul style="list-style-type: none"> * Edinburgh Postnatal Depression Scale * Postpartum Depression Screening Scale * Patient Health Questionnaire 9 (PHQ-9) * Beck Depression Inventory * Beck Depression Inventory-II * Center for Epidemiologic Studies Depression Scale * Zung Self-rating Depression Scale <p>Follow-Up Plan: Documented follow-up for a positive depression screening must include one or more of the following:</p> <ul style="list-style-type: none"> * Referral to a practitioner who is qualified to diagnose and treat depression * Pharmacological interventions * Other interventions or follow-up for the diagnosis or treatment of depression <p>The numerator definition is revised to read: For the MIPS CQMs Specifications and the Medicare Part B Claims Measure Specifications collection type: Examples of a follow-up plan include but are not limited to:</p> <ul style="list-style-type: none"> • Referral to a practitioner or program for further evaluation for depression, for example, referral to a psychiatrist, psychologist, social worker, mental health counselor, or other mental health service such as family or group therapy, support group, depression management program, or other service for treatment of depression • Other interventions designed to treat depression such as behavioral health evaluation, psychotherapy, pharmacological interventions, or additional treatment options <p>Patients with a Documented Reason for not Screening for Depression (Denominator Exception) Patient Reason(s) Patient refuses to participate OR Medical Reason(s)</p>

Category	Description
	<p>Documentation of medical reason for not screening patient for depression (e.g., cognitive, functional, or motivational limitations that may impact accuracy of results; patient is in an urgent or emergent situation where time is of the essence and to delay treatment would jeopardize the patient's health status)</p> <p>Updated denominator exclusion definition: For the MIPS CQMs Specifications and the Medicare Part B Claims Measure Specifications collection type: Revised: Not Eligible for Depression Screening or Follow-Up Plan (Denominator Exclusion) Patients who have been diagnosed with bipolar disorder- F31.10, F31.11, F31.12, F31.13, F31.2, F31.30, F31.31, F31.32, F31.4, F31.5, F31.60, F31.61, F31.62, F31.63, F31.64, F31.71, F31.72, F31.73, F31.74, F31.75, F31.76, F31.77, F31.78, F31.81, F31.89, F31.9 Patients who have been diagnosed with depression-- F01.51, F32.0, F32.1, F32.2, F32.3, F32.4, F32.5, F32.89, F32.9, F33.0, F33.1, F33.2, F33.3, F33.40, F33.41, F33.42, F33.8, F33.9, F34.1, F34.81, F34.89, F43.21, F43.23, F53.0, F53.1, O90.6, O99.340, O99.341, O99.342, O99.343, O99.345</p> <p>The guidance is revised to read: For the eCQM Specifications collection type: A depression screen is completed on the date of the encounter or up to 14 days prior to the date of the encounter using an age-appropriate standardized depression screening tool AND if positive, a follow-up plan must be documented on the date of the encounter, such as referral to a practitioner who is qualified to treat depression, pharmacological interventions or other interventions for the treatment of depression. This eCQM is a patient-based measure. Depression screening is required once per measurement period, not at all encounters. The intent of the measure is to screen for depression in patients who have never had a diagnosis of depression or bipolar disorder prior to the eligible encounter used to evaluate the numerator. Patients who have ever been diagnosed with depression or bipolar disorder will be excluded from the measure. Screening Tools: <ul style="list-style-type: none"> * An age-appropriate, standardized, and validated depression screening tool must be used for numerator compliance. * The name of the age-appropriate standardized depression screening tool utilized must be documented in the medical record * The depression screening must be reviewed and addressed in the office of the provider, filing the code, on the date of the encounter. Positive pre-screening results indicating a patient is at high risk for self-harm should receive more urgent intervention as determined by the provider practice * The screening should occur during a qualifying encounter or up to 14 days prior to the date of the qualifying encounter * The measure assesses the most recent depression screening completed either during the eligible encounter or within the 14 days prior to that encounter. Therefore, a clinician would not be able to complete another screening at the time of the encounter to count towards a follow-up, because that would serve as the most recent screening. To satisfy the follow-up requirement for a patient screening positively, the eligible clinician would need to provide one of the aforementioned follow-up actions, which does not include use of a standardized depression screening tool Follow-Up Plan: The follow-up plan must be related to a positive depression screening, for example: "Patient referred for psychiatric evaluation due to positive depression screening." Examples of a follow-up plan include but are not limited to: <ul style="list-style-type: none"> * Referral to a practitioner or program for further evaluation for depression, for example, referral to a psychiatrist, psychologist, social worker, mental health counselor, or other mental health service such as family or group therapy, support group, depression management program, or other service for treatment of depression * Other interventions designed to treat depression such as behavioral health evaluation, psychotherapy, pharmacological interventions, or additional treatment options Should a patient screen positive for depression, a clinician should opt to complete a suicide risk assessment when appropriate and based on individual patient characteristics. However, for the purposes of this measure, a suicide risk assessment or additional screening using a standardized tool will not qualify as a follow-up plan. This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM.</p> <p>Updated denominator criteria: For the Medicare Part B Claims Measures Specifications and the MIPS CQMs Specifications collection types: Revised: Patients aged ≥ 12 years. For the eCQM Specifications collection type: Added physical therapy MIPS eligible clinician.</p> <p>Updated denominator note: For the Medicare Part B Claims Measures Specifications and the MIPS CQMs Specifications collection types: Added: The intent of the measure is to screen for depression in patients who have never had a diagnosis of depression or bipolar disorder prior to the eligible encounter used to evaluate the numerator. Patients who have ever been diagnosed with depression or bipolar disorder will be excluded from the measure.</p> <p>Updated denominator exclusion: For the eCQM Specifications collection type: Revised: Patients who have been diagnosed with depression or with bipolar disorder. For the MIPS CQMs Specifications and the Medicare Part B Claims Measure Specifications collection type: Revised: Documentation stating the patient has had a diagnosis of depression or has had a diagnosis of bipolar disorder.</p> <p>Updated numerator: For the eCQM Specifications collection type: Removed additional evaluation or assessment for depression and suicide risk assessment as follow-up from the measure in header and from technical specifications and add guidance statement regarding suicide risk assessment.</p> <p>The numerator instruction is revised to read: For the Medicare Part B Claims Measures Specifications collection type and the MIPS CQM Specifications collection type: A depression screen is completed on the date of the encounter or up to 14 days prior to the date of the encounter using an age-appropriate standardized depression screening tool AND if positive, a follow-up plan must be documented on the date of the encounter, such as referral to a practitioner who is qualified to treat depression, pharmacological interventions or other interventions for the treatment of depression. Depression screening is required once per measurement period, not at all encounters. An age-appropriate, standardized, and validated depression screening tool must be</p>

Category	Description
	<p>used for numerator compliance. The name of the age-appropriate standardized depression screening tool utilized must be documented in the medical record. The depression screening must be reviewed and addressed in the office of the provider on the date of the encounter. Positive pre-screening results indicating a patient is at high risk for self-harm should receive more urgent intervention as determined by the provider practice. The screening should occur during a qualifying encounter or up to 14 days prior to the date of the qualifying encounter.</p> <p>The measure assesses the most recent depression screening completed either during the eligible encounter or within the 14 days prior to that encounter. Therefore, a clinician would not be able to complete another screening at the time of the encounter to count towards a follow-up, because that would serve as the most recent screening. To satisfy the follow-up requirement for a patient screening positively, the eligible clinician would need to provide one of the aforementioned follow-up actions, which does not include use of a standardized depression screening tool.</p> <p>Should a patient screen positive for depression, a clinician should opt to complete a suicide risk assessment when appropriate and based on individual patient characteristics. However, for the purposes of this measure, a suicide risk assessment or additional screening using a standardized tool, will not qualify as a follow-up plan.</p>
Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed to update the description to provide clarity and better align with the measure intent. We proposed to update the measure language in the definitions, guidance, and numerator note sections to provide clarity as to what constitutes a follow-up plan. The measure assesses the most recent depression screening completed either during the eligible encounter or within the 14 days prior to that encounter. Therefore, a clinician would not be able to complete another screening at the time of the encounter to count towards a follow-up, since that would serve as the most recent screening. To satisfy the follow-up requirement for a patient screening positively, the eligible clinician would need to provide one of the aforementioned follow-up actions, which does not include use of a standardized depression screening tool. Additionally, suicide risk assessments have been removed as a numerator compliant follow-up plan option as this should be completed when appropriate and based on the assessment by the clinician regarding the severity of the patient's symptoms of depression at the time of depression screening. We also proposed to update the measure language and denominator exclusions to reflect that this measure is screening of depression for patients who have not been previously diagnosed or have an active diagnosis of depression or bipolar disorder. This preventive measure assesses screening and follow up plan for patients that are screened positive for depression. We also proposed to update the denominator criteria for the Medicare Part B Claims Measure Specifications and the MIPS CQM Specifications collection types to align with the measure denominator language which states patients age 12 or older at the beginning of the measurement period. Additionally, we proposed to add the physical therapy MIPS eligible clinician type based on stakeholder feedback regarding the applicability of this measure to this clinician type.</p> <p>We proposed to remove the CMS Web Interface Measure Specifications collection type. This collection type was proposed to be sunset for the purposes of MIPS starting with the 2021 performance year. We have determined it is not fiscally viable, feasible, or sustainable for MIPS to continue this collection type/submission type due to an 80 percent reduction and a continued decrease in interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures. For further rationale, please see section IV.A.3.c.(1)(c) of this final rule.</p>
<p>We proposed a substantive change to the numerator instruction for the Medicare Part B Claims Measures Specifications collection type and the MIPS CQM Specifications collection type; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state:</p> <p>A depression screen is completed on the date of the encounter or up to 14 days prior to the date of the encounter using an age-appropriate standardized depression screening tool AND if positive, a follow-up plan must be documented on the date of the encounter, such as referral to a practitioner who is qualified to treat depression, pharmacological interventions or other interventions for the treatment of depression. Depression screening is required once per measurement period, not at all encounters. An age-appropriate, standardized, and validated depression screening tool must be used for numerator compliance. The name of the age-appropriate standardized depression screening tool utilized must be documented in the medical record. The depression screening must be reviewed and addressed in the office of the provider on the date of the encounter. Positive pre-screening results indicating a patient is at high risk for self-harm should receive more urgent intervention as determined by the provider practice. The screening should occur during a qualifying encounter or up to 14 days prior to the date of the qualifying encounter.</p> <p>The measure assesses the most recent depression screening completed either during the eligible encounter or within the 14 days prior to that encounter. Therefore, a clinician would not be able to complete another screening at the time of the encounter to count towards a follow-up, because that would serve as the most recent screening. In order to satisfy the follow-up requirement for a patient screening positively, the eligible clinician would need to provide one of the aforementioned follow-up actions, which does not include use of a standardized depression screening tool.</p> <p>Should a patient screen positive for depression, a clinician should opt to complete a suicide risk assessment when appropriate and based on individual patient characteristics. However, for the purposes of this measure, a suicide risk assessment or additional screening using a standardized tool, will not qualify as a follow-up plan.</p> <p>This additional refinement of adding 'In order' prior to 'to satisfy' does not affect the intent of the proposed substantive change.</p> <p>Comment: One commenter cited follow-up plan may not follow provider workflow. For example, an EHR software may capture the date the order was signed which may be signed by the provider the next day (not the day of the order). The commenter recommended that grace period be allowed for providers to get caught up with paper work (1 to 3 days after the encounter).</p> <p>Response: We thank the commenter for their comment. As the measure steward, we will take this feedback into consideration during the annual revisions for possible implementation in future years.</p> <p>Comment: One commenter agreed with the proposal to remove suicide risk assessment from a numerator option. A suicide risk assessment is a screening tool, and if needed, should be done at the initial screening point, rather than a follow up.</p> <p>Response: We thank the commenter for supporting the change to this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q134 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of the CMS Web Interface Specifications collection type. At § 414.1305, we proposed to modify the definition of the terms collection type and submission type by removing the CMS Web Interface Specifications as an available option starting with the 2023 payment year (85 FR</p>	

Category	Description
50290	<p>); however, the CMS Web Interface Measure Specifications collection type will be an available option for an extension of one additional year (2021 MIPS performance period/2023 MIPS payment year) and will be removed as a collection and submission type starting with the 2022 MIPS performance period/2024 MIPS payment year. None of the substantive changes above will be applied to the CMS Web Interface Measure Specifications for the 2021 MIPS performance period. The CMS Web Interface Measure Specifications for the 2021 MIPS performance period will reflect the 2020 CMS Web Interface Measure Specifications. For this measure, we note that 2020 CMS Web Interface Measure Specifications included the following change, Numerator/Numerator Codes/Numerator Drug Codes: Follow-up Plan (For Positive Screen) REMOVED ADDITIONAL_EVAL_CODE SNM. Such change is applicable for the 2021 MIPS performance period/2023 MIPS payment year given that the 2021 CMS Web Interface Measure Specifications reflect the 2020 CMS Web Interface Measure Specifications. Also, it should be noted that the CMS Web Interface Specifications collection type is not able to establish a benchmark for this measure. Thus, this measure will be excluded from the Merit-based Incentive Payment System (MIPS) scoring in accordance with § 414.1380(b)(1)(i)(A)(2)(i) provided that the measure meets the data completeness requirement and the data applicable to the measure is reported via the CMS Web Interface Measure Specifications.</p>

D.27 Melanoma: Continuity of Care – Recall System

Category	Description
NQF # / eCQM NQF #:	N/A/N/A
Quality#:	137
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients, regardless of age, with a current diagnosis of melanoma or a history of melanoma whose information was entered, at least once within a 12-month period, into a recall system that includes: <ul style="list-style-type: none"> • A target date for the next complete physical skin exam, AND • A process to follow up with patients who either did not make an appointment within the specified timeframe or who missed a scheduled appointment.
Substantive Change:	Updated denominator: Added telehealth as eligible encounter.
Steward:	American Academy of Dermatology
High Priority Measure:	Yes
Measure Type:	Structure
Rationale:	We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.
Comment: One commenter supported the addition of telehealth reporting for measure Q137.	
Response: We thank the commenter for supporting the addition of telehealth reporting for this measure.	
After consideration of public comments, we are finalizing the changes to measure Q137 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.28 Primary Open-Angle Glaucoma (POAG): Reduction of Intraocular Pressure (IOP) by 15% OR Documentation of a Plan of Care

Category	Description
NQF # / eCQM NQF #:	0563 / N/A
Quality#:	141
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of primary open-angle glaucoma (POAG) whose glaucoma treatment has not failed (the most recent IOP was reduced by at least 15% from the pre-intervention level) OR if the most recent IOP was not reduced by at least 15% from the pre-intervention level, a plan of care was documented within the 12-month performance period.
Substantive Change:	Modified collection type: MIPS CQMs Specifications
Steward:	American Academy of Ophthalmology
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale:	We proposed to remove the Medicare Part B Claims Measure Specifications as it shows very high performance year after year leaving little opportunity to drive improvement in quality outcomes. However, the benchmarking data continues to show a gap for the MIPS CQMs Specifications collection type, as such, the measure will be retained for this collection type.
<p>Comment: One commenter opposed CMS's proposal to remove the claims collection type from measure Q141. Removal of the measure from claims would adversely impact ophthalmologists, particularly those in small and rural practices who must rely on the claims reporting collection type because they cannot afford to adopt CEHRT. The commenter recognized that this measure is topped out under the claims collection type, but clinicians reporting these measures are already limited in the number of points they can receive for this measure.</p> <p>Response: We understand that ensuring there are measures available for small and rural practices is important; however, we strive to ensure that all measures align with the Meaningful Measures Initiative. After careful considerations, we will maintain the Medicare Part B Claims Measure Specifications collection type for consistency and stability as it is not extremely topped out and still in alignment with guidelines, but may consider removal in the future.</p> <p>After consideration of public comments, we are not finalizing the changes to measure Q141 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.29 Oncology: Medical and Radiation – Pain Intensity Quantified

Category	Description
NQF # / eCQM NQF #:	0384 / 0384c
Quality#:	143
CMS eCQM ID:	CMS157v9
National Quality Strategy Domain:	Person and Caregiver-Centered Experience and Outcomes
Current Collection Type:	eCQM Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patient visits, regardless of patient age, with a diagnosis of cancer currently receiving chemotherapy or radiation therapy in which pain intensity is quantified.
Substantive Change:	<p>Updated logic: For the eCQM Specifications collection type: Revised logic to limit the date range for chemotherapy administered within 31 days before and after the measurement period. Added definition: Chemotherapy within 30 days Prior and After the Measurement Period.</p> <p>The guidance is revised to read: For the eCQM Specifications collection type: This eCQM is an episode-of-care measure; the level of analysis for this measure is every visit for patients with a diagnosis of cancer who are also currently receiving chemotherapy or radiation therapy during the measurement period. For patients receiving radiation therapy, pain intensity should be quantified at each radiation treatment management encounter where the patient and physician have a face-to-face interaction. Due to the nature of some applicable coding related to radiation therapy (e.g., delivered in multiple fractions), the billing date for certain codes may or may not be the same as the face-to-face encounter date. In this instance, for the reporting purposes of this measure, the billing date should be used to pull the appropriate patients into the initial population. It is expected, though, that the numerator criteria would be performed at the time of the actual face-to-face encounter during the series of treatments. A lookback (retrospective) period of 7 days, including the billing date, may be used to identify the actual face-to-face encounter, which is required to assess the numerator. Therefore, pain intensity should be quantified during the face-to-face encounter occurring on the actual billing date or within the 6 days prior to the billing date. For patients receiving chemotherapy, pain intensity should be quantified at each face-to-face encounter with the physician while the patient is currently receiving chemotherapy. For purposes of identifying eligible encounters, patients "currently receiving chemotherapy" refers to patients administered chemotherapy within 30 days prior to the encounter AND administered chemotherapy within 30 days after the date of the encounter. Pain intensity should be quantified using a standard instrument, such as a 0-10 numerical rating scale, visual analog scale, a categorical scale, or pictorial scale. Examples include the Faces Pain Rating Scale and the Brief Pain Inventory (BPI). This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM.</p> <p>Updated Instructions: For the MIPS CQM Specifications collection type: Revised note to reflect both face-to-face and telehealth encounters are allowed.</p> <p>The denominator note is revised to read: For the MIPS CQMs Specifications collection type: For the reporting purposes for this measure, in instances where CPT code 77427 is reported, the billing date, which may or may not be the same date as the face-to-face or telehealth encounter with the physician, should be used to pull the appropriate patient population into the denominator. It is expected, though, that the numerator criteria would be performed at the time of the actual face-to-face or telehealth encounter during the series of treatments. A lookback (retrospective) period of 7 days, including the billing date, may be used to identify the actual face-to-face or telehealth encounter, which is required to assess the numerator. Therefore, pain intensity should be quantified during the face-to-face or telehealth encounter occurring on the actual billing date or within the 6 days prior to the billing date.</p> <p>Updated denominator: For all collection types: Added telehealth as eligible encounter.</p>
Steward:	American Society of Clinical Oncology
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	<p>We proposed to update the logic within the eCQM Specifications collection type to limit the range of time for chemotherapy procedures to only capture the chemotherapy procedures that satisfy the measure requirements. This will decrease implementation burden for some MIPS eligible clinicians while improving reporting capabilities for some practices. Additionally, the eCQM Specifications and MIPS CQMs Specifications collection types the guidance/denominator note was proposed to be revised to allow for a lookback period when utilizing CPT codes that may not have the same billing and encounter date. This will align more closely with actual clinical workflow and encounter billing practices.</p> <p>We proposed to add telehealth encounters as denominator eligible for submission criteria 1 as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</p>
<p>Comment: One commenter indicated that the rationale included in the 2021 PFS proposed rule for Table D.29 should be corrected to read: "We propose to add telehealth encounters as denominator eligible for submission criteria 1 and 2 as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured." Another commenter supported the addition of telehealth reporting for this measure.</p> <p>Response: We thank the commenter for their comment regarding telehealth for measure Q143. As currently specified for PY 2020, the measure allows for telehealth visits for denominator submission criteria two, but contains a telehealth exclusion for denominator submission criteria one. For PY2021, we proposed to allow for telehealth as an eligible encounter for submission criteria one so both submission criteria will allow for telehealth encounters to ensure a complete patient population is captured for assessment of the quality action.</p> <p>Comment: One commenter supported the proposed changes to measure Q143, which ensure pain assessment and subsequent management is incorporated into virtual health care and align with current cancer care guidelines. It is critical to account for the growing need and utilization of virtual care, and the variety providers qualified to conduct these visits, including advanced practice providers.</p>	

Category	Description
Response: We thank the commenter for supporting the changes to this measure.	
After consideration of public comments, we are finalizing the changes to measure Q143 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.30 Oncology: Medical and Radiation - Plan of Care for Pain

Category	Description
NQF # / eCQM NQF #:	0383 / N/A
Quality#:	144
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Person and Caregiver-Centered Experience and Outcomes
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of visits for patients, regardless of age, with a diagnosis of cancer currently receiving chemotherapy or radiation therapy who report having pain with a documented plan of care to address pain.
Substantive Change:	<p>Updated instructions: Added: THERE ARE TWO SUBMISSION CRITERIA FOR THIS MEASURE: 1) All visits for patients, regardless of age, with a diagnosis of cancer currently receiving chemotherapy who report having pain OR 2) All visits for patients, regardless of age, with a diagnosis of cancer currently receiving radiation therapy who report having pain</p> <p>The denominator is revised to read: Submission Criteria 1: All visits for patients, regardless of age, with a diagnosis of cancer currently receiving chemotherapy who reporting having pain Denominator (Submission Criteria 1): All visits for patients, regardless of age, with a diagnosis of cancer currently receiving chemotherapy who report having pain Submission Criteria 2: All visits for patients, regardless of age, with a diagnosis of cancer currently receiving radiation therapy who report having pain Denominator (Submission Criteria 2): All visits for patients, regardless of age, with a diagnosis of cancer currently receiving radiation therapy who report having pain</p> <p>Updated denominator: For all collection types: Added telehealth as eligible encounter.</p> <p>Updated denominator criteria: Revised: Submission Criteria One</p> <ul style="list-style-type: none"> Removed coding for radiation therapy <p>Submission Criteria Two</p> <ul style="list-style-type: none"> Added coding for cancer diagnosis Added coding for patient procedure <p>Updated denominator note: For Submission Criteria Two: Added: For the reporting purposes of this measure, in instances where CPT code 77427 is reported, the billing date, which may or may not be the same date as the face-to-face or telehealth encounter with the physician, should be used to pull the appropriate patient population into the denominator. It is expected, though, that the numerator criteria would be performed at the time of the actual face-to-face encounter during the series of treatments.</p> <p>The numerator is revised to read: NUMERATOR (SUBMISSION CRITERIA 1): Patient visits that included a documented plan of care to address pain. NUMERATOR (SUBMISSION CRITERIA 2): Patient visits that included a documented plan of care to address pain.</p> <p>Updated numerator instructions: For Submission Criteria Two: Added: A documented plan of care may include: use of opioids, nonopioid analgesics, psychological support, patient and/or family education, referral to a pain clinic, or reassessment of pain at an appropriate time interval.</p> <p>Updated numerator options: For Submission Criteria Two: Added: Performance Met: Plan of care to address pain documented Performance Not Met: Plan of care for pain not documented, reason not otherwise specified</p>
Steward:	American Society of Clinical Oncology
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	<p>We proposed to separate the measure into two submission criteria based upon treatment to add clarity based on stakeholder feedback. This also aligns the measure with the format of measure Q143: Oncology: Medical and Radiation – Pain Intensity Quantified. The patient procedure coding was updated to ensure only coding applicable to the updated submission criteria is included within the denominator criteria.</p> <p>We proposed to add telehealth encounters as denominator eligible for submission criteria 1 as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</p>
<p>We proposed a substantive change to the denominator note for submission criteria two; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state: For the reporting purposes of this measure, in instances where CPT code 77427 is reported, the billing date, which may or may not be the same date as the face-to-face or telehealth encounter with the physician, should be used to pull the appropriate patient population into the denominator. It is expected, though, that the numerator criteria would be performed at the time of the actual face-to-face or telehealth encounter during the series of treatments.</p> <p>This additional refinement of the addition of ‘or telehealth’ in the final sentence does not affect the intent of the proposed substantive change, but clarifies and aligns with the other revisions.</p> <p>Comment: One commenter indicated that the rationale included in the 2021 PFS proposed rule for Table D.30 should be corrected to read: “We propose to add</p>	

Category	Description
	<p>telehealth encounters as denominator eligible for submission criteria 1 and 2 as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.” Another commenter supported telehealth reporting for this measure.</p> <p>Response: We thank the commenter for their comment regarding telehealth for measure Q144. As currently specified for PY 2020, the measure allows for telehealth visits for all procedural codes, but contains a telehealth exclusion for patient encounters associated with the chemotherapy patient population. For PY2021, we proposed to allow for telehealth as an eligible encounter for submission criteria one, which is those patients who are receiving chemotherapy and the only criteria for a patient encounter, so both submission criteria will allow for any available telehealth encounters and procedures, to ensure a complete patient population is captured for assessment of the quality action.</p> <p>Comment: One commenter supported the proposed changes to measure Q144, which ensures pain assessment and subsequent management is incorporated into virtual health care and align with current cancer care guidelines. It is critical to account for the growing need and utilization of virtual care, and the variety of providers qualified to conduct these visits, including advanced practice providers.</p> <p>Response: We thank the commenter for supporting the changes to this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q144 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>

D.31 Radiology: Exposure Dose Indices or Exposure Time and Number of Images Reported for Procedures Using Fluoroscopy

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	145
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Patient Safety
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Final reports for procedures using fluoroscopy that document radiation exposure indices, or exposure time and number of fluorographic images (if radiation exposure indices are not available).
Substantive Change:	Updated numerator instructions: For all collection types: Added: Documentation: Information populating the final report may reside in a dedicated field in the electronic health record (EHR) or picture archiving and communication system (PACS), however fluoroscopy exposure dose or time should be included in the final report to be readily accessible in all circumstances.
Steward:	American College of Radiology
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to update the denominator criteria encounter coding to ensure that all of the codes are associated with fluoroscopy and to create a more complete patient population. Additionally, we proposed to add numerator instructions to further clarify how the fluoroscopy information should be recorded in the final report to be numerator compliant and meet the intent of the measure.
We proposed a substantive change to the numerator instructions; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state: Documentation: Information populating the final report may reside in a dedicated field in the electronic health record (EHR) or picture archiving and communication system (PACS), however fluoroscopy exposure dose or time should be included in the final report in order to be readily accessible in all circumstances. This additional refinement does not affect the intent of the proposed substantive change.	
Comment: One commenter recognized the changes to measure Q145 without issue. A second commenter supported the changes as they better fit the intent of the measure and will lessen clinical burden to some extent.	
Response: We thank the commenters for supporting the changes to this measure.	
After consideration of public comments, we are finalizing the changes to measure Q145 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.32 Nuclear Medicine: Correlation with Existing Imaging Studies for All Patients Undergoing Bone Scintigraphy

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	147
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of final reports for all patients, regardless of age, undergoing bone scintigraphy that include physician documentation of correlation with existing relevant imaging studies (e.g., x-ray, Magnetic Resonance Imaging (MRI), Computed Tomography (CT), etc.) that were performed.
Substantive Change:	The denominator is revised to read: For all collection types: All final reports for patients, regardless of age, undergoing bone planar and whole body scintigraphy.
Steward:	Society of Nuclear Medicine and Molecular Imaging
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to update the denominator to account for encounter codes that can be utilized for imaging other than bone scintigraphy. This will narrow the eligible patient population to those using bone imaging agents and only assess MIPS eligible clinicians that are relevant to this measure's intent.
Comment: One commenter supported the changes to measure Q147 as they better fit the intent of this measure and will lessen clinical burden to some extent.	
Response: We thank the commenter for supporting the changes to this measure.	
After consideration of public comments, we are finalizing the changes to measure Q147 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.33 Rheumatoid Arthritis (RA): Tuberculosis Screening

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	176
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of rheumatoid arthritis (RA) who have documentation of a tuberculosis (TB) screening performed and results interpreted within 12 months prior to receiving a first course of therapy using a biologic disease-modifying anti-rheumatic drug (DMARD).
Substantive Change:	<p>The title is revised from 'Rheumatoid Arthritis (RA): Tuberculosis Screening' to: Tuberculosis Screening Prior to First Course Biologic Therapy</p> <p>The description is revised to read: If a patient has been newly prescribed a biologic disease-modifying anti-rheumatic drug (DMARD) therapy, then the medical record should indicate TB testing in the preceding 12-month period.</p> <p>The instructions are revised to read: This measure is to be submitted a minimum of once per performance period for patients who are being considered or prescribed a first course of biologic disease-modifying anti-rheumatic drug therapy seen during the performance period. This measure may be submitted by Merit-based Incentive Payment System (MIPS) eligible clinicians who perform the quality actions described in the measure based on the services provided and the measure-specific denominator coding.</p> <p>The denominator is revised to read: All patients aged 18 years and older who are receiving a first course of therapy using a biologic DMARD.</p> <p>The denominator instructions are updated to read: Patients are considered to be receiving a first course of therapy using a biologic DMARD only if they have been prescribed DMARD biologic therapy during the measurement period and were not prescribed DMARD biologic therapy in the 12 months preceding the encounter where DMARD biologic therapy was newly started. Biologic DMARD therapy includes:-Abatacept (Orencia) -Adalimumab (HUMIRA) -Anakinra (Kineret) -Baricitinib (Olumiant) -Canakinumab (ILARIS) -Certolizumab pegol and lyophilized certolizumab pegol (CIMZIA) -Denosumab (Prolia) -Etanercept (Enbrel) -Golimumab (Simponi) -Infliximab (REMICADE) -Infliximab-dyyb (Inflectra) -Infliximab-abda (Renflexis) -Sarilumab (KEVZARA) -Secukinumab (Cosentyx) -Tocilizumab (ACTEMRA) -Tofacitinib (XELJANZ) -Ustekinumab (STELARA) The list of biologic DMARD therapies is subject to change as new therapies are approved by the FDA.</p> <p>Updated denominator criteria: Removed: 'Diagnosis for RA' criteria Revised: Patient receiving first-time biologic disease modifying anti-rheumatic drug therapy</p> <p>Updated denominator: Added telehealth as eligible encounter.</p> <p>The numerator is revised to read: Patients for whom any record of TB testing is documented or performed (PPD, IFN-gamma release assays, or other appropriate method) in the medical record in the 12 months preceding the biologic prescription.</p> <p>Updated numerator definition: Removed 'Biologic DMARD Therapy' definition.</p> <p>Updated numerator options: Revised: Performance Met: TB screening performed and results interpreted within 12 months prior to initiation of first-time biologic disease modifying anti-rheumatic drug therapy.</p>
Steward:	American College of Rheumatology
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed to expand the measure to remove disease specificity from the measure to assess all patients prescribed a first course biologic DMARD therapy. This will expand monitoring of patient safety guidance compliance to all patients initiating DMARD therapy. The language throughout the measure has been updated to align with the change in patient population.</p> <p>We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</p> <p>We proposed a substantive change to the denominator instructions; however, during review of this proposed substantive change, there was additional language refinement. Therefore, we are finalizing the substantive change to state: Patients are considered to be receiving a first course of therapy using a biologic DMARD only if they have been prescribed DMARD biologic therapy during the measurement period and were not prescribed DMARD biologic therapy in the 12 months preceding the encounter where DMARD biologic therapy was newly started. Biologic DMARD therapy includes:-Abatacept (Orencia) -Adalimumab (HUMIRA) -Anakinra (Kineret) -Baricitinib (Olumiant) -Canakinumab (ILARIS) -Certolizumab pegol and lyophilized certolizumab pegol (CIMZIA) -Etanercept (Enbrel) -Golimumab (Simponi) -Infliximab (REMICADE) -Infliximab-dyyb (Inflectra) -Infliximab-abda (Renflexis) -Sarilumab (KEVZARA) -Secukinumab (Cosentyx) -Tocilizumab (ACTEMRA) -Tofacitinib (XELJANZ) -Ustekinumab (STELARA) The list of biologic DMARD therapies is subject to change as new therapies are approved by the FDA. This refinement removes the medication Denosumab (Prolia) from the list of biological DMARD therapies as it is not necessary to complete a TB test prior to use of this medication. Inclusion of this medication would be in contradiction of current medical guidelines and would subject patients to unnecessary testing, with potential of deleterious effects, while creating additional and unnecessary costs. It is for these reasons that we feel Denosumab (Prolia) must be removed as patient safety and making care affordable are healthcare priorities.</p> <p>Comment: One commenter supported the addition of telehealth reporting for measure Q176.</p> <p>Response: We thank the commenter for supporting the addition of telehealth reporting for this measure.</p>

Category	Description
	<p>Comment: Several commenters opposed the removal of measure Q337: Psoriasis: Tuberculosis (TB) Prevention for Patients with Psoriasis, Psoriatic Arthritis and Rheumatoid Arthritis on a Biological Immune Response Modifier as stated under Table C.6. The proposed update to measure Q176 would mean the denominator population would overlap with measure Q337. Instead of the measure being specific to rheumatoid arthritis (measure Q176) or psoriasis patients (measure Q337), it looks to assess all patients prescribed a first course biologic DMARD therapy. The commenters stated that the revision to measure Q176 does not sufficiently cover the patients that dermatologist treat or the medications that are used, as are currently reported under measure Q337.</p> <p>Response: After consideration of public comments, we are no longer finalizing the removal of measure Q337. See Table C.6 of the final rule for further information. We encourage the commenters to reach out to the measure steward to work towards possible revisions in an effort to develop a unified measure reflecting a broader patient population and more inclusive medication therapy for possible future implementation.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q176 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>

D.34 Rheumatoid Arthritis (RA): Functional Status Assessment

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	178
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of rheumatoid arthritis (RA) for whom a functional status assessment was performed at least once within 12 months.
Substantive Change:	Updated denominator: Added telehealth as eligible encounter.
Steward:	American College of Rheumatology
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.
<p>Comment: Several commenter supported the addition of telehealth reporting for measure Q178.</p> <p>Response: We thank the commenters for supporting the addition of telehealth reporting for this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q178 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.35 Rheumatoid Arthritis (RA): Glucocorticoid Management

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	180
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of rheumatoid arthritis (RA) who have been assessed for glucocorticoid use and, for those on prolonged doses of prednisone > 5 mg daily (or equivalent) with improvement or no change in disease activity, documentation of glucocorticoid management plan within 12 months.
Substantive Change:	Updated denominator: Added telehealth as eligible encounter.
Steward:	American College of Rheumatology
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.
Comment: One commenter supported the addition of telehealth reporting for measure Q180.	
Response: We thank the commenter for supporting the addition of telehealth reporting for this measure.	
After consideration of public comments, we are finalizing the changes to measure Q180 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.36 Elder Maltreatment Screen and Follow-Up Plan

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	181
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Patient Safety
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 65 years and older with a documented elder maltreatment screen using an Elder Maltreatment Screening tool on the date of encounter AND a documented follow-up plan on the date of the positive screen.
Substantive Change:	Updated denominator: For all collection types: Added care management services.
Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to add coding applicable to chronic care management services as these capture encounters where screening may occur and is an appropriate patient population for this measure.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q181 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.37 Functional Outcome Assessment

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	182
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of visits for patients aged 18 years and older with documentation of a current functional outcome assessment using a standardized functional outcome assessment tool on the date of the encounter AND documentation of a care plan based on identified functional outcome deficiencies on the date of the identified deficiencies.
Substantive Change:	<p>Updated denominator: For all collection types: Added home health and domiciliary/rest home settings.</p> <p>The numerator note is revised to read: For all collection types: The intent of this measure is for a functional outcome assessment tool to be utilized at a minimum of every 30 days but submission is only required at each qualifying encounter due to coding limitations. Therefore, for visits occurring within 30 days of a previously documented functional outcome assessment, the numerator quality-data code G8942 should be used for submission purposes.</p> <p>Updated numerator definition: For all collection types: Revised: Current (Functional Outcome Assessment) – A patient having a documented functional outcome assessment utilizing a standardized tool and a care plan if indicated at a qualifying encounter within the previous 30 days.</p>
Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to add the home health and domiciliary/rest home settings as denominator eligible settings as functional assessments may occur at these visits and would lead to a more complete denominator eligible patient population. Additionally, we proposed to update the definition for 'Current (Functional Outcome Assessment)' and the numerator note to clarify the measure intent, which is to only report for qualifying encounters and not each visit.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q182 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.38 Cataracts: 20/40 or Better Visual Acuity within 90 Days Following Cataract Surgery

Category	Description
NQF # / eCQM NQF #:	0565 / 0565e
Quality#:	191
CMS eCQM ID:	CMS133v9
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	eCQM Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of cataract surgeries for patients aged 18 years and older with a diagnosis of uncomplicated cataract and no significant ocular conditions impacting the visual outcome of surgery and had best-corrected visual acuity of 20/40 or better (distance or near) achieved in the operative eye within 90 days following the cataract surgery.
Substantive Change:	Updated numerator: For the eCQM Specifications collection type: Added data element: "Best Corrected Visual Acuity Exam Using Snellen Chart" (2.16.840.1.113883.3.526.3.1560)
Steward:	American Academy of Ophthalmology
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale:	For the eCQM Specifications collection type, we proposed to add a data element for "Best Corrected Visual Acuity Exam Using Snellen Chart" allowing an alternative method to capture an exam commonly used in clinical practice that may not have been accurately captured prior. This added numerator compliant option is clinically in line with the measure intent and appropriate for inclusion.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q191 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.39 Radiology: Stenosis Measurement in Carotid Imaging Reports

Category	Description
NQF # / eCQM NQF #:	0507 / N/A
Quality#:	195
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of final reports for carotid imaging studies (neck magnetic resonance angiography [MRA], neck computed tomography angiography [CTA], neck duplex ultrasound, carotid angiogram) performed that include direct or indirect reference to measurements of distal internal carotid diameter as the denominator for stenosis measurement.
Substantive Change:	<p>The instructions are revised to read: For all collection types: This measure is to be submitted each time a carotid imaging study is performed during the performance period for patients aged 18 years and older during the submission period. There is no diagnosis associated with this measure. Merit-based Incentive Payment System (MIPS) eligible clinicians who provide the professional component of diagnostic imaging studies of the carotids will submit this measure.</p> <p>The denominator is revised to read: For all collection types: All final reports for carotid imaging studies (neck MR angiography [MRA], neck CT angiography [CTA], neck duplex ultrasound, carotid angiogram) performed on patients aged 18 years and older during the submission period.</p> <p>Updated denominator criteria: For all collection types: Added: Patients aged ≥ 18 years on date of encounter.</p>
Steward:	American College of Radiology
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to update the measure's eligible patient population to include only patients aged 18 years and older. This will allow for closer monitoring regarding who is eligible and more appropriate for inclusion in the eligible patient population, which will decrease overall burden for the clinicians reporting this measure.
<p>Comment: One commenter recognized the changes to measure Q195 without issue. A second commenter supported the changes to this measure as they better fit the intent of this measure and will lessen clinical burden to some extent.</p> <p>Response: We thank the commenters for supporting the changes to this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q195 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.40 Functional Status Change for Patients with Knee Impairments

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	217
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	A patient-reported outcome measure of risk-adjusted change in functional status for patients aged 14 years+ with knee impairments. The change in functional status (FS) is assessed using the Knee FS patient-reported outcome measure (PROM) (©2009-2019 Focus on Therapeutic Outcomes, Inc.). The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static measure).
Substantive Change:	<p>The description is revised to read: A patient-reported outcome measure of risk-adjusted change in functional status for patients aged 14 years+ with knee impairments. The change in functional status (FS) is assessed using the FOTO Lower Extremity Physical Function (LEPF) patient-reported outcome measure (PROM). The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician level, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static measure).</p> <p>Updated definition: Revised: Encounter – A visit between the patient and the provider for the purpose of assessing and/or improving a functional deficit.</p> <p>Updated denominator exclusion: Revised: Patient unable to complete the LEPF PROM at Initial Evaluation and/or Discharge due to blindness, illiteracy, severe mental incapacity or language incompatibility and an adequate proxy is not available.</p> <p>The numerator is revised to read: Patients who were presented with the LEPF PROM at Initial Evaluation (Intake) and at or near Discharge (Status) for the purpose of calculating the patient's Risk-Adjusted Functional Status Change Residual Score.</p> <p>Updated denominator exception: Revised:</p> <ol style="list-style-type: none"> 1. Ongoing care not clinically indicated because the patient needed a home program only, referral to another provider or facility, or consultation only, as documented in the medical record. 2. Ongoing care not medically possible because the patient was discharged early due to specific medical events, documented in the medical record, such as the patient became hospitalized or scheduled for surgery. 3. Ongoing care not possible because the patient self-discharged early (e.g., financial or insurance reasons, transportation problems, or reason unknown). <p>Updated numerator options: Revised: Performance Not Met: Risk-Adjusted Functional Status Change Residual Score for the knee impairment not measured because the patient did not complete the LEPF PROM at Initial Evaluation and/or near Discharge, reason not given.</p>
Steward:	Focus on Therapeutic Outcomes, Inc.
High Priority Measure:	Yes
Measure Type:	Patient Reported Outcome
Rationale:	We proposed to update the description, denominator exclusion, numerator statement, and numerator options to reflect the change in functional assessment tool, Knee FS PROM to the LEPF PROM. The assessment is being revised to address scientific updates and maintenance necessary for item-response theory based outcome measures. We proposed to update the denominator exception language to add clarity and better align with measure's intent.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q217 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.41 Functional Status Change for Patients with Hip Impairments

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	218
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	A patient-reported outcome measure of risk-adjusted change in functional status for patients 14 years+ with hip impairments. The change in functional status (FS) is assessed using the Hip FS patient-reported outcome measure (PROM) (©2009-2019 Focus on Therapeutic Outcomes, Inc.). The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static measure).
Substantive Change:	<p>The description is revised to read: A patient-reported outcome measure of risk-adjusted change in functional status for patients 14 years+ with hip impairments. The change in functional status (FS) is assessed using the FOTO Lower Extremity Physical Function (LEPF) patient-reported outcome measure (PROM). The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician level, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static measure).</p> <p>Updated definition: Revised: Encounter – A visit between the patient and the provider for the purpose of assessing and/or improving a functional deficit.</p> <p>Updated denominator exclusion: Revised: Patient unable to complete the LEPF PROM at Initial Evaluation and/or Discharge due to blindness, illiteracy, severe mental incapacity or language incompatibility and an adequate proxy is not available.</p> <p>The numerator is revised to read: Patients who were presented with the LEPF PROM at Initial Evaluation (Intake) and at or near Discharge (Status) for the purpose of calculating the patient's Risk-Adjusted Functional Status Change Residual Score.</p> <p>Updated denominator exception: Revised: 1. Ongoing care not clinically indicated because the patient needed a home program only, referral to another provider or facility, or consultation only, as documented in the medical record. 2. Ongoing care not medically possible because the patient was discharged early due to specific medical events, documented in the medical record, such as the patient became hospitalized or scheduled for surgery. 3. Ongoing care not possible because the patient self-discharged early (e.g., financial or insurance reasons, transportation problems, or reason unknown).</p> <p>Updated numerator options: Revised: Performance Not Met: Risk-Adjusted Functional Status Change Residual Score for the hip impairment not measured because the patient did not complete the LEPF PROM at Initial Evaluation and/or near discharge, reason not given.</p>
Steward:	Focus on Therapeutic Outcomes, Inc.
High Priority Measure:	Yes
Measure Type:	Patient Reported Outcome
Rationale:	We proposed to update the description, denominator exclusion, numerator statement, and numerator options to reflect the change in functional assessment tool, Hip FS PROM to the LEPF PROM. The assessment is being revised to address scientific updates and maintenance necessary for item-response theory based outcome measures. We proposed to update the denominator exception language to add clarity and better align with measure's intent.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q218 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.42 Functional Status Change for Patients with Lower Leg, Foot or Ankle Impairments

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	219
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	A patient-reported outcome measure of risk-adjusted change in functional status for patients 14 years+ with foot, ankle and lower leg impairments. The change in functional status (FS) is assessed using the Foot/Ankle FS patient-reported outcome measure (PROM) (©2009-2019 Focus on Therapeutic Outcomes, Inc.). The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static measure).
Substantive Change:	<p>The description is revised to read: A patient-reported outcome measure of risk-adjusted change in functional status for patients 14 years+ with foot, ankle and lower leg impairments. The change in functional status (FS) is assessed using the FOTO Lower Extremity Physical Function (LEPF) patient-reported outcome measure (PROM). The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician level, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static measure).</p> <p>Updated definition: Revised: Encounter – A visit between the patient and the provider for the purpose of assessing and/or improving a functional deficit.</p> <p>Updated denominator criteria: Revised ICD-10 coding for ‘With a lower leg, foot, or ankle impairment and/or diagnosis pertaining to a functional deficit affecting lower leg, foot, or ankle’.</p> <p>Updated denominator exclusion: Revised: Patient unable to complete the LEPF PROM at Initial Evaluation and/or Discharge due to blindness, illiteracy, severe mental incapacity or language incompatibility and an adequate proxy is not available.</p> <p>The numerator is revised to read: Patients who were presented with the LEPF PROM at Initial Evaluation (Intake) and at or near Discharge (Status) for the purpose of calculating the patient’s Risk-Adjusted Functional Status Change Residual Score.</p> <p>Updated denominator exception: Revised: 1. Ongoing care not clinically indicated because the patient needed a home program only, referral to another provider or facility, or consultation only, as documented in the medical record. 2. Ongoing care not possible because the patient self-discharged early (e.g., financial or insurance reasons, transportation problems, or reason unknown).</p> <p>Updated numerator options: Revised: Performance Not Met: Risk-Adjusted Functional Status Change Residual Score for the lower leg, foot or ankle impairment not measured because the patient did not complete the LEPF PROM at Initial Evaluation and/or near discharge, reason not given.</p>
Steward:	Focus on Therapeutic Outcomes, Inc.
High Priority Measure:	Yes
Measure Type:	Patient Reported Outcome
Rationale:	We proposed to update the description, denominator exclusion, numerator statement, and numerator options to reflect the change in functional assessment tool, Hip FS PROM to the LEPF PROM. The assessment is being revised to address scientific updates and maintenance necessary for item-response theory based outcome measures. We proposed to update the denominator exception language to add clarity and better align with measure’s intent. Additionally, we proposed to update the ICD-10 coding related to the denominator criteria statement, ‘With a lower leg, foot, or ankle impairment and/or diagnosis pertaining to a functional deficit affecting lower leg, foot, or ankle,’ to align with current coding.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q219 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.43 Functional Status Change for Patients with Low Back Impairments

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	220
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	A patient-reported outcome measure of risk-adjusted change in functional status for patients 14 years+ with low back impairments. The change in functional status (FS) is assessed using the Low Back FS patient-reported outcome measure (PROM) (©2009-2019 Focus on Therapeutic Outcomes, Inc.). The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static measure).
Substantive Change:	<p>The description is revised to read: A patient-reported outcome measure of risk-adjusted change in functional status for patients 14 years+ with low back impairments. The change in functional status (FS) is assessed using the FOTO Low Back FS patient-reported outcome measure (PROM). The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient level, at the individual clinician level, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static measure).</p> <p>Updated definition: Revised: Encounter – A visit between the patient and the provider for the purpose of assessing and/or improving a functional deficit.</p> <p>Updated denominator exception: Revised:</p> <ol style="list-style-type: none"> 1. Rationale:	We proposed to refine the description for easier readability. We proposed to update the denominator exception language to add clarity and better align and communicate the measure's intent.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q222 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.46 Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention

Category	Description
NQF # / eCQM NQF #:	0028 / 0028e
Quality#:	226
CMS eCQM ID:	CMS138v9
National Quality Strategy Domain:	Community/Population Health
Current Collection Type:	Medicare Part B Claims Measure Specifications, eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	<p>Percentage of patients aged 18 years and older who were screened for tobacco use one or more times within 24 months AND who received tobacco cessation intervention if identified as a tobacco user</p> <p>a. Percentage of patients aged 18 years and older who were screened for tobacco use one or more times within 24 months.</p> <p>b. Percentage of patients aged 18 years and older who were identified as a tobacco user who received tobacco cessation intervention.</p> <p>c. Percentage of patients aged 18 years and older who were screened for tobacco use one or more times within 24 months AND who received tobacco cessation intervention if identified as a tobacco user.</p>
Substantive Change:	<p>Modified collection type: Medicare Part B Claims Measure Specifications, eCQM Specifications, and MIPS CQMs Specifications.</p> <p>The description is revised to read: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Percentage of patients aged 18 years and older who were screened for tobacco use one or more times within 12 months AND who received tobacco cessation intervention if identified as a tobacco user.</p> <p>The description is revised to read: For the eCQM Specifications collection type: Percentage of patients aged 18 years and older who were screened for tobacco use one or more times within 12 months AND who received tobacco cessation intervention if identified as a tobacco user.</p> <p>Three rates are reported:</p> <p>a. Percentage of patients aged 18 years and older who were screened for tobacco use one or more times within 12 months</p> <p>b. Percentage of patients aged 18 years and older who were identified as a tobacco user who received tobacco cessation intervention</p> <p>c. Percentage of patients aged 18 years and older who were screened for tobacco use one or more times within 12 months AND who received tobacco cessation intervention if identified as a tobacco user</p> <p>Updated instructions: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Revised the language to reflect a 12-month timeframe for the look back period and assessment of clinical quality action.</p> <p>Updated guidance: For the eCQM Specifications collection type: Revised: To satisfy the intent of this measure, a patient must have at least one tobacco use screening during the 12-month period. If a patient has multiple tobacco use screenings during the 12-month period, only the most recent screening, which has a documented status of tobacco user or tobacco non-user, will be used to satisfy the measure requirements.</p> <p>Added:</p> <p>To promote a team-based approach to patient care, the tobacco cessation intervention can be performed by another healthcare provider; therefore, the tobacco use screening and tobacco cessation intervention do not need to be performed by the same provider or clinician.</p> <p>Updated denominator: For all collection types: Added Physical Therapy MIPS eligible clinician and telehealth as eligible encounters for all submission criteria.</p> <p>Updated denominator exception: For eCQM Specifications collection type: Removed coding from the 'Medical Reason' value set for concepts not indicating medical contraindication.</p> <p>Updated logic: For the eCQM Specifications collection type: Revised to reflect a 12-month timeframe for the look back period and assessment of clinical quality action.</p> <p>Updated numerator: For the eCQM Specifications collection type: Revised to reflect a 12-month timeframe for the look back period and assessment of clinical quality action. Additionally, revised the logic to unlink the intervention from having to occur after the tobacco user status.</p> <p>Updated numerator: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Revised to reflect a 12-month timeframe for the look back period and assessment of clinical quality action.</p> <p>Updated numerator note: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Revised to reflect a 12-month timeframe for the look back period and assessment of clinical quality action.</p>
Steward:	National Committee for Quality Assurance
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed to revise the measure to shorten the look back period to 12 months and require that tobacco screening and cessation, if patient screened positive, occur every 12 months. The revision is based upon stakeholder feedback, input from the eCQM clinical review process, and the measure steward's technical expert panel (TEP). We agreed that it is important to do this annually as tobacco use is an important population health concern and smoking is the leading cause of preventable death (https://www.cdc.gov/tobacco/data_statistics/fact_sheets/index.htm). The language throughout the measure specification is being</p>

Category	Description
	<p>revised to reflect this update. Additionally, we proposed to add physical therapy MIPS eligible clinicians to the denominator eligible encounters as this is applicable to their scope of practice.</p> <p>For the eCQM Specifications collection type we proposed to unlink the intervention from having to occur after the tobacco status within the measure logic. This revision is better aligned with the clinical reality that for patients actively trying to quit a plan will be in place and further tobacco cessation intervention is redundant, as well as lessening the burden of clinicians, especially for those patients who are not planning on quitting. The measure steward updated the guidance statement based upon technical expert feedback to reflect that team-based care would be appropriate for this measure. We agreed that this guidance update is clinically appropriate and aligns better with clinical care workflows. Additionally, we proposed to revise the 'Medical Reason' value set based upon expert and stakeholder feedback to remove codes based upon intent of concepts which do not indicate a medical contraindication, but rather a provider decision to discontinue or adjust a course of treatment. These codes do not meet the intent of the denominator exception.</p> <p>We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</p> <p>We proposed to remove the CMS Web Interface Measure Specifications collection type. This collection type was proposed to be sunset for the purposes of MIPS starting with the 2021 performance year. We have determined it is not fiscally viable, feasible, or sustainable for MIPS to continue this collection type/submission type due to an 80 percent reduction and a continued decrease in interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures. For further rationale, please see section IV.A.3.c.(1)(c) of this final rule.</p> <p>In the event the proposed substantive change(s) were finalized, the substantive changes would not allow for a direct comparison of performance data from prior years to performance data submitted after the implementation of these substantive changes.</p>
<p>Comment: One commenter supported the update of the denominator to add physical therapy MIPS-eligible clinicians and telehealth as eligible encounters for measure Q226. Multiple commenters supported the addition of telehealth reporting for this measure.</p> <p>Response: We thank the commenters for supporting adding physical therapists to this measure and for supporting the adding telehealth as eligible encounters.</p> <p>Comment: One commenter greatly appreciated the numerator change to tobacco cessation for eCQMs, specifically the language "Additionally, revised the logic to unlink the intervention from having to occur after the tobacco user status."</p> <p>Response: We thank the commenter for supporting this change to the numerator language for eCQMs.</p> <p>Comment: One commenter agreed, and one commenter disagreed with the proposal to shorten the lookback period for evidence of tobacco use screening from 24 to 12 months. The vast majority of smokers pick up the habit before age 18. Consequently, while tobacco screening and intervention should – of necessity – be more frequent in the years of patient adolescence and young adulthood, there is little evidence to indicate more frequent screening is warranted in older adults. The commenter preferred that the lookback period stay at 24 months. An alternative – though admittedly a burdensome one – is for the lookback period to vary by age to account for clinical realities.</p> <p>Response: We thank the commenters for their comments. The U.S. Preventive Services Task Force indicated that "Tobacco use is the leading preventable cause of disease, disability, and death in the United States. Cigarette smoking results in more than 480,000 premature deaths each year and accounts for approximately 1 in every 5 deaths". Due to the harmful effect tobacco use can have on patients' health, we believe that clinicians should engage with their patients to screen for tobacco use and, if positive, provide tobacco cessation counseling annually.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q226 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of the CMS Web Interface Specifications collection type. At § 414.1305, we proposed to modify the definition of the terms collection type and submission type by removing the CMS Web Interface Specifications as an available option starting with the 2023 payment year (85 FR 50290); however, the CMS Web Interface Measure Specifications collection type will be an available option for an extension of one additional year (2021 MIPS performance period/2023 MIPS payment year) and will be removed as a collection and submission type starting with the 2022 MIPS performance period/2024 MIPS payment year. None of the substantive changes above will be applied to the CMS Web Interface Measure Specifications for the 2021 MIPS performance period. The CMS Web Interface Specifications for the 2021 MIPS performance period will reflect the 2020 CMS Web Interface Specifications. In addition, we are not finalizing the proposed additional telehealth encounter eligibility substantive change for the eCQM Specifications collection type because this is already specified in the current measure.</p>	

D.47 Controlling High Blood Pressure

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	236
CMS eCQM ID:	CMS165v9
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	Medicare Part B Claims Measure Specifications, eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients 18-85 years of age who had a diagnosis of hypertension overlapping the measurement period and whose most recent blood pressure was adequately controlled (<140/90mmHg) during the measurement period.
Substantive Change:	<p>Modified collection type: Medicare Part B Claims Measure Specifications, eCQM Specification and MIPS CQMs Specifications</p> <p>Updated denominator note: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Added: The diagnosis of essential hypertension must be present sometime between 1 year prior to the measurement period and before the end of the measurement period (January 1, 2020 through December 31, 2021).</p> <p>Updated denominator exclusion: For the eCQM Specification collection type: Revised: Exclude patients 66 and older who are living long term in an institution for more than 90 consecutive days during the measurement period.</p> <p>Updated denominator exclusion logic: For the eCQM Specifications collection type: Updated encounters so they are "on or" before the end of the measurement period. Updated the LTI exclusion to be 90 consecutive days. Changed the name of the under 81 exclusion definition to "FrailtyLTI.Advanced Illness and Frailty Exclusion Not Including Over Age 80".</p> <p>Updated denominator exclusion: For the MIPS CQMs Specifications and Medicare Part B Claims Measure Specification collection type: Added coding to identify patients with advanced illness and frailty</p> <p>Updated logic: For the eCQM Specifications collection type: Change to the Essential Hypertension Diagnosis definition logic used to define the initial patient population requires hypertension overlap the measurement period indicating hypertension must be present prior to and during the measurement period.</p> <p>Updated denominator exclusion: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Revised: <ol style="list-style-type: none"> 1. Patients age 66 or older in Institutional Special Needs Plans (SNP) or residing in long-term care with POS code, 32, 33, 34, 54, or 56 for more than 90 consecutive days during the measurement period. 2. Patients 66-80 years of age with at least one claim/encounter for frailty during the measurement period AND a dispensed medication for dementia during the measurement period or the year prior to the measurement period 3. Patients 66-80 years of age with at least one claim/encounter for frailty during the measurement period AND either one acute inpatient encounter with a diagnosis of advanced illness or two outpatient, observation, ED or nonacute inpatient encounters on different dates of service with an advanced illness diagnosis during the measurement period or the year prior to the measurement period Added: <ol style="list-style-type: none"> 1. Patients 81 years of age and older with at least one claim/encounter for frailty during the measurement period. </p> <p>Updated instructions note/numerator note: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Added: <ul style="list-style-type: none"> • Reported by or taken by the patient (with the exception of BP values taken by a remote monitoring device, which are then reported to the provider). </p>
Steward:	National Committee for Quality Assurance
High Priority Measure:	Yes
Measure Type:	Intermediate Outcome
Rationale:	<p>We proposed that the denominator exclusion language and logic be updated in all collection types to clarify that, for the measure, long-term care will be defined as patients staying 90 consecutive days at the long-term care facility versus any 90 days within the performance period. For the eCQM Specifications collection type we proposed to update the logic to allow for new hypertension diagnoses within the first 6 months of the performance period to better align with the intent of the measure.</p> <p>We proposed to add a denominator note to clarify the patient population eligible for the measure and to reflect the revision in timing for the essential hypertension diagnosis; ensuring patients that should be assessed are included within the denominator eligible patient population. Additionally, for the MIPS CQMs Specifications and Medicare Part B Claims Measure Specifications collection types, we proposed adding applicable coding to better define the advanced illness and frailty patient population for the purposes of this measure. We also proposed to update the instructions note and the numerator note to add clarity regarding the use of remote monitoring devices for the purposes of this measure in response to stakeholder feedback.</p> <p>We proposed to remove the CMS Web Interface Measure Specifications collection type. This collection type was proposed to be sunset for the purposes of MIPS starting with the 2021 performance year. We have determined it is not fiscally viable, feasible, or sustainable for MIPS to continue this collection type/submission type due to an 80 percent reduction and a continued decrease in interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures. For further rationale, please see section IV.A.3.c.(1)(c) of this final rule.</p>
Comment:	One commenter stated that although telehealth is available for this measure, it is restricted to using only remote devices (via Bluetooth technology). The concern is that this may be restrictive to some patients who might benefit from telehealth (virtual visits) but do not have and/or cannot afford a new device and/or technology. The commenter recommended that the measure follow HEDIS specifications that allows visual confirmation on the blood pressure measuring device by the provider during the virtual visit and then to record the blood pressure in the EHR.

Category	Description
	<p>Response: We thank the commenter for their comment. We encourage the commenter to reach out to the measure steward to discuss revisions for possible implementation in future years.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q236 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of the CMS Web Interface Specifications collection type. At § 414.1305, we proposed to modify the definition of the terms collection type and submission type by removing the CMS Web Interface Specifications as an available option starting with the 2023 payment year (85 FR 50290); however, the CMS Web Interface Measure Specifications collection type will be an available option for an extension of one additional year (2021 MIPS performance period/2023 MIPS payment year) and will be removed as a collection and submission type starting with the 2022 MIPS performance period/2024 MIPS payment year. None of the substantive changes above will be applied to the CMS Web Interface Measure Specifications for the 2021 MIPS performance period. The CMS Web Interface Specifications for the 2021 MIPS performance period will reflect the 2020 CMS Web Interface Specifications.</p> <p>We have identified a technical error in the language for the update to the eCQM Specifications collection type for the denominator logic. For the eCQM Specifications collection type, we inadvertently indicated that the timeframe for the hypertension diagnosis must be present prior to “and” during the measurement period. To resolve this technical error, the “and” was replaced with “or”. We have updated the language for the logic from the proposed change for the eCQM Specifications collection type as follows:</p> <p>Technical error: Change to the Essential Hypertension Diagnosis definition logic used to define the initial patient population requires hypertension overlap the measurement period indicating hypertension must be present prior to and during the measurement period.</p> <p>To resolve technical error: Change to the Essential Hypertension Diagnosis definition logic used to define the initial patient population requires hypertension overlap the measurement period indicating hypertension must be present prior to OR during the measurement period.</p> <p>This reflects the change to the denominator logic proposed for the Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications collection types. The 2021 performance period eCQM measure specifications have been published since May 7, 2020 on the CMS Electronic Clinical Quality Improvement (eCQI) Resource Center website at https://ecqi.healthit.gov/ecqm/ep/2021/cms165v9 and we have not received feedback or public comments regarding this change in denominator logic.</p> <p>Further refinements were made to the measure specifications in order to align with the proposed update to the denominator note for the Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications collection types. We are finalizing a modification of the Measure Description for the Medicare Part B Claims Measure Specifications, eCQM Specification, and MIPS CQMs Specifications collection types as follows:</p> <p>Current: Percentage of patients 18-85 years of age who had a diagnosis of hypertension overlapping the measurement period and whose most recent blood pressure was adequately controlled (<140/90mmHg) during the measurement period.</p> <p>Revised to read: Percentage of patients 18-85 years of age who had a diagnosis of hypertension overlapping the measurement period or the year prior to the measurement period, and whose most recent blood pressure was adequately controlled (<140/90mmHg) during the measurement period.</p> <p>Additionally, we are finalizing a modification to the Denominator Statement for the Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications collection types, and the Initial Patient Population for the eCQM Specifications collection type. The following finalized modification pertains to the Denominator Statement for the Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications collection types.</p> <p>Current: Patients 18-85 years of age who had a visit and a diagnosis of hypertension overlapping the measurement period.</p> <p>Revised to read: Patients 18-85 years of age who had a visit and diagnosis of essential hypertension overlapping the measurement period or the year prior to the measurement period.</p> <p>The following finalized modification pertains to the Initial Patient Population for the eCQM Specifications collection type.</p> <p>Current: Patients 18-85 years of age who had a visit and diagnosis of essential hypertension overlapping the measurement period.</p> <p>Revised to read: Patients 18-85 years of age who had a visit and diagnosis of essential hypertension overlapping the measurement period or the year prior to the measurement period.</p> <p>We are finalizing the denominator note for the Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications collection types as proposed. For the reasons noted above, we are finalizing a modification of the logic for the eCQM Specifications collection type: Change to the Essential Hypertension Diagnosis definition logic used to define the initial patient population requires hypertension overlap the measurement period indicating hypertension must be present prior to or during the measurement period.</p> <p>The additional changes to the description, denominator statement, and initial patient population do not affect the intent of the proposed substantive change, but adds alignment and clarity between the collection types in order to ensure proper implementation within and across collection types.</p>

D.48 Use of High-Risk Medications in the Elderly

Category	Description
NQF # / eCQM NQF #:	0022 / N/A
Quality#:	238
CMS eCQM ID:	CMS156v9
National Quality Strategy Domain:	Patient Safety
Current Collection Type:	eCQM Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients 65 years of age and older who were ordered high-risk medications. Two rates are submitted. 1) Percentage of patients who were ordered at least one high-risk medication. 2) Percentage of patients who were ordered at least two of the same high-risk medications.
Substantive Change:	<p>The title is revised from 'Use of High-Risk Medications in the Elderly' to: Use of High-Risk Medications in Older Adults.</p> <p>The description is revised to read: Percentage of patients 65 years of age and older who were ordered at least two of the same high-risk medications.</p> <p>Updated measure analytics: For all collection types: One performance rate.</p> <p>The guidance is revised to read: For the eCQM Specifications collection type: The intent of the measure is to assess if the patient has been prescribed at least two of the same high-risk medications on different days. The intent of the measure is to assess if the reporting provider ordered the high-risk medication(s). If the patient had a high-risk medication previously prescribed by another provider, they would not be counted towards the numerator unless the reporting provider also ordered a high-risk medication for them. This eCQM is a patient-based measure. This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM.</p> <p>Updated instructions: For the MIPS CQMs Specifications collection type: Removed language related to the submission of two performance rates and two submission criteria.</p> <p>Updated denominator: For all collection types: Removed submission criteria one.</p> <p>For MIPS CQMs Specifications collection type: Added ophthalmology, skilled nursing facility, and domiciliary/rest home settings and preventive care services.</p> <p>The numerator is revised to read: For all collection type: Patients with at least two orders for the same high-risk medication on different days during the measurement period.</p> <p>Updated numerator: For the MIPS CQMs Specifications collection type: Removed submission criteria one numerator. Revised High-Risk Medications at any dose or duration Table 1:</p> <p>Added: Pyrilamine, Orphenadrine, Chlordiazepoxide-clidinium, Methscopolamine, Glimepiride</p> <p>Removed: Clidinium Chlorazepoxide, Ticlopidine, Pentazocine</p> <p>For the eCQM Specifications collection type: Added medication value sets: Scopolamine, Secobarbital, Propantheline, Doxylamine, Ergoloid Mesylates, Butalbital, Amobarbital, Pentobarbital</p>
Steward:	National Committee for Quality Assurance
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	<p>We proposed to remove submission criteria one from this measure and continue to assess the percentage of patients 65 years of age and older who were ordered at least two of the same high-risk medications. This change will lessen clinician burden while still assessing an important aspect of patient safety. This patient population is a better assessment of the riskier, longer-term use and allows MIPS eligible clinicians/groups to address potentially inappropriate medication dispensing to improve quality outcomes. The eCQM Specifications collection type added medication value sets to the numerator to align with the Beers Criteria for Potentially Inappropriate Medication list, as well as to reflect expert review and stakeholder feedback. These updates ensure all high-risk medications are being assessed for numerator compliance. The MIPS CQMs Specifications collection type was revised to align medications across collection types.</p> <p>In the event the proposed substantive change(s) were finalized, the substantive changes would not allow for a direct comparison of performance data from prior years to performance data submitted after the implementation of these substantive changes.</p>
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q238 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.49 Cardiac Rehabilitation Patient Referral from an Outpatient Setting

Category	Description
NQF # / eCQM NQF #:	0643 / N/A
Quality#:	243
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients evaluated in an outpatient setting who within the previous 12 months have experienced an acute myocardial infarction (MI), coronary artery bypass graft (CABG) surgery, a percutaneous coronary intervention (PCI), cardiac valve surgery, or cardiac transplantation, or who have chronic stable angina (CSA) and have not already participated in an early outpatient cardiac rehabilitation/secondary prevention (CR) program for the qualifying event/diagnosis who were referred to a CR program.
Substantive Change:	Updated denominator: Added Skilled Nursing Facility, Domiciliary/Rest Home, Home Visit, and Outpatient Consultation settings. Added telehealth as eligible encounter.
Steward:	American Heart Association
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to add settings, Skilled Nursing Facility, Domiciliary/Rest Home, Home Visit, and Outpatient Consultation, as denominator eligible as they are clinically relevant settings that can ensure that patients receive or continue outpatient cardiac rehabilitation to support positive outcomes in their clinical care. We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.
<p>Comment: Several commenters supported the addition of telehealth reporting for measure Q243.</p> <p>Response: We thank the commenters for supporting the addition of telehealth reporting for this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q243 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.50 Biopsy Follow-Up

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	265
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of new patients whose biopsy results have been reviewed and communicated to the primary care/referring physician and patient.
Substantive Change:	Updated denominator: Added telehealth as eligible encounter.
Steward:	American Academy of Dermatology
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.
Comment: One commenter supported the addition of telehealth reporting for measure Q265.	
Response: We thank the commenter for supporting the addition of telehealth reporting for this measure.	
After consideration of public comments, we are finalizing the changes to measure Q265 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.51 Epilepsy: Counseling for Women of Childbearing Potential with Epilepsy

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	268
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of all patients of childbearing potential (12 years and older) diagnosed with epilepsy who were counseled at least once a year about how epilepsy and its treatment may affect contraception and pregnancy.
Substantive Change:	<p>Modified collection type: MIPS CQMs Specifications</p> <p>The denominator is revised to read: All females, including all individuals of childbearing potential (12 years and older) with a diagnosis of epilepsy.</p> <p>Updated denominator: Added telehealth as eligible encounter.</p>
Steward:	American Academy of Neurology
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed to remove the Medicare Part B Claims Measure Specifications collection type. The limited patient population and adoption of the quality measure for this collection type does not allow for the creation of benchmarks to provide a meaningful impact to quality improvement.</p> <p>We proposed the denominator statement be revised to be more inclusive of the eligible patient population.</p> <p>We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</p>
<p>Comment: One commenter requested the removal of Medicare Part B Claims Measure Specifications for measure Q268 through the measure review process. The commenter noted that these changes were not reflected in the 2021 PFS proposed rule and the measure specifications should be removed, as the measure steward is no longer maintaining these specifications.</p> <p>Response: We did propose to modify the collection type to only include the MIPS CQMs Specifications collection type. We thank the commenter for their support in the removal of the Medicare Part B Claims Measure Specifications collection type.</p> <p>Comment: One commenter supported the addition of telehealth reporting for measure Q268.</p> <p>Response: We thank the commenter for supporting the addition of telehealth reporting for this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q268 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.52 Sleep Apnea: Severity Assessment at Initial Diagnosis

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	277
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of obstructive sleep apnea who had an apnea hypopnea index (AHI) or a respiratory disturbance index (RDI) measured at the time of initial diagnosis.
Substantive Change:	Updated denominator: Added telehealth as eligible encounter.
Steward:	American Academy of Sleep Medicine
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.
<p>Comment: One commenter supported the addition of telehealth reporting for measure Q277.</p> <p>Response: We thank the commenter for supporting the addition of telehealth reporting for this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q277 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.53 Sleep Apnea: Assessment of Adherence to Positive Airway Pressure Therapy

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	279
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of visits for patients aged 18 years and older with a diagnosis of obstructive sleep apnea who were prescribed positive airway pressure therapy who had documentation that adherence to positive airway pressure therapy was objectively measured.
Substantive Change:	Updated denominator: Added telehealth as eligible encounter.
Steward:	American Academy of Sleep Medicine
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.
Comment: One commenter supported the addition of telehealth reporting for measure Q279.	
Response: We thank the commenter for supporting the addition of telehealth reporting for this measure.	
After consideration of public comments, we are finalizing the changes to measure Q279 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.54 Dementia: Cognitive Assessment

Category	Description
NQF # / eCQM NQF #:	N/A / 2872e
Quality#:	281
CMS eCQM ID:	CMS149v9
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	eCQM Specifications
Current Measure Description:	Percentage of patients, regardless of age, with a diagnosis of dementia for whom an assessment of cognition is performed and the results reviewed at least once within a 12-month period.
Substantive Change:	<p>The guidance is revised to read:</p> <p>Use of a standardized tool or instrument to assess cognition other than those listed will meet numerator performance. Standardized tools can be mapped to the concept "Intervention, Performed": "Cognitive Assessment" included in the numerator logic below.</p> <p>The requirement of two or more visits is to establish that the eligible professional or eligible clinician has an existing relationship with the patient.</p> <p>In recognition of the growing use of integrated and team-based care, the diagnosis of dementia and the assessment of cognitive function need not be performed by the same provider or clinician.</p> <p>The DSM-5 has replaced the term dementia with major neurocognitive disorder and mild neurocognitive disorder. For the purposes of this measure, the terms are equivalent.</p> <p>This eCQM is a patient-based measure.</p> <p>This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM.</p>
Steward:	American Academy of Neurology
High Priority Measure:	No
Measure Type:	Process
Rationale:	The measure steward's technical expert panel suggested adding language within the guidance statement to reflect that team-based care is appropriate for this measure. We agreed that this is an important concept and applicable to this measure, adding the language helps to clarify the measure intent.
<p>Comment: One commenter supported the changes for measure Q281 related to dementia and associated screening assessments.</p> <p>Response: We thank the commenter for supporting the changes to this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q281 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.55 Dementia: Functional Status Assessment

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	282
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients with dementia for whom an assessment of functional status was performed at least once in the last 12 months.
Substantive Change:	<p>The definition is revised to read: Assessment of functional status - Functional status is assessed by use of a validated tool, direct assessment of the patient, or by querying a knowledgeable informant. A direct assessment of functional status includes an evaluation of the patient's ability to perform instrumental activities of daily living (IADL) and basic activities of daily living (ADL).</p> <p>Updated denominator: Added telehealth as eligible encounter.</p> <p>The numerator instructions are revised to read: To meet this measure, providers must assess BOTH IADL and ADL performance.</p> <ol style="list-style-type: none"> IADL Assessment (users must meet one of the two below bullets to meet IADL assessment component) <ul style="list-style-type: none"> To meet the measure's IADL component using a validated tool, providers must use one of the following tools: <ul style="list-style-type: none"> Lawton Instrumental Activities of Daily Living Scale Bristol Activities of Daily Living Scale Katz Index of Independence in Activities of Daily Living Functional Activities Questionnaire Functional Independence Measure Instrument To meet the measure's IADL component using a direct assessment, providers must document 3 out of the following 5 domains. <ul style="list-style-type: none"> Cleaning or hobbies Money management, Medication management, Transportation, and Cooking or communication ADL Assessment (users must meet one of the two below bullets to meet ADL assessment component) <ul style="list-style-type: none"> To meet the measure's ADL component using a validated tool, providers must use either: <ul style="list-style-type: none"> Barthel ADL Index Bristol Activities of Daily Living Scale To meet the measure's ADL component using a direct assessment, providers must document 3 out of the following 7 domains. <ul style="list-style-type: none"> Grooming, Bathing, Dressing, Eating, Toileting, Gait, and Transferring <p>The numerator notes is revised to read: The 12-month look back period is defined as 12 months from the date of the denominator eligible encounter. Denominator Exception(s) are determined on the date of the denominator eligible encounter. Documentation of advanced stage dementia and caregiver knowledge is limited would meet the measure exception criteria.</p> <p>The denominator exception is revised to read: Documentation of advanced stage dementia and caregiver knowledge is limited.</p>
Steward:	American Academy of Neurology
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed the measure definition and numerator instructions to provide clarity regarding expectations for numerator compliance. This updated language should address any stakeholder confusion for implementing the measure. The numerator note was updated to align with revised denominator exception. We proposed to update the denominator exception to reduce ambiguity regarding patient scenarios where an exception is clinically appropriate.</p> <p>We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</p>
<p>Comment: One commenter supported the changes for measure Q282 related to dementia and associated screening assessments. Another commenter supported adding telehealth reporting to this measure. Another commenter support adopting language in its guidance recognizing the growing use of integrated and team-based care in the diagnosis of dementia and the assessment of cognitive impairment and concur with CMS's continued recognition that functional status includes an evaluation of a patient's ability to perform instrumental activities of daily living (IADLs) and activities of daily living (ADLs). The commenter also applauded CMS's ongoing monitoring and measurement of the percentage of patients with dementia for whom there is documented screening because it reflects CMS's recognition of the critical importance of regular screening, assessment, and management of patients with dementia for other behavioral and psychiatric symptoms.</p> <p>Response: We thank the commenters for supporting the changes to this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q282 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.56 Dementia Associated Behavioral and Psychiatric Symptoms Screening and Management

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	283
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients with dementia for whom there was a documented screening for behavioral and psychiatric symptoms, including depression, and for whom, if symptoms screening was positive, there was also documentation of recommendations for management in the last 12 months.
Substantive Change:	<p>Updated denominator: Added telehealth as eligible encounter.</p> <p>The definition is revised to read: Behavioral and Psychiatric Symptoms Screening - Screening is defined as using a validated instrument or directly examining the patient or knowledgeable informant to determine the presence or absence of symptoms from three domains: Activity disturbances, mood disturbances (including depression), and thought and perceptual disturbances. The following validated instruments can be used to meet the measure:</p> <ul style="list-style-type: none"> • Dementia Signs and Symptoms (DSS) Scale • Neuropsychiatric Inventory (NPI) • Minimum Data Set (MDS) (suggested for nursing home only). <p>Updated numerator instructions: Added: Thought and perceptual disturbances under 'Thought and perceptual disturbances'. Revised: Examples of reliable and valid instruments that can be used to assess behavioral and psychiatric symptoms are: Dementia Signs and Symptoms (DSS) Scale or Neuropsychiatric Inventory (NPI). For patients residing in nursing homes, it may be the Minimum Data Set (MDS). Other reliable and valid instruments may be used to assess individual measure components for activity disturbances, mood disturbances including depression, and thought and perceptual disturbances.</p>
Steward:	American Academy of Neurology
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed to update the definition to remove 'positive', as this was not appropriate or aligned with the definition for the purposes of this measure. Additionally, information regarding approved screening instruments was moved to this section as it is more appropriately in this section of the measure specification. We proposed to update the numerator instructions to add 'thought and perceptual disturbance' and provide greater clarity regarding the requirements of numerator compliance for this measure.</p> <p>We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</p>
<p>Comment: One commenter supported the changes for measure Q283 related to dementia and associated screening assessments. Another commenter supported adding telehealth reporting to this measure.</p> <p>Response: We thank the commenter for supporting the changes to this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q283 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.57 Dementia: Safety Concern Screening and Follow-Up for Patients with Dementia

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	286
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Patient Safety
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients with dementia or their caregiver(s) for whom there was a documented safety concerns screening in two domains of risk: 1) dangerousness to self or others and 2) environmental risks; and if safety concerns screening was positive in the last 12 months, there was documentation of mitigation recommendations, including but not limited to referral to other resources.
Substantive Change:	The denominator exception is revised to read: Documentation patient unable to communicate and informant not available. Updated denominator: Added telehealth as eligible encounter.
Steward:	American Academy of Neurology
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to revise the denominator exception to better align with real-world clinical scenarios where safety screening could not be completed and therefore no mitigation recommendations could be provided. This change aids clinicians reporting the measure with an exception to excuse them from performance in a clinical situation they are unable to control. We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.
<p>Comment: One commenter supported the changes for measure Q286 related to dementia and associated screening assessments. Another commenter supported adding telehealth reporting to this measure.</p> <p>Response: We thank the commenter for supporting the changes to this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q286 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.58 Dementia: Education and Support of Caregivers for Patients with Dementia

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	288
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients with dementia whose caregiver(s) were provided with education on dementia disease management and health behavior changes AND were referred to additional resources for support in the last 12 months.
Substantive Change:	<p>Updated denominator: Added telehealth as eligible encounter.</p> <p>Updated denominator exceptions: Revised: Patient does not have a caregiver. Added: 1. Documentation caregiver is trained and certified in dementia care. 2. Patient/caregiver dyad has been referred to appropriate resources and connection to those resources is confirmed.</p>
Steward:	American Academy of Neurology
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	<p>We proposed to revise the denominator exception to reduce ambiguity regarding patient scenarios where an exception is clinically appropriate. Additionally, we proposed to add two denominator exceptions to further clarify clinical scenarios where it may not be appropriate to attribute the quality action to that MIPS eligible clinician.</p> <p>We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</p>
<p>Comment: One commenter supported the changes for measure Q288 related to dementia and associated screening assessments. Another commenter supported adding telehealth reporting to this measure.</p> <p>Response: We thank the commenter for supporting the changes to this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q288 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.59 Parkinson's Disease: Psychiatric Symptoms Assessment for Patients with Parkinson's Disease

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	290
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of all patients with a diagnosis of Parkinson's Disease [PD] who were assessed for psychiatric symptoms in the past 12 months.
Substantive Change:	<p>The description is revised to read: Percentage of all patients with a diagnosis of Parkinson's Disease [PD] who were assessed for psychiatric symptoms once in the past 12 months.</p> <p>Updated denominator: Added telehealth as eligible encounter.</p>
Steward:	American Academy of Neurology
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed to update the measure description to include the word 'once' to provide added clarity regarding measure intent.</p> <p>We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</p>
<p>Comment: One commenter supported the addition of telehealth reporting for measure Q290.</p> <p>Response: We thank the commenter for supporting the addition of telehealth reporting for this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q290 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.60 Parkinson's Disease: Cognitive Impairment or Dysfunction Assessment for Patients with Parkinson's Disease

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	291
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of all patients with a diagnosis of Parkinson's Disease [PD] who were assessed for cognitive impairment or dysfunction in the past 12 months.
Substantive Change:	<p>The description is revised to read: Percentage of all patients with a diagnosis of Parkinson's Disease [PD] who were assessed for cognitive impairment or dysfunction once in the past 12 months.</p> <p>Updated denominator: Added telehealth as eligible encounter.</p>
Steward:	American Academy of Neurology
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed to update the measure description to include the word 'once' to provide added clarity regarding measure intent.</p> <p>We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</p>
<p>Comment: One commenter supported the addition of telehealth reporting for measure Q291.</p> <p>Response: We thank the commenter for supporting the addition of telehealth reporting for this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q291 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.61 Parkinson's Disease: Rehabilitative Therapy Options

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	293
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of all patients with a diagnosis of Parkinson's Disease (or caregiver(s), as appropriate) who had rehabilitative therapy options (i.e., physical, occupational, and speech therapy) discussed in the past 12 months.
Substantive Change:	<p>The description is revised to read: Percentage of all patients with a diagnosis of Parkinson's Disease (or caregiver(s), as appropriate) who had rehabilitative therapy options (i.e., physical, occupational, and speech therapy) discussed once in the past 12 months.</p> <p>Updated denominator exception: Removed: Documentation of medical reason(s) for not discussing rehabilitative therapy options with patient (or caregiver).</p> <p>Updated denominator: Added telehealth as eligible encounter.</p>
Steward:	American Academy of Neurology
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	<p>We proposed to update the measure description to include the word 'once' to provide added clarity regarding measure intent. Additionally, we proposed to remove the denominator exception, which allowed for medical reason(s) for not discussing rehabilitative therapy options. We agreed that MIPS eligible clinicians should discuss rehabilitative therapy options with all patients/caregivers as these therapies play an important role in not only improving function in the patient, but also their quality of life.</p> <p>We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</p>
<p>Comment: One commenter supported the addition of telehealth reporting for measure Q293.</p> <p>Response: We thank the commenter for supporting the addition of telehealth reporting for this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q293 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.61 Parkinson's Disease: Rehabilitative Therapy Options

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	293
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of all patients with a diagnosis of Parkinson's Disease (or caregiver(s), as appropriate) who had rehabilitative therapy options (i.e., physical, occupational, and speech therapy) discussed in the past 12 months.
Substantive Change:	<p>The description is revised to read: Percentage of all patients with a diagnosis of Parkinson's Disease (or caregiver(s), as appropriate) who had rehabilitative therapy options (i.e., physical, occupational, and speech therapy) discussed once in the past 12 months.</p> <p>Updated denominator exception: Removed: Documentation of medical reason(s) for not discussing rehabilitative therapy options with patient (or caregiver).</p> <p>Updated denominator: Added telehealth as eligible encounter.</p>
Steward:	American Academy of Neurology
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	<p>We proposed to update the measure description to include the word 'once' to provide added clarity regarding measure intent. Additionally, we proposed to remove the denominator exception, which allowed for medical reason(s) for not discussing rehabilitative therapy options. We agreed that MIPS eligible clinicians should discuss rehabilitative therapy options with all patients/caregivers as these therapies play an important role in not only improving function in the patient, but also their quality of life.</p> <p>We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</p>
<p>Comment: One commenter supported the addition of telehealth reporting for measure Q293.</p> <p>Response: We thank the commenter for supporting the addition of telehealth reporting for this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q293 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.63 Cervical Cancer Screening

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	309
CMS eCQM ID:	CMS124v9
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	eCQM Specifications
Current Measure Description:	Percentage of women 21-64 years of age who were screened for cervical cancer using either of the following criteria: <ul style="list-style-type: none"> • Women age 21-64 who had cervical cytology performed every 3 years • Women age 30-64 who had cervical cytology/human papillomavirus (HPV) co-testing performed every 5 years.
Substantive Change:	<p>The description is revised to read: Percentage of women 21-64 years of age who were screened for cervical cancer using either of the following criteria: <ul style="list-style-type: none"> * Women age 21-64 who had cervical cytology performed within the last 3 years * Women age 30-64 who had cervical human papillomavirus (HPV) testing performed within the last 5 years </p> <p>The guidance is revised to read: To ensure the measure is only looking for a cervical cytology test only after a woman turns 21 years of age, the youngest age in the initial population is 23. Patient self-report for procedures, as well as diagnostic studies should be recorded in 'Procedure, Performed' template or 'Diagnostic Study, Performed' template in QRDA-1. This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM. This eCQM is a patient-based measure.</p> <p>The numerator is revised to read: Women with one or more screenings for cervical cancer. Appropriate screenings are defined by any one of the following criteria: <ul style="list-style-type: none"> * Cervical cytology performed during the measurement period or the two years prior to the measurement period for women who are at least 21 years old at the time of the test * Cervical human papillomavirus (HPV) testing performed during the measurement period or the four years prior to the measurement period for women who are 30 years or older at the time of the test. </p> <p>Updated logic: Updated logic definition to use HPV only every 5 years and remove Pap test.</p>
Steward:	National Committee for Quality Assurance
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to update the measure to align with current clinical guidelines, which removes the Pap test requirement and allow HPV only testing every 5 years. This update is reflected in revisions to the description, guidance, numerator, and logic.
<p>Comment: One commenter opposed the proposed changes to measure Q309, citing that the proposal was to update the measure to align with the current clinical guidelines, which removes the Pap/HPV test (co-testing) requirement and allow only HPV testing every 5 years. While this proposed change would align to the recently updated American Cancer Society (ACS) cervical cancer screening guidelines, the commenter stated the change is not consistent with the current recommendations from the American College of Obstetricians and Gynecologists (ACOG), the United States Preventive Services Task Force (USPSTF), the National Committee for Quality Assurance (NCQA), and numerous other guideline bodies or current clinical practice in the United States.</p> <p>In response to the ACS guidelines, ACOG issued a statement affirming their current guidelines, which encompasses all three screening regimens (high-risk human papillomavirus testing alone, cervical cytology alone, and co-testing). In August 2018, the USPSTF recommended screening women aged 30 to 65 years, screening every 3 years with cervical cytology alone, every 5 years with high-risk human papillomavirus (hrHPV) testing alone, or every 5 years with hrHPV testing in combination with cytology (co-testing)3 with an “A” rating.</p> <p>In addition, the NCQA HEDIS measure is also in conflict with the proposed revisions to the MIPS measure. The NCQA HEDIS measure for cervical cancer screening includes all three screening regimens (high-risk human papillomavirus testing alone, cervical cytology alone, and co-testing). Lastly, the proposed change to the MIPS quality measure eliminated the recommended option of co-testing for cervical cancer, a change that is inconsistent with current guidelines recommended by ACOG, the USPSTF and NCQA. Accordingly, the leading authorities in cervical cancer screening are on record that co-testing is a valuable cervical cancer screening test. The commenter asked for measure Q309 to be retained without any revisions. A second commenter sought clarification on whether the measure is specifically looking at HPV only testing every 5 years. The description and logic have conflicting definitions between the usage of cervical cytology and HPV testing, and solely HPV testing. A third commenter cited the proposal to change the measure description to remove “co-testing” from the criteria for HPV testing. The commenter indicated that it had affirmed its 2018 Practice Advisory, which includes all three cervical cancer screening strategies (high-risk human papillomavirus testing alone, cervical cytology alone, and co-testing). The commenter’s current screening guidelines reflect a balance of benefit and potential harms and support shared decision-making between patients and their clinicians and recommended that changes to this measure not be finalized.</p> <p>Response: We thank the commenters for their comments. The revisions to this measure are in alignment with the updated clinical guidelines. The guidelines for patients 30 to 65 years of age recommend that either; cervical cytology only be completed every 3 years or hrHPV testing alone every 5 years or co-testing (hrHPV + cervical cytology) every 5 years. The guidelines now allow hrHPV testing alone every 5 years as opposed to requiring that co-testing be completed every 5 years. However, if co-testing was completed every 5 years this would be numerator compliant as co-testing contains the hrHPV testing component. Conversely, if co-testing was completed every 3 years, this would also suffice for numerator compliance as the co-testing has the cervical cytology component. Therefore, the components of screening are all still included for the purposes of achieving the quality action for this measure, but the requirements have been revised to align with the updated guidelines. We encourage the commenters to reach out to the measure steward to discuss revisions in language to help clarify the numerator component for possible implementation in future years.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q309 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.64 Preventive Care and Screening: Screening for High Blood Pressure and Follow-Up Documented

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	317
CMS eCQM ID:	CMS22v9
National Quality Strategy	Community/Population Health

Category	Description
Domain:	
Current Collection Type:	Medicare Part B Claims Specifications, eCQM Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older seen during the submitting period who were screened for high blood pressure AND a recommended follow-up plan is documented based on the current blood pressure (BP) reading as indicated.
Substantive Change:	<p>The description is revised to read: For all collection types: Percentage of patient visits for patients aged 18 years and older seen during the measurement period who were screened for high blood pressure AND a recommended follow-up plan is documented, as indicated, if blood pressure is pre-hypertensive or hypertensive.</p> <p>The guidance is revised to read: For the eCQM Specifications collection type: This eCQM is an episode-based measure and should be reported at every visit for patients aged 18 years and older. This measure will be calculated based upon the clinical actions performed at every visit during the measurement period for each patient. The measure requires that blood pressure measurements (i.e., diastolic and systolic) be obtained during each visit to determine the blood pressure reading used to evaluate if an intervention is needed. Both the systolic and diastolic blood pressure measurements are required for inclusion. If there are multiple blood pressures obtained during a patient visit, only the last, or most recent, pressure measurement will be used to evaluate the measure requirements. The intent of this measure is to screen patients for high blood pressure and provide recommended follow-up as indicated. The documented follow-up plan must be related to the current blood pressure reading as indicated, example: "Patient referred to primary care provider for BP management." This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM.</p> <p>The instructions are revised to read: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs collections type: This measure is to be submitted at each visit for patients seen during the measurement period. Merit-based Incentive Payment System (MIPS) eligible clinicians who submit the measure must perform the blood pressure screening at each patient visit by a MIPS eligible clinician and may not obtain measurements from external sources.</p> <p>The initial patient population is revised to read: For the eCQM Specifications collection type: All patient visits for patients aged 18 years and older at the beginning of the measurement period.</p> <p>The denominator is revised to read: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs collections type: All patient visits for patients aged 18 years and older at the beginning of the measurement period.</p> <p>The denominator exception is revised to read: For the eCQM Specifications collection type:</p> <ol style="list-style-type: none"> 1. Documentation of medical reason(s) for not screening for high blood pressure (e.g., patient is in an urgent or emergent medical situation where time is of the essence and to delay treatment would jeopardize the patient's health status). 2. Documentation of patient reason(s) for not screening for blood pressure measurements or for not ordering an appropriate follow-up intervention if patient is pre-hypertensive or hypertensive (e.g., patient refuses). <p>Updated denominator exception logic: For the eCQM Specifications collection type: Added:</p> <ol style="list-style-type: none"> 1. Follow-up within 1 year 2. Follow-up within 4 weeks <p>The numerator is revised to read: For all collection types: Patient visits where patients were screened for high blood pressure AND have a recommended follow-up plan documented, as indicated, if the blood pressure is pre-hypertensive or hypertensive.</p> <p>Updated numerator definition: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Revised: Patients with a Documented Reason for not Screening or no Follow-Up Plan for High Blood Pressure (Denominator Exception) –</p> <ul style="list-style-type: none"> • Documentation of medical reason(s) for not screening for high blood pressure (e.g., patient is in an urgent or emergent medical situation where time is of the essence and to delay treatment would jeopardize the patient's health status). • Documentation of patient reason(s) for not screening for blood pressure measurements or for not ordering an appropriate follow-up intervention if patient is pre-hypertensive or hypertensive (e.g., patient refuses). <p>The numerator notes is revised to read: For the Medicare Part B Claims Measure Specifications and the MIPS CQMs Specifications collection types: Although the recommended screening interval for a normal BP reading is every 2 years, to meet the intent of this measure, BP screening and follow-up must be performed at every patient visit. For patients with Normal blood pressure, a follow-up plan is not required (G8783). Denominator Exception(s) are determined on the date of the denominator eligible encounter.</p> <p>Per the 'Telehealth Guidance for Electronic Clinical Quality Measures (eCQMs) for Eligible Professional/Eligible Clinician 2021 Quality Reporting': Medicare telehealth eligible codes found in any encounter value set must only be used for in-person encounters for the following eCQMs.</p>
Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed to update the measure frequency so that the clinical quality action is occurring at all denominator eligible visits. Hypertension is a prevalent condition, and the United States Preventive Services Task Force (USPSTF) found good evidence that screening for and treatment of high blood pressure in adults substantially reduces the incidence of cardiovascular events. In alignment with this update, the measure language has been revised to reflect the change in frequency to all visits.</p> <p>Additionally, the eCQM Specifications collection type revised the logic to align with the measure's reporting frequency update, as well as updating the denominator exception logic to add two elements that were missing from the existing logic to ensure that all valid denominator exception options are accounted for within the logic. The denominator exception language was revised in the eCQM Specifications collection type to follow best practices and add clarity to implementing the measure. To align with this</p>

Category	Description
	<p>update, the definition for denominator exception was revised in the Medicare Part B Claims Measure Specifications and MIPS CQMs Specifications collection types.</p> <p>We proposed to remove telehealth encounters from the denominator of the eCQM Specifications collection type as telehealth is not an appropriate setting for this measure, as well as to align with the other collection types. This guidance can be found in a separate document that will be published on the eCQI Resource Center.</p> <p>In the event the proposed substantive change(s) were finalized, the substantive changes would not allow for a direct comparison of performance data from prior years to performance data submitted after the implementation of these substantive changes.</p>
<p>Comment: One commenter opposed the proposed change in the frequency of blood pressure screening required for this measure from annual to every patient encounter. CMS states that this is in response to the update on screening recommendations from the United States Preventive Services Task Force (USPSTF).</p> <p>The USPSTF is updating their guidance, but their most recent draft guidance states the following on recommended screening frequency: The USPSTF suggests annual screening for hypertension in adults age 40 years or older and for adults at increased risk for hypertension (such as persons with high-normal blood pressure, who are overweight or obese, or who are African American). Screening less frequently (i.e., every 3 to 5 years) is appropriate for adults ages 18 to 39 years not at increased risk for hypertension and with a prior normal blood pressure reading. CMS's proposed change is in opposition to recommended best practices and unnecessarily creates additional burden for clinicians. Meaningful measures should be based on best evidence.</p> <p>Response: While the USPSTF does give these suggestions, they also note that available evidence regarding optimal screening intervals for hypertension are limited. However, given the prevalence of the condition, as hypertension affects approximately 45% of the adult U.S. population (https://www.cdc.gov/nchs/products/databriefs/db364.htm), and is a major contributing factor to chronic conditions such as heart failure, heart attack, stroke, and chronic kidney disease, we believe it is important to screen blood pressure often to ensure the opportunity to offer a timely diagnoses.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q317 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.65 Falls: Screening for Future Fall Risk

Category	Description
NQF # / eCQM NQF #:	0101 / N/A
Quality#:	318
CMS eCQM ID:	CMS139v9
National Quality Strategy Domain:	Patient Safety
Current Collection Type:	eCQM Specifications, CMS Web Interface Measure Specifications
Current Measure Description:	Percentage of patients 65 years of age and older who were screened for future fall risk during the measurement period.
Substantive Change:	<p>Modified collection type: eCQM Specifications</p> <p>Updated denominator exclusion: For the eCQM Specifications collection type: Removed: Exclude patients who were non-ambulatory at some point in the measurement period.</p>
Steward:	National Committee for Quality Assurance
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	<p>We proposed to remove the denominator exclusion for non-ambulatory patients to address implementation challenges as there is a lack of available documentation for a non-ambulatory status.</p> <p>We proposed to remove the CMS Web Interface Measure Specifications collection type. This collection type was proposed to be sunset for the purposes of MIPS starting with the 2021 performance year. We have determined it is not fiscally viable, feasible, or sustainable for MIPS to continue this collection type/submission type due to an 80 percent reduction and a continued decrease in interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures. For further rationale, please see section IV.A.3.c.(1)(c) of this final rule.</p>
<p>Comment: One commenter supported the proposal to remove the denominator exclusion for non-ambulatory patients.</p> <p>Response: We thank the commenter for supporting the change to this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q318 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of the CMS Web Interface Specifications collection type. At § 414.1305, we proposed to modify the definition of the terms collection type and submission type by removing the CMS Web Interface Specifications as an available option starting with the 2023 payment year (85 FR 50290); however, the CMS Web Interface Measure Specifications collection type will be an available option for an extension of one additional year (2021 MIPS performance period/2023 MIPS payment year) and will be removed as a collection and submission type starting with the 2022 MIPS performance period/2024 MIPS payment year. None of the substantive changes above will be applied to the CMS Web Interface Measure Specifications for the 2021 MIPS performance period. The CMS Web Interface Specifications for the 2021 MIPS performance period will reflect the 2020 CMS Web Interface Specifications.</p>	

D.66 Atrial Fibrillation and Atrial Flutter: Chronic Anticoagulation Therapy	
Category	Description
NQF # / eCQM NQF #:	1525 / N/A
Quality#:	326
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with nonvalvular atrial fibrillation (AF) or atrial flutter who were prescribed warfarin OR another FDA-approved oral anticoagulant drug for the prevention of thromboembolism during the measurement period.
Substantive Change:	<p>The denominator is revised to read: For all collection types: All patients aged 18 years and older with a diagnosis of nonvalvular AF or atrial flutter who do not have a documented CHA₂DS₂-VASc risk score of 0 or 1 for men or 0, 1, or 2 for women.</p> <p>The denominator/numerator note is revised to read: For all collection types: The intent of the denominator exclusion G9931 is to allow patients with a low risk for a thromboembolic event (i.e. a CHA₂DS₂-VASc score of 0 or 1 for men or 0, 1, or 2 for women) to be excluded from the sample. This denominator exclusion serves as documentation that a patient's risk for a thromboembolic event was appropriately assessed using the CHA₂DS₂-VASc scoring tool and that the risk was low enough to not warrant anticoagulation treatment. To exclude low risk patients, eligible clinicians must use the CHA₂DS₂-VASc assessment tool to determine a patient's risk score and must document either the numeric score (i.e. 0 or 1 for men or 0, 1, or 2 for women) or all the individual risk factors assessed to support an assessment of the CHA₂DS₂-VASc score.</p> <p>Updated denominator exclusion: For all collection types: Revised: Documentation of CHA₂DS₂-VASc risk score of 0 or 1 for men; 0, 1, or 2 for women.</p> <p>Updated denominator: For all collection types: Added telehealth as eligible encounter.</p>
Steward:	American Heart Association
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed to revise the measure to reflect the updated guidelines regarding when it is clinically appropriate to prescribe an oral anticoagulant for patients that are diagnosed with atrial fibrillation or atrial flutter. This update is reflected in the denominator statement, denominator note, and denominator exclusion.</p> <p>We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</p>
<p>Comment: One commenter supported the addition of telehealth reporting for measure Q326.</p> <p>Response: We thank the commenter for supporting the addition of telehealth reporting for this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q326 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.67 Adult Sinusitis: Antibiotic Prescribed for Acute Viral Sinusitis (Overuse)

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	331
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Efficiency and Cost Reduction
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients, aged 18 years and older, with a diagnosis of acute viral sinusitis who were prescribed an antibiotic within 10 days after onset of symptoms.
Substantive Change:	Updated denominator: Added telehealth as eligible encounter.
Steward:	American Academy of Otolaryngology – Head and Neck Surgery Foundation
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.
<p>Comment: Several commenters supported the addition of telehealth as an eligible encounter to measure Q331. The commenter appreciated CMS recognizing telehealth as an appropriate modality for effective, high quality patient care.</p> <p>Response: We thank the commenters for supporting the substantive change to measure Q331.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q331 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.68 Adult Sinusitis: Appropriate Choice of Antibiotic: Amoxicillin With or Without Clavulanate Prescribed for Patients with Acute Bacterial Sinusitis (Appropriate Use)

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	332
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Efficiency and Cost Reduction
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of acute bacterial sinusitis that were prescribed amoxicillin, with or without clavulanate, as a first line antibiotic at the time of diagnosis.
Substantive Change:	Updated denominator: Added telehealth as eligible encounter.
Steward:	American Academy of Otolaryngology – Head and Neck Surgery Foundation
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.
<p>Comment: Several commenters supported the addition of telehealth as an eligible encounter to measure Q332. The commenter appreciated CMS recognizing telehealth as an appropriate modality for effective, high quality patient care.</p> <p>Response: We thank the commenters for supporting the change to measure Q332.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q332 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.69 Maternity Care: Elective Delivery or Early Induction Without Medical Indication at < 39 Weeks (Overuse)

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	335
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Patient Safety
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients, regardless of age, who gave birth during a 12-month period who delivered a live singleton at < 39 weeks of gestation completed who had elective deliveries or early inductions without medical indication.
Substantive Change:	<p>The description is revised to read: Percentage of patients, regardless of age, who gave birth during a 12-month period who delivered a live singleton at < 39 weeks of gestation completed who had elective deliveries by cesarean section (C-section), or early inductions of labor, without medical indication.</p> <p>Updated instructions: Revised: This measure is to be submitted each time a procedure is performed for patients undergoing delivery by C-section, or induction of labor, at less than 39 weeks gestation during the performance period.</p> <p>The denominator is revised to read: All patients, regardless of age, who gave birth during a 12-month period delivering a live singleton at < 39 weeks of gestation completed.</p> <p>The numerator is revised to read: Patients who had elective deliveries by C-section, or early inductions of labor, without medical indication.</p> <p>Updated numerator options: Revised: Performance Met: Early elective delivery by C-section, or early elective induction, not performed (< 39 weeks gestation). Performance Not Met: Early elective delivery by C-section, or early elective induction, performed (< 39 weeks gestation).</p>
Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale:	We proposed to update the description and instructions to provide further clarity regarding what suffices for elective deliveries. Additionally, we proposed to move the “without medical indication” from the denominator to the numerator as the denominator should capture all patients with a single live birth at less than 39 weeks gestation. The numerator assesses whether or not there was medical indication for an early elective delivery by C-section, or early elective induction. This update will better align the language with the measure intent.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q335 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.70 Maternity Care: Postpartum Follow-up and Care Coordination

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	336
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients, regardless of age, who gave birth during a 12-month period who were seen for postpartum care within 8 weeks of giving birth and who received a breast-feeding evaluation and education, postpartum depression screening, postpartum glucose screening for gestational diabetes patients, family and contraceptive planning counseling, tobacco use screening and cessation education, healthy lifestyle behavioral advice, and an immunization review and update.
Substantive Change:	The description is revised to read: Percentage of patients, regardless of age, who gave birth during a 12-month period who were seen for postpartum care before or at 8 weeks of giving birth and received the following at the postpartum visit: breast-feeding evaluation and education, postpartum depression screening, postpartum glucose screening for gestational diabetes patients, family and contraceptive planning counseling, tobacco use screening and cessation education, healthy lifestyle behavioral advice, and an immunization review and update.
Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to update the measure description for clarity and readability so that it is easy to understand the measure intent.
We proposed a substantive change to the description; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state: Percentage of patients, regardless of age, who gave birth during a 12-month period who were seen for postpartum care before or at 8 weeks of giving birth and received the following at a postpartum visit: breast-feeding evaluation and education, postpartum depression screening, postpartum glucose screening for gestational diabetes patients, family and contraceptive planning counseling, tobacco use screening and cessation education, healthy lifestyle behavioral advice, and an immunization review and update. This additional refinement does not affect the intent of the proposed substantive change.	
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q336 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.71 Optimizing Patient Exposure to Ionizing Radiation: Appropriateness: Follow-up CT Imaging for Incidentally Detected Pulmonary Nodules According to Recommended Guidelines

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	364
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of final reports for CT imaging studies with a finding of an incidental pulmonary nodule for patients aged 35 years and older that contain an impression or conclusion that includes a recommended interval and modality for follow-up (e.g., type of imaging or biopsy) or for no follow-up, and source of recommendations (e.g., guidelines such as Fleischner Society, American Lung Association, American College of Chest Physicians).
Substantive Change:	Updated denominator note: Added: Granulomas, hamartomas or lesions with internal fat, or other characteristically benign findings are not considered incidental findings in the context or intent of this measure. Therefore, they are not included in the measure denominator. However, generally accepted radiology practices should be followed for communication and management of these characteristically benign findings.
Steward:	American College of Radiology
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to add language to the denominator note to add clarity as to which incidental findings are not appropriate for the purposes of this measure. Some incidental findings are widely known to be benign and would therefore not necessitate a specific documentation of a recommendation of no follow-up. This will reduce clinician burden and ensure only the appropriate patients are included in the denominator eligible population.
<p>We proposed a substantive change to the denominator note; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state: Granulomas, hamartomas or lesions with internal fat, or other characteristically benign findings are not considered incidental findings in the context or intent of this measure. Therefore, they are not included in the measure denominator. However, generally accepted radiology practices should be followed with respect to communication and management of these characteristically benign findings.</p> <p>Comment: One commenter recognized the changes to measure Q364 without issue. A second commenter supported the changes as they better fit the intent of these measures and will lessen clinical burden to some extent.</p> <p>Response: We thank the commenters for supporting the changes to this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q364 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.72 Depression Remission at Twelve Months

Category	Description
NQF # / eCQM NQF #:	0710 / 0710e
Quality#:	370
CMS eCQM ID:	CMS159v9
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	The percentage of adolescent patients 12 to 17 years of age and adult patients 18 years of age or older with major depression or dysthymia who reached remission 12 months (+/- 60 days) after an index event date.
Substantive Change:	<p>Modified collection type: eCQM Specifications and MIPS CQMs Specifications</p> <p>Updated guidance: For the eCQM Specifications collection type: Added: When a baseline assessment is conducted with PHQ 9M, the follow-up assessment can use either a PHQ 9M or PHQ 9. This eCQM is a patient-based measure. This version of the eCQM uses QDM version 5.5. Please refer to the eCQI resource center (https://ecqi.healthit.gov/qdm) for more information on the QDM.</p> <p>Updated denominator: For the MIPS CQMs Specifications collection type: Added telehealth with qualified non-physician healthcare professional.</p> <p>Updated denominator exclusion: For the eCQM Specifications collection type: Revised: Patients with a diagnosis of personality disorder emotionally labile.</p>
Steward:	Minnesota Community Measurement
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale:	<p>We proposed to update the guidance for eCQM Specifications collection type to add clarity regarding the assessment that may be used for the follow-up assessment for the purposes of meeting performance for this measure. Additionally, we proposed to revise the denominator exclusion language for a diagnosis of personality disorder to further clarify ensuring the correct patient population is being excluded from quality action assessment.</p> <p>We proposed to update the denominator of the MIPS CQMs Specifications collection type to include telehealth encounters with qualified non-physician healthcare professionals as it would be appropriate to assess this patient population for numerator compliance.</p> <p>We proposed to remove the CMS Web Interface Measure Specifications collection type. This collection type was proposed to be sunset for the purposes of MIPS starting with the 2021 performance year. We have determined it is not fiscally viable, feasible, or sustainable for MIPS to continue this collection type/submission type due to an 80 percent reduction and a continued decrease in interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures. For further rationale, please see section IV.A.3.c.(1)(c) of this final rule.</p>
<p>We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q370 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of the CMS Web Interface Specifications collection type. At § 414.1305, we proposed to modify the definition of the terms collection type and submission type by removing the CMS Web Interface Specifications as an available option starting with the 2023 payment year (85 FR 50290); however, the CMS Web Interface Measure Specifications collection type will be an available option for an extension of one additional year (2021 MIPS performance period/2023 MIPS payment year) and will be removed as a collection and submission type starting with the 2022 MIPS performance period/2024 MIPS payment year. None of the substantive changes above will be applied to the CMS Web Interface Measure Specifications for the 2021 MIPS performance period. The CMS Web Interface Measure Specifications for the 2021 MIPS performance period will reflect the 2020 CMS Web Interface Measure Specifications. Also, it should be noted that the CMS Web Interface Specifications collection type is not able to establish a benchmark for this measure. Thus, this measure will be excluded from the Merit-based Incentive Payment System (MIPS) scoring in accordance with § 414.1380(b)(1)(i)(A)(2)(i) provided that the measure meets the data completeness requirement and the data applicable to the measure is reported via the CMS Web Interface Measure Specifications.</p>	

D.73 Closing the Referral Loop: Receipt of Specialist Report

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	374
CMS eCQM ID:	CMS50v9
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	eCQM Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients with referrals, regardless of age, for which the referring provider receives a report from the provider to whom the patient was referred.
Substantive Change:	<p>Updated logic: For the eCQM Specifications collection type: Updated logic for 'First Referral During Measurement Period' to allow an additional, optional way to capture the first referral.</p> <p>Updated denominator: For all collection types: Added telehealth as eligible encounter.</p> <p>Updated numerator: For the eCQM Specifications collection type: Removed pathology consult note from 'Consultant Report' value set.</p>
Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	<p>We proposed to update the logic for 'First Referral During Measurement Period' to allow for a referral order, in addition to a referral being performed. This revision is consistent with the measure intent and provides options to capture the first referral within the electronic medical record. Additionally, we proposed to remove the pathology consult note from the 'Consultant Report' value set based upon terminology updates as the availability of the general consult note is available as an option.</p> <p>We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</p>
<p>Comment: One commenter supported the addition of telehealth reporting for measure Q374.</p> <p>Response: We thank the commenter for supporting the addition of telehealth reporting for this measure.</p> <p>Comment: One commenter requested additional clarification on the proposed updated eCQM logic to capture a referral order without a referral actually being made or conducted. It is unclear how a clinician can close the referral loop if a referral does not occur.</p> <p>Response: This revision is in alignment with the intent of the measure, which is to ensure patient's referred for an outside consultation complete the encounter with a consult report being returned to the referring physician. As the measure steward, we will review and consider revision of the coding within the measure for possible implementation in future years.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q374 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.74 Functional Status Assessments for Congestive Heart Failure

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	377
CMS eCQM ID:	CMS90v9
National Quality Strategy Domain:	Person and Caregiver-Centered Experience and Outcomes
Current Collection Type:	eCQM Specifications
Current Measure Description:	Percentage of patients 18 years of age and older with congestive heart failure who completed initial and follow-up patient-reported functional status assessments.
Substantive Change:	<p>Updated logic:</p> <p>Initial Patient Population: Revised timing of congestive heart failure (CHF) diagnosis in the initial population logic so it overlaps before the measurement period.</p> <p>Qualifying Encounter: Revised timing of the encounter from the start of the measurement period to the end of the measure period.</p> <p>Numerator:</p> <ul style="list-style-type: none"> Revised to ensure assessments completed during the encounter count toward the numerator. Revised KCCQ logic to address the 6 domain subcategories used to account for the KCCQ assessment total score. Added the KCCQ Total Assessment Score logic to include the summary score as an option to meet the KCCQ assessment requirement. Revised timing and logic of the follow-up functional status assessment (FSA) to relate to the initial FSA performed and not the encounter. Revised measurement period for the Veterans RAND 12 Item Health Survey (VR-12) to allow for the initial FSA to occur prior to the measurement period if the encounter occurs within the first few days of the measurement period.
Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	<p>We proposed to update the initial patient population logic to ensure the CHF diagnosis occurs before the denominator eligible encounter, which aligns more closely with the measure intent. We proposed to update the qualifying encounter logic to account for leap year. This refinement will eliminate the need to adjust the number of days for leap years. Additionally, we proposed to update the numerator logic for the Kansas City Cardiomyopathy Questionnaire (KCCQ) FSA so that it can be reported by either utilizing the six domain subcategories or the total score. This added flexibility better aligns with different clinical workflows, and is consistent with measure intent. The logic and timing were revised to relate to the initial functional status (FSA) and not the encounter to better align with the measure intent. We proposed, to all the VR-12, to allow for the initial FSA to occur prior to the measurement in the instance the encounter occurs within the first few days of the measurement period to improve harmonization with the measure intent.</p>
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q377 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.75 Children Who Have Dental Decay or Cavities

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	378
CMS eCQM ID:	CMS75v9
National Quality Strategy Domain:	Community/Population Health
Current Collection Type:	eCQM Specifications
Current Measure Description:	Percentage of children, age 0-20 years, who have had tooth decay or cavities during the measurement period.
Substantive Change:	<p>The description is revised to read: Percentage of children, 6 months - 20 years of age, who have had tooth decay or cavities during the measurement period.</p> <p>The stratification is revised to read: None</p> <p>The initial patient population is revised to read: Children, 6 months - 20 years of age, with a visit during the measurement period.</p> <p>Updated denominator: Removed: "Office Visit" (2.16.840.1.113883.3.464.1003.101.12.1001) "Preventive Care - Established Office Visit, 0 to 17" (2.16.840.1.113883.3.464.1003.101.12.1024) "Preventive Care Services - Established Office Visit, 18 and Up" (2.16.840.1.113883.3.464.1003.101.12.1025) "Preventive Care Services-Initial Office Visit, 18 and Up" (2.16.840.1.113883.3.464.1003.101.12.1023) "Preventive Care- Initial Office Visit, 0 to 17" (2.16.840.1.113883.3.464.1003.101.12.1022)</p>
Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale:	<p>We proposed to raise the minimum age for this measure to 6 months to better align with average tooth eruption. Children under 6 months of age are less likely to have teeth and would therefore not meet numerator criteria, which is why they are being removed from the initial patient population. Additionally, we proposed to update the denominator to limit the denominator eligible encounters to the "Clinical Oral Evaluation" value set as the clinical quality action is more appropriate for the dentistry MIPS eligible clinician.</p>
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q378 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.76 Primary Caries Prevention Intervention as Offered by Primary Care Providers, including Dentists

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	379
CMS eCQM ID:	CMS74v10
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	eCQM Specifications
Current Measure Description:	Percentage of children, age 0-20 years, who received a fluoride varnish application during the measurement period.
Substantive Change:	<p>The description is revised to read: Percentage of children, 6 months - 20 years of age, who received a fluoride varnish application during the measurement period.</p> <p>The stratification is revised to read: Population 1: age 6 months-5 years Population 2: age 6-12 Population 3: age 13-20</p> <p>The initial patient population is revised to read: Children, 6 months - 20 years of age, with a visit during the measurement period.</p>
Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to raise the minimum age for this measure to 6 months to better align with average tooth eruption. Children under 6 months of age are less likely to have teeth and would therefore not meet numerator criteria, which is why they are being removed from the initial patient population.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q379 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.77 Child and Adolescent Major Depressive Disorder (MDD): Suicide Risk Assessment

Category	Description
NQF # / eCQM NQF #:	N/A / 1365e
Quality#:	382
CMS eCQM ID:	CMS177v9
National Quality Strategy Domain:	Patient Safety
Current Collection Type:	eCQM Specifications
Current Measure Description:	Percentage of patient visits for those patients aged 6 through 17 years with a diagnosis of major depressive disorder with an assessment for suicide risk.
Substantive Change:	Updated guidance: Added: In recognition of the growing use of integrated and team-based care, the diagnosis of depression and the assessment for suicide risk need not be performed by the same provider or clinician.
Steward:	Mathematica
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	The measure steward updated the guidance statement based upon technical expert feedback to reflect that team-based care would be appropriate for this measure. We agreed that this guidance update is clinically appropriate and aligns better with clinical care workflows.
<p>Comment: One commenter stated that guidance reads “A suicide risk assessment should be performed at every visit for major depressive disorder during the measurement period.” Feedback from specialists in this field voice the following: “Our concern is that therapists provide group visits and some of those teens have MDD on their problem list. Currently, suicide risk assessments are not conducted at group visits. Most patients who attend group visits also have a cadence of seeing their therapists separately.” The commenter recommended that this requirement make exceptions of the required suicide assessment during group visits.</p> <p>Response: We thank the commenter for their comment. We encourage the commenter to reach out to the measure steward to discuss revisions for possible implementation in future years.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q382 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.78 Adherence to Antipsychotic Medications For Individuals with Schizophrenia	
Category	Description
NQF # / eCQM NQF #:	1879 / N/A
Quality#:	383
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Patient Safety
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of individuals at least 18 years of age as of the beginning of the measurement period with schizophrenia or schizoaffective disorder who had at least two prescriptions filled for any antipsychotic medication and who had a Proportion of Days Covered (PDC) of at least 0.8 for antipsychotic medications during the measurement period (12 consecutive months).
Substantive Change:	<p>The description is revised to read: Percentage of individuals at least 18 years of age with schizophrenia or schizoaffective disorder as of the beginning of the performance period who had at least two prescriptions filled for any antipsychotic medication and who had a Proportion of Days Covered (PDC) of at least 0.8 for antipsychotic medications during the performance period.</p> <p>Updated instructions: Revised: This measure is to be submitted a minimum of once per performance period for all patients with a preexisting (before the performance period) diagnosis of schizophrenia or schizoaffective disorder who are seen during the performance period.</p> <p>The denominator statement is revised to read: Individuals at least 18 years of age with schizophrenia or schizoaffective disorder as of the beginning of the performance period and at least two prescriptions filled for antipsychotic medications during the performance period.</p> <p>Updated denominator criteria: Revised the timing for the diagnosis for schizophrenia or schizoaffective disorder to be prior to the performance period.</p> <p>Updated denominator exclusion: Added opioid abuse with intoxication with perceptual disturbance to diagnosis for dementia.</p> <p>Updated numerator note: Revised: PDC NUMERATOR: The PDC numerator is the sum of the days covered by the days' supply of all antipsychotic prescriptions. The period covered by the PDC starts on the day within the performance period when the first prescription is filled (i.e., the index date) and lasts through the end of the performance period, or death, whichever comes first. For prescriptions with a days' supply that extends beyond the end of the performance period, count only the days for which the drug was available to the individual during the performance period. If there are prescriptions for the same drug (generic name) on the same date of service, keep the prescription with the largest days' supply. If prescriptions for the same drug (generic name) overlap, then adjust the prescription start date to be the day after the previous fill has ended.</p>
Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	Yes
Measure Type:	Intermediate Outcome
Rationale:	<p>We proposed to update the measure language to reflect that the diagnosis of schizophrenia or schizoaffective disorder should be prior to the performance period as this aligns more closely to the intent of the measure and allows for assessment of medication adherence over a longer timeframe. We proposed to remove the "12 consecutive months" from the description as this was causing confusion amongst MIPS eligible clinicians. The denominator exclusion coding was expanded to include opioid abuse with intoxication with perceptual disturbance as this is appropriate for identifying patients with a dementia diagnosis and therefore, applicable to the denominator exclusion. Additionally, we proposed to update the numerator note to clarify that the index date is the date the prescription was first filled during the performance period.</p> <p>We, as the measure steward, have decided not to finalize the substantive change to revise the timing of the diagnosis for schizophrenia or schizoaffective disorder to be prior to the performance period, to ensure patient safety and drive positive clinical outcomes. Research has shown that adherence to antipsychotic medications in individuals with first-episode psychosis (FEP) improves patient outcomes while preventing downstream harm. Treatment FEP has shown favorable outcomes, including positive effects on likelihood of remission and risk/rate of relapse, and improvement in cognitive deficits (Karson, C., et al. <i>Neuropsychiatric Disease and Treatment</i>, 12, 57-67). Given the potential long-term benefits for treatment of FEP, we believe that it is important to assess all patients with a diagnosis for schizophrenia or schizoaffective disorder for medication adherence, regardless of when diagnosed. This aligns with our healthcare priority of promoting effective treatment of chronic diseases and current clinical best practices.</p> <p>We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q383 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years, with the exception of the revisions in the timing of diagnosis for schizophrenia or schizoaffective disorder. This revision is located within the description, instructions, denominator statement, and denominator criteria and will be updated as needed for clarity of the concept as needed within the specification.</p>

D.79 Amyotrophic Lateral Sclerosis (ALS) Patient Care Preferences

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	386
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Person and Caregiver-Centered Experience and Outcomes
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients diagnosed with Amyotrophic Lateral Sclerosis (ALS) who were offered assistance in planning for end of life issues (e.g., advance directives, invasive ventilation, hospice) at least once annually.
Substantive Change:	Updated denominator: Added telehealth as eligible encounter.
Steward:	American Academy of Neurology
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.
<p>Comment: One commenter supported the addition of telehealth reporting for measure Q386.</p> <p>Response: We thank the commenter for supporting the addition of telehealth reporting for this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q386 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.80 Annual Hepatitis C Virus (HCV) Screening for Patients who are Active Injection Drug Users

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	387
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients, regardless of age, who are active injection drug users who received screening for HCV infection within the 12-month reporting period.
Substantive Change:	Updated denominator: Added telehealth as eligible encounter.
Steward:	American Gastroenterological Association
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.
<p>Comment: Several commenters supported the addition of telehealth reporting for measure Q387.</p> <p>Response: We thank the commenters for supporting the addition of telehealth reporting for this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q387 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.81 Follow-Up After Hospitalization for Mental Illness (FUH)

Category	Description
NQF # / eCQM NQF #:	0576 / N/A
Quality#:	391
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	The percentage of discharges for patients 6 years of age and older who were hospitalized for treatment of selected mental illness or intentional self-harm diagnoses and who had a follow-up visit with a mental health practitioner. Two rates are submitted: <ul style="list-style-type: none"> • The percentage of discharges for which the patient received follow-up within 30 days after discharge. • The percentage of discharges for which the patient received follow-up within 7 days after discharge.
Substantive Change:	Updated numerator options: Revised: Submission Criteria 1: Performance Met: Patient received follow-up within 30 days after discharge.
Steward:	National Committee for Quality Assurance
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to update the performance met numerator option to align with the numerator statement, which prohibits the use of visits that occur on the date of discharge, as this would not meet the intent of the measure.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q391 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.82 Immunizations for Adolescents

Category	Description
NQF # / eCQM NQF #:	1407 / N/A
Quality#:	394
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Community/Population Health
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	The percentage of adolescents 13 years of age who had the recommended immunizations by their 13th birthday.
Substantive Change:	The description is revised to read: The percentage of adolescents 13 years of age who had one dose of meningococcal vaccine (serogroups A, C, W, Y), one tetanus, diphtheria toxoids and acellular pertussis (Tdap) vaccine, and have completed the human papillomavirus (HPV) vaccine series by their 13th birthday.
Steward:	National Committee for Quality Assurance
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to revise the description to detail the components within the measure. This allows for a more clear understanding of the intent of the measure.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q394 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.83 Lung Cancer Reporting (Biopsy/Cytology Specimens)

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	395
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Communication and Care Coordination
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Pathology reports based on biopsy and/or cytology specimens with a diagnosis of primary non-small cell lung cancer classified into specific histologic type or classified as non-small cell lung cancer not otherwise specified (NSCLC-NOS) with an explanation included in the pathology report.
Substantive Change:	The numerator is revised to read: For all collection types: Biopsy and cytology specimen reports with a diagnosis of primary non-small cell lung cancer classified into specific histologic type (including but not limited to squamous cell carcinoma, adenocarcinoma, large cell carcinoma) OR classified as NSCLC-NOS with an explanation included in the pathology report.
Steward:	College of American Pathologists
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to update the numerator statement to more clearly detail the acceptable histologic types. This revision, provided based on stakeholder feedback, includes keywords that are can be used in clinical practice.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q395 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.84 One-Time Screening for Hepatitis C Virus (HCV) for Patients at Risk

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	400
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 18 years and older with one or more of the following: a history of injection drug use, receipt of a blood transfusion prior to 1992, receiving maintenance hemodialysis, OR birthdate in the years 1945-1965 who received one-time screening for hepatitis C virus (HCV) infection.
Substantive Change:	Updated denominator: Added telehealth as eligible encounter.
Steward:	American Gastroenterological Association
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.
<p>Comment: Several commenter supported the addition of telehealth reporting for measure Q400.</p> <p>Response: We thank the commenters for supporting the addition of telehealth reporting for this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q400 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.85 Appropriate Follow-up Imaging for Incidental Abdominal Lesions

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	405
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of final reports for imaging studies for patients aged 18 years and older with one or more of the following noted incidentally with a specific recommendation for no follow-up imaging recommended based on radiological findings: <ul style="list-style-type: none"> • Cystic renal lesion that is simple appearing* (Bosniak I or II) • Adrenal lesion less than or equal to 1.0 cm • Adrenal lesion greater than 1.0 cm but less than or equal to 4.0 cm classified as likely benign by unenhanced CT or washout protocol CT, or MRI with in- and opposed-phase sequences or other equivalent institutional imaging protocols
Substantive Change:	<p>The description is revised to read: Percentage of final reports for imaging studies for patients aged 18 years and older with one or more of the following noted incidentally with a specific recommendation for no follow-up imaging recommended based on radiological findings:</p> <ul style="list-style-type: none"> • Cystic renal lesion that is simple appearing* (Bosniak I or II) • Adrenal lesion less than or equal to 1.0 cm • Adrenal lesion greater than 1.0 cm but less than or equal to 4.0 cm classified as likely benign or diagnostic benign by unenhanced CT or washout protocol CT, or MRI with in- and opposed-phase sequences or other equivalent institutional imaging protocols <p>The denominator is revised to read: For all collection types: All final reports for imaging studies for patients aged 18 years and older with one or more of the following incidentally noted:</p> <ul style="list-style-type: none"> • Cystic renal lesion that is simple appearing (Bosniak I or II) <p>or</p> <ul style="list-style-type: none"> • Adrenal lesion less than or equal to 1.0 cm <p>or</p> <ul style="list-style-type: none"> • Adrenal lesion greater than 1.0 cm but less than or equal to 4.0 cm classified as likely benign or diagnostic benign by unenhanced CT or washout protocol CT, or MRI with in- and opposed-phase sequences or other equivalent institutional imaging protocols <p>Updated denominator criteria: For all collection types: Removed diagnostic ultrasound procedures.</p> <p>The denominator note is revised to read: For all collection types: The intent of this measure is to ensure patients with incidental findings that are highly likely to be benign do not receive follow up imaging routinely. * “Simple-appearing criteria”:</p> <ul style="list-style-type: none"> • § Incidental renal mass on non-contrast enhanced abdominal CT that does not contain fat, is homogenous in appearance, -10-20 HU or ≥70 HU. (ACR, 2017) • § Incidental renal mass on contrast-enhanced abdominal CT that does not contain fat, is homogenous in appearance, -10-20 HU. (ACR, 2017) <p>When reporting this measure, masses and lesions that do not meet all the criteria for “no further work-up” as provided in Management of the Incidental Renal Mass on CT: A White Paper of the ACR Incidental Findings Committee or the Management of the Incidental Adrenal Mass on CT: A White Paper of the ACR Incidental Findings Committee should not be considered in the context or intent of this measure. However, generally accepted radiology practices should be followed for communication and management of any characteristically benign findings. A measure performance goal of 100% should not substitute for clinical judgment in individual cases.</p> <p>Updated numerator note: For the Medicare Part B Claims Measure Specifications collection type: Removed numerator note.</p> <p>Updated numerator options: For all collection types: Revised:</p> <p>Performance Not Met: Final reports for imaging studies with follow-up imaging recommended, or final reports that do not include a specific recommendation of no follow-up.</p>
Steward:	American College of Radiology
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	<p>We proposed to update the numerator options to add clarifying language that accounts for those instances where no follow-up recommendation is given within the final reports for imaging studies. The intent of the measure includes the documentation of follow-up recommendations within the final report. Additionally, we proposed to remove diagnostic ultrasound procedures from the denominator eligible criteria as it does not align with the intent of the measure.</p> <p>We proposed a substantive change to the denominator note; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state:</p> <p>The intent of this measure is to ensure patients with incidental findings that are highly likely to be benign do not receive follow up imaging routinely. * “Simple-appearing criteria”:</p> <ul style="list-style-type: none"> • § Incidental renal mass on non-contrast enhanced abdominal CT that does not contain fat, is homogenous in appearance, -10-20 HU or ≥70 HU. (ACR, 2017) • § Incidental renal mass on contrast-enhanced abdominal CT that does not contain fat, is homogenous in appearance, -10-20 HU. (ACR, 2017) <p>When reporting this measure, masses and lesions that do not meet all the criteria for “no further work-up” as provided in Management of the Incidental Renal Mass on CT: A White Paper of the ACR Incidental Findings Committee or the Management of the Incidental Adrenal Mass on CT: A White Paper of the ACR Incidental Findings Committee should not be considered in the context or intent of this measure. However, generally accepted radiology practices should be followed with respect to communication and management of any characteristically benign findings. A measure performance goal of 100% should not substitute for clinical judgment in individual cases.</p> <p>This additional refinement of changing “for communication” to “with respect to communication” does not affect the intent of the proposed substantive change.</p>

Category	Description
	<p>Comment: One commenter supported the changes to measure Q405 as they better fit the intent of these measures and will lessen clinical burden to some extent.</p> <p>Response: We thank the commenter for supporting the changes to this measure.</p> <p>Comment: One commenter believed that the changes to measure Q405 should be more comprehensive. The measure focuses exclusively on reporting “no-follow up recommended” for incidental and likely benign renal and adrenal lesions. While the commenter understood the intention to address inappropriate use of imaging, the measure neglects appropriate usage. It should also support evidence-based recommendations for follow-up of worrisome lesions. A more balanced approach would indicate performance met when specific evidence-based guidance is used for necessary follow-up and when no follow-up is necessary, as included in the measure steward’s two white papers referenced in the measure.</p> <p>Response: We encourage the commenter to reach out the measure steward to discuss possible revisions for consideration for future implementation.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q405 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>

D.86 Psoriasis: Clinical Response to Systemic Medications

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	410
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Person and Caregiver-Centered Experience and Outcomes
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of psoriasis vulgaris patients receiving systemic medication who meet minimal physician-or patient- reported disease activity levels. It is implied that establishment and maintenance of an established minimum level of disease control as measured by physician-and/or patient-reported outcomes will increase patient satisfaction with and adherence to treatment.
Substantive Change:	<p>The instructions are revised to read: This measure is to be submitted a minimum of once per performance period for all patients during the performance period. The most recent denominator eligible encounter in which the numerator action was performed, should be used.</p> <p>Updated denominator: Added telehealth as eligible encounter.</p>
Steward:	American Academy of Dermatology
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale:	<p>We proposed to revise the instructions language to clarify what denominator eligible encounter should be used when assessing the quality action.</p> <p>We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</p>
<p>Comment: One commenter supported the addition of telehealth reporting for measure Q410.</p> <p>Response: We thank the commenter for supporting the addition of telehealth reporting for this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q410 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.87 Emergency Medicine: Emergency Department Utilization of CT for Minor Blunt Head Trauma for Patients Aged 18 Years and Older

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	415
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Efficiency and Cost Reduction
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of emergency department visits for patients aged 18 years and older who presented with a minor blunt head trauma who had a head CT for trauma ordered by an emergency care provider who have an indication for a head CT.
Substantive Change:	<p>Updated denominator criteria: Diagnosis for minor blunt head trauma - removed coding for fracture of skull and facial bones and superficial injury of neck.</p> <p>The definition is revised to read: Indications for a head CT in patients presenting to the emergency department for minor blunt head trauma: Patients with no loss of consciousness (LOC) AND no post-traumatic amnesia AND any one of the following:</p> <ul style="list-style-type: none"> • GCS score less than 15 • Severe headache • Vomiting • Age 65 years and older • Physical signs of a basilar skull fracture (signs include haemotympanum, "raccoon" eyes, cerebrospinal fluid leakage from the ear or nose, Battle's sign) • Focal neurological deficit • Coagulopathy • Thrombocytopenia • Currently taking any of the following anticoagulant medications*: apixaban, argatroban, betrixaban, bivalirudin, dabigatran, dalteparin, desirudin, edoxaban, enoxaparin, fondaparinux, heparin, rivaroxaban, warfarin • Dangerous mechanism of injury (i.e., ejection from a motor vehicle, a pedestrian struck, and a fall from a height of more than 3 feet or 5 stairs) <p>OR</p> <p>Patients with either LOC OR Posttraumatic amnesia AND any one of the following:</p> <ul style="list-style-type: none"> • GCS score less than 15 • Headache • Age 60 years and older, and less than 65 years • Drug/alcohol intoxication • Short-term memory deficits • Evidence of trauma above the clavicles (physical location, any trauma to the head or neck [i.e., laceration, abrasion, bruising, ecchymosis, hematoma, swelling, fracture]) • Posttraumatic seizure.
Steward:	American College of Emergency Physicians
High Priority Measure:	Yes
Measure Type:	Efficiency
Rationale:	<p>We proposed to update the coding for 'Diagnosis of minor blunt head trauma' base on the measure steward's clinical expert input as closed fractures of the skull and facial bones, as well as concepts that relate to neck of below the head anatomical locations. The measures intent is to capture those patients with minor blunt head trauma and the fractures captured above are not clinically appropriate for the denominator criteria and should not be assessed for the purposes of this measure. We proposed revisions to the definition language to improve clarity regarding indications for a head CT for the purposes of this measure. We agreed that these revisions better define how to determine appropriate indication(s) for a head CT.</p>
<p>Comment: One commenter supported the substantive changes to measure Q415, which will improve clarity regarding indications for a head CT for the purposes of this measure.</p> <p>Response: We thank the commenter for supporting the changes to measure Q415.</p> <p>After consideration of publication comments, we are finalizing the changes to measure Q415 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.88 Emergency Medicine: Emergency Department Utilization of CT for Minor Blunt Head Trauma for Patients Aged 2 Through 17 Years

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	416
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Efficiency and Cost Reduction
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of emergency department visits for patients aged 2 through 17 years who presented with a minor blunt head trauma who had a head CT for trauma ordered by an emergency care provider who are classified as low risk according to the Pediatric Emergency Care Applied Research Network (PECARN) prediction rules for traumatic brain injury.
Substantive Change:	<p>Updated denominator criteria: Diagnosis for minor blunt head trauma - removed coding for fracture of skull and facial bones and superficial injury of neck.</p> <p>The numerator definition is revised to read: For all collection types: Low Risk for Traumatic Brain Injury according to PECARN prediction rules – Patients can be classified as low risk if ALL of the following are met:</p> <ul style="list-style-type: none"> • No signs of altered mental status (e.g., agitation, somnolence, repetitive questioning, slow response to verbal communication) OR no GCS < 15 • No signs of basilar skull fracture (signs include haemotympanum, “raccoon” eyes, cerebrospinal fluid leakage from the ear or nose, Battle’s sign) • No loss of consciousness • No vomiting • No severe mechanism of injury (i.e., motor vehicle crash with patient ejection, death of another passenger, or rollover; pedestrian or bicyclist without helmet struck by a motorized vehicle; falls of more than 5 feet; or head struck by a high-impact object) • No severe headache.
Steward:	American College of Emergency Physicians
High Priority Measure:	Yes
Measure Type:	Efficiency
Rationale:	<p>We proposed to update the coding for ‘Diagnosis of minor blunt head trauma’ base on the measure steward’s clinical expert input as closed fractures of the skull and facial bones, as well as concepts that relate to neck of below the head anatomical locations. The measures intent is to capture those patients with minor blunt head trauma and the fractures captured above are not clinically appropriate for the denominator criteria and should not be assessed for the purposes of this measure. We proposed revisions to the definition language to improve clarity regarding low risk for traumatic brain injury (TBI) for the purposes of this measure. We agreed that these revisions better define how to appropriately determine whether the patient is low risk for traumatic brain injury or not.</p>
<p>Comment: One commenter supported the substantive changes to measure Q416, which will improve clarity regarding indications for a head CT for the purposes of this measure.</p> <p>Response: We thank the commenter for supporting the changes to measure Q416.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q416 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.89 Osteoporosis Management in Women Who Had a Fracture

Category	Description
NQF # / eCQM NQF #:	0053 / N/A
Quality#:	418
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	The percentage of women age 50-85 who suffered a fracture in the six months prior to the performance period through June 30 of the performance period and who either had a bone mineral density test or received a prescription for a drug to treat osteoporosis in the six months after the fracture.
Substantive Change:	<p>Updated denominator criteria: For all collection types: Option 1: Added denominator eligible patient encounters including discharge, outpatient observation, outpatient consultation, emergency department, home services, preventive medicine and counseling, work related/medical disability, care planning, and annual well check.</p> <p>Updated denominator exclusions: For all collection type: Option 1 and Option 2: Revised:</p> <ol style="list-style-type: none"> 1. Patients age 66 or older in Institutional Special Needs Plans (SNP) or residing in long-term care with POS code, 32, 33, 34, 54, or 56 for more than 90 consecutive days during 6 months prior to the measurement period through December 31 of the measurement period. 2. Patient 66 - 80 years of age and had at least one claim/encounter for frailty during the measurement period AND either one acute inpatient encounter with a diagnosis of advanced illness or two outpatient, observation, ED or nonacute inpatient encounters on different dates of service with an advanced illness diagnosis during the measurement period or the year prior to the measurement period. 3. Patients 66 - 80 years of age and had at least one claim/encounter for frailty during the measurement period AND a dispensed medication for dementia during the measurement period or the year prior to the measurement period. <p>Added:</p> <ol style="list-style-type: none"> 1. Patients 81 years of age and older with at least one claim/encounter for frailty during 6 months prior to the measurement period through December 31 of the measurement period. <p>Updated denominator exclusion: For all collection types: For Option 1 and Option 2: Added coding to identify patients with advanced illness and frailty</p> <p>Updated definition: For all collection types: Revised: Pharmacologic Therapy – U.S. Food and Drug Administration approved pharmacologic options for osteoporosis prevention and/or treatment of postmenopausal osteoporosis include: bisphosphonates, alendronate, alendronate-cholecalciferol, ibandronate, risedronate, zoledronic acid, teriparatide, denosumab, abaloparatide, romosozumab, and raloxifene.</p>
Steward:	National Committee for Quality Assurance
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed to expand the eligible encounter coding for Option 1 to include all relevant encounters and create a more complete eligible patient population.</p> <p>We proposed that the denominator exclusion language and logic be updated in all collection types to clarify that, for the measure, long-term care will be defined as patients staying 90 consecutive days at the long-term care facility versus any 90 days within the performance period. A denominator exclusion was added to remove patient 81 years of age and older with a frailty encounter during the measurement period as patients within this age stratification are more appropriately assessed less stringently when determine if they should be excluded from the eligible patient population. Additionally, we proposed adding applicable coding to better define the advanced illness and frailty patient population for the purposes of this measure.</p> <p>We proposed to update the definition for pharmacologic therapy to align with the current U.S. Food and Drug Administration approved pharmacologic options for osteoporosis prevention and/or treatment of postmenopausal osteoporosis.</p>
<p>We proposed a substantive change to the denominator exclusions; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state:</p> <p>Updated denominator exclusions: For all collection type: Option 1 and Option 2: Revised:</p> <ol style="list-style-type: none"> 1. Patients age 66 or older in Institutional Special Needs Plans (SNP) or residing in long-term care with POS code, 32, 33, 34, 54, or 56 for more than 90 consecutive days during the six months prior to the measurement period through December 31 of the measurement period 2. Patients 66 - 80 years of age with at least one claim/encounter for frailty during the measurement period AND a dispensed medication for dementia during the measurement period or the year prior to the measurement period 3. Patients 66 - 80 years of age with at least one claim/encounter for frailty during the measurement period AND either one acute inpatient encounter with a diagnosis of advanced illness or two outpatient, observation, ED or nonacute inpatient encounters on different dates of service with an advanced illness diagnosis during the measurement period or the year prior to the measurement period <p>Added:</p> <ol style="list-style-type: none"> 1. Patients 81 years of age and older with at least one claim/encounter for frailty during the six months prior to the measurement period through December 31 of the measurement period <p>This additional refinement does not affect the intent of the proposed substantive change.</p> <p>We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q418 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.90 Overuse of Imaging for the Evaluation of Primary Headache

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	419
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Efficiency and Cost Reduction
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of patients for whom imaging of the head (CT or MRI) is obtained for the evaluation of primary headache when clinical indications are not present.
Substantive Change:	<p>Modified collection type: MIPS CQMs Specifications</p> <p>Updated denominator criteria: Removed inpatient setting. Removed "Patients with no clinical indications for imaging of the head". Added telehealth as eligible encounter.</p> <p>Updated denominator instructions: Removed denominator instructions.</p> <p>Updated denominator exclusion: Added: Patients with clinical indications for imaging of the head</p> <ul style="list-style-type: none"> • Head trauma • New or change in headache above 50 years of age • Abnormal neurologic exam • Headache radiating to the neck • Positional headaches • Temporal headaches in patients over 55 years of age • New onset headache in pre-school children or younger (<6 years of age) • New onset headache in pediatric patients with disabilities for which headache is a concern as inferred from behavior • Occipital headache in children • Thunderclap headache • Trigeminal pain • Persistent headaches <p>Updated denominator exception: Revised: Imaging needed as part of a clinical trial; or other clinician ordered the study.</p>
Steward:	American Academy of Neurology
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	<p>We proposed to remove the Medicare Part B Claims Measure Specifications collection type. The limited adoption of the quality measure for this collection type does not allow for the creation of benchmarks to provide a meaningful impact to quality improvement.</p> <p>We proposed to update the denominator criteria to remove the inpatient setting as this measure is appropriate for the outpatient setting only. We proposed to remove the denominator criteria for patients with no clinical indications for head imaging and replace it with a denominator exclusion that clarifies patients with clinical indications for whom imaging of the head would be clinically relevant and warranted. The denominator instructions were removed as they were duplicative of the added denominator exclusion. Additionally, we proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured. The denominator exception is being updated to delete outdated language and no longer allows for system reason(s).</p>
<p>Comment: One commenter requested the removal of Medicare Part B Claims Measure Specifications for measure Q419 through the measure review process. The commenter noted that these changes were not reflected in the 2021 PFS proposed rule and the measure specifications should be removed, as the measures steward is no longer maintaining these specifications. A second commenter opposed the removal of the Claims collection type because it would adversely impact ophthalmologists, particularly those in small and rural practices who must rely on the claims reporting collection type because they cannot afford to adopt CEHRT.</p> <p>Response: We refer the commenter to the substantive change proposed to include a modification to the collection type resulting in the removal of the Medicare Part B Claims Measure Specification. We thank the commenter for their support in the removal of the Medicare Part B Claims Measure Specification collection type.</p> <p>Comment: One commenter supported and one commenter did not support the addition of telehealth reporting for measure Q419.</p> <p>Response: We believe that including telehealth encounters as denominator eligible as this will lead to a more complete patient population to ensure appropriate use of imaging for a diagnosis of primary headache. We encourage the commenter who did not support adding telehealth to this measure to reach out to the measure steward to discuss revisions for possible implementation in future years.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q419 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.91 Preventive Care and Screening: Unhealthy Alcohol Use: Screening & Brief Counseling

Category	Description
NQF # / eCQM NQF #:	2152 / N/A
Quality#:	431
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Community/Population Health
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	<p>Percentage of patients aged 18 years and older who were screened for unhealthy alcohol use using a systematic screening method at least once within the last 24 months AND who received brief counseling if identified as an unhealthy alcohol user.</p> <p>The description is revised to read: Percentage of patients aged 18 years and older who were screened for unhealthy alcohol use using a systematic screening method at least once within the last 12 months AND who received brief counseling if identified as an unhealthy alcohol user.</p> <p>Updated instructions: Revised: For the purposes of the measure, the most recent denominator eligible encounter should be used to determine if the numerator action for the submission criteria was performed within the 12-month look back period. Added: This measure will be calculated with 3 performance rates: 1) Percentage of patients aged 18 years and older who were screened for unhealthy alcohol use using a systematic screening method at least once within the last 12 months 2) Percentage of patients aged 18 years and older who were identified as unhealthy alcohol users who received brief counseling 3) Percentage of patients aged 18 years and older who were screened for unhealthy alcohol use using a systematic screening method at least once within the last 12 months AND who received brief counseling if identified as unhealthy alcohol users The denominator of submission criteria 2 is a subset of the resulting numerator for submission criteria 1, as submission criteria 2 is limited to assessing if patients identified as unhealthy alcohol users received brief counseling. For all patients, submission criteria 1 and 3 are applicable, but submission criteria 2 will only be applicable for those patients who are identified as unhealthy alcohol users. Therefore, data for every patient that meets the age and encounter requirements will only be submitted for submission criteria 1 and 3, whereas data submitted for submission criteria 2 will be for a subset of patients who meet the age and encounter requirements, as the denominator has been further limited to those who were identified as unhealthy alcohol users.</p> <p>THERE ARE THREE SUBMISSION CRITERIA FOR THIS MEASURE: 1) All patients who were screened for unhealthy alcohol use using a systematic screening method AND 2) All patients who were identified as unhealthy alcohol users who received brief counseling AND 3) All patients who were screened for unhealthy alcohol use using a systematic screening method and, if identified as unhealthy alcohol users received brief counseling, or were not identified as unhealthy alcohol users This measure contains three submission criteria which aim to identify patients who were screened for unhealthy alcohol use using a systematic screening method (submission criteria 1), patients who were identified as unhealthy alcohol users and who received brief counseling (submission criteria 2), and a comprehensive look at the overall performance on unhealthy alcohol use screening and brief counseling (submission criteria 3). By separating this measure into various submission criteria, the MIPS eligible professional or MIPS eligible clinician will be able to better ascertain where gaps in performance exist, and identify opportunities for improvement. The overall rate (submission criteria 3) should be utilized to compare performance to published versions of this measure prior to the 2021 performance year, when the measure had a single performance rate. For accountability reporting in the CMS MIPS program, the rate for submission criteria 2 is used for performance.</p> <p>The denominator is revised to read: Submission Criteria 1: All patients aged 18 years and older seen for at least two visits or at least one preventive visit during the measurement period. Submission Criteria 2: All patients aged 18 years and older seen for at least two visits or at least one preventive visit during the measurement period who were screened for unhealthy alcohol use and identified as an unhealthy alcohol user. Submission Criteria 3: All patients aged 18 years and older seen for at least two visits or at least one preventive visit during the measurement period.</p> <p>Updated denominator: Added telehealth as eligible encounter.</p> <p>The numerator is revised to read: Submission Criteria 1: Patients who were screened for unhealthy alcohol use using a systematic screening method at least once within the last 12 months. Submission Criteria 2: Patients who received brief counseling. Submission Criteria 3: Patients who were screened for unhealthy alcohol use using a systematic screening method at least once within 12 months AND who received brief counseling if identified as an unhealthy alcohol user.</p> <p>The numerator definition is revised to read: Submission Criteria 1: Systematic screening method – For purposes of this measure, one of the following systematic methods to assess unhealthy alcohol use must be utilized. Systematic screening methods and thresholds for defining unhealthy alcohol use include: • AUDIT Screening Instrument (score ≥ 4) • AUDIT-C Screening Instrument (score ≥ 4 for men; score ≥ 3 for women) • Single Question Screening - How many times in the past year have you had 5 (for men) or 4 (for women and all adults older than 65 years) or more drinks in a day? (response ≥ 1). Submission Criteria 2 and 3: Brief counseling – Brief counseling for unhealthy alcohol use refers to one or more counseling sessions, a minimum of 5-15 minutes, which may include: feedback on alcohol use and harms; identification of high risk situations for drinking and coping strategies; increased motivation and the development of a personal plan to reduce drinking.</p>

Substantive Change:

Category	Description
	<p>Updated numerator note: Submission Criteria 1: Added: To satisfy the intent of this measure, a patient must have at least one screening for unhealthy alcohol use during the 12-month period. If a patient has multiple screenings for unhealthy alcohol use during the 12-month period, only the most recent screening, which has a documented status of unhealthy alcohol user or unhealthy alcohol non-user, will be used to satisfy the measure requirements. Submission Criteria 2: Added: In the event that a patient is screened for unhealthy alcohol use and identified as an unhealthy user but did not receive brief alcohol cessation counseling submit GXXXX. Denominator Exception(s) are determined on the date of the most recent denominator eligible encounter for all submission criteria. Submission Criteria 3: Added: To satisfy the intent of this measure, a patient must have at least one unhealthy alcohol use screening during the 12-month period. If a patient has multiple unhealthy alcohol use screenings during the 12-month period, only the most recent screening, which has a documented status of unhealthy alcohol user or unhealthy alcohol non-user, will be used to satisfy the measure requirements. In the event that a patient is screened for unhealthy alcohol use and identified as an unhealthy user but did not receive brief alcohol cessation counseling submit G9624. Denominator Exception(s) are determined on the date of the most recent denominator eligible encounter for all submission criteria.</p> <p>Updated numerator options: Submission Criteria 1: Revised: Performance Met: Patient identified as an unhealthy alcohol user when screened for unhealthy alcohol use using a systematic screening method. Performance Not Met: Patient not screened for unhealthy alcohol use using a systematic screening method, reason not given. Submission Criteria 2: Added: Performance Met: Patient identified as an unhealthy alcohol user received brief counseling. Denominator Exception: Documentation of medical reason(s) for not providing brief counseling (e.g., limited life expectancy, other medical reasons). Performance Not Met: Patient did not receive brief counseling if identified as an unhealthy alcohol user, reason not given. Submission Criteria 3: Performance Met: Patient identified as an unhealthy alcohol user when screened for unhealthy alcohol use using a systematic screening method and received brief counseling. Performance Met: Patient not identified as an unhealthy alcohol user when screened for unhealthy alcohol use using a systematic screening method. Denominator Exception: Documentation of medical reason(s) for not screening for unhealthy alcohol use (e.g., limited life expectancy, other medical reasons). Denominator Exception: Documentation of medical reason(s) for not providing brief counseling if identified as an unhealthy alcohol user (e.g., limited life expectancy, other medical reasons). Performance Not Met: Patient not screened for unhealthy alcohol use using a systematic screening method OR patient did not receive brief counseling if identified as an unhealthy alcohol user, reason not given.</p> <p>Updated performance rate calculation: Revised into three submission criteria. Submission Criteria 2 will be used for benchmarking purposes.</p>
Steward:	National Committee for Quality Assurance
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed to update the measure overall by splitting the measure into separate populations for three submission criteria. This will allow MIPS eligible clinicians to more readily find where the gaps in performance lie, allowing them to be better informed and able to adjust to improve quality care and patient outcomes. We proposed to revise the measure to shorten the look back period to 12 months and require that unhealthy alcohol screening who received brief counseling, if patient screened positive, occur every 12 months. The revision is based upon stakeholder feedback and input from the eQIM Clinical Review Process (CRP) and the measure steward's technical expert panel (TEP) and we agreed that it is important to do this annually excessive alcohol use is one of the most common causes of premature mortality in the United States (https://www.uspreventiveservicestaskforce.org/Page/Document/RecommendationStatementFinal/unhealthy-alcohol-use-in-adolescents-and-adults-screening-and-behavioral-counseling-interventions). The numerator definition for Systematic screening method has been revised to align with current recommendations for the AUDIT C and the Single Questions Screening threshold.</p> <p>We proposed to add telehealth encounters as denominator eligible as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured. In the event the proposed substantive change(s) were finalized, the substantive changes would not allow for a direct comparison of performance data from prior years to performance data submitted after the implementation of these substantive changes.</p>
Comment: Several commenters supported the addition of telehealth reporting for measure Q431.	
Response: We thank the commenters for supporting the addition of telehealth reporting for this measure.	
After consideration of public comments, we are finalizing the changes to measure Q431 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.92 Statin Therapy for the Prevention and Treatment of Cardiovascular Disease	
Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	438
CMS eCQM ID:	CMS347v4
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	eCQM Specifications, CMS Web Interface Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of the following patients - all considered at high risk of cardiovascular events - who were prescribed or were on statin therapy during the measurement period: <ul style="list-style-type: none"> Adults aged ≥ 21 years who were previously diagnosed with or currently have an active diagnosis of clinical atherosclerotic cardiovascular disease (ASCVD); OR Adults aged ≥ 21 years who have ever had a fasting or direct low-density lipoprotein cholesterol (LDL-C) level ≥ 190 mg/dL or were previously diagnosed with or currently have an active diagnosis of familial or pure hypercholesterolemia; OR Adults aged 40-75 years with a diagnosis of diabetes with a fasting or direct LDL-C level of 70-189 mg/dL.
Substantive Change:	<p>Modified collection type: eCQM Specifications, MIPS CQMs Specifications</p> <p>Updated denominator logic: For the eCQM Specifications collection type: Added "CABG, PCI Procedure" 2.16.840.1.113762.1.4.1138.566 value set.</p> <p>Updated denominator exclusion logic: For the eCQM Specifications collection type: Added Hospice Care value sets.</p> <p>The numerator definition is revised to read: For the MIPS CQMs Specifications collection type: Statin therapy - Administration of one or more of a group of medications that are used to lower plasma lipoprotein levels in the treatment of hyperlipoproteinemia. Table 1 - Statin Medication Therapy List (NOTE: List does NOT include dosage): Atorvastatin, Fluvastatin, Lovastatin (Mevinolin), Pitavastatin, Pravastatin Sodium, Rosuvastatin Calcium, Simvastatin, Amlodipine Besylate/Atorvastatin, Ezetimibe/Simvastatin</p> <p>Updated denominator note: For the MIPS CQMs Specifications collection type: Revised: Denominator Exclusions should be active at any time during the measurement period.</p> <p>Updated denominator: For the MIPS CQMs Specifications collection type: Added telehealth as eligible encounters for all submission criteria.</p>
Steward:	Centers for Medicare & Medicaid Services
High Priority Measure:	No
Measure Type:	Process
Rationale:	<p>We proposed to add a value set to the eCQM Specifications collection type denominator to allow for the use of CPT and HCPCS codes for reporting patients who have had a CABG or PCI for inclusion within the denominator. This will improve data capture to ensure a more complete patient population. Additionally, a Hospice Care value set was added to align with the measure intent to exclude both palliative care and hospice patients.</p> <p>We proposed to add telehealth encounters as denominator eligible for the MIPS CQMs Specifications collection type as the telehealth setting is directly applicable to this measure and these patients should be included in the denominator to allow for numerator compliance to be measured.</p> <p>We proposed to add the numerator definition for the MIPS CQMs Specifications collection type to include a table of medications within this section and not in the clinical recommendations statement to ensure MIPS eligible clinicians are following these recommendations based on the clinical guidelines. Additionally, we proposed to update the denominator note to add clarity regarding when the denominator exclusion would be assessed within the medical record for the purposes of reporting this measure.</p> <p>We proposed to remove the CMS Web Interface Measure Specifications collection type. This collection type was proposed to be sunset for the purposes of MIPS starting with the 2021 performance year. We have determined it is not fiscally viable, feasible, or sustainable for MIPS to continue this collection type/submission type due to an 80 percent reduction and a continued decrease in interest of groups and virtual groups seeking to report quality data on CMS Web Interface measures. For further rationale, please see section IV.A.3.c.(1)(c) of this final rule.</p>
<p>Comment: Several commenters supported the addition of telehealth reporting for measure Q438.</p> <p>Response: We thank the commenters for supporting the addition of telehealth reporting for this measure.</p> <p>Comment: One commenter was not opposed to CMS being more prescriptive with the qualifying medications as long as frequent updates are made to the acceptable medications list.</p> <p>Response: We thank the commenter for supporting the substantive change to the medication list for measure Q438.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q438 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years with the exception of the CMS Web Interface Specifications collection type. At § 414.1305, we proposed to modify the definition of the terms collection type and submission type by removing the CMS Web Interface Specifications as an available option starting with the 2023 payment year (85 FR 50290); however, the CMS Web Interface Measure Specifications collection type will be an available option for an extension of one additional year (2021 MIPS performance period/2023 MIPS payment year) and will be removed as a collection and submission type starting with the 2022 MIPS performance period/2024 MIPS payment year. None of the substantive changes above will be applied to the CMS Web Interface Measure Specifications for the 2021 MIPS performance period. The CMS Web Interface Measure Specifications for the 2021 MIPS performance period will reflect the 2020 CMS Web Interface Measure Specifications. Also, it should be noted that the CMS Web Interface Specifications collection type is not able to establish a benchmark for this measure. Thus, this measure will be excluded from the Merit-based Incentive Payment System (MIPS) scoring in accordance with § 414.1380(b)(1)(i)(A)(2)(i) provided that the measure meets the data completeness requirement and the data applicable to the measure is reported via the CMS Web Interface Measure Specifications.</p>	

D.93 Age Appropriate Screening Colonoscopy

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	439
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Efficiency and Cost Reduction
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	The percentage of patients greater than 85 years of age who received a screening colonoscopy from January 1 to December 31.
Substantive Change:	<p>The description is revised to read: The percentage of screening colonoscopies performed in patients greater than or equal to 86 years of age from January 1 to December 31.</p> <p>The denominator is revised to read: All screening colonoscopy examinations performed on patients greater than or equal to 50 years of age during the encounter period.</p> <p>Updated denominator criteria: Revised: All patients greater than or equal to 50 years of age on date of encounter receiving a colonoscopy for screening purposes only.</p> <p>The numerator is revised to read: Screening colonoscopies performed in patients greater than or equal to 86 years of age.</p> <p>The numerator options are revised to read:</p> <p>Performance Met: Patients greater than or equal to 86 years of age who underwent a screening colonoscopy and did not have a history of colorectal cancer or other valid medical reason for the colonoscopy, including: iron deficiency anemia, lower gastrointestinal bleeding, Crohn's Disease (i.e., regional enteritis), familial adenomatous polyposis, Lynch Syndrome (i.e., hereditary non-polyposis colorectal cancer), inflammatory bowel disease, ulcerative colitis, abnormal finding of gastrointestinal tract, or changes in bowel habits.</p> <p>Denominator Exception: Documentation of medical reason(s) for a colonoscopy performed on a patient greater than or equal to 86 years of age (e.g., iron deficiency anemia, lower gastrointestinal bleeding, Crohn's Disease (i.e., regional enteritis), familial history of adenomatous polyposis, Lynch Syndrome (i.e., hereditary non-polyposis colorectal cancer), inflammatory bowel disease, ulcerative colitis, abnormal finding of gastrointestinal tract, or changes in bowel habits).</p> <p>Performance Not Met: Patients greater than or equal to 86 years of age who received a colonoscopy for an assessment of signs/symptoms of GI tract illness, and/or because the patient meets high risk criteria, and/or to follow-up on previously diagnosed advanced lesions.</p> <p>Performance Not Met: Patients between 50 and 85 years of age who received a screening colonoscopy during the performance period.</p>
Steward:	American Gastroenterological Association
High Priority Measure:	Yes
Measure Type:	Efficiency
Rationale:	<p>We proposed to update the denominator population to include all patients aged 50 and older to ensure a more complete patient population as the intent of the measure is to assess age appropriate screening colonoscopies, which include patients under the age of 86 years. The description, denominator, and denominator criteria have been updated to reflect these revisions. The numerator and numerator options have been revised to more clearly reflect the patient population and a performance not met numerator option was added to reflect the expanded denominator eligible patient population.</p> <p>In the event the proposed substantive change(s) were finalized, the substantive changes would not allow for a direct comparison of performance data from prior years to performance data submitted after the implementation of these substantive changes.</p>
<p>We proposed a substantive change to the numerator options; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state:</p> <p>The numerator options are revised to read:</p> <p>Performance Met: Patients greater than or equal to 86 years of age who underwent a screening colonoscopy and did not have a history of colorectal cancer or other valid medical reason for the colonoscopy, including: iron deficiency anemia, lower gastrointestinal bleeding, Crohn's Disease (i.e., regional enteritis), familial adenomatous polyposis, Lynch Syndrome (i.e., hereditary non-polyposis colorectal cancer), inflammatory bowel disease, ulcerative colitis, abnormal finding of gastrointestinal tract, or changes in bowel habits.</p> <p>Performance Not Met: Documentation of medical reason(s) for a colonoscopy performed on a patient greater than or equal to 86 years of age (e.g., iron deficiency anemia, lower gastrointestinal bleeding, Crohn's Disease (i.e., regional enteritis), familial history of adenomatous polyposis, Lynch Syndrome (i.e., hereditary non-polyposis colorectal cancer), inflammatory bowel disease, ulcerative colitis, abnormal finding of gastrointestinal tract, or changes in bowel habits).</p> <p>Performance Not Met: Patients greater than or equal to 86 years of age who received a colonoscopy for an assessment of signs/symptoms of GI tract illness, and/or because the patient meets high risk criteria, and/or to follow-up on previously diagnosed advanced lesions.</p> <p>Performance Not Met: Patients between 50 and 85 years of age who received a screening colonoscopy during the performance period.</p> <p>This additional refinement of changing the Denominator Exception to a Performance Not Met does not affect the intent of the proposed substantive change. This revision aligns with the current measure specification and will not affect the final performance as this is an inverse measure. It is just a reclassification of the numerator option.</p> <p>Comment: One commenter supported the changes to measure Q439.</p> <p>Response: We thank the commenter for supporting the changes to this measure.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q439 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.94 Medication Management for People with Asthma

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	444
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Efficiency and Cost Reduction
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	The percentage of patients 5-64 years of age during the performance period who were identified as having persistent asthma and were dispensed appropriate medications that they remained on for at least 75% of their treatment period.
Substantive Change:	<p>Updated numerator: Updated medication table to split medications by controller versus reliever and adding 'Medication List' and 'Route' column.</p> <p>Asthma Controller Medications: Dyphylline-guaifenesin, Omalizumab, Benralizumab, Mepolizumab, Reslizumab, Budesonide-formoterol, Fluticasone-salmeterol, Fluticasone-vilanterol, Formoterol-mometasone, Beclomethasone, Budesonide, Ciclesonide, Flunisolide, Fluticasone, Mometasone, Montelukast, Zafirlukast, Zileuton, Theophylline.</p> <p>Asthma Reliever Medications: Albuterol, Levalbuterol.</p>
Steward:	National Committee for Quality Assurance
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to update the medications table to ensure the list includes current and appropriate medications for the purposes of meeting performance of this measure. The measure specification medication tables were reformatted for clarity and readability.
<p>Comment: One commenter encouraged CMS to double check the list of medications for completeness for this measure.</p> <p>Response: We thank the commenter for their comment. This list has been reviewed for accuracy; however, we encourage the commenter to reach out to the measure steward regarding the medication list for potential revisions for possible inclusion in future years.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q444 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.95 Trastuzumab Received By Patients With AJCC Stage I (T1c) – III And HER2 Positive Breast Cancer Receiving Adjuvant Chemotherapy

Category	Description
NQF # / eCQM NQF #:	1858 / N/A
Quality#:	450
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of female patients (aged 18 years and older) with AJCC stage I (T1c) – III, human epidermal growth factor receptor 2 (HER2) positive breast cancer receiving adjuvant chemotherapy who are also receiving Trastuzumab.
Substantive Change:	<p>The title is revised from ‘Trastuzumab received by patients with AJCC stage I (T1c) - III and HER2 positive breast cancer receiving adjuvant chemotherapy’ to: Appropriate Treatment for Patients with Stage I (T1c) - III HER2 Positive Breast Cancer.</p> <p>The description is revised to read: Percentage of female patients aged 18 to 70 with stage I (T1c) - III HER2 positive breast cancer for whom appropriate treatment is initiated.</p> <p>The denominator is revised to read: All female breast cancer patients aged 18 to 70 with stage I (T1c) - III HER2 positive breast cancer.</p> <p>Updated denominator criteria: Revised: Female patients age 18-70 years on date of encounter. Removed: Breast Adjuvant Chemotherapy administered.</p> <p>Updated denominator exclusions: Removed: <ul style="list-style-type: none"> • Patient transferred to practice after initiation of chemotherapy. • Patient has metastatic disease at diagnosis. Added: <ul style="list-style-type: none"> • Patients with pregnancy during adjuvant treatment course. </p> <p>The numerator is revised to read: Patients whose adjuvant treatment course includes both chemotherapy and HER2-targeted therapy.</p> <p>The numerator note is revised to read: The quality action of this measure is the appropriateness of treatment rather than timeliness of treatment. The timing of administration of HER2-targeted therapies is expected to vary depending on the cytotoxic agents used. The numerator statement is intended to capture an adjuvant treatment course that includes both chemotherapy and HER2-targeted therapy, independent of possible administration sequences. Adjuvant chemotherapy is defined as a chemotherapy regimen initiated within 6 months of cancer diagnosis. An FDA-approved trastuzumab biosimilar is an appropriate substitute for trastuzumab.</p> <p>The numerator options are revised to read: Performance Met: Patient received adjuvant treatment course including both chemotherapy and HER2-targeted therapy. Denominator Exception: Reason for not administering adjuvant treatment course including both chemotherapy and HER2-targeted therapy (e.g. poor performance status (ECOG 3-4; Karnofsky ≤50), cardiac contraindications, insufficient renal function, insufficient hepatic function, other active or secondary cancer diagnoses, other medical contraindications, patients who died during initial treatment course or transferred during or after initial treatment course). Performance Not Met: Patient did not receive adjuvant treatment course including both chemotherapy and HER2-targeted therapy.</p>
Steward:	American Society of Clinical Oncology
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	<p>We proposed to expand the scope and clinical focus of the measure to include all female patients age 18 – 70 years with stage I (T1c) - III HER2 positive breast cancer, allowing for assessment of chemotherapy within the numerator, necessitating the removal of the denominator criteria for chemotherapy. NCCN recommendations support the administration of chemotherapy and trastuzumab for this patient population.</p> <p>We proposed to remove the current denominator exclusions and add new denominator exclusions based upon feasibility testing which determined these histologies are rare enough and are unlikely to have HER2 positivity such that it is not necessary to specifically target for removal from the denominator population. We agreed that these exclusions are not appropriate for inclusion. The added denominator exclusions reflect the measure’s change in clinical scope and allows for removal of patients for whom treatment with chemotherapy and HER2-targeted therapy would not be appropriate.</p> <p>The measure steward’s technical expert panel acknowledged that patients who fail to receive timely treatment may also fail to receive appropriate treatment. Because the quality action of this measure is appropriateness rather than timeliness of treatment, a broader timeframe is utilized to capture patients who may be less likely to receive appropriate treatment, therefore, 6 months was chosen to define adjuvant chemotherapy. The inclusion of an FDA-approved trastuzumab biosimilar as substitute for trastuzumab is in accordance with updated NCCN breast cancer guidelines. We agreed with this revision to the numerator note as it clarifies the updated measure scope and aligns with current clinical guidelines.</p> <p>Additionally, we proposed to update the numerator options to reflect the updated scope and clinical focus of the measure.</p> <p>In the event the proposed substantive change(s) were finalized, the substantive changes would not allow for a direct comparison of performance data from prior years to performance data submitted after the implementation of these substantive changes.</p>
We received no public comments on the substantive changes propose for this measure; therefore, we are finalizing the changes to measure Q450 as proposed for	

Category	Description
the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.96 RAS (KRAS and NRAS) Gene Mutation Testing Performed for Patients with Metastatic Colorectal Cancer who receive Anti-epidermal Growth Factor Receptor (EGFR) Monoclonal Antibody Therapy

Category	Description
NQF # / eCQM NQF #:	1859 / N/A
Quality#:	451
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of adult patients (aged 18 or over) with metastatic colorectal cancer who receive anti-epidermal growth factor receptor monoclonal antibody therapy for whom RAS (KRAS and NRAS) gene mutation testing was performed.
Substantive Change:	Updated denominator: Added telehealth exclusion to patient encounter.
Steward:	American Society of Clinical Oncology
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to add a telehealth exclusion to the patient encounter as telehealth encounters are not applicable to this measure and these patients should not be included in the denominator.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q451 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

**D.97 Patients with Metastatic Colorectal Cancer and RAS (KRAS or NRAS) Gene Mutation Spared Treatment with
Anti-epidermal Growth Factor Receptor (EGFR) Monoclonal Antibodies**

Category	Description
NQF # / eCQM NQF #:	1860 / N/A
Quality#:	452
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Patient Safety
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of adult patients (aged 18 or over) with metastatic colorectal cancer and RAS (KRAS or NRAS) gene mutation spared treatment with anti-EGFR monoclonal antibodies.
Substantive Change:	Updated denominator: Added telehealth exclusion to patient encounter.
Steward:	American Society of Clinical Oncology
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to add a telehealth exclusion to the patient encounter as telehealth encounters are not applicable to this measure and these patients should not be included in the denominator.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q452 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.98 Percentage of Patients Who Died from Cancer Receiving Chemotherapy in the Last 14 Days of Life (lower score – better)

Category	Description
NQF # / eCQM NQF #:	0210 / N/A
Quality#:	453
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients who died from cancer receiving chemotherapy in the last 14 days of life.
Substantive Change:	Updated denominator: Added telehealth exclusion to patient encounter.
Steward:	American Society of Clinical Oncology
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to add a telehealth exclusion to the patient encounter as telehealth encounters are not applicable to this measure and these patients should not be included in the denominator.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q453 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.99 Percentage of Patients Who Died from Cancer Admitted to the Intensive Care Unit (ICU) in the Last 30 Days of Life
(lower score – better)

Category	Description
NQF # / eCQM NQF #:	0213 / N/A
Quality#:	455
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients who died from cancer admitted to the ICU in the last 30 days of life.
Substantive Change:	Updated denominator: Added telehealth exclusion to patient encounter.
Steward:	American Society of Clinical Oncology
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale:	We proposed to add a telehealth exclusion to the patient encounter as telehealth encounters are not applicable to this measure and these patients should not be included in the denominator.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q455 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.100 Percentage of Patients Who Died from Cancer Admitted to Hospice for Less than 3 days (lower score – better)

Category	Description
NQF # / eCQM NQF #:	0216 / N/A
Quality#:	457
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients who died from cancer and admitted to hospice and spent less than 3 days there.
Substantive Change:	Updated denominator: Added telehealth exclusion to patient encounter.
Steward:	American Society of Clinical Oncology
High Priority Measure:	Yes
Measure Type:	Outcome
Rationale:	We proposed to add a telehealth exclusion to the patient encounter as telehealth encounters are not applicable to this measure and these patients should not be included in the denominator.
<p>Comment: One commenter was concerned about adding a telehealth exclusion to measure Q457 because CMS claimed that telehealth encounters were not applicable to this measure. The commenter disagreed with this statement and believed it would be appropriate to include telehealth encounters in this measure. This measure aims to identify patients who either did not have a hospice referral prior to death or received hospice care too late. Including telehealth encounters would help CMS to more comprehensively and accurately identify patients who were unable to benefit from hospice services.</p> <p>Response: We thank the commenter for their comment. This measure currently requires two or more encounters at the reporting site and that the patient be enrolled in hospice as part of the denominator eligibility criteria. The inclusion of a telehealth modifier exclusion for the patient encounters aligns with the intent of the measure. To be eligible for this measure, the patient must already be enrolled in hospice. This measure assesses whether or not patients were enrolled in hospice in a timely manner in order to maximize benefits that may be attained from this service. We encourage the commenter to reach out to the measure steward to discuss revisions for possible implementation in future years.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q457 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.101 Back Pain After Lumbar Discectomy/Laminectomy

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	459
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Person and Caregiver-Centered Experience and Outcomes
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	For patients 18 years of age or older who had a lumbar discectomy/laminectomy procedure, back pain is rated by the patients as less than or equal to 3.0 OR an improvement of 5.0 points or greater on the Visual Analog Scale (VAS) Pain scale at three months (6 to 20 weeks) postoperatively.
Substantive Change:	Updated denominator exclusion: Revised: Patient had cancer, acute fracture or infection related to the lumbar spine OR patient had neuromuscular, idiopathic or congenital lumbar scoliosis.
Steward:	Minnesota Community Measurement
High Priority Measure:	Yes
Measure Type:	Patient Reported Outcome
Rationale:	We proposed to add neuromuscular scoliosis to the denominator exclusion based upon feedback from clinicians following statewide implementation of the measure. We agreed that patients with this type of scoliosis should be removed to help create a more heterogeneous population, which reflects the original intent of this denominator exclusion.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q459 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.102 Back Pain After Lumbar Fusion

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	460
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Person and Caregiver-Centered Experience and Outcomes
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	For patients 18 years of age or older who had a lumbar fusion procedure, back pain is rated by the patient as less than or equal to 3.0 OR an improvement of 5.0 points or greater on the Visual Analog Scale (VAS) Pain* scale at one year (9 to 15 months) postoperatively. * hereafter referred to as VAS Pain
Substantive Change:	Updated denominator exclusion: Revised: Patient had cancer, acute fracture or infection related to the lumbar spine OR patient had neuromuscular, idiopathic or congenital lumbar scoliosis.
Steward:	Minnesota Community Measurement
High Priority Measure:	Yes
Measure Type:	Patient Reported Outcome
Rationale:	We proposed to add neuromuscular scoliosis to the denominator exclusion based upon feedback from clinicians following statewide implementation of the measure. We agreed that patients with this type of scoliosis should be removed to help create a more heterogeneous population, which reflects the original intent of this denominator exclusion.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q460 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.103 Leg Pain After Lumbar Discectomy/Laminectomy

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	461
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Person and Caregiver-Centered Experience and Outcomes
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	For patients 18 years of age or older who had a lumbar discectomy/laminectomy procedure, leg pain is rated by the patient as less than or equal to 3.0 OR an improvement of 5.0 points or greater on the VAS Pain scale at three months (6 to 20 weeks) postoperatively.
Substantive Change:	Updated denominator exclusion: Revised: Patient had cancer, acute fracture or infection related to the lumbar spine OR patient had neuromuscular, idiopathic or congenital lumbar scoliosis.
Steward:	Minnesota Community Measurement
High Priority Measure:	Yes
Measure Type:	Patient Reported Outcome
Rationale:	We proposed to add neuromuscular scoliosis to the denominator exclusion based upon feedback from clinicians following statewide implementation of the measure. We agreed that patients with this type of scoliosis should be removed to help create a more heterogeneous population, which reflects the original intent of this denominator exclusion.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q461 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.104 Bone Density Evaluation for Patients with Prostate Cancer and Receiving Androgen Deprivation Therapy

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	462
CMS eCQM ID:	CMS645v4
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	eCQM Specifications
Current Measure Description:	Patients determined as having prostate cancer who are currently starting or undergoing androgen deprivation therapy (ADT), for an anticipated period of 12 months or greater and who receive an initial bone density evaluation. The bone density evaluation must be prior to the start of ADT or within 3 months of the start of ADT.
Substantive Change:	Updated definition: Added: First Androgen Deprivation Therapy - The First Androgen Deprivation Therapy (ADT) is measured as the first order or administration of ADT for an anticipated period of 12 months or greater to a patient with prostate cancer.
Steward:	Oregon Urology Institute
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to add a definition for 'First Androgen Deprivation Therapy' to clarify the timing of the bone density evaluation necessary for numerator compliance.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q462 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.105 Otitis Media with Effusion: Systemic Antimicrobials - Avoidance of Inappropriate Use

Category	Description
NQF # / eCQM NQF #:	0657 / N/A
Quality#:	464
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of patients aged 2 months through 12 years with a diagnosis of OME who were not prescribed systemic antimicrobials.
Substantive Change:	Updated denominator: Added telehealth exclusion to patient encounter.
Steward:	American Academy of Otolaryngology – Head and Neck Surgery Foundation
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	We proposed to add a telehealth exclusion to the patient encounter as telehealth encounters are not applicable to this measure and these patients should not be included in the denominator.
<p>Comment: One commenter supported the addition of telehealth reporting for measure Q464. The commenter noted that there is an error in the substantive change: “Updated denominator: Added telehealth exclusion to patient encounter.” The substantive change should instead read, “Updated denominator: Telehealth exclusion to patient encounter is removed” as telehealth encounters are applicable to this measure and these patients should not be excluded in the denominator.</p> <p>Response: We agree that the measure specification currently excludes telehealth and the substantive change was to remove the telehealth exclusion as it would be appropriate to include these patients into the measure denominator eligible population.</p> <p>After consideration of public comments, we are finalizing the changes to measure Q464 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>	

D.106 Continuity of Pharmacotherapy for Opioid Use Disorder (OUD)

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	468
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	Percentage of adults aged 18 years and older with pharmacotherapy for opioid use disorder (OUD) who have at least 180 days of continuous treatment.
Substantive Change:	<p>Updated instructions: Revised: This measure is to be submitted a minimum of once per performance period for all adults aged 18 years and older with pharmacotherapy for OUD seen during the measurement period that meet additional denominator criteria described below.</p> <p>The denominator is revised to read: Adults aged 18 years and older who had a qualifying encounter during the performance year, and a diagnosis of OUD and pharmacotherapy for OUD during the denominator identification period. Eligibility to submit results for a patient requires a qualifying encounter in the performance year, i.e., between January 1, 2021, and December 31, 2021. Solely administering or prescribing OUD medication does not convey eligibility to submit. If a patient has a qualifying encounter within the performance year, the patient is included in the denominator, if the following criteria are met in the denominator identification period between July 1, 2020, and June 30, 2021:</p> <ul style="list-style-type: none"> • Have a diagnosis of OUD • Receive pharmacotherapy for OUD <p>Updated denominator definition: Added: Qualifying Encounter – Encounter during the performance year.</p> <p>Revised: Denominator Identification Period – The period in which eligible adults receive pharmacotherapy for OUD. The denominator identification period is defined as the 12-month period from 07/1/2020 to 6/30/2021. The denominator identification period includes the first 6 months of the reporting year and the last 6 months of the previous year to ensure that all included patients can be observed for at least 180 days of treatment in the reporting year. Patients started on treatment in the second half of the reporting year will be included in the denominator of the subsequent year. The patient must have at least one OUD medication and one visit with a OUD diagnosis during the denominator identification period to be eligible for the measure.</p> <p>Updated denominator criteria: Revised: Adults aged ≥ 18 years on date of qualifying encounter. Encounter during the measurement period.</p> <p>Updated denominator exclusion: Removed: Pharmacotherapy for OUD initiated after June 30th of 2020.</p> <p>The numerator note is revised to read: Numerator compliance is expected to be determined within an 18-month period that includes the measurement period and the 6 months prior to the measurement period (July 1, 2020– December 31, 2021).</p>
Steward:	University of Southern California
High Priority Measure:	Yes
Measure Type:	Process
Rationale:	<p>We proposed to update the measure to ensure the denominator eligible encounter occurs within the current performance period and the initiation of pharmacotherapy for opioid use disorder (OUD) occurs within the denominator identification period to allow for assessment of at least 180 days for continuous pharmacotherapy for OUD. Additionally, we proposed to update the definitions by adding an additional definition of qualifying encounter to clarify which encounters are denominator eligible and revising the denominator identification period definition to align with and clarify the changes to the denominator in regards to timing and eligibility. The numerator note is being revised to align with these changes outlined above and reiterates the guidance pertaining to the timeframes allowed for clinicians to determine if the patient was on at least 180 days for continuous pharmacotherapy for OUD</p>
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q468 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.107 Functional Status After Lumbar Fusion

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	469
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Person and Caregiver-Centered Experience and Outcomes
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	For patients 18 years of age and older who had a lumbar fusion procedure, functional status is rated by the patient as less than or equal to 22 OR a change of 30 points or greater on the Oswestry Disability Index (ODI version 2.1a)* at one year (9 to 15 months) postoperatively.
Substantive Change:	Updated denominator exclusion: Revised: Patient had cancer, acute fracture or infection related to the lumbar spine OR patient had neuromuscular, idiopathic or congenital lumbar scoliosis.
Steward:	Minnesota Community Measurement
High Priority Measure:	Yes
Measure Type:	Patient Reported Outcome
Rationale:	We proposed to add neuromuscular scoliosis to the denominator exclusion based upon feedback from clinicians following statewide implementation of the measure. We agreed that patients with this type of scoliosis should be removed to help create a more heterogeneous population, which reflects the original intent of this denominator exclusion.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q469 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.108 Functional Status After Primary Total Knee Replacement

Category	Description
NQF # / eCOM NQF #:	N/A / N/A
Quality#:	470
CMS eCOM ID:	N/A
National Quality Strategy Domain:	Person and Caregiver-Centered Experience and Outcomes
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	For patients age 18 and older who had a primary total knee replacement procedure, functional status is rated by the patient as greater than or equal to 37 on the Oxford Knee Score (OKS) at one year (9 to 15 months) postoperatively.
Substantive Change:	<p>The description is revised to read: For patients age 18 and older who had a primary total knee replacement procedure, functional status is rated by the patient as greater than or equal to 37 on the Oxford Knee Score (OKS) or a 71 or greater on the KOOS, JR tool at one year (9 to 15 months) postoperatively.</p> <p>Updated instructions: Revised: NOTE: This measure is a target-based measure, where the numerator is met by having a one-year postoperative Oxford Knee Score (OKS) greater than or equal to 37 or a KOOS, JR score greater than or equal to 71. It is expressed as a proportion or rate. Patients having received a primary total knee replacement procedure who are not assessed for functional status postoperatively remain in the denominator and are considered as not meeting the target. The measure intent is that MIPS eligible clinicians will submit all denominator eligible procedures for performance calculation.</p> <p>The numerator is revised to read: All eligible patients whose functional status is greater than or equal to 37 on the Oxford Knee Score (OKS) or greater than or equal to 71 on the KOOS, JR patient reported outcome tool at one year (9 to 15 months) postoperatively.</p> <p>Updated numerator definition: Added: KOOS, JR - The KOOS, JR was developed from the original long version of the Knee injury and Osteoarthritis Outcome Score (KOOS) survey using Rasch analysis. The KOOS, JR contains 7 items from the original KOOS survey. Items are coded from 0 to 4, none to extreme respectively. KOOS, JR is scored by summing the raw response (range 0-28) and then converting it to an interval score using the table provided below. The interval score ranges from 0 to 100 where 0 represents total knee disability and 100 represents perfect knee health. This short form tool was developed by Stephen Lyman, PhD at the Hospital for Specialty Surgery in 2017. https://www.hss.edu/hoos-jr-koos-jr-outcomes-surveys.asp KOOS, JR Target - A patient who is assessed postoperatively at one year (9 to 15 months) after the procedure rates their functional status score as greater than or equal to 71.</p> <p>The numerator note is revised to read: The following situations are those in which the numerator targets cannot be reached and Performance Not Met (M1046) is submitted:</p> <ul style="list-style-type: none"> Oxford Knee Score (OKS) or Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) is not administered postoperatively at one year (9 to 15 Months) Functional status is measured using a different patient-reported functional status tool or Oxford Knee Score (OKS) version or Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) Postoperative Oxford Knee Score (OKS) or Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) is administered less than 9 Months or greater than 15 Months Postoperative Oxford Knee Score (OKS) is less than 37 or Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) is less than 71. <p>The numerator options are revised to read: Performance Met: Functional status measured by the Oxford Knee Score (OKS) at one year (9 to 15 months) postoperatively was greater than or equal to 37 or Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) was greater than or equal to 71. Performance Not Met: Functional status measured by the Oxford Knee Score (OKS) or the Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) at one year (9 to 15 months) postoperatively was less than 37. Performance Not Met: Functional status measured by the Oxford Knee Score (OKS) at one year (9 to 15 months) postoperatively was less than 37 or the Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) was less than 71.</p>
Steward:	Minnesota Community Measurement
High Priority Measure:	Yes
Measure Type:	Patient Reported Outcome
Rationale:	<p>We proposed to update the measure to allow for the inclusion of the Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) tool as numerator compliance. The KOOS, JR is recommended by the American Academy of Orthopaedic Surgeons (AAOS) and is part of the Joint Commission on Accreditation of Healthcare Organizations (JCAHO) accreditation and is an appropriate tool for the purposes of this measure. The language was updated throughout the measure to reflect this update and to define numerator compliance when utilizing the KOOS, JR tool.</p> <p>We proposed a substantive change to numerator options; however, during the quality measure annual revision process with the measure steward, there was additional language refinement. Therefore, we are finalizing the substantive change to state:</p> <p>Performance Met: Functional status measured by the Oxford Knee Score (OKS) at one year (9 to 15 months) postoperatively was greater than or equal to 37 or Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) was greater than or equal to 71.</p> <p>Performance Not Met: Functional status was not measured by the Oxford Knee Score (OKS) or the Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) at one year (9 to 15 months) postoperatively</p> <p>Performance Not Met: Functional status measured by the Oxford Knee Score (OKS) at one year (9 to 15 months) postoperatively was less than 37 or the Knee injury and Osteoarthritis Outcome Score Joint Replacement (KOOS, JR) was less than 71.</p> <p>This additional refinement does not affect the intent of the proposed substantive change, but is in alignment with the updates to the entire measure and the guidance given in the numerator note.</p> <p>We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q470 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years.</p>

D.109 Functional Status After Lumbar Discectomy/Laminectomy

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	471
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Person and Caregiver-Centered Experience and Outcomes
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	For patients age 18 and older who had lumbar discectomy/laminectomy procedure, functional status is rated by the patient as less than or equal to 22 OR a change of 30 points or greater on the Oswestry Disability Index (ODI version 2.1a) * at three months (6 to 20 weeks) postoperatively.
Substantive Change:	Updated denominator exclusion: Revised: Patient had cancer, acute fracture or infection related to the lumbar spine OR patient had neuromuscular, idiopathic or congenital lumbar scoliosis.
Steward:	Minnesota Community Measurement
High Priority Measure:	Yes
Measure Type:	Patient Reported Outcome
Rationale:	We proposed to add neuromuscular scoliosis to the denominator exclusion based upon feedback from clinicians following statewide implementation of the measure. We agreed that patients with this type of scoliosis should be removed to help create a more heterogeneous population, which reflects the original intent of this denominator exclusion.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q471 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.110 Leg Pain After Lumbar Fusion

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	473
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Person and Caregiver-Centered Experience and Outcomes
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	For patients 18 years of age or older who had a lumbar fusion procedure, leg pain is rated by the patient as less than or equal to 3.0 OR an improvement of 5.0 points or greater on the Visual Analog Scale (VAS) Pain* scale at one year (9 to 15 months) postoperatively. * hereafter referred to as VAS Pain.
Substantive Change:	Updated denominator exclusion: Revised: Patient had cancer, acute fracture or infection related to the lumbar spine OR patient had neuromuscular, idiopathic or congenital lumbar scoliosis.
Steward:	Minnesota Community Measurement
High Priority Measure:	Yes
Measure Type:	Patient Reported Outcome
Rationale:	We proposed to add neuromuscular scoliosis to the denominator exclusion based upon feedback from clinicians following statewide implementation of the measure. We agreed that patients with this type of scoliosis should be removed to help create a more heterogeneous population, which reflects the original intent of this denominator exclusion.
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q473 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

**D.111 International Prostate Symptom Score (IPSS) or American Urological Association-Symptom Index (AUA-SI)
Change 6-12 Months After Diagnosis of Benign Prostatic Hyperplasia**

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	476
CMS eCQM ID:	CMS771v2
National Quality Strategy Domain:	Person and Caregiver-centered Experience and Outcomes
Current Collection Type:	eCQM Specifications
Current Measure Description:	Percentage of patients with an office visit within the measurement period and with a new diagnosis of clinically significant Benign Prostatic Hyperplasia who have International Prostate Symptoms Score (IPSS) or American Urological Association (AUA) Symptom Index (SI) documented at time of diagnosis and again 6-12 months later with an improvement of 3 points.
Substantive Change:	<p>The title is revised from 'International Prostate Symptom Score (IPSS) or American Urological Association-Symptom Index (AUA-SI) Change 6-12 Months After Diagnosis of Benign Prostatic Hyperplasia' to: Urinary Symptom Score Change 6-12 Months After Diagnosis of Benign Prostatic Hyperplasia.</p> <p>Per the 'Telehealth Guidance for Electronic Clinical Quality Measures (eCQMs) for Eligible Professional/Eligible Clinician 2021 Quality Reporting': Medicare telehealth eligible codes found in any encounter value set must only be used for in-person encounters for the following eCQMs.</p>
Steward:	Large Urology Group Practice Association and Oregon Urology Institute
High Priority Measure:	Yes
Measure Type:	Patient Reported Outcome
Rationale:	<p>We proposed to shorten the title to replace the very specific score wording with more general wording to be more consistent with definitions and language used within the measure.</p> <p>We proposed to remove telehealth encounters from the denominator and denominator exclusions as telehealth is not an appropriate setting for this measure. This guidance can be found in a separate document that will be published on the eCQI Resource Center.</p>
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q476 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.112 Functional Status Change for Patients with Neck Impairments

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	478
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Person and Caregiver-centered Experience and Outcomes
Current Collection Type:	MIPS CQMs Specifications
Current Measure Description:	<p>This is a patient-reported outcome performance measure (PRO-PM) consisting of a patient-reported outcome measure (PROM) of risk-adjusted change in functional status (FS) for patients aged 14+ with neck impairments. The change in FS is assessed using the Neck FS PROM.* The measure is risk-adjusted to patient characteristics known to be associated with FS outcomes. It is used as a performance measure at the patient, individual clinician, and clinic levels to assess quality.</p> <p>*The Neck FS PROM is an item-response theory-based computer adaptive test (CAT). In addition to the CAT version, which provides for reduced patient response burden, it is available as a 10-item short form (static/paper-pencil).</p>
Substantive Change:	<p>The description is revised to read: This is a patient-reported outcome measure of risk-adjusted change in functional status for patients aged 14 years+ with neck impairments. The change in functional status (FS) is assessed using the FOTO Neck FS patient-reported outcome measure (PROM). The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk-adjusted) and used as a performance measure at the patient level, at the individual clinician level, and at the clinic level to assess quality. The measure is available as a computer adaptive test, for reduced patient burden, or a short form (static/paper-pencil).</p> <p>The definition is revised to read: Functional Deficit – Limitation or impairment of physical abilities/function resulting in evaluation and inclusion in a treatment plan of care. Treatment Episode – A Treatment Episode is defined as beginning with an Initial Evaluation for a functional neck deficit, progressing through treatment without interruption (for example, a hospitalization or surgical intervention), and ending with Discharge signifying that the treatment has been completed. A patient currently under clinical care for a neck deficit remains in a single Treatment Episode until the Discharge is conducted and documented by the MIPS eligible clinician. Initial Evaluation – An Initial Evaluation is the first encounter for a functional deficit involving the neck and includes an evaluation (CPT 97161, 97162, 97163, 97165, 97166, 97167, 99201, 99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215, 98940, 98941, 98942, or 98943), or an Initial Evaluation Status M-code (M1143). A patient presenting with a neck impairment, who has had an interruption of a Treatment Episode for the same functional neck deficit secondary to an appropriate reason like hospitalization or surgical intervention, is an Initial Evaluation. Discharge – Discharge is accompanied by a treatment finalization and evaluation completion M-Code (Mxxx) identifying the close of a Treatment Episode for the same neck deficit identified at the Initial Evaluation and documented by a Discharge report by the MIPS eligible clinician. An interruption in clinical care for an appropriate reason like hospitalization or surgical intervention requires a discharge from the current Treatment Episode. Encounter – A visit between the patient and the provider for the purpose of assessing and/or improving a functional deficit. Patient Reported – The patient directly provides answers to the FS measure items using a standardized, reliable and valid, computerized adaptive testing or short form (static/paper and pencil-type) method. If the patient cannot reliably respond independently (for example, in the presence of cognitive deficits), a suitable proxy may provide answers.</p> <p>The denominator is revised to read: All patients aged 14 years and older with neck impairments who initiated a Treatment Episode.</p> <p>Updated denominator criteria: Revised: All patients aged ≥14 years on date of Initial Evaluation. Added: With a neck impairment and/or diagnosis pertaining to a functional deficit affecting the neck.</p> <p>Updated denominator exclusions: Removed: Ongoing care not indicated, patient seen only 1-2 visits (e.g., home program only, referred to another provider or facility, consultation only). Added: Patient unable to complete the Neck FS PROM at Initial Evaluation and/or Discharge due to blindness, illiteracy, severe mental incapacity or language incompatibility, and an adequate proxy is not available.</p> <p>The numerator is revised to read: Patients who were presented with the Neck FS PROM at Initial Evaluation (Intake) and at or near Discharge (Status) for the purpose of calculating the patient's Risk-Adjusted Functional Status Change Residual Score.</p> <p>The numerator definition is revised to read: Patient's Functional Status Score – A functional status score is produced when the patient completes the functional status patient-reported outcome measure (either by short form or computerized adaptive testing administration). The functional status score is continuous and linear. Scores range from 0 to 100 with higher scores meaning higher functional abilities. The measure is standardized, and the scores are validated for the measurement of function for this population. Patient's Functional Status Change Score – A functional status change score is calculated by subtracting the Patient's Functional Status Score at Initial Evaluation from the Patient's Functional Status Score at Discharge. Predicted Functional Status Change Score – Functional Status Change Scores for patients are risk adjusted using multiple linear regression methods that include the following independent variables: Patient's Functional Status Score at Initial Evaluation, patient age, symptom acuity, surgical history, gender, specific co-morbidities, use of medication for the condition at Initial Evaluation, exercise history, history of previous treatment for the condition and type of post-surgical status. The Patient's Functional Status Change Score is the dependent variable. For each patient completing a functional status assessment at Initial Evaluation (Intake), the regression model provides a risk-adjusted prediction of functional status change at Discharge. Risk-Adjusted Functional Status Change Residual Score – The difference between the raw non-risk-adjusted Patient's Functional Status Change Score and the Risk-Adjusted Predicted Functional Status Change Score (raw minus predicted) is the Risk-Adjusted Functional Status Change Residual Score, which is in the same units as the Patient's Functional Status Scores, and should be interpreted as the unit of functional status change different than predicted given the risk-adjustment variables of the patient being treated. As such, the Risk-Adjusted Residual Change Score represents Risk-Adjusted Change corrected for the level</p>

Category	Description
	<p>of severity of the patient. Risk-Adjusted Residual Change Scores of zero (0) or greater (> 0) should be interpreted as functional status change scores that were predicted or better than predicted given the risk- adjustment variables of the patient, and risk-adjusted residual change scores less than zero (< 0) should be interpreted as functional status change scores that were less than predicted given the risk-adjustment variables of the patient. Aggregated Risk-Adjusted Residual Scores allow meaningful comparisons amongst clinicians or clinics.</p> <p>Updated numerator note: Removed all.</p> <p>The numerator options are revised to read: Performance Met: Risk-Adjusted Functional Status Change Residual Score for the neck impairment successfully calculated and the score was equal to zero (0) or greater than zero (> 0) Denominator Exceptions: 1. Ongoing care not clinically indicated because the patient needed a home program only, referral to another provider or facility, or consultation only, as documented in the medical record. 2. Ongoing care not medically possible because the patient was discharged early due to specific medical events, documented in the medical record, such as the patient became hospitalized or scheduled for surgery. 3. Ongoing care not possible because the patient self-discharged early (e.g., financial or insurance reasons, transportation problems, or reason unknown). 4. Patient refused to participate. Performance Not Met: Risk-Adjusted Functional Status Change Residual Score for the neck impairment not measured because the patient did not complete the Neck FS PROM at Initial Evaluation and/or near Discharge, reason not given. Performance Not Met: Risk-Adjusted Functional Status Change Residual Score for the neck impairment successfully calculated and the score was less than zero (< 0).</p>
Steward:	Focus on Therapeutic Outcomes, Inc.
High Priority Measure:	Yes
Measure Type:	Patient Reported Outcome
Rationale:	<p>We proposed to update the measure to align with the other Focus on Therapeutic Outcomes, Inc. (FOTO) measures within MIPS. This will lessen MIPS eligible clinician burden when reporting this measure in conjunction with FOTO's other measures as the structure and content will now align. Definitions were included to add clarity and provide guidance when reporting this measure. Additional denominator criteria for patients with a neck impairment and/or diagnosis pertaining to a functional deficit affect the neck was included to further define the appropriate patient population for this measure. Additionally, the denominator exclusions and exceptions were updated, along with the other numerator options, to align across all FOTO measures for consistency.</p> <p>In the event the proposed substantive change(s) were finalized, the substantive changes would not allow for a direct comparison of performance data from prior years to performance data submitted after the implementation of these substantive changes.</p>
We received no public comments on the substantive changes proposed for this measure; therefore, we are finalizing the changes to measure Q478 as proposed for the 2021 MIPS performance period/2023 MIPS payment year and future years.	

D.113 Urinary Incontinence: Assessment of Presence or Absence of Urinary Incontinence in Women Aged 65 Years and Older

Category	Description
NQF # / eCQM NQF #:	N/A / N/A
Quality#:	048
CMS eCQM ID:	N/A
National Quality Strategy Domain:	Effective Clinical Care
Current Collection Type:	Medicare Part B Claims Measure Specifications, MIPS CQMs Specifications
Current Measure Description:	Percentage of female patients aged 65 years and older who were assessed for the presence or absence of urinary incontinence within 12 months.
Substantive Change:	Modified collection type: MIPS CQMs Specifications
Steward:	National Committee for Quality Assurance
High Priority Measure:	No
Measure Type:	Process
Rationale:	We proposed to remove the Medicare Part B Claims Measure Specifications collection type as it has reached the end of the topped out lifecycle as finalized in 82 FR 53640.
After consideration of public comments received under Table C.2, we are finalizing the removal of measure Q048 as indicated for the 2021 MIPS performance period/2023 MIPS payment year and future years for the Medicare Part B Claims Specifications collection type only. Measure Q048 will remain in the MIPS program for 2021 for the MIPS CQMs Specifications collection type.	

MISCELLANEOUS PUBLIC COMMENTS AND RESPONSES

Note: The following table summarizes public comments received that are general to individual MIPS measures but not specific to newly proposed measures, specialty measure sets, measures proposed for removal, or measures with substantive changes. In addition, some comments summarized below are out-of-scope to our proposed changes to the MIPS quality measure set.

Comment: One commenter was supportive of the proposal to remove 14 quality measures that do not add value to the quality of care, and instead add more meaningful measurements.

Response: We thank the commenter for supporting the removal of measures from the MIPS program that do not add value to the quality of care.

Comment: One commenter recommended maintaining the existing MIPS quality measures to ensure consistency, reduce a burden, and allow options in the future for MVPs.

Response: We understand that ensuring there are measures available for future use in MVPs is important; however, we strive to ensure that all measures align with the Meaningful Measures Initiative, which includes removing those measures that are duplicative, extremely topped out or at the end of the topped out lifecycle, no longer in alignment with the current clinical guidelines, or where a meaningful benchmark cannot be created. By removing measures with high performance rates, we are attempting to reduce reporting burden where there is little room for improvement. We encourage stakeholders to submit potential new measures that will align with the Meaningful Measures Initiative and allow MIPS eligible clinicians to maximize their potential performance within MIPS during the annual Call for Measures.

Comment: One commenter stated that CMS is proposing to expand the list of telehealth visits that include quality and cost measures in 2021. The commenter supported having expanded telehealth services. However, inclusion in the denominator across its measures does not translate to numerator compliance. There is certainly impact to administrative burden, and the commenter wanted to ensure data is captured and mapped appropriately for reporting. Use of telemedicine services for important clinical conditions is not yet fully understood. Some types of quality measurements (numerator compliance) may not be easily obtained via telemedicine or require additional infrastructure development such as remote monitoring. There should be additional time for adaptation.

Response: We thank the commenter for their comment. Each year the measure specifications are revised and reviewed to ensure coding updates and the inclusion of telehealth encounters aligns with the measure's intent, are clinically appropriate and applicable, and are feasible for implementation. The allowance of telehealth for denominator eligibility does not translate into numerator compliance, as some quality actions are not able to be performed via telehealth, however, it is important to ensure a complete patient population is assessed for numerator compliance therefore supporting the assessment of providing quality care. We encourage the commenter to reach out to measure stewards to review expanding telehealth as a possible revision for implementation in future years and review the 2021 MIPS specifications to determine if or how telehealth is included within the measure.

Comment: One commenter indicated that in terms of numerator compliance, CMS guidance has stated that there may be instances where the quality action cannot be completed during the telehealth visit. If an eligible clinician is providing services via telehealth but unable to complete the quality action in the numerator via telehealth, the commenter strongly believes that measure should be excluded from the list of telehealth eligible measures.

Response: We agree that there are some measures available via the eCQM Specifications collection type that include telehealth encounters as denominator eligible with a quality action that cannot be met via telehealth. This decision is driven by how each measure is structured and ensuring a complete and appropriate patient population. Measures that do not require a quality action for every encounter, but allow for patient report, look back periods, or completion at encounter, would be appropriate for inclusion of telehealth. For measures that have defined performance or assessment of the quality action (e.g., measure Q317: Preventive Care and Screening: Screening for High Blood Pressure and Follow-Up Documented), telehealth encounters would not be appropriate. We would encourage the commenter to review 2021 eCQM guidance found on the eCQI Resource Center at <https://ecqi.healthit.gov/ep-ec?globalyearfilter=2020>.

Comment: Current eCQM standards do not allow for the use of modifiers and therefore do not clearly include or exclude telehealth encounters when these "telehealth-eligible" CPT and HCPCS codes are used.

Response: We do recognize that value sets by eCQMs do not include codes modifiers and would encourage stakeholders to review the 2021 eCQM guidance found on the eCQI Resource Center. In instances where a modifier is submitted, the code is used by the eCQM, however the modifier is not. As such, eCQM logic and value sets do not differentiate between in-person encounters or telehealth encounters when these "telehealth-eligible" codes are applied. Therefore, it is the eligible professionals' and eligible clinicians' responsibility to make sure they can meet all other aspects of the quality action within the measure specification, including other quality actions that cannot be completed via telehealth when considering which measure to report. And, that the encounter, either in-person or via telehealth, is in alignment with current measure specification level guidance. In instances where a POS modifier is applied for billing and is submitted for the eCQM, only the encounter code is used by the eCQM and the modifier is not used.

APPENDIX 2: IMPROVEMENT ACTIVITIES

NOTE: In this final rule, for the CY 2021 performance period and future years, we are modifying two previously adopted improvement activities in the Inventory, removing one previously adopted improvement activity, and finalizing one improvement activity that was originally adopted in the March 31st COVID-19 IFC (85 FR 19277) and continued with modification in the September 2nd COVID-19 IFC (85 FR 54850 through 54851). These improvement activities are discussed in detail below.

Table A: Changes to Previously Adopted Improvement Activities for the MIPS CY 2021 Performance Period and Future Years

Current Improvement Activity	
Current Activity ID:	IA_BE_4
Current Subcategory:	Beneficiary Engagement
Current Activity Title:	Engagement of patient through implementation of improvements in patient portal
Current Activity Description:	Access to an enhanced patient portal that provides up to date information related to relevant chronic disease health, blood pressure control, and includes interactive features allowing patients to enter health information and/or enables bidirectional communication about medication changes and adherence.
Current Weighting:	Medium
Proposed Change and Rationale:	<p>This improvement activity was originally finalized in the CY 2017 QPP final rule (81 FR 77825). This modification would add language to include caregivers as additional potential users of the patient portal, instead of just patients and clinicians, given the important role caregivers can play in bidirectional information exchange regarding the clinical care of the patient.</p> <p>This modification would also add language to clarify that the portal's use should be for "bidirectional information exchange between the patient and their provider" and "the primary use...should be clinical, and not administrative."</p> <p>In addition, the modifications would replace existing description with a nonexhaustive list of examples of bidirectional portal functions that are clinical rather than administrative. The list of examples would include: "brief patient reevaluation by messaging; communication about test results and follow up; communication about medication adherence, side effects, and refills; blood pressure management for a patient with hypertension; blood sugar management for a patient with diabetes; and any relevant acute or chronic disease management."</p>
Proposed Revised Activity Description:	To receive credit for this activity, MIPS eligible clinicians must provide access to an enhanced patient/caregiver portal that allows users (patients or caregivers and their clinicians) to engage in bidirectional information exchange. The primary use of this portal should be clinical and not administrative. Examples of the use of such a portal include, but are not limited to: brief patient reevaluation by messaging; communication about test results and follow up; communication about medication adherence, side effects, and refills; blood pressure management for a patient with hypertension; blood sugar management for a patient with diabetes; or any relevant acute or chronic disease management.
Comments:	Several commenters supported the modification of this improvement activity. Several commenters noted that caregivers are a critical component of patient-centered care. A few commenters noted the importance of bidirectional information exchange in the provision of care.
Response:	The modification to this improvement activity includes caregivers in the bidirectional information exchange regarding the clinical care of patients and provides clarity that the portal should be used for bidirectional information exchange that is clinical not administrative in nature.
Final Action:	After consideration of the public comments received, we are finalizing changes to this improvement activity as proposed.
Finalized Improvement Activity	
Activity ID:	IA_BE_4
Subcategory:	Beneficiary Engagement
Activity Title:	Engagement of patient through implementation of improvements in patient portal

Activity Description:	To receive credit for this activity, MIPS eligible clinicians must provide access to an enhanced patient/caregiver portal that allows users (patients or caregivers and their clinicians) to engage in bidirectional information exchange. The primary use of this portal should be clinical and not administrative. Examples of the use of such a portal include, but are not limited to: brief patient reevaluation by messaging; communication about test results and follow up; communication about medication adherence, side effects, and refills; blood pressure management for a patient with hypertension; blood sugar management for a patient with diabetes; or any relevant acute or chronic disease management.
Weighting:	Medium
Current Improvement Activity	
Current Activity ID:	IA_AHE_7
Current Subcategory:	Achieving Health Equity
Current Activity Title:	Comprehensive Eye Exams
Current Activity Description:	<p>To receive credit for this activity, MIPS eligible clinicians must promote the importance of a comprehensive eye exam, which may be accomplished by providing literature and/or facilitating a conversation about this topic using resources such as the “Think About Your Eyes” campaign and/or referring patients to resources providing no-cost eye exams, such as the American Academy of Ophthalmology’s EyeCare America and the American Optometric Association’s VISION USA.</p> <p>This activity is intended for:</p> <ul style="list-style-type: none"> • Non-ophthalmologists / optometrists who refer patients to an ophthalmologist/optometrist; • Ophthalmologists/optometrists caring for underserved patients at no cost; or • Any clinician providing literature and/or resources on this topic. <p>This activity must be targeted at underserved and/or high-risk populations that would benefit from engagement regarding their eye health with the aim of improving their access to comprehensive eye exams.</p>
Current Weighting:	Medium
Proposed Change and Rationale:	This improvement activity was originally finalized in the CY 2019 PFS final rule (83 FR 59452). This modification would add language that expands the types of services that eligible clinicians can promote to underserved and/or high-risk populations to receive credit for this activity. Specifically, we are proposing to add the following sentence: “promoting access to vision rehabilitation services as appropriate for individuals with chronic vision impairment.” Also, “or vision rehabilitation services” would be added to the end of the activity description. These modifications would broaden this improvement activity to eligible clinicians who promote vision rehabilitation services, if they are serving patients with vision impairments detected during comprehensive eye exams.
Proposed Revised Activity Description:	<p>To receive credit for this activity, MIPS eligible clinicians must promote the importance of a comprehensive eye exam, which may be accomplished by any one or more of the following:</p> <ul style="list-style-type: none"> • providing literature, • facilitating a conversation about this topic using resources such as the “Think About Your Eyes” campaign, • referring patients to resources providing no-cost eye exams, such as the American Academy of Ophthalmology’s EyeCare America and the American Optometric Association’s VISION USA, or • promoting access to vision rehabilitation services as appropriate for individuals with chronic vision impairment. <p>This activity is intended for:</p> <ul style="list-style-type: none"> • Non-ophthalmologists / optometrists who refer patients to an ophthalmologist/optometrist; • Ophthalmologists/optometrists caring for underserved patients at no cost; or • Any clinician providing literature and/or resources on this topic. <p>This activity must be targeted at underserved and/or high-risk populations that would benefit from engagement regarding their eye health with the aim of improving their</p>

	access to comprehensive eye exams or vision rehabilitation services.
Comments:	Several commenters supported the modification of this improvement activity.
Response:	We appreciate the support for this modification. The modification to this improvement activity allows clinicians also to receive credit by providing vision rehabilitation services to patients who are underserved and/or high-risk with vision impairments detected during comprehensive exams.
Final Action:	After consideration of the public comments received, we are finalizing changes to this improvement activity as proposed.
Finalized Improvement Activity	
Activity ID:	IA_AHE_7
Subcategory:	Achieving Health Equity
Activity Title:	Comprehensive Eye Exams
Activity Description:	<p>To receive credit for this activity, MIPS eligible clinicians must promote the importance of a comprehensive eye exam, which may be accomplished by any one or more of the following:</p> <ul style="list-style-type: none"> ● providing literature, ● facilitating a conversation about this topic using resources such as the “Think About Your Eyes” campaign, ● referring patients to resources providing no-cost eye exams, such as the American Academy of Ophthalmology’s EyeCare America and the American Optometric Association’s VISION USA, or ● promoting access to vision rehabilitation services as appropriate for individuals with chronic vision impairment. <p>This activity is intended for:</p> <ul style="list-style-type: none"> ● Non-ophthalmologists / optometrists who refer patients to an ophthalmologist/optometrist; ● Ophthalmologists/optometrists caring for underserved patients at no cost; or ● Any clinician providing literature and/or resources on this topic. <p>This activity must be targeted at underserved and/or high-risk populations that would benefit from engagement regarding their eye health with the aim of improving their access to comprehensive eye exams or vision rehabilitation services.</p>
Weighting:	Medium

TABLE B: Improvement Activity for Removal for the MIPS CY 2021 MIPS Performance Period and Future Years

In this final rule, we are finalizing the removal of one previously finalized improvement activity from the MIPS Program for the MIPS CY 2021 performance period/2023 MIPS payment year and future years. This improvement activity is discussed in detail below. Improvement activity removal factors are discussed in the MIPS CY 2020 final rule (84 FR 62568 through 63563).

Current Improvement Activity	
Current Activity ID:	IA CC 5
Current Subcategory:	Care Coordination
Current Activity Title:	CMS Partner in Patients Hospital Engagement Network
Current Activity Description:	Membership and participation in a CMS Partnership for Patients Hospital Engagement Network.
Current Weighting:	Medium
Removal Rationale:	Subsequent to publication of the proposed rule, we became aware that the underlying program, which forms the basis for this improvement activity, has expired. The Partner in Patients Hospital Engagement Network activity description requires membership and participation in a CMS Partnership for Patients Hospital Engagement Network which ended March 31, 2020, and may be found at https://innovation.cms.gov/innovation-models/partnership-for-patients . Because the Partnership for Patients Hospital Engagement Network has ended and performance of this activity will no longer be possible starting with the CY 2021 performance year, this improvement activity is obsolete (Factor 7, 84 FR 62988) and no longer available for clinicians to participate in; therefore, we are finalizing removal of this improvement activity beginning with the CY 2021 performance year/2023 MIPS payment year to avoid any potential confusion.
Comments:	N/A – Not included in the notice of proposed rulemaking.
Response:	N/A – Not included in the notice of proposed rulemaking.
Final Action:	We are finalizing the removal of this improvement activity beginning with the CY 2021 performance year/2023 MIPS payment year.
Finalized Improvement Activity	
Activity ID:	N/A – Removed

Table C: Finalization of Improvement Activity Previously Adopted in the March 31st COVID-19 IFC (85 FR 19277) and Continued with Modification in the September 2nd COVID -19 IFC (85 FR 54850 through 54851) for the MIPS CY 2021 Performance Period

Original Improvement Activity	
Original Activity ID:	IA ERP XX
Original Subcategory:	Emergency Response and Preparedness
Original Activity Title:	COVID-19 Clinical Trials
Original Activity Description:	<p>To receive credit for this activity, a MIPS eligible clinician must participate in a COVID-19 clinical trial utilizing a drug or biological product to treat a patient with a COVID-19 infection and report their findings through a clinical data repository or clinical data registry for the duration of their study. For more information on COVID-19 clinical trials we refer readers to the U.S. National Library of Medicine website at https://clinicaltrials.gov/ct2/results?cond=COVID-19.</p> <p>This improvement activity was finalized for the MIPS CY 2020 performance period only in response to the PHE for COVID-19.</p>
Original Weighting:	High
Original Comments:	Several commenters supported our efforts to encourage and recognize clinician participation in COVID-related clinical trials through the finalization of this improvement activity.
Original Responses:	We appreciate the commenters' support. We believe that clinicians who treat patients diagnosed with COVID-19 and simultaneously submit relevant data regarding that patient to a clinical data registry for COVID-19 research should receive credit. We believe that all clinical data gathered in the treatment of patients diagnosed with COVID-19 may be helpful in finding a solution to end this pandemic. Encouraging clinicians collectively to utilize a clinical data registry for data reporting could facilitate sharing of data for use in additional clinical studies with larger sample sizes. These additional and larger clinical studies are likely to identify efficacy of certain treatments, which in turn could result in wider improvements in health outcomes, including reduced severity and mortality due to COVID-19 across the nation. This could benefit patients nationwide as well as improve clinical practice and care delivery for the patients of the clinician attesting to this improvement activity.
Modified Improvement Activity	
Modified Activity ID:	IA ERP 3
Modified Subcategory:	Emergency Response and Preparedness
Modified Activity Title:	COVID-19 Clinical Data Reporting with or without Clinical Trial
Change and Rationale:	<p>Following the publication of the March 31st IFC for COVID-19, we received several inquiries through meetings, email correspondence, and Quality Payment Program help desk requesting further information on whether a clinician working with COVID-19 patients who provides their data to a clinical data registry, without participating in a clinical trial, may get credit for this activity. The Quality Payment Program help desk tracks, documents, and resolves inquiries submitted by MIPS eligible clinicians and groups. Stakeholders may submit inquiries to the help desk via 1-866-288-8292 (Monday-Friday 8 a.m.-8 p.m. ET) or email QPP@cms.hhs.gov. Some stakeholders believed that clinicians providing care to patients with COVID-19 outside of a clinical trial that report those data through a clinical data registry should receive credit for this activity. It came to our attention that clinical data registries not only collect data as part of clinical trials, but also collect data from clinicians not participating in clinical trials. The improvement activity as written was causing confusion for clinicians and groups attempting to meet the needs of patients and address gaps in research. Since IA ERP 3 titled "COVID-19 Clinical Trials" was established, this improvement activity has been the subject of approximately 30 percent of the inquiries to the Quality Payment Program help desk, demonstrating the desire for clinicians to improve clinical care and overall outcomes for patients diagnosed with COVID-19 by conducting this improvement activity, but also indicating the need for further clarity in its activity description. As a result, we expanded the improvement activity to include clinicians</p>

	<p>participating in the care of a patient diagnosed with COVID-19 who simultaneously submit their clinical patient data to a clinical data registry for research. Thus, in order to receive credit for this improvement activity, a MIPS eligible clinician or group must: (1) Participate in a COVID-19 clinical trial utilizing a drug or biological product to treat a patient with a COVID-19 infection and report their findings through a clinical data repository or clinical data registry for the duration of their study; or (2) participate in the care of patients diagnosed with COVID-19 and simultaneously submit relevant clinical data to a clinical data registry for ongoing or future COVID-19 research. Data would be submitted to the extent permitted by applicable privacy and security laws.</p> <p>We also modified the improvement activity title to reflect this change.</p> <p>We had previously added the improvement activity to the Inventory for the CY 2020 performance period only in response to the PHE for COVID-19. In this IFC, we extended the newly modified COVID-19 Clinical Data Reporting with or without Clinical Trial improvement activity through the CY 2021 performance period due to the increased rate of COVID-19 infection we were experiencing nationwide. We anticipated the need for COVID-19 clinical trials and data collection/sharing through registries to continue through CY 2021 at which time we would reassess whether there remains a need for additional data sharing or if preventive measures and clinical treatments have advanced to the point where these type of data are not needed. We wanted eligible clinicians to be able to attest to this improvement activity if it is still pertinent. We believed that participation in this improvement activity was likely to result in improved outcomes by improving the collection of data clinicians use for the care of their patients as they monitor and manage COVID-19.</p>
Modified Activity Description:	<p>To receive credit for this improvement activity, a MIPS eligible clinician or group must: (1) participate in a COVID-19 clinical trial utilizing a drug or biological product to treat a patient with a COVID-19 infection and report their findings through a clinical data repository or clinical data registry for the duration of their study; or (2) participate in the care of patients diagnosed with COVID-19 and simultaneously submit relevant clinical data to a clinical data registry for ongoing or future COVID-19 research. Data would be submitted to the extent permitted by applicable privacy and security laws. Examples of COVID-19 clinical trials may be found on the U.S. National Library of Medicine website at https://clinicaltrials.gov/ct2/results?cond=COVID-19. In addition, examples of COVID-19 clinical data registries may be found on the National Institute of Health website at https://search.nih.gov/search?utf8=%E2%9C%93&affiliate=nih&query=COVID19+registries&commit=Search.</p> <p>For purposes of this improvement activity, clinical data registries must meet the following requirements: (1) the receiving entity must declare that they are ready to accept data as a clinical registry; and (2) be using the data to improve population health outcomes. Most public health agencies and clinical data registries declare readiness to accept data from clinicians via a public online posting. Clinical data registries should make publically available specific information on what data the registry gathers, technical requirements or specifications for how the registry can receive the data, and how the registry may use, re-use, or disclose individually identifiable data it receives. For purposes of credit toward this improvement activity, any data should be sent to the clinical data registry in a structured format, which the registry is capable of receiving. A MIPS eligible clinician may submit the data using any standard or format that is supported by the clinician's health IT systems, including but not limited to, certified functions within those systems. Such methods may include, but are not limited to, a secure upload function on a web portal, or submission via an intermediary, such as a health information exchange. To ensure interoperability and versatility of the data submitted, any electronic data should be submitted to the clinical data registry using appropriate vocabulary standards for the specific data elements, such as those identified in the United States Core Data for Interoperability (USCDI) standard adopted in 45 CFR 170.213.</p> <p>This improvement activity was continued through the CY 2021 performance period.</p>

Modified Weighting:	High
Comments:	<p>In response to the September 2nd COVID-19 IFC (85 FR 54850 through 54851), several commenters supported the proposal to expand this improvement activity to include clinicians participating in the care of a patient diagnosed with COVID-19 who simultaneously submit their clinical patient data to a clinical data registry for research. Commenters noted that this expansion will increase clinician participation in this improvement activity and increase the availability of COVID-19 patient data. One commenter specifically noted this proposal will improve data for a COVID-19 registry focused on cancer patients and appreciated that a cancer registry is acceptable to meet this improvement activity. A few commenters noted support for the extension of this improvement activity into 2021.</p> <p>Additionally, in response to the September 2nd COVID-19 IFC, a few commenters recommended additional clarifications or expansions around the COVID-19 Clinical Data Reporting with or without Clinical Trial improvement activity. One commenter requested that CMS clarify whether anyone submitting COVID-19 related data to a registry would qualify for credit for this improvement activity, whether it is a Qualified Registry (QR), Qualified Clinical Data Registry (QCDR), or a data registry that collects clinical data, provided it meets the other outlined criteria. Another commenter recommended that CMS add additional research targets to the improvement activity, including research related to diagnostic and medical devices rather than just therapeutics. One commenter noted that reporting for the COVID-19 Clinical Data Reporting with or without Clinical Trial improvement activity represents an opportunity to meet Promoting Interoperability performance category requirements and recommended that CMS coordinate with both the CDC and ONC to develop common electronic case reporting (eCR) standards.</p> <p>In response to the PFS for the CY 2021 performance period and future years NPRM, several commenters also provided support for the COVID-19 Clinical Data Reporting with or without Clinical Trial improvement activity, including extension of this improvement activity until at least the end of the 2021 reporting period. One commenter provided their disappointment that as a group reporter, they would be unable to attest to this improvement activity because they would not be able to have more than 50 percent of their group participate in clinical data reporting.</p>
Response:	<p>We appreciate the commenters support for the improvement activity. We believe that this improvement activity will increase clinical data reporting and ultimately improve the collection of data clinicians use for the care of their patients. We anticipate that clinical data gathered in the treatment of patients with COVID-19 may be helpful in finding a solution to end this pandemic. To clarify, to receive credit for this improvement activity, a MIPS eligible clinician or group must either: (1) participate in a COVID-19 clinical trial utilizing a drug or biological product to treat a patient with a COVID-19 infection and report their findings through a clinical data repository or clinical data registry for the duration of their study; or (2) participate in the care of patients diagnosed with COVID-19 and simultaneously submit relevant clinical data to a clinical data registry for ongoing or future COVID-19 research. If the clinician or group is participating in a COVID-19 clinical trial, it must utilize a drug or biological product. On the other hand, the clinician or group could participate in the care of patients diagnosed with COVID-19 and simultaneously submit relevant clinical data to a clinical data registry for ongoing or future COVID-19 research. This latter option is more broad and could include use of diagnostics and medical devices. In addition, for purposes of this improvement activity, clinical data registries must meet the following requirements: (1) the receiving entity must declare that they are ready to accept data as a clinical registry; and (2) be using the data to improve population health outcomes. We refer readers to the activity description for full details. In many cases, this could include a Qualified Registry (QR), Qualified Clinical Data Registry (QCDR), or a data registry that collects clinical data, so long as it meets the stated requirements.</p> <p>We will take into consideration the recommendation that we coordinate with CDC and ONC to develop common electronic case reporting (eCR) standards related to this improvement activity. We understand the disappointment that this improvement activity is more difficult for group reporters to attest.</p>

Final Action:	After consideration of the public comments received, we are adopting this improvement activity as finalized in the September 2nd COVID-19 IFC (85 FR 54850 through 54851) to apply through the CY 2021 performance year.
Finalized Improvement Activity	
Activity ID:	IA_ERP_3
Subcategory:	Emergency Response and Preparedness
Activity Title:	COVID-19 Clinical Data Reporting with or without Clinical Trial
Activity Description:	<p>To receive credit for this improvement activity, a MIPS eligible clinician or group must: (1) participate in a COVID-19 clinical trial utilizing a drug or biological product to treat a patient with a COVID-19 infection and report their findings through a clinical data repository or clinical data registry for the duration of their study; or (2) participate in the care of patients diagnosed with COVID-19 and simultaneously submit relevant clinical data to a clinical data registry for ongoing or future COVID-19 research. Data should be submitted to the extent permitted by applicable privacy and security laws. Examples of COVID-19 clinical trials may be found on the U.S. National Library of Medicine website at https://clinicaltrials.gov/ct2/results?cond=COVID-19. In addition, examples of COVID-19 clinical data registries may be found on the National Institute of Health website at https://search.nih.gov/search?utf8=%E2%9C%93&affiliate=nih&query=COVID19+registries&commit=Search.</p> <p>For purposes of this improvement activity, clinical data registries must meet the following requirements: (1) the receiving entity must declare that they are ready to accept data as a clinical registry; and (2) be using the data to improve population health outcomes. Most public health agencies and clinical data registries declare readiness to accept data from clinicians via a public online posting. Clinical data registries should make publically available specific information on what data the registry gathers, technical requirements or specifications for how the registry can receive the data, and how the registry may use, re-use, or disclose individually identifiable data it receives. For purposes of credit toward this improvement activity, any data should be sent to the clinical data registry in a structured format, which the registry is capable of receiving. A MIPS eligible clinician may submit the data using any standard or format that is supported by the clinician's health IT systems, including but not limited to, certified functions within those systems. Such methods may include, but are not limited to, a secure upload function on a web portal, or submission via an intermediary, such as a health information exchange. To ensure interoperability and versatility of the data submitted, any electronic data should be submitted to the clinical data registry using appropriate vocabulary standards for the specific data elements, such as those identified in the United States Core Data for Interoperability (USCDI) standard adopted in 45 CFR 170.213.</p>
