

abutment that is equipped with a headgate and trashrack with 2-inch clear bar spacing; (4) a 26-foot-long, 22-foot-wide wood and steel powerhouse containing one 265-kilowatt vertical Flygt submersible turbine-generator unit; (5) a 400-foot-long, 20-foot-wide tailrace that discharges into the Cocheco River; (6) a generator lead, transformer, and transmission line that connect the project to the local utility distribution system; and (7) appurtenant facilities.

Watson Associates voluntarily operates the project in a run-of-river mode using an automatic pond level control system to regulate turbine operation, such that outflow from the project approximates inflow. The project creates an approximately 250-foot-long and a 400-foot-long bifurcated bypassed reaches of the Cocheco River.

Downstream fish passage is provided by a bypass pipe located on the left side of the dam. There is no upstream fish passage facility at the project.

The current license requires a minimum flow release of 83 cubic feet per second (cfs), or inflow to the impoundment, whichever is less from the dam to protect and enhance aquatic resources in the Cocheco River. The average annual generation of the project is approximately 1,100 megawatt-hours.
