Hospitals are required to submit information for structural measures once annually using a CMS-approved web-based data collection tool available within the HQR System. We refer readers to section IX.E.10. (Form, Manner, and Timing of Quality Data Submission) of the preamble of this final rule for more details on our previously finalized data submission and deadline requirements across measure types, and specifically, section IX.E.10.i. for our data and submission requirements for structural measures.

We invited public comment on this proposal.

Comment: Many commenters supported the proposal to adopt the Screen Positive Rate for Social Drivers of Health measure beginning with voluntary reporting for the CY 2023 reporting period and mandatory reporting beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years. Those commenters agreed with our described rationale for the proposal. Commenters believed the Screen Positive Rate for Social Drivers of Health measure would advance CMS' strategic pillar to advance health equity by providing data about the impact of drivers of health on patients' health outcomes, health disparities, physician quality performance, and health care costs. Several commenters applauded the proposal of the first drivers of health measures in hospital quality performance measurement. A commenter referenced recent studies that have quantified the significant

[610] National Quality Forum. (2022). Measure Applications Partnership (MAP) 2021–2022 Final Recommendations. Available at: *https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=96698.*

impact of drivers of health on physician performance and Medicare spending. A commenter referenced recent research reports of approximately 80 percent of health outcomes being directly associated with drivers of health and many physicians reporting that such factors influence patients' health and health outcomes. Several commenters stated the measure would improve healthcare transparency, promote data-driven community resource investments, and inform and strengthen quality improvement efforts addressing health equity.

Response: We thank commenters for their support of the measure and agree that it, in combination with the Screening for Social Drivers of Health measure, will be a first step towards addressing drivers of health to improve health equity, which is one of our strategic pillars.

Comment: Many commenters supported the measure because it would provide data needed to identify factors that perpetuate health disparities. A commenter stated the measure would provide data on key contributors to poor physical and mental health outcomes. A few commenters noted the measure would provide additional data on the specific drivers of health challenges faced by patients in complement to the Screening for Social Drivers of Health measure. A few commenters believed the measure would highlight variability in drivers of health prevalence across hospitals, thereby reflecting the challenges faced by hospitals that disproportionately serve patients with higher HRSN burden. Several commenters believed the measure would allow CMS to account for HRSNs in risk adjustment for quality performance scoring and support targeted quality improvement activities. A few commenters noted the measure would promote data transparency and build credibility for hospitals engaging in social drivers of health screening and intervention activities. A few commenters emphasized the measure would be person- or patient-level which will support enhanced evaluation of the economic implications of HRSNs on healthcare billing, risk adjustment, and cost benchmarks. A commenter noted the measure would be especially important for practicing physicians and their patients because it would accelerate quality improvement activities that address health disparities. A few commenters believed the measure would enable public and private institutions to make strategic investments that will strengthen capacity-building for addressing patients' HRSNs.

Response: We thank commenters for their support of the measure and the multiple ways in which the data could potentially be used to inform evidence-based decision making. We believe this measure is the next logical step after screening for HRSNs. We agree with commenters that data from the measure will contribute to efforts to close the health equity gap. Specifically, for the Hospital IQR Program, we recognize that drivers of health contribute significantly to unplanned hospital re-admissions and other patient outcomes in the hospital inpatient setting which impacts hospitals and healthcare providers that serve patients who are disproportionately burdened with unmet HRSNs. We intend for the two measures to encourage hospitals' accountability for addressing health disparities and, specifically, that the Screen Positive Rate for Social Drivers of Health will enable identification of specific unmet needs among patients.

Comment: Several commenters did not support adoption of the Screen Positive Rate for Social Drivers of Health measure. A commenter did not support adoption of the Screen Positive Rate for Social Drivers of Health measure because they believed the measure would be inappropriate for CMS quality measurement.

Response: We thank the commenters for their input, but respectfully disagree. The intent of both measures is to promote adoption of HRSN screening by hospitals as part of a larger long-term strategy to improve patient outcomes and eliminate health equity gaps in the hospital inpatient setting. We refer readers to the Overview section in the proposed rule (87 FR 28505) where we state that the measure is intended to provide information to hospitals on the level of unmet social needs among patients served. We also refer the reader to our definition of quality measures as noted in our Measure Management System.[611] We believe the Screen Positive Rate for Social Drivers of Health measure will function as tools to help us measure and quantify healthcare processes and patient outcomes in the hospital inpatient setting.

Comment: A few commenters stated the measure lacks comparability across hospitals.

Response: We thank the commenters for their input. We refer readers to the Overview section in the proposed rule where we state that the measure is intended to provide information to hospitals on the level of unmet social needs among patients served, and not for comparison between hospitals (87 FR 28505).

Comment: A few commenters believed the measure would be difficult to interpret. Specifically, a commenter believed the Screen Positive Rate for Social Drivers of Health measure interpretation would be extremely difficult because the denominator will not be specific to the numerator's drivers of health domains. A few commenters expressed concern about potential confusion among patients and unclear interpretation that could lead to data misuse.

Response: We thank the commenters for their input. We appreciate the concerns noted and we will take them into consideration for our future outreach efforts aimed at enhancing understanding of the measures and how the data will be used. We do not agree with the commenters that the measure may lack specificity or clarity or create confusion. We refer readers to the explanation of the measure specifications and specifically, the Measure Calculation section (IX. E.5.b.(2).(f).), in which we discuss the relationship between the numerator and denominator.

Comment: A few commenters stated the measure does not capture response to screening or whether intervention occurred and was effective.

Response: We thank the commenters for their input. We stated in the proposed rule that utilization of screening tools to identify the burden of unmet HRSNs can be a helpful first step in identifying necessary community partners connecting individuals to resources in their communities (87 FR 28500). The measure does not currently include measurement of intervention efficacy, and we will consider this in future rulemaking.

Comment: A commenter questioned the value of public reporting of the Screen Positive Rate for Social Drivers of Health measure data.

Response: We thank the commenter for their input. Collecting healthcare quality data related to social drivers can promote transparency in delivery of care by increasing involvement of leadership in healthcare quality improvement, increasing a sense of accountability, helping to focus organizational priorities and providing a means of delivering important healthcare information to patients. We believe this will be especially important as we advance the aims of our strategic pillar to improve health equity in general and address the disproportionate impact that drivers of health have on hospital quality performance for organizations

[611] *https://mmshub.cms.gov/about-quality/new-to-measures/what-is-a-measure.*

that serve patient populations with high HRSN levels.

Comment: Several commenters stated the proposed timeline for voluntary and mandatory reporting is inadequate. A commenter stated the work required to make the measures meaningful and establish effective workflows would take many years to develop.

Response: We thank the commenters for their feedback. We appreciate the concerns about the operational complexity of introducing drivers of health quality measures into existing clinical workflows. While the implementation of these two Social Drivers of Health measures may be a major undertaking for some providers, especially given the ongoing COVID–19 PHE, we also recognize that the COVID–19 PHE magnified the disproportionate burden of drivers of health on communities who have been historically under-resourced.[612] We have therefore determined that the proposed voluntary and mandatory reporting periods balance the time needed to implement these measures with the urgency of capturing drivers of health data and taking actionable steps towards closing the health equity gap. As stated in the proposed rule, potential sources of these data could include, for example, administrative claims data, electronic clinical data, standardized patient assessments, or patient-reported data and surveys (87 FR 28503). Additionally, we note that 92 percent of hospitals already screen for one or more of the five HRSNs—food insecurity, housing instability, transportation needs, utility difficulties, and interpersonal safety—specified in the proposed measures (87 FR 28498). We believe that this is a strong indication that hospitals have processes in place to conduct the screening required.

Comment: A commenter identified inadequate measure design and lack of measure specification and testing to support adoption as challenges to implementation of the proposed measures; the commenter recommended an attestation-based data collection approach.

Response: We thank the commenters for their input. We respectfully disagree with the commenter that the measures lack specification and testing. We appreciate the concerns noted and we refer readers to the Overview of Measure section in the proposed rule (and section E.5.b.(2).(b). of this final rule) where we provide the measure specifications (87 FR 28506). Specifically, we explain the numerator, denominator, and measure calculation for both measures. Moreover, evidence from the AHC Model evaluation supports adoption of the measure as proposed because it demonstrated the ability of drivers of health screening to identify higher cost and utilization patients in the hospital inpatient setting. The measures were reviewed by the MAP Hospital Workgroup, MAP Health Equity Workgroup, and the MAP Rural Health Workgroup and all supported inclusion of the measures in the Hospital IQR Program. We expect this will advance efforts for hospitals to reduce unplanned readmission rates.

Comment: A commenter was concerned about the appropriateness of including the measure in the Hospital IQR Program. The commenter believed the measure is a hospital ''case-mix'' measure instead of a structural measure. The commenter believed the measure does not reflect hospital quality performance because hospitals are not resourced to address the problems identified in HRSN screening.

Response: We thank the commenter for this input. We define a structural quality measure, also known as a structure measure, in the CMS Measurement Management System Blueprint as a measure that ''assesses features of a healthcare organization or clinician relevant to its capacity to provide healthcare.'' [613] This is particularly relevant in the hospital patient setting where patients with high levels of HRSNs tend to have higher utilization and costs related to care delivery. While case mix reflects the diversity, complexity, and severity of patient illnesses treated at a given hospital, patients' HRSNs and the levels of unmet need among screened patients have not previously been measured or publicly reported on a national scale. Moreover, while HRSNs contribute to case mix components such as illness severity and complexity, our initial aim with these measures centers on using drivers of health screening to understand the precursors of patient illnesses and disparities in health outcomes over time. We aim to encourage hospitals to address patient-level HRSNs in care delivery because patient characteristics greatly influence healthcare organizations' and healthcare professionals' capacity to deliver healthcare. We emphasize that screening for and reporting of HRSN prevalence among patients are intended to be *initial steps* towards more robust accounting of the impact of HRSNs on patient health and related outcomes during and following hospitalization. Hospitals will not be expected to address the problems identified by screening but instead will be expected to facilitate linkage to community resources that can assist patients in meaningful ways.

Comment: A few commenters recommended against publicly reporting the data for this measure. A few commenters specifically recommended against reporting data on the Compare tool due to risk of misinterpretation by consumers. A few commenters were concerned that public reporting of the data might suggest that hospitals serving communities with high HRSNs are under-performing. A commenter believed that public reporting the data would discourage hospitals from screening patients with higher risk. A commenter recommended we ensure the measures are implemented consistently to allow fair comparisons across providers and regions due to differences in capacity for screening and making follow-on services available. Several commenters recommended we provide outreach and education to patients and providers to address the meaning, reasons, and interpretation of the measures. A commenter recommended developing guidance on effective education on the measures for patients and providers. A commenter recommended we evaluate the ability of consumers to interpret the measure rate(s) accurately.

Response: We appreciate the commenters' concerns. We wish to remind readers that the measure is intended to provide information to hospitals on the level of unmet need among their patients, and not for comparison between hospitals (87 FR 28505). We intend to conduct outreach and education in conjunction with public reporting of the data for the two Social Drivers of Health measures. We believe public reporting of healthcare quality data promotes transparency in the delivery of care by increasing the involvement of leadership in healthcare quality improvement, creating a sense of accountability, helping to focus organizational priorities, and providing a means of delivering important healthcare information to consumers.[614]

[614] Centers for Medicare & Medicaid Services Quality Net. Public Reporting Overview. Available

Continued

We intend to conduct outreach and education with providers and patients to share information about the two Social Drivers of Health measures in conjunction with public reporting.

Comment: A commenter believed the name of the measure is misleading and recommending changing the name because patients may misinterpret ''screening positive'' as a positive event.

Response: We thank the commenter for their input about potential misinterpretation of the measure name. While we are not changing the measure name at this time, we appreciate this feedback and will consider it in outreach and education in conjunction with public reporting of the data and potential future development of this and other related measures.

Comment: A commenter recommended considering a minimum level of cross-cultural validation of the measures and/or demonstration of how community members and patients participated in domain prioritization.

Response: We appreciate the commenters recommendations. We will consider this input as part of future measure maintenance analyses as well as future policy development.

Comment: A commenter recommended modifying the measure so that in addition to capturing the five separate rates, one for each of the HRSN domains, the measure would ''drill down'' into sub-components to include three options for each: Screen positive, screen negative, and did not screen. A commenter recommended reconsideration of the measure specifications to reduce risk of small denominator sizes that would impede calculation and/or interpretation.

Response: We thank the commenter for their input. We will consider this input as part of future measure maintenance analyses as well as policy development.

Comment: A commenter recommended consolidating the two Screening for Social Drivers measures into a single measure and adding a component that would capture screening follow-up. The commenter believed that one single measure then could be stratified by whether an individual screened positive or negative.

Response: We thank the commenter for their input. We will consider this input as part of future measure maintenance analyses as well as policy development.

After consideration of the public comments we received, we are finalizing our proposal as proposed.

c. Cesarean Birth eCQM Beginning With the CY 2023 Reporting Period/FY 2025 Payment Determination With Mandatory Reporting Beginning With the CY 2024 Reporting Period/FY 2026 Payment Determination and for Subsequent Years

In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28506 through 28510), we proposed to adopt the Cesarean Birth eCQM as one of the eCQMs in the Hospital IQR Program measure set that hospitals can self-select to report for the CY 2023 reporting period/FY 2025 payment determination. We also proposed to make reporting of this eCQM mandatory beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years.

(1) Background

A Cesarean section (C-section) is the use of surgery to deliver a baby (or babies) in lieu of vaginal delivery. The procedure entails surgical and anesthesia risks and requires mothers to undergo several days of inpatient, post-operative recovery. A C-section may occur on an elective or nonelective basis.[615] Elective C-sections may be planned due to the presence of a complicating medical condition, abnormal positioning of the baby, or other medical indications.[616] Elective C-sections may also occur for non-medical reasons, including maternal preference (in consultation with their healthcare provider), local practice patterns, malpractice risk, or other factors.[617] [618] [619] C-sections that occur upon a mother's request are rare, but occur after consultation with a clinician.[620]

The total rate of (elective and nonelective) C-sections has risen in the U.S. since the 1990s.[621] C-sections accounted for 31.8 percent of U.S. live births in 2020,[622] and there is a considerable amount of variation in the rates based on U.S. region, state, and healthcare institution.[623] There is also substantial variability across races and ethnicities; the rate of C-sections is: 30.8 percent among Non-Hispanic White women, 36.3 percent among Black women, 28.8 percent among American Indian or Alaska Native women, 32.6 among Asian women, and 31.4 percent among Hispanic women.[624] U.S. practice guidelines have not indicated an optimal rate of C-section or an appropriate variance rate; while international studies suggest a preference for a lower range than current U.S. rates.[625] [626] [627]

When medically indicated, a C-section can effectively prevent maternal and neonatal morbidity and mortality.[628] However, clinicians and consensus groups agree that increased C-section rates have not improved overall perinatal outcomes and that C-sections are overused.[629] [630]

[629] Caughey AB, Cahill AG, Guise JM, Rouse DJ. (2014). Safe prevention of the primary cesarean

Additionally, low risk C-sections—defined as deliveries by nulliparous, term, or singleton vertex (NTSV) women—have seen an increase. ''Nulliparous'' women are those who have never given birth to a live baby but may have had a miscarriage, stillbirth, or elective abortion. They have a lower risk of maternal morbidity and mortality during vaginal birth than do women who have undergone a previous C-section.[631,632] ''Term'' indicates a term birth (that is on or after 37 weeks' gestation), which has better outcomes than a preterm birth, and ''singleton'' refers to the birth of a single child during one delivery. Vertex presentations, which are those where the child is positioned headfirst, carry less risk than breech or transverse presentations.[633] The rate of low-risk C-section deliveries also varies by race and ethnicity; low-risk C-section births in 2020 were: 24.9 percent among NTSV Non-Hispanic White women, 30.6 percent among NTSV Non-Hispanic Black women, 23.6 percent among NTSV American Indian or Alaska Native women, 27.7 percent among NTSV Asian women, and 25.2 percent among NTSV Hispanic women.[634] A majority of which are still higher than the Centers for Disease Control and Prevention's (CDC's) Healthy People 2020 goal to reduce C-section births among NTSV women to 23.9 percent by 2020.[635]

C-sections have higher morbidity and mortality (9.2 percent) than vaginal deliveries (8.6 percent).[636] Existing literature largely does not distinguish whether inferior outcomes derive from cause (higher-risk patients undergo C-section) or effect (surgery carries inherent risks due to anesthesia, bleeding, infection, post-operative recovery, etc.).[637] However, taking an aggregate view of multiple studies over time, it appears that C-sections carry a higher risk of subsequent miscarriage, placental abnormalities, and repeat C-section.[638] The rates of transfusions, ruptured uteri, unplanned hysterectomies, and intensive care unit (ICU) admissions are higher among women who deliver via C-section for the first time than those who deliver vaginally for the first time across all races and ethnicities. However, non-Hispanic Black women who deliver via C-section for the first time had the highest rates of uterine rupture and ICU admission compared with all other races and ethnicities.[639]

In terms of neonatal outcomes, C-sections have higher respiratory morbidity (1 percent to 4 percent) than vaginal births (<1 percent).[640] Again, it is unclear whether this is because of cause (high-risk fetuses are more likely to be delivered by C-section) or effect (surgery carries inherent risks due to anesthesia, bleeding, infection, post-operative recovery, etc.). The medical indications for a C-section entail broad provider discretion because of the need to: (1) Balance any conflicting medical conditions of mother versus fetus; and (2) balance the C-section against any other competing clinical considerations or external constraints (for example, availability of operation room, personnel, and/or blood). It should also be noted that reducing the rate of C-sections does not result in worse outcomes for the mother or newborn, with newborn complications even declining in some hospitals with significant C-section reductions.[641]

Furthermore, C-sections receive higher reimbursement than vaginal deliveries (typically about 50 percent more). The prevalence of non-medically indicated C-sections carries economic impacts because C-sections are more expensive than vaginal deliveries and may be accompanied by adverse outcomes and complications, which similarly have substantial cost implications.[642]

We believe this eCQM will help further our goal of addressing maternal health outcomes in the Hospital IQR Program. Currently, the Hospital IQR Program includes two measures that address improving maternal health: The Elective Delivery measure (PC–01) (77 FR 53530) and the Maternal Morbidity Structural measure (86 FR 45361 through 45365). However, neither of these measures directly address the factors contributing to maternal mortality, such as the high rates of C-sections in the U.S. We believe adopting measures like the Cesarean Birth eCQM presents unique opportunities for large-scale quality measurement and activities that can improve the short- and long-term health outcomes for mothers and children.[643] We also refer readers to section IX.E.5.d. of the preamble of this final rule, where we also finalized the adoption of the Severe Obstetric Complications eCQM as part of the Hospital IQR Program measure set.

In response to increases in low-risk C-sections, HHS has included a goal of reducing low-risk C-sections by 25 percent in the next five years as part of the Maternal Action Plan.[644] To build on the previously established HHS Maternal Health Action Plan, the Vice President's nationwide call to action to reduce maternal morbidity and mortality, and ongoing efforts with HHS and across the federal government,[645]

[645] Department of Health and Human Services. HHS Initiative to Improve Maternal Health. Available at: *https://aspe.hhs.gov/topics/public-health/hhs-initiative-improve-maternal-health*.

the Biden-Harris Administration seeks to use a whole-of-government approach for improving maternal health and advancing maternal health equity that reduces maternal mortality and morbidity, reduces persistent disparities, and among other activities, increases hospital participation in HHS-sponsored maternal health quality improvement initiatives. A critical focus is reducing existing disparities in maternal health outcomes across race, ethnicity, and geographic area. The Cesarean Birth eCQM is intended to facilitate safer patient care by assessing the rate of NTSV C-sections to ultimately reduce the occurrence of non-medically indicated C-sections, promoting adherence to recommended clinical guidelines, and encouraging hospitals to track and improve their practices of appropriate monitoring and maternity care delivery for pregnant and postpartum patients. The 2020 performance measurement data for the Cesarean Birth eCQM indicates a 27.5 percent average rate of C-section birth for NTSV women (across 15 hospitals, N=933). A group of subject matter experts for NQF noted that decreasing the rate of non-medically indicated C-sections can result in increased patient safety, decreased maternal and neonatal morbidity, and substantial savings in healthcare costs.[646] Additionally, considering that Non-Hispanic Black women have the highest rate of low-risk C-sections along with the highest rates of uterine ruptures and ICU admissions as a result of C-sections, reducing low-risk C-section rates could improve maternal health outcomes for this population in particular by reducing the excess maternal morbidity they experience.[647] [648] [649]

Under CMS' Meaningful Measures Framework,[650] the Cesarean Birth eCQM addresses the quality priority of ''Make Care Safer by Reducing Harm Caused in the Delivery of Care'' through the Meaningful Measures Area of ''Preventable Healthcare Harm.'' [651] Additionally, pursuant to Meaningful Measures 2.0,[652] this measure addresses the ''Safety'' priority area and aligns with our commitment to a patient-centered approach in quality measurement to ensure that patients are safe and receive the highest quality care.[653] Finally, this measure aligns with our strategic priorities including the pillar to advance health equity by addressing the health disparities that underlie our health system.[654]

Therefore, in the proposed rule, we proposed the adoption of the Cesarean Birth eCQM beginning with the CY 2023 reporting period/FY 2025 payment determination. As part of the currently finalized eCQM reporting and submission requirements, hospitals must report on three self-selected eCQMs and the Safe Use of Opioids—Concurrent Prescribing eCQM, for a total of four eCQMs (85 FR 58939). Hospitals may choose to report it as one of the three self-selected eCQMs for the CY 2023 reporting period/FY 2025 payment determination. After which, beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years, the Cesarean Birth eCQM would be required to be reported by all hospitals, except those hospitals that do not have an obstetrics department and do not perform deliveries. We also refer readers to section IX.E.10.e. of the preamble of this final rule for our policy to modify the eCQM reporting and submission requirements beginning with the CY 2024 reporting period/FY 2026 payment determination.

(2) Overview of Measure

This measure assesses the rate of NTSV pregnancies delivered via C-section. Determining the NTSV C-section rate permits a hospital to compare its outcomes to other hospitals while focusing only on the NTSV population which can impact the rates of first time and possibly subsequent C-section rates. We note that the NQF has endorsed the chart-abstracted form of this measure (PC–02: Cesarean Birth, NQF #0471) as a voluntary consensus standard since 2008 and continuously renewed its endorsement (most recently in 2020).[655] The Rural Health Workgroup of the NQF's MAP also identified the chart-abstracted version as a measure that holds particular relevance for rural hospitals, noting how important it is to focus on best practices in obstetric care in rural areas.[656] We acknowledge that there are instances where C-sections are medically indicated, and we emphasize that this measure is not intended to discourage practitioners from performing C-sections when they are medically indicated. We believe that assessing the rate of NTSV C-sections may ultimately reduce the occurrence of non-medically indicated C-sections. We encourage hospitals whose measure rates are higher than rates at other hospitals to explore and evaluate differences in the clinical management of women in labor.[657] Further, this measure will help ensure that the Hospital IQR Program includes measures which are applicable to rural hospitals.

The Cesarean Birth eCQM was included in a publicly available document entitled ''List of Measures Under Consideration for December 1, 2018'' (MUC List).[658] The MAP's Final Report on February 15, 2019

conditionally supported the eCQM for rulemaking pending NQF evaluation and endorsement.[659] The MAP suggested further feasibility testing, consultation with multiple stakeholders, and examination of unintended consequences.

Given the importance of this measure, we sought stakeholder input on the potential future inclusion of this measure in the FY 2020 IPPS/LTCH PPS proposed rule (84 FR 19491 through 19494). Many stakeholders supported inclusion of the measure, though some stakeholders shared similar concerns as the MAP (84 FR 42493 through 42496). Thereafter, the measure steward conducted further reliability and validity testing in 2021 and submitted the measure to the NQF for consideration of endorsement in Spring 2022. Given the additional testing performed and feedback provided, we proposed this measure in the proposed rule.

We also note that in 2020, the measure steward introduced the Cesarean Birth eCQM as one of the available eCQMs hospitals can choose for data submission to meet The Joint Commission's ORYX® requirements.[660] The ORYX initiative integrates performance measurement data into The Joint Commission's accreditation process.[661] Currently, we understand that The Joint Commission uses both the chart-abstracted (PC–02) and the eCQM versions. A total of 15 hospitals (representing 6 sites) submitted production data for one quarter of calendar year 2020. We note that the measure steward reached out to all 15 hospitals to recruit sites willing to participate in reliability testing on the data submitted. Seven hospitals (representing 2 sites) volunteered. One site is a system representing six hospitals. The seventh hospital is a stand-alone facility that uses a different EHR system. During the third quarter of 2021, feasibility scorecards were completed, and the feasibility rate was found to be 98 percent across the two EHR systems. Reliability and validity testing revealed the Cesarean Births eCQM to have a measure outcome agreement rate of 83.7 percent with a kappa score of .750 indicating substantial agreement. Overall, the data element agreement rate for all hospitals was 92.2 percent.

As mentioned previously, the NQF has endorsed the chart-abstracted form of this measure. Additionally, the measure steward submitted the eCQM to the NQF for consideration of endorsement during Spring 2022. We note that section 1866(b)(3)(B)(viii)(IX)(aa) of the Act requires that any measure specified by the Secretary must have been endorsed by the entity with a contract under section 1890(a) of the Act (the NQF is the entity that currently holds this contract). Under section 1886(b)(3)(B)(viii)(IX)(bb) of the Act, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. We reviewed NQF-endorsed measures and note that while the chart-abstracted version is endorsed, we were unable to identify any other NQF-endorsed measures on this topic, and, therefore we believe the exception in section 1886(b)(3)(B)(viii)(IX)(bb) of the Act applies.

The measure specifications for the Cesarean Birth eCQM can be found on the eCQI Resource Center website, available at: *https://ecqi.healthit.gov/pre-rulemaking-eh-cah-ecqms*.

(3) Data Sources

The eCQM uses data collected through hospitals' EHRs. The measure is designed to be calculated by the hospitals' CEHRT using the patient-level data and then submitted by hospitals to CMS.

(4) Measure Calculation

This eCQM assesses the rate of nulliparous women with a term, singleton baby in a vertex position delivered by C-section birth.[662] The eCQM uses one of the following: Nulliparous defined as Parity = 0, Gravidity = 0, or Preterm and Term both = 0. Parity is the number of completed pregnancies reaching 20 weeks gestation regardless of the number of fetuses or outcome of the pregnancy. Gravidity is the number of pregnancies, current and past, regardless of the pregnancy outcome. Preterm is less than 37 weeks and 0 days, and Term is greater than or equal to 37 weeks and 0 days using best Estimated Due Delivery (EDD).

(5) Outcome

The outcome of interest is the number of C-sections to NTSV women divided by all live, term (≥37 weeks gestation) singleton deliveries to NTSV women.

(6) Cohort

The cohort consists of all patients in the denominator: Nulliparous women with a singleton, vertex fetus at ≥37 weeks of gestation who deliver a liveborn infant. The cohort includes all pertinent patients regardless of payer (for example, Medicare, Medicaid, other public programs, private insurance, self-pay, or charity care) or admission source (for example, home, ED, nursing home, hospice, another hospital, or law enforcement).

(7) Numerator

The measure numerator consists of the subset of patients delivering by C-section.

(8) Denominator

The measure denominator consists of the number of nulliparous women with a singleton, vertex fetus at ≥37 weeks of gestation who deliver a liveborn infant.

(9) Exclusion Criteria

The measure excludes patients with abnormal presentations or placenta previa.

(10) Risk Adjustment

This measure is not currently risk adjusted. When developing the measure, the exclusion criteria were chosen to ensure that the focus population will be women with NTSV pregnancies. Nulliparous women are those experiencing their first birth. These women have a lower risk of maternal morbidity and mortality during a vaginal birth delivery than do women who have undergone a previous C-section.[663] The population of women in the denominator as a result of the exclusions allow the measure to focus on a more homogeneous group of women where the greatest improvement opportunity exists as evidenced by variation in rates of NTSV C-sections,

[663] Caughey AB, Cahill AG, Guise JM, Rouse DJ. (2014). Safe prevention of the primary cesarean delivery. Am J Obstet Gynecol, 210(3): 179–93. doi: 10.1016/j.ajog.2014.01.026.

indicating clinical practice patterns may affect this rate.[664] Lowering the C-section rate in NTSV pregnancies is important because C-sections may carry a higher risk of subsequent miscarriage, placental abnormalities, and repeat C-section.[665] The rates of ruptured uteri, unplanned hysterectomies, and ICU admission are higher among women who deliver via C-section for the first time than those who deliver vaginally for the first time across all races and ethnicities. However, non-Hispanic Black women who deliver via C-section for the first time had the highest rates of uterine rupture and ICU admission compared with all other races.[666] Focusing on the NTSV population aligns with the measure intent to have a significant effect on cesarean birth rates. We believe this could encourage a decrease in C-section rates in the NTSV population, which will in turn have a meaningful impact on future pregnancies and maternal health. Including a comprehensive set of maternal medical exclusions will add data collection burdens without commensurate benefit.

(11) Data Submission and Reporting

We refer readers to: Section IX.E.10.e. of the preamble of this final rule for a discussion of our previously finalized eCQM reporting and submission policies; and section IX.E.13.b. for the public reporting of eCQM data. Additionally, we refer readers to section IX.E.10.e.(4). where we discuss the use of the zero denominator declarations and case threshold exemption policies for hospitals.

We also refer readers to four related proposals discussed in the preamble of this final rule: (1) Section IX.E.10.e. where we discuss modifications to our reporting and submission requirements for eCQMs, including a discussion of our policy to require hospitals to report on the Cesarean Birth eCQM; (2) section IX.E.5.d. for our policy to adopt the Severe Obstetric Complications eCQM; (3) section IX.H.10.a.(2).of the preamble of this final rule for a discussion of similar policies to adopt these two perinatal eCQMs in the Medicare Promoting Interoperability Program for Eligible Hospitals and Critical Access Hospitals (CAHs); and (4) section IX.E.8. where we are establishing a publicly-reported hospital designation to capture the quality and safety of maternity care and other related activities in advancing maternal health equity.

We invited public comment on this proposal.

Comment: Many commenters supported adoption of the Cesarean Birth eCQM beginning with the CY 2023 reporting period/FY 2025 payment determination and mandatory reporting beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years. Commenters agreed with our rationale in the preamble of the FY 2023 IPPS/LTCH PPS proposed rule and underscored their beliefs that the measure could support the provision of high- quality maternity care, that this data is necessary for addressing the maternal health crisis, and that the measure could lead to improved clinical practices. Additionally, a few commenters indicated that their support was tied to the measure's alignment with their state's or The Joint Commission's reporting practices.

Response: We thank the commenters for their support of the Cesarean Birth eCQM and agree that measure is in line with best practices for reducing low-risk C-sections. As we noted in the preamble of the FY 2023 IPPS/LTCH PPS proposed rule, we believe the measure addresses a key priority area and will further our goal of addressing maternal health outcomes in the Hospital IQR Program (87 FR 28507).

Comment: A few commenters supported the proposal, but recommended staggered implementation, extending the voluntary reporting period for an additional year, or making the measure voluntary permanently.

Response: We thank commenters for their input on the timeline of adoption and implementation of the Cesarean Birth eCQM. We believe adopting measures like the Cesarean Birth eCQM presents unique opportunities for large-scale quality measurement and activities that can improve the short- and long-term health outcomes for mothers and children (87 FR 28508). As a result, we believe the proposed timeline of inclusion of this eCQM into the Hospital IQR Program measure set beginning in CY 2023 reporting period/FY 2025 payment determination (in which hospitals can choose to self-select reporting of this measure) followed by mandatory reporting beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years is sufficient for EHR vendors and hospitals to incorporate, adopt, and implement this measure.

Comment: A few commenters supported the proposal and recommended monitoring the measures in the future to track performance or to modify or expand the exclusion criteria as needed.

Response: We thank commenters for their support and agree that continued monitoring of the measures is important. We believe collecting data and reporting results will provide a critical baseline and we will monitor the data and any unintended consequences of the measure as part of standard measure maintenance.

Comment: A commenter supported the measure and requested clarification on how non-birthing hospitals would be affected by the adoption of this eCQM.

Response: We thank the commenter for their requested clarification on how hospitals which do not provide labor and delivery services would be affected. As stated in the FY 2023 IPPS/LTCH PPS proposed rule, the Cesarean Birth eCQM would be reported by all hospitals participating in the Hospital IQR Program, except those hospitals that do not have an obstetrics department and do not perform deliveries (87 FR 28507). We also refer readers to section IX.E.10.e.(4). of this final rule where we discuss the Hospital IQR Program's zero denominator declarations and case threshold exemption policies for eCQMs. Zero denominator declarations allow a hospital whose EHR is capable of reporting eCQM data to submit a zero in the denominator for the reporting of an eCQM if the hospital does not have patients that meet the denominator criteria of that hybrid measure (82 FR 38387). Similarly, the case threshold exemptions policy allows for a hospital with five or fewer inpatient discharges per quarter or 20 or fewer inpatient discharges per year in a given denominator declaration be exempted from reporting on that individual eCQM (82 FR 38387). We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49705 through 49708) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57170) for our previously adopted eCQM file format requirements. Hospitals can continue to meet the reporting requirements by submitting data via QRDA I files, zero denominator declaration, or case threshold exemption (82 FR 38387).

[666] Curtin, S.C., Gregory, K.D., Korst, L.M., Uddin, S.F.G. (2015) Maternal Morbidity for Vaginal and Cesarean Deliveries, According to Previous Cesarean History: New Data from the Birth Certificate, 2013. National Vital Statistics Reports, 64(4). Available at: *https://www.cdc.gov/nchs/data/nvsr/nvsr64/nvsr64_04.pdf.*

Comment: Many commenters did not support the adoption of the Cesarean Birth eCQM. Several commenters believed the measure is misaligned with factors that contribute to negative outcomes, or that testing and validation of the eCQM has been insufficient to establish that the measure is appropriately aligned. Several commenters did not support the measure because it does not have NQF endorsement. A few commenters recommended the adoption of alternative measures which they believed would more appropriately align with the equity goal. A few commenters did not support the measure because they believed there is no ideal rate of C-sections. A commenter did not support because they believed that diverting natural birth from C-section begins earlier than when a patient seeks hospital labor and delivery services, which the measure does not capture.

Response: We thank the commenters for their input. As stated in the FY 2023 IPPS/LTCH PPS proposed rule, the NQF has endorsed the chart-abstracted version of this measure and the measure steward has submitted the eCQM to NQF for consideration of endorsement (87 FR 28509). We also note that section 1886(b)(3)(B)(viii)(IX)(bb) offers an exception in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity under contract under section 1890(a) of the Act, and the Secretary may specify a measure that is not endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. We reviewed NQF-endorsed measures and note that while the chart-abstracted measure is endorsed, we were unable to identify any other NQF-endorsed measures on this topic and therefore believe the exception at 1886(b)(3)(B)(viii)(IX)(bb) applies. Given the severity of the maternal morbidity crisis and as there are currently no NQF-endorsed measures that address Cesarean birth we believe it is important to implement this measure as soon as possible. We appreciate the suggestions of alternative measures and will consider them for potential future rulemaking.

Regarding commenter concerns about testing and validation, the measure steward conducted additional testing in 2021. The reliability and validity testing found the measure to have an overall data element agreement rate of 92.2 percent and we therefore believe the measure to be reliable and valid for use in the Hospital IQR Program. We believe that this measure serves as a key first step in measuring and promoting quality improvement in maternity care by encouraging hospitals to track their rate of low- risk C-sections and practices that may be contributing to trends in low-risk C-sections in the United States. While we agree that there is no ideal rate of low-risk C-sections, we noted in the FY 2023 IPPS/LTCH PPS proposed rule, the Cesarean Birth eCQM is intended to facilitate safer patient care by assessing the rate of NTSV C-sections to ultimately reduce the occurrence of non-medically indicated C-sections, promoting adherence to recommended clinical guidelines, and encouraging hospitals to track and improve their practices in caring for pregnant and postpartum patients (87 FR 28508). Additionally, we acknowledged that there are instances where C-sections are medically indicated and continue to emphasize that this measure is not intended to discourage practitioners from performing C-sections writ large (87 FR 28508). A group of subject matter experts for NQF noted that decreasing the rate of non-medically indicated C-sections can result in increased patient safety, decreased maternal and neonatal morbidity, and substantial savings in healthcare costs.[667]

Comment: A commenter did not support adoption and expressed concern that the time to implement the measure was insufficient.

Response: We thank the commenter for their input and respectfully disagree that the timeline for adoption is not appropriate. We emphasize that as proposed, hospitals may choose to report the Cesarean Birth eCQM as one of the three self-selected eCQMs for the CY 2023 reporting period/FY 2025 payment determination. After which, beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years, the Cesarean Birth eCQM would be required to be reported by all hospitals, except those hospitals that do not have an obstetrics department and do not perform deliveries. This timeline will allow hospitals at least one year to prepare and implement the measure before they are required to report it.

Comment: A few commenters did not support the proposal because they believed the exclusion criteria are not broad enough and should be risk adjusted. A few commenters did not support adoption of the measure because it does not distinguish between medically necessary and non-medically necessary procedures. A commenter requested that CMS clarify that the measure is not intended to discourage medically necessary C-sections.

Response: We thank the commenters for their input. While we agree that there are many ways to track data related to the C-section rate in the United States, and ultimately reduce excess non-medically indicated C-sections, the standards and comprehensiveness of initiatives can vary widely, and we do not believe broadening exclusion criteria or risk adjustment is necessary at this time. As we noted in the FY 2023 IPPS/LTCH PPS proposed rule, when developing the measure, the exclusion criteria were chosen to ensure that the focus population would be women with NTSV pregnancies (86 FR 28510). Barring the presence of other co-morbidities, such women often have a lower risk of maternal morbidity and mortality at the time of delivery than their counterparts who have undergone a previous C-section (87 FR 28510). As a result of the existing exclusion criteria, the population denominator allows the measure to focus on a more homogeneous group where the greatest improvement opportunity exists. As evidenced by variation in rates of NTSV C-sections, clinical practice patterns in particular may affect this rate (87 FR 28510). Lowering the C-section rate in NTSV pregnancies is important because C-sections may carry a higher risk of subsequent miscarriage, placental abnormalities, and repeat C-section (87 FR 28510). The rates of ruptured uteri, unplanned hysterectomies, and ICU admission are higher among women who deliver via C-section for the first time than those who deliver vaginally for the first time across all races and ethnicities (87 FR 28507). However, non-Hispanic Black women who deliver via C-section for the first time had the highest rates of uterine rupture and ICU admission compared with all other races.[668] Including a comprehensive set of maternal medical exclusions would add data collection burdens without commensurate benefit. Regarding commenters' concerns based on a lack of distinction between medically indicated and non-medically indicated procedures, the measure is designed to

[667] National Quality Forum. (2008) Perinatal and Reproductive Health Project NQF #0471 PC–02 Cesarean Section: Measure Submission and Evaluation Worksheet 5.0. Available at: *https://www.qualityforum.org/Projects/n-r/Perinatal_Care_Endorsement_Maintenance_2011/0471.aspx.*

[668] Curtin, S.C., Gregory, K.D., Korst, L.M., Uddin, S.F.G. (2015) Maternal Morbidity for Vaginal and Cesarean Deliveries, According to Previous Cesarean History: New Data from the Birth Certificate, 2013. National Vital Statistics Reports, 64(4). Available at: *https://www.cdc.gov/nchs/data/nvsr/nvsr64/nvsr64_04.pdf.*

track C-section prevalence in the lowest-risk population, and we believe that any reduction in the rate will inherently overburden non-medically indicated C-sections.

Comment: A few commenters did not support the eCQM because they believed the chart-abstracted version of the measure was acceptable.

Response: We thank the commenters for their input. We note that the NQF has endorsed the chart-abstracted form of this measure (PC–02: Cesarean Birth, NQF #0471) as a voluntary consensus standard since 2008 and continuously renewed its endorsement (most recently in 2020) (87 FR 28508). Additionally, the measure steward introduced the Cesarean Birth eCQM as one of the available eCQMs hospitals can choose for data submission to meet The Joint Commission's ORYX® requirements (87 FR 28509). We believe that the proposal for use of the eCQM version continues our approach to collect data derived from EHRs and make progress toward a transition to fully digital measurement. We refer readers to section IX.C. of the preamble of this final rule—''Continuing to Advance to Digital Quality Measurement and the Use of Fast Healthcare Interoperability Resources (FHIR) in Hospital Quality Programs—Request for Information''—where we outlined and solicited comments on ongoing efforts to advance digital quality measurement.

Comment: Many commenters recommended delaying adoption of the measure because they requested we conduct additional testing for validity and reliability testing.

Response: We thank commenters for their input and feedback on this measure. As we noted in the FY 2023 IPPS/LTCH PPS proposed rule, the measure steward submitted the eCQM to the NQF for consideration of endorsement during Spring 2022 (87 FR 28509). As part of that process, it has gone through the Scientific Methods Panel and no major issues were raised around measure reliability. Regarding reliability concerns, we refer readers to the discussion in FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28509) and in section IX.E.5.c. of the preamble of this final rule where we discuss the validity and reliability testing which found that this measure has a measure outcome agreement rate of 83.7 percent with a kappa score of .750 indicating substantial agreement. Overall, the data element agreement rate for all hospitals was 92.2 percent. Additionally, the measure developer notes that the Cesarean Birth eCQM rates for the 13 hospitals who submitted both eCQM and chart-abstracted measure results to the measure developer for 2020 discharges were correlated. A correlation of 0.1–0.3 is considered weak, 0.3–0.5 is considered moderate, and over 0.5 is considered strong. The measure developer also clarified that the eCQM and the chart-based (NQF-endorsed) versions of the measure correlate at 0.88 which is strong and is statistically significant ($p<0.01$). Given the severity of the maternal morbidity crisis we believe it is important to implement this measure as soon as possible.

Comment: A few commenters suggested additions to the measure to increase alignment with the measure's goals. The comments included recommendations that the measure: (1) track efforts taken to eliminate disparities in maternal health outcomes; (2) track unexpected complications in term newborns; (3) data be disaggregated; (4) track how social drivers of health contribute to C-section rates; (5) exclusion criteria be broadened; and (6) be monitored closely to determine if the measure is tracking useful data.

Response: We thank commenters for their recommendations on changes to the measure specifications. We note the current scope of the exclusion criteria are selected based on the most up-to-date literature and then were rigorously tested by the measure steward. While we agree that there are many ways to track data related to the C-section rate in the United States, the standards and comprehensiveness of initiatives can vary widely. We will keep the recommendations in mind in the future if any changes to the eCQM are necessary as part of our regular measure maintenance. Regarding monitoring of the measure's impact, we note that, as with all Hospital IQR Program measures, we will monitor the data as part of the standard measure maintenance.

Comment: A commenter recommended that the specifications for the measure be published concurrently with the final rule.

Response: As part of notice-and-comment rulemaking, we publish measure specifications on a CMS website for interested parties to review. As we noted in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28509), measure specifications for eCQMs, including the Cesarean Birth eCQM, can be found on the eCQI Resource Center website, available at: *https://ecqi.healthit.gov*.

Comment: A commenter recommended that CMS clarify that the measure tracks all procedures, regardless of payer.

Response: As we noted in the FY 2023 IPPS/LTCH PPS proposed rule that the cohort includes all pertinent patients regardless of payer (87 FR 28509).

Comment: A few commenters expressed concerns about the consistency of performance data extraction from clinical data or patient charts or requested clarification on extracting data from clinical notes. Specifically, a commenter expressed concern that not all components of the proposed measure are identifiable using standard coding data.

Response: We thank the commenters for their feedback. We interpret the commenters to mean that they have concerns about extracting clinical data from paper charts or notes. We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49705 through 49708) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57169 through 57170) for our previously adopted eCQM file format requirements. Under these requirements, hospitals: (1) Must submit eCQM data via the Quality Reporting Document Architecture Category I (QRDA I) file format as was previously required; (2) may use third parties to submit QRDA I files on their behalf; and (3) may either use abstraction or pull the data from noncertified sources in order to then input these data into CEHRT for capture and reporting QRDA I files. Hospitals can continue to meet the reporting requirements by submitting data via QRDA I files, zero denominator declaration, or case threshold exemption (82 FR 38387). We encourage hospitals to continue to work with their EHR vendors to refine their processes optimally.

After consideration of the public comments we received, we are finalizing our proposal as proposed.

d. Severe Obstetric Complications eCQM Beginning With the CY 2023 Reporting Period/FY 2025 Payment Determination With Mandatory Reporting Beginning With the CY 2024 Reporting Period/FY 2026 Payment Determination and for Subsequent Years

In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28510 through 28515), we proposed to adopt the Severe Obstetric Complications eCQM as one of the eCQMs in the Hospital IQR Program measure set on which hospitals can self-select to report for the CY 2023 reporting period/FY 2025 payment determination. We also proposed to make reporting of this eCQM mandatory beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years.

(1) Background

Severe maternal morbidity (SMM) refers to unexpected outcomes due to complications at labor and delivery that result in significant consequences to a woman's health, and includes, but is not limited to, hemorrhage, embolism, severe hypertension, stroke, and other serious complications.[669] Despite the highest rate of spending on maternity care, totaling $1.4 billion dollars in FY 2021,[670] the U.S. ranks worse than most other developed nations in pregnancy-related deaths and the rate of SMM is continuing to steadily increase.[671] [672] As reported by the CDC, the overall rate of SMM increased almost 200 percent, from 49.5 per 10,000 delivery hospitalizations in 1993 to 144 per 10,000 delivery hospitalizations in 2014.[673] [674] [675] Increasing rates of SMM are resulting in increased healthcare costs, longer hospitalization stays, and short- and long-term negative outcomes to women's health.[676] [677] [678] [679]

Without proper treatment and awareness surrounding SMM, such complications can lead to mortality.[680] While partially attributed to changes in reporting standards, the maternal mortality rate has also risen in the U.S. from 17 deaths per 100,000 live births in 1990 to 26 deaths per 100,000 live births in 2015.[681] Recent maternal mortality data from 2018 reveal that 658 women died from pregnancy-related complications, resulting in a rate of 17.4 deaths per 100,000 live births, with 77 percent of the deaths attributed to direct obstetric causes like hemorrhage, preeclampsia, obstetric embolism, and other complications.[682] [683] Researchers have found that the presence of select maternal morbidities such as chronic hypertension, preeclampsia, and sepsis were strongly associated with increased odds of mortality at the time of delivery.[684] [685] Similar to maternal mortality, the existing literature on maternal morbidity indicates that a significant proportion of maternal morbidity is highly preventable.[686] Therefore, timely and appropriate treatment of maternal morbidities is imperative to prevent complications that can lead to maternal mortality.[687]

Additionally, racial and ethnic disparities are significant; non-Hispanic Black women are at considerably higher risk for developing these maternal complications than are non-Hispanic White women.[688] [689] Maternal death rate data indicate wide ethnic and racial gaps exist in maternal healthcare and outcomes. The maternal death rate for Black women is more than double that of White women—37.1 deaths per 100,000 live births compared to 14.7—and almost three times the rate compared to Hispanic women—11.8 deaths per 100,000 live births.[690]

As stated in the HHS Action Plan to Improve Maternal Health in America,[691] we are pursuing a vision for improving maternal health by focusing on: (1) Reducing maternal mortality, including disparities by race, ethnicity, and geography, in 5 years; (2) reducing SMM, including disparities by race and ethnicity, in five years; and (3) increasing hospital participation in HHS-sponsored maternal health quality improvement initiatives. As reflected in these goals, a critical focus of our maternal health efforts is reducing existing disparities in maternal health outcomes across race, ethnicity, and geographic area. This is further reflected in the Biden-Harris Administration's first ever Presidential Proclamation recognizing Black Maternal Health Week.[692] CMS is also interested in promoting policies that ensure Americans who live in rural areas have access to high quality care, particularly in the area of maternal health where residents in rural settings have a 9 percent greater probability of SMM and mortality, compared with urban residents.[693] Ultimately, driving the development and execution of evidence-based best practices in maternity care, improving overall maternal health, and closing the racial and ethnic disparity gaps in outcomes are among our

agency's top healthcare quality and safety goals.[694]

Currently, the Hospital IQR Program includes two measures that address improving maternal health: The Elective Delivery measure (PC–01) (77 FR 53530) and the Maternal Morbidity Structural measure (86 FR 45361 through 45365). In section IX.E.5.c. of the preamble of this final rule, we are finalizing the adoption of the Cesarean Birth eCQM as part of the Hospital IQR Program measure set. However, there are currently no maternal morbidity or obstetric complications outcome-based measures in the Hospital IQR Program.

The Severe Obstetric Complications eCQM has been developed to focus on the high maternal morbidity and mortality rates in the U.S., which we believe will present important opportunities for large-scale quality measurement and improvement activities in the Hospital IQR Program.[695] Statistics on preventability vary but suggest that a considerable proportion of maternal morbidity and mortality events could be prevented.[696] [697] This measure is intended to facilitate safer patient care by increasing awareness of the danger of obstetric complications, promoting adherence to recommended clinical guidelines, and encouraging hospitals to track and improve their practices of appropriate monitoring and care delivery for pregnant and postpartum patients.

Under CMS' Meaningful Measures Framework, the Severe Obstetric Complications eCQM addresses the quality priority of ''Make Care Safer by Reducing Harm Caused in the Delivery of Care'' through the Meaningful Measures Area of ''Preventable Healthcare Harm.'' Additionally, pursuant to Meaningful Measures 2.0, this measure addresses the ''Safety'' priority area and aligns with our commitment to a patient-centered approach in quality measurement to ensure that patients are safe and receive the highest quality care.[698]

Therefore, in the proposed rule, we proposed the adoption of the Severe Obstetric Complications eCQM beginning with the CY 2023 reporting period/FY 2025 payment determination. We previously finalized that hospitals must report on three self-selected eCQMs and the Safe Use of Opioids—Concurrent Prescribing eCQM, for a total of four eCQMs in the CY 2023 reporting period/FY 2025 payment determination (85 FR 58939). In the proposed rule, we proposed to include this measure as part of the measure set in the Hospital IQR Program which hospitals will be able to self-select for the CY 2023 reporting period/FY 2025 payment determination. After which, beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years, we proposed to require reporting of the Severe Obstetric Complications eCQM by all hospitals except those hospitals that do not perform deliveries or have an obstetrics department. We refer readers to section IX.E.10.e. of preamble of this final rule for our related policy to modify the eCQM reporting and submission requirements beginning with the CY 2024 reporting period/FY 2026 payment determination.

(2) Overview of Measure

This measure assesses the proportion of patients with severe obstetric complications which occur during the inpatient delivery hospitalization. The Severe Obstetric Complications eCQM was included in the publicly available ''List of Measures Under Consideration for December 1, 2021'' (MUC List).[699] The MAP Rural Health Advisory Group reviewed the MUC List and the Severe Obstetric Complications eCQM (MUC 2021–104) on December 8, 2021.[700] The MAP Rural Health Advisory Workgroup discussed questions regarding the specifications of the measure. First, there was discussion about the use of blood transfusions as an intervention and concern that blood transfusions would be excluded and/or delayed when clinical evidence indicates that patients would benefit from transfusions as an earlier intervention. The measure developer provided clarification that this measure reports two outcomes, one that includes all patients that meet the numerator criteria, and one that excludes patients whose only qualification for the numerator is a transfusion.[701] This is as a recognition that transfusions may be necessary for a number of reasons and for less severe complications. Second, the MAP Rural Health Advisory Workgroup discussed that rural settings have high maternal morbidity and mortality and that this measure would help improve maternal health outcomes, and that since the measure is risk adjusted for the presence of economic/housing instability the measure has a focus on accounting for potential disparities. The measure developer added that as an EHR-based measure, these data are patient-specific and the measure was tested in both rural and urban settings.[702] The Workgroup voted majority support in agreement of the applicability of the Severe Obstetric Complications eCQM to rural health settings.[703]

The Severe Obstetric Complications eCQM (MUC2021–104) was also reviewed by the NQF MAP Hospital Workgroup on December 15, 2021, and received conditional support pending NQF endorsement.[704] Some MAP stakeholders expressed concerns about the minimum sample size and low case volumes as well as the risk adjustment methodology. The measure developer underscored for the MAP that this measure was tested in ten health systems which represented 28 hospitals and tested over 60,000 delivery encounters, and there was no concern

about case volumes.[705] The measure developer also clarified that testing was underway to evaluate the ideal risk adjustment methodology to determine approaches that would consider stratification based on sociodemographic factors, such as race and ethnicity, pre- and post-risk adjustment. We emphasized the importance of this measure and its role in helping hospitals to understand the disparities existent in maternal health outcomes.[706] Ultimately, MAP Hospital Workgroup stakeholders supported this measure and recommended conditional support because it would assist in surveillance on maternal morbidity, a clinical area that needs further measurement.[707] The MAP Coordinating Committee, which provides direction to the MAP workgroups, reviewed the Severe Obstetric Complications eCQM (MUC2021–104) on January 19, 2022, and voted to uphold the MAP Hospital Workgroup recommendation for conditional support pending NQF endorsement.[708]

In January 2022, the Severe Obstetric Complications eCQM was submitted for endorsement by NQF, and is currently under review. We note that section 1866(b)(3)(B)(viii)(IX)(aa) of the Act requires that any measure specified by the Secretary must have been endorsed by the entity with a contract under section 1890(a) of the Act (the NQF is the entity that currently holds this contract). Under section 1886(b)(3)(B)(viii)(IX)(bb) of the Act, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. We reviewed NQF-endorsed measures and were unable to identify any other NQF-endorsed measures on this topic, and, therefore, we believe the exception in section 1886(b)(3)(B)(viii)(IX)(bb) of the Act applies.

To evaluate the validity, feasibility, and reliability of the measure, in 2021, the measure developer, conducted pilot testing in a total of 10 sites, consisting of 28 hospitals. The measure developer conducted alpha testing (formative testing)[709] and beta testing (field testing)[710] on the measure. Feasibility testing was conducted to assess data collection and accessibility, and included nine sites in the analysis, which consisted of 27 hospitals and three different EHR systems.[711] Using NQF's eCQM Feasibility Scorecard template,[712] the measure developer calculated results which indicated high feasibility of data elements defining the measure specifications (98 percent), clinical and documentation workflows compared to measure intent (99 percent), data element availability (95 percent) and accuracy (98 percent), and use of data standards (96 percent).

Following feasibility testing, one site representing two hospitals withdrew from the project, one site representing one hospital was unable to submit beta testing data in the timeline requested, and one site representing one hospital was added; as a result, the measure developer conducted beta testing in eight healthcare test sites and 25 hospitals, representing three different EHR systems. The measure developer pulled data for delivery hospital encounters discharged from January 1 to December 31, 2020. During measure testing, the measure score reliability was assessed, which is the degree to which repeated measurements of the same entity agree with each other.[713] The measure developer estimated the measure score reliability using a signal-to-noise ratio to assess the values according to conventional standards. They assessed signal-to-noise reliability that describes how well the measure can distinguish the performance of one hospital from another. The signal is the proportion of the variability in measured performance that can be explained by real differences in performance. Scores can range from zero to one, where a score of zero implies that all the variability in a measure is attributable to measurement error, and a score of one implies that all the variability is attributable to real difference in performance. The reliability analysis yielded a median reliability score of 0.991 (range: 0.983–0.997) for any severe obstetric complication and 0.957 (range: 0.918–0.984) for severe obstetric complications excluding blood transfusion-only cases.

The measure developer completed validity testing on six sites representing 15 hospitals, which was a statistically relevant sample of electronically submitted inpatient encounters selected for re-abstraction for reliability testing and clinical adjudication from six of the beta testing sites. Validity testing of the measure refers to the correctness of conclusions about the quality of measured entities that can be made based on the measure scores (that is a higher score on a quality measure reflects higher quality).[714] Overall, the data element agreement rate for all six sites was 90.4 percent. Further, validity testing of the measure showed a performance score agreement rate of 91.2 percent with a kappa score of .881 indicating good agreement. Measure score validity testing revealed a high positive predictive value (rate of agreement) of 94.7 percent, and a

negative predictive value of 100 percent. Likewise, sensitivity (responsiveness to change) and specificity (accuracy) across test sites for the measure score were high, at 100 percent and 90.5 percent, respectively.

The measure developer conducted testing of the Severe Obstetric Complications eCQM and found that across 60,184 delivery encounters at 8 different sites, the current observed rate of any severe obstetric complications was 244 and the mean risk-standardized rate across test sites was 247 (per 10,000 delivery hospitalizations). The severe obstetric complications rate excluding blood transfusion-only cases was 50 for both the observed rate and the mean risk-standardized rate across test sites (per 10,000 delivery hospitalizations). Through rigorous testing, the measure developer found that the measure was feasible, reliable, and valid.

The measure specifications for the Severe Obstetric Complications eCQM can be found on the eCQI Resource Center website, available at: *https://ecqi.healthit.gov/pre-rulemaking-eh-cah-ecqms*.

(3) Data Sources

The eCQM uses data collected through hospitals' EHRs. The measure is designed to be calculated by the hospitals' CEHRT using the patient-level data and then submitted by hospitals to CMS.

(4) Outcome

The outcome of interest (numerator) for the Severe Obstetric Complications eCQM is the number of inpatient hospitalizations for patients with severe obstetric complications occurring during the delivery hospitalization, not present on admission, which include the following: Severe maternal morbidity *diagnoses* (we refer readers to the subsequent table); severe maternal morbidity *procedures,* including blood transfusion, conversion of cardiac rhythm, hysterectomy, temporary tracheostomy, and ventilation; or a discharge disposition of expired.[715] [716] Table IX.E–03. summarizes the severe maternal morbidity categories along with their corresponding diagnoses:

TABLE IX.E-03. SEVERE MATERNAL MORBIDITY DIAGNOSIS SPECIFIED IN THE NUMERATOR DEFINITION

Severe Maternal Morbidity Diagnoses Category	Severe Maternal Morbidity Diagnoses
Cardiac	Acute heart failure
	Acute myocardial infarction
	Aortic aneurysm
	Cardiac arrest/ventricular fibrillation
	Heart failure/arrest during procedure or surgery
Hemorrhage	Disseminated intravascular coagulation
	Shock
Renal	Acute renal failure
Respiratory	Adult respiratory distress syndrome
	Pulmonary edema
Sepsis	Sepsis
Other Obstetric Complications (OB)	Air and thrombotic embolism
	Amniotic fluid embolism
	Eclampsia
	Severe anesthesia complications
Other Medical Complications	Puerperal cerebrovascular disease
	Sickle cell disease with crisis

This measure is intended to report two outcomes: (1) Severe obstetric complications; and (2) severe obstetric complications, but excluding delivery hospitalizations for which blood transfusion was the only numerator event.

(5) Cohort

The measure cohort (denominator) consists of inpatient hospitalizations for patients between eight years of age and less than 65 years of age admitted to the hospital for inpatient acute care who undergo a delivery procedure for a stillbirth or livebirth greater than or equal to 20 weeks' gestation, with a discharge date that ends during the measurement period. Patients with confirmed diagnosis of COVID–19 with COVID–19-related respiratory condition or patients with confirmed diagnosis of COVID–19-related respiratory procedure are excluded from the measure calculation.[717]

(6) Risk Adjustment

The Severe Obstetric Complications eCQM is a risk-adjusted measure. The measure developer identified candidate risk variables for severe obstetric complications for consideration in the measure risk adjustment model by utilizing literature and research findings, consulting with an expert clinical consultant, and by soliciting input from a technical expert panel (TEP). Following the identification of candidate risk adjustment variables, the measure developer developed risk models for the outcomes of severe obstetric complications and severe obstetric complications excluding blood transfusion-only encounters. The measure developer then utilized the variables included in the final risk models for use as the risk adjustment variables when calculating the risk

[715] eCQI Resource Center. (2022). Eligible Hospital/Critical Access Hospital Pre-rulemaking eCQMs. Available at: *https://ecqi.healthit.gov/pre-rulemaking-eh-cah-ecqms*.

[716] The Joint Commission. (2021). eCQM Specifications 2022 Reporting Period. Available at: *https://www.jointcommission.org/-/media/tjc/documents/measurement/specification-manuals/2022-reporting-period/january-2022/ecqm_specifications_reportingperiod_2022.zip*.

[717] eCQI Resource Center. (2022). Eligible Hospital/Critical Access Hospital Pre-rulemaking eCQMs. Available at: *https://ecqi.healthit.gov/pre-rulemaking-eh-cah-ecqms*.

standardized severe obstetric complication rates for the two versions of the measure outcome (with and without transfusion-only encounters).

Variables included in the measure's risk adjustment are: patient age; several preexisting conditions that are present on admission defined by ICD–10 codes (listed later in the section); pregnancy characteristics; laboratory tests and vital signs upon hospital arrival (hematocrit, white blood cell (WBC) count, heart rate, systolic blood pressure); long term anticoagulant medication use; and social risk measured by the presence of economic/housing instability.

The following preexisting conditions and pregnancy characteristics, defined by ICD–10 codes, are included in the measure's risk adjustment: Anemia, asthma, autoimmune disease, bariatric surgery, bleeding disorder, Body Mass Index (BMI), cardiac disease, gastrointestinal disease, gestational diabetes, Human Immunodeficiency Virus (HIV), Hypertension, mental health disorder, multiple pregnancy, neuromuscular disease, obstetric venous thromboembolism (VTE), other pre-eclampsia, placental accreta spectrum, placental abruption, placenta previa, preexisting diabetes, preterm birth, previous cesarean, pulmonary hypertension, renal disease, severe pre-eclampsia, substance abuse, and thyrotoxicosis.

(7) Measure Calculation

The measure is an outcome measure that assesses the risk-standardized proportion of eligible patients with severe obstetric complications, and the risk-standardized proportion of eligible patients with severe obstetric complications excluding transfusion-only hospital delivery encounters, which occur during the inpatient delivery hospitalization. The measure calculates the proportion of inpatient hospitalizations with severe obstetric complications occurring during the delivery hospitalization out of the total number of inpatient hospitalizations for patients delivering stillborn or live birth with greater than or equal to least 20 weeks and 0 days of gestation completed. The measure score will be reported as a rate per 10,000 deliveries.

(8) Data Submission and Reporting

We refer readers to: Section IX.E.10.e. of the preamble of this final rule for discussion of our previously finalized eCQM reporting and submission policies; and section IX.E.13.b. for the public reporting of eCQM data. Additionally, we refer readers to section IX.E.10.e.(4). where we discuss the use of the zero denominator declarations and case threshold exemption policies for hospitals.

We also refer readers to four related proposals discussed in the preamble of this final rule: (1) Section IX.E.10.e. where we discuss modifications to our reporting and submission requirements for eCQMs, including a discussion of our policy to require hospitals to report on the Severe Obstetric Complications eCQM; (2) section IX.E.5.c. for our policy to adopt the Cesarean Birth eCQM; (3) section IX.H.10.a.(2). of the preamble of this final rule for a discussion of similar policies to adopt these two perinatal eCQMs in the Medicare Promoting Interoperability Program for Eligible Hospitals and CAHs; and (4) section IX.E.8. where we are establishing a publicly-reported hospital designation to capture the quality and safety of maternity care and other related activities in advancing maternal health equity.

We invited public comment on this proposal.

Comment: Many commenters support the proposed adoption of the Severe Obstetric Complications eCQM beginning with the CY 2023 reporting period/FY 2025 payment determination and mandatory reporting beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years. A few commenters indicated that they supported the measure because the measure aligns with existing state or Joint Commission reporting practices.

Response: We thank the commenters for their support and agree that the measure is in line with best practices for improving maternal morbidity and mortality rates.

Comment: A few commenters expressed support for the measure but had recommendations for how the measure should be implemented. A commenter recommended that COVID–19 patients not be excluded. A commenter recommended monitoring the measure in the future to determine whether modifications would be appropriate.

Response: We thank commenters for their recommendations. Regarding ongoing monitoring of the measure's performance, impact on reporters, and alignment with the measure's goals, we will monitor the data for any unintended consequences as part of the standard measure maintenance. Regarding the COVID–19 exclusions, at this time patients with confirmed diagnosis of COVID–19, with COVID–19-related respiratory condition or with COVID–19-related respiratory procedure are excluded from the measure calculation (87 FR 28514). The measure currently excludes COVID–19 patients from the measure cohort due to potential concerns of the COVID–19 impact on maternal health. We will continue to monitor the impact of COVID–19 on the measure's performance and alignment with the measure's goals as part of the standard measure maintenance.

Comment: A few commenters either expressed concern about the impact that public reporting may have on low volume hospitals or requested clarification on how non-birthing hospitals would be affected by the adoption of the measure.

Response: We thank the commenter for their requested clarification on how hospitals without birthing programs would be affected. In the FY 2023 IPPS/LTCH PPS proposed rule, we stated the Severe Obstetric Complications eCQM would be reported by all hospitals participating in the Hospital IQR Program except those hospitals that do not have an obstetrics department (87 FR 28512). We refer readers to section IX.E.10.e.(4). of this final rule where we discuss the Hospital IQR Program's zero denominator declarations and case threshold exemption policies for eCQMs. Zero denominator declarations allow a hospital whose EHR is capable of reporting eCQM data to submit a zero in the denominator for the reporting of an eCQM if the hospital does not have patients that meet the denominator criteria of that measure. Similarly, the case threshold exemptions policy allows for a hospital with five or fewer inpatient discharges per quarter or 20 or fewer inpatient discharges per year in a given denominator declaration be exempted from reporting on that individual eCQM. We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49705 through 49708) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57170) for our previously adopted eCQM file format requirements. Hospitals can continue to meet the reporting requirements by submitting data via QRDA I files, zero denominator declaration, or case threshold exemption (82 FR 38387).

Comment: A commenter requested clarification on the definition and appropriate documentation of ''housing instability.''

Response: Housing instability is included in the risk adjustment for this measure due to evidence for its inclusion and availability in the EHR.[718]

[718] Centers for Medicare & Medicaid Services. (2021). Severe Obstetric Complications Electronic Clinical Quality Measure (eCQM) Methodology Report: Version 1. Available at: *https://*

Continued

While not explained in the proposed ruled, we are clarifying here that for purposes of this measure consistent with the measure specifications available on the eCQI Resource Center website at: *https://ecqi.healthit.gov/*, economic housing instability is defined by the National Library of Medicine (NLM) value set [719] (2.16.840.1.113762.1.4.1029.292) comprising the following ICD–10 Z codes:

Z59.0	Homelessness
Z59.1	Inadequate housing
Z59.2	Discord with neighbors, lodgers and landlord
Z59.3	Problems related to living in residential institution
Z59.4	Lack of adequate food
Z59.5	Extreme poverty
Z59.6	Low income
Z59.7	Insufficient social insurance and welfare support
Z59.8	Other problems related to housing and economic circumstances
Z59.9	Problem related to housing and economic circumstances, unspecified

Comment: Several commenters did not support the measure because they believed it does not provide a meaningful measure for driving improvements in maternal health disparities and would not encourage hospitals to take the desired actions to mitigate severe maternal morbidity.

Response: We appreciate the commenters' concerns and respectfully disagree that the proposed measure does not provide a meaningful measure for driving improvements in maternal health disparities. We believe that this measure serves as a key activity in measuring and promoting quality improvement in maternity care by incentivizing hospitals to track and report severe obstetric complications and to publicly report measure data for transparency.

Comment: A commenter believed the measure may not be feasible.

Response: The measure developer's testing established the feasibility of the measure, first in 25 hospitals across eight healthcare sites and then in an additional hospital unaffiliated with the first 25, and across several different electronic health record systems. Based on the testing performed, we respectfully disagree that the measure is not feasible. All numerator indicators and 30 of 34 risk factors use easily mapped ICD–10 codes.[720] The two laboratory and two vital sign risk factors were chosen in part because of their availability and high rates of extractability from the medical record.

Comment: Several commenters either did not support the measure or expressed concerns about the proposed eCQM due to perceived resource limitations or because they believed the adoption timeline is too rapid.

Response: We acknowledge commenters' concerns and believe that the maternal health crisis requires urgent action without delay. In addition, we refer readers to section XII.B.4. for information on measure burden and note that, as with all Hospital IQR Program measures, we will monitor the data and any unintended consequences of the measure as part of the standard measure maintenance.

Comment: Many commenters recommended that the measure be adopted only once it is NQF endorsed. A few commenters recommended that the measure be risk adjusted or the exclusion criteria broadened. A few commenters recommended disaggregated or stratified data reporting. A commenter recommended that the measure be finalized with voluntary reporting and believed facilities are better positioned to set clinical priorities. A commenter recommended making the measure modifiable in case new risk factors are identified.

Response: We acknowledge commenters' recommendations that we seek NQF endorsement for the measure. As we stated in the FY 2023 IPPS/LTCH PPS proposed rule that the Severe Obstetric Complication eCQM was submitted to NQF in January 2022 and is currently under review (87 FR 28512). As there are currently no NQF-endorsed measures that address severe obstetric complications, we believe the exception at section 1886(b)(3)(B)(viii)(IX)(bb) of the Act applies.

We further thank commenters for their recommendations on changes to the measure specifications. We note that the measure is risk adjusted by several variables including patient age, several preexisting conditions, pregnancy characteristics, laboratory test results, long term anticoagulant medication use, and social risk (87 FR 28514). In the FY 2023 IPPS/LTCH PPS proposed rule, we also stated that the measure developer is currently conducting testing to determine approaches that would consider stratification based on sociodemographic factors (87 FR 28512). We also refer readers to section IX.B. (Overarching Principles for Measuring Healthcare Quality Disparities Across CMS Quality Programs—Request for Information) for additional discussion on CMS' potential use of measure stratification in the future. We also regularly conduct measure maintenance and evaluate whether any modifications to measures are necessary. Any substantive changes to measures would be proposed in future notice-and-comment rulemaking.

In regard to voluntary reporting and prioritization, we believe that the maternal health crisis is urgent, maternal health inequities are unacceptable, and this persistent problem requires prompt action. Therefore, we believe allowing hospitals to self-select reporting beginning with the CY 2023 reporting period/FY 2025 payment determination and require

www.cms.gov/files/document/measure-methodology-report.pdf.

[719] *https://vsac.nlm.nih.gov/valueset/2.16.840.1.113762.1.4.1029.292/expansion/Latest.*

[720] eCQI Resource Center. (2022). Eligible Hospital/Critical Access Hospital Pre-rulemaking eCQMs. Available at: *https://ecqi.healthit.gov/pre-rulemaking-eh-cah-ecqms.*

reporting beginning with the CY 2024 reporting period/FY 2026 payment determination is imperative.

Comment: A commenter recommended that the measure only report the second outcome of the Severe Obstetric Complications eCQM (the outcome of severe complications excluding transfusion-only encounters) because the commenter believes it would be inappropriate to publicly report the outcome of the severe obstetric complications with transfusion as the measure does not place a threshold on the number of units of blood involved in the transfusion. A commenter expressed concern that there may be negative unintended consequences.

Response: We appreciate commenters' concerns. As proposed, this measure is intended to report two outcomes: (1) Severe obstetric complications; and (2) severe obstetric complications but excluding delivery hospitalizations for which blood transfusion was the only numerator event (87 FR 28512, 28514). We believe that reporting on both outcomes is necessary to advance the goals of this eCQM. We note that we do not anticipate any unintended consequences, but as with all Hospital IQR Program measures, we will monitor the data for any unintended consequences as part of the standard measure maintenance.

Comment: A commenter expressed concern about the complexity of documenting the procedures and outcomes indicated in this measure and suggested that CMS assess whether the procedures reportable in the measures are documented in medical records (specifically, ventilation and transfusion).

Response: We thank the commenter for their recommendation. We appreciate the commenter's recommendation about evaluating the accuracy and applicability of the procedures reported under this measure. We note that these procedures are currently defined with ICD–10 procedure codes in the measure specifications, which can be found at *https://ecqi.healthit.gov/* (87 FR 28513 through 28514). The measure developer conducted medical record reviews to test the validity of the procedure codes and found high positive predictive value for both ventilation and transfusion.

Comment: A few commenters raised concerns that conditions accounted for in the numerator may not be predictable, preventable, or indicators of the quality of care provided. A commenter raised concerns that the eCQM data requirement is not aligned with current clinical practice guides on data collected, meaning that standards of practice will be negatively affected. A commenter raised concerns that the non-birthing hospitals may score disproportionately high if the measure is adopted because they may have zero-denominator measures. A few commenters requested clarification on how rates would be reportable if the volume of delivery hospitalizations was so low as to make only one rate reportable.

Response: We appreciate the commenters' concerns about measure data. As discussed in the FY 2023 IPPS/LTCH PPS proposed rule, the measure developer conducted rigorous testing and found the measure to be valid, feasible, and reliable (87 FR 28513). With regard to concerns about low rates, we note that the measure developer conducted measure score reliability testing in both rural and urban settings, and that the thresholds for consideration for implementation of public reporting were found to be appropriate due to the risk-adjustment for the presence of economic/housing instability, the measure has a focus on accounting for potential disparities; the measure was tested in ten health systems with varying case volumes and no concerns were identified for low-volume hospitals (87 FR 28512). Regarding potential zero-denominator reporting hospitals, we believe this will not be a problem because, as stated previously, in the FY 2023 IPPS/LTCH PPS proposed rule that the Severe Obstetric Complications eCQM would be reported by all hospitals except those hospitals that do not have an obstetrics department and therefore zero-denominator hospitals would be exempt (87 FR 28512).

We refer readers to section IX.E.10.e.(4). of this final rule where we discuss the Hospital IQR Program's zero denominator declarations and case threshold exemption policies for eCQMs. Zero denominator declarations allow a hospital whose EHR is capable of reporting eCQM data to submit a zero in the denominator for the reporting of an eCQM if the hospital does not have patients that meet the denominator criteria of that hybrid measure (82 FR 38387). Similarly, the case threshold exemptions policy allows for a hospital with five or fewer inpatient discharges per quarter or 20 or fewer inpatient discharges per year in a given denominator declaration be exempted from reporting on that individual eCQM (82 FR 38387).

Comment: A commenter requested guidance on extrapolating data from clinical notes and patient records.

Response: We reiterate that this is an eCQM in which the data is collected through hospitals' EHR and designed to be calculated by the hospital's CEHRT (87 FR 28513). For more information regarding data submission, we refer readers to section IX.E.10.a. for discussion of our previously finalized eCQM reporting and submission requirements and to the measure specifications, which can be found at *https://ecqi.healthit.gov*.

After consideration of the public comments we received, we are finalizing our proposal as proposed.

e. Hospital-Harm—Opioid-Related Adverse Events eCQM (NQF #3501e) Beginning With the CY 2024 Reporting Period/FY 2026 Payment Determination and for Subsequent Years

(1) Background

Opioids are among the most frequently implicated medications in adverse drug events among hospitalized patients.[721] The most serious opioid-related adverse events include those involving respiratory depression, which can lead to brain damage and death.[722] [723] [724] Opioid-related adverse events have both a negative impact on patients and financial implications. Patients who experience adverse events due to opioid administration have been noted to have 55 percent longer lengths of stay, 47 percent higher costs, 36 percent higher risk of 30-day readmission, and 3.4 times higher payments than patients without these adverse events.[725] While noting that data are limited, The Joint Commission suggested that opioid-induced respiratory arrest may contribute

Pharmacotherapy, 33(4): 383–91.

substantially to the 350,000 to 750,000 in-hospital cardiac arrests annually.[726]

Most opioid-related adverse events are preventable.[727] Of the opioid-related adverse drug events reported to The Joint Commission's Sentinel Event database, 47 percent were due to a wrong medication dose, 29 percent due to improper monitoring, and 11 percent due to other causes (for example, medication interactions and/or drug reactions).[728] In addition, in a review of cases from a malpractice claims database in which there was opioid-induced respiratory depression among post-operative surgical patients, 97 percent of these adverse events were judged preventable with better monitoring and response.[729]

While hospital quality interventions such as proper dosing, adequate monitoring, and attention to potential drug interactions that can lead to overdose are key to prevention of opioid-related adverse events, the use of these practices can vary substantially across hospitals.[730] [731] [732] In addition, administration of opioids also varies widely by hospital, ranging from 5 percent in the lowest-use hospital to 72 percent in the highest-use hospital.[733] Notably, hospitals that use opioids most frequently have increased adjusted risk of severe opioid-related adverse events.[734] The measure developer, under contract with CMS, developed the Hospital Harm–Opioid-Related Adverse Events eCQM to assess the rates of adverse events as well as the variation in rates among hospitals.

(2) Overview of Measure

The Hospital Harm—Opioid-Related Adverse Events eCQM is an outcome measure focusing specifically on opioid-related adverse events during an admission to an acute care hospital by assessing the administration of naloxone. Naloxone is a lifesaving emergent therapy with clear and unambiguous applications in the setting of opioid overdose.[735] [736] [737] [738] Naloxone administration has also been used in a number of studies as an indicator of opioid-related adverse events to indicate harm to a patient during inpatient admission to a hospital.[739] [740] The intent of this measure is for hospitals to track and improve their monitoring and response to patients administered opioids during hospitalization, and to avoid harm, such as respiratory depression, which can lead to brain damage and death. This measure focuses specifically on in-hospital opioid-related adverse events, rather than opioid overdose events that happen in the community and may bring a patient into the ED.

The goal of this measure is to incentivize hospitals to closely monitor patients who receive opioids during their hospitalization to prevent serious adverse events. The measure requires evidence of hospital opioid administration prior to the naloxone administration during the first 24 hours after hospital arrival to ensure that the harm was hospital acquired and not due to an overdose that happened outside of the hospital.[741] This measure does not identify preventability of an individual harm instance or whether each instance of harm was an error, but rather, it assesses the overall rate of harm within a hospital by incorporating a definition of harm that is likely to be reduced as a result of hospital best practice.

The Hospital Harm—Opioid-Related Adverse Events eCQM was included as a measure undergoing field testing in the publicly available ''List of Measures Under Consideration for December 1, 2017'' (MUC List).[742] The measure was reviewed by the NQF MAP Hospital Workgroup in December 2017, and received the recommendation to refine and resubmit with completed test results demonstrating reliability and validity prior to rulemaking, as referenced in the ''2017–2018 Spreadsheet of Final Recommendations to HHS and CMS.'' [743]

This measure was submitted for endorsement consideration to NQF's Patient Safety Standing Committee for the Spring 2019 cycle. NQF reviewed the measure on June 21, 2019, but did not proceed with full endorsement consideration due to concerns with the performance gap criterion. In the FY 2020 IPPS/LTCH PPS proposed rule (84 FR 19477), we proposed but did not finalize the adoption of the Hospital-Harm—Opioid-Related Adverse Events eCQM. Commenters provided measure suggestions and refinements, as outlined in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42459), and we decided to further assess the measure and the suggested considerations with intent to re-propose the measure. The main areas of suggestions were to better establish the connection between naloxone administration and an opioid-related event and consider narrowing the broad denominator that, as specified, may result in the calculation of very low rates of adverse events.

In response to the feedback received, the measure developer refined and retested the measure specifications. The measure developer limited the

denominator to encounters where patients received at least one opioid during the hospitalization. The measure developer constrained the numerator to those patients with an opioid administration that preceded the subsequent naloxone administration by no more than a 12-hour time window, to ensure that a hospital administered opioid was the cause for the naloxone administration. The measure developer also updated the value sets to ensure that the most current codes for hospital administered opioids and naloxone are used and that the codes harmonize across other current eCQMs in our quality reporting programs. Finally, the measure was re-tested by the measure developer for feasibility at 23 hospital test sites using four different EHR vendor systems and for the scientific acceptability of the measure's properties including reliability and validity at six beta implementation test sites.[744] Participant test sites varied by EHR vendor systems, bed size, geographic location, teaching/non-teaching status, and urban/rural representation.

The Hospital Harm—Opioid-Related Adverse Events eCQM (NQF #3501e) was then re-submitted to the NQF for the Spring 2021 review cycle and received NQF endorsement on December 7, 2021.[745] The MAP Rural Health Advisory Group also reviewed the MUC List and Hospital Harm—Opioid-Related Adverse Events eCQM (MUC2021–084) on December 8, 2021 and voted majority support in agreement on the applicability of the eCQM to rural health settings.[746] The refined and retested eCQM was also re-considered by the MAP Hospital Workgroup on December 15, 2021, which voted to support the measure for rulemaking.[747] The MAP Coordinating Committee, which provides direction to the MAP workgroups, then reviewed the measure on January 19, 2022 [748] and upheld the MAP Hospital Workgroup recommendation to support the measure for rulemaking.[749]

We believe this measure will provide hospitals with reliable and timely measurement of their opioid-related adverse event rates, which is a high-priority measurement area. We believe implementation of this measure can lead to safer patient care by incentivizing hospitals to implement or refine clinical workflows that facilitate evidence-based use and monitoring when administering opioids. We also believe implementation of this measure may result in fewer patients experiencing adverse events associated with the administration of opioids, such as respiratory depression, which can lead to brain damage and death. This measure addresses the quality priority of ''Making Care Safer by Reducing Harm Caused in the Delivery of Care'' through the Meaningful Measures Area of ''Preventable Healthcare Harm.''[750]

For detailed information on the Hospital Harm—Opioid-Related Adverse Events eCQM, we refer readers to the measure specifications, available at: *https://ecqi.healthit.gov/pre-rulemaking-eh-cah-ecqms*.

(3) Data Sources

The eCQM uses data collected through hospitals' EHRs. The measure is designed to be calculated by the hospitals' CEHRT using the patient-level data and then submitted by hospitals to CMS.

As with all quality measures we develop, testing was performed to confirm the feasibility of the measure, data elements, and validity of the numerator, using clinical adjudicators who validated the EHR data compared with medical chart-abstracted data. Testing demonstrated no missing or erroneous data (0 percent) for all six implementation test sites. These results suggest that all critical data elements are reliably and consistently captured in patient EHRs, and that measure implementation is feasible. Testing also showed that the positive predictive value (PPV),[751] which describes the probability that a patient with a positive result (numerator case) identified by the EHR data was also a positive result verified by review of the patient's medical record done by a clinical adjudicator, was high at all hospital testing sites (98 percent in one hospital to 100 percent in the five other hospitals). Testing was completed using output from the Measure Authoring Tool (MAT) in 23 hospitals using four different EHR systems for feasibility and six different hospitals for implementation testing for reliability and validity.

(4) Outcome

This measure assesses the proportion of inpatient hospital encounters where patients 18 years of age or older have been administered an opioid medication, subsequently suffer the harm of an opioid-related adverse event, and are administered an opioid antagonist (naloxone) within 12 hours. This measure excludes opioid antagonist (naloxone) administration occurring in the operating room setting.

(5) Cohort

This measure's cohort includes all patients ages 18 years and older at the start of the encounter, and for whom at least one opioid medication was administered during the encounter. An inpatient hospitalization includes time spent in the ED or in observation status when the patients are ultimately admitted to inpatient status.

(6) Inclusion and Exclusion Criteria

This measure excludes opioid antagonist (naloxone) administration occurring in the operating room setting. There are no denominator exclusions.

(7) Risk Adjustment

This measure is not risk adjusted for chronic opioid use, as most instances of opioid-related adverse events should be preventable for all patients regardless of prior exposure to opioids or chronic opioid use.

Generally, patient characteristics, including gender, age, race/ethnicity, reasons for hospitalization, clinical status when patients arrive at the hospital, or comorbidities can influence the risk of harm occurring during a hospitalization.[752] Therefore, if hospitals care for patients with different

degrees of risk, then it may be important to account for such case mix to compare hospital performance.[753] However, opioid-related adverse events should be avoidable regardless of patient risk, particularly when the opioid was given after patients have arrived at the hospital.[754] During measure development, in evaluating whether this measure needed to be risk adjusted, the measure developer considered the following in determining whether risk adjustment is warranted for this measure: Patients are at risk of the harm regardless of their demographic and clinical characteristics; most incidents of harm are linkable to care provision under the hospital control, for example, harms caused by excessive or inappropriate medication dosing; and there is evidence that the risk of harm can be largely reduced by following best care practices independent of patient inherent risks. For example, patients with multiple risk factors can still avoid the harm event when providers adhere to care guidelines.

Opioid-related adverse events should be avoidable regardless of patient risk, particularly when the opioid was given after patients have arrived at the hospital.[755] While certain patients may require higher doses to achieve pain control or are more sensitive to opioids (depending on their age, sex, and weight), the most common cause is hospital administration of excessive doses and inadequate monitoring.[756] Because the dosing of opioids and the intensity of patient monitoring is entirely under the control of providers in hospitals, the risk of an opioid-related adverse event can be reduced by following best practices.[757] [758] [759] Therefore, the measure developer did not think risk adjustment is warranted for this measure.

To provide supportive evidence of the clinical rationale for not risk adjusting, the measure developer examined the measure performance rate in various subgroups of population. All these analyses demonstrated no pattern in measure performance rates across subgroups.[760] During measure development, TEP members gave feedback on whether the measure required risk adjustment and agreed with this rationale. Subsequently the NQF Scientific Methods Panel (SMP), the Patient Safety Standing Committee, and the Consensus Standards Advisory Committee (CSAC) also agreed with this approach.[761] [762] [763]

(8) Measure Calculation

The Hospital Harm—Opioid-Related Adverse Events eCQM is an outcome measure that defines the indication of a harm for an opioid-related adverse event by assessing administration of an opioid antagonist (naloxone). The numerator is the number of inpatient hospitalizations where an opioid antagonist (naloxone) was administered outside of the operating room and within 12 hours following administration of an opioid medication. Only one numerator event is counted per encounter. The denominator includes inpatient hospitalizations for patients 18 years or older during which at least one opioid medication was administered. An inpatient hospitalization includes time spent in the ED or in observation status when the patients are ultimately admitted to inpatient status.

To calculate the hospital-level measure result, divide the total numerator events by the total number of qualifying inpatient encounters (denominator). Qualifying inpatient encounters include all patients 18 years of age or older at the start of the encounter with at least one opioid medication administered during the encounter. The measure does not include naloxone use in the operating room where it could be part of the sedation plan as administered by an anesthesiologist or nurse anesthetist. Uses of naloxone for procedures outside of the operating room (such as bone marrow biopsy) are counted in the numerator as its use will indicate the patient was over sedated.[764] The measure numerator identifies a harm using the administration of naloxone, and purposely does not include any medications that combine naloxone with other agents.

(9) Data Submission and Reporting

We proposed the adoption of the Hospital-Harm—Opioid-Related Adverse Events eCQM as part of the Hospital IQR Program for which hospitals can self-select beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years. We refer readers to section IX.E.10.e. of the preamble of this final rule for a discussion of our previously finalized eCQM reporting and submission policies, as well as our proposal to modify these eCQM reporting and submission requirements. Additionally, we refer readers to section IX.H.10.a.(2). of the preamble of this final rule for a discussion of a similar proposal to adopt this measure in the Medicare Promoting Interoperability Program for Eligible Hospitals and CAHs.

We invited public comment on this proposal.

Comment: Many commenters supported adoption of the Hospital Harm—Opioid-Related Adverse Events eCQM (NQF #3501e) beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years. Several commenters believed that measure implementation will result in fewer adverse events associated with the administration of opioids (for example, respiratory depression) and will lead to safer patient care and saved lives. A few commenters agreed that the measure

will incentivize hospitals to implement or refine clinical workflows and implement continual monitoring protocols when administering opioids. Several commenters recognized and appreciated the refinements made to the measure since its earlier proposal in the FY 2020 IPPS/LTCH PPS proposed rule (84 FR 19477). A few commenters applauded CMS for expanding the choices of available eCQMs for reporting in the Hospital IQR Program.

A few commenters highlighted the potential positive impact measure reporting may have on vulnerable populations. A commenter noted that opioid use is a serious concern in rural health and appreciated the transparency this measure will bring. Another commenter noted this measure will help to track and improve quality for older adult patients and a commenter stated that the measure will help to address the disproportionate overdose deaths occurring among racial and ethnic minorities.

Response: We thank commenters for their support and input on the inclusion of the measure. We agree that this measure captures important quality information that is critical to patient safety and improving patient outcomes.

Comment: A few commenters did not support the inclusion of the measure due to concerns that implementation could lead to unintended consequences for care delivery, as the potential for lower performance could lead to hesitancy in hospitals' or clinicians' use of naloxone in clinically appropriate, rapid-response situations. These commenters also noted that implementation could lead to undertreatment of pain after surgery. A commenter recommended that a more robust methodology be developed for identifying the cause of the event as opioid-related. Another commenter suggested we consider ways to distinguish appropriate use of naloxone in the measure specifications.

Response: We thank commenters for their input and feedback on this measure. We acknowledge that some stakeholders have expressed concern that implementation of the measure could result in deterring or delaying clinically appropriate administration of naloxone or under-prescribing of opioids for pain control when clinically necessary. We reiterate that naloxone is a life-saving emergent therapy with clear and unambiguous applications in the setting of opioid overdose,[765] [766] [767] [768] and we outline below the methodology deployed to ascertain that numerator cases flagged by the measure are true positives.

During testing at six sites, the measure developer examined whether numerator cases identified by the measure were true positives and found that in 98 percent of cases naloxone was administered for respiratory depression or reduced arousal or for opioid reversal and resulted in improvement in the patient's level of consciousness.[769] To examine if the numerator cases identified by the quality reporting engine are true positives, clinical abstractors pulled additional information regarding the indication for and subsequent reaction to the naloxone administration from the nurse notes and physician orders. We also found that some, but not all, test sites also used the Pasero Opioid-induced Sedation Scale (POSS) [770] in recording the appropriateness of opioid dosage, which is a 5 point scale as follows:

- S = Sleep, easy to arouse; acceptable; no action necessary; may increase opioid dose if needed.
- 1 = Awake and alert: acceptable; no action necessary; may increase opioid dose if needed.
- 2 = Slightly drowsy, easily aroused; acceptable; no action necessary; may increase opioid dose if needed.
- 3 = Frequently drowsy, arousable, drifts off to sleep during conversation; unacceptable; monitor respiratory status and sedation level closely until sedation level is stable at less than 3 and respiratory status is satisfactory; decrease opioid dose 25 percent to 50 percent or notify prescriber or anesthesiologist for orders; consider administering a non-sedating, opioid-sparing nonopioid, such as acetaminophen or a NSAID, if not contraindicated.
- 4 = Somnolent, minimal or no response to verbal and physical stimulation; unacceptable; stop opioid; consider administering naloxone; notify prescriber or anesthesiologist; monitor respiratory status and sedation level closely until sedation level is stable at less than 3 and respiratory status is satisfactory.

The POSS is a valid, reliable tool used to assess sedation when administering opioid medications to manage pain. The POSS is endorsed by The Joint Commission and the American Society for Pain Management Nursing to help prevent adverse opioid-related respiratory events.[771] Of the identified numerator cases where POSS were used, most showed an initial POSS of 3 or 4. After the naloxone administration, patients' POSS decreased to 1 or 2. We also note that patients showing no immediate responses may be due to the inadequate dosage of naloxone, as there were some instances identified during the manual abstraction where patients became responsive only after the second naloxone. Overall, the developer found that the use of naloxone in the absence of opioid toxicity was rare.[772] We are confident that hospitals and clinicians will continue to administer naloxone when it is clinically necessary and will monitor for evidence of unintended consequences as we do for all Hospital IQR Program measures.

Comment: A few commenters raised concerns about implementation burden. Two commenters highlighted that there is a substantial cost and time burden faced by hospitals when adopting new eCQMs. A commenter also reported they are already collecting a similar opioid measure.

Response: We thank commenters for their feedback. We highlight that this measure is one of the available (not required) eCQMs hospitals may self-select for submission beginning with the CY 2024 reporting period. The addition of this eCQM further advances CMS' goal of transitioning to a fully digital quality measures landscape, promoting interoperability that will help decrease burden.

We also recognize there is an opioid measure in the Hospital IQR Program, Safe Use of Opioids—Concurrent Prescribing (NQF #3316e) (84 FR 42598). While both measures are designed to reduce adverse events or harms associated with opioid use, the main focus of each measure is different. The Safe Use of Opioids—Concurrent Prescribing eCQM focuses on concurrent prescriptions of opioids and benzodiazepines at discharge, an area of high-risk prescribing (84 FR 42598). The Hospital Harm—Opioid-Related Adverse Events eCQM is designed to reduce adverse events associated with the administration of opioids in the hospital setting by assessing the administration of naloxone as an indicator of harm (87 FR 28516). We believe implementation of the Hospital Harm—Opioid-Related Adverse Events eCQM can lead to safer patient care by incentivizing hospitals to track and improve their monitoring of patients who receive opioids during hospitalization.

Comment: A few commenters offered recommendations to augment the measure's exclusions; for example, by excluding patients who receive naloxone for indications other than over-sedation (for example, pruritis).

Response: We thank commenters for their input and recommendations regarding potential measure exclusions. We note the exclusions as presented in the measure specifications in the proposed rule (87 FR 28516) were evaluated and endorsed by the NQF Scientific Methods Panel (SMP),[773] the Patient Safety Standing Committee,[774] and the Consensus Standards Advisory Committee (CSAC).[775] This eCQM was also evaluated by the MAP Hospital Workgroup and the MAP Coordinating Committee,[776] [777] [778] who both supported the measure for rulemaking. We aim to be as inclusive as possible in defining a measure cohort to ensure the measure will have the most impact on important subgroups of patients. We will take these suggestions into consideration and are assessing the feasibility of capturing the indication(s) for administration of naloxone.

Comment: Two commenters requested clarifications on the measure. A commenter requested if CMS has target data for hospitals to compare their own results to and whether zero events is an attainable target. Another commenter requested more information about which opioids would be included in the calculations of ''opioid-related adverse events'' and if the measure is based on prescription history within a provider's electronic health record.

Response: We thank commenters for their questions. Regarding the commenter's question on benchmarks, we note that the Hospital IQR Program does not implement benchmarks or target levels of performance for its measures as it is a pay-for-reporting quality program. Moreover, the intent of this measure is not to reduce clinically appropriate use of naloxone, nor to bring the measure rate to zero, but to identify if hospitals have particularly high rates of naloxone use as an indicator of high rates of over-administration of opioids in the inpatient setting, and thereby incentivize improved clinical practices when administering opioids (87 FR 28516).

Regarding which opioids are included in the calculation of opioid-related adverse events, the opioid value set includes all formulations of opioids that may be administered in an inpatient or outpatient setting regardless of intended use (87 FR 28516). It also includes combination medications that contain both an opioid and another class of medication, as it is possible to overdose on these combination medications (87 FR 28516).

Comment: A few commenters were generally supportive of the measure but questioned whether the adoption will be impactful (especially given the resources and time needed for hospitals to implement the measure) as they noted the overall number of inpatient naloxone rescue events is small. A commenter did not support measure adoption noting it focused on rare events in the inpatient setting rather than targeting the primary drivers of the opioid epidemic. A commenter recommended additional testing in a broader range of hospitals and vendor systems to further assess variation in performance scores. A few commenters requested we collect and analyze several years of data before adding this measure to a pay-for-performance program.

Response: We acknowledge that some stakeholders have expressed concern regarding the measure's impact given the small number of overall events. However, our overall analysis during testing demonstrated the rate of ORAE ranged from 1.1 to 6.1 per 1,000 qualified inpatient encounters, signaling there is still opportunity for improvement. As noted in the proposed rule, we tested feasibility at 23 hospital test sites using four different EHR vendor systems and for the scientific acceptability of the measure's properties including reliability and validity at six beta implementation test sites (87 FR 28516). Participant test sites varied by EHR vendor systems, bed size, geographic location, teaching/non-teaching status, and urban/rural representation. This far exceeds NQF measure evaluation criteria for testing eCQMs, which requires testing using at least two EHR vendor systems (87 FR 28516). We will monitor the performance gap as hospitals begin to report this measure. Future potential use of the measure for a pay-for-performance program would be through notice-and-comment rulemaking.

Comment: A few commenters supported inclusion of the measure into the Hospital IQR Program but requested changes to the reporting schedule and requirements. A commenter stated the measure should not impact hospital payment until the CY 2025 reporting period/FY 2027 payment determination, while another commenter suggested mandating opioid-related adverse event reporting by all hospitals in the program.

Response: We thank commenters for their support and input. This measure

was proposed for inclusion as one of the eCQMs hospitals can self-select for reporting beginning with the CY 2024 reporting period/FY 2026 payment determination, which we believe allows sufficient time for hospitals to prepare and implement the measure. The addition of this eCQM further advances CMS' goal of transitioning to a fully digital quality measures landscape, and we will take the commenter's suggestion to make this eCQM mandatory under consideration for future rulemaking.

Comment: A few commenters requested we monitor clinical literature and hospital administration practices in the coming years to determine if the measurement area remains of critical importance.

Response: We thank the commenters for their feedback. We will continue to evaluate and refine the measure through implementation as necessary.

Comment: A commenter suggested considering the potential value of risk adjustment for the measure.

Response: We thank the commenter for their feedback to consider risk adjusting this measure. We did not apply risk adjustment in the measure, given strong evidence that most instances of severe over-sedation requiring naloxone for reversal can be avoided by following best practices; and given that opioid dosing and patient monitoring are under the control of providers in hospitals, such that risk can be minimized by following best practices.[779] [780]

We will continue to evaluate and refine the measure through implementation as necessary.

After consideration of the public comments we received, we are finalizing our proposal as proposed.

f. Global Malnutrition Composite Score eCQM (NQF #3592e) Beginning With the CY 2024 Reporting Period/FY 2026 Payment Determination and for Subsequent Years

(1) Background

From 1960 until the start of the COVID–19 pandemic,[781] life expectancy for the total population in the U.S. increased by almost 10 years.[782] While adults are living longer lives, the amount of time spent in poor health at the end of life is similarly increasing.[783] Studies found that healthy nutrition is indeed more important for healthy aging than generally recognized.[784] Malnutrition includes undernutrition (wasting, stunting, underweight), inadequate vitamins or minerals, overweight, and obesity, and can result in diet-related noncommunicable diseases.[785] The developmental, economic, social, and medical impacts of the global burden of malnutrition are serious and lasting, for individuals and their families, for communities, and for countries.[786] Malnutrition is complex and may be both associated with and exacerbated by chronic conditions, age-related cognitive or physical changes, medication side effects, and poverty.[787] Evidence shows that healthy eating contributes to prevention and risk reduction of many common chronic health conditions prevalent in older adults including hypertension, heart disease, heart failure, diabetes, obesity, certain cancers, and osteoporosis.[788] While it is estimated that sixty percent of older adults manage two or more chronic health conditions, many underuse preventive services, including those related to nutrition.[789] Research indicates that preventive screening and interventions may reduce risk of malnutrition in older adults and improve quality of life, particularly for individuals with chronic conditions.[790] While disease-related malnutrition is not limited to older adults, it is more frequent among those with higher age, and the consequences appear to be more severe in older persons due to their impaired regenerative capacity, inflammation, and other factors.[791] Malnutrition remains a challenge for older adults in the U.S. as approximately 7.7 percent of seniors, or 5.5 million, are food insecure annually with reports of reduced quality, variety, or desirability of diet while 3.1 percent, or 2.1 million are very low food insecure with reports of multiple indications of disrupted eating patterns and reduced food intake.[792] [793] From late September through mid-October 2021, U.S. Census Bureau data indicates that more than 2.5 million adults ages 65 and older responded ''sometimes'' or ''often'' when questioned about the frequency of not having enough food to eat in the past seven days.[794] As our population continues to age, it is expected that 1 in 5 residents will be 65 years or older by the year 2030 [795] and malnutrition risk among seniors is likely to increase.[796]

One factor contributing to the burden of malnutrition is health disparity across racial and ethnic groups. Black, Hispanic, and other non-White older adult populations have higher hunger

rates than White populations.[797] Black Americans and Hispanic Americans are nearly 2.5 times and 1.4 times as likely as White Americans, respectively, to lack access to a full-service grocery store; this contributes to higher rates of food insecurity and can increase risk of malnutrition.[798] Black, Hispanic, and other non-White Americans are also at higher risk for many chronic diseases, emphasizing the importance of addressing nutrition through both prevention and management of these condition—especially when they cannot access healthy food.[799]

Patients over 65 comprise more than one-third of all discharges and nearly 13 million seniors are hospitalized each year.[800] [801] While federal data indicate that approximately 8 percent of all hospitalized adults have a diagnosis of malnutrition,[802] [803] additional research finds that malnutrition and malnutrition risk can be found in 20 to 50 percent of hospitalized adults.[804] [805] This indicates that between 910,000 and 6.5 million hospitalized seniors may experience malnutrition.[806] Hospitalized adults with a diagnosis of malnutrition have a longer length of stay, higher costs, more comorbidities, five times the likelihood of death, and greater risk of infectious disease and injury compared with other adult inpatients without malnutrition.[807] [808] Malnutrition may also contribute to post-hospital syndrome—described as ''an acquired, transient period of vulnerability'' following hospitalization[809]—which may dramatically increase the risk of readmission.[810] [811]

Partly due to the substantial impacts on clinical outcomes,[812] malnutrition imposes a serious burden on the healthcare system.[813] Hospitalized patients with poor nutrition have been estimated to incur approximately 300 percent higher healthcare costs than those who are adequately nourished.[814] Reports indicate that the average cost for an individual hospital stay (including both direct and indirect costs) for a malnourished patient is $25,600 while it is only $13,900 for a well-nourished patient; [815] further, malnutrition-associated diseases among older adults in the US has been estimated to cost $51.3 billion annually.[816]

Hospitals have an opportunity to identify malnutrition during the patient admission process and to address it efficiently and effectively with individualized interventions that could optimize outcomes including reduced readmissions and lengths of stay.[817] Research demonstrates that there is significant room to improve identification, diagnosis, and treatment of malnutrition in hospitalized patients.[818] [819] Nutrition screening is the first step in optimal malnutrition care and triggers a nutrition assessment for patients found to be at risk.[820] [821]

We have consistently received stakeholder input requesting the addition of nutrition measures to the Hospital IQR Program measure set to address malnutrition of hospitalized patients, including comments described in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51639), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53535), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50810), the FY 2015 IPPS/LTCH PPS final rule (79 FR 50056), and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49561). In the FY 2018 IPPS/LTCH PPS proposed rule, we solicited public comments on potential future inclusion of malnutrition eCQMs in the Hospital IQR Program (82 FR 20060 through 20061), and in the FY 2018 IPPS/LTCH PPS final rule we provided a summary of these comments (82 FR 38379 through 38380). Commenters expressed support and stated that Medicare beneficiaries would benefit from the adoption of malnutrition eCQMs that support prompt malnutrition screening, assessment, diagnosis, and development of a care plan (82 FR 38379). In addition, the commenters stated that eCQMs specifically designed and tested to be used with patient data documented directly in the EHR would likely impose minimal data collection

and reporting burden (82 FR 38379 through 38380). The commenters further stated that the inclusion of malnutrition eCQMs in the Hospital IQR Program measure set could help improve outcomes and quality of life for patients, especially for seniors and the disadvantaged (82 FR 38380). We believe adopting a malnutrition measure will address several priority areas identified in the CMS Equity Plan for Medicare, including evaluating impacts of disparities, integrating equity solutions across CMS programs, and increasing the ability of the healthcare workforce to meet the needs of [822] [823]

Therefore, in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28518 through 28523) rule, we proposed to adopt the Global Malnutrition Composite Score eCQM (NQF #3592e) beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years. At this time, CMS quality reporting programs do not include quality measures that specifically address malnutrition. In the CY 2022 Physician Fee Schedule (PFS) final rule (86 FR 65970 through 65971), we adopted the Implement Food Insecurity and Nutrition Risk Identification and Treatment Protocols Improvement Activity (IA) as part of the Merit-based Incentives Payment System (MIPS), which incentivizes MIPS-eligible clinicians to create or improve, and then implement, protocols for identifying and providing appropriate support to: a) Patients with or at risk for food insecurity, and b) patients with or at risk for poor nutritional status.[824] In conjunction with adopting the IA under MIPS, we believe adoption of the Global Malnutrition Composite Score eCQM in the Hospital IQR Program has the potential to improve care delivery in the inpatient setting and is likely to ameliorate food insecurity and malnutrition and lead to better health outcomes.

Under the CMS Meaningful Measures Framework,[825] the Global Malnutrition Composite Score eCQM addresses the quality priority of ''Promote Effective Communication & Coordination of Care'' as well as ''Promote Effective Prevention and Treatment of Chronic Disease.'' Under the CMS Meaningful Measures 2.0 Initiative, the Global Malnutrition Composite Score eCQM addresses the quality priority of ''Affordability and Efficiency.'' [826]

(2) Overview of Measure

The Global Malnutrition Composite Score eCQM assesses adults 65 years of age and older admitted to inpatient hospital service who received care appropriate to their level of malnutrition risk and malnutrition diagnosis, if properly identified. Best practices for malnutrition care recommend inpatients be screened for malnutrition risk, assessed to confirm findings of malnutrition if found at-risk, and have the proper severity of malnutrition indicated in their diagnosis along with a corresponding nutrition care plan that addresses the respective severity of malnutrition.[827] [828]

The malnutrition composite measure includes four component measures, which are first scored separately, and then integrated into an overall composite score. The overall composite score is derived from averaging the individual performance scores of the following four component measures:

- Screening for malnutrition risk at admission;
- Completing a nutrition assessment for patients who screened for risk of malnutrition;
- Appropriate documentation of malnutrition diagnosis in the patient's medical record if indicated by the assessment findings; and
- Development of a nutrition care plan for malnourished patients including the recommended treatment plan.

Together, the four component measures represent the key processes of care of malnutrition associated with the risk identification, diagnosis, and treatment of malnutrition in older hospitalized adults as supported by clinical guidelines and submitted evidence.[829]

The four component measures were initially submitted for endorsement as individual process measures in the NQF 2015–2017 Health and Well-Being Project.[830] The NQF declined to endorse any of the individual component measures based on evidence, provider burden concern (including timing of malnutrition screening and assessment), and the unavailability of necessary data elements to report the eCQMs.[831] The 2015–2017 Health and Well-Being Standing Committee recommended combining individual measures or all measures into a composite measure to make the measure more meaningful by including both the screening and the development of a nutrition care plan into one measure.[832]

Based on these recommendations, the measure developer conducted additional testing. The four component measures were piloted as a single composite measure at a large hospital in the Midwest and the testing results demonstrated that the measures were usable for identifying key improvement areas in malnutrition care related to identifying risk, assessing for malnutrition, developing the appropriate care plan, and ensuring the diagnosis of malnutrition was documented to support follow-up care.[833] Subsequently, a group of 27 hospitals adopted and reported on the use of the four component measures to guide various projects focused on improving care provided to hospitalized patients who were malnourished or at risk of malnutrition.[834] The

participating hospitals reported changes in measure performance based on implementation of cyclical quality improvement initiatives at their respective institutions. Multivariate analyses were then conducted to identify the relationships between performance on the four component measures with patient outcomes of 30-day readmission and length of stay. The study results concluded that the four component measures could be implemented in a cohort of diverse hospitals and lead to meaningful improvements in measure performance as all four components of the composite measure were significantly associated with improved outcomes for 30-day readmissions.[835] [836] Prior analyses also reported early nutrition interventions were associated with reduced patient length of stay.[837] [838] [839] [840] [841] Following measure testing, the measure developer returned to NQF with the composite eCQM for consideration in the Fall 2020 measure cycle.

The Global Malnutrition Composite Score eCQM (MUC20–0032) was included in the publicly available ''List of Measures Under Consideration for December 21, 2020'' (MUC List).[842] The measure was voted on and approved by the Scientific Methods Panel in October 2020.[843] The MAP Rural Health Advisory Group reviewed the measure during its January 2021 meeting and agreed that this measure was suitable for use with rural providers in the Hospital IQR Program.[844] The MAP subsequently offered conditional support for rulemaking, pending NQF endorsement of the measure.[845]

The composite measure was initially reviewed by the NQF Prevention and Population Health (PPH) Standing Committee for endorsement suitability during its February 2021 measure evaluation meeting [846] and the full review of the measure was detailed in the NQF Prevention and Population Health Fall 2020 Consensus Development Process (CDP) Report.[847] The NQF PPH Standing Committee members agreed malnutrition is a significant contributor to infections and pressure ulcers requiring treatment, especially for patients transferred to other care facilities (such as an inpatient rehabilitation hospital), and held a robust discussion with most members supporting the presented evidence and topic area importance that assigns accountability to the hospital team.[848] Some PPH Standing Committee members questioned the lack of validated and standardized screening and assessment tools specified in the first two components. The measure developer along with the measure steward stated that objective, validated screening tools [849] and standardized assessment tools [850] can be implemented to capture variables from structured EHR data fields, such as BMI, dietary history, recent weight loss, illness severity, laboratory values, and age. After further discussion on performance gaps and the ability to discern differences within and between populations, many PPH Standing Committee members stated they wanted to review additional performance data for the eCQM.[851] The measure developer submitted the requested performance data for the PPH NQF Standing Committee to review, discuss, and revote at the NQF Standing Committee post-comment meeting on June 3, 2021.[852] At that time, the NQF PPH Standing Committee voted on the overall suitability for endorsement and the NQF Consensus Standards Approval Committee (CSAC) subsequently endorsed the measure (NQF #3592e).[853]

The measure specifications for the Global Malnutrition Composite Score eCQM can be found on the eCQI Resource Center website, available at: *https://ecqi.healthit.gov/pre-rulemaking-eh-cah-ecqms*.

(3) Data Sources

The eCQM uses data collected through hospitals' EHRs. The measure is designed to be calculated by the hospitals' CEHRT using the patient-level data and then submitted by hospitals to CMS.

(4) Measure Calculation

The Global Malnutrition Composite Score eCQM consists of four component measures, which are first scored separately.[854] [855] The overall composite

score is derived from averaging the individual performance scores of the four component measures. The malnutrition component measures are all fully specified for use in EHRs. Table IX.E–04. outlines the data specification(s) and data sources for each of the four components.

TABLE IX.E-04. GLOBAL MALNUTRITION COMPOSITE SCORE ECQM COMPONENTS AND DATA SOURCES

Component	Description	Data Sources
Completion of a Malnutrition Screening	Patients age 65 years and older who were screened for malnutrition	- Inpatient Admission Time - Inpatient Discharge Time - Birthdate - Completed Malnutrition Screening - Completed Malnutrition Screening Time Stamp
Completion of a Nutrition Assessment for Patients Identified as At-Risk for Malnutrition	Patients age 65 years and older identified as at-risk for malnutrition based on a malnutrition screening who have a nutrition assessment documented in the medical record	- Inpatient Admission Time - Inpatient Discharge Time - Birthdate - Completed Malnutrition Screening - Malnutrition Screening Result - Completed Nutrition Assessment - Completed Nutrition Assessment Time Stamp
Appropriate Documentation of a Malnutrition Diagnosis	Patients age 65 years and older and found to be malnourished based on a completed nutrition assessment who have documentation of a malnutrition diagnosis	- Inpatient Admission Time - Inpatient Discharge Time - Birthdate - Completed Nutrition Assessment - Nutrition Assessment Result - Malnutrition Diagnosis
Nutrition Care Plan for Patients Identified as Malnourished after a Completed Nutrition Assessment	Patients age 65 years and older and found to be malnourished based on a completed nutrition assessment who have a documented nutrition care plan in the medical record.	- Inpatient Admission Time - Inpatient Discharge Time - Birthdate - Completed Nutrition Assessment - Nutrition Assessment Result - Documented Nutrition Care Plan

(5) Measure Numerator

The Global Malnutrition Composite Score eCQM numerator is comprised of the four component measures, that are individually scored for patients 65 years of age and older who are admitted to an acute inpatient hospital. Details on the numerator for each component are specified in Table IX.E–05.

TABLE IX.E-05. GLOBAL MALNUTRITION COMPOSITE SCORE ECQM COMPONENTS' NUMERATOR DESCRIPTIONS

Component	Numerator
Completion of a Malnutrition Screening	Patients in the denominator who have a malnutrition screening documented in the medical record
Completion of a Nutrition Assessment for Patients Identified as At-Risk for Malnutrition	Patients in the denominator who have a nutrition assessment documented in the medical record
Appropriate Documentation of a Malnutrition Diagnosis	Patients in the denominator with a diagnosis of malnutrition documented in the medical record
Nutrition Care Plan for Patients Identified as Malnourished after a Completed Nutrition Assessment	Patients in the denominator who have a nutrition care plan documented in the medical record

(6) Measure Denominator

The measure denominator is the composite, or total, of the four component measures for patients aged 65 years and older who are admitted to an acute inpatient hospital. Details on the denominator (and any exclusions) for each component are specified in Table IX.E–06.

https://www.jandonline.org/article/S2212-2672(21)00075-7/fulltext.

[855] National Quality Forum. #3592e Global Malnutrition Composite Score. Available at: *http://www.qualityforum.org/ProjectTemplateDownload.aspx?SubmissionID=3592e.*

TABLE IX.E-06. GLOBAL MALNUTRITION COMPOSITE SCORE ECQM COMPONENTS' DENOMINATOR DESCRIPTIONS AND EXCLUSIONS

Component	Denominator	Denominator Exclusions
Completion of a Malnutrition Screening	Patients age 65 years and older at time of admission who are admitted to an inpatient hospital	Patients with a length of stay of less than 24 hours
Completion of a Nutrition Assessment for Patients Identified as At-Risk for Malnutrition	Patients age 65 years and older at time of admission who are admitted to an inpatient hospital and were identified as at-risk for malnutrition upon completing a malnutrition screening	Patients with a length of stay of less than 24 hours
Appropriate Documentation of a Malnutrition Diagnosis	Patients age 65 years and older at time of admission who are admitted to an inpatient hospital with findings of malnutrition upon completing a nutrition assessment	Patients with a length of stay of less than 24 hours
Nutrition Care Plan for Patients Identified as Malnourished after a Completed Nutrition Assessment	Patients age 65 years and older at time of admission who are admitted to an inpatient hospital with findings of malnutrition upon completing a nutrition assessment.	Patients with a length of stay of less than 24 hours

Each measure component is a proportion with a possible performance score of 0 to 100 percent. After each component score is calculated individually, an unweighted average of all four scores is completed to determine the final composite score with a total score ranging from 0 to 100 percent.[856]

(7) Data Submission and Reporting

We are proposed the adoption of the Global Malnutrition Composite Score eCQM as part of the Hospital IQR Program measure set for which hospitals can self-select beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years. We refer readers to section IX.E.10.e. of this final rule for our previously finalized eCQM reporting and submission requirements, as well as proposed modifications for these requirements. We also refer readers to section IX.H.10.a.(2). of the preamble of this final rule for discussion of a similar proposal to adopt this measure in the Medicare Promoting Interoperability Program for Eligible Hospitals and CAHs.

We invited public comment on this proposal.

Comment: Many commenters supported our proposal to adopt the Global Malnutrition Composite Score eCQM beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years. Many commenters supported our proposal to adopt this measure, expressing their beliefs that the measure will provide valuable information and insights to providers, patients, families, communities, as well as policymakers. Many commenters supported this measure because of its positive implications for healthcare, including improving care coordination and the quality of life after hospitalization, providing timely interventions and connections to community resources, and reducing issues like costly outcomes, readmissions, lengths of stay, complications, and mortality. Many commenters appreciated that this measure may help close the gap between identification of and intervention for malnutrition. Several commenters indicated appreciation that this measure may help raise awareness and support for screening for malnutrition by clinicians, helping to ensure that hospitals are consistently screening patients. Many commenters supported our proposal because they believe that malnutrition is a significant issue for aging populations and is tied to health outcomes. Several commenters appreciated that this measure is a step toward improving and standardizing care for malnutritioned older adults. Several commenters appreciated our proposal, noting that it will fill a measurement gap because malnutrition is otherwise unaddressed by our other quality reporting and value-based purchasing programs. A few commenters suggested that we should focus on whether patients received appropriate nutrition while in the hospital, or whether their nutritional needs were met after discharge. A commenter noted that operationalizing this measure may be more challenging for rural hospitals without full-time dietician support. A commenter suggested we consider trying to assess upstream flagging measures for nutrition prior to hospitalization.

Response: We thank the commenters for their support of our proposal to adopt the Global Malnutrition Composite Score eCQM. The developmental, economic, social, and medical impacts of the global burden of malnutrition are serious and lasting, for individuals and their families, for communities, and for countries (87 FR 28518). We agree that this measure may provide valuable information and may help us begin to address the serious burden that malnutrition imposes on the healthcare system. We agree that disease-related malnutrition, while not limited to older adults, is more frequent among those with higher age, and the consequences appear to be more severe in older persons (87 FR 28518). This measure will capture important information that may be critical to improving care for aging people with malnutrition. Further, we believe that adoption of the Global Malnutrition Composite Score eCQM has the potential to improve care delivery in the inpatient setting and is likely to ameliorate food insecurity and malnutrition and lead to better health outcomes by delivering necessary attention and resources to hospitalized individuals with nutrition needs that can improve their quality of care. With regard to dietician support, while we acknowledge that hospitals have different staffing levels, we believe that nutrition screening is an important aspect of a patient's holistic health and it is the responsibility of all clinicians to support appropriate nutrition, particularly in inpatient settings where hospitalized individuals can receive

[856] Valladares A.F., McCauley S.M., Khan M., D'Andrea C., Kilgore K., and Mitchell K. (2021). Development and Evaluation of a Global Malnutrition Composite Score. Journal of the Academy of Nutrition and Dietetics. 122(2): p251–253.

resources, education, and appropriate nutrition to address their needs.

Comment: Many commenters supported our proposal because it aligns with our health equity priorities for reducing disparities in healthcare. Many commenters supported our proposal because they believe that malnutrition disproportionately affects vulnerable populations and anticipate this measure may be important to advancing health equity. Several commenters appreciated that the measure will help provide a safety net for vulnerable patients and historically underserved populations. A few commenters noted that malnutrition disproportionately impacts rural residents and emphasized that this measure may be particularly helpful for rural communities.

Response: We thank the commenters for their support. We agree that adopting a malnutrition measure may help address several priority areas identified in the CMS Framework for Health Equity,[857] including evaluating impacts of disparities, integrating equity solutions across CMS programs, and increasing the ability of the healthcare workforce to meet the needs of underserved populations (87 FR 28520). We also note that addressing nutrition disparities is a priority for the Biden-Harris administration, which has set a goal of ending hunger and increasing healthy eating so fewer Americans experience diet-related diseases.[858] We agree that health disparities are one factor that contributes to the burden of malnutrition across racial and ethnic groups and inpatient hospitals have an opportunity to identify malnutrition and optimize outcomes for patients including reduced readmissions, which are significantly higher for Black and Hispanic Americans as well as American Indian and Alaskan Natives.[859] [860] This measure may help underscore the importance of addressing nutrition for the health of vulnerable patients in historically underserved populations (87 FR 28519). We also note that the MAP Rural Health Advisory Group reviewed this measure and determined it would be suitable for use with rural providers in the Hospital IQR Program (87 FR 28521).

Comment: A commenter requested that we provide a direction score to help hospitals better understand their performance.

Response: We appreciate the commenter's suggestion and will consider it as part of our educational materials and outreach during implementation of this measure. We note that the Hospital IQR Program does not implement benchmarks or target levels of performance for its measures as it is a pay-for-reporting program. However, a higher score on the Global Malnutrition Composite Score eCQM represents better quality of care.

Comment: A commenter recommended that we refine the exclusion criteria to give more time for sufficient nutrition assessments.

Response: We thank the commenter for their feedback. We note that the NQF assessed and endorsed this measure with the current exclusion criteria.[861] We will continue to evaluate the appropriateness of refinements to the exclusion criteria upon implementation of the measure.

Comment: A commenter expressed concern that the measure could be overly subjective and noted that providers do not control patient choices regarding the management of their own health.

Response: We acknowledge the commenter's concern that providers do not control patient choices; however, we respectfully disagree that the measure is overly subjective. The four component measures that make up this composite eCQM represent the key processes of care of malnutrition associated with the risk and identification, diagnosis, and treatment of malnutrition in older hospitalized adults as supported by clinical guidelines and submitted evidence (87 FR 28520). Measure testing across a group of 27 hospitals found that the four component measures could be implemented in a cohort of diverse hospitals and lead to meaningful improvements in measure performance as all four components of the composite measure were significantly associated with improved outcomes for 30-day readmissions (87 FR 28521). Based on the measure testing and ultimate NQF endorsement of this measure, we believe that adoption of the Global Malnutrition Composite Score eCQM has the potential to improve the quality of care delivery in the inpatient setting and is likely to ameliorate food insecurity and malnutrition and lead to better health outcomes, particularly in inpatient settings where hospitalized individuals can receive resources, education, and appropriate nutrition to address their needs.

Comment: A few commenters expressed concern that this measure may be duplicative of the food insecurity attestation proposed in the Screening for Social Drivers of Health measure. A commenter did not support our proposal to adopt this measure for that same concern.

Response: We acknowledge the commenters' concern, however we believe that the measures, while related, are not duplicative. The Screening for Social Drivers of Health measure, discussed in section IX.E.5.b.(1). of the preamble of this final rule, and the Global Malnutrition Composite Score eCQM both speak to nutrition as a driver of health because it is an important contributor to a healthful population. However, the measures address different but related goals. The Screening for Social Drivers of Health measure focuses on incentivizing the screening and identifying of patients for food insecurity, defined as limited or uncertain access to adequate quality and quantity of food (87 FR 28500), while the Global Malnutrition Composite Score eCQM focuses not only on screening for malnutrition risk (of which food insecurity may be a contributing factor), but also the performance of a nutrition assessment and development of a care plan for identified malnourished patients (87 FR 28520). We believe these two measures are equally important and complementary, but not duplicative as they measure different aspects of quality care processes.

Comment: Several commenters addressed requiring reporting of this measure. A few commenters suggested we require reporting on this eCQM. A few commenters specifically supported the measure as a measure that hospitals can choose to self-select. A few commenters expressed their belief that this measure may not be relatively important for the Hospital IQR Program and recommended that we not require reporting of it in the future. A commenter suggested that we not

require reporting of this measure until after several years' worth of the measure data have been validated.

Response: We appreciate the commenters' feedback on our proposal to adopt, but not yet require, reporting on this eCQM. We believe that our proposal is balanced so as to provide hospitals with the option of reporting on this new eCQM. The addition of this eCQM further advances CMS' goal of transitioning to a fully digital quality measures landscape, and we will take the commenters' suggestion to make this eCQM mandatory under consideration as we begin to collect data. We note that any proposal to require reporting this eCQM would be made through future notice-and-comment rulemaking.

Comment: Several commenters expressed concern about implementing and operationalizing this measure given the detailed and complex nature of the measure specification and because of competing EHR-related proposals and reporting requirements. They believe that implementation would require updates to EHRs and workflows. A commenter requested additional implementation guidance to support standardized implementation across hospitals.

Response: We appreciate the commenters' concerns about implementation of the measure and note that the measure uses data collected through hospital's EHRs and is designed to be calculated by the hospital's CEHRT, thereby reducing reporting burden and complexity. Regarding resource commitments and the proposed adoption schedule, we believe that the design of the measure is balanced to provide hospitals sufficient information for driving healthful outcomes by quickly identifying and addressing patients' nutrition needs and additional resource allocations to support reporting for this eCQM, particularly in the hospital inpatient older adult population of which up to 6.5 million patients experience malnutrition (87 FR 28519). We also remind hospitals that they may self-select to report on this eCQM; it is not a required eCQM for the CY 2024 reporting period/FY 2026 performance period. As we noted in the FY 2023 IPPS/LTCH PPS proposed rule, the measure developer conducted testing on this measure across a group of 27 hospitals and concluded that the four component measures could be implemented in a cohort of diverse hospitals and lead to meaningful improvements in measure performance (87 FR 28521). For implementation guidance, we refer readers to the measure specifications, implementation guide, and other resources, which can be found on the eCQI Resource Center website, available at: *https://ecqi.healthit.gov*.

After consideration of the public comments we received, we are finalizing our proposal as proposed.

g. Hospital-Level, Risk Standardized Patient-Reported Outcomes Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) (NQF #3559), Beginning With Two Voluntary Reporting Periods in CYs 2025 and 2026, Followed by Mandatory Reporting for Eligible Elective Procedures Occurring July 1, 2025 Through June 30, 2026, Impacting the FY 2028 Payment Determination and for Subsequent Years

(1) Background

Approximately six million adults aged 65 or older suffer from osteoarthritis in the U.S.[862] Osteoarthritis accounts for more than half of all arthritis-related hospitalizations,[863] and in 2013 there were approximately 1,023,000 hospitalizations for osteoarthritis.[864] Hip and knee osteoarthritis is one of the leading causes of disability among non-institutionalized adults,[865] and roughly 80 percent of patients with osteoarthritis have some limitation in mobility.[866] Elective total hip arthroplasty (THA) and total knee arthroplasty (TKA) are most commonly performed for degenerative joint disease or osteoarthritis, which affects more than 30 million Americans.[867] THA and TKA offer significant improvement in quality of life by decreasing pain and improving function in a majority of patients, without resulting in a high risk of complications or death.[868] [869] [870] [871] However, not all patients experience benefit from these procedures.[872] Many patients note that their pre-operative expectations for functional improvement have not been met.[873] [874] [875] [876] In addition, clinical practice variation has been well documented in the U.S.,[877] [878] [879] readmission and complication rates vary across hospitals,[880] [881] and international

experience documents wide hospital-level variation in patient-reported outcome measure results following THA and TKA.[882]

For example, data from the United Kingdom demonstrate that there is a greater than 15 percent difference across hospitals in the proportion of patients showing improvement after surgery.[883] [884]

Peri-operative care and care coordination across provider groups and specialties have important effects on clinical outcomes.[885] [886] The goal of a hospital-level outcome measure is to capture the full spectrum of care to incentivize collaboration and shared responsibility for improving patients' health and reducing the burden of their disease. THA and TKA procedures provide a suitable environment for optimizing care, as there are many studies indicating how hospitals and providers can improve outcomes of their patients by addressing aspects of pre-, peri-, and post-operative care.[887] [888] [889] [890] [891] [892]

Due to the absence of large scale and uniformly collected patient-reported outcome (PRO) data available from patients undergoing elective primary THA/TKA, in November 2015 we established an incentivized, voluntary PRO data collection opportunity within the Comprehensive Care for Joint Replacement (CJR) model [893] to support measure development. Requirements for successful submission of PRO data for eligible elective primary THA/TKA procedures were set forth in the 2015 CJR final rule (80 FR 73274). This Hospital-Level, Risk-Standardized Patient-Reported Outcomes Following Elective Primary Total Hip and/or Total Knee Arthroplasty (THA/TKA) performance measure (THA/TKA PRO–PM) was developed and tested using PRO instruments and risk variable data collected and submitted by CJR participant hospitals. PRO data from the first few performance years for the CJR model revealed hospital-level variation in these outcomes across U.S. hospitals, although the full degree and extent of variation is unknown.

In October 2017, we launched the Meaningful Measures Framework to identify high priority areas for quality measurement that improve patient outcomes while also reducing burden on providers.[894] The initiative captures the agency's vision in evaluating and streamlining regulations with a goal to reduce unnecessary cost and burden, increase efficiencies, and improve beneficiary experience. The scope of the Meaningful Measures Framework continues to evolve as the healthcare environment continues to change. Meaningful Measures 2.0 [895] is currently underway and aims to promote better collection and integration of patients' voices by incorporating patient reported outcome measures that are embedded into the clinical workflow, are easy to use, and reduce reporting burden.[896] The THA/TKA PRO–PM is fully developed and aligns with these future Meaningful Measures 2.0 goals, which are still under development.

Elective THA/TKAs are important, effective procedures performed on a broad population, and the patient outcomes for these procedures (such as pain, mobility, and quality of life) can be measured in a scientifically soundway,

[909] White D., Master H. Patient Reported Measures of Physical Function in Knee Osteoarthritis. Rheum Dis Clin North Am. 2016;42(2):239–252.

improvements in care,[910] [911] [912] [913] [914] [915] [916] [917] and demonstrate hospital-level variation even after patient case mix adjustment.[918] [919] Further, THA/TKA procedures are specifically intended to improve function and reduce pain, making patient reported outcomes a meaningful outcome metric to assess.[920]

Several stakeholder groups were engaged throughout the development process of the THA/TKA PRO–PM, as recommended in the Measures Management System (MMS) Blueprint,[921] including a Technical Advisory Group (TAG), a Patient Working Group, and a national, multi-stakeholder TEP consisting of a diverse set of stakeholders, including providers and patients. These groups were convened by the measure developer under contract with CMS and provided feedback on the measure concept, outcome, cohort, risk model variables, reporting results, and data collection. We received feedback from patients and providers that they had a desire for a flexible data collection approach. For example, providers wanted the option to choose to collect their own data or have data collected through an external entity, such as a vendor. Patients wanted to choose from multiple modes of data collection, such as telephone, paper, and/or electronic. We also received feedback from patients and providers that they would like to utilize their patient reported outcome results as part of the shared decision-making process. Patients were more willing to report data if they knew the survey was from their provider, they understood the importance and use of the survey, and they had access to their own survey responses. In response to this feedback, we did not propose a specific mode for data collection for the THA/TKA PRO–PM. Rather, we proposed that hospitals may determine a data collection mode that accommodates their clinical workflow. We also received multiple public comments as summarized in the 2015 CJR final rule (80 FR 73274) that we used to support the development of this measure.

The THA/TKA PRO–PM (MUC20–0003) was included in the publicly available ''2020 Measures Under Consideration List.'' [922] The MAP Coordinating Committee supported the measure, as referenced in the 2020–2021 Final Recommendations report to HHS and CMS.[923] The NQF endorsed the THA/TKA PRO–PM (NQF #3559) in November 2020.[924]

In the FY 2022 IPPS/LTCH PPS proposed rule (86 FR 25588 through 25592), we requested public comment on the potential future inclusion of the THA/TKA PRO–PM in the Hospital IQR Program. Many commenters expressed support for the measure, with many commending joint-specific PRO–PMs as an effective way to provide insights to quality improvement opportunities, PRO–PMs for assessing results of surgery as interpreted by patients, and describing the measure as essential for value-based payment models (86 FR 45411 through 45414). Many commenters recommended that the measure be implemented in a phased approach, with voluntary reporting occurring prior to public reporting (86 FR 45411 through 45414). In response to these comments, we proposed a phased implementation approach, with two voluntary reporting periods in CY 2025 and 2026 reporting periods prior to mandatory reporting beginning with the CY 2027 reporting period/FY 2028 payment determination, as described in further detail in our discussion on data submission in section IX.E.5.g.(9).

Furthermore, many commenters recommended that we offer multiple options for data submission, including through the hospital directly or by an external vendor engaged by a hospital for this purpose, to ensure hospitals have the flexibility needed to implement the measure (86 FR 45411 through 45414). In response to those comments, in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28526 through 28529), we proposed flexible options for data submission as discussed in more detail in subsequent section. For a more detailed description of the public comments received, we refer readers to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45411 through 45414).

Additionally, we note that many hospitals have already incorporated PRO data collection into their workflows. While we did not propose to require how hospitals collect data, hospitals new to collecting PRO data have multiple options for when and how they will collect this data and can best determine the mode of data collection that works for their patient population.

(2) Overview of Measure

The THA/TKA PRO–PM reports the hospital-level risk-standardized improvement rate (RSIR) in patient reported outcomes following elective primary THA/TKA for Medicare FFS beneficiaries aged 65 years and older.

Substantial clinical improvement will be measured by achieving a pre-defined improvement in score on joint-specific PRO instruments measuring hip or knee pain and functioning, from the pre-operative assessment (data collected 90 to 0 days before surgery) to the post-operative assessment (data collected 300 to 425 days following surgery). For additional details regarding the measure specifications, we refer readers to the Patient-Reported Outcomes (PROs) Following Elective Primary Total Hip and/or Total Knee Arthroplasty: Hospital-Level Performance Measure—

(3) Data Sources

The THA/TKA PRO–PM uses four sources of data for the calculation of the measure: (1) PRO data; (2) claims data; (3) Medicare enrollment and beneficiary data; and (4) U.S. Census Bureau survey data. The measure uses PRO data collected by hospitals pre-operatively and post-operatively (described in section IX.E.5.g.(9).) and limited patient-level risk factor data collected with PRO data and identified in claims. The measure includes PRO data collected with several PRO instruments, among them are two joint-specific PRO instruments—the Hip dysfunction and Osteoarthritis Outcome Score for Joint Replacement (HOOS, JR) [925] for completion by THA recipients and the Knee injury and Osteoarthritis Outcome Score for Joint Replacement (KOOS, JR) [926] for completion by TKA recipients—from which scores are used to assess substantial clinical improvement. For risk adjustment by pre-operative mental health score, hospitals will submit one of two additional PRO instruments, either all of the items in the Patient-Reported Outcomes Measurement Information System (PROMIS)-Global Mental Health subscale or all of the items in the Veterans RAND 12-Item Health Survey (VR–12) Mental Health subscale.[927] [928] The risk model also includes a one-question patient-reported assessment of health literacy—the Single Item Literacy Screener questionnaire.

Furthermore, the following data are collected for identification of the measure cohort, outcome and for risk adjustment purposes. Claims data are used to identify eligible elective primary THA/TKA procedures for the measure cohort to which submitted PRO data can be matched, and to identify additional variables for risk adjustment and in the statistical approach to accounting for response bias, including patient demographics and clinical comorbidities up to 12 months prior to surgery. The Medicare Enrollment Database (EDB) identifies Medicare FFS enrollment and race, and the Master Beneficiary Summary File allows for determination of Medicare and Medicaid dual eligibility enrollment status. Demographic information from the U.S. Census Bureau's American Community Survey [929] allows for derivation of the AHRQ SES Index score. Race, dual eligibility, and AHRQ SES Index score are used in the statistical approach to accounting for non-response bias. We refer readers to section IX.E.5.g.(9). for further details regarding the variables required for data collection and submission.

(4) Outcome

The measure outcome (numerator) is the risk-standardized proportion of patients undergoing elective primary THA/TKA who meet or exceed a substantial clinical improvement threshold between pre-operative and post-operative assessments on two joint-specific PRO instruments. The measure outcome will assess patient improvement in PROs using the HOOS, JR following elective primary THA and the KOOS, JR following elective primary TKA. PRO data will be collected 90 to zero days prior to surgery and 300 to 425 days following surgery. These PRO collection periods align with typical patient visits prior to and following surgery.

The measure outcome defines patient improvement as a binary outcome (''Yes''/''No'') of meeting or exceeding the pre-defined improvement threshold between pre-operative and post-operative assessments on the joint-specific PRO instruments: Specifically, for THA patients, meeting or exceeding the threshold of 22 points on the HOOS, JR and, for TKA patients, meeting or exceeding the threshold of 20 points on the KOOS, JR.

(5) Cohort

The measure cohort (denominator) is Medicare FFS beneficiaries aged 65 years and older undergoing elective primary THA/TKA procedures as inpatients in acute care hospitals. We are aware that elective primary THA/TKA procedures are increasingly occurring in hospital outpatient and ambulatory surgical center settings and we will be evaluating options to address measurement of those procedures and settings.

For additional details regarding the measure cohort, we refer readers to the Patient-Reported Outcomes (PROs) Following Elective Primary Total Hip and/or Total Knee Arthroplasty: Hospital-Level Performance Measure—Measure Methodology Report, available in Hip and Knee Arthroplasty Patient-Reported Outcomes folder at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology*.

(6) Inclusion and Exclusion Criteria

The THA/TKA PRO–PM includes patients who are:

- Enrolled in Medicare FFS Part A and Part B for the 12 months prior to the date of the index admission and enrolled in Part A during the index admission;
- Aged 65 or older; and
- Discharged alive from a non-Federal short-term acute care hospital.

The measure includes only elective primary THA/TKA procedures (patients with fractures and revisions are not included). The measure excludes patients with staged procedures, defined as more than one elective primary THA or TKA performed on the same patient during distinct hospitalizations during the measurement period, and patients who leave the hospital against medical advice following the procedure.

(7) Risk Adjustment

The risk model was developed with clinically relevant risk variables identified by public comment in the 2015 CJR final rule (80 FR 73274), the TEP, and expert orthopedic consultants, and supported by empirical analyses. The risk model includes some of the same risk variables collected with PRO data by hospitals in the CJR model as well as risk variables identified in claims. The pre-operative score of the Mental Health subscale from one of two global PRO instruments (the PROMIS-Global or the VR–12) is included as a risk variable. In addition, the risk model includes a validated, one-question patient-reported assessment of health literacy—the Single Item Literacy Screener questionnaire.

Furthermore, poorly or incompletely collected PRO data may be asymmetrically distributed across lower socioeconomic or disadvantaged populations, potentially affecting measure scores. Research on PRO–PM response has indicated that patients of non-White race, patients of lower socio-economic status, and patients with

[926] Lyman S., Lee Y–Y., Franklin P.D., Li W., Cross M.B., Padgett D.E. Validation of the KOOS, JR: A Short-form Knee Arthroplasty Outcomes Survey. *Clinical Orthopaedics and Related Research®*. 2016;474(6):1461–1471.

[927] National Institutes of Health (NIH). (Patient Reported Outcomes Measurement Information Systems) PROMIS Instrument Details. Available at: *https://www.healthmeasures.net/explore-measurement-systems/promis.*

[928] Iqbal U.S., Rogers W., Selim A., et al. The Veterans Rand 12 Item Health Survey (VR–12): What It Is and How It Is Used. *http://www.hosonline.org/globalassets/hos-online/publications/veterans_rand_12_item_health_survey_vr-12_2007.pdf*.

[929] American Community Survey, available at: *https://www.census.gov/programs-surveys/acs.*

Medicare and Medicaid coverage have lower response rates.[930] [931] [932] Therefore, the measure developer used empirical analyses and stakeholder input to develop an approach to account for response bias in the measure calculation. The approach uses comorbidities, social drivers of health, and demographic variables (such as non-White individuals, dual eligibility, and AHRQ SES index lowest quartile) to predict response to the PRO survey. Weighting the responders based on their likelihood of response (given their patient characteristics) helps reduce non-response bias when calculating the RSIR.

For additional details regarding the approach to risk adjustment and the full risk model, we refer readers to the Patient-Reported Outcomes (PROs) Following Elective Primary Total Hip and/or Total Knee Arthroplasty: Hospital-Level Performance Measure—Measure Methodology Report, available in Hip and Knee Arthroplasty Patient-Reported Outcomes folder at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology*.

(8) Measure Calculation

The hospital-level THA/TKA PRO–PM measure result is calculated by aggregating all patient-level results across the hospital. At the hospital level, this measure will be calculated and presented as a RSIR, producing a performance measure per hospital which accounts for patient case mix, addresses potential non-response bias, and represents a measure of quality of care following elective primary THA and TKA. Response rates for PRO data will be calculated as the percentage of elective primary THA or TKA procedures for which complete and matched pre-operative and post-operative PRO data have been submitted divided by the total number of eligible THA or TKA procedures performed at each hospital.

(9) Data Submission

Comments submitted on a request for information in the FY 2022 IPPS/LTCH PPS proposed rule and summarized in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45411 through 45414) recommended CMS provide multiple options for data submission mechanisms to ensure flexibility, including through qualified clinical data registries, as well as through the hospital.

In response to ongoing stakeholder feedback and public comments in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45411 through 45414), we proposed in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28527) to adopt the THA/TKA PRO–PM in the Hospital IQR Program utilizing multiple submission approaches. For example, hospitals may choose to: (1) Send their data to CMS for measure calculation directly; or (2) utilize an external entity, such as through a vendor or registry, to submit data on behalf of the hospital to CMS for measure calculation. Furthermore, hospitals or vendors will use the HQR System as part of data submission for the THA/TKA PRO–PM. Use of the HQR System leverages existing CMS infrastructure already utilized for other quality measures (such as the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) Survey). The HQR System allows for data submission using multiple file formats (such as CSV, XML) and a manual data entry option, allowing hospitals and vendors additional flexibility in data submission. We will provide hospitals with more detailed instructions and information regarding data submission through CMS' existing website QualityNet, and through list servs. This data submission approach is consistent with stakeholder input received by the measure developer during measure development and comments as summarized in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45411 through 45414) which recommended CMS provide multiple options for data submission mechanisms to ensure flexibility.

Hospitals will submit the following pre-operative assessment variables collected between 90 and zero days prior to the THA/TKA procedure: Medicare provider number, Medicare health insurance claim (HIC) number/Medicare beneficiary identifier (MBI), date of birth, date of procedure, date of PRO data collection, procedure type, mode of collection, person completing the survey, date of admission to anchor hospitalization, generic patient reported outcome measure version, PROMIS-Global (mental health subscale items) or VR–12 (mental health subscale items), HOOS, JR (for THA patients), KOOS, JR (for TKA patients), Single-Item Health Literacy Screening (SILS2) questionnaire, BMI or weight (kg)/height (cm), chronic (≥ 90 day) narcotic use, total painful joint count (patient-reported in non-operative lower extremity joint), and quantified spinal pain (patient-reported back pain, Oswestry index question[933] [934]).

Hospitals will submit the following post-operative assessment variables collected between 300 and 425 days following the THA/TKA procedure: Medicare provider number, Medicare health insurance claim number/Medicare beneficiary identifier, date of birth, procedure date, date of PRO data collection, procedure type, mode of collection, person completing the survey, date of admission to anchor hospitalization, KOOS, JR (TKA patients), and HOOS, JR (THA patients). The data submission period for the THA/TKA PRO–PM will also serve as the review and correction period. Data will not be able to be corrected following the submission deadline.

For additional details we refer readers to the Patient-Reported Outcomes (PROs) Following Elective Primary Total Hip and/or Total Knee Arthroplasty: Hospital-Level Performance Measure—Measure Methodology Report, available in Hip and Knee Arthroplasty Patient-Reported Outcomes folder at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology*.

(a) Voluntary Reporting Period

[930] Hutchings A., Neuburger J., Frie K., Black N., van der Meulen J. Factors associated with nonresponse in routine use of patient reported outcome measures after elective surgery in England. Health and Quality of Life Outcomes. 2012;10(34).

[931] Schamber E., Takemoto S., Chenok K., Bozic K. Barriers to completion of patient reported outcome measures. The Journal of arthroplasty. 2013;28:1449–1453.

[932] Patel J., Lee J., Zhongmin L., SooHoo N., Bozic K., Huddleston J. Predictors of low patient-reported outcomes response rates in the California Joint Replacement Registry. The Journal of arthroplasty. 2015;30:2071–2075.

[933] Fairbank J.C., Pynsent P.B. The Oswestry Disability Index. Spine (Phila Pa 1976). 2000 Nov 15;25(22):2940–52; discussion 2952. doi: 10.1097/00007632–200011150–00017. PMID: 11074683.

[934] The Oswestry Disability Index is in the public domain and available for all hospitals to use.

We proposed a phased implementation approach for adoption of this measure to the Hospital IQR Program, with two voluntary reporting periods prior to mandatory reporting in the Hospital IQR Program. Voluntary reporting prior to mandatory reporting will allow time for hospitals to incorporate the THA/TKA PRO–PM data collection into their clinical workflows and is responsive to stakeholder comments as summarized in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45411 through 45414). For each voluntary and subsequent mandatory reporting period, we will collect data on the THA/TKA PRO–PM in accordance with, and to the extent permitted by, the HIPAA Privacy and Security Rules (45 CFR parts 160 and 164, subparts A, C, and E), and other applicable law.

We proposed that the first voluntary reporting period for CY 2025 would include pre-operative PRO data collection from October 3, 2022 through June 30, 2023 (for eligible elective primary THA/TKA procedures performed from January 1, 2023 through June 30, 2023) and post-operative PRO data collection from October 28, 2023 to August 28, 2024. Hospitals will submit pre-operative data in 2023 and post-operative data in 2024, and we intend to provide hospitals with their results in confidential feedback reports in 2025. We refer readers to section IX.E.10.k., where we discuss the form, manner, and timing for PRO–PMs, including submission deadlines.

The second voluntary reporting period for CY 2026 will include pre-operative PRO data collection from April 2, 2023 through June 30, 2024 (for eligible elective primary THA/TKA procedures performed from July 1, 2023 through June 30, 2024) and post-operative PRO data collection from April 26, 2024 to August 29, 2025. Hospitals will submit pre-operative data in 2024 and post-operative data in 2025, and we intend to provide hospitals with their results in confidential feedback reports in 2026. We refer readers to section IX.E.10.k., where we discuss the form, manner, and timing for PRO–PMs, including submission deadlines.

Hospitals that voluntarily submit data for this measure will receive confidential feedback reports that detail submission results from the reporting period. If feasible, we will calculate and provide each participating hospital with their risk-standardized improvement rate as part of the confidential feedback reports. This will provide each hospital with an indication of their performance relative to the other hospitals that participate in the voluntary reporting period. We refer readers to Table IX.E–07. for an overview of the pre- and post-operative performance periods, data collection windows, and data submission deadlines during voluntary reporting.

TABLE IX.E-07. PRE-OPERATIVE AND POST-OPERATIVE PERIODS FOR THA/TKA PRO-PM FOR VOLUNTARY REPORTING

Reporting Period	Performance Period	Pre-operative Data Collection Window	Pre-operative Data Submission Deadline	Post-operative Data Collection Window	Post-operative Data Submission Deadline
Voluntary Reporting 1 (2025)	January 1, 2023 through June 30, 2023	October 3, 2022 through June 30, 2023	October 2, 2023	October 28, 2023 to August 28, 2024	September 30, 2024
Voluntary Reporting 2 (2026)	July 1, 2023 through June 30, 2024	April 2, 2023 through June 30, 2024	September 30, 2024	April 26, 2024 to August 29, 2025	September 30, 2025

(b) Mandatory Reporting

Following the two voluntary reporting periods, we proposed that mandatory reporting of the THA/TKA PRO–PM would begin with eligible elective primary THA/TKA procedures from July 1, 2024 through June 30, 2025 with affecting the FY 2028 payment determination. Hospitals' data reporting requirements will be based on pre-operative PRO data collection from April 2, 2024 through June 30, 2025 (for eligible elective THA/TKA procedures from July 1, 2024 through June 30, 2025) and post-operative PRO data collection from April 27, 2025 to August 29, 2026. Pre-operative data submission will occur in 2025 and post-data submission in 2026 and we intend to provide hospitals with their results in 2027 before publicly reporting results on the Compare tool hosted by HHS, currently available at: *https://www.medicare.gov/care-compare*, or its successor website. For this first mandatory reporting period, hospitals that fail to timely meet the reporting requirements will receive a reduction of their Annual Payment Update (APU) in FY 2028. We refer readers to the section IX.E.10.k., where we discuss the form, manner, and timing for PRO–PMs, including submission deadlines. We refer readers to Table IX.E–08. for an overview of the pre- and post-operative performance periods, data collection windows, and data submission deadlines during mandatory reporting.

TABLE IX.E-08. PRE-OPERATIVE AND POST-OPERATIVE PERIODS FOR THA/TKA PRO-PM FOR MANDATORY REPORTING

Reporting Period	Performance Period	Pre-operative data Collection Window	Pre-operative Data Submission Deadline	Post-operative Data Collection Window	Post-operative Data Submission Deadline
Mandatory Reporting (2027)	July 1, 2024 through June 30, 2025	April 2, 2024 through June 30, 2025	September 30, 2025	April 27, 2025 to August 29, 2026	September 30, 2026

(10) Public Reporting

(a) Voluntary Reporting Periods

We proposed to provide hospitals with their THA/TKA PRO–PM results in confidential feedback reports during the two voluntary reporting periods occurring in 2025 and 2026. While we did not propose to publicly report voluntary THA/TKA PRO–PM hospital-level risk-standardized improvement rates (RSIR) during this period, to acknowledge the efforts of stakeholders who choose to participate in voluntary reporting, and to support their efforts to improve quality in this important area, we proposed to publicly report which hospitals choose to participate in voluntary reporting and/or the percent of pre-operative data submitted by participating hospitals for the first voluntary reporting period, and their percent of pre-operative and post-operative matched PRO data submitted for subsequent voluntary reporting periods. For example, if out of 100 eligible procedures a hospital submits 45 pre-operative cases that match to post-operative cases, then we will report that hospital submitted 45 percent of matched pre-operative and post-operative PRO surveys during voluntary reporting

(b) Mandatory Reporting

The THA/TKA PRO–PM results and response rates will be publicly reported on the Compare tool hosted by HHS, currently available at: *https://www.medicare.gov/care-compare*, or its successor website, beginning with the first mandatory reporting period for the FY 2028 payment determination. Reporting will be based on pre-operative PRO data April 2, 2024 through June 30, 2025 (for eligible elective THA/TKA procedures from July 1, 2024 through June 30, 2025) and post-operative PRO data collection from April 27, 2025 to August 29, 2026. Hospitals will receive confidential feedback reports prior to public reporting that detail results from the reporting period. If feasible, confidential feedback reports will include the risk-standardized improvement rate as well as other results that support understanding of their performance.

We invited public comment on this proposal.

Comment: Many commenters expressed support for the adoption of the THA/TKA PRO–PM in the Hospital IQR Program. A commenter strongly supported the adoption of the measure as it provides patients with valuable information on the quality of joint care provided by hospitals, as well as information on post-operative functional improvements. Another commenter strongly supported the adoption of the measure as it assesses the success of procedures based on outcomes that are important to patients while also supplying clinical teams with information essential to a patient's recovery. The commenter noted this information is useful to other patients seeking care and should be publicly posted. A commenter stated patient-reported outcomes for elective primary THA and TKA procedures are critical to ensure the procedure quality is accurately captured. Another commenter supported the measure's adoption as it incentivizes collaboration in patient care between hospitals and providers, both pre- and post-operatively, which improves patient outcomes. Many commenters expressed support for the collection of PRO data for hospital quality improvement efforts, and use of PRO–PMs in CMS programs, generally. A commenter stated that THA and TKA procedures offer the majority of patients significant improvement in quality of life by decreasing pain and improving function without high risk of complication or death and, therefore, supported collection of PRO data for total joint replacements. A commenter supported adoption of the measure for Critical Access Hospitals that provide THA and TKA services. A commenter supported the adoption of the measure and requested more information on the mechanism for data collection for providers and patients.

Response: We thank commenters for their support and agree with the importance of measuring patient-reported outcomes for elective primary THA and TKA procedures, particularly to measure functional improvement following the applicable surgical procedure. We will conduct education and outreach activities for hospitals and other stakeholders with detailed information, including data collection and reporting processes for the THA/TKA PRO–PM to support preparation for the voluntary reporting periods in the Hospital IQR Program.

Comment: Many commenters did not support the proposed adoption of the THA/TKA PRO–PM to the Hospital IQR Program because of the volume of newly proposed quality measures and EHR-related reporting requirements proposed by CMS for the Hospital IQR Program. Many commenters expressed concern that the adoption of the THA/TKA PRO–PM to the Hospital IQR Program would be burdensome to hospitals. Many commenters stated that the financial, resource, and labor costs required to collect, track, and submit data would burden hospitals and make successful implementation of the measure difficult, even if hospitals opt to use a third-party vendor for data collection and submission. A commenter expressed concern about the burden specifically for small and rural hospitals. A few commenters noted that data are not collected in a standardized way and EHRs are not integrated with patient portals that would allow hospitals to collect patient-reported information, adding manual burden to extrapolate data or infrastructure investments. A commenter noted their belief that the measure is counter to CMS's efforts to reduce administrative burden for hospitals and detracts from their primary mission of direct patient care. A few commenters urged CMS to work with stakeholders to develop a less burdensome measure or reassess the burden compared to the value of this measure following voluntary reporting.

A few commenters expressed concerns regarding the burden of tracking patients pre- and post-operatively to collect PRO data, stating that data are not centrally housed, patients receive post-operative care outside the hospital, and the tracking of patients for the duration of the post-operative data collection timeframe of 300 to 425 days would be expensive and burdensome. Additionally, a few commenters stated that reaching out to patients to collect surveys in multiple modes would be expensive; however, other commenters encouraged having multiple modes of survey collection.

Response: We acknowledge commenters' concerns with the volume of measures and reporting requirements proposed for the Hospital IQR Program. We will continue to evaluate the Hospital IQR Program measure set and take this feedback into consideration. However, we believe that measuring patient-reported outcomes is an important aspect of patient-centered healthcare and continue to emphasize, as highlighted in our Meaningful Measures 2.0 Framework,[935] that the patient voice should be prioritized across healthcare systems and providers. Our aim is to promote better collection and integration of patients' voices by incorporating PROMs that are embedded into clinical workflow, easy to use, and as minimally burdensome to patients and providers as possible.

We thank commenters for their feedback regarding the financial, labor, and resource burdens associated with adopting the THA/TKA PRO–PM to the Hospital IQR Program. We acknowledge

[935] *https://www.cms.gov/medicare/meaningful-measures-framework/meaningful-measures-20-moving-measure-reduction-modernization.*

that while PROMs and PRO–PMs may involve more burden and initial implementation resources compared to some other types of quality measures, we believe the benefit of collecting direct functional improvement information from the patients outweighs the burden. We are carefully considering public comments and are seeking to advance patient-centered measurement with as little burden as possible to both providers and patients. While PRO–PMs require providers to integrate data collection into clinical workflows, this integration provides an important opportunity for patient-reported outcomes to inform clinical decision making and benefit patients by engaging them in discussions about potential outcomes. To provide more flexibility, we are not requiring hospitals to collect data in a standardized way. In fact, we acknowledge hospitals may use a variety of data collection, storage, and submission approaches, and we encourage hospitals to use processes best suited to them. Instead, we are standardizing the specific data elements that need to be collected and reported to CMS. Further, we believe that clinicians, providers, and hospitals should determine practices that avoid duplication across care settings. We will continue to monitor data collection burden and duplication during the voluntary reporting period.

The PRO instruments used to calculate pre- and post-operative scores for this THA/TKA PRO–PM were carefully considered, with extensive stakeholder input, including from clinicians, to be low burden and are non-proprietary for free use. We will evaluate data collection burden and response rates associated with the THA/TKA PRO–PM and will also consider this information in future measure reevaluation.

Comment: A few commenters expressed concern about the data collection burden for patients, with a commenter specifically citing survey fatigue as patients are already responding to the HCAHPS survey measure. Another commenter expressed concern that completion of surveys for the measure beyond only the HOOS, JR and KOOS, JR would burden patients resulting in lower completion rates.

Response: This measure was developed with extensive input from patients, who indicated strong support for a PRO–PM following elective primary THA and TKA. We anticipate data collection for this measure to present a low burden to patients. Regarding survey fatigue, we designed the measure to illuminate a patient's pain and functional status before and after a THA or TKA, which is different than other surveys such as HCAHPS that capture patient experience. Regarding the comment that the THA/TKA PRO–PM may have a reporting impact on other measures, such as HCAHPS, we anticipate a minimal impact to other measures as the THA/TKA PRO–PM's eligible population is procedure-specific which reduces the likelihood of the same patient receiving the HCAHPS and a PRO survey. Additionally, the THA/TKA PRO–PM pre-operative assessment (90 to 0 days before surgery) and post-operative assessment (300 to 425 days following surgery) timeframe is different than HCAHPS, which is two weeks after a hospital visit.

Comment: Another commenter requested CMS assess survey completion rates during voluntary reporting of the measure as part of the Hospital IQR Program compared to the CJR Model. A few commenters requested CMS not adopt the THA/TKA PRO–PM in the Hospital IQR Program until operational challenges identified by CJR participating hospitals are shared publicly, independently analyzed, and addressed. Commenters expressed concern that reporting of the THA/TKA PRO–PM as part of the CJR Model has been challenging and burdensome, potentially impacting completion rates.

Response: We appreciate commenters' request for information about use of the measure in the CJR Model. We have collected feedback from CJR participating hospitals and applied lessons learned to the THA/TKA PRO–PM proposal for adoption into the Hospital IQR Program. These lessons learned include requiring hospitals to collect and submit fewer variables, allowing hospitals flexibility in data collection options to better integrate into their workflows, and influenced the decision to set the reporting threshold to a moderate rate of 50 percent. We highlight that our proposal includes two voluntary reporting periods in which we will gather feedback from participating hospitals on their experience collecting and submitting data and apply any lessons learned prior to mandatory reporting.

We thank commenters for their feedback. We will continue to evaluate feedback on challenges with data collection during voluntary reporting and consider them prior to mandatory reporting.

Comment: A few commenters suggested ways to reduce data collection and submission burden for hospitals and providers. A commenter suggested CMS align THA/TKA PRO–PM data collection with The Joint Commission Advanced Hip and Knee certification requirements. Another commenter suggested data collection should occur through registries, specifically the American Academy of Orthopedic Surgeons American Joint Replacement registry. A few commenters recommended CMS only use claims data or develop a new measure using Medicare claims to assess total joint arthroplasty revisions and mortality rates. A commenter recommended CMS directly collect post-operative surveys because CMS has access to current beneficiary information, could collect surveys for different surgeries across care settings, and reduce burden on providers.

Response: We thank commenters for their recommendations to reduce burden of data collection and submission associated with adoption of the THA/TKA PRO–PM to the Hospital IQR Program. We confirm that the measure as proposed notes registries as an acceptable form of data collection for the measure (87 FR 28527 through 28528). We agree with use of registries to reduce data collection burden for hospitals. Regarding alignment of the THA/TKA PRO–PM with The Joint Commission Advanced Hip and Knee certification requirements, we note that alignment exists in the PRO instruments, specifically the HOOS, JR and KOOS, JR (collected for the measure outcome for the THA/TKA PRO–PM) as well as the PROMIS–10 or VR–12 (collected for the risk model of the THA/TKA PRO–PM).[936] We will continue to monitor potential areas for alignment, as appropriate. We will also consider commenter suggestions about CMS's role in post-operative data collection, and the development of claims-based joint arthroplasty measures.

Comment: Many commenters expressed concerns with the 300 through 425 days post-operative data collection window related to appropriateness, feasibility, and burden to hospitals and other care settings, though a commenter supported assessment of longer-term outcomes generally. A few commenters stated that the proposed post-operative data collection window is not aligned with clinical practice where patients receive follow up care from their surgeons ranging between three to eight weeks post-operatively. A few commenters

[936] The Joint Commission. *R3 Report Issue 26: Advanced Total Hip and Total Knee Replacement Certification Standards;* 2020. *https://www.jointcommission.org/-/media/tjc/documents/standards/r3-reports/thkr-standards-r3-final-copy-1_17_20.pdf.*

added that most improvement is demonstrated before the 300 through 425 post-operative data collection windows: for example, within 80 or 90 days. A commenter stated the proposed post-operative data collection window will introduce unnecessary health care encounters which add risk to patients. A few commenters noted challenges with tracking patients during the post-operative data collection window, stating beneficiaries do not always return for follow up care or may relocate. A commenter was concerned the post-operative data collection window was too far removed from the surgery and patient survey responses could be inaccurate. Several commenters recommended CMS shorten the post-operative data collection window. Commenters offered the following suggestions: 3 months, 3 through 6 months, and 8 through 12 months.

Response: We appreciate commenters' concerns with the 300 through 425-day post-operative data collection window; however, we disagree that the proposed post-operative window should be changed at this time. In development of the THA/TKA PRO–PM, the measure developer conducted extensive stakeholder engagement, a thorough literature review, and reviewed registry data capture to inform the post-operative assessment window (initially 270 to 365 days) for capture of full recovery from both THA and TKA and alignment with the typically scheduled one-year post-surgery appointments so that the collection of the post-operative data collection would not require an additional appointment. Following several years of PRO data collection through the CJR Model, clinical experts expressed concern that the initial 365-day upper limit missed patients who were scheduled or rescheduled for this one-year follow-up beyond 365 days, and they strongly advocated for shifting the post-operative data collection window to better align with clinical practice and increase PRO data collection. For additional details we refer readers to the Patient-Reported Outcomes (PROs) Following Elective Primary Total Hip and/or Total Knee Arthroplasty: Hospital-Level Performance Measure—Measure Methodology Report, available in Hip and Knee Arthroplasty Patient-Reported Outcomes folder at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology*.

Comment: Many commenters provided feedback on the proposed voluntary and mandatory reporting timelines for the THA/TKA PRO–PM adoption into the Hospital IQR Program but expressed a mix of support and recommended changes. A few commenters supported the proposed voluntary and mandatory reporting timelines, noting they give hospitals an opportunity to incorporate data collection into clinical workflows. However, a few commenters supported only the voluntary reporting timeline without mandatory reporting. A few commenters requested CMS extend the voluntary reporting timeline and delay mandatory reporting to support hospitals learning and their incorporation of data collection into clinical workflows; to allow CMS to assess the success, value, and burden of the measure; and to allow time for data collection challenges to be reduced. A commenter suggested four years of voluntary reporting. Another commenter recommended CMS use multiple six- month reporting periods before requiring a full year of reporting data.

Response: We thank commenters for their support of the phased approach of adopting the THA/TKA PRO–PM in the Hospital IQR Program. We have considered commenters' recommendations regarding voluntary and mandatory reporting timelines. We believe the proposed voluntary and mandatory reporting implementation approach will allow hospitals sufficient time to make the necessary enhancements to their clinical workflow to successfully report this measure. We highlight that our proposal includes two voluntary reporting periods prior to mandatory reporting which balances the need to allow hospitals time to prepare for mandatory reporting with the need to make this information public for patient use. We will carefully consider feedback received during voluntary reporting to inform improvements that may be made for mandatory reporting. We also refer readers to section IX.E.10.k. of this final rule where we discuss in more detail the form, manner, and timing of reporting the THA/TKA PRO–PM.

Comment: A few commenters did not support the adoption of the THA/TKA PRO–PM into the Hospital IQR Program as proposed. A commenter expressed that physician performance cannot be differentiated using patient-reported outcomes, noting many factors that influence an outcome are beyond an individual physician's influence, such as those related to patient factors and quality of care received overall.

Response: We acknowledge commenters' concerns regarding the adoption of the THA/TKA PRO–PM and patient-reported outcomes generally. However, we believe that PRO–PMs are an important aspect of patient-centered healthcare and continue to emphasize our position in our Meaningful Measures 2.0 Framework [937] that the patient voice is prioritized across healthcare systems and providers. Our aim is to promote better collection and integration of patients' voices by incorporating PRO–PMs that are embedded into clinical workflow, easy to use, and reduce reporting burden. We agree with the commenter that many factors influence a patient's outcome after a THA or TKA procedure, many of which are related to the overall quality of care the patient received at the hospital. As such, we are beginning to measure patient reported outcomes for these procedures at the hospital level but believe future measurement in other care settings, such as for HOPDs, ASCs, or at the clinician level, is important to understanding quality of care across settings.

Comment: Many commenters discussed the appropriateness of CMS' use of the THA/TKA PRO–PM in the hospital setting. A few commenters recommended CMS expand use of the measure across other care settings where THA/TKA procedures are performed. Many commenters noted the transition of THA/TKA procedures from the inpatient hospital setting to the outpatient setting and encouraged use of the measure in the Hospital Outpatient Quality Reporting (OQR) Program or the Ambulatory Surgical Center Quality Reporting (ASCQR) Program, and at the clinician level, with a few commenters recommending CMS monitor shifts in volume of procedures between settings during the voluntary reporting period. A few commenters expressed concern that, given the shift of procedures to the outpatient setting, only the sickest and most complex patients would undergo THA/TKA procedures in the hospital, and this could skew hospital results on the measure. A few commenters suggested that CMS consider risk adjusting to account for trends in greater acuity of inpatient patients undergoing THA/TKA procedures. A few commenters had concerns attributing outcomes to hospitals because surgeons' offices or other settings commonly administer PRO surveys. Another commenter requested CMS consider its future public reporting approach to ensure inappropriate comparisons cannot be made between hospital and outpatient THA/TKA PRO–PM results.

[937] *https://www.cms.gov/medicare/meaningful-measures-framework/meaningful-measures-20-moving-measure-reduction-modernization*.

A commenter suggested CMS consider efficiencies gained by linking hospital data with MIPS data for providers.

Response: We thank commenters for their support for expanding this measure to other programs and settings. We agree that monitoring trends and transition of THA/TKA procedures to outpatient settings is also important. We appreciate commenter insights on the differences in patient complexity across care settings and will continue to monitor this during reevaluation of the measure's risk adjustment model. We disagree that the measure is not appropriate for the inpatient hospital setting at this time. We note that the proposed THA/TKA PRO–PM measure is case mix adjusted for patient comorbidities and is a relative performance measure for hospitals performing these elective THA and TKA procedures (87 FR 28527).[938] As such, we believe that this measure accurately reflects hospital performance even if patients receiving these procedures in the inpatient setting tend to be sicker, on average, than those treated in an outpatient setting.

Given the relatively recent removal of TKA and THA from the Inpatient Only (IPO) list (82 FR 52521 through 52526) (84 FR 61352 through 61355), we expect that the volume of THA and TKA procedures will continue to increase in HOPDs and ASCs, and that significant numbers of Medicare beneficiaries 65 and older will potentially undergo these procedures in the outpatient setting in future years. We recognize that potential future adoption and implementation of a respecified version of the THA/TKA PRO–PM in the Hospital OQR Program would require sufficient numbers of procedures for each measured HOPD and ASC to ensure a reliable measure score. We proposed the measure in the inpatient setting at this time and will consider potential expansion to other outpatient settings. We refer readers to the CY 2022 OPPS final rule for a summary of comments on the request for comment on the potential future adoption of the measure into the Hospital OQR and ASCQR Programs (86 FR 63851 through 63854 and 63896 through 63898). We also agree that there is value in measurement at the clinician level, however, the hospital level measure helps capture the quality of care provided during a patient's stay and provides the opportunity for more entities to have sufficient case volume to be included in the measure. A respecified version of the measure at the clinician level, the Clinician-Level and Clinician Group-Level Total Hip and/or Total Knee Arthroplasty Patient-Reported Outcome-Based Performance Measure, was included on the 2021 Measures Under Consideration List. For additional details we refer readers to the List of Measures Under Consideration for December 1, 2021 at: *https://www.cms.gov/files/document/measures-under-consideration-list-2021-report.pdf*. Any proposal to implement the measure in other CMS programs would be announced through future rulemaking.

Comment: A few commenters provided recommendations on reimbursement and incentives for adopting the THA/TKA PRO–PM in the Hospital IQR Program. A commenter stated CMS should not use the measure in determining hospital reimbursement due to limits in risk stratification. Another commenter stated it is too early to compare hospital scores to determine reimbursement as PRO scores are not fully understood at the patient level. Another commenter urged CMS not to impose penalties if the measure is adopted. A few commenters recommended CMS provide incentives for hospitals to report the measure. Another commenter stated rural hospitals that are burdened by the measure would benefit from incentives similar to the facility bonus used in the Quality Payment Program (QPP). A few commenters encouraged CMS to consider reimbursing hospitals for data collection, such as using a CPT code with a bonus, similar to QPP. Another commenter recommended a quality bonus payment similar to the CJR Model or Bundled Payments for Care Improvement Initiative.

Response: We thank commenters for their recommendations about reimbursement and incentives for reporting the THA/TKA PRO–PM. We are not able to provide incentive payments under the Hospital IQR Program. We note that the Hospital IQR Program is a pay-for-reporting program, and hospitals' payments are not based on their performance on measures; hospitals will receive credit for the reporting of their measure data regardless of their measure score.

Comment: A few commenters provided recommendations regarding the measure specifications. A commenter supported the risk adjustment approach for the measure. However, another commenter recommended CMS include social determinants of health, body mass index, and smoking as risk variables and a third commenter requested CMS also consider variables that are outside of providers' influence that impact outcomes, such as patient adherence to surgical instructions or comorbidities. A few commenters recommended separating THA and TKA into their own procedure specific measures, stating that THA procedures have a higher success rate for improvement while the same level of improvement is not reached for TKA procedures. A few commenters suggested CMS calculate the change in PRO survey scores for individual patients pre- and post-operatively rather than the measure calculation approach as currently proposed. A commenter requested CMS exclude patients with history of prosthetic knee joint infections for reimplantation of knee arthroplasty and arthroplasties where the medical record includes a diagnosis of nonunion where the surgery is performed on a joint previously fractured that failed to heal. The commenter expressed concern that these surgeries are highly complex and dissimilar to other procedures captured in the THA/TKA PRO–PM's cohort as proposed.

Response: We thank commenters for their input on the THA/TKA PRO–PM's specifications for the cohort, risk adjustment, and measure calculation. We note that the measure is risk adjusted for several risk variables including but not limited to health literacy, body mass index, and several comorbidities (87 FR 28527). The threshold improvement approach to measure score calculation was strongly supported by clinical experts and patients during measure development and preferred to averaging patient change scores. We note that the National Quality Forum endorsed the THA/TKA PRO–PM as proposed.[939] For additional details we refer readers to the Patient-Reported Outcomes (PROs) Following Elective Primary Total Hip and/or Total Knee Arthroplasty: Hospital-Level Performance Measure—Measure Methodology Report, available in Hip and Knee Arthroplasty Patient-Reported Outcomes folder at *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology*. We will review these recommendations and consider any adjustments to the measure as appropriate as part of normal ongoing measure reevaluation.

Comment: A few commenters provided input on the PRO instruments

[938] Patient-Reported Outcomes (PROs) Following Elective Primary Total Hip and/or Total Knee Arthroplasty: Hospital-Level Performance Measure (Version 1.0 Methodology Report). March 2021.

[939] National Quality Forum. Patient Experience and Function Final Report—Spring 2020 Cycle; 2021. Available at: *https://www.qualityforum.org/Publications/2021/03/Patient_Experience_and_Function_Final_Report_-_Spring_2020_Cycle.aspx*.

selected for the THA/TKA PRO–PM. A commenter requested CMS clarify rationale for collecting quantified spinal pain in the Oswestry Disability index. Another commenter opposed limiting the THA/TKA PRO–PM to just HOOS, JR and KOOS, JR instruments and suggested CMS allow communities to decide which validated PRO instrument to use for their patient population. The commenter noted the HOOS, JR and KOOS, JR lack cross cultural validation and suggested use of HOOS and KOOS full forms, Joint Replacement Shortforms, Physical Function Shortform, or PROMIS Physical Function.

Response: We thank commenters for their feedback on the selected PRO instruments. Use of the HOOS, JR and KOOS, JR instruments to calculate pre- and post-operative scores for this THA/TKA PRO–PM were carefully considered, with extensive stakeholder input from clinicians, and found to be low burden. The clinicians also believed, and data demonstrated, that joint-specific functional status tools such as the HOOS, JR and KOOS, JR are more relevant for clinical decision making and are more responsive than other PROMs that are not as specific. We believe the use of different PRO instruments by different facilities would prevent a valid comparison of hospital performance and quality. In response to the commenter's objection to collection of Quantified Spinal Pain as part of the Oswestry Disability index,[940] [941] we note that variable was identified as a clinical risk variable supported by the Technical Expert Panel and orthopedic experts as relevant and important for risk adjustment of outcomes following elective primary THA and TKA procedures. We note that the National Quality Forum endorsed the THA/TKA PRO–PM as proposed.[942] For additional details we refer readers to the Patient-Reported Outcomes (PROs) Following Elective Primary Total Hip and/or Total Knee Arthroplasty: Hospital-Level Performance Measure—Measure Methodology Report, available in Hip and Knee Arthroplasty Patient-Reported Outcomes folder at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology*.

Comment: A few commenters discussed concerns with the THA/TKA PRO–PM's impact on health disparities and response bias. A few commenters stated that surveys may only provide a limited sample of patient data, introducing bias and masking lower completion rates among marginalized groups. Surveys administered through technologies such as Epic, text, or third-party vendors could worsen racial disparities, introduce barriers, and limit a hospital's ability to collect a representative sample of patients from all races, socioeconomic statuses, and languages. A commenter questioned whether the THA/TKA PRO–PM as proposed adjusts for non-response bias for patients with limited English language proficiency, as such patients would be challenged to complete surveys, and hospitals with a high proportion of patients with limited English proficiency may have a lower response rate. A commenter suggested CMS provide reimbursement to hospitals to overcome these challenges in data collection. Another commenter encouraged stratification and reporting of results to hospitals for underrepresented populations.

Response: We thank commenters for their input regarding health disparities and response bias. We agree with commenters that considering the unique experience of populations with social risk factors is important. As proposed, the measure accounts for potential non-response bias (inverse probability weighting) and considers patient characteristics, including non-White race, dual eligibility, and the AHRQ SES index score (87 FR 28527). The AHRQ SES index score is computed using US census data and considers factors including zip code, median household income, percentage of persons below the Federal poverty line, unemployment, education, property value, and percentage of persons in crowded households.[943] Although preferred language spoken is not a variable currently included in the non-response bias approach, the measure as proposed includes health literacy in the risk model. For additional details we refer readers to the Patient-Reported Outcomes (PROs) Following Elective Primary Total Hip and/or Total Knee Arthroplasty: Hospital-Level Performance Measure—Measure Methodology Report, available in Hip and Knee Arthroplasty Patient-Reported Outcomes folder at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology*. We appreciate the comments regarding the importance of considering disadvantaged populations within the measure specifications and implementation, and we will continue to assess any impact of social risk factors on the measure and response rates over time.

Regarding non-response bias and the measure results, we encourage hospitals to consider a variety of PRO data collection methods to support responses from all eligible patients. We also recognize that addressing health disparities and response bias are complex issues. We are firmly committed to addressing health disparities and response bias for patient reported outcomes. We believe finalizing the Hospital Commitment to Health Equity structural measure and the two Social Drivers of Health screening measures, discussed in sections IX.E.5.a. and IX.E.5.b. of this final rule, respectively, supports addressing these issues and incentivizes structural quality improvement. We believe it will take a complementary set of quality measures focused on health equity to see significant improvements.

Comment: A few commenters expressed concern about reporting thresholds as well as the pre- and post-operative survey matching requirements. A commenter suggested CMS lower the reporting threshold for the measure and study response rates before finalizing a threshold. Another commenter urged CMS to use the voluntary reporting periods to set realistic matching percentages between pre- and post-operative surveys. A commenter noted the transition from performing THA and TKA procedures from hospitals to outpatient settings may affect hospital's ability to meet reporting thresholds. A commenter noted that the CJR Model uses an 80% reporting threshold which is challenging for hospitals to meet. The commenter encouraged CMS to analyze response rates from CJR participating hospitals and identify ways to increase pre- and post-operative survey responses. Another commenter questioned if hospitals will be penalized for not meeting reporting thresholds due to low response rates.

Response: We selected the 50 percent reporting threshold after considering numerous factors and the experience of CJR Model participants. The proposed reporting threshold is based on average response rates for both pre-operative

[940] Fairbank JC, Pynsent PB. The Oswestry Disability Index. Spine (Phila Pa 1976). 2000 Nov 15;25(22):2940–52; discussion 2952. doi: 10.1097/00007632–200011150–00017. PMID: 11074683.

[941] The Oswestry Disability Index is in the public domain and available for all hospitals to use.

[942] National Quality Forum. Patient Experience and Function Final Report—Spring 2020 Cycle; 2021. *https://www.qualityforum.org/Publications/2021/03/Patient_Experience_and_Function_Final_Report_-_Spring_2020_Cycle.aspx*.

[943] Bonito A, Bann C, Eicheldinger C, Carpenter L. Creation of new race-ethnicity codes and socioeconomic status (SES) indicators for Medicare beneficiaries. Final Report, Sub-Task. 2008;2.

and post-operative surveys collected by participating hospitals in the CJR Model. The proposed reporting threshold for adoption of the measure into the Hospital IQR Program is lower than that currently used in the CJR Model (50 percent versus 80 percent). Additionally, hospitals are not held to reporting thresholds until mandatory reporting; therefore, we believe hospitals will have time to develop their data collection and reporting processes. Lastly, the proposed thresholds for the Hospital IQR Program are percentages based on the number of eligible inpatient procedures performed by a hospital; therefore, we do not expect any potential future transition of procedures to outpatient settings to impact a hospital's ability to meet reporting thresholds (87 FR 28559 through 28560).

We will continue to consider the appropriate pre- and post-operative matched survey response rate, as well as reporting thresholds. We will evaluate our proposed approach during voluntary reporting and consider adjustments based on feedback prior to mandatory reporting.

Comment: A few commenters requested CMS adjust the threshold of functional improvement of 20 and 22 points for KOOS, JR and HOOS, JR, respectively. A commenter requested CMS to adopt an average functional gain for HOOS, JR and KOOS, JR scores to better capture the extent of patient-reported post-operative improvement, stating that the proposed approach sets the quality bar too low and is not aligned with the literature.

Response: The substantial clinical benefit thresholds of a 20-point improvement on the KOOS, JR and a 22-point improvement on the HOOS, JR were selected based on our analyses of published literature and measure development data and with considerable stakeholder input to capture variation in patient outcomes among hospitals that reflect differences in care quality among hospitals. During measure development, these improvement thresholds were supported by the Technical Expert Panel and patients. For additional details, we refer readers to the Patient-Reported Outcomes (PROs) Following Elective Primary Total Hip and/or Total Knee Arthroplasty: Hospital-Level Performance Measure—Measure Methodology Report, available in the Hip and Knee Arthroplasty Patient-Reported Outcomes folder at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology*. We thank commenters for their recommendations and will consider this feedback during routine measure reevaluation.

After consideration of the public comments we received, we are finalizing the proposal as proposed.

h. Medicare Spending per Beneficiary (MSPB) Hospital Measure (NQF #2158) Beginning With the FY 2024 Payment Determination

For the purpose of continuing to assess hospitals' efficiency and resource use and to meet statutory requirements under section 1886(o)(2)(B)(ii) of the Act, in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28529 through 28532) we proposed the adoption of the re-evaluated version of the MSPB Hospital measure in the Hospital IQR Program. We plan to subsequently propose this for the Hospital VBP Program measure set under the Efficiency and Cost Reduction Domain sometime in the future.

(1) Background

In the FY 2012 IPPS/LTCH PPS final rule, we adopted a prior version of the MSPB Hospital measure in both the Hospital IQR Program (76 FR 51618) and the Hospital VBP Program (under the Efficiency and Cost Reduction Domain) (76 FR 51654). The original MSPB Hospital measure was subsequently removed from the Hospital IQR Program beginning with the FY 2020 payment determination, under the proposed removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program (83 FR 41559). The original version of the MSPB Hospital measure that was removed from the Hospital IQR Program was identical to the version that was concurrently, and continues to be used in the Hospital VBP Program. For more information on the removal of the original MSPB Hospital measure from the Hospital IQR Program, please see section VIII.A.4.b of the FY 2019 IPPS/LTCH PPS final rule (83 FR 41540 through 41544). We note that adding the updated MSPB Hospital measure with the refinements outlined previously to the Hospital IQR Program would follow the process associated with adopting new measures into the Hospital VBP Program, as specified under section 1889(o)(2)(C)(i) of the Act, and provide beneficiaries, hospitals, and other stakeholders with an opportunity to familiarize themselves with this updated version of the measure before we propose to replace the original MSPB Hospital measure in the Hospital VBP Program and calculate incentive payment adjustments for eligible hospitals. Given that the proposed updated MSPB Hospital measure is different from the original MSPB Hospital measure currently in use in the Hospital VBP Program, we believe that including the updated MSPB Hospital measure in the Hospital IQR Program will not incur costs that justified the removal of the original MSPB Hospital measure from the Hospital IQR Program in the FY 2019 IPPS/LTCH PPS final rule.

The original MSPB Hospital measure evaluated hospitals' efficiency relative to the efficiency of the national median hospital. Specifically, it assessed the cost to Medicare during an episode of care, which is composed of the period three days prior to an IPPS hospital admission through 30 days after discharge. The measure included Medicare Part A and B payments for services provided to a Medicare beneficiary during an episode. The costs included in this measure were payment standardized to remove sources of variation not directly related to hospitals' care decisions, such as geographic differences in practice expenses. The measure was risk adjusted to account for factors outside of hospitals' influence. The details of the original MSPB Hospital episode construction and measure calculation can be found in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51618 through 51627).

As part of our measure maintenance process (as required in section 8 of the Blueprint for the CMS Measures Management System Version 17.0 available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/Downloads/Blueprint.pdf*), we comprehensively re-evaluated the original MSPB Hospital measure in 2020, after it was removed from the Hospital IQR Program beginning with the FY 2020 payment determination period. The re-evaluation was informed by feedback received on this measure through prior public comment periods [944] and the literature. Specifically, regarding the all-cost nature of the measure, some stakeholders raised concerns that an all-cost approach may result in the measure capturing services that are not under the influence of the facilities or practitioners, while others noted that there is a need for all-cost/condition measures such as the MSPB Hospital

[944] We received feedback during the public comment periods of the FY 2012 and FY 2013 IPPS/LTCH PPS proposed rules. We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51619 through 51627) and the FY 2013 IPPS/LTCH PPS final rule (77 FR 53584 through 53592) for a summary of the comments received.

measure to promote broad incentives for care coordination. Regarding readmissions triggering new episodes, commenters noted that potentially high cost services occurring after an inpatient readmission are not fully captured under the current methodology that does not allow readmissions to initiate new episodes, and that the correlation between the MSPB Hospital measure and the Hospital Readmission Reduction Program's readmission measures is weak. Finally, some commenters suggested potential need for social risk factor (SRF) adjustments.[945] Relatedly, the literature has identified dual enrollment in Medicare and Medicaid as a potentially meaningful SRF to adjust for in the VBP programs.[946]

In the process of evaluating this feedback, the TEP reviewed four main topics to explore as potential changes to the specifications, including:

(1) Narrowing the all-cost approach through service inclusion and exclusion rules;

(2) Including SRFs in the measure's risk adjustment model;

(3) Allowing readmissions to trigger a new episode and include an indicator variable in the risk adjustment model for whether there was an inpatient stay in the 30 days prior to episode start date; and

(4) Changing the measure calculation from the sum of observed costs divided by the sum of expected costs to the mean of observed costs divided by expected costs.

After reviewing the analyses prepared by the measure development contractor and discussed during the February 2020 meeting, the TEP members provided feedback on each of the potential refinements during the process of re-evaluation. In brief, the TEP believed that the current all-cost methodology approach appropriately reflected the broad scope of a hospital's responsibility of care, and that this was needed to promote broad incentive for care coordination. TEP members highlighted the need for further testing around the impact of including SRF variables in the risk adjustment model. The TEP supported the refinement to allow readmissions to trigger new episodes, as they believed it was clinically appropriate to hold the hospital responsible for these costs. The members also agreed that the slight change to the measure calculation would reduce the impact of outliers on the final measure scores. The summary of the TEP's discussions of the MSBP Hospital measure is in the February 2020 Physician Cost Measures and Patient Relationship Codes TEP Summary Report.[947]

Through the re-evaluation process and the feedback that was provided by the TEP, we identified three refinements to the measure which will ensure a more comprehensive and consistent reflection of hospital performance by capturing more episodes and adjusting the measure calculation. First, we refined the measure to include all readmissions to trigger new episodes to account for episodes and costs that are currently not included in the measure but that could be within the hospital's reasonable influence. Second, we added an indicator variable in the risk adjustment model for whether there was an inpatient stay in the 30 days prior to episode start date. And third, we revised the measure to change one step in the measure calculation from the sum of observed costs divided by the sum of expected costs (ratio of sums) to the mean of observed costs divided by expected costs (mean of ratios). Based on our measure development contractor's recommendations, informed by the guidance from the TEP and the additional testing of the potential refinements suggested by the TEP, we believe that these changes will benefit the MSPB Hospital measure's relevance and statistical stability as well as ensure a more comprehensive and consistent reflection of hospital performance by capturing more episodes and adjusting the measure calculation. We describe these changes in a summary of the measure re-evaluation on the CMS QualityNet website posted in July 2020.[948]

We proposed the updated MSPB Hospital measure for the Hospital IQR Program that incorporates the three changes, which are detailed in the subsequent discussion. We note that aside from these three described refinements, all other aspects of the updated measure are the same as compared to the original measure.

[945] FY 2012 IPPS/LTCH PPS final rule (76 FR 51624 through 51625) and FY 2013 IPPS/LTCH PPS final rule (77 FR 53586 through 53587).

[948] Medicare Spending Per Beneficiary (MSPB) Measure Methodology. Available at: *https://qualitynet.cms.gov/inpatient/measures/mspb/methodology*.

(a) Update To Allow Readmissions To Trigger New Episodes

First, we refined the measure to allow readmissions to trigger new episodes to account for episodes and costs that are currently not included in the measure but that could be within the hospital's reasonable influence. It is clinically appropriate to hold the hospital responsible for the costs that are associated with the readmissions (that is, from 3 days prior to the readmission through 30 days post-discharge) to encourage care transitions and coordination in improving patient care and reducing unnecessary readmissions. Under the previously adopted measure methodology, the measure only included episodes that are triggered by initial hospital admissions, and inpatient readmissions occurring in the 30-day post-discharge period of an existing episode are excluded from initiating new episodes (76 FR 51620 through 51624). Allowing readmissions to trigger new episodes will increase the number of episodes for which a provider can be scored and align the incentives of the measure during readmissions, by encouraging hospitals to provide cost efficient care and improve care coordination not only during initial hospitalizations, but also during readmissions. This refinement will also ensure that the measure captures potentially high-cost services that would otherwise be excluded.

To illustrate this refinement, take for example a beneficiary who is admitted to an inpatient hospital for a spinal procedure with major complication or comorbidity (MS–DRG 028). This hospital admission triggers an episode (Episode 1), where the episode window starts three days prior to the admission date and ends 30 days after discharge. Episode 1 is attributed to the hospital where the inpatient stay occurs. Fifteen days after being discharged from the hospital, the beneficiary needs to receive additional inpatient hospital care for pneumonia (MS–DRG 194). This readmission occurs within the 30-day post-discharge period of Episode 1 (that is, the episode triggered by the initial hospitalization), and will trigger a new episode (Episode 2). Episode 2's window will start three days prior to this readmission and end 30 days after discharge. Episode 2 will be attributed to the hospital managing this readmission. Under the previous methodology, the readmission would not be calculated under the measure as a new episode because it occurred during the 30-day post-discharge period of Episode 1. However, under the proposed new methodology, the

readmission will trigger a new episode (Episode 2), and the episode will be included in the MSPB rate for the hospital managing the readmission. Episode 2 will include the costs in the post-discharge period of the readmission that would not be previously captured. Additionally, the costs where Episode 1 and Episode 2 overlap will be counted towards each episode. We note that the services being assigned to these episodes will only be counted once per episode. In other words, costs will not be double-counted. The revised measure calculation compares each hospital's observed episode costs to predicted episode costs among their peers for patients with the same observable characteristics, rather than to a pre-defined standard. By comparing hospitals to other hospitals that are all attributed in the same way, we expect this comparison to be fair. This also helps to maintain care coordination incentives of the MSPB Hospital measure.

(b) New Indicator Variable in the Risk Adjustment Model

Additionally, to account for the differences in expected costs for episodes that are triggered by readmissions, the updated methodology includes an indicator variable in the risk adjustment model showing whether there was an inpatient stay in the 30 days prior to episode start date. The previous methodology does not include this indicator variable, given that all episodes with an inpatient stay in the 30 days prior to the episode start date (that is, episodes that are based on a hospital readmission) are excluded from the measure calculation (76 FR 51620 through 51624). Continuing with the example used earlier, given that Episode 2 is based on a hospital readmission and there was an inpatient stay within 30 days prior to its episode start date, the risk adjustor indicator will be turned on for Episode 2. This means that when we calculate predicted spending for Episode 2, the risk adjustment model will take into account the fact that this episode was triggered by a readmission, and not an initial admission. This will ensure that the hospital is not unfairly penalized for providing care to the patient during the episode that could be more high cost due to its readmission status.

An illustration of this refinement that compares the previously adopted methodology where a readmission does not trigger a new episode and the proposed new methodology where a readmission does trigger a new episode, is available in Appendix B of the Measure Information Form (MIF) document available at: *https://qualitynet.cms.gov/files/5f1b3bd12bd4670021abc1b4?filename=MSPB_Hospital_MIF_2020.pdf*.

(c) Updated MSPB Amount Calculation Methodology

The third refinement changes one step in the measure calculation from the sum of observed costs divided by the sum of expected costs (ratio of sums) to the mean of observed costs divided by expected costs (mean of ratios). Under the previously adopted methodology, we calculated the MSPB Amount as follows: ((Sum of Observed Costs//# of Attributed Episodes)/(Sum of Expected Costs/# of Attributed Episodes)) * Average Observed Cost Nationally (76 FR 51626). The revised methodology calculates the MSPB Amount instead as follows: (Sum (Observed Costs/Expected Costs)/# of Attributed Episodes) * Average Observed Cost Nationally. Under this refinement, changing the measure calculation will: (a) Slightly increase measure reliability with minimal score changes; and (b) evenly weight attributed episodes in the final performance score, where previously good or poor performance on more expensive episodes will have more weight in the provider's final score. Specifically, by changing the measure calculation, the impact of outlier episodes on a measure score will be reduced (under the previously adopted calculation methodology, most costly episodes are weighted proportionately, which will make the measure slightly more sensitive to outlier episodes).

Additionally, the updated MSPB Hospital measure will further align with MSPB cost measures in other settings, including the MSPB Clinician measure in MIPS (84 FR 62974 through 62977), and the MSPB-Post Acute Care (PAC) measures, including MSPB–PAC for Inpatient Rehabilitation Facilities (81 FR 52087 through 52095), Long-Term Care Hospitals (81 FR 57199 through 57207), Skilled Nursing Facilities (81 FR 52014 through 52021), and Home Health Agencies (81 FR 76757 through 76765). The updated MSPB Hospital measure will also align with the acute inpatient medical condition episode-based cost measures in MIPS (83 FR 59767 through 59773, 84 FR 62962 through 62968. and 86 FR 65446 through 65453). We note that while the scope of care is different for clinician, hospital, and post-acute care level measures, we believe aligning these measures will help to ensure consistent care coordination incentives between the hospital, post-acute care facility, and the clinician(s) providing care in those settings.

(2) NQF Re-Endorsement

This original MSPB Hospital measure was first endorsed by the NQF in 2013 [949] and then again in 2017.[950] We presented the updated MSPB Hospital measure (NQF ID #2158) with these three refinements to NQF in the Fall 2020 cycle for measure re-endorsement. During the Fall 2020 NQF endorsement cycle, the updated MSPB Hospital measure was reviewed by the Scientific Methods Panel (SMP), Cost and Efficiency Standing Committee, and Consensus Standards Approval Committee (CSAC) during the 11-month endorsement process.[951] The updated measure passed on the reliability and validity criteria when reviewed by the SMP. The Cost and Efficiency Standing Committee reviewed each aspect of the updated measure in detail across three meetings. They also closely reviewed our testing around the impact of social risk factors. Specifically, we had tested whether the inclusion of sex, dual eligibility status, race/ethnicity, the AHRQ SES index, components of the AHRQ SES index, and the Area Deprivation Index could meaningfully be incorporated into the measure, so as not to penalize the hospital for the patients they treat, while also not setting a lower standard of care for hospitals with patients that have social risk factors. Results showed that the inclusion of these social risk factors had a limited and inconsistent effect on measure scores, and some of the variation that was captured by tested covariates was attributable to the hospital in which the episodes were initiated. Therefore, social risk factors continue to not be included in the measure's risk adjustment model. The CSAC approved the Standing Committee's endorsement recommendation unanimously, meaning that the updated MSPB Hospital measure (NQF #2158) was re-endorsed in June 2021 with the three refinements discussed.[952]

Continued

(3) Measure Applications Partnership Review

Following NQF re-endorsement, the updated measure was included in CMS's ''List of Measures Under Consideration for December 1, 2021.'' [953] The updated MSPB Hospital measure (MUC2021–131) underwent MAP review during the 2021–2022 cycle. On December 15, 2021, the MAP Hospital Workgroup supported the updated measure for rulemaking. On January 19, 2022, the MAP Coordinating Committee upheld the MAP Hospital Workgroup's preliminary recommendation to support the updated measure for rulemaking. More detail on the discussion is available in the MAP's final report.[954]

We proposed the updated MSPB Hospital measure (NQF #2158) for the Hospital IQR Program beginning with the FY 2024 payment determination and for subsequent years. This will allow us to assess hospitals' efficiency and resource use and meet statutory requirements for future adoption in the Hospital VBP Program.[955]

We invited public comment on this proposal.

Comment: Several commenters supported the proposed revisions to the MSPB Hospital measure, and the measure's adoption in the Hospital IQR Program in general. Some commenters expressed specific support for the refinement to allow readmissions to trigger a new episode, with a commenter stating that this refinement would encourage greater care coordination and shared accountability for avoidable readmissions. A commenter supported the refinement to add an indicator in the risk adjustment model for a previous inpatient stay within 30 days of the episode start date. A few commenters were also appreciative that the revised measure was NQF-endorsed prior to its proposal to be included in the Hospital IQR Program.

Response: We appreciate the commenters' support for inclusion of the revised MSPB Hospital measure in the Hospital IQR Program.

Comment: While some commenters supported the proposed revisions to the MSPB Hospital measure, a few commenters urged that we share information on the impact of proposed refinements on the measure. A few commenters requested that we provide example calculations under the revised and original measure versions to illustrate the potential effects of the proposed measure calculation changes and their impact on hospitals. A commenter noted that they would be interested to see how the revised version of the MSPB Hospital measure and the measure scores compare to those of the current version of the measure that is currently used in the Hospital VBP Program. The commenter further noted that they would be interested in how the refinement of the measure calculation would affect Hospital VBP Program scores and outcomes. Finally, a commenter urged that we closely monitor the results for both versions of the measure in the Hospital IQR and Hospital VBP Programs for any unintended consequences, especially during the period of time when the measure specifications are not aligned.

Response: We thank the commenters for their feedback. We note that as part of the NQF endorsement process, we provided statistics on the impacts of the proposed refinements to the measure. For example, Table 3.b of the testing appendix that was submitted to NQF contains an analysis of changes in MSPB Hospital measure scores between the current version of the measure and the version of the measure with proposed refinements implemented. In addition, Table 3.a includes testing results on the MSPB Hospital measure episodes stratified by whether an episode was triggered by an original hospitalization or a readmission. The submission materials that include these testing results are available at: *https://www.qualityforum.org/ProjectMeasures.aspx?projectID=86056&cycleNo=2&cycleYear=2020*. Additional information on the impact of the refinements and the TEP's discussion on each refinement is also available in the February 2020 Physician Cost Measures and Patient Relationship Codes TEP Summary Report available at: *https://www.cms.gov/files/zip/physician-cost-measures-and-patient-relationship-codes-pcmp.zip*. In order to evaluate the impact of the refinements on the Hospital VBP Program scores (that is, the Total Performance Scores that are used to adjust hospital payments) and outcomes, the measure would need to be implemented in the Hospital VBP Program, so that hospital performance on the measure can be aggregated with hospital performance on measures in other domains. We will continue monitoring the results for both versions of the measure in each program for any unintended consequences in the future.

Comment: Some commenters expressed concerns that for a period of time, there would be two slightly different versions of the measure used to assess hospital performance in the Hospital IQR and the Hospital VBP Programs, respectively. Commenters noted that this could make it difficult for hospitals to interpret performance results and could lead to additional burden on providers who would need to track two different reporting rates. Some commenters also expressed concerns about publicly reporting two versions of the MSPB Hospital measure, with a commenter requesting clarification on how these measures would be distinguished for the public. Some commenters recommended that we suppress one set of measures from public reporting, but maintain both results in downloadable files. To reduce any confusion caused by having two version of the measures being simultaneously reported publicly, a few commenters recommended only publicly reporting the current measure that is used in Hospital VBP Program, while waiting for at least one year before starting to publicly report the revised version of the measure. Another commenter recommended suppressing the version used in Hospital VBP Program if the revised version is used in the Hospital IQR Program and made publicly available.

Response: We thank the commenters for raising these concerns. As we have previously stated (87 FR 28529), a couple of goals of adopting the revised version of the measure in the Hospital IQR Program is to publicly report it for at least a year in order to meet requirements for potential future use in the Hospital VBP Program (as required by the Hospital VBP Program statute at section 1886(o) of the Act) as well as to provide interested parties with an opportunity to become familiar with the new version of the measure and provide feedback. Therefore, we do not want to delay the public reporting of the measure by one year, as suggested by the commenters. Additionally, by statute, there must be a cost measure in the Hospital VBP Program, which is the MSPB Hospital measure, so we are unable to remove the current version of the measure from Hospital VBP Program, as it is the only cost measure under the Efficiency and Cost Reduction

---

[954] National Quality Forum, (2022) Measure Applications Partnership 2021–2022 Considerations for Implementing Measures in Federal Programs: Clinician, Hospital, and Post-Acute Care Long-Term Care (*https://www.qualityforum.org/Publications/2022/03/MAP_2021-2022_Considerations_for_Implementing_Measures_Final_Report_-_Clinicians,_Hospitals,_and_PAC-LTC.aspx*).

[955] Sections 1886(o)(2)(B)(ii) and 1886(o)(2)(C)(i) of the Social Security Act (*https://www.ssa.gov/OP_Home/ssact/title18/1886.htm*).

domain and we believe this domain is an essential part of assessing value in addition to quality in the program. We will work to clearly identify the version of the measure when publicly reporting the revised MSPB Hospital measure and help address any potential confusion. The updated version of the measure will be posted with other Hospital IQR Program data on the Compare tool, which displays data in a consumer-focused way. Hospital VBP Program data will continue to be posted to *data.cms.gov* which presents the data as downloadable files and is targeted more towards data analysts and researchers rather than consumers. We also plan to publicly post educational materials and provide support via help desk to respond to stakeholder inquiries.

Comment: Several commenters did not support the measure and expressed concerns that allowing readmissions to trigger a new episode in the revised MSPB Hospital measure could lead to the same costs being attributed to hospitals twice and potentially result in a misleading portrayal of hospital performance. Another commenter expressed concern that a facility would be penalized twice related to readmissions, once through in the Hospital IQR Program based on their performance on the revised MSPB Hospital measure, and again through the Hospital Readmissions Reduction Program.

Response: We thank the commenters for raising these concerns. As previously stated in the proposed rule(87 FR 28530), the refinement allows readmissions to trigger new episodes which would result in some services being assigned to multiple episodes. These services, however, would only be counted once per episode, so the cost of these services would not be counted twice within the same episode. Additionally, the presence of an inpatient admission within 30 days before the start date of an episode based on a readmission is controlled for in the risk adjustment model to account for the additional complexity that readmissions may entail.[956] Further, the inclusion of episodes triggered by readmissions does not necessarily result in a worse measure score for the provider. Such episodes still use the observed over expected cost ratios, where it is possible for the observed cost to be lower than expected cost, if the hospital performed better on the episode than expected. Additionally, we do not agree with the commenter's statement that this refinement would result in hospitals being penalized twice. The revised MSPB Hospital measure, whether used in the Hospital IQR Program or Hospital VBP Program, and the condition- and procedure-specific readmission measures used in the Hospital Readmissions Reduction Program assess readmissions for different purposes (for example, assess hospitals' cost efficiency on readmissions and reduce avoidable readmissions, respectively) to help encourage hospitals to provide higher value care to their patients; thus, it is beneficial to have this alignment. Additionally, allowing readmissions to trigger new MSPB Hospital episodes does not impact a hospital's readmissions rates, given that it merely captures episodes that are based on existing readmissions so that those episodes can be used to assess hospital performance.

Comment: Several commenters did not support the measure, expressing concerns that the reliability and validity of the revised MSPB Hospital measure are low.

Response: We respectfully disagree with the comments that the reliability and validity of the revised MSPB Hospital measure are low. The NQF rated reliability as high when endorsing the measure. The average reliability score of hospitals with at least 25 episodes was 0.92,[957] [958] which far exceeds the standard generally considered as 'high' reliability. The NQF rated validity as moderate when endorsing the measure.[959] [960] As part of the NQF endorsement submission, we undertook three approaches to empirically examine the extent to which the revised MSPB Hospital measure captures what it intends to capture. Firstly, we examined the relationship between risk adjusted episode cost ratios and episodes with and without post-admission events that are known indicators of high cost or intensive care. Secondly, we examined the relationship between a hospital's average expected episode cost and average episode rates of several service use categories, to test whether the risk adjustment model can predict patient need for certain services. Thirdly, we examined the relationship between the revised MSPB Hospital measure and other cost-specific measures, efficiency-related measures, and measures in other Hospital VBP Program domains. For all three types of validity testing, we observed results that were in line with our expectations, demonstrating that the measure is functioning as intended.

Comment: Some commenters raised concerns about the risk adjustment approach for the revised MSPB Hospital measure. Specifically, a few commenters were concerned that the measure does not adjust for social risk factors. A commenter stated that social risk factors should not be considered supplementary to clinical risk factors in risk adjustment models. Additionally, a commenter did not believe that the risk adjustment model's fit with the unadjusted and adjusted R-squared (ranging from 0.11 to 0.67) was sufficiently addressed. Finally, a commenter requested for additional clarification on whether the revised MSPB Hospital measure takes into account patient acuity, impact of patient social drivers of health, supply chain impact, COVID–19 impacts, and short staffing as variables that could impact Medicare spending per beneficiary.

Response: We thank the commenters for their feedback. As noted previously, as part of the NQF endorsement submission we assessed the impact of social drivers of health on the measure, conducting testing based on NQF precedents, as well as supplemented with novel testing and in response to specific stakeholder feedback. The NQF's Scientific Methods Panel carefully reviewed the testing results on the impacts of social risk factors on the measure and our recommendation to continue not including them in the measure's risk adjustment model, and passed the measure on validity criterion. Additionally, as part of normal measure maintenance, we plan to continue to conduct testing and monitoring of the impact of social risk factors on the measure.

Regarding the commenter's note about the measure's low R-squared metrics that were included in the NQF endorsement submission materials, we would like to clarify that R-squared metrics, which are calculated to analyze the proportion of cost variation explained by the risk adjustment model,

[956] Medicare Spending Per Beneficiary (MSPB) Measure Methodology. Available at: *https://qualitynet.cms.gov/inpatient/measures/mspb/methodology.*

[957] The submission materials, including the testing results, are available at: *https://www.qualityforum.org/ProjectMeasures.aspx?projectID=86056&cycleNo=2&cycleYear=2020.*

[958] NQF's Cost and Efficiency Final Report with the summary of the Scientific Methods Panel's and Standing Committee's discussion is available here: *https://www.qualityforum.org/Publications/2021/09/Cost_and_Efficiency_Final_Report_-_Fall_2020_Cycle.aspx.*

[959] The submission materials, including the testing results, are available at: *https://www.qualityforum.org/ProjectMeasures.aspx?projectID=86056&cycleNo=2&cycleYear=2020.*

[960] NQF's Cost and Efficiency Final Report with the summary of the Scientific Methods Panel's and Standing Committee's discussion is available here: *https://www.qualityforum.org/Publications/2021/09/Cost_and_Efficiency_Final_Report_-_Fall_2020_Cycle.aspx.*

should be interpreted within the context of the measure construction, what it is intended to capture, and its use. A low R-squared is conceptually neither required nor expected for a ''valid'' measure, so some valid measures will have low R-squared metrics, while others will have high R-squared metrics. We also note that extensive testing demonstrates the validity of the risk adjustment models for the revised MSPB Hospital measure, with model discrimination and calibration results demonstrating predictive ability across the full range of episodes, from low to high spending risk. There was no evidence of excessive under- or over-estimation at the extremes of episode risk.

Given that the revised MSPB Hospital measure is calculated using administrative claims data, the measure is unable to directly account for supply chain impacts and short staffing. Regarding the commenter's note on the impact of COVID–19 on the measure, given that the measure uses a risk adjustment model that is run separately for each Major Diagnostic Category (MDC), and COVID–19 diagnoses are mapped to particular Diagnosis-Related Groups (DRGs), the measure would adjust for COVID–19 when risk adjusting by the DRG of the hospitalization. We also observed that COVID–19 hospitalizations are highly concentrated within MDC 4 (*Respiratory System*), which further improves comparability of COVID–19 episodes to non-COVID–19 episodes. We will continue monitoring the effects of COVID–19 on both the current and revised versions of the MSPB Hospital measure, however, because of the ways the measure already accounts for COVID–19 hospitalizations as described, we do not believe any additional adjustments for COVID–19 are needed at this time.

Finally, the measure's risk adjustment methodology accounts for patient case-mix and other factors by adjusting for patient age and severity of illness. Specifically, the risk adjustment methodology includes 12 age categorical variables, 79 hierarchical condition category (HCC) indicators, status indicator variables for whether the beneficiary qualifies for Medicare through disability or age and End-Stage Renal Disease (ESRD), indicators to account for disease interactions, an indicator of whether the beneficiary recently required long-term care, and the Medicare Severity-Diagnosis Related Group (MS–DRG) of the index hospitalization. We believe this provides adequate adjustment for patient acuity.

Comment: A few commenters raised concerns about a lack of alignment between the revised MSPB Hospital measure and relevant quality data, and stated that without this alignment or the incorporation of these data into the revised MSPB Hospital measure, it cannot accurately assess efficiency. The commenters believe that efficiency of care must be a measure of cost of care associated with a specified level of quality of care. They also believe measures should be grounded in current best evidence, should evaluate clinical outcomes concurrently with resource use, and should be interpretable based on outcomes achieved with resources expended. The commenter added that to fully interpret cost measure data, relevant quality data must also be available. The inclusion of cost measures alone could discourage the provision of needed care or innovative treatments to reduce costs. As a result, the commenter encouraged that we investigate alternative frameworks for efficiency measurement to properly align the evaluation of cost and quality.

Response: We thank the commenters for their feedback. For the purposes of the Hospital IQR Program, we determine the quality of care provided by hospitals to their patients by using a variety of measures that include both cost and quality measures, thus ensuring alignment between cost and quality. Specifically, such measures include payment measures (including four condition-specific measures and the revised MSPB Hospital measure being proposed), patient safety, morality outcome, patient experience of care survey, and others. Similarly, in the Hospital VBP Program, the revised MSPB Hospital measure would be used in alignment with several quality measures that span Clinical Outcomes, Person and Community Engagement, and Safety measure domains, so together these measures would facilitate profiling hospital value, from both the cost and quality perspectives. In addition, to ensure that hospitals are able to understand their performance on the revised MSPB Hospital measure and identify areas for improvement, eligible hospitals will receive Hospital-Specific Reports (HSRs) that contain different breakdowns of the hospital's performance on the measure. Providing these files to hospitals would also allow them to provide informed feedback on the measure to the measure developer and CMS.

We also add that the measure itself safeguards against potential care stinting by including the costs of consequences of care. For example, if the attributed hospital attempts to reduce costs by discharging a patient too early, it could result in higher post-acute care costs, re-hospitalization for complications, or emergency department visits soon after the discharge, which would be captured by the measure, resulting in worse performance. Testing submitted as part of the NQF endorsement cycle demonstrated that the measure accurately reflects high-cost adverse outcomes, confirming that the measure can appropriately distinguish that better providers tend to have fewer downstream re-hospitalizations and post-acute care use.[961] Thus, by being able to differentiate between good and poor performance, the measure is able to accurately assess a hospital's efficiency as compared to other hospitals.

Finally, to address a commenter's feedback that the measure should be grounded in current best evidence and practices, we note that prior to being proposed in the FY 2023 IPPS/LTCH PPS proposed rule, the NQF and MAP reviewed the revised MSPB Hospital measure against the measure evaluation criteria, which include importance to measure and report, scientific acceptability of measure properties, feasibility, usability and use, and related/competing measures, to ensure the measure's suitability, and subsequently recommended the measure for endorsement and implementation in the Hospital IQR Program.

Comment: A commenter recommended that CMS delay adopting the revised MSPB Hospital measure in the Hospital IQR Program until the FY 2025 payment determination due the impact that COVID–19 could have on measure calculations.

Response: We appreciate the commenter's concern that the impact of COVID–19 on the healthcare system has been profound. We intend to closely monitor the effect of COVID–19 on the revised MSPB Hospital measure and the Hospital IQR Program. As noted previously, by construction the revised MSPB Hospital measure adjusts for COVID–19 when risk adjusting by the DRG of the hospitalization. Additionally, for the MSPB Hospital measure currently used in the Hospital VBP Program, our analyses using data from the first three quarters of 2021 showed that admission volumes returned to near pre-COVID–19 levels, while cost ratios were not significantly different for episodes with and without COVID–19. Based on the findings

[961] The submission materials, including the testing results, are available at: *https://www.qualityforum.org/ProjectMeasures.aspx?projectID=86056&cycleNo=2&cycleYear=2020.*

indicating that COVID–19 had a small impact on the measure in 2021, we did not propose to suppress the measure for the purposes of Hospital VBP Program scoring. We disagree about delaying the implementation of the measure in the Hospital IQR Program as this would prevent stakeholders from familiarizing themselves with the revised version of the measure and would further delay the potential future implementation of the measure in the Hospital VBP Program.

After consideration of the public comments we received, we are finalizing our proposal as proposed.

i. Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) Measure (NQF#1550) Beginning With the FY 2024 Payment Determination

(1) Background

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53516 through 53521) and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50062 through 50063), we adopted the Hospital-Level RSCR Following Elective Primary THA/TKA (hereinafter referred to as the THA/TKA Complication measure) for use in both the Hospital IQR and Hospital VBP Programs, respectively. We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49674) for information on the previously adopted measure specifications. Although the measure is still included in the Hospital VBP Program and measure results are still publicly reported, in the FY 2018 IPPS/LTCH PPS final rule (83 FR 41150) we finalized the removal of the measure from the Hospital IQR Program as part of agency-wide efforts to reduce provider burden since the measure was also being reported under the Hospital VBP Program. We, however, believe it is important to assess the quality of care provided to Medicare beneficiaries who undergo one or both of these procedures. In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28532 through 28534), we proposed to adopt the re-evaluated form of the THA/TKA Complication measure with an expanded measure outcome. Since the measure was removed from the Hospital IQR Program, it has been revised to include 26 additional mechanical complication ICD–10 codes which were identified during measure maintenance. The statutory requirements of the Hospital VBP Program are set forth in section 1886(o) of the Social Security Act. As noted at 42 CFR 412.164(b) measures must be publicly reported for one year prior to the beginning of the performance period in the Hospital VBP Program. Therefore, we proposed to adopt this measure into the Hospital IQR Program with the intention to eventually propose the updated measure into the Hospital VBP Program after the required year of public reporting in Hospital IQR Program.

THA and TKA are commonly performed procedures for the Medicare population that improve quality of life. From 2016 to 2019, there were 1,012,190 THA and TKA procedures performed on Medicare fee-for-service (FFS) patients 65 years and older. [962] The number of procedures being performed has steadily increased over the last decade and is projected to reach over four million by 2030. [963] [964] While these procedures can dramatically improve a person's quality of life, they are costly. Based on projections of the annual demand for THA and TKA procedures, researchers estimate that Medicare expenditures on Total Joint Arthroplasty (TJA) could climb from $3.95 billion and $7.42 billion for both primary THA and TKA, respectively, in 2005, [965] to $50 billion by 2030. [966] Complications following elective THA and TKA procedures are rare, but the results can be devastating. Evidence shows that periprosthetic joint infection rates following THA and TKA range from 0.7 percent to 1.6 percent depending upon the population. [967] [968] Reported 30- and 90-day death rates following THA range from 0.4 percent to 0.7 percent. [969] Rates for pulmonary embolism following THA range from 0.5 percent to 1.22 percent [970] and range from 0.5 percent to 0.9 percent [971] following TKA. Rates for wound infection in Medicare population-based studies vary between 0.21 percent and 1.0 percent. [972] Rates for sepsis/septicemia range from 0.09 percent during the index admission to 0.3 percent 90 days following discharge for primary TKA. Rates for bleeding and hematoma following TKA range from 0.94 percent to 1.7 percent.[973]

The updated THA/TKA Complication measure was listed in the publicly available document entitled ''List of Measures Under Consideration for December 1, 2021'' [974] (MUC List) with identification number MUC2021–118. The MAP reviewed the updated measure and voted to conditionally support the measure for rulemaking for use in the Hospital IQR Program pending NQF review and endorsement of the measure update. The MAP Rural Health Advisory Group reviewed this updated measure on December 8, 2021 and voted to majority support the measure given that there would be no undue consequences for rural hospitals.[975]

The NQF re-endorsed the original measure in July of 2021; and we intend to submit the updated measure to NQF for endorsement in Fall 2024.[976] We note that section 1866(b)(3)(B)(viii)(IX)(aa) of the Act requires that any measure specified by the Secretary must have been endorsed by the entity with a contract under section 1890(a) of the Act (the NQF is the entity that currently holds this

contract). Under section 1886(b)(3)(B)(viii)(IX)(bb) of the Act, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. We reviewed NQF-endorsed measures and were unable to identify any other NQF-endorsed measures on this topic, and, therefore, we believe the exception in section 1886(b)(3)(B)(viii)(IX)(bb) of the Act applies.

(2) Overview of Measure

The original THA/TKA Complication measure (NQF # 1550) was previously removed from the Hospital IQR Program, but is currently implemented in the Hospital VBP Program (79 FR 50062 through 50063). Adopting the newly refined version of this measure into the Hospital IQR Program will expand the measure outcome to include 26 additional mechanical complication ICD–10 codes. We note that aside from the additional ICD–10 codes, measure specifications align with the version of the measure currently in use in the Hospital VBP Program.

(3) Data Sources

The updated THA/TKA Complication measure uses index admission diagnoses and in-hospital comorbidity data from Medicare Part A claims. Additional comorbidities prior to the index admission are assessed using Part A inpatient, outpatient, and Part B office visit Medicare claims in the 12 months prior to index (initial) admission. Enrollment status is obtained from the Medicare Enrollment Database which contains beneficiary demographic, benefit/coverage, and vital status information. We proposed to use claims data with admission dates beginning from April 1, 2019–March 31, 2022 (excluding data from the period covered by the ECE granted by CMS related to the COVID–19 Public Health Emergency (PHE)) that is associated with the FY 2024 payment determination. As a claims-based measure, hospitals will not be required to submit additional data for calculating the measure.

(4) Outcome

The outcome for the updated THA/TKA Complication measure is any complication occurring during the index admission (not coded as present on admission (POA)) to 90 days post-date of the index admission. Complications are counted in the measure only if they occur during the index hospital admission or during a readmission. The complication outcome is a dichotomous (yes/no) outcome. If a patient experiences one or more of these complications in the applicable time period, the complication outcome for that patient is counted in the measure as a ''yes.''

The updated measure includes the following 26 additional clinically vetted mechanical complication ICD–10 codes:

- M96.65 Fracture of pelvis following insertion of orthopedic implant, joint prosthesis, or bone plate;
- M96.661 Fracture of femur following insertion of orthopedic implant, joint prosthesis, or bone plate, right leg;
- M96.662 Fracture of femur following insertion of orthopedic implant, joint prosthesis, or bone plate, left leg;
- M96.669 Fracture of femur following insertion of orthopedic implant, joint prosthesis, or bone plate, unspecified leg;
- M96.671 Fracture of tibia or fibula following insertion of orthopedic implant, joint prosthesis, or bone plate, right leg;
- M96.672 Fracture of tibia or fibula following insertion of orthopedic implant, joint prosthesis, or bone plate, left leg;
- M96.679 Fracture of tibia or fibula following insertion of orthopedic implant, joint prosthesis, or bone plate, unspecified leg;
- M97.01XA Periprosthetic fracture around internal prosthetic right hip joint, initial encounter;
- M97.01XD Periprosthetic fracture around internal prosthetic right hip joint, subsequent encounter;
- M97.01XS Periprosthetic fracture around internal prosthetic right hip joint, sequela;
- M97.02XA Periprosthetic fracture around internal prosthetic left hip joint, initial encounter;
- M97.02XD Periprosthetic fracture around internal prosthetic left hip joint, subsequent encounter;
- M97.02XS Periprosthetic fracture around internal prosthetic left hip joint, sequela;
- M97.11XA Periprosthetic fracture around internal prosthetic right knee joint, initial encounter;
- M97.11XD Periprosthetic fracture around internal prosthetic right knee joint, subsequent encounter;
- M97.11XS Periprosthetic fracture around internal prosthetic right knee joint, sequela;
- M97.12XA Periprosthetic fracture around internal prosthetic left knee joint, initial encounter;
- M97.12XD Periprosthetic fracture around internal prosthetic left knee joint, subsequent encounter;
- M97.12XS Periprosthetic fracture around internal prosthetic left knee joint, sequela;
- M97.8XXA Periprosthetic fracture around other internal prosthetic joint, initial encounter;
- M97.8XXD Periprosthetic fracture around other internal prosthetic joint, subsequent encounter;
- M97.8XXS Periprosthetic fracture around other internal prosthetic joint, sequela;
- M97.9XXA Periprosthetic fracture around unspecified internal prosthetic joint, initial encounter;
- M97.9XXD Periprosthetic fracture around unspecified internal prosthetic joint, subsequent encounter;
- M97.9XXS Periprosthetic fracture around unspecified internal prosthetic joint, sequela; and
- M96.69 Fracture of other bone following insertion of orthopedic implant, joint prosthesis, or bone plate.

During routine measure maintenance, our analyses showed the addition of these clinically relevant codes contributed to an increase in the THA/TKA national observed complication rate. Findings demonstrated an increase of approximately 0.5 percent (from 2.42 percent to 2.93 percent) in the THA/TKA national observed complication rate when evaluated for the FY 2021 performance period (April 1, 2016 through March 30, 2019). These findings suggest that the expanded outcome will allow the updated THA/TKA Complication measure to capture a more complete outcome.

The updated THA/TKA Complication measure as with the version of measure currently implemented in the Hospital VBP Program (86 FR 45279 through 45281), excludes admissions with a principal or secondary COVID–19 diagnosis, POA, from the measure outcome, as outcomes for patients with COVID–19 who are receiving THA/TKA surgery may differ from patients without COVID–19. The four medical complication outcomes that this applies to are:

(1) Acute myocardial infarction (AMI) during a subsequent inpatient admission that occurs within seven days from the start of the index admission; (2) pneumonia or other acute respiratory complication during a subsequent inpatient admission that occurs within seven days from the start of the index admission, (3) sepsis/septicemia/shock during a subsequent inpatient

admission that occurs within seven days from the start of the index admission, and (4) pulmonary embolism during the index admission or a subsequent inpatient admission within 30 days from the start of the index admission. In these cases, readmissions with a principal or secondary diagnosis POA of COVID–19 (U07.1) will be removed from the numerator.

We refer readers to the Hip and Knee Arthroplasty Complications (ZIP) folder on the *CMS.gov* Measure Methodology website at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology* for measure specification details on this newly restructured measure.

(5) Cohort

The updated THA/TKA Complication measure continues to include Medicare FFS beneficiaries, aged 65 years or older, having a qualifying elective primary THA or TKA procedure during the index admission. Beneficiaries must be enrolled in Medicare FFS Part A and Part B for the 12 months prior to the date of admission and enrolled in Part A during the index admission. We also note that the updated THA/TKA Complication measure excludes admissions with a principal or secondary COVID–19 diagnosis, POA, from the measure cohort.

(6) Risk Adjustment

The updated THA/TKA Complication measure is risk adjusted using clinically relevant risk variables identified from inpatient and outpatient claims in the 12 months prior to the procedure. We will also include a covariate adjustment for patient history of COVID–19 in the 12 months prior to the admission.

(7) Measure Calculation

The updated THA/TKA Complication measure will be calculated using a hospital risk-standardized complication rate by producing a ratio of the number of ''predicted'' complications (that is, the adjusted number of complications at a specific hospital based on its patient population) to the number of ''expected'' complications (that is, the number of complications if an average quality hospital treated the same patients) for each hospital and then multiplying the ratio by the national observed complication rate. For each hospital, the numerator of the ratio is the number of complications within the specified time period (up to 90 days) predicted on the basis of the hospital's performance with its observed case mix, and the denominator is the number of complications expected based on the nation's performance with that hospital's case mix. This approach is analogous to a ratio of ''observed'' to ''expected'' used in other types of statistical analyses. It conceptually allows for a comparison of a particular hospital's performance given its case mix to an average hospital's performance with the same case mix.

We proposed to adopt the newly restructured version of the THA/TKA Complication measure beginning with admission dates from April 1, 2019–March 31, 2022 (excluding data from the period covered by the ECE granted by CMS related to the COVID–19 Public Health Emergency (PHE)) affecting the FY 2024 payment determination.

(8) Public Reporting

We will also publicly report the updated THA/TKA Complication measure on the Compare tool hosted by HHS, currently available at: *https://www.medicare.gov/care-compare*, or its successor website, beginning in 2023.

We invited public comment on this proposal.

Comment: Many commenters expressed their support for the proposed adoption into the Hospital IQR Program of the updated THA/TKA Complication measure beginning with the FY 2024 payment determination. A commenter noted that they believe the additional complications codes are clinically appropriate to be paired with arthroplasty and will improve the measure's accuracy. A few commenters noted that they believe measuring and reporting risk-standardized complications rates will inform health care providers about opportunities to improve care, strengthen incentives for quality improvement, and promote improvements in the quality of care received by patients and the outcomes they experience. A few commenters reiterated that they believe this measure will provide patients with beneficial information that could guide their choices regarding where they seek care for these procedures, increase transparency for consumers and that it has the potential to lower health care costs by decreasing the likelihood of costly readmissions associated with these complications.

Response: We thank the commenters for their support.

Comment: A few commenters did not support the proposed adoption of the updated THA/TKA Complication measure. A commenter expressed concern that, because they believe that the majority of these procedures take place in outpatient settings, hospitals subject to this measure will be caring for the sickest patients and therefore subject to improper penalties. A commenter did not support the proposed adoption of the updated the THA/TKA Complication measure because they did not believe the updated measure accurately reflects hospital performance. Specifically, they expressed concern that the ICD–10 codes proposed to be included reflect falls and fractures since THA/TKA patients are at a greater risk for falls regardless of the level of care provided at the hospital. A commenter recommended that using the ratio of observed to expected would be an easier concept to understand than the currently used ratio of predicted to expected.

Response: We thank the commenters for their feedback and acknowledge their concerns. We are monitoring the shifts of THA/TKA from the inpatient to outpatient setting as well as the potential impacts on this inpatient only measure. The proposed updated THA/TKA Complication measure is case mix adjusted for patient comorbidities and is a relative performance measure for hospitals performing these elective THA/TKA procedures.[977] As such, we believe that this measure accurately reflects hospital performance even if patients receiving these procedures in the inpatient setting tend to be sicker, on average, than those treated in an outpatient setting.

We believe this updated measure provides an accurate representation of hospital performance. As noted in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28532 through 28534), during routine measure maintenance, our internal analyses showed the addition of these clinically relevant codes contributed to an increase in the THA/TKA national observed complication rate. Findings demonstrated an increase of approximately 0.5 percent (from 2.42 percent to 2.93 percent) in the THA/TKA national observed complication rate when evaluated for the FY 2021 performance period (April 1, 2016 through March 30, 2019). These findings suggest that the expanded outcome will allow the updated THA/TKA Complication measure to capture a more complete assessment of complications. We note while conducting these analyses, orthopedic surgeons and clinical coding experts vetted the additional 26 mechanical complication ICD–10 codes and agreed they should be included. Thus, these additions are

[977] For more detailed measure specifications, we refer readers to the ''2022 Procedure-Specific Complication Measure Updates and Specifications: THA/TKA'' at the *CMS.gov* QualityNet website at: *https://qualitynet.cms.gov/inpatient/measures/complication/methodology*.

directly responsive to input from stakeholders, including hospitals.

Lastly, we thank the commenter for their recommendation related to the reporting ratio. We reiterate that, as proposed in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28532 through 28534), the proposed updated THA/TKA Complication measure is calculated using a hospital risk-standardized complication rate by producing a ratio of the number of ''predicted'' complications (that is, the adjusted number of complications at a specific hospital based on its patient population) to the number of ''expected'' complications (that is, the number of complications if an average quality hospital treated the same patients) for each hospital and then multiplying the ratio by the national observed complication rate. For each hospital, the numerator of the ratio is the number of complications within the specified time period (up to 90 days) predicted on the basis of the hospital's performance with its observed case mix, and the denominator is the number of complications expected based on the nation's performance with that hospital's case mix.[978] This approach is analogous to a ratio of ''observed'' to ''expected'' used in other types of statistical analyses, and it conceptually allows for a comparison of a particular hospital's performance given its case mix to an average hospital's performance with the same case mix. Further details on the predicted/expected calculation approach are provided within the THA/TKA Complication Measure Methodology Report and other publicly available resources on our QualityNet website, available at: *https://qualitynet.cms.gov/inpatient/measures/complication/methodology*.

Comment: A few commenters expressed concern that the required data collection will be burdensome to hospitals.

Response: We respectfully disagree that the proposed updated THA/TKA Complication measure with the additional 26 complication codes will cause significant data collection burden. Hospitals will not be required to submit additional data for calculating the measure as it is a claims-based measure. As stated in the in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28532 through 28534), the proposed updated THA/TKA Complication measure uses index admission diagnoses and in-hospital comorbidity data from Medicare Part A claims. Additional comorbidities prior to the index admission are assessed using Part A inpatient, outpatient, and Part B office visit Medicare claims in the 12 months prior to index (initial) admission. Enrollment status is obtained from the Medicare Enrollment Database which contains beneficiary demographic, benefit/coverage, and vital status information.[979]

Comment: A few commenters expressed concern that the proposed updates to the THA/TKA Complication measure would result in two similar, but not identical, measures in the Hospital IQR Program and the Hospital VBP Program. The commenters believe that public reporting of both measures, which could yield different results, has the potential to be misleading or confusing for providers and patients. A commenter requested clarification on how the versions of the measure will be distinguished in public reporting and which version of the measure will be in use for the Overall Hospital Quality Star Ratings.

Response: We acknowledge the commenters' concerns that two slightly different versions of the measure would be in use in the Hospital IQR and Hospital VBP Programs simultaneously. However, the statutory requirements of the Hospital VBP Program, as set forth in section 1886(o) of the Act and at 42 CFR 412.164(b), state that measures must be publicly reported for one year prior to the beginning of the performance period in the Hospital VBP Program. Therefore, we proposed to adopt this updated version of the THA/TKA Complication measure into the Hospital IQR Program with the intention to consider proposing the updated measure for use in the Hospital VBP Program in the future. As proposed in the FY 2023 IPPS/LTCH PPS proposed rule, the proposed updated THA/TKA Complication measure would be publicly reported on the Compare tool hosted by HHS, currently available at: *https://www.medicare.gov/care-compare*, or its successor website, beginning in 2023 (87 FR 28532 through 28534). Overall Hospital Quality Star Ratings utilize the publicly reported version of the measure on the Compare tool, as finalized in the CY 2021 OPPS/ASC final rule (85 FR 86202). That is, those ratings would use the proposed updated THA/TKA Complication measure with the additional 26 complication codes once it is publicly reported beginning in 2023. Results for the THA/TKA Complication measure currently implemented in the Hospital VBP Program will continue to be available according to program policies (for example, on the Provider Data Catalog) as noted in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50062 through 50063).

Comment: A commenter expressed interest in obtaining detailed information about all relevant complications, including the 26 newly added complications, so they can prepare for potential implementation of the new measure.

Response: We thank the commenter for their interest in obtaining the detailed information on the newly added mechanical complication ICD–10 codes. We refer the commenter to the measure specifications as proposed in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28532 through 28534) and ICD–10 resources provided publicly here: *https://www.cms.gov/medicare/icd-10/2023-icd-10-pcs*. The annual Procedure-Specific Complication Measure Updates and Specifications Report will be posted during the 2023 spring preview period and will contain any further details related to the added codes. This is expected to be available on our QualityNet website at: *https://qualitynet.cms.gov/inpatient/measures/complication/methodology*.

Comment: A commenter was concerned by the lack of inclusion of social risk factors in the measure.

Response: We appreciate commenter's feedback. We are committed to measuring and improving health equity and addressing social risk factors in quality measurement. During the last NQF endorsement maintenance submission for the original THA/TKA Complication measure prior to 2022, comprehensive testing was completed which included an assessment of the impact of social risk as captured by dual eligibility and the AHRQ SES Index.[980] The AHRQ SES Index score considers aspects of socioeconomic status and is computed using U.S. census data, and considers factors including median household income, percentage of persons below the Federal poverty line, unemployment, education, property value, and percentage of persons in crowded households at the 9-digit zip code level.[981] We found wide variation

[978] For more detailed measure specifications, we refer readers to the ''2022 Procedure-Specific Complication Measure Updates and Specifications: THA/TKA'' at the *CMS.gov* QualityNet website at: *https://qualitynet.cms.gov/inpatient/measures/complication/methodology*.

[979] For more detailed measure specifications, we refer readers to the ''2022 Procedure-Specific Complication Measure Updates and Specifications: THA/TKA'' at the *CMS.gov* QualityNet website at: *https://qualitynet.cms.gov/inpatient/measures/complication/methodology*.

[981] Bonito A, Bann C, Eicheldinger C, Carpenter L. Creation of new race-ethnicity codes and socioeconomic status (SES) indicators for Medicare beneficiaries. Final Report, Sub-Task. 2008;2.

in the prevalence of the two social risk factors we examined, with a large proportion of hospitals treating zero patients with these risk factors. We also found that both had some association with complication risk. However, adjustment for these factors did not have a material impact on hospital RSCRs.[982] Our decisions about which risk factors should be included in each measure's risk adjustment model are based on whether inclusion of such variables is likely to make the measures more successful at illuminating quality differences and motivating quality improvement. Given these empiric findings and program considerations, we chose not to include these two social risk factors in the final risk model. In presenting these results and interpretation, the NQF re-endorsed the original measure (NQF #1550) in June of 2021 without adjustment for patient-level social risk factors.[983] We acknowledge the importance of balancing these competing considerations and we plan to continue to reevaluate this risk adjustment model and available risk factors on an ongoing basis, with the goal of producing the most accurate and fair risk adjustment models for assessing provider performance. Further details related to social risk testing for this measure can be found from downloading the measure specifications from NQF's Surgery Fall Cycle 2020 project here: *https://nqfappservicesstorage.blob.core.windows.net/proddocs/22/Fall/2020/measures/1550/shared/1550.zip*.

Comment: A few commenters encouraged CMS to seek NQF endorsement of this measure.

Response: We thank the commenters for their feedback. The NQF re-endorsed the original measure (NQF #1550) in June of 2021;[984] and we intend to submit the updated measure to the NQF for endorsement maintenance in Fall 2024.

After consideration of the public comments we received, we are finalizing our proposal as proposed.

6. Refinements to Current Measures in the Hospital IQR Program Measure Set

In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28534), we proposed refinements to two measures currently in the Hospital IQR Program measure set—Hospital-Level, Risk-Standardized Payment Associated with an Episode-of-Care for Primary Elective THA and/or TKA and Excess Days in Acute Care (EDAC) After Hospitalization for Acute Myocardial Infarction (AMI)—beginning with the FY 2024 payment determination. We provide more details on our proposals in the subsequent discussion.

a. Refinement of the Hospital-Level, Risk-Standardized Payment Associated With an Episode of Care for Primary Elective Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) Measure (NQF #3474) Beginning With the FY 2024 Payment Determination and for Subsequent Years

(1) Background

In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28534 through 28536), we proposed a refinement to the Hospital-Level, Risk-Standardized Payment Associated with an Episode of Care for Primary Elective THA and/or TKA Measure (NQF #3474) (hereinafter referred to as the THA/TKA Payment measure), which expands the measure outcome to include 26 clinically vetted mechanism complication ICD–10 codes, for the FY 2024 payment determination and subsequent years. For the purposes of describing the refinement of this measure, we note that the ''outcome'' is defined as hospital-level, risk-standardized payment associated with a 90-day episode-of-care for primary elective THA and/or TKA.

The THA/TKA Payment measure was first adopted into the Hospital IQR Program in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49680) for the FY 2018 payment determination and subsequent years. Prior to adopting the measure, the MAP conditionally supported it on December 10, 2014, pending a timely review by the NQF Cost and Resource Use Standing Committee.[985] The MAP recommended harmonizing and determining the most parsimonious approach to measure the costs of hip and knee replacements to minimize the burden and confusion of competing methodologies.[986] The original measure was initially NQF endorsed in June 2019 and will be submitted for the first re-endorsement in Fall 2022.[987]

The proposed refined measure was included on a publicly available document entitled ''List of Measures Under Consideration for December 1, 2021'' [988] (MUC List) with identification number MUC2021–120. The refined measure was reviewed by the MAP and conditionally supported for rulemaking pending NQF review and endorsement of the measure update.[989]

As noted earlier we intend to submit the revised measure for the first NQF re-endorsement in the Fall of 2022. We note that section 1866(b)(3)(B)(viii)(IX)(aa) of the Act requires that any measure specified by the Secretary must have been endorsed by the entity with a contract under section 1890(a) of the Act (the NQF is the entity that currently holds this contract). Under section 1886(b)(3)(B)(viii)(IX)(bb) of the Act, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. We reviewed NQF-endorsed measures and were unable to identify any other NQF-endorsed measures on this topic, and, therefore, we believe the exception in section 1886(b)(3)(B)(viii)(IX)(bb) of the Act applies.

(2) Overview of Measure

The proposed measure refinement will expand the measure outcome to include 26 mechanical complication ICD–10 codes to the outcome. This refinement is in alignment with the refinement of the updated THA/TKA Complication measure in section IX.E.5.i. of this final rule. The data sources, cohort, inclusion and exclusion criteria, and risk adjustment remain substantively unchanged. We proposed this measure refinement for the FY 2024 payment determination and subsequent years, reflecting data collected beginning from April 1, 2019 through March 31, 2022 admissions (excluding data from the period covered by the ECE

granted by CMS related to the COVID–19 PHE).

(3) Data Sources

We did not propose any changes to the data sources for the THA/TKA Payment measure. The measure uses Part A and Part B Medicare administrative claims data that contain payments for Medicare FFS beneficiaries who were hospitalized and underwent an elective THA/TKA. This measure uses three years of data.

(4) Outcome

The primary outcome of this measure is the hospital-level risk-standardized payment for an elective primary THA/TKA episode-of-care. This measure captures payments for Medicare FFS patients across multiple care settings, services, and supplies (inpatient, outpatient, skilled nursing facility, home health, hospice, physician/clinical laboratory/ambulance services, and durable medical equipment, prosthetics/orthotics, and supplies). This measure includes patient copayments as well as payments from coinsurance.

This measure uses the index admission for an elective primary THA/TKA to 90 days postadmission. The measurement includes all payments for the first 30 days after admission and only certain payments based on a pre-defined set of care settings and services for days 31–90. Payments in the 31–90-day window include readmissions for complications as defined in the THA/TKA Complication measure (Mechanical Complications and Periprosthetic Joint Infection/Wound Infection and Other Wound Complications) (see section IX.E.5.i. of this final rule for discussion on this measure), therefore, the expansion of the definition of mechanical complications impacts this measure as well.

As we did not propose any changes besides the addition of the 26 mechanical complication codes, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49674) for information on the previously adopted measure specifications. We refer readers to Hip and Knee Arthroplasty Payment (ZIP) folder on the CMS.gov Methodology website at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology* for updated specifications on this measure.

The proposed additional 26 mechanical complication ICD–10 codes are the following:

- M96.65 Fracture of pelvis following insertion of orthopedic implant, joint prosthesis, or bone plate;
- M96.661 Fracture of femur following insertion of orthopedic implant, joint prosthesis, or bone plate, right leg;
- M96.662 Fracture of femur following insertion of orthopedic implant, joint prosthesis, or bone plate, left leg;
- M96.669 Fracture of femur following insertion of orthopedic implant, joint prosthesis, or bone plate, unspecified leg;
- M96.671 Fracture of tibia or fibula following insertion of orthopedic implant, joint prosthesis, or bone plate, right leg;
- M96.672 Fracture of tibia or fibula following insertion of orthopedic implant, joint prosthesis, or bone plate, left leg;
- M96.679 Fracture of tibia or fibula following insertion of orthopedic implant, joint prosthesis, or bone plate, unspecified leg;
- M97.01XA Periprosthetic fracture around internal prosthetic right hip joint, initial encounter;
- M97.01XD Periprosthetic fracture around internal prosthetic right hip joint, subsequent encounter;
- M97.01XS Periprosthetic fracture around internal prosthetic right hip joint, sequela;
- M97.02XA Periprosthetic fracture around internal prosthetic left hip joint, initial encounter;
- M97.02XD Periprosthetic fracture around internal prosthetic left hip joint, subsequent encounter;
- M97.02XS Periprosthetic fracture around internal prosthetic left hip joint, sequela;
- M97.11XA Periprosthetic fracture around internal prosthetic right knee joint, initial encounter;
- M97.11XD Periprosthetic fracture around internal prosthetic right knee joint, subsequent encounter;
- M97.11XS Periprosthetic fracture around internal prosthetic right knee joint, sequela;
- M97.12XA Periprosthetic fracture around internal prosthetic left knee joint, initial encounter;
- M97.12XD Periprosthetic fracture around internal prosthetic left knee joint, subsequent encounter;
- M97.12XS Periprosthetic fracture around internal prosthetic left knee joint, sequela;
- M97.8XXA Periprosthetic fracture around other internal prosthetic joint, initial encounter;
- M97.8XXD Periprosthetic fracture around other internal prosthetic joint, subsequent encounter;
- M97.8XXS Periprosthetic fracture around other internal prosthetic joint, sequela;
- M97.9XXA Periprosthetic fracture around unspecified internal prosthetic joint, initial encounter;
- M97.9XXD Periprosthetic fracture around unspecified internal prosthetic joint, subsequent encounter;
- M97.9XXS Periprosthetic fracture around unspecified internal prosthetic joint, sequela; and
- M96.69 Fracture of other bone following insertion of orthopedic implant, joint prosthesis, or bone plate.

We proposed the addition of these codes as proposed refinements to the THA/TKA Payment measure in response to recent analyses during routine measure maintenance showing that the addition of these codes will increase the national observed complication rate within the proposed THA/TKA Complication measure (NQF #1550) discussed earlier in this final rule. This demonstrates that the exclusion of these codes could result in missed complications. A number of clinicians in the field of orthopedics vetted the proposed addition of the new ICD–10 codes to identify the complications of care. As described in section IX.E.5.i. of the preamble of this final rule, we anticipate the inclusion of these additional complication codes will increase the national observed complication rate and therefore may impact payments. Payments in the 31–90-day window are included readmissions for complications as defined in the proposed THA/TKA Complication measure (Mechanical Complications and Periprosthetic Joint Infection/Wound Infection and Other Wound Complications), therefore, the expansion of the definition of mechanical complications impacts the THA/TKA Payment measure as well. Since the payment measure uses these codes for payment included in the post-30-day window, we also anticipate an increase in total payments.

These refinements to the measure will be effective for admissions from April 1, 2019 through March 31, 2022 (excluding data from the period covered by the ECE granted by CMS related to the COVID–19 PHE) and impacting the FY 2024 payment determination and subsequent years.

We invited public comment on this proposal.

Comment: Several commenters expressed their support for adoption of refinements to the THA/TKA Payment measure beginning with the FY 2024 payment determination.

Response: We thank the commenters for their support.

Comment: A few commenters recommended we update the testing and achieve endorsement of the proposed refinements from NQF before implementation in the Hospital IQR Program. They additionally recommended we consider delaying measure adoption until NQF endorsement is achieved, if unable to be endorsed prior to the proposed implementation timeline. A commenter expressed that they do believe the refined measure to be an improvement over the current version, and while they agreed that it would capture complications being missed by the current measure version, they noted a concern about overlap between this episode payment measure and the MSPB Hospital measure that we are also proposing to adopt into to the Hospital IQR Program beginning with the FY 2024 payment determination.

Response: We thank the commenters for their feedback. As noted in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28534 through 28536), we intend to submit the revised measure for the first NQF re-endorsement cycle in the Fall of 2022. Under section 1886(b)(3)(B)(viii)(IX)(bb) of the Act, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. We reviewed NQF-endorsed measures and were unable to identify any other NQF-endorsed measures on this topic, and, therefore, we believe the exception in section 1886(b)(3)(B)(viii)(IX)(bb) of the Act applies.

We acknowledge the commenters concerns about overlap between the episode payment measure and the revised MSPB Hospital measure discussed in section IX.E.5.h. of the preamble of this final rule. Although the revised MSPB Hospital and THA/TKA Payment measures are aligned in how the outcome is determined by using the same claim standardization process, the revised MSBP Hospital measure cohort includes most, if not all inpatient admissions at a hospital (that is, it is broader) while the cohort of the THA/TKA Payment measure is more narrow and aligns with the THA/TKA Complication measure. The THA/TKA Payment measure was developed to be viewed in combination with the THA/TKA Complication measure as an indicator of value of care. Therefore, the revised MSPB Hospital and THA/TKA Payment measures serve different purposes.

After consideration of the public comments we received, we are finalizing our proposal as proposed.

b. Refinement of the Excess Days in Acute Care (EDAC) After Hospitalization for Acute Myocardial Infarction (AMI) Measure (NQF #2881) Beginning With the FY 2024 Payment Determination and for Subsequent Years

(1) Background

The EDAC After Hospitalization for AMI (hereinafter referred to as AMI EDAC) measure was initially adopted in the Hospital IQR Program in the FY 2016 IPPS/LTCH PPS final rule (FR 80 49660 through 49690) beginning with the FY 2018 payment determination. The measure is intended to capture the quality-of-care transitions provided to discharged patients hospitalized with AMI by collectively measuring a set of adverse acute care outcomes that can occur post-discharge: (1) ED visits, (2) observation stays, and (3) unplanned readmissions at any time during the 30 days post-discharge. Safely transitioning patients from hospital to home requires a complex series of tasks including timely and effective communication between providers, prevention of and response to complications, patient education about post-discharge care and self-management, timely follow-up, and more. Suboptimal transitions contribute to a variety of adverse events post-discharge, including ED evaluation, need for observation, and readmission. Within the Hospital IQR Program's measure set, the AMI EDAC measure illuminates post-discharge outcomes that are important to patients, better informs consumers about care quality, and incentivizes improvement in transitional care.

(2) Overview of Measure

We proposed to refine this measure by increasing the minimum case count for reporting. The NQF Scientific Methods Panel Committee and stakeholder feedback indicated that the measure's reliability was not adequate. Therefore, we proposed to increase the reporting threshold to 50 cases in an effort to balance the need to include as many hospitals as possible while maintaining acceptable measure reliability.[990] The remainder of the AMI EDAC measure specifications, including the data sources, outcome, cohort, exclusion criteria, risk adjustment approach, and measure calculation will remain unchanged as compared to what is currently adopted in the Hospital IQR Program.

For more detailed measure specifications, we refer readers to the ''2017 Condition-Specific Measures Updates and Specifications Report Hospital-Level 30-Day Risk-Standardized Excess Days in Acute Care Measures: Acute Myocardial Infarction—Version 2.0'' available in the AMI, HF Excess Days in Acute Care folder on the *CMS.gov* Measure Methodology website at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology* and the *CMS.gov* QualityNet website at: *https://qualitynet.cms.gov/inpatient/measures/complication/methodology*.

(3) Update to Minimum Case Count

In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28536), we proposed a refinement to the currently adopted version of the AMI EDAC measure to increase the minimum case count of 25 to a minimum case count of 50 during the measurement period. The increase to the minimum case count will improve the measure's reliability. Based on internal analyses using the reporting period July 1, 2016 through June 30, 2019, the split-sample intraclass correlation (ICC) with Spearman Brown Adjustment increased when we increased the minimum case count from .384 with 25 admissions to .402 with 50 admissions. Based on our analysis, the mean performance rate for all hospitals was 3.6 excess days per 100 discharges, with a standard deviation of 26.3. For hospitals with at least 50 admissions in the same performance period, the mean performance rate was 6.9 per 100 discharges, with a standard deviation of 22. Additionally, 1,805 hospitals of 4,074 hospitals (or 44.3 percent) meet the minimum case count of 50 admissions for the same performance period.

Based on this improvement in reliability, we proposed to increase the AMI EDAC measure's minimum case count reporting threshold from 25 to 50 beginning with the FY 2024 payment determination using the reporting period July 1, 2019 through June 30, 2022 (excluding data from the period covered by the ECE granted by CMS related to the COVID–19 PHE), for which public display of the measure results will occur as part of a 2023 Compare website refresh (or as soon as operationally feasible thereafter), and

[990] National Quality Forum. Scientific Methods Panel: Spring 2021 Measure Evaluation Meeting Transcript. March 30, 2021. *https://www.qualityforum.org/Measuring_Performance/Scientific_Methods_Panel/Docs/Transcript_03302021.aspx.*

for subsequent years. Hospitals with fewer than 50 cases for the AMI EDAC measure will continue to receive confidential feedback reports containing measure results to understand their performance. Public reporting of measure results on the Compare tool hosted by HHS, currently available at: *https://www.medicare.gov/care-compare*, or its successor website, will only occur for hospitals meeting the 50 minimum cases required for reporting. Hospitals will not need to submit additional data as the AMI EDAC measure is calculated using administrative claims submitted to CMS for payment purposes.

We invited public comment on this proposal.

Comment: Several commenters expressed their support for the proposed refinements to the AMI EDAC measure beginning with the FY 2024 payment determination. A few commenters noted that they believe increasing the minimum denominator for the AMI EDAC measure from 25 to 50 cases improves measure reliability.

Response: We thank the commenters for their support of our proposal to increase the AMI EDAC measure's minimum case count reporting threshold from 25 to 50 cases.

Comment: A few commenters recommended that the AMI EDAC measure be removed from the Hospital IQR Program. A commenter stated they do not believe the measure adds value to the Hospital IQR Program. Other commenters expressed concerns with the measure outcome being a combination of readmissions, observation stays, and ED visits into a single category, stating their belief that each of these settings reflect widely different approaches to patient-centered care and cannot be meaningfully interpreted from a single number of days. Commenters added that they believe CMS added the AMI EDAC measure with the assumption that the then-new readmission measures would increase use of observation stays and ED visits and stated that evidence to support that assumption is not available.

Response: We thank the commenters for their input but we respectfully disagree that the measure does not add value to the Hospital IQR Program or that it should be removed. We believe the measure adds value to the Hospital IQR Program because the measure illuminates additional post-discharge outcomes that are important to patients beyond readmissions only, better informs consumers about care quality, and incentivizes improvement in transitional care. Regarding the commenters' concern about combining the count of days for readmissions, observation stays or ED visits, we believe this single count can be meaningfully interpreted because, from a patient perspective, it is the count of total days that is most meaningful and representative of the disruption, cost, or risk. This measure is meant to provide patients with a complete picture of potential post-discharge acute care use. For this reason, the AMI EDAC measure's outcome is expressed in days, and we combine day counts for each type of event and do not publicly report rates of each type of event. Further information on the public reporting of the measure can be accessed here: *https://data.cms.gov/provider-data/topics/hospitals/unplanned-hospital-visits/*. Regarding the commenters' concern related to different approaches to patient centered care, we note that the measure developer's discussions with patients and the TEP, as well as published literature, indicate that acute care utilization after discharge (that is, return to the ED, observation stay, and readmission), for any reason, is disruptive to patients and caregivers, costly to the healthcare system, and puts patients at additional risk of hospital-acquired infections and complications. We are confident that for most patients, remaining home or remaining in a non-acute setting rather than returning to the hospital indicates a better outcome. Although some hospital returns are unavoidable, others may result from poor quality of care, overutilization of care, or inadequate transitional care. Transitional care includes effective discharge planning, transfer of information at the time of discharge, patient assessment and education, and coordination-of-care and monitoring in the post-discharge period. When appropriate care transition processes are in place (for example, a patient is discharged to a suitable location, communication occurs between clinicians, medications are correctly reconciled, timely follow-up is arranged), fewer patients return to an acute care setting, either for an ED visit, observation stay, or hospital readmission during the 30 days post-discharge. Numerous studies have found an association between quality of inpatient or transitional care and early (typically 30-day) readmission rates [991] [992] [993] [994] [995] [996] [997] [998] [999] and ED visits [1000] [1001] [1002] [1003] [1004] for a wide range of conditions including AMI.

In response to the commenters' stated assumption that the AMI EDAC measure may have been developed out of concern for the use of observation stays and ED visits in lieu of readmission without evidence that either are being substituted for readmissions, we reiterate that we developed the measure to provide a broad perspective on post-discharge events. The goal of the measure is not to prevent hospitals from keeping patients in the ED or observation units; it is to help patients and providers understand variation among hospitals in the days that are spent by patients in acute care settings

following a discharge for AMI, as discussed in the FY 2016 IPPS/LTCH PPS proposed rule (80 FR 24574 through 24576).

Comment: A commenter noted they appreciate our responsiveness to the concerns of the NQF's Scientific Methods Panel and thereby increased the case minimum to 50 patients to improve the intraclass correlation coefficient (ICC) result but suggested that measures should have a minimum ICC reliability threshold of 0.6 or higher. The commenter noted that reaching 0.6 or higher for this measure would require a minimum of 300 cases, which would in turn exclude too many hospitals from the measure and therefore believe it is not appropriate for use in the Hospital IQR Program.

Response: We thank the commenter for their feedback. We agree that is it important to balance the need to include as many hospitals as possible while maintaining acceptable measure reliability. We would like to further clarify that during the NQF Spring 2021 Measure Evaluation Meeting, the NQF Scientific Methods Panel Committee indicated that a split-sample ICC threshold of around 0.4 or higher is considered acceptable measure reliability.[1005] As noted previously in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28536), the proposed refinement of increasing the minimum case count from 25 to 50 will increase the ICC with Spearman Brown Adjustment from 0.384 to 0.402, therefore improving the measure's reliability and meeting an acceptable threshold as determined by the NQF Scientific Methods Panel Committee's guidance at that time. As guidance on acceptable reliability is often changing, we will continue to take this into consideration as we conduct routine measure maintenance.

Comment: A few commenters offered recommendations for ongoing reevaluation of the AMI EDAC measure. A commenter recommended we consider how the COVID–19 pandemic may pose challenges to timely discharge, as hospitals may face constraints due to other health care settings (for example, a skilled nursing facility) being unable to promptly accept patients. Another commenter recommended that we should identify methods to address the issue of fewer hospitals meeting the proposed increased minimum case count and suggested that we could remedy this issue by using all-payer claims data to increase the denominator, improve reliability, include additional risk factors, and increase the relevancy of the measure to a broader base of providers and consumers.

Response: We thank the commenter for their feedback to consider the impact of the COVID–19 pandemic on timely discharge, specifically the concern that the pandemic has presented novel circumstances that might extend the length of a patient's stay in situations in which a hospital is ready to discharge a patient to another healthcare setting but is unable to do so because the other setting, for instance, is unable or unwilling to accept new patients due to issues related to COVID–19. The following COVID–19 adjustments have been made to the AMI EDAC measure for 2022 public reporting as technical updates: (1) Exclusion of COVID–19 patients (ICD–10–CM U07.1) from the cohort; (2) claims for ED visits, observation stays, and readmissions with COVID–19 coding (ICD–10–CM U07.1) are not eligible for the AMI EDAC outcome and are excluded; and (3) addition of a new ''History of COVID–19'' risk variable for risk adjustment. The COVID–19 pandemic continues to have significant and enduring effects on the provision of medical care in the country and around the world. It affects care decisions, including readmissions to the hospital. National or regional shortages or changes in healthcare personnel, medical supplies, equipment, diagnostic tools, and patient case volumes or facility-level case mix may affect quality measurement data.[1006] Adjustments to public reporting methodologies and specifications for 2022 help to ensure the intent of the measures is maintained. Further details of COVID–19 adjustment can be accessed by viewing the 2022 Condition-Specific Excess Days in Acute Care Measures Updates and Specifications Report: AMI, HF, and the Pneumonia and 2022 AMI EDAC Measure Code Specifications Supplemental File, both available on the QualityNet website here: *https://qualitynet.cms.gov/inpatient/measures/edac/methodology*.

We appreciate the suggestion of utilizing all-payer claims data to increase the number of hospitals with at least 50 cases, and we will take this into consideration when planning ongoing measure maintenance analyses. Hospitals with fewer than 50 cases for the AMI EDAC measure will continue to receive confidential feedback reports containing measure results to understand their performance.

Comment: A commenter requested that CMS explain their rationale for proposing the case minimum refinements based on reliability concerns for only the AMI EDAC measure and not including the Excess Days in Acute Care after Hospitalization for Pneumonia (NQF #2882) (Pneumonia EDAC) and Excess Days in Acute Care after Hospitalization for Heart Failure (NQF #2880) (Heart Failure EDAC) measures for consistency. The commenter expressed an assumption that the Pneumonia EDAC and Heart Failure EDAC measures would also be affected by the same reliability concerns as the AMI EDAC measure and would therefore need to adopt the same minimum case count to improve reliability.

Response: We thank the commenter for sharing these concerns. We would like to clarify that the NQF Scientific Methods Panel Committee did not raise concerns with reliability regarding the Pneumonia EDAC or Heart Failure EDAC measures, therefore, refinements for these measures were not proposed alongside those for the AMI EDAC measure. During the Spring 2021 project cycle, NQF's Scientific Methods Panel Committee reviewed and passed both Pneumonia EDAC and Heart Failure EDAC measures on reliability with a rating of moderate, and NQF's All-Cause Admissions and Readmissions Standing Committee voted to uphold the Scientific Methods Panel Committee's rating on reliability. Thus, as both Pneumonia EDAC and Heart Failure EDAC measures were found to have met the NQF's Scientific Acceptability criteria, we did not propose reliability related refinements to these measures at this time.[1007] Further details regarding NQF's ratings on reliability for these measures can be accessed here: *https://www.qualityforum.org/Publications/2022/02/All-Cause_Admissions_and_Readmissions_Final_Report_-_Spring_2021_Cycle.aspx*.

[1006] The Centers for Medicare and Medicaid. 2022 Condition-Specific Excess Days in Acute Care Measures Updates and Specifications Report: AMI, HF. Available at: *https://qualitynet.cms.gov/inpatient/measures/edac/methodology*.

[1007] National Quality Forum. All-Cause Admissions and Readmissions, Spring 2021 Cycle: CDP Report February 14, 2022. Available at: *https://www.qualityforum.org/Publications/2022/02/All-Cause_Admissions_and_Readmissions_Final_Report_-_Spring_2021_Cycle.aspx*.

After consideration of the public comments we received, we are finalizing our proposal as proposed.

7. Summary of Previously Finalized and New Hospital IQR Program Measures

a. Summary of Previously Finalized and New Hospital IQR Program Measures for the FY 2024 Payment Determination

This table summarizes the previously finalized and newly finalized Hospital IQR Program measure set for the FY 2024 payment determination:

BILLING CODE 4120–01–P

TABLE IX.E-09. MEASURES FOR THE FY 2024 PAYMENT DETERMINATION

Short Name	Measure Name	NQF #
National Healthcare Safety Network Measures		
HCP Influenza Vaccination	Influenza Vaccination Coverage Among Healthcare Personnel	0431
HCP COVID-19 Vaccination	COVID-19 Vaccination Coverage Among Health Care Personnel	N/A
Claims-Based Patient Safety Measures		
CMS PSI-04	Death Rate among Surgical Inpatients with Serious Treatable Complications (CMS Recalibrated Death Rate among Surgical Inpatients with Serious Treatable Complications)	0351
Claims-Based Outcome Measures		
MORT-30-STK	Hospital 30-Day, All-Cause, Risk Standardized Mortality- Rate Following Acute Ischemic Stroke	N/A
COMP-HIP-KNEE*	Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary THA and/or TKA	1550
Claims-Based Coordination of Care Measures		
READM-30-HWR**	Hospital-Wide All-Cause Unplanned Readmission Measure (HWR)	1789
AMI Excess Days***	Excess Days in Acute Care after Hospitalization for Acute Myocardial Infarction	2881
HF Excess Days	Excess Days in Acute Care after Hospitalization for Heart Failure	2880
PN Excess Days	Excess Days in Acute Care after Hospitalization for Pneumonia	2882
Claims-Based Payment Measures		
AMI Payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Acute Myocardial Infarction (AMI)	2431
HF Payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care For Heart Failure (HF)	2436
PN Payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-day Episode-of-Care For Pneumonia	2579
THA/TKA Payment***	Hospital-Level, Risk-Standardized Payment Associated with an Episode-of-Care for Primary Elective Total Hip Arthroplasty and/or Total Knee Arthroplasty	3474
MSPB****	Medicare Spending Per Beneficiary (MSPB)—Hospital	2158
Claims and Electronic Data Measures		
Hybrid HWR**	Hybrid Hospital-Wide All-Cause Readmission Measure (HWR)	2879
Chart-Abstracted Clinical Process of Care Measures		
PC-01	Elective Delivery	0469
Sepsis	Severe Sepsis and Septic Shock: Management Bundle (Composite Measure)	0500
Structural Measures		
Maternal Morbidity	Maternal Morbidity Structural Measure	N/A
EHR-based Clinical Process of Care Measures (that is, Electronic Clinical Quality Measures (eCQMs))		
ED-2	Admit Decision Time to ED Departure Time for Admitted Patients	0497
PC-05	Exclusive Breast Milk Feeding	0480
Safe Use of Opioids	Safe Use of Opioids – Concurrent Prescribing	3316e
STK-02	Discharged on Antithrombotic Therapy	0435
STK-03	Anticoagulation Therapy for Atrial Fibrillation/Flutter	0436
STK-05	Antithrombotic Therapy by the End of Hospital Day Two	0438
STK-06	Discharged on Statin Medication	0439
VTE-1	Venous Thromboembolism Prophylaxis	0371
VTE-2	Intensive Care Unit Venous Thromboembolism Prophylaxis	0372
Patient Experience of Care Survey Measures		
HCAHPS	Hospital Consumer Assessment of Healthcare Providers and Systems Survey (including Care Transition Measure)	0166 (0228)

* In this final rule, we are finalizing adoption of a refined Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary THA and/or TKA measure beginning with the FY 2024 payment determination and for subsequent years. We refer readers to section IX.E.5.i. for more detailed discussion.

** In the FY 2020 IPPS/LTCH PPS final rule, we removed the claims-only Hospital-Wide All-Cause Unplanned Readmission (HWR claims-only) measure (NQF #1789) and replaced it with the Hybrid HWR measure (NQF #2879), beginning with the FY 2026 payment determination (84 FR 42465 through 42481). The removal of the HWR claims-only measure was contingent on our finalizing our proposal to adopt the Hybrid HWR measure. We finalized our proposal to align the removal of the HWR claims only measure such that its removal aligns with the end of the finalized 2-year voluntary reporting period and the beginning of the finalized mandatory data submission and public reporting of the Hybrid HWR measure.

*** In this final rule, we are finalizing refinements to two current Hospital IQR Program measures—Hospital-Level, Risk-Standardized Payment Associated with an Episode-of-Care for Primary Elective THA/TKA and Excess Days in Acute Care (EDAC) after Hospitalization for Acute Myocardial Infarction (AMI)—beginning with the FY 2024 payment determination. We refer readers to sections IX.E.6.a. and IX.E.6.b, respectively, for more detailed discussion.

**** In this final rule, we are finalizing adoption of a refined the MSPB Hospital measure beginning with the FY 2024 payment determination. We refer readers to section IX.E.5.h. for more detailed discussion.

b. Summary of Previously Finalized and New Hospital IQR Program Measures for the FY 2025 Payment Determination

This table summarizes the previously finalized and newly finalized Hospital IQR Program measure set for the FY 2025 payment determination:

TABLE IX.E-10. MEASURES FOR THE FY 2025 PAYMENT DETERMINATION

Short Name	Measure Name	NQF #
National Healthcare Safety Network Measures		
HCP Influenza Vaccination	Influenza Vaccination Coverage Among Healthcare Personnel	0431
HCP COVID-19 Vaccination	COVID-19 Vaccination Coverage Among Health Care Personnel	N/A
Claims-Based Patient Safety Measures		
CMS PSI-04	Death Rate among Surgical Inpatients with Serious Treatable Complications (CMS Recalibrated Death Rate among Surgical Inpatients with Serious Treatable Complications)	0351
Claims-Based Mortality/Complications Measures		
MORT-30-STK	Hospital 30-Day, All-Cause, Risk Standardized Mortality- Rate Following Acute Ischemic Stroke	N/A
COMP-HIP-KNEE*	Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary THA and/or TKA	1550
Claims-Based Coordination of Care Measures		
READM-30-HWR**	Hospital-Wide All-Cause Unplanned Readmission Measure (HWR)	1789
AMI Excess Days***	Excess Days in Acute Care after Hospitalization for Acute Myocardial Infarction	2881
HF Excess Days	Excess Days in Acute Care after Hospitalization for Heart Failure	2880
PN Excess Days	Excess Days in Acute Care after Hospitalization for Pneumonia	2882
Claims-Based Payment Measures		
AMI Payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Acute Myocardial Infarction (AMI)	2431
HF Payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care For Heart Failure (HF)	2436
PN Payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-day Episode-of-Care For Pneumonia	2579
THA/TKA Payment***	Hospital-Level, Risk-Standardized Payment Associated with an Episode-of-Care for Primary Elective Total Hip Arthroplasty and/or Total Knee Arthroplasty	3474
MSPB****	Medicare Spending Per Beneficiary (MSPB)—Hospital	2158
Claims and Electronic Data Measures		
Hybrid HWR**	Hybrid Hospital-Wide All-Cause Readmission Measure (HWR)	2879
Hybrid HWM*****	Hybrid Hospital-Wide All-Cause Risk Standardized Mortality Measure (HWM)	3502
Chart-Abstracted Clinical Process of Care Measures		
PC-01	Elective Delivery	0469
Sepsis	Severe Sepsis and Septic Shock: Management Bundle (Composite Measure)	0500
Structural Measures		
Maternal Morbidity	Maternal Morbidity Structural Measure	N/A
HCHE******	Hospital Commitment to Health Equity	N/A
EHR-based Clinical Process of Care Measures (that is, Electronic Clinical Quality Measures (eCQMs))		
ED-2	Admit Decision Time to ED Departure Time for Admitted Patients	0497
PC-05	Exclusive Breast Milk Feeding	0480
Safe Use of Opioids	Safe Use of Opioids – Concurrent Prescribing	3316e
STK-02	Discharged on Antithrombotic Therapy	0435
STK-03	Anticoagulation Therapy for Atrial Fibrillation/Flutter	0436
STK-05	Antithrombotic Therapy by the End of Hospital Day Two	0438
STK-06	Discharged on Statin Medication	0439
VTE-1	Venous Thromboembolism Prophylaxis	0371
VTE-2	Intensive Care Unit Venous Thromboembolism Prophylaxis	0372
HH-01	Hospital Harm—Severe Hypoglycemia Measure	3503e
HH-02	Hospital Harm—Severe Hyperglycemia Measure	3533e
ePC-02*******	Cesarean Birth	N/A
ePC-07/SMM*******	Severe Obstetric Complications	N/A
Patient Experience of Care Survey Measures		
HCAHPS	Hospital Consumer Assessment of Healthcare Providers and Systems Survey (including Care Transition Measure)	0166 (0228)
Process Measures		
SDOH-1********	Screening for Social Drivers of Health	N/A
SDOH-2********	Screen Positive Rate for Social Drivers of Health	N/A

* In this final rule, we are finalizing adoption of a refined Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary THA and/or TKA measure beginning with the FY 2024 payment determination and for subsequent years. We refer readers to section IX.E.5.i. for more detailed discussion.
** In the FY 2020 IPPS/LTCH PPS final rule, we removed the claims-only Hospital-Wide All-Cause Unplanned Readmission (HWR claims-only) measure (NQF #1789) and replaced it with the Hybrid HWR measure (NQF #2879), beginning with the FY 2026 payment determination (84 FR 42465 through 42481). The removal of the HWR claims-only measure was contingent on our finalizing our proposal to adopt the Hybrid HWR measure. We finalized our proposal to align the removal of the HWR claims only measure such that its removal aligns with the end of the finalized 2-year voluntary reporting period and the beginning of the finalized mandatory data submission and public reporting of the Hybrid HWR measure.
*** In this final rule, we are finalizing refinements to two current Hospital IQR Program measures—Hospital-Level, Risk-Standardized Payment Associated with an Episode-of-Care for Primary Elective THA/TKA and Excess Days in Acute Care (EDAC) after Hospitalization for Acute Myocardial Infarction (AMI)—beginning with the FY 2024 payment determination. We refer readers to sections IX.E.6.a. and IX.E.6.b, respectively, for more detailed discussion.
**** In this final rule, we are finalizing adoption of a refined MSPB Hospital measure beginning with the FY 2024 payment determination. We refer readers to section IX.E.5.h. for more detailed discussion.
***** In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45365), we finalized adoption of the Hybrid HWM measure beginning with one voluntary reporting period (July 1, 2023-June 30, 2023), followed by mandatory reporting beginning with the July 1, 2023- June 30, 2024 reporting period, impacting the FY 2026 payment determination.
****** In this final rule, we are finalizing the adoption of the Hospital Commitment to Health Equity measure beginning with the CY 2023 reporting period/FY 2025 payment determination and for subsequent years. We refer readers to section IX.E.5.a. for more detailed discussion.
******* In this final rule, we are finalizing two eCQMs beginning with the CY 2023 reporting period/FY 2025 payment determination: Cesarean Birth and Severe Obstetric Complications. We are finalizing mandatory reporting of these two measures beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years. We refer readers to sections IX.E.5.c. and IX.E.5.d., respectively, for more detailed discussion. We also refer readers to section IX.E.10.e. for changes to our eCQM reporting and submission requirements beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years.
******** In this final rule, we are finalizing adoption of the Screening for Social Drivers of Health measure and the Screen Positive Rate for Social Drivers of Health measure beginning with voluntary reporting in the CY 2023 reporting period and mandatory reporting in the CY 2024 reporting period/FY 2026 payment determination and for subsequent years. We refer readers to sections IX.E.5.b.(1). and IX.E.5.b.(2), respectively, for more detailed discussion.

c. Summary of Previously Finalized and New Hospital IQR Program Measures for the FY 2026 Payment Determination

This table summarizes the previously finalized and newly finalized Hospital IQR Program measure set for the FY 2026 payment determination:

TABLE IX.E-11. MEASURES FOR THE FY 2026 PAYMENT DETERMINATION

Short Name	Measure Name	NQF #
National Healthcare Safety Network Measures		
HCP Influenza Vaccination	Influenza Vaccination Coverage Among Healthcare Personnel	0431
HCP COVID-19 Vaccination	COVID-19 Vaccination Coverage Among Health Care Personnel	N/A
Claims-Based Patient Safety Measures		
CMS PSI-04	Death Rate among Surgical Inpatients with Serious Treatable Complications (CMS Recalibrated Death Rate among Surgical Inpatients with Serious Treatable Complications)	0351
Claims-Based Mortality/Complications Measures		
MORT-30-STK	Hospital 30-Day, All-Cause, Risk Standardized Mortality- Rate Following Acute Ischemic Stroke	N/A
COMP-HIP-KNEE*	Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary THA and/or TKA	1550
Claims-Based Coordination of Care Measures		
AMI Excess Days**	Excess Days in Acute Care after Hospitalization for Acute Myocardial Infarction	2881
HF Excess Days	Excess Days in Acute Care after Hospitalization for Heart Failure	2880
PN Excess Days	Excess Days in Acute Care after Hospitalization for Pneumonia	2882
Claims-Based Payment Measures		
AMI Payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Acute Myocardial Infarction (AMI)	2431
HF Payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care For Heart Failure (HF)	2436
PN Payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-day Episode-of-Care For Pneumonia	2579
THA/TKA Payment**	Hospital-Level, Risk-Standardized Payment Associated with an Episode-of-Care for Primary Elective Total Hip Arthroplasty and/or Total Knee Arthroplasty	3474
MSPB***	Medicare Spending Per Beneficiary (MSPB)—Hospital Measure	2158
Claims and Electronic Data Measures		
Hybrid HWM****	Hybrid Hospital-Wide All-Cause Risk Standardized Mortality Measure (HWM)	3502
Hybrid HWR*****	Hybrid Hospital-Wide All-Cause Readmission Measure (HWR)	2879
Chart-Abstracted Clinical Process of Care Measures

Sepsis	Severe Sepsis and Septic Shock: Management Bundle (Composite Measure)	0500
Structural Measures		
Maternal Morbidity	Maternal Morbidity Structural Measure	N/A
HCHE******	Hospital Commitment to Health Equity	N/A
EHR-based Clinical Process of Care Measures (that is, Electronic Clinical Quality Measures (eCQMs))		
Safe Use of Opioids	Safe Use of Opioids – Concurrent Prescribing	3316e
STK-02	Discharged on Antithrombotic Therapy	0435
STK-03	Anticoagulation Therapy for Atrial Fibrillation/Flutter	0436
STK-05	Antithrombotic Therapy by the End of Hospital Day Two	0438
VTE-1	Venous Thromboembolism Prophylaxis	0371
VTE-2	Intensive Care Unit Venous Thromboembolism Prophylaxis	0372
HH-01	Hospital Harm—Severe Hypoglycemia Measure	3503e
HH-02	Hospital Harm—Severe Hyperglycemia Measure	3533e
ePC-02*******	Cesarean Birth	N/A

d. Summary of Previously Finalized and New Hospital IQR Program Measures for the FY 2027 Payment Determination

This table summarizes the previously finalized and newly finalized Hospital IQR Program measure set for the FY 2027 payment determination:

Short Name	Measure Name	NQF #
ePC-07/SMM*******	Severe Obstetric Complications	N/A
HH-ORAE********	Hospital-Harm—Opioid Related Adverse Events	3501e
GMCS********	Global Malnutrition Composite Score	3592e
Patient Experience of Care Survey Measures		
HCAHPS	Hospital Consumer Assessment of Healthcare Providers and Systems Survey (including Care Transition Measure)	0166 (0228)
Patient-Reported Outcome Performance Measures		
THA/TKA PRO-PM*********	Hospital-Level Total Hip Arthroplasty and/or Total Knee Arthroplasty Patient-Reported Outcome-Based Performance Measure (PRO-PM)	3559
Process Measures		
SDOH-1**********	Screening for Social Drivers of Health	N/A
SDOH-2*********	Screen Positive Rate for Social Drivers of Health	N/A

* In this final rule, we are finalizing adoption of a refined Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary THA and/or TKA measure beginning with FY 2024 payment determination and for subsequent years. We refer readers to section IX.E.5.i. for more detailed discussion.

** In this final rule, we are finalizing refinements to two current Hospital IQR Program measures—Hospital-Level, Risk-Standardized Payment Associated with an Episode-of-Care for Primary Elective THA/TKA and Excess Days in Acute Care (EDAC) after Hospitalization for Acute Myocardial Infarction (AMI)—beginning with the FY 2024 payment determination. We refer readers to sections IX.E.6.a. and IX.E.6.b, respectively, for more detailed discussion.

*** In this final rule, we are finalizing adoption of a refined MSPB Hospital measure beginning with the FY 2024 payment determination. We refer readers to section IX.E.5.h. for more detailed discussion.

**** In the FY 2022 IPPS/LTCH PPS final rule 86 FR 45365, we finalized adoption of the Hybrid HWM measure beginning with one voluntary reporting period (July 1, 2023-June 30, 2023), followed by mandatory reporting beginning with the July 1, 2023- June 30, 2024 reporting period, impacting the FY 2026 payment determination.

***** In the FY 2020 IPPS/LTCH PPS final rule, we removed the claims-only Hospital-Wide All-Cause Unplanned Readmission (HWR claims-only) measure (NQF #1789) and replaced it with the Hybrid HWR measure (NQF #2879), beginning with the FY 2026 payment determination (84 FR 42465 through 42481). The removal of the HWR claims-only measure was contingent on our finalizing our proposal to adopt the Hybrid HWR measure. We finalized our proposal to align the removal of the HWR claims only measure such that its removal aligns with the end of the finalized 2-year voluntary reporting period and the beginning of the finalized mandatory data submission and public reporting of the Hybrid HWR measure.

****** In this final rule, we are finalizing the adoption of the Hospital Commitment to Health Equity measure beginning with the CY 2023 reporting period/FY 2025 payment determination and for subsequent years. We refer readers to section IX.E.5.a. for more detailed discussion.

******* In this final rule, we are finalizing adoption of two eCQMs beginning with the CY 2023 reporting period/FY 2025 payment determination: Cesarean Birth and Severe Obstetric Complications. We are finalizing mandatory reporting of these two measures beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years. We refer readers to sections IX.E.5.c. and IX.E.5.d., respectively, for more detailed discussion. We also refer readers to section IX.E.10.e. for changes to our eCQM reporting and submission requirements beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years.

******** In this final rule, we are finalizing the adoption of two eCQMs beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years: Hospital-Harm—Opioid-Related Adverse Events and Global Malnutrition Composite Score. We refer readers to sections IX.E.5.e. and IX.E.5.f., respectively for more detailed discussion. We also refer readers to section IX.E.10.e. for changes to our eCQM reporting and submission requirements beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years.

********* In this final rule, we are finalizing adoption of the Hospital-Level THA/TKA PRO-PM measure. We are finalizing voluntary reporting of the measure across two periods—July 1, 2023 through June 30, 2024 and July 1, 2024 through June 30, 2025—followed by mandatory reporting for the reporting period which runs from July 1, 2025 through June 30, 2026, impacting the FY 2028 payment determination and for subsequent years. We refer readers to section IX.E.5.g. for more detailed discussion.

********** In this final rule, we are finalizing adoption of the Screening for Social Drivers of Health measure and the Screen Positive Rate for Social Drivers of Health measure beginning with voluntary reporting in the CY 2023 reporting period and mandatory reporting in the CY 2024 reporting period/FY 2026 payment determination and for subsequent years. We refer readers to sections IX.E.5.b.(1). and IX.E.5.b.(2)., respectively, for more detailed discussion.

TABLE IX.E-12. MEASURES FOR THE FY 2027 PAYMENT DETERMINATION

Short Name	Measure Name	NQF #
National Healthcare Safety Network Measures		
HCP Influenza Vaccination	Influenza Vaccination Coverage Among Healthcare Personnel	0431
HCP COVID-19 Vaccination	COVID-19 Vaccination Coverage Among Health Care Personnel	N/A
Claims-Based Patient Safety Measures		
CMS PSI-04	Death Rate among Surgical Inpatients with Serious Treatable Complications (CMS Recalibrated Death Rate among Surgical Inpatients with Serious Treatable Complications)	0351
Claims-Based Mortality/Complications Measures		
MORT-30-STK	Hospital 30-Day, All-Cause, Risk Standardized Mortality- Rate Following Acute Ischemic Stroke	N/A
COMP-HIP-KNEE*	Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary THA and/or TKA	1550
Claims-Based Coordination of Care Measures		
AMI Excess Days**	Excess Days in Acute Care after Hospitalization for Acute Myocardial Infarction	2881
HF Excess Days	Excess Days in Acute Care after Hospitalization for Heart Failure	2880
PN Excess Days	Excess Days in Acute Care after Hospitalization for Pneumonia	2882
Claims-Based Payment Measures		
AMI Payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Acute Myocardial Infarction (AMI)	2431
HF Payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care For Heart Failure (HF)	2436
PN Payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-day Episode-of-Care For Pneumonia	2579
THA/TKA Payment**	Hospital-Level, Risk-Standardized Payment Associated with an Episode-of-Care for Primary Elective Total Hip Arthroplasty and/or Total Knee Arthroplasty	3474
MSPB***	Medicare Spending Per Beneficiary (MSPB)—Hospital Measure	2158
Claims and Electronic Data Measures		
Hybrid HWM****	Hybrid Hospital-Wide All-Cause Risk Standardized Mortality Measure (HWM)	3502
Hybrid HWR*****	Hybrid Hospital-Wide All-Cause Readmission Measure (HWR)	2879
Chart-Abstracted Clinical Process of Care Measures		
PC-01	Elective Delivery	0469
Sepsis	Severe Sepsis and Septic Shock: Management Bundle (Composite Measure)	0500

HH-ORAE********	Hospital-Harm—Opioid Related Adverse Events	3501e
GMCS********	Global Malnutrition Composite Score	3592e
Patient Experience of Care Survey Measures		
HCAHPS	Hospital Consumer Assessment of Healthcare Providers and Systems Survey (including Care Transition Measure)	0166 (0228)
Patient-Reported Outcome Performance Measures		
THA/TKA PRO-PM*********	Hospital-Level Total Hip Arthroplasty and/or Total Knee Arthroplasty Patient-Reported Outcome-Based Performance Measure (PRO-PM)	3559
Process Measures		
SDOH-1**********	Screening for Social Drivers of Health	N/A

Short Name	Measure Name	NQF #
SDOH-2**********	Screen Positive Rate for Social Drivers of Health	N/A

* In this final rule, we are finalizing adoption of the Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary THA and/or TKA measure beginning with the FY 2024 payment determination and for subsequent years. We refer readers to section IX.E.5.i. for more detailed discussion.

** In this final rule, we are finalizing refinements to two current Hospital IQR Program measures—Hospital-Level, Risk-Standardized Payment Associated with an Episode-of-Care for Primary Elective THA/TKA and Excess Days in Acute Care (EDAC) after Hospitalization for Acute Myocardial Infarction (AMI)—beginning with the FY 2024 payment determination. We refer readers to sections IX.E.6.a. and IX.E.6.b, respectively, for more detailed discussion.

*** In this final rule, we are finalizing adoption of a refined MSPB-Hospital measure beginning with the FY 2024 payment determination. We refer readers to section IX.E.5.h. for more detailed discussion.

**** In the FY 2022 IPPS/LTCH PPS final rule 86 FR 45365, we finalized adoption of the Hybrid HWM measure beginning with one voluntary reporting period (July 1, 2023-June 30, 2023), followed by mandatory reporting beginning with the July 1, 2023- June 30, 2024 reporting period, impacting the FY 2026 payment determination.

***** In the FY 2020 IPPS/LTCH PPS final rule, we removed the claims-only Hospital-Wide All-Cause Unplanned Readmission (HWR claims-only) measure (NQF #1789) and replaced it with the Hybrid HWR measure (NQF #2879), beginning with the FY 2026 payment determination (84 FR 42465 through 42481). The removal of the HWR claims-only measure was contingent on our finalizing our proposal to adopt the Hybrid HWR measure. We finalized our proposal to align the removal of the HWR claims only measure such that its removal aligns with the end of the finalized 2-year voluntary reporting period and the beginning of the finalized mandatory data submission and public reporting of the Hybrid HWR measure.

****** In this final rule, we are finalizing adoption of the Hospital Commitment to Health Equity measure beginning with the CY 2023 reporting period/FY 2025 payment determination and for subsequent years. We refer readers to section IX.E.5.a. for more detailed discussion.

******* In this final rule, we are finalizing adoption of two eCQMs beginning with the CY 2023 reporting period/FY 2025 payment determination: Cesarean Birth and Severe Obstetric Complications. We are finalizing mandatory reporting of these two measures beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years. We refer readers to sections IX.E.5.c. and IX.E.5.d., respectively, for more detailed discussion. We also refer readers to section IX.E.10.e. for changes to our eCQM reporting and submission requirements beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years.

******** In this final rule, we are finalizing the adoption of two eCQMs beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years: Hospital-Harm—Opioid-Related Adverse Events and Global Malnutrition Composite Score. We refer readers to sections IX.E.5.e. and IX.E.5.f., respectively for more detailed discussion. We also refer readers to section IX.E.10.e. for changes to our eCQM reporting and submission requirements beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years

********* In this final rule, we are finalizing adoption of the Hospital-Level THA/TKA PRO-PM measure. We are finalizing voluntary reporting of the measure across two periods—July 1, 2023 through June 30, 2024 and July 1, 2024 through June 30, 2025—followed by mandatory reporting for the reporting period which runs from July 1, 2025 through June 30, 2026, impacting the FY 2028 payment determination and for subsequent years. We refer readers to section IX.E.5.g. for more detailed discussion.

********** In this final rule, we are finalizing adoption of the Screening for Social Drivers of Health measure and the Screen Positive Rate for Social Drivers of Health measure beginning with voluntary reporting in the CY 2023 reporting period and mandatory reporting in the CY 2024 reporting period/FY 2026 payment determination and for subsequent years. We refer readers to sections IX.E.5.b.(1) and IX.E.5.b.(2)., respectively, for more detailed discussion.

e. Summary of Previously Finalized and New Hospital IQR Program Measures for the FY 2028 Payment Determination and for Subsequent Years

This table summarizes the previously finalized and newly finalized Hospital IQR Program measure set for the FY 2028 payment determination and for subsequent years:

TABLE IX.E-13. MEASURES FOR THE FY 2028 PAYMENT DETERMINATION AND FOR SUBSEQUENT YEARS

Short Name	Measure Name	NQF #
National Healthcare Safety Network Measures		
HCP Influenza Vaccination	Influenza Vaccination Coverage Among Healthcare Personnel	0431
HCP COVID-19 Vaccination	COVID-19 Vaccination Coverage Among Health Care Personnel	N/A
Claims-Based Patient Safety Measures		
CMS PSI-04	Death Rate among Surgical Inpatients with Serious Treatable Complications (CMS Recalibrated Death Rate among Surgical Inpatients with Serious Treatable Complications)	0351
Claims-Based Mortality/Complications Measures		
MORT-30-STK	Hospital 30-Day, All-Cause, Risk Standardized Mortality- Rate Following Acute Ischemic Stroke	N/A
COMP-HIP-KNEE*	Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary THA and/or TKA	1550
Claims-Based Coordination of Care Measures		
AMI Excess Days**	Excess Days in Acute Care after Hospitalization for Acute Myocardial Infarction	2881
HF Excess Days	Excess Days in Acute Care after Hospitalization for Heart Failure	2880
PN Excess Days	Excess Days in Acute Care after Hospitalization for Pneumonia	2882
Claims-Based Payment Measures		
AMI Payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Acute Myocardial Infarction (AMI)	2431
HF Payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care For Heart Failure (HF)	2436
PN Payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-day Episode-of-Care For Pneumonia	2579
THA/TKA Payment**	Hospital-Level, Risk-Standardized Payment Associated with an Episode-of-Care for Primary Elective Total Hip Arthroplasty and/or Total Knee Arthroplasty	3474
MSPB***	Payment-Standardized Medicare Spending Per Beneficiary (MSPB)	2158
Claims and Electronic Data Measures		
Hybrid HWM****	Hybrid Hospital-Wide All-Cause Risk Standardized Mortality Measure (HWM)	N/A
Hybrid HWR*****	Hybrid Hospital-Wide All-Cause Readmission Measure (HWR)	2879
Chart-Abstracted Clinical Process of Care Measures		
PC-01	Elective Delivery	0469
Sepsis	Severe Sepsis and Septic Shock: Management Bundle (Composite Measure)	0500
Structural Measures		
Maternal Morbidity	Maternal Morbidity Structural Measure	N/A
HCHE******	Hospital Commitment to Health Equity	N/A
EHR-based Clinical Process of Care Measures (that is, Electronic Clinical Quality Measures (eCQMs))		
Safe Use of Opioids	Safe Use of Opioids – Concurrent Prescribing	3316e
STK-02	Discharged on Antithrombotic Therapy	0435
STK-03	Anticoagulation Therapy for Atrial Fibrillation/Flutter	0436
STK-05	Antithrombotic Therapy by the End of Hospital Day Two	0438
VTE-1	Venous Thromboembolism Prophylaxis	0371
VTE-2	Intensive Care Unit Venous Thromboembolism Prophylaxis	0372
HH-01	Hospital Harm—Severe Hypoglycemia Measure	3503e
HH-02	Hospital Harm—Severe Hyperglycemia Measure	3533e
ePC-02*******	Cesarean Birth	N/A
ePC-07/SMM*******	Severe Obstetric Complications	N/A
HH-ORAE********	Hospital-Harm—Opioid Related Adverse Events	3501e
GMCS********	Global Malnutrition Composite Score	3592e
Patient Experience of Care Survey Measures		
HCAHPS	Hospital Consumer Assessment of Healthcare Providers and Systems Survey (including Care Transition Measure)	0166 (0228)
Patient-Reported Outcome Performance Measures		
THA/TKA PRO-PM*********	Hospital-Level Total Hip Arthroplasty and/or Total Knee Arthroplasty Patient-Reported Outcome-Based Performance Measure (PRO-PM)	3559
Process Measures		
SDOH-1**********	Screening for Social Drivers of Health	N/A
SDOH-2**********	Screen Positive Rate for Social Drivers of Health	N/A

* In this final rule, we are finalizing adoption of a refined Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary THA and/or TKA measure beginning with the CY 2022 reporting period/FY 2024 payment determination. We refer readers to section IX.E.5.i. for more detailed discussion.

** In this final rule, we are finalizing refinements to two current Hospital IQR Program measures—Hospital-Level, Risk-Standardized Payment Associated with an Episode-of-Care for Primary Elective THA/TKA and Excess Days in Acute Care (EDAC) after Hospitalization for Acute Myocardial Infarction (AMI)—beginning with the FY 2024 payment determination. We refer readers to sections IX.E.6.a. and IX.E.6.b, respectively, for more detailed discussion.

*** In this final rule, we are finalizing adoption of a refined MSPB Hospital measure beginning with the /FY 2024 payment determination. We refer readers to section IX.E.5.h. for more detailed discussion.

**** In the FY 2022 IPPS/LTCH PPS final rule 86 FR 45365, we finalized adoption of the Hybrid HWM measure beginning with one voluntary reporting period (July 1, 2023-June 30, 2023), followed by mandatory reporting beginning with the July 1, 2023- June 30, 2024 reporting period, impacting the FY 2026 payment determination.

***** In the FY 2020 IPPS/LTCH PPS final rule, we removed the claims-only Hospital-Wide All-Cause Unplanned Readmission (HWR claims-only) measure (NQF #1789) and replaced it with the Hybrid HWR measure (NQF #2879), beginning with the FY 2026 payment determination (84 FR 42465 through 42481). The removal of the HWR claims-only measure was contingent on our finalizing our proposal to adopt the Hybrid HWR measure. We finalized our proposal to align the removal of the HWR claims only measure such that its removal aligns with the end of the finalized 2-year voluntary reporting period and the beginning of the finalized mandatory data submission and public reporting of the Hybrid HWR measure.

****** In this final rule, we are finalizing the adoption of the Hospital Commitment to Health Equity measure beginning with the CY 2023 reporting period/FY 2025 payment determination and for subsequent years. We refer readers to section IX.E.5.a. for more detailed discussion.

******* In this final rule, we are finalizing the adoption of two eCQMs beginning with the CY 2023 reporting period/FY 2025 payment determination: Cesarean Birth and Severe Obstetric Complications. We are finalizing mandatory reporting of these two measures beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years. We refer readers to sections IX.E.5.c and IX.E.5.d, respectively, for more detailed discussion. We also refer readers to section IX.E.10.e. for changes to our eCQM reporting and submission requirements beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years.

******** In this final rule, we are finalizing the adoption of two eCQMs beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years: Hospital-Harm—Opioid-Related Adverse Events and Global Malnutrition Composite Score. We refer readers to sections IX.E.5.e. and IX.E.5.f., respectively for more detailed discussion. We also refer readers to section IX.E.10.e. for changes to our eCQM reporting and submission requirements beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years.

********* In this final rule, we are finalizing adoption of the Hospital-Level THA/TKA PRO-PM measure. We are finalizing voluntary reporting of the measure across two periods—July 1, 2023 through June 30, 2024 and July 1, 2024 through June 30, 2025—, followed by mandatory reporting for the reporting period which runs from July 1, 2025 through June 30, 2026, impacting the FY 2028 payment determination and for subsequent years We refer readers to section IX.E.5.g. for more detailed discussion.

********** In this final rule, we are finalizing adoption of the Screening for Social Drivers of Health measure and the Screen Positive Rate for Social Drivers of Health measure beginning with a voluntary reporting in the CY 2023 reporting period and mandatory reporting in the CY 2024 reporting period/FY 2026 payment determination and for subsequent years. We refer readers to sections IX.E.5.b.(1). and IX.E.5.b.(2)., respectively, for more detailed discussion.

BILLING CODE 4120–01–C

8. Establishment of a Publicly-Reported Hospital Designation To Capture the Quality and Safety of Maternity Care

In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28547 through 28550), we proposed to establish a hospital quality designation that we would publicly report on a CMS website beginning in Fall 2023. We proposed this designation would be awarded to hospitals based on their attestation of submission of the Maternal Morbidity Structural measure, which we believe will reflect their commitment to the quality and safety of maternity care they furnish. This will be the first-ever hospital quality designation by HHS or CMS that specifically focuses on maternal health. We proposed this policy in conjunction with Vice President Harris' ''Maternal Health Day of Action'' announcement [1008] which also signaled CMS' intent to establish this proposed ''birthing-friendly'' hospital designation. Additionally, we requested feedback on potential additional activities that we could undertake to advance maternal health equity.

a. The U.S. Maternal Health Crisis

Despite the highest rate of spending on maternity care, maternal mortality rates in the U.S. are among the highest in the developed world. Every year, approximately 700 women die of complications related to pregnancy and childbirth, and over 25,000 women experience severe complications of pregnancy (severe maternal morbidity). [1009] [1010] Approximately one-third of all pregnancy-related deaths occur at the time of delivery and immediately postpartum, with nearly 20 percent occurring between one and six days postpartum.[1011] Yet, three out of five pregnancy-related deaths are considered preventable.[1012]

Racial, ethnic, disability, and geographic disparities intensify the U.S. maternal health crisis. Adverse maternal health outcomes vary considerably by race and ethnicity, and are highest among Black and American Indian/Alaskan Native women, regardless of their income or education levels.[1013] [1014] Black and American Indian/Alaskan Native women die from pregnancy-related causes at a rate two to three times higher [1015] and experience severe maternal morbidity at a rate nearly two

times higher than their White, Asian Pacific Islander, and Hispanic counterparts.[1016] The COVID–19 pandemic in the U.S. has exacerbated such racial and ethnic disparities in maternal outcomes, likely associated with Black and Hispanic women facing higher rates of economic hardship and reporting higher rates of mental health concerns compared to their White counterparts.[1017] [1018] [1019] [1020] Women with disabilities have a higher mortality risk and significantly higher risk in almost all adverse maternal outcomes compared with women without disabilities.[1021] Finally, geographic disparities in maternal outcomes also exist. Pregnant women who live in rural communities are at higher risk for severe maternal morbidity and about 60 percent more likely to die before, during, or after delivery than those living in urban settings.[1022]

b. HHS Focus on Improving Maternal Health in the U.S.

To build on the previously established HHS Maternal Health Action Plan, the Vice President's nationwide call to action to reduce maternal morbidity and mortality, and ongoing efforts with HHS and across the federal government,[1023] the Administration seeks to use a whole-of-government approach for improving maternal health and advancing maternal health equity that reduces maternal mortality and morbidity, reduces persistent disparities, and among other activities, increases hospital participation in HHS-sponsored maternal health quality improvement initiatives. A critical focus is reducing existing disparities in maternal health outcomes across race, ethnicity, and geographic area. This targeted strategy is further embodied by other efforts spearheaded by the Biden-Harris Administration, including the first-ever Presidential Proclamation in recognition of Black Maternal Health Week in April 2021, as well as the first-ever federal ''Maternal Health Day of Action'' on December 7, 2021. [1024] [1025]

As part of the ''Day of Action,'' Vice President Harris issued a nationwide call to action to reduce maternal mortality and morbidity and made several key announcements, including CMS' intention to establish the proposed hospital designation.[1026] Additionally, we released a quality, safety, and oversight memorandum (QSO–22–05-Hospitals) to state survey agencies. In that memorandum, we encourage hospitals to consider implementation of evidence-based best practices for the management of obstetric emergencies, along with interventions to address other key contributors to maternal health disparities, to support the delivery of equitable, high-quality care for all pregnant and postpartum individuals.[1027] Such best practices include participation in local/regional perinatal quality collaboratives, application of early warning sign tools, and the use of patient safety ''bundles.'' We encourage hospitals to review the guidance and resources provided in the memorandum to assess their own capacity to provide optimal management of obstetric emergencies and to combat maternal health disparities.

As part of our commitment to reducing high maternal morbidity and mortality rates, the Hospital IQR Program adopted the Maternal Morbidity Structural measure in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45361 through 45365). This measure is designed to determine hospital participation in a state or national Perinatal Quality Improvement (QI) Collaborative and implementation of patient safety practices or bundles through that QI initiative. As noted in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45361 through 45365), hospital participation in QI collaboratives has been shown to be effective in improving the infrastructure surrounding management of obstetric conditions that may lead to severe maternal morbidity or mortality.[1028] Additionally, hospital implementation of related QI efforts has been associated with both enhanced quality and safety of care as well as a reduction in the maternal health disparity gap.

The Maternal Morbidity Structural measure is specified to capture whether hospitals are: (1) Currently participating in a structured state or national Perinatal QI Collaborative; and (2) implementing patient safety practices or bundles as part of these QI initiatives. In reporting on this measure, hospitals respond ''Yes,'' ''No,'' or ''N/A (our hospital does not provide inpatient labor/delivery care)'' to a two-part question assessing these two topic areas.[1033] Data collection began with

fourth quarter 2021 data, which hospitals must have reported by May 2022. We refer readers to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45361 through 45365) for more details on the measure.

c. Establishment of a Publicly-Reported Hospital Designation To Capture the Quality and Safety of Maternity Care

In alignment with the announcement made during the ''Maternal Health Day of Action''[1034] we proposed to establish a hospital designation to be publicly reported on a CMS website beginning in Fall 2023. We will give this designation to hospitals that report ''Yes'' to both questions in the Maternal Morbidity Structural measure. This designation will initially be based only on data from hospitals reporting an affirmative attestation to the Maternal Morbidity Structural measure. This will allow us to initially award the designation based on the data hospitals are currently reporting on the Maternal Morbidity Structural measure under the Hospital IQR Program. In future notice and comment rulemaking, we intend to propose a more robust set of metrics for awarding the designation that may include other maternal health-related measures that may be finalized for the Hospital IQR Program measure set in the future. We note that in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28506 through 28515), we proposed to adopt two new electronic clinical quality measures (eCQMs) for the Hospital IQR Program—the Cesarean Birth (ePC–02) and Severe Obstetric Complications (ePC–07)—in sections IX.E.5.c. and IX.E.5.d, respectively, which are discussed in sections IX.E.5.c. and IX.E.5.d., respectively, of this final rule.

Section 1886(b)(3)(B)(viii)(VII) of the Social Security Act requires that the Secretary establish procedures for making information regarding Hospital IQR Program measures available to the public (74 FR 43864; 75 FR 50184 through 50815). We believe adding this designation to a consumer-facing CMS website will allow patients and families to choose hospitals that have demonstrated a commitment to improving maternal health through their participation in related perinatal QI collaboratives and their implementation of best practices that support the delivery of high-quality maternity care.

We invited public comment on this proposal.

Comment: Many commenters supported the creation of a public designation related to maternity care.

Response: We thank commenters for their support of our proposal to establish a maternity care hospital designation to be publicly reported on a CMS website beginning in Fall 2023. We believe that adoption of this designation represents a first step in informing the public in a meaningful and consumer-friendly manner about hospitals' commitment to the provision of high-quality maternity care and it will empower the public to make more informed decisions as to where they choose to obtain care during pregnancy and postpartum (87 FR 28549). We also note that since the publication of the FY 2023 IPPS/LTCH PPS proposed rule, the White House has published the ''White House Blueprint for Addressing the Maternal Health Crisis'' which further outlines how the hospital designation will fit in with the HHS' maternal health strategy.[1035]

Comment: While many commenters supported the creation of the designation, many of these commenters also stated that they believe the attestation-based Maternal Morbidity Structural measure is not sufficient in fully addressing maternal health. The commenters encouraged CMS to, in the near future, push beyond the use of an attestation by incorporating more rigorous quality reporting components that incentivize hospitals to deliver high-quality care and provide consumers with more detailed, reliable data on hospital results in improving maternal health. Several commenters emphasized the importance of including clear, consistent, patient-centered, and evidence-based measures on maternal health and encouraged our engagement with hospitals, clinicians, and consumers to design and apply a maternal health designation. A few commenters expressed support for the designation's potential to increase participation in perinatal quality collaboratives and other quality improvement initiatives. A couple of commenters noted the proposal builds off an existing Hospital IQR Program measure and will therefore mitigate administrative burden for hospitals. A commenter supported the designation's potential to address the issue of maternal hemorrhage and facilitate timely initiation of interventions.

Response: We appreciate commenters' feedback and support for the maternity care hospital designation. We acknowledge and agree that this iteration of the proposed designation is a first step towards informing the public in a meaningful and consumer-friendly manner about maternity care quality, and advancing maternal health equity more broadly, using a measure that was already finalized in the Hospital IQR Program. As we stated in the FY 2023 IPPS/LTCH PPS proposed rule, we intend to propose a more robust set of criteria for awarding the designation in future notice-and-comment rulemaking (87 FR 28549). We thank the commenters for their support and agree that the designation could support greater participation in perinatal quality improvement collaboratives and implementation of best practices. We are committed to engaging with interested parties as we continue to improve upon this designation in future notice-and-comment rulemaking.

Comment: Many commenters did not support the proposal as currently proposed, indicating that the attestation of participation in a perinatal quality improvement collaborative (as captured by the Maternal Morbidity Structural measure) is insufficient to demonstrate hospital maternity care quality. The commenters suggested that participation in quality improvement collaboratives and initiatives should be considered the floor for acceptable maternity care rather than the ceiling. A few of these commenters noted that participation in such collaboratives varies and using it as the basis for the designation may not be meaningful. A few commenters noted that the designation will be particularly unhelpful in states where the vast majority of birthing facilities participate in perinatal quality improvement collaboratives because the designation would not offer distinction in quality among hospitals. Another commenter questioned whether the designation as proposed meaningfully informs patients beyond the information that is currently available and publicly reported. A few commenters stated further concern that, as proposed, the designation will mislead consumers who believe it indicates an exceptional level of quality when it reflects a less stringent

or health system participate in a Statewide and/or National Perinatal Quality Improvement Collaborative Program aimed at improving maternal outcomes during inpatient labor, delivery and post-partum care, and has it implemented patient safety practices or bundles related to maternal morbidity to address complications, including, but not limited to, hemorrhage, severe hypertension/preeclampsia or sepsis?.'' Further details on this measure can be found in the FY 2022 IPPS/LTCH PPS final rule at 86 FR 45361 through 45365.

[1034] The White House. (2021). Fact Sheet: Vice President Kamala Harris Announces Call to Action to Reduce Maternal Mortality and Morbidity. Accessed January 26, 2022. Available at: *https://www.whitehouse.gov/briefing-room/statements-releases/2021/12/07/fact-sheet-vice-president-kamala-harris-announces-call-to-action-to-reduce-maternal-mortality-and-morbidity/*.

[1035] White House Blueprint for Addressing the Maternal Health Crisis. (2022). Available at: *https://www.whitehouse.gov/wp-content/uploads/2022/06/Maternal-Health-Blueprint.pdf*.

criterion. A commenter noted that some state perinatal quality improvement collaboratives have had to suspend initiatives due to the COVID–19 pandemic and introduction of a designation based on measures or initiatives that are unattainable for many hospitals is not appropriate at this time. Relatedly, a commenter noted that they used to participate in perinatal quality improvement collaboratives but found the cost of paid membership to be a barrier.

Response: We appreciate the commenters' feedback and acknowledge their concerns. As we stated in the FY 2023 IPPS/LTCH PPS proposed rule, at this time we will base the designation only on data from hospitals reporting an affirmative attestation to the Maternal Morbidity Structural measure under the Hospital IQR Program (87 FR 28549). This measure is already reported as part of the Hospital IQR Program measure set (as finalized in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45361)) and we believe using an existing measure will reduce burden for hospitals during the first year of the designation which is particularly critical in light of the ongoing public health emergency. This is a first step. In future notice-and-comment rulemaking, we intend to propose a more robust set of metrics for awarding the designation that may include other maternal health-related measures that may be finalized for the Hospital IQR Program measure set (87 FR 28549). In the Biden-Harris Administration Blueprint to Address the Maternal Health Crisis (hereto referred to as the Blueprint), we acknowledge that full-scale adoption of perinatal quality improvement collaboratives has not happened for several reasons: Not all states have been funded to support this key infrastructure; hospitals are not required to adopt these best practices and therefore may struggle to procure the resources needed to implement them; and, hospitals are not externally incentivized to do so.[1036] In the Blueprint, we state our intent to explore opportunities to advance equitable, high-quality maternity care provided by hospitals in several ways, including through this hospital designation and through the FY 2023 President's Budget which, would support a perinatal quality collaborative in every state.[1037] We believe this will further support hospitals in areas where perinatal quality collaboratives have not been available due to resource or access issues. We acknowledge commenters' concerns that participation in perinatal quality improvement collaboratives may vary. However, as stated in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28548) and the FY 2022 IPPS/LTCH PPS final rule (86 FR 45361 through 45365), hospital participation in quality improvement collaboratives has been shown to be effective in improving the infrastructure surrounding management of obstetric conditions that may lead to severe maternal morbidity or mortality, and hospital implementation of quality improvement efforts has been associated with both enhanced quality and safety of maternity care as well as a reduction in the maternal health disparity gap. We believe supporting hospital participation in such efforts is critical to addressing maternal health. In addition, we believe that while the Maternal Morbidity Structural measure and the hospital designation do not directly mandate participation in perinatal quality collaboratives and other quality improvement initiatives, they create strong incentives to the over 3,000 participating hospitals and CAHs that voluntarily participate in the Hospital IQR Program to begin active participation if they have not yet done so or to continue participation in such activities that are an important part of improving the quality of maternity care offered in hospitals.

Comment: Several commenters recommended that hospitals that participate in any state, national, or regional quality improvement activities or collaboratives be considered for the designation. A few commenters noted this flexibility is particularly important for rural hospitals, safety net hospitals, and hospitals in states or regions where a perinatal quality improvement collaborative is not available. A commenter suggested that state Medicaid programs may use national or state Alliance for Innovation on Maternal Health (AIM) or other quality improvement initiatives and these should be considered for the designation. A couple of commenters encouraged us to consider recognizing hospitals that already participate in maternal health designation programs as recipients of the CMS designation.

Response: We thank the commenters for their recommendations. We recognize that hospitals are involved in a variety of quality improvement activities. As stated in the FY 2022 IPPS/LTCH PPS final rule, for purposes of the Maternal Morbidity Structural measure in the Hospital IQR Program, we define a State or national perinatal quality improvement collaborative as a Statewide or a multi-State network working to improve women's health and maternal health outcomes by addressing the quality and safety of maternity care (86 FR 45362). (Specifications for the measure are available on the CMS Measure Methodology page under the file name 'Maternal Morbidity Structural Measure Specifications,' available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/*Measure-Methodology.) We believe this provides hospitals with some flexibility to identify a perinatal quality improvement collaborative, of which the HRSA-funded AIM Program is one example, in their state or region in addition to national options.[1038] However, we acknowledge that some hospitals, and especially those in rural areas, may lack immediate access to a collaborative. We continue to consider additional measures for future years of the designation. In the interim, we direct commenters and providers to the December 2021 quality, safety, and oversight memo that provides information on a variety of maternity care quality improvement resources.[1039]

Comment: A few commenters stated that the Maternal Morbidity Structural measure has yet to receive NQF endorsement and therefore should not be the only metric used to designate maternity care quality.

Response: We stated in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45364) that section 1886(b)(3)(B)(viii)(IX)(bb) of the Act provides an exception for NQF endorsement that, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary.

We reviewed NQF-endorsed measures and were unable to identify any other NQF-endorsed measures that addressed maternal morbidity through hospital participation in perinatal quality improvement initiatives and the implementation of associated bundles or patient safety practices. We found no other feasible and practical measures on the topic of maternal health; therefore, we believe the exception in section 1886(b)(3)(B)(viii)(IX)(bb) of the Act applies. In future notice-and-comment rulemaking, we intend to propose a more robust set of measures for the designation. We believe that the maternal health crisis is urgent, maternal health inequities are unacceptable, and this persistent problem requires prompt action. We will consider commenter suggestions received as part of the related request for comment included in the FY 2023 IPPS/LTCH PPS proposed rule.

Comment: Many commenters questioned the intent and purpose of the designation. A few commenters disagreed with the designation's narrow focus on maternal health. A commenter stated that a ''birthing-friendly'' designation without neonatal health components is inadequate and suggested that a designation that includes maternal and neonatal health care would be most appropriate for such a designation.

Response: We thank the commenters for their feedback. As previously stated, the proposed designation is intended as a first step in our efforts to adopt policies that address maternal health. In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28549), we expressed our intent to propose a more robust set of criteria for awarding the designation, such as other maternal health-related measures that may be finalized for the Hospital IQR Program in the future; which could include two maternal health eCQMs–Cesarean Birth and Severe Obstetric Complications– that we are finalizing in this final rule (in sections IX.E.5.c. and IX.E.5.d., respectively). We acknowledge that there may be other measures that could be candidates for the designation, and we reiterate our intention to continue exploring opportunities across future notice-and-comment rulemaking to continue refining the designation so that it remains meaningful and useful for patients and hospitals.

Comment: A few commenters noted that patients often have limited choice in their delivery location, due to, for example, insurance coverage or provider admitting privileges, and questioned whether this designation could therefore be impactful when considering where to deliver. A commenter stated that because Medicare beneficiaries tend to produce relatively few claims for services related to maternity care, the desired impact with the designation is unclear.

Response: We thank these commenters for their feedback. We acknowledge that for some patients, including those in emergent situations, there may not be opportunities to choose the hospital in which they deliver. However, for many patients, there is an opportunity for some choice and we believe it is important to provide meaningful and user-friendly information to help inform those choices. We also note that there are other important uses for collecting and publishing the data, including transparency to incentivize continuous improvement. We appreciate the commenter's feedback that Medicare claims would likely be less useful as sources of quality data for a maternity care quality designation, which is why we have focused on the use of an attestation measure to begin, and will explore potential EHR-based and other quality measure data to base future iterations of the designation.

Comment: Many commenters expressed concern about potential consequences of evolving the designation over time. Several commenters noted that changing the criteria for the designation without properly educating and informing consumers is likely to impact the integrity of the initiative and the perception of care delivered in hospitals with birthing facilities that may gain and then lose designation. A few commenters stated that hospitals may lose their designation, but continue to prominently feature their previous recognition and create a false assurance of quality to consumers. A commenter expressed concern that CMS could choose to add criteria or metrics to the designation from outside of the Hospital IQR Program or quality measures that have not been reviewed or endorsed through the NQF process, both of which they believe could negatively impact the integrity and accuracy of the designation.

Response: We thank the commenters for their feedback, and we acknowledge commenters' concerns about potential evolution of the designation. We understand many public-facing quality indicators and summary scores, such as star ratings, rankings, or grades, undergo revisions over time rather than remain static to continuously improve the data quality, reliability, and validity, as well as to ensure information remain meaningful to users and align with the state of the field. We do not believe that such revisions jeopardize the integrity of the designation. In addition, as participating facilities continue to provide quality data for the Maternal Morbidity Structural measure each year, the designation will be accordingly refreshed to reflect the most current data. We believe that future refinements to the designation will be needed in order to continue to provide hospitals and consumers the opportunity to access timely quality and safety data to inform decision-making. We encourage hospitals to routinely and accurately update public-facing materials related to the designation to provide the most up-to-date information and avoid misleading the public. We additionally intend to provide additional outreach, communication, and educational materials as we rollout and improve upon this designation. We also note that interested parties may review any future new measures included for the designation as they would be proposed through notice-and-comment rulemaking. With regard to concerns about future adoption of measures for the designation that may lack NQF endorsement, while we prioritize measures that are endorsed when available, we reiterate that section 1886(b)(3)(B)(viii)(IX)(bb) of the Act provides an exception that, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. As noted earlier, we believe the maternal health crisis is urgent, maternal health inequities are unacceptable, and this persistent problem requires immediate action.

Comment: Several commenters requested additional support or consideration for certain hospital and facility types. Several commenters expressed concern that the designation would have unintended consequences for small and rural hospitals as well as hospitals, including Indian Health Service (IHS) hospitals, caring for populations that have been historically underserved. Commenters cautioned that such a designation could potentially exacerbate disparities and limit access in areas where hospitals struggle to maintain labor and delivery units due to low volume. Commenters worried that patients with the means to

seek care elsewhere could bypass local undesignated hospitals due to a perception of low-value care, further reducing the availability and provision of maternity care in those communities. A few commenters requested CMS consider exempting IHS providers from the designation.

A few commenters recommended the designation consider hospital capacity and offer special consideration to low-volume hospitals to avoid penalizing those hospitals by withholding a designation that could improve access to quality maternity care. The commenters noted that rural hospitals may lack the resources to participate in perinatal quality improvement collaboratives. The commenters suggested providing incentives and resources to rural hospitals to collaborate with any nearby hospital to achieve collective designation, thereby allowing more pregnant individuals to seek care at a local hospital. Similarly, another commenter requested CMS set aside funding for technical assistance for rural hospitals and other facilities to fill in gaps in training and workforce shortages that limit a hospital from participating in a perinatal quality improvement collaborative.

A commenter requested clarification on whether IPPS-exempt, self-governing children's hospitals would be eligible for the designation.

Response: We appreciate commenters sharing their concerns. As stated in the FY 2023 IPPS/LTCH PPS proposed rule, geographic disparities in maternal outcomes persist and we recognize the challenges faced by small and rural hospitals that offer maternity care in these areas, as well as poor maternal health outcomes disproportionately affecting rural communities of color, including American Indian/Alaska Native people (87 FR 28548). We additionally appreciate commenters' concerns regarding the resources required to participate in a perinatal quality improvement collaborative and subsequently affirmatively attest to the Maternal Morbidity Structural measure in order to earn the designation. We recognize that rural and low-volume hospitals may face challenges achieving the designation. We intend to work with HRSA to explore approaches that could support maternity care quality improvement in those facilities in the future. In the Blueprint, the Biden-Harris Administration states its intent to improve rural obstetric readiness at hospitals and IHS facilities by developing guidelines and standards so that facilities without obstetric units are still ''obstetric ready,'' expanding HRSA's Rural Maternity and Obstetrics Management Strategies (RMOMS) Program to enhance access to maternal and obstetric care in rural communities, and providing free readily-accessible online obstetrical trainings to HRSA-funded health centers and free clinics to support the delivery of competent preconception, prenatal, intrapartum, and postpartum care.[1040]

With regard to the recommendation to offer financial or technical assistance, we note that the Hospital IQR Program statute does not authorize incentive payments based on performance as it is a pay-for-reporting program. However, with our federal partners, we will explore opportunities to offer technical and other resources to providers. With regard to considerations for hospital capacity, we will consider the suggestions for potential modifications to the designation in the future and explore additional variables that can affect quality of maternity care, including but not limited to delivery volume, staffing capabilities, and levels of risk-appropriate care. Any additional changes would be made through future rulemaking. Regarding a commenter requesting clarification on IPPS-exempt children's hospitals, we note that we use data from participating subsection (d) hospitals and CAHs that voluntarily participate in the Hospital IQR Program for the designation, which means IPPS-exempt children's hospitals are excluded. We further wish to clarify that subsection (d) hospitals participating in the Hospital IQR Program receive credit under the Hospital IQR Program for the reporting of their Maternal Morbidity Structural measure results, whether they attest to the affirmative or not because it is a pay-for-reporting program (86 FR 45365). This designation is in addition to, but separate from, the reporting of the Maternal Morbidity Structural measure. We continue to assess opportunities to improve maternity care quality, safety, and equity through this designation and will consider strategies focused on rural and low-volume hospitals in future notice-and-comment rulemaking.

Comment: Several commenters requested that any measures used to inform the designation be risk-adjusted. Some commenters also requested that publicly reported measure data be disaggregated and stratified across drivers of health. A few commenters requested that publicly reported data from the designation should include indicators for consumers when a hospital delivers care primarily to populations that are disadvantaged and/or underserved by the healthcare system.

Response: We thank the commenters for their feedback. The initial implementation of the designation would be based on the Maternal Morbidity Structural measure, which is an attestation-based measure that is not risk-adjusted or stratified. We will consider the feasibility, applicability, and appropriateness of risk-adjustment and stratification of measures as we continue to develop this designation in future years. We refer readers to the Overarching Principles for Measuring Healthcare Quality Disparities Across CMS Quality Programs—Request for Information in section IX.B. of the preamble of this final rule for more information on CMS' potential use of measure stratification in the future.

Comment: A few commenters recommended CMS develop a monitoring program to inform consumers on the efficacy of the designation, both for hospitals that receive the designation and those that do not. The commenters recommended hospitals that did not receive the designation should be monitored to determine whether a lack of designation may contribute to a reduction in maternity care access and/or quality, including the closure of obstetric units.

Response: We thank commenters for this recommendation and as we monitor hospital performance on the Maternal Morbidity Structural measure and the new designation, we will consider mechanisms to assess the implementation and impact of the designation.

Comment: Several commenters emphasized the importance of engaging interested parties at state, local, and national levels prior to implementing the designation and in advance of making any modifications to the qualification requirements for the designation. Some commenters noted that the designation is likely to lack value to hospitals, patients, and communities without engagement with relevant interested parties across the spectrum of maternal health. Several commenters also expressed disappointment and concern that more outreach was not done prior to the creation of the designation and requested a delay in implementation so that hospitals have time to allocate the resources required to qualify for the designation. A commenter noted that labor and resource shortages resulting from the ongoing COVID–19 PHE continue to impact hospitals and a delay in implementation is needed.

[1040] The White House. White House Blueprint for Addressing the Maternal Health Crisis. June 2022. Available at: *https://www.whitehouse.gov/wp-content/uploads/2022/06/Maternal-Health-Blueprint.pdf*.

Response: We appreciate feedback from interested parties and the value it adds to proposals set forth for the Hospital IQR Program. We finalized the adoption of the Maternal Morbidity Structural measure for the Hospital IQR Program in the FY 2022 IPPS/LTCH PPS final rule with a reporting period starting October 1, 2021 (86 FR 45361). We additionally indicated our commitment to a serious focus and rapid action for maternal health improvement (86 FR 45365). We seek to use a whole-of-government approach for improving maternal health and advancing maternal health equity to reduce maternal mortality and morbidity, reduce persistent disparities, and increase hospital participation in evidence-based maternal health quality improvement initiatives. As mentioned earlier, we signaled our intent for this designation in December 2021 alongside Vice President Harris' ''Maternal Health Day of Action.'' It is our intention to consider ongoing opportunities for engagement with interested parties as we continue to improve upon the designation across future years. While we recognize that hospitals may participate in a variety of quality improvement activities with a focus on maternal health and that many hospitals face challenges due to the COVID–19 PHE, we believe that the maternal health crisis is urgent, maternal health inequities are unacceptable, and this persistent problem requires prompt action. Thus, we do not believe delaying the fall 2023 implementation timeframe to launch the hospital designation information to the public is sufficiently responsive nor appropriate.

Comment: A few commenters expressed concern about the reputational impact to birth centers and other non-hospital birthing facilities that may provide especially high-quality care but will be excluded from the designation as they do not participate in the Hospital IQR Program.

Response: We thank the commenters, and we recognize that people may receive maternity care in a non-hospital birthing facility for a variety of reasons. Birth centers, for example, are not subsection (d) hospitals, so they cannot participate in the Hospital IQR Program, and would therefore not be eligible for a designation. We encourage consumers to utilize publicly reported quality information to better understand the quality of maternity services and care available in their communities. We also intend to provide additional outreach, communication, and educational materials as we launch the designation.

After consideration of the public comments we received, we are finalizing our proposal as proposed.

d. Solicitation of Comments on Designation Name and Additional Data Sources To Consider for Purposes of Awarding This Publicly-Reported Hospital Designation

While our ultimate goal is to designate hospitals with demonstrated commitment to the provision of high-quality, safe, and equitable maternity care, we wish to do so in a way that is meaningful and useful to patients and their families as well as clinicians and hospitals. Therefore, we solicited comments on a name for this designation for future years.

In addition as noted previously, we proposed to designate hospital commitment to maternity care quality and safety based initially on data collected on the Maternal Morbidity Structural measure. Our intent is to expand the criteria we use to award this designation so that it more comprehensively captures the quality and safety of the maternity care delivered by hospitals. Other future sources of data potentially include data collected on the two eCQMs we proposed to add to the Hospital IQR Program measure set, or data on other Hospital IQR Program maternal health measures, should such measures be adopted in the future. We also considered the feasibility of including other quality measurement data sources. In particular, we welcomed comments about patient experience measures that could be relevant for this designation, including patient experience measures that are currently in use in other care settings, patient experience measures that have been developed but require additional testing in pilot settings, or other measures of patient experience that would be appropriate for inclusion in the designation.

We invited public comment on these and other potential quality measurement data sources that would be appropriate to include in a designation that captures the quality and safety of maternity care furnished by hospitals, including quality measures used in other quality reporting programs or care delivery settings. In the previous section IX.E.8.c., we address related comments in the discussion of the maternity care hospital designation. This section of this document contains additional comments received related to the designation name and additional sources of data to consider.

Comment: Many commenters shared other recommendations related to potential future iterations of the designation. Many commenters urged CMS to use evidence-based outcome measures to inform a designation instead of the attestation-based Maternal Morbidity Structural measure. Several commenters recommended inclusion of existing levels of maternal care (LoMC) [1041] in the designation, including those already promoted and endorsed by national stakeholder groups, accrediting bodies, and commissions, as an alternative to participation in a perinatal quality improvement collaborative. Another commenter suggested CMS consider other payment models, including trauma activation or a maternal and fetal health disproportionate share reimbursement model that combines U.S. Census indices with Healthcare Effectiveness Data and Information Set (HEDIS) and CCO data. A commenter suggested designated hospitals be required to offer remote patient monitoring to high-risk patients. One commenter believes that the designation would be better managed by an accreditation agency rather than CMS.

Response: We appreciate commenters' suggestions. We note that the Hospital IQR Program specifically uses quality measures to improve the quality of care as a pay-for-reporting program. As previously stated, we intend to continue exploring opportunities to refine the designation for the future based on measures that are meaningful and useful for patients and hospitals.

Comment: A few commenters urged CMS to dedicate sufficient resources to clearly and deliberately communicate with and educate consumers so they are easily able to understand what the designation does and does not indicate. A couple of commenters recommended a consumer-focused campaign with details about the designation and where to find information on which hospitals are designated. The commenters also recommended that such a campaign include resources on safe and healthy birth for consumers who may not have access to a designated facility or may not have a provider with clinical privileges in a designated hospital. A commenter suggested we partner with local health departments and Medicaid offices to share information in multiple formats and languages with consumers.

Response: We agree with commenters about the importance of clear communication, and are dedicated to communicate in a way that is culturally and linguistically appropriate and

[1041] American College of Obstetricians and Gynecologists. Levels of Maternal Care. 2021. Available at: *https://www.acog.org/clinical/clinical-guidance/obstetric-care-consensus/articles/2019/08/levels-of-maternal-care.*

accessible by people with disabilities, with consumers. We intend to work with hospitals and other interested parties to make information about the designation available and accessible to patients, their families, and communities in a way that clearly describes what the designation means and where they can find additional information and resources.

Comment: Commenters had varying recommendations on whether other maternal health measures proposed for the Hospital IQR Program would be appropriate for inclusion in the designation. Several commenters supported the future inclusion of the Cesarean Birth eCQM and Severe Obstetrics Complications eCQM in the designation. Conversely, a few commenters opposed the potential inclusion of these two eCQMs into the designation citing potential burden concerns. A few commenters specifically noted that they would not support the inclusion of the Cesarean Birth eCQM as part of the designation until it receives NQF endorsement.

Response: We thank commenters for their recommendations on the potential future inclusion of the Cesarean Birth eCQM and Severe Obstetrics Complications eCQM as part of the designation. We will consider these measures as we continue to develop this designation. Any additional measures or data sources would undergo notice-and-comment rulemaking before inclusion in the designation. In regard to NQF endorsement, we remind readers that both of these eCQMs are currently undergoing NQF review and refer readers to our response in sections IX.E.5.c. and IX.E.5.d. to similar comments. While we prioritize measures that are endorsed when available, we reiterate that section 1886(b)(3)(B)(viii)(IX)(bb) of the Act provides an exception that, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. We further reiterate, as stated in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45365) that, given the severity of the maternal morbidity crisis and as there are currently no NQF-endorsed measures that address maternal morbidity through hospital participation in Statewide or national Perinatal QI Collaboratives, we believe it is important to implement this measure as soon as possible.

Comment: Many commenters suggested other measures for inclusion in the designation requirements. Several commenters recommended breastfeeding measures. Several commenters recommended that the designation include a requirement to demonstrate the provision of respectful maternity care, which could include training on cultural competency, implicit bias, and antiracism. A few commenters suggested demonstration of hiring practices that are culturally and community representative. A couple of commenters recommended maternity adaptations of the sixth CAHPS development cycle to track disrespect and related forms of provider behavior. The commenters also suggested Patient Reported Outcome Measures (PROMs) and Patient-Reported Outcome-based Performance Measures (PRO–PMs) measuring the various dimensions of respect and experience of care. Several commenters emphasized the importance of a designation that highlights hospitals providing access to a diverse maternity care workforce. Commenters cited certified nurse midwives and certified midwives, doulas, certified lactation consultants, community health workers, mental health professionals, and substance use treatment clinicians as vital members of the team. Some commenters recommended the designation include a requirement for hospitals to report whether or not they provide access to such providers. A commenter recommended CMS adopt a sufficient minimum staffing rate as a designation criterion to ensure quality and safety in maternity care delivery. One commenter recommended hospitals seeking the designation conduct simulations of urgent or emergency obstetric scenarios, attest that they have regional transport agreements in place, and that emergency department staff are trained in neonatal resuscitation. Another commenter recommended a measure of postpartum patients with new medical conditions who are discharged with at least seven days of medication. Another commenter recommended requiring implementation of the AIM Postpartum Discharge Transition Patient Safety Bundle.[1042] Another commenter suggested a structural measure of hospital participation in Maternal Early Warning System (MEWS) programs.[1043] Another commenter recommended measurement of the rate of completion of two-week postpartum visits. Another commenter recommended a measure of access to a certified lactation consultant. Another commenter suggested a measure of skin-to-skin rates. Another commenter recommended a measure of access to postpartum contraception (NQF #2902) as well as a measure of unexpected complications of the healthy newborn (NQF #0716). A couple of commenters recommended CMS include the establishment of a hemorrhage protocol as a requirement of the designation. Another commenter recommended implementation of a triage acuity tool specifically designed for obstetric units as a component of the designation.

Several commenters expressed concern about the rights of patients and their ability to access medically necessary care. A couple of commenters recommended that any hospitals that receive the designation be required to transparently report any non-medical restrictions on care, including bans on postpartum tubal ligations, offering other forms of postpartum contraception, and treatments for ectopic pregnancy or premature rupture of membranes. The commenters also requested a commitment from designated hospitals to publicly report the number of patients who are denied those forms of care each year. Additionally, the commenters recommended that designated hospitals not be allowed to send away patients with emergency medical conditions and should be required to comply with Emergency Medical Treatment and Labor Act (EMTALA). The commenters further encouraged CMS to utilize Beneficiary and Family Care Quality Improvement Organizations (BFCC–QIOs) and Quality Innovation Network (QIN) QIOs to help patients better understand the quality of care to which they are entitled, work with hospitals to improve delivery of care, assist patients with complaint processes, and help patients understand their rights and hospitals their obligations under EMTALA.

Response: We thank the commenters for their feedback and appreciate their robust recommendations. We note that we recently communicated with hospitals regarding their existing obligations to comply with EMTALA and refer readers to *https://www.cms.gov/files/document/qso-22-*

[1042] American College of Obstetrics and Gynecology. Alliance for Innovation on Maternal Health (AIM). 2014. Available at: *https://www.acog.org/practice-management/patient-safety-and-quality/partnerships/alliance-for-innovation-on-maternal-health-aim.*

[1043] TCHMB. Maternal Early Warning System. Available at: *https://www.tchmb.org/maternal-early-warning-system#:~:text=The%20Maternal%20Early%20Warning%20System,avoiding%20major%20morbidity%20and%20mortality.*

22-hospitals.pdf for more details.[1044] We further reaffirm our ongoing commitment to improving maternal health and note that actions related to many suggestions from commenters are discussed in more detail in the Biden-Harris Administration's Blueprint for Addressing the Maternal Health Crisis, including the call to eliminate coverage gaps for postpartum women by encouraging states to extend Medicaid coverage from 60 days to a full 12 months postpartum.[1045] The Blueprint also discusses plans to address the gaps in our perinatal workforce, including increasing the number of physicians, licensed midwives, doulas, and community health workers in communities that are historically underserved and under-resourced by the healthcare system; providing guidance to states to help them expand access to licensed midwives, doulas, and freestanding birth centers in Medicaid; and encouraging insurance companies to improve reimbursement for and coverage of licensed midwives and perinatal supports, such as doulas and nurse home visits.[1046] Additionally, the FY 2023 President's Budget allocates funds to help train providers on implicit biases as well as culturally and linguistically appropriate care and to educate and empower more pregnant women and families to know the early warning signs of pregnancy-related complications and behavioral health needs.[1047] We appreciate these recommendations as we consider future direction and policy related to the designation for future notice-and-comment rulemaking.

Comment: A commenter recommended future measures be submitted through the Measures Under Consideration (MUC) process.

Response: We thank the commenter for the suggestion and note that measures adopted for the Hospital IQR Program are required to go through the pre-rulemaking process (which includes the MUC process and review of the MAP) in compliance with section 1890A of the Act.

Comment: Another commenter cautioned that hospitals should not be penalized through components in the designation that fail to account for patients who choose to receive care from non-physician practitioners and are then transferred to physician care late in pregnancy due to an advanced complication. The commenter stated that many factors remain outside of the control of the hospital or treating physician and designation components should take this into account. A few commenters urged CMS to maintain facility-level measures under the designation and cautioned against the adoption of physician-level measures.

Response: We acknowledge the commenter's concern and understand the commenter to mean that hospitals may provide care to pregnant patients in labor or delivery who have not previously received care at that hospital and the commenter is concerned about the impact such situations may have on a hospital's ability to earn the designation. At this time, the designation is based solely on affirmative attestation to the Maternal Morbidity Structural measure and we do not believe that situations such as those described by the commenter would negatively affect a hospital's ability to attest to that measure. We further recognize that there are factors beyond the control of hospitals when treating pregnant women, but we believe that the maternal health crisis requires urgent action, and that this designation can support hospital action on maternal health quality improvement activities.

Comment: Several commenters suggested names for the new maternity care hospital designation. A few commenters suggested ''Quality Birthing Hospital'' as a possible name. A commenter recommended use of ''Birth Star Hospital'' or ''Better Birthing Hospital'' to reflect the quality of birthing care. Another commenter suggested ''Quality Care for Birthing People'' while another commenter recommended ''Quality Care and Birth Equity'' or ''Excellence in Birthing Outcomes.'' Another commenter suggested ''Birthing-Conscious Hospital'' to reflect the maternal and neonatal process. Another commenter suggested ''Center of Excellence in Maternity Care.''

Several commenters stated that the designation name should reflect the data it is measuring and meaningfully represent the population of interest. A commenter recommended that the name emphasize our commitment to excellence. Another commenter cautioned against a name that could be mistaken for marketing.

Several commenters were concerned that use of ''birthing-friendly'' was too similar to the Baby-Friendly Hospital Initiative, a program developed by the World Health Organization (WHO) and the United Nations International Children's Emergency Fund (UNICEF). The commenters encouraged moving away from use of ''birthing-friendly'' to avoid any potential confusion.

Response: We thank commenters for their suggestions and will take them into consideration for a future name for the designation.

e. Additional Activities To Advance Maternal Health Equity—Request for Information

We are committed to advancing equity for all, including those in historically underserved and under-resourced communities (American Indian or Alaska Native, Asian or Pacific Islander, Black, Hispanic, and other persons of color; members of religious minorities; lesbian, gay, bisexual, transgender, and queer (LGBTQ+) persons; persons with disabilities; persons who live in rural areas and others who have been historically underserved, marginalized, and adversely affected by persistent poverty and inequality).

We specifically sought to explore how we can address the U.S. maternal health crisis through policies and programs, including, but not limited to, the Conditions of Participation (CoPs) and through measures in our quality reporting programs. The CoPs are the health and safety standards that Medicare-certified providers and suppliers must meet to receive Medicare and Medicaid payment. CMS has broad statutory authority to establish health and safety regulations for various providers and suppliers; that statutory authority is usually found within the statutory definition of each provider and supplier type. In the case of hospitals, for instance, section 1861(e)(1) through (8) of the Act sets out specified requirements that hospitals must meet; in addition, section 1861(e)(9) of the Act requires hospitals to ''meet[ ] such other requirements as the Secretary finds necessary in the interest of the health and safety of individuals who are furnished services in the institution.''

We invited public comment on the following:

- CMS outlines best practices in the memorandum to state survey agencies entitled ''Evidence-Based Best Practices for Hospitals in Managing Obstetric

[1044] Centers for Medicare & Medicaid Services Center for Clinical Standards and Quality. QSO–22–22-Hospitals. Reinforcement of EMTALA Obligations specific to Patients who are Pregnant or are Experiencing Pregnancy Loss (QSO–21–22-HospitalsUPDATED JULY 2022). July 2022. Available at: *https://www.cms.gov/files/document/qso-22-22-hospitals.pdf.*

[1045] The White House. White House Blueprint for Addressing the Maternal Health Crisis. June 2022. Available at: *https://www.whitehouse.gov/wp-content/uploads/2022/06/Maternal-Health-Blueprint.pdf.*

[1046] The White House. White House Blueprint for Addressing the Maternal Health Crisis. June 2022. Available at: *https://www.whitehouse.gov/wp-content/uploads/2022/06/Maternal-Health-Blueprint.pdf.*

[1047] The White House. Budget of the U.S. Government Fiscal Year 2023. Accessed June 24, 2022. Available at: *https://www.whitehouse.gov/wp-content/uploads/2022/03/budget_fy2023.pdf.*

emergencies and Other Key Contributors to Maternal Health Disparities.'' [1048] What other additional effective best practices or quality improvement initiatives are currently being utilized by hospitals? How else can hospitals improve maternal health outcomes, enhance their quality of maternity care, and reduce maternal health disparities?

- For hospitals that offer inpatient maternity services, including labor and delivery care, how could the CoPs be modified to improve maternity care and address disparities in maternal health outcomes? How would hospitals focus their governance, provider and staff training, and care-delivery activities to effectively demonstrate compliance with CoPs related to improving maternal health outcomes? What types of measurable activities targeting maternal health outcomes might demonstrate a reduction in maternal health care disparities or improvement in maternal health care delivery?
- Are there new requirements that could be established in the CoPs that would require hospitals to address and improve the quality of postpartum care and support provided to patients? How can the CoPs specifically address the need to improve behavioral health services and monitoring offered during prenatal and postpartum care?
- Might the potential additional maternal health-focused CoPs have unintended consequences on providers with certain characteristics (such as being located in a rural area or having low-volume)? Please provide details on how certain providers might be differentially affected by potential maternal health CoPs. Are there barriers or facilitators that would influence rural hospital achievement of a publicly-reported maternal health designation that may not relate directly to the quality of services provided? How might maternal health CoPs impact providers considering whether it is feasible or viable to offer labor and delivery services in their area?
- What services and staff training should hospitals without inpatient maternity services have in place in preparation for patients in labor?
- What are the best practices that hospitals are utilizing to educate and conduct outreach to patients in underserved communities to increase access to timely maternity care?
- What are best practices for hospitals to actively engage with patients and their families, community-based organizations, and others within their local community to obtain information on ways to improve maternity care? Are there barriers to such engagement (if so, what are the barriers)?
- Do hospitals provide prevention-related education and community outreach on the specific maternal health conditions that have the greatest impact on disadvantaged and underserved communities?
- How can hospitals review and monitor aggregate data on the maternal health risks of the patient population that they serve? What data should hospitals review related to the maternal health risks of the patient population they serve? What data sharing best practices are required for hospitals to share data with external entities, including local and state health departments, community-based organizations, or other health care providers? How can hospitals connect data collected for mothers and their babies after delivery to support research and evaluation of maternal health care after delivery?
- What challenges are there to collecting data on patients with specific maternal health risks? Can these data be stratified by demographics (for example, race and ethnicity)? In addition, how can these data be used in a hospital's quality improvement efforts, and specifically, in their quality assurance and performance improvement (QAPI) program, to improve maternal health outcomes and advance health equity and reduce disparities within their facility? How can maternity care can be incorporated into an ongoing QAPI program?
- How do hospitals conduct reviews of maternal deaths that have occurred within the facility?
- Are hospitals currently utilizing community health needs assessments to determine the specific maternity care needs and social determinants of health of the patient population that they serve? For those hospitals that are utilizing community health needs assessments, are there certain best practices or examples of ways that this assessment can be used to reduce disparities in maternal outcomes?
- Do hospitals have reporting relationships or mechanisms among primary care physicians, obstetrician-gynecologists, and other health care providers such as nurses and certified nurse midwives, and community-based perinatal workers, such as doulas, for optimal coordination of care?
- Do hospitals have readily available referral relationships and points of contact with community resources or community-based organizations to address additional services that a postpartum patient may need upon discharge? This could include the consideration of behavioral and mental health services or resources to address health-related social needs, such as food insecurity, housing instability, and transportation challenges. If hospitals do not have readily available referral relationships and points of contact within the community, what barriers and facilitators impact hospital relationships with community resources or community-based organizations?
- How do hospitals evaluate their perinatal customer experience? What are best practices that are currently being utilized for getting robust input from patients on their perinatal experience?
- What best practices exist for ensuring systemic racism and biases, including implicit bias, are not perpetuated in maternity care?

We received comments on this topic.

Comment: Commenters provided many recommendations for additional maternal health considerations. These included suggestions on how to effectively disseminate best practices in maternity care, the potential applicability of CoPs related to maternal health outcomes, staff training on antiracism and implicit bias in maternity care, approaches for risk-adjustment and stratification of maternal health data, frameworks for implementing maternal health safety monitoring programs, integration of comprehensive clinical and community-based maternity care delivery systems, opportunities for hospitals to build referral relationships with community-based providers, staffing cross-functional and holistic maternity care teams, and designing customer experience and evaluation tools for maternity care patients and families.

Commenters additionally shared examples from state, local, and regional groups as well as individual hospitals working to improve maternity care. Commenters also urged our pursuit of meaningful, continuous outreach with interested parties to ensure that future maternal health actions are effective and add value to hospitals, patients, and communities.

Response: We appreciate learning about the many meaningful programs and practices hospitals are utilizing across our nation and the commitment to implementation of evidence-based practices to improve maternal health and maternity care delivery. We also

[1048] Evidence-based best practices for hospitals in managing obstetric emergencies and other key contributors to maternal health disparities. U.S. Department of Health and Human Services. *https://www.hhs.gov/guidance/document/evidence-based-best-practices-hospitals-managing-obstetric-emergencies-and-other-key.*

thank commenters for the range of recommendations and measure suggestions. As noted in the Blueprint, every person should have a safe, dignified pregnancy and birth and equitable access to health care before, during, and after pregnancy.[1049] We will consider all input as we continue to develop and make progress in strategies that address maternity care quality, safety, and equity in the Hospital IQR Program, through potential new CoPs, and other CMS activities, and will continue outreach to interested parties on future maternal health actions.

9. Future Considerations

We seek to develop a comprehensive set of quality measures to be available for widespread use for informed decision-making and quality and cost improvements through the inpatient hospital setting. We have identified potential future measures for future development, which we believe address areas that are important to stakeholders, but which are not currently covered in the Hospital IQR Program. Therefore, in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28550) we sought comment on these potential future considerations, as detailed later in the section.

We also refer readers to the following sections: (1) section IX.A. where we sought comments from stakeholders on the health impacts due to climate change, especially on underserved populations, and how we could potentially support hospitals and health systems to more effectively determine and plan for climate impacts, reduce greenhouse gas emissions, and track progress; (2) section IX.B. where we sought input on overarching principles in measuring healthcare quality disparities in hospital quality programs and value-based purchasing programs; and (3) section IX.C. where we sought input on ongoing ways we can advance digital quality measurement and use of Fast Healthcare Interoperability Resources (FHIR) in quality reporting programs.

a. Potential Future Inclusion of Two Digital National Healthcare Safety Network (NHSN) Measures

The Hospital IQR Program previously included NHSN measures that were finalized for removal from the measure set in the FY 2019 IPPS/LTCH PPS final rule (83 FR 4157 through 41553), and retained in the Hospital-Acquired Condition (HAC) Reduction Program (83 FR 41474 through 41477; 83 FR 41449 through 41452) and the Hospital VBP Program (83 FR 41449 through 41452). We have recently identified two new potential measures that utilize EHR-derived data to help address hospital-based adverse events, specifically, hospital-onset infections.

In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28550 through 28554), we discussed these two measures in more detail and sought public comment on the future inclusion of these measures in the Hospital IQR Program. We also invited public comment on other aspects of these two measures related to future implementation. In addition, we sought public comment on the application of one or both of these measures in other quality reporting programs, including the HAC Reduction Program, the Hospital VBP Program, the PCHQR Program, and the LTCH QRP.

(1) National Healthcare Safety Network (NHSN) Healthcare-Associated Clostridioides difficile Infection Outcome Measure

(a) Background

Clostridioides difficile [1050] is a bacterium that causes diarrhea, pseudomembranous colitis, and toxic megacolon which can lead to sepsis or death.[1051] [1052] [1053] *Clostridioides difficile* infections (CDI) can be reduced in healthcare settings using a multi-faceted approach, including development of an infrastructure for monitoring CDI, implementation of effective antibiotic stewardship to reduce the use of unnecessary antibiotics, isolation and contact precautions for patients with CDI, performance of environmental cleaning with sporicidal agents, and other measures.[1054] CDI is one of the most common healthcare-associated infections (HAIs) in the U.S.[1055] [1056] At any given time, 1 in 31 patients has an HAI in the U.S., and over a million cases of HAIs are reported every year, making HAIs one of the most common adverse events that occurs in a healthcare setting.[1057] [1058]

As one of the most common HAIs, CDIs are a significant contributor to inpatient morbidity and mortality, particularly among older adults.[1059] Incidence of CDI is higher among White patients, female patients, and patients over 65 years of age.[1060] CDIs result in an estimated 500,000 cases annually and between 15,000 and 20,000 deaths.[1061] Additionally, costs associated with CDIs average about $11,400 per case and can have a significant impact on the U.S. healthcare system.[1062] More broadly, HAIs cost over $9.8 billion dollars annually with CDIs contributing to 15.4 percent, or about $1.5 billion dollars of these total annual costs.[1063] Therefore, we currently require reporting of CDI outcomes, along with other HAIs, in value-based purchasing programs like the Hospital VBP Program and HAC

[1063] Zimlichman E, Henderson D, Tamir O, et al. (2013). Health care-associated infections: a meta-analysis of costs and financial impact on the US health care system. JAMA Intern Med.173(22):2039–46. doi: 10.1001/jamainternmed.2013.9763.

Reduction Program, in order to connect performance on HAI measures with payment adjustments.[1064]

The CDC has developed the National Healthcare Safety Network (NHSN) Healthcare-Associated *Clostridioides difficile* Infection Outcome measure that utilizes EHR-derived data. The goal of this measure is to drive an increase in prevention practices, which would result in fewer CDI cases and reduced morbidity and mortality in patients. We believe this would be especially useful given that most cases of CDIs may be prevented or stopped from spreading to other patients when inpatient facilities utilize infection control steps recommended by the CDC. We believe utilizing the CDC's NHSN reporting and submission infrastructure will impose less administrative burden related to data collection and submission for this measure.

Previously, the Hospital IQR Program included a CDI measure which only required CDI facility-wide Lab-ID event reporting (we refer readers to the FY 2012 IPPS/LTCH PPS final rule, 76 FR 51630 through 51631).[1065] The newly developed version of the measure would improve on the original version of the measure by requiring both microbiologic evidence of CDI in stool and evidence of antimicrobial treatment, whereas the original measure only required CDI facility-wide Lab-ID event reporting. The addition of anti-microbial treatment evidence may provide further validity in the reporting of CDIs, as it serves as a surrogate for test results that were clinically interpreted as true infections.

The NHSN Healthcare-Associated *Clostridioides difficile* Infection Outcome measure addresses the quality priority of ''Make Care Safer by Reducing Harm Caused in the Delivery of Care'' through the Meaningful Measures Area of ''Healthcare Associated Infections.'' [1066]

Additionally, pursuant to Meaningful Measures 2.0, this measure addresses the ''Safety'' and ''Wellness and Prevention'' priority areas and aligns with our commitment to a patient-centered approach in quality measurement to ensure that patients are safe and receive the highest quality care.[1067]

In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28551 through 28552), we requested feedback on the potential future inclusion of the NHSN Healthcare-Associated *Clostridioides difficile* Infection Outcome measure into the Hospital IQR Program measure set to aid in disease monitoring, provide hospitals and patients with more information to inform care delivery, and improve patient outcomes.

(b) Overview of Measure

The NHSN Healthcare-Associated *Clostridioides difficile* Infection Outcome measure would track the development of new CDIs among patients already admitted to healthcare facilities, using algorithmic determinations from data sources widely available in EHRs. Both the original and new measure employ the Standardized Infection Ratio (SIR), a statistic used to track HAIs over time. Along with the SIR, this new measure would also use the Adjusted Ranking Metric (ARM) of hospital-onset CDIs among hospitalized patients. The SIR is a primary summary statistic used by the NHSN to track HAIs, and ARM is a new statistic available for acute care hospitals that accounts for differences in the volume of exposure (specifically, denominator) between facilities. ARM provides complementary information to the SIR as ARM provides the reliability-adjusted number of events and allows for ranking facilities.[1068]

The measure was previously endorsed by MAP on June 11, 2019. The CDC submitted the measure for re-endorsement and it was included in the publicly available ''List of Measures Under Consideration for December 1, 2021'' (MUC List),[1069] a list of measures under consideration for use in various Medicare programs. The NHSN Healthcare-Associated *Clostridioides difficile* Infection Outcome measure (MUC2021–098) was reviewed by the NQF MAP Hospital Workgroup on December 15, 2021, and received conditional support pending NQF review and re-endorsement once the revised measure is fully tested.[1070] The MAP Coordinating Committee, which provides direction to the MAP workgroups, concurred with the recommendations of the MAP Hospital Workgroup.[1071] We understand that the CDC intends to submit the measure in the future for NQF review and endorsement.

(c) Data Sources

Hospitals would provide data for this measure from their EHRs. The primary sources of data for determining numerator events include microbiology data (CDI test), medication administration data (CDI antimicrobial treatment), and patient encounter, demographic, and location information.

To facilitate rapid, automated, and secure data exchange, the CDC's NHSN is planning to enable and promote reporting of this measure using FHIR. However, as FHIR capabilities are evolving and not yet uniform across healthcare systems, the CDC is also planning on enabling reporting using the existing Health Level 7 (HL7) Clinical Document Architecture (CDA), and potentially other formats as well to provide all facilities with an option for reporting. We are also working with the CDC and ONC to consider how certified health IT can support reporting of data for this measure.

We invited public comment on potential reporting formats for this measure.

(d) Outcome

The outcome of interest is the number of new CDIs among patients already admitted to healthcare facilities.

[1064] Centers for Disease Control and Prevention. (2018). Analysis and Recommendations on the NHSN *Clostridioides difficile* Outcome. Available at: *https://www.cdc.gov/hicpac/pdf/NHSN-C-diff-H.pdf#:~:text=NHSN%20is%20the%20most%20widely%20used%20secure%2C%20internet-based,decreasing%20in%20contrast%20to%20other%20healthcare-associated%20infections.%202.*

[1065] In the FY 2019 IPPS/LTCH PPS final rule (83 FR 41547 through 41553) we removed the NHSN Facility-Wide Inpatient Hospital-Onset Clostridium difficile Infection (CDI) Outcome measure (NQF #1717) from the Hospital IQR Program measure set but retained it in the HAC Reduction Program and Hospital VBP Program where it is reported via the CDC NHSN portal (83 FR 41474 through 41477; 83 FR 41449 through 41452). We removed this measure under removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program (83 FR 41547).

[1066] Centers for Medicare & Medicaid Services. (2021). Meaningful Measures Hub. Available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/QualityInitiativesGenInfo/MMF/General-info-Sub-Page.*

Available at: *https://www.qualityforum.org/Publications/2022/03/MAP_2021-2022_Considerations_for_Implementing_Measures_Final_Report_-_Clinicians,_Hospitals,_and_PAC-LTC.aspx.*

(e) Cohort

The measure cohort consists of all patients in the denominator: the expected number of hospital-acquired CDIs based on predictive models using facility- and patient- care location data as predictors.

(f) Exclusion Criteria

The measure excludes patients in the denominator who are not assigned to an inpatient bed in an applicable location, including outpatient clinics and ED visits. Patients <365 days old will also be excluded. As an aside, inpatient rehabilitation locations and inpatient psychiatric locations that have their own CMS Certification Number (CCN) are also excluded from the denominator.

(g) Risk adjustment

The risk adjustment was developed with a statistical risk model. The SIR is risk adjusted for each facility, and the ARM adjusts for volume of exposure between facilities as well as risk adjustment.

(h) Measure Calculation

The measure assesses the development of new CDI among patients already admitted to healthcare facilities.

(i) Numerator and Denominator

The measure's denominator consists of the expected number of hospital-associated CDIs based on predictive models using facility and patient care location data as predictors. The numerator consists of the total observed number of observed CDIs among all inpatients in the facility based on the combination of laboratory test for CDIs plus a therapeutic administered within a window period around the specimen date.

We received comments on this topic.

Comment: Many commenters supported the potential inclusion of the NHSN Healthcare-Associated *Clostridioides difficile* Infection Outcome measure in the Hospital IQR Program, stating that it is an improvement over the previously developed CDC NHSN Facility-wide Inpatient Hospital-onset *Clostridium difficile* Outcome Measure and will prevent hospital-acquired infections. A few commenters suggested that we use a phased adoption timeline to give hospitals time to familiarize themselves with reporting measure data. A commenter supported the measure on the condition that certified health IT systems can support data reporting for this measure.

Response: We thank the commenters for their support and suggestions to improve the measure. We will continue to collaborate with the CDC and take the feedback into account for future notice-and-comment rulemaking.

Comment: Several commenters did not support potential inclusion of the NHSN Healthcare-Associated *Clostridioides difficile* Infection Outcome measure into the Hospital IQR Program. A commenter opposed adoption because the measure has not received NQF endorsement yet, while another cited uncertainties in the measure definitions. A commenter stated that the measure does not take into account patient factors that increase the risk of developing CDIs. A commenter believed that the technology to report this measure is currently not ready for use. Another commenter did not support providing evidence of antimicrobial treatment for CDI.

Response: We thank the commenters for their feedback and for sharing their concerns. We will continue to collaborate with the CDC and consider this feedback during future notice-and-comment rulemaking.

Comment: Many commenters requested that we postpone adopting the NHSN Healthcare-Associated *Clostridioides difficile* Infection Outcome measure until it has been fully tested for validity and reliability and receives NQF endorsement. Several commenters recommended that the measure exclude immunocompromised patients or include risk adjustment based on patients' vulnerability to infections. A commenter recommended that the measure include an exclusion for infections following the use of antibiotics and expressed concern about the measure's impact on rural and low-volume hospitals. A few commenters requested additional clarification and guidance on the measure definitions.

Response: We appreciate the commenters' recommendations. We note that the CDC is still refining the measure specifications. We will take this feedback into consideration as part of future notice-and-comment rulemaking.

Comment: Several commenters were concerned that the NHSN Healthcare-Associated *Clostridioides difficile* Infection Outcome measure might have unintended side effects, such as hospitals discouraging health care practitioners from testing or treating patients for CDIs to reduce the number of patients reported in the numerator. To prevent this, a few suggested that we consider working with the CDC to monitor for such practices, or conduct parallel monitoring of complementary metrics. A few commenters expressed concern over the administrative burden of reporting the measure, especially while Fast Healthcare Interoperability Resources (FHIR) and other electronic reporting capabilities are still evolving. A few others suggested that CMS delay mandatory reporting to provide hospitals with enough time to develop their digital reporting capabilities. A commenter recommended that the measure include incentives to hire infection prevention staff given that existing staff are already overworked.

Response: We thank commenters for their feedback and share their concern for avoiding any negative effects on patient care arising from adoption of this measure. We note that this measure is not being proposed for adoption at this time and we requested input as we consider its future inclusion into quality reporting and value-based programs. We will take these comments into consideration as part of future notice-and-comment rulemaking.

Comment: Several commenters shared their feedback on including the NHSN Healthcare-Associated *Clostridioides difficile* Infection Outcome measure in the Hospital VBP and HAC Reduction Programs. A few commenters were supportive of including the measure in the value-based purchasing programs, with a commenter noting that including this potential future measure in the Hospital VBP and HAC Reduction Programs could improve quality of care, especially for the most vulnerable patients. A few commenters expressed concern that the new digital measure is not yet ready for the value-based purchasing programs because it lacks baseline testing data, the measure definitions need refinement, and the risk adjustment methodology does not account for patient factors that increase the risk of developing CDIs. They urged that this measure be fully defined, validated, and NQF endorsed prior to implementation. A commenter expressed their belief that CMS should not adopt this measure for the Hospital VBP Program or HAC Reduction Program until hospitals can consistently report using FHIR or testing confirms comparable results using different reporting methods. A commenter sought clarification on how this potential future measure would be weighted in the Hospital VBP and HAC Reduction Programs and how CMS would establish baseline data from which to determine percentiles and rankings that would impact Hospital VBP and HAC Reduction Program payments. Another commenter recommended that the CDC NHSN MRSA and CLABSI measures be maintained in their current programs because they are more specific and better understood by consumers. A commenter stated that CMS should

match the measure definition with the one utilized in the CDI project as part of the CDC's Emerging Infections Program (EIP) and consider general measure alignment with EIP.

Response: We thank commenters for their feedback on the potential future inclusion of this measure in the Hospital VBP and HAC Reduction Programs, and we will consider it for future notice-and-comment rulemaking. We note that specifics about weighting and scoring of any future measures would be proposed in future notice and comment rulemaking.

Comment: A commenter supported the potential inclusion of the NHSN Healthcare-Associated *Clostridioides difficile* Infection Outcome measure in the PCHQR Program pending removal of the previously adopted NHSN Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure. The commenter also requested that the measure take into consideration that cancer hospitals using PCR testing for CDIs may be penalized unfairly because of the test's higher sensitivity than other testing options. Another commenter supported the measure once it has been fully refined and receives NQF endorsement, stating that the measure would protect patients at cancer hospitals, who as a population are at a higher risk of contracting HAIs.

Response: We thank the commenters for their support and will take their feedback into consideration.

(2) National Healthcare Safety Network (NHSN) Hospital-Onset Bacteremia & Fungemia Outcome Measure

(a) Background

HAIs are the most frequent adverse event in the delivery of healthcare globally.[1072] Incidence rates for most types of HAIs had been declining for several years in the U.S., but the COVID–19 pandemic reversed these trends.[1073] Central line-associated bloodstream infections (CLABSI) declined 31 percent between 2015 and 2019.[1074] Despite this initial trend, the SIR for CLABSI increased in 2020 compared to 2019 in the later quarters due to the pandemic. The NHSN found a 47 percent increase in CLABSI in Quarter 4 of 2020 compared to Quarter 4 of 2019. Overall, CLABSI increased by 24 percent from 2019 to 2020, with the largest increase (50 percent) being found in the ICU. Other types of infections also rose during this period, including hospital-onset MRSA by 15 percent, and Ventilator-Associated Events (VAE) by 35 percent.[1075]

One likely reason for this reversal was the staffing and institutional challenges of caring for COVID–19 patients, which led to a breakdown in previous standards of care. In qualitative studies, infection prevention teams have reported that the pandemic made it difficult to maintain routine CLABSI prevention practices in the ICU.[1076] Another possible reason is that many hospitals underwent large staffing changes, leading to more workers who were not accustomed to the hospital's standard HAI prevention practices.[1077]

The NHSN Hospital-Onset Bacteremia & Fungemia Outcome measure was developed to help further our goal of addressing patient safety outcomes in the hospital care setting. The frequency of hospital fungemia and bacteremia infection rates in the U.S. present unique opportunities for large-scale quality measurement and improvement activities. Statistics on preventability vary but suggest that a considerable proportion of fungemia and bacteremia could be prevented.[1078] The NHSN Hospital-Onset Bacteremia & Fungemia Outcome measure is intended to facilitate safer patient care by increasing awareness of the dangers of fungemia and bacteremia, promoting adherence to recommended clinical guidelines, and encouraging hospitals to track and improve their practices of appropriate monitoring and care delivery for patients. For these reasons, we requested feedback on the potential future inclusion of this measure into the Hospital IQR Program measure set to aid in disease monitoring, provide hospitals and patients with more information to inform care delivery, and improve patient outcomes.

Under CMS' Meaningful Measures Framework, the NHSN Hospital-Onset Bacteremia & Fungemia Outcome measure addresses the quality priority of ''Make Care Safer by Reducing Harm Caused in the Delivery of Care'' through the Meaningful Measures Area of ''Healthcare Associated Infection.'' [1079] Additionally, pursuant to Meaningful Measures 2.0, this measure addresses the ''Safety'' priority area and aligns with our commitment to a patient-centered approach in quality measurement to ensure that patients are safe and receive the highest quality care.[1080]

While the HAC Reduction Program and Hospital VBP Program use several HAI measures, we believe that the NHSN Hospital-Onset Bacteremia & Fungemia Outcome measure may be necessary to build upon previous efforts to reduce HAIs because it encompasses all types of bacteremia and fungemia that occur among already hospitalized patients. Meanwhile, the NHSN Central Line-Associated Bloodstream Infection (CLABSI) Outcome measure and NHSN Facility-wide Inpatient Hospital-onset Methicillin-resistant Staphylococcus aureus (MRSA) Bacteremia Outcome measure only capture specific types of HAIs.

In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28553), we invited public comment on the potential use of this measure in the Hospital IQR Program. We are also considering its use in the PCHQR Program and the possibility of replacing the current CLABSI and MRSA measures in the

HAC Reduction Program and Hospital VBP Program with the NHSN Hospital-Onset Bacteremia & Fungemia Outcome measure.

(b) Overview of Measure

This measure captures the development of new bacteremia and fungemia among patients already admitted to acute care hospitals, using algorithmic determinations from data sources widely available in EHRs.

The NHSN Hospital-Onset Bacteremia & Fungemia Outcome measure was previously endorsed by MAP on June 11, 2019. The CDC submitted the measure for re-endorsement and it was included in the publicly available ''List of Measures Under Consideration for July 15, 2021'' (MUC List),[1081] a list of measures under consideration for use in various Medicare programs. The NHSN Hospital-Onset Bacteremia & Fungemia Outcome measure (MUC2021–100) was reviewed by the NQF MAP Hospital Workgroup on December 15, 2021 and received conditional support pending NQF review and re-endorsement once the revised measure is fully tested.[1082] The MAP Coordinating committee, which provides direction to the MAP workgroups, concurred with the recommendations of the MAP Hospital Workgroup. We understand that the CDC intends to submit the measure in the future for NQF review and endorsement.

(c) Data Sources

The data submission and reporting standard procedures for the NHSN Hospital-Onset Bacteremia & Fungemia Outcome measure have been set forth by the CDC for NHSN participation in general and for submission of measure data. Although the NHSN Hospital-Onset Bacteremia & Fungemia Outcome measure is not specified as an eCQM, manual data entry is not available. The primary sources of data for determining numerator events include microbiology data (blood culture) and patient encounter, demographic, and location information often located in Admission-Discharge-Transfer data (Fast Healthcare Interoperability Resources (FHIR): Encounter, Patient, Observation, Location).

To facilitate rapid, automated, and secure data exchange, the CDC's NHSN is planning to enable and promote reporting of this measure using FHIR. However, as FHIR capabilities are evolving and not uniform across healthcare systems, the CDC is also planning on enabling reporting using the existing Health Level 7 (HL7) Clinical Document Architecture (CDA), and potentially other formats as well to provide all facilities with an option for reporting. We are also working with the CDC and ONC to consider how certified health IT can support reporting of data for this measure.

We invited public comment on potential reporting formats for this measure.

(d) Outcome

The measures outcome (numerator) is defined as the observed number of HOB events. This is defined as growth of a recognized bacterial or fungal pathogen from a blood culture specimen collected on the 4th calendar day of admission or later (where the date of admission to an inpatient location is calendar day 1).

(e) Cohort

The measures outcome (numerator) is defined as the observed number of hospital-onset bacteremia and fungemia (HOB) events based on predictive models using facility-level factors (community-onset incidence of bacteremia and fungemia, blood culture utilization rates), patient care location, and potentially other data as predictors.

(f) Exclusion Criteria

The measure has two numerator exclusions for patients with previous matching POA bacteremia or fungemia. The first numerator exclusion is HOB infections in which the pathogen is the same species or genus level as the one identified from a blood specimen by culture that the hospital collected in the POA window (defined as hospital calendar day three or earlier). Additionally, if multiple pathogens are identified from the same blood culture, then a match of any of those pathogens to a POA blood pathogen is sufficient to exclude the event from the HOB measure. The measure also excludes patients with a previous HOB event who experience additional HOB events during the same hospital admission. We understand that the CDC may consider additional exclusion criteria for patients with significant risk factors for bacteremia or fungemia infections that are judged not likely to be preventable in rigorous studies.

The measure has one denominator exclusion for data from patients who are not assigned to an inpatient bed in an applicable location. As an aside, denominator counts exclude data from inpatient rehabilitation units and inpatient psychiatric units with a unique CCN from the acute care facility.

(g) Measure Calculation

The measure is an outcome measure that assesses the observed number of HOB events. The measure calculates the ratio of the observed number of HOB events out of the expected number of HOB events based on predictive models using facility and patient care location data as predictors.

We received comments on this topic.

Comment: Many commenters supported the potential inclusion of the NHSN Hospital-Onset Bacteremia & Fungemia Outcome measure to the Hospital IQR Program. Numerous commenters stated that the measure would improve patient safety by preventing hospital-acquired infections. Several commenters supported the digital reporting aspect of the measure, expressing their belief that it would make reporting less subjective, make data more traceable, and reduce the administrative burden on hospital staff. A commenter specifically supported the flexibility of reporting via either FHIR or HL7. A commenter supported the measure for adoption in the Hospital IQR Program prior to adding the measure to other quality programs to determine the measure's validity.

Response: We thank the commenters for their support. We will continue to collaborate with the CDC and keep this feedback in mind as part of future notice-and-comment rulemaking.

Comment: Many commenters did not support the potential inclusion of the NHSN Hospital-Onset Bacteremia & Fungemia Outcome measure in the Hospital IQR Program. Numerous commenters opposed adoption because the measure has not received NQF endorsement and has yet to be fully tested, while a few others stated that hospitals would incur a significant burden to prepare for reporting electronically sourced data. Several commenters opposed adoption of this measure because it does not take into account patient factors that can increase their risk of developing CDIs. Some expressed concern over potential unintended side effects of this measure, such as the overuse of antibiotics and placing major teaching hospitals at a disadvantage. A commenter cited the uncertainties in measure definitions.

Response: We thank the commenters for their feedback and acknowledge their concerns. We will continue to collaborate with the CDC and consider this feedback as we determine the

[1081] Centers for Medicare & Medicaid Services. (2021). List of Measures Under Consideration for December 1, 2021. Available at: *https://www.cms.gov/files/document/measures-under-consideration-list-2021-report.pdf.*

[1082] National Quality Forum. (2022). Measure Applications Partnership (MAP) 2021–2022 Final Recommendations. Available at: *https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=96698.*

potential future inclusion of this measure.

Comment: Many commenters expressed their belief that the measure specifications need to be further refined. Several commenters suggested that the measure exclude immunocompromised patients or include risk adjustment based on patients' vulnerability to infections, to account for factors outside of hospitals' control. Several other commenters posed questions about the measure definitions and requested additional clarification. A commenter recommended that the measure account for the type of vascular access device used in patients with HOBs. Several commenters recommended that we postpone adoption of the measure to the Hospital IQR Program until the measure has been validated and NQF endorsed.

Response: We appreciate the recommendations and requests for information. We note that the CDC is still refining the measure specifications. We will take this feedback into consideration as part of future notice-and-comment rulemaking.

Comment: Many commenters were concerned that collecting, reviewing, and reporting data for the NHSN Hospital-Onset Bacteremia & Fungemia Outcome measure would be a major burden to hospital staff. Several stated that preparing for digital reporting would be time- and resource-intensive for hospitals while a few others expressed their belief that the measure would be overly burdensome to infection control staff. To improve the measure implementation process, a few commenters recommended that we implement voluntary reporting until the measure has been fully refined, hospitals have time to prepare for reporting, and the technology for data submission is mature.

A few other commenters were concerned about unintended consequences for patient care, including that hospitals might use antimicrobials inappropriately or reduce blood culture orders. To prevent this, A commenter recommended that we consider another measure focused on specific types of bacteremia and fungemia instead. A few commenters recommended that we monitor additional sources of data for surveillance in addition to the NHSN Hospital-Onset Bacteremia & Fungemia Outcome measure, such as complementary NHSN metrics.

Response: We appreciate commenters sharing their concerns. We will consider the recommendations for improving the measure and preventing unintended consequences as we consider the potential future inclusion of this measure.

Comment: Several commenters provided feedback on including the NHSN Hospital-Onset Bacteremia & Fungemia Outcome measure in the Hospital VBP and HAC Reduction Programs. A few commenters supported the inclusion of this measure in the value-based purchasing programs, with a commenter noting it was a step in the right direction. A few commenters expressed concern that the new digital measure is not yet ready for adoption because it lacks baseline testing data, the measure definitions need refinement, and the risk adjustment methodology does not account for patient factors that increase the risk of developing CDIs. They urged that we ensure that this measure is fully defined, validated, and NQF endorsed prior to implementation. A commenter stated that CMS should not adopt this measure for the Hospital VBP Program or HAC Reduction Program until hospitals can consistently report using FHIR or testing confirms comparable results using different reporting methods. A commenter recommended that the HOB measure replace the CDC NHSN MRSA and CLABSI measures. Another commenter suggested that the CDC NHSN MRSA and CLABSI measures be maintained in the Hospital VBP and HAC Reduction Programs because they are more specific and better understood by consumers. A commenter recommended peer baselining the measure to account for institutional differences in demographics and size.

Response: We thank commenters for their feedback on the potential future inclusion of this measure in the Hospital VBP and HAC Reduction Programs. We will consider all input and note that any future proposal to implement such a measure would be announced through future notice-and-comment rulemaking.

10. Form, Manner, and Timing of Quality Data Submission

a. Background

Sections 1886(b)(3)(B)(viii)(I) and (b)(3)(B)(viii)(II) of the Act state that the applicable percentage increase for FY 2015 and each subsequent year shall be reduced by one-quarter of such applicable percentage increase (determined without regard to sections 1886(b)(3)(B)(ix), (xi), or (xii) of the Act) for any subsection (d) hospital that does not submit data required to be submitted on measures specified by the Secretary in a form and manner, and at a time, specified by the Secretary. To successfully participate in the Hospital Inpatient Quality Reporting (IQR) Program, hospitals must meet specific procedural, data collection, submission, and validation requirements. Previously, the applicable percentage increase for FY 2007 and each subsequent fiscal year until FY 2015 was reduced by 2.0 percentage points for subsection (d) hospitals failing to submit data in accordance with the previous description. In accordance with the statute, the FY 2023 payment determination will begin the ninth year that the Hospital IQR Program will reduce the applicable percentage increase by one-quarter of such applicable percentage increase.

b. Maintenance of Technical Specifications for Quality Measures

For each Hospital IQR Program payment determination, we require that hospitals submit data on each specified measure in accordance with the measure's specifications for a particular period of time. We refer readers to the FY 2019 IPPS/LTCH PPS final rule (83 FR 41538), in which we summarized how the Hospital IQR Program maintains the technical measure specifications for quality measures and the subregulatory process for incorporation of nonsubstantive updates to the measure specifications to ensure that measures remain up-to-date. We did not propose any changes to these policies in the proposed rule.

The data submission requirements, Specifications Manual, and submission deadlines are posted on the QualityNet website at: *https://qualitynet.cms.gov* (or other successor CMS designated websites). The CMS Annual Update for the Hospital Quality Reporting Programs (Annual Update) contains the technical specifications for electronic clinical quality measures (eCQMs). The Annual Update contains updated measure specifications for the year prior to the reporting period. For example, for the CY 2022 reporting period/FY 2024 payment determination, hospitals are collecting and will submit eCQM data using the May 2021 Annual Update and any applicable addenda. The Annual Update and implementation guidance documents are available on the Electronic Clinical Quality Improvement (eCQI) Resource Center website at: *https://ecqi.healthit.gov/*.

Hospitals must register and submit quality data through the Hospital Quality Reporting (HQR) System (previously referred to as the QualityNet Secure Portal) (86 FR 45520). The HQR System is safeguarded in accordance with the HIPAA Privacy and Security Rules to protect submitted patient information. See 45 CFR parts 160 and 164, subparts A, C, and E.

We also refer readers to section IX.C. of the preamble of the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28486 through 28491) where we requested information on potential actions that would continue to transform the Hospital IQR Program's quality measurement enterprise toward the use of the FHIR standard for data submission.

c. Procedural Requirements

The Hospital IQR Program's procedural requirements are codified in regulation at 42 CFR 412.140. We refer readers to these codified regulations for participation requirements, as further explained by the FY 2014 IPPS/LTCH PPS final rule (78 FR 50810 through 50811) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57168). The previously finalized requirements, including setting up a QualityNet account and the associated timelines, are described at 42 CFR 412.140(a)(2), 42 CFR 412.140(e)(2)(iii), and in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51639 through 51640). In the FY 2022 IPPS/LTCH PPS final rule, we finalized the following changes to the Hospital IQR Program regulation text: (1) Update references to the QualityNet website at 42 CFR 412.140(a)(1) and 42 CFR 412.140(c)(2)(i); and (2) use the term ''QualityNet security official'' instead of ''QualityNet Administrator'' at 42 CFR 412.140(a)(2). We did not propose any changes to these policies in the proposed rule.

d. Data Submission Requirements for Chart-Abstracted Measures

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51640 through 51641), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53536 through 53537), and the FY 2014 IPPS/LTCH PPS final rule (78 FR 50811) for details on the Hospital IQR Program data submission requirements for chart-abstracted measures. We did not propose any changes to these policies in the proposed rule.

e. Reporting and Submission Requirements for eCQMs

(1) Background

For a discussion of our previously finalized eCQMs and policies, we refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50807 through 50810; 50811 through 50819), the FY 2015 IPPS/LTCH PPS final rule (79 FR 50241 through 50253; 50256 through 50259; and 50273 through 50276), the FY 2016 IPPS/LTCH PPS final rule (80 FR 49692 through 49698; and 49704 through 49709), the FY 2017 IPPS/LTCH PPS final rule (81 FR 57150 through 57161; and 57169 through 57172), the FY 2018 IPPS/LTCH PPS final rule (82 FR 38355 through 38361; 38386 through 38394; 38474 through 38485; and 38487 through 38493), the FY 2019 IPPS/LTCH PPS final rule (83 FR 41567 through 41575; 83 FR 41602 through 41607), the FY 2020 IPPS/LTCH PPS final rule (84 FR 42501 through 42506), the FY 2021 IPPS/LTCH PPS final rule (85 FR 58932 through 58940), and the FY 2022 IPPS/LTCH PPS final rule (86 FR 45417 through 45421).

In the FY 2018 IPPS/LTCH PPS final rule, we finalized eCQM reporting and submission requirements such that hospitals were required to report only one, self-selected calendar quarter of data for four self-selected eCQMs for the CY 2018 reporting period/FY 2020 payment determination (82 FR 38358 through 38361). Those reporting requirements were extended to the CY 2019 reporting period/FY 2021 payment determination through the CY 2021 reporting period/FY 2023 payment determination (83 FR 41603 through 41604; 84 FR 42501 through 42503). In the FY 2020 IPPS/LTCH PPS final rule, we finalized that for the CY 2022 reporting period/FY 2024 payment determination, hospitals would be required to report one, self-selected calendar quarter of data for: (a) Three self-selected eCQMs; and (b) the Safe Use of Opioids—Concurrent Prescribing eCQM, for a total of four eCQMs (84 FR 42503 through 42505).

In the FY 2021 IPPS/LTCH PPS final rule, we finalized a progressive increase in the number of required reported quarters of eCQM data, from one self-selected quarter of data to four quarters of data over a three-year period (85 FR 58932 through 58939). Specifically, for the CY 2021 reporting period/FY 2023 payment determination, hospitals were required to report two self-selected calendar quarters of data for each of the four self-selected eCQMs (85 FR 58939). For the CY 2022 reporting period/FY 2024 payment determination, hospitals are required to report three self-selected calendar quarters of data for each eCQM: (a) Three self-selected eCQMs, and (b) the Safe Use of Opioids—Concurrent Prescribing eCQM (85 FR 58939). We clarified in the FY 2021 IPPS/LTCH PPS final rule that until hospitals are required to report all four quarters of data beginning with the CY 2023 reporting period/FY 2025 payment determination, they may submit consecutive or non-consecutive self-selected quarters of data (85 FR 58939). In the FY 2022 IPPS/LTCH PPS final rule, we did not propose any changes to these policies, and we clarified that the self-selected eCQMs must be the same eCQMs across quarters in a given reporting year (86 FR 45418). We did not propose any changes to these policies in the proposed rule. The following Table IX.E–14. summarizes our finalized policy:

TABLE IX.E-14. eCQM DATA PUBLIC REPORTING REQUIREMENTS

Reporting Period / Payment Determination	eCQM Data Publicly Reported
CY 2021 / FY 2023	Two Quarters of Data
CY 2022 / FY 2024	Three Quarters of Data
CY 2023 / FY 2025 (and for subsequent years)	Four Quarters of Data

For the CY 2023 reporting period/FY 2025 payment determination and subsequent years, hospitals are required to report four calendar quarters of data for each eCQM: (a) Three self-selected eCQMs, and (b) the Safe Use of Opioids-Concurrent Prescribing eCQM (85 FR 58939). We did not propose any changes to the eCQM reporting or submission requirements for the CY 2023 reporting period/FY 2025 payment determination.

In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28555 through 28556), we proposed to modify eCQM reporting and submission requirements beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years.

(2) Reporting and Submission Requirements for eCQMs for the CY 2024 Reporting Period/FY 2026 Payment Determination and for Subsequent Years

In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28555 through 28556), we proposed to modify the eCQM reporting and submission requirements, such that beginning with the CY 2024 reporting period/FY 2026 payment determination hospitals would be required to report four calendar quarters of data for each required eCQM: (1) Three self-selected eCQMs; (2) the Safe Use of Opioids—Concurrent Prescribing eCQM; (3) the proposed Cesarean Birth eCQM; and (4) the proposed Severe Obstetric Complications eCQM; for a total of six eCQMs. We refer readers to Table IX.E–15. which represents the progressive increase in eCQM reporting requirements, including our proposed changes.

TABLE IX.E-15. CURRENT AND PROPOSED eCQM REPORTING AND SUBMISSION REQUIREMENTS FOR THE CY 2022 REPORTING PERIOD/FY 2024 PAYMENT DETERMINATION AND FOR SUBSEQUENT YEARS

Reporting Period / Payment Determination	eCQM Data Publicly Reported	Total Number of eCQMs Reported	eCQMs Required to be Reported
CY 2022 / FY 2024	Three Quarters of Data	Four	• Three self-selected eCQMs; and • Safe Use of Opioids—Concurrent Prescribing eCQM[1083]
CY 2023 / FY 2025	Four Quarters of Data	Four	• Three self-selected eCQMs; and • Safe Use of Opioids—Concurrent Prescribing eCQM
Proposed: CY 2024 / FY 2026 (and for subsequent years)	Four Quarters of Data	Six	• Three self-selected eCQMs; and • Safe Use of Opioids—Concurrent Prescribing eCQM; and • Proposed Cesarean Birth eCQM; and • Proposed Severe Obstetric Complications eCQM

This proposal is made in conjunction with our proposals discussed in sections IX.E.5.c. and IX.E.5.d. of the preamble of this final rule, in which we are adopting the Cesarean Birth eCQM and Severe Obstetric Complications eCQM, respectively. Addressing the maternal health crisis, improving maternal health, and closing any gaps that exist as a result of health disparities are among our top goals for quality improvement. The high maternal mortality and morbidity rates in the U.S. necessitate large-scale quality measurement and improvement activities. As part of the effort to reduce maternal mortality and morbidity, we believe it to be important to receive data from all hospitals that provide perinatal care and not to limit data to just hospitals that may self-select those eCQMs. Requiring these eCQMs will also aid in the surveillance of maternal morbidity, mortality, and associated comorbidities and complications as we collect data from all of the hospitals participating in the Hospital IQR Program. Additionally, no maternal morbidity or obstetric complications outcome-based measures exist in national reporting programs, and we believe these measures have the potential to reduce preventable harm and costs associated with adverse events related to perinatal care.

Accordingly, after consideration of public comments and as we are finalizing to adopt the Cesarean Birth eCQM and the Severe Obstetric Complications eCQM, all hospitals participating in the Hospital IQR Program will also be required to report these two eCQMs, increasing the total number of eCQMs reported from four to six beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years as discussed further below.

At the start of required eCQM reporting, we stated that increasing the reporting requirements over time is consistent with our goal of reporting on all eCQMs in the Hospital IQR Program in a stepwise manner while being responsive to hospitals' concerns about timing, readiness, and burden associated with the increased number of measures required to be reported (81 FR 57151 through 57152). With the addition of new measures to the eCQM measure set and increasing the quarters of eCQM data to be reported, our approach to eCQM reporting requirements has supported the goal to incrementally increase eCQM reporting requirements as hospitals continue to gain experience with eCQMs (84 FR 42502). After several years of a steady eCQM reporting requirement, we believe a proposed change to the reporting requirement is timely. We believe that allowing hospitals to continue self-selection of three eCQMs from the measure set for the CY 2024 reporting period/FY 2026 payment determination while requiring reporting of three additional eCQMs provides sufficient flexibility to report on eCQMs applicable to a hospital's quality improvement priorities while also reporting on measures that address the opioid and maternal health crises and that advance health equity. Additionally, we believe that our proposal for hospitals to submit data from three self-selected eCQMs and three required eCQMs continues our approach to collect data derived from EHRs and make progress toward a transition to fully digital quality measurement (86 FR 45345).

We invited public comment on our proposal to increase the number of

[1083] In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28556), we stated in Table IX.E–15. ''Four self-selected eCQMs'' for the eCQMs required to be reported for the CY 2022 reporting period/FY 2024 payment determination. We correct this error in table IX.E–15 of this final rule to ''Three self-selected eCQMs; and Safe Use of Opioids—Concurrent Prescribing eCQM'' in alignment with the language throughout the preamble and as finalized in previous policy.

mandatory measures to be reported from one to three, as described previously, and thereby increase the total number of required eCQMs from four to six.

We refer readers to section IX.H.10.b. of the preamble of this final rule for a discussion of a similar proposal by the Medicare Promoting Interoperability Program for Eligible Hospitals and Critical Access Hospitals (CAHs).

Comment: Several commenters supported our proposal to modify the reporting and submission requirements for eCQMs such that beginning with the CY 2024 reporting period/FY 2026 payment determination hospitals would be required to submit four calendar quarters of data and three required eCQMs. Commenters cited improved transparency and oversight over eCQM submissions, increased data ensuring comparison of quality on priority topics, and enabling hospitals to leverage electronic data collection and reporting to the greatest extent possible.

Response: We thank commenters for their support.

Comment: A commenter supported the proposal to modify eCQM reporting and submission requirements and requested two years of voluntary reporting for the Severe Obstetric Complications eCQM before mandatory reporting.

Response: We thank the commenter for its support of our proposal. Regarding the recommendation to increase the voluntary reporting period from one year to two years, which would delay the start of mandatory reporting of these two finalized perinatal eCQMs, we reiterate that addressing the maternal health crisis, improving maternal health, and closing any gaps that exist as a result of health disparities are among our top goals for quality improvement. By proposing a one-year voluntary reporting period, we sought to balance the need for hospitals and their vendors to prepare for reporting the new eCQMs with the urgency of measuring at a national scale and addressing the high maternal mortality and morbidity rates in the U.S. by requiring mandatory reporting of both the Severe Obstetric Complications eCQM and the Cesarean Birth eCQM beginning with the CY 2024 reporting period/FY 2026 payment determination.

Comment: Several commenters did not support the proposal to modify eCQM reporting and submission requirements, expressing concerns about the pace of change in eCQM reporting and submission proposals, including the amount of time for hospital workflow changes, measure validation, and EHR vendor readiness for eCQM changes. A few commenters recommended a longer timeframe prior to increased requirements for eCQM reporting, including two years of optional reporting prior to mandatory reporting of an eCQM due to the need to address current eCQM challenges before additional eCQMs are required to be reported. Specifically, commenters noted difficulties extracting data from production ready eCQM products delivered by developers, the cost and time associated with eCQM adoption, the demands on hospital resources to meet COVID–19 PHE needs, other CMS quality reporting requirements, and federal EHR requirements given the competing demands on limited hospital quality and health IT resources.

Response: We appreciate commenters' concerns related to additions to the eCQM measure set when some hospitals are experiencing challenges with eCQM reporting and submission. We establish program requirements considering all hospitals that participate in the Hospital IQR Program at a national level, which involves a wide spectrum of capabilities and resources with respect to eCQM reporting. In establishing our eCQM policies, we must balance the needs of hospitals with variable preferences and capabilities. We believe our finalized policy to modify the eCQM reporting and submission requirements will offer opportunities for hospitals that are prepared to voluntarily report the two perinatal eCQMs—Cesarean Birth and Severe Obstetric Complications—to do so for the CY 2023 reporting period/FY2025 payment determination, while providing more than one year for other hospitals to prepare and implement the two perinatal eCQMs for the CY 2024 reporting period/FY 2026 payment determination and for subsequent years. We believe the long-term benefits associated with reporting a full year of data for six eCQMs will outweigh the burdens and that increasing the number of eCQMs for which hospitals are required to report will produce more comprehensive and reliable quality information for patients and providers.

Hospitals have had several years to gain experience reporting eCQM data. In the FY 2021 IPPS/LTCH PPS final rule, we stated that, after holding eCQM reporting and submission policies constant for a number of years in order to give hospitals and their vendors additional time to improve eCQM reporting capabilities, we intended to transition to more robust reporting (85 FR 58934). We reiterate our intention to continue a transition toward more robust eCQM reporting (82 FR 38356 and 84 FR 42502). We believe that increasing the amount of eCQM data reported is in line with our goals to increase electronic reporting of clinical quality measures. We add that eCQM reporting and submission will be supported by technology certified to the 2015 Edition Cures Update that hospitals have had several years to possess, implement, and use in advance of the December 31, 2022 deadline (86 FR 45418). We recognize the cost and time associated with eCQM adoption and refer readers to section XII.B.4.f. of the preamble of this final rule (information collection requirements) for a detailed discussion of our burden estimates associated with the modification of our eCQM reporting and submission requirements.

We acknowledge the commenters' concern that modifying the eCQM reporting and submission requirement for the CY 2024 reporting period/FY 2026 payment determination will require hospital quality and health IT resources to support Hospital IQR Program and other CMS quality reporting requirements and federal EHR requirements, however, we point to the alignment between Hospital IQR Program's reporting requirements and other quality programs, such as the Medicare Promoting Interoperability Program for hospitals and critical access hospitals (CAHs). We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49705 through 49708) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57170) for our previously adopted eCQM file format requirements, zero denominator declaration, and case threshold exemption policies, and the FY 2018 IPPS/LTCH PPS final rule (81 FR 57255 through 57257) where we stated the finalized successful submission requirements in the Hospital IQR Program align with the CQM electronic reporting requirements of Medicare Promoting Interoperability Program for eligible hospitals and CAHs. We will continue to look across all quality programs to identify areas for further streamlining of quality reporting requirements. As referenced in section IX.C., in the ''Continuing to Advance Digital Quality Measurement and Use of Fast Healthcare Interoperability Resources (FHIR) in Hospital Quality Programs—Request for Information,'' we also believe utilizing standardized data for EHR-based measurement (based on the FHIR standard) and aligning where possible with other interoperability requirements can reduce the data collection burden incurred by providers for the purpose of reporting quality measures. We appreciate the comments on, and interest in, opportunities to reduce reporting burden and we will continue to take all comments into

account as we develop future regulatory proposals or other guidance for our quality measurement policies.

We also recognize the burden that the COVID–19 PHE has had on the healthcare system and will continue to monitor the impact that the COVID–19 PHE has on hospitals, including small, rural hospitals. Additionally, if, due to COVID–19 or any other extraordinary circumstance, we emphasize that hospitals may be eligible for an extraordinary circumstances exception (ECE). Hospitals may request an ECE if they are unable to fulfill program requirements due to extraordinary circumstances beyond their control. We refer readers to section IX.E.15 of this final rule, the eCQM ECE resources on the QualityNet website (available at: *https://qualitynet.cms.gov/inpatient/measures/ecqm/participation#tab2*), and 42 CFR 412.140(c)(2) for more information about the Hospital IQR Program's Extraordinary Circumstances Exceptions policy.

Comment: A few commenters did not support the proposal to revise eCQM reporting and submission requirements due to concerns with vendors' timelines to complete upgrades and programming.

Response: We appreciate the commenters' concern, and we urge hospitals to continue to work with their vendor to secure timely delivery of their products. We acknowledge the effort required for hospitals to adopt and implement updated technology to meet the eCQM reporting and submission requirements. However, we respectfully disagree that our proposal would not permit adequate time for product implementation and use. We believe our finalized policy to modify the eCQM reporting and submission requirements will offer opportunities for hospitals that are prepared to voluntarily report the two perinatal eCQMs to do so for the CY 2023 reporting period while providing more than one year for other hospitals to prepare and implement the two perinatal eCQMs for the CY 2024 reporting period/FY 2026 payment determination.

Comment: A few commenters did not support our proposal to modify eCQM reporting and submission requirements due to the cost and time required for EHR changes and updates for small and rural hospitals with limited IT and staffing resources. A commenter requested clarification for hospitals without obstetric departments or who do not perform deliveries and the proposal to require reporting of the two perinatal eCQMs, inquiring if such hospitals replace the measures or omit the perinatal measures.

Response: We acknowledge that facilitating quality improvement for small or rural hospitals can present unique challenges. When selecting eCQMs for inclusion in the measure set we have, and will continue to, consider the recommendations from the rural stakeholders to ensure eCQMs are meaningful to quality improvement for small, rural hospitals (85 FR 58935). As stated in sections IX.E.5.c. and IX.E.5.d., a critical focus in the national approach for improving maternal health and advancing maternal health equity is reducing existing disparities in maternal health outcomes by race, ethnicity, and geography. If a hospital does not have an obstetrics department or has few or no deliveries during a reporting period, the hospital would submit a zero denominator declaration for the measure that allows a hospital to meet the reporting requirements for a particular eCQM if a hospital does not have patients that meet the denominator criteria. We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50258), the FY 2016 IPPS/LTCH PPS final rule (80 FR 49705 through 49708), and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57170) for our previously adopted eCQM file format requirements. A QRDA Category I file with patients meeting the initial patient population of the applicable measures, a zero denominator declaration, and/or a case threshold exemption all count toward a successful submission for eCQMs for the Hospital IQR Program (82 FR 38387).

Comment: A few commenters did not support the proposal to modify eCQM reporting and submission requirements due to the as yet determined benefit relative to the administrative costs and the need for more comprehensive, frequent, and actionable eCQM performance feedback.

Response: We thank the commenters for their input and we appreciate their concern, but reiterate our eCQM policies further advance our goal of incrementally increasing the use of EHR data for quality measurement and improvement and is responsive to the feedback of some interested parties urging a faster transition to full electronic reporting (84 FR 42503). We also use a validation process to address concerns about reliability and validity of eCQM data. As stated in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58935), we have conducted an eCQM validation pilot (OMB Control #0938–1022) and completed eCQM data validation from the CY 2017 reporting period and the CY 2018 reporting period. Based on our internal review of the CY 2017 and CY 2018 eCQM data submitted for validation, over half of the measures validated had agreement rates of 80 percent or better. As discussed in section IX.E.11.b. of this final rule, we have an ongoing goal of continuing to assess the accuracy of eCQM measure data (81 FR 57155). Through the finalized modifications to the existing processes for validation of Hospital IQR Program eCQM data discussed in section IX.E.11.b. of this final rule and our finalized policy to modify eCQM reporting and submission requirements we expect to gain a better understanding of how to increase the accuracy of eCQM data by continuing to analyze the validation process and the results (85 FR 58935). We appreciate commenters' statements in support of comprehensive, frequent, and actionable eCQM performance feedback. The implementation of the updated HQR System has provided a more comprehensive platform for eCQM performance feedback as compared to the legacy system. The new HQR System provides various reports and user interfaces to be used by the hospitals to validate their submissions and overall performance. Overall measure outcomes, including the ability to review individual measure outcomes, are available on the eCQM user interface in near real time. Users of the HQR System for eCQM reporting can generate reports real time instead of waiting on the system refresh. This enhanced functionality in the HQR System allows submitters to export a downloadable report for rejected files providing details, including the associated conformance number of the error to make it easier for the submitter to troubleshoot, correct and resubmit the file to achieve the expected outcome.

Comment: A few commenters did not support the proposal to increase the number of mandatory measures, citing concerns about the two proposed perinatal eCQMs and the support for self-selection as an appropriate approach to achieving quality improvement goals. They recommended continuation of the current reporting and submission requirements to provide time for hospitals and the CMS platform to acclimate to the existing requirement to report four quarters of eCQM data.

Response: We appreciate commenters' position regarding mandatory reporting of the two perinatal eCQMs, but note our longstanding view that electronic reporting of quality measure data derived from the EHR will, over time, reduce the burden on hospitals to collect and submit data for the Hospital IQR Program (78 FR 50956). We believe that mandatory reporting of the two perinatal eCQMs in order to gain comprehensive, national measure data

are important tools in addressing the maternal health crisis, as no maternal morbidity or obstetric complications outcome-based measures exist in national reporting programs.

Regarding comments about the CMS platform, we launched the HQR System for reporting quality data (beginning with the CY 2019 reporting period) to improve the experience for program participants (82 FR 38390 and 85 FR 58958). After several years of requiring only one quarter of eCQM data for reporting, at the end of March 2022, we successfully completed the submission period for two quarters of CY 2021 eCQM data. Three quarters of CY 2022 eCQM data will be due by February 28, 2023, and four quarters of CY 2023 eCQM data will not be due until February 29, 2024. We believe this progressive increase in the quarters of data to be reported allows sufficient time for system readiness. In addition, we plan to continue to make changes to improve the system's usability as needed.

Comment: A commenter requested clarification on the proposals for new eCQMs in the Hospital IQR Program given the stated intent to transition to FHIR-based quality measures.

Response: We appreciate the commenter's request for clarification. We consider eCQMs to be a type of digital quality measure (87 FR 28487). As we stated in section IX.C., in the ''Continuing to Advance Digital Quality Measurement and Use of Fast Healthcare Interoperability Resources (FHIR) in Hospital Quality Programs—Request for Information,'' while eCQMs meet the definition for dQMs in many respects, limitations in data standards, requirements, and technology have limited their interoperability. We appreciate the comments on, and interest in, this topic and we will continue to take all comments into account as we develop future regulatory proposals or other guidance for our digital quality measurement efforts.

Comment: A commenter noted an error in Table IX.E–15 of the preamble of the FY 2023 IPPS/LTCH PPS proposed rule indicating the number of eCQMs required to be reported for the CY 2022 reporting period/FY 2024 payment determination.

Response: We thank the commenter for the comment. In the FY 2023 IPPS/LTCH PPS proposed rule(87 FR 28556), Table IX.E.15, first row, erroneously stated ''Four self-selected eCQMs'' for the eCQMs required to be reported for the CY 2022 reporting period/FY 2024 payment determination. We correct this error in Table IX.E–15 of this final rule to state ''Three self-selected eCQMs; and Safe Use of Opioids—Concurrent Prescribing eCQM'' in alignment with the language throughout the preamble and as finalized in previous policy. To be clear, this was an inadvertent technical error. As finalized in the FY 2020 IPPS/LTCH PPS final rule, four eCQMs are required to be reported for the CY 2022 reporting period/FY 2024 payment determination of which three are self-selected and the Safe Use of Opioids—Concurrent Prescribing eCQM is required (84 FR 42505). In this final rule, we have revised Table IX. E–15 to correct the error.

Comment: A commenter supported the proposal to modify eCQM reporting and submission requirements if CMS mandates the specific eCQMs to be reported, removing the ability of facilities to self-select eCQMs.

Response: We thank the commenter for their input. For the present state, particularly before the implementation of the FHIR standard for eCQM reporting, we believe it is beneficial for hospitals to have the flexibility to self-select eCQMs for reporting and submission in addition to submitting data from high priority eCQMs that are mandatory for reporting. However, as we continue to transition toward more robust eCQM reporting, we will consider the commenter's feedback in future rulemaking.

Comment: A commenter cautioned that public reporting before four quarters of data are reported for a reporting period may not show correct trends or patterns within the quality of care being provided by the organization.

Response: We appreciate the commenter's concern and refer readers to the FY 2020 IPPS/LTCH PPS final rule where we finalized eCQM reporting and submission requirements for the CY 2023 reporting period/FY 2025 payment determination to require hospitals to report four calendar quarters of data for each required eCQM: (a) Three self-selected eCQMs; and (b) the Safe Use of Opioids—Concurrent Prescribing eCQM (85 FR 58974 through 58975). In the FY 2020 IPPS/LTCH PPS final rule, we also finalized public reporting requirements of eCQMs for the CY 2021 reporting period/FY 2023 payment determination and subsequent years, specifically publicly reporting two quarters of data for the CY 2021 reporting period/FY 2023 payment determination, three quarters of data for the CY 2022 reporting period/FY 2024 payment determination, and for the CY 2023 reporting period/FY 2025 payment determination and subsequent years, we will publicly report four quarters of eCQM data (85 FR 58956). We believe that, beginning with the CY 2023 reporting period, the four quarters of data reported will provide more robust insight on the trends and patterns in the quality of care.

After consideration of the public comments we received, we are finalizing our proposal as proposed.

(3) Continuation of Certification Requirements for eCQM Reporting

(a) Requiring Use of the 2015 Edition and 2015 Edition Cures Update Certification Criteria

In the CY 2021 Physician Fee Schedule (PFS) final rule (85 FR 84825 through 84828), we expanded flexibility under the Hospital IQR Program for the CY 2020 reporting period/FY 2022 payment determination and for subsequent years to allow hospitals to use either: (1) Technology certified to the 2015 Edition criteria as was previously finalized for reporting eCQMs in the FY 2019 IPPS/LTCH PPS final rule (83 FR 41537 through 41608), or (2) certified technology updated consistent with the 2015 Edition Cures Update as finalized in the ONC 21st Century Cures Act final rule (85 FR 25642 through 25961). We adopted this flexible approach to encourage hospitals to be early implementers of the 2015 Edition Cures Update while remaining in compliance with Hospital IQR Program data submission requirements and maintaining alignment with requirements in the Medicare Promoting Interoperability Program for Eligible Hospitals and CAHs.

In the FY 2022 IPPS/LTCH PPS final rule, beginning with the CY 2023 reporting period/FY 2025 payment determination and subsequent years, we finalized the requirement for hospitals to use only certified technology updated consistent with the 2015 Edition Cures Update to submit data for the Hospital IQR Program data (86 FR 45418). We refer readers to the ONC 21st Century Cures Act final rule for additional information about the updates included in the 2015 Edition Cures Update (85 FR 25665). We did not propose any changes to this policy.

(b) Requiring EHR Technology To Be Certified to All Available eCQMs

In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42505 through 42506), we finalized the requirement that EHRs be certified to all available eCQMs used in the Hospital IQR Program for the CY 2020 reporting period/FY 2022 payment determination and subsequent years. In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45418), we finalized the requirement for hospitals to use the 2015 Edition Cures Update beginning

with the CY 2023 reporting period/FY 2025 payment determination, then all available eCQMs used in the Hospital IQR Program for the CY 2023 reporting period/FY 2025 payment determination and subsequent years would need to be reported using certified technology updated to the 2015 Edition Cures Update. We did not propose any changes to this policy.

(4) File Format for EHR Data, Zero Denominator Declarations, and Case Threshold Exemptions

We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49705 through 49708) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57170) for our previously adopted eCQM file format requirements. Under these requirements, hospitals: (1) Must submit eCQM data via the Quality Reporting Document Architecture Category I (QRDA I) file format, (2) may use third parties to submit QRDA I files on their behalf, and (3) may either use abstraction or pull the data from non-certified sources to then input these data into Certified EHR Technology (CEHRT) for capture and reporting QRDA I. Hospitals can continue to meet the reporting requirements by submitting data via QRDA I files, zero denominator declaration, or case threshold exemption (82 FR 38387).

More specifically regarding the use of QRDA I files, we refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 57169 through 57170) and the FY 2020 IPPS/LTCH PPS final rule (85 FR 58940), in which we stated that we expect QRDA I files to reflect data for one patient per file per quarter, and identified the five key elements that are utilized to identify the file:

- CMS Certification Number (CCN);
- CMS Program Name;
- EHR Patient ID;
- Reporting period specified in the Reporting Parameters Section per the CMS Implementation Guide for the applicable reporting year, which is published on the eCQI Resource Center website at: *https://ecqi.healthit.gov/QRDA*; and
- EHR Submitter ID (beginning with the CY 2021 reporting period/FY 2023 payment determination).

We did not propose any changes to this policy.

(5) Submission Deadlines for eCQM Data

We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50256 through 50259), the FY 2016 IPPS/LTCH PPS final rule (80 FR 49705 through 49709), and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57169 through 57172) for our previously adopted policies to align eCQM data reporting periods and submission deadlines for both the Hospital IQR Program and the Medicare Promoting Interoperability Program for Eligible Hospitals and CAHs. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57172), we finalized the alignment of the Hospital IQR Program eCQM submission deadline with that of the Medicare Promoting Interoperability Program for Eligible Hospitals and CAHs—the end of two months following the close of the calendar year—for the CY 2017 reporting period/FY 2019 payment determination and subsequent years. We note the submission deadline will be moved to the next business day if it falls on a weekend or Federal holiday. We did not propose any changes to this policy.

f. Data Submission and Reporting Requirements for Hybrid Measures

(1) Background

The Hospital IQR Program recently adopted hybrid measures into the program's measure set. In the FY 2018 IPPS/LTCH PPS final rule (82 FR 38350 through 38355), we finalized voluntary reporting of the Hybrid Hospital-Wide Readmission (Hybrid HWR) measure for the CY 2018 reporting period. In the FY 2020 IPPS/LTCH PPS final rule, we finalized the adoption of the Hybrid HWR measure for the Hospital IQR Program (84 FR 42465 through 42481) such that, beginning with the FY 2026 payment determination, hospitals are required to report on the Hybrid HWR measure (84 FR 42479). In the FY 2022 IPPS/LTCH PPS final rule, we also finalized the adoption of the Hybrid Hospital-Wide All-Cause Risk Standardized Mortality (Hybrid HWM) measure in a stepwise fashion, beginning with a voluntary reporting period from July 1, 2022 through June 30, 2023, and followed by mandatory reporting from July 1, 2023 through June 30, 2024, affecting the FY 2026 payment determination and for subsequent years (86 FR 45365). We also finalized several requirements related to data submission and reporting requirements for hybrid measures under the Hospital IQR Program (84 FR 42506 through 42508). In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28557 through 28558), we proposed changes specific to the zero denominator declarations and case threshold exemptions policies for hybrid measures, as discussed further in the subsequent section.

(2) Certification and File Format Requirements

We refer readers to the FY 2020 IPPS/LTCH PPS final rule (84 FR 19498 through 19499), the FY 2021 IPPS/LTCH PPS final rule (85 FR 58941), and the CY 2021 PFS final rule (85 FR 84472) for our previously adopted policies regarding certification and file format requirements for hybrid measures in the Hospital IQR Program.

In the CY 2021 PFS final rule (85 FR 84825 through 84828), we finalized flexibility to allow hospitals to use either: (1) Technology certified to the 2015 Edition criteria as was previously finalized in the FY 2019 IPPS/LTCH PPS final rule (83 FR 41537 through 41608) or (2) certified technology updated consistent with the 2015 Edition Cures Update as finalized in the ONC 21st Century Cures Act final rule (85 FR 25642 through 25961, 85 FR 50271), beginning with the CY 2020 reporting period/FY 2022 payment determination and subsequent years. The Hospital IQR Program offers flexibility to meet hybrid measure submission requirements to facilitate successful reporting during the period of transition as providers are updating certified technology to be consistent with the 2015 Edition Update. This flexibility applies to all Hospital IQR Program measures which use EHR data elements to calculate measure rates, including eCQMs and hybrid measures.

In the FY 2022 IPPS/LTCH PPS final rule, to align with the health IT certification requirements for eCQM reporting, we finalized to require hospitals to use only certified technology that has been updated consistent with the 2015 Edition Cures Update to submit hybrid measure data beginning with the CY 2023 reporting period/FY 2025 payment determination and for subsequent years (86 FR 45421). We did not propose any changes to these policies in the proposed rule.

(3) Additional Submission Requirements

In the FY 2020 IPPS/LTCH PPS final rule, we finalized allowing hospitals to meet the hybrid measure reporting and submission requirements by submitting any combination of data via QRDA I files, zero denominator declarations, and case threshold exemptions (84 FR 42507). We also finalized applying similar zero denominator declaration and case threshold exemption policies to hybrid measure reporting as we allow for eCQM reporting (84 FR 42507 through 42508).

We note that the ONC 21st Century Cures Act final rule revises the clinical

quality measurement criterion at 45 CFR 170.315(c)(3) to refer to CMS QRDA IGs and remove the HL7® QRDA standard requirements (85 FR 25645). We encourage all hospitals and their health IT vendors to submit QRDA I files early, and to use one of the pre-submission testing tools for electronic reporting, such as submitting test files to the HQR System, to allow additional time for testing and make sure all required data files are successfully submitted by the deadline.

(4) Modification of the Zero Denominator Declarations Policy and Case Threshold Exemptions Policy for Hybrid Measures

As stated in the previous section (section IX.E.10.f.(3).), in the FY 2020 IPPS/LTCH PPS final rule, we finalized applying the zero denominator declarations policy and case threshold exemptions policy to hybrid measure reporting (84 FR 42507 through 42508). Additionally, in the FY 2020 IPPS/LTCH PPS final rule, we indicated that zero denominator declarations and case threshold exemptions would not be necessary during the voluntary reporting periods for hybrid measures but would be an option for hospitals to utilize when hybrid measure reporting became mandatory (84 FR 42508).

In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28558), we proposed to remove zero denominator declarations and case threshold exemptions as an option for the reporting of hybrid measures beginning with the FY 2026 payment determination for reasons discussed in the subsequent section. We note that the FY 2026 payment determination is the first year for which hybrid measures, finalized as part of the Hospital IQR Program measure set, will become mandatory for reporting.

Zero denominator declarations allow a hospital whose EHR is capable of reporting hybrid measure data to submit a zero in the denominator for the reporting of a measure if the hospital does not have patients that meet the denominator criteria of that hybrid measure (84 FR 42507). Similarly, the case threshold exemptions policy allows for a hospital with five or fewer inpatient discharges per quarter or 20 or fewer inpatient discharges per year in a given denominator declaration be exempted from reporting on that individual hybrid measure (84 FR 42507). These policies were originally developed for eCQMs and were extended to hybrid measures to ensure hospitals were not penalized for the absence of patients that meet the denominator criteria in the reporting of those measures.

Upon further analysis, however, we do not believe that these policies are applicable for hybrid measures due to the process of reporting the measure data. Hybrid measures do not require that hospitals report a traditional denominator as is required for the submission of eCQMs. Instead, hybrid measures utilize the Initial Patient Population (IPP), as per their measure specifications, that identifies the patients for which hospitals need to extract the EHR data and annual claims data. Additionally, we calculate hybrid measures by merging both the claims and EHR data received. Therefore, since we will confirm the measure cohort to determine whether a hospital has met the denominator criteria, both the zero denominator declaration and the case threshold exemption for hybrid measures will not be applicable to hospitals.

We invited public comment on this proposal.

Comment: A commenter supported our proposal to remove the zero denominator declarations and case threshold exemptions policies for hybrid measures beginning with the FY 2026 payment determination.

Response: We thank the commenter for the support.

After consideration of the public comments we received, we are finalizing our proposal as proposed.

(5) Submission Deadlines for Hybrid Measures

We refer readers to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42508), where we finalized submission deadlines for hybrid measures. We did not propose any changes to these policies in the proposed rule.

g. Sampling and Case Thresholds for Chart-Abstracted Measures

We refer readers to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50221), the FY 2012 IPPS/LTCH PPS final rule (76 FR 51641), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53537), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50819), and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49709) for details on our sampling and case thresholds for the FY 2016 payment determination and subsequent years. We did not propose any changes to these policies in the proposed rule.

h. HCAHPS Administration and Submission Requirements

We refer readers to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50220), the FY 2012 IPPS/LTCH PPS final rule (76 FR 51641 through 51643), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53537 through 53538), and the FY 2014 IPPS/LTCH PPS final rule (78 FR 50819 through 50820) for details on previously-adopted HCAHPS submission requirements. We also refer hospitals and HCAHPS Survey vendors to the official HCAHPS website at *http://www.hcahpsonline.org* for new information and program updates regarding the HCAHPS Survey, its administration, oversight, and data adjustments. We did not propose any changes to these policies in the proposed rule.

i. Data Submission Requirements for Structural Measures

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51643 through 51644) and the FY 2013 IPPS/LTCH PPS final rule (77 FR 53538 through 53539) for details on the data submission requirements for structural measures. Hospitals are required to submit information for structural measures once annually using a CMS-approved web-based data collection tool available within the HQR System. The data submission period for structural measures begins in April and has the same submission deadline as the fourth calendar quarter chart-abstracted measure deadline. For example, for the FY 2025 payment determination, hospitals would be required to submit the required information between April 1, 2024 and May 15, 2024, with respect to the time period of January 1, 2023 through December 31, 2023.

We note that, in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45361), for the Maternal Morbidity Structural Measure and the CY 2021 reporting period/FY 2023 payment determination only, we finalized a shortened reporting period from October 1, 2021 through December 31, 2021, while retaining the standard data submission period. Specifically, for the shortened reporting period hospitals will be required to submit the data between April 1, 2022 and May 16, 2022 (we note that May 15, 2022 falls on a weekend and therefore the close of this data submission period is moved to May 16, 2022). Thereafter, we finalized that the reporting period for the Maternal Morbidity Structural Measure will run from: January 1 through December 31 on an annual basis, and that the data submission period will continue to be consistent with our current policy (beginning in April until the same submission deadline as for the fourth calendar quarter of the chart-abstracted measures with respect to the reporting period for

the previous calendar year) (86 FR 45361).

We did not propose any changes to these policies in the proposed rule.

j. Data Submission and Reporting Requirements for CDC NHSN Measures

For details on the data submission and reporting requirements for measures reported via the CDC's National Healthcare Safety Network (NHSN), we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51629 through 51633; 51644 through 51645), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53539), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50821 through 50822), and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50259 through 50262). The data submission deadlines are posted on the QualityNet website.

We note that in the FY 2022 IPPS/LTCH PPS final rule, we finalized the adoption of the COVID–19 Vaccination Among Health Care Personnel measure, beginning in October 2021 for the October 1, 2021 through December 31, 2021 reporting period affecting the FY 2023 payment determination and continuing for each quarter in subsequent years (86 FR 45374). Specific details on data submission for this measure can be found in the CDC's Overview of the Healthcare Safety Component, available at: *https://www.cdc.gov/nhsn/PDFs/slides/NHSN-Overview-HPS_Aug2012.pdf*. We did not propose any changes to these policies in the proposed rule.

k. Data Submission and Reporting Requirements for Patient-Reported Outcome-Based Performance Measures (PRO–PMs)

In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28559 through 28560), in section IX.E.5.g., we proposed the adoption of the hospital-level THA/TKA PRO–PM into the Hospital IQR Program measure set. In this section of the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28559 through 28560), we proposed the reporting and submission requirements for PRO–PM measures as a new type of measure to the Hospital IQR Program.

(1) Submission of PRO–PM Data

(a) Data Submission

In section IX.E.5.g. of the preamble of this final rule, we discuss adoption of the THA/TKA PRO–PM in the Hospital IQR Program. In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28527), we proposed that hospitals would have the choice of selecting from multiple submission approaches.

First hospitals may choose to: (1) Send their data to CMS for measure calculation directly; or (2) utilize an external entity, such as through a vendor or registry, to submit their data on behalf of the hospital to CMS for measure calculation. This data submission approach is consistent with stakeholder input received by the measure developer during measure development and comments as summarized in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45411 through 45414) which recommended CMS provide multiple options for data submission mechanisms to ensure flexibility.

Whether a hospital chooses to submit the data itself or via a vendor, we would allow a range of file formats. Both hospitals and vendors would use the HQR System for data submission for the THA/TKA PRO–PM. Use of the HQR System leverages existing CMS infrastructure already utilized for other quality measures (such as, HCAHPS or the Sepsis measure). The HQR System allows for data submission using the following file formats: CSV, XML, and a manual data entry option; allowing hospitals and vendors flexibility in data submission. We would provide hospitals with additional detailed information and instructions for submitting data using the HQR System through CMS' existing websites, such as on QualityNet, and through listservs or both.

(b) Data Submission Reporting Requirements

(1) Voluntary Reporting Requirements for the Proposed THA/TKA PRO–PM

As discussed earlier, we proposed a phased implementation approach for adoption of the THA/TKA PRO–PM, with two voluntary reporting periods for the CY 2025 and 2026 reporting periods prior to mandatory reporting beginning with the FY 2028 payment determination. Voluntary reporting prior to mandatory reporting would allow time for hospitals to incorporate the THA/TKA PRO–PM data collection into their clinical workflows and is responsive to stakeholder comments summarized in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45411 through 45414). For each voluntary and subsequent mandatory reporting periods, we would collect data on the THA/TKA PRO–PM in accordance with, and to the extent permitted by, the HIPAA Privacy and Security Rules (45 CFR parts 160 and 164, Subparts A, C, and E), and other applicable federal law.

For hospitals participating in voluntary reporting, hospitals would submit pre-operative PRO data, as well as matching post-operative PRO data for at least 50 percent of their eligible elective primary THA/TKA procedures. The first voluntary reporting period for CY 2025 would include pre-operative PRO data collection from October 3, 2022 through June 30, 2023 (for eligible elective THA/TKA procedures performed from January 1, 2023 through June 30, 2023) and post-operative PRO data collection from October 28, 2023 to August 28, 2024. Hospitals would submit pre-operative data in 2023 and post-operative data in 2024, and we intend to provide hospitals with their results in confidential feedback reports in 2025. Hospitals would submit pre-operative data for the first voluntary reporting three months following the end of the performance period. For post-operative data, hospitals would be required to submit data one month following the end of the performance period. If that day falls on a weekend, submissions will be due the following Monday. For example, for procedures performed between January 1, 2023 and June 30, 2023, pre-operative data will need to be submitted by October 2, 2023. After the initial submission of pre-operative data in the first voluntary period, hospitals would submit both pre-operative and post-operative data by the same day, but for different time periods. For example, hospitals would need to submit: (1) Post-operative data for the first voluntary reporting (for procedures performed between January 1, 2023 and June 30, 2023); and (2) pre-operative data for the second voluntary reporting (for procedures performed between July 1, 2023 and June 30, 2024) of the THA/TKA PRO–PM by September 30, 2024.

The second voluntary reporting period will include pre-operative PRO data collection from April 2, 2023 through June 30, 2024 (for eligible elective THA/TKA procedures performed from July 1, 2023 through June 30, 2024) and post-operative PRO data collection from April 26, 2024 to August 29, 2025. Hospitals would submit pre-operative data in 2024 and post-operative data in 2025, and we noted our intention to provide hospitals with their results in confidential feedback reports in 2026.

We refer readers to Table IX.E–16. for an overview of the proposed performance period, pre- and post-operative data collection timeframes, and data submission deadlines during voluntary reporting.

TABLE IX.E-16. VOLUNTARY REPORTING OF PRE-OPERATIVE AND POST-OPERATIVE PERIODS FOR THA/TKA PRO-PM

Reporting Period	*Performance Period*	*Pre-Operative Data Collection*	*Pre-Operative Data Submission Deadline*	*Post-Operative Data Collection*	*Post-Operative Data Submission deadline*
Voluntary Reporting 1 (2025)	January 1, 2023 through June 30, 2023	October 3, 2022 through June 30, 2023	October 2, 2023	October 28, 2023 to August 28, 2024	September 30, 2024
Voluntary Reporting 2 (2026)	July 1, 2023 through June 30, 2024	April 2, 2023 through June 30, 2024	September 30, 2024	April 26, 2024 to August 29, 2025	September 30, 2025

(2) Mandatory Reporting

Following the two voluntary reporting periods, we proposed the mandatory reporting of the THA/TKA PRO–PM would begin with reporting PRO data for eligible elective THA/TKA procedures from July 1, 2024 through June 30, 2025 (performance period), impacting the FY 2028 payment determination. This initial mandatory reporting would include pre-operative PRO data collection from three months preceding the applicable performance period and from 10 to 14 months after the performance period. For example, pre-operative data from April 2, 2024 through June 30, 2025 (for eligible elective primary THA/TKA procedures from July 1, 2024 through June 30, 2025) and post-operative PRO data collection from April 27, 2025 to August 29, 2026. Pre-operative data submission would occur in 2025 and post-operative data submission in 2026 and we noted our intention to provide hospitals with their results in 2027 before publicly reporting results on the Compare tool hosted by HHS, currently available at: *https://www.medicare.gov/care-compare*, or its successor website. Hospitals would be required to submit 50 percent of eligible, complete pre-operative data with matching eligible, complete post-operative data as a minimum amount of data for mandatory reporting in the Hospital IQR Program.

We refer readers to Table IX.E–17. for an overview of the proposed performance period, pre- and post-operative data collection timeframes, and data submission deadlines during the mandatory reporting period.

TABLE IX.E-17. MANDATORY REPORTING OF PRE-OPERATIVE AND POST-OPERATIVE PERIODS FOR THA/TKA PRO-PM

Reporting Period	*Performance Period*	*Pre-operative Data Collection*	*Pre-operative Data Submission Deadline*	*Post-Operative Data Collection*	*Post-Operative Data Submission Deadline*
Mandatory Reporting (2027)	July 1, 2024 through June 30, 2025	April 2, 2024 through June 30, 2025	September 30, 2025	April 27, 2025 to August 29, 2026	September 30, 2026

We invited public comment on this proposal.

Comment: Several commenters supported the adoption of the Hospital-Level, Risk Standardized Patient-Reported Outcomes Performance Measure (PRO–PM) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) (THA/TKA PRO–PM), beginning with two voluntary reporting periods followed by mandatory reporting for the reporting period which runs from July 1, 2025, through June 30, 2026, impacting the FY 2028 payment determination. A commenter specifically supported patient-reported outcome measures as a way to assess quality of care and effectiveness from the patient perspective. A commenter generally supported the addition of PRO–PMs into quality programs for clinical scenarios where reliable PRO instruments are available for patients to complete. A commenter supported CMS beginning PRO–PMs using elective procedures. A few commenters specifically supported the adoption of the THA/TKA PRO–PM to the Hospital IQR Program stating it enables patient voices to be heard throughout all phases of their care and recovery, and the measure is important as it includes the patient voice in assessment of outcomes which should be reflected in quality and safety performance.

Response: We thank commenters for their support.

Comment: Several commenters discussed the data collection approach and burden associated with the adoption of the THA/TKA PRO–PM into the Hospital IQR Program. A few commenters supported having multiple modes for data collection and submission of PRO data, including the use of registries. A commenter supported the use of Medicare enrollment data as the source to identify dual eligibility status and variables for risk adjustment.

Many commenters stated specifically that the financial, resource, and labor costs required to collect, track, and submit data would burden hospitals and make successful implementation of the measure difficult. A commenter encouraged delayed adoption for several years to give health systems time to recover resources and staffing impacted by the COVID–19 pandemic. Another commenter expressed concern about small hospitals' ability to collect and report data and suggested we institute technical support as well as financial bonuses for them to utilize. A commenter urged us to consider technical difficulties of adopting a PRO–PM and noted limitations in data infrastructure and EHR systems, and a lack of integration between PRO data. The commenter expressed that progress in this area will require adoption of newer technologies such as machine learning and artificial intelligence to advance the healthcare system.

Response: We thank commenters for their feedback regarding data collection and burden. We agree that having multiple modes of data collection, including use of registries, would be

beneficial to hospitals and reduce burden. We acknowledge the concerns regarding financial, labor, and resource burdens associated with adopting the THA/TKA PRO–PM into the Hospital IQR Program and are seeking to advance patient-centered measurement with as little burden as possible to both providers and patients. While PRO–PMs require providers to integrate data collection into clinical workflows, this integration provides an opportunity for patient-reported outcomes to inform clinical decision making and benefits patients by engaging them in discussions about potential outcomes.

The PRO instruments used to calculate pre- and post-operative scores for this THA/TKA PRO–PM were carefully considered, with extensive stakeholder input from clinicians, to be low burden and are non-proprietary for free use. We will evaluate data collection burden and response rates associated with the THA/TKA PRO–PM. Any feedback on data collection will be considered in future measure development and reevaluation.

We thank commenters for their feedback, and will provide hospitals and other interested parties with more information on data collection and reporting for the THA/TKA PRO–PM through education and outreach activities prior to implementation. We will continue to evaluate feedback on challenges with data collection during voluntary reporting and consider them prior to mandatory reporting.

Comment: A commenter encouraged us to minimize data collection burden to patients by leveraging technology and considering other surveys they are requested to complete, such as HCAHPS. Another commenter requested additional research to understand the burden of the measure on hospitals and patients, including patient survey fatigue, impact of new PRO–PMs on established survey measures like HCAHPS, and acceptable level of burden for use of the measure.

Response: This measure was developed with extensive input from patients, who indicated strong support for a PRO–PM following elective primary THA and TKA. We anticipate data collection for this measure to present a low burden to patients. Regarding survey fatigue, we designed the measure to illuminate a patient's pain and functional status before and after a THA or TKA, which is different than other surveys such as HCAHPS that capture patient experience. Regarding the comment that the THA/TKA PRO–PM may have a reporting impact on other measures, such as HCAHPS, we anticipate a minimal impact to other measures as the THA/TKA PRO–PM's eligible population is procedure-specific which reduces the likelihood of the same patient receiving the HCAHPS and PRO survey. Additionally, the THA/TKA PRO–PM pre-operative assessment (90 to 0 days before surgery) and post-operative assessment (300 to 425 days following surgery) timeframe is different than HCAHPS, which is two weeks after a hospital visit.

Comment: A commenter requested we not adopt the THA/TKA PRO–PM in the Hospital IQR Program until operational challenges identified by CJR participating hospitals are shared publicly, independently analyzed, and addressed. Commenters expressed concern that reporting of the THA/TKA PRO–PM as part of the CJR Model has been challenging and burdensome, resulting in potentially impacting completion rates. A commenter expressed concern response rates will be insufficient to calculate reliable and valid results for comparison of hospital performance. Another commenter stated hospitals have not been able to meet high reporting thresholds and have challenges with survey response rates for the THA/TKA PRO–PM as part of the CJR Model. The commenter recommended CMS analyze pre- and post-operative response rates in the CJR Model and consider ways to support hospitals in increasing responsiveness. Another commenter requested CMS lower the 50 percent submission requirement proposal until it is clear hospitals can produce this.

Response: We appreciate commenters' request for information about use of the measure in the CJR Model. We have gathered feedback from several years of PRO data collection by CJR participating hospitals and applied lessons learned to the THA/TKA PRO–PM proposal for adoption in the Hospital IQR Program, including requiring hospitals to collect and submit fewer variables, allowing hospitals flexibility in data collection options to better integrate into their workflows, and influenced the decision to set the initial reporting threshold to a moderate rate of 50 percent reporting threshold. We highlight that our proposal included two voluntary reporting periods in which we would gather additional feedback from participating hospitals on their experience collecting and submitting data and apply any lessons learned prior to mandatory reporting.

The proposed reporting threshold is based on average response rates for both pre-operative and post-operative surveys collected by participating hospitals in the CJR Model. The proposed reporting threshold for adoption of the measure to the Hospital IQR Program is lower than that currently used in the CJR Model. Additionally, hospitals are not held to reporting thresholds until mandatory reporting. We believe hospitals will therefore have time to develop their data collection and reporting processes. We will continue to consider the appropriate pre- and post-operative matched survey response rate, as well as reporting thresholds. We will evaluate this approach during voluntary reporting and consider adjustments based on feedback prior to mandatory reporting.

Comment: A few commenters supported the proposed phased implementation timeline. A few commenters requested CMS delay mandatory reporting of the measure to allow hospitals time to enhance interoperability and develop processes for successful data collection and submission. A commenter stated the proposed voluntary and mandatory reporting timeline does not provide hospitals sufficient time to gain experience or use results to improve data collection processes. A commenter requested three years of voluntary reporting.

Response: We thank commenters for their support of the phased approach of adopting the THA/TKA PRO–PM in the Hospital IQR Program. We have considered commenters' recommendations regarding voluntary and mandatory reporting timelines. We believe the proposed voluntary and mandatory reporting implementation approach allows hospitals time and notice to make the necessary enhancements to their clinical workflow to successfully report this measure. We highlight that our proposal included two voluntary reporting periods prior to mandatory reporting which balances the need to allow hospitals time to prepare for mandatory reporting with the importance of measuring patients' functional status for these common surgical procedures and the need to make this information publicly available for patient use and quality improvement (87 FR 28528 through 28529). We also note that the proposed first voluntary reporting period uses just six months of data to allow hospitals an opportunity to receive feedback more quickly on, and improve, their data collection and submission processes (87 FR 28528). We intend to carefully consider feedback received during voluntary reporting to inform improvements that may be made for mandatory reporting.

Comment: A commenter requested reimbursement to incentivize reporting

of the THA/TKA PRO–PM and suggested we create a G code for near term use, and a CPT code for permanent use.

Response: We acknowledge commenters' feedback on reimbursement incentives. The Hospital IQR Program statutory authority in section 1886(b)(3)(B)(viii) of the Act does not provide for the ability to award incentive payments for meeting program requirements as it is a pay-for-reporting quality program.

Comment: Another commenter requested CMS share performance results with hospitals transparently and in real time for use in shared decision making.

Response: We confirm that hospitals will receive performance results confidentially as part of both voluntary and mandatory reporting. We encourage hospitals to use these results as part of shared decision making with their patients.

Comment: A commenter expressed concern with response bias and noted accounting for patient socioeconomic status, race, or dual eligibility in the risk model is not adequate to address lack of response.

Response: We thank the commenter for their input regarding health disparities and response bias. We agree that considering the unique experience of populations with social risk factors is important. The measure as proposed accounts for potential non-response bias through inverse probability weighting and considers patient characteristics, including non-white race, dual eligibility, and the AHRQ SES index score.[1084] The AHRQ SES index score is computed using US census data and considers factors including zip code, median household income, percentage of persons below the Federal poverty line, unemployment, education, property value, and percentage of persons in crowded households.[1085] The measure also includes health literacy in the risk model.[1086] We encourage hospitals to consider a variety of PRO data collection methods to support responses from all eligible patients. We will continue to assess the impact of social risk factors on the measure and response rates over time.

After consideration of the public comments we received, we are finalizing our proposal as proposed.

11. Validation of Hospital IQR Program Data

In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28560 through 28562), we proposed to update our eCQM validation process. Specifically, we proposed to update our validation requirements for eCQMs from our current requirement that hospitals submit timely and complete data for 75 percent of requested records to submission of timely and complete data for 100 percent of requested records beginning with CY 2022 eCQM data affecting the FY 2025 payment determination and for subsequent years. We note that this will not affect finalized policies with respect to validation of chart-abstracted measures.

a. Background

We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53539 through 53553), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50822 through 50835), the FY 2015 IPPS/LTCH PPS final rule (79 FR 50262 through 50273), the FY 2016 IPPS/LTCH PPS final rule (80 FR 49710 through 49712), the FY 2017 IPPS/LTCH PPS final rule (81 FR 57173 through 57181), the FY 2018 IPPS/LTCH PPS final rule (82 FR 38398 through 38403), the FY 2019 IPPS/LTCH PPS final rule (83 FR 41607 through 41608), the FY 2020 IPPS/LTCH PPS final rule (84 FR 42509), the FY 2021 IPPS/LTCH PPS final rule (85 FR 58942 through 58953), and the FY 2022 IPPS/LTCH PPS final rule (86 FR 45423 through 45426) for detailed information on and previous changes to chart-abstracted and eCQM validation requirements for the Hospital IQR Program.

In the FY 2017 IPPS/LTCH PPS final rule, we finalized our policy to require submission of at least 75 percent of sampled eCQM medical records in a timely and complete manner for validation (81 FR 57181). To ensure we have adequate data to assess and validate eCQMs, we finalized a requirement that hospitals submit at least 75 percent of sampled eCQM medical records (81 FR 57173 through 57175). In the FY 2021 IPPS/LTCH PPS final rule, we combined the validation processes for eCQMs and chart-abstracted measures, but did not update the threshold submission percent for eCQM medical records (85 FR 58952 through 58944). In that rule, we adopted a policy to remove the separate process for eCQM validation, beginning with the validation affecting the FY 2024 payment determination (for validation commencing in CY 2022 using data from the CY 2021 reporting period) (85 FR 58942 through 58953). Beginning with validation affecting the FY 2024 payment determination and subsequent years, we finalized a policy to incorporate eCQMs into the existing validation process for chart-abstracted measures such that there would be one pool of hospitals selected through random selection and one pool of hospitals selected using targeting criteria, for both chart-abstracted measures and eCQMs (85 FR 58942 through 58953). Under the aligned validation process, a single hospital could be selected for validation of both eCQMs and chart-abstracted measures and is expected to submit data for both chart-abstracted measures and eCQMs (85 FR 58942 through 58953). We refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 57179 through 57180) for details on the Hospital IQR Program data submission requirements for chart-abstracted measures. We did not propose any changes to finalized policies for validation of chart-abstracted measures.

b. Modifications to the Existing Processes for Validation of Hospital IQR Program eCQM Data

In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28561), we proposed to update our eCQM validation requirement to require that hospitals selected for validation submit timely and complete data for 100 percent of requested records for eCQM validation beginning with CY 2022 eCQM data, affecting the FY 2025 payment determination and for subsequent years. Hospitals selected for eCQM validation are required to submit timely and sufficient medical records. As finalized in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57178 through 57179), hospitals must submit timely medical records—within 30 days of the records request—to meet eCQM validation requirements. To meet the eCQM validation requirement for sufficient medical records, we proposed to increase the submission threshold from 75 percent to 100 percent beginning with validation of CY 2022 eCQM data affecting the FY 2025 payment determination and for subsequent years.

Ever since validation of eCQMs commenced with CY 2017 data (81 FR 57173 through 57181), all hospitals selected for eCQM validation have successfully submitted at least 75 percent of eCQM medical records

[1084] Patient-Reported Outcomes (PROs) Following Elective Primary Total Hip and/or Total Knee Arthroplasty: Hospital-Level Performance Measure (Version 1.0 Methodology Report). March 2021.

[1085] Bonito A, Bann C, Eicheldinger C, Carpenter L. Creation of new race-ethnicity codes and socioeconomic status (SES) indicators for Medicare beneficiaries. Final Report, Sub-Task. 2008;2.

[1086] Patient-Reported Outcomes (PROs) Following Elective Primary Total Hip and/or Total Knee Arthroplasty: Hospital-Level Performance Measure (Version 1.0 Methodology Report). March 2021.

requested by the Clinical Data Abstraction Center (CDAC). Additionally, 95 percent of hospitals selected for participation in eCQM validation for the FY 2020 and FY 2021 payment determinations, which are the most recently available periods, voluntarily and successfully submitted 100 percent of requested records. We believe that increasing the submission threshold from 75 percent to 100 percent of the requested records will support our ongoing goal of continuing to assess the accuracy of eCQM measure data (81 FR 57155). Also, given the high rate of hospitals voluntarily submitting 100 percent of records, we believe updating the submission threshold to 100 percent will be feasible for hospitals.

We note that under our current policy, the accuracy of eCQM data (the extent to which data abstracted for validation matches the data submitted in the QRDA I file) submitted for validation does not affect a hospital's validation score as described in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57180 through 57181) and will not be impacted by this finalized update to the submission threshold. We also note that hospitals that fail to submit timely and complete medical records will not meet the eCQM validation requirement and will be subject to payment reduction as described in our previously finalized policy (81 FR 57180). Chart-abstracted data continue to be weighted at 100 percent for payment determination as finalized in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58942 through 58953) and will not be impacted by our proposed modification to the eCQM validation.

The previously finalized eCQM validation requirements, including data submission requirements, are described at 42 CFR 412.140(d)(2)(ii). We also proposed to update the references to ''at least 75 percent'' in this Hospital IQR Program regulation text. Specifically, we proposed to remove the phrase ''at least 75 percent'' and add in its place the phrase ''100 percent.'' We continue to evaluate data submitted for validation for potential future policy changes.

Our previously finalized and newly proposed validation scoring changes are summarized in Table IX.E–18.

TABLE IX.E-18. SUMMARY OF PREVIOUSLY FINALIZED AND PROPOSED eCQM VALIDATION SCORING

	Quarters of Data Required for Validation	Scoring
Previously Finalized Validation Scoring for the FY 2023 Payment Determination (81 FR 57179 through 57181)		
Chart-Abstracted Measures Validation: 400 Random Hospitals + up to 200 Targeted Hospitals	3Q 2020	At least 75% validation score
	4Q 2020	
eCQM Validation: Up to 200 Random Hospitals	1Q 2020 – 4Q 2020	Successful submission of at least 75% of requested medical records
Previously Finalized Validation Scoring for the FY 2024 Payment Determination (85 FR 58942 through 58953)		
COMBINED Process (Chart-Abstracted Measures and eCQM Validation): up to 200 Random Hospitals + up to 200 Targeted Hospitals	1Q 2021 – 4Q 2021	Chart-Abstracted Measures: at least 75% validation score (weighted at 100%) And eCQMs: Successful submission of 75% of requested medical records
Proposed Update to eCQM Validation Scoring for the FY 2025 Payment Determination and Subsequent Years		
COMBINED Process (Chart-Abstracted Measures and eCQM Validation): up to 200 Random Hospitals + up to 200 Targeted Hospitals	1Q 2022 – 4Q 2022	Chart-Abstracted Measures: at least 75% validation score (weighted at 100%) And eCQMs: Successful submission of 100% of requested medical records

We invited public comment on this proposal.

Comment: Several commenters supported our proposal to increase the requested medical records for eCQM validation from 75 percent to 100 percent. A commenter emphasized its belief that the vast majority of hospitals already provide 100 percent of requested medical records for eCQM validation.

Response: We thank the commenters for their support.

Comment: A few commenters did not support our proposal. A commenter requested that the 75 percent threshold be maintained until after the end of the COVID–19 PHE. A commenter did not support this modification requesting the current requirement be maintained until scoring is satisfactory enough to score based on performance. Another commenter recommended focusing on accuracy and quality for eCQM validation.

Response: We thank the commenters for their feedback. We acknowledge that hospitals continue to be affected by COVID–19 and we do not wish to further burden these hospitals, but respectfully disagree that we should delay this requirement. As we noted in the FY 2023 IPPS/LTCH PPS proposed rule, ever since validation of eCQMs commenced with CY 2017 data (81 FR 57173 through 57181), all hospitals selected for eCQM validation have successfully submitted at least 75 percent of eCQM medical records requested by the Clinical Data Abstraction Center (CDAC) (86 FR 28561). Additionally, 95 percent of hospitals selected for participation in eCQM validation for the FY 2020 and FY 2021 payment determinations, which are the most recently available periods, voluntarily and successfully submitted 100 percent of requested records (86 FR 28561). Given the high rate of hospitals voluntarily submitting 100 percent of records, we believe updating the submission threshold to 100 percent will be feasible for hospitals (86 FR 28561). We note that under our current policy, the accuracy of eCQM data (the extent to which data abstracted

for validation matches the data submitted in the QRDA I file) submitted for validation does not affect a hospital's validation score as described in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57180 through 57181). We will consider the commenters' feedback for future notice-and-comment rulemaking as we continue to improve our current requirements.

Comment: A few commenters shared concerns about vendor-related issues. A commenter requested that hospitals not be penalized for vendor delays. Another commenter requested that vendor systems be thoroughly vetted before these changes are implemented. A commenter noted concerns about the timeliness and value of validation results that they have received back from the validation vendor.

Response: We thank the commenters for their feedback. We encourage hospitals to work closely with their vendors to ensure they are up-to-date with previous and newly finalized requirements. We note that hospitals have had several years to meet the functional and operational demands of eCQM reporting and validation (81 FR 57173 through 57181). We wish to clarify that the accuracy of eCQM data submitted for validation currently does not affect a hospital's payment determination as described in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57181).

We did not receive any comments on our proposal to update the regulatory language at 42 CFR 412.140(d)(2)(ii) to reflect this change in our validation policy.

After consideration of the public comments we received, we are finalizing our proposal as proposed.

12. Data Accuracy and Completeness Acknowledgement (DACA) Requirements

We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53554) for previously adopted details on DACA requirements. We did not propose any changes to this policy.

13. Public Display Requirements

a. Background

Section 1886(b)(3)(B)(viii)(VII) of the Act requires the Secretary to report quality measures of process, structure, outcome, patients' perspectives on care, efficiency, and costs of care that relate to services furnished in inpatient settings in hospitals on the internet website of CMS. Section 1886(b)(3)(B)(viii)(VII) of the Act also requires that the Secretary establish procedures for making information regarding measures available to the public after ensuring that a hospital has the opportunity to review its data before they are made public. Our current policy is to report data from the Hospital IQR Program as soon as it is feasible on CMS websites such as the Compare tool hosted by HHS, currently available at: *https://www.medicare.gov/care-compare*, or its successor website, after a 30-day preview period (78 FR 50776 through 50778). We refer readers to the FY 2008 IPPS/LTCH PPS final rule (72 FR 47364), the FY 2011 IPPS/LTCH PPS final rule (75 FR 50230), the FY 2012 IPPS/LTCH PPS final rule (76 FR 51650), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53554), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50836), the FY 2015 IPPS/LTCH PPS final rule (79 FR 50277), the FY 2016 IPPS/LTCH PPS final rule (80 FR 49712 through 49713), the FY 2018 IPPS/LTCH PPS final rule (82 FR 38403 through 38409), the FY 2019 IPPS/LTCH PPS final rule (83 FR 41538 through 41539), and the FY 2021 IPPS/LTCH PPS final rule (85 FR 58953) for details on public display requirements. The Hospital IQR Program quality measures are typically reported on the Compare tool hosted by HHS, currently available at: *https://www.medicare.gov/care-compare*.

In the FY 2023 IPPS/LTCH PPS proposed rule, we also proposed a publicly-reported hospital designation on a public-facing website to capture the quality and safety of maternity care. We refer readers to section IX.E.8. of the preamble of this final rule for more details.

b. Public Reporting of eCQM Data

We direct readers to the FY 2021 IPPS/LTCH PPS final rule (85 FR 58954 through 58959) where we finalized public reporting requirements of eCQM data reported by hospitals for the CY 2021 reporting period/FY 2023 payment determination and for subsequent years. We note that this policy incrementally increases the eCQM data publicly reported to four quarters of data for the CY 2023 reporting period/FY 2025 payment determination and subsequent years. We did not propose any changes to these policies in the proposed rule.

c. Overall Hospital Star Ratings

In the CY 2021 OPPS/ASC final rule with comment period and interim final rule with comment period (85 FR 86193 through 86236), we finalized a methodology to calculate the Overall Hospital Quality Star Rating (Overall Star Ratings). The Overall Star Ratings utilizes data collected on hospital inpatient and outpatient measures that are publicly reported on a CMS website, including data from the Hospital IQR Program. We refer readers to section XVI. of the CY 2021 OPPS/ASC final rule with comment period for details (85 FR 86193 through 86236). We did not propose any changes to these policies in the proposed rule. However, we refer readers to the CY 2023 OPPS/ASC proposed rule [1087] where we proposed to amend the language of 42 CFR 412.190(c) to state that we would use publicly available measure results on Hospital Compare or its successor websites from a quarter within the prior twelve months (instead of the ''prior year'').

14. Reconsideration and Appeal Procedures

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51650 through 51651), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50836), and 42 CFR 412.140(e) for details on reconsideration and appeal procedures for the FY 2017 payment determination and subsequent years. We did not propose any changes to these policies in the proposed rule.

15. Hospital IQR Program Extraordinary Circumstances Exceptions (ECE) Policy

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51651 through 51652), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50836 through 50837), the FY 2015 IPPS/LTCH PPS final rule (79 FR 50277), the FY 2016 IPPS/LTCH PPS final rule (80 FR 49713), the FY 2017 IPPS/LTCH PPS final rule (81 FR 57181 through 57182), the FY 2018 IPPS/LTCH PPS final rule (82 FR 38409 through 38411), and 42 CFR 412.140(c)(2) for details on the current Hospital IQR Program ECE policy. We also refer readers to the QualityNet website at: *https://qualitynet.cms.gov* for our current requirements for submission of a request for an exception. As finalized in the FY 2017 IPPS/LTCH PPS final rule, if a hospital is granted an Extraordinary Circumstances Exception with respect to eCQM reporting for the applicable eCQM reporting period, the hospital would be excluded from the eCQM validation sample due to its inability to supply data for validation (81 FR 57181). We did not propose any changes to these policies in the proposed rule.

[1087] **Federal Register** unpublished display version available at: *https://www.federalregister.gov/public-inspection/2022-15372/medicare-program-hospital-outpatient-prospective-payment-and-ambulatory-surgical-center-payment*

F. Updates to the PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program

1. Background

The PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program is authorized by section 1866(k) of the Act and applies to hospitals described in section 1886(d)(1)(B)(v) (referred to as ''PPS-Exempt Cancer Hospitals'' or ''PCHs''). For additional background information, including previously finalized measures and other policies for the PCHQR Program, we refer readers to all of the following final rules:

- The FY 2013 IPPS/LTCH PPS final rule (77 FR 53555 through 53567).
- The FY 2015 IPPS/LTCH PPS final rule (79 FR 50277 through 50286).
- The FY 2016 IPPS/LTCH PPS final rule (80 FR 49713 through 49723).
- The FY 2017 IPPS/LTCH PPS final rule (81 FR 57182 through 57193).
- The FY 2018 IPPS/LTCH PPS final rule (82 FR 38411 through 38425).
- The FY 2019 IPPS/LTCH PPS final rule (83 FR 41609 through 41624).
- The CY 2019 OPPS/ASC final rule with comment period (83 FR 59149 through 59154).
- The FY 2020 IPPS/LTCH PPS final rule (84 FR 42509 through 42524).
- The FY 2021 IPPS/LTCH PPS final rule (85 FR 58959 through 58966).
- The FY 2022 IPPS/LTCH PPS final rule (86 FR 45426 through 45437).

We also refer readers to 42 CFR 412.23(f) and 412.124 for the PCHQR Program regulations.

2. Measure Retention and Removal Factors for the PCHQR Program

a. Current Measure Retention and Removal Factors

For a detailed discussion regarding our retention and removal factors, we refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 57182 through 57183), where we adopted policies for measure retention and removal, and the FY 2019 IPPS/LTCH PPS final rule (83 FR 41609 through 41611), where we updated our measure removal factors. We did not propose any changes to our measure retention policy. We describe our proposal to update our measure removal policy in the following section.

b. Adoption of a Patient Safety Exception to the Measure Removal Policy

To further align with the measure removal policies adopted in other quality programs such as the Hospital IQR Program (74 FR 43864), Hospital VBP Program (83 FR 41446), and HAC Reduction Program (84 FR 42404 to 42406), we proposed that if we believe continued use of a measure in the PCHQR Program raises specific patient safety concerns, we may promptly remove the measure from the program without rulemaking and notify hospitals and the public of the removal of the measure, along with the reasons for its removal through routine communication channels to hospitals, vendors, and QIOs, including, but not limited to, issuing memos, emails, and notices on the QualityNet website. We would then provide notice of the removal in the **Federal Register**. In circumstances where we do not believe that continued use of a measure raises specific patient safety concerns, we would use the regular rulemaking process to remove a measure. We stated that the proposed policy mirrors that of the Hospital IQR Program, Hospital VBP Program, and HAC Reduction Program, and we continue to believe that a mechanism to immediately remove a quality measure that is causing specific and unintended patient harm aligns with our patient-centered focus.

We further proposed to add this patient safety exception to our regulations by revising 42 CFR 412.24(d)(3) to add a new paragraph (d)(3)(iii). We invited public comment on these proposals.

Comment: Commenters supported the proposal to adopt a patient safety exception to the measure removal policy and revise 42 CFR 412.24(d)(3) to add a new paragraph (d)(3)(iii).

Response: We appreciate the commenters' support.

After consideration of the public comments we received, we are finalizing our proposal to adopt a patient safety exception to the measure removal policy and revise 42 CFR 412.24(d)(3) to add a new paragraph (d)(3)(iii) beginning in FY 2023.

3. Potential Adoption of Two National Healthcare Safety Network (NHSN) Measures—Request for Information

In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28563), we sought comment on a potential future proposal to adopt the NHSN Healthcare-associated *Clostridioides difficile* Infection Outcome measure and NHSN Hospital-Onset Bacteremia & Fungemia Outcome measure into the PCHQR Program. We refer readers to section IX.E.9.a. of the preamble of the proposed rule, where we requested information on potentially adopting them for the Hospital IQR Program, and we noted that we are also considering proposing them for the HAC Reduction Program. With respect to the PCHQR Program, we stated that we were considering proposing these measures because cancer patients are often immunosuppressed and therefore more vulnerable to healthcare-associated infections (HAIs). We stated that we believed these measures will drive an increase in prevention practices, which may lead to a reduction in the number of HAI cases, morbidity, and mortality. We refer readers to section IX.E.9.a. of the preamble of this final rule for a discussion of the comments received regarding this cross-program RFI.

4. Summary of PCHQR Program Measures for the FY 2024 Program Year and Subsequent Years

Table IX.F.–01 summarizes the PCHQR Program measure set for the FY 2024 program year and subsequent years. We did not propose any changes to the PCHQR Program measure set.

TABLE IX.F.-01: FY 2024 PCHQR PROGRAM MEASURE SET AND SUBSEQUENT YEARS

Short Name	NQF Number	Measure Name
Safety and Healthcare-Associated Infection (HAI) Measures		
CAUTI	0138	National Healthcare Safety Network (NHSN) Catheter-associated Urinary Tract Infection (CAUTI) Outcome Measure
CLABSI	0139	National Healthcare Safety Network (NHSN) Central line-associated Bloodstream Infection (CLABSI) Outcome Measure
HCP	0431	Influenza Vaccination Coverage Among Healthcare Personnel
Colon and Abdominal Hysterectomy SSI	0753	American College of Surgeons – Centers for Disease Control and Prevention (ACS-CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure [currently includes SSIs following Colon Surgery and Abdominal Hysterectomy Surgery]
MRSA	1716	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure
CDI	1717	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure
COVID-19 HCP Vaccination	N/A	COVID-19 Vaccination Coverage Among HCP
Clinical Process/Oncology Care Measures		
EOL-Chemo	0210	Proportion of Patients Who Died from Cancer Receiving Chemotherapy in the Last 14 Days of Life
EOL-Hospice	0215	Proportion of Patients Who Died from Cancer Not Admitted to Hospice
Intermediate Clinical Outcome Measures		
EOL-ICU	0213	Proportion of Patients Who Died from Cancer Admitted to the ICU in the Last 30 Days of Life
EOL-3DH	0216	Proportion of Patients Who Died from Cancer Admitted to Hospice for Less Than Three Days
Patient Engagement/Experience of Care Measure		
HCAHPS	0166	HCAHPS (Hospital Consumer Assessment of Healthcare Providers and Systems) Survey
Claims Based Outcome Measures		
N/A	N/A	Admissions and Emergency Department (ED) Visits for Patients Receiving Outpatient Chemotherapy
N/A	3188	30-Day Unplanned Readmissions for Cancer Patients
N/A	N/A	Surgical Treatment Complications for Localized Prostate Cancer

5. Maintenance of Technical Specifications for Quality Measures

We maintain and periodically update technical specifications for the PCHQR Program measures. The specifications may be found on the QualityNet website at *https://qualitynet.cms.gov/pch*. We also refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50281), where we adopted a policy to use a subregulatory process to make nonsubstantive updates to measures used for the PCHQR Program. We did not propose any changes to our processes for maintaining technical specifications for PCHQR Program measures.

6. Public Display Requirements

a. Background

Under section 1866(k)(4) of the Act, we are required to establish procedures for making the data submitted under the PCHQR Program available to the public. Such procedures must ensure that a PCH has the opportunity to review its data before they are made public. We are specifically required to report quality measures of process, structure, outcome, patients' perspective on care, efficiency, and costs of care that relate to services furnished by PCHs on the CMS website.

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57191 through 57192), we finalized that although we would continue to use rulemaking to establish what year we first publicly report data on each measure, we would publish the data as soon as feasible during that year. We also stated that our intent is to make the data available on at least a yearly basis, and that the time period for PCHs to review their data before the data are made public would be approximately 30 days in length. We announce the exact data review and public reporting timeframes on a CMS website and our applicable Listservs. Currently, the PCHQR measures' performance data are made publicly available on the Provider Data Catalog available at *https://data.cms.gov/provider-data/*.

We recognize the importance of being transparent and keeping the public abreast of any changes that arise with the PCHQR Program measure set. As such, in this final rule, we are finalizing our proposals to begin public display of the four end-of-life measures with modification and the 30-Day Unplanned Readmissions for Cancer Patients measure.

b. Public Display of the End-of-Life (EOL) Measures

We proposed to begin public display of the EOL-Chemo, EOL-Hospice, EOL–ICU, and EOL–3DH measures (collectively, the ''EOL measures'') beginning with FY 2024 program year data. We adopted these measures for the PCHQR measure set beginning with FY 2020 program year data (82 FR 38414 through 38420). In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42523

through 42524), we finalized that we would confidentially report PCH performance on these measures to individual PCHs, and we indicated that we would propose to publicly display PCH performance on the measures after this initial confidential reporting period. We stated that we anticipated providing confidential reports on the data collected on the measures for the FY 2022 and FY 2023 program years, which correspond to data collected from July 1, 2019, to June 30, 2020 and July 1, 2020, to June 30, 2021, respectively, within calendar year 2022. We also stated that under our current policy, the measures are calculated on a yearly basis based on data collected from July 1 of the year 3 years prior to the program year to June 30 of the year 2 years prior to the program year. Therefore, we proposed to begin public reporting of these measures beginning with the FY 2024 program year data, which corresponds to data collected from July 1, 2021 through June 30, 2022. We stated that we would make these data publicly available following a 30-day period in which PCHs would have an opportunity to review the data. Public display would occur during the July 2023 refresh cycle or as soon as feasible thereafter. We further stated that we would announce the exact timeframe on a CMS website and our applicable listservs.

We invited public comment on the proposal to begin public display of the four EOL measures beginning with the FY 2024 program year data.

Comment: A few commenters supported the proposal to begin public display of the four EOL measures, stating that this public display will provide valuable information about hospital performance to patients. Another commenter specifically supported public display of the EOL-Chemo and EOL–ICU measures, stating that the data from these measures would complement the ADCC Serious Illness project.

Response: We thank the commenters for their support of publicly displaying the four EOL measures. We also thank the commenter who supported public display of the EOL-Chemo and EOL–ICU measures.

Comment: Several commenters requested that CMS delay public reporting of the EOL measures until hospitals can review their FY 2022 confidential reports, the release of which was delayed by one year.

Response: We thank the commenters for their feedback. The FY 2022 confidential feedback reports were made available to PCHs in June 2022. We anticipate the FY 2023 confidential reports will be made available to PCHs in August 2022 or as soon as feasible thereafter. We agree that the delay in releasing the FY 2022 and FY 2023 confidential feedback reports necessitates a delay in public reporting in order to provide PCHs with sufficient time to gain familiarity with the measure calculation and results. We believe a one-year delay, which is the minimum delay possible due to measure reporting timelines, will be sufficient to provide PCHs with additional time while balancing the importance of transparency of the EOL measure data.

Comment: Another commenter expressed concern about the lack of context for publicly displayed measure data such as individual patients' preferences and needs, which may lead to misrepresentation of the quality of cancer care.

Response: We thank the commenter for sharing their concern. The measure information will initially be available only via the Provider Data Catalog (PDC), and we are in the process of making this data available via Care Compare for public display. We would like to reiterate that PCHs will have a 30-day review period to confirm accuracy of the measure data before public display, and measures rates will be displayed with any appropriate context for ease of understanding the results.

After consideration of the public comments we received, we are finalizing our proposal to begin public reporting of the four EOL measures, with modification. Specifically, we are finalizing to begin public reporting beginning with FY 2025 program year data, which corresponds to data collected from July 1, 2022, through June 30, 2023, to provide hospitals with enough time to review their confidential reports. Public display will occur during the July 2024 refresh cycle or as soon as feasible thereafter. We will announce the exact timeframe on a CMS website and PCHQR Program listservs.

c. Public Display of the 30-Day Unplanned Readmissions for Cancer Patients Measure Beginning With the FY 2024 Program Year Data

We proposed to begin public display of the 30-Day Unplanned Readmissions for Cancer Patients measure beginning with FY 2024 program year data. We adopted this measure for the PCHQR measure set beginning with FY 2021 program year data (83 FR 41613 through 41616). In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42523 through 42524), we finalized that we would confidentially report this measure to individual PCHs, and we indicated that we would propose public display after this initial confidential reporting period. We provided confidential reports on the data collected on this measure for the FY 2022 program year in July 2021. In addition, we stated that we anticipated confidentially reporting data collected on the measure for the FY 2023 program year, which corresponds to data collected from October 1, 2020 to September 30, 2021, in July 2022.

Under our current policy, the measure is calculated on a yearly basis based on data collected from October 1 of the year 3 years prior to the program year to September 30 of the year 2 years prior to the program year. We proposed to begin public reporting of this measure beginning with the FY 2024 program year data, which corresponds to data collected from October 1, 2021 through September 30, 2022. We stated that we would make these data publicly available following a 30-day period in which PCHs would have an opportunity to review the data. Public display would occur during the October 2023 refresh cycle or as soon as feasible thereafter. We stated that we would announce the exact timeframe on a CMS website and our applicable listservs.

We invited public comment on the proposal to begin public display of the 30-Day Unplanned Readmissions for Cancer Patients measure beginning with the FY 2024 program year data.

Comment: Several commenters supported the proposal to begin public display of the 30-Day Unplanned Readmissions for Cancer Patients measure beginning with the FY 2024 program year data. A few commenters noted that that the FY 2021 confidential reports were reflective of measure specifications. A few commenters applauded CMS' early release of the confidential reports, allowing for proactive review prior to reporting periods. A commenter stated their belief that the measure will provide valuable information about hospital performance to patients.

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing our proposal to begin public display of the 30-Day Unplanned Readmissions for Cancer Patients measure beginning with the FY 2024 program year data.

d. Summary of Previously Finalized and Newly Finalized Public Display Requirements for the PCHQR Program

Our previously finalized and newly finalized public display requirements for the PCHQR Program measures are shown in the following Table IX.F.–02:

TABLE IX.F-02: PREVIOUSLY FINALIZED AND NEWLY FINALIZED PUBLIC DISPLAY REQUIREMENTS FOR THE PCHQR PROGRAM

Summary of Previously Finalized and Newly Finalized Public Display Requirements	
Measures	**Public Reporting**
• HCAHPS (NQF #0166) • Oncology: Plan of Care for Pain – Medical Oncology and Radiation Oncology (NQF #0383)*	2016 and subsequent years
• American College of Surgeons – Centers for Disease Control and Prevention (ACS-CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure [currently includes SSIs following Colon Surgery and Abdominal Hysterectomy Surgery] (NQF #0753) • National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* Bacteremia Outcome Measure (NQF #1716) • National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure (NQF #1717) • National Healthcare Safety Network (NHSN) Influenza Vaccination Coverage Among Healthcare Personnel (NQF #0431)	2019 and subsequent years
• COVID-19 Vaccination Coverage Among Healthcare Personnel	October 2022 and subsequent years
• Admissions and Emergency Department (ED) Visits for Patients Receiving Outpatient Chemotherapy	April 2020 and subsequent years
• CAUTI (NQF #0138) • CLABSI (NQF #0139)	Deferred until October 2022
• Proportion of Patients Who Died from Cancer Receiving Chemotherapy in the Last 14 Days of Life (NQF #0210)** • Proportion of Patients Who Died from Cancer Not Admitted to Hospice (NQF #0215)** • Proportion of Patients Who Died from Cancer Admitted to the ICU in the Last 30 Days of Life (NQF #0213)** • Proportion of Patients Who Died from Cancer Admitted to Hospice for Less Than Three Days (NQF #0216)**	July 2024 or as soon as feasible thereafter
• 30-day Unplanned Readmissions for Cancer Patients (NQF #3188)***	October 2023 or as soon as feasible thereafter

**Measure finalized for removal, beginning with the FY 2024 program year.*
***Measure finalized for public display beginning with FY 2025 program year data.*
****Measure finalized for public display beginning with FY 2024 program year data.*

7. Form, Manner, and Timing of Data Submissions

We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53563 through 53567) for our previously finalized procedural requirements for the PCHQR Program. Data submission requirements and deadlines for the PCHQR Program are posted on the QualityNet website. We did not propose any updates to our previously finalized data submission requirements and deadlines.

8. Extraordinary Circumstances Exceptions (ECE) Policy Under the PCHQR Program

We refer readers to the FY 2019 IPPS/LTCH PPS final rule (83 FR 41623 through 41624), for a discussion of the Extraordinary Circumstances Exceptions (ECE) policy under the PCHQR Program. We did not propose any changes to this policy.

G. Long-Term Care Hospital Quality Reporting Program (LTCH QRP)

1. Background and Statutory Authority

The Long-Term Care Hospital Quality Reporting Program (LTCH QRP) is authorized by section 1886(m)(5) of the Act, and it applies to all hospitals certified by Medicare as Long-Term Care Hospitals (LTCHs). Section 1886(m)(5)(C) of the Act requires LTCHs to submit to the Secretary quality measure data specified under section 1886(m)(5)(D) in a form and manner, and at a time, specified by the Secretary. In addition, section 1886(m)(5)(F) of the Act requires LTCHs to submit data on quality measures under section 1899B(c)(1) of the Act, resource use or other measures under section 1899B(d)(1) of the Act, and standardized patient assessment data required under section 1899B(b)(1) of the Act. LTCHs must submit the data required under section 1886(m)(5)(F) of the Act in the form and manner, and at the time, specified by the Secretary. Under the LTCH QRP, the Secretary must reduce by 2 percentage points the annual update to the LTCH PPS standard Federal rate for discharges for an LTCH during a fiscal year if the LTCH has not complied with the LTCH QRP requirements specified for that fiscal year. For more information on the background for the LTCH QRP, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51743 through 51744), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53614), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50853), the FY 2015 IPPS/LTCH PPS final rule (79 FR 50286), the FY 2016 IPPS/LTCH PPS final rule (80 FR 49723 through 49725), the FY 2017 IPPS/LTCH PPS final rule (81 FR 57193), the FY 2018 IPPS/LTCH PPS final rule (82 FR 38425 through 38426), the FY 2019 IPPS/LTCH PPS

final rule (83 FR 41624 through 41634), the FY 2020 IPPS/LTCH PPS final rule (84 FR 42524 through 42591), and the FY 2022 IPPS/LTCH PPS final rule (86 FR 45438 through 45446). For more information on the requirements under the LTCH QRP, we refer readers to 42 CFR 412.560.

2. General Considerations Used for the Selection of Quality Measures for the LTCH QRP

For a detailed discussion of the considerations we historically use for the selection of LTCH QRP quality, resource use, and other measures, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49728).

3. Quality Measures Currently Adopted for the FY 2023 LTCH QRP

The LTCH QRP currently has 18 measures for the FY 2023 LTCH QRP, which are set out in the following Table IX.G.-01. For a discussion of the factors used to evaluate whether a measure should be removed from the LTCH QRP, we refer readers to the FY 2019 IPPS/LTCH PPS final rule (83 FR 41624 through 41634) and to the regulations at 42 CFR 412.560(b)(3).

TABLE IX.G.-01. QUALITY MEASURES CURRENTLY ADOPTED FOR THE FY 2023 LTCH QRP

Short Name	Measure Name & Data Source
LTCH CARE Data Set	
Pressure Ulcer/Injury	Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury
Application of Falls	Application of Percent of Residents Experiencing One or More Falls with Major Injury (Long Stay) (NQF #0674)
Functional Assessment	Percent of Long-Term Care Hospital (LTCH) Patients with an Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (NQF #2631)
Application of Functional Assessment/ Care Plan	Application of Percent of Long-Term Care Hospital (LTCH) Patients with an Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (NQF #2631)
Change in Mobility	Functional Outcome Measure: Change in Mobility Among Long-Term Care Hospital (LTCH) Patients Requiring Ventilator Support (NQF #2632)
DRR	Drug Regimen Review Conducted With Follow-Up for Identified Issues–Post Acute Care (PAC) Long-Term Care Hospital (LTCH) Quality Reporting Program (QRP)
Compliance with SBT	Compliance with Spontaneous Breathing Trial (SBT) by Day 2 of the LTCH Stay
Ventilator Liberation	Ventilator Liberation Rate
TOH–Provider*	Transfer of Health Information to the Provider Post-Acute Care (PAC)
TOH–Patient*	Transfer of Health Information to the Patient Post-Acute Care (PAC)
NHSN	
CAUTI	National Healthcare Safety Network (NHSN) Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure (NQF #0138)
CLABSI	National Healthcare Safety Network (NHSN) Central Line-associated Bloodstream Infection (CLABSI) Outcome Measure (NQF #0139)
CDI	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure (NQF #1717)
HCP Influenza Vaccine	Influenza Vaccination Coverage among Healthcare Personnel (NQF #0431)
HCP COVID-19 Vaccine	COVID-19 Vaccination Coverage among Healthcare Personnel (HCP)
Claims-Based	
MSPB LTCH	Medicare Spending Per Beneficiary (MSPB)–Post Acute Care (PAC) Long-Term Care Hospital (LTCH) Quality Reporting Program (QRP) (NQF #3562)
DTC	Discharge to Community (DTC)–Post Acute Care (PAC) Long-Term Care Hospital (LTCH) Quality Reporting Program (QRP) (NQF #3480)
PPR	Potentially Preventable 30-Day Post-Discharge Readmission Measure for Long-Term Care Hospital (LTCH) Quality Reporting Program (QRP)

*In response to the COVID-19 public health emergency (PHE), we released an interim final rule (85 FR 27595 through 27597) which delayed the compliance date for the collection and reporting of the Transfer of Health Information measures. The compliance date for the collection and reporting of the Transfer of Health Information measures was revised to October 1, 2022 in the CY 2022 Home Health Prospective Payment System Rate Update final rule (86 FR 62386 through 62390).

There were no proposals in the proposed rule for new measures for the LTCH QRP.

4. LTCH QRP Quality Measure Concepts Under Consideration for Future Years: Request for Information (RFI) Included in the FY 2023 IPPS/LTCH PPS Proposed Rule

In the FY 2023 IPPS/LTCH PPS proposed rule, we sought input on the importance, relevance, and applicability of the concepts under consideration listed in Table IX.G.-02 for future years in the LTCH QRP. More specifically, we sought input on a cross-setting functional measure that would incorporate the domains of self-care and mobility. Our measure development contractor for the cross-setting functional outcome measure convened a Technical Expert Panel (TEP) on June 15 and June 16, 2021 to obtain expert input on the development of a functional outcome measure for PAC. During this meeting, the possibility of creating one measure to capture both self-care and mobility was discussed. We also sought input on measures of health equity, such as structural measures that assess an organization's leadership in advancing equity goals or assess progress towards achieving equity priorities. Finally, we sought input on the value of a COVID–19 Vaccination Coverage measure that would assess whether LTCH patients were up to date on their COVID–19 vaccine.

TABLE IX.G.-02: FUTURE MEASURE CONCEPTS UNDER CONSIDERATION FOR THE LTCH QRP

Quality Measure Concepts
Cross-Setting Function
Health Equity Measures
PAC - COVID-19 Vaccination Coverage among Patients

Comment: Commenters were generally supportive of a cross-setting functional outcome measure, although some commenters expressed concern over the potential burden of collecting additional information. Some commenters emphasized that the measure should provide meaningful information to patients, caregivers, discharge planners, providers, and payers, and noted that LTCH patients often have different levels of acuity and treatment needs so a future measure must be able to differentiate LTCHs from one another. Two commenters stated that since LTCH patients have different levels of acuity and treatment needs, it may make comparisons to other ''PAC'' settings not appropriate, even when risk adjustment is used. These commenters urged CMS to consider measures that incorporate improvement in function, but also recognize that some patients may not demonstrate improvement due to their medical condition(s). A commenter stated they preferred separate quality measures for self-care and mobility, but would support the initial use of a composite measure reflecting both self-care and mobility function. Another commenter opposed the inclusion of a measure that was based on provider-reported assessment data.

We received mixed comments regarding a health equity measure in the LTCH QRP. Two commenters were concerned with how accurate a health equity measure could be for LTCHs given their small sample sizes, and whether LTCHs would be able to meaningfully improve a measure of health equity. Other commenters were strongly supportive of including health equity measures in the LTCH QRP in a future year.

Commenters stated they understood why CMS was considering a COVID–19 Vaccination Coverage among Patients measure, but noted CMS should postpone considering this measure since the definition of ''fully vaccinated'' is evolving.

We also received comments suggesting CMS consider other measure concepts for the LTCH QRP, including malnutrition and patient-reported outcomes. A commenter urged CMS to consider a measure of malnutrition screening since malnutrition is a risk factor for several clinical events, including falls and delayed healing. Another commenter suggested measures of patient experience, patient and workforce safety and reliability, clinical quality, and caregiver engagement that are evidence-based, targeted, and meaningful to patients and caregivers.

Response: As discussed in the proposed rule, we are not responding to specific comments submitted in response to this RFI in this final rule, but we intend to use this input to inform our future measure development efforts.

5. Inclusion of the National Healthcare Safety Network (NHSN) Healthcare-Associated *Clostridioides difficile* Infection Outcome Measure in the LTCH QRP—Request for Information (RFI) Included in the FY 2023 IPPS/LTCH PPS Proposed Rule

a. Solicitation of Public Comment

In the FY 2023 IPPS/LTCH PPS proposed rule, we requested stakeholder input on the potential electronic submission of quality data from LTCHs via their electronic health records (EHRs) under the LTCH QRP. We specifically sought public comment on the future inclusion of the NHSN Healthcare-Associated *Clostridioides difficile* Infection Outcome measure (HA–CDI) (MUC2021–098) as a digital quality measure in the LTCH QRP.

Specifically, we sought public comment on the following:

- Would you support utilizing LTCH EHRs as the mechanism of data collection and submission for LTCH QRP measures?
- Would your EHR support exposing data via HL7 Fast Healthcare Interoperability Resources (FHIR) to a locally installed Measure Calculation Tool (MCT)? For LTCHs using certified health IT systems, how can existing certification criteria under the Office of the National Coordinator (ONC) Health Information Technology (IT) Certification Program support reporting of these data? What updates, if any, to the Certification Program would be needed to better support capture and submission of these data?
- Is a transition period between the current method of data submission and

an electronic submission method necessary? If so, how long of a transition would be necessary, and what specific factors are relevant in determining the length of any transition?

• Would vendors, including those that service LTCHs, be interested in or willing to participate in pilots or voluntary electronic submission of quality data?

• Do LTCHs anticipate challenges, other than the adoption of EHR, to adopting the NHSN HA–CDI measure, and if so, what are potential solutions for those challenges?

We received several comments on this RFI, which are summarized in this section of this document:

Comment: Commenters were mixed in their support of utilizing LTCH EHRs as the mechanism for data collection and submission for LTCH QRP measures. While all commenters supported the concept of reducing provider burden through using fully digital measures, commenters did note several barriers. A commenter noted that the transition would take time and staffing hours away from other clinical initiatives. Most commenters raised concerns about the cost associated with LTCHs t adopting EHR systems that are equipped to collect and exchange digital quality measure (dQM) data. They stated that EHR adoption has been slower and less uniform than it was in acute care hospitals, due to the lack of incentive payments available to LTCHs. They urged CMS to provide incentive payments to LTCHs as they did for acute care hospitals through the Health Information Technology for Economic and Clinical Health (HITECH) Act prior to requiring LTCHs' transition to dQMs.

A commenter stated that their EHR would support exposing data via HL7 FHIR to a locally installed MCT. Another commenter stated they had concerns about the definition of treatment, as well as potential gaming of the measure that could lead to the untended consequences of overuse of antimicrobials or the undertreatment of patients with CDI. This commenter also suggested CMS to work with CMS to determine whether risk adjustment based on hospital characteristics is needed. Finally, they cautioned that electronic reporting is evolving and they requested CMS work with the Office of the National Coordinator for Health Information Technology (ONC) and other EHR vendors to fully integrate electronic reporting options before implementation.

Commenters universally agreed that a transition period would be necessary to set up processes capable of electronic submission of data. They stressed that LTCHs would need significant lead time to ensure they could be compliant with new digital reporting requirements, and estimated it would take a minimum of 2 years to transition to digital reporting. Another commenter stated that a switch to dQMs would involve a number of different workflows, and that sufficient testing would be important since LTCHs could be penalized 2% for an entire year if they were found non-compliant.

A commenter urged CMS to allow LTCH provider organizations, in addition to vendors, to participate in any pilots or testing of dQMs before implementation.

Response: We will consider all input as we develop future regulatory proposals. Any updates to specific program requirements related to quality measurement and reporting provisions would be addressed through separate and future notice-and-comment rulemaking, as necessary.

6. Overarching Principles for Measuring Equity and Healthcare Quality Disparities Across CMS

a. Solicitation of Public Comment

The goal of this request for information was to describe some key principles and approaches that we will consider when advancing the use of quality measure development and stratification to address healthcare disparities and advance health equity across our programs.

We invited general comments on the principles and approaches described previously in this section of the rule, as well as additional thoughts about disparity measurement guidelines suitable for overarching consideration across CMS's QRP programs. Specifically, we invited comment on the following:

• *Identification of Goals and Approaches for Measuring Healthcare Disparities and Using Measure Stratification Across CMS Quality Reporting Programs*

++ The use of the within- and between-hospital disparity methods in LTCHs to present stratified measure results.

++ The use of decomposition approaches to explain possible causes of measure performance disparities.

++ Alternative methods to identify disparities and the drivers of disparities.

• *Guiding Principles for Selecting and Prioritizing Measures for Disparity Reporting*

++ Principles to consider for prioritization of health equity measures and measures for disparity reporting, including prioritizing stratification for validated clinical quality measures, those measures with established disparities in care, measures that have adequate sample size and representation among healthcare providers and outcomes, and measures of appropriate access and care.

• *Principles for Social Risk Factor (SRF) and Demographic Data Selection and Use*

++ Principles to be considered for the selection of SRFs and demographic data for use in collecting disparity data including the importance of expanding variables used in measure stratification to consider a wide range of SRFs, demographic variables, and other markers of historic disadvantage. In the absence of patient-reported data we will consider use of administrative data, area-based indicators, and imputed variables as appropriate.

• *Identification of Meaningful Performance Differences*

++ Ways that meaningful difference in disparity results should be considered.

• *Guiding Principles for Reporting Disparity Measures*

++ Guiding principles for the use and application of the results of disparity measurement.

• *Measures Related to Health Equity*

++ The usefulness of a Health Equity Summary Score (HESS) for LTCHs, both in terms of provider actionability to improve health equity, and in terms of whether this information would support Care Compare website users in making informed healthcare decisions.

++ The potential for a structural measure assessing an LTCH's commitment to health equity, the specific domains that should be captured, and options for reporting these data in a manner that would minimize burden.

++ Options to collect facility-level information that could be used to support the calculation of a structural measure of health equity.

++ Other options for measures that address health equity.

We received several comments on the RFI for Overarching Principles for Measuring Equity and Healthcare Quality Disparities Across CMS Quality Programs. While we will not be responding to specific comments submitted in response to this RFI, the following is a summary of some comments received:

Comment: Many commenters provided feedback on the use of the within-provider and between provider disparity methods to present stratified measure results. Overall, comments were generally supportive of implementing both methods in order to provide a more complete picture of the

quality of care provided to beneficiaries with SRFs.

In terms of specific feedback related to the implementation of these stratification approaches, a few commenters stated CMS should prioritize expansion of the within-provider method over the between-provider method due to the fact that the latter method might provide an incomplete picture of disparity and would not inform a LTCH's an understanding of its own performance. Other commenters suggested CMS consider using peer groups for between-provider comparisons, such as peer LTCHs identified based patient demographic profile, geographic location, or bed size. A commenter noted concern that within-provider methods may place excessive responsibility on providers to mitigate the disparities without providing the resources to take action. Another commenter stated the feedback would be more actionable and useful if the results included information beyond what hospitals already collect. Finally, a commenter recommended feedback methods should be carefully considered for each type of measure, and specifically pointed out that patient experience measures may not be appropriate to compare between subgroups since it could lend itself to misinterpretation and labeling of certain subgroups of patients.

Several commenters responded to the disparity decomposition approach presented in the proposed rule. A commenter noted the decomposition approach described could be a promising method to identify specific drivers of performance disparities, which would increase the actionability of stratified measure information while adding no additional burden to providers. Other commenters supported the method, but a commenter did caution that LTCHs would be limited in their ability to address patients' needs while under their care. A few commenters opposed the use of decomposition techniques, citing their concern that if statistical methods are poorly chosen, some LTCHs may be labeled discriminatory unintentionally, causing harm to beneficiaries, providers and the Medicare program.

Commenters were overwhelmingly supportive of prioritizing existing quality measures for disparity reporting, and most commenters were also supportive of prioritizing measures with identified disparities in treatment or outcomes, or conditions that have highly disproportionate prevalence in certain populations. Many commenters stated CMS should focus on: (1) outcome measures over process measures; (2) use existing collected patient data and prevent additional reporting burdens on providers; and (3) have a meaningful and quantifiable impact on overall patient health and system cost. For those reasons, these commenters suggested measures such as hospital readmissions, mortality associated with certain health conditions, and potentially avoidable events. Support for prioritizing measures with adequate sample sizes and measures that seek to determine patient access to care and the appropriate use of care were suggested by many commenters as well.

Commenter also suggested additional guiding principles. A commenter recommended the measures should have essential characteristics such as being data-driven, actionable, feasible, have utility and be constructed such that providers have prompt feedback. Another commenter suggested CMS should focus on the areas of clinical quality, clinical safety and patient experience, while still another stressed alignment with other programs and agencies, where possible and appropriate.

We received a number of other comments on the guiding principles for selecting and prioritizing measures for disparity reporting. A commenter suggested the only criteria that should be used is whether the measure highlights disparities in care. Another commenter requested CMS clarify how it defines ''industry standards for measure reliability and validity.'' Finally, another commenter cautioned CMS against using this information to single out healthcare providers and take punitive action against them.

A number of commenters provider feedback on considerations for the selection of SRFs and demographic data for use in collecting disparity data. A majority of commenters supported using race and ethnicity, although a commenter recommended using any SRFs other than dual eligibility, race and ethnicity. Several commenters suggested using disability status, and two of these commenters also suggested using primary language. Other data points were suggested, including sexual orientation, gender identity, age, and health literacy. Finally, a commenter recommended CMS use a standard definition of the term ''disparity'' that can be used as a measurable benchmark across programs.

The feedback received on methods for determining meaningful performance differences in disparity results was mixed. First, we summarize the comments regarding the four possible reporting approaches discussed in section IX.E.6.1.4 the proposed rule, and then summarize comments recommending other approaches.

While several commenters were generally supportive of benchmarking, one provider stated the data was too limited at the current time to apply benchmarks and another commenter noted it could mask local or regional differences in patient populations and thus inadvertently penalize providers. A commenter provided feedback specific to using statistical differences to identifying meaningful performance differences, and the commenter recommended that if this approach were used the measure, along with an estimate of its variability, such as a confidence interval, be displayed with it to aid in its interpretation. Several commenters did not support ranked orderings and percentiles and cautioned they could lead to significant unintended consequences, and two of these commenters noted that they do not necessarily translate to meaningful clinical differences. Finally we received two comments supporting the use of defined thresholds, such as fixed intervals of results of disparity reporting, but several commenters did not support this method. The most notable reason given was their concern this method created an artificial cutoff where small performance differences are either acceptable or unacceptable, and it could result in inappropriately characterizing some LTCHs as practicing discrimination. We also received one comment recommending CMS use a combination of peer group benchmarking and statistical significance.

Commenters also recommended other approaches. A commenter recommended CMS conduct analyses to compare the results of different methods and publish the results of these analyses for stakeholder review and public comment. Other commenters urged CMS not to apply a one-size-fits-all approach, and suggested CMS may need to tailor the approaches to the individual patient populations and quality program. A few commenters noted that before any analyses are completed, CMS will need to define a statistically acceptable minimum threshold for determining a disparity exists as well as a high reliability standard for determining the minimum number of observations required for a provider's performance to be stratified and reported.

Several commenters responded to CMS' request for information about measures CMS could develop to assess and encourage health equity, including

comments regarding the usefulness and actionability of HESS and the potential for a structural measure to assess SNFs' commitment to health equity. We first summarize the comments regarding the HESS, then summarize comments related to a structural measure to assess commitment to equity.

Several commenters specifically addressed the HESS. A commenter simply encouraged CMS to clarify that the HESS would assess individual SNFs as a whole, as opposed to the individual clinicians within each SNF. The two remaining commenters either supported or appreciated the HESS score in concept, but raised several concerns pertaining to technical barriers, ambiguity in the methodology, and usability of the measure. In terms of technical concerns, a commenter noted that the availability of a standardized set of demographic data elements must be available for each patient, and stated that demographic data elements are not yet standardized across healthcare setting and organizations. Regarding methodological concerns, a commenter questioned how one could combine within-facility disparities and disparities across facilities into a single summary score in a manner that would accurately reflect both the individual and potentially independent factors that may result in these different types of disparities. Other commenters raised similar concerns about the usability the HESS, primarily stemming from the extent to which disparities across multiple measures and SRFs are aggregated into a single score. Specifically, commenters noted that one SRF included in the HESS could mask the effects of other SRFs, which could potentially lead to misinterpretation of the overall score. Another commenter stated the measure was vague and therefore would not be actionable by their members or meaningful to the public.

Several commenters addressed the potential for a structural measures to assess health equity. A commenter stated that a structural measure would have a low level of burden, while signaling to the LTCH community the importance of focusing improvement efforts on health equity and prompting the healthcare organization to consider their ongoing or needed efforts to address each domain. Another commenter noted that the development of a structural measure to assess engagement and commitment of leadership toward advancing health equity should be included as one of several guiding principles to address health disparities and achieve health equity. Another commenter cautioned against the development of structural measures, suggesting that such measures would only demonstrate whether an organization is ''good at checking the box'' for the purpose of meeting the requirements of a measure.

Response: We appreciate all of the comments and interest in this important topic. Public input is very valuable in the continuing development of CMS's health equity quality measurement efforts and broader commitment to health equity, a key pillar of our strategic vision as well as a core agency function. Thus, we will continue to take all concerns, comments, and suggestions into account for future development and expansion of policies to advance health equity across the LTCH QRP, including by supporting LTCHs in their efforts to ensure equity for all of their patients, and to identify opportunities for improvements in health outcomes. Any updates to specific program requirements related to quality measurement and reporting provisions would be addressed through separate and future notice-and-comment rulemaking, as necessary.

7. Form, Manner, and Timing of Data Submission Under the LTCH QRP

We refer readers to the regulatory text at 42 CFR 412.560(b) for information regarding the current policies for reporting LTCH QRP data.

For more details about the required reporting periods of measures or standardized patient assessment data during the first and subsequent years upon adoption, please refer to the FY 2020 IPPS/LTCH PPS final rule (84 FR 24588 through 24590).

We did not propose any new policies regarding the form, manner, and timing of data submission under the LTCH QRP.

8. Policies Regarding Public Display of Measure Data for the LTCH QRP

We did not propose any new policies regarding the public display of LTCH QRP measure data.

H. Changes to the Medicare Promoting Interoperability Program

1. Statutory Authority for the Medicare Promoting Interoperability Program for Eligible Hospitals and Critical Access Hospitals (CAHs)

The Health Information Technology for Economic and Clinical Health Act (HITECH Act) (Title IV of Division B of the American Recovery and Reinvestment Act of 2009 (ARRA), together with Title XIII of Division A of the ARRA) authorized incentive payments under Medicare and Medicaid, as well as downward payment adjustments under Medicare, for the adoption and meaningful use of certified electronic health record technology (CEHRT). Incentive payments under Medicare were available to eligible hospitals and CAHs for certain payment years (as authorized under sections 1886(n) and 1814(l) of the Act, respectively) if they successfully demonstrated meaningful use of CEHRT, which included reporting on clinical quality measures using CEHRT. In accordance with the timeframe set forth in the statute, these incentive payments under Medicare are no longer available. Sections 1886(b)(3)(B)(ix) and 1814(l)(4) of the Act authorize downward payment adjustments under Medicare, beginning with Federal fiscal year (FY) 2015 (and beginning with FY 2022 for subsection (d) Puerto Rico hospitals), for eligible hospitals and CAHs that do not successfully demonstrate meaningful use of CEHRT for certain associated electronic health record (EHR) reporting periods.

2. EHR Reporting Period

Under the definition of ''EHR reporting period for a payment adjustment year'' at 42 CFR 495.4, for eligible hospitals and CAHs that are new or returning participants in the Medicare Promoting Interoperability Program, the EHR reporting period in calendar year (CY) 2023 is a minimum of any continuous 90-day period within CY 2023, and the EHR reporting period in CY 2024 is a minimum of any continuous 180-day period within CY 2024. For more information, we refer readers to the discussion in the FY 2022 Hospital Inpatient Prospective Payment Systems for Acute Care Hospitals and the Long-Term Care Hospital (IPPS/LTCH) Prospective Payment System (PPS) final rule (86 FR 45460 through 45462).

a. CEHRT Requirements

The Promoting Interoperability Program and the Quality Payment Program (QPP) require the use of CEHRT as defined at 42 CFR 495.4 and 414.1305, respectively. Since 2019, in general, this has consisted of EHR technology (which could include multiple technologies) certified under the Office of the National Coordinator for Health Information Technology (ONC) Health Information Technology (IT) Certification Program that meets the 2015 Edition Base EHR definition (as defined at 45 CFR 170.102) and has been certified to certain other 2015 Edition health IT certification criteria as specified in the definition.

The ''21st Century Cures Act: Interoperability, Information Blocking, and the ONC Health IT Certification Program'' final rule (also referred to as the ''ONC 21st Century Cures Act final rule''), published in the May 1, 2020, **Federal Register** (85 FR 25642 through 25961), finalized a number of updates to the 2015 Edition of health IT certification criteria (also referred to as the 2015 Edition Cures Update) and introduced new 2015 Edition certification criteria. In connection with these updates, ONC also finalized that health IT developers have 24 months from the publication date of the final rule (until May 2, 2022) to make technology available that is certified to the updated, or new criteria. In response to additional calls for flexibility in response to the Public Health Emergency (PHE) for COVID–19, ONC published an interim final rule with comment period on November 4, 2020 entitled, ''Information Blocking and the ONC Health IT Certification Program: Extension of Compliance Dates and Timeframes in Response to the COVID–19 Public Health Emergency'' (hereinafter the ''ONC interim final rule'') (85 FR 70064). In this interim final rule, ONC finalized extended compliance dates for certain 2015 Edition certification criteria. Specifically, where the ONC 21st Century Cures Act final rule provided that developers of certified health IT have 24 months from the publication date of the final rule to make technology certified to new or updated criteria available, ONC extended the timeline until December 31, 2022 (and until December 31, 2023, for 45 CFR 170.315(b)(10), ''electronic health information (EHI) export'').

In the CY 2021 Physician Fee Schedule (PFS) final rule (85 FR 84815 through 84825), we finalized that the technology used by health care providers to satisfy the definitions of CEHRT at 42 CFR 495.4 and 414.1305 must be certified under the ONC Health IT Certification Program, in accordance with the updated 2015 Edition certification criteria as finalized in the ONC 21st Century Cures Act final rule (85 FR 25642). We further finalized aligning the transition period during which health care providers participating in the Promoting Interoperability Program or QPP may use technology certified to either the existing or updated 2015 Edition certification criteria, with the December 31, 2022, date established in the ONC interim final rule for health IT developers to make updated certified health IT available. After this date, health care providers will be required to use only certified technology updated to the 2015 Edition Cures Update for an EHR reporting period or performance period in CY 2023. We did not propose any changes to this policy.

We remind readers that health care providers would not be required to demonstrate that they are using updated technology to meet the CEHRT definitions immediately upon the transition date of December 31, 2022. In accordance with the EHR reporting period and performance period established for the Promoting Interoperability Program and the Merit-based Incentive Payment System (MIPS) Promoting Interoperability performance category, participants are only required to use technology meeting the CEHRT definitions during a self-selected EHR reporting period or performance period of a minimum of any consecutive 90 days in CY 2023, including the final 90 days of 2023 (86 FR 45460 through 45462 and 86 FR 65466, respectively). The eligible hospital, CAH, or MIPS eligible clinician is not required to demonstrate meaningful use of technology meeting the 2015 Edition Cures Update until the EHR reporting period or performance period they have selected.

3. Electronic Prescribing Objective: Changes to the Query of Prescription Drug Monitoring Program Measure and Technical Update to the E-Prescribing Measure

a. Query of Prescription Drug Monitoring Program Measure Background

We have adopted the Query of Prescription Drug Monitoring Program (PDMP) measure under the Electronic Prescribing Objective. For background on this measure, we refer readers to the FY 2019 IPPS/LTCH PPS final rule (83 FR 41648 through 41653), the FY 2020 IPPS/LTCH PPS final rule (84 FR 42593 through 42595), the FY 2021 IPPS/LTCH PPS final rule (85 FR 58967 through 58969), and the FY 2022 IPPS/LTCH PPS final rule (86 FR 45462 through 45464). In the FY 2021 IPPS/LTCH PPS final rule (85 FR 58967 through 58969), we finalized that the Query of PDMP measure will remain optional and eligible for 5 bonus points for EHR reporting periods in CY 2021. In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45464), we finalized that the Query of PDMP measure will remain optional and increased the eligible bonus points to 10 points for CY 2022.

In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42593 through 42596), FY 2021 IPPS/LTCH PPS final rule (85 FR 58967 through 58969), and FY 2022 IPPS/LTCH PPS final rule (86 FR 45462 through 45464), we described the concern expressed by interested parties who believed it was premature for the Medicare Promoting Interoperability Program to require the Query of PDMP measure and to score it based on performance. We heard extensive feedback from EHR developers that effectively incorporating the ability to count the number of PDMP queries in the EHR would require more robust measurement specifications. These interested parties stated that EHR developers may face significant cost burdens if they fully develop numerator and denominator calculations and are then required to change the specification at a later date. Interested parties stated that the costs of additional development would likely be passed on to health care providers without additional benefit, as this development would be solely for the purpose of calculating the measure, rather than furthering the clinical goal of the measure. While we recognize that a numerator/denominator-based measure remains challenging, we also note (as discussed in more detail later in this section of the final rule) that the widespread availability of PDMPs across the country, and recent progress toward solutions for connecting PDMPs with provider EHR systems, has made use of PDMPs feasible through a wide variety of approaches.

b. Current Status of PDMP Adoption

Today, all 50 states and several localities host PDMPs.[1088] The final state to establish a PDMP, the state of Missouri, passed legislation to address this issue in 2021, and is currently working to make its PDMP operational. A 2021 American Medical Association report found that physicians and others used state PDMPs more than 910 million times in 2020.[1089] An assessment of PDMPs conducted by the PDMP Training and Technical Assistance Center (TTAC) at the Institute for Intergovernmental Research (IIR) found an increase in the number of PDMPs that are integrated with Health Information Exchanges (HIEs), EHRs, and/or Pharmacy Dispensing Systems (PDSs), with 44 PDMPs integrated in

[1088] Prescription Drug Monitoring Program Training and Technical Assistance Center, PDMP Policies and Capabilities: Results From 2021 State Assessment, September 2021, *https://www.pdmpassist.org/pdf/PDMP%20Policies%20and%20Capabilities%202021%20Assessment%20Results_20210921.pdf.*

[1089] American Medical Association, 2021 Overdose Epidemic Report, *https://www.ama-assn.org/system/files/ama-overdose-epidemic-report.pdf.*

2021 reflecting an increase from 28 PDMPs with at least one type of integration in 2017. We refer readers to Table IX.H.-01. for the report's findings on the type of integration and the number of PDMPs that have implemented that type of integration in 2021.

TABLE IX.H.-01.: PDMP INTEGRATION – TYPE AND NUMBER OF PDMPS[1090]

Type of Integration	# of PDMPs
EHR and PDS	35
HIE and EHR	20
HIE, EHR, and PDS	18
EHR only	5
HIE only	1
PDS only	1

Moreover, a number of enhancements to PDMPs and related initiatives are occurring across the country, including enhancements to RxCheck, which is a free, federally supported interstate exchange hub for PDMP data. RxCheck is connected to 50 out of 54 PDMPs in states and territories and does not require providers to pay to have access to PDMP data from other states and territories that are also live on RxCheck. The CDC, in partnership with ONC and other industry stakeholders, have been working to connect RxCheck to the eHealth Exchange as an alternative pathway for providers to conduct interstate queries of patient medication histories. The goal of the project is to allow any health care provider who is live on the eHealth Exchange to use that existing connection to query a patient's record through the RxCheck Hub, which routes the query to individual State PDMPs that are also live on RxCheck. This solution enables health care providers to query PDMPs via existing connections to health information exchange networks. Most states use either RxCheck or Prescription Monitoring Program (PMP) InterConnect or both to facilitate the sharing of PDMP information between states, allowing health care providers to query other states' PDMP.[1091]

We also note that the Substance Use-Disorder Prevention that Promotes Opioid Recovery and Treatment (SUPPORT) for Patients and Communities Act (Pub. L. 115–271), enacted in 2018, has focused on ways to address the nation's opioid epidemic. The SUPPORT for Patients and Communities Act included new requirements for PDMP enhancement and integration, to help reduce opioid misuse and overprescribing and promote the effective prevention and treatment of opioid use disorder beginning in October of 2021. Enhanced Federal matching funds were available to states to support related PDMP design, development, and implementation activities during fiscal years 2019 and 2020.

c. Changes to the Query of PDMP Measure and Related Policies

(1) Changes to the Query of PDMP Measure Description

The description of the Query of PDMP measure provides that for at least one Schedule II opioid electronically prescribed using CEHRT during the EHR reporting period, the eligible hospital or CAH uses data from CEHRT to conduct a query of a PDMP for prescription drug history, except where prohibited and in accordance with applicable law (42 CFR 495.24(e)(5)(iii)(B)). In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28579), beginning with the EHR reporting period in CY 2023, we proposed to require the Query of PDMP measure for eligible hospitals and CAHs participating in the Medicare Promoting Interoperability Program. We also noted that should we finalize our proposal to require the Query of PDMP measure beginning with the EHR reporting period in CY 2023, we proposed two exclusions beginning with the EHR reporting period in CY 2023: (1) Any eligible hospital or CAH that does not have an internal pharmacy that can accept electronic prescriptions for controlled substances that include drugs from Schedules II, III, and IV, and is not located within 10 miles of any pharmacy that accepts electronic prescriptions for controlled substances at the start of their EHR reporting period; and (2) any eligible hospital or CAH that cannot report on this measure in accordance with applicable law (87 FR 28581). We also noted in the FY 2023 IPPS/LTCH PPS proposed rule that should we finalize the proposals to require the Query of PDMP measure and the associated exclusions, we believe the inclusion of the phrase ''except where prohibited and in accordance with applicable law'' in the description of the Query of PDMP measure and the inclusion of the phrase ''in accordance with applicable law'' in the second proposed exclusion for the Query of PDMP measure would be duplicative and potentially cause confusion (87 FR 28578). Therefore, we proposed to remove the phrase ''except where prohibited and in accordance with applicable law'' from the description of the Query of PDMP measure should our proposals to require the Query of PDMP measure and the associated exclusions be finalized. For additional information on proposed changes to the Query of PDMP measure, we referred readers to the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28580).

We also stated in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28579) that should our proposal to remove associated regulatory text related to measures and objectives for the Medicare Promoting Interoperability Program not be finalized, we propose to update the regulatory text to reflect these proposed changes at 42 CFR 495.24(e)(5). We invited public comment on these proposals.

Comment: A few commenters expressed support for our proposal to change the Query of PDMP measure description.

Response: We thank commenters for their support.

After consideration of the public comments we received, we are finalizing our proposal to change the

[1090] PDMP Policies and Capabilities: Results From 2021 State Assessment, September 2021, *https://www.pdmpassist.org/pdf/PDMP%20Policies%20and%20Capabilities%202021%20Assessment%20Results_20210921.pdf*.

[1091] Government Accountability Office. GAO–21–22, PRESCRIPTION DRUG MONITORING PROGRAMS: Views on Usefulness and Challenges of Programs.

Query of PDMP measure description to remove the phrase ''except where prohibited and in accordance with applicable law''; we refer the reader to section IX.H.3.c.(3) for the finalized measure description. In section IX.H.8. of this final rule, we are finalizing our proposal to remove the associated regulatory text related to measures and objectives for the Medicare Promoting Interoperability Program, and therefore, we will not be updating 42 CFR 495.24(e)(5) with our finalized changes to the Query of PDMP measure description.

(2) Changes To Require the Query of PDMP Measure

In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45462), we noted that the decision to maintain the Query of PDMP as an optional measure for EHR reporting periods in CY 2022 considered the current efforts to improve the technical foundation for EHR–PDMP integration, the continued implementation of the SUPPORT for Patients and Communities Act, our ongoing review of alternative measure approaches, and interested party concerns about the current readiness across states for implementation of the existing measure. We also noted that this measure can play an important role in helping health care providers to improve clinical decision making by utilizing this information to identify potential opioid use disorders, inform the development of care plans, and develop effective interventions (86 FR 45463); maintaining it as an optional measure with bonus points signals to the hospital and vendor community that this is an important measure which can help spur development and innovation to reduce barriers and challenges (86 FR 45463).

We continue to believe that PDMPs play an important role in patient safety by assisting in the identification of patients who have multiple prescriptions for controlled substances or may be misusing or overusing them. Querying the PDMP is important for tracking dispensed controlled substances and improving prescribing practices. Efforts to expand the use of PDMPs and integrate PMDPs with health information technology systems are supported by Federal agencies including ONC, the Centers for Disease Control and Prevention (CDC), the Department of Justice (DOJ), and the Substance Abuse and Mental Health Services Administration (SAMHSA). The Query of PDMP measure offers a way to reward health care providers who participate in current PDMP initiatives that are supported by Federal partners.

While work continues to improve standardized approaches to PDMP and EHR interoperability, we believe that it is feasible at this time to require health care providers to report the current Query of PDMP measure requiring a ''yes/no'' response. Given our policies for the Query of PDMP measure that included increasing the eligible bonus points to reward eligible hospitals and CAHs that could report the measure, as well as the recent progress in the availability of PDMPs in all fifty states, and solutions which support accessibility of PDMPs to health care providers, we believe eligible hospitals and CAHs have had time to grow familiar with what this measure requires of them, even as technical approaches to the use of PDMPs continue to advance. By requiring a ''yes/no'' response the current measure allows health care providers to use a variety of technical solutions to conduct a query of the PDMP and receive credit for the measure.

Therefore, beginning with the EHR reporting period in CY 2023, we proposed to require the current Query of PDMP measure requiring a ''yes/no'' response for eligible hospitals and CAHs participating in the Medicare Promoting Interoperability Program. We stated that we would maintain the associated points at 10 points and referred readers to section IX.H.6. of the proposed rule for a discussion of our scoring methodology and proposed concurrent changes. As a result of this proposal, the maximum total points available for the Electronic Prescribing Objective would remain at 20 points for EHR reporting periods in CY 2023. We also stated in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28579) that should our proposal to remove associated regulatory text related to measures and objectives for the Medicare Promoting Interoperability Program not be finalized, we propose to update the regulatory text to reflect these proposed changes at 42 CFR 495.24(e)(5)(iii)(B).

We invited public comment on these proposals.

Comment: Many commenters expressed support for requiring the Query of PDMP measure because it remains a ''yes/no'' attestation-based measure; they noted that it allows for use of a variety of technical solutions to report the measure, and includes exclusions. Several commenters supported requiring the measure because querying a PDMP is critical to understanding a patient's medication history to inform effective, quality care, particularly when Schedule II opioids and Schedules III and IV drugs are prescribed and dispensed. They further stated that it is important for future public health initiatives and drug abuse prevention efforts.

Response: We would like to thank the commenters for their support. We agree that the Query of PDMP measure is an important tool for clinicians, and for improving prescribing practices geared towards overall patient safety.

Comment: Several commenters expressed their support stating that eligible hospitals and CAHs have had ample time to prepare for this change. For eligible hospitals and CAHs with continued challenges, a commenter shared that there are technological solutions available to make this requirement feasible. Last, commenters shared that the benefits of the measure outweigh concerns with implementation of improved systems to support access to PDMP data health IT system design, and that requiring the measure will continue to promote data exchange and more advanced EHR workflows.

Response: We appreciate the commenters' support for requiring the Query of PDMP measure. We agree that eligible hospitals and CAHs have had ample time to prepare for this requirement, and have had time to grow familiar with what this measure requires of them. As states continue to improve the accessibility of PDMPs through technical advances, we believe eligible hospitals and CAHs have an increasing number of solutions available to effectively query PDMPs.

Comment: Several commenters offered suggestions and recommendations for our consideration. A commenter recommended that CMS ensure that requiring the Query of PDMP measure would not create a barrier for clinicians appropriately prescribing opioids for patients. Another commenter recommended that CMS consider accounting for state laws that already require PDMP queries, and adjusting for known challenges, including state variability of PDMP requirements and processes and the availability of interstate data. A commenter recommended that CMS require States to work with EHR vendors to continue the integration process, thereby improving clinician workflow. A commenter recommended that CMS monitor the ability of CAHs and small rural hospitals to comply with the Query of PDMP measure and provide flexibility, support and technical assistance if disparities in capacity and ability to use IT systems are identified.

Response: We appreciate the commenters' support, including their

recommendations for our proposal. We agree it is important that the measure not create barriers for appropriate prescribing or create additional administrative burden, and believe that maintaining the measure as requiring a ''yes/no'' response allows eligible hospitals and CAHs to report while minimizing burden. Regarding the recommendation that CMS require states to work with EHR vendors and continuously monitor for known challenges, we thank commenters for this suggestion. CMS maintains communication with ONC, and together, we assess and monitor challenges that eligible hospitals and CAHs face with vendors and state-specific PDMPs. We appreciate commenters' concerns about the impact of requiring the Query of PDMP measure on CAHs and small rural hospitals. The Query of PDMP measure requires a ''yes/no'' response, and we believe this helps to minimize potential burden for small rural hospitals. We also refer readers to the finalized measure description for the Query of PDMP measure of this final rule at section IX.H.3.c.(3), where we state that we require a minimum of ''at least one'' query of the PDMP and that no maximum or suggested number of queries have been established. Last, CMS, as well as other HHS agencies, are supporting a number of initiatives to enable better integration between PDMPs and health IT systems used by health care providers. We refer readers to the FY 2023 IPPS/LTCH PPS proposed rule for further discussion (87 FR 28577 through 28578).

Comment: A few commenters expressed support for making the Query of PDMP measure required, so long as it is delayed until CY 2024. A few commenters have requested a delay in requiring the measure until every state has an operational statewide PDMP, or until there is an exclusion for those eligible hospitals and CAHs without a statewide PDMP. A few commenters cited the need for additional time for network development and nationwide integration between EHRs and PDMPs. A commenter noted that EHR vendors require a minimum of 24 months to complete development and deployment of any new functionality.

Response: We disagree that requiring the Query of PDMP measure should be delayed until CY 2024. While we appreciate the importance of ongoing work to improve interoperability of PDMP data and integration systems, we also believe that at this time, there is sufficient technical capacity across the country to support finalizing the measure in its current form, requiring a ''yes/no'' attestation. We also understand that there is currently only one state without an operational statewide PDMP, and that this remaining state is moving towards an operational status. Last, we note that we are not finalizing any new technology requirements to support the completion of the actions associated with this measure.

Comment: Many commenters did not support requiring the Query of PDMP measure citing inconsistencies across state lines with regard to interoperability standards, varying degrees of implementation, and the complexities resulting from inconsistent state laws and licensing requirements. Some commenters did not support requiring the Query of PDMP measure due to a lack of standardized privacy and security protocols.

Response: CMS recognizes the work required to improve integration between PDMPs and health care provider health IT systems, as well as the efforts required to standardize data sharing between the systems that may include consideration of privacy and security protocols, and that these efforts are ongoing across the country. While we believe that the importance of querying the PDMP, and the widespread availability of PDMPs at this time is sufficient to finalize requiring the current measure requiring a ''yes/no'' response, we will continue to support efforts to improve the technical approaches supporting data exchange between systems. As these approaches mature, we will work with ONC to consider whether these approaches should be incorporated into the ONC Health IT Certification Program and the Medicare Promoting Interoperability Program.

After consideration of the public comments we received, we are finalizing our proposal to require the Query of PDMP measure beginning with the EHR reporting period in CY 2023. In section IX.H.8. of this final rule, we are finalizing our proposal to remove the associated regulatory text related to measures and objectives for the Medicare Promoting Interoperability Program, and therefore, we will not be updating 42 CFR 495.24(e)(5) with our finalized changes to the Query of PDMP measure.

(3) Changes to the Query of PDMP Measure To Include Schedule II Opioids and Schedule III and IV Drugs

Under 42 CFR 495.24(e)(5)(iii)(B), the Query of PDMP measure provides that for at least one Schedule II opioid electronically prescribed using CEHRT during the EHR reporting period, the eligible hospital or CAH uses data from CEHRT to conduct a query of a PDMP for prescription drug history, except where prohibited and in accordance with applicable law. The Query of PDMP measure was adopted in the FY 2019 IPPS/LTCH PPS final rule as one of two measures under the Electronic Prescribing Objective intended to support HHS initiatives related to the treatment of opioid and substance use disorders by helping health care providers avoid inappropriate prescriptions, improving coordination of prescribing amongst health care providers, and focusing on the advanced use of CEHRT (83 FR 41648 through 41653).

Under the Controlled Substances Act (CSA),[1092] the Drug Enforcement Administration classifies drugs, substances, and certain chemicals used to make drugs into five distinct categories or schedules depending upon the drug's acceptable medical use and the drug's abuse or dependency potential. A drug's abuse rate is a factor used to determine its classification; for example, Schedule I medications have the highest abuse potential while medications in Schedule V have a low abuse potential. We refer readers to Table IX. H.-02. for information on each Schedule, including abuse potential, medicinal use, if any, and drug examples. For additional information, we refer readers to the listing of drugs and their schedule located at CSA Scheduling at *https://www.deadiversion.usdoj.gov/schedules/orangebook/c_cs_alpha.pdf.*[1093]

[1092] Public Law 91–513, tit. II, 84 Stat. 1236, 1242–84 (1970); codified, as amended, at 21 U.S.C. 801 *et seq.*

[1093] See also *https://www.dea.gov/sites/default/files/2020-04/Drugs%20of%20Abuse%202020-Web%20Version-508%20compliant-4-24-20_0.pdf.*

TABLE IX.H.-02.: CONTROLLED SUBSTANCE SCHEDULES, DESCRIPTIONS, AND EXAMPLES[1094]

Schedule	Description	Examples
Schedule I	No accepted medical use, are unsafe, and hold a high potential for abuse.	Heroin and LSD
Schedule II	Accepted medical use, high potential for abuse, abuse could lead to severe psychological or physical dependence.	Hydrocodone, methadone, Demerol, OxyContin, Percocet, morphine, codeine, and amphetamine
Schedule III	Accepted medical use, less potential for abuse than schedule I or II substances, abuse may lead to moderate or low physical dependence or high psychological dependence.	Tylenol with Codeine and anabolic steroids
Schedule IV	Accepted medical use, low potential for abuse relative to schedule III substances, abuse may lead to limited physical or psychological dependence relative to schedule III substances.	Xanax, Klonopin, Valium, and Ativan
Schedule V	Accepted medical use, low potential for abuse relative to schedule IV substances, abuse may lead to limited physical or psychological dependence relative to schedule IV substances.	Cough syrups containing codeine

PDMPs are operated at the state level and individual state requirements for reporting and use differ from state to state.[1095] Currently, every state collects data on schedules II, III, and IV drugs.[1096] Some states collect information about certain non-controlled substances that are potentially subject to abuse or on all prescription drugs.[1097] While state laws vary, we note that most state PDMPs require physicians and dispensing pharmacists to review a patient's prescribing information for the past twelve months prior to prescribing or dispensing any Schedule II, III, and IV drugs.[1098]

PDMPs play an important role in patient safety by assisting in the identification of patients who have multiple prescriptions for controlled substances or may be misusing or overusing them. We believe that expanding the requirements of the Query of PDMP measure to include not only Schedule II opioids, and but also Schedule III and IV drugs, this would further support HHS initiatives related to the treatment of opioid and substance use disorders by expanding the types of drugs included in the Query of PDMP measure while aligning with the PDMP requirements in a majority of states. We also believe this expansion to include additional Scheduled drugs would facilitate more informed prescribing practices and improve patient outcomes. Therefore, in the FY 2023 IPPS/LTCH PPS proposed rule, we proposed to expand the Query of PDMP measure to include Schedule II opioids, and Schedule III and IV drugs beginning with the EHR reporting period in CY 2023 (87 FR 28579 through 28581).

Proposed Measure Description: For at least one Schedule II opioid or Schedule III or IV drug electronically prescribed using CEHRT during the EHR reporting period, the eligible hospital or CAH uses data from CEHRT to conduct a query of a PDMP for prescription drug history.

To align with the policy for the Query of PDMP measure with regard to Schedule II opioids, we proposed in the FY 2023 IPPS/LTCH PPS proposed rule that the query of the PDMP for prescription drug history must occur prior to the electronic transmission of an electronic prescription for a Schedule II opioid or Schedule III or IV drug (87 FR 28580). We also proposed that this measure would include all permissible prescriptions and dispensing of Schedule II opioids, and Schedule III or IV drugs, no matter how small the dose prescribed during an encounter. This would allow eligible hospitals and CAHs to identify multiple health care provider episodes (physician shopping), prescriptions of dangerous combinations of drugs, and controlled substances prescribed in high quantities (87 FR 28580). We also proposed that multiple prescriptions for Schedule II opioids or Schedule III and IV drugs prescribed on the same date, by the same eligible hospital or CAH would not require multiple queries of the PDMP, and at least one query would have to be performed for this measure. We proposed that eligible hospitals and CAHs would have flexibility to query the PDMP using data from CEHRT in

[1094] GAO–21–22, Prescription Drug Monitoring Programs: Views on Usefulness and Challenges of Programs; 21 U.S.C. 812, and the U.S. Drug Enforcement Administration.

[1095] For additional information, we refer readers to *https://www.cdc.gov/drugoverdose/pdf/Leveraging-PDMPs-508.pdf*; *https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4605194/*; and *https://www.pdmpassist.org/Policies/Legislative/StatutesAndRegulations*.

[1096] *https://www.pdmpassist.org/State*.

[1097] GAO report, GAO–21–22 Prescription Drug Monitoring Programs.

[1098] *https://www.pdmpassist.org/State*.

any manner allowed under state law (87 FR 28580). We also stated in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28580 through 28581) that should our proposal to remove associated regulatory text related to measures and objectives for the Medicare Promoting Interoperability Program not be finalized, we proposed to update the regulatory text to reflect these proposed changes at 42 CFR 495.24(e)(5)(iii)(B).

We invited public comment on these proposals. We also invited public comment on whether to expand this measure to include Schedule V or other drugs with the potential for abuse.

Comment: Many commenters expressed support to expand the Query of PDMP measure to include Schedule III and IV drugs. A commenter expressed their belief that understanding a patient's medication history is critical to safe, effective, quality care, particularly when Schedule II opioids and Schedule III and IV drugs are prescribed and dispensed. A commenter expressed its belief that the proposed expansion makes sense because many states also require similar queries.

Response: We thank commenters for their support, and agree that in expanding our measure to also include Schedule III and IV drugs, this will offer eligible hospitals and CAHs a broader clinical picture, aimed at overall patient safety efforts, and agree that expanding these schedules will support better alignment with state regulations.

Comment: A commenter expressed support to include Schedule III and IV drugs, and further recommended that CMS consider similar state laws that require PDMP queries, and how those requirements differ from CMS's requirements.

Response: We thank the commenter for their support. While state laws do vary, we generally understand that many states' PDMPs require physicians and dispensing pharmacists to review each patient's prescribing information for twelve months prior to prescribing or dispensing any Schedule II opioids or Schedule III and IV controlled substances. We may consider the additional feedback in future rulemaking.

Comment: A few commenters did not support expanding the Query of PDMP measure to include Schedule III and IV drugs citing the lack of harmony between state requirements, the potential for confusion, and that some states do not have an operational statewide PDMP.

Response: We disagree with the commenter that expanding the Query of PDMP measure to include Schedule III and IV drugs would contribute to a lack of harmony between state requirements, thereby causing potential confusion. We note that currently, every state collects data on Schedule II opioids, and Schedule III and IV drugs. We believe that in collecting similar data this would minimize the potential for confusion, and instead, promote harmony.

Comment: A few commenters requested clarification on whether the expansion includes all Schedule II drugs.

Response: We proposed expanding the Query of PDMP measure to include Schedule III and IV drugs, but did not propose any changes to the language in the measure description that references Schedule II opioids, and clarify that the Query of PDMP measure does not include or apply to Schedule II drugs that are not opioids (for example, central nervous system stimulants).

Comment: A few commenters recommended furthering the expansion of the Query of PDMP measure to also include Schedule V drugs if there would be value in doing so.

Response: We appreciate the commenters' feedback. While we are not including Schedule V drugs at this time due to the current low potential for abuse in that category, we may consider this in future rulemaking.

After consideration of the public comments we received, we are finalizing our proposals related to the expansion of the Query of PDMP measure to include Schedule II opioids, and Schedule III and IV drugs beginning with the EHR reporting period in CY 2023, as well as the proposed Query of PDMP measure description, and our proposals related to requiring that the query of the PDMP for prescription drug history must occur prior to the electronic transmission of an electronic prescription for a Schedule II opioid or Schedule III or IV drug; that the measure would include all permissible prescriptions and dispensing of Schedule II opioids, and Schedule III or IV drugs, no matter how small the dose prescribed during an encounter; that multiple prescriptions for Schedule II opioids or Schedule III and IV drugs prescribed on the same date, by the same eligible hospital or CAH would not require multiple queries of the PDMP, and at least one query would have to be performed for this measure; and that eligible hospitals and CAHs would have flexibility to query the PDMP using data from CEHRT in any manner allowed under state law . In section IX.H.8. of this final rule, we are finalizing our proposal to remove the associated regulatory text related to measures and objectives for the Medicare Promoting Interoperability Program, and therefore, we will not be updating 42 CFR 495.24(e)(5) with our finalized changes to the Query of PDMP measure.

(4) Exclusions

In FY 2019 IPPS/LTCH PPS final rule, we finalized exclusions for eligible hospitals and CAHs from reporting the Query of PDMP measure beginning with EHR reporting period in CY 2020 when the measure would have been required by the Medicare Promoting Interoperability Program (83 FR 41653). The finalized exclusions included: (1) Any eligible hospital or CAH that does not have an internal pharmacy that can accept electronic prescriptions for controlled substances and is not located within 10 miles of any pharmacy that accepts electronic prescriptions for controlled substances at the start of their EHR reporting period; and (2) any eligible hospital and CAH that could not report on this measure in accordance with applicable law. We also finalized that beginning with EHR reporting period in CY 2020, an eligible hospital or CAH that qualifies for the e-Prescribing measure exclusion is also excluded from reporting on the Query of PDMP measure (83 FR 41649). We noted our intention to propose a third exclusion where integration with a statewide PDMP was not yet feasible or widely available (83 FR 41652).

In FY 2020 IPPS/LTCH PPS final rule (84 FR 42595), we finalized the removal of the exclusions associated with the Query of PDMP measure, noting that exclusions were not necessary because we finalized the Query of PDMP measure as optional for the EHR reporting period in CY 2020. We also finalized the Query of the PDMP measure as an optional measure for EHR reporting periods in CY 2021 and CY 2022 in FY 2021 IPPS/LTCH PPS final rule (85 FR 58969) and the FY 2022 IPPS/LTCH PPS final rule (86 FR 45464), respectively.

In the FY 2023 IPPS/LTCH PPS proposed rule, beginning with the EHR reporting period in CY 2023, we proposed to require the Query of PDMP measure for eligible hospitals and CAHs participating in the Medicare Promoting Interoperability Program (87 FR 28581). We noted that should we finalize our proposal to require the Query of PDMP measure beginning with CY 2023, we believed that exclusions for the measure would be necessary (87 FR 28581). We revisited the exclusions established in the FY 2019 IPPS/LTCH PPS final rule and subsequently removed in the FY 2020 IPPS/LTCH PPS final rule because

the Query of PDMP measure would continue to be an optional measure. In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28581), we stated that if we finalize our proposal to require the Query of PDMP measure, we proposed the following exclusions beginning with the EHR reporting period in CY 2023: (1) Any eligible hospital or CAH that does not have an internal pharmacy that can accept electronic prescriptions for controlled substances that include drugs from Schedules II, III, and IV, and is not located within 10 miles of any pharmacy that accepts electronic prescriptions for controlled substances at the start of their EHR reporting period; and (2) any eligible hospital or CAH that cannot report on this measure in accordance with applicable law. We also referred readers to our proposed policy to redistribute points to the e-Prescribing measure under the Electronic Prescribing Objective should an eligible hospital or CAH claim an exclusion for the Query of PDMP measure for an EHR reporting period (87 FR 28589 through 28592). We also stated in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28581) that should our proposal to remove associated regulatory text related to measures and objectives for the Medicare Promoting Interoperability Program not be finalized, we proposed to update the regulatory text to reflect these proposed changes at 42 CFR 495.24(e)(5).

In the FY 2019 IPPS/LTCH PPS final rule (83 FR 41652), we signaled our intention to propose an additional exclusion beginning in CY 2020 for health care providers in states where integration with a statewide PDMP is not yet feasible or not yet widely available. In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28581), we expressed our belief that this exclusion is no longer needed given the flexibility of the Query PDMP measure, which requires a ''yes/no'' response, as well as the implementation of PDMPs in all 50 states and several localities and the increasing number of PDMPs offering some degree of integration with EHRs (from 28 PDMPs with at least one type of integration in 2017 to 44 PDMPs that are integrated with HIEs, EHRs, and/or PDSs in 2021 [1099]). We also expressed our belief that broadly requiring this measure across health care providers who may access PDMPs in different ways would help to continue to drive development of improved solutions for PDMP access. In addition, we stated that while we believe the Query of PDMP measure is achievable for eligible hospitals and CAHs and that the proposed exclusions offer significant flexibilities such that most health care providers would be able to meet the measure or claim an exclusion, we welcomed public comment on other barriers, including barriers related to technology solutions, cost, and workflow, that should be considered. We also requested comment on any additional exclusions that we should consider for this measure and may propose in the future.

We invited public comment on these proposals.

Comment: Several commenters expressed support for our proposed exclusions.

Response: We thank commenters for their support.

Comment: Several commenters recommended that CMS consider additional exclusions. Suggestions included allowing an exclusion for eligible hospitals and CAHs in states where EHR–PDMP integration is limited, not possible, or where there is no operational statewide PDMP. A few commenters recommended an exclusion, waiver, or discretion enforcement for the Query of PDMP measure noting it could be burdensome on clinician workflows to compile supporting documentation for attestation using multiple systems, and that this is not the time to put additional burden on clinicians until states have improved their technologies to enable more efficient inquiries. Other commenters recommended that CMS consider exclusions for eligible hospitals and CAHs that are required by the state to use their PDMP outside of, and independent from, their CEHRT, and may not be able to meet the requirements of the Query of PDMP measure.

Response: We thank commenters for their recommendations to include additional exclusions. After reviewing the comments, we agree with commenters that an additional exclusion is needed for eligible hospitals and CAHs for one year. We understand that, for some, accessing state PDMPs can be time-consuming and disruptive to clinical workflow, if technology requires exiting the hospital medical record, connecting with the state PDMP, then compiling supporting documentation for attestation using multiple systems. We also understand that while most states have an operational statewide PDMP, for those eligible hospitals and CAHs located in a state that does not have an operational statewide PDMP, they would need to check a limited county-level PDMP to meet the requirements of the Query of PDMP measure, and we agree, that could interrupt workflows for providers. We believe that this additional, and temporary, exclusion would address concerns raised by CAHs and small rural hospitals where disparities in capacity, and the ability to use IT systems, make meeting the requirements of the Query of PDMP measure costly or burdensome.

We believe that offering an additional exclusion for the CY 2023 EHR reporting period for eligible hospitals or CAHs would provide more time for technologies to improve and for increased EHR–PDMP integration to enable more efficient queries of the PDMP. This exclusion would be available for a limited time (CY 2023), because we believe that one year would offer eligible hospitals and CAHs time to become familiar with new technologies, processes and make necessary adjustments to their workflow with minimal burden and allow for improved readiness.

We appreciate the commenter's recommendation for an exclusion to address when state laws may not allow for an eligible hospital or CAH to meet the requirements of the Query of PDMP measure, and believe the proposed exclusion for ''any eligible hospital or CAH that cannot report on this measure in accordance with applicable law'' would address that scenario.

After consideration of the public comments we received, we are finalizing our proposals with modification to include the following three exclusions for the Query of PDMP measure: (1) Any eligible hospital or CAH that does not have an internal pharmacy that can accept electronic prescriptions for controlled substances that include Schedule II, III and IV drugs, and is not located within 10 miles of any pharmacy that accepts electronic prescriptions for controlled substances at the start of their EHR reporting period; (2) Any eligible hospital or CAH that cannot report on this measure in accordance with applicable law; and (3) Any eligible hospital or CAH for which querying a PDMP would impose an excessive workflow or cost burden prior to the start of the EHR reporting period they select in CY 2023. We note that we are finalizing this third exclusion related to workflow and cost burden on a time-limited basis for those eligible hospitals and CAHs that believe they would face significant burden associated with querying a PDMP at least once when reporting the measure during an EHR

[1099] PDMP Policies and Capabilities: Results From 2021 State Assessment, September 2021, *https://www.pdmpassist.org/pdf/PDMP%20Policies%20and%20Capabilities%202021%20Assessment%20Results_20210921.pdf.*

reporting period in CY 2023. This exclusion will no longer be available for EHR reporting periods after CY 2023. We expect that those eligible hospitals and CAHs claiming this exclusion in 2023 will be able to utilize the additional time provided by this time-limited exclusion to resolve any remaining barriers to reporting the measure. In section IX.H.8. of this final rule, we are finalizing our proposal to remove the associated regulatory text related to measures and objectives for the Medicare Promoting Interoperability Program, and therefore, we will not be updating 42 CFR 495.24(e)(5) with our finalized changes to the Query of PDMP measure.

d. Future Direction

While we believe that finalizing our proposals for the Query of PDMP measure are feasible and appropriate at this time, we continue to work with industry and Federal partners to advance common standards for the exchange of information between PDMPs, EHRs, pharmacy information systems, and exchange networks. We believe this work will ultimately allow us to achieve our ideal state, where we would further modify the Query of PDMP measure to be numerator/denominator-based, and require use of standardized functionality within CEHRT to support the actions associated with the measure while reporting on a numerator and denominator. We will continue to collaborate with ONC to monitor developments across the industry, efforts made toward advancing relevant standards, and plan to revisit this measure in the future to explore further specifying health IT requirements if they become available and are incorporated into the ONC Health IT Certification Program.

Federally supported activities continue to focus on developing and refining standards-based approaches to enable effective integration into clinical workflows; exploring emerging technical solutions to enhance access to and use of PDMP data; and providing technical resources to a variety of interested parties to advance and scale the interoperability of health IT systems and PDMPs. Moreover, updates to certified health IT systems incorporating application programming interfaces (APIs) based on HL7® FHIR® standard version Release 4 (85 FR 25642) can help support future technical approaches that enable more seamless exchange of data between CEHRT and PDMP systems. For more information about current and emerging standards related to PDMP data capture and exchange, we refer readers to the ONC Interoperability Standards Advisory.[1100]

e. Technical Update to the E-Prescribing Measure

The ONC 21st Century Cures Act final rule (85 FR 25642; 85 FR 25660 through 25661) retired the ''drug-formulary and preferred drug list checks'' certification criterion at 45 CFR 170.315(a)(10) which was associated with measures under the Electronic Prescribing Objective for the Medicare Promoting Interoperability Program and the MIPS Promoting Interoperability performance category (80 FR 62882 and 83 FR 59817). ONC retired this criterion after January 1, 2022 (85 FR 26661).

In the CY 2021 PFS final rule, we finalized that the ''drug-formulary and preferred drug list checks'' criterion will no longer be associated with measures under the Electronic Prescribing Objective and will no longer be required to meet the CEHRT definition for the Medicare Promoting Interoperability Program and the MIPS Promoting Interoperability performance category, beginning with CY 2021 EHR reporting and performance periods (85 FR 84815 through 84825).

In the FY 2022 IPPS/LTCH PPS final rule, we inadvertently omitted a revision to TABLE IX.F.-02.: Objectives and Measures for the Medicare Promoting Interoperability Program in 2022 to reflect this change and included the text ''queried for a drug formulary'' in the measure description and in the numerator of the e-Prescribing measure (86 FR 45484). In an effort to more clearly capture the previously established policy finalized in the CY 2021 PFS final rule with respect to the e-Prescribing measure, we proposed in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28582) to revise the measure description in TABLE 56 to read, ''For at least one hospital discharge, medication orders for permissible prescriptions (for new and changed prescriptions) are transmitted electronically using CEHRT'' and the numerator will be updated to read to indicate ''[t]he number of prescriptions in the denominator generated and transmitted electronically'' to reflect the removal of the health IT certification criterion ''drug-formulary and preferred drug list checks'' (86 FR 65478).

We invited comment on our proposal.

Comment: A few commenters supported our proposal.

Response: We thank commenters for their support. After consideration of the public comments we have received, we are finalizing our proposal to revise the measure description in [TABLE XX] to read ''For at least one hospital discharge, medication orders for permissible prescriptions (for new and changed prescriptions) are transmitted electronically using CEHRT,'' and the numerator will be updated to read to indicate ''[t]he number of prescriptions in the denominator generated and transmitted electronically'' to reflect the removal of the health IT certification criterion ''drug-formulary and preferred drug list checks''.

4. Health Information Exchange (HIE) Objective: Addition of An Alternative Measure for Enabling Exchange Under the Trusted Exchange Framework and Common Agreement (TEFCA)

a. Background on the Health Information Exchange Objective

The Health Information Exchange (HIE) Objective and its associated measures for eligible hospitals and CAHs hold particular importance because of the role they play within the care continuum. In addition, these measures encourage and leverage interoperability on a broader scale and promote health IT-based care coordination. The Health Information Exchange Objective currently includes three measures: Support Electronic Referral Loops by Sending Health Information, Support Electronic Referral Loops by Receiving and Reconciling Health Information, and Health Information Exchange Bi-Directional Exchange. For background on this objective and its associated measures, we refer readers to the FY 2019 IPPS/LTCH PPS final rule (83 FR 41656 through 41661), the FY 2020 IPPS/LTCH PPS final rule (84 FR 42596 through 42597), the FY 2021 IPPS/LTCH PPS final rule (85 FR 58969), and the FY 2022 IPPS/LTCH PPS final rule (86 FR 45465 through 45470).

In the FY 2022 IPPS/LTCH PPS final rule, we finalized the HIE Bi-Directional Exchange measure, under the Health Information Exchange Objective (86 FR 45465 through 45470). The HIE Bi-Directional Exchange measure is worth 40 points, the maximum number of points of the Health Information Exchange Objective, and was finalized as an alternative to reporting on the two existing Health Information Exchange Objective measures: The Support Electronic Referral Loops by Sending Health Information measure (42 CFR 495.24(e)(6)(ii)(A)) and the Support Electronic Referral Loops by Receiving and Reconciling Health Information measure (42 CFR 495.24(e)(6)(ii)(B)). To

[1100] *https://www.healthit.gov/isa/allows-a-provider-request-a-patients-medication-history-a-state-prescription-drug-monitoring.*

meet the measure requirements, eligible hospitals and CAHs must attest to the following statements:

- *Statement 1:* Participating in an HIE to enable secure, bi-directional exchange of information to occur for all unique patients discharged from the eligible hospital or CAH inpatient or emergency department (POS 21 or 23), and all unique patient records stored or maintained in the EHR for these departments, during the EHR reporting period in accordance with applicable law and policy.
- *Statement 2:* Participating in an HIE that is capable of exchanging information across a broad network of unaffiliated exchange partners including those using disparate EHRs, and not engaging in exclusionary behavior when determining exchange partners.
- *Statement 3:* Using the functions of CEHRT to support bi-directional exchange with an HIE.

We stated that, by enabling bi-directional exchange of information between health care providers and aggregating data across health care providers with disparate systems, HIEs (including a wide range of organizations facilitating health information exchange) can bring together the information needed to create a true longitudinal care record and support improved care coordination by facilitating timely access to robust health information across care settings (86 FR 45465). We further described how participation in HIEs can amplify health care providers' capacity to share information beyond what a health care provider can achieve through the sending and receiving actions described in the existing measures under the Health Information Exchange Objective, for instance, by facilitating information exchange when a health care provider is unaware of another health care provider's need to receive information about a patient (86 FR 45466). By finalizing this measure for eligible hospitals and CAHs, we sought to ensure that eligible hospitals and CAHs participating in the Medicare Promoting Interoperability Program would be rewarded for connecting to exchange arrangements that can enable this type of robust information sharing.

b. Background on TEFCA

Section 4003(b) of the 21st Century Cures Act (Pub. L. 114–255), enacted in 2016, amended section 3001(c) of the Public Health Service Act (42 U.S.C. 300jj–11(c)), and required HHS to take steps to advance interoperability for the purpose of ensuring full network-to-network exchange of health information. Specifically, Congress directed the National Coordinator to ''develop or support a trusted exchange framework, including a common agreement among health information networks nationally.'' Since the enactment of the 21st Century Cures Act, HHS has pursued development of a Trusted Exchange Framework and Common Agreement, or TEFCA. ONC's goals for TEFCA are: [1101]

Goal 1: Establish a universal policy and technical floor for nationwide interoperability.

Goal 2: Simplify connectivity for organizations to securely exchange information to improve patient care, enhance the welfare of populations, and generate health care value.

Goal 3: Enable individuals to gather their health care information.

In the FY 2019 IPPS/LTCH PPS proposed rule (83 FR 20537), we requested comment on whether eligible hospital or CAH participation in TEFCA should be considered a health IT activity that could count for credit within the Health Information Exchange Objective in lieu of reporting on measures for this objective. We received comments in support of this concept, although some commenters disagreed indicating that they were concerned about adding additional burden (83 FR 41669).

In the FY 2022 IPPS/LTCH PPS proposed rule (86 FR 25631 through 25634), in which we proposed the HIE Bi-Directional Exchange measure for eligible hospitals and CAHs, we noted that the proposed attestation statements for the measure did not explicitly refer to participation in a health information network or partnering with a health information network that enables exchange under TEFCA. However, we stated TEFCA was likely to be an important way for eligible hospitals and CAHs to enable bi-directional health information exchange in the future and that we would continue to explore ways to provide further guidance or update this measure to align with the use of health information networks that enable exchange under TEFCA in the future (86 FR 25634). In the final rule, we noted that several commenters were encouraged to see our acknowledgement that this measure could align with the efforts on TEFCA (86 FR 45468).

Since the publication of the FY 2022 IPPS/LTCH PPS final rule, important additional developments have occurred with respect to TEFCA.[1102] On January 18, 2022, ONC announced a significant TEFCA milestone by releasing the Trusted Exchange Framework [1103] and Common Agreement Version 1.[1104] The Trusted Exchange Framework is a set of non-binding principles for health information exchange, and the Common Agreement for Nationwide Health Information Interoperability Version 1 (also referred to as Common Agreement) is a contract that advances those principles. The Common Agreement and the incorporated by reference Qualified Health Information Network (QHIN) Technical Framework Version 1 (QTF) [1105] establish the technical infrastructure model and governing approach for different health information networks and their users to securely share clinical information with each other—all under commonly agreed-to terms. The Common Agreement is a legal contract that QHINs [1106] sign with the ONC Recognized Coordinating Entity (RCE),[1107] a private-sector entity that implements the Common Agreement and ensures QHINs comply with its terms.

The technical and policy architecture of how exchange occurs under TEFCA follows a network-of-networks structure, which allows for connections at different levels and is inclusive of many different types of entities at different levels, such as health information networks, care practices, hospitals, public health agencies, and Individual

[1101] See *https://www.healthit.gov/buzz-blog/interoperability/321tefca-is-go-for-launch*.

[1104] Common Agreement for Nationwide Health Information Interoperability Version 1 (Jan. 2022), *https://www.healthit.gov/sites/default/files/page/2022-01/Common_Agreement_for_Nationwide_Health_Information_Interoperability_Version_1.pdf*.

[1105] Qualified Health Information Network (QHIN) Technical Framework (QTF) Version 1.0 (Jan. 2022), *https://rce.sequoiaproject.org/wp-content/uploads/2022/01/QTF_0122.pdf*.

[1106] The Common Agreement defines a QHIN as ''to the extent permitted by applicable SOP(s), a Health Information Network that is a U.S. Entity that has been Designated by the RCE and is a party to the Common Agreement countersigned by the RCE.'' *See* Common Agreement for Nationwide Health Information Interoperability Version 1, at 10 (Jan. 2022), *https://www.healthit.gov/sites/default/files/page/2022-01/Common_Agreement_for_Nationwide_Health_Information_Interoperability_Version_1.pdf*.

[1107] In August 2019, ONC awarded a cooperative agreement to The Sequoia Project to serve as the initial RCE. The RCE will operationalize and enforce the Common Agreement, oversee QHIN-facilitated network operations, and ensure compliance by participating QHINs. The RCE will also engage interested parties to create a roadmap for expanding interoperability over time. *https://sequoiaproject.org/onc-awards-the-sequoia-project-a-cooperative-agreement-for-the-trusted-exchange-framework-and-common-agreement-to-support-advancing-nationwide-interoperability-of-electronic-health-information/*.

Access Services (IAS) [1108] Providers.[1109] QHINs connect directly to each other to facilitate nationwide interoperability, and each QHIN can connect Participants, which can connect Subparticipants.[1110] Compared to most nationwide exchange today, the Common Agreement includes an expanded set of Exchange Purposes beyond Treatment to include Individual Access Services, Payment, Health Care Operations, Public Health, and Government Benefits Determination [1111]—all built upon common technical and policy requirements to meet key needs of the U.S. health care system.[1112] This flexible structure allows interested parties to participate in the way that makes the most sense for them, while supporting simplified, seamless exchange.

The QTF,[1113] which was developed and released by the RCE, describes the functional and technical requirements that a Health Information Network (HIN) [1114] must fulfill to serve as a QHIN under the Common Agreement. The QTF specifies the technical underpinnings for QHIN-to-QHIN exchange and certain other responsibilities described in the Common Agreement. The technical and functional requirements described in the QTF enable information exchange modalities, including querying and message delivery across participating entities.

In general, the information to be exchanged within the TEFCA ecosystem allows for the use of the Health Level Seven (HL7®) Implementation Guide for Clinical Document Architecture (CDA®) Release 2: Consolidated CDA Templates for Clinical Notes (US Realm) Draft Standard for Trial Use Release 2.1 (C–CDA 2.1) document format, including data defined as part of U.S. Core Data for Interoperability (USCDI), with allowance for flexibility to further expand the content to support a multitude of use cases.[1115] The Common Agreement and the QTF do not require HL7® Fast Healthcare Interoperability Resource (FHIR®)-based exchange. TEFCA allows for the optional exchange of FHIR content using more traditional, established standards to enable the transport of that content. However, TEFCA can nonetheless be a strong catalyst for network enablement of FHIR maturation. To that end, the RCE released a three-year FHIR Roadmap for TEFCA Exchange, which lays out a deliberate strategy to add FHIR-based exchange under TEFCA in the near future.[1116]

c. New Enabling Exchange Under TEFCA Measure

In 2022, prospective QHINs are anticipated to begin signing the Common Agreement and applying for designation. The RCE will then begin onboarding and designating QHINs to share information. In 2023, HHS expects interested parties across the care continuum to have increasing opportunities to enable exchange under TEFCA. Specifically, this would mean such interested parties would be: (1) signatories to either the Common Agreement or an agreement that meets the flow-down requirements of the Common Agreement (called a Framework Agreement [1117] under the Common Agreement), (2) in good standing (that is not suspended) under that agreement, and (3) enabling secure, bi-directional exchange of information to occur, in production. TEFCA is expected to give individuals and entities easier, more efficient access to more health information. The Common Agreement will require strong privacy and security protections for all entities who elect to participate, including entities not covered by the Health Insurance Portability and Accountability Act (HIPAA).[1118]

By connecting to an entity that connects to a QHIN or connecting directly to a QHIN, an eligible hospital or CAH can share health information in the same manner as described in the attestation statements previously finalized for the HIE Bi-Directional Exchange measure (42 CFR 495.24(e)(6)(ii)(C)). By connecting to an entity that connects to a QHIN, or connecting directly to a QHIN, that supports sharing information on patients as part of a Framework Agreement,[1119] an eligible hospital or

[1108] The Common Agreement defines Individual Access Services (IAS) as ''with respect to the Exchange Purposes definition, the services provided utilizing the Connectivity Services, to the extent consistent with Applicable Law, to an Individual with whom the QHIN, Participant, or Subparticipant has a Direct Relationship to satisfy that Individual's ability to access, inspect, or obtain a copy of that Individual's Required Information that is then maintained by or for any QHIN, Participant, or Subparticipant.'' *See* Common Agreement for Nationwide Health Information Interoperability Version 1, at 7 (Jan. 2022), *https://www.healthit.gov/sites/default/files/page/2022-01/Common_Agreement_for_Nationwide_Health_Information_Interoperability_Version_1.pdf.*

[1109] The Common Agreement defines ''IAS Provider'' as: ''Each QHIN, Participant, and Subparticipant that offers Individual Access Services.'' *See* Common Agreement for Nationwide Health Information Interoperability Version 1, at 7 (Jan. 2022), *https://www.healthit.gov/sites/default/files/page/2022-01/Common_Agreement_for_Nationwide_Health_Information_Interoperability_Version_1.pdf.*

[1110] For the Common Agreement definitions of QHIN, Participant, and Subparticipant, *see* Common Agreement for Nationwide Health Information Interoperability Version 1, at 8–12 (Jan. 2022), *https://www.healthit.gov/sites/default/files/page/2022-01/Common_Agreement_for_Nationwide_Health_Information_Interoperability_Version_1.pdf.*

[1111] For the Common Agreement definitions of Payment, Health Care Operations, Public Health, and Government Benefits Determination, *see* Common Agreement for Nationwide Health Information Interoperability Version 1, at 6–10 (Jan. 2022), *https://www.healthit.gov/sites/default/files/page/2022-01/Common_Agreement_for_Nationwide_Health_Information_Interoperability_Version_1.pdf.*

[1112] Exchange Purpose(s): means the reason, as authorized by [the] Common Agreement including the Exchange Purposes SOP, for a Request, Use, Disclosure, or Response transmitted via QHIN-to-QHIN exchange as one step in the transmission. Authorized Exchange Purposes are: Treatment, Payment, Health Care Operations, Public Health, Government Benefits Determination, Individual Access Services, and any other purpose authorized as an Exchange Purpose by the Exchange Purposes SOP, each to the extent permitted under Applicable Law, under all applicable provisions of [the] Common Agreement, and, if applicable, under the implementation SOP for the applicable Exchange Purpose. Definitions for each of these exchange purposes can be found in the Common Agreement for Nationwide Health Information Interoperability Version 1, at 6 *(Jan. 2022), https://www.healthit.gov/sites/default/files/page/2022-01/Common_Agreement_for_Nationwide_Health_Information_Interoperability_Version_1.pdf.*

Continued

CAH would be thereby enabling bi-directional exchange with other health care providers as described in Statement 1 of the HIE Bi-Directional Exchange measure. Since participation in a Framework Agreement as a QHIN, Participant, or Sub-participant will be open to all qualifying entities and will not be restricted by use of a single vendor, a connection via a Framework Agreement would also satisfy the requirements of Statement 2 of the HIE Bi-Directional Exchange measure. Finally, as discussed previously, the technical requirements for exchanging information by entities through the Common Agreement and Framework Agreements utilize standards included in certified technology referenced under the CEHRT definition (see 42 CFR 495.4), including the ability to exchange and receive data using the C–CDA standard (see certification criteria at 45 CFR 170.315(b)(1) and (2)), thus health care providers participating in a Framework Agreement can use the functions of CEHRT to support bi-directional exchange with an HIE.

To offer health care providers more opportunities to earn credit for the Health Information Exchange Objective, and given the alignment between enabling exchange under TEFCA and the existing HIE Bi-Directional Exchange measure, in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28582 through 28585), we proposed to add an additional measure through which an eligible hospital or CAH could earn credit for the Health Information Exchange Objective by connecting to an entity that connects to a QHIN or connecting directly to a QHIN. Specifically, we proposed to add the following new measure to the Health Information Exchange Objective beginning with the EHR reporting period in CY 2023: Enabling Exchange Under TEFCA measure. We proposed that eligible hospitals and CAHs would have three reporting options for the Health Information Exchange Objective: (1) report on both the Support Electronic Referral Loops by Sending Health Information measure and the Support Electronic Referral Loops by Receiving and Reconciling Health Information measure, (2) report on the HIE Bi-Directional Exchange measure, or (3) report on the proposed Enabling Exchange Under TEFCA measure.

We proposed that the Enabling Exchange Under TEFCA measure would be worth the total amount of points available for the Health Information Exchange Objective. Under the current scoring methodology finalized in the FY 2022 IPPS/LTCH PPS final rule, the Health Information Exchange Objective is worth a total of 40 points (86 FR 45466). We noted in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28589) that we were proposing changes to the scoring methodology beginning with the EHR reporting period in CY 2023 such that the Health Information Exchange Objective would be worth no more than 30 points. Therefore, under our proposal, the proposed Enabling Exchange Under TEFCA measure would be worth 30 points. We proposed this change to the scoring methodology as a result of our proposal in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28579) to make the Query of PDMP measure required and worth 10 points. However, we stated that should we not finalize the Query of PDMP measure proposal, we proposed that the Enabling Exchange Under TEFCA measure would be worth 40 points (the current total point value of the Health Information Exchange Objective). In no case could more than 40 points total be earned for the Health Information Exchange Objective. In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28593 through 28594), we proposed to remove text for the objectives and measures from paragraph (e) under 42 CFR 495.24 beginning in CY 2023. We stated that if we do not finalize that proposal, we would revise 42 CFR 495.24(e) to reflect the addition of the proposed Enabling Exchange Under TEFCA measure.

We stated that we believe the new measure for enabling exchange under TEFCA that we proposed would incentivize eligible hospitals and CAHs to exchange information by connecting directly or indirectly to a QHIN and support health information exchange at a national level. We believe that fulfillment of this measure is an extremely high value action. The overall TEFCA goal of establishing a universal floor of interoperability across the country aligns with our commitment to promoting and prioritizing interoperability and exchange of healthcare data. Incentivizing providers to enable exchange under TEFCA is a critical component to advancing healthcare data exchange nationwide. We proposed that eligible hospitals and CAHs would report the Enabling Exchange Under TEFCA measure by attestation, and the measure would require a ''yes/no'' response. A ''yes'' response would enable eligible hospitals and CAHs to earn the proposed 30 points allotted to the Health Information Exchange Objective. Further, we proposed that this measure may be calculated by reviewing only the actions for patients whose records are maintained using CEHRT. A patient's record is maintained using CEHRT if sufficient data were entered in the CEHRT to allow the record to be saved, and not rejected due to incomplete data.

We proposed that eligible hospitals and CAHs would attest to the following:

- Participating as a signatory to a Framework Agreement (as that term is defined by the Common Agreement for Nationwide Health Information Interoperability as published in the **Federal Register** and on ONC's website) (in good standing, that is, not suspended) and enabling secure, bi-directional exchange of information to occur, in production, for all unique patients discharged from the eligible hospital or CAH inpatient or emergency department (POS 21 or 23), and all unique patient records stored or maintained in the EHR for these departments, during the EHR reporting period in accordance with applicable law and policy.
- Using the functions of CEHRT to support bi-directional exchange of patient information, in production, under this Framework Agreement.

Similar to the HIE Bi-Directional Exchange measure, to successfully attest to this measure, we proposed the eligible hospital or CAH must use the capabilities of CEHRT to support bi-directional exchange under a Framework Agreement, which includes capabilities that support exchanging the clinical data within the Common Clinical Data Set (CCDS) or the United States Core Data for Interoperability (USCDI). This is consistent with the other measures under the Health Information Exchange Objective, which point to the use of CEHRT to support the exchange of the clinical data within the CCDS or the USCDI. We note that, beginning in 2023, when this measure would be available for eligible hospitals and CAHs to report eligible hospitals and CAHs must use certified health IT that has been updated consistent with the 2015 Edition Cures Update, including updates to relevant certification criteria to reference the USCDI instead of the CCDS (85 FR 25642).

We stated that we believe there are numerous certified health IT capabilities that can support bi-directional exchange under a Framework Agreement. For instance, participants may exchange information under a Framework Agreement by using technology certified to the criterion at 45 CFR 170.315(b)(1), ''Care

2022) *https://www.healthit.gov/sites/default/files/page/2022-01/Common_Agreement_for_Nationwide_Health_Information_Interoperability_Version_1.pdf.*

coordination—Transitions of care,'' to transmit C–CDAs across a network. Where supported, participants could also utilize API technology certified to either the criterion at 45 CFR 170.315(g)(8), ''Design and performance—Application access—data category request,'' or (g)(10), ''Design and performance—Standardized API for patient and population services,'' as finalized in the ONC 21st Century Cures Act final rule (85 FR 25742), to enable exchange of data in the USCDI from a participant's EHR. Additional certified health IT modules may also support exchange of information under a Framework Agreement for transitions of care, including modules certified to certification criteria at 45 CFR 170.315(g)(7), ''Design and performance—Application access—patient selection,'' and (g)(9), ''Design and performance—Application access—all data request,'' which support information exchange via API; the certification criterion at 45 CFR 170.315(e)(1), ''Patient engagement—View, download, and transmit to 3rd party,'' which supports patient access to their information; and the certification criterion at 45 CFR 170.315(g)(6), ''Design and performance—Consolidated CDA creation performance,'' which supports creation of a summary of care record. We recognize that entities that will connect directly or indirectly to a QHIN are currently interacting with health care providers using certified health IT in a variety of ways, and, as with the HIE Bi-Directional Exchange measure, believe that we should allow for substantial flexibility in how health care providers use certified health IT to exchange data under a Framework Agreement.

We stated that the Enabling Exchange Under TEFCA measure could offer health care providers an alternative to earn credit for the Health Information Exchange Objective. The Enabling Exchange Under TEFCA measure would not require an eligible hospital or CAH to assess whether they participate in a health information exchange that meets the attributes of attestation Statement 2 under the HIE Bi-Directional Exchange measure regarding exchange across a broad network of unaffiliated exchange partners including those using disparate EHRs. These attributes are key to the goals of TEFCA, which aims to offer health care providers a uniform set of expectations around information sharing regardless of which network for information exchange they participate in.

We invited public comment on these proposals.

Comment: Many commenters expressed support for the proposal. A few commenters believed the measure would allow health care providers to have options to meet this objective that enable more broad-based data exchange across the health ecosystem and utilize TEFCA when appropriate. Many commenters expressed support for the adoption of the Enabling Exchange Under TEFCA measure as a means to advance health information exchange and interoperability on a national level. A commenter suggested that this improved means toward interoperability would help optimize patient care. Another commenter believed the measure would support compliance with the regulations finalized in the ONC 21st Cures Act Final Rule. Several commenters noted the measure would promote capabilities for bi-directional exchange, which they believed would be critical to advancing effective interoperability. A few commenters noted the measure would help improve health care provider reporting. A few commenters thanked CMS for a flexible model that would allow newly created programs to mature and reduce burdens associated with participation requirements, all while incentivizing participation in TEFCA.

Response: We thank commenters for their support and feedback. We agree that adding a third measure under the Health Information Exchange Objective to offer an additional path to earn credit and accelerate the bi-directional exchange of health information is consistent with the goals of the HIE Objective and aligns with the overall goal to promote nationwide interoperability.

Comment: A few commenters expressed specific support for CMS' and ONC's collaboration in making TEFCA a key pillar in the nationwide strategy to establish a ''floor'' and framework for health data interoperability and exchange.

Response: We thank commenters for recognizing our continued efforts toward alignment and inter-agency collaboration. CMS and ONC will continue to collaborate and work with interested parties on TEFCA implementation to support advancements in health information exchange.

Comment: A few commenters expressed support for the Enabling Exchange under TEFCA measure as a means to position TEFCA to be a more effective mechanism for data delivery for a range of important use cases, such as patient access and patient-centered care.

Response: We thank commenters for their support. We believe that widespread adoption of the Common Agreement will facilitate patients, health care providers, payers, HINs, health IT developers, and other interested parties having access to data when and where it is needed to better support patient care.

Comment: Many commenters expressed support around the optional or alternative nature of this measure, specifically citing concerns around the technical maturity and functionality of TEFCA. Several commenters cautioned against requiring this measure without first confirming that the infrastructure is mature and widespread enough to support the requirements. For example, a few commenters expressed concern around whether there would be an available QHIN in which to participate in time for the 2023 reporting period.

Response: We thank the commenters for their support and acknowledge these concerns. We note that TEFCA will be operationalized in 2022 before the start of the EHR reporting period in CY 2023, and that the Enabling Exchange under TEFCA measure was proposed as an optional alternative for the HIE Objective beginning with the EHR reporting period in CY 2023. We anticipate that TEFCA will provide a valuable pathway for health care providers to access information needed to support value-based care, care management, and population health. By connecting a set of nationwide, trusted health information networks and creating baseline legal and technical requirements that would enable secure information sharing across different networks nationwide, TEFCA has the potential to significantly reduce the need for duplicative network connectivity interfaces, which are costly, complex to create and maintain, and an inefficient use of health care provider and health IT developer resources. As more eligible hospitals and CAHs enable exchange under TEFCA and are able to report on this new measure, we believe technical maturity and functionality of health information exchange will also continue to significantly improve.

Comment: A commenter suggested CMS should consider the impact on eligible hospitals and CAHs if TEFCA participation were to become unstable due to entities that facilitate exchange not meeting relevant terms and conditions and offer a hardship exception if a health care provider's ability to exchange information under TEFCA were to be limited or terminated due to suspension/termination of an entity which a provider relies upon in

order to exchange information under TEFCA. Another commenter expressed related concerns and stated that CMS should add exceptions to the Enabling Exchange under TEFCA measure to allow for potential trickle-down effect disruptions that are beyond the control of eligible hospitals and CAHs.

Response: We understand that there could be a scenario in which an eligible hospital or CAH is unable to exchange information under the Common Agreement or a Framework Agreement for the duration of a reporting period using a specific entity due to that entity being terminated or suspended under the terms of the Common Agreement or an associated Framework Agreement. In such cases, an eligible hospital or CAH could explore connecting to a different QHIN, Participant, or Subparticipant, which could enable the exchange of health information by the eligible hospital or CAH, limit the disruption, and potentially allow the eligible hospital or CAH to continue to attest to the statements required for the measure. If the eligible hospital or CAH is not able to connect to a different QHIN, Participant, or Subparticipant, the eligible hospital or CAH would likely no longer be able to attest ''yes'' to the statements required for the measure. In such cases, the eligible hospital or CAH could select one or more of the other measures that are included under the HIE Objective (for instance, the HIE Bi-directional measure could still be relevant if an eligible hospital or CAH can continue to use a network previously connected under TEFCA). We do not believe a hardship exception would be necessary for the Enabling Exchange Under TEFCA measure because it is an optional measure.

Comment: Several commenters, in addition to expressing support for the proposed measure, offered additional recommendations for future efforts. A few commenters suggested continued collaboration among CMS, ONC and other entities to support TEFCA implementation. A commenter recommended CMS consider future measures that would further support health care provider interactions with payers for processes such as coverage requirements discovery and submission of prior authorization requests. Another commenter noted there are similar, already existing private sector solutions that seek to accomplish the same goals as this measure. This commenter recommended government participation in those efforts to expand impact of this measure. A commenter recommended CMS consider innovative technologies like blockchain within TEFCA.

Response: We appreciate these recommendations. ONC and CMS will continue to work together to explore how TEFCA can support a wide range of CMS programs and activities. Furthermore, we note that ONC and CMS invite collaboration around TEFCA by all private sector solutions that are seeking to accomplish the same goal of advancing interoperability nationwide.

Comment: Several commenters did not support the proposed measure. These commenters suggested CMS proceed with caution when adding a new measure related to TEFCA before additional TEFCA milestones are achieved, citing uncertainties around how TEFCA will function and the lack of details around participation to fully understand all of its implications. A commenter suggested CMS wait to implement the measure until TEFCA transitions from the ''TEFCA Transitional Council'' advisory group to the full ''TEFCA Governing Council,'' which, according to the commenter, would signal that the QHINs are operational and ready to govern the Common Agreement themselves. Another commenter cited the lack of standard operating procedures released by the RCE. This commenter believed that the measure could encourage eligible hospitals and CAHs to shift from more mature and interoperable networks, leading to an overall decrease in interoperability. Another commenter suggested CMS postpone this measure until at least CY 2024, after data exchange under TEFCA has been initiated.

Response: We thank the commenters for their feedback and acknowledge these concerns. The Trusted Exchange Framework and the Common Agreement Version 1 were published in January 2022, and entities will soon be able to apply to be designated as QHINs. By proposing this as an optional measure, hospitals may opt into reporting if they are ready to exchange information under TEFCA, but including this optional measure does not create any requirement for eligible hospitals and CAHs to exchange information under TEFCA if they choose not to at this time due to concerns such as those expressed by commenters around postponing the measure. We are hopeful that the finalization of this proposal will help incentivize readiness as well as increase participation in exchange under TEFCA. We disagree with commenters that this measure should be postponed, or that the measure would pose a threat to current progress towards interoperability.

Comment: A few commenters did not support the measure because they believed it duplicates the HIE Bi-Directional Exchange measure and therefore may be confusing to health care providers. These commenters state that the current HIE Bi-Directional measure would allow participants in TEFCA to claim credit for the objective. A commenter recommended a step-wise approach for facilities to allow a ramp up to compliance while meeting other interoperability requirements simultaneously.

Response: We thank the commenters for their feedback and acknowledge this concern. We disagree that the Enabling Exchange under TEFCA measure is duplicative of the HIE Bi-Directional Exchange measure. Instead, we believe the optional Enabling Exchange under TEFCA measure would complement the HIE Bi-Directional Exchange measure by providing a convenient option for those who enable exchange under TEFCA to claim credit for the HIE objective. At this time, we believe, it is unclear what a step-wise approach would look like, given the binary nature of TEFCA participation, and do not believe a step-wise approach would more effectively support participation. We expect that many eligible hospitals and CAHs will already be participating in health information networks that will enable exchange under the TEFCA and would not need to engage in an incremental process in order to begin attesting to this measure in 2023.

Comment: Several commenters offered recommendations for CMS with regard to this measure. A few commenters suggested CMS should add this optional measure for eligible clinicians to report under the Promoting Interoperability performance category of MIPS. Several commenters suggested CMS provide resources on the benefits of TEFCA and reasons why eligible hospitals and CAHs should invest in exchanging information under TEFCA, including how eligible hospitals or CAHs can justify additional investments to hospital boards and communities for exchange under TEFCA.

Response: We appreciate this feedback and will take these comments into consideration for future rulemaking. Regarding a complementary proposal for eligible clinicians in MIPS, we refer readers to the 2023 PFS NPRM, in which we have proposed a similar measure for inclusion in the Promoting Interoperability performance category.[1120]

[1120] See *https://www.federalregister.gov/public-inspection/2022-14562/medicare-and-medicaid-programs-calendar-year-2023-payment-policies-under-the-physician-fee-schedule.*

Regarding resources on the benefits of TEFCA and reasons why eligible hospitals and CAHs should invest in exchanging information under TEFCA, we note that some resources are already available on this topic, including an information resource developed by the RCE entitled ''The Nationwide Network Based on the Common Agreement Benefits for Health Care Providers Across the Continuum.'' [1121] However, we will continue to collaborate with ONC and other partners to identify resources that can help providers to better understand the benefits of TEFCA, and invite public comment on what kinds of resources would be most useful to stakeholders.

Comment: Commenters recommended that the alternative measure require eligible hospitals and CAHs to attest to facilitating exchange for all required Exchange Purposes, including Individual Access Services. A commenter recommended that CMS should increase incentives for the use of HIEs for Exchange Purposes beyond Treatment, so as not to go against information blocking rules, furthering the need for HIEs to facilitate data exchange for a broad range of purposes authorized by law. Another commenter suggested that CMS and ONC coordinate to ensure measures that reference TEFCA include measurement of participation in the Individual Access Services Exchange Purpose in addition to Treatment, Payment, and Health Care Operations Exchange Purposes.

Response: For this Enabling Exchange under TEFCA measure, we have focused on aligning with the goals of the HIE Objective which pertains to care coordination and exchange between health care providers. However, we will consider whether this model can be applied to other Promoting Interoperability objectives that may align with other TEFCA Exchange Purposes, such as IAS, in the future. We do believe that HIEs can support other Exchange Purposes beyond Treatment and will continue to explore ways to incentivize these use cases. Finally, we do not believe there is any conflict between incentives for care coordination under this proposal and the information blocking rules. We refer readers to the resources around TEFCA cited in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28582 through 28585).[1122] [1123] [1124] [1125] [1126] [1127] CMS will continue to explore additional opportunities to provide further education and outreach regarding TEFCA.

Comment: A commenter requested clarification from CMS on requirements for health care providers participating in multiple state HIEs, including hospitals near state borders.

Response: For health care providers near state borders, there is no specific requirement that an eligible hospital or CAH must ensure that exchange enabled under TEFCA includes health care providers in a neighboring state with which a health care provider may need to share information. However, we believe that by enabling exchange across networks nationwide, providers exchanging information under TEFCA will be more likely to be able to effectively exchange information across state lines.

Comment: A commenter suggested CMS should clarify that the exchange of patient summaries or other patient data need not occur for all unique patients but only as needed or requested. A commenter requested clarity on the definition of ''enable'' in the context of this measure.

Response: We thank commenters for their feedback. The first attestation statement, as proposed, would require an eligible hospital or CAH to enable secure, bi-directional exchange of information to occur under a Framework Agreement. As we noted in our discussion of the final policy for the HIE Bi-Directional Measure (86 FR 45468), enabling bi-directional exchange does not mean that an eligible hospital or CAH would be required to conduct information transactions that are not clinically necessary. Rather, it means that an eligible hospital or CAH has established the capabilities necessary to complete exchanges of information for its patients at the appropriate time. In the case of the Enabling Exchange under TEFCA measure, this means the capabilities to exchange information under a Framework Agreement.

Comment: Commenters requested clarity around what data is to be exchanged and whether there is an expectation to incorporate any of the exchanged information into the patient chart as with the current HIE Objective measure ''Support Electronic Referral Loops by Receiving and Reconciling Health Information,'' for instance, through reconciliation of parsed data from received C–CDAs.

Response: We note that, at a minimum, TEFCA requires the exchange of all available data elements from USCDI Version 1.[1128] Health care providers participating in a Framework Agreement and attesting to this measure would be required to exchange data according to the terms of the Framework Agreement. Regarding reconciliation of information, the requirements for the measure are limited to attesting to the statements related to engaging in bi-directional exchange under a Framework Agreement using the functions of CEHRT. There are no additional explicit requirements related to how the health care provider must incorporate information received under the Framework Agreement into the patient's record.

Comment: Another commenter requested clarity on the definition of ''calculated'' in the context of this measure.

Response: Thank you for the comment. We wish to clarify that the proposed attestation statements do not require an eligible hospital or CAH to perform calculations, as part of this measure, such as those necessary for measures that are based on reporting of a numerator and denominator and count unique patients or actions. Therefore, we are not finalizing our proposal that this measure may be calculated by reviewing only the actions for patients whose records are maintained using CEHRT, as this proposal is not relevant to the measure.

Comment: A commenter requested CMS provide further clarity on how to document completion of this measure and what would suffice as a

demonstration of the capacity to exchange information with others efficiently and effectively.

Response: In order to successfully ''complete'' this measure, eligible hospitals and CAHs must attest to the required statements. Completion of the measure would be limited to attesting to the required statements. For audit purposes, eligible hospitals and CAHs should retain evidence of their agreement with a QHIN, Participant, or Subparticipant that includes the terms of a Framework Agreement.

Comment: A few commenters who supported the measure also expressed some concerns regarding this measure. A commenter believed CMS is adding technical requirements without confirming that the functionality of vendor systems is useful with regard to system integration, user interface, or workflow of the technology, placing this burden on eligible hospitals and CAHs. This commenter requested that CMS and ONC reassess measurement of compliance for vendor systems. Another commenter cautioned CMS against offering a measure based on enabling information exchange under TEFCA because they believed TEFCA implementation will be slow and additional milestones should be confirmed and achieved first.

Response: We appreciate commenters' feedback and acknowledge these concerns. In order to attest to this measure, the eligible hospital or CAH must use the functions of CEHRT to connect directly or indirectly to a QHIN. As noted in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28585) and reiterated above, there are currently a number of certified health IT capabilities that support the technical requirements for exchange under TEFCA, thus these capabilities would be useful for participation in exchange under TEFCA and earning credit under this measure. We believe that by finalizing this measure as optional, eligible hospitals and CAHs can opt in to reporting it once they are ready to enable exchange under TEFCA and are confident in the infrastructure.

After consideration of the public comments we received, we are finalizing our proposal to add an additional measure through which an eligible hospital or CAH could earn credit for the Health Information Exchange Objective by connecting to an entity that connects to a QHIN or connecting directly to a QHIN. We are finalizing our proposal to add this measure to the Health Information Exchange Objective beginning with the EHR reporting period in CY 2023: Enabling Exchange Under TEFCA measure. We are finalizing our proposal that eligible hospitals and CAHs will now have three reporting options for the Health Information Exchange Objective: (1) Report on both the Support Electronic Referral Loops by Sending Health Information measure and the Support Electronic Referral Loops by Receiving and Reconciling Health Information measure, (2) report on the HIE Bi-Directional Exchange measure, or (3) report on the Enabling Exchange Under TEFCA measure. We are finalizing our proposal that the Enabling Exchange Under TEFCA measure would be worth the total amount of points available for the Health Information Exchange Objective. We are finalizing our proposal in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28589 through 28591) to change the scoring methodology beginning with the EHR reporting period in CY 2023, such that the Health Information Exchange Objective would be worth no more than 30 points, therefore we are finalizing our proposal that the Enabling Exchange Under TEFCA measure would be worth 30 points. We are finalizing our proposal that eligible hospitals and CAHs would report the Enabling Exchange Under TEFCA measure by attestation, and that the measure would require a ''yes/no'' response. We are not finalizing our proposal that this measure be calculated by reviewing only the actions for patients whose records are maintained using CEHRT as calculations are not necessary for this measure, which instead requires attestation to the specified statements. We are finalizing our proposal that eligible hospitals and CAHs would attest to the following: Participating as a signatory to a Framework Agreement (as that term is defined by the Common Agreement for Nationwide Health Information Interoperability as published in the **Federal Register** and on ONC's website) (in good standing that is, not suspended) and enabling secure, bi-directional exchange of information to occur, in production, for all unique patients discharged from the eligible hospital or CAH inpatient or emergency department (POS 21 or 23), and all unique patient records stored or maintained in the EHR for these departments, during the EHR reporting period in accordance with applicable law and policy; and using the functions of CEHRT to support bi-directional exchange of patient information in production, under this Framework Agreement. We refer readers to the FY 2023 IPPS/LTCH PPS proposed rule for additional information on certified health IT capabilities that can support bi-directional exchange under a Framework Agreement (87 FR 28582 through 28585). Additionally, we are finalizing our proposal in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28593 through 28594) to remove associated regulatory text, therefore, we will not be updating 42 CFR 495.24(e) to reflect the addition of the Enabling Exchange Under TEFCA measure.

5. Public Health and Clinical Data Exchange Objective

a. Background

The Medicare Promoting Interoperability Program for eligible hospitals and CAHs has been an important mechanism for encouraging healthcare data exchange for public health purposes through the Public Health and Clinical Data Exchange Objective. Effective responses to public health events, such as the COVID–19 PHE, require fast, accurate exchange of data between health care providers and Federal, state, and local public health agencies (PHAs). Health care providers collect these data for patient care, and PHAs need them to protect the public, whether to track an outbreak, initiate contact tracing, find gaps in vaccine coverage, or pinpoint the source of a foodborne outbreak.

There are six measures under the Public Health and Clinical Data Exchange Objective: Immunization Registry Reporting, Syndromic Surveillance Reporting, Electronic Case Reporting, Electronic Reportable Laboratory (ELR) Result Reporting, Public Health Registry Reporting, and Clinical Data Registry Reporting. For background on this objective and its associated measures, we refer readers to the FY 2019 IPPS/LTCH PPS final rule (83 FR 41665 through 41667), and the FY 2022 IPPS/LTCH PPS final rule (86 FR 45470 through 45479). In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45470 through 45479), we finalized the requirement for eligible hospitals and CAHs to report four of the six of the measures associated with the Public Health and Clinical Data Exchange Objective, beginning with the EHR reporting period in CY 2022: Syndromic Surveillance Reporting; Immunization Registry Reporting; Electronic Case Reporting; and Electronic Reportable Laboratory Result Reporting. These four measures will put PHAs on better footing for future health threats and a long-term COVID–19 pandemic recovery by strengthening three important public health functions: (1) early warning surveillance, (2) case surveillance, and (3) vaccine uptake. Requiring these measures will enable nationwide

syndromic surveillance for early warning of emerging outbreaks and threats; automated case and laboratory reporting for fast public health response; and local and national visibility on immunization uptake so PHAs can tailor vaccine distribution strategies.

b. Modifications to the Reporting Requirements for the Public Health and Clinical Data Exchange Objective: Antimicrobial Use and Resistance (AUR) Surveillance Measure

Antimicrobial-resistant (AR) infections are caused by pathogens that no longer respond to the drugs designed to kill them and directly threaten patient and population health. An effective national response to the threat presented by antimicrobial resistant bacteria requires robust systems for systematically collecting, analyzing, and using antimicrobial use and resistance data to direct action.

Each year in the United States, more than three million people are infected by an antimicrobial-resistant pathogen or *C. difficile* (an opportunistic pathogen associated with antimicrobial use), and nearly 50,000 people die.[1129] As more pathogens become resistant to available antimicrobials, options for reliably and rapidly treating infections—including pneumonias, foodborne illnesses, and healthcare-associated infections—become increasingly limited, more expensive and, in some cases, nonexistent. The CDC has found that one-third to one-half of all antimicrobials used in inpatient and outpatient settings are either unnecessary or prescribed incorrectly.[1130] The misuse and overuse of antimicrobials both facilitates the emergence of drug-resistant pathogens and exposes patients to needless risk for adverse effects. AR infections can also complicate the response to and recovery from other serious health risks, such as COVID–19. Rates of AR infections have increased in healthcare settings since the beginning of the COVID–19 pandemic, reversing previous prevention successes such as declines of AR infections by as much as 30 percent prior to the pandemic.[1131] Additionally, Methicillin-resistant *Staphylococcus aureus* (MRSA) infections increased five consecutive quarters from 2020 to 2021, including some quarter over quarter increases of 39 percent.[1132] Strengthening of infection prevention and control and antibiotic stewardship is needed to address these challenges and ensure a solid foundation for future public health emergencies.

As outlined in the National Action Plan for Combating Antibiotic-Resistant Bacteria (CARB), 2020–2025,[1133] an effective national response to the threat presented by AR bacteria and fungi depends in part on slowing the emergence of new resistant threats and preventing the spread of existing resistant infections. Successfully meeting this goal, in turn, requires robust systems for collecting, analyzing, and using AUR data to direct action. Systematically collecting AUR data also helps inform the availability and potential need for new antibiotics to address emerging forms of resistance.

Antimicrobial use (AU) data delivered to antimicrobial stewardship programs (ASPs) enable stewards to develop, select, and assess interventions aimed at optimizing antimicrobial prescribing. These interventions, in turn, serve to improve antimicrobial treatment effectiveness, protect patients from harms caused by unnecessary antimicrobial exposure, and curb antimicrobial resistance associated with prophylactic and therapeutic excess. Studies have shown that ASPs can help slow the emergence of antimicrobial resistance while optimizing treatment and minimizing costs—all in support of safe and appropriate care for patients.

Antimicrobial resistance data can aid in clinical decision making (hospital cumulative antibiograms) and direct transmission prevention and antimicrobial stewardship efforts. With timely and complete reporting, these data can also facilitate rapid identification and control of potential outbreaks, as well as longer term assessment of progression or improvement to guide public health response efforts. Currently, acute care hospitals and CAHs voluntarily report to CDC's National Healthcare Safety Network's (NHSN) AUR Module with approximately 2000 eligible hospitals and 1000 CAHS reporting on AUR NHSN. Compared to the hospitals that have not reported AUR data, those that reported were more likely to be larger and teaching hospitals.

The extensive voluntary participation in NHSN's AUR surveillance, which calls for hospitals to buy or build an AUR reporting solution, indicates that thousands of hospitals see value in NHSN's AUR surveillance. However, incomplete participation in NHSN's AUR surveillance limits the generalizability of the AUR data: The data are subject to selection bias and do not provide a comprehensive national picture. Other comparable NHSN reporting pathways—such as those used to report data on blood stream infections, urinary tract infections, and other healthcare-associated infections—are required under CMS quality reporting and value-based payment programs, including the Hospital Value-Based Purchasing (VBP) and Hospital-Acquired Condition (HAC) Reduction Programs. In the Hospital VBP and HAC Reduction Programs, the reporting coverage and compliance with NHSN measures is routinely approximately 97 percent. The benefits of monitoring AUR data for patient care and public health are most likely to be achieved when data collection and analysis are systematic, standardized, and achieve complete coverage across eligible facilities. In fact, as more hospitals participate, the system becomes better at detecting emerging threats as the network for data collection grows.

We believe that requiring an AUR measure under the Medicare Promoting Interoperability Program would enable the development of a true national picture of the threat posed by antimicrobial overuse and resistance. Requiring AUR reporting through CDC's NHSN would produce inpatient AU and AR benchmarks that can be used to guide clinical and public health action and enable a true national picture of the threat posed by antimicrobial overuse and resistance. In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28586 through 28587), we proposed the following new AUR Surveillance measure under the Public Health and Clinical Data Exchange Objective:

AUR Surveillance measure: The eligible hospital or CAH is in active engagement with CDC's National Healthcare Safety Network (NHSN) to submit antimicrobial use and resistance (AUR) data for the EHR reporting period and receives a report from NHSN indicating their successful submission of AUR data for the EHR reporting period.

We proposed to require eligible hospitals and CAHs to report this

[1129] CDC. Antibiotic Resistance Threats in the United States, 2019. Atlanta, GA: U.S. Department of Health and Human Services, CDC; 2019.

[1130] CDC. Antibiotic Use in the United States, 2018 Update: Progress and Opportunities. Atlanta, GA: US Department of Health and Human Services, CDC; 2019.

''The Impact of Coronavirus Disease 2019 (COVID–19) on Healthcare-Associated Infections in 2020: A Summary of Data Reported to the National Healthcare Safety Network.'' *Infection Control & Hospital Epidemiology,* vol. 43, no. 1, 2022, pp. 12–25., doi:10.1017/ice.2021.362.

[1133] Office of the Assistant Secretary for Planning and Evaluation (ASPE). (2020). National Action Plan for Combatting Antibiotic-Resistant Bacteria, 2020–2025. Available at: *https://aspe.hhs.gov/reports/national-action-plan-combating-antibiotic-resistant-bacteria-2020-2025*.

measure beginning with the EHR reporting period in CY 2023. Eligible hospitals and CAHs that report a ''yes'' response or an exclusion for which they are eligible would receive credit for reporting the measure. Eligible hospitals and CAHs that report a ''no'' response or fail to report any response would not receive credit for reporting the measure and would fail to satisfy the Public Health and Clinical Data Exchange Objective. No additional points would be associated with the reporting of this measure, but it would be one of five required measures required to satisfy the Public Health and Clinical Data Exchange Objective. See the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28589) for further detail on the proposals and section IX.H.6 of this final rule for the finalized modification of the scoring of this objective.

For purposes of this proposed measure, we proposed eligible hospitals and CAHs must use technology certified to the criterion at 45 CFR 170.315(f)(6), ''Transmission to public health agencies—antimicrobial use and resistance reporting.'' We also stated we were aware of an updated version of the standard referenced in the criterion [1134] and that we would work with our partners at CDC and ONC to consider avenues for addressing use of this specification within the ONC Health IT Certification program. We provide additional information on use of this updated version below.

We proposed three exclusions for the AUR Surveillance measure as follows: the eligible hospital or CAH: (1) Does not have any patients in any patient care location for which data are collected by NHSN during the EHR reporting period; (2) Does not have electronic medication administration records (eMAR)/barcoded medication administration (BCMA) records or an electronic admission discharge transfer (ADT) system during the EHR reporting period; or (3) Does not have an electronic laboratory information system (LIS) or electronic ADT system during the EHR reporting period (87 FR 28587). We anticipate reevaluating exclusions #2 and #3 for future EHR reporting periods. The AUR Surveillance measure would leverage the standards and functionality included in certified technology referenced under the CEHRT definition, including the ability to transmit to PHAs for antimicrobial use and resistance reporting.

We invited public comment on these proposals. We also invited comments on the feasibility of the timeline and any additional exclusions that we should consider for this measure for proposal in future rulemaking.

Comment: Many commenters supported the proposal to add the AUR Surveillance measure agreeing on the critical role this measure would play in improving antibiotic use and reducing antibiotic resistance, facilitating targeting areas for improvement, providing data critical to tracking threats and identifying trends nationwide, informing clinicians, public health agencies, government, and policymakers alike. Several commenters noted the importance of this measure to provide a much needed national, generalizable comparison and benchmarks. A few commenters noted the utility of this data to potentially drive increased investment from Congress to address the rising threat of adverse events such as antibiotic resistance.

Response: We appreciate commenters' support of the proposal to require the AUR Surveillance measure under the Public Health and Clinical Data Exchange Objective. We believe that this measure will help produce inpatient AU and AR benchmarks that can be used to guide clinical and public health action and enable a true national picture of the threat posed by antimicrobial overuse and resistance.

Comment: Many commenters did not support the proposal to add the AUR Surveillance measure. Several commenters stated that the implementation timeline was too ambitious and that the financial burden on health care providers was substantial. A commenter pointed out that it is already too late to include this in the budget for CY 2023 which has, at the time of the FY 2023 IPPS/LTCH PPS proposed rule being published, already been approved. A few commenters highlighted that the majority of CAHs will not be ready and thus find themselves at a substantial disadvantage. A few commenters noted that eligible hospitals are still dealing with burden related to the PHE and these proposals overwhelm systems already tasked with substantial COVID–19 related reporting and clinical requirements. Many commenters offered recommendations to delay the adoption of the AUR Surveillance measure to the Public Health and Data Exchange Objective with most recommending a delay of at least one year and several recommending alternative periods of delay. A commenter requested that the adoption of the measure be delayed until CEHRT criteria are adopted and vendors and hospitals have sufficient time to implement the CEHRT criteria. A few commenters requested adoption be delayed until the end of the PHE. Several commenters recommend making the measure optional to allow time for implementation. A commenter noted that smaller and resource-limited facilities may need a phase in time not to exceed two years and another commenter recommended a phase-in time with stronger incentives.

Response: We thank the commenters for their feedback. We believe that the AUR Surveillance measure is critical to stem AR infections nationwide, by providing the necessary AUR data to direct action. However, we also heard very clearly from commenters that eligible hospitals and CAHs continue to face enormous operational challenges as a result of the ongoing PHE.

We understand that many commenters believe that more time may be needed for health care providers and EHR vendors to implement the necessary changes in workflows, infrastructure and functionality to report the AUR Surveillance measure. We recognize more time may be beneficial for eligible hospitals and CAHs to implement the necessary infrastructure. Therefore, we are delaying our adoption of this measure by one year, so that it will be included in the Public Health and Clinical Data Exchange Objective and will be a required measure beginning with the EHR reporting period in CY 2024. Regarding the concern over a lack of applicable certification criteria referenced in the CEHRT definition, we inform readers that the applicable criteria is available in ''Transmission to public health agencies—antimicrobial use and resistance reporting'' in 45 CFR 170.315(f)(6), and was finalized in the ''2015 Edition Health Information Technology (Health IT) Certification Criteria, 2015 Edition Base Electronic Health Record (EHR) Definition, and ONC Health IT Certification Program Modifications'' final rule published on October 16, 2015 (80 FR 62668).

Comment: A few commenters recommended adding exceptions for hospitals when they encounter situations related to bi-directional exchange that are outside their control such as encountering deficiencies in the state/local public health agency. A commenter recommended adding an exclusion for eligible hospitals and CAHs using CEHRT that does not include technology certified per § 170.315(f)(6) at the beginning of the EHR reporting period. This type of exclusion would be similar to the one year exclusion that is available for MIPS eligible clinicians for the Electronic Case Reporting measure under the

[1134] *https://www.hl7.org/implement/standards/product_brief.cfm?product_id=426.*

Public Health and Clinical Data Exchange Objective for those clinicians in CY 2022 using CEHRT that does not include technology certified to the electronic case reporting certification criterion. Some commenters expressed concern that their ability to successfully fulfill this measure is limited based on dependence their health IT vendor team, and potentially by delays at the state level.

Response: We thank commenters for their feedback.

We do not believe that additional exclusions related to state and local readiness to engage in bi-directional exchange are necessary, as data within the AUR measure are reported directly to CDC through NHSN. We believe that granting eligible hospitals and CAHs an additional year to prepare to report on this measure will alleviate the concerns that the commenters have raised. Any health IT vendors that have not yet certified under 45 CFR 170.315(f)(6) ''Transmission to public health agencies—antimicrobial use and resistance reporting,'' will have sufficient time to update their product and complete certification due to the one year delay.

Comment: A few commenters requested clarification around the specific standards submitters are required to use, additional information on a minimum period for hospitals to transmit data, and technical assistance and support during the implementation period.

Response: As noted in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28587), for purposes of this measure, we proposed that eligible hospitals and CAHs must use technology certified to the criterion at 45 CFR 170.315(f)(6), ''Transmission to public health agencies—antimicrobial use and resistance reporting.'' This certification criterion references the ''HL7® Implementation Guide for CDA® Release 2—Level 3: Healthcare Associated Infection (HAI) Reports, Release 1, U.S. Realm, August 2013'' implementation specification, adopted at § 170.205(r)(1).

We note that an updated version of this this implementation specification has been approved under ONC's Standards Version Advancement Process. The Standards Version Advancement Process (SVAP) permits health IT developers to voluntarily update health IT products certified under the ONC Health IT Certification Program to newer versions of adopted standards and implementation specifications (85 FR 25775). Specifically, as part of the 2022 SVAP cycle, ONC has approved the use of ''HL7 CDA® R2 Implementation Guide: Healthcare Associated Infection (HAI) Reports, Release 3—US Realm, December 2020'' for the ''Transmission to public health agencies—antimicrobial use and resistance reporting'' at 45 CFR 170.315(f)(6). Health IT developers may begin voluntarily incorporating this specification into Certified Health IT Modules beginning August 29, 2022.

Our experience with NHSN has shown that reporting is not just broadly feasible but also highly valuable for hospitals and their state/local public health partners. As previously noted, over 2000 hospitals currently submit AU and/or AR data through CDC's NHSN. Eligible hospitals and CAHs that do encounter challenges submitting, reviewing, interpreting and using their AU and AR data have access to a robust suite of training and technical assistance resources, as well as one-on-one assistance from subject matter experts via a help desk system. NHSN gives eligible hospitals and CAHs the ability to see and analyze their data in real-time, as well as share that information with clinicians and facility leadership, as well as with other facilities (for example, a multi-hospital system) and partners such as health departments or quality improvement organizations. The measure must be fulfilled during the eligible hospital or CAH's EHR reporting period but it is hoped that once they are able to submit data that they will do so throughout the year.

Comment: Several commenters offered suggestions to support health care provider implementation and reduce participant burden associated with validation. A commenter recommended NHSN and CMS validation reports be aligned to reduce burden on health care providers. A commenter recommended that RxNorm codes be used. Finally, a commenter recommended that CMS allow health care providers to alternatively report on any 5 of the 7 available measures in the Public Health and Clinical Data Exchange Objective to achieve the 10 points.

Response: We thank them for their comments and agree with the importance of ensuring eligible hospitals and CAHs have the resources and support they need to meet requirements without undue reporting burden. CDC already offers a wide array of tools and resources to support onboarding, testing and validation, and data submission (see *https://www.cdc.gov/nhsn/pdfs/cda/PHDI-Facility-Guidance-508.pdf*). And CDC and CMS will work together to build upon these resources as needed to support health care provider participation. Similarly, CDC and CMS will work together to align and streamline accountability processes (for example, reporting validation; (letters from the NHSN to the hospitals to serve as proof of their active engagement). With respect to the commenter's suggestion that the AUR measure support the use of RxNorm codes, the CDC has confirmed that the measure already does so. Finally, as we have previously discussed, we believe that requiring reporting for specific measures under the Public Health and Clinical Data Exchange objective is necessary to better prepare for and support public health responses to health threats. For a thorough discussion of our reasoning for selecting each required measure we refer readers to the FY 2022 IPPS/LTCH final rule (86 FR 45470 through 45479).

After consideration of the public comments we received, we are finalizing our proposal to require eligible hospitals and CAHs to report the AUR surveillance measure, with the modification that it will be required beginning with the EHR reporting period in CY 2024. Eligible hospitals and CAHs that report a ''yes'' response or an exclusion for which they are eligible will receive credit for reporting the measure. Eligible hospitals and CAHs must use technology certified to the criterion at 45 CFR 170.315(f)(6), ''Transmission to public health agencies—antimicrobial use and resistance reporting.'' We are adopting three exclusions as proposed for the AUR Surveillance measure as follows: the eligible hospital or CAH: (1) Does not have any patients in any patient care location for which data are collected by NHSN during the EHR reporting period; (2) Does not have electronic medication administration records (eMAR)/barcoded medication administration (BCMA) records or an electronic admission discharge transfer (ADT) system during the EHR reporting period; or (3) Does not have an electronic laboratory information system (LIS) or electronic ADT system during the EHR reporting period.

c. Revisions to Active Engagement

(1) Background

The Medicare Promoting Interoperability Program has been an important mechanism for encouraging data exchange between health care providers and PHAs through the Public Health and Clinical Data Exchange Objective. In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45470 through 45479), we finalized beginning with the EHR reporting period in CY 2022, eligible hospitals and CAHs must report

on the four required measures to obtain points under the Public Health and Clinical Data Exchange Objective: (1) Syndromic Surveillance Reporting; (2) Immunization Registry Reporting; (3) Electronic Case Reporting; and, (4) Electronic Reportable Laboratory Result Reporting. We believe these required measures will motivate health IT vendors to implement the necessary capabilities in their products and encourage eligible hospitals and CAHs to engage in the reporting activities described in the measures.

Despite these gains, ensuring the nation's thousands of hospitals implement and initiate data production for these vital public health capabilities remains an ongoing and important effort. The Medicare Promoting Interoperability Program provides an opportunity to continue strengthening the incentives for eligible hospitals and CAHs to engage in these essential reporting activities. Without adequate incentives, it will be difficult to attain the comprehensive data exchange needed to ensure fast, complete, actionable data in response to future public health threats.

In the EHR Incentive Program Stage 3 final rule (80 FR 62862 through 62864), beginning with the EHR reporting period in 2016, we established a definition for active engagement under the Public Health and Clinical Data Registry Reporting Objective. Active engagement is defined as when an eligible hospital or CAH is in the process of moving towards sending ''production data'' to a public health agency or clinical data registry, or is sending production data to a public health agency or clinical data registry. We noted that the term ''production data'' refers to data generated through clinical processes involving patient care and it is used to distinguish between this data and ''test data'' which may be submitted for the purposes of enrolling in and testing electronic data transfers. We established the following three options for eligible hospitals and CAHs to demonstrate active engagement:

Option 1—Completed registration to submit data: The eligible hospital or CAH registered to submit data with the PHA or, where applicable, the clinical data registry (CDR) to which the information is being submitted; registration was completed within 60 days after the start of the EHR reporting period; and the eligible hospital or CAH is awaiting an invitation from the PHA or CDR to begin testing and validation. Eligible hospitals or CAHs that have registered in previous years do not need to submit an additional registration to meet this requirement for each EHR reporting period.

Option 2—Testing and validation: The eligible hospital or CAH is in the process of testing and validation of the electronic submission of data. Eligible hospitals or CAHs must respond to requests from the PHA or, where applicable, the CDR within 30 days; failure to respond twice within an EHR reporting period would result in that health care provider not meeting the measure.

Option 3—Production: The eligible hospital or CAH has completed testing and validation of the electronic submission and is electronically submitting production data to the PHA or CDR. For more information about the current options for active engagement, we refer readers to the EHR Incentive Program Stage 3 final rule (80 FR 62862 through 62864).

(2) Revision to Options for Active Engagement

The three active engagement options provided flexibility for eligible hospitals and CAHs to meet the measures under the Public Health and Clinical Data Exchange Objective in a variety of ways, but they did not provide an incentive to move through the options and get to option 3, production, where there is the ongoing electronic submission of data. Option 1, completed registration to submit data, was an important option in 2016 as many PHAs and CDRs were starting to come online, and thus the provision of this option recognized that many eligible hospitals and CAHs were just beginning to engage in electronic data exchange with PHAs and CDRs. Now many years have passed, and we believe that eligible hospitals and CAHs have had ample time to complete option 1.

Thus, in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28588), we proposed to consolidate current options 1 and 2 into one option beginning with the EHR reporting period in CY 2023. We did not propose any substantive changes to the individual options or requirements for selecting the individual options; rather, we would combine current options 1 and 2 into a single option, as follows:

1. Proposed Option 1. Pre-production and Validation (a combination of current option 1, completed registration to submit data, and current option 2, testing and validation);

2. Proposed Option 2. Validated Data Production (current option 3, production).

Eligible hospitals and CAHs must demonstrate their level of active engagement as either proposed Option 1 (pre-production and validation) or proposed Option 2 (validated data production) to fulfill each measure. We invited public comment on these proposed changes to the options for active engagement.

Comment: Many commenters supported the proposal to modify the active engagement options under the Public Health and Clinical Data Exchange Objective.

Response: We thank commenters for their support of our proposal to modify the options of active engagement under the Public Health and Clinical Data Exchange Objective.

Comment: A commenter requested clarification on the consolidation of options 1 and 2 for the levels of active engagement with regard to eligible hospitals and CAHs that have completed registration but not yet begun testing and validation.

Response: The proposed active engagement option 1: Pre-Production and Validation includes both the completion of registration to submit data with the PHA or CDR, as applicable, and being in the process of testing and validation of the electronic submission of data. Upon receiving an invitation from the PHA or CDR to begin testing and validation, the eligible hospital or CAH should begin testing and validation, as we understand the validation process can take some time. If, at any point in the process, an eligible hospital or CAH encounters a lack of readiness on the part of the PHA or CDR, the eligible hospital or CAH could consider whether it could report an exclusion for one or more of the measures associated with the Public Health and Clinical Data Exchange Objective.

Comment: A few commenters expressed concern that eligible hospitals and CAHs are determining their active engagement status without input from the appropriate public health agency. These commenters requested that CMS provide further guidance to define the active engagement option 2 criteria, and identify at what point an eligible hospital or CAH can move from active engagement option 1 to active engagement option 2.

Response: To move from Active Engagement Option 1: Pre-production and Validation, to Active Engagement Option 2: Validated Data Production, the eligible hospital or CAH must finish validation. Validation is an effort to ensure that the data exchanged with a public health agency is high quality and useful, and meets the appropriate HL7 implementation guide standard. Only the PHA or CDR can confirm validation

has been completed and a ''production'' state has been reached.

Comment: Several commenters did not support the proposal, stating that the reduction of levels obscures the necessary granularity of where hospitals are in the onboarding process. The commenters stated that since eligible hospitals and CAHs do not control the onboarding process, and that this varies based on the resources at the public health departments, it is important to distinguish between those who are waiting to begin testing and validation from those who are actively engaged in testing and validation.

Response: CMS does not agree that it is important to differentiate between those who are registered and those who have begun testing and validation. CMS has collaborated with the PHA community and has received comments that PHAs currently do not have any waitlists, and the eligible hospitals or CAHs who register are immediately invited to begin testing and validation. CMS agrees that eligible hospitals and CAHs should not be held accountable for actions outside of their control. However, at this time, registration is no longer a meaningful status, as PHAs are ready to begin testing and validation with those who register right away. CMS is not concerned with the loss of granularity, and we believe that this will facilitate easier reporting from our partners.

Additionally, we do not believe that allowing eligible hospitals and CAHs to remain at the registration stage fulfills the intent of the public health measures. Validation is critical as it ensures that the data from eligible hospitals and CAHs meets the needs of public health for both routine and emergency reporting. This is true across the Electronic Case Reporting measure, the Electronic Reportable Laboratory Result Reporting measure, the Syndromic Surveillance Reporting measure, the Immunization Registry Reporting measure, and in the future, the AUR Surveillance measure. In addition, public health capabilities for onboarding may have been delayed at the state level due to the COVID–19 pandemic. As such, CDC is providing funding for PHAs to improve and modernize their data infrastructure, which will result in more rapid testing and validation.

After consideration of the public comments we received, we are finalizing our proposal to consolidate current options 1 and 2 into a new combined option called Pre-production and Validation and renaming the current option 3 as Validated Data Production beginning with EHR reporting periods in CY 2023. Our goal continues to be that all eligible hospitals and CAHs will be at the Validated Data Production option as successful exchange of data is needed because that is where that data can be utilized to combat current and future PHEs.

(3) Reporting Requirement for Level of Engagement

Although we established the active engagement options, eligible hospitals and CAHs currently are not required to report their level of active engagement for any of the measures associated with the Public Health and Clinical Data Exchange Objective. During the recent COVID–19 PHE, we recognized the importance of public health reporting, as discussed further in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28585 through 28586), and we believe that knowing the level of active engagement that an eligible hospital or CAH selects would provide information on the types of registries and geographic areas with health care providers in the Pre-production and Validation stage. Our goal is for all health care providers nationwide to be at the Validated Data Production stage so that data will be actively flowing and public health threats can be monitored. Therefore, as proposed in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28588), for the Public Health and Clinical Data Exchange Objective, in addition to submitting responses for the required measures and any optional measures an eligible hospital or CAH chooses to report, we proposed to require eligible hospitals and CAHs to submit their level of active engagement, either Pre-production and Validation or Validated Data Production) for each measure they report beginning with the EHR reporting period in CY 2023. We believe that this information regarding the level of active engagement would be helpful as it would enable HHS to identify registries and PHAs which may be having difficulty onboarding eligible hospitals and CAHs and moving them to the Validated Data Production level. If we can identify the PHAs with which eligible hospitals and CAHs are encountering difficulties, we believe we will be able to identify the barriers that prevent them from moving to the Validated Data Production level and work to develop solutions to overcome the barriers.

We invited public comment on the proposal to require submission of the level of active engagement.

Comment: Many commenters supported the proposal to require eligible hospitals and CAHs to report level of active engagement on measures in the Public Health and Clinical Data Exchange Objective. Many commenters cited that bi-directional data exchange is integral to achieve meaningful impacts in health care delivery and the importance of reporting the level of active engagement to promote transparency of active engagement status at a national level.

Response: We thank the commenters for their support of our proposal to require eligible hospitals and CAHs to report their level of active engagement on measures in the Public Health and Clinical Data Exchange Objective. We agree with commenters that bi-directional data exchange is integral in health care delivery.

Comment: A commenter requested that hospitals be required to provide proof from a public health agency of their active engagement status through a letter or other forms of acknowledgement as through HL7 messages and emails indicating confirmation.

Response: At this time, eligible hospitals and CAHs attest to CMS. PHAs have no role in the attestation process. Many eligible hospitals and CAHs request documentation from the PHA to support their active engagement status, which is used in case of an audit by CMS. CMS agrees that this is a best practice. CMS does acknowledge the desire of PHAs to become more engaged in the attestation process for eligible hospitals and CAHs but to date we have not established what that relationship might be. However, eligible hospitals and CAHs will be required to report their level of active engagement for the first time. If CMS learns that there is a mismatch between the active engagement records at PHAs and the active engagement status provided through attestation, CMS may consider making a future change to the attestation process. No change will be made until CMS has more evidence about eligible hospitals' and CAHs' self-reported active engagement status.

Comment: A few commenters did not support the proposal to require reporting the Active Engagement option selected under the Public Health and Clinical Data Exchange Objective and requested this not be required until the technology can facilitate the reporting. Some raised concerns that PHAs may not be able to offer documentation of level of active engagement in a reasonable amount of time to support compliance with a 90-day reporting period. Commenters also recommended active engagement be demonstrated with information provided either by the eligible hospital or CAH, or the PHA, or that CMS incentivize PHAs to turn

around this information in a timely manner. A few commenters requested that CMS provide further guidance illustrating expectations for completion of active engagement options and how eligible hospitals and CAHs can prove their active engagement status. A commenter requested that CMS allow eligible hospitals and CAHs at least one year of stable reporting of public health measures without implementing this active engagement reporting requirement. Many commenters supported an exclusion for situations in which the state or public health department has not declared readiness or lacks resources for timely onboarding.

Response: We acknowledge commenters' concerns regarding our proposal to require eligible hospitals and CAHs to report their level of active engagement for each Public Health and Clinical Data Exchange measure. However, we believe that this information will be extremely valuable to better understand progress with reporting over time and readiness for public health emergencies.

We offer the following examples as ways an eligible hospital or CAH may demonstrate their level of active engagement:

- A dated report or screenshot from CEHRT that documents successful submission to the registry or PHA. The report should include evidence to support that it was generated for that eligible hospital's or CAH's system (for example, identified by CMS certification number [CCN] and eligible hospital or CAH) name or;
- A dated report or screenshot of successful registration or electronic transmission (for example, screenshot from another system, etc.). The report should include evidence to support that it was generated for that eligible hospital or CAH (for example, identified by CMS certification number [CCN] and eligible hospital or CAH name) or;
- A letter or email from a registry or PHA confirming registration.

With respect to the recommendation to include an exclusion, we refer readers to the existing exclusions for each measure within the Public Health and Clinical Data Exchange Objective (See Table IX.H.-07.). For instances when there is an issue with the ability of a PHA or CDR to receive the data in the specific standards required to meet the CEHRT definition or where no PHA has declared readiness to receive data from eligible hospitals or CAHs, there are exclusions available for eligible hospitals and CAHs (42 CFR 495.24 (e)(8)(iii)). While we recognize that there may be variability in ability to quickly test and validate state to state, PHAs have been requiring transmission of electronic laboratory reporting, immunization registry reporting, and syndromic surveillance reporting for many years. To help address the existing variability, CDC is providing funding for PHAs to improve and modernize their data infrastructure, which will result in more rapid testing and validation. In addition, most eligible hospitals and CAHs are successfully reporting these measures.

Comment: A few commenters requested that CMS provide further guidance on whether the previous EHR Incentive Program registration satisfies current program requirements. A few commenters requested that CMS address concerns over lack of vendor readiness. A few commenters requested that CMS provide more clarity on how active engagement status is impacted by eligible hospitals and CAHs that registered with PHAs in the past but will only now be engaging in data exchange with the PHA.

Response: If an eligible hospital or CAH has previously registered and has not received an invitation to proceed to testing and validation, we recommend that they reach out to the PHA to confirm that they remain actively engaged and to discuss their timeline for moving into testing and validation.

After consideration of the public comments we received, we are finalizing our proposal for the Public Health and Clinical Data Exchange Objective to require that in addition to submitting responses for the required measures and any optional measures an eligible hospital or CAH chooses to report, that they submit their level of active engagement, either Option 1: Pre-production and Validation or Option 2: Validated Data Production (as finalized in section H.5.c(2)), for each measure they report beginning with the EHR reporting period in CY 2023.

(4) Changes to the Duration of Active Engagement Options

As discussed in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28588), eligible hospitals and CAHs currently are not required to report their level of active engagement, or advance from one option to the next option within a certain period of time. As we proposed requiring eligible hospitals and CAHs to submit their level of active engagement for each measure they report, we also proposed, beginning with the EHR reporting period in CY 2023, that eligible hospitals and CAHs may spend only one EHR reporting period at the Option 1: Pre-production and Validation level of active engagement per measure, and that they must progress to the Option 2: Validated Data Production level for the next EHR reporting period for which they report a particular measure. For example, under this proposal, if an eligible hospital or CAH submits a level of active engagement at the proposed option 1 level (Pre-production and Validation) for the Syndromic Surveillance Reporting measure for the EHR reporting period in CY 2023, the eligible hospital must report a level of active engagement at the proposed option 2 level (Validated Data Production) for the next EHR reporting period for which it reports the Syndromic Surveillance Reporting measure, or it would fail to satisfy the Public Health and Clinical Data Exchange Objective for its next EHR reporting period. The options for active engagement assume the same PHA or CDR is used by the hospital. In the event an eligible hospital or CAH chooses to switch between one or more CDRs or PHAs, we proposed they would be permitted to spend an additional EHR reporting period at the Option 1: Pre-production and Validation level to assist with onboarding to the new CDR or PHA. As electronic transmission of high-quality data is achieved at the Option 2: Validated Data Production level, we want all eligible hospitals and CAHs to reach this level.

We invited public comments on these proposed changes to the duration of the active engagement options.

Comment: Many commenters supported the proposal to limit the amount of time an eligible hospital or CAH may spend at the pre-production and validation level of active engagement to one EHR reporting period. Many commenters noted the importance of eligible hospitals and CAHs exchanging data with public health agencies, as highlighted by the COVID–19 PHE, as well as how this limit on duration in the pre-production and validation level promotes and incentivizes progress through the levels of active engagement and data exchange.

Response: We thank the commenters for their support of our proposal to limit the amount of time an eligible hospital or CAH may spend in the pre-production and validation level of active engagement. We agree on the importance of data exchange between eligible hospitals and public health agencies and clinical registries, particularly in light of the ongoing COVID–19 PHE, and thus have prioritized efforts to promote data exchange with public health agencies and clinical registries.

Comment: While offering support, several commenters expressed concern

about the readiness of state and local public health agencies and registries to accept production data and urged CMS to implement changes to the duration of active engagement levels in a phased approach or offer exclusions for circumstances that are out of the control of the eligible hospital or CAH.

Response: We appreciate commenters' recommendations regarding including exclusions for when state and local jurisdictions may not be ready or capable of accepting production data, or are slow to onboard, and refer readers to the existing exclusions for each Public Health and Clinical Data Exchange measure. For instance, when there is an issue with the ability of a PHA or CDR to receive the data in the specific standards required to meet the CEHRT definition or where no PHA has declared readiness to receive data from eligible hospitals or CAHs, there are exclusions available for eligible hospitals and CAHs (42 CFR 495.24 (e)(8)(iii)).

Comment: Many commenters did not support the proposal to limit the duration of Pre-production and Validation level of active engagement to one EHR reporting period citing that progression out of this level is often not under hospital control and depends on the resources available from a given PHA and their technical capabilities and timeliness in communications. A few commenters recommended adding an exclusion to allow for when public health agencies have limited resources to validate and onboard. A few commenters suggested this could lead to rushed validation and poor data quality, particularly with a move to a 180-day EHR reporting period. A few commenters stated concerns that EHR vendors may not be ready for testing in 2023 or 2024 and suggested CMS allow hospitals multiple reporting years under the Pre-Production and Validation level. A commenter requested that CMS allow hospitals at least one year of stable reporting of public health measures without implementing this active engagement reporting requirement. Another commenter did not support the proposal because the commenter stated CMS lacks a baseline as it has never collected eligible hospitals or CAHs active engagement level.

Response: We acknowledge commenters' concerns regarding the lack of control that eligible hospitals or CAHs may have when moving through the levels of active engagement. In particular, we recognize that an eligible hospital's or CAH's successful progression through the levels of active engagement is partially dependent on the readiness, resources, and technical capabilities of the PHAs to which it reports. We further recognize that public health capacity remains somewhat variable and constrained—particularly as PHAs continue to direct substantial resources to the COVID–19 PHE response efforts. Accordingly, we agree with the commenter who suggested allowing at least one year of stable reporting of public health measures before instituting limits on the length of time eligible hospitals and CAHs can spend in the pre-production and validation level of active engagement.

For these reasons, we are delaying the implementation of this requirement by one year, such that it will apply beginning with the EHR reporting period in CY 2024. This delay balances the urgent need to move eligible hospitals and CAHs into data production with the need identified by the commenters for additional time for public health agencies and health care providers to prepare for this change. Without this requirement, facilities can linger in registration, testing or validation for years, which provides little benefit to the public in a PHE or to address health threats. Moreover, existing data PHAs have shared with CDC indicate that registration, testing and validation completion rates are already fairly rapid—typically less than 3 months in many cases. Admittedly, there are exceptions—in particular, the validation stage can take longer, as it depends on PHA readiness, as well as the quality of the data a provider is sending and the CEHRT product being used. However, we anticipate that testing and validation cycle times will continue to shrink over the next year as public health agencies use CDC funding to modernize their data infrastructures.

Nonetheless, we appreciate and agree with commenters' recommendations regarding the need for exclusions when state and local jurisdictions are not ready or capable of accepting production data, or are slow to onboard facilities (for example, an eligible hospital is unable to complete testing and validation in a single EHR reporting period because the PHA has a backlog of validation requests). We believe an eligible hospital or CAH could consider whether the existing exclusions for each measure associated with the Public Health and Clinical Data Exchange Objective could be claimed in these cases and refer readers to these exclusions at 42 CFR 495.24 (e)(8)(iii). However, we will continue to examine this issue in collaboration with CDC and, if additional exclusions are warranted, we may address them and any other changes warranted in future rulemaking.

Comment: A few commenters had questions regarding allowances for when hospitals need to migrate from testing/validation to production and back if the public health department performs systems updates, for unforeseen outages, or if hospitals move to a different vendor and their testing does not line up well to be in production during their next reporting period. A few commenters expressed concern over the lack of control hospitals have in moving from one level to another, or in receiving documentation that proves they have achieved a certain level of active engagement. A commenter requested that CMS work with other agencies to support state organizations in providing the technical support necessary and suggested including an exclusion for situations in which a state has limited capacity for engagement.

Response: We appreciate commenters' feedback on the proposal to limit the time spent in the Pre-production and Validation level of active engagement to one EHR reporting period. With respect to the concern about moving to different vendors, PHAs, or CDRs, the options for active engagement assume the same PHA or CDR is used by the hospital. In the event an eligible hospital or CAH chooses to switch between one or more CDRs or PHAs, we proposed they would be permitted to spend an additional EHR reporting period at the Pre-production and Validation level to assist with onboarding to the new CDR or PHA (87 FR 28588). As we have previously stated, we acknowledge commenters' concerns regarding the lack of control that eligible hospitals or CAHs may have when moving through the levels of active engagement and the dependency on resources and technical capabilities at public health departments and registries. We refer readers to the existing exclusions for each Public Health and Clinical Data Exchange measure. For instances when there is an issue with the ability of a PHA or CDR to receive the data in the specific standards required to meet the CEHRT definition or where no PHA has declared readiness to receive data from eligible hospitals or CAHs, there are exclusions available for eligible hospitals and CAHs (42 CFR 495.24 (e)(8)(iii)).

Comment: A commenter expressed concern for smaller hospitals who may need more time to progress to production and stated that establishing a time limit should be based on a solid understanding of the barriers hospitals face to moving between levels of active engagement. A commenter recommended that CMS incentivize

health care organizations (HCOs) and vendors to continue to engage with PHAs once initial validated production data are flowing to ensure that accurate, complete, and timely data for reportable conditions are available to PHAs as required by jurisdictional laws and regulations and for effective public health response activities. A commenter recommended CMS create a list of states where certain types of public health and clinical data exchange is immature to identify potential scoring issues.

Response: We appreciate commenters' feedback regarding the impact of this policy on smaller hospitals and recommendations to provide incentives for continued engagement with PHAs as well as developing resources to identify where public health and clinical data exchange is immature. We will monitor implementation and consider future changes if necessary.

Comment: Several commenters noted that local and state health departments have limitations and offer variable levels of technical capacity to support this type of data exchange and that CMS should follow and support development efforts at the state and local levels of PHAs and registries.

Response: We agree with the importance of ensuring health care providers and PHAs have the ability to set up data exchange within a reasonable timeframe. Our goal is that all parties continue to move towards validated production, which will prepare the nation for a more effective response to public health emergencies. As we discussed above, given the many challenges identified in the comments, we are delaying the implementation of this requirement until the beginning of the EHR reporting period in CY 2024.

Additionally, among the core objectives of CDC's DMI are seamless reporting to public health agencies and interoperability among core public health surveillance strategies. As such, CDC is providing funding to public health agencies to improve and modernize their data infrastructure. We are working closely with CDC to coordinate healthcare program requirements and public health modernization investments to foster co-maturation and readiness for bi-directional data exchange.

After consideration of the public comments we received, we are finalizing the proposals to limit the amount of time an eligible hospital or CAH may spend at the pre-production and validation level of active engagement to one EHR reporting period with the modification that this limitation will apply beginning with the EHR reporting period in CY 2024.

(5) Public Health Reporting and Information Blocking

The ONC 21st Century Cures Act final rule (85 FR 25642) implemented policies related to information blocking as authorized under section 4004 of the 21st Century Cures Act, as discussed further in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28588 through 28589).

6. Changes to Scoring Methodology for the EHR Reporting Period in CY 2023

In the FY 2019 IPPS/LTCH PPS final rule (83 FR 41636 through 41645), we adopted a new performance-based scoring methodology for eligible hospitals and CAHs attesting under the Medicare Promoting Interoperability Program beginning with the EHR reporting period in CY 2019, which included a minimum scoring threshold of a total score of 50 points or more which eligible hospitals and CAHs must meet to satisfy the requirement to report on the objectives and measures of meaningful use under 42 CFR 495.24. In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45491 through 45492), we increased the minimum scoring threshold from 50 points to 60 points beginning with the EHR reporting period in CY 2022. As shown in Table IX.H.-03, the points associated with the required measures sum to 100 points, and the optional measures may add additional bonus points. The scores for each of the measures are added together to calculate a total score of up to 100 possible points for each eligible hospital or CAH (83 FR 41636 through 41645). We note in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28589), we erroneously stated that we calculate a total score of up to 105 possible points, but we want to clarify that we cap the number of points at 100.

Table IX.H.–03 reflects the objectives and measures for the EHR reporting period in CY 2022 and was included in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45492).

TABLE IX.H.-03: PERFORMANCE-BASED SCORING METHODOLOGY EHR REPORTING PERIOD IN CY 2022

Objective	Measure	Maximum Points
Electronic Prescribing	e-Prescribing	10 Points
	Bonus: Query of PDMP	10 points (*bonus*)*
Health Information Exchange	Support Electronic Referral Loops by Sending Health Information	20 points
	Support Electronic Referral Loops by Receiving and Reconciling Health Information	20 points
	-OR-	
	Health Information Exchange Bi-Directional Exchange*	40 points*
Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information	40 points
Public Health and Clinical Data Exchange	Report the following four measures: * • Syndromic Surveillance Reporting • Immunization Registry Reporting • Electronic Case Reporting • Electronic Reportable Laboratory Result Reporting	10 points
	Report one of the following measures: • Public Health Registry Reporting • Clinical Data Registry Reporting	5 points (*bonus*)*

Notes: The Security Risk Analysis measure, SAFER Guides measure, and attestations required by section 106(b)(2)(B) of MACRA are required, but will not be scored. Electronic clinical quality measures (eCQM) measures are required, but will not be scored.
*Signifies a final policy adopted in the FY 2022 IPPS/LTCH PPS final rule.

In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28590), we noted that in proposing to make the Query of PDMP measure required, we would retain the 10 points associated with it, which are allocated as bonus points for the EHR reporting period in CY 2022. If finalized, we proposed to reduce the points associated with the Health Information Exchange Objective measures from the current 40 points to 30 points beginning with the CY 2023 EHR reporting period. The Public Health and Clinical Data Exchange Objective, with its current four required measures, is currently worth 10 points. Despite increasing the number of required measures from two to four to make the objective more effective in promoting public health data electronic exchange, the total number of points did not change between CY 2021 and CY 2022. We believe that increasing the point value of the Public Health and Clinical Data Exchange Objective would create a more meaningful incentive for eligible hospitals and CAHs to engage in the electronic reporting of public health information and recognize the importance of public health systems affirmed by the COVID–19 pandemic. Increasing the point value would make the Public Health and Clinical Data Exchange Objective a more central piece of the Promoting Interoperability Program, and better incentivize eligible hospitals and CAHs to implement these essential public health data exchange capabilities. Without adequate incentives, there remains a risk that eligible hospitals and CAHs will simply not prioritize implementing these capabilities, which are essential to ongoing efforts to address COVID–19 and will be indispensable for responding to future public health threats and emergencies. Increasing the point value would more appropriately incentivize eligible hospitals and CAHs to engage in the electronic reporting of public health information, and would align the value of the objective with the objective's importance and the effort necessary to meet the required measures.

Thus, we proposed to increase the points allocated to the Public Health and Clinical Data Exchange Objective from 10 to 25 points to better align with the true value of this objective beginning with the EHR reporting period in CY 2023. This proposal was independent of our proposal to add the AUR Surveillance measure to the objective, and we considered increasing the points regardless of whether the proposal to add the AUR Surveillance measure to the objective was finalized. We believe assigning 25 points to the objective reflects the importance of comprehensive, nationwide health care data exchange between eligible hospitals and CAHs and public health agencies. Nationwide health care data exchange would provide immense value to the public by improving the speed and effectiveness of public health responses, as well as to eligible hospitals and CAHs, since better public health response reduces pressure on hospitals, which can be overwhelmed in a public health crisis. To balance the increase in the points associated with the Public Health and Clinical Data Exchange Objective, we also proposed to reduce the points associated with the Provide Patients Electronic Access to Their Health Information measure from the current 40 points to 25 points beginning with the EHR reporting period in CY 2023.

We included Table IX.H.–04. in the FY 2023 IPPS/LTCH PPS proposed rule, which reflects the objectives, measures, and maximum points available for the EHR reporting period in CY 2023, if the proposals discussed (87 FR 28598) are finalized.

TABLE IX.H.-04: PROPOSED PERFORMANCE-BASED SCORING METHODOLOGY FOR EHR REPORTING PERIOD IN CY 2023

Objective	Measure	Maximum Points	Required/Optional
Electronic Prescribing	e-Prescribing	10 points	Required
	Query of PDMP*	10 points*	Required
Health Information Exchange	Support Electronic Referral Loops by Sending Health Information	15 points*	Required (eligible hospital or CAHs choice of one of the three reporting options)
	Support Electronic Referral Loops by Receiving and Reconciling Health Information	15 points*	
	-OR-		
	Health Information Exchange Bi-Directional Exchange	30 points*	
	-OR-		
	Enabling Exchange under TEFCA*	30 points*	
Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information	25 points*	Required
Public Health and Clinical Data Exchange	Report the following five measures:* • Syndromic Surveillance Reporting • Immunization Registry Reporting • Electronic Case Reporting • Electronic Reportable Laboratory Result Reporting • AUR Surveillance Reporting*	25 points*	Required
	Report one of the following measures: • Public Health Registry Reporting • Clinical Data Registry Reporting	5 points (*bonus*)	Optional

Notes: The Security Risk Analysis measure, SAFER Guides measure, and attestations required by section 106(b)(2)(B) of MACRA are required, but will not be scored. eCQM measures are required, but will not be scored.

*Signifies a proposal made in the FY 2023 IPPS/LTCH PPS proposed rule.

The maximum points available in Table [IX.H.–04.] do not include the points that would be redistributed in the event an exclusion is claimed. For ease of reference, in the FY 2023 IPPS/LTCH PPS proposed rule, we included Table [IX.H.–054 at 87 FR 28592] which shows the point redistribution among the objectives and measures for the EHR reporting period in CY 2023 in the event an eligible hospital or CAH claims an exclusion, if the proposals made in the FY 2023 IPPS/LTCH PPS proposed rule are finalized.

TABLE IX.H.-05.: PROPOSED EXCLUSION REDISTRIBITION FOR EHR REPORTING PERIOD IN CY 2023

Objective	Measure	Redistribution if exclusion is claimed
Electronic Prescribing	e-Prescribing	10 points to HIE Objective
	Query of PDMP*	10 points to e-Prescribing measure
Health Information Exchange	Support Electronic Referral Loops by Sending Health Information	No exclusion
	Support Electronic Referral Loops by Receiving and Reconciling Health Information	No exclusion
	-OR-	
	Health Information Exchange Bi-Directional Exchange	No exclusion
	-OR-	
	Enabling Exchange under TEFCA*	No exclusion
Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information	No exclusion
Public Health and Clinical Data Exchange	Report the following five measures:* • Syndromic Surveillance Reporting • Immunization Registry Reporting • Electronic Case Reporting • Electronic Reportable Laboratory Result Reporting • AUR Surveillance Reporting*	If an exclusion is claimed for each of the five measures, 25 points are redistributed to the Provide Patients Electronic Access to their Health Information measure

Notes: The Security Risk Analysis measure, SAFER Guides measure, and attestations required by section 106(b)(2)(B) of MACRA are required, but will not be scored. eCQM measures are required, but will not be scored.

*Signifies a proposal made in the FY 2023 IPPS/LTCH PPS proposed rule.

We invited public comment on these proposed changes to our scoring methodology.

Comment: A few commenters expressed support for the proposed changes to the scoring methodology. A commenter expressed support for increasing the points associated with the Electronic Prescribing Objective from 10 to 20 to further incentivize electronic prescribing. A few commenters supported the proposed reduction in points of the HIE Objective from 40 to 30 points. Many commenters supported the adjustment of the Public Health and Clinical Data Exchange Objective from 10 to 25 points. Several agreed with the importance of incentivizing efforts related to the COVID–19 pandemic.

Response: We thank the commenters for their support.

Comment: A few commenters did not support our proposal to reduce the number of points assigned to the HIE Objective citing that the current point allocation reflects the push for the continued adoption and expansion of clinical data exchange. A few commenters did not support the point reduction of the Provider to Patient Exchange Objective citing that such a reduction would signal that CMS devalues the exchange of data between patients and health care providers. A few commenters did not support our proposal to increase the total score of the Public Health and Clinical Data Exchange Objective citing the lack of readiness of, and variability among, states and public health agencies to receive and process data.

Response: We thank commenters for their concerns and feedback. Point changes across objectives reflect the importance of shifting priorities, especially during the COVID–19 pandemic. Thus we are reducing the points associated with the Provider to Patient Exchange Objective so we can increase the points associated with the Public Health and Clinical Data Exchange Objective due to the importance of public health data during PHEs. The reduction to the HIE Objective was to accommodate the requirement of the Query of PDMP measure which increased the points associated with the Electronic Prescribing Objective.

Comment: A commenter recommended increasing the number of points that hospitals can earn to accommodate the necessary point increases.

Response: While we appreciate this suggestion, we believe that increasing the number of points may inflate scores and would not reflect the priorities that are conveyed through the reallocation of points.

After consideration of the public comments we received, we are finalizing our proposals for changes to the scoring methodology for the EHR reporting period in CY 2023 without modification.

7. Public Reporting of Medicare Promoting Interoperability Program Data

Section 1886(n)(4)(B) of the Act requires the Secretary to post in an easily understandable format a list of the names and other relevant data, as determined appropriate by the Secretary, of eligible hospitals and CAHs who are meaningful EHR users under the Medicare FFS program, on a CMS website. In addition, that section requires the Secretary to ensure that an eligible hospital or CAH has the opportunity to review the other relevant data that are to be made public with respect to the eligible hospital or CAH prior to such data being made public.

As the Medicare Promoting Interoperability Program has evolved over the years, we have continued to expand the scope of relevant data points across the Medicare Promoting Interoperability Program. For example, we post information on a CMS website available to the public regarding those eligible hospitals and CAHs who attest to limiting or restricting the compatibility or interoperability of CEHRT under 42 CFR 495.40(b)(2)(i)(I), as established in the 2020 Patient Access and Interoperability final rule (85 FR 25578 through 25580). Additionally, in alignment with the Hospital IQR Program, we finalized proposals to begin publicly reporting eCQM data beginning with the CY 2021 reporting period, and subsequent years (85 FR 58975 through 58976).

To date, we have not publicly reported eligible hospitals' and CAHs' total scores for the Medicare Promoting Interoperability Program. We calculate a total score of up to 100 possible points by adding together the points earned for each required measure and any optional measures reported by an eligible hospital or CAH (83 FR 41636 through 41645). In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28592 through 28593), we proposed to post the eligible hospital's or CAH's actual score, up to 105 possible points, so that consumers can clearly see the high performing hospitals. We wish to clarify in this final rule that although we cap the total score at 100 points, the actual score includes the addition of any bonus points earned by the eligible hospital or CAH that could total up to 105 possible points. We believe an eligible hospital's or CAH's actual score for the Medicare Promoting Interoperability Program measures, which includes any bonus points earned, could constitute other relevant data because it would help consumers make informed decisions regarding their health care team, such as knowing whether and to what extent their health care provider is involved in health information exchange or providing patients with electronic access to their health information. We believe that publicly reporting additional Medicare Promoting Interoperability Program data demonstrates our commitment to providing data to patients, consumers, and health care providers, to assist them in their decision-making; promoting enhanced health information exchange processes across eligible hospitals and CAHs; and continually aligning processes and policies with the Hospital IQR Program and the MIPS Promoting Interoperability performance category. For example, for the MIPS Promoting Interoperability performance category, individual measure scores and the total performance score across all measures reported by eligible clinicians are posted on a CMS website available to the public.

Therefore, in alignment with our goals to encourage interoperability and transparency, in the FY 2023 IPPS/LTCH PPS proposed rule, we proposed to publicly report certain Medicare Promoting Interoperability Program data submitted by eligible hospitals and CAHs beginning with the EHR reporting period in CY 2023 (87 FR 28592 through 28593). In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28592 through 28593), we used the term ''total score'' within the public reporting proposals and wish to clarify that we were referring to the ''actual score'' that includes bonus points that could add up to 105 possible points. The language in this final rule has been updated to reflect the distinction and clarification. Specifically, as a first step, we proposed to publish on a CMS website available to the public, the actual score of up to 105 points for each eligible hospital and CAH, and the CMS EHR certification ID that represents the CEHRT used by the eligible hospital or CAH, beginning with the scores and CMS EHR certification IDs for the EHR reporting period in CY 2023. We did not propose to publish individual measure scores at this time, but we will continue to evaluate that possibility for future rulemaking. For example, under our proposal, if an eligible hospital scored a total of 75 points for the EHR reporting period in CY 2023, we would publish the score of 75 points, and not the number of points earned for each individual measure within the score.

We stated that if our proposal is finalized, the actual score and CMS EHR certification ID data could be made available to the public as early as the Fall of CY 2024, or as soon as operationally feasible. In addition, as required by section 1886(n)(4)(B) of the Act, we proposed that eligible hospitals and CAHs would have the opportunity to review their data that we would publish, during a 30-day preview period before the data are made public. We proposed to follow our current policy and operational process that eligible hospitals and CAHs are already familiar with for the Hospital IQR Program and use the Hospital Quality Reporting (HQR) system (formerly, the QualityNet Secure Portal) for eligible hospitals and CAHs to access and review their Medicare Promoting Interoperability Program data during a 30-day preview period before publication. We proposed to post the Medicare Promoting Interoperability Program data using the Compare tool hosted by Health and Human Services currently available at *https://www.medicare.gov/care-compare*.

We invited public comments on these proposals. Specifically, we are interested in comments that provide information on how these proposals might affect existing incentives and burdens under the Medicare Promoting Interoperability Program, as well as the benefit and utility of such data being publicly available. We also sought comments on which Medicare Promoting Interoperability Program data points to publish in future years, including specific objective or measure performance rates.

Comment: A few commenters expressed general support for our proposal to publicly report Medicare Promoting Interoperability Program actual scores because they believe it will promote data transparency and help consumers make informed decisions.

Response: We thank commenters for their support of our proposal and agree that it will help promote data transparency and help consumers make informed decisions.

Comment: A few commenters noted their support for allowing a 30-day review and dispute period prior to publicly posting data. A commenter recommended CMS notify eligible hospitals and CAHs prior to the 30-day review, and another commenter suggested that CMS not publish data until any concerns or disputes that arise during the 30-day review are resolved.

Response: We appreciate commenters' feedback regarding CMS notifying eligible hospitals and CAHs prior to the 30-day review period, and the request that CMS address and resolve any disputes prior to publication. As stated previously, we proposed to follow our current policy and operational process for the 30-day review period that eligible hospitals and CAHs are already

familiar with for the Hospital IQR Program. We proposed to use the Hospital Quality Reporting (HQR) system (formerly, the QualityNet Secure Portal) for eligible hospitals and CAHs to access and review their Medicare Promoting Interoperability Program data during a 30-day preview period before publication.

Comment: Many commenters did not support the proposal to publicly report data stating they do not believe the data would be of interest, hold meaning, or be understandable to consumers; thus, it would not help consumers make informed health care decisions. A few commenters cited that given the complexity of the Medicare Promoting Interoperability Program, the actual score may not accurately reflect eligible hospitals' or CAHs' levels of interoperability, such as supporting patient access to health information. A commenter did not support the proposal to publicly report the EHR Certification ID, stating that health IT vendors do not have control over which functionality eligible hospitals or CAHs choose to implement, therefore this information should not be publicly reported.

Response: We appreciate commenters' feedback and concerns regarding whether the Medicare Promoting Interoperability Program data would be of interest, meaningful, or understandable to consumers, especially as a tool used to help make informed decisions about their health care. As we have previously stated, we believe public reporting demonstrates our commitment to transparency and providing data to consumers, and that these data would help consumers make informed decisions regarding their health care team. This would extend to knowing whether, and to what extent, their health care provider is involved in health information exchange or providing patients with electronic access to their health information. We believe these data depict levels of health IT adoption and functionality across eligible hospitals and CAHs. Additionally, we believe it is important to align policies across CMS programs, and this proposal to publicly report Medicare Promoting Interoperability Program data for eligible hospitals and CAHs aligns with the current policy for the MIPS Promoting Interoperability performance category, wherein individual measure scores and the total performance score across all measures reported by eligible clinicians are posted on a CMS website available to the public.

Comment: Several commenters provided recommendations for CMS to consider if the proposal to publicly report Medicare Promoting Interoperability Program data is finalized. These recommendations include providing explanations of what the Medicare Promoting Interoperability Program score indicates, what the EHR Certification ID is, and the process for searching for the information within the CHLP site. This would allow consumers to understand and determine how the actual score is calculated, emphasizing the importance of presenting data in a format that is both valuable and understandable to multiple audiences. A few commenters recommended CMS include the data in the CMS Provider Data Catalog so it is available to researchers and others seeking to understand the current variability and performance within the Medicare Promoting Interoperability Program. A commenter suggested implementing a ''star rating'' program based on national benchmarks to provide more meaningful information to patients and another commenter urged CMS to ensure any publicly reported data will not have unintended impacts on health care providers or the health care system. A few commenters recommended aligning with the Hospital IQR Program's policy for publicly reporting performance data to ensure information is easily understood. A commenter recommended, if CMS finalizes the proposal, to publish points available and points earned along with the yes and no attestations for measures within the Medicare Promoting Interoperability Program.

Response: We appreciate commenters' recommendations to include explanations of what the Medicare Promoting Interoperability score indicates, as well as recommendations for the specific data points to publish in the future. We also appreciate commenters' recommendations to align with the Hospital IQR Program's policy for publicly reporting. As we have previously stated, we proposed to publicly report these data to align with the Hospital IQR Program and the MIPS Promoting Interoperability performance category public reporting policies. We also appreciate the recommendation to include a key for consumers alongside the publicly reported data allowing consumers to better understand the data. We may consider this feedback in future rulemaking.

After consideration of the public comments we received, we are finalizing our proposal to publicly report certain Medicare Promoting Interoperability program data submitted by eligible hospitals and CAHs beginning with the EHR reporting period in CY 2023. We are finalizing our proposal to publish, on a CMS website available to the public, the actual score of up to 105 points for each eligible hospital and CAH, and the CMS EHR certification ID that represents the CEHRT used by the eligible hospital or CAH, beginning with the EHR reporting period in CY 2023. Additionally, and as required by section 1886(n)(4)(B) of the Act, we are finalizing our proposal that eligible hospitals and CAHs would have the opportunity to review their data that we would publish, during a 30-day preview period before the data are made public. We finalized our proposal to follow our current policy and operational process that eligible hospitals are already familiar with for the Hospital IQR Program and use the Hospital Quality Reporting (HQR) system (formerly, the QualityNet Secure Portal) for eligible hospitals and CAHs to access and review their Medicare Promoting Interoperability Program data during a 30-day preview period before publication. We are also finalizing our proposal to post the Medicare Promoting Interoperability Program data using the Compare tool hosted by Health and Human Services currently available at: *https://www.medicare.gov/care-compare*.

8. Modifications and Additions to the Regulatory Text

In the FY 2019 IPPS/LTCH PPS final rule (83 FR 41636 through 41668), we finalized the objectives, measures, exclusion criteria, and scoring methodology for eligible hospitals and CAHs attesting under the Medicare Promoting Interoperability Program beginning with the EHR reporting period in CY 2019 and codified these policies in paragraph (e) under 42 CFR 495.24. We have updated the regulatory text to reflect policy changes in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42616), the FY 2021 IPPS/LTCH PPS final rule (85 FR 59026), and the FY 2022 IPPS/LTCH PPS final rule (86 FR 45522).

We note that historically, the objectives, measures, exclusion criteria, and associated scoring methodology for the Medicare Promoting Interoperability Program have been included in both the preamble and associated regulatory text under 42 CFR part 495 (see, for example, the Medicare and Medicaid EHR Incentive Programs Stage 1 final rule (75 FR 44314)). We also note that many CMS quality reporting and performance-based programs, including, but not limited to, the Hospital VBP Program, Hospital IQR Program, the End-Stage Renal Disease Quality Incentive Program (ESRD QIP), and Quality Payment Program/MIPS, do not

include the text of the measures (also referred to as the measure specifications) adopted for those programs in the Code of Federal Regulations. Instead, the measure specifications generally are included in the rulemaking preamble or maintained by measure stewards outside of CMS and referenced in the preamble. For example, the specifications for the objectives and measures for the Promoting Interoperability performance category of MIPS are not included in the regulatory text for the program under 42 CFR part 414 and instead appear in the preamble only (for example, see CY 2022 PFS final rule (86 FR 65466 through 65485)).

We believe that aligning with the approach taken by other CMS programs to include measures only in the preamble would simplify the Medicare Promoting Interoperability Program and minimize confusion by ensuring consistency across similar CMS programs. We also believe taking this approach for the Medicare Promoting Interoperability Program would reduce burden on regulated parties, CMS, and the general public both during and outside of the rulemaking process. Ensuring the objectives and measures are described consistently in the preamble and regulation text can involve significant effort in terms of time and resources, and inconsistency has the potential to create confusion for regulated parties and the general public. For these reasons, we proposed to remove the text of the objectives and measures for the Medicare Promoting Interoperability Program from paragraph (e) under 42 CFR 495.24 beginning in CY 2023 (87 FR 28593 through 28594). We noted that this proposal does not include any changes in policy for the Medicare Promoting Interoperability Program, including changes to the objectives and measures (87 FR 285593). We referred readers to the proposed changes in policies related to objectives and measures in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28579 through 28581). We also emphasized that this proposal does not change our view that the objectives and measures are rules intended to bind regulated parties, nor does it change our intention to enforce the objectives and measures. Specifically, we proposed to modify the introductory paragraph to 42 CFR 495.24 and paragraph (e) and to establish a new paragraph (f), under 42 CFR 495.24 as described in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28593 through 28594). In the event that our proposals are not finalized, we proposed that we would update the regulatory text to reflect those policy changes to the objectives and measures in this final rule.

TABLE IX.H.-06: PROPOSED MODIFICATIONS AND ADDITIONS TO THE REGULATORY TEXT UNDER 42 CFR 495.24

Objectives and Measures	Regulatory Text Impacted	Proposed Regulatory Text Modifications and Additions
§ 495.24 Stage 3 meaningful use objectives and measures for EPs, eligible hospitals and CAHs for 2019 and subsequent years	§ 495.24 –(Introductory text)	Modification--To remove "for 2019 and subsequent years" and add "for 2019 through 2022. Addition—Add the following sentence to the end of the introductory paragraph: "The criteria specified in paragraph (f) of this section are applicable for eligible hospitals and CAHs attesting to CMS for 2023 and subsequent years."
Stage 3 objectives and measures for eligible hospitals and CAHs attesting to CMS for 2019 and subsequent years	§ 495.24(e) – (Heading)	Modification--In paragraph heading: delete "for 2019 and subsequent years" and to add "for 2019 through 2022."
General rule	§ 495.24(e)(1)(i)(C)	Modification--Delete "In 2022 and subsequent years, earn" and to add "In 2022, earn" at § 495.24(e)(1)(i)(C).
Protect Patient Health Information	§ 495.24(e)(4)(ii)	Modification--Remove "In 2022 and subsequent years" and to add "In 2022" at § 495.24(e)(4)(ii).
Electronic Prescribing	§ 495.24(e)(5)(ii)(B)*	Modification--Delete "In 2020 and subsequent years" and to add "In 2020 through 2022" at § 495.24(e)(5)(ii)(B).
Electronic Prescribing	§ 495.24(e)(5)(iii)(A)*	Modification--Delete "in CY 2019 and subsequent years" and to add "in CY 2019 through CY 2022".
Electronic Prescribing	§ 495.24(e)(5)(v)*	Modification--Delete "Beginning with the EHR reporting period in CY 2019" and to add "For the EHR reporting periods in CY 2019 through CY 2022".
Provider to Patient Exchange	§ 495.24(e)(7)(ii)	Modification--Delete "beginning in CY 2019" and to add "for CY 2019 through CY 2022." at § 495.24(e)(7)(ii).
Public Health and Clinical Data Exchange	§ 495.24(e)(8)	Modification--Delete "For CY 2022 and subsequent years" and to add "For CY 2022" at § 495.24(e)(8)(ii) introductory text; (e)(8)(ii)(A); (e)(8)(iii) introductory text; (e)(8)(iii)(A)(*2*); (e)(8)(iii)(D)(*2*); and (e)(8)(iii)(E)(*2*).
Stage 3 objectives and measures for eligible hospitals and CAHs attesting to CMS for 2023 and subsequent years	§ 495.24(f) –	Addition-- Adds new paragraph (f) that would set forth the Stage 3 objectives and measures for eligible hospitals and CAHs attesting to CMS for 2023 and subsequent years. (See § 495.24(f) of the regulations text for the proposed requirements.)

* The FY 2023 IPPS/LTCH PPS proposed rule inadvertently included an incorrect numerical reference that has been corrected in this table.

We invited public comment on our proposed modifications and additions to the regulatory text at 42 CFR 495.24 beginning in CY 2023.

We received no comments on this proposal, and for the reasons stated in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28593 through 28594), we are finalizing our proposal without modification.

9. Overview of Objectives and Measures for the Medicare Promoting Interoperability Program for the EHR Reporting Period in CY 2023

For ease of reference, Table [IX.H.-07.] lists the objectives and measures for the Medicare Promoting Interoperability Program for the EHR reporting period in CY 2023 as revised to reflect the final policies established in this final rule. Due to our modifications to the regulatory text at 42 CFR 495.24(e) (described in section [IX.H.8.] of the preamble of this final rule), we are adding a column to Table [IX.H.-07.] indicating whether the measures that count unique patients or actions may be calculated by reviewing only the actions for patients whose records are maintained using CEHRT or must be calculated by reviewing all patient records, which is intended to reflect the

policy codified at 42 CFR 495.24(e)(3). Table [IX.H.-08.] lists the 2015 Edition certification criteria required to meet the objectives and measures.

TABLE IX.H.-07.: SUMMARY OF OBJECTIVES AND MEASURES FOR THE MEDICARE PROMOTING INTEROPERABILITY PROGRAM FOR THE EHR REPORTING PERIOD IN CY 2023

Objective	Measure	Numerator	Denominator	Exclusion	Calculation Considerations Related to Counting Unique Patients or Actions
Electronic Prescribing	e-Prescribing:* At least one hospital discharge medication order for permissible prescriptions (for new and changed prescriptions) is queried for a drug formulary and transmitted electronically using certified electronic health record technology (CEHRT).	The number of prescriptions in the denominator generated, queried for a drug formulary, and transmitted electronically.	The number of new or changed prescriptions written for drugs requiring a prescription in order to be dispensed other than controlled substances for patients discharged during the EHR reporting period.	Any eligible hospital or CAH that does not have an internal pharmacy that can accept electronic prescriptions and there are no pharmacies that accept electronic prescriptions within 10 miles at the start of their EHR reporting period.	Measure may be calculated by reviewing only actions for patients whose records are maintained using CEHRT for which sufficient data were entered in the CEHRT to allow the record to be saved and not rejected due to incomplete data.
Electronic Prescribing	Query of Prescription Drug Monitoring Program (PDMP):* For at least one Schedule II opioid or Schedule III or IV drug electronically prescribed using CEHRT during the EHR reporting period, the eligible hospital or CAH uses data from CEHRT to conduct a query of a PDMP for prescription drug history.	N/A (measure is Y/N)	N/A (measure is Y/N)	Any eligible hospital or CAH that does not have an internal pharmacy that can accept electronic prescriptions for controlled substances and is not located within 10 miles of any pharmacy that accepts electronic prescriptions for controlled substances at the start of their EHR reporting period. Any eligible hospital or CAH that could not report on this measure in accordance with applicable law.	Measure may be calculated by reviewing only actions for patients whose records are maintained using CEHRT for which sufficient data were entered in the CEHRT to allow the record to be saved and not rejected due to incomplete data.
Health Information Exchange	Support Electronic Referral Loops by	Number of transitions of care and referrals in the denominator	Number of transitions of care and referrals during the EHR reporting	N/A	Measure may be calculated by reviewing only

	Sending Health Information: For at least one transition of care or referral, the eligible hospital or CAII that transitions or refers its patient to another setting of care or provider of care: (1) Creates a summary of care record using CEHRT; and (2) Electronically exchanges the summary of care record.	where a summary of care record was created using CEHRT and exchanged electronically.	period for which the eligible hospital or CAH inpatient or emergency department (POS 21 or 23) was the transitioning or referring provider.		actions for patients whose records are maintained using CEHRT for which sufficient data were entered in the CEHRT to allow the record to be saved and not rejected due to incomplete data.
Health Information Exchange	Support Electronic Referral Loops by Receiving and Reconciling Health Information: For at least one electronic summary of care record received using CEHRT for patient encounters during the EHR reporting period for which an eligible hospital or CAH was the receiving party of a transition of care or referral, or for patient encounters during the EHR reporting period in which the eligible hospital or CAH has never before encountered the patient, the eligible hospital or CAH conducts clinical information reconciliation for medication, medication allergy, and current problem list using CEHRT.	Number of electronic summary of care records in the denominator for which clinical information reconciliation is completed using CEHRT for the following three clinical information sets: (1) Medication – Review of the patient's medication, including the name, dosage, frequency, and route of each medication; (2) Medication Allergy – Review of the patient's known medication allergies; and (3) Current Problem List – Review of the patient's current and active diagnoses.	Number of electronic summary of care records received using certified electronic health record technology (CEHRT) for patient encounters during the EHR reporting period for which an eligible hospital or CAH was the reconciling party of a transition of care or referral, and for patient encounters during the EHR reporting period in which the eligible hospital or CAH has never before encountered the patient.	N/A	Measure may be calculated by reviewing only actions for patients whose records are maintained using CEHRT for which sufficient data were entered in the CEHRT to allow the record to be saved and not rejected due to incomplete data.
Health Information Exchange	HIE Bi-Directional Exchange The eligible hospital or CAH must attest to the following: (*1*) Participating in an HIE in order to	N/A (measure is Y/N)	N/A (measure is Y/N)	N/A (measure is Y/N)	Measure may be calculated by reviewing only actions for patients whose records are maintained using CEHRT for which sufficient data were entered in the CEHRT to allow the

	enable secure, bi-directional exchange of information to occur for all unique patients discharged from the eligible hospital or CAH inpatient or emergency department (POS 21 or 23), and all unique patient records stored or maintained in the EHR for these departments, during the EHR reporting period in accordance with applicable law and policy. (*2*) Participating in an HIE that is capable of exchanging information across a broad network of unaffiliated exchange partners including those using disparate EHRs, and not engaging in exclusionary behavior when determining exchange partners. (*3*) Using the functions of CEHRT to support bi-directional exchange with an HIE.				record to be saved and not rejected due to incomplete data.
Health Information Exchange	Enabling Exchange under TEFCA* The eligible hospital or CAH must attest to the following: (1) Participating as a signatory to a Framework Agreement (as that term is defined by the Common Agreement for Nationwide Health Information Interoperability as published in the Federal Register and on ONC's website)	N/A (measure is Y/N)	N/A (measure is Y/N)	N/A (measure is Y/N)	N/A

	in good standing (that is not suspended) and enabling secure, bi-directional exchange of information to occur, in production, for all unique patients discharged from the eligible hospital or CAH inpatient or emergency department (POS 21 or 23), and all unique patient records stored or maintained in the EHR for these departments, during the EHR reporting period in accordance with applicable law and policy. (2) Using the functions of CEHRT to support bi-directional exchange of patient information, in production, under this Framework Agreement.				
Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information: For at least one unique patient discharged from the eligible hospital or CAH inpatient or emergency department (POS 21or 23): (1) the patient (or patient-authorized representative) is provided timely access to view online, download, and transmit his or her health information; and (2) the eligible hospital or CAH ensures the patient's health information is available for the	The number of patients in the denominator (or patient authorized representative) who are provided timely access to health information to view online, download and transmit to a third party and to access using an application of their choice that is configured to meet the technical specifications of the API in the eligible hospitals or CAH's CEHRT.	The number of unique patients discharged from an eligible hospital or CAH inpatient or emergency department (POS 21 or 23) during the EHR reporting period.	N/A	Measure must be calculated by reviewing all patient records, not just those maintained using CEHRT.

	patient (or patient-authorized representative) to access using any application of their choice that is configured to meet the technical specifications of the application programming interface (API) in the eligible hospital or CAH's CEHRT.				
Public Health and Clinical Data Exchange	Immunization Registry Reporting: The eligible hospital or CAH is in active engagement with a public health agency (PHA) to submit immunization data and receive immunization forecasts and histories from the public health immunization registry/immunization information system (IIS).	N/A (measure is Y/N)	N/A (measure is Y/N)	Any eligible hospital or CAH meeting one or more of the following criteria may be excluded from the immunization registry reporting measure if the eligible hospital or CAH: (1) Does not administer any immunizations to any of the populations for which data is collected by their jurisdiction's immunization registry or IIS during the EHR reporting period; (2) Operates in a jurisdiction for which no immunization registry or IIS is capable of accepting the specific standards required to meet the certified electronic health record technology (CEHRT) definition at the start of the EHR reporting period; or (3) Operates in a jurisdiction where no immunization registry or IIS has declared readiness to receive immunization data as of six months prior to the start of the EHR reporting period.	Measure may be calculated by reviewing only actions for patients whose records are maintained using CEHRT for which sufficient data were entered in the CEHRT to allow the record to be saved and not rejected due to incomplete data.
Public Health and Clinical Data Exchange	Syndromic Surveillance Reporting: The eligible hospital or CAH is in active engagement with a public health agency (PHA) to submit syndromic surveillance data	N/A (measure is Y/N)	N/A (measure is Y/N)	Any eligible hospital or CAH meeting one or more of the following criteria may be excluded from the syndromic surveillance reporting measure if the eligible hospital or CAH: (1) Does not have an emergency department; (2) Operates in a	Measure may be calculated by reviewing only actions for patients whose records are maintained using CEHRT for which sufficient data were entered in the CEHRT to allow the record to be saved and not

	from an emergency department (POS 23).			jurisdiction for which no PHA is capable of receiving electronic syndromic surveillance data from eligible hospitals or CAHs in the specific standards required to meet the certified electronic health record technology (CEHRT) definition at the start of the EHR reporting period; or (3) Operates in a jurisdiction where no PHA has declared readiness to receive syndromic surveillance data from eligible hospitals or CAHs as of six months prior to the start of the EHR reporting period.	rejected due to incomplete data.
Public Health and Clinical Data Exchange	Electronic Case Reporting: The eligible hospital or CAH is in active engagement with a public health agency (PHA) to submit case reporting of reportable conditions.	N/A (measure is Y/N)	N/A (measure is Y/N)	Any eligible hospital or CAH meeting one or more of the following criteria may be excluded from the case reporting measure if the eligible hospital or CAH: (1) Does not treat or diagnose any reportable diseases for which data is collected by their jurisdiction's reportable disease system during the EHR reporting period; (2) Operates in a jurisdiction for which no PHA is capable of receiving electronic case reporting data in the specific standards required to meet the certified electronic health record technology (CEHRT) definition at the start of the EHR reporting period; or (3) Operates in a jurisdiction where no PHS has declared readiness to receive electronic case reporting data as of six months prior to the start of the EHR reporting period.	Measure may be calculated by reviewing only actions for patients whose records are maintained using CEHRT for which sufficient data were entered in the CEHRT to allow the record to be saved and not rejected due to incomplete data.
Public Health and Clinical Data Exchange	Electronic Reportable	N/A (measure is Y/N)	N/A (measure is Y/N)	Any eligible hospital or CAH meeting one or more of the following criteria may be excluded	Measure may be calculated by reviewing only actions for patients

	Laboratory (ELR) Result Reporting: The eligible hospital or CAH is in active engagement with a public health agency (PHA) to submit ELR results.			from the case reporting measure if the eligible hospital or CAH: (1) Does not perform or order laboratory tests that are reportable in their jurisdiction during (EHR reporting period; (2) Operates in a jurisdiction for which no PHA is capable of accepting the specific ELR standards required to meet the certified electronic health record technology (CEHRT) definition at the start of the EHR reporting period; or (3) Operates in a jurisdiction where no PHA has declared readiness to receive ELR results from an eligible hospital or CAH as of 6 months prior to the start of the EHR reporting period.	whose records are maintained using CEHRT for which sufficient data were entered in the CEHRT to allow the record to be saved and not rejected due to incomplete data.
Public Health and Clinical Data Exchange	Public Health Registry Reporting: The eligible hospital or CAH is in active engagement with a public health agency (PHA) to submit data to public health registries.	N/A (measure is Y/N)	N/A (measure is Y/N)	None	Measure may be calculated by reviewing only actions for patients whose records are maintained using CEHRT for which sufficient data were entered in the CEHRT to allow the record to be saved and not rejected due to incomplete data.
Public Health and Clinical Data Exchange	Clinical Data Registry Reporting: The eligible hospital or CAH is in active engagement to submit data to a clinical data registry (CDR).	N/A (measure is Y/N)	N/A (measure is Y/N)	None	Measure may be calculated by reviewing only actions for patients whose records are maintained using CEHRT for which sufficient data were entered in the CEHRT to allow the record to be saved and not rejected due to incomplete data.
Protect Patient Health Information	Security Risk Analysis Conduct or review a security risk analysis in accordance with	N/A (measure is Y/N)	N/A (measure is Y/N)	None	Measure may be calculated by reviewing only actions for patients whose records are

	the requirements under 45 CFR 164.308(a)(1), including addressing the security (including encryption) of data created or maintained by CEHRT in accordance with requirements under 45 CFR 164.312(a)(2)(iv) and 45 CFR 164.306(d)(3), implement security updates as necessary, and correct identified security deficiencies as part of the provider's risk management process. Actions included in the security risk analysis measure may occur any time during the calendar year in which the EHR reporting period occurs.				maintained using CEHRT for which sufficient data were entered in the CEHRT to allow the record to be saved and not rejected due to incomplete data.
Protect Patient Health Information	Safety Assurance Factors for EHR Resilience Guides (SAFER Guides) Conduct an annual self- assessment using all nine SAFER Guides at any point during the calendar year in which the EHR reporting period occurs.	N/A (measure is Y/N)	N/A (measure is Y/N)	None	Measure may be calculated by reviewing only actions for patients whose records are maintained using CEHRT for which sufficient data were entered in the CEHRT to allow the record to be saved and not rejected due to incomplete data.

Health Information Exchange (alternative)	Health Information Exchange (HIE Bi-Directional Exchange	Examples of certified health IT capabilities to support the actions of this measure may include but are not limited to technology certified to the following criteria:
		§ 170.315(b)(1) Transitions of care
		§ 170.315(b)(2) Clinical information reconciliation and incorporation
		§ 170.315(g)(7) Application access — patient selection
		§ 170.315(g)(8) Application access — data category request
		§ 170.315(g)(9) Application access — all data request
		§ 170.315(g)(10) Application access — standardized API for patient and population services
Health Information Exchange (alternative)	Enabling Exchange Under TEFCA	Examples of certified health IT capabilities to support the actions of this measure may include but are not limited to technology certified to the following criteria:
		§ 170.315(b)(1) Transitions of care
		§ 170.315(b)(2) Clinical information reconciliation and incorporation
		§ 170.315(g)(7) Application access — patient selection
		§ 170.315(g)(8) Application access — data category request
		§ 170.315(g)(9) Application access — all data request
		§ 170.315(g)(10) Application access — standardized API for patient and population services
Provider to Patient Exchange	Provide patients electronic access to their health information	§ 170.315(e)(1) View, download, and transmit to 3rd party
		§ 170.315(g)(7) Application access — patient selection
		§ 170.315(g)(8) Application access — data category request
		§ 170.315(g)(9) Application access — all data request
		§ 170.315(g)(10) Application access — standardized API for patient and population services
Public Health and Clinical Data Exchange	Immunization registry reporting	§ 170.315(f)(1) Transmission to immunization registries
	Syndromic surveillance reporting	§ 170.315(f)(2) Transmission to public health agencies — syndromic surveillance

	Electronic case reporting	§ 170.315(f)(5) Transmission to public health agencies — electronic case reporting
	Public health registry reporting	§ 170.315(f)(6) Transmission to public health agencies — antimicrobial use and resistance reporting
		§ 170.315(f)(7) Transmission to public health agencies — health care surveys
	Clinical data registry reporting	No 2015 health IT certification criteria at this time.
	Electronic reportable laboratory result reporting	§ 170.315(f)(3) Transmission to public health agencies — reportable laboratory tests and value/results
	AUR Surveillance Reporting (for 2024)	§ 170.315(f)(6) Transmission to public health agencies — antimicrobial use and resistance reporting
Electronic Clinical Quality Measures (eCQMs)	eCQMs for eligible hospitals and CAHs	§ 170.315(c)(1)
		§ 170.315(c)(2)
		§ 170.315(c)(3)(i) and (ii)
		§ 170.315(c)(4) (optional)
Protect Patient Health Information	Security Risk Assessment	The requirements are a part of CEHRT specific to each certification criterion.
	Safety Assurance Factors for EHR Resilience Guides (SAFER Guides)	No 2015 health IT certification criteria at this time.

*The ONC Cures Act final rule made changes to the existing 2015 Edition Health IT Certification Criteria by introducing new criteria, and revising and removing existing criteria (85 FR 25667 through 25668). These changes are required for the CY2023 EHR reporting period.

BILLING CODE 4120–01–C

10. Clinical Quality Measurement for Eligible Hospitals and CAHs Participating in the Medicare Promoting Interoperability Program

a. Changes to Clinical Quality Measures in Alignment With the Hospital IQR Program

(1) Background

Under sections 1814(l)(3)(A) and 1886(n)(3)(A) of the Act and the definition of ''meaningful EHR user'' under 42 CFR 495.4, eligible hospitals and CAHs must report on clinical quality measures selected by CMS using CEHRT (also referred to as electronic clinical quality measures, or eCQMs), as part of being a meaningful EHR user under the Medicare Promoting Interoperability Program.

Tables IX.H.-09. through IX.H.-11. summarize the previously finalized eCQMs available for eligible hospitals and CAHs to report under the Medicare Promoting Interoperability Program for the CY 2022 reporting period, the CY 2023 reporting period, and the CY 2024 reporting period and subsequent years (86 FR 45496 through 45497). The tables include the Safe Use of Opioids—Concurrent Prescribing measure (NQF #3316e), which we finalized as mandatory for reporting beginning with the CY 2022 reporting period (84 FR 42598 through 42600).

BILLING CODE 4120–01–P

TABLE IX.H.-09: PREVIOUSLY FINALIZED ECQMS FOR ELIGIBLE HOSPITALS AND CAHS FOR THE CY 2022 REPORTING PERIOD

Short Name	Measure Name	NQF No.
ED-2	Admit Decision Time to ED Departure Time for Admitted Patients	0497
PC-05	Exclusive Breast Milk Feeding	0480
STK-02	Discharged on Antithrombotic Therapy	0435
STK-03	Anticoagulation Therapy for Atrial Fibrillation/Flutter	0436
STK-05	Antithrombotic Therapy by the End of Hospital Day Two	0438
STK-06	Discharged on Statin Medication	0439
VTE-1	Venous Thromboembolism Prophylaxis	0371
VTE-2	Intensive Care Unit Venous Thromboembolism Prophylaxis	0372
Safe Use of Opioids*	Safe Use of Opioids – Concurrent Prescribing	3316e

*Reporting the Safe Use of Opioids-Concurrent Prescribing eCQM is mandatory beginning with the CY 2022 reporting period.

Safe Use of Opioids*	Safe Use of Opioids – Concurrent Prescribing	3316e

*Reporting the Safe Use of Opioids-Concurrent Prescribing eCQM is mandatory beginning with the CY 2022 reporting period.

(2) eCQM Adoptions

As we have stated previously in rulemaking (82 FR 38479), we intend to continue to align the eCQM reporting requirements for the Medicare Promoting Interoperability Program with similar requirements under the Hospital IQR Program to the extent feasible. Section 1886(n)(3)(B)(i)(I) of the Act provides in part that in selecting clinical quality measures for the Medicare Promoting Interoperability Program, the Secretary shall provide preference to such measures that have been selected for purposes of the Hospital IQR Program (section 1886(b)(3)(B)(viii) of the Act). In addition, section 1886(n)(3)(B)(iii) of the Act provides that in selecting clinical quality measures for the Medicare Promoting Interoperability Program, and in establishing the form and manner for reporting, the Secretary shall seek to avoid redundant or duplicative reporting with reporting otherwise required, including reporting under the Hospital IQR Program. To minimize redundant or duplicative reporting, while maintaining a set of meaningful clinical quality measures that continue to incentivize improvement in the quality of care provided to patients, we proposed to adopt four new eCQMs for the Medicare Promoting Interoperability Program in alignment with the Hospital IQR Program, as further discussed in this section of the final rule.

In alignment with proposals for the Hospital IQR Program eCQM measure set, we proposed two new eCQMs that address factors contributing to maternal mortality and morbidity, beginning with the CY 2023 reporting period. Specifically, we proposed to add the following eCQMs in the Medicare Promoting Interoperability Program eCQM measure set beginning with the CY 2023 reporting period: (1) Severe Obstetric Complications eCQM (NQF NA); and (2) Cesarean Birth eCQM (NQF NA) (87 FR 28609). We also proposed to require mandatory reporting of the Severe Obstetric Complications eCQM and Cesarean Birth eCQM for the CY 2024 reporting period and for subsequent years. We refer readers to the discussion of the same proposals for the Hospital IQR Program in sections IX.E.5.d. and IX.E.5.c. of the preamble of this final rule for more information about these proposed measures.

We invited public comments on these proposed measures for the Medicare Promoting Interoperability Program.

Comment: Several commenters support our proposal to adopt the Severe Obstetric Complications eCQM in alignment with the Hospital IQR Program. A few commenters requested a delay in mandatory reporting until the CY 2025 reporting period, or until the measure receives NQF endorsement. A commenter recommended optional reporting if NQF endorsement is received.

Response: We thank commenters for their support. We disagree with commenters who have suggested delaying reporting until the CY 2025 reporting period. Addressing factors contributing to maternal mortality and morbidity is one of our priorities. The Severe Obstetric Complications eCQM has been developed to focus on the high maternal morbidity and mortality rates in the U.S. which we believe will present important opportunities for large-scale quality measurement and improvement activities.[1135] The Severe Obstetric Complications eCQM was also reviewed by the NQF Measure Applications Workgroup (MAP) Hospital Workgroup on December 15, 2021 and received conditional support pending NQF endorsement.[1136] The MAP Coordinating Committee, which provides direction to the MAP workgroups, reviewed the Severe Obstetric Complications eCQM on January 19, 2022, and voted to uphold the MAP Hospital Workgroup recommendation for conditional support pending NQF endorsement.[1137] We acknowledge commenters' recommendations that we seek NQF endorsement for the measure; the Severe Obstetric Complication eCQM was submitted to NQF in January 2022 and is currently under review (87 FR 28512).

Comment: Several commenters supported the proposal to add the Cesarean Birth eCQM and mandatory reporting of this measure. A commenter supported the adoption of the measure for self-selection rather than mandatory reporting. A commenter supported adoption and mandatory reporting and recommended identification of community partners such as HIEs for data capture and sharing. A few commenters supported the measure adoption and requested an adoption delay until NQF endorsement is received. A commenter supported the proposal and requested clarifications on the reporting requirements for non-birthing eligible hospitals and CAHs.

Response: We thank commenters for their support of the Cesarean Birth eCQM. We believe adopting the Cesarean Birth eCQM addresses a priority area.[1138] We also believe adopting measures like the Cesarean Birth eCQM presents unique opportunities for large-scale quality measurement and activities that can improve the short- and long-term health outcomes for mothers and children (87 FR 28508). As a result, we believe that the timeline should not be further delayed as the urgency of the quality issues necessitates making the measure mandatory for data collection from all participating hospitals, not just those hospitals that self-select to report on the measure. We also believe the voluntary reporting in the CY 2023 reporting period before mandatory reporting beginning with the CY 2024 reporting period balances the urgency of the measure with the need for EHR vendors and hospitals to incorporate, adopt, and implement this measure. We acknowledge the comment regarding community partners such as HIEs for data capture and sharing and refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49705 through 49708) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57170) for our previously adopted eCQM file format requirements. Under these requirements, hospitals: (1) Must submit eCQM data via the Quality Reporting Document Architecture Category I (QRDA I) file format, (2) may use third parties to submit QRDA I files on their behalf, and (3) may either use abstraction or pull the data from noncertified sources in order to then input these data into CEHRT for capture and reporting QRDA I. However, we do not currently have a policy to publicly identify any such third parties. We acknowledge commenters' recommendations that we seek NQF endorsement for the measure. As stated in the FY 2023 IPPS/LTCH PPS proposed rule, the NQF has endorsed the chart-abstracted version of this measure and the measure steward has submitted the eCQM to NQF for

Available at: *https://aspe.hhs.gov/sites/default/files/private/aspe-files/264076/healthy-women-healthy-pregnancies-healthy-future-action-plan_0.pdf.*

consideration of endorsement (87 FR 28509). We also note that the measure steward submitted this measure for endorsement in the Spring of 2022. Non-birthing eligible hospitals and CAHs that do not perform deliveries would submit a zero denominator declaration that allows a hospital to meet the reporting requirements for an eCQM if the hospital does not have patients that meet the denominator criteria of the measure. We refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 57153) where we stated that utilization of the zero denominator declaration and case threshold exemptions are considered as part of the criteria for successful submissions when reporting eCQMs (81 FR 57170). Hospitals can continue to meet the reporting requirements by submitting data via QRDA I files, zero denominator declaration, or case threshold exemption (82 FR 38387). We also refer readers to the FY 2018 IPPS/LTCH PPS final rule (81 FR 57255 through 57257) where we stated the finalized successful submission requirements in the Hospital IQR Program align with the CQM electronic reporting requirements of the Medicare Promoting Interoperability Program for eligible hospitals and CAHs. For additional information about the requirements for successful submission of eCQMs, we refer readers to our QualityNet website (*https://qualitynet.cms.gov/inpatient/measures/ecqm/participation*).

Comment: Several commenters did not support the proposal to adopt the Severe Obstetric Complications eCQM in the measure set, expressing concerns about feasibility and reliability and the lack of NQF endorsement, the proposal for mandatory reporting, vendors' ability to support the measure, and the measure's achievement of its stated goal. A few commenters offered recommendations about the proposal including securing NQF endorsement before requiring reporting in the Medicare Promoting Interoperability Program. A commenter encouraged CMS to collaborate with eligible hospitals and CAHs, and connect the measurement to community-involved initiatives to reduce complications.

Response: We appreciate commenters' concerns and believe that this measure serves as a key activity in measuring and promoting quality improvement in maternity care by incentivizing eligible hospitals and CAHs to track and report severe obstetric complications and to publicly report the measure data for transparency. As with the Cesarean Birth eCQM, due to the priority on improving maternity care particularly to reduce morbidity and mortality during inpatient births, we believe the timeline for reporting the Severe Obstetric Complications eCQM is appropriate and should not be further delayed. We acknowledge commenters' recommendations that we seek NQF endorsement for the measure; the Severe Obstetric Complication eCQM was submitted to NQF in January 2022 and is currently under review (87 FR 28512). Testing established the feasibility of the measure, first in 25 hospitals across eight healthcare sites and then in additional hospitals unaffiliated with the first 25. The data elements were feasible to collect across three different electronic health record systems.[1139] All numerator indicators and 30 of 34 risk factors use easily mapped ICD–10 codes. The two laboratory and two vital sign risk factors were chosen in part because of their availability and high rates of extractability from the medical record. Using NQF's eCQM Feasibility Scorecard template,[1140] the measure developer calculated results which indicated high feasibility of data elements defining the measure specifications (98 percent), clinical and documentation workflows compared to measure intent (99 percent), data element availability (95 percent) and accuracy (98 percent), and use of data standards (96 percent).

Comment: Several commenters did not support the proposal to adopt the Cesarean Birth eCQM due to concerns about feasibility and validity, the adequacy of the adoption timeline for hospitals and vendors, and the measure as an indicator of quality performance. A few commenters recommended that CMS consider further refining the measure exclusions.

Response: We thank commenters for sharing their concerns and their input on the timeline of adoption, and implementation of the Cesarean Birth eCQM. With regard to feasibility and validity, the measure steward conducted additional measure testing in 2021. The reliability and validity testing found the measure to have an overall data element agreement rate of 92.2 percent and we therefore believe the measure to be reliable and valid for use. As we noted in the preamble of the FY 2023 IPPS/LTCH PPS proposed rule, we are proposing eCQMs that address factors contributing to maternal mortality and morbidity (87 FR 28609) in alignment with proposals for the Hospital IQR Program that address maternal health outcomes. We believe the proposed timeline of inclusion of this eCQM into the Medicare Promoting Interoperability Program measure set beginning with the CY 2023 EHR reporting period, followed by mandatory reporting beginning with the CY 2024 reporting period and for subsequent years, provides sufficient time for EHR vendors and hospitals to incorporate, adopt, and implement the measure. We believe one year of voluntary reporting is sufficient because as noted in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28509), in 2020, the measure steward introduced the Cesarean Birth eCQM as one of the available eCQMs hospitals can choose for data submission to meet The Joint Commission's ORYX® requirements.

We agree that continued monitoring of the measure is important. We believe collecting data and reporting results will provide a critical baseline and we will monitor the data and any unintended consequences of the measure. While we agree that there are many ways to track data related to the C-section rate in the United States, and ultimately reduce excess non-medically indicated C-sections, the standards and comprehensiveness of initiatives can vary widely and we do not believe broadening exclusion criteria or risk adjustment is necessary at this time. As we noted in the FY 2023 IPPS/LTCH PPS proposed rule, when developing the measure, the exclusion criteria were chosen to ensure that the focus population would be women with NTSV pregnancies (86 FR 28510). Barring the presence of other co-morbidities, such women often have a lower risk of maternal morbidity and mortality at the time of delivery than their counterparts who have undergone a previous C-section (87 FR 28510). As a result of the existing exclusion criteria, the population denominator allows the measure to focus on a more homogeneous group where the greatest improvement opportunity exists. As evidenced by variation in rates of NTSV C-sections, clinical practice patterns in particular may affect this rate (87 FR 28510). Lowering the C-section rate in NTSV pregnancies is important because C-sections may carry a higher risk of subsequent miscarriage, placental abnormalities, and repeat C-section (87 FR 28510). The rates of ruptured uteri, unplanned hysterectomies, and ICU admission are higher among women who deliver via C-section for the first time than those who deliver vaginally

[1139] Centers for Medicare & Medicaid Services. (2018). eCQM Feasibility: How Stakeholders Inform Measure Development. Available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/Downloads/eCQM-Feasibility.pdf*.

[1140] National Quality Forum. (2022). NQF eCQM Feasibility Scorecard. Available at: *https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=89036*.

for the first time across all races and ethnicities. However, non-Hispanic Black women who deliver via C-section for the first time had the highest rates of uterine rupture and ICU admission compared with all other races.[1141] Including a comprehensive set of maternal medical exclusions would add data collection burdens without commensurate benefit. After consideration of the public comments we received, we are finalizing our proposal to add the following eCQMs in the Medicare Promoting Interoperability Program eCQM measure set beginning with the CY 2023 reporting period: (1) Severe Obstetric Complications eCQM (NQF NA); and (2) Cesarean Birth eCQM (NQF NA), and we are finalizing our proposal to require mandatory reporting of the Severe Obstetric Complications eCQM and the Cesarean Birth eCQM for the CY 2024 reporting period and for subsequent years. We refer readers to the discussion of the same proposals for the Hospital IQR Program in sections IX.E.5.d. and IX.E.5.c. of the preamble of this final rule for more information about these finalized policies.

TABLE IX.H.-12.: ECQMS FOR ELIGIBLE HOSPITALS AND CAHS FOR THE CY 2023 REPORTING PERIOD

Short Name	Measure Name	NQF No.
ED-2	Admit Decision Time to ED Departure Time for Admitted Patients	0497
HH-02	Hospital Harm—Severe Hyperglycemia Measure	3533e
HH-01	Hospital Harm—Severe Hypoglycemia Measure	3503e
PC-05	Exclusive Breast Milk Feeding	0480
STK-02	Discharged on Antithrombotic Therapy	0435
STK-03	Anticoagulation Therapy for Atrial Fibrillation/Flutter	0436
STK-05	Antithrombotic Therapy by the End of Hospital Day Two	0438
STK-06	Discharged on Statin Medication	0439
VTE-1	Venous Thromboembolism Prophylaxis	0371
VTE-2	Intensive Care Unit Venous Thromboembolism Prophylaxis	0372
Safe Use of Opioids*	Safe Use of Opioids – Concurrent Prescribing	3316e
ePC-07/SMM**	Severe Obstetric Complications	NA
ePC-02**	Cesarean Birth	NA

*Reporting the Safe Use of Opioids-Concurrent Prescribing eCQM is mandatory beginning with the CY 2022 reporting period.

** eCQM available for reporting in the CY 2023 reporting period.

We also proposed, in alignment with the proposals for the Hospital IQR Program eCQM measure set, to adopt two new eCQMs which eligible hospitals and CAHs can self-select to report on for the CY 2024 reporting period and subsequent years. These eCQMs focus on opioid-related adverse events during an admission to an acute care hospital, and malnutrition. Specifically, we proposed to add the following two additional eCQMs to the Medicare Promoting Interoperability Program eCQM measure set on which hospitals can self-select to report beginning with the CY 2024 reporting period: Hospital Harm-Opioid-Related Adverse Event eCQM (NQF #3501e) and Global Malnutrition Composite Score eCQM (NQF #3592e). Table IX.H.-13 summarizes the finalized eCQMs in the Medicare Promoting Interoperability Program for the CY 2024 reporting period and subsequent years. We refer readers to the discussion of the same proposals for the Hospital IQR Program in sections IX.E.5.e. and IX.E.5.f. of the preamble of this final rule for more information about these measures and our policy reasons for proposing them.

We invited public comments on these proposed measures for the Medicare Promoting Interoperability Program.

Comment: Many commenters expressed support for our proposal to adopt the Hospital Harm—Opioid Related Adverse Events eCQM (NQF #3501e), stating that its implementation will incentivize opioid adverse event monitoring and reporting, which commenters believe may also address a disproportionate number of inpatient overdose deaths among racial and ethnic minorities. A commenter supported the measure and requested information about performance and what the intended action with the collected data would be.

Response: We thank commenters for their support of the measure. The intent of the measure is to identify if hospitals have particularly high rates of naloxone use, as an indicator of high rates of over-administration of opioids in the inpatient setting, and thereby incentivize improved clinical practices when administering opioids.

Comment: A commenter did not support the proposed adoption of the Hospital Harm—Opioid Related Adverse Events eCQM (NQF #3501e), because the measure focuses on a rare event rather than large population-based approaches and could create unintended consequences and recommended CMS consider or create an alternative measure. A commenter suggested considering a re-specification of the measure for the outpatient setting. A commenter expressed concern that the Hospital Harm—Opioid-Related Adverse Event eCQM does not focus on undertreatment of pain or other symptoms for which opioids may be appropriately prescribed.

[1141] Curtin, S.C., Gregory, K.D., Korst, L.M., Uddin, S.F.G. (2015) Maternal Morbidity for Vaginal and Cesarean Deliveries, According to Previous Cesarean History: New Data from the Birth Certificate, 2013. National Vital Statistics Reports, 64(4). Available at: *https://www.cdc.gov/nchs/data/nvsr/nvsr64/nvsr64_04.pdf.*

Response: We thank commenters for their support of the measure. The intent of the measure is not to reduce clinically appropriate use of naloxone, nor to bring the measure rate to zero, but to identify if hospitals have particularly high rates of naloxone use as an indicator of high rates of over-administration of opioids in the inpatient setting, and thereby incentivize improved clinical practices when administering opioids. We acknowledge that some interested parties have expressed concern regarding the measure's impact given the small number of overall events. However, our overall analysis during testing demonstrated the rate of ORAE ranged from 1.1 to 6.1 per 1,000 qualified inpatient encounters, signaling there is still opportunity for improvement. We also acknowledge that some interested parties have expressed concern that implementation of the measure could result in deterring or delaying clinically appropriate administration of naloxone or under-prescribing of opioids for pain control when clinically necessary. However, we reiterate that naloxone is a life-saving emergent therapy with clear and unambiguous applications in the setting of opioid overdose and we note that it would be unethical to withhold lifesaving medication.

Comment: Many commenters expressed support for our proposal to adopt the Global Malnutrition Composite Score eCQM as there is a gap between performance measures focused on nutrition care and malnutrition. With malnutrition contributing to increased lengths of stay, complications and mortality, commenters believe this measure will benefit patients, families, caregivers and health care providers.

Response: We thank the commenters for their support of our proposal and agree that the adoption of the Global Malnutrition Composite Score eCQM may help address several priority areas identified in the CMS Equity Plan for Medicare. This would allow us to further evaluate the impact of disparities, while integrating equity solutions across CMS programs, and increasing the ability of the healthcare workforce to meet the needs of populations that have been disadvantaged and/or underserved by the healthcare system.

Comment: A commenter did not support our proposal to adopt the Global Malnutrition Composite Score due to the practicality of translating a complex multi-step measure into an eCQM, and have instead requested delaying its adoption for one additional year. A few commenters expressed concern about operationalizing and implementing the measure, its value, and potential duplication with the CMS proposed Health Related Social Needs screening measure.

Response: We appreciate the commenters' concerns about our proposed measure. The Screening for Social Drivers of Health measure, discussed in section IX.E.5.b. of the preamble of this final rule, and the Global Malnutrition Composite Score eCQM both speak to nutrition as a driver of health because it is an important contributor to a healthful population. However, the measures address different but related goals. The Screening for Social Drivers of Health measure focuses on incentivizing the screening and identifying of patients for food insecurity, defined as limited or uncertain access to adequate quality or quantity of food (87 FR 28500). The Global Malnutrition Composite Score eCQM focuses not only on screening for malnutrition risk (of which food insecurity may be a contributing factor) but also the performance of a nutrition assessment and development of a care plan for identified malnourished patients (87 FR 28520). We believe these two measures are equally important and complementary, but not duplicative as they measure different aspects of the care process. We also appreciate the recommendation to delay adoption for one additional year, however we disagree because we have proposed to adopt this as a self-select eCQM. Additionally, we have not yet determined future plans with respect to requiring reporting of this measure. Any proposal to mandate reporting this eCQM would be made through future notice-and-comment rulemaking.

After consideration of the public comments we received, we are finalizing our proposals as proposed. We refer readers to the discussion of the same proposals for the Hospital IQR Program in sections IX.E.5.e. and IX.E.5.f. of the preamble of this final rule for more information about these finalized policies.

TABLE IX.H.-13: ECQMS FOR ELIGIBLE HOSPITALS AND CAHS FOR THE CY 2024 REPORTING PERIOD AND SUBSEQUENT YEARS

Short Name	Measure Name	NQF No.
HH-02	Hospital Harm—Severe Hyperglycemia Measure	3533e
HH-01	Hospital Harm—Severe Hypoglycemia Measure	3503e
STK-02	Discharged on Antithrombotic Therapy	0435
STK-03	Anticoagulation Therapy for Atrial Fibrillation/Flutter	0436
STK-05	Antithrombotic Therapy by the End of Hospital Day Two	0438
VTE-1	Venous Thromboembolism Prophylaxis	0371
VTE-2	Intensive Care Unit Venous Thromboembolism Prophylaxis	0372
Safe Use of Opioids*	Safe Use of Opioids – Concurrent Prescribing	3316e
ePC-07/SMM***	Severe Obstetric Complications	NA
ePC-02***	Cesarean Birth	NA
HH-ORAE****	Hospital Harm-Opioid Related Adverse Event	3501e
GMCS****	Global Malnutrition Composite Score	3592e

*Reporting the Safe Use of Opioids-Concurrent Prescribing eCQM is mandatory beginning with the CY 2022 reporting period.

*** Reporting the Severe Obstetric Complications eCQM (ePC-07) and Cesarean Birth (ePC-02) is mandatory beginning with the CY 2024 reporting period.

****Hospital Harm-Opioid Related Adverse Event eCQM and Global Malnutrition Composite Score eCQM available for reporting beginning with the CY 2024 reporting period.

b. eCQM Reporting and Submission Requirements for the CY 2024 Reporting Period and Subsequent Years

Consistent with our goal to align the eCQM reporting periods and criteria in the Medicare Promoting Interoperability Program and the Hospital IQR Program, we previously finalized the requirement that eligible hospitals and CAHs reporting eCQMs for the Medicare Promoting Interoperability Program must report four calendar quarters of data from CY 2023 and each subsequent year for: (a) Three self-selected eCQMs from the set of available eCQMs for CY 2023 and each subsequent year, and (b) the Safe Use of Opioids-Concurrent Prescribing eCQM (NQF #3316e), for a total of four eCQMs (85 FR 58975). We did not propose to change the data reporting and submission requirements for the CY 2023 reporting period.

In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28610), in alignment with proposals for the Hospital IQR Program, we proposed to modify the eCQM reporting and submission requirements under the Medicare Promoting Interoperability Program for eligible hospitals and CAHs beginning with the CY 2024 reporting period such that hospitals would be required to report four calendar quarters of data for each required eCQM: (1) Three self-selected eCQMs; (2) the Safe Use of Opioids—Concurrent Prescribing eCQM; (3) the proposed Severe Obstetric Complications eCQM; and (4) the proposed Cesarean Birth eCQM, for a total of six eCQMs, beginning with the CY 2024 reporting period and for subsequent years. We noted that the number of calendar quarters of data required and the number of self-selected eCQMs would remain the same, but we proposed to increase the number of eCQMs that all eligible hospitals and CAHs would be required to report from one to three. This proposal was made in conjunction with our proposals discussed in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28609), in which we proposed to adopt the Severe Obstetric Complications eCQM and Cesarean Birth eCQM, respectively. We stated that we believe by 2024, eligible hospitals and CAHs will have had sufficient experience with eCQM reporting to propose an increase in the number of required eCQMs from four to six eCQMs. In addition, we stated that we believe in light of the maternal health crisis as described in sections IX.E.5.d.(1) and IX.E.5.c.(1) of this final rule, and our commitment to reducing unacceptably high maternal morbidity and mortality rates, it is important to collect and utilize quality measure data focused on maternal health to incentive improved quality of care.

As detailed in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28610), we proposed that if our proposals to adopt the Severe Obstetric Complications eCQM and the Cesarean Birth eCQM are finalized, these measures would be available for eligible hospitals and CAHs to select as one of their three self-selected eCQMs for the CY 2023 reporting period, and then beginning with the CY 2024 reporting period, all eligible hospitals and CAHs would be required to report these two eCQMs. We referred readers to the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28555) for the reporting and submission requirements associated with the proposal to modify the eCQM reporting requirements for the Hospital IQR Program. We invited public comments on these proposed eCQM reporting requirements.

Comment: A few commenters supported our proposal to modify the reporting and submission requirements for eCQMs such that beginning with the CY 2024 reporting period/FY 2026 payment determination hospitals would be required to submit four calendar quarters of data from three self-selected eCQMs and three required eCQMs.

Response: We thank commenters for their support.

Comment: A commenter supported the proposal to modify eCQM reporting

and submission requirements and requested two years of voluntary reporting for the Severe Obstetric Complications eCQM before mandatory reporting.

Response: We thank the commenter for their support of our proposal but, regarding a delay in mandatory reporting of our two finalized perinatal eCQMs, reiterate that addressing the maternal health crisis, improving maternal health, and closing any gaps that exist as a result of health disparities are among our top goals and mandatory reporting of the Severe Obstetric Complications eCQM beginning with the CY 2024 reporting period advances that goal.

Comment: Many commenters did not support the proposal to modify eCQM reporting and submission requirements due to current eCQM challenges such as the lack of frequent and actionable eCQM performance feedback, difficulties extracting data from production ready eCQM products delivered by developers, insufficient time for vendor design and development and for hospitals to complete testing, validation, staff education before required reporting, and the costly and prolonged process of eCQM health care provider adoption. A few commenters recommended a delayed and phase implementation of modified reporting and submission requirements as clinical quality measure reporting is moving from eCQMs to dQMs.

Response: We appreciate commenters' concerns related to modifications of the eCQM reporting and submission requirements due to eCQM reporting challenges experienced by hospitals. We urge hospitals to continue to work with their vendor to secure timely delivery of their products and we believe our finalized policy will offer opportunities for hospitals that are prepared to voluntarily report the two perinatal eCQMs to do so for the CY 2023 reporting period while providing more than one year for other hospitals to prepare and implement the two perinatal eCQMs for the CY 2024 reporting period.

With respect to the challenges of extracting eCQM data, we believe that our proposal to modify the eCQM reporting and submission requirements advances our goal of increasing the use of EHR data for quality measurement and improvement. We also believe the implementation of the production ready product supports feasible data extraction processes, and we will be considerate of this feedback in future rulemaking.

We understand commenters' concerns related to the effort by hospitals to customize their health IT and to potentially update workflows and train staff following vendor delivery of their product; however, we expect the burden for hospitals to be no greater than that already required to comply with CMS annual updates which includes the eCQM specifications, educational materials, value sets, code systems direct reference codes, and terminology that are posted on the eCQI Resource Center.[1142]

We recognize the process of hospital adoption of eCQMs can be costly and prolonged. We refer readers to section XII.B.9.e. of the preamble of this final rule (information collection requirements) for a detailed discussion of our burden estimates associated with the modification of our eCQM reporting and submission requirements. We believe the long-term benefits associated with reporting a full year of data for six eCQMs will outweigh the burdens and that increasing the number of eCQMs for which hospitals are required to report will produce more comprehensive and reliable quality information for patients and health care providers. We will continue to look across CMS programs to identify areas for further streamlining of reporting requirements. Also, as referenced in section IX.C. of the preamble of this final rule, in the ''Continuing to Advance Digital Quality Measurement and Use of Fast Healthcare Interoperability Resources (FHIR) in Hospital Quality Programs—Request for Information,'' we also believe utilizing standardized data for EHR-based measurement (based on the FHIR standard) and aligning where possible with other interoperability requirements can reduce the data collection burden incurred by health care providers.

For the purpose of reporting quality measures and alleviating the concern about the costly and prolonged process of eCQM adoption. We appreciate the comments and interest in opportunities to reduce reporting burden, and we will continue to take all under consideration as we develop future regulatory proposals.

Comment: A commenter did not support due to the cost, time and limited IT resources barriers faced by small rural hospitals for EHR changes and updates.

Response: We appreciate the commenter's concern regarding the cost, time and IT resources required to in eCQM reporting and submission. We establish program requirements considering all hospitals and CAHs that participate in the Medicare Promoting Interoperability Program for eligible hospitals and CAHs, which involves a wide spectrum of capabilities and resources with respect to eCQM reporting. We acknowledge that advancing quality improvement supported by health IT can present unique challenges for small or rural hospitals. We believe our finalized policy to modify the eCQM reporting and submission requirements will offer opportunities for hospitals that are prepared to voluntarily report the two perinatal eCQMs—Cesarean Birth and Severe Obstetric Complications—to do so for the CY 2023 reporting period, while providing more than one year for other hospitals to prepare and implement the two perinatal eCQMs for mandatory reporting in the CY 2024 reporting period and subsequent years. We recognize the cost and time associated with eCQM adoption and refer readers to section XII.B.9.k. of the preamble of this final rule (information collection requirements) for a discussion of our burden estimates associated with the modification of our eCQM reporting and submission requirements. When considering modifications to program requirements, we have, and may continue to, consider the recommendations from the rural health care providers to ensure eCQMs policies are meaningful to quality improvement for small, rural hospitals.

Comment: A few commenters did not support the proposal to modify eCQM reporting and submission requirements and recommended a phased and incremental timeline for increasing the number of required eCQMs. A commenter recommended financial incentives to support hospitals with changing eCQM requirements.

Response: We thank the commenters and acknowledge the concerns about the pace of change in eCQM reporting and submission policy. However, we believe that hospitals have had several years to report eCQM data. After holding eCQM reporting and submission policies constant for a number of years in order to give hospitals and their vendors additional time to improve eCQM reporting capabilities, we intended to transition to more robust reporting.

Comment: Several commenters offered recommendations such as alignment of eCQM data submissions with the quarterly timeline for submission of Hospital IQR Program's chart-based measure data, an analysis of required measures and a proposal to remove measures less impactful to improved health outcomes, limit eCQMs to self-selection until hospitals gain experience to confirm feasibility and reliability, delay of public reporting

[1142] *https://ecqi.healthit.gov/.*

until one year of data is reported and a proposal for a quarter exception rather than a full year hardship exception for eCQM reporting in future rulemaking. A commenter recommended reconsideration of the proposal.

Response: We thank commenters for their comments. Concerning the eCQM data submission timeline, the data submission deadline for eCQM data under the Medicare Promoting Interoperability Program for eligible hospitals and CAHs continues to be the end two months following the close of the calendar year. We note the submission deadline may be moved to the next business day if it falls on a weekend or Federal holiday. We did not propose any changes to this policy in the FY 2023 IPPS/LTCH proposed rule. We plan to monitor the implementation of the finalized eCQM data reporting and submission requirements and welcome continued feedback from stakeholders through webinars, listservs, and help desk questions.

We utilize principles and frameworks to assess clinical quality measures included in our programs including the CMS National Quality Strategy [1143] and the Meaningful Measures Initiative,[1144] which identifies high-priority areas for quality measurement and improvement to assess core issues most critical to high-quality healthcare and improving patient outcomes. In 2021, we launched Meaningful Measures 2.0 to promote innovation and modernization of all aspects of quality, and to address a wide variety of settings, stakeholders, and measure requirements.[1145] We will continue to utilize this approach.

We believe the Cesarean Birth eCQM and Severe Obstetric Complications eCQM present unique opportunities for large-scale quality measurement and activities that can improve the short- and long-term health outcomes for mothers and children (87 FR 28508) and self-selection of these measures would not advance us toward our short-and long-term goals.

We acknowledge commenters' concern about public reporting and refer readers to the FY2021 IPPS/LTCH PPS final rule (85 FR 58976) for a discussion of our previously finalized public reporting of eCQM data policy. Additionally, we would like to remind readers that the Medicare Promoting Interoperability Program allows hardship exception applications for extreme and uncontrollable circumstances, including vendor issues. Additional information on this process is available at: *https://www.cms.gov/Regulations-and-Guidance/Legislation/EHRIncentivePrograms/PaymentAdj_Hardship.* We did not propose any changes to this policy in the FY 2023 IPPS/LTCH PPS proposed rule. We thank commenters for their recommendations. We acknowledge commenters' recommendations, and we may continue to take all comments into account as we develop future regulatory proposals.

Comment: A commenter requested clarification for hospitals without obstetric departments or providing labor and delivery services. A commenter expressed concern that hospitals could be penalized due to hospital or vendor inability to meet reporting and submission requirements.

Response: If a hospital does not have an obstetrics department or has few or no deliveries during a reporting period, the hospital may submit a zero-denominator declaration or a case threshold exemption for an eCQM that is being reported. A QRDA Category I file with patients meeting the initial patient population of the applicable measures, a zero-denominator declaration and/or a case threshold exemption all count toward a successful submission for eCQMs for the Medicare EHR Incentive Program (now called the Promoting Interoperability Program) (82 FR 38482). Hospitals may request a hardship exception if they are unable to fulfill program requirements due to extreme and uncontrollable circumstances, including vendor issues. Additional information on this process is available at: *https://www.cms.gov/Regulations-and-Guidance/Legislation/EHRIncentivePrograms/PaymentAdj_Hardship*.

After consideration of the public comments we received, we are finalizing our proposal as proposed.

11. Patient Access to Health Information Measure—Request for Information (RFI)

Patient use of portals to access their health information has been tied to benefits such as improvements in access, quality of care, and health outcomes, and reductions in healthcare expenditures.[1146] In particular, access to health information has been shown to enable the discovery of medical errors, to improve medication adherence, and to promote communication between the patient and health care provider.[1147] However, despite the fact that surveyed patients experiencing shared access to notes with health care providers has been largely positive,[1148] voluntary uptake and use of patient portals has been low, with nearly two-thirds of hospitals having less than 25 percent of patients activate access to the hospital's patient portal in 2017.[1149] Health care provider encouragement (and other facilitating conditions), perceived usefulness, ease of use, control of health information, and enhanced communication are demonstrated as facilitators, while concerns of privacy, security, and lack of awareness have been tied to barriers of use.[1150] [1151]

The Health Information National Trends Survey (HINTS), a large, nationally representative survey operated by the National Cancer Institute (with support from ONC), is conducted routinely and contains key utilization data on consumer access and use of their online medical record through patient portals. The HINTS results showed the rates of individuals being offered and subsequently using their health information through a patient portal, as well as use of mobile health applications (apps) and the role health care providers play in

encouraging use.[1152] Results showed that health care providers and staff have a substantial role in influencing patient use of the portal.

In the past for the Medicare Promoting Interoperability Program, we attempted to promote patient access to their health information through measuring the number of patients who actively engaged with the electronic health record through the View, Download, or Transmit (VDT) measure at 42 CFR 495.24(c)(6)(ii)(A). In the FY 2019 IPPS/LTCH PPS final rule (83 FR 41636 through 41668), we renamed the Patient Electronic Access Objective to the Provider to Patient Exchange Objective and updated the measures within the Provider to Patient Exchange Objective. Specifically, we removed the standalone VDT measure from the Medicare Promoting Interoperability Program in response to interested party feedback, including hospitals and hospital associations detailing the significant challenges they faced in implementing measures that require patient action (83 FR 41665). These challenges included, but were not limited to, patients who have limited knowledge of, proficiency with, or access to information technology; patients declining to access the portals provided by the eligible hospital or CAH to view, download, and transmit their health information via this platform; as well as the lack of availability of user-friendly portals and the immaturity of the health IT infrastructure needed to facilitate useful access and use of their own health information. We also noted that data analysis of the VDT measure showed low percentages of patients taking action to view, download, and transmit their health information (83 FR 41665). Additionally, in the FY 2019 IPPS/LTCH PPS final rule (83 FR 41661 through 41663) we changed the name of the Provide Patient Access measure at 42 CFR 495.24(c)(5)(ii)(A) to Provide Patients Electronic Access to Their Health Information at 42 CFR 495.24(e)(7)(ii) and finalized changes to the measure description. These measure changes included a requirement for eligible hospitals or CAHs to provide timely access for viewing, downloading or transmitting their health information for at least one unique patient discharged using any application of the patient's choice (83 FR 41661 through 41663). This change emphasized timely electronic access of patient health information rather than requiring health care providers to be accountable for patient actions.

Through the current Provide Patients Electronic Access to Their Health Information measure in the Provider to Patient Exchange Objective, we are ensuring that patients have access to their health information through any application of their choice that is configured to meet the technical specifications of the Application Programing Interface (API) in the CEHRT of the eligible hospital or CAH. Promoting the use of API-enabled applications that provide timely access to updated information whenever the patient needs that information is an integral step in enhancing patient access and use of their health information. These API-enabled applications should be configured using standardized technology and contain the information the patient needs to make informed decisions about their care in a way the patient understands, and that recognizes the community's level of access to devices and internet connectivity. While we removed the VDT measure holding eligible hospitals and CAHs responsible for patient action (83 FR 41665), we still require that the technical capabilities be in place within an eligible hospital's or CAH's CEHRT through the Provide Patients Electronic Access to Their Health Information measure should patients choose to access and use their health information (83 FR 41661 through 41663).

We continue to believe in the importance of taking a patient-centered approach to health information access and moving to a system in which patients have immediate access to their electronic health information and can be assured that their health information will follow them as they move throughout the health care system. Recognizing the concerns and barriers with the previous VDT measure discussed previously, but acknowledging the advancements made within the health IT industry over the past few years, this request for information (RFI) sought a broad array of public comments regarding how to further promote equitable patient access and use of their health information without adding unnecessary burden on the hospital or health care provider. Specifically, we sought public comment on the following questions:

- Moving beyond providing the information and technical capabilities to access their data, are there additional approaches to promote patient access and use of their health information? Are there examples of successful approaches or initiatives that have enhanced patient access and use of their health information?

++ Would allowing patients to add information to their records be useful in promoting patient access and utilization? Are there other incentives that would promote patient access?

++ Are there potential unintended consequences in allowing patients to add information to their records? What could be done to mitigate any potential unintended consequences?

++ Are there certain tools found to be useful in promoting patient access and use of their health information?

- Recent studies have raised concerns about the presence of racial bias and stigmatizing language within EHRs that could lead to unintended consequences if patients were to obtain disparaging notes regarding their medical care.[1153] [1154]

++ What policy, implementation strategies, or other considerations are necessary to address existing racial bias or other biases and prevent use of stigmatizing language?

- Additional analysis of HINTS data provides insights into common barriers to patient portal access and use as well as characteristics that can help predict which individuals are more likely to experience certain barriers (for example, preference for in-person communication with their health care provider is one of the most prevalent barriers experienced more often by older adults and women).[1155]

++ What are the most common barriers to patient access and use of their health information that have been observed? Are there differences by populations or individual characteristics?

- Patients' health information may be found in multiple patient portals. How could CMS or HHS facilitate individuals' ability to access all their health information in one place?

++ If patient portals connected to a network participating in the recently launched TEFCA,[1156] [1157] would this

enable more seamless access to individual health information across various patient portals?

• With the advancement of HIT, EHRs and other health-related communication technologies, there are concerns of equity to health outcomes and access with populations who could receive greater benefits from these technologies but are less likely to adopt them.[1158] [1159] What policy, governance and implementation strategies or other considerations are necessary to ensure equal access to patient portals, equitable portal implementation, appropriate design and encouragement of use?

• What challenges do eligible hospitals and CAHs face when addressing patient questions and requests resulting from patient access of patient portals or access of data through use of a mobile app? What can be done to mitigate potential burden?

• For patients who access their health information, how could CMS, HHS, and health care providers help patients manage their health through the use of their personal health information?

• Do you believe the API and app ecosystem is at the point where it would be beneficial to revisit adding a measure of patient access to their health information which assesses health care providers on the degree to which their patients actively access their health information?

* What should be considered when designing a measure of patient access of their health information through portals or apps?

We welcomed input on how we can encourage and enable patient access to and use of their health information to manage and improve their care across the care continuum. We thank the interested parties who submitted comments for our review and consideration.

Comment: Many commenters provided input on additional approaches to promote patient access and use of patient health information. Several commenters supported individuals contributing to their own records as an approach to promote patient access to and engagement with their health information. These commenters offered a number of successful suggestions for individuals to contribute to their records, as well as important considerations regarding potentially duplicative or erroneous information being added, and the need for clinical review of information entered by individuals before inclusion in the medical record. A commenter recommended CMS work with ONC to develop certification criteria and technical capabilities to amend or update their records. Several commenters recommended including beneficial capabilities within the patient portal to promote patient access, such as appointment scheduling, prescription refills, immediate release of lab results, push notifications to patients, and secure physician messaging. Many commenters provided support for TEFCA implementation and the use of HIEs as an approach to promote a standard nationwide method of collecting patient health data and consolidating into one view for seamless patient access. Commenters stated that TEFCA has a lot of potential to improve patient access to health information, but CMS should monitor the progress of TEFCA implementation.

Many commenters provided input on potential unintended consequences and concerns around increasing patient access to their health information related to racial bias and stigmatizing language. A few commenters stated the importance of developing educational materials for health care providers to reduce stigmatizing language, including providing guidance on the information blocking regulations so health care providers are aware of requirements for patient access to clinical notes, and provide patient-facing resources to address questions when reviewing records. A few commenters stated the importance of accurate translation of health information from other languages and how technology can provide reliable real-time translation of information contained in a portal. A commenter recommended implementing a policy to permit patients to complete sexual orientation, and gender identity fields within the patient portal.

Many commenters provided input on the potential barriers to patient access including those associated with individuals having limited access to technology or insufficient understanding of how to use health technology who encounter difficulties navigating portals. Several commenters stated that racial and ethnic minority groups, socioeconomically disadvantaged, rural, elderly, and people who are at risk of poor health outcomes lack physical tools including computers, email addresses, smartphones, and inconsistent internet access. Commenters discussed the absence of technical assistance to help patients access information as well as the lack of understanding of their rights under the Health Insurance Portability and Accountability Act of 1996 (HIPAA) Privacy Rule, including the right to access an electronic copy when their health information is stored electronically. A commenter stated the success of publishing health care provider compliance rates with patient access requirements under HIPAA and recommended similar approaches to help improve patient access. A few commenters discussed the complications and potential barriers regarding proxy access to patient portals and patient applications. Additionally, commenters stated the lack of a unique patient identifier or identity proofing and authentication creates a barrier to access health information.

Many commenters provided input on challenges and burdens faced by hospitals including cumbersome and decentralized processes for requesting records as well as the manual workflows for health information professionals fulfilling requests. Commenters recommended CMS continue to monitor challenges related to patient access of data and solicit feedback from interested parties, particularly health information professionals who field patient questions and concerns related to the access of data.

Many commenters provided input and recommendations on policy, governance, and implementation considerations for promoting patient access and the role of CMS and HHS. Commenters recommended continued collaboration with OCR and ONC to develop guidance regarding HIPAA requirements, particularly in the context of health information exchanges and networks, as well as guidance regarding the lack of HIPAA protections when data moves to third-party applications. Commenters recommended CMS remain actively engaged in the work of standards development organizations to determine the best avenue for regulatory alignment. Commenters also recommended CMS work with ONC to improve patient matching and identification to promote longitudinal records, and further advance and ensure adoption of standards. Many commenters recommended providing funding for equipment and studying the optimal use of digital technology including wearable devices. A few

commenters recommended CMS use their authority and exercise enforcement to ensure health plans subject to CMS oversight facilitate patient access and implement APIs.

Many commenters provided input on the prospect of adding a measure of patient access. A few commenters supported adding a measure for patient access to their health information but several commenters did not support adding a new measure of patient access stating many reasons including lack of control, unnecessary burden, and existing patient access barriers.

Response: We appreciate the comments and suggestions we have received. While we will not be responding to specific comments submitted in response to this RFI, we believe that this input is valuable in our efforts to continue to promote patient access to their health information. We may consider these suggestions in future rulemaking.

X. Changes for Hospitals and Other Providers

A. Codification of the Costs Incurred for Qualified and Non-Qualified Deferred Compensation Plans

1. Background

Currently, certain costs incurred on behalf of Deferred Compensation Plans may be allowable costs under Medicare to the extent such costs are related to the reasonable and necessary cost of providing patient care and represent costs actually incurred. Reasonable cost reimbursement is addressed in section 1861(v)(1)(A) of the Act. Section 1861(v)(1)(A) of the Act defines ''reasonable cost,'' in part, as the cost actually incurred, excluding costs found to be unnecessary in the efficient delivery of needed health services. Section 1861(v)(1)(A) of the Act does not specifically address the determination of reasonable costs, but authorizes the Secretary to promulgate regulations and principles to be applied in determining reasonable costs.

We have issued regulations implementing this provision of the Act, including 42 CFR 413.9(a), which provides that the payments ''must be based on the reasonable cost of services covered under Medicare and related to the care of beneficiaries.'' In addition, § 413.9(c)(2) states that ''[t]he provision in Medicare for payment of reasonable cost of services is intended to meet the actual costs.'' Further, § 413.9(c)(3) provides that ''[r]easonable cost includes all necessary and proper expenses incurred in furnishing services . . . .'' Therefore, in accordance with the statute, the regulations include two principles that help guide the determination of which expenses may be considered allowable reasonable costs that can be paid under Medicare; that is, such costs must be ''related'' to the care of Medicare beneficiaries, and such costs must actually be ''incurred.''

Consistent with these provisions, we have issued instructions in sections 2140 through 2142 of the Medicare Provider Reimbursement Manual, Part I (PRM–I) for determining and reporting the policies that govern how providers of services are to determine and report the allowable costs of Deferred Compensation Plans. Section 2140.1 of PRM–I defines Deferred Compensation as ''remuneration currently earned by an employee but which is not received until a subsequent period, usually after retirement. Accordingly, a Deferred Compensation Plan defers the receipt of income beyond the year in which it is earned.'' The policies for Deferred Compensation plans that we have established in sections 2140 through 2142 of PRM–I vary depending on whether a plan is funded using an allowable funding mechanism or unfunded, and whether a plan is a Defined Contribution plan or a Defined Benefit plan. The term funded essentially means that funds are set aside to protect payment of future benefits for plan participants, and not simply paid out of current revenues, as is the case with unfunded plans. Allowable Non-Qualified Deferred Compensation Plan costs that are considered unfunded are based on reasonable benefits that providers of services paid to participating employees.

Allowable Defined Contribution plan costs are based on reasonable contributions made by providers of services to Defined Contribution accounts. Prior to August 2011, allowable funded Defined Benefit plan costs were based on Employee Retirement Income Security Act of 1974 (ERISA) components of accrued pension costs (for example, Normal Cost, Actuarial Accrued Liability, Actuarial Value of Assets) if the resulting computation of costs was funded into an approved account. In August 2011, the FY 2012 IPPS/LTCH PPS final rule (76 FR 51693 through 51697), established regulations for reporting costs of Qualified Defined Benefit plans for Medicare cost-finding purposes. Specifically, for cost reporting periods beginning on or after October 1, 2011, a provider of services cost equals the cash basis contribution deposits plus any carry forward contributions, subject to a limitation (§ 413.100(c)(2)(vii)(D)(*1*)). Providers of services with current contributions and carry forward contributions that exceed the limit may request approval of excess contributions, which are reviewed by the contractor on a case-by-case basis (§ 413.100(c)(2)(vii)(D)(*3*)).

At the time the FY 2012 IPPS/LTCH final rule was issued, the regulations at §§ 413.24 and 413.100 specified that pension costs of Qualified Defined Benefit plans were reported on an accrual basis of accounting method. To conform this accrual requirement in the regulations with the cash-basis methodology for reporting pension costs finalized in the FY 2012 IPPS/LTCH PPS final rule, in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53448), we amended the general cost reporting rules under §§ 413.24(a)(2) and 413.100(c)(2)(vii)(D) to note the exception for recognizing actual contributions funded during the cost reporting period on a cash basis.

In the FY 2023 IPPS/LTCH proposed rule (87 FR 28612 through 28618), we proposed to codify and clarify additional policies relating to Deferred Compensation in a new section in part 413, subpart F. We did not propose to change our current policies for allowable Deferred Compensation costs associated with Qualified and Non-Qualified Deferred Compensation Plans (the plans) that are included in Medicare cost reports. Nor did we propose to change the way in which Deferred Compensation costs are to be audited by the Medicare Administrative Contractors (MACs).

In the paragraphs that follow, we discuss our proposals in the FY 2023 IPPS/LTCH proposed rule. We received no comments on these proposals and are finalizing our proposals without modification.

2. Qualified and Funded Non-Qualified Deferred Compensation Plans (§ 413.99)

In accordance with section 1861(v)(1)(A) of the Act, in the FY 2023 IPPS/LTCH proposed rule (87 FR 28613), we proposed to add a new § 413.99 in subpart F of part 413 of title 42, titled ''Qualified and Funded Non-Qualified Deferred Compensation Plans,'' to establish rules for allowable and non-allowable costs incurred for the plans, by providers of services, under the program. Our proposals, which we discuss in more detail throughout this section of this final rule, set forth general requirements; definitions; requirements for costs of the plans to be allowable under the program; additional requirements for payments to funded defined benefit plans; data and documentation requirements to support payments/contributions to the plans;

and allowable administrative and other costs associated with the plans, including costs related to the Pension Benefit Guaranty Corporation (PBGC).

We received no comments on these proposals and are finalizing our proposals without modification.

3. Statutory Basis, Scope, and Definitions (§ 413.99(a))

In accordance with section 1861(v)(1)(A) of the Act, in the FY 2023 IPPS/LTCH proposed rule (87 FR 28613), we proposed to establish the ''Basis,'' ''Scope,'' and ''Definitions'' of these regulations that determine the allowable and non-allowable costs of the plans under the program at proposed new § 413.99(a)(1), (2), and (3), respectively. Specifically, we proposed at new § 413.99(a)(1) to specify that all payments to providers of services must be based on the ''reasonable cost'' of services covered under Title XVIII in accordance with section 1861(v) of the Act and the regulations in 42 CFR part 413. In addition, we proposed at new § 413.99(a)(2) to specify that this section and § 413.100(c)(2)(vii) will apply to Medicare's treatment of the costs incurred for Qualified and Non-Qualified Deferred Compensation Plans.

CMS has previously defined certain terms related to the program's policies on Deferred Compensation and the plans in sections 2140 through 2142 of PRM–I. In the FY 2023 IPPS/LTCH proposed rule (87 FR 28613), we proposed to codify these definitions, with clarifications where appropriate, at new § 413.99(a)(3). We also proposed to add definitions for several new terms to ensure clarity and consistent application. Specifically, we proposed at new § 413.99(a)(3) to establish, for purposes of § 413.99, definitions for the following terms: *Deferred Compensation, Employee Retirement Income Security Act of 1974 (ERISA), Funded Plan, Non-Qualified Deferred Compensation Plan (NQDC), Non-Qualified Defined Benefit Plan (NQDB), Pension Benefit Guaranty Corporation (PBGC), Qualified Defined Benefit Plan (QDBP), Qualified Defined Contribution or Individual Account Plan (QDCP),* and *Unfunded plan.* The specific definitions we proposed to codify at § 413.99(a)(3) appear in the proposed rule at 87 FR 28648 through 28649.

We received no comments on this proposal and are finalizing this proposal without modification.

4. Principle Requirements (§ 413.99(b))

In the FY 2023 IPPS/LTCH proposed rule (87 FR 28613 through 28614), we proposed to establish at new § 413.99(b) the ''Principle requirements'' that must be satisfied by all Deferred Compensation Plans in order for costs incurred by a provider of services in connection with such plans to be allowable under the program. A formal Deferred Compensation Plan is an agreement between the provider of services and its participating employees, in which the agreeing parties can make contributions to the plan for the exclusive benefit of its participating employees. Proposed § 413.99(b)(1) would specify that amounts be contributed by a provider of services, or an employee of the provider of services, to a Qualified or Non-Qualified Deferred Compensation Plan, established and maintained by the provider of services to provide retirement income to employees or to result in the deferral of income by employees for periods extending to the termination of covered employment or beyond. Contributions or payments made by a provider of services for the benefit of its employees to a Qualified or Non-Qualified Deferred Compensation Plan are allowable when, and to the extent that, such costs are actually incurred by the provider of services and found to be reasonable and necessary under the principles of reasonable cost.

Contracts or agreements between hospital-based physicians and hospitals involve a variety of arrangements under which the physician is compensated by the hospital for the full range of services within the institution. We proposed to include requirements for recognition of the costs incurred to fund the plans for hospital-based physician patient care services and guarantee arrangements for physician emergency room services. Deferred compensation paid for physician services to hospitals and SNFs is part of physician compensation under § 415.60(a) and is directly attributable to an employee's salary. Deferred compensation is salary earned in the current period that is not received until a subsequent period, usually after retirement. Defined Contribution plans and Defined Benefit plans generally specify contributions and benefits as a percentage of employee salary. Deferred compensation based on unallowable compensation is also unallowable. Consistent with the policies in PRM–I, we proposed in § 413.99(b)(2) to specify that costs incurred by a hospital or SNF to fund a Qualified or Non-Qualified Deferred Compensation Plan for a provider-based physician must meet certain requirements to be allowable. These proposed requirements at § 413.99(b)(2)(i) through (iii) would establish that: (i) the allocation of physician compensation costs required under § 415.60 does not attribute the provider-based physician's Deferred Compensation entirely to one category of service and his current compensation to another; (ii) contributions or payments toward the Qualified or Non-Qualified Deferred Compensation Plan do not include any cost excluded from the definition of physician compensation at § 415.60(a); and (iii) the amount of Deferred Compensation does not exceed the amount specified in the agreement required by § 415.60(g).

In situations where the provider is merely acting as the billing agent for the physician whose remuneration is derived from billing for patient care services, the Medicare program will not recognize such remuneration. As a result, these proposed requirements would also specify that an arrangement between a physician and a provider of services under which the physician is reimbursed for patient charges, but the provider of services does the billing as a Deferred Compensation agreement, is not allowed. We proposed to codify this policy at § 413.99(b)(2)(iv).

We proposed to codify at § 413.99(b)(2)(v) that the costs incurred for physician guarantee arrangements for hospital emergency room availability services must also meet the additional requirements that: (1) the terms of both the guarantee arrangement and the Deferred Compensation plan establish the amounts to be included at the beginning of the hospital's cost reporting period; (2) the amount of Deferred Compensation is included in the guaranteed amount; (3) the hospital contributes to the fund established under the Deferred Compensation Plan from its own funds; (4) the amount of Deferred Compensation that is allowable is limited to the amount by which the guarantee, including Deferred Compensation, exceeds the total billed by the hospital to all patients for the physician's patient care services; and (5) when the physician's charges to all patients equal or exceed the amount guaranteed by the hospital, the program does not recognize a Deferred Compensation contribution/payment.

We received no comments on the proposed principle requirements of § 413.99(c) and are finalizing this proposal without modification.

5. Requirements for Non-Qualified and Qualified Deferred Compensation Plans (§ 413.99(c))

In the FY 2023 IPPS/LTCH proposed rule (87 FR 28614 through 28615), we proposed to codify the guidance from sections 2140 through 2142 of PRM–I regarding the requirements that must be

met in order for costs incurred by providers of services to be allowable for inclusion as Deferred Compensation in the Medicare cost report. The requirements vary based on the type of plan established by the provider of services. The plans currently recognized by the program include Deferred Compensation Plans, currently set forth in section 2140 of PRM–I, Qualified Defined Contribution Deferred Compensation Plans set forth in section 2141 of PRM–I, and Qualified Defined Benefit Pension Plans set forth in section 2142 of PRM–I. As discussed previously in section X.A.1. of this final rule, we proposed to codify the definitions of these types of plans and related terms, with clarifications where appropriate, in proposed new § 413.99(a)(3). We proposed to establish at new § 413.99(c) the plan-specific requirements that each type of Qualified or Non-Qualified Deferred Compensation Plan must meet in order for a provider of servicers contributions or payments to the plan to be allowable under the program.

Employer contributions for the benefit of employees under a Deferred Compensation Plan are allowable when, and to the extent that, such costs are actually incurred by the provider or services. Contributions to a funded Deferred Compensation Plan are allowable costs when they are made to the plan, to the extent they fall under the computed limit. Benefits paid for an unfunded Deferred Compensation Plans are allowable costs only when actually paid to the participating employees (or their beneficiaries), and only to the extent considered reasonable.

First, we proposed to codify at § 413.99(c)(1) the requirements for NQDCs, which can be funded or unfunded. Proposed § 413.99(c)(1)(i) would establish that an NQDC must meet the requirements for document compliance and operational compliance set forth in Internal Revenue Code (IRC) section 409A. Proposed paragraph (c)(1)(ii) would specify that a funded NDQC must meet the proposed definition of a Funded Plan in § 413.99(a)(3) and comply with the requirements in proposed § 413.99(c)(5) (discussed later in this section of this final rule). Proposed paragraph (c)(1)(iii) would provide that an unfunded NQDC must meet the definition of an Unfunded Plan as proposed in § 413.99(a)(3), and there must be no constructive receipt of income for employees from the NQDC as a result of contributions made by a provider of services.

Second, we proposed to codify at § 413.99(c)(2) the requirements for QDCPs. Consistent with our existing policies for Defined Contribution Deferred Compensation Plans found in section 2141.1 of PRM–I, proposed paragraph (c)(2)(i) would specify that a QDCP must meet the applicable requirements of ERISA, as amended, and the requirements set forth in IRC section 401(a), and, if applicable, section 401(k). In addition, proposed paragraph (c)(2)(ii) would specify that a QDCP must meet the proposed definition for a Funded Plan in § 413.99(a)(3) and comply with the requirements in proposed § 413.99(c)(5).

Third, we proposed to codify at § 413.99(c)(3) the requirements for QDBPs. Specifically, proposed § 413.99(c)(3)(i) would establish that a QDBP must meet the applicable requirements of ERISA, as amended, and the requirements for a QDBP under IRC section 401(a). Proposed paragraph (c)(3)(ii) would specify that a QDBP must meet the definition of a Funded Plan as proposed in § 413.99(a)(3) and comply with the requirements in proposed § 413.99(c)(5).

Fourth, we proposed to codify at § 413.99(c)(4) the requirements for NQDBs, which may be funded or unfunded. Proposed § 413.99(c)(4)(i) would establish that an NQDB must meet the requirements for document compliance and operational compliance set forth in Internal Revenue Code (IRC) section 409A. Proposed paragraph (c)(4)(ii) would specify that a funded NQDB must meet the definition of a Funded Plan as proposed in § 413.99(a)(3) and comply with the requirements in proposed § 413.99(c)(5). Proposed paragraph (c)(4)(iii) would provide that an unfunded NQDB must meet the definition of an Unfunded Plan as proposed in § 413.99(a)(3), and there must be no constructive receipt of income for employees from the NQDC as a result of contributions made by a provider of services.

We proposed to codify at § 413.99(c)(5) certain requirements for Funded Plans. We proposed to establish at paragraph (c)(5)(i) the types of funding mechanisms that Funded Plans must use in order for provider of services contributions and employee contributions to such plans to be included in allowable costs. Specifically, a Funded Plan would be required to use either to purchase an insured plan with a commercial insurance company, to establish a custodial bank account, or to establish a trust fund administered by a trustee. Proposed paragraph (c)(5)(ii) would codify our longstanding policy, set forth in section 2140.3.B of PRM–I, disallowing the use of an ordinary life insurance contract as a funding mechanism for a Funded Plan. Specifically, proposed paragraph (c)(5)(ii) would specify that the purchase of an ordinary life insurance contract (for example, whole life, straight life, or other) is not a deferral of compensation and is not recognized as a funding mechanism, even where it is convertible at the normal retirement date specified in the policy to an annuity payable over the remaining life of the employee. Proposed paragraph (c)(5)(iii) would establish that, regardless of the funding mechanism utilized, all provider of services and employee contributions to the fund established under the Deferred Compensation Plan and income therefrom must be used for the sole benefit of the participating employees.

The proposed requirements for a Funded Plan are based on the generally accepted definition of a Funded Plan, along with existing CMS policies on the funding of Deferred Compensation Plans found in section 2140.3 of PRM–I.

We received no comments on the proposed requirements of § 413.99(c) for Non-Qualified and Qualified Deferred Compensation plans and are finalizing this proposal without modification.

6. Recognition of Contributions or Payments to Qualified and Non-Qualified Deferred Compensation Plans (§ 413.99(d))

In the FY 2023 IPPS/LTCH proposed rule (87 FR 28615 through 28616), at proposed § 413.99(d), we proposed to codify rules and requirements that determine when payments or contributions by a provider to Qualified or Non-Qualified Deferred Compensation Plans that meet the applicable plan-specific requirements at proposed § 413.99(c) are recognized and included in allowable costs under the program. In general, the rules in proposed § 413.99(d) vary depending on whether a plan is qualified or non-qualified. In addition, certain special rules apply to contributions to QDBPs and NQDBs that are deposited into trusts.

First, for unfunded Deferred Compensation Plans (which include unfunded NQDBs), we proposed to codify at proposed § 413.99(d)(1)(ii) that payments made to such plans are included in allowable costs only during the cost reporting period in which an actual payment is made to the participating employees (or their beneficiaries) and only to the extent considered reasonable in accordance with § 413.100(c)(2)(vii)(A). This proposed requirement incorporates the existing regulatory requirement for

payments to unfunded Deferred Compensation Plans at § 413.100(c)(2)(vii)(A), to aid the reader in understanding related policies that appear in other sections of this part that affect unfunded NQDCs and unfunded NQDBs.

Second, regarding certain funded Deferred Compensation Plans (specifically funded Defined Contribution Plans, but excluding QDBPs and funded NQDBs), we proposed to include at § 413.99(d)(1)(ii) a cross reference to § 413.100(c)(2)(vii)(B), which requires that accrued costs related to matching or non-elective contributions to a funded Deferred Compensation Plan must be liquidated within 1 year after the end of the cost reporting period in which the liability is incurred. Under § 413.100(c)(2)(viii)(B), an extension, not to exceed 3 years beyond the end of the cost reporting year in which the liability was incurred, may be granted for good cause if the provider of services, within the 1-year time limit, furnishes to the contractor sufficient written justification for non-payment of the liability. Applying this requirement to QDCPs is consistent with § 413.100(c)(2)(vii)(B) and with policies established in section 2141.2 of PRM–I.

Third, contributions into a protected trust for QDBPs and funded NQDBs are allowable. We require that these assets be protected solely for the plan participants and to pay reasonable plan administrative expenses. Contributions or payments must be made by the provider into a protected trust and accounted for on a cash basis. For these plans, we proposed to establish at § 413.99(d)(1)(iii) that contributions by providers must satisfy the following four requirements to be allowable: first, the contributions must be paid to the plan participants or the plan trust; second, contributions are accounted for on a cash basis; third, money refunded from a plan must be treated as a negative contribution; and fourth, the allowable cost must be computed in accordance with the calculation defined in § 413.100(c)(2)(vii)(D). We described each of these proposed requirements in greater detail in the paragraphs that follow.

First, we proposed to establish at § 413.99(d)(1)(iii)(A) that QDBP or funded NQDB contributions are found to have been incurred only if paid directly to participants or beneficiaries under the terms of the plan or to the QDBP or NQDB. Proposed paragraph (d)(1)(iii)(A) codifies our existing policy, which is described in section 2142.6.A of PRM–I. Section 2142.6 states that provider contributions or payments made to a defined benefit pension plan are allowable only to the extent that costs are actually incurred by the provider. Such costs are found to have been incurred only if paid directly to participants or beneficiaries under the terms of the plan or paid to a pension fund which meets the applicable tax qualification requirements under IRC section 401(a).

Second, we proposed to codify at § 413.99(d)(1)(iii)(B) the existing regulatory requirement at § 413.100(c)(2)(vii)(D) for contributions to a QDBP or funded NQDB. Specifically, proposed § 413.99(d)(1)(iii)(B) would require that payments to a QDBP or funded NQDB for a cost reporting period be measured on a cash basis. A contribution or payment would be deemed to occur on the date it is credited to the fund established for the QDBP or funded NQDB, or for provider of services payments made directly to a plan participant or beneficiary, on the date the provider of services account is debited.

Third, we proposed to clarify the treatment of pension contributions when a QDBP or funded NQDB is terminated at § 413.99(d)(1)(iii)(C) as payments/contributions made to fully fund a terminating QDBP or funded NQDB are to be included as funding on the date they are paid. Excess assets withdrawn from a QDBP or funded NQDB are to be treated as negative contributions on the date that they are withdrawn. We believe our proposal to recognize negative contributions by reference to the date of withdrawal provides greater clarity than the standard under our current guidance under section 2140.3 of PRM–I, which refers to the ''year of plan termination,'' which is less specific and subject to interpretation.

Fourth, we proposed to specify at § 413.99(d)(1)(iii)(D) that QDBP and funded NQDB costs and limits are computed in accordance with the existing regulatory requirements at § 413.100(c)(2)(vii)(D). For purposes of determining the QDBP or funded NQDB cost limit under § 413.100(c)(2)(vii)(D)(*2*), we propose that provider of services contribution payments for each applicable cost reporting period shall be determined on a cash basis in accordance with proposed § 413.99(d)(1)(iii)(B), without regard to any limit determined for the period during which the contributions were made, and excluding any contributions deposited in a prior period and treated as carry forward contributions. We proposed that the averaging period used to determine the QDBP or funded NQDB cost limit shall be determined without regard to a provider of services period of participation in the Medicare program. Periods that are not Medicare cost reporting periods (for example, periods prior to the hospital's participation in the Medicare program) shall be defined as consecutive twelve-month periods ending immediately prior to the provider of services initial Medicare cost reporting period. We proposed that the averaging period used to determine the QDBP or funded NQDB cost limit shall exclude all periods ending prior to the initial effective date of the plan (or a predecessor plan in the case of a merger). Lastly, we proposed that in general, the current period defined benefit cost and limit shall be computed and applied separately for each QDBP or funded NQDB offered by a provider of services. In the case of a plan merger, the contribution payments made by a provider of services to a predecessor QDBP or funded NQDB and reflected in the assets subsequently transferred to a successor plan shall be treated as contribution payments made to the successor plan.

In the FY 2012 IPPS/LTCH PPS final rule, we established separate methodologies for measuring pension costs for Medicare cost-finding purposes (76 FR 51693 through 51697) and for purposes of updating the hospital wage index (76 FR 51586 through 51590). Under the methodology we established for the wage index, the pension costs that are to be included in the wage index equal a hospital's average cash contributions deposited to its defined benefit pension plan over a 3-year period or, if less than a 3-year period, the number of years that the hospital has sponsored a defined benefit plan. The 3-year average was centered on the base cost reporting period for the wage index. For example, the FY 2013 wage index is based on Medicare cost reporting periods beginning during Federal FY 2009 and reflects the average pension contributions made in hospitals' cost reporting periods beginning during Federal FYs 2008, 2009, and 2010. In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49505 through 49508), we modified the policy such that the 3-year average is based on pension contributions made during the base cost reporting period plus the prior 2 cost reporting years. For example, the FY 2017 wage index is based on Medicare cost reporting periods beginning during Federal FY 2013. Therefore, the FY 2017 wage index reflects the average pension contributions made in hospitals' cost

reporting periods beginning during Federal FYs 2011, 2012, and 2013 (rather than Federal FYs 2012, 2013, and 2014 under the prior policy established in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51586 through 51590)). While the QDBP cost for cost-finding purposes is computed using the cost period annual contributions limited by a cap (as codified in § 413.100(c)(2)(vii)(D)), the wage index QDBP cost is a 3-year average of annual plan contributions without adjustment or cap.

We received no comments on the proposed recognition under § 413.99(d) of contributions or payments to Qualified and Non-Qualified Deferred Compensation Plans and are finalizing this proposal without modification.

7. Documentation Requirements (§ 413.99(e))

In the FY 2023 IPPS/LTCH proposed rule (87 FR 28616 through 28617), we proposed to codify at § 413.99(e) that a provider of services must maintain and make available upon request documentation to substantiate the costs incurred for the plans included in its Medicare cost report. These proposed requirements for documentation are based on the existing regulatory requirements at § 413.20, which require providers of services to maintain sufficient financial records and statistical data for proper determination of costs payable under the program.

In addition, these requirements are based in part on the policy established when CMS revised the calculation for a QDBP and funded NQDB in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51693 through 51697). Section 2142.5.F of PRM–I states that the provider must have available data to show the amount(s) and date(s) of contribution payments made to a defined benefit pension plan during the current reporting period and any applicable prior periods. If the pension costs included in the cost report for a period differ from the pension contribution payments made during the reporting period (for example, as a result of carry forward contributions), the provider must also have data available to track and reconcile the difference.

Specifically, we proposed at § 413.99(e) that documentation must be maintained by the provider of services in accordance with § 413.20 to substantiate the allowability of the payments or contributions to Qualified or Non-Qualified Deferred Compensation Plans (or both) that it has included in its cost reports. With respect to *required documentation,* we proposed to specify at § 413.99(e)(1) that the provider of services must maintain and make available, upon request from the contractor or CMS, certain specified documentation, to substantiate the allowability of payments or contributions made by the provider of services to a Qualified or Non-Qualified Deferred Compensation Plan. Under proposed § 413.99(e)(1), the following documentation would be required: documentation that demonstrates that the provider of services is in compliance with IRC section 409A and IRC section 409A(a), and if applicable IRC section 457; ledger accounts/account statements for each plan participant noting current year deferrals, distributions, and loans, including any deferral election forms completed by employees, any change requests, and the approval of such requests; documentation that demonstrates the amount(s) and date(s) of actual payment/contributions made to the Non-Qualified or Qualified Deferred Compensation Plan during the current cost reporting period; Schedule SB of Form 5500 (tri-agency form (Department of Labor (DOL), Internal Revenue Service (IRS), PBGC) that plans file with the DOL's ''EFAST'' electronic filing system. The ''Form 5500'' is the Annual Return/Report of Employee Benefit Plan for a QDBP for the current cost reporting period, or any applicable prior periods; and, in the case of a system wide (multiple employer) plan, the home office shall identify the contributions attributed to each participating provider of services. If the costs included in the cost report for a period differ from the contributions made during the reporting period (for example, as a result of carry forward contributions), the provider of services must also have data available to track and reconcile the difference.

We also proposed to establish at § 413.99(e)(2) that the following additional documentation must be made available, upon request by the contractor or CMS, to substantiate the allowability of payments or contributions made by a provider of services to a Qualified or Non-Qualified Deferred Compensation Plan: the plan document, the trust document and all amendments related to the current cost reporting period; if applicable, any Form 5330, Return of Excise Taxes Related to Employee Benefit Plans, for the cost reporting period; supporting documents for all plan assets and liabilities, such as broker's statements, bank statements, insurance contracts, loan documents, deeds, etc., and verification of how assets are valued; trustee or administrator reports; ledgers; journals; trustee, administrator and investment committee minutes; certified audit report; and other financial reports for the trust. Any other financial reports, including receipt and disbursement statements, a detailed income statement and a detailed balance sheet; and, for each covered QDBP, documentation of the certified premium information and payments to the PBGC.

We received no comments on the proposed documentation requirements of § 413.99(e) and are finalizing this proposal without modification.

8. Administrative and Other Costs Associated With Qualified and Non-Qualified Deferred Compensation Plans (§ 413.99(f))

In the FY 2023 IPPS/LTCH proposed rule (87 FR 28617), in proposed § 413.99(f), we proposed to codify our current policies, as set forth in sections 2140, 2141, and 2142 of PRM–I, regarding the treatment of certain administrative and other costs related to Deferred Compensation Plans as allowable or non-allowable under the program. In the paragraphs that follow, we discuss our proposed treatment of various administrative costs related to Deferred Compensation Plans. First, we proposed to establish at § 413.99(f) that the provider of services shall file a cost report required under §§ 413.20 and 413.24(f) that is consistent with the proposed policies set forth in proposed § 413.99.

We received no comments on this proposal and are finalizing this proposal without modification.

a. Trustee and Custodial Fees

In the FY 2023 IPPS/LTCH proposed rule (87 FR 28617), we proposed to codify at § 413.99(f)(1) that reasonable trustee or custodial fees, including PBGC premiums, paid by the provider of services are allowed as an administrative cost, except where the plan provides that such fees are paid out of the corpus or earnings of the fund. Fees paid out of the corpus or earnings of the fund would not be allowed, based on the rationale that, because contributions into the plan trust pay for benefits and expenses that are paid from the trust, that means administrative costs paid out of the plan trust have already been accounted for through the allowance of contributions made by the provider of services. This proposed provision would codify our current policy, which is set forth in section 2140.3.B.1.d of PRM–I.

We received no comments on this proposal and are finalizing this proposal without modification.

b. Vested Benefits

In the FY 2023 IPPS/LTCH proposed rule (87 FR 28617), we proposed to codify at § 413.99(f)(2) that the forfeiture of an employee's benefits for cause (as defined in the plan) is recognized as an allowable cost provided that such forfeited amounts are used to reduce the provider of services contributions or payments to the plan during the cost reporting period in which the forfeiture occurs. This proposed provision would codify our policy on the effects of a forfeiture of vested benefits on the plan costs that are allowable under the program, as set forth at section 2140.3.D of PRM–I, with the added clarification that the reduction must occur in the cost reporting period in which the forfeiture occurs.

We proposed to codify at § 413.99(f)(3) our existing policy on the effects of employees' termination of participation in a plan before their rights are vested in the contributions/payments to the plan that are allowable under the program. Specifically, proposed § 413.99(f)(3) would specify that if an employee terminates participation in the Deferred Compensation Plan before their rights are vested, the applicable non-vested contributions/payments cannot be applied to increase the benefits of the surviving participants. Instead, the non-vested contributions/payments should be used to reduce the provider of services contributions/payments to the Deferred Compensation Plan, in the cost reporting period wherein the employee terminated participation in the Deferred Compensation Plan. Otherwise, the contributions/payments made by the provider of services must be applied to reduce the subsequent contributions/payments to the Deferred Compensation Plan in the next cost reporting period. If subsequent provider of services contributions/payments to the Deferred Compensation Plan are not made, then provider of services costs will be reduced by the contractor to the extent of such non-vested funds.

We received no comments on this proposal and are finalizing this proposal without modification.

c. DOL, IRS, and PBGC Penalties

Providers of services who maintain a Deferred Compensation Plan are required to comply with regulatory requirements related to the plan that are established by the Department of Labor (DOL), the IRS and the PBGC. Where providers of services fail to follow these requirements, a penalty may be levied. For example, the IRS levies an excise tax when payments are not timely filed. Section 1861(v)(8) of the Act sets forth items unrelated to patient care that are not considered reasonable under the program. In other words, these items are unallowable, and therefore cannot be included in the allowable costs of the provider of services. One of these items is the cost for fines and penalties resulting from violations of Federal, State, or local laws. Accordingly, in the FY 2023 IPPS/LTCH proposed rule (87 FR 28617), we proposed at § 413.99(f)(4) to specify that if the provider of services is assessed an excise tax or other remedy by DOL or IRS or PBGC for failure to follow the DOL, IRS, or PBGC requirements under ERISA, or any other penalty fee or penalty interest applicable to its Deferred Compensation Plan, the associated cost is unallowable, in accordance with section 1861(v)(8)(iv) of the Act.

We received no comments on this proposal and are finalizing this proposal without modification.

d. Loans Made From a Deferred Compensation Plan

Under our current policy, as set forth in section 2140.3.C of PRM–I providers of services are able to make a loan to themselves out of either corpus or income from their Qualified or Non-Qualified Deferred Compensation Plan on the conditions that the fund receive adequate security and a reasonable rate of interest on the loan. This existing policy is inconsistent with ERISA section 406 (29 U.S.C. 1106(1)(B)) which specifically prohibits lending of money or other extension of credit between the plan and a party in interest, unless found to be excepted under 29 U.S.C. 1108. The definition of a ''party in interest'' includes an employer any of whose employees are covered by such plan. The same provision exists in the IRC at 26 U.S.C. 4975. We believe that the policy we proposed to codify in new § 413.99 should reflect these provisions in ERISA and the IRS rules that are designed to protect Deferred Compensation Plans and the plans' participants and beneficiaries. Accordingly, in the FY 2023 IPPS/LTCH proposed rule (87 FR 28617), we proposed at § 413.99(f)(5) to specify that a provider of services cannot make a loan to itself from a Deferred Compensation Plan where ERISA or IRS rules prohibit such a transaction, except where specifically excepted. In cases where an exception applies, our existing policy on allowable interest expense at § 413.153 continues to apply.

We received no comments on this proposal and are finalizing this proposal without modification.

e. Termination/Discontinuation of a Deferred Compensation Plan

Sections 2140.3.D and 2141.3.D of PRM–I set forth CMS's policy on the effect of a provider of services declining to vest its outstanding required contributions/payments as a result of a termination, in full or in part, or a discontinuation of contributions or payments to a Deferred Compensation Plan. Under this policy, we proposed n the FY 2023 IPPS/LTCH proposed rule (87 FR 28617 through 28618), to codify at § 413.99(f)(6), where the provider of services declines to vest its outstanding required contributions/payments (that is, matching and non-elective or both) to a Deferred Compensation Plan, as a result of a termination, in full or in part, or a discontinuation of contributions or payments to a Deferred Compensation Plan, then the provider of services total outstanding required contributions or payments to the Deferred Compensation Plan during the cost reporting period wherein such termination is initiated cannot be included in the provider of services allowable cost for the cost reporting period in which the termination is initiated, nor any future period.

We received no comments on this proposal and are finalizing this proposal without modification.

f. Required Offset Against Interest Expense

In section 2140.3.D of PRM–I, CMS has established a policy that investment income earned on a fund after its termination but prior to liquidation of the fund's assets and distribution to the provider is offset against the provider's allowable interest expense. In the FY 2023 IPPS/LTCH proposed rule (87 FR 28618), we proposed to adopt the current policy in section 2140.3 of PRM–I at proposed § 413.99(f)(7), which would state that investment income earned on a Deferred Compensation Plan after its termination but prior to liquidation of the plan's assets and distribution to the provider of services must be offset against the provider of services allowable interest expense under § 413.153.

We received no comments on this proposal and are finalizing this proposal without modification.

g. Treatment of Residual Assets Following Termination of a Funded Plan

In section 2140.3.D of PRM–I, CMS has established a policy describing how residual assets arising from the termination of a funded plan are to be handled on the Medicare cost report. In

the FY 2023 IPPS/LTCH proposed rule (87 FR 28618), we proposed to adopt the current policy, as it appears in section 2140.3.D of PRM–I, at new § 413.99(f)(8). Specifically, we proposed that § 413.99(f)(8) would specify that residual assets arising from the termination of a funded plan must be recouped in the year of the plan termination only against the cost center(s) in which the provider of services reported its plan contributions/payments, usually the administrative and general cost center. Residual assets exceeding the amount in the administrative and general (or other) cost center are not further offset in the current or subsequent years. The Medicare share of the reversion is based on the Medicare utilization rate in the year the reversion occurs (or the year the actuarial surplus is determined), and not Medicare's utilization in the years the contributions to the plan were made.

We received no comments on this proposal and are finalizing this proposal without modification.

9. Treatment of Costs Associated With the Pension Benefit Guaranty Corporation (PBGC) (§ 413.99(g))

Since 1974, the PBGC has protected retirement security and the retirement incomes of over 33 million American workers, retirees, and their families in private sector defined benefit pension plans. A Qualified Defined Benefit Plan (defined previously as a QDBP) provides a specified monthly benefit at retirement, often based on a combination of salary and years of service. The PBGC was created by ERISA to encourage the continuation and maintenance of private sector defined benefit pension plans, provide timely and uninterrupted payment of pension benefits, and keep pension insurance premiums at a minimum.

General tax revenues do not fund the PBGC Single-Employer Program. The PBGC collects insurance premiums from employers that sponsor insured pension plans, earns money from investments, and receives funds from pension plans it takes over (see *https://www.pbgc.gov/about/how-pbgc-operates*).

Providers of services who offer a QDBP may incur costs related to the PBGC premiums. The proposed regulations outlined in this section of this final rule establish which costs incurred by providers of services who maintain a QDBP and pay premiums for basic benefits to the PBGC are allowable under the program. We proposed to include these provisions on the treatment of costs associated with the PBGC in paragraph (g) of proposed § 413.99.

In 29 U.S.C. 1306 the schedule for the premium rates, and the bases for application of those rates are set forth. Under 29 U.S.C. 1306, premiums are established for basic benefits, non-basic benefits, and reimbursement for uncollectible withdrawal liability. In the FY 2023 IPPS/LTCH proposed rule (87 FR 28618), we proposed at § 413.99(g)(1) that PBGC premiums and costs paid out of the corpus or earnings of the trust are included in the contributions allowed by § 413.99(d)(3)(ii), and therefore are not allowable as separate costs. We note, in the proposed rule we inadvertently made a typographical error and referred to § 413.99(d)(3)(ii) when we intended to refer to § 413.99(d)(1)(iii)(A). We also proposed at § 413.99(g)(2) that the amount of PBGC premiums paid for basic benefits (that is, flat rate or variable, excluding amounts paid out of the corpus or earnings of the trust) by a provider of services who sponsors a QDBP are allowable under the program. Similar to allowance of Administrative Costs as stated in proposed § 413.99(f)(1), while PBGC premiums are an allowable cost, they are not allowed if they are paid from the plan trust.

In 29 CFR part 4050, the rules for PBGC's program that holds retirement benefits for missing participants and beneficiaries of terminated retirement plans and pays those benefits to participants and beneficiaries when found, are provided. A Missing Participant is a former employee of a provider of services who has a liability remaining with the plan but cannot be located or is unresponsive when the plan terminates and closes out. Transfers of funds to the PBGC by the provider of services to cover this liability under the PBGC Missing Participant Program are allowable as long as they are not paid out of the corpus or earnings of the trust. In the FY 2023 IPPS/LTCH proposed rule (87 FR 28618), we proposed at new § 413.99(g)(3) that the total amount paid to the PBGC by a provider of services who sponsors a QDBP (excluding amounts paid out of the corpus or earnings of the trust) of the benefit transfer amount (see 29 CFR 4050.103(d)) for all missing participants or beneficiaries of the QDBP is allowable under the program.

After entering into a trusteeship agreement with the employer or after receiving an order issued by a U.S. district court approving termination, the PBGC guarantees employee plan benefits will be paid up to a certain limit if the QDBP has insufficient assets as part of a Distress Termination (as described in 29 CFR part 4041) or as part of a PBGC-initiated termination under 29 U.S.C. 1342. In the FY 2023 IPPS/LTCH proposed rule (87 FR 28618), we proposed at § 413.99(g)(4) that for terminated plans with insufficient assets to pay all of the plan benefits, where the PBGC guarantees the payment of vested benefits up to limits defined by law, only contributions to the QDBP made by a provider of services are allowable. Benefits paid to the participants and beneficiaries of the QDBP by the PBGC are unallowable.

In 29 CFR part 4047, PBGC is given the authority to restore a plan from terminated status to ongoing. Contributions and benefits paid by the provider of services to the PBGC or the plan or its participants and beneficiaries are allowable in this situation. In the FY 2023 IPPS/LTCH proposed rule (87 FR 28618), we proposed at § 413.99(g)(5) that where the PBGC issues or has issued a plan restoration order as described in 29 CFR part 4047, the amounts that the provider of services repays to the PBGC for guaranteed benefits and related expenses under the plan while the plan was in terminated status, and any administrative costs assessed by the PBGC, excluding penalties, are allowable.

We received no comments on the proposed treatment of costs associated with the PBGC under § 413.99(g) and are generally finalizing this proposal without modification, except we are revise the proposed regulation text at § 413.99(g)(1) so that the erroneous reference to § 413.99(d)(3)(ii) is corrected in the finalized regulation text and instead refers to § 413.99(d)(1)(iii)(A).

B. Condition of Participation (CoP) Requirements for Hospitals and CAHs To Continue Reporting Data for COVID–19 and Influenza After the PHE Ends as Determined by the Secretary

Under sections 1866 and 1902 of the Act, providers of services seeking to participate in the Medicare or Medicaid program, or both, must enter into an agreement with the Secretary or the state Medicaid agency, as appropriate. Hospitals (all hospitals to which the requirements of 42 CFR part 482 apply, including short-term acute care hospitals, LTC hospitals, rehabilitation hospitals, psychiatric hospitals, cancer hospitals, and children's hospitals) and CAHs seeking to be Medicare and Medicaid providers of services under 42 CFR part 485, subpart F, must be certified as meeting Federal participation requirements. Our conditions of participation (CoPs), conditions for coverage (CfCs), and requirements set out the patient health

and safety protections established by the Secretary for various types of providers and suppliers. The specific statutory authority for hospital CoPs is set forth in section 1861(e) of the Act; section 1820(e) of the Act provides similar authority for CAHs. The hospital provision at section 1861(e)(9) of the Act authorizes the Secretary to issue any regulations he or she deems necessary to protect the health and safety of patients receiving services in those facilities; the CAH provision at section 1820(e)(3) of the Act authorizes the Secretary to issue such other criteria as he or she may require. The CoPs are codified in the implementing regulations at part 482 for hospitals, and at 42 CFR part 485, subpart F, for CAHs.

Our CoPs at § 482.42 for hospitals and § 485.640 for CAHs require that hospitals and CAHs, respectively, have active facility-wide programs, for the surveillance, prevention, and control of healthcare-associated infections (HAIs) and other infectious diseases and for the optimization of antibiotic use through stewardship. Additionally, the programs must demonstrate adherence to nationally recognized infection prevention and control guidelines, as well as to best practices for improving antibiotic use where applicable, and for reducing the development and transmission of HAIs and antibiotic-resistant organisms. Infection prevention and control problems and antibiotic use issues identified in the required hospital and CAH programs must also be addressed in coordination with facility-wide quality assessment and performance improvement (QAPI) programs.

Infection prevention and control is a primary goal of hospitals and CAHs in their normal day-to-day operations, and these programs have been at the center of initiatives taking place in hospitals and CAHs during the PHE for COVID–19. Our regulations at §§ 482.42(a)(3) and 485.640(a)(3) require infection prevention and control program policies to address any infection control issues identified by public health authorities. We proposed to revise the hospital and CAH infection prevention and control and antibiotic stewardship programs CoPs to extend the current COVID–19 reporting requirements and to establish new reporting requirements for any future PHEs related to a specific infectious disease or pathogen.

Specifically, we proposed to revise the COVID–19 and Seasonal Influenza reporting standards for hospitals and CAHs (at §§ 482.42(e) and (f); and 485.640(d) and (e), respectively) to require that, beginning at the conclusion of the current COVID–19 PHE declaration and continuing until April 30, 2024, a hospital (or a CAH) must electronically report information about COVID–19 and seasonal influenza in a standardized format specified by the Secretary. In addition, we proposed additional requirements to address future PHEs related to infectious diseases at §§ 482.42(g) and 485.640(f), for hospitals and CAHs respectively. Specifically, when the Secretary has declared a PHE, we proposed to require hospitals and CAHs to report specific data elements to the CDC's National Health Safety Network (NHSN), or other CDC-supported surveillance systems, as determined by the Secretary. We noted that the proposed requirements of this section would apply to local, state, and national PHEs as declared by the Secretary.

In the proposed rule, we highlighted the various interim final rules with comment (IFC) that currently require hospitals and CAHs to report important data critical to support the fight against COVID–19 and noted that these requirements are both tied to the current PHE (meaning they would no longer be required post-PHE) and emphasized that COVID–19 reporting, by all hospitals and CAHs, have been, and continue to be, important in supporting surveillance of, and response to, the PHE for COVID–19. We stressed that such reporting requirements are necessary for CMS to monitor whether individual hospitals and CAHs are appropriately tracking, responding to, and mitigating the spread and impact of viral and bacterial pathogens and infectious diseases of pandemic or epidemic potential on patients, the staff who care for them, and the general public and the important role that such reporting plays when considering future planning. Additionally, we noted our concern that current reporting, while appropriately focused on the current COVID–19 pandemic, are too limited in scope for potential future use and noted that we are considering ways to ensure a more flexible regulatory framework to promote a nimble and informed response to the next potential pandemic or epidemic, so that we are able to immediately respond to the situation at hand. We refer readers to the FY 2023 IPPS proposed rule for this detailed discussion (87 FR 28618–28622).

In response to the proposed rule, we received approximately 757 public comments that specifically addressed the proposals to continue COVID–19-related data reporting and to establish reporting in the event of a future PHE declaration involving an infectious disease. Commenters included individuals, health care professionals and corporations, national associations, health department and emergency management professionals, and individual facilities that would be impacted by the regulation. We have organized our responses to the comments as follows: (1) general comments, (2) comments focused on the proposals for continued COVID–19-related data reporting, and (3) comments pertaining to the proposals for data reporting in the event of a future PHE declaration. We note that for many comments, CMS was unable to discern if the content was applicable to both proposals or specific to either the proposals for continued COVID–19-related reporting or future data reporting for a declared PHE involving an infectious diseases. We address these comments as general comments. To the extent possible, in those instances where commenters clearly referenced specific requirements in the proposals for either continued COVID–19-related reporting or reporting in the event of a future PHE, we address those comments in the applicable section. Comments related to the collection of information requirements and burden estimates are addressed in sections XII.B.10 and XII.H.11, ''Collection of Information Requirements'' and ''Regulatory Impact Analysis'' of this final rule, as appropriate.

A. General Comments

Comment: Several commenters agreed with our goal to ensure patient health and safety by continuing and establishing a flexible framework for data-driven surveillance and response for COVID–19 and future PHEs involving infectious diseases, respectively. Commenters stated that although collecting and reporting data may consume resources and increase demands on staff, such data are important for establishing and maintaining situational awareness during a PHE and beyond. They noted that these data are critical and used in decision making at the local, state, and federal levels. In addition, while these commenters noted the increased demands experienced by health care facilities and their staff during the COVID–19 PHE, they shared that efforts to recover and resume normal operations are well under way and re-enforced their commitment to providing the highest quality and safe level of care to patients at all times.

Response: We appreciate the support from commenters. We agree that data are critical for monitoring the spread of infectious diseases, informing research and guidance development by government and non-governmental

entities, and responding during and after a public health emergency. We commend health care facilities and their staff for their efforts throughout the COVID–19 pandemic and recovery, and we are also committed to ensuring high quality and safe care to patients.

Comment: While several commenters supported the overall policy goal, many commenters disagreed with our approach to achieve a flexible regulatory framework for data-driven surveillance and response for COVID–19 and future infectious diseases in the event of a PHE declaration. Commenters noted that these proposals would place undue burden on facilities, and particularly during and/or directly after PHEs, when patient care demands and stress and burnout among staff are increased. Some commenters stated the proposed data categories reflected a high level of detail that would be burdensome to collect and report thereby negatively impacting the accuracy of the data and taking time away from patient care, infection prevention and control, and quality improvement activities. Commenters also raised concerns regarding duplicative reporting and encouraged increased coordination at the local, state, and federal level to ease the burden on providers and limit the need to report the same information through multiple streams. Commenters also suggested reviewing the use case for each data category and eliminating those that are not providing valuable information. A few commenters stated that more reimbursement would be needed to support any additional reporting requirements. Others suggested that incentives for reporting data would be helpful.

Response: We understand the burden concerns expressed by commenters. As indicated in the proposed rule, CMS recognizes that the health and safety benefits associated with any reporting requirements must be carefully weighed against the potential burden they impose on facility operations—particularly in situations, like a public health emergency, where staff resources are stretched. We appreciate the comments about reimbursement and incentives; however, reimbursement and incentives are outside of the scope of the CoPs. As suggested by the commenters, we reviewed the use case for each data category, and we discuss this in greater detail in sections B and C. As with the current COVID–19 reporting required during the ongoing PHE, CDC and ASPR are working with states and other jurisdictions for the continuation of COVID–19-related reporting to ensure that states have access to the data reported directly to the federal government and that jurisdictions so inclined can continue to report on behalf of the hospitals within their jurisdictions. According to ASPR, approximately half of the states currently submit data on behalf of the hospitals in their jurisdictions and many have expressed their interest in continuing this capability. CDC, CMS, and ASPR concur and will continue to leverage this capability—where desired by jurisdictions—so that they may receive the data directly from hospitals to fulfill local jurisdictional reporting requirements and then pass the data to the federal government to alleviate the burden of hospitals reporting to both state health departments and the federal government.

Comment: Many commenters noted the significant administrative burden associated with manual entry, configuration, and submission of required data elements, and most agreed that greater automation of the reporting enterprise would be critical to minimizing future hospital burden. A few of these commenters also believed that, given widespread adoption of certified EHR technologies and associated interoperability standards, such automation was within reach for most hospitals. The majority, however, shared concern about the extent to which the technical and technological architecture to support automated, electronic reporting was in place—or would be soon, given the complex array of systems from which hospitals have to pull and assemble required data. These commenters noted that small, rural hospitals and CAHs in particular often lack the resources and IT expertise to establish and maintain the necessary system interfaces. Most commenters focused more on the capabilities necessary for automated data reporting, while some commenters focused on specific systems for data reporting. Specifically, some commenters recommended use of NHSN as a single pathway for data reporting and indicated that this would streamline reporting guidance and the systems for submitting data. Some commenters suggested that the data reporting pathways currently in place for the COVID–19 PHE should remain available for continued COVID–19-related reporting after the PHE ends and for reporting in the event of a future PHE declaration. These commenters noted that changing reporting systems requires modifying workflows and making these changes would increase burden.

Response: We thank commenters for their feedback and agree that greater automation of the reporting enterprise will greatly reduce burden on providers. We expect reporting to become increasingly automated and real-time as data systems and standards continue to mature and become more interoperable. As noted in the proposed rule, the CDC is investing in increasing the automation capabilities of surveillance systems, like the NHSN, and their ability to connect with other data submission techniques, vendors, and systems (87 FR 28622). We look forward to continuing the work in this space and are excited about the future possibilities as we continue efforts to protect and ensure the health and safety of patients.

Comment: Some commenters stated there was a lack of transparency in why CMS would need the data, who would use the data, and how the data would be used. These commenters also indicated that there should be a bi-directional flow of the information reported and that the data should be accessible to all health partners to both increase transparency and inform emergency management efforts.

Response: As CMS noted in the proposals, the proposed rule aimed to minimize data reporting while maintaining transparency [1160] and ensuring that public health agencies, researchers, and the public have sufficient awareness [1161] of overall health system capacity amid evolving epidemiological conditions in order to rapidly direct preventive and response actions. In addition, NHSN provides ready access to data to state and many local public health agencies for the facilities in their jurisdictions via their NHSN accounts and contributes aggregate data to multiple public-facing platforms, including HHS Protect and CMS Care Compare. For example, the COVID–19-related data pertaining to bed census and occupancy, vaccination of staff, and PPE supplies reported by hospitals and CAHs throughout the COVID–19 PHE has been publicly posted in aggregate on a regular basis on HHS Protect and/or NHSN websites.

Requiring the collection of the data supports our responsibility and commitment to protect the health and safety of hospital and CAH patients. These data would allow CMS to monitor whether individual hospitals and CAHs were appropriately tracking, responding to, and mitigating the impact on patients, the staff who care for them, and the general public. A streamlined approach will greatly assist government leaders in tracking, identifying new

[1160] *https://obamawhitehouse.archives.gov/the-press-office/2013/05/09/executive-order-making-open-and-machine-readable-new-default-government-*

[1161] *https://digital.gov/open-data-policy-m-13-13/*

threats, and ultimately inform decision-making, resource allocation, and the ability to inform a coordinated response effort across the nation. For example, during the COVID–19 PHE, the data collected and reported by hospitals and CAHs enabled CMS, in partnership with CDC and ASPR, to monitor the ability of facilities to provide safe care for patients by determining the number of COVID–19 patients being cared for in facilities; the amount of resources facilities were using; and facilities' continued capacity to provide safe care based on these factors. Throughout the COVID–19 pandemic, HHS and state and local agencies used these data to provide resources (such as PPE, staffing, strike teams, financial resources) to hospitals to ensure safe care and used these data to update guidance on the provision of care to patients during periods of scarce staffing, scarce PPE, and limited hospital capacity.

Comment: In response to our request for strategies to support a smooth transition, several commenters suggested implementation approaches that CMS could take to support compliance with the proposed reported policies. Commenters emphasized that the data definitions across facility types and different reporting organizations need to be clearly defined and consistent. These commenters noted that as an example, for healthcare worker COVID–19 vaccination data, the definition of a ''week'' is different depending on to which organization the data are being reported. Commenters stated that providing education to facilities on the context for data requests and usage would improve the quality, timeliness, and participation of reporting. Some commenters stated that data reporting requirements and relevant interpretative guidance should be clearly communicated with adequate lead time so that facilities could develop, implement, and update workflows and procedures for collecting and reporting the necessary data, as well as any changes in the data they are required to report. A few commenters suggested that facilities would need this interpretive guidance with a minimum notice of 30 to 60 days to prepare data reporting workflows and procedures.

Response: We appreciate the feedback and suggestions provided regarding strategies to help support implementation and a smooth transition. As stated in the proposed rule, facilities will be notified of the specific reporting requirements (start date, data elements and definitions, frequency, etc.) and subsequent changes in guidance, such as a Quality, Safety, and Oversight (QSO) memorandum, consistent with the notification methods used previously for COVID–19-related reporting (87 FR 28620); (see QSO–21–03-Hospitals/CAHs at *https://www.cms.gov/files/document/qso-21-03-hospitalscahs.pdf-0*). We will consider these comments when developing the interpretive guidance for this final rule.

B. Comments Focused on the Proposals for Continued COVID–19-Related Data Reporting

Comment: A few commenters stated that the proposal for continued COVID–19-related data was unclear, because the proposal indicated that hospitals and CAHs would report data in a standardized format specified by the Secretary. These commenters recommended that the rule clearly identify the systems by which hospitals and CAHs would be able to report data, to include HHS Protect.

Response: We agree that the rule does not identify specific systems for data reporting by hospitals and CAHs. Current regulations for COVID–19 reporting and reporting of acute respiratory illness, including seasonal influenza virus, influenza-like illness, and severe acute respiratory infection at § 482.42(e) and (f) (hospitals) and § 485.640(d) and (e) (CAHs) state that hospitals and CAHs must report information in a standardized format specified by the Secretary. We adopted that approach because it affords flexibility to adapt data reporting requirements in response to changing circumstances. In this rule, we maintain this regulatory language (in a standardized format as specified by the Secretary) thereby ensuring a sustained, flexible approach for continued COVID–19-related data reporting after the PHE ends. As indicated in the proposed rule, throughout the COVID–19 PHE, CMS notified hospitals and CAHs of the reporting requirements with QSO memorandums (for example, see QSO–21–03-Hospitals/CAHs at *https://www.cms.gov/files/document/qso-21-03-hospitalscahs.pdf-0*.) We anticipate a similar model of notification for the continued COVID–19-related data reporting requirements finalized in this rule.

Comment: A few commenters stated that it was difficult to understand the purpose of continuing COVID–19-related reporting beyond the current PHE declaration. The commenters stated that the data is of questionable value given the current state of the pandemic. Some commenters recommended that the COVID–19-related reporting requirements end when the current PHE expires and restart in the event another PHE is declared.

Response: We acknowledge the concerns raised by commenters, however disagree that there is no value in continued COVID–19 reporting beyond the current PHE. Due to the unpredictable nature of the novel SARS-CoV–2 virus that causes COVID–19, we believe that continuing COVID–19-related data reporting is necessary to protect the health and safety of hospital and CAH patients as well as the communities in which the hospitals and CAHs are located. The COVID–19-related data reported by all hospitals and CAHs, have been, and continue to be, important in supporting surveillance of, and response to, COVID–19 and other respiratory illnesses. These data play an important role in evaluating spread of respiratory viruses and infections, including but not limited to COVID–19 and influenza. Retaining the data reporting requirements after the end of the current COVID–19 PHE is an important element of maintaining effective surveillance of this novel virus. Timely and actionable surveillance will enable CMS to continue to respond to facilities in need of additional technical support and oversight, should they experience increased cases or outbreaks of COVID–19 and/or influenza. Furthermore, we note that these requirements will sunset April 2024, unless the Secretary establishes an earlier end date, based upon the statutory authority in the Social Security Act that authorizes the Secretary to issue any regulations deemed necessary to protect the health and safety of patients receiving services in hospitals (section 1861(e)(9) of the Act) and CAHs (section 1820(e)(3) of the Act).

Comment: Some commenters stated that our proposal to continue COVID–19-related data reporting beyond the current PHE declaration was burdensome and labor intensive, especially for infection preventionists and nurses who have worked additional hours and taken on additional duties since the start of the COVID–19 pandemic in March 2020. These commenters indicated that the proposals would add to an already high level of stress among health care personnel, prompting individuals to leave their positions and thereby exacerbating staffing shortages. Some commenters offered suggestions for reducing the data categories required to mitigate concerns regarding burden, particularly those pertaining to suspected cases, staff vaccination, and staffing shortages as these have already been made optional or retired from

current reporting requirements under the PHE (available at *https://www.hhs.gov/sites/default/files/covid-19-faqs-hospitals-hospital-laboratory-acute-care-facility-data-reporting.pdf*). In addition, a few commenters suggested reducing or changing specific data elements for health care worker vaccination status, including but not limited to those elements for vaccine manufacturer and first and second doses in a series. Some commenters suggested that we reevaluate the data categories and reduce where necessary without identifying specific data categories to remove. Other commenters stated that the proposed data categories were reasonable and represented a balance between burden on facilities and patient health and safety considerations associated with COVID–19.

Response: We understand the burden concerns shared by commenters and appreciate the suggestions offered to mitigate those concerns. As noted previously, we believe this information collection and record is vital to ensure the health and safety of patients and the communities in which they live. However, we agree that in a post-PHE posture that certain COVID–19 specific data categories may not provide additional value to inform our surveillance and mitigation efforts. Therefore, as further discussed in this section, we have re-evaluated the proposed data elements in consideration of the feedback shared by commenters and the evolving state of the current PHE and are modifying our proposal to remove the following from the list of required data categories to report:

- Suspected COVID–19 infections among patients and staff—Although data pertaining to suspected cases were valuable throughout the COVID–19 PHE, particularly in instances when testing supplies were limited and cases were often identified based on clinical signs and symptoms, this information is less meaningful now that testing supplies are readily available to confirm the presence of infection. Thus, we do not believe suspected COVID–19 infection data would be necessary to collect from hospitals and CAHs once the PHE declaration ends, and therefore, we removed this data category.
- Confirmed COVID–19 and influenza infections among staff, confirmed co-morbid influenza and COVID–19 infections among staff, and COVID–19 and influenza deaths among staff—The data categories for staff (suspected infections among staff; confirmed COVID–19, influenza, and co-morbid infections among staff; COVID–19 and influenza deaths among staff) have not been among the information that hospitals and CAHs were required to report throughout the COVID–19 PHE. Hospitals and CAHs were required to report suspected, confirmed, and comorbid infections, as well as deaths, for patients only. Upon reflection, we do not believe collecting these data for staff from hospitals and CAHs post-PHE is necessary.

While beneficial during an active PHE and the specific circumstances of the COVID–19 PHE, we believe the data categories previously noted are not necessary to provide the most valuable information during a post-PHE state for continued monitoring, and as such we are removing these data categories to be responsive to commenter concerns regarding increased burden on facilities and staff, while also attempting to provide quality care for patients.

The data categories that we are finalizing in this rule that hospitals and CAHs will be required to report relevant to COVID–19, to the extent as determined by the Secretary, are as follows: Confirmed infections among patients; Total deaths among patients; Personal protective equipment and testing supplies; Ventilator use, capacity, and supplies; Total bed and intensive care unit bed census and capacity; Staffing shortages; Vaccine administration data of patients and staff; and Relevant therapeutic inventories or usage, or both. The data categories that we are finalizing in this rule that hospitals and CAHs will be required to report relevant to influenza, to the extent as determined by the Secretary, are as follows: Confirmed infections among patients; Total deaths among patients; and Confirmed co-morbid influenza and COVID–19 infections among patients. We believe these data will offer the most valuable information during a post-PHE state by continuing to capture critical data on COVID–19 for ongoing surveillance and to inform any potential action to protect patient health and safety. As previously discussed, these data will enable the federal government to monitor the ability of facilities to provide safe care for patients by determining the number of COVID–19 and influenza infections being treated by facilities; the quantity of resources available to facilities and the volume of resources they are using; and facilities' continued capacity to provide safe patient care. In addition, as done throughout the COVID–19 pandemic, local, state, and federal authorities will continue to use these data to identify possible resurgence in cases and outbreaks, for resource allocation purposes, and to update guidance pertaining to the safe provision of patient care.

As indicated in the proposal, we do not expect continued daily reporting for COVID–19 or influenza outside of a declared PHE. Moreover, the rule allows for the scope of data categories and frequency of data collection and reporting to be reduced and limited, as determined by the Secretary, responsive to evolving clinical and epidemiology circumstances. This approach to reducing the proposed set of required data categories will provide a path towards winding down the overall reporting of COVID–19-related data between the end of the current PHE and April 2024, when these requirements will sunset. These requirements will not be implemented and enforced until the current COVID–19 PHE declaration concludes, and CMS will issue guidance indicating such a transition. As discussed previously, we expect the method of notification to follow a model similar to that which we used to inform regulated entities at the beginning of the COVID–19 PHE (see QSO–21–03-Hospitals/CAHs at *https://www.cms.gov/files/document/qso-21-03-hospitalscahs.pdf-0*).

C. Comments Pertaining to the Proposals for Data Reporting in the Event of a Future PHE Declaration

Comment: In the proposed rule, we solicited comment on the potential that long-term data collection in the event of a future PHE may duplicate elements already reported elsewhere and on the feasibility of such a requirement. Many commenters acknowledged the hard work of the hospital system during the COVID–19 PHE and the many efforts taken by facilities to quickly adapt and respond to both the demands of the PHE and the requirements to report critical data for monitoring and surveillance. When considering the feasibility of maintaining these efforts long-term, a few commenters questioned the appropriateness of requiring its collection as a CoP (noting that many hospitals provided such data voluntarily prior to mandating its collection), especially within the CoPs for infection prevention and control and antibiotic stewardship. Specifically, these commenters indicated that the COVID–19 data do not directly or indirectly reflect a facility's infection control policies or practices, but rather, are descriptive of public health information (such as, infection rate, bed capacity, supplies, etc.). With regard to duplication, some commenters raised concerns about accessibility and the flow of reported information across various government entities and response partners. Many noted that, throughout the COVID–19 PHE,

hospitals have been required to report similar (but not necessarily standardized) data elements to multiple agencies (federal, state, local) and through multiple platforms. Likewise, commenters also reiterated that various reporting requirements already exist such as requirements to report quality measures and shared concerns that the new requirements proposed would perpetuate, if not exacerbate, reporting redundancies that tax already limited facility and staff time and resources—particularly if state and local public health and emergency management agencies do not have timely or complete access to data reported through federal systems. Nearly all of these commenters called for CMS and other HHS agencies to work closely with facilities, as well as state and local agencies, to align and streamline future reporting requirements.

Response: We appreciate this informative feedback regarding the challenges and often redundant efforts associated with current reporting. As noted in the proposed rule, CMS does not intend to supplant or duplicate existing state and local requirements and mechanisms for reporting of public health and disease surveillance data (87 FR 28622). We believe that the reporting requirements proposed for health care facilities in these CoPs are distinct from and serve a different purpose than case surveillance of notifiable diseases and conditions that is conducted by state and local health departments. State and local authorities define their own reporting requirements and data definitions, but differences among these data neither enable comparisons across states and local jurisdictions nor provide a national perspective. Moreover, HHS does not have easy access to the data reported to state and local authorities; these authorities are not required to report the data to the federal government, and, unless such authorities are also directly providing health services, CMS has no authority to require state and local authorities to collect certain data, standardize the data collected, and report such data to the federal government. However, as discussed previously in this rule, during the COVID–19 PHE, HHS worked with states and other jurisdictions to ensure they had access to the data reported by hospitals and CAHs directly to the federal government, and several states submitted data to the federal government on behalf of hospitals and CAHs within their jurisdictions. HHS will continue to partner with state and local jurisdictions, health care facilities, and stakeholders to coordinate data collection, sharing, and accessibility in a streamlined fashion that satisfies the needs of all stakeholders while reducing duplicative reporting requirements, to the extent possible. Also as previously discussed, data collected and reported by hospitals and CAHs during the COVID–19 PHE enabled the federal government to monitor the ability of facilities to provide safe care to patients, and these date were used by local, state, and federal government agencies to allocate resources (such as PPE, staff, strike teams, funding) to hospitals and to update guidance on the provision of care, which was particularly important during periods of staffing and PPE scarcity and limited capacity. Therefore, we continue to see the value in creating long-term opportunities to activate the collection of this data and the need for increased preparedness across the health care system in the event of a future PHE. Lessons learned from the COVID–19 PHE have also highlighted the need for and importance of community engagement and collaboration amongst hospitals and CAHs, but also across provider types.

Throughout the COVID–19 pandemic, it has been imperative for facilities to have the ability to both assess and communicate their needs and to monitor their ability to continue to provide safe care. While we can appreciate the concerns shared by commenters regarding the burden and appropriateness of including a requirement for surveillance reporting as a long-term CoP in a facility's infection control and prevention standards, we disagree that such reporting is not appropriate for the CoPs in an effort to protect patient health and safety. However, we agree that additional consideration is necessary to fully establish a long-term solution for ensuring the preparedness of the healthcare system in the event of another PHE. Therefore, we are withdrawing our proposal to require future infectious disease reporting in the event of a declared PHE. We agree that continued collaboration across government partners and engagement with interested parties to standardize and streamline reporting efforts would be beneficial. We also echo commenters encouragement to continue efforts to further enhance the infrastructure used to support the submission of data for the long-term in hopes of mitigating many of the burden concerns raised by comments. We appreciate the commenters who have acknowledged the ongoing efforts by facilities to meet the current reporting requirements and the willingness of many hospitals to report the information voluntarily. While CMS considers a longer-term solution for ensuring overall preparedness as previously noted, it is our expectation that hospitals and CAHs will continue increasing their readiness and will be prepared to report data in the event of a future declared PHE.

Comment: We received a mixed response to our proposal to require facilities to report person-level data during a pandemic. Commenters who supported the proposal noted that person-level data would provide information about how different groups are affected by an infectious disease thereby supporting efforts focused on advancing health equity and suggested this data should include socioeconomic status. Commenters who disagreed noted concerns related to burden and indicated that such reporting would be unreasonable, particularly for larger facilities or those facilities lacking automated processes to collect and report such data. These commenters also questioned the use of and need for person-level data. Other commenters acknowledged our efforts to limit any directly or potentially individually identifiable person-level data, but noted the that local health departments currently use information such as name, date of birth, and patient addresses to link case and exposure data to identify clusters and inform infection prevention and control efforts by local jurisdictions.

Response: We thank commenters for their feedback. We believe that person-level data elements, such as race, ethnicity, age, sex residential county and zip code, and relevant comorbidities for affected patients, will help to inform response management and address health equity issues. In the absence of these data, it is challenging to take actions to reduce disparities in disease incidence and severity, access, and effectiveness of relevant preventive and therapeutic services (for example, vaccines) among vulnerable or otherwise marginalized populations. As noted in the proposed rule, the lack of individual data elements was an important gap raised during the COVID–19 PHE and we are seeking ways to increase our ability to follow patients through the health care system to provide actionable information on outcomes and health care facility capacities. We will consider all of the feedback received as we continue to explore issues of if and when person-level data may be warranted in the context of future PHE reporting requirements.

Comment: Many commenters supported our proposal to require facilities to report the required data to

the NHSN or some other CDC-supported surveillance system. Commenters acknowledged the CDC's NHSN as a leader for data collection and reporting in health care settings and supported our goal of promoting a standardized and streamlined framework for data reporting. However, while supporting the use of NHSN commenters emphasized that its usage must complement, not replace, existing data collection efforts that provide awareness and inform health care practices, especially those at the local level. Commenters noted that local health departments are increasingly called to facilitate coordination between health care facilities, provide leadership in response efforts, and often leverage their jurisdictional data to establish trends for their jurisdiction, and target stewardship and infection prevention and control initiatives. These commenters shared concerns regarding the likelihood that critical data would continue to be reported to both NHSN and any local surveillance systems given the resource burden that would be placed on providers. Specifically, commenters noted systems such as those used for case reporting, laboratory data, and vaccination registries.

Response: We appreciate the feedback and the additional comments noted previously regarding additional reporting streams and data collection efforts. In the proposed rule, we noted that we proposed reporting the CDC's NHSN because it is a vendor-neutral, federally owned system and as such provides ready access to data to state and many local public health agencies and can accept data submitted by outside vendors contracted either by hospitals, jurisdictions, or other Federal entities to submit data on behalf of providers (87 FR 28622). Additionally, as previously noted in the proposed rule, through resources provided by the American Rescue Plan Act and its Data Modernization Initiative, CDC is investing in increasing the automation capabilities of surveillance systems, like NHSN, and its ability to connect with other data submission techniques, vendors, and systems to further automate data collection, reduce provider burden, and increase data accessibility for stakeholders. In the proposed rule, CMS also noted the existing requirement for eligible hospitals and CAHs participating in the Promoting Interoperability Program to report four of the six of the measures associated with the Public Health and Clinical Data Exchange Objective (Syndromic Surveillance Reporting, Immunization Registry Reporting, Electronic Case Reporting, and Electronic Reportable Laboratory Result Reporting), and that to take advance of other reporting streams, CMS would consider other CDC-supported surveillance systems, as determined by the Secretary, for data reporting to allow for flexibility in the designation of future systems that are most capable of meeting these needs. We will consider all of these comments as we continue to seek opportunities to work with interested parties to explore the most effective approaches for data reporting that informs the success of our response efforts, incentivizes and encourages preparedness among providers in the event of a future PHE, and ensures health and safety for patients and communities served by providers.

Final Rule Action: After consideration of the public comments, we are finalizing our proposal with the following changes—

1. We are modifying our proposal at §§ 482.42(e) and (f) for hospitals and §§ 485.640(d) and (e) for CAHs, to decrease the scope of data categories required for continued COVID–19 and seasonal influenza reporting.

2. We are withdrawing our proposal to add new paragraphs at 482.42(g) (hospitals) and 485.640(f) (CAHs), to establish reporting requirements for an infectious disease in the event of a PHE declaration. CMS believes that additional consideration is necessary to establish a longer-term solution for data collection and reporting that ensures the ongoing preparedness of the entire health care system in the event of another PHE involving an infectious disease or a PHE resulting from natural or human-made factors. We also believe that continued collaboration among government and interested parties would be beneficial to standardize and streamline data reporting to the extent possible thereby reducing burden on facilities, particularly during emergencies when resources are stretched and patient care-related work demands are elevated. As previously discussed, while CMS considers a longer-term solution for ensuring overall preparedness in the event of future emergencies, it is our expectation that hospitals and CAHs will continue assessing and improving their readiness to report data in the event of a future declared PHE, consistent with their existing requirements for emergency preparedness.

C. Public Comments Requested on IPPS and OPPS Payment Adjustments for Wholly Domestically Made NIOSH-Approved Surgical N95 Respirators

In the FY 2023 IPPS/LTCH PPS proposed rule, we requested public comments on potential IPPS and OPPS payment adjustments for wholly domestically made National Institute for Occupational Safety & Health (NIOSH)-approved surgical N95 respirators (87 FR 28622 through 28625). Given the importance of NIOSH-approved surgical N95 respirators in protecting hospital personnel and beneficiaries from the SARS–CoV–2 virus and future respiratory pandemic illnesses, we indicated we were considering whether it might be appropriate to provide payment adjustments to hospitals to recognize the additional resource costs they incur to acquire NIOSH-approved surgical N95 respirators that are wholly domestically made. We stated that NIOSH-approved surgical N95 respirators, which faced severe shortage at the onset of the COVID–19 pandemic, are essential for the protection of patients and hospital personnel that interface with patients. We indicated that procurement of NIOSH-approved surgical N95 respirators that are wholly domestically made, while critical to pandemic preparedness and protecting health care workers and patients, can result in additional resource costs for hospitals.

We stated we were interested in feedback and comments on the appropriateness of payment adjustments that would account for these additional resource costs. We stated that we believed such payment adjustments could help achieve a strategic policy goal, namely, sustaining a level of supply resilience for NIOSH-approved surgical N95 respirators that is critical to protect the health and safety of personnel and patients in a public health emergency. We stated we were considering such payment adjustments for 2023 and potentially subsequent years.

We received many comments that were helpful in developing the payment adjustment that we proposed in the CY 2023 OPPS/ASC proposed rule. For instance, many commenters were supportive of a payment adjustment, acknowledging the importance of surgical N95 respirators in keeping health care workers and patients safe and attesting to the difficulties of procuring surgical N95 respirators during the height of the COVID–19 pandemic. The majority of commenters supported an approach of CMS making biweekly interim lump-sum payments

that would be reconciled at cost report settlement, although some commenters preferred a claims-based approach. Many commenters urged CMS to minimize the administrative burden on hospitals in the development of any N95 payment policy. We also acknowledge the comments of MedPAC and others stating that Medicare payment policy is not the most appropriate mechanism to support domestic manufacturing of medical supplies.

In the CY 2023 OPPS/ASC proposed rule, we proposed to make a payment adjustment under the OPPS and IPPS for the additional resource costs of domestic NIOSH-approved surgical N95 respirators for cost reporting periods beginning on or after January 1, 2023. We refer the reader to the CY 2023 OPPS/ASC proposed rule for the complete discussion on this proposal.

XI. MedPAC Recommendations

Under section 1886(e)(4)(B) of the Act, the Secretary must consider MedPAC's recommendations regarding hospital inpatient payments. Under section 1886(e)(5) of the Act, the Secretary must publish in the annual proposed and final IPPS rules the Secretary's recommendations regarding MedPAC's recommendations. We have reviewed MedPAC's March 2022 ''Report to the Congress: Medicare Payment Policy'' and have given the recommendations in the report consideration in conjunction with the policies set forth in this final rule. MedPAC recommendations for the IPPS for FY 2023 are addressed in Appendix B to this final rule.

For further information relating specifically to the MedPAC reports or to obtain a copy of the reports, contact MedPAC at (202) 653–7226, or visit MedPAC's website at *https://www.medpac.gov*.

XII. Other Required Information

A. Publicly Available Files

IPPS-related data are available on the internet for public use. The data can be found on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index*. We listed the data files available in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28625 through 28627).

Commenters interested in discussing any data files used in construction of this final rule should contact Michael Treitel at (410) 786–4552.

B. Collection of Information Requirements

1. Statutory Requirement for Solicitation of Comments

Under the Paperwork Reduction Act (PRA) of 1995, we are required to provide 60-day notice in the **Federal Register** and solicit public comment before a collection of information requirement is submitted to the Office of Management and Budget (OMB) for review and approval. In order to fairly evaluate whether an information collection should be approved by OMB, section 3506(c)(2)(A) of the PRA of 1995 requires that we solicit comment on the following issues:

- The need for the information collection and its usefulness in carrying out the proper functions of our agency.
- The accuracy of our estimate of the information collection burden.
- The quality, utility, and clarity of the information to be collected.
- Recommendations to minimize the information collection burden on the affected public, including automated collection techniques.

In the FY 2023 IPPS/LTCH PPS proposed rule, we solicited public comment on each of these issues for the following sections of this document that contain information collection requirements (ICRs).

2. ICRs for the Hospital Wage Index for Acute Care Hospitals

Section III.E.1. of the preamble of this final rule, use of 2019 Medicare wage index occupational mix survey for the FY 2023 wage index, references the information collection request currently approved under 0938–0907. There were no proposed changes to the currently approved information collection request associated with this rulemaking; however, we note that the information collection expires October 31, 2022. An extension of the information collection request is currently being developed. The public will have an opportunity to review and submit comments regarding the extension of this PRA package through a public notice and comment period separate from this rulemaking.

Section III.I.2.a. of the preamble of this final rule, FY 2023 Reclassification Application Requirements and Approvals, references the information collection request 0938–0573 which expired on January 31, 2021. A reinstatement of the information collection request is currently being developed. The public will have an opportunity to review and submit comments regarding the reinstatement of this PRA package through a public notice and comment period separate from this rulemaking.

We did not receive comments regarding the ICRs for the hospital wage index for acute care hospitals.

3. ICRs for Payments for Low-Volume Hospitals

As discussed in section V.C. of this final rule, in accordance with section 1886(d)(12) of the Act, beginning with FY 2023, the low-volume hospital definition and payment adjustment methodology will revert back to the statutory requirements that were in effect prior to the amendments made by the Affordable Care Act and subsequent legislation. Therefore, effective for FY 2023 and subsequent years, under current policy at § 412.101(b), in order to qualify as a low-volume hospital, a subsection (d) hospital must be more than 25 road miles from another subsection (d) hospital and have less than 200 discharges during the fiscal year. In that section we also discuss the process for requesting and obtaining the low-volume hospital payment adjustment under § 412.101. Specifically, a hospital makes a written request to its MAC that contains sufficient documentation to establish that the hospital meets the applicable statutory mileage and discharge criteria. While this information collection requirement would normally be subject to the PRA, we believe in this instance it is exempt. Based on historical data, we estimated there are fewer than 5 hospitals among all subsection (d) hospitals that will meet the applicable mileage and discharge criteria for FY 2023. In accordance with the implementing regulations of the PRA at 5 CFR 1320.3(c)(4), the requirement will be exempt as it affects less than 10 entities in a 12-month period.

We did not receive comments regarding the ICRs for payments for low-volume hospitals.

4. ICRs Relating to the Hospital Readmissions Reduction Program

In section V.H of the preamble of this final rule, we discuss requirements for the Hospital Readmissions Reduction Program. In this rule, we are not removing or adopting any new measures into the Hospital Readmissions Reduction Program for FY 2023. All six of the current Hospital Readmissions Reduction Program's measures are claims-based measures. We believe that continuing to use these claims-based measures would not create or reduce any information collection burden for hospitals because they will continue to be collected using Medicare FFS claims that hospitals are already submitting to

the Medicare program for payment purposes.

5. ICRs for the Hospital Value—Based Purchasing (VBP) Program

In section V.I. of the preamble of this final rule, we discuss new requirements we are finalizing for the Hospital VBP Program. Specifically, in this final rule, with respect to quality measures, we are finalizing our proposals to suppress the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) Survey and the five Healthcare—Associated Infection (HAI) measures for the FY 2023 program year. We are also finalizing our proposal to continue requiring hospitals to report data for all measures, including measures we are suppressing for FY 2023. Because the FY 2023 Hospital VBP Program will use data that are also used to calculate quality measures in other programs and Medicare FFS claims data that hospitals are already submitting to CMS for payment purposes, we do not anticipate any change in burden associated with this final rule.

6. ICRs Relating to the Hospital-Acquired Condition (HAC) Reduction Program

In this final rule, we are not removing any measures, adopting any new measures into the HAC Reduction Program, or updating our validation procedures.[1162] The HAC Reduction Program has previously adopted six measures: the CMS PSI 90 measure and five CDC NHSN HAI measures. We are not finalizing our proposal to not calculate measure results for PSI 90 and thus will be calculating measure results for the FY 2023 HAC Reduction program. We do not believe that the claims-based CMS PSI 90 measure in the HAC Reduction Program creates additional burden for hospitals because the measure is calculated using the Medicare FFS claims that hospitals have submitted to the Medicare program for payment purposes. Accordingly, we do not believe that our finalized policy in sections V.J.3.c.(1). to increase the minimum volume threshold for the CMS PSI 90 measure changes any information collection burden for hospitals.

We note the burden associated with collecting and submitting data for the HAI measures (CAUTI, CLABSI, Colon and Abdominal Hysterectomy SSI, MRSA bacteremia, and CDI) via the CDC's NHSN system is captured under a separate OMB control number, 0920–0666 (expiration January 1, 2025). As discussed in sections V.J.2.b.(2). and V.J.2.b.(3). of the preamble of this final rule, we are suppressing the five NHSN measures from the FY 2023 HAC Reduction Program. We are also suppressing CY 2021 CDC NHSN HAI data from the FY 2024 program year. Because hospitals would continue to report data for the HAI measures, this policy does not change information collection burden for hospitals as accounted for under CDC's OMB control number 0920–1066.

In section V.J.7. of the preamble of this final rule, we clarify the removal of the No Mapped Locations (NML) policy beginning in FY 2023. Hospitals will be required to appropriately submit data to the NHSN or, if hospitals do not have the applicable locations for the CLABSI and CAUTI measures, the hospital must submit an IPPS Measure Exception Form to be exempt from CLABSI and CAUTI reporting for CMS programs. The burden for all hospitals to submit data to the NHSN is already accounted for under OMB control number 0920–0666, therefore there is no increase in burden for hospitals which submit data as a result of this clarification. In addition, the burden associated with completion of forms (including the IPPS Measure Exception Form) is already accounted for under OMB control number 0938–1022 (expiration date December 31, 2022), therefore there is no increase in burden for hospitals which elect to submit this form as a result of this clarification. This clarification does not necessitate substantive changes to the IPPS Measure Exception Form, therefore any change in burden is negligible and our currently approved burden estimates under OMB control number 0938–1022 are conservative enough to accommodate the change. Revisions to the IPPS Measure Exception Form, will be submitted for approval under OMB control number 0938–1022.

We did not receive comments regarding the ICRs for the HAC Reduction Program.

7. ICRs for the Hospital Inpatient Quality Reporting (IQR) Program

a. Background

The Hospital IQR Program (formerly referred to as the Reporting Hospital Quality Data for Annual Payment Update (RHQDAPU) Program) was originally established to implement section 501(b) of the MMA, Public Law 108–173. OMB has currently approved 1,572,810 hours of burden and approximately $65 million under OMB control number 0938–1022 (expiration date December 31, 2022), accounting for information collection burden experienced by approximately 3,300 IPPS hospitals and 1,100 non-IPPS hospitals for the FY 2024 payment determination. In the proposed rule (87 FR 28627 through 28635) and this final rule, we describe the burden changes regarding collection of information under OMB control number 0938–1022 (expiration date December 31, 2022) for IPPS hospitals.

For more detailed information on our finalized policies for the Hospital IQR Program, we refer readers to section IX.E. of the preamble of this final rule. We are adopting four measures that we expect to affect our collection of information burden estimates: (1) The Hospital Commitment to Health Equity structural measure, beginning with the CY 2023 reporting period/FY 2025 payment determination and for subsequent years; (2) the Screening for Social Drivers of Health measure, beginning with voluntary reporting for the CY 2023 reporting period and mandatory reporting beginning with the CY 2024 reporting period/FY 2026 payment determination; (3) the Screen Positive Rate for Social Drivers of Health measure, beginning with voluntary reporting for the CY 2023 reporting period and mandatory reporting beginning with the CY 2024 reporting period/FY 2026 payment determination; and (4) the Hospital-level THA/TKA PRO–PM, beginning with voluntary reporting across two periods, followed by mandatory reporting of the measure for the reporting period which runs from July 1, 2025 through June 30, 2026, impacting the FY 2028 payment determination. We are also modifying our eCQM reporting and submission requirements which will increase the total number of eCQMs to be reported from four to six eCQMs beginning with the CY 2024 reporting period/FY 2026 payment determination, which will additionally affect our collection of information burden. The estimated collection of burden associated with our finalized proposals is discussed in this section of this final rule.

We are also finalizing policies which will not affect the information collection burden associated with the Hospital IQR Program. As discussed in section IX.E. of the preamble of this final rule, we are adopting four eCQMs: (1) Cesarean Birth electronic clinical quality measure (eCQM), with inclusion in the eCQM measure set beginning with the CY 2023 reporting period/FY 2025 payment determination, followed by mandatory reporting beginning with the CY 2024 reporting period/FY 2026 payment

[1162] Burden associated with the validation procedures in the HAC Reduction Program are accounted for under OMB Control Number 0938–1352.

determination; (2) Severe Obstetric Complications eCQM, with inclusion in the eCQM measure set beginning with the CY 2023 reporting period/FY 2025 payment determination, followed by mandatory reporting beginning with the CY 2024 reporting period/FY 2026 payment determination; (3) Hospital-Harm—Opioid-Related Adverse Events eCQM, beginning with inclusion in the eCQM measure set in the CY 2024 reporting period/FY 2026 payment determination; and (4) Global Malnutrition Composite Score eCQM, beginning with inclusion in the eCQM measure set in the CY 2024 reporting period/FY 2026 payment determination. We are also adopting two claims-based measures beginning with the FY 2024 payment determination: (1) MSPB Hospital; and (2) the Hospital-Level RSCR Following Elective Primary THA/TKA. We are refining two current Hospital IQR Program claims-based measures beginning with the FY 2024 payment determination: (1) Hospital-Level, Risk-Standardized Payment Associated with an Episode of Care for Primary Elective THA/TKA; and (2) The Acute Myocardial Infarction (AMI) Excess Days in Acute Care (EDAC). Lastly, we are: (1) Establishing a hospital designation related to patient care to be publicly-reported on a public-facing website beginning in Fall 2023; (2) modifying our case threshold exemptions and zero denominator declaration policies for hybrid measures as we believe they are not applicable for this measure type beginning with the FY 2026 payment determination; and (3) modifying our eCQM validation policy to increase the reporting of medical requests from 75 percent of records to 100 percent of records, beginning with the validation of CY 2022 eCQM data affecting the FY 2025 payment determination.

The most recent data from the Bureau of Labor Statistics reflects a median hourly wage of $21.20 per hour for a medical records and health information technician professional.[1163] We calculated the cost of overhead, including fringe benefits, at 100 percent of the median hourly wage, consistent with previous years. This is necessarily a rough adjustment, both because fringe benefits and overhead costs vary significantly by employer and methods of estimating these costs vary widely in the literature. Nonetheless, we believe that doubling the hourly wage rate ($21.20 × 2 = $42.40) to estimate total cost is a reasonably accurate estimation method. Accordingly, unless otherwise specified, we will calculate cost burden to hospitals using a wage plus benefits estimate of $42.40 per hour throughout the discussion in this section of this rule for the Hospital IQR Program.

In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45507), our burden estimates were based on an assumption of approximately 3,300 IPPS hospitals. For this final rule, we are updating our assumption to 3,150 IPPS hospitals based on recent data from the FY 2022 Hospital IQR Program payment determination which reflects a closer approximation of the total number of hospitals reporting data to the Hospital IQR Program.

b. Information Collection Burden Estimate for the Hospital Commitment to Health Equity Structural Measure Beginning With the CY 2023 Reporting Period/FY 2025 Payment Determination

In section IX.E.5.a. of the preamble of this final rule, we are finalizing adoption of the Hospital Commitment to Health Equity structural measure beginning with the CY 2023 reporting period/FY 2025 payment determination. Hospitals will report data through the Hospital Quality Reporting (HQR) System.

Hospitals will submit the response on an annual basis during the submission period. We estimate the information collection burden associated with this structural measure to be, on average across all 3,150 IPPS hospitals, no more than 10 minutes per hospital per year, as it involves attesting to as many as five questions one time per year for a given reporting period. While we understand some hospitals may require more than 10 minutes to research the information needed to respond, we believe that the majority of hospitals will have the information readily available to respond to the questions listed in section IX.E.5.a. of the preamble of this final rule and will require less than 10 minutes. In addition, we believe that many hospitals will be able to submit similar responses in future years, thereby reducing the actual time to respond in subsequent reporting periods. Using the estimate of 10 minutes (or 0.167 hours) per hospital per year, and the updated wage estimate as described previously, we estimate that this policy will result in a total annual burden increase of 525 hours across all participating IPPS hospitals (0.167 hours × 3,150 IPPS hospitals) at a cost of $22,260 (525 hours × $42.40). With respect to any costs/burdens unrelated to data submission, we refer readers to the Regulatory Impact Analysis (section I.K. of Appendix A of this final rule).

c. Information Collection Burden Estimate for the Screening for Social Drivers of Health Measure Beginning With Voluntary Reporting in the CY 2023 Reporting Period and Mandatory Reporting in the CY 2024 Reporting Period/FY 2026 Payment Determination

In section IX.E.5.b.(1). of the preamble of this final rule, we are adopting the Screening for Social Drivers of Health measure beginning with voluntary reporting in the CY 2023 reporting period and mandatory reporting beginning with the CY 2024 reporting period/FY 2026 payment determination. Hospitals will report data through the HQR System.

As discussed in the preamble of this final rule, hospitals will be able to collect data and report the measure via multiple methods. We believe that most hospitals will likely collect data through a screening tool incorporated into their electronic health record (EHR) or other patient intake process.

We believe the Outcome and Assessment Information Set (OASIS), which is currently used in the Home Health Quality Reporting Program, is a reasonable comparison for estimating the information collection burden for the Screening for Social Drivers of Health measure due to analogous assessment of patient-level need. The OASIS is a core standard assessment data set home health agencies integrate into their own patient-specific, comprehensive assessment to identify each patient's need for home care that meets the patient's medical, nursing, rehabilitative, social, and discharge planning needs. For OASIS, the currently approved information collection burden under OMB 0938–1279 (expiration date November 30, 2024) is estimated to be 0.3 minutes per data element (18 seconds). For the five HRSN domains screened for by the Social Drivers of Health measure under the Hospital IQR Program, we estimate a total of 2 minutes (0.033 hours) per patient to conduct this screening. The most recent data from the Bureau of Labor Statistics reflects an Average Hourly Earnings of $31.31.[1164] Based on information collected by the American Hospital Association,[1165] we estimate

[1163] U.S. Bureau of Labor Statistics. Occupational Outlook Handbook, Medical Records and Health Information Technicians. Accessed on January 13, 2022. Available at: *https://www.bls.gov/ooh/healthcare/medical-records-and-health-information-technicians.htm.*

[1164] U.S. Bureau of Labor Statistics. Economy at a Glance, Average Hourly Earnings. Accessed on January 24, 2022; available at: *https://www.bls.gov/eag/eag.us.htm.*

[1165] *https://www.aha.org/system/files/media/file/2020/01/2020-aha-hospital-fast-facts-new-Jan-2020.pdf.*

approximately 21,000,000 patients (34,251,159 total admissions in U.S. community hospitals × 3,150 IPPS hospitals ÷ 5,198 total U.S. community hospitals) will be screened annually across all participating IPPS hospitals. For the purposes of calculating burden, we estimate that during the voluntary period, 50 percent of hospitals will survey 50 percent of patients. We estimate during the mandatory period, hospitals would submit for 100 percent of patients. For the CY 2023 voluntary reporting period, we estimate a total burden of 175,000 hours (21,000,000 respondents × 50 percent of patients × 50 hospitals of hospitals × 0.033 hours) at a cost of $5,479,250 (175,000 hours × $31.31) across all participating IPPS hospitals. For the CY 2024 reporting period and subsequent years, we estimate a total annual burden of 700,000 hours (21,000,000 respondents × 0.033 hours) at a cost of $21,917,000 (700,000 hours × $31.31) across all participating IPPS hospitals.

Measure data will be submitted via the HQR System annually. Similar to the currently approved data submission and reporting burden estimate for eCQMs in the Hospital IQR Program and web-based measures for the Ambulatory Surgical Center Quality Reporting (ASCQR) Program (OMB control number 0938–1270; expiration date July 31, 2024) reported via the HQR System, we estimate a burden of 10 minutes per hospital response to transmit the measure data. Therefore, we estimate that each participating facility will spend 10 minutes (0.1667 hours) annually to collect and submit the data via this portal. For the purposes of calculating burden, we estimate that during the voluntary period, 50 percent of hospitals will submit data. For the CY 2023 voluntary reporting period, we estimate a total burden of 263 hours (0.1667 hours × 3,150 hospitals × 50 percent of hospitals) at a cost of $11,151 (263 hours × $42.40) across all participating IPPS hospitals. For the CY 2024 reporting period and subsequent years, we estimate a total annual burden for all participating IPPS hospitals of 525 hours (0.1667 hours × 3,150 hospitals) at a cost of $22,260 (525 hours × $42.40).

With respect to any costs/burdens unrelated to data submission, we refer readers to the Regulatory Impact Analysis (section I.K. of Appendix A of this final rule).

d. Information Collection Burden Estimate for the Screen Positive Rate for Social Drivers of Health Process Measure Beginning With Voluntary Reporting in the CY 2023 Reporting Period and Mandatory Reporting Beginning With the CY 2024 Reporting Period/FY 2026 Payment Determination

In section IX.E.5.b.(2). of the preamble of this final rule, we are adopting the Screen Positive Rate for Social Drivers of Health measure beginning with voluntary reporting in the CY 2023 reporting period and mandatory reporting beginning with the CY 2024 reporting period/FY 2026 payment determination. Hospitals will report data through the HQR System. For this measure, hospitals will be required to report on an annual basis the number of patients who screen positive for one or more of the five domains (reported as five separate rates) divided by the total number of patients screened.

We previously included the burden associated with screening patients in our discussion of the Screening for Social Drivers of Health measure. For this measure, we estimate only the additional burden for a hospital reporting via the HQR System since patients would not need to provide any additional information for this measure. We estimate that each participating facility will spend 10 minutes (0.1667 hours) annually to collect and submit the data. For the purposes of calculating burden, we estimate that during the voluntary period, 50 percent of hospitals would submit data. For the CY 2023 voluntary reporting period, we estimate a total burden of 263 hours (0.1667 hours × 3,150 hospitals × 50 percent of hospitals) at a cost of $11,130 (263 hours × $42.40) across all participating IPPS hospitals. For the CY 2024 reporting period and subsequent years, we estimate a total annual burden estimate for all IPPS hospitals of 525 hours (0.1667 hours × 3,150 hospitals) at a cost of $22,260 (525 hours × $42.40).

e. Information Collection Burden Estimate for the Hospital-Level, Risk Standardized Patient-Reported Outcomes Performance Measure (PRO–PM) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) Beginning With Two Voluntary Reporting Periods Followed by Mandatory Reporting for Eligible Elective Procedures Occurring July 1, 2025 Through June 30, 2026, Impacting the FY 2028 Payment Determination, and for Subsequent Years

In section IX.E.5.g. of the preamble of this final rule, we are adopting the THA/TKA PRO–PM beginning with voluntary reporting across two periods (July 1, 2023 through June 30, 2024 and July 1, 2024 through June 30, 2025), followed by mandatory reporting of the measure beginning with the reporting period which runs from July 1, 2025 through June 30, 2026, impacting the FY 2028 payment determination.

The THA/TKA PRO–PM uses four sources of data for the calculation of the measure: (1) PRO data; (2) claims data; (3) Medicare enrollment and beneficiary data; and (4) U.S. Census Bureau survey data. We estimate no additional burden associated with claims data, Medicare enrollment and beneficiary data, and U.S. Census Bureau survey data as these data are already collected via other mechanisms.

Many hospitals have already incorporated patient-reported outcome (PRO) data collection into their workflows. While we are not requiring how hospitals collect data, hospitals new to collecting PRO data have multiple options for when and how they would collect this data so they can best determine the mode and timing of collection that works best for their patient population. The possible patient touchpoints for pre-operative PRO data collection include the doctor's office, pre-surgical steps such as education classes, or medical evaluations that can occur in an office or at the hospital. The modes of PRO data collection can include completion of the pre-operative surveys using electronic devices (such as an iPad or tablet), pen and paper, mail, phone call, or through the patient's portal. Post-operative PRO data collection modes are similar to pre-operative modes. The possible patient touchpoints for post-operative data collection can occur before the follow-up appointment, at the doctor's office, or after the follow-up appointment. The potential modes of PRO data collection for post-operative data are the same as for pre-operative data. If the patient does not or cannot attend a follow-up appointment, the modes of collection can include completion of the post-operative survey using email, mail, phone, or through the patient portal. Use of multiple modes will increase response rates as it allows for different patient preferences.

For the THA/TKA PRO–PM data, hospitals will be able to submit data during two voluntary periods, followed by mandatory reporting for eligible elective procedures occurring July 1, 2025 through June 30, 2026, impacting the FY 2028 payment determination and for subsequent years. Hospitals will need to submit data twice (pre-operative data and post-operative data). For the

purposes of calculating burden, we estimate that during the voluntary periods, 50 percent of hospitals that perform at least one THA/TKA procedure would submit data, and will do so for 50 percent of THA/TKA patients. We estimate during the mandatory period, hospitals will submit for 100 percent of patients. While we are requiring hospitals to submit, at minimum, 50 percent of eligible, complete pre-operative data with matching eligible, complete post-operative data, we are conservative in our estimate for the mandatory period in case hospitals exceed this threshold.

Under OMB control number 0938–0981 (expiration date September 30, 2024), the currently approved burden per respondent to complete the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) Survey measure is 7.25 minutes (0.120833 hours). We estimate that the time to complete both the preoperative and post-operative surveys is analogous to completing the HCAHPS Survey once. The most recent data from the Bureau of Labor Statistics reflects an Average Hourly Earnings of $31.31.[1166] For burden estimating purposes, we assume that most hospitals will likely undertake PRO data collection through a screening tool incorporated into their EHR or other patient intake process. We estimate that approximately 330,000 THA/TKA procedures occur in the inpatient setting each year, and that many patients could complete both the pre-operative and postoperative questionnaires, although from our experience with using this measure in the Comprehensive Joint Replacement model, we are also aware that not all patients who complete the pre-operative questionnaire would complete the post-operative questionnaire. Due to the performance period for the first voluntary reporting period being 6 months, we assume 41,250 patients will complete the survey (165,000 patients × 0.50 × 0.50 of hospitals) for a total of 4,984 hours annually (41,250 respondents × 0.120833 hours) at a cost of $156,049 (4,984 hours × $31.31) across all IPPS hospitals. For the second voluntary reporting periods, we assume 82,500 patients will complete the survey (330,000 patients × 0.50 × 0.50 hospitals) for a total of 9,969 hours annually (82,500 respondents × 0.120833 hours) at a cost of $312,122 (9,969 hours × $31.31) across all IPPS hospitals. Beginning with mandatory reporting for the FY 2028 payment determination, we estimate a total of 39,875 hours (330,000 patients × 0.120833 hours) at a cost of $1,248,486 (39,875 hours × $31.31) across all IPPS hospitals.

For the data submission, which will be reported via the HQR System, we estimate a burden of 10 minutes per response. For each of the two voluntary reporting periods, we estimate that each hospital will spend 20 minutes (0.33 hours) annually (10 minutes × 2 surveys) to collect and submit the data via this tool. We estimate a resulting burden for all participating IPPS hospitals of 525 hours (0.33 hours × 3,150 hospitals × 50 percent) at a cost of $22,260 (525 hours × $42.40). Beginning with mandatory reporting for the FY 2028 payment determination, we estimate a total of 1,050 hours (0.33 hours × 3,150 hospitals) at a cost of $44,520 (1,050 hours × $42.40).

With respect to any costs/burdens unrelated to data submission, we refer readers to the Regulatory Impact Analysis (section I.K. of Appendix A of this final rule).

f. Information Collection Burden Estimate for the Modification of the eCQM Reporting and Submission Requirements Beginning With the CY 2024 Reporting Period/FY 2026 Payment Determination

In section IX.E.10.e. of the preamble of this final rule, we are modifying our eCQM reporting and submission requirements whereby we are increasing the total number of eCQMs to be reported from four to six eCQMs beginning with the CY 2024 reporting period/FY 2026 payment determination.

We previously finalized in the FY 2020 IPPS/LTCH PPS final rule that, for the CY 2021 reporting period/FY 2023 payment determination, hospitals are required to submit data for four self-selected eCQMs each year (84 FR 42503). Additionally, for the CY 2022 reporting period/FY 2024 payment determination, hospitals are required to submit data for three self-selected eCQMs and the Safe Use of Opioids-Concurrent Prescribing eCQM for a total of four eCQMs (84 FR 42505). We also finalized in the FY 2021 IPPS/LTCH PPS final rule to require hospitals to submit four quarters of eCQM data beginning in the CY 2023 reporting period/FY 2025 payment determination (85 FR 59008 through 59009). We continue to estimate the information collection burden associated with the eCQM reporting and submission requirements to be 10 minutes per measure per quarter. For the increase in submission from four to six eCQMs, we estimate a total of 20 minutes or 0.33 hours (10 minutes × 2 eCQMs) per hospital per quarter. We estimate a total burden increase of 1,050 hours across all participating IPPS hospitals (0.33 hour × 3,150 IPPS hospitals) for each quarter of eCQM data or 4,200 hours annually (1,050 hours × 4 quarters) at a cost of $178,080 (4,200 hours × $42.40).

g. Information Collection Burden Estimate for the Adoption of Four eCQMs: Two Perinatal eCQMs Beginning With the CY 2023 Reporting Period/FY 2025 Payment Determination; One Opioid-Related Hospital-Harm eCQM and One Malnutrition eCQM Beginning With the CY 2024 Reporting Period/FY 2026 Payment Determination

In sections IX.E.5.c. and IX.E.5.d. of the preamble of this final rule, we are adopting two perinatal eCQMs—Cesarean Birth and Severe Obstetric Complications—beginning with the CY 2023 reporting period/FY 2025 payment determination, followed by mandatory reporting beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years. Also, in sections IX.E.5.e. and IX.E.5.f. of the preamble of this final rule, we are adopting the Hospital-Harm—Opioid-Related Adverse Events eCQM and the Global Malnutrition Composite Score eCQM, respectively, beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years.

The addition of these four eCQMs do not affect the information collection burden of submitting eCQMs under the Hospital IQR Program. Current Hospital IQR Program policy requires hospitals to select four eCQMs from the eCQM measure set on which to report (84 FR 42503 through 4250). In other words, although these new eCQMs are being added to the eCQM measure set, hospitals are not required to report more than a total of six eCQMs, as finalized in section IX.E.10.e. of the preamble of this final rule. In the previous section XII.B.4.f. (of the Collection of Information section of this final rule), we account for the burden of reporting six eCQMs.

With respect to any costs/burdens unrelated to data submission, we refer readers to the Regulatory Impact Analysis (section I.K. of Appendix A of this final rule).

h. Information Collection Burden Estimate for the Adoption or Refinement of Four Claims-Based Measures

In sections IX.E.5.h., IX.E.5.i., IX.E.6.a., and IX.E.6.b. of the preamble of this final rule, we are adopting two claims-based measures—MSPB Hospital and Hospital-Level RSCR Following Elective Primary THA/TKA—and refining two claims-based measures currently in the Hospital IQR Program measure set—Hospital-Level, Risk-Standardized Payment Associated with an Episode of Care for Primary Elective THA/TKA and AMI EDAC. We are adopting the Hospital MSPB measure and the Hospital-Level RSCR Following Elective Primary THA/TKA beginning with the FY 2024 payment determination and are refining the other two measures beginning with the FY 2024 payment determination and for subsequent years. Because these measures are calculated using data that are already reported to the Medicare program for payment purposes, adopting and refining these measures does not result in a change to the burden estimates provided in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45507 through 45512).

i. Information Collection Burden Estimate for Addition of the Publicly-Reported Hospital Designation To Capture Hospital Commitment to the Quality and Safety of Maternal Health Beginning Fall 2023

In section IX.E.8. of the preamble of this final rule, we are establishing the publicly-reported hospital designation to capture hospital commitment to the quality and safety of maternity care on a CMS website, for hospitals who qualify for the designation, beginning in Fall 2023. In the FY 2022 IPPS/LTCH PPS final rule, we finalized adoption of the Maternal Morbidity Structural measure (86 FR 45365) and accounted for that burden under OMB control number 0938–1022 (expiration date December 31, 2022). We expect that our policy will not yield a change in burden as it does not require any additional information collection nor affect the requirements for data submission for hospitals.

j. Information Collection Burden Estimate for the Modification of the Case Threshold Exemptions and Zero Denominator Declaration Policies for Hybrid Measures Beginning With the FY 2026 Payment Determination

In section IX.E.10.f.(4). of the preamble of this final rule, we are modifying our case threshold exemptions and zero denominator declaration policies for hybrid measures as we believe they are not applicable for those measure types, beginning with the FY 2026 payment determination and for subsequent years.

In the FY 2020 IPPS/LTCH PPS final rule, we finalized the adoption of the Hybrid Hospital-Wide Readmission Measure with Claims and Electronic Health Record Data (Hybrid HWR) (84 FR 42505 through 42508) and in the FY 2022 IPPS/LTCH PPS final rule, we finalized the Hybrid Hospital-Wide Mortality Measure with Claims and Electronic Health Record Data (Hybrid HWM) (86 FR 45508). For each hybrid measure, all IPPS hospitals are required to submit one of three things: Data via QRDA I file, a zero denominator declaration, or a case threshold exemption. Of these three options, submission of data via QRDA I file is the most burden-intensive. For both hybrid measures, our currently approved burden estimates assume data submission via QRDA I file for all IPPS hospitals; therefore, we do not believe this modification results in an increase in burden.

k. Information Collection Burden Estimate for the Modification of the eCQM Validation Policy Medical Record Requests Beginning With the FY 2025 Payment Determination

In section IX.E.11.b. of the preamble of this final rule, we are modifying our eCQM validation policy to increase the reporting of medical requests from at least 75 percent of records to 100 percent of records beginning with the FY 2025 payment determination and for subsequent years.

In the FY 2017 IPPS/LTCH PPS final rule, we finalized to require submission of at least 75 percent of sampled eCQM medical records in a timely and complete manner (81 FR 57181). While we adopted a policy to require submission of at least 75 percent of sampled records, we estimated the burden associated with this finalized policy with the assumption that hospitals would submit 100 percent of sampled eCQM medical records (81 FR 57261). Based on this estimate, we believe the currently approved burden already encompasses burden associated with our finalized policy.

l. Information Collection Burden Estimate To Add Reporting and Submission Requirements for PRO–PMs Beginning With the FY 2026 Payment Determination

In section IX.E.10.k. of the preamble of this final rule, we are adopting reporting and submission requirements for PRO–PMs beginning with the FY 2026 payment determination. Our policy does not yield a change in burden beyond that which is discussed in section X.B.6.e. of the preamble of this final rule for the THA/TKA PRO–PM.

m. Summary of Information Collection Burden Estimates for the Hospital IQR Program

In summary, under OMB control number 0938–1022 (expiration date December 31, 2022), we estimate that the policies promulgated in this final rule will result in a total increase of 746,300 hours annually for 3,150 IPPS hospitals from the CY 2023 reporting period/FY 2025 payment determination through the CY 2026 reporting period/FY 2028 payment determination. The total cost increase related to this information collection is approximately $23,437,906. The subsequent tables summarize the total burden changes for each respective FY payment determination compared to our currently approved information collection burden estimates (the table for the FY 2028 payment determination reflects the total burden change associated with all proposals). For the THA/TKA PRO–PM, only one survey will be administered during the CY 2023 reporting period due to the start of reporting occurring in 3Q and the beginning of mandatory reporting would take place in 3Q of the CY 2025 reporting period. We will submit the revised information collection estimates to OMB for approval under OMB control number 0938–1022 which expires December 31, 2022.

SUMMARY OF HOSPITAL IQR PROGRAM ESTIMATED INFORMATION COLLECTION BURDEN CHANGE FOR THE CY 2023 REPORTING PERIOD/FY 2025 PAYMENT DETERMINATION

	Annual Recordkeeping and Reporting Requirements Under OMB Control Number 0938-1022 for the CY 2023 Reporting Period / FY 2025 Payment Determinations							
Activity	**Estimated time per record (minutes)**	**Number reporting quarters per year**	**Number of respondents reporting**	**Average number records per respondent per quarter**	**Annual burden (hours) per hospital**	**Newly Finalized Annual burden (hours) across hospitals**	**Previously finalized annual burden (hours) across hospitals**	**Net difference in annual burden hours**
Add Hospital Commitment to Health Equity Structural Measure	10	1	3,150	1	.167	525	N/A	+525

8. ICRs for PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program

OMB has currently approved 0 hours of burden under OMB control number 0938–1175 (expiration date January 31, 2025), accounting for the information collection requirements for 11 PCHs for the FY 2024 program year.

For more detailed information on our finalized policies for the PCHQR Program, we refer readers to section IX.F. of the preamble of this final rule. We are: (1) adopting and codifying a patient safety exemption for the measure removal policy; (2) beginning public display of the End-of-Life (EOL) measures with modification to begin with FY 2025 program year data; and (3) beginning public display of the 30-Day Unplanned Readmissions for Cancer Patients measure beginning with FY 2024 program year data. These new requirements do not impact our currently approved information collection burden estimates.

We did not receive comments regarding the ICRs for the PCHQR Program.

9. ICRs for the Medicare Promoting Interoperability Program

a. Historical Background

In section IX.H. of the preamble of this final rule, we discussed several policies for the Medicare Promoting Interoperability Program. An information collection request under OMB control number 0938–1278 (expiration date July 31, 2022) reflecting program policies finalized in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45514) is pending approval, which

includes an estimated total burden of 21,450 hours and $879,450, accounting for information collection burden experienced by approximately 3,300 eligible hospitals that attest to CMS under the Medicare Promoting Interoperability Program. We will be submitting an updated information collection request under OMB control number 0938–1278 in connection with this FY 2023 IPPS/LTCH PPS final rule that will reflect the inclusion of CAHs and additional new information pertinent to the collection requirements. The collection of information burden analysis in this final rule focuses on all eligible hospitals and CAHs that could participate in the Medicare Promoting Interoperability Program and attest to the objectives and measures, and report eCQMs, under the Medicare Promoting Interoperability Program for the EHR reporting periods in CY 2023, CY 2024, and CY 2025.

For more detailed information on our finalized policies for the Medicare Promoting Interoperability Program, we refer readers to section IX.H. of the preamble of this final rule. We are finalizing the following changes for eligible hospitals and CAHs that attest to CMS under the Medicare Promoting Interoperability Program that we expect to affect our collection of information burden estimates: (1) requiring the Electronic Prescribing Objective's Query of Prescription Drug Monitoring Program (PDMP) measure beginning in the CY 2023 electronic health record (EHR) reporting period while maintaining its associated points at 10 points and with the two exclusions that we proposed and an additional exclusion based on public comment; (2) adopting a new Antimicrobial Use and Resistance (AUR) Surveillance measure that will be required for eligible hospitals and CAHs under the Medicare Promoting Interoperability Program's Public Health and Clinical Data Exchange Objective with associated exclusions beginning with the CY 2024 EHR reporting period, and (3) requiring eligible hospitals and CAHs to submit their level of active engagement in addition to submitting responses for the Public Health and Clinical Data Exchange Objective required measures and the optional measures beginning with the CY 2023 EHR reporting period. We are also modifying our eCQM reporting and submission requirements whereby we are increasing the total number of eCQMs to be reported from four to six eCQMs beginning with the CY 2024 reporting period. Details on these policies and associated burden changes are discussed further in this section of this final rule.

We are also finalizing several policies which will not affect the information collection burden associated with the Medicare Promoting Interoperability Program. As discussed in section IX.H.10.a.(2) of the preamble to this final rule, we are adopting four eCQMs: (1) Severe Obstetric Complications eCQM with inclusion in the eCQM measure set beginning with the CY 2023 reporting period, followed by mandatory reporting beginning with the CY 2024 reporting period; (2) Cesarean Birth (ePC–02) eCQM with inclusion in the eCQM measure set beginning with the CY 2023 reporting period, followed by mandatory reporting beginning with the CY 2024 reporting period; (3) Hospital-Harm—Opioid-Related Adverse Events eCQM with inclusion in the eCQM measure set beginning with the CY 2024 reporting period; and (4) Global Malnutrition Composite Score eCQM with inclusion in the eCQM measure set beginning with the CY 2024 reporting period. We are also: (1) expanding the Query of PDMP measure to include not only Schedule II opioids, but also Schedule III and IV drugs, beginning with the EHR reporting period in CY 2023; (2) adding the Enabling Exchange Under TEFCA measure to the Health Information Exchange Objective as an optional alternative to the three existing measures and updating the scoring methodology for the Health Information Exchange Objective beginning with EHR reporting period in CY 2023; (3) reducing the active engagement options for the Public Health and Clinical Data Exchange Objective from three to two options beginning with the CY 2023 EHR reporting period; (4) modifying the scoring methodology for the Medicare Promoting Interoperability Program beginning with EHR reporting period in CY 2023; (5) instituting public reporting of certain Medicare Promoting Interoperability Program data beginning with data from EHR reporting period in CY 2023; and (6) removing regulation text for the objectives and measures under 42 CFR 495.24(e) and adding new paragraph (f) beginning in CY 2023.

The most recent data from the Bureau of Labor Statistics reflects a median hourly wage of $21.20 per hour for a medical records and health information technician professional.[1167] We calculated the cost of overhead, including fringe benefits, at 100 percent of the median hourly wage, consistent with previous years. This is necessarily a rough adjustment, both because fringe benefits and overhead costs vary significantly by employer and methods of estimating these costs vary widely in publicly available literature. Nonetheless, we believe that doubling the hourly wage rate ($21.20 × 2 = $42.40) to estimate total cost is a reasonably accurate estimation method and is consistent with OMB guidance. Accordingly, we will calculate cost burden to hospitals using a wage plus benefits estimate of $42.40 per hour throughout the discussion in this section of this rule for the Medicare Promoting Interoperability Program.

In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45514), our burden estimates were based on an assumption of 3,300 eligible hospitals and CAHs. We have determined that our assumption was in error as we inadvertently omitted the number of CAHs in our estimate. For this final rule, we are updating our assumption to 3,150 eligible hospitals and 1,350 CAHs based on data from the CY 2020 EHR reporting period, for a total number of 4,500 respondents. These estimates differ from those of the information collection request under OMB control number 0938–1278 as they are based on updated data from the CY 2020 EHR reporting period and reflect the addition of the number of CAHs. As indicated earlier, an updated information collection request will be submitted with updated numbers inclusive of CAHs. We are making this adjustment to reflect the total number of potential eligible hospitals and CAHs that could report under the Medicare Promoting Interoperability Program.

b. Information Collection Burden Estimate for the Electronic Prescribing Objective's Query of PDMP Measure Beginning with the CY 2023 EHR Reporting Period

In section IX.H.3.c.(2) of the preamble of this final rule, we are requiring the Query of PDMP measure for eligible hospitals and CAHs participating in the Medicare Promoting Interoperability Program beginning in CY 2023 and maintain the associated points at 10 points.

In the FY 2020 IPPS/LTCH PPS final rule, we estimated the burden associated with reporting the Electronic Prescribing Objective and associated measures to be 10 minutes (84 FR 42608) coinciding with the finalized change to the Query of PDMP measure to require a ''yes/no'' response instead of a numerator/denominator calculation.

[1167] U.S. Bureau of Labor Statistics. Occupational Outlook Handbook, Medical Records and Health Information Technicians. Accessed on January 13, 2022. Available at: *https://www.bls.gov/ooh/healthcare/medical-records-and-health-information-technicians.htm.*

However, the burden associated with the Query of PDMP measure was not accounted for in the burden estimate of 10 minutes for the Electronic Prescribing Objective in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42608 through 42609), the FY 2021 IPPS/LTCH PPS final rule (85 FR 59014), or the FY 2022 IPPS/LTCH PPS final rule (86 FR 45516). In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45464), we finalized that the Query of PDMP measure will remain optional. As a result of the finalized policy to require the Query of PDMP measure beginning with the EHR reporting period in CY 2023, and considering the burden estimate of 30 seconds (0.5 minutes) for similar ''yes/no'' response measures for the Public Health and Clinical Data Exchange Objective as reflected in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45515), we have updated our burden estimate for the Electronic Prescribing Objective to 10.5 minutes to reflect the additional burden of reporting the Query of PDMP measure. Therefore, we estimate a total increase in burden of 38 hours across all eligible hospitals and CAHs (0.5 minutes × 4,500 eligible hospitals and CAHs) annually at a cost of $1,590 (38 hours × $42.40).

In addition, in section IX.H.3.c.(3) of the preamble of this final rule, we are refining the Query of PDMP measure to include not only Schedule II opioids, but also Schedule III and IV drugs, beginning with EHR reporting period in CY 2023. Our policy will not yield a change in burden as it does not affect the requirements for data submission for eligible hospitals or CAHs as we continue to assume all eligible hospitals and CAHs will report this measure once per year.

c. Information Collection Burden Estimate for the Antimicrobial Use and Resistance (AUR) Surveillance Measure Beginning With the CY 2024 EHR Reporting Period

In section IX.H.5.b. of the preamble of this final rule, we are finalizing the requirement to report a new Antimicrobial Use and Resistance (AUR) Surveillance measure for eligible hospitals and CAHs under the Medicare Promoting Interoperability Program's Public Health and Clinical Data Exchange Objective with a modification to delay the beginning of reporting until the EHR reporting period in CY 2024 instead of the EHR reporting period in CY 2023. Eligible hospitals and CAHs will be required to attest to active engagement with CDC's National Healthcare Safety Network (NHSN) to submit AUR data and receive a report from NHSN indicating their successful submission of AUR data for the EHR reporting period.

In the FY 2022 IPPS/LTCH PPS final rule, we finalized that eligible hospitals and CAHs are required to report four measures for the Public Health and Clinical Data Exchange Objective with a total estimated burden of 2 minutes annually (30 seconds × 4 measures) (86 FR 45516). Therefore, we estimate the burden associated with this new measure to be 30 seconds, or 0.5 minutes, per eligible hospital or CAH annually. We estimate a total increase in burden of 38 hours across all eligible hospitals and CAHs (0.5 minutes × 4,500 eligible hospitals and CAHs) annually at a cost of $1,611 (38 hours × $42.40).

While the burden associated with attesting to active engagement for the AUR Surveillance measure will be accounted for under OMB control number 0938–1278 (expiration date July 31, 2022), the burden associated with the actual submission of AUR data to NHSN is accounted for under OMB control number 0920–0666 (expiration date January 31, 2025).

d. Information Collection Burden Estimate for the Policy To Require Eligible Hospitals and CAHs To Submit Their Level of Active Engagement for the Public Health and Clinical Data Exchange Objective

In section IX.H.5.c.(3) of the preamble of this final rule, we are requiring eligible hospitals and CAHs to submit their level of engagement for the measures under the Public Health and Clinical Data Exchange Objective, either Pre-production and Validation or Validated Data Production. This requirement is in addition to submitting responses for the required measures and the optional measures, if applicable.

The burden associated with this requirement is similar to the burden associated with the attestation that eligible hospitals and CAHs must complete for the four previously finalized measures under this objective and the finalized AUR Surveillance measure. Therefore, we estimate the burden associated with this new requirement to be 30 seconds, or 0.5 minutes, per eligible hospital or CAH annually. We estimate a total increase in burden of 38 hours across all eligible hospitals and CAHs (0.5 minutes/hospital × 4,500 eligible hospitals and CAHs) annually at a cost of $1,611 (38 hours × $42.40).

In addition, in section IX.H.c.(2) of the preamble of this final rule, we are reducing the active engagement options for the Public Health and Clinical Data Exchange Objective from three to two options beginning with EHR reporting period in CY 2023. We are delaying the requirement that eligible hospitals and CAHs may spend only one EHR reporting period at the pre-production and validation phase until the EHR reporting period in CY 2024. Our policy will not yield a change in burden as it does not affect the requirements for data submission for eligible hospitals or CAHs but instead will motivate health IT vendors to implement these capabilities in their products and encourage healthcare organizations to engage in these reporting activities.

e. Information Collection Burden Estimate for the Modification of the eCQM Reporting and Submission Requirements Beginning With the CY 2024 Reporting Period

In section IX.H.10.b of the preamble of this final rule, we are modifying our eCQM reporting and submission requirements whereby we are increasing the total number of eCQMs to be reported from four to six eCQMs beginning with the CY 2024 reporting period. In addition, the six eCQMs must be comprised of: (1) Three self-selected eCQMs; (2) the Safe Use of Opioids—Concurrent Prescribing eCQM; (3) the finalized Severe Obstetric Complications eCQM; and (4) the finalized Cesarean Birth eCQM, for a total of six eCQMs.

We previously finalized in the FY 2021 IPPS/LTCH PPS final rule that, for the CY 2023 reporting period, eligible hospitals and CAHs are required to submit data for three self-selected eCQMs each year and the Safe Use of Opioids-Concurrent Prescribing eCQM for a total of four eCQMs (85 FR 58975). We also finalized in the FY 2021 IPPS/LTCH PPS final rule to require eligible hospitals and CAHs to submit four quarters of eCQM data beginning in the CY 2023 reporting period (85 FR 58975). We continue to estimate the information collection burden associated with the eCQM reporting and submission requirements to be 10 minutes per measure per quarter. As discussed in the section IX.E.4.f. of the preamble of this final rule, we already account for the burden associated with the reporting of eCQM measures for eligible hospitals as part of the Hospital Inpatient Quality Reporting Program, therefore the burden for the 3,150 eligible hospitals is included there. For the submission of six eCQM measures for CAHs, we estimate a total of 1 hour (0.167 hours/eCQM × 6 eCQMs) per CAH per quarter. We estimate a total burden of 1,350 hours across all CAHs (1 hour × 1,350 CAHs) for each quarter of eCQM data or 5,400 hours annually (1,350 hours × 4

quarters) at a cost of $228,960 (5,400 hours × $42.40/).

f. Information Collection Burden Estimate for the Adoption of Two eCQMs Beginning With the CY 2023 Reporting Period and Two eCQMs Beginning With the CY 2024 Reporting Period

In section IX.H.10.a. of the preamble of this final rule, we are adopting four eCQMs: (1) Severe Obstetric Complications eCQM beginning with the CY 2023 reporting period, followed by mandatory reporting beginning with the CY 2024 reporting period; (2) Cesarean Birth (ePC–02) eCQM beginning with the CY 2023 reporting period, followed by mandatory reporting beginning with the CY 2024 reporting period; (3) Hospital-Harm—Opioid-Related Adverse Events eCQM beginning with the CY 2024 reporting period; and (4) Global Malnutrition Composite Score eCQM beginning with the CY 2024 reporting period.

The addition of these four eCQMs do not affect the information collection burden of submitting eCQMs under the Medicare Promoting Interoperability Program beyond the burden described in section IX.B.4.f. of the preamble of this final rule. Current Medicare Promoting Interoperability Program policy requires hospitals to submit data for three self-selected eCQMs each year and the Safe Use of Opioids-Concurrent Prescribing eCQM for a total of four eCQMs (85 FR 58975). In other words, although these new eCQMs are being added to the eCQM measure set, hospitals are not required to report more than a total of six eCQMs as discussed in section IX.10. of the preamble of this final rule.

With respect to any costs unrelated to data submission, we refer readers to section I.K. of Appendix A of this final rule.

g. Information Collection Burden Estimate To Add the Enabling Exchange Under TEFCA Measure to the Health Information Exchange Objective Beginning With the CY 2023 EHR Reporting Period

In section IX.H.4.c. of the preamble of this final rule, we are adding the Enabling Exchange Under TEFCA measure to the Health Information Exchange Objective as an optional alternative to the three existing measures (Support Electronic Referral Loops by Sending Health Information measure and the Support Electronic Referral Loops by Receiving and Reconciling Health Information measure, or the HIE Bi-Directional Exchange measure) and updating the scoring methodology for the Health Information Exchange Objective beginning with EHR reporting period in the CY 2023. Our policy does not yield a change in burden as eligible hospitals and CAHs may choose to report the two Support Electronic Referral Loop measures, or may choose to report the HIE Bi-Directional Exchange measure, or may choose to report the new Enabling Exchange Under TEFCA measure.

h. Information Collection Burden Estimate To Modify the Scoring Methodology for the Medicare Promoting Interoperability Program Beginning With the CY 2023 EHR Reporting Period

In section IX.H.6. of the preamble of this final rule, we are finalizing the following changes to the scoring methodology:

- Increasing the points allocated to the Public Health and Clinical Data Exchange Objective from 10 points to 25 points,
- Increasing the points allocated to the Electronic Prescribing Objective from 10 points to 20 points,
- Decreasing the points allocated to the Health Information Exchange Objective from 40 points to 30 points, and
- Decreasing the points allocated to the Provide to Patient Exchange Objective from 40 points to 25 points.

Our policy does not yield a change in burden as it does not affect the requirements for data submission for eligible hospitals or CAHs but only changes the scoring methodology.

i. Information Collection Burden Estimate To Institute Public Reporting of Medicare Promoting Interoperability Program Data Beginning With Data From the CY 2023 EHR Reporting Period

In section IX.H.7. of the preamble of this final rule, we are finalizing to publicly report certain Medicare Promoting Interoperability Program data submitted by eligible hospitals and CAHs beginning with EHR reporting period in CY 2023. Specifically, we are finalizing that we will publish eligible hospitals' and CAHs' actual scores and their CMS EHR certification ID, beginning with data submitted for the CY 2023 EHR reporting period. Our policy does not yield a change in burden as it does not affect the requirements for data submission for eligible hospitals or CAHs.

j. Information Collection Burden Estimate for Modifications to Regulatory Text

In section IX.H.8. of the preamble of this final rule, we are removing references to objectives and measures and making modifications to regulatory text at 42 CFR 495.24 beginning in CY 2023. Our policy does not yield a change in burden as it does not affect the requirements for data submission for eligible hospitals or CAHs since the changes only modify regulatory text.

k. Summary of Estimates Used To Calculate the Collection of Information Burden

In summary, under OMB control number 0938–1278 (expiration date July 31, 2022), we estimate that the policies in this final rule result in a total increase in burden of 5,513 hours through the CY 2024 EHR reporting period. The total cost increase related to this information collection is approximately $233,730 (5,513 hours × $42.40) across 4,500 eligible hospitals and CAHs. The tables summarize the total burden changes for the CY 2023 and for CY 2024 EHR reporting periods compared to our currently approved information collection burden estimates (the table for the CY 2024 EHR reporting period reflects the total burden change associated with all policies being finalized).

In the FY 2022 IPPS/LTCH PPS final rule, we estimated each eligible hospital and CAH would require 6.5 hours annually to participate in the Medicare Promoting Interoperability Program (86 FR 45517). As a result of the policies in this final rule, we estimate the new total annual burden to be 6.6 hours per eligible hospital and CAH as well as an additional 4 hours annually for CAHs to report eCQMs. Therefore, we estimate the adjustment in the number of eligible hospitals and CAHs from 3,300 to 4,500 results in an increase of approximately +13,290 hours ((6.6 hours × −150 eligible hospitals) + (10.6 hours × 1,350 CAHs)) at a cost of +$563,496 (+13,290 hours × $42.40).

We will submit the revised information collection estimates to OMB for approval under OMB control number 0938–1278 (expiration date July 31, 2022).

SUMMARY OF ANNUAL MEDICARE PROMOTING INTEROPERABILITY PROGRAM INFORMATION COLLECTION BURDEN CHANGES FOR THE CY 2023 EHR REPORTING PERIOD

	Annual Recordkeeping and Reporting Requirements Under OMB Control Number 0938-1278							
Activity	**Estimated time per record (minutes)**	**Number reporting quarters per year**	**Number of eligible hospitals/CAHs reporting**	**Average number records per eligible hospital or CAH per quarter**	**Annual burden (hours) per eligible hospital/ CAH**	**Newly Finalized annual burden (hours) across eligible hospitals/CAHs**	**Previously finalized annual burden (hours) across eligible hospitals/CAHs**	**Net difference in annual burden hours**
Require Query of PDMP measure	0.5	1	4,500	1	0.0083	37.5	N/A	+37.5
Require Active Engagement Reporting	0.5	1	4,500	1	0.0083	37.5	N/A	+37.5
	Total Change in Information Collection Burden Hours: +75							
	Total Cost Estimate: Updated Hourly Wage ($42.40) x Change in Burden Hours (+75) = **+$3,180**							

SUMMARY OF ANNUAL MEDICARE PROMOTING INTEROPERABILITY PROGRAM INFORMATION COLLECTION BURDEN CHANGE FOR THE CY 2024 EHR REPORTING PERIOD

	Annual Recordkeeping and Reporting Requirements Under OMB Control Number 0938-1278							
Activity	**Estimated time per record (minutes)**	**Number reporting quarters per year**	**Number of eligible hospitals/CAHs reporting**	**Average number records per hospital or CAH per quarter**	**Annual burden (hours) per eligible hospital/ CAH**	**Newly Finalized annual burden (hours) across eligible hospitals/CAHs**	**Previously finalized annual burden (hours) across eligible hospitals/CAHs**	**Net difference in annual burden hours**
Require Query of PDMP measure	0.5	1	4,500	1	0.0083	37.5	N/A	+37.5
Add Antimicrobial Use and Resistance (AUR) Surveillance measure	0.5	1	4,500	1	0.0083	37.5	N/A	+37.5
Require Active Engagement Reporting	0.5	1	4,500	1	0.0083	37.5	N/A	+37.5
Modify eCQM Reporting	20	4	1,350	1	1.33	5,400	N/A	+5,400
	Total Change in Information Collection Burden Hours: +5,513							
	Total Cost Estimate: Updated Hourly Wage ($42.40) x Change in Burden Hours (+5,513) = **+$233,730**							

We did not receive comments regarding the ICRs for the Medicare Promoting Interoperability Program.

10. ICRs for the Codification of the Costs Incurred for Qualified and Non-Qualified Deferred Compensation Plans

As discussed in section X.A. of the preamble of this final rule, we are finalizing proposed codifications and clarifications for certain policies relating to Deferred Compensation. This finalized provision will not change our current policies for allowable Deferred Compensation costs associated with Qualified and Non-Qualified Deferred Compensation Plans that are included in Medicare cost reports. The documentation requirements will require that a provider of services must maintain and make available to its contractor and CMS, documentation to substantiate the costs incurred for the plans included in its Medicare cost report. These documentation requirements are based on the recordkeeping requirements at current § 413.20, which require providers of services to maintain sufficient financial records and statistical data for proper determination of costs payable under Medicare. The OMB control number for this information collection request is 0938–0050, which expired on March 31, 2022. A 30-day **Federal Register** notice published on June 22, 2022 (87 FR 37338) for the reinstatement of the information collection request. The comment period closed July 22, 2022.

We did not receive comments regarding the ICRs for the codification of the costs incurred for qualified and non-qualified deferred compensation plans.

11. ICRs for Condition of Participation (CoP) Requirements for Hospitals and CAHs To Continue Reporting Data for COVID–19 and Influenza After the PHE Ends as Determined by the Secretary

a. Continued COVID–19 and Seasonal Influenza Reporting

We are finalizing proposed revisions the regulations by adding provisions to the CoPs (§ 482.42 for hospitals and § 485.640 for CAHs) requiring hospitals and CAHs, after the conclusion of the current COVID–19 PHE, to continue COVID–19 and seasonal influenza-related reporting. The revisions will continue to apply upon conclusion of the COVID–19 Public Health Emergency (PHE) and would continue until April 30, 2024, unless the Secretary establishes an earlier ending date. The data elements align closely with those COVID–19 reporting requirements for long-term care (LTC) facilities that were finalized on November 9, 2021 (86 FR 62421) and are representative of the guidance provided to hospitals and CAHs for reporting. Therefore, we do not expect that these categories of data elements will require hospitals and CAHs to report any information beyond that which they have already been reporting. Furthermore, similar to the requirements for LTC facilities, this provision will also allow for the scope and frequency of data collection to be reduced and limited responsive to the evolving clinical and epidemiological circumstances.

Specifically, as discussed in section XX.B.2 of the preamble of this final rule, we have re-evaluated the proposed data elements in consideration of the feedback shared by commenters and the evolving state of the current PHE and are modifying our proposal to remove the following from the list of required data categories to report:

- Suspected COVID–19 infections among patients and staff
- Confirmed COVID–19 and influenza infections among staff
- COVID–19 and influenza deaths among staff
- Confirmed co-morbid influenza and COVID–19 infections among staff

Although data pertaining to suspected cases were valuable throughout the COVID–19 PHE, particularly in instances when testing supplies were limited and cases were often identified based on clinical signs and symptoms, this information is less meaningful now that testing supplies are readily available to confirm the presence of infection. Thus, we do not believe suspected COVID–19 infection data would be necessary to collect from hospitals and CAHs once the PHE declaration ends, and therefore, we removed this data category.

The data categories for staff (suspected infections among staff; confirmed COVID–19, influenza, and co-morbid infections among staff; COVID–19 and influenza deaths among staff) have not been among the information that hospitals and CAHs were required to report throughout the COVID–19 PHE. Hospitals and CAHs were required to report suspected, confirmed, and comorbid infections, as well as deaths, for patients only. In the proposed rule, CMS did not intend to extend these data categories to include staff. The inclusion of staff in the proposed rule for these data categories was a technical error; therefore, we removed these data categories.While beneficial during an active PHE and the specific circumstances of the COVID–19 PHE, we believe the above data categories are not necessary to provide the most valuable information during a post-PHE state for continued monitoring and as such we are removing these data categories to be responsive to commenter concerns regarding increased burden on facilities and staff, while also attempting to provide quality care for patients.

The data categories that we are finalizing in this rule that hospitals and CAHs will be required to report relevant to COVID–19, to the extent as determined by the Secretary, are as follows: Confirmed infections among patients; Total deaths among patients; Personal protective equipment and testing supplies; Ventilator use, capacity, and supplies; Total bed and intensive care unit bed census and capacity; Vaccine administration data of patients and staff; and Relevant therapeutic inventories or usage, or both. The data categories that we are finalized in this rule that hospitals and CAHs will be required to report relevant to influenza, to the extend as determined by the Secretary, are as follows: Confirmed infections among patients; Total deaths among patients; and Confirmed co-morbid influenza and COVID–19 infections among patients. We believe these data will offer the most valuable information during a post-PHE state by continuing to capture critical information on COVID–19 and seasonal influenza for ongoing surveillance and to inform any potential action to protect patient health and safety. As previously discussed, these data will enable the federal government to monitor the ability of facilities to provide safe care for patients by determining the number of COVID–19 and influenza infections being treated by facilities; the quantity of resources available to facilities and the volume of resources they are using; and facilities' continued capacity to provide safe patient care. In addition, as done throughout the COVID–19 pandemic, local, state, and federal authorities will continue to use these data to identify possible resurgence in cases and outbreaks, for resource allocation purposes, and to update guidance pertaining to the safe provision of patient care.

As indicated in the proposal, we do not expect continued daily reporting for COVID–19 or influenza outside of a declared PHE. Moreover, the rule allows for the scope of data categories and frequency of data collection and reporting to be reduced and limited, as determined by the Secretary, responsive to evolving clinical and epidemiology circumstances. This approach to reducing the proposed set of required data categories will provide a path towards winding down the overall

reporting of COVID–19-related data between the end of the current PHE and April 2024 when these requirements will sunset. These requirements will not be implemented and enforced until the current COVID–19 PHE declaration concludes, and CMS will issue guidance indicating such a transition. As discussed previously, we expect the method of notification to follow a model similar to that which we used to inform regulated entities at the beginning of the COVID–19 PHE (see QSO–21–03–Hospitals/CAHs at *https://www.cms.gov/files/document/qso-21-03-hospitalscahs.pdf-0*). The data that hospitals and CAHs will be required to report are consistent with the information they have already been reporting throughout the COVID–19 PHE (OMB control numbers 0938–0328 for hospitals and 0938–1043 for CAHs).

For purposes of burden estimates, we do not differentiate among hospitals and CAHs as they all will complete the same data collection.

For the estimated costs contained in the analysis that follows, we used data from the U.S. Bureau of Labor Statistics (BLS) to determine the mean hourly wage for the staff member responsible for reporting the required information for a hospital (or a CAH).[1168] Based on our experience with hospitals and CAHs and the current COVID–19 and related reporting requirements, we believe that this will primarily be the responsibility of a registered nurse and we have used this position in this analysis at an average hourly salary of $39.27. For the total hourly cost, we doubled the mean hourly wage for a 100 percent increase to cover overhead and fringe benefits, according to standard HHS estimating procedures. If the total cost after doubling resulted in 0.50 or more, the cost was rounded up to the next dollar. If it was 0.49 or below, the total cost was rounded down to the next dollar. Therefore, we estimated the total hourly cost for a registered nurse to perform these duties would be $79.

According to the most recent COVID–19 hospital reporting guidance (available at *https://www.hhs.gov/sites/default/files/covid-19-faqs-hospitals-hospital-laboratory-acute-care-facility-data-reporting.pdf*), hospitals are reporting COVID–19 and influenza-related data on a daily basis, with backdating permitted for weekends and holidays, except psychiatric and rehabilitation hospitals who report weekly. Some data element reporting fields are inactive for data collection, and therefore, hospitals can optionally report data for these fields. The inactive fields and active fields together reflect what is listed in this final rule for continued COVID–19 and influenza-related reporting as well as future reporting in the event of a declared PHE, which we discuss next. We do not expect, nor did we propose, continued daily reporting for COVID–19 or influenza outside of a declared PHE. If we were to assume a weekly reporting frequency, we would anticipate that there are reduced cases and fewer data elements (with no line level patient data) being reported. Based on these assumptions, we estimated that total annual burden hours for all participating hospitals and CAHs to comply with these requirements would be 483,600 hours based on weekly reporting of the required information by approximately 6,200 hospitals and CAHs × 52 weeks per year and at an average weekly response time of 1.5 hours for a registered nurse with an average hourly salary of $79. Therefore, the estimate for total annual costs for all hospitals and CAHs to comply with the required reporting provisions weekly would be $38,204,400 or approximately $6,162 per facility annually. We acknowledge that the data elements and reporting frequency could increase or decrease over the next 2 years, and those changes would impact this burden estimate.

We note that this estimate is assumed to be a 1-day snapshot of reporting information as opposed to a cumulative weekly report accounting for information based on each day of that week. If we assumed a cumulative weekly account, we can assume reduced burden related to the actual reporting time, but anticipate that the estimate would be slightly higher to account for the need to track closely to daily reporting. We also acknowledged that respondents may have to track and invest in infrastructure in order to timely and accurately report on the specified frequency. Thus, respondents may face ongoing burdens associated with this collection even in the case of reduced frequency of submissions. We solicited comment on this potentiality.

Furthermore, we note that this estimate likely overestimates the costs associated with reporting because it assumes that all hospitals and CAHs will report manually. Efforts are underway to automate hospital and CAH reporting that have the potential to significantly decrease reporting burden and improve reliability. Our preliminary estimates for these reporting activities (OMB control numbers 0938–0328 for hospitals and 0938–1043 for CAHs) can be found in the tables that follow.

ESTIMATED ANNUALIZED BURDEN HOURS

Type of Respondent	Form Name	Number of Respondents	Number of Responses per Respondent (low range – high range)	Average Burden per Response (in hours)	Total Burden Hours (low range – high range)
Hospitals and CAHs	Standardized format as determined by the Secretary	6,200	52	1.5	483,600
Total					483,600

[1168] BLS. *May 2020 National Occupational Employment and Wage Estimates United* States. United States Department of Labor. Accessed at *https://www.bls.gov/oes/current/oes_nat.htm.* Accessed on August 25, 2021.

ESTIMATED ANNUALIZED RESPONDENT BURDEN COSTS			
Type of Respondent	**Total Burden Hours**	**Hourly Wage Rate**	**Total Respondent Costs**
Hospital and CAH Staff—Registered Nurses	483,600	* $79	$38,204,400
Total			$38,204,400

b. Future Reporting in the Event of a PHE Declaration

In addition, we proposed to establish reporting requirements for future PHEs related to infectious diseases by requiring hospitals and CAHs to electronically report information on Acute Respiratory Illness (including, but not limited to, Seasonal Influenza Virus, Influenza-like Illness, and Severe Acute Respiratory Infection), SARS–CoV–2/COVID–19, and other viral and bacterial pathogens or infectious diseases of pandemic or epidemic potential only when the Secretary has declared a PHE directly related to such specific pathogens and infectious diseases. Specifically, we proposed that when the Secretary has declared a PHE, hospitals and CAHs would be required to report specific data elements to the CDC's National Health Safety Network (NHSN), or other CDC-supported surveillance systems, as determined by the Secretary.

We also proposed to require that a hospital (or a CAH) would be required to report each applicable infection (confirmed and suspected) and the applicable vaccination data in a format that provides person-level information, to include medical record identifier, race, ethnicity, age, sex, residential county and zip code, and relevant comorbidities for affected patients, unless the Secretary specifies an alternative format by which the hospital (or CAH) would be required to report these data elements. Lastly, we proposed that a hospital (or a CAH) would provide the information specified on a daily basis, unless the Secretary specifies a lesser frequency, to the Centers for Disease Control and Prevention's National Healthcare Safety Network (NHSN) or other CDC-supported surveillance systems as determined by the Secretary. We noted that in this final rule, we have withdrawn this proposal to establish requirements for hospitals and CAHs to report certain data in the event of a future PHE declaration.

We solicited comment on the burden associated with these proposed requirements given the intended flexibility provided in reducing or limiting the scope and frequency of reporting based on the state of the PHE and ongoing circumstances, requested comment on the potential burden associated with the proposed reporting requirements as they might relate to any differences in the public health response to one specific pathogen or infectious disease versus another that would be directly related to the declared PHE, and requested public comments addressing burden estimates (and the potential differences in those estimates) for variations in the required reporting response for a local PHE versus a regional PHE versus a national PHE that might be declared by the Secretary based on the specific circumstances at the time of the declaration.

Comment: A few commenters indicated that our cost estimate for continued COVID–19-related data reporting was inaccurate and underestimated. The commenters stated that collecting and reporting these data involves multiple staff from nursing, human resources, medical staff, infection prevention and control, laboratory, respiratory, materials, pharmacy, and information technology departments, and these staff have had to repeatedly adjust how they collect and report data in response to changes in guidance throughout the COVID–19 PHE while also performing their other duties. Likewise, a few commenters indicated that data collection and reporting was solely performed by infection prevention and control staff, while and other commenters stated that quality staff solely compiled and reported the data. One commenter also noted that lost revenue due to nursing staffing having to devote time and resources to non-direct care activities, such as manual data collection/reporting, and the current staffing shortages, should also be considered in the burden estimate acknowledging that this is an opportunity cost that is difficult to quantify.

Response: We agree that data collection and reporting procedures, including but not limited to the number and type of staff involved (job title, direct care or non-direct care) vary among hospitals and CAHs. After reviewing these comments and other feedback we received, we also believe the method of collecting the data (automated or manual) varies among hospitals and CAHs. As discussed in detail in section X.B. of this final rule, we modified our proposal to decrease the amount of data categories required for continued COVID–19-related reporting beginning at the conclusion of the current PHE. Specifically, we are finalizing the proposed revisions at § 482.42(e) and (f) and § 485.640(d) and (e) for hospitals and CAHs, respectively, with the following information no longer required to be reported: (1) Suspected COVID–19 infections among patients and staff, (2) Confirmed COVID–19 and influenza infections among staff, (3) COVID–19 and influenza deaths among staff, and (4) Confirmed co-morbid influenza and COVID–19 infections among staff. Given that this final rule decreases the scope of data categories and that the data collecting and reporting procedures among hospitals and CAHs varies, we believe the estimate reflects an accurate average burden.

Comment: With regard to reporting frequency and the burden associated, commenters provided various suggestions for the appropriate frequency of reporting including weekly, Mondays through Fridays only, while excluding holidays, and Mondays, Wednesdays, and Fridays only. One commenter noted that even if reporting were reduced from a daily requirement to once per week the burden would still be far greater than 1.5 hours per week. However, other commenters emphasized that, while more burdensome, standardized data reporting on a daily basis is necessary to detect trends and outbreaks in a timely manner and improves accuracy of real-time models developed to forecast spread of infectious diseases. Some commenters also noted the proposal as an unfunded mandate and indicated that CMS payment rates do not keep up with inflation rates.

Response: As noted in the proposed rule, we do not expect, nor did we propose, continued daily reporting for COVID–19 or seasonal influenza data outside of a declared PHE (87 FR 28642). We appreciate the suggestions from commenters and will consider them as decisions are made over the

next two years until this requirement sunsets in April 2024. Ultimately, the scope and frequency of reporting will be informed by the ongoing circumstances and evolving state of the public health response efforts.

13. Summary of All Burden in This Final Rule

The following chart reflects the total burden and associated costs for the ICRs presented in this section of this final rule.

Information Collection Requests	Burden Hours Increase/Decrease (+/-)*	Cost (+/-)*
Hospital Wage Index	0	$0
Payment for Low-Volume Hospitals	0	$0
Hospital Inpatient Quality Reporting Program	+746,300	+$23,437,906
PPS-Exempt Cancer Hospital Quality Reporting Program	0	$0
Hospital Value-Based Purchasing Program	0	$0
Hospital-Acquired Condition Reduction Program	0	$0
Hospital Readmissions Reduction Program	0	$0
Medicare Promoting Interoperability Program	+13,290	+$563,496
Long Term Care Hospital Quality Reporting Program	0	$0
Costs Incurred for Qualified and Non-Qualified Deferred Compensation Plans	0	$0
CoP Requirements for Hospitals and CAHs to Continue Reporting Data for COVID-19 and Influenza After the PHE ends as Determined by the Secretary	+483,600	$38,204,400
TOTAL	**=1,243,190**	**=$62,205,402**

Chiquita Brooks-LaSure,
Administrator of the Centers for Medicare & Medicaid Services,
approved this document on July 22, 2022.

List of Subjects

42 CFR Part 412

Administrative practice and procedure, Health facilities, Medicare, Puerto Rico, Reporting and recordkeeping requirements.

42 CFR Part 413

Diseases, Health facilities, Medicare, Puerto Rico, Reporting and recordkeeping requirements.

42 CFR Part 482

Grant programs—health, Hospitals, Medicaid, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 485

Grant programs—health, Health facilities, Medicaid, Privacy, Reporting and recordkeeping requirements.

42 CFR Part 495

Administrative practice and procedure, Health facilities, Health maintenance organizations (HMO), Health professions, Health records, Medicaid, Medicare, Penalties, Privacy, Reporting and recordkeeping requirements.

For the reasons set forth in the preamble, the Centers for Medicare and Medicaid Services amends 42 CFR chapter IV as set forth below:

PART 412—PROSPECTIVE PAYMENT SYSTEMS FOR INPATIENT HOSPITAL SERVICES

■ 1. The authority citation for part 412 continues to read as follows:

Authority: 42 U.S.C. 1302 and 1395hh.

■ 2. Section 412.24 is amended by adding paragraph (d)(3)(iii) to read as follows:

§ 412.24 Requirements under the PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program.

* * * * *

(d) * * *

(3) * * *

(iii) *Patient safety exception.* Upon a determination by CMS that the continued requirement for PCHs to submit data on a measure raises specific patient safety concerns, CMS may elect to immediately remove the measure from the PCHQR measure set. CMS will, upon removal of the measure—

(A) Provide notice to PCHs and the public at the time CMS removes the measure, along with a statement of the specific patient safety concerns that would be raised if PCHs continued to submit data on the measure; and

(B) Provide notice of the removal in the **Federal Register**.

* * * * *

■ 3. Section 412.60 is amended by revising paragraph (b) to read as follows:

§ 412.60 DRG classification and weighting factors.

* * * * *

(b) *DRG weighting factors.* CMS assigns, for each DRG, an appropriate weighting factor that reflects the estimated relative cost of hospital resources used with respect to discharges classified within that group compared to discharges classified within other groups, subject to a maximum ten percent reduction to the weighting factor for a DRG as compared to the weighting factor for the same DRG for the prior fiscal year.

* * * * *

■ 4. Section 412.64 is amended by adding paragraph (h)(7) to read as follows:

§ 412.64 Federal rates for inpatient operating costs for Federal fiscal year 2005 and subsequent fiscal years.

* * * * *

(h) * * *

(7) Beginning with fiscal year 2023, if CMS determines that a hospital's wage index value for a fiscal year would decrease by more than 5 percent as compared to the hospital's wage index value for the prior fiscal year, CMS limits the decrease to 5 percent for the fiscal year.

* * * * *

■ 5. Section 412.103 is amended by adding paragraph (a)(8) to read as follows:

§ 412.103 Special treatment: Hospitals located in urban areas and that apply for reclassification as rural.

(a) * * *

(8) For a hospital with a main campus and one or more remote locations under a single provider agreement where services are provided and billed under the inpatient hospital prospective payment system and that meets the provider-based criteria at § 413.65 of this chapter as a main campus and a remote location of a hospital, approved rural reclassification status applies to the main campus and any remote location located in an urban area (as defined in § 412.64(b) and including a main campus or any remote location deemed urban under section 1886(d)(8)(B) of the Act).

* * * * *

■ 6. Section 412.106 is amended by—

■ a. Revising paragraph (g)(1)(ii);

■ b. In paragraph (g)(1)(iii)(C)(*8*), removing the phrase ''For each subsequent fiscal year,'' and adding in its place the phrase ''For fiscal year 2022,'';

■ c. Adding paragraphs (g)(1)(iii)(C)(*10*) and (*11*);

■ d. Redesignating paragraph (h) as paragraph (i); and

■ e. Adding a new paragraph (h).

The revisions and additions read as follows:

§ 412.106 Special treatment: Hospitals that serve a disproportionate share of low-income patients.

* * * * *

(g) * * *

(1) * * *

(ii) *Factor 2.* (A) For each of fiscal years 2014, 2015, 2016, and 2017, a factor equal to 1 minus the percent change in the percent of individuals under the age of 65 who are uninsured (and subtracting from the factor 0.1 percentage point for fiscal year 2014 and 0.2 percentage point for each of fiscal years 2015, 2016, and 2017), as determined by comparing—

(*1*) 18 percent, the percent of such individuals who are uninsured in 2013, based on the March 20, 2010, estimate of the ''Insured Share of the Nonelderly Population Including All Residents'' by the Congressional Budget Office.

(*2*) The percent of such individuals who are uninsured in the applicable fiscal year, based on the most recent estimate of the ''Insured Share of the Nonelderly Population Including All Residents'' by the Congressional Budget Office available at the time of development of the annual final rule for the hospital inpatient prospective payment system.

(B) For FY 2018 and subsequent fiscal years, a factor equal to 1 minus the percent change in the percent of individuals who are uninsured (and subtracting from the factor 0.2 percentage point for each of fiscal years 2018 and 2019), as determined by comparing the percent of individuals who are uninsured in—

(*1*) 2013 (as estimated by the Secretary, based on data from the Census Bureau or other sources the Secretary determines appropriate, and certified by the Chief Actuary of the CMS); and

(*2*) The most recent period for which data is available (as so estimated and certified).

(iii) * * *

(C) * * *

(*10*) For fiscal year 2023, for all eligible hospitals, CMS will base its estimates of the amount of hospital uncompensated care on data on uncompensated care costs, defined as charity care costs plus non-Medicare and non-reimbursable Medicare bad debt costs from cost reports from the two most recent cost reporting years for

which audits have been conducted. If a hospital is a new hospital (that is, a hospital that began participation in the Medicare program after the two most recent cost reporting years for which audits have been conducted) or if the hospital is treated as a new hospital for purposes of Factor 3, the Medicare administrative contractor (MAC) will determine Factor 3 as the ratio of the hospital's uncompensated care costs from its FY 2023 cost report to the sum of uncompensated care costs for all DSH-eligible hospitals as estimated by CMS from the most recent cost reporting year for which audits have been conducted.

(*11*) For fiscal year 2024 and subsequent fiscal years, for all eligible hospitals, CMS will base its estimates of the amount of hospital uncompensated care on data on uncompensated care costs, defined as charity care costs plus non-Medicare and non-reimbursable Medicare bad debt costs from cost reports from the three most recent cost reporting years for which audits have been conducted. If a hospital is a new hospital (that is, a hospital that began participation in the Medicare program after the three most recent cost reporting years for which audits have been conducted) or if the hospital is treated as a new hospital for purposes of Factor 3, the Medicare administrative contractor (MAC) will determine Factor 3 as the ratio of the hospital's uncompensated care costs from its cost report for the applicable fiscal year to the sum of uncompensated care costs for all disproportionate share hospital (DSH)-eligible hospitals as estimated by CMS from the most recent cost reporting year for which audits have been conducted.

(h) *Supplemental payment for Indian Health Service and Tribal hospitals and Puerto Rico hospitals.* (1) For fiscal year 2023 and each subsequent fiscal year, Indian Health Service and Tribal Hospitals and Puerto Rico hospitals that qualify for an additional payment for uncompensated care under paragraph (g) of this section for the applicable fiscal year may also qualify to receive a supplemental payment.

(2) Indian Health Service and Tribal Hospitals and Puerto Rico hospitals that do not have a Factor 3 amount for fiscal year 2022 determined under paragraph (g)(1)(iii)(C)(*9*) of this section are not eligible to receive a supplemental payment under this paragraph (h).

(3) The amount of the supplemental payment for a fiscal year is determined as the difference between the following:

(i) A base year amount defined as the FY 2022 uncompensated care payment determined for the hospital, in accordance with paragraph (g)(1) of this section, adjusted by 1 plus the percent change in the aggregate amount of uncompensated care payments as estimated by CMS in accordance with paragraphs (g)(1)(i) and (ii) of this section between fiscal year 2022 and the applicable fiscal year. If the hospital did not qualify for an additional payment for uncompensated care under paragraph (g) of this section for fiscal year 2022, CMS uses the Factor 3 determined for the hospital under paragraph (g)(1)(iii)(C)(*9*) of this section to estimate the amount of the additional payment for uncompensated care that the hospital would have received in fiscal year 2022 if the hospital had qualified for an additional payment for uncompensated care under paragraph (g)(1) of this section for that fiscal year.

(ii) The additional payment for uncompensated care determined for the hospital for the applicable fiscal year, in accordance with paragraph (g)(1) of this section.

(4) If the base year amount under paragraph (h)(3)(i) of this section is equal to or lower than the additional payment for uncompensated care determined for the hospital for the applicable fiscal year in accordance with paragraph (g)(1) of this section, the hospital will not receive a supplemental payment under paragraph (h) of this section for that fiscal year.

* * * * *

§ 412.140 [Amended]

■ 7. Section 412.140 is amended in paragraph (d)(2)(ii) by removing the phrase ''at least 75 percent'' and adding in its place the phrase ''100 percent''.

■ 8. Section 412.168 is amended by—

■ a. Revising the section heading;

■ b. In paragraph (a), removing the phrase ''for the fiscal year 2022'' and adding in its place ''for each of fiscal years 2022 and 2023''; and

■ c. By adding paragraphs (g) through (k).

The revision and additions read as follows:

§ 412.168 Special rules for FY 2022 and FY 2023.

* * * * *

(g) CMS calculates a measure rate for all measures selected under § 412.164(a) for fiscal year 2023 but only applies § 412.165(a) to the measures included in the Clinical Outcomes Domain and the Efficiency and Cost Reduction Domain for that fiscal year, which are the following:

(1) Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Acute Myocardial Infarction (AMI) Hospitalization (MORT–30–AMI).

(2) Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Heart Failure (HF) Hospitalization (MORT–30–HF).

(3) Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Pneumonia Hospitalization (MORT–30–PN (updated cohort)).

(4) Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Chronic Obstructive Pulmonary Disease (COPD) Hospitalization (MORT–30–COPD).

(5) Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Coronary Artery Bypass Graft (CABG) Surgery (MORT–30–CABG).

(6) Hospital-Level Risk-Standardized Complication Rate Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) (COMP–HIP–KNEE).

(7) Medicare Spending Per Beneficiary (MSPB)—Hospital.

(h) CMS calculates—

(1) A Clinical Outcomes Domain score for fiscal year 2023 for hospitals that report the minimum number of cases and measures with respect to the measures described in paragraphs (g)(1) through (6) of this section; and

(2) An Efficiency and Cost Reduction Domain score for fiscal year 2023 for hospitals that report the minimum number of cases with respect to the measure described in paragraph (g)(7) of this section.

(i) CMS does not award a Total Performance Score to any hospital for fiscal year 2023.

(j) The total amount available for value-based incentive payments for fiscal year 2023 is equal to the total amount of base-operating DRG payment reductions for that fiscal year, as estimated by the Secretary.

(k) CMS awards a value-based incentive payment percentage (as defined in § 412.160) for fiscal year 2023 to all hospitals to ensure that each hospital receives a value-based incentive payment amount equal to the amount of the reduction made to its base-operating DRG payment amounts.

■ 9. Section 412.273 is amended by revising paragraphs (d)(2) and (e) to read as follows:

§ 412.273 Withdrawing an application, terminating an approved 3-year reclassification, or canceling a previous withdrawal or termination.

* * * * *

(d) * * *

(2) *Timing and process of cancellation request.* Cancellation requests must be submitted in writing to the MGCRB according to the method prescribed by the MGCRB no later than the deadline

for submitting reclassification applications for the following fiscal year, as specified in § 412.256(a)(2).

* * * * *

(e) *Written request only.* (1) A request to withdraw an application must be submitted in writing to the MGCRB according to the method prescribed by the MGCRB by all hospitals that are party to the application.

(2) A request to terminate an approved reclassification must be submitted in writing to the MGCRB according to the method prescribed by the MGCRB by an individual hospital or by an individual hospital that is party to a group classification.

* * * * *

■ 10. Section 412.515 is revised to read as follows:

§ 412.515 LTC–DRG weighting factors.

(a) For each LTC–DRG, CMS assigns an appropriate weight that reflects the estimated relative cost of hospital resources used within that group compared to discharges classified within other groups.

(b)(1) Beginning FY 2023, each LTC–DRG weight is subject to a maximum 10 percent reduction as compared to the weight for the same LTC–DRG for the prior fiscal year, except as provided in paragraph (b)(2) of this section.

(2) The limitation described in paragraph (b)(1) of this section does not apply to LTC–DRGs with less than 25 applicable LTCH cases in the data used to determine the relative weights for the fiscal year.

■ 11. Section 412.525 is amended by revising paragraph (c)(1) to read as follows:

§ 412.525 Adjustments to the Federal prospective payment.

* * * * *

(c) * * *

(1) The labor portion of a long-term care hospital's Federal prospective payment is adjusted to account for geographical differences in the area wage levels using an appropriate wage index (established by CMS), which reflects the relative level of hospital wages and wage-related costs in the geographic area (that is, urban or rural area as determined in accordance with the definitions set forth in § 412.503) of the hospital compared to the national average level of hospital wages and wage-related costs.

(i)(A) The appropriate wage index that is established by CMS is updated annually.

(B) Beginning in fiscal year 2023, if CMS determines that an LTCH's wage index value for a fiscal year would decrease by more than 5 percent as compared to the LTCH's wage index value for the prior fiscal year, CMS limits the decrease to 5 percent for the fiscal year.

(ii) The labor portion of a long-term care hospital's Federal prospective payment is established by CMS and is updated annually.

* * * * *

■ 12. Section 412.529 is amended by revising paragraphs (d)(4)(ii)(B) and (d)(4)(iii)(B) to read as follows:

§ 412.529 Special payment provision for short-stay outliers.

* * * * *

(d) * * *

(4) * * *

(ii) * * *

(B)(*1*) Is adjusted for different area wage levels based on the geographic classifications set forth at § 412.503 and the applicable hospital inpatient prospective payment system (IPPS) labor-related share, using the applicable hospital inpatient prospective payment system wage index value for nonreclassified hospitals (an LTCH's applicable IPPS wage index).

(*2*) Beginning in fiscal year 2023, if CMS determines that an LTCH's applicable IPPS wage index value for a fiscal year would decrease by more than 5 percent as compared to the LTCH's applicable IPPS wage index value for the prior fiscal year, CMS limits the decrease to 5 percent for the fiscal year.

(*3*) For LTCHs located in Alaska and Hawaii, the amount specified in paragraph (d)(4)(ii) of this section is also adjusted by the applicable hospital inpatient prospective payment system cost of living adjustment factors.

* * * * *

(iii) * * *

(B)(*1*) Is adjusted for the applicable geographic adjustment factors, including local cost variation based on the geographic classifications set forth at § 412.503 and the applicable full hospital inpatient prospective payment system (IPPS) wage index value for nonreclassified hospitals (an LTCH's applicable IPPS wage index) and applicable cost of living adjustment factors for LTCHs in Alaska and Hawaii.

(*2*) Beginning in fiscal year 2023, if CMS determines that an LTCH's applicable IPPS wage index value for a fiscal year would decrease by more than 5 percent as compared to the LTCH's applicable IPPS wage index value for the prior fiscal year, CMS limits the decrease to 5 percent for the fiscal year.

* * * * *

PART 413—PRINCIPLES OF REASONABLE COST REIMBURSEMENT; PAYMENT FOR END-STAGE RENAL DISEASE SERVICES; PROSPECTIVELY DETERMINED PAYMENT RATES FOR SKILLED NURSING FACILITIES; PAYMENT FOR ACUTE KIDNEY INJURY DIALYSIS

■ 13. The authority citation for part 413 continues to read as follows:

Authority: 42 U.S.C. 1302, 1395d(d), 1395f(b), 1395g, 1395l(a), (i), and (n), 1395x(v), 1395hh, 1395rr, 1395tt, and 1395ww.

■ 14. Section 413.75 is amended in paragraph (b) by adding in alphabetical order the definitions of ''Rural track Medicare GME affiliated group'' and ''Rural track Medicare GME affiliation agreement'' to read as follows:

§ 413.75 Direct GME payments: General requirements.

* * * * *

(b) * * *

Rural track Medicare GME affiliated group means an urban hospital and a rural hospital that—

(i) Participate in a rural track program defined in this paragraph (b);

(ii) Have rural track FTE limitations in effect prior to October 1, 2022; and

(iii) Comply with the regulations at § 413.79(f)(1) through (6) for Medicare GME affiliated groups.

Rural track Medicare GME affiliation agreement means a written, signed, and dated agreement by responsible representatives of each respective hospital in a rural track Medicare GME affiliated group, as defined in this paragraph (b), that specifies all of the following:

(i) A statement attesting that each participating hospital's FTE counts and rural track FTE limitations in the agreement do not reflect FTE residents nor FTE caps associated with programs other than the rural track program.

(ii) The term of the rural track Medicare GME affiliation agreement (which, at a minimum is 1 year), beginning on July 1 of a year.

(iii) Each participating hospital's direct and indirect GME rural track FTE limitations in effect prior to the rural track Medicare GME affiliation.

(iv) The total adjustment to each hospital's rural track FTE limitations in each year that the rural track Medicare GME affiliation agreement is in effect, for both direct GME and indirect medical education (IME), that reflects a positive adjustment to one hospital's direct and indirect rural track FTE limitations that is offset by a negative adjustment to the other hospital's (or

hospitals') direct and indirect rural track FTE limitations of at least the same amount.

(v) The adjustment to each participating hospital's FTE counts resulting from the FTE resident's (or residents') participation in a shared rotational arrangement at each hospital participating in the rural track Medicare GME affiliated group for each year the Medicare GME affiliation agreement is in effect. This adjustment to each participating hospital's FTE count is also reflected in the total adjustment to each hospital's rural track FTE limitations (in accordance with paragraph (iii) of this definition).

(vi) The names of the participating hospitals and their Medicare provider numbers.

* * * * *

■ 15. Section 413.79 is amended by revising paragraphs (c)(2)(iii) and adding a sentence at the end of paragraph (d)(3) to read as follows:

§ 413.79 Direct GME payments: Determination of the weighted number of FTE residents.

* * * * *

(c) * * *

(2) * * *

(iii) Effective for cost reporting periods beginning on or after October 1, 2001, if the hospital's unweighted number of FTE residents exceeds the limit described in this section, and the number of weighted FTE residents in accordance with paragraph (b) of this section also exceeds that limit, the respective primary care and obstetrics and gynecology weighted FTE counts and other weighted FTE counts are adjusted to make the total weighted FTE count equal the limit. If the number of FTE residents weighted in accordance with paragraph (b) of this section does not exceed that limit, then the allowable weighted FTE count is the actual weighted FTE count.

* * * * *

(d) * * *

(3) * * * For cost reporting periods beginning on or after October 1, 2001, the hospital's weighted FTE counts for the preceding two cost reporting periods are calculated in accordance with the payment formula in paragraph (c)(2)(iii) of this section.

■ 16. Subpart F is amended by adding § 413.99 to read as follows:

§ 413.99 Qualified and Non-Qualified Deferred Compensation Plans.

(a) *Statutory basis, scope, and definitions*—(1) *Basis.* All payments to providers of services must be based on the reasonable cost of services covered under Title XVIII in accordance with section 1861(v) of the Act and the regulations in this part.

(2) *Scope.* This section and § 413.100(c)(2)(vii) apply to Medicare's treatment of the costs incurred for Qualified and Non-Qualified Deferred Compensation Plans.

(3) *Definitions.* As used in this section the following definitions apply:

Deferred Compensation means remuneration currently earned by an employee that is not received until a subsequent period, usually after retirement.

Employee Retirement Income Security Act of 1974 (ERISA) is a Federal law that sets standards of protection for individuals in most voluntarily established, private-sector retirement plans. The law is set forth in Title 29, Chapter 18 of the U.S. Code.

Funded Plan means a plan in which assets have been irrevocably and unconditionally set aside with a third party for the payment of plan benefits (for example, in a trust or escrow account), and those assets are beyond the reach of the employer or its general creditors.

Non-Qualified Deferred Compensation Plan (NQDC) means an elective or non-elective plan, agreement, method, or arrangement between an employer and an employee to pay the employee compensation in the future. In comparison with qualified plans, nonqualified plans do not provide employers and employees with the tax benefits associated with qualified plans because NQDC plans do not satisfy all the requirements of 26 U.S.C. 401(a).

Non-Qualified Defined Benefit Plan (NQDB) means a type of NQDC that is established and maintained by the employer primarily to provide definitely determinable benefits to its employees usually over a period of years, or for life, after retirement. Such benefits are generally measured by, and based on, such factors as age of employees, years of service, and compensation received by the employees.

Pension Benefit Guaranty Corporation (PBGC) is a Federal agency created by ERISA to protect benefits in private-sector QDBP plans described in section 3(35) of ERISA.

Qualified Defined Benefit Plan (QDBP) means a type of Qualified Deferred Compensation Plan that is established and maintained by the employer primarily to provide definitely determinable benefits to its employees usually over a period of years, or for life, after retirement. Such benefits are generally measured by, and based on, such factors as age of employees, years of service, and compensation received by the employees. A QDBP meets the applicable requirements of ERISA, as amended, and the requirements for a QDBP under 26 U.S.C. 401(a). Under a qualified plan, employers are entitled to deduct expenses in the year the employer makes contributions even though employees will not recognize income until the receipt of distributions.

Qualified Defined Contribution or Individual Account Plan (QDCP) means a type of Deferred Compensation Plan in which the employee, the employer, or both, contribute to an employee's individual account under the plan. The amount in the account at distribution includes the contributions and investment gains or losses, minus any investment and administrative fees. The value of the account changes based on contributions and the value and performance of the investments. A QDCP meets the applicable requirements of ERISA, as amended, and the requirements set forth in 26 U.S.C. 401(a), and, if applicable 26 U.S.C. 401(k).

Unfunded Plan means a plan in which benefits are supported by assets that have not been set aside (that is, a ''pay as you go'' plan), or by assets that have been set aside, but remain subject to the claims of the employer's general creditors.

(b) *Principle requirements*—(1) *General.* Deferred Compensation contributions or payments must be made by a provider of services, or an employee of the provider of services, to a Qualified or Non-Qualified Deferred Compensation Plan, established and maintained by the provider of services to provide retirement income to employees or to result in the deferral of income by employees for periods extending to the termination of covered employment or beyond. Contributions or payments made by a provider of services for the benefit of its employees to a Qualified or Non-Qualified Deferred Compensation Plan are allowable, when, and to the extent that, such costs are actually incurred by the provider of services and found to be reasonable and necessary under the principles of reasonable cost.

(2) *Deferred Compensation for provider-based physicians services in a hospital or SNF.* Costs incurred by a hospital or SNF to fund a Qualified or Non-Qualified Deferred Compensation Plan for a provider-based physician must meet the following requirements to be allowable under the program:

(i) The allocation of physician compensation costs required under § 415.60 of this chapter does not attribute the provider-based physician's Deferred Compensation entirely to one

category of service and his current compensation to another.

(ii) Contributions or payments toward the Qualified or Non-Qualified Deferred Compensation Plan do not include any cost excluded from the definition of physician compensation at § 415.60(a) of this chapter.

(iii) The amount of Deferred Compensation does not exceed the amount specified in the agreement required by § 415.60(g) of this chapter.

(iv) An arrangement between a physician and a provider of services under which the physician is reimbursed for patient charges, but the provider of services does the billing as a Deferred Compensation agreement, is not allowed.

(v) The costs incurred for physician guaranteed arrangements for hospital emergency room availability services, must meet the following additional requirements:

(A) The terms of both the guarantee arrangements and the Deferred Compensation Plan establish the amounts to be included at the beginning of the hospital's cost reporting period.

(B) The amount of Deferred Compensation is included in the guaranteed amount.

(C) The hospital contributes to the Deferred Compensation Plan from its own funds.

(D) The amount of Deferred Compensation that is allowable is limited to the amount by which the guarantee, including Deferred Compensation, exceeds the total billed by the hospital to all patients for the physician's patient care services.

(E) When the physician's charges to all patients equal or exceed the amount guaranteed by the hospital, the program does not recognize a Deferred Compensation contribution/payment.

(c) *Requirements for Non-Qualified and Qualified Deferred Compensation Plans*—(1) *NQDC requirements.* In order for contributions or payments by a provider of services to an NQDC as defined at paragraph (a)(3) of this section to be allowable under the program, the NQDC must meet the general requirements at paragraph (c)(1)(i) of this section, and it must either meet the requirements for a funded NQDC at paragraph (c)(1)(ii) of this section or the requirements for an unfunded NQDC at paragraph (c)(1)(iii) of this section, as applicable.

(i) *General requirements.* An NQDC must satisfy the requirements for document compliance and operational compliance set forth in 26 U.S.C. 409A.

(ii) *Funded NQDCs.* A funded NQDC must meet the definition of a Funded Plan in paragraph (a)(3) of this section and comply with the requirements in paragraph (c)(5) of this section.

(iii) *Unfunded NQDCs.* An NQDC that is unfunded must meet the definition of an Unfunded Plan in paragraph (a)(3) of this section, and there must be no constructive receipt of income for employees from a NQDC as a result of contributions made by a provider of services.

(2) *QDCP requirements.* A QDCP must meet the applicable requirements of ERISA, as amended, and the requirements set forth in 26 U.S.C. 401(a), and if applicable 26 U.S.C. 401(k). A QDCP must meet the definition of a Funded Plan in paragraph (a)(3) of this section and comply with the requirements in paragraph (c)(5) of this section.

(3) *QDBP requirements.* A QDBP must meet the applicable requirements of ERISA, as amended, and the requirements for a defined benefit plan under 26 U.S.C. 401(a). A QDBP must meet the definition of a Funded Plan in paragraph (a)(3) of this section and comply with the requirements in paragraph (c)(5) of this section.

(4) *NQDB requirements.* In order for contributions or payments by a provider of services to an NQDB as defined at paragraph (a)(3) of this section to be allowable under the program, the NQDB must meet the general requirements at paragraph (c)(4)(i) of this section, and it must either meet the requirements for a funded NQDB at paragraph (c)(4)(ii) of this section or the requirements for an unfunded NQDB at paragraph (c)(4)(iii) of this section, as applicable.

(i) *General requirements.* An NQDB must satisfy the requirements for document compliance set forth in 26 U.S.C. 409A and operational compliance set forth in 26 U.S.C. 409A(a).

(ii) *Funded NQDBs.* An NQDB that is funded must meet the definition of a Funded Plan in paragraph (a)(3) of this section and comply with the requirements in paragraph (c)(5) of this section.

(iii) *Unfunded NQDBs.* An NQDB that is unfunded must meet the definition of an Unfunded Plan in paragraph (a)(3) of this section, and there must be no constructive receipt of income for employees from a NQDB as a result of contributions made by a provider of services.

(5) *Funded Plan requirements*—(i) *Acceptable funding mechanism.* Both provider of services contributions and employee contributions must be used either to purchase an insured plan with a commercial insurance company, to establish a custodial bank account, or to establish a trust fund administered by a trustee.

(ii) *Life insurance contracts.* The purchase of an ordinary life insurance contract (for example, whole life, straight life, or other) is not a deferral of compensation and is not recognized as a funding mechanism, even where it is convertible at the normal retirement date specified in the policy to an annuity payable over the remaining life of the employee.

(iii) *Sole benefit of participating employees.* Regardless of the funding mechanism utilized, all provider of services and employee contributions to the fund established under the Deferred Compensation Plan and income therefrom must be used for the sole benefit of the participating employees.

(d) *Recognition of contributions or payments to Qualified and Non-Qualified Deferred Compensation Plans*—(1) *General rule.* Except as provided for in paragraph (c)(1)(iii) of this section with respect to QDBPs and funded NQDBs, contributions to Qualified Deferred Compensation Plans or payments to plan participants from Non-Qualified Deferred Compensation Plans are recognized as allowable costs in accordance with paragraph (c)(1)(i) of this section (in the case of Unfunded Plans) and paragraph (c)(1)(ii) of this section (in the case of Funded Plans).

(i) *Unfunded Plans.* Contributions or payments made to an unfunded Deferred Compensation Plans (including unfunded NQDBs) by a provider of services on behalf of its employees are included in allowable costs only during the cost reporting period in which an actual payment is made to the participating employees (or their beneficiaries) and only to the extent considered reasonable, in accordance with § 413.100(c)(2)(vii)(A).

(ii) *Funded Plans.* Reasonable provider of services payments made under funded Deferred Compensation Plans (specifically, funded Defined Contribution Plans, but excluding QDBPs and funded NQDBs) are included in allowable costs in accordance with § 413.100(c)(2)(vii)(B).

(iii) *Exception for QDBPs and funded NQDBs.* (A) QDBP and NQDB contributions are found to have been incurred only if paid directly to participants or beneficiaries under the terms of the plan or to the QDBP or NQDB.

(B) Payments to a QDBP or funded NQDB for a cost reporting period must be measured on a cash basis. A contribution or payment is deemed to occur on the date it is credited to the fund established for the QDBP or funded NQDB, or for provider of

services payments made directly to a plan participant or beneficiary, on the date the provider of services account is debited.

(C) Payments or contributions made to fully fund a terminating QDBP or funded NQDB are to be included as funding on the date they are paid. Excess assets withdrawn from a QDBP or funded NQDB are to be treated as negative contributions on the date that they are withdrawn.

(D) QDBP and funded NQDB annual allowable costs are computed as follows:

(*1*) QDBP and funded NQDB costs and limits are computed in accordance with § 413.100(c)(2)(vii)(D).

(*2*) For purposes of determining the QDBP or funded NQDB cost limit under § 413.100(c)(2)(vii)(D)(*2*), provider of services contribution payments for each applicable cost reporting period must be determined on a cash basis without regard to any limit determined for the period during which the contributions were made, and excluding any contributions deposited in a prior period and treated as carry forward contributions.

(*3*) The averaging period used to determine the QDBP or funded NQDB cost limit must be determined without regard to a provider of services period of participation in the Medicare program. Periods that are not Medicare cost reporting periods (for example, periods prior to the hospital's participation in the Medicare program) must be defined as consecutive 12-month periods ending immediately prior to the provider of services initial Medicare cost reporting period.

(*4*) The averaging period used to determine the QDBP or funded NQDB cost limit must exclude all periods ending prior to the initial effective date of the plan (or a predecessor plan in the case of a merger).

(*5*) In general, the current period defined benefit cost and limit is computed and applied separately for each QDBP or funded NQDB offered by a provider of services. In the case of a plan merger, the contributions or payments made by a provider of services to a predecessor QDBP or funded NQDB and reflected in the assets subsequently transferred to a successor plan are treated as contribution payments made to the successor plan.

(2) [Reserved]

(e) *Documentation requirements.* Documentation must be maintained by the provider of services in accordance with § 413.20 to substantiate the allowability of contributions or payments to Qualified and Non-Qualified Deferred Compensation Plan(s) that it has included in its cost reports.

(1) *Required documentation.* The provider of services must maintain and make available, upon request by the contractor or CMS, certain specified documentation, to substantiate the allowability of the contributions or payments to its Qualified or Non-Qualified Deferred Compensation Plan(s), or both:

(i) Documentation that demonstrates that the provider of services is in compliance with 26 U.S.C. 409A and 409A(a), and, if applicable, 26 U.S.C. 457.

(ii) Ledger accounts/account statements for each plan participant noting current year deferrals, distributions and loans, including any deferral election forms completed by employees, any change requests, and the approval of such requests.

(iii) Documentation that demonstrates the amount(s) and date(s) of actual contributions or payments made to the Qualified or Non-Qualified Deferred Compensation Plan during the current cost reporting period.

(iv) Schedule SB of Form 5500 (tri-agency form (Department of Labor (DOL), Internal Revenue Service (IRS), and PBGC) that plans file with the DOL's ''EFAST'' electronic filing system) for a QDBP for the current cost reporting period, or any applicable prior periods.

(v) In the case of a system-wide (multiple employer) plan, the home office shall identify the contributions attributed to each participating provider of services. If the costs included in the cost report for a period differ from the contributions made during the reporting period (that is, as a result of carry forward contributions), the provider of services must also have data available to track and reconcile the difference.

(2) *Additional documentation.* The following additional documentation must be made available, upon request by the contractor or CMS, to substantiate the allowability of the payments/contributions by a provider of services to a Qualified or Non-Qualified Deferred Compensation Plan:

(i) The plan document, the trust document and all amendments related to the current cost reporting period.

(ii) If applicable, any Form 5330, Return of Excise Taxes Related to Employee Benefit Plans, for the cost reporting period.

(iii)(A) Supporting documents for all plan assets and liabilities, such as broker's statements, bank statements, insurance contracts, loan documents, deeds, etc.

(B) Verification of how assets are valued.

(iv)(A) Trustee or administrator reports.

(B) Ledgers.

(C) Journals.

(D) Trustee, administrator, and investment committee minutes.

(E) Certified audit report and other financial reports for the trust.

(F) Any other financial reports, including receipt and disbursement statements, a detailed income statement, and a detailed balance sheet.

(v) For each covered QDBP, documentation of the certified premium information and payments to the PBGC.

(f) *Administrative and other costs associated with Deferred Compensation Plans.* The provider of services shall file a cost report required under §§ 413.20 and 413.24(f) that is consistent with the policies set forth in this section.

(1) *Trustee and custodial fees.* Reasonable trustee or custodial fees, including PBGC premiums, paid by the provider of services are allowed as an administrative cost except where the plan provides that such fees are paid out of the corpus or earnings of the fund.

(2) *Vested benefits.* The forfeiture of an employee's benefits for cause (as defined in the plan) is recognized as an allowable cost provided that such forfeited amounts are used to reduce the provider of services contributions or payments to the plan during the cost reporting period in which the forfeiture occurs.

(3) *Benefits to be paid.* If an employee terminates participation in the Deferred Compensation Plan before their rights are vested, the applicable non-vested contributions/payments cannot be applied to increase the benefits of the surviving participants. Instead the non-vested contributions or payments should be used to reduce the provider of services contributions or payments to the Deferred Compensation Plan, in the cost reporting period in which the employee terminated participation in the Deferred Compensation Plan. Otherwise, the contributions/payments made by the provider of services must be applied to reduce the subsequent contributions or payments to the Deferred Compensation Plan in the next cost reporting period. If subsequent provider of services contributions/payments to the Deferred Compensation Plan are not made, then the provider of services costs are reduced by the contractor to the extent of such non-vested funds.

(4) *DOL, IRS, or PBGC penalties.* If the provider of services is assessed an excise tax or other remedy by the DOL, IRS, or PBGC for failure to follow DOL,

IRS, or PBGC requirements under ERISA or any other penalty fee or penalty interest applicable to its Deferred Compensation Plan, the cost is unallowable in accordance with section 1861(v)(8) of the Act.

(5) *Loans made from a Deferred Compensation Plan.* A provider of services cannot make a loan to itself from a Deferred Compensation Plan where ERISA or IRS rules prohibit such a transaction, except where specifically excepted.

(6) *Termination/discontinuation of a Deferred Compensation Plan.* If the provider of services declines to vest its outstanding required contributions or payments (that is, matching or non-elective) to a Deferred Compensation Plan as a result of a termination in full or in part or a discontinuation of contributions or payments to a Deferred Compensation Plan, then the provider of services total outstanding required contributions or payments to the Deferred Compensation Plan during the cost reporting period wherein such termination is initiated cannot be included in the provider of services allowable cost for the cost reporting period in which the termination is initiated, nor any future period.

(7) *Required offset against interest expense.* Investment income earned on a Deferred Compensation Plan after its termination but prior to liquidation of the plan's assets and distribution to the provider of services must be offset against the provider of services allowable interest expense under § 413.153.

(8) *Treatment of residual assets following termination of a Funded Plan.* (i) Residual assets arising from the termination of a funded Deferred Compensation Plan must be recouped in the year of the plan termination only against the cost center(s) in which the provider of services reported its plan contributions or payments, usually the administrative and general cost center.

(ii) Residual assets exceeding the amount in the administrative and general (or other) cost center are not further offset in the current or subsequent years.

(iii) The Medicare share of the reversion is based on the Medicare utilization rate in the year the reversion occurs (or the year the actuarial surplus is determined), and not Medicare's utilization in the years the contributions to the plan were made.

(g) *Treatment of costs associated with the PBGC.* Costs associated with the requirements set forth in ERISA and by the PBGC and incurred by a provider of services who sponsors a QDBP are allowable or unallowable under the program as provided for in this paragraph (g).

(1) *Costs paid out of the plan trust.* PBGC premiums and costs paid out of the corpus or earnings of the trust are included in the contributions allowed under paragraph (d)(1)(iii)(A) of this section, and are not allowable as separate costs.

(2) *Premium payments for single- and multi-employer plans.* The amount of PBGC premiums paid for basic benefits (flat rate or variable, excluding amounts paid out of the corpus or earnings of the trust) by a provider of services who sponsors a QDBP are allowable under the program.

(3) *Liability for missing participants or beneficiaries.* The total amount paid to the PBGC by a provider of services who sponsors a QDBP (excluding amounts paid out of the corpus or earnings of the trust) of the benefit transfer amount (as described in 29 CFR 4050.103(d)) for all missing participants or beneficiaries of the QDBP, is allowable under the program.

(4) *Plan termination due to distress.* For a defined benefit plan that terminated with insufficient assets to pay all of the plan benefits, which resulted in the PBGC making payment of vested benefits up to limits defined by law in accordance with 29 CFR part 4022, such amounts contributed to the QDBP by the provider of services who sponsors the QDBP are allowable. Benefits paid to the participants and beneficiaries of the QDBP by the PBGC are unallowable.

(5) *Restored plan payments.* If the PBGC issues or has issued a plan restoration order as described in 29 CFR part 4047, the amounts that the provider of services repays to the PBGC for guaranteed benefits and related expenses under the plan while the plan was in terminated status, and any administrative costs assessed by the PBGC, excluding penalties, are allowable.

PART 482—CONDITIONS OF PARTICIPATION FOR HOSPITALS

■ 17. The authority citation for part 482 continues to read as follows:

Authority: 42 U.S.C. 1302, 1395hh, and 1395rr, unless otherwise noted.

■ 18. Section 482.42 is amended by revising paragraphs (e) and (f) to read as follows:

§ 482.42 Condition of participation: Infection prevention and control and antibiotic stewardship programs.

* * * * *

(e) *COVID–19 reporting.* (1) During the Public Health Emergency, as defined in § 400.200 of this chapter, the hospital must report information in accordance with a frequency as specified by the Secretary on COVID–19 in a standardized format specified by the Secretary. This report must include, but not be limited to, the following data elements:

(i) The hospital's current inventory supplies of any COVID–19-related therapeutics that have been distributed and delivered to the hospital under the authority and direction of the Secretary.

(ii) The hospital's current usage rate for any COVID–19-related therapeutics that have been distributed and delivered to the hospital under the authority and direction of the Secretary.

(2) Beginning at the conclusion of the COVID–19 Public Health Emergency, as defined in § 400.200 of this chapter, and continuing until April 30, 2024, except when the Secretary specifies an earlier end date for the requirements of this paragraph (e)(2), the hospital must electronically report information about COVID–19 in a standardized format specified by the Secretary. To the extent as required by the Secretary, this report must include the following data elements:

(i) Confirmed COVID–19 infections among patients.

(ii) Total deaths among patients.

(iii) Personal protective equipment and testing supplies.

(iv) Ventilator use, capacity, and supplies.

(v) Total bed and intensive care unit bed census and capacity.

(vi) Staffing shortages.

(vii) COVID–19 vaccine administration data of patients and staff.

(viii) Relevant therapeutic inventories or usage, or both.

(f) *Standard: Reporting of acute respiratory illness, including seasonal influenza virus, influenza-like illness, and severe acute respiratory infection.* (1) During the Public Health Emergency, as defined in § 400.200 of this chapter, the hospital must report information, in accordance with a frequency as specified by the Secretary, on Acute Respiratory Illness (including, but not limited to, Seasonal Influenza Virus, Influenza-like Illness, and Severe Acute Respiratory Infection) in a standardized format specified by the Secretary.

(2) Beginning at the conclusion of the COVID–19 Public Health Emergency, as defined in § 400.200 of this chapter, and continuing until April 30, 2024, except when the Secretary specifies an earlier end date for the requirements of this paragraph (f)(2), the hospital must electronically report information about seasonal influenza in a standardized format specified by the Secretary. To the

extent as required by the Secretary, this report must include the following data elements:

(i) Confirmed influenza infections among patients.

(ii) Total deaths among patients.

(ii) Confirmed co-morbid influenza and COVID–19 infections among patients.

PART 485—CONDITIONS OF PARTICIPATION: SPECIALIZED PROVIDERS

■ 19. The authority citation for part 485 is revised to read as follows:

Authority: 42 U.S.C. 1302 and 1395(hh).

■ 20. Section 485.640 is amended by revising paragraphs (d) and (e) to read as follows:

§ 485.640 Condition of participation: Infection prevention and control and antibiotic stewardship programs.

* * * * *

(d) *COVID–19 reporting.* (1) During the Public Health Emergency, as defined in § 400.200 of this chapter, the CAH must report information in accordance with a frequency as specified by the Secretary on COVID–19 in a standardized format specified by the Secretary. This report must include, but not be limited to, the following data elements:

(i) The CAH's current inventory supplies of any COVID–19-related therapeutics that have been distributed and delivered to the CAH under the authority and direction of the Secretary; and

(ii) The CAH's current usage rate for any COVID–19-related therapeutics that have been distributed and delivered to the CAH under the authority and direction of the Secretary.

(2) Beginning at the conclusion of the COVID–19 Public Health Emergency, as defined in § 400.200 of this chapter, and continuing until April 30, 2024, except when the Secretary specifies an earlier end date for the requirements of this paragraph (d)(2), the CAH must electronically report information about COVID–19 in a standardized format specified by the Secretary. To the extent as required by the Secretary, this report must include the following data elements:

(i) Confirmed COVID–19 infections among patients.

(ii) Total deaths among patients.

(iii) Personal protective equipment and testing supplies.

(iv) Ventilator use, capacity, and supplies.

(v) Total bed and intensive care unit bed census and capacity.

(vi) Staffing shortages.

(vii) COVID–19 vaccine administration data of patients and staff.

(viii) Relevant therapeutic inventories or usage, or both.

(e) *Standard: Reporting of acute respiratory illness, including seasonal influenza virus, influenza-like illness, and severe acute respiratory infection.* (1) During the Public Health Emergency, as defined in § 400.200 of this chapter, the CAH must report information, in accordance with a frequency as specified by the Secretary, on Acute Respiratory Illness (including, but not limited to, Seasonal Influenza Virus, Influenza-like Illness, and Severe Acute Respiratory Infection) in a standardized format specified by the Secretary.

(2) Beginning at the conclusion of the COVID–19 Public Health Emergency, as defined in § 400.200 of this chapter, and continuing until April 30, 2024, except when the Secretary specifies an earlier end date for the requirements of this paragraph (e)(2), the CAH must electronically report information about seasonal influenza in a standardized format specified by the Secretary. To the extent as required by the Secretary, this report must include the following data elements:

(i) Confirmed influenza infections among patients.

(ii) Total deaths among patients.

(iii) Confirmed co-morbid influenza and COVID–19 infections among patients.

PART 495—STANDARDS FOR THE ELECTRONIC HEALTH RECORD TECHNOLOGY INCENTIVE PROGRAM

■ 21. The authority citation for part 495 continues to read as follows:

Authority: 42 U.S.C. 1302 and 1395hh.

■ 22. Section § 495.24 is amended—

■ a. In the introductory text, by revising the last sentence and adding a new sentence at the end of the paragraph;

■ b. In paragraph (e), in the paragraph heading by removing the phrase ''for 2019 and subsequent years'' and adding in its place the phrase ''for 2019 through 2022.'';

■ c. In paragraph (e)(1)(i)(C), by removing the phrase ''In 2022 and subsequent years, earn'' and adding in its place the phrase ''In 2022, earn'';

■ d. In paragraph (e)(4)(ii), by removing the phrase ''In 2022 and subsequent years'' and adding in its place the phrase ''In 2022'';

■ e. In paragraph (e)(5)(ii)(B), by removing the phrase ''In 2020 and subsequent years'' and adding in its place the phrase ''In 2020 through 2022'';

■ f. In paragraph (e)(5)(iii)(A), by removing the phrase ''in CY 2019 and subsequent years'' and adding in its place ''in CY 2019 through CY 2022.'';

■ g. In paragraph (e)(5)(v), by removing the phrase ''Beginning with the EHR reporting period in CY 2019'' and adding in its place ''For the EHR reporting periods in CY 2019 through CY 2022'';

■ h. In paragraph (e)(7)(ii) introductory text, by removing the phrase ''beginning in CY 2019'' and adding in its place the phrase ''for CY 2019 through CY 2022'';

■ i. In paragraph (e)(8)(ii), by removing the phrase ''For CY 2022 and subsequent years'' and adding in its place ''For CY 2022'';

■ j. In paragraph (e)(8)(ii)(A), by removing the phrase ''For CY 2022 and subsequent years'' and adding in its place ''For CY 2022'';

■ k. In paragraphs (e)(8)(iii) introductory text, by removing the phrase ''For CY 2022 and subsequent years'' and adding in its place ''For CY 2022'';

■ l. In paragraph (e)(8)(iii)(A)(*2*), by removing the phrase ''For CY 2022 and subsequent years'' and adding in its place ''For CY 2022'';

■ m. In paragraph (e)(8)(iii)(D)(*2*), by removing the phrase ''For CY 2022 and subsequent years'' and adding in its place ''For CY 2022'';

■ n. In paragraph (e)(8)(iii)(E)(*2*), by removing the phrase ''For CY 2022 and subsequent years'' and adding in its place ''For CY 2022''; and

■ o. Adding paragraph (f).

The revision and addition read as follows:

§ 495.24 Stage 3 meaningful use objectives and measures for EPs, eligible hospitals and CAHs for 2019 and subsequent years.

* * * The criteria specified in *paragraph (e)* of this section are applicable for eligible hospitals and CAHs attesting to CMS for 2019 through 2022. The criteria specified in paragraph (f) of this section are applicable for eligible hospitals and CAHs attesting to CMS for 2023 and subsequent years

* * * * *

(f) *Stage 3 objectives and measures for eligible hospitals and CAHs attesting to CMS for 2023 and subsequent years.* (1) *General rule.* (i) Except as specified in paragraph (f)(2) of this section, eligible hospitals and CAHs must do all of the following as part of meeting the definition of a meaningful EHR user under § 495.4:

(A) Meet all objectives and associated measures selected by CMS under section 1886(n)(3) of the Act for an EHR reporting period.

(B) In 2023 and subsequent years, earn a total score of at least 60 points.

(ii) The numerator and denominator of the measures increment based on actions occurring during the EHR reporting period selected by the eligible hospital or CAH, unless otherwise indicated.

(2) *Exclusion for nonapplicable measures.* (i) *Exclusion of a particular measure.* An eligible hospital or CAH may exclude a particular measure that includes an option for exclusion if the eligible hospital or CAH meets the following requirements:

(A) Meets the criteria in the applicable measure that would permit the exclusion.

(B) Attests to the exclusion.

(ii) *Distribution of points for nonapplicable measures.* For eligible hospitals or CAHs that claim such exclusion, the points assigned to the excluded measure are distributed to other measures as specified by CMS for an EHR reporting period.

Dated: July 27, 2022.

Xavier Becerra,

Secretary, Department of Health and Human Services.

Note: The following Addendum and Appendixes will not appear in the Code of Federal Regulations.

Addendum—Schedule of Standardized Amounts, Update Factors, Rate-of-Increase Percentages Effective With Cost Reporting Periods Beginning on or After October 1, 2022, and Payment Rates for LTCHs Effective for Discharges Occurring on or After October 1, 2022

I. Summary and Background

In this Addendum, we are setting forth a description of the methods and data we used to determine the prospective payment rates for Medicare hospital inpatient operating costs and Medicare hospital inpatient capital-related costs for FY 2023 for acute care hospitals. We also are setting forth the rate-of-increase percentage for updating the target amounts for certain hospitals excluded from the IPPS for FY 2023. We note that, because certain hospitals excluded from the IPPS are paid on a reasonable cost basis subject to a rate-of-increase ceiling (and not by the IPPS), these hospitals are not affected by the proposed figures for the standardized amounts, offsets, and budget neutrality factors. Therefore, in this final rule, we are setting forth the rate-of-increase percentage for updating the target amounts for certain hospitals excluded from the IPPS that will be effective for cost reporting periods beginning on or after October 1, 2022. In addition, we are setting forth a description of the methods and data we used to determine the LTCH PPS standard Federal payment rate that will be applicable to Medicare LTCHs for FY 2023.

In general, except for SCHs, for FY 2023, each hospital's payment per discharge under the IPPS is based on 100 percent of the Federal national rate, also known as the national adjusted standardized amount. This amount reflects the national average hospital cost per case from a base year, updated for inflation. Under current law, the MDH program is effective for discharges on or before September 30, 2022. Therefore, under current law, the MDH program will expire at the end of FY 2022.

Sole Community Hospitals (SCHs) are paid based on whichever of the following rates yields the greatest aggregate payment: the Federal national rate (including, as discussed in section IV.G. of the preamble of this final rule, uncompensated care payments under section 1886(r)(2) of the Act); the updated hospital-specific rate based on FY 1982 costs per discharge; the updated hospital-specific rate based on FY 1987 costs per discharge; the updated hospital-specific rate based on FY 1996 costs per discharge; or the updated hospital-specific rate based on FY 2006 costs per discharge.

As discussed in section V.A.2. of the preamble of this final rule, section 1886(n)(6)(B) of the Act was amended to specify that the adjustments to the applicable percentage increase under section 1886(b)(3)(B)(ix) of the Act apply to subsection (d) Puerto Rico hospitals that are not meaningful EHR users, effective beginning FY 2022. In general, Puerto Rico hospitals are paid 100 percent of the national standardized amount and are subject to the same national standardized amount as subsection (d) hospitals that receive the full update. Accordingly, our discussion later in this section does not include references to the Puerto Rico standardized amount or the Puerto Rico-specific wage index.

As discussed in section II. of this Addendum, we are making changes in the determination of the prospective payment rates for Medicare inpatient operating costs for acute care hospitals for FY 2023. In section III. of this Addendum, we discuss our policy changes for determining the prospective payment rates for Medicare inpatient capital-related costs for FY 2023. In section IV. of this Addendum, we are setting forth the rate-of-increase percentage for determining the rate-of-increase limits for certain hospitals excluded from the IPPS for FY 2023. In section V. of this Addendum, we discuss policy changes for determining the LTCH PPS standard Federal rate for LTCHs paid under the LTCH PPS for FY 2023. The tables to which we refer in the preamble of this final rule are listed in section VI. of this Addendum and are available via the internet on the CMS website.

II. Changes to Prospective Payment Rates for Hospital Inpatient Operating Costs for Acute Care Hospitals for FY 2023

The basic methodology for determining prospective payment rates for hospital inpatient operating costs for acute care hospitals for FY 2005 and subsequent fiscal years is set forth under § 412.64. The basic methodology for determining the prospective payment rates for hospital inpatient operating costs for hospitals located in Puerto Rico for FY 2005 and subsequent fiscal years is set forth under §§ 412.211 and 412.212. In this section, we discuss the factors we are using for determining the proposed prospective payment rates for FY 2023. In summary, the standardized amounts set forth in Tables 1A, 1B, and 1C that are listed and published in section VI. of this Addendum (and available via the internet on the CMS website) reflect—

- Equalization of the standardized amounts for urban and other areas at the level computed for large urban hospitals during FY 2004 and onward, as provided for under section 1886(d)(3)(A)(iv)(II) of the Act.
- The labor-related share that is applied to the standardized amounts to give the hospital the highest payment, as provided for under sections 1886(d)(3)(E) and 1886(d)(9)(C)(iv) of the Act. For FY 2023, depending on whether a hospital submits quality data under the rules established in accordance with section 1886(b)(3)(B)(viii) of the Act (hereafter referred to as a hospital that submits quality data) and is a meaningful EHR user under section 1886(b)(3)(B)(ix) of the Act (hereafter referred to as a hospital that is a meaningful EHR user), there are four possible applicable percentage increases that can be applied to the national standardized amount. We refer readers to section IV.A. of the preamble of this final rule for a complete discussion on the FY 2023 inpatient hospital update. The table that follows shows these four scenarios:

FY 2023 APPLICABLE PERCENTAGE INCREASES FOR THE IPPS				
FY 2023	**Hospital Submitted Quality Data and is a Meaningful EHR User**	**Hospital Submitted Quality Data and is NOT a Meaningful EHR User**	**Hospital Did NOT Submit Quality Data and is a Meaningful EHR User**	**Hospital Did NOT Submit Quality Data and is NOT a Meaningful EHR User**
Adjustment for Failure to Submit Quality Data under Section 1886(b)(3)(B)(viii) of the Act	0	0	-1.025	-1.025
Adjustment for Failure to be a Meaningful EHR User under Section 1886(b)(3)(B)(ix) of the Act	0	-3.075	0	-3.075
Productivity Adjustment under Section 1886(b)(3)(B)(xi) of the Act	-0.3	-0.3	-0.3	-0.3
Applicable Percentage Increase Applied to Standardized Amount	**3.8**	**0.725**	**2.775**	**-0.3**

We note that section 1886(b)(3)(B)(viii) of the Act, which specifies the adjustment to the applicable percentage increase for ''subsection (d)'' hospitals that do not submit quality data under the rules established by the Secretary, is not applicable to hospitals located in Puerto Rico.

In addition, section 602 of Public Law 114–113 amended section 1886(n)(6)(B) of the Act to specify that Puerto Rico hospitals are eligible for incentive payments for the meaningful use of certified EHR technology, effective beginning FY 2016, and also to apply the adjustments to the applicable percentage increase under section 1886(b)(3)(B)(ix) of the Act to subsection (d) Puerto Rico hospitals that are not meaningful EHR users, effective beginning FY 2022. Accordingly, for FY 2022, section 1886(b)(3)(B)(ix) of the Act in conjunction with section 602(d) of Public Law 114–113 requires that any subsection (d) Puerto Rico hospital that is not a meaningful EHR user (as defined in section 1886(n)(3) of the Act) and not subject to an exception under section 1886(b)(3)(B)(ix) of the Act will have ''three-quarters'' of the applicable percentage increase (prior to the application of other statutory adjustments), or three-quarters of the applicable market basket update, reduced by 33⅓ percent. The reduction to three-quarters of the applicable percentage increase for subsection (d) Puerto Rico hospitals that are not meaningful EHR users increases to 66⅔ percent for FY 2023, and, for FY 2024 and subsequent fiscal years, to 100 percent. In the FY 2019 IPPS/LTCH PPS final rule, we finalized the payment reductions (83 FR 41674). The regulations at 42 CFR 412.64(d)(3)(ii) reflect the current law for the update for subsection (d) Puerto Rico hospitals for FY 2023 and subsequent fiscal years.

- An adjustment to the standardized amount to ensure budget neutrality for DRG recalibration and reclassification, as provided for under section 1886(d)(4)(C)(iii) of the Act.
- An adjustment to the standardized amount to ensure budget neutrality for our permanent 10-percent cap on the reduction in a MS–DRG's relative weight in a given fiscal year beginning FY 2023, as discussed in section II.E.2.d. of the preamble of this final rule, consistent with our current methodology for implementing DRG recalibration and reclassification budget neutrality under section 1886(d)(4)(C)(iii) of the Act.
- An adjustment to ensure the wage index and labor-related share changes (depending on the fiscal year) are budget neutral, as provided for under section 1886(d)(3)(E)(i) of the Act (as discussed in the FY 2006 IPPS final rule (70 FR 47395) and the FY 2010 IPPS final rule (74 FR 44005)). We note that section 1886(d)(3)(E)(i) of the Act requires that when we compute such budget neutrality, we assume that the provisions of section 1886(d)(3)(E)(ii) of the Act (requiring a 62-percent labor-related share in certain circumstances) had not been enacted.
- An adjustment to ensure the effects of geographic reclassification are budget neutral, as provided for under section 1886(d)(8)(D) of the Act, by removing the FY 2022 budget neutrality factor and applying a revised factor.
- A positive adjustment of 0.5 percent in FYs 2019 through 2023 as required under section 414 of the MACRA.
- An adjustment to the standardized amount to implement in a budget neutral manner the increase in the wage index values for hospitals with a wage index value below the 25th percentile wage index value across all hospitals (as described in section III.N. of the preamble of this final rule).
- An adjustment to the standardized amount to implement in a budget neutral manner our permanent wage index cap policy, as discussed in section III. N of the preamble of this final rule.
- An adjustment to ensure the effects of the Rural Community Hospital Demonstration program required under section 410A of Public Law 108–173 (as amended by sections 3123 and 10313 of Public Law 111–148; section 15003 of Public Law 114–255; and Division CC, section 128 of Public Law 116–260, which extended the program), are budget neutral, as required under section 410A(c)(2) of Public Law 108–173.
- An adjustment to remove the FY 2022 outlier offset and apply an offset for FY 2023, as provided for in section 1886(d)(3)(B) of the Act.

For FY 2023, consistent with current law, we are applying the rural floor budget neutrality adjustment to hospital wage indexes. Also, consistent with section 3141 of the Affordable Care Act, instead of applying a State-level rural floor budget neutrality adjustment to the wage index, we are applying a uniform, national budget neutrality adjustment to the FY 2023 wage index for the rural floor.

For FY 2023, we proposed to not remove the Stem Cell Acquisition Budget Neutrality Factor from the prior year's standardized amount and to not apply a new factor. If we removed the prior year's adjustment, we would not satisfy budget neutrality. We believe this approach ensures the effects of the reasonable cost-based payment for allogeneic hematopoietic stem cell acquisition costs under section 108 of the Further Consolidated Appropriations Act, 2020 (Pub. L. 116–94) are budget neutral as required under section 108 of Public Law 116–94. For a discussion of Stem Cell Acquisition Budget Neutrality Factor, we refer the reader to the FY 2021 IPPS/LTCH PPS final rule (85 FR 59032 and 59033). When cost report data regarding reasonable cost of acquisition become available, we intend to consider using that reasonable cost data in future rulemaking for budget neutrality.

We did not receive comments on stem cell acquisition budget neutrality. We are finalizing as proposed without modification.

A. Calculation of the Adjusted Standardized Amount

1. Standardization of Base-Year Costs or Target Amounts

In general, the national standardized amount is based on per discharge averages of adjusted hospital costs from a base period (section 1886(d)(2)(A) of the Act), updated and otherwise adjusted in accordance with the provisions of section 1886(d) of the Act. The September 1, 1983, interim final rule (48 FR 39763) contained a detailed explanation of how base-year cost data (from cost reporting periods ending during FY 1981) were established for urban and rural hospitals in the initial development of standardized amounts for the IPPS.

Sections 1886(d)(2)(B) and 1886(d)(2)(C) of the Act require us to update base-year per discharge costs for FY 1984 and then standardize the cost data in order to remove the effects of certain sources of cost

variations among hospitals. These effects include case-mix, differences in area wage levels, cost-of-living adjustments for Alaska and Hawaii, IME costs, and costs to hospitals serving a disproportionate share of low-income patients.

For FY 2023, as we proposed, we are continuing to use the national labor-related and nonlabor-related shares (which are based on the 2018-based IPPS market basket) that were used in FY 2022. Specifically, under section 1886(d)(3)(E) of the Act, the Secretary estimates, from time to time, the proportion of payments that are labor-related and adjusts the proportion (as estimated by the Secretary from time to time) of hospitals' costs which are attributable to wages and wage-related costs of the DRG prospective payment rates. We refer to the proportion of hospitals' costs that are attributable to wages and wage-related costs as the ''labor-related share.'' For FY 2023, as discussed in section III.M. of the preamble of this final rule, as we proposed, we are using a labor-related share of 67.6 percent for the national standardized amounts for all IPPS hospitals (including hospitals in Puerto Rico) that have a wage index value that is greater than 1.0000. Consistent with section 1886(d)(3)(E) of the Act, as proposed, we are applying the wage index to a labor-related share of 62 percent of the national standardized amount for all IPPS hospitals (including hospitals in Puerto Rico) whose wage index values are less than or equal to 1.0000.

The standardized amounts for operating costs appear in Tables 1A, 1B, and 1C that are listed and published in section VI. of the Addendum to this final rule and are available via the internet on the CMS website.

2. Computing the National Average Standardized Amount

Section 1886(d)(3)(A)(iv)(II) of the Act requires that, beginning with FY 2004 and thereafter, an equal standardized amount be computed for all hospitals at the level computed for large urban hospitals during FY 2003, updated by the applicable percentage update. Accordingly, as proposed, we are calculating the FY 2023 national average standardized amount irrespective of whether a hospital is located in an urban or rural location.

3. Updating the National Average Standardized Amount

Section 1886(b)(3)(B) of the Act specifies the applicable percentage increase used to update the standardized amount for payment for inpatient hospital operating costs. We note that, in compliance with section 404 of the MMA, we are using the 2018-based IPPS operating and capital market baskets for FY 2023. As discussed in section IV.B. of the preamble of this final rule, in accordance with section 1886(b)(3)(B) of the Act, as amended by section 3401(a) of the Affordable Care Act, we are reducing the FY 2023 applicable percentage increase (which for this final rule is based on IGI's second quarter 2022 forecast of the 2018-based IPPS market basket) by the productivity adjustment, as discussed elsewhere in this final rule.

Based on IGI's second quarter 2022 forecast (as discussed in Appendix B of this final rule), the forecast of the IPPS market basket increase for FY 2023 for this final rule is 4.1 percent. As discussed earlier, for FY 2023, depending on whether a hospital submits quality data under the rules established in accordance with section 1886(b)(3)(B)(viii) of the Act and is a meaningful EHR user under section 1886(b)(3)(B)(ix) of the Act, there are four possible applicable percentage increases that can be applied to the standardized amount. We refer readers to section V.B. of the preamble of this final rule for a complete discussion on the FY 2023 inpatient hospital update to the standardized amount. We also refer readers to the previous table for the four possible applicable percentage increases that would be applied to update the national standardized amount. The standardized amounts shown in Tables 1A through 1C that are published in section VI. of this Addendum and that are available via the internet on the CMS website reflect these differential amounts.

Although the update factors for FY 2023 are set by law, we are required by section 1886(e)(4) of the Act to recommend, taking into account MedPAC's recommendations, appropriate update factors for FY 2023 for both IPPS hospitals and hospitals and hospital units excluded from the IPPS. Section 1886(e)(5)(A) of the Act requires that we publish our recommendations in the **Federal Register** for public comment. Our recommendation on the update factors is set forth in Appendix B of this final rule.

4. Methodology for Calculation of the Average Standardized Amount

The methodology we used to calculate the FY 2023 standardized amount is as follows:

- To ensure we are only including hospitals paid under the IPPS in the calculation of the standardized amount, we applied the following inclusion and exclusion criteria: include hospitals whose last four digits fall between 0001 and 0879 (section 2779A1 of Chapter 2 of the State Operations Manual on the CMS website at *https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/som107c02.pdf*); exclude CAHs at the time of this final rule; exclude hospitals in Maryland (because these hospitals are paid under an all payer model under section 1115A of the Act); and remove PPS excluded-cancer hospitals that have a ''V'' in the fifth position of their provider number or a ''E'' or ''F'' in the sixth position.
- As in the past, we are adjusting the FY 2023 standardized amount to remove the effects of the FY 2022 geographic reclassifications and outlier payments before applying the FY 2023 updates. We then applied budget neutrality offsets for outliers and geographic reclassifications to the standardized amount based on FY 2023 payment policies.
- We do not remove the prior year's budget neutrality adjustments for reclassification and recalibration of the DRG relative weights and for updated wage data because, in accordance with sections 1886(d)(4)(C)(iii) and 1886(d)(3)(E) of the Act, estimated aggregate payments after updates in the DRG relative weights and wage index should equal estimated aggregate payments prior to the changes. If we removed the prior year's adjustment, we would not satisfy these conditions.

Budget neutrality is determined by comparing aggregate IPPS payments before and after making changes that are required to be budget neutral (for example, changes to MS–DRG classifications, recalibration of the MS–DRG relative weights, updates to the wage index, and different geographic reclassifications). We include outlier payments in the simulations because they may be affected by changes in these parameters.

- Consistent with our methodology established in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50422 through 50433), because IME Medicare Advantage payments are made to IPPS hospitals under section 1886(d) of the Act, we believe these payments must be part of these budget neutrality calculations. However, we note that it is not necessary to include Medicare Advantage IME payments in the outlier threshold calculation or the outlier offset to the standardized amount because the statute requires that outlier payments be not less than 5 percent nor more than 6 percent of total ''operating DRG payments,'' which does not include IME and DSH payments. We refer readers to the FY 2011 IPPS/LTCH PPS final rule for a complete discussion on our methodology of identifying and adding the total Medicare Advantage IME payment amount to the budget neutrality adjustments.
- Consistent with the methodology in the FY 2012 IPPS/LTCH PPS final rule, in order to ensure that we capture only fee-for-service claims, we are only including claims with a ''Claim Type'' of 60 (which is a field on the MedPAR file that indicates a claim is an FFS claim).
- Consistent with our methodology established in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57277), in order to further ensure that we capture only FFS claims, we are excluding claims with a ''GHOPAID'' indicator of 1 (which is a field on the MedPAR file that indicates a claim is not an FFS claim and is paid by a Group Health Organization).
- Consistent with our methodology established in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50422 through 50423), we examine the MedPAR file and remove pharmacy charges for anti-hemophilic blood factor (which are paid separately under the IPPS) with an indicator of ''3'' for blood clotting with a revenue code of ''0636'' from the covered charge field for the budget neutrality adjustments. We are removing organ acquisition charges, except for cases that group to MS–DRG 018, from the covered charge field for the budget neutrality adjustments because organ acquisition is a pass-through payment not paid under the IPPS. Revenue centers 081X–089X are typically excluded from ratesetting. However, we are not removing revenue center 891 charges from MS–DRG 018 claims during ratesetting, because those revenue 891 charges were included in the relative weight calculation for MS–DRG 018, which is consistent with the policy finalized in FY 2021 final rule (85 FR 58600). We note that a new MedPAR variable for revenue code 891 charges was introduced in April 2020.

• For FY 2023, we are continuing to remove allogeneic hematopoietic stem cell acquisition charges from the covered charge field for budget neutrality adjustments. As discussed in the FY 2021 IPPS/LTCH PPS final rule, payment for allogeneic hematopoietic stem cell acquisition costs is made on a reasonable cost basis for cost reporting periods beginning on or after October 1, 2020 (85 FR 58835 through 58842).

• The participation of hospitals under the BPCI (Bundled Payments for Care Improvement) Advanced model started on October 1, 2018. The BPCI Advanced model, tested under the authority of section 3021 of the Affordable Care Act (codified at section 1115A of the Act), is comprised of a single payment and risk track, which bundles payments for multiple services beneficiaries receive during a Clinical Episode. Acute care hospitals may participate in the BPCI Advanced model in one of two capacities: as a model Participant or as a downstream Episode Initiator. Regardless of the capacity in which they participate in the BPCI Advanced model, participating acute care hospitals would continue to receive IPPS payments under section 1886(d) of the Act. Acute care hospitals that are Participants also assume financial and quality performance accountability for Clinical Episodes in the form of a reconciliation payment. For additional information on the BPCI Advanced model, we refer readers to the BPCI Advanced web page on the CMS Center for Medicare and Medicaid Innovation's website at *https://innovation.cms.gov/initiatives/bpci-advanced/*.

For FY 2023, consistent with how we treated hospitals that participated in the BPCI Advanced Model in the FY 2021 IPPS/LTCH PPS final rule (85 FR 59029 and 59030), as we proposed, we are including all applicable data from subsection (d) hospitals participating in the BPCI Advanced model in our IPPS payment modeling and ratesetting calculations. We believe it is appropriate to include all applicable data from the subsection (d) hospitals participating in the BPCI Advanced model in our IPPS payment modeling and ratesetting calculations because these hospitals are still receiving IPPS payments under section 1886(d) of the Act. For the same reasons, as we proposed, we included all applicable data from subsection (d) hospitals participating in the Comprehensive Care for Joint Replacement (CJR) Model in our IPPS payment modeling and ratesetting calculations.

• Consistent with our methodology established in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53687 through 53688), we believe that it is appropriate to include adjustments for the Hospital Readmissions Reduction Program and the Hospital VBP Program (established under the Affordable Care Act) within our budget neutrality calculations.

Both the hospital readmissions payment adjustment (reduction) and the hospital VBP payment adjustment (redistribution) are applied on a claim-by-claim basis by adjusting, as applicable, the base-operating DRG payment amount for individual subsection (d) hospitals, which affects the overall sum of aggregate payments on each side of the comparison within the budget neutrality calculations.

In order to properly determine aggregate payments on each side of the comparison, consistent with the approach we have taken in prior years, for FY 2023, we are continuing to apply a proxy based on the prior fiscal year hospital readmissions payment adjustment (for FY 2023 this would be FY 2022 final adjustment factors from Table 15 of the FY 2022 IPPS/LTCH PPS final rule) and a proxy based on the prior fiscal year hospital VBP payment adjustment (for FY 2023, this proxy would be an adjustment factor of 1 to reflect our policy for the FY 2022 program year to suppress measures and award each hospital a value-based payment amount that matches the reduction to the base operating DRG payment amount) on each side of the comparison, consistent with the methodology that we adopted in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53687 through 53688). That is, we are applying a proxy readmissions payment adjustment factor from the prior final rule and a proxy hospital VBP payment adjustment factor from the prior final rule on both sides of our comparison of aggregate payments when determining all budget neutrality factors described in section II.A.4. of this Addendum.

• The Affordable Care Act also established section 1886(r) of the Act, which modifies the methodology for computing the Medicare DSH payment adjustment beginning in FY 2014. Beginning in FY 2014, IPPS hospitals receiving Medicare DSH payment adjustments receive an empirically justified Medicare DSH payment equal to 25 percent of the amount that would previously have been received under the statutory formula set forth under section 1886(d)(5)(F) of the Act governing the Medicare DSH payment adjustment. In accordance with section 1886(r)(2) of the Act, the remaining amount, equal to an estimate of 75 percent of what otherwise would have been paid as Medicare DSH payments, reduced to reflect changes in the percentage of individuals who are uninsured and any additional statutory adjustment, would be available to make additional payments to Medicare DSH hospitals based on their share of the total amount of uncompensated care reported by Medicare DSH hospitals for a given time period. In order to properly determine aggregate payments on each side of the comparison for budget neutrality, prior to FY 2014, we included estimated Medicare DSH payments on both sides of our comparison of aggregate payments when determining all budget neutrality factors described in section II.A.4. of this Addendum.

To do this for FY 2023 (as we did for the last 9 fiscal years), as we proposed, we are including estimated empirically justified Medicare DSH payments that would be paid in accordance with section 1886(r)(1) of the Act and estimates of the additional uncompensated care payments made to hospitals receiving Medicare DSH payment adjustments as described by section 1886(r)(2) of the Act. That is, we considered estimated empirically justified Medicare DSH payments at 25 percent of what would otherwise have been paid, and also the estimated additional uncompensated care payments for hospitals receiving Medicare DSH payment adjustments on both sides of our comparison of aggregate payments when determining all budget neutrality factors described in section II.A.4. of this Addendum.

• When calculating total payments for budget neutrality, to determine total payments for SCHs, we model total hospital-specific rate payments and total Federal rate payments and then include whichever one of the total payments is greater. As discussed in section IV.G. of the preamble to this final rule and later in this section, we are continuing to use the FY 2014 finalized methodology under which we take into consideration uncompensated care payments in the comparison of payments under the Federal rate and the hospital-specific rate for SCHs. Therefore, we are including estimated uncompensated care payments in this comparison.

• As we proposed, we included an adjustment to the standardized amount for those hospitals that are not meaningful EHR users in our modeling of aggregate payments for budget neutrality for FY 2023. Similar to FY 2022, we are including this adjustment based on data on the prior year's performance. Payments for hospitals will be estimated based on the applicable standardized amount in Tables 1A and 1B for discharges occurring in FY 2023.

• In our determination of all budget neutrality factors described in section II.A.4. of this Addendum, we used transfer-adjusted discharges. Specifically, we calculated the transfer-adjusted discharges using the statutory expansion of the postacute care transfer policy to include discharges to hospice care by a hospice program as discussed in section IV.A.2. of the preamble of the FY 2020 IPPS/LTCH PPS final rule (84 FR 45239 through 42342).

We note that prior to FY 2020, the Rural Community Hospital (RCH) Demonstration budget neutrality factor was typically applied to the standardized amount after all wage index and other budget neutrality factors were applied. In the past we completed all the wage index budget neutrality factors and then applied the RCH Demonstration budget neutrality factor. Beginning with FY 2020, we finalized and implemented additional policies in a budget neutral manner such as the increase in the wage index values for hospitals with a wage index value below the 25th percentile wage index value across all hospitals and the transitional wage indexes. When these new policies were implemented beginning with FY 2020, the associated budget neutrality adjustments were applied to the standardized amount after the RCH Demonstration budget neutrality factor was applied. Taking into consideration that we are placing a permanent cap on wage index decreases beginning FY 2023, we believe the RCH Demonstration budget neutrality factor should revert to the order prior to FY 2020 and be applied after all wage index and other budget neutrality adjustments. Therefore, in the FY 2023 IPPS/LTCH proposed rule (87 FR 28659), beginning in FY 2023 we proposed to change the ordering of budget

neutrality factors with the RCH Demonstration budget neutrality factor applied after all wage index and other budget neutrality factors. We stated that we believe this re-ordering of applying the RCH Demonstration budget neutrality factor after all wage index and other budget neutrality factors will have a minimal impact and minor interactive affects.

We received no comments on our proposal and therefore are finalizing as proposed without modification to change the ordering of budget neutrality factors with the RCH Demonstration budget neutrality factor applied after all wage index and other budget neutrality factors.

a. Reclassification and Recalibration of MS–DRG Relative Weights Before Cap

Section 1886(d)(4)(C)(iii) of the Act specifies that, beginning in FY 1991, the annual DRG reclassification and recalibration of the relative weights must be made in a manner that ensures that aggregate payments to hospitals are not affected. As discussed in section II.E of this final rule, we are determining the MS DRG relative weights for FY 2023 by averaging the relative weights as calculated with and without COVID–19 cases in the FY 2021 data. We refer the reader to section II.E.2.c for complete details. As discussed in section II.E. of the preamble of this final rule, we normalized the recalibrated MS–DRG relative weights by an adjustment factor so that the average case relative weight after recalibration is equal to the average case relative weight prior to recalibration. However, equating the average case relative weight after recalibration to the average case relative weight before recalibration does not necessarily achieve budget neutrality with respect to aggregate payments to hospitals because payments to hospitals are affected by factors other than average case relative weight. Therefore, as we have done in past years, we are making a budget neutrality adjustment to ensure that the requirement of section 1886(d)(4)(C)(iii) of the Act is met.

For this FY 2023 final rule, as we proposed, to comply with the requirement that MS–DRG reclassification and recalibration of the relative weights be budget neutral for the standardized amount and the hospital-specific rates, we used FY 2021 discharge data to simulate payments and compared the following:

- Aggregate payments using the FY 2022 labor-related share percentages, the FY 2022 relative weights, and the FY 2022 pre-reclassified wage data, and applied the estimated FY 2023 hospital readmissions payment adjustments and estimated FY 2023 hospital VBP payment adjustments; and
- Aggregate payments using the FY 2022 labor-related share percentages, the FY 2023 relative weights before applying the 10-percent cap, and the FY 2022 pre-reclassified wage data, and applied the estimated FY 2023 hospital readmissions payment adjustments and estimated FY 2023 hospital VBP payment adjustments applied previously.

Because this payment simulation uses the FY 2023 relative weights (before application of the 10-percent cap), consistent with our policy in section IV.I. of the preamble to this final rule, we applied the adjustor for certain cases that group to MS–DRG 018 in our simulation of these payments. We note that because the simulations of payments for all of the budget neutrality factors discussed in this section also use the FY 2023 relative weights, we are applying the adjustor for certain MS–DRG 18 cases in all simulations of payments for the budget neutrality factors discussed later in this section. We refer the reader to section IV.I. of the preamble of this final rule for a complete discussion on the adjustor for certain cases that group to MS–DRG 018 and to section II.E.2.b. of the preamble of this final rule, for a complete discussion of the adjustment to the FY 2023 relative weights to account for certain cases that group to MS–DRG 018.

Based on this comparison, we computed a budget neutrality adjustment factor and applied this factor to the standardized amount. As discussed in section IV. of this Addendum, as we proposed, we are applying the MS–DRG reclassification and recalibration budget neutrality factor to the hospital-specific rates that are effective for cost reporting periods beginning on or after October 1, 2022. Please see the table later in this section setting forth each of the FY 2023 budget neutrality factors.

b. Budget Neutrality Adjustment for Reclassification and Recalibration of MS–DRG Relative Weights With Cap

As discussed in section II.E.2.d of this final rule, as proposed we are establishing a permanent 10-percent cap on the reduction in a MS–DRG's relative weight in a given fiscal year, beginning in FY 2023. As discussed in section II.E.2.d of this final rule, and consistent with our current methodology for implementing budget neutrality for MS–DRG reclassification and recalibration of the relative weights under section 1886(d)(4)(C)(iii) of the Act, we are applying a budget neutrality adjustment to the standardized amount for all hospitals so that this 10-percent cap on relative weight reductions does not increase estimated aggregate Medicare payments beyond the payments that would be made had we never applied this cap. We refer the reader to section II.E.2.d of this final rule for further discussion on our permanent 10-percent cap on the reduction in a MS–DRG's relative weight in a given fiscal year, including the budget neutrality adjustment to the standardized amount.

To calculate this budget neutrality adjustment factor for FY 2023, we used FY 2021 discharge data to simulate payments and compared the following:

- Aggregate payments using the FY 2022 labor-related share percentages, the FY 2023 relative weights before applying the 10-percent cap, and the FY 2022 pre-reclassified wage data, and applied the estimated FY 2023 hospital readmissions payment adjustments and estimated FY 2023 hospital VBP payment adjustments.
- Aggregate payments using the FY 2022 labor-related share percentages, the FY 2023 relative weights with the 10-percent cap, and the FY 2022 pre-reclassified wage data, and applied the estimated FY 2023 hospital readmissions payment adjustments and estimated FY 2023 hospital VBP payment adjustments applied previously.

Because this payment simulation uses the FY 2023 relative weights, consistent with our policy in section IV.I. of the preamble to this final rule, we applied the adjustor for certain cases that group to MS–DRG 018 in our simulation of these payments. We note that because the simulations of payments for all of the budget neutrality factors discussed in this section also use the FY 2023 relative weights, we are applying the adjustor for certain MS–DRG 18 cases in all simulations of payments for the budget neutrality factors discussed later in this section. We refer the reader to section IV.I. of the preamble of this final rule for a complete discussion on the adjustor for certain cases that group to MS–DRG 018 and to section II.E.2.b. of the preamble of this final rule, for a complete discussion of the adjustment to the FY 2023 relative weights to account for certain cases that group to MS–DRG 018.

In addition, we applied the MS–DRG reclassification and recalibration budget neutrality adjustment factor before the cap (derived in the first step) to the payment rates that were used to simulate payments for this comparison of aggregate payments from FY 2022 to FY 2023. Based on this comparison, we computed a budget neutrality adjustment factor and applied this factor to the standardized amount. As discussed in section IV. of this Addendum, we are applying this budget neutrality factor to the hospital-specific rates that are effective for cost reporting periods beginning on or after October 1, 2022. Please see the table later in this section setting forth each of the FY 2023 budget neutrality factors.

c. Updated Wage Index—Budget Neutrality Adjustment

Section 1886(d)(3)(E)(i) of the Act requires us to update the hospital wage index on an annual basis beginning October 1, 1993. This provision also requires us to make any updates or adjustments to the wage index in a manner that ensures that aggregate payments to hospitals are not affected by the change in the wage index. Section 1886(d)(3)(E)(i) of the Act requires that we implement the wage index adjustment in a budget neutral manner. However, section 1886(d)(3)(E)(ii) of the Act sets the labor-related share at 62 percent for hospitals with a wage index less than or equal to 1.0000, and section 1886(d)(3)(E)(i) of the Act provides that the Secretary shall calculate the budget neutrality adjustment for the adjustments or updates made under that provision as if section 1886(d)(3)(E)(ii) of the Act had not been enacted. In other words, this section of the statute requires that we implement the updates to the wage index in a budget neutral manner, but that our budget neutrality adjustment should not take into account the requirement that we set the labor-related share for hospitals with wage indexes less than or equal to 1.0000 at the more advantageous level of 62 percent. Therefore, for purposes of this budget neutrality adjustment, section 1886(d)(3)(E)(i) of the Act prohibits us from taking into account the fact that hospitals with a wage index less than or equal to 1.0000 are paid using a labor-related share of 62 percent.

Consistent with current policy, for FY 2023, as we proposed, we are adjusting 100 percent of the wage index factor for occupational mix. We describe the occupational mix adjustment in section III.E. of the preamble of this final rule.

To compute a budget neutrality adjustment factor for wage index and labor-related share percentage changes, we used FY 2021 discharge data to simulate payments and compared the following:

- Aggregate payments using the FY 2023 relative weights and the FY 2022 pre-reclassified wage indexes, applied the FY 2022 labor-related share of 67.6 percent to all hospitals (regardless of whether the hospital's wage index was above or below 1.0000), and applied the FY 2023 hospital readmissions payment adjustment and the estimated FY 2023 hospital VBP payment adjustment.
- Aggregate payments using the FY 2023 relative weights and the FY 2023 pre-reclassified wage indexes, applied the labor-related share for FY 2023 of 67.6 percent to all hospitals (regardless of whether the hospital's wage index was above or below 1.0000), and applied the same FY 2023 hospital readmissions payment adjustments and estimated FY 2023 hospital VBP payment adjustments applied previously.

In addition, we applied the MS–DRG reclassification and recalibration budget neutrality adjustment factor before the cap (derived in the first step) and the 10-percent cap on relative weight reductions adjustment factor (derived from the second step) to the payment rates that were used to simulate payments for this comparison of aggregate payments from FY 2022 to FY 2023. Based on this comparison, we computed a budget neutrality adjustment factor and applied this factor to the standardized amount for changes to the wage index. Please see the table later in this section for a summary of the FY 2023 budget neutrality factors.

d. Reclassified Hospitals—Budget Neutrality Adjustment

Section 1886(d)(8)(B) of the Act provides that certain rural hospitals are deemed urban. In addition, section 1886(d)(10) of the Act provides for the reclassification of hospitals based on determinations by the MGCRB. Under section 1886(d)(10) of the Act, a hospital may be reclassified for purposes of the wage index.

Under section 1886(d)(8)(D) of the Act, the Secretary is required to adjust the standardized amount to ensure that aggregate payments under the IPPS after implementation of the provisions of sections 1886(d)(8)(B) and (C) and 1886(d)(10) of the Act are equal to the aggregate prospective payments that would have been made absent these provisions.

As discussed in section III.G.1. of the preamble of this final rule, for FY 2023 and subsequent years, we are finalizing a policy to include the wage data of hospitals that have reclassified from urban to rural under section 1886(d)(8)(E) of the Act (as implemented in the regulations at § 412.103) and have no additional form of reclassification (MGCRB or Lugar) in the calculation of the rural floor, and to include the wage data of such hospitals in the calculation of ''the wage index for rural areas in the State in which the county is located'' as referred to in section 1886(d)(8)(C)(iii) of the Act. We refer the reader to the FY 2015 IPPS final rule (79 FR 50371 and 50372) for a complete discussion regarding the requirement of section 1886(d)(8)(C)(iii) of the Act. We further note that the wage index adjustments provided for under section 1886(d)(13) of the Act are not budget neutral. Section 1886(d)(13)(H) of the Act provides that any increase in a wage index under section 1886(d)(13) of the Act shall not be taken into account in applying any budget neutrality adjustment with respect to such index under section 1886(d)(8)(D) of the Act. To calculate the proposed budget neutrality adjustment factor for FY 2023, we used FY 2021 discharge data to simulate payments and compared the following:

- Aggregate payments using the FY 2023 labor-related share percentage, the FY 2023 relative weights, and the FY 2023 wage data prior to any reclassifications under sections 1886(d)(8)(B) and (C) and 1886(d)(10) of the Act, and applied the estimated FY 2023 hospital readmissions payment adjustments and the estimated FY 2023 hospital VBP payment adjustments.
- Aggregate payments using the FY 2023 labor-related share percentage, the FY 2023 relative weights, and the FY 2023 wage data after such reclassifications, and applied the same estimated FY 2023 hospital readmissions payment adjustments and the estimated FY 2023 hospital VBP payment adjustments applied previously.

We note that the reclassifications applied under the second simulation and comparison are those listed in Table 2 associated with this final rule, which is available via the internet on the CMS website. This table reflects reclassification crosswalks for FY 2023, and applies the policies explained in section III. of the preamble of this final rule. Based on this comparison, we computed a budget neutrality adjustment factor and applied this factor to the standardized amount to ensure that the effects of these provisions are budget neutral, consistent with the statute. Please see the table later in this section for a summary of the FY 2023 budget neutrality factors.

The FY 2023 budget neutrality adjustment factor was applied to the standardized amount after removing the effects of the FY 2022 budget neutrality adjustment factor. We note that the FY 2023 budget neutrality adjustment reflects FY 2023 wage index reclassifications approved by the MGCRB or the Administrator at the time of development of this final rule.

e. Rural Floor Budget Neutrality Adjustment

Under § 412.64(e)(4), we make an adjustment to the wage index to ensure that aggregate payments after implementation of the rural floor under section 4410 of the BBA (Pub. L. 105–33) is equal to the aggregate prospective payments that would have been made in the absence of this provision. Consistent with section 3141 of the Affordable Care Act and as discussed in section III.G. of the preamble of this final rule and codified at § 412.64(e)(4)(ii), the budget neutrality adjustment for the rural floor is a national adjustment to the wage index.

Similar to our calculation in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50369 through 50370), for FY 2023, as we proposed, we calculated a national rural Puerto Rico wage index. Because there are no rural Puerto Rico hospitals with established wage data, our calculation of the FY 2023 rural Puerto Rico wage index is based on the policy adopted in the FY 2008 IPPS final rule with comment period (72 FR 47323). That is, we use the unweighted average of the wage indexes from all CBSAs (urban areas) that are contiguous (share a border with) to the rural counties to compute the rural floor (72 FR 47323; 76 FR 51594). Under the OMB labor market area delineations, except for Arecibo, Puerto Rico (CBSA 11640), all other Puerto Rico urban areas are contiguous to a rural area. Therefore, based on our existing policy, the FY 2023 rural Puerto Rico wage index is calculated based on the average of the FY 2023 wage indexes for the following urban areas: Aguadilla-Isabela, PR (CBSA 10380); Guayama, PR (CBSA 25020); Mayaguez, PR (CBSA 32420); Ponce, PR (CBSA 38660); San German, PR (CBSA 41900); and San Juan-Carolina-Caguas, PR (CBSA 41980).

We also note, as discussed in section III.G.1. of the preamble of this final rule, based on the district court's decision in *Citrus* and the comments we received, we are not finalizing our rural floor wage index policy as proposed, which would have excluded § 412.103 hospitals from the calculation of the rural floor and from the calculation of ''the wage index for rural areas in the State in which the county is located'' as referred to in section 1886(d)(8)(C)(iii) of the Act. Rather, we are finalizing a policy that calculates the rural floor as it was calculated before FY 2020. For FY 2023 and subsequent years, we are finalizing a policy to include the wage data of hospitals that have reclassified from urban to rural under section 1886(d)(8)(E) of the Act (as implemented in the regulations at § 412.103) and have no additional form of reclassification (MGCRB or Lugar) in the calculation of the rural floor, and to include the wage data of such hospitals in the calculation of ''the wage index for rural areas in the State in which the county is located'' as referred to in section 1886(d)(8)(C)(iii) of the Act.

To calculate the national rural floor budget neutrality adjustment factor, we used FY 2021 discharge data to simulate payments, and the post-reclassified national wage indexes and compared the following:

- National simulated payments without the rural floor.
- National simulated payments with the rural floor.

Based on this comparison, we determined a national rural floor budget neutrality adjustment factor. The national adjustment was applied to the national wage indexes to produce rural floor budget neutral wage indexes. Please see the table later in this section for a summary of the FY 2023 budget neutrality factors.

As further discussed in section III.G.2. of the preamble of this final rule, we note that section 9831 of the American Rescue Plan Act of 2021 (Pub. L. 117–2), enacted on March 11, 2021 amended section

1886(d)(3)(E)(i) of the Act (42 U.S.C. 1395ww(d)(3)(E)(i)) and added section 1886(d)(3)(E)(iv) of the Act to establish a minimum area wage index (or imputed floor) for hospitals in all-urban States for discharges occurring on or after October 1, 2021. Unlike the imputed floor that was in effect from FY 2005 through FY 2018, section 1886(d)(3)(E)(iv)(III) of the Act provides that the imputed floor wage index shall not be applied in a budget neutral manner. Specifically, section 9831(b) of Public Law 117–2 amends section 1886(d)(3)(E)(i) of the Act to exclude the imputed floor from the budget neutrality requirement under section 1886(d)(3)(E)(i) of the Act. In the past, we budget neutralized the estimated increase in payments each year resulting from the imputed floor that was in effect from FY 2005 through FY 2018. For FY 2022 and subsequent years, in applying the imputed floor required under section 1886(d)(3)(E)(iv) of the Act, we are applying the imputed floor after the application of the rural floor and applying no reductions to the standardized amount or to the wage index to fund the increase in payments to hospitals in all-urban States resulting from the application of the imputed floor. We refer the reader to section III.G.2. of the preamble of this final rule for a complete discussion regarding the imputed floor.

f. Continuation of the Low Wage Index Hospital Policy—Budget Neutrality Adjustment

As discussed in section III.G.3. of the preamble of this final rule, we are continuing for FY 2023 the wage index policy finalized in the FY 2020 IPPS/LTCH PPS final rule to address wage index disparities by increasing the wage index values for hospitals with a wage index value below the 25th percentile wage index value across all hospitals (the low wage index hospital policy). As discussed in section III.G.3. of this final rule, consistent with our current methodology for implementing wage index budget neutrality under section 1886(d)(3)(E) of the Act, we are making a budget neutrality adjustment to the national standardized amount for all hospitals so that the increase in the wage index for hospitals with a wage index below the 25th percentile wage index, is implemented in a budget neutral manner.

To calculate this budget neutrality adjustment factor for FY 2023, we used FY 2021 discharge data to simulate payments and compared the following:

- Aggregate payments using the FY 2023 labor-related share percentage, the FY 2023 relative weights, and the FY 2023 wage index for each hospital before adjusting the wage indexes under the low wage index hospital policy, and applied the estimated FY 2023 hospital readmissions payment adjustments and the estimated FY 2023 hospital VBP payment adjustments, and the operating outlier reconciliation adjusted outlier percentage discussed later in this section.
- Aggregate payments using the FY 2023 labor-related share percentage, the FY 2023 relative weights, and the FY 2023 wage index for each hospital after adjusting the wage indexes under the low wage index hospital policy, and applied the same estimated FY 2023 hospital readmissions payment adjustments and the estimated FY 2023 hospital VBP payment adjustments applied previously, and the operating outlier reconciliation adjusted outlier percentage discussed later in this section.

This FY 2023 budget neutrality adjustment factor was applied to the standardized amount.

g. Permanent Cap Policy for the Wage Index—Budget Neutrality Adjustment

As noted previously, in section III.N. of the preamble of this final rule, for FY 2023 and subsequent years, we are finalizing as proposed to apply a 5-percent cap on any decrease to a hospital's wage index from its wage index in the prior FY, regardless of the circumstances causing the decline. That is, a hospital's wage index for FY 2023 would not be less than 95 percent of its final wage index for FY 2022, and that for subsequent years, a hospital's wage index would not be less than 95 percent of its final wage index for the prior FY. In section III.N.2. of this final rule, we are also applying this wage index cap policy in a budget neutral manner through an adjustment to the standardized amount to ensure that estimated aggregate payments under our wage index cap policy for hospitals that will have a decrease in their wage indexes for the upcoming fiscal year of more than 5 percent will equal what estimated aggregate payments would have been without the wage index cap policy. We refer readers to sections III.N.1 and III.N.2 of the preamble of this final rule for a complete discussion regarding this policy.

To calculate a wage index cap budget neutrality adjustment factor for FY 2023, we used FY 2021 discharge data to simulate payments and compared the following:

- Aggregate payments without the 5-percent cap using the FY 2023 labor-related share percentages, the FY 2023 relative weights, the FY 2023 wage index for each hospital after adjusting the wage indexes under the low wage index hospital policy with the associated budget neutrality adjustment to the standardized amount, and applied the estimated FY 2023 hospital readmissions payment adjustments and the estimated FY 2023 hospital VBP payment adjustments, and the operating outlier reconciliation adjusted outlier percentage discussed later in this section.
- Aggregate payments with the 5-percent cap using the FY 2023 labor-related share percentages, the FY 2023 relative weights, the FY 2023 wage index for each hospital after adjusting the wage indexes under the low wage index hospital policy with the associated budget neutrality adjustment to the standardized amount, and applied the same estimated FY 2023 hospital readmissions payment adjustments and the estimated FY 2023 hospital VBP payment adjustments applied previously, and the operating outlier reconciliation adjusted outlier percentage discussed later in this section.

We note, Table 2 associated with this final rule contains the wage index by provider before and after applying the low wage index hospital policy and the cap.

h. Rural Community Hospital Demonstration Program Adjustment

In section V.K. of the preamble of this final rule, we discuss the Rural Community Hospital (RCH) Demonstration program, which was originally authorized for a 5-year period by section 410A of the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (MMA) (Pub. L. 108–173) and extended for another 5-year period by sections 3123 and 10313 of the Affordable Care Act (Pub. L. 111–148). Subsequently, section 15003 of the 21st Century Cures Act (Pub. L. 114–255), enacted December 13, 2016, amended section 410A of Pub. L. 108–173 to require a 10-year extension period (in place of the 5-year extension required by the Affordable Care Act, as further discussed later in this section). Finally, Division CC, section 128(a) of the Consolidated Appropriations Act of 2021 (Pub. L. 116–260) again amended section 410A to require a 15-year extension period in place of the 10-year period. We make an adjustment to the standardized amount to ensure the effects of the RCH Demonstration program are budget neutral as required under section 410A(c)(2) of Public Law 108–173. We refer readers to section V.K. of the preamble of this final rule for complete details regarding the Rural Community Hospital Demonstration.

With regard to budget neutrality, as mentioned earlier, we make an adjustment to the standardized amount to ensure the effects of the Rural Community Hospital Demonstration are budget neutral, as required under section 410A(c)(2) of Public Law 108–173. For FY 2023, based on the latest data for this final rule, the total amount that we will apply to make an adjustment to the standardized amounts to ensure the effects of the Rural Community Hospital Demonstration program are budget neutral is $108,439,824. Accordingly, using the most recent data available to account for the estimated costs of the demonstration program, for FY 2023, we computed a factor for the Rural Community Hospital Demonstration budget neutrality adjustment that will be applied to the standardized amount. Please see the table later in this section for a summary of the FY 2023 budget neutrality factors. We refer readers to section V.K. of the preamble of this final rule for complete details regarding the calculation of the amount we will apply to make an adjustment to the standardized amounts.

The following table is a summary of the FY 2023 budget neutrality factors, as discussed in the previous sections.

Summary of FY 2023 Budget Neutrality Factors	
MS-DRG Reclassification and Recalibration Budget Neutrality Factor	1.000509
Cap Policy MS-DRG Weights Budget Neutrality Factor	0.999764
Wage Index Budget Neutrality Factor	1.000968
Reclassification Budget Neutrality Factor	0.984399
*Rural Floor Budget Neutrality Factor	0.991909
Low Wage Index Hospital Policy Budget Neutrality Factor	0.998146
Cap Policy Wage Index Budget Neutrality Factor	0.999689
Rural Demonstration Budget Neutrality Factor	0.998935

*The rural floor budget neutrality factor is applied to the national wage indexes while the rest of the budget neutrality adjustments are applied to the standardized amounts.

As discussed in section II.A. of this final rule, we are using the FY 2021 data for FY 2023 ratesetting, with certain modifications to our relative weight and outlier methodologies. As discussed elsewhere in this final rule and in this Addendum, we solicited comments on, as an alternative to our proposed approach, the use of the FY 2021 MedPAR claims for purposes of FY 2023 ratesetting without these proposed modifications to our usual methodologies. In order to facilitate comments on this alternative approach, we made available budget neutrality and other ratesetting adjustments calculated under this alternative approach, which can be found on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index*. We refer the reader to section I.O. of Appendix A of this final rule for further discussion of the files that we made available with regard to our alternative approach.

i. Adjustment for FY 2023 Required Under Section 414 of Public Law 114–10 (MACRA)

As stated in the FY 2017 IPPS/LTCH PPS final rule (81 FR 56785), once the recoupment required under section 631 of the ATRA was complete, we had anticipated making a single positive adjustment in FY 2018 to offset the reductions required to recoup the $11 billion under section 631 of the ATRA. However, section 414 of the MACRA (which was enacted on April 16, 2015) replaced the single positive adjustment we intended to make in FY 2018 with a 0.5 percent positive adjustment for each of FYs 2018 through 2023. (As noted in the FY 2018 IPPS/LTCH PPS proposed and final rules, section 15005 of the 21st Century Cures Act (Pub. L. 114–255), which was enacted December 13, 2016, reduced the adjustment for FY 2018 from 0.5 percentage points to 0.4588 percentage points.) Therefore, for FY 2023, we are implementing the required +0.5 percent adjustment to the standardized amount. This is a permanent adjustment to the payment rates.

j. Outlier Payments

Section 1886(d)(5)(A) of the Act provides for payments in addition to the basic prospective payments for ''outlier'' cases involving extraordinarily high costs. To qualify for outlier payments, a case must have costs greater than the sum of the prospective payment rate for the MS–DRG, any IME and DSH payments, uncompensated care payments, any new technology add-on payments, and the ''outlier threshold'' or ''fixed-loss'' amount (a dollar amount by which the costs of a case must exceed payments in order to qualify for an outlier payment). We refer to the sum of the prospective payment rate for the MS–DRG, any IME and DSH payments, uncompensated care payments, any new technology add-on payments, and the outlier threshold as the outlier ''fixed-loss cost threshold.'' (As discussed later in this section, we are also including the supplemental payment for eligible IHS/Tribal hospitals and Puerto Rico hospitals in the computation of the outlier fixed-loss cost threshold beginning in FY 2023.) To determine whether the costs of a case exceed the fixed-loss cost threshold, a hospital's CCR is applied to the total covered charges for the case to convert the charges to estimated costs. Payments for eligible cases are then made based on a marginal cost factor, which is a percentage of the estimated costs above the fixed-loss cost threshold. The marginal cost factor for FY 2023 is 80 percent, or 90 percent for burn MS–DRGs 927, 928, 929, 933, 934 and 935. We have used a marginal cost factor of 90 percent since FY 1989 (54 FR 36479 through 36480) for designated burn DRGs as well as a marginal cost factor of 80 percent for all other DRGs since FY 1995 (59 FR 45367).

In accordance with section 1886(d)(5)(A)(iv) of the Act, outlier payments for any year are projected to be not less than 5 percent nor more than 6 percent of total operating DRG payments (which does not include IME and DSH payments) plus outlier payments. When setting the outlier threshold, we compute the percent target by dividing the total operating outlier payments by the total operating DRG payments plus outlier payments. As discussed in the next section, for FY 2023, we are incorporating an estimate of outlier reconciliation when setting the outlier threshold. We do not include any other payments such as IME and DSH within the outlier target amount. Therefore, it is not necessary to include Medicare Advantage IME payments in the outlier threshold calculation. Section 1886(d)(3)(B) of the Act requires the Secretary to reduce the average standardized amount by a factor to account for the estimated proportion of total DRG payments made to outlier cases. More information on outlier payments may be found on the CMS website at *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/outlier.html*.

(1) Methodology To Incorporate an Estimate of Outlier Reconciliation in the FY 2023 Outlier Fixed-Loss Cost Threshold

The regulations in 42 CFR 412.84(i)(4) state that any outlier reconciliation at cost report settlement will be based on operating and capital cost-to-charge ratios (CCRs) calculated based on a ratio of costs to charges computed from the relevant cost report and charge data determined at the time the cost report coinciding with the discharge is settled. We have instructed MACs to identify for CMS any instances where: (1) A hospital's actual CCR for the cost reporting period fluctuates plus or minus 10 percentage points compared to the interim CCR used to calculate outlier payments when a bill is processed; and (2) the total outlier payments for the hospital exceeded $500,000.00 for that cost reporting period. If we determine that a hospital's outlier payments should be reconciled, we reconcile both operating and capital outlier payments. We refer readers to section 20.1.2.5 of Chapter 3 of the Medicare Claims Processing Manual (available on the CMS website at *https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/clm104c03.pdf*) for complete details regarding outlier reconciliation. The regulation at § 412.84(m) further states that at the time of any outlier reconciliation under § 412.84(i)(4), outlier payments may be adjusted to account for the time value of any underpayments or overpayments. Section 20.1.2.6 of Chapter 3 of the Medicare Claims Processing Manual contains instructions on how to assess the time value of money for reconciled outlier amounts.

If the operating CCR of a hospital subject to outlier reconciliation is lower at cost report settlement compared to the operating CCR used for payment, the hospital would owe CMS money because it received an outlier overpayment at the time of claim payment. Conversely, if the operating CCR increases at cost report settlement compared to the operating CCR used for payment, CMS would owe the hospital money because the hospital outlier payments were underpaid.

In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42623 through 42635), we finalized a methodology to incorporate outlier reconciliation in the FY 2020 outlier fixed

loss cost threshold. As discussed in the FY 2020 IPPS/LTCH PPS proposed rule (84 FR 19592), we stated that rather than trying to predict which claims and/or hospitals may be subject to outlier reconciliation, we believe a methodology that incorporates an estimate of outlier reconciliation dollars based on actual outlier reconciliation amounts reported in historical cost reports would be a more feasible approach and provide a better estimate and predictor of outlier reconciliation for the upcoming fiscal year. We also stated that we believe the methodology addresses stakeholder's concerns on the impact of outlier reconciliation on the modeling of the outlier threshold. For a detailed discussion of additional background regarding outlier reconciliation, we refer the reader to the FY 2020 IPPS/LTCH PPS final rule.

(a) Incorporating a Projection of Outlier Payment Reconciliations for the FY 2023 Outlier Threshold Calculation

Based on the methodology finalized in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42623 through 42625), for FY 2023, as we proposed, we are continuing to incorporate outlier reconciliation in the FY 2023 outlier fixed loss cost threshold.

As discussed in the FY 2020 IPPS/LTCH PPS final rule, for FY 2020, we used the historical outlier reconciliation amounts from the FY 2014 cost reports (cost reports with a begin date on or after October 1, 2013, and on or before September 30, 2014), which we believed would provide the most recent and complete available data to project the estimate of outlier reconciliation. We refer the reader to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42623 through 42625) for a discussion on the use of the FY 2014 cost report data for purposes of projecting outlier payment reconciliations for the FY 2020 outlier threshold calculation. For FYs 2021 and 2022, we applied the same methodology finalized in FY 2020, using the historical outlier reconciliation amounts from the FY 2015 cost reports (cost reports with a begin date on or after October 1, 2014, and on or before September 30, 2015) and the FY 2016 cost reports (cost reports with a begin date on or after October 1, 2015, and on or before September 30, 2016), respectively.

Similar to the FY 2022 methodology, in this final rule, we are determining a projection of outlier payment reconciliations for the FY 2023 outlier threshold calculation, by advancing the methodology by 1 year. Specifically, we are using FY 2017 cost reports (cost reports with a begin date on or after October 1, 2016, and on or before September 30, 2017).

For FY 2023, as we proposed, we are using the same methodology from FY 2020 to incorporate a projection of operating outlier payment reconciliations for the FY 2023 outlier threshold calculation. The following steps are the same as those finalized in the FY 2020 final rule but with updated data for FY 2023:

Step 1.—Use the Federal FY 2017 cost reports for hospitals paid under the IPPS from the most recent publicly available quarterly HCRIS extract available at the time of development of the proposed and final rules, and exclude sole community hospitals (SCHs) that were paid under their hospital-specific rate (that is, if Worksheet E, Part A, Line 48 is greater than Line 47). We note that when there are multiple columns available for the lines of the cost report described in the following steps and the provider was paid under the IPPS for that period(s) of the cost report, then we believe it is appropriate to use multiple columns to fully represent the relevant IPPS payment amounts, consistent with our methodology for the FY 2020 final rule.

Step 2.—Calculate the aggregate amount of historical total of operating outlier reconciliation dollars (Worksheet E, Part A, Line 2.01) using the Federal FY 2017 cost reports from Step 1.

Step 3.—Calculate the aggregate amount of total Federal operating payments using the Federal FY 2017 cost reports from Step 1. The total Federal operating payments consist of the Federal payments (Worksheet E, Part A, Line 1.01 and Line 1.02, plus Line 1.03 and Line 1.04), outlier payments (Worksheet E, Part A, Line 2 and Line 2.02), and the outlier reconciliation payments (Worksheet E, Part A, Line 2.01). We note that a negative amount on Worksheet E, Part A, Line 2.01 for outlier reconciliation indicates an amount that was owed by the hospital, and a positive amount indicates this amount was paid to the hospital.

Step 4.—Divide the amount from Step 2 by the amount from Step 3 and multiply the resulting amount by 100 to produce the percentage of total operating outlier reconciliation dollars to total Federal operating payments for FY 2017. This percentage amount would be used to adjust the outlier target for FY 2023 as described in Step 5.

Step 5.—Because the outlier reconciliation dollars are only available on the cost reports, and not in the Medicare claims data in the MedPAR file used to model the outlier threshold, we are targeting 5.1 percent minus the percentage determined in Step 4 in determining the outlier threshold. Using the FY 2017 cost reports based on the December 2021 HCRIS extract, because the aggregate outlier reconciliation dollars from Step 2 are negative, we are targeting an amount higher than 5.1 percent for outlier payments for FY 2023 under our methodology.

In the FY 2023 proposed rule, we used the December 2021 HCRIS extract of the cost report data to calculate the proposed percentage adjustment for outlier reconciliation. For the FY 2023 final rule, we proposed to use the latest quarterly HCRIS extract that is publicly available at the time of the development of that rule which, for FY 2023, would be the March 2022 extract. Similar to the FY 2022 final rule, we stated that we may also consider the use of more recent data that may become available for purposes of projecting the estimate of operating outlier reconciliation used in the calculation of the final FY 2023 outlier threshold.

In the FY 2023 proposed rule, based on the December 2021 HCRIS, 10 hospitals had an outlier reconciliation amount recorded on Worksheet E, Part A, Line 2.01 for total operating outlier reconciliation dollars of negative $11,939,505 (Step 2). The total Federal operating payments based on the December 2021 HCRIS was $88,388,722,611 (Step 3). The ratio (Step 4) is a negative 0.013508 percent, which, when rounded to the second digit, is −0.01 percent. Therefore, for FY 2023, we proposed to incorporate a projection of outlier reconciliation dollars by targeting an outlier threshold at 5.11 percent [5.1 percent − (−0.01 percent)].

When the percentage of operating outlier reconciliation dollars to total Federal operating payments rounds to a negative value (that is, when the aggregate amount of outlier reconciliation as a percent of total operating payments rounds to a negative percent), the effect is a decrease to the outlier threshold compared to an outlier threshold that is calculated without including this estimate of operating outlier reconciliation dollars. In section II.A.4.i.(2). of the Addendum to the proposed rule, we provided the proposed FY 2023 outlier threshold as calculated for the proposed rule both with and without including this percentage estimate of operating outlier reconciliation.

As explained in the FY 2020 IPPS/LTCH PPS final rule, we finalized the continued use a 5.1 percent target (or an outlier offset factor of 0.949) in calculating the outlier offset to the standardized amount. In the past, the outlier offset was six decimals because we targeted and set the threshold at 5.1 percent by adjusting the standardized amount by the outlier offset until operating outlier payments divided by total operating Federal payments plus operating outlier payments equaled approximately 5.1 percent (this approximation resulted in an offset beyond 3 decimals). However, under our methodology, we believe a 3-decimal offset of 0.949 reflecting 5.1 percent is appropriate rather than the unrounded 6-decimal offset that we have calculated for prior fiscal years. Specifically, as discussed in section II.A.5. of this Addendum, we proposed to determine an outlier adjustment by applying a factor to the standardized amount that accounts for the projected proportion of total estimated FY 2023 operating Federal payments paid as outliers. Our proposed modification to the outlier threshold methodology is designed to adjust the total estimated outlier payments for FY 2023 by incorporating the projection of negative outlier reconciliation. That is, under this proposal, total estimated outlier payments for FY 2023 would be the sum of the estimated FY 2023 outlier payments based on the claims data from the outlier model and the estimated FY 2023 total operating outlier reconciliation dollars. We stated that we believe the proposed methodology would more accurately estimate the outlier adjustment to the standardized amount by increasing the accuracy of the calculation of the total estimated FY 2023 operating Federal payments paid as outliers. In other words, the net effect of our proposal to incorporate a projection for outlier reconciliation dollars into the threshold methodology would be that FY 2023 outlier payments (which included the proposed estimated recoupment percentage for FY 2023 of 0.01 percent) would be 5.1 percent of total operating Federal payments plus total outlier payments. Therefore, the proposed

operating outlier offset to the standardized amount is 0.949 (1 − 0.051).

We invited public comment on our proposed methodology for projecting an estimate of outlier reconciliation and incorporating that estimate into the modeling for the fixed-loss cost outlier threshold for FY 2023.

We did not receive any comments on the proposed methodology, and for the reasons discussed in the proposed rule and in this final rule, we are finalizing the methodology described previously for incorporating the outlier reconciliation in the outlier threshold calculation. Therefore, for this final rule we used the same steps described previously and in the proposed rule to incorporate a projection of operating outlier payment reconciliations for the calculation of the FY 2023 outlier threshold calculation. The March 2022 HCRIS contained data for 15 hospitals. As stated previously, while we proposed to use the March 2022 HCRIS extract to calculate the reconciliation adjustment for this FY 2023 IPPS final rule, we also stated that similar to the FY 2022 final rule, we may also consider the use of more recent data that may become available for purposes of projecting the estimate of operating outlier reconciliation used in the calculation of the final FY 2023 outlier threshold. Data for 2 additional outlier reconciliations were made available to CMS outside of the March 2022 HCRIS update. Similar to our discussion of the estimated operating outlier reconciliation for FY 2021 in the FY 2021 IPPS/LTCH PPS final rule (85 FR 59036) and FY 2022 in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45535), we believe supplementing with 2 hospitals' outlier reconciliation data will lend additional accuracy to project the estimate of operating outlier reconciliation used in the calculation of the outlier threshold. Therefore, in order to use the most complete data for FY 2017 cost reports, we are using the March 2022 HCRIS extract, supplemented by these 2 additional hospitals' data for this FY 2023 IPPS final rule. Based on March 2022 HCRIS and supplemental data for 2 hospitals, a total of 17 hospitals had an outlier reconciliation amount recorded on Worksheet E, Part A, Line 2.01 for total operating outlier reconciliation dollars of negative $17,153,313 (Step 2). The total Federal operating payments based on the March 2022 HCRIS and supplemental data for 2 hospitals is $ 88,414,357,653 (Step 3). The ratio (Step 4) is a negative 0.019401 percent, which, when rounded to the second digit, is negative 0.02 percent. Therefore, for FY 2023, using the finalized methodology, we incorporated a projection of operating IPPS outlier reconciliation dollars by targeting an outlier threshold at 5.12 percent [5.1 percent − (− 0.02 percent)]. As noted previously, when the percentage of operating outlier reconciliation dollars to total Federal operating payments is negative (such is the case when the aggregate amount of outlier reconciliation is negative), the effect is a decrease to the outlier threshold compared to an outlier threshold that is calculated without including this estimate of operating outlier reconciliation dollars.

(b) Reduction to the FY 2023 Capital Standard Federal Rate by an Adjustment Factor To Account for the Projected Proportion of Capital IPPS Payments Paid as Outliers

We establish an outlier threshold that is applicable to both hospital inpatient operating costs and hospital inpatient capital related costs (58 FR 46348). Similar to the calculation of the adjustment to the standardized amount to account for the projected proportion of operating payments paid as outlier payments, as discussed in greater detail in section III.A.2. of this Addendum, we proposed to reduce the FY 2023 capital standard Federal rate by an adjustment factor to account for the projected proportion of capital IPPS payments paid as outliers. The regulations in 42 CFR 412.84(i)(4) state that any outlier reconciliation at cost report settlement would be based on operating and capital CCRs calculated based on a ratio of costs to charges computed from the relevant cost report and charge data determined at the time the cost report coinciding with the discharge is settled. As such, any reconciliation also applies to capital outlier payments.

For FY 2023, we proposed to use the same methodology from FY 2020 to adjust the FY 2023 capital standard Federal rate by an adjustment factor to account for the projected proportion of capital IPPS payments paid as outliers. Similar to FY 2020, as part of our proposal for FY 2023 to incorporate into the outlier model the total outlier reconciliation dollars from the most recent and most complete fiscal year cost report data, we also proposed to adjust our estimate of FY 2023 capital outlier payments to incorporate a projection of capital outlier reconciliation payments when determining the adjustment factor to be applied to the capital standard Federal rate to account for the projected proportion of capital IPPS payments paid as outliers (that is, the capital outlier payment adjustment factor). To do so, we proposed to use the following methodology, which generally parallels the proposed methodology to incorporate a projection of operating outlier reconciliation payments for the FY 2023 outlier threshold calculation.

Step 1.—Use the Federal FY 2017 cost reports for hospitals paid under the IPPS from the most recent publicly available quarterly HCRIS extract available at the time of development of the proposed and final rules, and exclude SCHs that were paid under their hospital-specific rate (that is, if Worksheet E, Part A, Line 48 is greater than Line 47). We note that when there are multiple columns available for the lines of the cost report described in the following steps and the provider was paid under the IPPS for that period(s) of the cost report, then we believe it is appropriate to use multiple columns to fully represent the relevant IPPS payment amounts, consistent with our methodology for the FY 2020 final rule. We used the December 2021 HCRIS extract for the proposed rule and we stated that we expect to use the March 2022 HCRIS extract for the FY 2023 final rule. Similar to the FY 2022 final rule, we stated that we may also consider the use of more recent data that may become available for purposes of projecting the estimate of capital outlier reconciliation used in the calculation of the final FY 2023 adjustment to the FY 2023 capital standard Federal rate.

Step 2.—Calculate the aggregate amount of the historical total of capital outlier reconciliation dollars (Worksheet E, Part A, Line 93, Column 1) using the Federal FY 2017 cost reports from Step 1.

Step 3.—Calculate the aggregate amount of total capital Federal payments using the Federal FY 2017 cost reports from Step 1. The total capital Federal payments consist of the capital DRG payments, including capital indirect medical education (IME) and capital disproportionate share hospital (DSH) payments (Worksheet E, Part A, Line 50, Column 1) and the capital outlier reconciliation payments (Worksheet E, Part A, Line 93, Column 1). We note that a negative amount on Worksheet E, Part A, Line 93 for capital outlier reconciliation indicates an amount that was owed by the hospital, and a positive amount indicates this amount was paid to the hospital.

Step 4.—Divide the amount from Step 2 by the amount from Step 3 and multiply the resulting amount by 100 to produce the percentage of total capital outlier reconciliation dollars to total capital Federal payments for FY 2017. This percentage amount would be used to adjust the estimate of capital outlier payments for FY 2023 as described in Step 5.

Step 5.—Because the outlier reconciliation dollars are only available on the cost reports, and not in the specific Medicare claims data in the MedPAR file used to estimate outlier payments, we proposed that the estimate of capital outlier payments for FY 2023 would be determined by adding the percentage in Step 4 to the estimated percentage of capital outlier payments otherwise determined using the shared outlier threshold that is applicable to both hospital inpatient operating costs and hospital inpatient capital-related costs. (We note that this percentage is added for capital outlier payments but subtracted in the analogous step for operating outlier payments. We have a unified outlier payment methodology that uses a shared threshold to identify outlier cases for both operating and capital payments. The difference stems from the fact that operating outlier payments are determined by first setting a ''target'' percentage of operating outlier payments relative to aggregate operating payments which produces the outlier threshold. Once the shared threshold is set, it is used to estimate the percentage of capital outlier payments to total capital payments based on that threshold. Because the threshold is already set based on the operating target, rather than adjusting the threshold (or operating target), we adjust the percentage of capital outlier to total capital payments to account for the estimated effect of capital outlier reconciliation payments. This percentage is adjusted by adding the capital outlier reconciliation percentage from Step 4 to the estimate of the percentage of capital outlier payments to total capital payments based on the shared threshold.) Because the aggregate capital outlier reconciliation dollars from Step 2 are negative, the estimate of capital outlier payments for FY 2023 under

our proposed methodology would be lower than the percentage of capital outlier payments otherwise determined using the shared outlier threshold.

Similarly, for the FY 2023 proposed rule, we used the December 2021 HCRIS extract of the cost report data to calculate the proposed percentage adjustment for outlier reconciliation. For this FY 2023 final rule, we proposed to use the latest quarterly HCRIS extract that is publicly available at the time of the development of that rule which, for FY 2023, would be the March 2022 extract. As previously noted, we stated that may also consider the use of more recent data that may become available for purposes of projecting the estimate of capital outlier reconciliation used in the calculation of the final FY 2023 adjustment to the FY 2023 capital standard Federal rate.

For the FY 2023 proposed rule, the estimated percentage of FY 2023 capital outlier payments otherwise determined using the shared outlier threshold was 5.56 percent (estimated capital outlier payments of $394,593,407 divided by (estimated capital outlier payments of $394,593,407 plus the estimated total capital Federal payment of $6,707,033,365)). Based on the December 2021 HCRIS, 9 hospitals had an outlier reconciliation amount recorded on Worksheet E, Part A, Line 93 for total capital outlier reconciliation dollars of negative $759,945 (Step 2). The total Federal capital payments based on the December 2021 HCRIS was $7,992,953,494 (Step 3) which results in a ratio (Step 4) of -0.01 percent. Therefore, for FY 2023, taking into account projected capital outlier reconciliation payments under our proposed methodology would decrease the estimated percentage of FY 2023 aggregate capital outlier payments by 0.01 percent.

As discussed in section III.A.2. of this Addendum, we proposed to incorporate the capital outlier reconciliation dollars from Step 5 when applying the outlier adjustment factor in determining the capital Federal rate based on the estimated percentage of capital outlier payments to total capital Federal rate payments for FY 2023.

We invited public comment on our proposed methodology for projecting an estimate of capital outlier reconciliation and incorporating that estimate into the modeling of the estimate of FY 2023 capital outlier payments for purposes of determining the capital outlier adjustment factor.

We did not receive comments about the proposed capital outlier reconciliation methodology. Therefore, we are finalizing the methodology for projecting an estimate of capital outlier reconciliation as previously described. We stated in the proposed rule that while we expect to use the March 2022 HCRIS extract for the FY 2023 final rule, similar to the FY 2022 final rule, we may also consider the use of more recent data that may become available for purposes of projecting the estimate of capital outlier reconciliation used in the calculation of the final FY 2023 adjustment to the FY 2023 capital standard Federal rate. For this final rule, for projecting the estimate of capital outlier reconciliation, similar to our projection of the estimate of operating outlier reconciliation, we are using cost report data of 12 hospitals from the March 2022 HCRIS supplemented for 2 hospitals for a total of 14 hospitals, which we believe will lend additional accuracy to the projection of estimated capital outlier reconciliation for FY 2023. We note that a difference in the number of cost reports for the operating and capital outlier reconciliation projections is possible and may be due to new hospitals defined in the regulations at 42 CFR 412.300(b) that may receive capital cost-based payments (in lieu of Federal rate payments), and therefore would not receive capital outlier payments. As a result, capital outlier reconciliation is not applicable to such hospitals since there is no capital outlier payment.

Based on the March 2022 HCRIS and supplemental data for 2 hospitals, 14 hospitals had an outlier reconciliation amount recorded on Worksheet E, Part A, Line 93 for total capital outlier reconciliation dollars of negative $1,101,225 (Step 2). The total Federal capital payments based on the March 2022 HCRIS is approximately $7,995,731,783 (Step 3). The ratio (Step 4) is a negative 0.013773 percent, which, when rounded to the second digit, is negative 0.01 percent (Step 4). Therefore, for FY 2023, taking into account projected capital outlier reconciliation payments under our methodology will decrease the estimated percentage of FY 2023 aggregate capital outlier payments by 0.01 percent. Accordingly, under our methodology as previously discussed, we are applying the 0.01 percent adjustment to our estimate of the capital outlier percentage (described below).

To determine the FY 2023 IPPS fixed-loss amount (shared threshold) in this final rule (as discussed in greater detail later in this section), after consideration of public comments we are incorporating modifications to our proposed methodology. Specifically, one of the modifications we are making is to determine the shared threshold as an average of the thresholds calculated when including and excluding COVID–19 cases. Because of this averaging, it is necessary to make a minor modification to the proposed methodology for incorporating the estimate of capital outlier reconciliation into the modeling of the estimate of FY 2023 capital outlier payments for purposes of determining the capital outlier adjustment factor. (We refer the reader to the discussion below in section II.A.4.j.(2). of this Addendum for complete details regarding the calculation of the shared threshold for FY 2023 based on the averaging of the thresholds as calculated including and excluding COVID–19 cases.)

Therefore, to incorporate the estimate of capital outlier reconciliation, after calculating the shared threshold based on the average of the thresholds as calculated with and without COVID–19 cases, for this final rule we are using the same steps as described in the proposed rule to reduce the FY 2023 capital standard Federal rate by an adjustment factor to account for the projected proportion of capital IPPS payments paid as outliers. However, with regard to Step 5 above, as discussed in more detail below, for this final rule we are determining the estimate of capital outlier payments for FY 2023 by adding the percentage in Step 4 to the estimated percentage of capital outlier payments calculated by averaging the estimated percentage of capital outlier payments including and excluding COVID–19 cases.

As explained previously, once a shared threshold is set, it is used to estimate the percentage of capital outlier payments to total capital payments based on that threshold. Therefore, our modified methodology produces two separate estimates of the percentage of capital outlier payments to total capital payments. One estimate is based on the shared threshold that was determined using all cases in the FY 2021 claims data, including COVID–19 cases. The other estimate is based on the shared threshold that was determined using FY 2021 claims data excluding COVID–19 cases. We then averaged these two estimates of capital outlier payments to total capital payments to estimate the percentage of capital outlier payments in FY 2023 using the final FY 2023 shared outlier threshold. This approach is also consistent with our belief that it is reasonable to assume there will be fewer COVID–19 cases in FY 2023 as compared to FY 2021 (as discussed later in this section and in section I.F of the preamble to this final rule).

For this final rule, we first determined a capital outlier percentage of 5.66 percent (estimated capital outlier payments of $406,733,862 divided by $7,190,928,057 (estimated capital outlier payments of $406,733,862 plus the estimated total capital Federal payment of $6,784,194,195)) based on the shared threshold that was calculated using all claims, including COVID–19 cases. We next determined a capital outlier percentage of 5.40 percent (estimated capital outlier payments of $346,066,050 divided by $6,412,816,596 (estimated capital outlier payments of $346,066,050 plus the estimated total capital Federal payment of $6,066,750,547)) based on the shared threshold that was calculated excluding COVID–19 cases. Therefore, taking the average of these two estimates, we estimate capital outlier payments to be 5.53 percent of total capital payments prior to incorporating the estimate of capital outlier reconciliation. Finally, under our methodology for accounting for capital outlier reconciliation as discussed previously, we are applying the 0.01 percent adjustment to this estimate of the capital outlier percentage as calculated using the average of the two estimates based on the shared thresholds including and excluding COVID–19 data of 5.53 percent, as previously described. Therefore, accounting for estimated capital outlier reconciliation, we estimate outlier payments for capital-related PPS payments will equal 5.52 percent (5.53 percent—0.01 percent) of inpatient capital-related payments based on the capital Federal rate in FY 2023.

(2) FY 2023 Outlier Fixed-Loss Cost Threshold

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50977 through 50983), in response to public comments on the FY 2013 IPPS/LTCH PPS proposed rule, we made changes to our methodology for projecting the outlier fixed-loss cost threshold for FY 2014. We refer readers to the FY 2014 IPPS/LTCH PPS final rule for a detailed discussion of the changes.

As we have done in the past, to calculate the FY 2023 outlier threshold, we simulated payments by applying FY 2023 payment rates and policies using cases from the FY 2021 MedPAR file. As noted in section II.C. of this Addendum, we specify the formula used for actual claim payment which is also used by CMS to project the outlier threshold for the upcoming fiscal year. The difference is the source of some of the variables in the formula. For example, operating and capital CCRs for actual claim payment are from the PSF while CMS uses an adjusted CCR (as described later in this section) to project the threshold for the upcoming fiscal year. In addition, charges for a claim payment are from the bill while charges to project the threshold are from the MedPAR data with an inflation factor applied to the charges (as described earlier).

In order to determine the proposed FY 2023 outlier threshold, we inflated the charges on the MedPAR claims by 2 years, from FY 2021 to FY 2023. Consistent with the FY 2020 IPPS/LTCH PPS final rule (84 FR 42626 and 42627), we proposed to use the following methodology to calculate the charge inflation factor for FY 2023:

- Include hospitals whose last four digits fall between 0001 and 0899 (section 2779A1 of Chapter 2 of the State Operations Manual on the CMS website at *https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/som107c02.pdf*); include CAHs that were IPPS hospitals for the time period of the MedPAR data being used to calculate the charge inflation factor; include hospitals in Maryland; and remove PPS-excluded cancer hospitals who have a ''V'' in the fifth position of their provider number or a ''E'' or ''F'' in the sixth position.
- Include providers that are in both periods of charge data that are used to calculate the 1-year average annual rate of-change in charges per case. We note this is consistent with the methodology used since FY 2014.
- We excluded Medicare Advantage IME claims for the reasons described in section I.A.4. of this Addendum. We refer readers to the FY 2011 IPPS/LTCH PPS final rule for a complete discussion on our methodology of identifying and adding the total Medicare Advantage IME payment amount to the budget neutrality adjustments.
- In order to ensure that we capture only FFS claims, we included claims with a ''Claim Type'' of 60 (which is a field on the MedPAR file that indicates a claim is an FFS claim).
- In order to further ensure that we capture only FFS claims, we excluded claims with a ''GHOPAID'' indicator of 1 (which is a field on the MedPAR file that indicates a claim is not an FFS claim and is paid by a Group Health Organization).
- We examined the MedPAR file and removed pharmacy charges for anti-hemophilic blood factor (which are paid separately under the IPPS) with an indicator of ''3'' for blood clotting with a revenue code of ''0636'' from the covered charge field. We also removed organ acquisition charges from the covered charge field because organ acquisition is a pass-through payment not paid under the IPPS. As noted previously, we are removing allogeneic hematopoietic stem cell acquisition charges from the covered charge field for budget neutrality adjustments. As discussed in the FY 2021 IPPS/LTCH PPS final rule, payment for allogeneic hematopoietic stem cell acquisition costs is made on a reasonable cost basis for cost reporting periods beginning on or after October 1, 2020 (85 FR 58835–58842).
- Because this payment simulation uses the FY 2023 relative weights, consistent with our policy discussed in section IV.I. of the preamble to this final rule, we applied the proposed adjustor for certain cases that group to MS–DRG 018 in our simulation of these payments. As discussed in section II.E.2.b. of the preamble of this final rule, we are applying an adjustment to account for certain cases that group to MS–DRG 018 in calculating the FY 2023 relative weights and for purposes of budget neutrality and outlier simulations.

Our general methodology to inflate the charges computes the 1-year average annual rate-of-change in charges per case which is then applied twice to inflate the charges on the MedPAR claims by 2 years since we typically use claims data for the fiscal year that is 2 years prior to the upcoming fiscal year.

In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42627), we modified our charge inflation methodology. We stated that we believe balancing our preference to use the latest available data from the MedPAR files and stakeholders' concerns about being able to use publicly available MedPAR files to review the charge inflation factor can be achieved by modifying our methodology to use the publicly available Federal fiscal year period (that is, for FY 2020, we used the charge data from Federal fiscal years 2017 and 2018), rather than the most recent data available to CMS which, under our prior methodology, was based on calendar year data. We refer the reader to the FY 2020 IPPS/LTCH PPS final rule for a complete discussion regarding this change.

For FY 2023, under our policy of computing the charge inflation factor using the publicly available Federal fiscal year period, we would ordinarily use charge data from the MedPAR files for Federal fiscal years 2020 and 2021 to compute the 1-year average annual rate-of-change in charges per case. Specifically, for the proposed rule, we would ordinarily use the December 2020 MedPAR file of FY 2020 (October 1, 2019, through September 30, 2020) charge data and the December 2021 MedPAR file of FY 2021 (October 1, 2021, through September 30, 2021) charge data to compute the proposed charge inflation factor. However, based on our analysis, the charge inflation factors calculated using these two most recently available years of MedPAR claims data (FY 2020 and FY 2021) are abnormally high as compared to recent historical levels prior to the COVID–19 PHE period. Specifically, in the proposed rule we stated that we calculated a 1-year average annual rate-of-change in charges per case of approximately 10 percent based on the FY 2020 and FY 2021 MedPAR claims data, as compared to approximately 6 percent based on the FY 2018 and 2019 MedPAR claims data for the two most recent Federal fiscal year time periods prior to the PHE. We stated that we believe this abnormally high charge inflation as compared to historical levels was partially due to the high number of COVID–19 cases with higher charges that were treated in IPPS hospitals in FY 2021. As discussed in section I.F of the preamble of this final rule, we believe there will be fewer COVID–19 cases in FY 2023 than in FY 2021. Therefore, we do not believe it is reasonable to assume charges will continue to increase at these abnormally high rates.

Therefore, in the FY 2023 IPPS/LTCH proposed rule (87 FR 28667), we proposed for FY 2023 to use the same methodology as FY 2020, with a proposed modification to use the most recent 1-year average annual rate-of-change in charges per case for the period prior to the COVID–19 PHE, and based on the same data used in the FY 2021 IPPS/LTCH PPS final rule to determine the charge inflation factor for the proposed rule. We further noted that this is the same data used to determine the charge inflation factor for the FY 2022 IPPS/LTCH PPS rulemaking. Specifically, for FY 2023, we proposed to use the MedPAR files for the two most recent available Federal fiscal year time periods prior to the COVID–19 PHE to calculate the charge inflation factor. Specifically, for the proposed rule we proposed to use the March 2019 MedPAR file of FY 2018 (October 1, 2017, to September 30, 2018) charge data (released for the FY 2020 IPPS/LTCH PPS final rule) and the March 2020 MedPAR file of FY 2019 (October 1, 2018, to September 30, 2019) charge data (released for the FY 2021 IPPS/LTCH PPS final rule) to compute the proposed charge inflation factor. We proposed that for the FY 2023 IPPS/LTCH PPS final rule, we would continue to use the charge inflation estimate from the FY 2021 IPPS/LTCH PPS final rule. Under this proposed methodology, to compute the 1-year average annual rate-of-change in charges per case for FY 2023, we compared the average covered charge per case of $61,578.82 ($584,618,863,834/9,493,830 cases) from October 1, 2017, through September 31, 2018, to the average covered charge per case of $65,522.10 ($604,209,834,327/9,221,466 cases) from October 1, 2018, through September 31, 2019. This rate-of-change was 6.4 percent (1.06404) or 13.2 percent over 2 years (1.13218). Because we proposed to use the FY 2021 MedPAR for the FY 2023 ratesetting, we applied a factor of 13.2 percent over 2 years. The billed charges are obtained from the claim from the MedPAR file and inflated by the inflation factor specified previously.

In the FY 2023 IPPS/LTCH proposed rule (87 FR 28667–28668), we also solicited comments on the alternative approach of

using the data we would ordinarily use to determine the charge inflation factor for purposes of this FY 2023 rule (that is, charge data from FYs 2020 and 2021 to compute the 1-year average annual rate of change in charges per case), and noted that under this alternative approach, if finalized, we would anticipate using more recently updated data from FYs 2020 and 2021 for purposes of the FY 2023 IPPS/LTCH PPS final rule. As previously noted, in order to facilitate comments on our alternative approach of using the FY 2021 MedPAR claims for purposes of FY 2023 ratesetting but without the proposed modifications to our usual methodologies, including use of the same data that we would ordinarily use for purposes of determining the charge inflation factor for this FY 2023 rulemaking, and which we stated we may consider finalizing for FY 2023 based on consideration of comments received, we made available budget neutrality and other ratesetting adjustments, including the charge inflation factor, calculated under this alternative approach, which can be found on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index*. We included in a supplemental data file the following: budget neutrality factors, charge inflation factor, the CCR adjustment factors, an impact file and outlier threshold based on this alternative approach. Consistent with historical practice, we stated that if we were to finalize this alternative approach, we would use the most recent available data for the final rule, as appropriate.

As discussed previously, in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28668), we proposed to establish the FY 2023 outlier threshold using hospital CCRs from the December 2021 update to the Provider-Specific File (PSF), the most recent available data at the time of developing the proposed rule. We proposed to apply the following edits to providers' CCRs in the PSF. We stated that we believe these edits are appropriate in order to accurately model the outlier threshold. We first searched for Indian Health Service providers and those providers assigned the statewide average CCR from the current fiscal year. We then replaced these CCRs with the statewide average CCR for the upcoming fiscal year. We also assigned the statewide average CCR (for the upcoming fiscal year) to those providers that have no value in the CCR field in the PSF or whose CCRs exceed the ceilings described later in this section (3.0 standard deviations from the mean of the log distribution of CCRs for all hospitals). We did not apply the adjustment factors described later in this section to hospitals assigned the statewide average CCR. For FY 2023, we also proposed to continue to apply an adjustment factor to the CCRs to account for cost and charge inflation (as explained further in this section).

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50979), we adopted a new methodology to adjust the CCRs. Specifically, we finalized a policy to compare the national average case-weighted operating and capital CCR from the most recent update of the PSF to the national average case-weighted operating and capital CCR from the same period of the prior year.

In the FY 2023 IPPS/LTCH proposed rule (87 FR 28668) we stated that ordinarily, for the proposed rule, we would apply a proposed adjustment factor to adjust the CCRs from the December 2021 update of the PSF by comparing the percentage change in the national average case-weighted operating CCR and capital CCR from the December 2020 update of the PSF to the national average case-weighted operating CCR and capital CCR from the December 2021 update of the PSF. However, the operating and capital CCR adjustment factors based on the data we ordinarily would use are above 1.0. Since the implementation of our new methodology to adjust the CCRs in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50979), the operating and capital CCR adjustment factors have typically been below 1.0 (for example, operating and capital CCR adjustment factors of approximately 1.03 and 1.03, respectively, based on the December 2020 and December 2021 updates to the PSF as compared to operating and capital CCR adjustment factors of approximately 0.97 and 0.96, respectively, based on the March 2019 and March 2020 updates to the PSF). As stated in section I.F. of the preamble to this final rule, we believe this abnormally high CCR adjustment factor as compared to historical levels is partially due to the high number of COVID–19 cases with higher charges that were treated in IPPS hospitals in FY 2021. As we previously stated, we believe there will be fewer COVID–19 cases in FY 2023 than in FY 2021. Therefore, we stated that we do not believe it is reasonable to assume CCRs will continue to increase at these abnormally high rates. Therefore, we proposed to adjust the CCRs from the December 2021 update of the PSF by comparing the percentage change in the national average case-weighted operating CCR and capital CCR from the March 2019 update of the PSF to the national average case-weighted operating CCR and capital CCR from the March 2020 update of the PSF, which is the last update of the PSF prior to the PHE. We noted that this is the same data used to adjust the CCRs for the FY 2022 IPPS/LTCH PPS rulemaking. We stated that we believe using these data for the latest available period prior to the PHE, for which the percentage change in the national average case weighted operating CCR and capital CCR is below 1.0, is appropriate in light of our expectation that the CCRs will not continue to increase at these abnormally high rates for FY 2023. We noted that we used total transfer-adjusted cases from FY 2019 to determine the national average case-weighted CCRs for both sides of the comparison. As stated in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50979), we believe that it is appropriate to use the same case count on both sides of the comparison, because this would produce the true percentage change in the average case-weighted operating and capital CCR from 1 year to the next without any effect from a change in case count on different sides of the comparison.

Using the proposed methodology, for the proposed rule, we calculated a March 2019 operating national average case-weighted CCR of 0.254027 and a March 2020 operating national average case-weighted CCR of 0.247548. We then calculated the percentage change between the two national operating case-weighted CCRs by subtracting the March 2019 operating national average case-weighted CCR from the March 2020 operating national average case-weighted CCR and then dividing the result by the March 2019 national operating average case-weighted CCR. This resulted in a proposed 1-year national operating CCR adjustment factor of 0.974495. In the proposed rule, we noted that because we proposed to use CCRs from the December 2021 update of the PSF for FY 2023, we applied a 1-year proposed national operating CCR adjustment.

We used this same proposed methodology to adjust the capital CCRs. Specifically, we calculated a March 2019 capital national average case-weighted CCR of 0.02073 and a March 2020 capital national average case-weighted CCR of 0.019935. We then calculated the percentage change between the two national capital case-weighted CCRs by subtracting the March 2019 capital national average case-weighted CCR from the March 2020 capital national average case-weighted CCR and then dividing the result by the March 2019 capital national average case-weighted CCR. This resulted in a proposed 1-year national capital CCR adjustment factor of 0.96165. Because we proposed to use CCRs from the December 2021 update of the PSF for FY 2023, we applied a 1-year proposed national capital CCR adjustment.

As discussed in section I.F. of the proposed rule and in section I.O. of Appendix A of the proposed rule, we solicited comments on an alternative approach of using the data that we would ordinarily use for purposes of adjusting the CCRs for this FY 2023 rulemaking, which we stated we may consider finalizing for FY 2023 based on consideration of comments received. As previously noted, in order to facilitate comments on our alternative approach of using the FY 2021 MedPAR claims for purposes of FY 2023 ratesetting but without the proposed modifications to our usual methodologies, we made available supplemental data files, including the following: budget neutrality factors, charge inflation factor, the CCR adjustment factors, and outlier threshold based on this alternative approach. Consistent with historical practice, we stated in the proposed rule if we were to finalize this alternative approach, we would use the most recent available data for the final rule, as appropriate.

For purposes of estimating the proposed outlier threshold for FY 2023, we used a wage index that reflects the policies discussed in the proposed rule. This includes all of the following:

- The proposed frontier State floor adjustments in accordance with section 10324(a) of the Affordable Care Act.
- The proposed out-migration adjustment as added by section 505 of Public Law 108–173.
- Incorporating the proposed FY 2023 low wage index hospital policy (described in section III. G. 4 of the FY 2023 IPPS/LTCH proposed rule (87 FR 28369)) for hospitals

with a wage index value below the 25th percentile, where the increase in the wage index value for these hospitals would be equal to half the difference between the otherwise applicable final wage index value for a year for that hospital and the 25th percentile wage index value for that year across all hospitals.

• Incorporating our proposed policy (described in section III.N. of the preamble of the proposed rule) to apply a 5-percent cap on any decrease to a hospital's wage index from its wage index in the prior FY, regardless of the circumstances causing the decline.

If we did not take the aforementioned into account, our estimate of total FY 2023 payments would be too low, and, as a result, our proposed outlier threshold would be too high, such that estimated outlier payments would be less than our projected 5.1 percent of total payments (which includes outlier reconciliation).

As described in sections V.K. and V.L., respectively, of the preamble of this final rule, sections 1886(q) and 1886(o) of the Act establish the Hospital Readmissions Reduction Program and the Hospital VBP Program, respectively. We stated in the proposed rule that we do not believe that it is appropriate to include the proposed hospital VBP payment adjustments and the hospital readmissions payment adjustments in the proposed outlier threshold calculation or the proposed outlier offset to the standardized amount. Specifically, consistent with our definition of the base operating DRG payment amount for the Hospital Readmissions Reduction Program under § 412.152 and the Hospital VBP Program under § 412.160, outlier payments under section 1886(d)(5)(A) of the Act are not affected by these payment adjustments. Therefore, outlier payments would continue to be calculated based on the unadjusted base DRG payment amount (as opposed to using the base-operating DRG payment amount adjusted by the hospital readmissions payment adjustment and the hospital VBP payment adjustment). Consequently, we proposed to exclude the estimated hospital VBP payment adjustments and the estimated hospital readmissions payment adjustments from the calculation of the proposed outlier fixed-loss cost threshold.

We noted in the proposed rule that, to the extent section 1886(r) of the Act modifies the DSH payment methodology under section 1886(d)(5)(F) of the Act, the uncompensated care payment under section 1886(r)(2) of the Act, like the empirically justified Medicare DSH payment under section 1886(r)(1) of the Act, may be considered an amount payable under section 1886(d)(5)(F) of the Act such that it would be reasonable to include the payment in the outlier determination under section 1886(d)(5)(A) of the Act. As we have done since the implementation of uncompensated care payments in FY 2014, for FY 2023, we proposed to allocate an estimated per-discharge uncompensated care payment amount to all cases for the hospitals eligible to receive the uncompensated care payment amount in the calculation of the outlier fixed-loss cost threshold methodology. We stated that we continue to believe that allocating an eligible hospital's estimated uncompensated care payment to all cases equally in the calculation of the outlier fixed-loss cost threshold would best approximate the amount we would pay in uncompensated care payments during the year because, when we make claim payments to a hospital eligible for such payments, we would be making estimated per-discharge uncompensated care payments to all cases equally. Furthermore, we stated that we continue to believe that using the estimated per-claim uncompensated care payment amount to determine outlier estimates provides predictability as to the amount of uncompensated care payments included in the calculation of outlier payments. Therefore, consistent with the methodology used since FY 2014 to calculate the outlier fixed-loss cost threshold, for FY 2023, we proposed to include estimated FY 2023 uncompensated care payments in the computation of the proposed outlier fixed-loss cost threshold. Specifically, we proposed to use the estimated per-discharge uncompensated care payments to hospitals eligible for the uncompensated care payment for all cases in the calculation of the proposed outlier fixed-loss cost threshold methodology.

In addition, as discussed in section IV.E. of the preamble of the proposed rule, we proposed to establish a supplemental payment for eligible IHS/Tribal hospitals and Puerto Rico hospitals, beginning in FY 2023. We proposed to make interim payments of this proposed new supplement payment on a per-discharge basis. Consistent with the policy of including estimated uncompensated care payments in the computation of the proposed outlier fixed-loss cost threshold, as previously summarized, we proposed to use our authority under section 1886(d)(5)(I) of the Act to include the estimated supplemental payments in the computation of the proposed outlier fixed-loss cost threshold. Specifically, we proposed to use the estimated per-discharge supplemental payments to hospitals eligible for the supplemental payment for all cases in the calculation of the proposed outlier fixed-loss cost threshold methodology.

Using this methodology, we used the formula described in section I.C.1. of this Addendum to simulate and calculate the Federal payment rate and outlier payments for all claims. In addition, as described in the earlier section to this Addendum, we proposed to incorporate an estimate of FY 2023 outlier reconciliation in the methodology for determining the outlier threshold. As noted previously, for the FY 2023 proposed rule, the ratio of outlier reconciliation dollars to total Federal Payments (Step 4) is a negative 0.013508 percent, which, when rounded to the second digit, is −0.01 percent. Therefore, for FY 2023, we proposed to incorporate a projection of outlier reconciliation dollars by targeting an outlier threshold at 5.11 percent [5.1 percent − (−.01 percent)]. Under this proposed approach, we determined a proposed threshold of $43,214 and calculated total outlier payments of $4,709,906,314 and total operating Federal payments of $88,837,735,468. We then divided total outlier payments by total operating Federal payments plus total outlier payments and determined that this threshold matched with the 5.11 percent target, which reflected our proposal to incorporate an estimate of outlier reconciliation in the determination of the outlier threshold (as discussed in more detail in the previous section of this Addendum). We noted that, if calculated without applying our proposed methodology for incorporating an estimate of outlier reconciliation in the determination of the outlier threshold, the proposed threshold would be $43,292. We proposed an outlier fixed-loss cost threshold for FY 2023 equal to the prospective payment rate for the MS–DRG, plus any IME, empirically justified Medicare DSH payments, estimated uncompensated care payment, proposed estimated supplemental payment for eligible IHS/Tribal hospitals and Puerto Rico hospitals, and any add-on payments for new technology, plus $43,214.

As previously noted, and as discussed further in section I.O of the Appendix A of this final rule, we also considered an alternative approach of using the FY 2021 MedPAR claims for purposes of FY 2023 ratesetting but without the proposed modifications to our usual methodologies, including use of the same data we would ordinarily use for purposes of this FY 2023 rulemaking to compute the charge inflation factors and CCR adjustment factors in determining the FY 2023 outlier fixed-loss amount for IPPS cases. Under this alternative approach, we estimated an outlier threshold of $58,798 rather than the proposed threshold of $43,214 noted previously.

Comment: Commenters expressed concern about the increase to the fixed-loss threshold for FY 2023. Several commenters acknowledged the steps CMS took to account for some of the COVID–19 pandemic-related factors that have driven the increase, which may not continue in FY 2023. Specifically, many commenters supported the use of pre-PHE data for charge inflation and CCR adjustment factors.

Several other commenters opposed the use of the charge inflation data and CCR adjustment factors from the period preceding the PHE for the following reasons.

• A commenter stated that the use of pre COVID–19 data for the charge inflation does not appear to consider the unusually high inflation currently facing hospitals. The commenter encouraged CMS to recognize that hospitals continue to experience atypical costs from COVID–19 care, along with historic inflation levels, continued labor shortages, and supply chain disruptions and to fully reflect these costs in the data and methodologies used for FY 2023.

• Another commenter believes that the charge inflation that has occurred during the PHE will continue as this trend has been consistent since before the pandemic.

• Another commenter stated that it does not support the use of an inflation factor preceding the COVID–19 PHE as this does not accurately reflect today's environment. The commenter stated that providers are experiencing the rise of inflation and additional costs that are not likely to resolve within the next fiscal year and while COVID–

19 hospitalizations may continue to decline, providers are also seeing higher acuity patients, many who delayed care and are now sicker and costlier to treat. The commenter recommended that CMS reevaluate the use of a pre-COVID–19 inflation factor and instead use 2021 data.

Some commenters supported the use of the FY 2021 claims data. Another commenter opposed the use of unadjusted FY 2021 claims data, stating that more recent data suggests that there should be far fewer high-cost COVID–19 cases in FY 2023 relative to FY 2021. This commenter suggested that CMS trim COVID–19 cases with costs that are more than three standard deviations from the geometric mean. Several other commenters suggested that CMS remove high-cost cases in MS–DRGs identified as COVID–19 related, while others suggested that CMS remove all COVID–19 cases. Other commenters suggested using a blend of FY 2019 and FY 2021 data, using a blend of FY 2019 and FY 2020 data with COVID–19 cases removed, reducing the weight of COVID–19 cases in the FY 2021 data by 50 percent, using claims data from prior to the PHE, or using an average of the current FY 2022 threshold with the newly proposed threshold. MedPAC suggested calculating the FY 2023 fixed-loss amount as an average of the outlier fixed-loss amounts calculated with and without COVID–19 cases in the FY 2021 data. MedPAC believes that this approach would be consistent with the approach CMS proposed for calculating the MS–DRG relative weights and would reflect the assumption that there will be fewer COVID–19 cases in FY 2023 as compared to FY 2021.

A commenter suggested that CMS model the inclusion of NCTAP payments and the increased payments for COVID–19 cases provided by the CARES Act in the FY 2021 claims data when calculating the fixed-loss threshold. This commenter stated that conservatively, the PHE is anticipated to end no earlier than mid-October 2022, which means that NCTAP payments will continue for all of FY 2023. This commenter stated that in using the FY 2021 MedPAR data, CMS is assuming that COVID–19 hospitalizations in FY 2023 will mirror those in FY 2021, which implies that the PHE will be further renewed, and that the increased payments for COVID–19 cases provided by the CARES Act will continue in FY 2023. (Section 3710 of the CARES Act provides for an increase in the MS–DRG weighting factor of 20 percent for an individual diagnosed with COVID–19 discharged during the period of the PHE for COVID–19.)

Some commenters suggested that CMS phase in the large proposed increase to the fixed-loss threshold over time. Many commenters suggested that CMS reexamine its methodology more closely and adopt additional changes to offset substantial increases in the outlier threshold. A commenter suggested that CMS better account for the data anomalies created by the pandemic until patient mix becomes more predictable and the data used for ratesetting reflects a more stable healthcare environment.

A commenter stated they believe that inadequate market basket updates in prior years and for the upcoming fiscal year do not accurately capture increases in costs which also drive increases to the outlier threshold. The commenter stated that smaller market basket adjustments leave IPPS payments too low, pushing the costs of too many claims above the MS–DRG payment amount and driving untenable growth in the fixed loss threshold. The commenter requested that CMS calculate the final rule outlier threshold using a higher market basket percentage increase.

Response: We appreciate commenters' support regarding the use of pre-PHE data for charge inflation and CCR adjustment factors. With respect to those commenters that opposed the use of this data, it appears that these commenters believe that the charge inflation factor is a measure of cost inflation, and that a higher charge inflation factor would more accurately account for the costs of providing medical care. The charge inflation factor is typically a 1-year average annual rate-of-change in charges which is applied to inflate the charges on the MedPAR claims by 2 years since we typically use claims data for the fiscal year that is 2 years prior to the upcoming fiscal year. For the reasons discussed in the proposed rule, we continue to believe that use of the pre-PHE data for the FY 2023 charge inflation and CCR adjustment factors is most appropriate given our belief that there will be fewer COVID–19 cases in FY 2023 than in FY 2021, based on the information available at this time. As mentioned in the proposed rule, the charge inflation factors calculated using the two most recently available years of MedPAR claims data (FY 2020 and FY 2021) are abnormally high as compared to recent historical levels prior to the COVID–19 PHE period. With regard to the CCR adjustment factors, the operating and capital CCR adjustment factors based on the data we ordinarily would use are above 1.0 while the operating and capital CCR adjustment factors have typically been below 1.0. We also continue to believe that these abnormal charges were partially due to the high number of COVID–19 cases with higher charges. Because we anticipate that there will be fewer COVID–19 cases in FY 2023 as compared to FY 2021, based on the information available at this time and as explained previously, we believe the use of the most recent available data prior to the COVID–19 PHE is appropriate for FY 2023. We also note that lower charges per case due to a lower charge inflation factor and lower CCRs based on a CCR adjustment factor below 1 will result in lower costs per case and will result in a lower threshold in order to ensure outlier payments are 5.1 percent of total payments. As discussed in the proposed rule, under the alternative approach of using the same data we would ordinarily use for purposes of this FY 2023 rulemaking to compute the charge inflation factors and CCR adjustment factors in determining the FY 2023 outlier fixed-loss amount for IPPS cases, we estimated an outlier threshold of $58,798 rather than the proposed threshold of $43,214.

With respect to commenters' recommendations of various approaches to modify the data or methodology to calculate the fixed-loss threshold, we continue to recognize that there is uncertainty regarding the utilization and costs that hospitals will experience in FY 2023. However, based on the information available at this time on the trajectory of the COVID–19 PHE, consistent with the discussion in section I.F. of the preamble to this final rule, we believe averaging the outlier-fixed loss thresholds calculated using FY 2021 data including and excluding COVID–19 claims, as suggested by MedPAC, would best reflect our belief that it is reasonable to assume there will be fewer COVID–19 hospitalizations among Medicare beneficiaries in FY 2023 than there were in FY 2021 (as discussed in section I.F of the preamble to this final rule). While another commenter recommended to reduce the weight of COVID–19 cases in the FY 2021 data by 50 percent, we believe that averaging the outlier-fixed loss thresholds as calculated with and without COVID–19 claims in the FY 2021 data as described would be most consistent with the approach we proposed and are finalizing for calculating the MS–DRG relative weights for FY 2023, as discussed in section II.E.2.c of the preamble to this final rule. As discussed below, we are adopting the approach suggested by MedPAC when determining the FY 2023 outlier fixed loss amount.

With regard to averaging the data with claims pre COVID–19 for modeling the fixed loss threshold, we note that the FY 2021 and FY 2022 thresholds used claims from FY 2019 to set the fixed loss threshold. The thresholds in FY 2021 and FY 2022 were $29,064 and $30,988 respectively. As noted in the proposed rule, if we made no modifications to our methodology to set the FY 2023 fixed loss threshold, the proposed fixed loss threshold would have been $58,798. Even with our modifications to the methodology that we proposed in the FY 2023 IPPS/LTCH proposed rule, the proposed threshold was lowered from $58,798 to $43,214. Because of this large variance in the thresholds as determined using pre and post COVID–19 data, we do not believe it would be appropriate to average the data used to calculate the threshold with pre COVID–19 data (including, as suggested by the commenters, by using a blend of FY 2019 and FY 2021 data, or using a blend of FY 2019 and FY 2020 data with COVID–19 cases removed) as we do not believe this approach would provide a reasonable estimate of outlier payments for FY 2023 as 5.1 percent of estimated total payments for FY 2023.

We also agree with the commenter that suggested that we include the increase in payments for COVID–19 cases provided by the CARES Act, based on the information available at this time on the trajectory of the COVID–19 PHE. Therefore, we incorporating these two suggested modifications to our proposed methodology for determining the FY 2023 outlier fixed-loss amount. Specifically, we calculated two fixed-loss thresholds, one using FY 2021 claims data including COVID–19 cases that reflect the payment increase provided by the CARES Act and one using FY 2021 claims data excluding COVID–19 cases, and then averaged these two fixed-loss thresholds to determine the final fixed-loss threshold for

FY 2023. We believe these adjustments to our proposed methodology will best reflect a reasonable estimation of the case mix and relative resource use of FY 2023 cases based on the information available at this time.

With respect to the comment that we should include NCTAP payments in the COVID–19 cases in the FY 2021 claims data, we note that, as stated in the Interim Final Rule Additional Policy and Regulatory Revisions in Response to the COVID–19 Public Health Emergency (85 FR 71142), the NCTAP will not be included as part of the calculation of the operating outlier payments. Therefore, including the NCTAP payments in the COVID–19 cases would not impact the calculation of the outlier threshold.

With respect to the comment that CMS phase in the large proposed increase to the fixed-loss threshold over time, if we used a phase in approach then the fixed loss threshold for FY 2023 would not meet the requirement that outlier payments result in 5.1 percent of estimated total payments.

In response to the commenters that suggested that CMS reexamine its methodology more closely and adopt additional changes to offset substantial increases in the outlier threshold, in addition to the proposed modifications in the proposed rule, we are making additional changes to the methodology for FY 2023 in this final rule in response to comments, specifically the averaging of the two fixed-loss thresholds and accounting for the payment increase provided by the CARES Act.

With respect to the commenter that suggested that CMS better account for the data anomalies created by the pandemic until patient mix becomes more predictable and the data used for ratesetting reflects a more stable healthcare environment, as previously discussed, we recognize that there is uncertainty regarding the utilization and costs that hospitals will experience in FY 2023. Therefore, we believe that based on the information available at this time on the trajectory of the COVID–19 PHE, our averaging of the outlier-fixed loss thresholds as previously described represents the best estimate of the fixed loss threshold for FY 2023.

With respect to commenters who expressed concerns regarding the effect of the market basket update on the calculation of the fixed-loss threshold, we refer readers to section V.A of the preamble of this final rule for our response to comments about the market basket update. We note, for this final rule, we now have an updated forecast of the price proxies underlying the market basket that incorporates more recent historical data and reflects a revised outlook regarding the U.S. economy (which incorporates more recent historical CPI growth, estimated impacts of the Russia/Ukraine war, expectations regarding changes to Federal Reserve interest rates, and the estimated impacts of continued tight labor markets).

Comment: A commenter requested that CMS consider whether it is appropriate to include extreme cases when calculating the threshold. This commenter explained that high charge cases have a significant impact on the threshold. The commenter stated that it examined the data to understand the factors that drove an increase of over $7,000 in the threshold between FY 2017 and FY 2022 and stated that it observed that the inclusion of extreme cases in the calculation of the threshold, the rate of which are increasing over time, significantly impacts CMS' determination of the fixed-loss threshold. If this trend continues (that is, if the number (and proportion) of extreme cases continues to increase each year), the commenter stated that the impact of this population of cases on the threshold will likewise increase. Thus, the commenter recommended that CMS carefully consider what is causing this trend, whether the inclusion of these cases in the calculation of the threshold is appropriate, or whether a separate outlier mechanism should apply to these cases that more closely hews outlier payments to marginal costs. The commenter believes this is consistent with the calculation process used for IPPS rate setting generally and that a 2013 OIG Report, Medicare Hospital Outlier Payments Warrant Increased Scrutiny, *https://oig.hhs.gov/oei/reports/oei-06-10-00520.asp*, concurs with this view. Another commenter suggested that CMS take steps to ensure that the outlier threshold approximates the FY 2022 outlier threshold.

Response: As we explained when responding to a similar comment in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38526), the methodology used to calculate the outlier threshold includes all claims in order to account for all different types of cases, including high charge cases, to ensure that CMS meets the 5.1 percent target. As the commenter pointed out, the volume of these cases continues to rise, making their impact on the threshold significant. We believe excluding these cases would artificially lower the threshold. We believe it is important to include all cases in the calculation of the threshold no matter how high or low the charges. Including these cases with high charges lends more accuracy to the threshold, as these cases have an impact on the threshold and continue to rise in volume. Therefore, we believe the inclusion of the high-cost outlier cases in the calculation of the outlier threshold is appropriate.

Also, with regard to the 2013 OIG report that the commenter references, this report studied the distribution of outlier payments and made recommendations based on the OIG findings, but did not mention concerns or make any recommendations with regard to the calculation of the outlier threshold. Therefore, we do not agree with the commenter that the OIG report concurs with its view.

Comment: A commenter stated that it believes that ordinarily it is important to the process for setting the outlier threshold that CMS accurately calculate prior year actual payment comparisons to the 5.1 percent target. Without doing so, the commenter stated it is impossible for CMS to appropriately modify its methodology to achieve an accurate result. The commenter also noted that CMS' estimates of past outlier payments also routinely exceed the calculations of outlier payments based on HCRIS cost report data. The commenter emphasized the importance of CMS using the most recent data available to more accurately assess the outlier payment level. The commenter stated that CMS has generally fallen short of its 5.1 percent outlier target virtually every FY since at least 2013 (the exceptions being meeting it in FY 2019 and exceeding it during the PHE) and yet is still proposing a significant increase in the threshold this year with no rationale offered to explain the prior years' shortfalls in outlier payments. Another commenter stated that to the extent an increase in the fixed loss threshold is necessary, it should be limited to the market basket increase.

Response: As noted previously, section 1886(d)(5)(A)(iv) of the Act states that outlier payments may not be not less than 5 percent nor more than 6 percent of the total payments projected or estimated to be made based on DRG prospective payment rates for discharges in that year. With regard to the comment that CMS has generally fallen short of its 5.1% outlier target virtually every FY since at least 2013 (the exceptions being meeting it in FY 2019 and exceeding it during the PHE) and yet is still proposing a significant increase in the threshold this year with no rationale offered to explain the prior year shortfalls in payment, as we have previously stated in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50379) and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49783), when we conduct our modeling to determine the outlier threshold, we generally factor in all payments and policies that would affect actual payments for the current year in order to estimate that outlier payments are 5.1 percent of total MS–DRG payments. While we recognize that outlier payments sometimes are below the 5.1 percent target in prior fiscal years, we do not believe that these lower payouts are relevant to the current fiscal year because they do not lend greater accuracy to the estimate of payments that are 5.1 percent of total MS–DRG payments for the upcoming fiscal year for FY 2023. We also note that in response to concerns such as the commenters', over the years we have modified our outlier threshold calculation by changing the way we adjust the CCRs, changing the measure of inflation and incorporating an adjustment for outlier reconciliation. While the commenter has expressed their concern, we note they have not provided any suggestions for how CMS can improve the calculation of the outlier threshold (based on the concerns expressed by this commenter). As in prior years, CMS will continue to evaluate our methodology of calculating the fixed loss threshold and consider any suggestions made by the commenters to improve the accuracy of the calculation of the outlier threshold.

We did not receive comments on our proposal to use the estimated per-discharge supplemental payments for eligible IHS/Tribal hospitals and Puerto Rico hospitals to hospitals eligible for the supplemental payment for all cases in the calculation of the proposed outlier fixed-loss cost threshold methodology. Therefore, we are finalizing as proposed without modification to include the estimated per-discharge supplemental payments to hospitals eligible for the

supplemental payment for all cases in the calculation of the proposed outlier fixed-loss cost threshold methodology.

After consideration of the public comments we received, we are finalizing the methodology we proposed to calculate the final outlier threshold with the two modifications described previously. That is, we are using the same methodology as proposed, which includes the use of charge inflation data and the CCR adjustment factors from the period preceding the PHE, with the modification that we calculated two fixed-loss thresholds using this methodology, one using FY 2021 claims data including COVID–19 cases that reflect the payment increase provided by the CARES Act and one using FY 2021 claims data excluding COVID–19 cases, and then averaged these two fixed-loss thresholds to determine the final fixed-loss threshold for FY 2023.

As discussed previously, we are finalizing as proposed to calculate charge inflation using the publicly available FY 2018 and FY 2019 claims data and to incorporate a projection of outlier payment reconciliations for the FY 2023 outlier threshold calculation. For the FY 2023 final outlier threshold, we used the March 2019 MedPAR file of FY 2018 (October 1, 2017 through September 30, 2018) charge data (released in conjunction with the FY 2020 IPPS/LTCH PPS final rule) and the March 2020 MedPAR file of FY 2019 (October 1, 2018 through September 30, 2019) charge data (released in conjunction with the FY 2021 IPPS/LTCH PPS final rule) to determine the charge inflation factor. To compute the 1 year average annual rate of change in charges per case, we compared the average covered charge per case of $61,578.82 ($584,618,863,834/9,493,830 cases) from October 1, 2017 through September 31, 2018, to the average covered charge per case of $65,522.10 ($604,209,834,327/9,221,466 cases) from October 1, 2018 through September 31, 2019. This rate-of-change was 6.4 percent (1.06404) or 13.2 percent over 2 years (1.13218) . Because are using the FY 2021 MedPAR for the FY 2023 ratesetting, we applied a factor of 13.2 percent over 2 years. The billed charges are obtained from the claim from the MedPAR file and inflated by the inflation factor specified previously.

For FY 2023, as we have done in the past, we are establishing the FY 2023 outlier threshold using hospital CCRs from the March 2022 update to the Provider-Specific File (PSF); the most recent available data at the time of the development of the final rule. We applied the following edits to providers' CCRs in the PSF. We believe these edits are appropriate in order to accurately model the outlier threshold. We first search for Indian Health Service providers and those providers assigned the statewide average CCR from the current fiscal year. We then replaced these CCRs with the statewide average CCR for the upcoming fiscal year. We also assigned the statewide average CCR (for the upcoming fiscal year) to those providers that have no value in the CCR field in the PSF or whose CCRs exceed the ceilings described later in this section (3.0 standard deviations from the mean of the log distribution of CCRs for all hospitals). We did not apply the adjustment factors described below to hospitals assigned the statewide average CCR. For FY 2023, we also are continuing to apply an adjustment factor to the CCRs to account for cost and charge inflation (as explained below).

As previously discussed, ordinarily, for the final rule, using the latest available data at the time of this final rule, we would apply an adjustment factor to adjust the CCRs from the March 2022 update of the PSF by comparing the percentage change in the national average case-weighted operating CCR and capital CCR from the March 2021 update of the PSF to the national average case-weighted operating CCR and capital CCR from the March 2022 update of the PSF. However, for the reasons as previously discussed, we are finalizing as proposed to adjust the CCRs from the March 2022 update of the PSF by comparing the percentage change in the national average case-weighted operating CCR and capital CCR from the March 2019 update of the PSF to the national average case-weighted operating CCR and capital CCR from the March 2020 update of the PSF, which is the last update of the PSF prior to the PHE. We note that this is the same data used to adjust the CCRs for the FY 2022 IPPS/LTCH PPS rulemaking. As previously stated, we believe using these data for the latest available period prior to the PHE, for which the percentage change in the national average case weighted operating CCR and capital CCR is below 1.0, is appropriate in light of our expectation that the CCRs will not continue to increase at these abnormally high rates for FY 2023. We note that we used total transfer-adjusted cases from FY 2019 to determine the national average case-weighted CCRs for both sides of the comparison. As stated in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50979), we believe that it is appropriate to use the same case count on both sides of the comparison, because this would produce the true percentage change in the average case-weighted operating and capital CCR from 1 year to the next without any effect from a change in case count on different sides of the comparison.

Using this methodology, for this final rule, we calculated a March 2019 operating national average case-weighted CCR of 0.254027 and a March 2020 operating national average case-weighted CCR of 0.247548. We then calculated the percentage change between the two national operating case-weighted CCRs by subtracting the March 2019 operating national average case-weighted CCR from the March 2020 operating national average case-weighted CCR and then dividing the result by the March 2019 national operating average case-weighted CCR. This resulted in a 1-year national operating CCR adjustment factor of 0.974495. Similar to the proposed rule, because we are using CCRs from the March 2022 update of the PSF for FY 2023, we applied a 1-year national operating CCR adjustment.

We used this same methodology to adjust the capital CCRs. Specifically, we calculated a March 2019 capital national average case-weighted CCR of 0.02073 and a March 2020 capital national average case-weighted CCR of 0.019935. We then calculated the percentage change between the two national capital case-weighted CCRs by subtracting the March 2019 capital national average case-weighted CCR from the March 2020 capital national average case-weighted CCR and then dividing the result by the March 2019 capital national average case-weighted CCR. This resulted in a 1-year national capital CCR adjustment factor of 0.96165. Similar to the proposed rule, because we use CCRs from the March 2022 update of the PSF for FY 2023, we applied a 1-year national capital CCR adjustment.

As discussed previously, consistent with the proposed rule, for FY 2023, we applied the following policies (as discussed in more detail earlier):

- We used a wage index based on the FY 2023 wage index that hospitals will be paid. This included our final policy to include the wage data of hospitals that have reclassified from urban to rural under section 1886(d)(8)(E) of the Act (as implemented in the regulations at § 412.103) in the calculation of the rural floor (see section III.G.1. of the preamble of this final rule for a complete discussion on this policy); application of the imputed floor adjustment, the frontier State floor adjustment in accordance with section 10324(a) of the Affordable Care Act, and the out migration adjustment as added by section 505 of Public Law 108–173; and application of our wage index policies to: (1) increase the wage index values for hospitals with a wage index value below the 25th percentile wage index value across all hospitals, and (2) apply a 5-percent cap on any decrease to a hospital's wage index from its wage index in the prior FY, regardless of the circumstances causing the decline (described in section III. N of the preamble of this final rule). As stated previously, if we did not take the above into account, our estimate of total FY 2023 payments would be too low, and, as a result, our outlier threshold would be too high, such that estimated outlier payments would be less than our projected 5.12 percent of total payments (which reflects the estimate of outlier reconciliation calculated for this final rule).
- We excluded the hospital VBP payment adjustments and the hospital readmissions payment adjustments from the calculation of the outlier fixed-loss cost threshold.
- We used the estimated per-discharge uncompensated care payments to hospitals eligible for the uncompensated care payment for all cases in the calculation of the outlier fixed-loss cost threshold methodology.
- Based on the policy finalized, as previously described, we used the estimated per-discharge supplemental payments to hospitals eligible for the supplemental payment for all cases in the calculation of the proposed outlier fixed-loss cost threshold methodology.

Using this methodology, we used the formula described in section I.C.1 of this Addendum to simulate and calculate the Federal payment rate and outlier payments for all claims. In addition, as described in the earlier section to this Addendum, we are finalizing to incorporate an estimate of FY 2023 outlier reconciliation in the methodology for determining the outlier threshold. As noted previously, for this FY

2023 final rule, the ratio of outlier reconciliation dollars to total Federal Payments (Step 4) is a negative 0.019401 percent, which when rounded to the second digit, is 0.02 percent. Therefore, for FY 2023, we incorporated a projection of outlier reconciliation dollars by targeting an outlier threshold at 5.12 percent [5.1 percent − (0.02 percent)].

As previously discussed, after consideration of the comments we received, we are modifying elements of our calculation of the fixed-loss threshold by averaging the fixed-loss thresholds calculated including and excluding COVID–19 cases in the FY 2021 claims data. We also agreed with the commenter's suggestion that we include the payment increase for COVID–19 cases provided by the CARES Act. As discussed previously, we calculated two fixed-loss thresholds, one using FY 2021 claims data including COVID–19 cases that reflect the payment increase provided by the CARES Act and one using FY 2021 claims data excluding COVID–19 cases, and then averaged these two fixed-loss thresholds to determine the final fixed-loss threshold for FY 2023.

Based on this finalized averaging approach, the following are the steps we used to determine the final fixed-loss threshold for FY 2023 using FY 2021 claims data.

Step 1: Using all claims, which included COVID–19 cases and incorporating the payment increase provided by the CARES Act, we determined a threshold of $39,389 and calculated total outlier payments of $4,658,400,549 and total operating Federal payments of $86,325,462,972. We then divided total outlier payments by total operating Federal payments plus total outlier payments and determined that this threshold matched with the 5.12 percent target, which reflects our methodology to incorporate an estimate of outlier reconciliation in the determination of the outlier threshold (as discussed in more detail in the previous section of this Addendum).

Step 2: Excluding COVID–19 cases, we determined a threshold of $38,328 and calculated total outlier payments of $4,073,729,554 and total operating Federal payments of $75,488,568,943. We then divided total outlier payments by total operating Federal payments plus total outlier payments and determined that this threshold matched with the 5.12 percent target, which reflects our methodology to incorporate an estimate of outlier reconciliation in the determination of the outlier threshold (as discussed in more detail in the previous section of this Addendum).

Step 3: We averaged the two fixed-loss thresholds from steps 1 and 2 to determine a final fixed-loss threshold for FY 2023 of $38,859 (($39,389 + $38,328)/2)).

We are finalizing an outlier fixed-loss cost threshold for FY 2023 equal to the prospective payment rate for the MS–DRG, plus any IME, empirically justified Medicare DSH payments, estimated uncompensated care payment, estimated supplemental payment for eligible IHS/Tribal hospitals and Puerto Rico hospitals and any addon payments for new technology, plus $38,859.

Comment: A commenter stated that the COVID–19 PHE increased case acuity and payments due to the suspension of the 2% sequestration. Therefore, the commenter recommended that payments should be adjusted from the FY 2022 estimated outlier threshold because of the temporal nature of these additional payments.

Response: We appreciate the commenter's input. The sequestration reduction is a 2-percent reduction to overall payments and is applied after calculating individual payments such as outlier payments. Therefore, CMS has not made any adjustments that consider the 2-percent reduction in our modeling of outlier payments. As a result, no change to the outlier model for FY 2023 is necessary. With regard to the commenter noting the increased case acuity, we refer the reader to section I.F. of this FY 2023 IPPS/LTCH final rule for a discussion of our final policy .

(3) Other Changes Concerning Outliers

As stated in the FY 1994 IPPS final rule (58 FR 46348), we establish an outlier threshold that is applicable to both hospital inpatient operating costs and hospital inpatient capital-related costs. When we modeled the combined operating and capital outlier payments, we found that using a common threshold resulted in a higher percentage of outlier payments for capital-related costs than for operating costs. We project that the threshold for FY 2023 (which reflects our methodology to incorporate an estimate of operating outlier reconciliation) would result in operating outlier payments that would equal 5.1 percent of operating DRG payments. As discussed previously, once an outlier threshold is set, it is used to estimate the percentage of capital outlier payments to total capital payments based on that threshold. Therefore, our modified methodology produces two separate estimates of the percentage of capital outlier payments to total capital payments. One estimate is based on the shared threshold that was determined using all cases in the FY 2021 data. The other estimate is based on the shared threshold that was determined excluding COVID–19 cases in the FY 2021 data. As stated, we averaged these two estimates together to establish the final estimate of capital outlier payments to total capital payments for FY 2023. Therefore, based on this finalized methodology to average these two estimates, we estimate that capital outlier payments would equal 5.52 percent of capital payments based on the Federal rate (which reflects our methodology discussed previously to incorporate an estimate of capital outlier reconciliation).

In accordance with section 1886(d)(3)(B) of the Act and as discussed previously, we are reducing the FY 2023 standardized amount by 5.1 percent to account for the projected proportion of payments paid as outliers.

The outlier adjustment factors that would be applied to the operating standardized amount and capital Federal rate based on the FY 2023 outlier threshold are as follows:

	Operating Standardized Amounts	Capital Federal Rate*
National	0.949	0.944837

*The adjustment factor for the capital Federal rate reflects this final rule's modified calculation and includes an adjustment to the estimated percentage of FY 2023 capital outlier payments for capital outlier reconciliation, as discussed previously and in section III. A. 2 in the Addendum of this final rule.

We are applying the outlier adjustment factors to the FY 2023 payment rates after removing the effects of the FY 2022 outlier adjustment factors on the standardized amount.

To determine whether a case qualifies for outlier payments, we currently apply hospital-specific CCRs to the total covered charges for the case. Estimated operating and capital costs for the case are calculated separately by applying separate operating and capital CCRs. These costs are then combined and compared with the outlier fixed-loss cost threshold.

Under our current policy at § 412.84, we calculate operating and capital CCR ceilings and assign a statewide average CCR for hospitals whose CCRs exceed 3.0 standard deviations from the mean of the log distribution of CCRs for all hospitals. Based on this calculation, for hospitals for which the MAC computes operating CCRs greater than 1.224 or capital CCRs greater than 0.134 or hospitals for which the MAC is unable to calculate a CCR (as described under § 412.84(i)(3) of our regulations), statewide average CCRs are used to determine whether a hospital qualifies for outlier payments. Table 8A listed in section VI. of this Addendum (and available via the internet on the CMS website) contains the statewide average operating CCRs for urban hospitals and for rural hospitals for which the MAC is unable to compute a hospital-specific CCR within the range previously specified. These statewide average ratios would be effective for discharges occurring on or after October 1, 2022, and would replace the statewide average ratios from the prior fiscal year. Table 8B listed in section VI. of this Addendum (and available via the internet on the CMS website) contains the comparable statewide average capital CCRs. As previously stated, the CCRs in Tables 8A and 8B would be used during FY 2023 when hospital-specific CCRs based on the latest settled cost report either are not available or are outside the range noted previously. Table

8C listed in section VI. of this Addendum (and available via the internet on the CMS website) contains the statewide average total CCRs used under the LTCH PPS as discussed in section V. of this Addendum.

We finally note that section 20.1.2 of chapter three of the Medicare Claims Processing Manual (on the internet at *https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/clm104c03.pdf*) covers an array of topics, including CCRs, reconciliation, and the time value of money. We encourage hospitals that are assigned the statewide average operating and/or capital CCRs to work with their MAC on a possible alternative operating and/or capital CCR as explained in the manual. Use of an alternative CCR developed by the hospital in conjunction with the MAC can avoid possible overpayments or underpayments at cost report settlement, thereby ensuring better accuracy when making outlier payments and negating the need for outlier reconciliation. We also note that a hospital may request an alternative operating or capital CCR at any time as long as the guidelines of the manual are followed. In addition, the manual outlines the outlier reconciliation process for hospitals and Medicare contractors. We refer hospitals to the manual instructions for complete details on outlier reconciliation.

(4) FY 2021 Outlier Payments

Our current estimate, using available FY 2021 claims data, is that actual outlier payments for FY 2021 were approximately 5.66 percent of actual total MS–DRG payments. Therefore, the data indicate that, for FY 2021, the percentage of actual outlier payments relative to actual total payments is higher than we projected for FY 2021. Consistent with the policy and statutory interpretation we have maintained since the inception of the IPPS, we do not make retroactive adjustments to outlier payments to ensure that total outlier payments for FY 2021 are equal to 5.1 percent of total MS–DRG payments. As explained in the FY 2003 Outlier final rule (68 FR 34502), if we were to make retroactive adjustments to all outlier payments to ensure total payments are 5.1 percent of MS–DRG payments (by retroactively adjusting outlier payments), we would be removing the important aspect of the prospective nature of the IPPS. Because such an across-the-board adjustment would either lead to more or less outlier payments for all hospitals, hospitals would no longer be able to reliably approximate their payment for a patient while the patient is still hospitalized. We believe it would be neither necessary nor appropriate to make such an aggregate retroactive adjustment. Furthermore, we believe it is consistent with the statutory language at section 1886(d)(5)(A)(iv) of the Act not to make retroactive adjustments to outlier payments. This section states that outlier payments be equal to or greater than 5 percent and less than or equal to 6 percent of projected or estimated (not actual) MS–DRG payments. We believe that an important goal of a PPS is predictability. Therefore, we believe that the fixed-loss outlier threshold should be projected based on the best available historical data and should not be adjusted retroactively. A retroactive change to the fixed-loss outlier threshold would affect all hospitals subject to the IPPS, thereby undercutting the predictability of the system as a whole.

We note that, because the MedPAR claims data for the entire FY 2022 period would not be available until after September 30, 2022, we are unable to provide an estimate of actual outlier payments for FY 2022 based on FY 2022 claims data in the proposed rule and this final rule. We will provide an estimate of actual FY 2022 outlier payments in the FY 2024 IPPS/LTCH PPS proposed rule.

5. FY 2023 Standardized Amount

The adjusted standardized amount is divided into labor-related and nonlabor-related portions. Tables 1A and 1B listed and published in section VI. of this Addendum (and available via the internet on the CMS website) contain the national standardized amounts that we are applying to all hospitals, except hospitals located in Puerto Rico, for FY 2023. The standardized amount for hospitals in Puerto Rico is shown in Table 1C listed and published in section VI. of this Addendum (and available via the internet on the CMS website). The amounts shown in Tables 1A and 1B differ only in that the labor-related share applied to the standardized amounts in Table 1A is 67.6 percent, and the labor-related share applied to the standardized amounts in Table 1B is 62 percent. In accordance with sections 1886(d)(3)(E) and 1886(d)(9)(C)(iv) of the Act, we are applying a labor-related share of 62 percent, unless application of that percentage would result in lower payments to a hospital than would otherwise be made. In effect, the statutory provision means that we would apply a labor-related share of 62 percent for all hospitals whose wage indexes are less than or equal to 1.0000.

In addition, Tables 1A and 1B include the standardized amounts reflecting the applicable percentage increases for FY 2023.

The labor-related and nonlabor-related portions of the national average standardized amounts for Puerto Rico hospitals for FY 2023 are set forth in Table 1C listed and published in section VI. of this Addendum (and available via the internet on the CMS website). Similarly, section 1886(d)(9)(C)(iv) of the Act, as amended by section 403(b) of Public Law 108–173, provides that the labor-related share for hospitals located in Puerto Rico be 62 percent, unless the application of that percentage would result in lower payments to the hospital.

The following table illustrates the changes from the FY 2022 national standardized amounts to the FY 2023 national standardized amounts. The second through fifth columns display the changes from the FY 2022 standardized amounts for each applicable FY 2023 standardized amount. The first row of the table shows the updated (through FY 2022) average standardized amount after restoring the FY 2022 offsets for outlier payments, geographic reclassification, rural demonstration, lowest quartile, and transition budget neutrality. The MS–DRG reclassification and recalibration, wage index, and stem cell acquisition budget neutrality factors are cumulative (that is, we have not restored the offsets). Accordingly, those FY 2022 adjustment factors have not been removed from the base rate in the following table. Additionally, for FY 2023 we have applied the budget neutrality factors for the lowest quartile hospital policy, described previously.

CHANGES FROM FY 2022 STANDARDIZED AMOUNTS TO THE FY 2023 STANDARDIZED AMOUNTS

	Hospital Submitted Quality Data and is a Meaningful EHR User	Hospital Submitted Quality Data and is NOT a Meaningful EHR User	Hospital Did NOT Submit Quality Data and is a Meaningful EHR User	Hospital Did NOT Submit Quality Data and is NOT a Meaningful EHR User
FY 2023 Base Rate after removing:1. FY 2022 Geographic Reclassification Budget Neutrality (0.986741) 2. FY 2022 Operating Outlier Offset (0.949) 3. FY 2022 Rural Demonstration Budget Neutrality Factor (0.999361) 4. FY 2022 Lowest Quartile Budget Neutrality Factor (0.998029) 5. FY 2022 Transition Budget Neutrality Factor (0.999859)	If Wage Index is Greater Than 1.0000: Labor (67.6%): $ 4,431.41 Nonlabor (32.4%): $ 2,123.93	If Wage Index is Greater Than 1.0000: Labor (67.6%): $ 4,431.41 Nonlabor (32.4%): $ 2,123.93	If Wage Index is Greater Than 1.0000: Labor (67.6%): $ 4,431.41 Nonlabor (32.4%): $ 2,123.93	If Wage Index is Greater Than 1.0000: Labor (67.6%): $ 4,431.41 Nonlabor (32.4%): $ 2,123.93
	If Wage Index is less Than or Equal to 1.0000: Labor (62%): $ 4,064.31 Nonlabor (38%): $ 2,491.03	If Wage Index is less Than or Equal to 1.0000: Labor (62%): $ 4,064.31 Nonlabor (38%): $ 2,491.03	If Wage Index is less Than or Equal to 1.0000: Labor (62%): $ 4,064.31 Nonlabor (38%): $ 2,491.03	If Wage Index is less Than or Equal to 1.0000: Labor (62%): $ 4,064.31 Nonlabor (38%): $ 2,491.03
FY 2023 Update Factor	1.038	1.00725	1.02775	0.9970
FY 2023 MS-DRG Reclassification and Recalibration Budget Neutrality Factor Before Cap	1.000509	1.000509	1.000509	1.000509
FY 2023 Cap Policy MS-DRG Weight Budget Neutrality Factor	0.999764	0.999764	0.999764	0.999764
FY 2023 Wage Index Budget Neutrality Factor	1.000968	1.000968	1.000968	1.000968
FY 2023 Reclassification Budget Neutrality Factor	0.984399	0.984399	0.984399	0.984399
FY 2023 Lowest Quartile Budget Neutrality Factor	0.998146	0.998146	0.998146	0.998146
FY 2023 Cap Policy Wage Index Budget Neutrality Factor	0.999689	0.999689	0.999689	0.999689
FY 2023 RCH Demonstration Budget Neutrality Factor	0.998935	0.998935	0.998935	0.998935
FY 2023 Operating Outlier Factor	0.949	0.949	0.949	0.949
Adjustment for FY 2023 Required under Section 414 of Pub. L. 114-10 (MACRA)	1.005	1.005	1.005	1.005
National Standardized Amount for FY 2023 if Wage Index is Greater Than 1.0000; Labor/Non-Labor Share Percentage (67.6/32.4)	**Labor: $4,310.00 Nonlabor $2,065.74**	**Labor: $4,182.32 Nonlabor: $2,004.54**	**Labor: $4,267.44 Nonlabor: $2,045.34**	**Labor: $4,139.76 Nonlabor: $1,984.15**
National Standardized Amount for FY 2023 if Wage Index is Less Than or Equal to 1.0000; Labor/Non-Labor Share Percentage (62/38)	**Labor: $3,952.96 Nonlabor: $2,422.78**	**Labor: $3,835.85 Nonlabor: $2,351.01**	**Labor: $3,913.92 Nonlabor: $2,398.86**	**Labor: $3,796.82 Nonlabor: $2,327.09**

B. Adjustments for Area Wage Levels and Cost-of-Living

Tables 1A through 1C, as published in section VI. of this Addendum (and available via the internet on the CMS website), contain the labor-related and nonlabor-related shares that we are using to calculate the prospective payment rates for hospitals located in the 50 States, the District of Columbia, and Puerto Rico for FY 2023. This section addresses two types of adjustments to the standardized amounts that are made in determining the prospective payment rates as described in this Addendum.

1. Adjustment for Area Wage Levels

Sections 1886(d)(3)(E) and 1886(d)(9)(C)(iv) of the Act require that we make an adjustment to the labor-related portion of the national prospective payment rate to account for area differences in hospital wage levels. This adjustment is made by multiplying the labor-related portion of the adjusted standardized amounts by the appropriate wage index for the area in which the hospital is located. For FY 2023, as discussed in section IV.B.3. of the preamble of this final rule, we are applying a labor-related share of 67.6 percent for the national standardized amounts for all IPPS hospitals (including hospitals in Puerto Rico) that have a wage index value that is greater than 1.0000. Consistent with section 1886(d)(3)(E) of the Act, we are applying the wage index to a labor-related share of 62 percent of the national standardized amount for all IPPS hospitals (including hospitals in Puerto Rico) whose wage index values are less than or equal to 1.0000. In section III. of the preamble of this final rule, we discuss the data and methodology for the FY 2023 wage index.

2. Adjustment for Cost-of-Living in Alaska and Hawaii

Section 1886(d)(5)(H) of the Act provides discretionary authority to the Secretary to make adjustments as the Secretary deems appropriate to take into account the unique circumstances of hospitals located in Alaska and Hawaii. Higher labor-related costs for these two States are taken into account in the adjustment for area wages described previously. To account for higher non-labor related costs for these two States, we multiply the nonlabor-related portion of the standardized amount for hospitals in Alaska and Hawaii by an adjustment factor.

In the FY 2013 IPPS/LTCH PPS final rule, we established a methodology to update the COLA factors for Alaska and Hawaii that were published by the U.S. Office of Personnel Management (OPM) every 4 years (at the same time as the update to the labor related share of the IPPS market basket), beginning in FY 2014. We refer readers to the FY 2013 IPPS/LTCH PPS proposed and final rules for additional background and a detailed description of this methodology (77 FR 28145 through 28146 and 77 FR 53700 through 53701, respectively). For FY 2022, in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45546 through 45547), we updated the COLA factors published by OPM for 2009 (as these are the last COLA factors OPM published prior to transitioning from COLAs to locality pay) using the methodology that we finalized in the FY 2013 IPPS/LTCH PPS final rule. Based on the policy finalized in the FY 2013 IPPS/LTCH PPS final rule, we are continuing to use the same COLA factors in FY 2023 that were used in FY 2022 to adjust the nonlabor-related portion of the standardized amount for hospitals located in Alaska and Hawaii. The following table lists the COLA factors for FY 2023.

FY 2023 Cost-of-Living Adjustment Factors (COLA): Alaska and Hawaii Hospitals

Area	FY 2022 - FY 2025
Alaska:	
City of Anchorage and 80-kilometer (50-mile) radius by road	1.22
City of Fairbanks and 80-kilometer (50-mile) radius by road	1.22
City of Juneau and 80-kilometer (50-mile) radius by road	1.22
Rest of Alaska	1.24
Hawaii:	
City and County of Honolulu	1.25
County of Hawaii	1.22
County of Kauai	1.25
County of Maui and County of Kalawao	1.25

Lastly, as we finalized in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53700 and 53701), we intend to update the COLA factors based on our methodology every 4 years, at the same time as the update to the labor-related share of the IPPS market basket.

C. Calculation of the Prospective Payment Rates

1. General Formula for Calculation of the Prospective Payment Rates for FY 2023

In general, the operating prospective payment rate for all hospitals (including hospitals in Puerto Rico) paid under the IPPS, except SCHs, for FY 2023 equals the Federal rate (which includes uncompensated care payments). Under current law, the MDH program is effective for discharges on or before September 30, 2022. Therefore, under current law, the MDH program will expire at the end of FY 2022.

SCHs are paid based on whichever of the following rates yields the greatest aggregate payment: the Federal national rate (which, as discussed in section VI.G. of the preamble of this final rule, includes uncompensated care payments); the updated hospital-specific rate based on FY 1982 costs per discharge; the updated hospital-specific rate based on FY 1987 costs per discharge; the updated hospital-specific rate based on FY 1996 costs per discharge; or the updated hospital-specific rate based on FY 2006 costs per discharge to determine the rate that yields the greatest aggregate payment.

The prospective payment rate for SCHs for FY 2022 equals the higher of the applicable Federal rate, or the hospital-specific rate as described later in this section.

2. Operating and Capital Federal Payment Rate and Outlier Payment Calculation

Note: The formula specified in this section is used for actual claim payment and is also used by CMS to project the outlier threshold for the upcoming fiscal year. The difference is the source of some of the variables in the formula. For example, operating and capital CCRs for actual claim payment are from the PSF while CMS uses an adjusted CCR (as described previously) to project the threshold for the upcoming fiscal year. In addition, charges for a claim payment are from the bill while charges to project the threshold are from the MedPAR data with an inflation factor applied to the charges (as described earlier). We note that the formula specified below reflects our finalized policy to include the estimated supplemental payment for eligible IHS/Tribal hospitals and Puerto Rico hospitals in the computation of the outlier fixed-loss cost threshold.

Step 1—Determine the MS–DRG and MS–DRG relative weight (from Table 5) for each claim based on the ICD–10–CM diagnosis and ICD–10–PCS procedure codes on the claim.

Step 2—Select the applicable average standardized amount depending on whether the hospital submitted qualifying quality data and is a meaningful EHR user, as described previously.

Step 3—Compute the operating and capital Federal payment rate:

— Federal Payment Rate for Operating Costs = MS–DRG Relative Weight × [(Labor-Related Applicable Standardized Amount × Applicable CBSA Wage Index) + (Nonlabor-Related Applicable Standardized Amount × Cost-of-Living Adjustment)] × (1 + IME + (DSH * 0.25))
— Federal Payment for Capital Costs = MS–DRG Relative Weight × Federal Capital Rate × Geographic Adjustment Fact × (l + IME + DSH)

Step 4—Determine operating and capital costs:

— Operating Costs = (Billed Charges × Operating CCR)
— Capital Costs = (Billed Charges × Capital CCR).

Step 5—Compute operating and capital outlier threshold (CMS applies a geographic adjustment to the operating and capital outlier threshold to account for local cost variation):

— Operating CCR to Total CCR = (Operating CCR)/(Operating CCR + Capital CCR)
— Operating Outlier Threshold = [Fixed Loss Threshold × ((Labor-Related Portion × CBSA Wage Index) + Nonlabor-Related portion)] × Operating CCR to Total CCR + Federal Payment with IME, DSH + Uncompensated Care Payment + Supplemental Payment for IHS/Tribal hospitals and Puerto Rico hospitals + New Technology Add-On Payment Amount
— Capital CCR to Total CCR = (Capital CCR)/(Operating CCR + Capital CCR)
— Capital Outlier Threshold = (Fixed Loss Threshold × Geographic Adjustment Factor × Capital CCR to Total CCR) + Federal Payment with IME and DSH

Step 6—Compute operating and capital outlier payments:

— Marginal Cost Factor = 0.80 or 0.90 (depending on the MS–DRG)
— Operating Outlier Payment = (Operating Costs—Operating Outlier Threshold) × Marginal Cost Factor
— Capital Outlier Payment = (Capital Costs—Capital Outlier Threshold) × Marginal Cost Factor

The payment rate may then be further adjusted for hospitals that qualify for a low-volume payment adjustment under section 1886(d)(12) of the Act and 42 CFR 412.101(b). The base-operating DRG payment amount may be further adjusted by the hospital readmissions payment adjustment and the hospital VBP payment adjustment as described under sections 1886(q) and 1886(o) of the Act, respectively. Payments also may be reduced by the 1-percent adjustment under the HAC Reduction Program as described in section 1886(p) of the Act. We also make new technology add-on payments in accordance with section 1886(d)(5)(K) and (L) of the Act. In addition, we add the uncompensated care payment to the total claim payment amount. As noted in the previous formula, we take uncompensated care payments and new technology add-on payments into consideration when calculating outlier payments. Finally, as previously discussed, we are finalizing, beginning in FY 2023, to take into consideration the supplemental payment for eligible IHS/Tribal hospitals and Puerto Rico hospitals when calculating outlier payments.

3. Hospital-Specific Rate (Applicable Only to SCHs and MDHs)

a. Calculation of Hospital-Specific Rate

Section 1886(b)(3)(C) of the Act provides that SCHs are paid based on whichever of the following rates yields the greatest aggregate payment: the Federal rate; the updated hospital-specific rate based on FY 1982 costs per discharge; the updated hospital-specific rate based on FY 1987 costs per discharge; the updated hospital-specific rate based on FY 1996 costs per discharge; or the updated hospital-specific rate based on FY 2006 costs per discharge to determine the rate that yields the greatest aggregate payment. (We note, under current law, the MDH program is effective for discharges on or before September 30, 2022. Therefore, under current law, the MDH program will expire at the end of FY 2022.)

For a more detailed discussion of the calculation of the hospital-specific rates, we refer readers to the FY 1984 IPPS interim final rule (48 FR 39772); the April 20, 1990 final rule with comment period (55 FR 15150); the FY 1991 IPPS final rule (55 FR 35994); and the FY 2001 IPPS final rule (65 FR 47082).

b. Updating the FY 1982, FY 1987, FY 1996, FY 2002 and FY 2006 Hospital-Specific Rate for FY 2023

Section 1886(b)(3)(B)(iv) of the Act provides that the applicable percentage increase applicable to the hospital-specific rates for SCHs equals the applicable percentage increase set forth in section 1886(b)(3)(B)(i) of the Act (that is, the same update factor as for all other hospitals subject to the IPPS). Because the Act sets the update factor for SCHs equal to the update factor for all other IPPS hospitals, the update to the hospital-specific rates for SCHs is subject to the amendments to section 1886(b)(3)(B) of the Act made by sections 3401(a) and 10319(a) of the Affordable Care Act. Accordingly, the proposed applicable percentage increases to the hospital-specific rates applicable to SCHs are the following:

FY 2023	Hospital Submitted Quality Data and is a Meaningful EHR User	Hospital Submitted Quality Data and is NOT a Meaningful EHR User	Hospital Did NOT Submit Quality Data and is a Meaningful EHR User	Hospital Did NOT Submit Quality Data and is NOT a Meaningful EHR User
Market Basket Rate-of-Increase	4.1	4.1	4.1	4.1
Adjustment for Failure to Submit Quality Data under section 1886(b)(3)(B)(viii) of the Act	0	0	-1.025	-1.025
Adjustment for Failure to be a Meaningful EHR User under section 1886(b)(3)(B)(ix) of the Act	0	-3.075	0	-3.075
Productivity Adjustment under section 1886(b)(3)(B)(xi) of the Act	-0.3	-0.3	-0.3	-0.3
Applicable Percentage Increase Applied to Standardized Amount	**3.8**	**0.725**	**2.775**	**-0.3**

For a complete discussion of the applicable percentage increase applied to the hospital-specific rates for SCHs, we refer readers to section V.B. of the preamble of this final rule.

In addition, because SCHs use the same MS–DRGs as other hospitals when they are paid based on the hospital-specific rate, the hospital-specific rate is adjusted by a budget neutrality factor to ensure that changes to the MS–DRG classifications and the recalibration of the MS–DRG relative weights are made in a manner so that aggregate IPPS payments are unaffected. Therefore, the hospital specific-rate for an SCH is adjusted by the MS–DRG reclassification and recalibration budget neutrality factor, as discussed in section III. of this Addendum and listed in the table in section II. of this Addendum. In addition, as discussed in section II.E.2.d of this final rule, we are establishing a permanent 10-percent cap on the reduction in a MS–DRG's relative weight in a given fiscal year, beginning in FY 2023. As discussed in section II.E.2.d of this final rule, and consistent with our current methodology for implementing budget neutrality for DRG reclassification and recalibration of the relative weights, we are applying a budget neutrality adjustment to the standardized amount for all hospitals so that this 10-percent cap on relative weight reductions does not increase estimated aggregate Medicare payments beyond the payments that would be made had we never applied this cap. As mentioned previously, SCHs use the same MS–DRGs as other hospitals when they are paid based on the

hospital-specific rate. Therefore, we are establishing that the hospital specific-rate for an SCH would be adjusted by the MS–DRG 10-percent cap budget neutrality factor. The resulting rate is used in determining the payment rate that an SCH would receive for its discharges beginning on or after October 1, 2022. We note that, in this final rule, for FY 2023, we are not making a documentation and coding adjustment to the hospital specific-rate. We refer readers to section II.D. of the preamble of this final rule for a complete discussion regarding our policies and previously finalized policies (including our historical adjustments to the payment rates) relating to the effect of changes in documentation and coding that do not reflect real changes in case mix. We note, as mentioned previously, under current law, the MDH program is effective for discharges on or before September 30, 2022. Therefore, under current law, the MDH program will expire at the end of FY 2022.

III. Changes to Payment Rates for Acute Care Hospital Inpatient Capital-Related Costs for FY 2023

The PPS for acute care hospital inpatient capital-related costs was implemented for cost reporting periods beginning on or after October 1, 1991. The basic methodology for determining Federal capital prospective rates is set forth in the regulations at 42 CFR 412.308 through 412.352. In this section of this Addendum, we discuss the factors that we used to determine the capital Federal rate for FY 2023, which would be effective for discharges occurring on or after October 1, 2022.

All hospitals (except ''new'' hospitals under § 412.304(c)(2)) are paid based on the capital Federal rate. We annually update the capital standard Federal rate, as provided in § 412.308(c)(1), to account for capital input price increases and other factors. The regulations at § 412.308(c)(2) also provide that the capital Federal rate be adjusted annually by a factor equal to the estimated proportion of outlier payments under the capital Federal rate to total capital payments under the capital Federal rate. In addition, § 412.308(c)(3) requires that the capital Federal rate be reduced by an adjustment factor equal to the estimated proportion of payments for exceptions under § 412.348. (We note that, as discussed in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53705), there is generally no longer a need for an exceptions payment adjustment factor.) However, in limited circumstances, an additional payment exception for extraordinary circumstances is provided for under § 412.348(f) for qualifying hospitals. Therefore, in accordance with § 412.308(c)(3), an exceptions payment adjustment factor may need to be applied if such payments are made. Section 412.308(c)(4)(ii) requires that the capital standard Federal rate be adjusted so that the effects of the annual DRG reclassification and the recalibration of DRG weights and changes in the geographic adjustment factor (GAF) are budget neutral.

Section 412.374 provides for payments to hospitals located in Puerto Rico under the IPPS for acute care hospital inpatient capital-related costs, which currently specifies capital IPPS payments to hospitals located in Puerto Rico are based on 100 percent of the Federal rate.

A. Determination of the Federal Hospital Inpatient Capital-Related Prospective Payment Rate Update for FY 2023

In the discussion that follows, we explain the factors that we used to determine the capital Federal rate for FY 2023. In particular, we explain why the FY 2023 capital Federal rate would increase approximately 2.36 percent, compared to the FY 2022 capital Federal rate. As discussed in the impact analysis in Appendix A to this final rule, we estimate that capital payments per discharge will increase approximately 0.6 percent during that same period. Because capital payments constitute approximately 10 percent of hospital payments, a 1-percent change in the capital Federal rate yields only approximately a 0.1 percent change in actual payments to hospitals.

As discussed in section I.F. of the preamble to this final rule, we are finalizing our proposal to use FY 2021 data for purposes of FY 2023 IPPS ratesetting. Consistent with this policy, for this final rule we are finalizing our proposal to use claims from the March 2022 update of the FY 2021 MedPAR file for purposes of calculating the budget neutrality adjustment factors for changes resulting from the annual DRG reclassification and recalibration and changes in the GAF. However, as we also discuss in section I.F. of the preamble to this final rule, we are finalizing certain modifications to our usual methodologies to account for the anticipated decline in COVID–19 hospitalizations of Medicare beneficiaries at IPPS hospitals in FY 2023 as compared to FY 2021. First, we are modifying the calculation of the FY 2023 MS–DRG relative weights by first calculating two sets of weights, one including and one excluding COVID–19 claims in the FY 2021 data, and then averaging the two sets of relative weights to determine the FY 2023 MS–DRG relative weight values (as described in greater detail in section II.E. of the preamble to this final rule). Second, we are modifying our methodology for determining the FY 2023 outlier fixed-loss amount for IPPS cases by using charge inflation factors and CCR adjustment factors based on the last 1-year period prior to the COVID–19 PHE. We also are modifying our methodology for determining the FY 2023 outlier fixed-loss amount for IPPS cases by establishing the fixed-loss amount as an average of fixed-loss amounts calculated including and excluding COVID–19 claims in the FY 2021 data. Lastly, we are modifying our methodology for determining the FY 2023 outlier fixed-loss amount for IPPS cases by including the increases in payments to COVID–19 cases provided by the CARES Act in the calculation of the fixed-loss amount. The modifications we have made to our methodology for determining the FY 2023 outlier fixed-loss amount for IPPS cases are discussed in greater detail in section II.A.4. of the Addendum to this final rule.

1. Projected Capital Standard Federal Rate Update

Under § 412.308(c)(1), the capital standard Federal rate is updated on the basis of an analytical framework that takes into account changes in a capital input price index (CIPI) and several other policy adjustment factors. Specifically, we adjust the projected CIPI rate of change, as appropriate, each year for case-mix index-related changes, for intensity, and for errors in previous CIPI forecasts. The update factor for FY 2023 under that framework is 2.5 percent based on a projected 2.5 percent increase in the 2018-based CIPI, a 0.0 percentage point adjustment for intensity, a 0.0 percentage point adjustment for case-mix, a 0.0 percentage point adjustment for the DRG reclassification and recalibration, and a forecast error correction of 0.0 percentage point. As discussed in section III.C. of this Addendum, we continue to believe that the CIPI is the most appropriate input price index for capital costs to measure capital price changes in a given year. We also explain the basis for the FY 2023 CIPI projection in that same section of this Addendum. In this final rule, we describe the policy adjustments that we applied in the update framework for FY 2023.

The case-mix index is the measure of the average DRG weight for cases paid under the IPPS. Because the DRG weight determines the prospective payment for each case, any percentage increase in the case-mix index corresponds to an equal percentage increase in hospital payments.

The case-mix index can change for any of several reasons—

- The average resource use of Medicare patient changes (''real'' case-mix change);
- Changes in hospital documentation and coding of patient records result in higher-weighted DRG assignments (''coding effects''); or
- The annual DRG reclassification and recalibration changes may not be budget neutral (''reclassification effect'').

We define real case-mix change as actual changes in the mix (and resource requirements) of Medicare patients, as opposed to changes in documentation and coding behavior that result in assignment of cases to higher-weighted DRGs, but do not reflect higher resource requirements. The capital update framework includes the same case-mix index adjustment used in the former operating IPPS update framework (as discussed in the May 18, 2004 IPPS proposed rule for FY 2005 (69 FR 28816)). (We no longer use an update framework to make a recommendation for updating the operating IPPS standardized amounts, as discussed in section II. of Appendix B to the FY 2006 IPPS final rule (70 FR 47707).)

For FY 2023, we project a 1.0 percent total increase in the case-mix index. We estimated that the real case-mix increase would equal 1.0 percent for FY 2023. The net adjustment for change in case-mix is the difference between the projected real increases in case mix and the projected total increase in case mix. Therefore, as proposed, the net adjustment for case-mix change in FY 2023 is 0.0 percentage point.

The capital update framework also contains an adjustment for the effects of DRG

reclassification and recalibration. This adjustment is intended to remove the effect on total payments of prior year's changes to the DRG classifications and relative weights, to retain budget neutrality for all case-mix index-related changes other than those due to patient severity of illness. Due to the lag time in the availability of data, there is a 2-year lag in data used to determine the adjustment for the effects of DRG reclassification and recalibration. For example, for this FY 2023 IPPS/LTCH PPS final rule, we have the FY 2021 MedPAR claims data available to evaluate the effects of the FY 2021 DRG reclassification and recalibration as part of our update for FY 2023. We assume for purposes of this adjustment, that the estimate of FY 2021 DRG reclassification and recalibration would result in no change in the case-mix when compared with the case mix index that would have resulted if we had not made the reclassification and recalibration changes to the DRGs. Therefore, as proposed, we are making a 0.0 percentage point adjustment for reclassification and recalibration in the update framework for FY 2023.

The capital update framework also contains an adjustment for forecast error. The input price index forecast is based on historical trends and relationships ascertainable at the time the update factor is established for the upcoming year. In any given year, there may be unanticipated price fluctuations that may result in differences between the actual increase in prices and the forecast used in calculating the update factors. In setting a prospective payment rate under the framework, we make an adjustment for forecast error only if our estimate of the change in the capital input price index for any year is greater than 0.25 percentage point in absolute terms. There is a 2-year lag between the forecast and the availability of data to develop a measurement of the forecast error. Historically, when a forecast error of the CIPI is greater than 0.25 percentage point in absolute terms, it is reflected in the update recommended under this framework. A forecast error of −0.1 percentage point was calculated for the FY 2021 update, for which there are historical data. That is, current historical data indicated that the forecasted FY 2021 CIPI (1.1 percent) used in calculating the FY 2021 update factor is 0.1 percentage point higher than actual realized price increases (1.0 percent). As this does not exceed the 0.25 percentage point threshold, as proposed we are not making an adjustment for forecast error in the update for FY 2023.

Under the capital IPPS update framework, we also make an adjustment for changes in intensity. Historically, we calculate this adjustment using the same methodology and data that were used in the past under the framework for operating IPPS. The intensity factor for the operating update framework reflects how hospital services are utilized to produce the final product, that is, the discharge. This component accounts for changes in the use of quality-enhancing services, for changes within DRG severity, and for expected modification of practice patterns to remove noncost-effective services. Our intensity measure is based on a 5-year average.

We calculate case-mix constant intensity as the change in total cost per discharge, adjusted for price level changes (the CPI for hospital and related services) and changes in real case-mix. Without reliable estimates of the proportions of the overall annual intensity changes that are due, respectively, to ineffective practice patterns and the combination of quality-enhancing new technologies and complexity within the DRG system, we assume that one-half of the annual change is due to each of these factors. Thus, the capital update framework provides an add-on to the input price index rate of increase of one-half of the estimated annual increase in intensity, to allow for increases within DRG severity and the adoption of quality-enhancing technology.

In this final rule, as proposed, we are continuing to use a Medicare-specific intensity measure that is based on a 5-year adjusted average of cost per discharge for FY 2023 (we refer readers to the FY 2011 IPPS/LTCH PPS final rule (75 FR 0436) for a full description of our Medicare-specific intensity measure). Specifically, for FY 2023, we are using an intensity measure that is based on an average of cost-per-discharge data from the 5-year period beginning with FY 2016 and extending through FY 2020. Based on these data, we estimated that case-mix constant intensity declined during FYs 2016 through 2020. In the past, when we found intensity to be declining, we believed a zero (rather than a negative) intensity adjustment was appropriate. Consistent with this approach, because we estimated that intensity would decline during that 5-year period, we believe it is appropriate to continue to apply a zero-intensity adjustment for FY 2023. Therefore, as proposed, we are making a 0.0 percentage point adjustment for intensity in the update for FY 2023.

Earlier, we described the basis of the components we used to develop the 2.5 percent capital update factor under the capital update framework for FY 2023, as shown in the following table.

FY 2023 UPDATE FACTOR TO THE CAPITAL FEDERAL RATE

Capital Input Price Index*	2.5
Intensity:	0.0
Case-Mix Adjustment Factors:	
Projected Case-Mix Change	-1.0
Real Across DRG Change	1.0
Subtotal	0.0
Effect of FY 2021 Reclassification and Recalibration	0.0
Forecast Error Correction	0.0
Total Update	2.5

*The capital input price index represents the 2018-based CIPI.

2. Outlier Payment Adjustment Factor

Section 412.312(c) establishes a unified outlier payment methodology for inpatient operating and inpatient capital-related costs. A shared threshold is used to identify outlier cases for both inpatient operating and inpatient capital-related payments. Section 412.308(c)(2) provides that the standard Federal rate for inpatient capital-related costs be reduced by an adjustment factor equal to the estimated proportion of capital-related outlier payments to total inpatient capital-related PPS payments. The outlier threshold is set so that operating outlier payments are projected to be 5.1 percent of total operating IPPS DRG payments. For FY 2023, we have incorporated the estimated outlier reconciliation payment amounts into the outlier threshold model, as we did for FY 2022. (For more details on our incorporation of the estimated outlier reconciliation payment amounts into the outlier threshold model, please see section II.A. of this Addendum to this final rule.)

For FY 2022, we estimated that outlier payments for capital-related PPS payments would equal 5.29 percent of inpatient capital-related payments based on the capital Federal rate. As discussed previously and in section II.A.4.j. of the Addendum to this final rule, we are modifying our methodology for determining the FY 2023 outlier threshold for IPPS cases. For FY 2023, this threshold is being determined as an average of the thresholds calculated when including and excluding COVID–19 cases in the FY 2021 claims data. As also discussed in section

II.A., this modification results in two separate estimates of outlier payments for capital related costs as a percentage of inpatient capital-related payments (prior to taking into account projected capital outlier reconciliation payments). One estimate is based on the outlier threshold that was calculated using all cases (that is including COVID–19 cases). The other estimate is based on the outlier threshold that was calculated excluding COVID–19 cases. Consistent with our modification to average the outlier thresholds in determining the final FY 2023 outlier threshold, we are estimating the capital outlier percentage for FY 2023 as the average of these two estimates. Accordingly, as discussed in more detail in section II.A.4.j. of the Addendum to this final rule, we estimate that prior to taking into account projected capital outlier reconciliation payments, outlier payments for capital-related costs will equal 5.53 percent of inpatient capital-related payments based on the capital Federal rate in FY 2023.

Using the methodology outlined in section II.A.4.j.(2). of this Addendum, we estimate that taking into account projected capital outlier reconciliation payments will decrease FY 2023 aggregate estimated capital outlier payments by 0.01 percent. Therefore, accounting for estimated capital outlier reconciliation, the estimated outlier payments for capital-related PPS payments would equal 5.52 percent (5.53 percent—0.01 percent) of inpatient capital-related payments based on the capital Federal rate in FY 2023. Accordingly, we applied an outlier adjustment factor of 0.9448 in determining the capital Federal rate for FY 2023. Thus, we estimate that the percentage of capital outlier payments to total capital Federal rate payments for FY 2023 will be higher than the percentage for FY 2022.

The outlier reduction factors are not built permanently into the capital rates; that is, they are not applied cumulatively in determining the capital Federal rate. The FY 2023 outlier adjustment of 0.9448 is a −0.24 percent change from the FY 2022 outlier adjustment of 0.9471. Therefore, the net change in the outlier adjustment to the capital Federal rate for FY 2023 is 0.9976 (0.9448/0.9471) so that the outlier adjustment will decrease the FY 2023 capital Federal rate by approximately −0.24 percent compared to the FY 2022 outlier adjustment.

3. Budget Neutrality Adjustment Factor for Changes in DRG Classifications and Weights and the GAF

Section 412.308(c)(4)(ii) requires that the capital Federal rate be adjusted so that aggregate payments for the fiscal year based on the capital Federal rate, after any changes resulting from the annual DRG reclassification and recalibration and changes in the GAF, are projected to equal aggregate payments that would have been made on the basis of the capital Federal rate without such changes.

As discussed in section III.G.3. of the preamble of this final rule, in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42325 through 42339), we finalized a policy to help reduce wage index disparities between high and low wage index hospitals by increasing the wage index values for hospitals with a wage index value below the 25th percentile wage index. We stated our intention that this policy will be effective for at least 4 years, beginning in FY 2020. As discussed in section III.G.3 of the preamble of this final rule, this policy was applied in FYs 2020, 2021, and 2022, and will continue to apply in FY 2023 as we proposed. In addition, in FYs 2020 and 2021, we placed a 5-percent cap on any decrease in a hospital's wage index from the hospital's final wage index in the prior fiscal year (see (84 FR 42336 through 42338) and (85 FR 58753 through 58755)). In FY 2022, we finalized a policy that for hospitals that received the transition in FY 2021 (that is hospitals that received a 5 percent cap on their FY 2021 wage index), we continued a wage index transition for FY 2022 under which we applied a 5-percent cap on any decrease in the hospital's wage index compared to its wage index for FY 2021 (86 FR 45164 through 45165). Beginning in FY 2023, as discussed in section III.N. of the preamble to this final rule, we finalized a permanent 5-percent cap on any decrease to a hospital's wage index from its wage index in the prior FY, regardless of the circumstances causing the decline. That is, a hospital's wage index will not be less than 95 percent of its final wage index for the prior FY.

As we discussed in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42638 through 42639), we augmented our historical methodology for computing the budget neutrality factor for changes in the GAFs in light of the effect of those wage index changes on the GAFs. Specifically, we established a 2-step methodology, under which we first calculate a factor to ensure budget neutrality for changes to the GAFs due to the update to the wage data, wage index reclassifications and redesignations, and application of the rural floor policy, consistent with our historical GAF budget neutrality factor methodology. In the second step, we calculate a factor to ensure budget neutrality for changes to the GAFs due to our policy to increase the wage index for hospitals with a wage index value below the 25th percentile wage index and our policy to place a 5-percent cap on any decrease in a hospital's wage index from the hospital's final wage index in the prior fiscal year. In this section of this Addendum, we refer to these two policies as the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases. We further note that in this section of this Addendum, for this final rule, we also refer to the permanent cap on wage index decreases beginning in FY 2023 as the 5-percent cap on wage index decreases policy.

The budget neutrality factors applied for changes to the GAFs due to the update to the wage data, wage index reclassifications and redesignations, and application of the rural floor policy are built permanently into the capital Federal rate; that is, they are applied cumulatively in determining the capital Federal rate. In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45552), we finalized our proposal to not permanently apply the budget neutrality factor for the lowest quartile hospital wage index adjustment and the 5 percent cap on wage index decreases such that they would not be applied cumulatively in determining the capital Federal rate. We believe this is more technically appropriate because the GAFs with the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases policies applied from the previous year are not used in the budget neutrality factor calculations for the current year. Accordingly, and consistent with this approach, prior to calculating the GAF budget neutrality factors for FY 2023, we removed from the capital Federal rate the budget neutrality factor applied in FY 2022 for the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases. Specifically, we divided the capital Federal rate by the FY 2022 budget neutrality factor of 0.9974 (86 FR 45552). We refer the reader to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45552) for additional discussion on our policy of removing the prior year budget neutrality factor for the lowest quartile hospital wage index adjustment and the 5 percent cap on wage index decreases from the capital Federal rate.

In light of the changes to the wage index and other wage index policies for FY 2023 discussed previously, which directly affect the GAF, we continue to compute a budget neutrality adjustment for changes in the GAFs in two steps. We discuss our 2-step calculation of the GAF budget neutrality factors for FY 2023 as follows.

To determine the GAF budget neutrality factors for FY 2023, we first compared estimated aggregate capital Federal rate payments based on the FY 2022 MS–DRG classifications and relative weights and the FY 2022 GAFs to estimated aggregate capital Federal rate payments based on the FY 2022 MS–DRG classifications and relative weights and the FY 2023 GAFs without incorporating the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases policy. To achieve budget neutrality for these changes in the GAFs, we calculated an incremental GAF budget neutrality adjustment factor of 1.0008 for FY 2023. Next, we compared estimated aggregate capital Federal rate payments based on the FY 2023 GAFs with and without the lowest quartile hospital wage index adjustment and the 5 percent cap on wage index decreases policy. For this calculation, estimated aggregate capital Federal rate payments were calculated using the FY 2023 MS–DRG classifications and relative weights (after application of the 10-percent cap discussed later in this section of the Addendum) and the FY 2023 GAFs (both with and without the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases policy). (We note, for this calculation the GAFs included the imputed floor, out-migration and Frontier state adjustments.) To achieve budget neutrality for the effects of the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases policy on the FY 2023 GAFs, we calculated an incremental GAF budget neutrality adjustment factor of 0.9972. As discussed earlier in this section of the Addendum, the budget neutrality factor for the lowest quartile hospital wage index adjustment factor and the 5-percent cap on

wage index decreases is not permanently built into the capital Federal rate. Consistent with this, we present the budget neutrality factor for the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases calculated under the second step of this 2-step methodology separately from the other budget neutrality factors in the discussion that follows, and this factor is not included in the calculation of the combined GAF/DRG adjustment factor described later in this section of the Addendum.

In section II.E.2. of the preamble to this final rule, we finalized our proposal to apply a permanent 10-percent cap on the reduction in a MS–DRG's relative weight in a given year. Consistent with our current methodology for adjusting the capital standard Federal rate to ensure that the effects of the annual DRG reclassification and the recalibration of DRG weights are budget neutral under § 412.308(c)(4)(ii), as we proposed, we are applying an additional budget neutrality factor to the capital standard Federal rate so that the 10-percent cap on decreases in an MS–DRG's relative weight is implemented in a budget neutral manner. Specifically, in light of this provision, as proposed, we are augmenting our historical methodology for computing the budget neutrality factor for the annual DRG reclassification and recalibration by computing a budget neutrality adjustment for the annual DRG reclassification and recalibration in two steps. We first calculate a budget neutrality factor to account for the annual DRG reclassification and recalibration prior to the application of the 10-percent cap on MS–DRG relative weight decreases. Then we calculate an additional budget neutrality factor to account for the application of the 10-percent cap on MS–DRG relative weight decreases.

To determine the DRG budget neutrality factors for FY 2023, we first compared estimated aggregate capital Federal rate payments based on the FY 2022 MS–DRG classifications and relative weights to estimated aggregate capital Federal rate payments based on the FY 2023 MS–DRG classifications and relative weights prior to the application of the 10-percent cap. For these calculations, estimated aggregate capital Federal rate payments were calculated using the FY 2023 GAFs without the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases. The incremental adjustment factor for DRG classifications and changes in relative weights prior to the application of the 10-percent cap is 1.0006. Next, we compared estimated aggregate capital Federal rate payments based on the FY 2023 MS–DRG classifications and relative weights prior to the application of the 10-percent cap to estimated aggregate capital Federal rate payments based on the FY 2023 MS–DRG classifications and relative weights after the application of the 10-percent cap. For these calculations, estimated aggregate capital Federal rate payments were also calculated using the FY 2023 GAFs without the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases. The incremental adjustment factor for the application of the 10-percent cap on relative weight decreases is 0.9998. Therefore, to achieve budget neutrality for the FY 2023 MS–DRG reclassification and recalibration (including the 10-percent cap), based on the calculations described previously, we are applying an incremental budget neutrality adjustment factor of 1.0004 (1.0006 × 0.9998) for FY 2023 to the capital Federal rate. We note that all the values are calculated with unrounded numbers.

The incremental adjustment factor for the FY 2023 MS–DRG reclassification and recalibration (1.0004) and for changes in the FY 2023 GAFs due to the update to the wage data, wage index reclassifications and redesignations, and application of the rural floor policy (1.0008) is 1.0012 (1.0004 × 1.0008). This incremental adjustment factor is built permanently into the capital Federal rates. To achieve budget neutrality for the effects of the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases policy on the FY 2023 GAFs, as described previously, we calculated a budget neutrality adjustment factor of 0.9972 for FY 2023. We refer to this budget neutrality factor for the remainder of this section as the lowest quartile/cap adjustment factor.

We applied the budget neutrality adjustment factors described previously to the capital Federal rate. This follows the requirement under § 412.308(c)(4)(ii) that estimated aggregate payments each year be no more or less than they would have been in the absence of the annual DRG reclassification and recalibration and changes in the GAFs.

The methodology used to determine the recalibration and geographic adjustment factor (GAF/DRG) budget neutrality adjustment is similar to the methodology used in establishing budget neutrality adjustments under the IPPS for operating costs. One difference is that, under the operating IPPS, the budget neutrality adjustments for the effect of updates to the wage data, wage index reclassifications and redesignations, and application of the rural floor policy are determined separately. Under the capital IPPS, there is a single budget neutrality adjustment factor for changes in the GAF that result from updates to the wage data, wage index reclassifications and redesignations, and application of the rural floor policy. In addition, there is no adjustment for the effects that geographic reclassification, the lowest quartile hospital wage index adjustment, or the 5-percent cap on wage index decreases policy described previously have on the other payment parameters, such as the payments for DSH or IME.

The incremental GAF/DRG adjustment factor of 1.0012 accounts for the MS–DRG reclassifications and recalibration (including application of the 10-percent cap on relative weight decreases) and for changes in the GAFs that result from updates to the wage data, the effects on the GAFs of FY 2023 geographic reclassification decisions made by the MGCRB compared to FY 2022 decisions, and the application of the rural floor policy. The lowest quartile/cap adjustment factor of 0.9972 accounts for changes in the GAFs that result from our policy to increase the wage index values for hospitals with a wage index value below the 25th percentile wage index and the 5-percent cap on wage index decreases policy. However, these factors do not account for changes in payments due to changes in the DSH and IME adjustment factors.

4. Capital Federal Rate for FY 2023

For FY 2022, we established a capital Federal rate of $472.59 (86 FR 45553, as corrected in 86 FR 58026). We are establishing an update of 2.5 percent in determining the FY 2023 capital Federal rate for all hospitals. As a result of this update and the budget neutrality factors discussed earlier, we are establishing a national capital Federal rate of $483.76 for FY 2023. The national capital Federal rate for FY 2023 was calculated as follows:

- The FY 2023 update factor is 1.025; that is, the update is 2.5 percent.
- The FY 2023 GAF/DRG budget neutrality adjustment factor that is applied to the capital Federal rate for changes in the MS–DRG classifications and relative weights (including application of the 10-percent cap on relative weight decreases) and changes in the GAFs that result from updates to the wage data, wage index reclassifications and redesignations, and application of the rural floor policy is 1.0012.
- The FY 2023 lowest quartile/cap budget neutrality adjustment factor that is applied to the capital Federal rate for changes in the GAFs that result from our policy to increase the wage index values for hospitals with a wage index value below the 25th percentile wage index and the 5-percent cap on wage index decreases policy is 0.9972.
- The FY 2023 outlier adjustment factor is 0.9448.

We are providing the following chart that shows how each of the factors and adjustments for FY 2023 affects the computation of the FY 2023 national capital Federal rate in comparison to the FY 2022 national capital Federal rate. The FY 2023 update factor has the effect of increasing the capital Federal rate by 2.5 percent compared to the FY 2022 capital Federal rate. The GAF/DRG budget neutrality adjustment factor has the effect of increasing the capital Federal rate by 0.12 percent. The FY 2023 lowest quartile/cap budget neutrality adjustment factor has the effect of decreasing the capital Federal rate by 0.02 percent compared to the FY 2022 capital Federal rate. The FY 2023 outlier adjustment factor has the effect of decreasing the capital Federal rate by 0.24 percent compared to the FY 2022 capital Federal rate. The combined effect of all the changes will increase the national capital Federal rate by approximately 2.36 percent, compared to the FY 2022 national capital Federal rate.

COMPARISON OF FACTORS AND ADJUSTMENTS: FY 2022 CAPITAL FEDERAL RATE AND THE FY 2023 CAPITAL FEDERAL RATE

	FY 2022	FY 2023	Change	Percent Change
Update Factor[1]	1.0080	1.0250	1.0250	2.50
GAF/DRG Adjustment Factor[1]	1.0004	1.0012	1.0012	0.12
Quartile/Cap Adjustment Factor[2]	0.9974	0.9972	0.9998	-0.02
Outlier Adjustment Factor[3]	0.9471	0.9448	0.9976	-0.24
Capital Federal Rate	$472.59	$483.76	1.0236	2.36[4]

[1] The update factor and the GAF/DRG budget neutrality adjustment factors are built permanently into the capital Federal rate. Thus, for example, the incremental change from FY 2022 to FY 2023 resulting from the application of the 1.0012 GAF/DRG budget neutrality adjustment factor for FY 2023 is a net change of 0.0012 (or 0.12 percent).

[2] The lowest quartile/cap budget neutrality adjustment factor is not built permanently into the capital Federal rate; that is, the factor is not applied cumulatively in determining the capital Federal rate. Thus, for example, the net change resulting from the application of the FY 2023 lowest quartile/cap budget neutrality adjustment factor is 0.9972/0.9974 or 0.9998 (or -0.02 percent).

[3] The outlier reduction factor is not built permanently into the capital Federal rate; that is, the factor is not applied cumulatively in determining the capital Federal rate. Thus, for example, the net change resulting from the application of the FY 2023 outlier adjustment factor is 0.9448/0.9471 or 0.9976 (or -0.24 percent).

[4] Percent change may not sum due to rounding.

B. Calculation of the Inpatient Capital-Related Prospective Payments for FY 2023

For purposes of calculating payments for each discharge during FY 2023, the capital Federal rate is adjusted as follows: (Standard Federal Rate) × (DRG weight) × (GAF) × (COLA for hospitals located in Alaska and Hawaii) × (1 + DSH Adjustment Factor + IME Adjustment Factor, if applicable). The result is the adjusted capital Federal rate.

Hospitals also may receive outlier payments for those cases that qualify under the threshold established for each fiscal year. Section 412.312(c) provides for a shared threshold to identify outlier cases for both inpatient operating and inpatient capital-related payments. The outlier threshold for FY 2023 is in section II.A. of this Addendum. For FY 2023, a case will qualify as a cost outlier if the cost for the case is greater than the prospective payment rates for the MS–DRG plus IME and DSH payments (including the empirically justified Medicare DSH payment and the estimated uncompensated care payment), any add-on payments for new technology, and, as we finalized beginning in FY 2023, the estimated supplemental payment for eligible IHS/Tribal hospitals and Puerto Rico hospitals (as discussed in section IV.E. of the preamble of this final rule), plus the fixed-loss amount of $38,859.

Currently, as provided under § 412.304(c)(2), we pay a new hospital 85 percent of its reasonable costs during the first 2 years of operation, unless it elects to receive payment based on 100 percent of the capital Federal rate. Effective with the third year of operation, we pay the hospital based on 100 percent of the capital Federal rate (that is, the same methodology used to pay all other hospitals subject to the capital PPS).

C. Capital Input Price Index

1. Background

Like the operating input price index, the capital input price index (CIPI) is a fixed-weight price index that measures the price changes associated with capital costs during a given year. The CIPI differs from the operating input price index in one important aspect—the CIPI reflects the vintage nature of capital, which is the acquisition and use of capital over time. Capital expenses in any given year are determined by the stock of capital in that year (that is, capital that remains on hand from all current and prior capital acquisitions). An index measuring capital price changes needs to reflect this vintage nature of capital. Therefore, the CIPI was developed to capture the vintage nature of capital by using a weighted-average of past capital purchase prices up to and including the current year.

We periodically update the base year for the operating and capital input price indexes to reflect the changing composition of inputs for operating and capital expenses. For this final rule, we are using the IPPS operating and capital market baskets that reflect a 2018 base year. For a complete discussion of this rebasing, we refer readers to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45194 through 45213).

2. Forecast of the CIPI for FY 2023

Based on IHS Global Inc.'s second quarter 2022 forecast, for this final rule, we are forecasting the 2018-based CIPI to increase 2.5 percent in FY 2023. This reflects a projected 2.9 percent increase in vintage-weighted depreciation prices (building and fixed equipment, and movable equipment), and a projected 6.7 percent increase in other capital expense prices in FY 2023, partially offset by a projected 1.7 percent decline in vintage-weighted interest expense prices in FY 2023. The weighted average of these three factors produces the forecasted 2.5 percent increase for the 2018-based CIPI in FY 2023. As proposed, we are using the more recent data available for this final rule to determine the FY 2023 increase in the 2018-based CIPI for this final rule.

IV. Changes to Payment Rates for Excluded Hospitals: Rate-of-Increase Percentages for FY 2023

Payments for services furnished in children's hospitals, 11 cancer hospitals, and hospitals located outside the 50 States, the District of Columbia and Puerto Rico (that is, short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa) that are excluded from the IPPS are made on the basis of reasonable costs based on the hospital's own historical cost experience, subject to a rate-of-increase ceiling. A per discharge limit (the target amount, as defined in § 413.40(a) of the regulations) is set for each hospital, based on the hospital's own cost experience in its base year, and updated annually by a rate-of-increase percentage specified in § 413.40(c)(3). In addition, as specified in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38536), effective for cost reporting periods beginning during FY 2018, the annual update to the target amount for extended neoplastic disease care hospitals (hospitals described in § 412.22(i) of the regulations) also is the rate-of-increase percentage specified in § 413.40(c)(3). (We note that, in accordance with § 403.752(a), religious nonmedical health care institutions (RNHCIs) are also subject to the rate-of-increase limits established under § 413.40 of the regulations.)

In the FY 2023 IPPS/LTCH PPS proposed rule, based on IGI's 2021 fourth quarter forecast, we estimated the 2018-based IPPS operating market basket update for FY 2023 to be 3.1 percent (that is, the estimate of the market basket rate-of-increase). However, we proposed that if more recent data subsequently became available (for example, a more recent estimate of the market basket update), we would use such data, if appropriate, to calculate the IPPS operating market basket update for FY 2023. More recent data did subsequently become available. Thus, for this FY 2023 IPPS/LTCH PPS final rule, based on IGI's second quarter 2022 forecast, the FY 2023 rate-of-increase percentage that will be applied to the FY 2022 target amounts in order to calculate the FY 2023 target amounts for children's hospitals, the 11 cancer hospitals, RNCHIs, short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa, and extended neoplastic disease care hospitals is 4.1 percent, in accordance with the applicable regulations at 42 CFR 413.40.

IRFs and rehabilitation distinct part units, IPFs and psychiatric units, and LTCHs are

excluded from the IPPS and paid under their respective PPSs. The IRF PPS, the IPF PPS, and the LTCH PPS are updated annually. We refer readers to section VIII. of the preamble and section V. of the Addendum of this final rule for the changes to the Federal payment rates for LTCHs under the LTCH PPS for FY 2023. The annual updates for the IRF PPS and the IPF PPS are issued by the agency in separate **Federal Register** documents.

We received no comments on this proposal and therefore are finalizing this provision without modification.

V. Changes to the Payment Rates for the LTCH PPS for FY 2023

A. LTCH PPS Standard Federal Payment Rate for FY 2023

1. Overview

In section VIII. of the preamble of this final rule, we discuss our annual updates to the payment rates, factors, and specific policies under the LTCH PPS for FY 2023.

Under § 412.523(c)(3) of the regulations, for FY 2012 and subsequent years, we updated the standard Federal payment rate by the most recent estimate of the LTCH PPS market basket at that time, including additional statutory adjustments required by sections 1886(m)(3) (citing sections 1886(b)(3)(B)(xi)(II) and 1886(m)(4) of the Act as set forth in the regulations at § 412.523(c)(3)(viii) through (xvii)). (For a summary of the payment rate development prior to FY 2012, we refer readers to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38310 through 38312) and references therein.)

Section 1886(m)(3)(A) of the Act specifies that, for rate year 2012 and each subsequent rate year, any annual update to the standard Federal payment rate shall be reduced by the productivity adjustment described in section 1886(b)(3)(B)(xi)(II) of the Act as discussed in section VIII.C.2. of the preamble of this final rule. This section of the Act further provides that the application of section 1886(m)(3)(B) of the Act may result in the annual update being less than zero for a rate year, and may result in payment rates for a rate year being less than such payment rates for the preceding rate year. (As noted in section VIII.C.2. of the preamble of this final rule, the annual update to the LTCH PPS occurs on October 1 and we have adopted the term ''fiscal year'' (FY) rather than ''rate year'' (RY) under the LTCH PPS beginning October 1, 2010. Therefore, for purposes of clarity, when discussing the annual update for the LTCH PPS, including the provisions of the Affordable Care Act, we use the term ''fiscal year'' rather than ''rate year'' for 2011 and subsequent years.)

For LTCHs that fail to submit the required quality reporting data in accordance with the LTCH QRP, the annual update is reduced by 2.0 percentage points as required by section 1886(m)(5) of the Act.

2. Development of the FY 2023 LTCH PPS Standard Federal Payment Rate

Consistent with our historical practice and § 412.523(c)(3)(xvii), for FY 2023, as we proposed, we are applying the annual update to the LTCH PPS standard Federal payment rate from the previous year. Furthermore, in determining the LTCH PPS standard Federal payment rate for FY 2023, we are also making certain regulatory adjustments, consistent with past practices. Specifically, in determining the FY 2023 LTCH PPS standard Federal payment rate, as we proposed, we are applying a budget neutrality adjustment factor for the changes related to the area wage level adjustment (that is, changes to the wage data and labor-related share) as discussed in section V.B.5. of this Addendum to this final rule.

In this final rule, we are establishing an annual update to the LTCH PPS standard Federal payment rate of 3.8 percent (that is, the most recent estimate of the LTCH PPS market basket increase of 4.1 percent less the productivity adjustment of 0.3 percentage point). Therefore, in accordance with § 412.523(c)(3)(xvii), we are applying an update factor of 1.038 to the FY 2022 LTCH PPS standard Federal payment rate of $44,713.67 to determine the FY 2023 LTCH PPS standard Federal payment rate. Also, in accordance with § 412.523(c)(3)(xvii) and (c)(4), we are required to reduce the annual update to the LTCH PPS standard Federal payment rate by 2.0 percentage points for LTCHs that fail to submit the required quality reporting data for FY 2023 as required under the LTCH QRP. Therefore, we are establishing an annual update to the LTCH PPS standard Federal payment rate of 1.8 percent (that is, an update factor of 1.018) for FY 2023 for LTCHs that fail to submit the required quality reporting data for FY 2023 as required under the LTCH QRP. Consistent with § 412.523(d)(4), we are applying an area wage level budget neutrality factor to the FY 2023 LTCH PPS standard Federal payment rate of 1.0004304, based on the best available data at this time, to ensure that any changes to the area wage level adjustment (that is, the annual update of the wage index (including application of the 5-percent cap on wage index decreases, discussed later in this section of this final rule), and labor-related share) will not result in any change (increase or decrease) in estimated aggregate LTCH PPS standard Federal payment rate payments. Accordingly, we are establishing an LTCH PPS standard Federal payment rate of $46,432.77 (calculated as $44,713.67 × 1.038 × 1.0004304) for FY 2023. For LTCHs that fail to submit quality reporting data for FY 2023, in accordance with the requirements of the LTCH QRP under section 1866(m)(5) of the Act, we are establishing an LTCH PPS standard Federal payment rate of $45,538.11 (calculated as $44,713.67 × 1.018 × 1.0004304) for FY 2023.

B. Adjustment for Area Wage Levels Under the LTCH PPS for FY 2023

1. Background

Under the authority of section 123 of the BBRA, as amended by section 307(b) of the BIPA, we established an adjustment to the LTCH PPS standard Federal payment rate to account for differences in LTCH area wage levels under § 412.525(c). The labor-related share of the LTCH PPS standard Federal payment rate is adjusted to account for geographic differences in area wage levels by applying the applicable LTCH PPS wage index. The applicable LTCH PPS wage index is computed using wage data from inpatient acute care hospitals without regard to reclassification under section 1886(d)(8) or section 1886(d)(10) of the Act.

The FY 2023 LTCH PPS standard Federal payment rate wage index values that will be applicable for LTCH PPS standard Federal payment rate discharges occurring on or after October 1, 2022, through September 30, 2023, are presented in Table 12A (for urban areas) and Table 12B (for rural areas), which are listed in section VI. of the Addendum to this final rule and available via the internet on the CMS website.

2. Geographic Classifications (Labor Market Areas) for the LTCH PPS Standard Federal Payment Rate

In adjusting for the differences in area wage levels under the LTCH PPS, the labor-related portion of an LTCH's Federal prospective payment is adjusted by using an appropriate area wage index based on the geographic classification (labor market area) in which the LTCH is located. Specifically, the application of the LTCH PPS area wage level adjustment under existing § 412.525(c) is made based on the location of the LTCH—either in an ''urban area,'' or a ''rural area,'' as defined in § 412.503. Under § 412.503, an ''urban area'' is defined as a Metropolitan Statistical Area (MSA) (which includes a Metropolitan division, where applicable), as defined by the Executive OMB, and a ''rural area'' is defined as any area outside of an urban area (75 FR 37246).

The geographic classifications (labor market area definitions) currently used under the LTCH PPS, effective for discharges occurring on or after October 1, 2014, are based on the Core Based Statistical Areas (CBSAs) established by OMB, which are based on the 2010 decennial census data. In general, the current statistical areas (which were implemented beginning with FY 2015) are based on revised OMB delineations issued on February 28, 2013, in OMB Bulletin No. 13–01. (We note we have adopted minor revisions and updates in the years between the decennial censuses.) We adopted these labor market area delineations because they were at that time based on the best available data that reflect the local economies and area wage levels of the hospitals that are currently located in these geographic areas. We also believed that these OMB delineations would ensure that the LTCH PPS area wage level adjustment most appropriately accounted for and reflected the relative hospital wage levels in the geographic area of the hospital as compared to the national average hospital wage level. We noted that this policy was consistent with the IPPS policy adopted in FY 2015 under § 412.64(b)(1)(ii)(D) (79 FR 49951 through 49963). (For additional information on the CBSA-based labor market area (geographic classification) delineations currently used under the LTCH PPS and the history of the labor market area definitions used under the LTCH PPS, we refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50180 through 50185).)

In general, it is our historical practice to update the CBSA-based labor market area delineations annually based on the most recent updates issued by OMB. Generally, OMB issues major revisions to statistical

areas every 10 years, based on the results of the decennial census. However, OMB occasionally issues minor updates and revisions to statistical areas in the years between the decennial censuses. OMB Bulletin No. 17–01, issued August 15, 2017, established the delineations for the Nation's statistical areas, and the corresponding changes to the CBSA-based labor market areas were adopted in the FY 2019 IPPS/LTCH PPS final rule (83 FR 41731). A copy of this bulletin may be obtained on the website at *https://www.whitehouse.gov/wp-content/uploads/legacy_drupal_files/omb/bulletins/2017/b-17-01.pdf*.

On April 10, 2018, OMB issued OMB Bulletin No. 18–03, which superseded the August 15, 2017 OMB Bulletin No. 17–01. On September 14, 2018, OMB issued OMB Bulletin No. 18–04, which superseded the April 10, 2018 OMB Bulletin No. 18–03. Historically OMB bulletins issued between decennial censuses have only contained minor modifications to CBSA delineations based on changes in population counts. However, OMB's 2010 Standards for Delineating Metropolitan and Micropolitan Standards created a larger mid-decade redelineation that takes into account commuting data from the American Commuting Survey. As a result, the September 14, 2018 OMB Bulletin No. 18–04 included more modifications to the CBSAs than are typical for OMB bulletins issued between decennial censuses. We adopted the updates set forth in OMB Bulletin No. 18–04 in the FY 2021 IPPS/LTCH PPS final rule (85 FR 59050 through 59051). A copy of the September 14, 2018 OMB Bulletin No. 18–04, may be obtained at *https://www.whitehouse.gov/wp-content/uploads/2018/09/Bulletin-18-04.pdf*.

On March 6, 2020, OMB issued Bulletin No. 20–01, which provided updates to and superseded OMB Bulletin No. 18–04, which was issued on September 14, 2018. The attachments to OMB Bulletin No. 20–01 provided detailed information on the update to statistical areas since September 14, 2018. (For a copy of this bulletin, we refer readers to the following website: *https://www.whitehouse.gov/wp-content/uploads/2020/03/Bulletin-20-01.pdf*.) In OMB Bulletin No. 20–01, OMB announced one new Micropolitan Statistical Area and one new component of an existing Combined Statistical Area. After reviewing OMB Bulletin No. 20–01, we determined that the changes in Bulletin 20–01 encompassed delineation changes that would not affect the CBSA-based labor market area delineations used under the LTCH PPS. Therefore, we adopted the updates set forth in OMB Bulletin No. 20–01 in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45556 through 45557) consistent with our general policy of adopting OMB delineation updates; however, the LTCH PPS area wage level adjustment was not altered as a result of adopting the updates because the CBSA-based labor market area delineations were the same as the CBSA-based labor market area delineations adopted in the FY 2021 IPPS/LTCH PPS final rule based on OMB Bulletin No. 18–04 (85 FR 59050 through 59051).

We believe the CBSA-based labor market area delineations, as established in OMB Bulletin 20–01, ensure that the LTCH PPS area wage level adjustment most appropriately accounts for and reflects the relative hospital wage levels in the geographic area of the hospital as compared to the national average hospital wage level based on the best available data that reflect the local economies and area wage levels of the hospitals that are currently located in these geographic areas (81 FR 57298). Therefore, for FY 2023, we did not propose any changes to the CBSA-based labor market area delineations as established in OMB Bulletin 20–01 and adopted in the FY 2022 IPPS/LTCH final rule.

CBSAs are made up of one or more constituent counties. Each CBSA and constituent county has its own unique identifying codes. The Census Bureau maintains a complete list of changes to counties or county equivalent entities on their website at *https://www.census.gov/programs-surveys/geography/technical-documentation/county-changes.html*. We believe that it is important to use the latest counties or county equivalent entities to properly crosswalk LTCHs from a county to a CBSA for purposes of the wage indexes used under the LTCH PPS. Based on the latest information included in the Census Bureau's website at *https://www.census.gov/programs-surveys/geography/technical-documentation/county-changes.2010.html*, the Census Bureau has made the following updates to the Federal Information Processing Series (FIPS) codes for counties or county equivalent entities:

- Chugach Census Area, AK (FIPS State County Code 02–063) and Copper River Census Area, AK (FIPS State County Code 02–066) were created from former Valdez-Cordova Census Area (02–261) which was located in CBSA 02. The CBSA code for these two new county equivalents remains 02.

We believe using the latest FIPS codes allows us to maintain a more accurate and up-to-date payment system that reflects population shifts and labor market conditions. Therefore, we are adopting these FIPS code updates listed previously, effective October 1, 2022. We note that while the county update changes listed previously changed the county names, the CBSAs to which these counties map did not change from the prior counties. We also note that there are currently no LTCHs located in these counties. However, if an LTCH were to open in one of these counties, there would be no impact or change to the LTCH for purposes of the LTCH PPS wage indexes as a result of our implementation of these FIPS code updates. We are publishing, as a supplemental file to this final rule, an updated county-to-CBSA crosswalk that reflects this provision.

3. Labor-Related Share for the LTCH PPS Standard Federal Payment Rate

Under the payment adjustment for the differences in area wage levels under § 412.525(c), the labor-related share of an LTCH's standard Federal payment rate is adjusted by the applicable wage index for the labor market area in which the LTCH is located. The LTCH PPS labor-related share currently represents the sum of the labor-related portion of operating costs and a labor-related portion of capital costs using the applicable LTCH market basket. Additional background information on the historical development of the labor-related share under the LTCH PPS can be found in the RY 2007 LTCH PPS final rule (71 FR 27810 through 27817 and 27829 through 27830) and the FY 2012 IPPS/LTCH PPS final rule (76 FR 51766 through 51769 and 51808).

For FY 2013, we rebased and revised the market basket used under the LTCH PPS by adopting a 2009-based LTCH market basket. In addition, for FY 2013 through FY 2016, we determined the labor-related share annually as the sum of the relative importance of each labor-related cost category of the 2009-based LTCH market basket for the respective fiscal year based on the best available data. (For more details, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53477 through 53479).) For FY 2017, we rebased and revised the 2009-based LTCH market basket to reflect a 2013 base year. In addition, for FY 2017 through FY 2020, we determined the labor-related share annually as the sum of the relative importance of each labor-related cost category of the 2013-based LTCH market basket for the respective fiscal year based on the best available data. (For more details, we refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 57085 through 57096).) Then, effective for FY 2021, we rebased and revised the 2013-based LTCH market basket to reflect a 2017 base year and determined the labor-related share annually as the sum of the relative importance of each labor-related cost category in the 2017-based LTCH market basket using the most recent available data. (For more details, we refer readers to the FY 2021 IPPS/LTCH PPS final rule (85 FR 58909 through 58926).)

In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28683 through 26864), consistent with our historical practice, we proposed that the LTCH PPS labor-related share for FY 2023 is the sum of the FY 2023 relative importance of each labor-related cost category in the LTCH market basket using the most recent available data. Specifically, we proposed that the labor-related share for FY 2023 would continue to include the sum of the labor-related portion of operating costs from the 2017-based LTCH market basket (that is, the sum of the FY 2023 relative importance shares of Wages and Salaries; Employee Benefits; Professional Fees: Labor-Related; Administrative and Facilities Support Services; Installation, Maintenance, and Repair Services; All Other: Labor-related Services) and a portion of the relative importance of Capital-Related cost weight from the 2017-based LTCH market basket. The relative importance reflects the different rates of price change for these cost categories between the base year (2017) and FY 2023. Based on IHS Global Inc.'s fourth quarter 2021 forecast of the 2017-based LTCH market basket, the sum of the FY 2023 relative importance for Wages and Salaries; Employee Benefits; Professional Fees: Labor-Related; Administrative and Facilities Support Services; Installation, Maintenance, & Repair Services; and All Other: Labor-Related Services was 64.0 percent. The portion of capital-related costs that is influenced by the local labor market is estimated to be 46

percent (that is, the same percentage applied to the 2009-based and 2013-based LTCH market baskets). Since the FY 2023 relative importance for capital-related costs was 9.2 percent based on IHS Global Inc.'s fourth quarter 2021 forecast of the 2017-based LTCH market basket, we took 46 percent of 9.2 percent to determine the labor-related share of capital-related costs for FY 2023 of 4.2 percent. Therefore, in the IPPS/LTCH PPS proposed rule (87 FR 28684), we proposed a total labor-related share for FY 2023 of 68.2 percent (the sum of 64.0 percent for the operating costs and 4.2 percent for the labor-related share of capital-related costs). We also proposed that if more recent data became available after the publication of the proposed rule and before the publication of the final rule (for example, a more recent estimate of the relative importance of each labor-related cost category of the 2017-based LTCH market basket), we would use such data, if appropriate, to determine the FY 2023 LTCH PPS labor-related share.

Comment: A commenter opposed the increase in labor-related share for LTCHs for FY 2023. The commenter noted that the increase in labor-related share adversely impacts any LTCH with a wage index of less than 1.0. According to the commenter, limiting the increase would help mitigate the growing disparity between high-wage and low-wage states.

Response: We thank the commenter for the feedback. As noted previously, effective for FY 2021, we rebased and revised the 2013-based LTCH market basket to reflect a 2017 base year and determined the labor-related share annually as the sum of the relative importance of each labor-related cost category in the 2017-based LTCH market basket using the most recent available data (85 FR 58909 through 58926). We continue to believe that this approach is the most appropriate methodology for determining the labor-related portion of the LTCH PPS standard Federal payment rate. We note that the proposed labor related share of 68.2 percent, which was based on IHS Global Inc's fourth quarter 2021 forecast of the 2017-based LTCH market basket, has been updated to reflect IHS Global Inc's second quarter 2022 forecast, and that this update, resulting in a labor related share of 68.0 percent, is a slightly smaller increase over the labor share from FY 2022, which was 67.9 percent.

After consideration of public comments, we are finalizing the FY 2023 labor-related share using the most recently available data. Based on IHS Global Inc.'s second quarter 2022 forecast of the 2017-based LTCH market basket, the sum of the FY 2023 relative importance for Wages and Salaries; Employee Benefits; Professional Fees: Labor-Related; Administrative and Facilities Support Services; Installation, Maintenance, & Repair Services; and All Other: Labor-Related Services is 63.8 percent. The portion of capital-related costs that is influenced by the local labor market is estimated to be 46 percent (that is, the same percentage applied to the 2009-based and 2013-based LTCH market baskets). Since the FY 2023 relative importance for capital-related costs is 9.1 percent based on IHS Global Inc.'s second quarter 2022 forecast of the 2017-based LTCH market basket, we took 46 percent of 9.1 percent to determine the labor-related share of capital-related costs for FY 2023 of 4.2 percent. Therefore, we are finalizing a total labor-related share for FY 2023 of 68.0 percent (the sum of 63.8 percent for the operating costs and 4.2 percent for the labor-related share of capital-related costs).

4. Wage Index for FY 2023 for the LTCH PPS Standard Federal Payment Rate

Historically, we have established LTCH PPS area wage index values calculated from acute care IPPS hospital wage data without taking into account geographic reclassification under sections 1886(d)(8) and 1886(d)(10) of the Act (67 FR 56019). The area wage level adjustment established under the LTCH PPS is based on an LTCH's actual location without regard to the ''urban'' or ''rural'' designation of any related or affiliated provider. As with the IPPS wage index, wage data for multicampus hospitals with campuses located in different labor market areas (CBSAs) are apportioned to each CBSA where the campus (or campuses) are located. We also employ a policy for determining area wage index values for areas where there are no IPPS wage data.

Consistent with our historical methodology, to determine the applicable area wage index values for the FY 2023 LTCH PPS standard Federal payment rate, under the broad authority of section 123 of the BBRA, as amended by section 307(b) of the BIPA, as we proposed, we are continuing to employ our historical practice of using the same data we used to compute the FY 2023 acute care hospital inpatient wage index, as discussed in section III. of the preamble of this final rule (that is, wage data collected from cost reports submitted by IPPS hospitals for cost reporting periods beginning during FY 2019) because these data are the most recent complete data available.

In addition, as we proposed, we computed the FY 2023 LTCH PPS standard Federal payment rate area wage index values consistent with the ''urban'' and ''rural'' geographic classifications (that is, the proposed labor market area delineations as previously discussed in section V.B. of this Addendum) and our historical policy of not taking into account IPPS geographic reclassifications under sections 1886(d)(8) and 1886(d)(10) of the Act in determining payments under the LTCH PPS. As we proposed, we also continued to apportion the wage data for multicampus hospitals with campuses located in different labor market areas to each CBSA where the campus or campuses are located, consistent with the IPPS policy. Lastly, consistent with our existing methodology for determining the LTCH PPS wage index values, for FY 2023 as we proposed, we continued to use our existing policy for determining area wage index values for areas where there are no IPPS wage data. Under our existing methodology, the LTCH PPS wage index value for urban CBSAs with no IPPS wage data is determined by using an average of all of the urban areas within the State, and the LTCH PPS wage index value for rural areas with no IPPS wage data is determined by using the unweighted average of the wage indices from all of the CBSAs that are contiguous to the rural counties of the State.

Based on the FY 2019 IPPS wage data that we used to determine the FY 2023 LTCH PPS area wage index values in this final rule, there are no IPPS wage data for the urban area of Hinesville, GA (CBSA 25980). Consistent with our existing methodology, we calculated the FY 2023 wage index value for CBSA 25980 as the average of the wage index values for all of the other urban areas within the State of Georgia (that is, CBSAs 10500, 12020, 12060, 12260, 15260, 16860, 17980, 19140, 23580, 31420, 40660, 42340, 46660 and 47580), as shown in Table 12A, which is listed in section VI. of the Addendum to this final rule.

Based on the FY 2019 IPPS wage data that we used to determine the FY 2023 LTCH PPS standard Federal payment rate area wage index values in this final rule, there are no rural areas without IPPS hospital wage data. Therefore, it is not necessary to use our established methodology to calculate a LTCH PPS wage index value for rural areas with no IPPS wage data for FY 2023. We note that, as IPPS wage data are dynamic, it is possible that the number of rural areas without IPPS wage data will vary in the future.

5. Permanent Cap on Wage Index Decreases

a. Permanent Cap on LTCH PPS Wage Index Decreases

In the past, we have proposed and finalized temporary transition policies to mitigate significant changes to payments due to changes to the LTCH PPS wage index, particularly when adopting changes that have large negative impacts on an LTCH's payments. In the FY 2021 IPPS/LTCH final rule (85 FR 59052), we implemented a 5-percent cap on any decrease in an LTCH's wage index from the LTCH's final wage index in FY 2020, so that the hospital's final wage index for FY 2021 would not be less than 95 percent of its final wage index for FY 2020. We implemented this policy to mitigate potential negative consequences of finalizing the adoption of revised CBSA delineations announced in OMB Bulletin 18–04 for FY 2021. In particular, we acknowledged that a significant portion of Medicare LTCH PPS payments are adjusted by the wage index and that some changes in OMB delineations destabilized payments to LTCHs. We stated our belief that applying the 5-percent cap to all wage index decreases for FY 2021 provided an adequate safeguard against significant payment reductions related to the adoption of the revised CBSAs and that it would improve stability and predictability in payment levels to LTCHs. We applied a budget neutrality adjustment to the FY 2021 standard Federal payment rate to achieve budget neutrality for this policy (85 FR 59053).

Although we did not propose or implement a cap on wage index decreases for LTCH's in FY 2022, we acknowledged that some commenters requested that we extend the FY 2021 transition policy, citing the continuing impact of changes related to the OMB updates and the unprecedented nature of the ongoing COVID–19 PHE. In response to those comments, we reiterated that our policy principles with regard to the wage index include generally using the most current data and information available and providing that

data and information, as well as addressing significant year-over-year variations in Medicare payments in notice and comment rulemaking.

For FY 2023, we further considered comments received during the FY 2022 rulemaking, including requests for a broader, permanent wage index policy to mitigate unpredictable changes in payments to LTCHs resulting from large wage index decreases. We recognize that changes to the wage index have the potential to create instability and significant negative impacts on certain providers even when we have not adopted specific changes to wage index policy. That is, year to year fluctuations in an area's wage index can occur due to external factors that can be difficult for an LTCH to predict and are often outside an LTCH's ability to directly control, such as the COVID–19 PHE. We recognize that predictability in Medicare payments is important to enable hospitals to budget and plan their operations. For LTCHs, in particular, we further recognize that a significant portion of Medicare LTCH PPS payments are adjusted by the wage index and that a large decrease from one year to the next can have significant implications for LTCH payments.

For these reasons, under the broad authority of section 123 of the BBRA, as amended by section 307(b) of the BIPA, in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28684 through 28685), we proposed, beginning with FY 2023, to apply a permanent 5-percent cap on any decrease to an LTCH's wage index from its wage index in the prior year. In the proposed rule, we stated our belief that a 5-percent reduction is an appropriate threshold to mitigate large negative financial impacts on hospitals and limit the magnitude of the associated proposed budget neutrality adjustment (discussed later in section V.A.5. of the Addendum). Typical year-to-year variations in the LTCH wage index have historically been within 5 percent, and we expect this will continue to be the case in future years. Because providers typically experience some level of wage index fluctuation, we stated our belief that applying a 5-percent cap on all wage index decreases each year, regardless of the reason for the decrease, would effectively mitigate instability and increase predictability in LTCH PPS payments due to any significant wage index decreases.

In the proposed rule, we stated our belief that this proposed policy of applying a permanent cap to wage index decreases would provide greater predictability to LTCHs. That is, the policy would smooth year-to-year changes in LTCHs' wage indexes and provide for increased predictability in their wage index and thus their LTCH PPS payments. We also stated our belief that our proposed permanent policy would mitigate significant payment reductions due to changes in wage index policy, such as the adoption of the revised CBSAs in FY 2021, thereby eliminating the need for one-off temporary transition adjustments to wage index levels in the future. Because applying a 5-percent cap on all wage index decreases would generally represent a small overall impact on the adjustment for area wage levels, we stated our belief that the 5-percent cap would not distort the integrity of the wage index as a relative measure of the value of labor in a labor market area.

Furthermore, consistent with the requirement at § 412.525(c)(2), that changes to area wage level adjustments are made in a budget neutral manner, we proposed that the 5-percent cap on the decrease on an LTCH's wage index would not result in any change in estimated aggregate LTCH PPS payments by including the application of this policy in the determination of the area wage level budget neutrality factor that is applied to the standard Federal payment rate, as is discussed later in section V.B.6. of the Addendum to the final rule.

We proposed that an LTCH's wage index cap adjustment would be determined based on the wage index value applicable to the LTCH on the last day of the prior Federal fiscal year. We proposed that new LTCHs that became operational during the prior Federal fiscal year would be subject to the LTCH PPS wage index cap. For example, if an LTCH begins operations on July 1, 2022 and is paid its area wage index of 0.9000 for the remainder of FY 2022, its FY 2023 wage index would be capped at 95 percent of that value and could not be lower than 0.8550 (0.95×0.9000). However, for newly opened LTCHs that become operational on or after the first day of the fiscal year to which this final rule would apply, we proposed that these LTCHs would not be subject to the LTCH PPS wage index cap since they were not paid under the LTCH PPS in the prior year. These LTCHs would receive the calculated wage index for the area in which they are geographically located, even if other LTCHs in the same geographic area are receiving a wage cap. For example, a hospital that opens on December 1, 2022 would not be eligible for a capped wage index in FY 2023, as it was not paid a wage index during FY 2022.

Comment: We received several comments expressing support for our proposed permanent 5-percent cap on any decrease to an LTCH's wage index from its wage index in the prior year beginning with FY 2023. Commenters generally agreed that the cap would help mitigate significant payment decreases and provide stability and predictability to LTCH payments. Some commenters encouraged CMS to apply this general principle of increasing stability to other aspects of LTCH payment policies.

Response: We appreciate the support for our proposal. We agree with commenters about the importance of stability and predictability in LTCH PPS payments. We will continue to consider additional policy options to achieve this objective in future rulemaking.

Comment: MedPAC supported our proposal to cap LTCH's wage index decreases at 5 percent, but suggested also applying a cap to increases of more than 5 percent.

Response: We appreciate MedPAC's suggestion that CMS should apply a cap on wage index increases greater than 5 percent. However, as we discussed in the proposed rule, the purpose of the proposed policy is to help mitigate the significant negative impacts of certain wage index changes. We believe applying a 5-percent cap on all wage index decreases would support increased predictability about LTCH PPS payments for providers, enabling them to more effectively budget and plan their operations. That is, we believe that a provider would be able to more effectively budget and plan when there is predictability about its expected minimum level of LTCH PPS payments in the upcoming fiscal year. We did not propose to limit wage index increases because we do not believe such a policy is needed to enable LTCHs to more effectively budget and plan their operations. So, we believe it is appropriate for providers that would experience an increase in their wage index value to receive the wage index value that most accurately reflects the labor costs in that area.

Comment: A number of commenters disagreed with our proposal to implement the proposed 5-percent cap on wage index decreases in a budget neutral manner and maintained that CMS has the statutory authority to implement the proposed policy in a non-budget neutral manner. Some of these commenters indicated that their support of the cap was conditional on CMS not implementing the cap in a budget neutral manner.

Response: While CMS's statutory authority is broad, we continue to believe it is appropriate to implement this policy in a budget neutral manner which is consistent with the requirement at § 412.525(c)(2) that changes to area wage level adjustments are made in a budget neutral manner. That is, we continue to believe that changes to area wage level adjustments, including the proposed 5-percent cap on the decrease on an LTCH's wage index, should not result in any change in estimated aggregate LTCH PPS payments. We also anticipate that in the absence of proposed policy changes most LTCHs will not experience year-to-year wage index declines greater than 5 percent in any given year and that the overall budget neutrality adjustments associated with the policy will be relatively small and would not create volatility in LTCH PPS payments.

Comment: A commenter recommended that CMS retroactively apply the 5-percent cap policy to the FY 2022 wage index for LTCHs that experienced wage index decreases due to their transition to a new CBSA based on the new OMB delineations that were finalized for FY 2021.

Response: As noted previously, in FY 2021, we implemented a transition to mitigate any negative effects of wage index changes by applying a 5-percent cap on any decrease in an LTCH's wage index from the LTCH's final wage index in FY 2020; we indicated that no cap would be applied to the reduction in the second year, FY 2022. In the FY 2023 IPPS/LTCH PPS proposed rule, we did not propose to modify that transition policy to extend the transition period for FY 2022. We have historically implemented transitions of limited duration to address CBSA changes due to substantial updates to OMB delineations. In accordance with our policy principles that we use the most updated data and information available with regard to the wage index, we proposed that the FY 2023 5-percent cap wage index policy would be prospective to mitigate any significant decreases beginning in FY 2023.

Comment: Some commenters disagreed with our proposal to apply the 5-percent cap on decreases to an LTCH's wage index only to existing hospitals; that is, hospitals that were already operational on the last day of the prior Federal fiscal year. The commenters stated that this policy would create unnecessary inequity in Medicare payments for hospitals in the same market. They encouraged CMS to apply the same area wage index value for new and existing hospitals.

Response: We appreciate the commenters' concerns about equity and fairness. As we have stated, however, the primary purpose of applying a 5-percent cap on decreases to an LTCH's wage index is to support predictability about LTCH payments, mitigate financial instability from one year to the next, and enable LTCHs to more effectively budget and plan their operations. LTCHs that were not operational on the last day of the prior Federal fiscal year could not experience LTCH PPS payment decreases relative to the prior year since they would have received no LTCH PPS payments in the prior year. In addition, we do not expect that there would be many LTCHs in this situation. There are few newly created LTCHs, in general, and even fewer that will open in an area that is receiving an adjustment under the policy. Finally, we note that any differential in the wage index related to a newly operational LTCH and an existing LTCH in the same labor market area will generally be limited to a single year, since typical year-to-year variations in the LTCH wage index have historically been, and we expect will continue to be, within 5 percent.

Comment: A commenter, while supportive of the proposed 5-percent cap on wage index decreases, believes it does not correct for an ongoing problem with the range in wage index values amongst LTCHs. This commenter believes the range in wage index values is too large and that CMS should establish an annual cap that would be placed on CBSAs with high wage index values. Furthermore, the same commenter believes that LTCHs should have the option to reclassify to a different CBSA as is permitted for IPPS hospitals.

Response: We disagree with the commenters' suggestion that we establish a cap for CBSAs with high wage index values. We believe the LTCH PPS wage index accurately reflects the relative labor costs in areas with both high wage index and low wage index values. In reference to the comment on LTCHs having an option to reclassify to a different CBSA, we did not propose this specific policy suggested by the commenters, but we will take this comment into consideration to potentially inform future rulemaking.

After consideration of the public comments we received, we are finalizing as proposed, that, beginning in FY 2023, we will apply a permanent 5-percent cap on any decrease to an LTCH's wage index from its wage index in the prior year. Also, after consideration of the public comments we received, we are establishing that this wage index cap policy will be implemented in a budget neutral manner by including the application of this policy in the area wage level budget neutrality factor that is applied to the standard Federal payment rate. We believe that this policy appropriately mitigates instability and significant negative impacts to LTCHs resulting from significant changes to the wage index and increases predictability of LTCH payments. We note that this provision is similar to our provision establishing a permanent 5-percent cap on annual wage index decreases for IPPS hospitals, as discussed in section III.N. of the preamble to this final rule.

We received no comments about our proposal to modify text at § 412.525(c)(1) to reflect the permanent cap on wage index decreases. Therefore, as we proposed, we are reflecting the permanent cap on wage index decreases at § 412.525(c)(1) by adding paragraphs (c)(1)(i) and (ii) to specify that CMS updates the wage index for LTCHs annually and that, beginning in FY 2023, if CMS determines that an LTCH's wage index value for a fiscal year would decrease by more than 5 percent as compared to the LTCH's wage index value for the prior year, we will limit the decrease to 5 percent for the fiscal year.

For each LTCH we identify in our rulemaking data, we are including in a supplemental data file the wage index values from both fiscal years used in determining its capped wage index. This includes the LTCH's final prior year wage index value, the LTCH's uncapped current year wage index value, and the LTCH's capped current year wage index value. Due to the lag in rulemaking data, a new LTCH may not be listed in this supplemental file for a few years. For this reason, a newly opened LTCH could contact their MAC to ensure that its wage index value is not less than 95 percent of the value paid to it for the prior Federal fiscal year. This supplemental data file for public use will be posted on the CMS website for this final rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*.

b. Permanent Cap on IPPS Comparable Wage Index Decreases

Determining LTCH PPS payments for short-stay-outlier cases (reflected in § 412.529) and site neutral payment rate cases (reflected in § 412.522(c)) requires calculating an ''IPPS comparable amount.'' For information on this ''IPPS comparable amount'' calculation, we refer the reader to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49608 through 49610). Determining LTCH PPS payments for LTCHs that do not meet the applicable discharge payment percentage (reflected in § 412.522(d)) requires calculating an ''IPPS equivalent amount.'' For information on this ''IPPS equivalent amount'' calculation, we refer the reader to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42439 through 42445).

Calculating both the ''IPPS comparable amount'' and the ''IPPS equivalent amount'' requires adjusting the IPPS operating and capital standardized amounts by the applicable IPPS wage index for nonreclassified IPPS hospitals. That is, the standardized amounts are adjusted by the IPPS wage index for nonreclassified IPPS hospitals located in the same geographic area as the LTCH. Consistent with our proposal to apply a 5-percent cap on decreases in the LTCH PPS wage index and under the broad authority of section 123 of the BBRA, as amended by section 307(b) of the BIPA, in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28685 through 28686), we also proposed, beginning with FY 2023 to apply a permanent 5-percent cap on decreases in an LTCH's applicable IPPS comparable wage index from its applicable IPPS comparable wage index in the prior year. As with our proposed policy to apply a cap on decreases in the LTCH PPS wage index each year, we stated our belief that a permanent cap on applicable IPPS comparable wage index decreases would provide greater predictability to LTCHs by mitigating instability and significant negative impacts to LTCHs resulting from significant changes to the wage index and increase predictability of LTCH payments. Historically, we have not budget neutralized changes to LTCH PPS payments that result from the annual update of the IPPS wage index for nonreclassified IPPS hospitals. Consistent with this approach, we proposed that the cap on decreases in an LTCH's applicable IPPS comparable wage index not be applied in a budget neutral manner.

We proposed that an LTCH's applicable IPPS comparable wage index cap adjustment would be determined based on the wage index value assigned to the LTCH on the last day of the prior Federal fiscal year. We also proposed that new LTCHs that became operational during the prior Federal fiscal year be subject to the applicable IPPS comparable wage index cap. However, for newly opened LTCHs that become operational on or after the first day of the fiscal year to which this final rule applies, we proposed that these LTCHs would not be subject to the applicable IPPS comparable wage index cap since they were not paid under the LTCH PPS in the prior year.

We received no comments on our proposal to apply a permanent 5-percent cap on decreases in an LTCH's applicable IPPS comparable wage index from its applicable IPPS comparable wage index in the prior year. Therefore, we are finalizing this proposal without modification.

We received no comments about our proposal to modify text at § 412.529(d)(4)(ii)(B) and § 412.529(d)(4)(iii)(B) to reflect the permanent cap on IPPS comparable wage index decreases. Similarly, we received no comments on our proposal to remove the reference in § 412.529(d)(4)(iii)(B) related to the applicable large urban location adjustment. Therefore, as proposed, we are reflecting the permanent cap on IPPS comparable wage index decreases at § 412.529(d)(4)(ii)(B) to state that, beginning in FY 2023, an LTCH's applicable IPPS wage index used to adjust the IPPS operating standardized amount is subject to a 5-percent cap on decreases to an LTCH's applicable IPPS wage index value from the prior fiscal year. We also are reflecting the permanent cap on IPPS comparable wage index decreases at § 412.529(d)(4)(iii)(B) to state that, beginning in FY 2023, an LTCH's applicable IPPS wage index used to adjust the IPPS capital Federal rate is subject to a 5-percent cap on decreases to an LTCH's

applicable IPPS wage index value from the prior fiscal year. In addition, we are finalizing our proposal to remove the reference in § 412.529(d)(4)(iii)(B) related to the applicable large urban location adjustment because this policy is no longer applicable under the IPPS effective with discharges occurring on or after October 1, 2007 (72 FR 47400).

Similar to the information we made available for the cap on the LTCH PPS wage index values (described previously), for each LTCH we identify in our rulemaking data, we are including in a supplemental data file the wage index values from both fiscal years used in determining its capped applicable IPPS comparable wage index. Due to the lag in rulemaking data, a new LTCH may not be listed in this supplemental file for a few years. For this reason, a newly opened LTCH could contact its MAC to ensure that its applicable IPPS comparable wage index value is not less than 95 percent of the value paid to them for the prior Federal fiscal year. This supplemental data file for public use will be posted on the CMS website for this final rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*.

6. Budget Neutrality Adjustments for Changes to the LTCH PPS Standard Federal Payment Rate Area Wage Level Adjustment

Historically, the LTCH PPS wage index and labor-related share are updated annually based on the latest available data. Under § 412.525(c)(2), any changes to the area wage index values or labor-related share are to be made in a budget neutral manner such that estimated aggregate LTCH PPS payments are unaffected; that is, will be neither greater than nor less than estimated aggregate LTCH PPS payments without such changes to the area wage level adjustment. Under this policy, we determine an area wage level adjustment budget neutrality factor that is applied to the standard Federal payment rate to ensure that any changes to the area wage level adjustments are budget neutral such that any changes to the area wage index values or labor-related share would not result in any change (increase or decrease) in estimated aggregate LTCH PPS payments. Accordingly, under § 412.523(d)(4), we have applied an area wage level adjustment budget neutrality factor in determining the standard Federal payment rate, and we also established a methodology for calculating an area wage level adjustment budget neutrality factor. (For additional information on the establishment of our budget neutrality policy for changes to the area wage level adjustment, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51771 through 51773 and 51809).)

For FY 2023, in accordance with § 412.523(d)(4), as we proposed, we applied an area wage level budget neutrality factor to adjust the LTCH PPS standard Federal payment rate to account for the estimated effect of the adjustments or updates to the area wage level adjustment under § 412.525(c)(1) on estimated aggregate LTCH PPS payments, consistent with the methodology we established in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51773). As discussed in section V.B.5. of the Addendum to this final rule, for each year, beginning with FY 2023, we are limiting a hospital's LTCH PPS wage index value for the coming year by capping it at 95 percent of its prior year value. As also discussed previously, we are applying the 5-percent cap on wage index decreases, consistent with § 412.525(c)(2), in a budget neutral manner.

Specifically, as we proposed, we determined an area wage level adjustment budget neutrality factor that is applied to the LTCH PPS standard Federal payment rate under § 412.523(d)(4) for FY 2023 using the following methodology, which will incorporate our 5-percent cap on decreases in a hospital's wage index:

Step 1—Simulate estimated aggregate LTCH PPS standard Federal payment rate payments using the FY 2022 wage index values and the FY 2022 labor-related share of 67.9 percent.

Step 2—Simulate estimated aggregate LTCH PPS standard Federal payment rate payments using the FY 2023 wage index values (including application of the 5-percent cap on wage index decreases) and the FY 2023 labor-related share of 68.0 percent. (As noted previously, the changes to the wage index values based on updated hospital wage data are discussed in section V.B.4. of this Addendum to this final rule and the labor-related share is discussed in section V.B.3. of this Addendum to this final rule.)

Step 3—Calculate the ratio of these estimated total LTCH PPS standard Federal payment rate payments by dividing the estimated total LTCH PPS standard Federal payment rate payments using the FY 2022 area wage level adjustments (calculated in Step 1) by the estimated total LTCH PPS standard Federal payment rate payments using the FY 2023 updates to the area wage level adjustment (calculated in Step 2) to determine the budget neutrality factor for updates to the area wage level adjustment for FY 2023 LTCH PPS standard Federal payment rate payments.

Step 4—Apply the FY 2023 updates to the area wage level adjustment budget neutrality factor from Step 3 to determine the FY 2023 LTCH PPS standard Federal payment rate after the application of the FY 2023 annual update.

In section I.F. of the preamble to this final rule, we discuss our use of FY 2021 claims data for the FY 2023 LTCH PPS ratesetting. We also state our belief that it is reasonable to assume that there will be fewer COVID–19 hospitalizations among Medicare beneficiaries at LTCHs in FY 2023 than there were in FY 2021. For this reason, we are making modifications in our determination of the FY 2023 MS–LTC–DRG relative weights and outlier fixed-loss amount for LTCH PPS standard Federal payment rate cases. We believe that these modifications will account for an anticipated decline in, but not elimination of, COVID–19 hospitalizations at LTCHs in FY 2023. However, in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28687), when modeling payments for determining the area wage level adjustment budget neutrality factor, we proposed to use the full set of LTCH PPS standard Federal payment rate cases (including all COVID–19 cases) identified in the FY 2021 claims data. We stated that in the absence of a set of MedPAR claims that reflect our expectation that there will be fewer (but not zero) COVID–19 cases in FY 2023 as compared to the COVID–19 cases in the FY 2021 claims data, we believe this is the best data available for determining the budget neutrality factors. We also solicited feedback from commenters on alternative ways to use the FY 2021 claims data for purposes of calculating the FY 2023 budget neutrality factors. We received no comments on this proposal or our request for feedback on alternatives and are finalizing this proposal without modification. Therefore, for this final rule, when modeling payments for determining the budget neutrality factors, we used the full set of standard Federal payment rate cases (including all COVID–19 cases) identified in the FY 2021 claims data. We note this is consistent with the calculation of the budget neutrality factors for changes to the MS–LTC–DRG classifications and relative weights (including the 10-percent cap) discussed in section VIII.B.4.b. (Step 11) of the preamble of this final rule. We also note this is consistent with the approach under the IPPS as discussed in section II.A.4. of the Addendum of this final rule.

We note that, because the area wage level adjustment under § 412.525(c) is an adjustment to the LTCH PPS standard Federal payment rate, consistent with historical practice, we only used data from claims that qualified for payment at the LTCH PPS standard Federal payment rate under the dual rate LTCH PPS to calculate the FY 2023 LTCH PPS standard Federal payment rate area wage level adjustment budget neutrality factor. For this final rule, using the steps in the methodology previously described, we determined a FY 2023 LTCH PPS standard Federal payment rate area wage level adjustment budget neutrality factor of 1.0004304. Accordingly, in section V.A. of the Addendum to this final rule, we applied the area wage level adjustment budget neutrality factor of 1.0004304 to determine the FY 2023 LTCH PPS standard Federal payment rate, in accordance with § 412.523(d)(4).

C. Cost-of-Living Adjustment (COLA) for LTCHs Located in Alaska and Hawaii

Under § 412.525(b), a cost-of-living adjustment (COLA) is provided for LTCHs located in Alaska and Hawaii to account for the higher costs incurred in those States. Specifically, we apply a COLA to payments to LTCHs located in Alaska and Hawaii by multiplying the nonlabor-related portion of the standard Federal payment rate by the applicable COLA factors established annually by CMS. Higher labor-related costs for LTCHs located in Alaska and Hawaii are taken into account in the adjustment for area wage levels previously described. The methodology used to determine the COLA factors for Alaska and Hawaii is based on a comparison of the growth in the Consumer Price Indexes (CPIs) for Anchorage, Alaska, and Honolulu, Hawaii, relative to the growth in the CPI for the average U.S. city as published by the Bureau of Labor Statistics (BLS). It also includes a 25-percent cap on the CPI-updated COLA factors. Under our

current policy, we update the COLA factors using the methodology as previously described every 4 years (at the same time as the update to the labor-related share of the IPPS market basket) and we last updated the COLA factors for Alaska and Hawaii published by OPM for 2009 in FY 2022 (86 FR 45559 through 45560).

We continue to believe that determining updated COLA factors using this methodology would appropriately adjust the nonlabor-related portion of the LTCH PPS standard Federal payment rate for LTCHs located in Alaska and Hawaii. Therefore, in this final rule, for FY 2023, under the broad authority conferred upon the Secretary by section 123 of the BBRA, as amended by section 307(b) of the BIPA, to determine appropriate payment adjustments under the LTCH PPS, as we proposed, we are continuing to use the COLA factors based on the 2009 OPM COLA factors updated through 2020 by the comparison of the growth in the CPIs for Anchorage, Alaska, and Honolulu, Hawaii, relative to the growth in the CPI for the average U.S. city as established in the FY 2022 IPPS/LTCH PPS final rule. (For additional details on our current methodology for updating the COLA factors for Alaska and Hawaii and for a discussion on the FY 2022 COLA factors, we refer readers to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45559 through 45560).)

COST-OF-LIVING ADJUSTMENT FACTORS (COLA): ALASKA AND HAWAII UNDER THE LTCH PPS FOR FY 2023

Area	FY 2023
Alaska:	
City of Anchorage and 80-kilometer (50-mile) radius by road	1.22
City of Fairbanks and 80-kilometer (50-mile) radius by road	1.22
City of Juneau and 80-kilometer (50-mile) radius by road	1.22
Rest of Alaska	1.24
Hawaii:	
City and County of Honolulu	1.25
County of Hawaii	1.22
County of Kauai	1.25
County of Maui and County of Kalawao	1.25

D. Adjustment for LTCH PPS High Cost Outlier (HCO) Cases

1. HCO Background

From the beginning of the LTCH PPS, we have included an adjustment to account for cases in which there are extraordinarily high costs relative to the costs of most discharges. Under this policy, additional payments are made based on the degree to which the estimated cost of a case (which is calculated by multiplying the Medicare allowable covered charge by the hospital's overall hospital CCR) exceeds a fixed-loss amount. This policy results in greater payment accuracy under the LTCH PPS and the Medicare program, and the LTCH sharing the financial risk for the treatment of extraordinarily high-cost cases.

We retained the basic tenets of our HCO policy in FY 2016 when we implemented the dual rate LTCH PPS payment structure under section 1206 of Public Law 113–67. LTCH discharges that meet the criteria for exclusion from the site neutral payment rate (that is, LTCH PPS standard Federal payment rate cases) are paid at the LTCH PPS standard Federal payment rate, which includes, as applicable, HCO payments under § 412.523(e). LTCH discharges that do not meet the criteria for exclusion are paid at the site neutral payment rate, which includes, as applicable, HCO payments under § 412.522(c)(2)(i). In the FY 2016 IPPS/LTCH PPS final rule, we established separate fixed-loss amounts and targets for the two different LTCH PPS payment rates. Under this bifurcated policy, the historic 8-percent HCO target was retained for LTCH PPS standard Federal payment rate cases, with the fixed-loss amount calculated using only data from LTCH cases that would have been paid at the LTCH PPS standard Federal payment rate if that rate had been in effect at the time of those discharges. For site neutral payment rate cases, we adopted the operating IPPS HCO target (currently 5.1 percent) and set the fixed-loss amount for site neutral payment rate cases at the value of the IPPS fixed-loss amount. Under the HCO policy for both payment rates, an LTCH receives 80 percent of the difference between the estimated cost of the case and the applicable HCO threshold, which is the sum of the LTCH PPS payment for the case and the applicable fixed-loss amount for such case.

To maintain budget neutrality, consistent with the budget neutrality requirement at § 412.523(d)(1) for HCO payments to LTCH PPS standard Federal rate payment cases, we also adopted a budget neutrality requirement for HCO payments to site neutral payment rate cases by applying a budget neutrality factor to the LTCH PPS payment for those site neutral payment rate cases. (We refer readers to § 412.522(c)(2)(i) of the regulations for further details.) We note that, during the 4-year transitional period, the site neutral payment rate HCO budget neutrality factor did not apply to the LTCH PPS standard Federal payment rate portion of the blended payment rate at § 412.522(c)(3) payable to site neutral payment rate cases. (For additional details on the HCO policy adopted for site neutral payment rate cases under the dual rate LTCH PPS payment structure, including the budget neutrality adjustment for HCO payments to site neutral payment rate cases, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49617 through 49623).)

2. Determining LTCH CCRs Under the LTCH PPS

a. Background

As noted previously, CCRs are used to determine payments for HCO adjustments for both payment rates under the LTCH PPS and also are used to determine payments for site neutral payment rate cases. As noted earlier, in determining HCO and the site neutral payment rate payments (regardless of whether the case is also an HCO), we generally calculate the estimated cost of the case by multiplying the LTCH's overall CCR by the Medicare allowable charges for the case. An overall CCR is used because the LTCH PPS uses a single prospective payment per discharge that covers both inpatient operating and capital-related costs. The LTCH's overall CCR is generally computed based on the sum of LTCH operating and capital costs (as described in Section 150.24, Chapter 3, of the Medicare Claims Processing Manual (Pub. 100–4)) as compared to total Medicare charges (that is, the sum of its operating and capital inpatient routine and ancillary charges), with those values determined from either the most recently settled cost report or the most recent tentatively settled cost report, whichever is from the latest cost reporting period. However, in certain instances, we use an alternative CCR, such as the statewide average CCR, a CCR that is specified by CMS, or one that is requested by the hospital. (We refer readers to § 412.525(a)(4)(iv) of the regulations for further details regarding CCRs and HCO adjustments for either LTCH PPS payment rate and § 412.522(c)(1)(ii) for the site neutral payment rate.)

The LTCH's calculated CCR is then compared to the LTCH total CCR ceiling. Under our established policy, an LTCH with a calculated CCR in excess of the applicable maximum CCR threshold (that is, the LTCH total CCR ceiling, which is calculated as 3 standard deviations from the national geometric average CCR) is generally assigned the applicable statewide CCR. This policy is premised on a belief that calculated CCRs in excess of the LTCH total CCR ceiling are most likely due to faulty data reporting or entry, and CCRs based on erroneous data should

not be used to identify and make payments for outlier cases.

b. LTCH Total CCR Ceiling

Consistent with our historical practice, as we proposed, we used the best available data to determine the LTCH total CCR ceiling for FY 2023 in this final rule. Specifically, in this final rule, we used our established methodology for determining the LTCH total CCR ceiling based on IPPS total CCR data from the March 2022 update of the Provider Specific File (PSF), which is the most recent data available. Accordingly, we are establishing an LTCH total CCR ceiling of 1.312 under the LTCH PPS for FY 2023 in accordance with § 412.525(a)(4)(iv)(C)(*2*) for HCO cases under either payment rate and § 412.522(c)(1)(ii) for the site neutral payment rate. (For additional information on our methodology for determining the LTCH total CCR ceiling, we refer readers to the FY 2007 IPPS final rule (71 FR 48117 through 48119).)

We did not receive any public comments on our proposals. Therefore, we are finalizing our proposals as described previously, without modification.

c. LTCH Statewide Average CCRs

Our general methodology for determining the statewide average CCRs used under the LTCH PPS is similar to our established methodology for determining the LTCH total CCR ceiling because it is based on ''total'' IPPS CCR data. (For additional information on our methodology for determining statewide average CCRs under the LTCH PPS, we refer readers to the FY 2007 IPPS final rule (71 FR 48119 through 48120).) Under the LTCH PPS HCO policy at § 412.525(a)(4)(iv)(C), the SSO policy at § 412.529(f)(4)(iii), and the site neutral payment rate at § 412.522(c)(1)(ii), the MAC may use a statewide average CCR, which is established annually by CMS, if it is unable to determine an accurate CCR for an LTCH in one of the following circumstances: (1) New LTCHs that have not yet submitted their first Medicare cost report (a new LTCH is defined as an entity that has not accepted assignment of an existing hospital's provider agreement in accordance with § 489.18); (2) LTCHs whose calculated CCR is in excess of the LTCH total CCR ceiling; and (3) other LTCHs for whom data with which to calculate a CCR are not available (for example, missing or faulty data). (Other sources of data that the MAC may consider in determining an LTCH's CCR include data from a different cost reporting period for the LTCH, data from the cost reporting period preceding the period in which the hospital began to be paid as an LTCH (that is, the period of at least 6 months that it was paid as a short-term, acute care hospital), or data from other comparable LTCHs, such as LTCHs in the same chain or in the same region.)

Consistent with our historical practice of using the best available data, in this final rule, we are using our established methodology for determining the LTCH statewide average CCRs, based on the most recent complete IPPS ''total CCR'' data from the March 2022 update of the PSF. As we proposed, we are establishing LTCH PPS statewide average total CCRs for urban and rural hospitals that will be effective for discharges occurring on or after October 1, 2022, through September 30, 2023, in Table 8C listed in section VI. of the Addendum to this final rule (and available via the internet on the CMS website). Consistent with our historical practice, as we also proposed, we used the best available data to determine the LTCH PPS statewide average total CCRs for FY 2023 in the final rule.

Under the current LTCH PPS labor market areas, all areas in Delaware, the District of Columbia, New Jersey, and Rhode Island are classified as urban. Therefore, there are no rural statewide average total CCRs listed for those jurisdictions in Table 8C. This policy is consistent with the policy that we established when we revised our methodology for determining the applicable LTCH statewide average CCRs in the FY 2007 IPPS final rule (71 FR 48119 through 48121) and is the same as the policy applied under the IPPS. In addition, although Connecticut has areas that are designated as rural, in our calculation of the LTCH statewide average CCRs, there were no short-term, acute care IPPS hospitals classified as rural or LTCHs located in these rural areas as of March 2022. Therefore, consistent with our existing methodology, we used the national average total CCR for rural IPPS hospitals for rural Connecticut in Table 8C. While Massachusetts also has rural areas, the statewide average CCR for rural areas in Massachusetts is based on one IPPS provider whose CCR is an atypical 1.205. Because this is much higher than the statewide urban average (0.484) and furthermore implies costs greater than charges, as with Connecticut, we used the national average total CCR for rural IPPS hospitals for rural Massachusetts in Table 8C. Furthermore, consistent with our existing methodology, in determining the urban and rural statewide average total CCRs for Maryland LTCHs paid under the LTCH PPS, as we proposed, we are continuing to use, as a proxy, the national average total CCR for urban IPPS hospitals and the national average total CCR for rural IPPS hospitals, respectively. We are using this proxy because we believe that the CCR data in the PSF for Maryland hospitals may not be entirely accurate (as discussed in greater detail in the FY 2007 IPPS final rule (71 FR 48120)).

We did not receive any public comments on our proposals. Therefore, we are finalizing our proposals as described previously, without modification.

d. Reconciliation of HCO Payments

Under the HCO policy at § 412.525(a)(4)(iv)(D), the payments for HCO cases are subject to reconciliation (regardless of whether payment is based on the LTCH standard Federal payment rate or the site neutral payment rate). Specifically, any such payments are reconciled at settlement based on the CCR that was calculated based on the cost report coinciding with the discharge. For additional information on the reconciliation policy, we refer readers to sections 150.26 through 150.28 of the Medicare Claims Processing Manual (Pub. 100–4), as added by Change Request 7192 (Transmittal 2111; December 3, 2010), and the RY 2009 LTCH PPS final rule (73 FR 26820 through 26821).

3. High-Cost Outlier Payments for LTCH PPS Standard Federal Payment Rate Cases

a. High-Cost Outlier Payments for LTCH PPS Standard Federal Payment Rate Cases

Under the regulations at § 412.525(a)(2)(ii) and as required by section 1886(m)(7) of the Act, the fixed-loss amount for HCO payments is set each year so that the estimated aggregate HCO payments for LTCH PPS standard Federal payment rate cases are 99.6875 percent of 8 percent (that is, 7.975 percent) of estimated aggregate LTCH PPS payments for LTCH PPS standard Federal payment rate cases. (For more details on the requirements for high-cost outlier payments in FY 2018 and subsequent years under section 1886(m)(7) of the Act and additional information regarding high-cost outlier payments prior to FY 2018, we refer readers to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38542 through 38544).)

b. Fixed-Loss Amount for LTCH PPS Standard Federal Payment Rate Cases for FY 2023

When we implemented the LTCH PPS, we established a fixed-loss amount so that total estimated outlier payments are projected to equal 8 percent of total estimated payments (that is, the target percentage) under the LTCH PPS (67 FR 56022 through 56026). When we implemented the dual rate LTCH PPS payment structure beginning in FY 2016, we established that, in general, the historical LTCH PPS HCO policy would continue to apply to LTCH PPS standard Federal payment rate cases. That is, the fixed-loss amount for LTCH PPS standard Federal payment rate cases would be determined using the LTCH PPS HCO policy adopted when the LTCH PPS was first implemented, but we limited the data used under that policy to LTCH cases that would have been LTCH PPS standard Federal payment rate cases if the statutory changes had been in effect at the time of those discharges.

To determine the applicable fixed-loss amount for LTCH PPS standard Federal payment rate cases, we estimate outlier payments and total LTCH PPS payments for each LTCH PPS standard Federal payment rate case (or for each case that would have been an LTCH PPS standard Federal payment rate case if the statutory changes had been in effect at the time of the discharge) using claims data from the MedPAR files. In accordance with § 412.525(a)(2)(ii), the applicable fixed-loss amount for LTCH PPS standard Federal payment rate cases results in estimated total outlier payments being projected to be equal to 7.975 percent of projected total LTCH PPS payments for LTCH PPS standard Federal payment rate cases.

In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45562 through 45566), we finalized a number of technical changes to the methodology for determining the charge inflation factor and the CCR used when calculating the fixed-loss amount, while maintaining estimated HCO payments at the projected 7.975 percent of total estimated LTCH PPS payments for LTCH PPS standard Federal payment rate cases. First, we

finalized a technical change to the methodology for determining the charge inflation factor applied to the charges on the MedPAR claims when calculating the fixed-loss amount for each FY. Second, we finalized a technical change to the methodology for determining the CCRs used when calculating the fixed-loss amount for each FY. These methodologies are described in greater detail later in this section of this Addendum.

(1) Charge Inflation Factor for Use in Determining the Fixed-Loss Amount for LTCH PPS Standard Federal Payment Rate Cases for FY 2023

Under the LTCH PPS, the cost of each claim is estimated by multiplying the charges on the claim by the provider's CCR. Due to the lag time in the availability of claims data, when estimating costs for the upcoming payment year we typically inflate the charges from the claims data by a uniform factor.

For greater accuracy in calculating the fixed-loss amount, in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45562 through 45566), we finalized a technical change to our methodology for determining the charge inflation factor. Similar to the method used under the IPPS hospital payment methodology (as discussed in section II.A.4.h.(2) of the Addendum to this final rule), our methodology determines the LTCH charge inflation factor based on the historical growth in charges for LTCH PPS standard Federal payment rate cases, calculated using historical MedPAR claims data. In this section of this Addendum, we describe our charge inflation factor methodology using the most recently available data. However, as discussed in further detail later in this section, we did not propose to use the charge inflation factor derived from the most recently available data. Rather, we proposed using the charge inflation factor used in the FY 2022 IPPS/LTCH PPS final rule that was based on the growth in charges that occurred between FY 2018 and FY 2019.

Step 1—Identify LTCH PPS Standard Federal Payment Rate Cases

The first step in our methodology is to identify LTCH PPS standard Federal payment rate cases from the MedPAR claim files for the two most recently available Federal fiscal year time periods. For both fiscal years, consistent with our historical methodology for determining payment rates for the LTCH PPS, we remove any claims submitted by LTCHs that were all-inclusive rate providers as well as any Medicare Advantage claims. For both fiscal years, we also remove claims from providers that only had claims in one of the fiscal years.

Step 2—Remove Statistical Outliers

The next step in our methodology is to remove all claims from providers whose growth in average charges was a statistical outlier. We remove these statistical outliers prior to calculating the charge inflation factor because we believe they may represent aberrations in the data that would distort the measure of average charge growth. To perform this statistical trim, we first calculate each provider's average charge in both fiscal years. Then, we calculate a charge growth factor for each provider by dividing its average charge in the most recent fiscal year by its average charge in the prior fiscal year. Then we remove all claims for providers whose calculated charge growth factor was outside 3 standard deviations from the mean provider charge growth factor.

Step 3—Calculate the Charge Inflation Factor

The final step in our methodology is to use the remaining claims to calculate a national charge inflation factor. We first calculate the average charge for those remaining claims in both fiscal years. Then we calculate the national charge inflation factor by dividing the average charge in the more recent fiscal year by the average charge in the prior fiscal year.

Following the methodology described previously, in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28690 through 28691), we computed a charge inflation factor based on the most recently available data. Specifically, we used the December 2021 update of the FY 2021 MedPAR file and the December 2020 update of the FY 2020 MedPAR as the basis of the LTCH PPS standard Federal payment rate cases for the two most recently available Federal fiscal year time periods, as described previously in our methodology. Therefore, we trimmed the December 2021 update of the FY 2021 MedPAR file and the December 2020 update of the FY 2020 MedPAR file as described in steps 1 and 2 of our methodology. To compute the 1-year average annual rate-of-change in charges per case, we compared the average covered charge per case of $239,245 ($14,013,531,722/58,574 cases) from FY 2020 to the average covered charge per case of $266,358 ($13,426,298,925/50,407 cases) from FY 2021. This rate-of-change was 11.3327 percent, which results in a 1-year charge inflation factor of 1.113327, and a 2-year charge inflation factor of 1.239497 (calculated by squaring the 1-year factor).

In the proposed rule, we recognized that this LTCH charge inflation factor calculated using the established methodology was abnormally high compared to recent historical levels prior to the COVID–19 PHE. We stated our belief that this abnormally high charge inflation factor is partially due to the high number of COVID–19 cases that were treated in LTCHs in FY 2021. We also stated our belief that there will be fewer COVID–19 cases in FY 2023 than in FY 2021 and therefore do not believe it is reasonable to assume charges will continue to increase at this abnormally high rate. Consequently, when determining the proposed fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2023, we did not propose to use this charge inflation factor, which was based on the growth in charges that occurred between FY 2020 and FY 2021. Rather, we proposed to use the charge inflation factor determined in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45565), which was based on the growth in charges that occurred between FY 2018 and FY 2019 (the last 1-year period prior to the COVID–19 PHE).

The rate of LTCH charge growth determined in the FY 2022 IPPS/LTCH PPS final rule, based on the growth in charges that occurred between FY 2018 and FY 2019, was 6.0723 percent. This results in a 1-year charge inflation factor of 1.060723, and a 2-year charge inflation factor of 1.125133 (calculated by squaring the 1-year factor). Therefore, we proposed to inflate the billed charges obtained from the FY 2021 MedPAR file by this 2-year charge inflation factor of 1.125133 when determining the fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2023.

Comment: Nearly all commenters were appreciative of CMS's efforts to account for some of the pandemic-related factors in calculating the fixed-loss amount by applying the final FY 2022 charge inflation factor rather than the calculated amounts using our previously established methodology.

Response: We appreciate the support for this modification to our methodology in determining the charge inflation factor. We are finalizing our proposal to use the 2-year charge inflation factor of 1.125133 determined in the FY 2022 IPPS/LTCH PPS final rule, which was based on the growth in charges that occurred between FY 2018 and FY 2019 (the last 1-year period prior to the COVID–19 PHE) in calculating the fixed-loss amount. We note that using our ordinary data for this final rule, we calculated a 2-year charge inflation of 1.241308.

(2) CCRs for Use in Determining the Fixed-Loss Amount for LTCH PPS Standard Federal Payment Rate Cases for FY 2023

For greater accuracy in calculating the fixed-loss amount, in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45562 through 45566), we finalized a technical change to our methodology for determining the CCRs used to calculate the fixed-loss amount. Similar to the methodology used for IPPS hospitals (as discussed in section II.A.4.h.(2). of the Addendum to this final rule), our methodology adjusts CCRs obtained from the best available PSF data by an adjustment factor that is calculated based on historical changes in the average case-weighted CCR for LTCHs. We believe these adjusted CCRs more accurately reflect CCR levels in the upcoming payment year because they account for historical changes in the relationship between costs and charges for LTCHs. In this section of this Addendum, we describe our CCR adjustment factor methodology using the most recently available data. However, as discussed in further detail later in this section of this Addendum, we did not propose to use the CCR adjustment factor derived from the most recently available data. Rather, we proposed using the CCR adjustment factor that was derived in the FY 2022 IPPS/LTCH PPS final rule, which is based on the change in CCRs that occurred between the March 2019 PSF and the March 2020 PSF.

Step 1—Assign Providers Their Historical CCRs

The first step in our methodology is to identify providers with LTCH PPS standard Federal payment rate cases in the most recent MedPAR claims file (excluding all-inclusive rate providers and providers with only Medicare Advantage claims). For each of these providers, we then identify the CCR from the most recently available PSF. For each of these providers we also identify the CCR from the PSF that was made available

one year prior to the most recently available PSF.

Step 2—Trim Providers With Insufficient CCR Data

The next step in our methodology is to remove from the CCR adjustment factor calculation any providers for which we cannot accurately measure changes to their CCR using the PSF data. We first remove any provider whose CCR was missing in the most recent PSF or prior year PSF. We next remove any provider assigned the statewide average CCR for their State in either the most recent PSF or prior year PSF. We lastly remove any provider whose CCR was not updated between the most recent PSF and prior year PSF (determined by comparing the effective date of the records).

Step 3—Remove Statistical Outliers

The next step in our methodology is to remove providers whose change in their CCR is a statistical outlier. To perform this statistical trim, for those providers remaining after application of Step 2, we calculate a provider-level CCR growth factor by dividing the provider's CCR from the most recent PSF by its CCR in the prior year's PSF. We then remove any provider whose CCR growth factor was outside 3 standard deviations from the mean provider CCR growth factor. These statistical outliers are removed prior to calculating the CCR adjustment factor because we believe that they may represent aberrations in the data that would distort the measure of average annual CCR change.

Step 4—Calculate a CCR Adjustment Factor

The final step in our methodology is to calculate, across all remaining providers after application of Step 3, an average case-weighted CCR from both the most recent PSF and prior year PSF. The provider case counts that we use to calculate the case-weighted average are determined from claims for LTCH standard Federal rate cases from the most recent MedPAR claims file. We note when determining these case counts, consistent with our historical methodology for determining the MS–LTC–DRG relative weights, we do not count short-stay outlier claims as full cases but instead as a fraction of a case based on the ratio of covered days to the geometric mean length of stay for the MS–LTC–DRG grouped to the case. We calculate the national CCR adjustment factor by dividing the case-weighted CCR from the most recent PSF by the case-weighted CCR from the prior year PSF.

Following the methodology described previously, in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28691 through 28692) we computed a CCR adjustment factor based on the most recently available data. Specifically, we used the December 2021 PSF as the most recently available PSF and the December 2020 PSF as the PSF that was made available one year prior to the most recently available PSF, as described in our methodology. In addition, we used claims from the December 2021 update of the FY 2021 MedPAR file in our calculation of average case-weighted CCRs described in Step 4 of our methodology. Specifically, following the methodology described previously and, for providers with LTCH PPS standard Federal payment rate cases in the December 2021 update of the FY 2021 MedPAR file, we identified their CCRs from both the December 2020 PSF and December 2021 PSF. After performing the trims outlined in our methodology, we used the LTCH PPS standard Federal payment rate case counts from the FY 2021 MedPAR file (classified using proposed Version 40 of the GROUPER) to calculate case-weighted average CCRs. Based on this data, we calculated a December 2020 national average case-weighted CCR of 0.244856 and a December 2021 national average case-weighted CCR of 0.234409. We then calculated a national CCR adjustment factor by dividing the December 2021 national average case-weighted CCR by the December 2020 national average case-weighted CCR. This results in a 1-year national CCR adjustment factor of 0.957334.

Unlike the charge inflation factor calculated using the most recently available data, the CCR adjustment factor calculated previously is not significantly different from historical levels. However, consistent with our proposal to derive our proposed charge inflation factor for FY 2023 based on data from the last 1-year period prior to the COVID–19 PHE, we proposed using the CCR adjustment factor determined in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45565), which was based on the change in CCRs that occurred between the March 2019 PSF and the March 2020 PSF (the last 1-year period prior to the COVID–19 PHE). We note that the CCR adjustment factor of 0.961554 determined in the FY 2022 IPPS/LTCH PPS final rule is close to the CCR adjustment factor we calculated previously using the most recently available data.

Comment: Nearly all commenters were appreciative of CMS's efforts to account for some of the pandemic-related factors in calculating the fixed-loss amount by applying the final FY 2022 CCR adjustment factor rather than the calculated amounts using our previously established methodology.

Response: We appreciate the support for our modified methodology for determining the CCR adjustment factor. We are finalizing our proposal to use the CCR adjustment factor of 0.961554 determined in the FY 2022 IPPS/LTCH PPS final rule, which was based on the change in CCRs that occurred between the March 2019 PSF and the March 2020 PSF (the last 1-year period prior to the COVID–19 PHE) in calculating the fixed loss amount. When calculating the fixed-loss amount for FY 2023, consistent with our proposal, we assigned the statewide average CCR for the upcoming fiscal year to all providers who were assigned the statewide average in the March 2022 PSF or whose CCR was missing in the March 2022 PSF. For all other providers, we multiplied their CCR from the March 2022 PSF by the 1-year national CCR adjustment factor of 0.961554. We note that using our ordinary data for this final rule, we calculated a 1-year national CCR adjustment factor of 0.959468.

(3) Fixed-Loss Amount for LTCH PPS Standard Federal Payment Rate Cases for FY 2023

In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28123 through 28125), we discussed our proposed use of FY 2021 claims data for the FY 2023 LTCH PPS ratesetting. In the proposed rule, we stated our belief that it is reasonable to assume that there will be fewer COVID–19 hospitalizations among Medicare beneficiaries at LTCHs in FY 2023 than there were in FY 2021. For this reason, as discussed previously, we proposed modifications to the charge inflation and CCR adjustment factors used in determining the outlier fixed-loss amount for LTCH PPS standard Federal payment rate cases.

However, when modeling payments for the outlier fixed-loss amount for LTCH PPS standard Federal payment rate cases, we proposed to use the full set of LTCH PPS standard Federal payment rate cases (including all COVID–19 cases) identified in the FY 2021 claims data. In the absence of a set of MedPAR claims that reflect our expectation that there will be fewer (but not zero) COVID–19 cases in FY 2023 as compared to the COVID–19 cases in the FY 2021 claims data, we stated our belief that this is the best data available for determining the outlier fixed-loss amount for LTCH PPS standard Federal payment rate cases. In the proposed rule, we solicited feedback from commenters on alternative ways to use the FY 2021 claims data for purposes of calculating the FY 2023 outlier fixed-loss amount for LTCH PPS standard Federal payment rate cases.

In the proposed rule, for FY 2023, using the best available data, we calculated a fixed-loss amount that would maintain estimated HCO payments at the projected 7.975 percent of total estimated LTCH PPS payments for LTCH PPS standard Federal payment rate cases (based on the payment rates and policies for these cases presented in the final rule). Therefore, based on LTCH claims data from the December 2021 update of the FY 2021 MedPAR file adjusted for charge inflation and adjusted CCRs from the December 2021 update of the PSF, under the broad authority of section 123(a)(1) of the BBRA and section 307(b)(1) of the BIPA, we proposed a fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2023 of $44,182 that would result in estimated outlier payments projected to be equal to 7.975 percent of estimated FY 2023 payments for such cases. We also proposed to continue making an additional HCO payment for the cost of an LTCH PPS standard Federal payment rate case that exceeds the HCO threshold amount that is equal to 80 percent of the difference between the estimated cost of the case and the outlier threshold (the sum of the adjusted LTCH PPS standard Federal payment rate payment and the fixed-loss amount for LTCH PPS standard Federal payment rate cases of $44,182). Consistent with our historical practice, we proposed to use the best available LTCH claims data and CCR data, if applicable, when determining the fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2023. In the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28740 through 28741), we also considered as an alternative, to use the FY 2021 data without any of our methodological changes that account for an anticipated decline in COVID–19 cases in FY 2023. We noted in the proposed rule that,

under this alternative, the fixed-loss amount for LTCH PPS standard Federal payment rate cases would be $61,842

Comment: We received numerous comments objecting to our proposed fixed-loss amount of $44,182 for standard Federal payment rate cases. Commenters stated that the increase over last year's fixed-loss amount of $33,015, particularly on top of the increase to the FY 2021 threshold of $27,195, would have a significant financial impact on LTCHs. Moreover, commenters stated their belief that the proposed fixed-loss amount would result in underpayments to LTCHs treating high-cost patients, hindering the ability of LTCHs to provide care to the sickest beneficiaries. Some commenters stated that CMS should lower the outlier fixed-loss amount in response to rising costs that have and will continue to impact LTCHs.

Several commenters expressed concern about our proposed use of FY 2021 claims data in determining the outlier fixed-loss amount for LTCH PPS standard Federal payment rate cases. Commenters recommended several alternative data sources or methodologies for calculating the outlier fixed-loss amount that they believed would more accurately reflect the impact of the COVID–19 pandemic on utilization in FY 2023.

The most commonly recommended approach by commenters was to determine the outlier fixed-loss amount as an average of the outlier fixed-loss amounts calculated using both FY 2019 and FY 2021 claims data, thereby incorporating data from one year before the COVID–19 PHE and one year during the COVID–19 PHE. Some commenters believed that this approach would better account for the uncertainty on whether the abnormal levels of charges and costs reflected in the FY 2021 claims data caused by the COVID–19 pandemic will normalize in FY 2023. Another commenter, while suggesting this alternative methodology, expressed its belief that costs in FY 2023 will more closely resemble pre-pandemic costs than what was experienced in FY 2021. Some commenters stated that this approach would be consistent with other FY 2023 proposals aimed to institute stability and predictability in payments from year to year.

Some commenters suggested that CMS use its regulatory authority under the PHE to establish the FY 2023 outlier fixed-loss amount for LTCH PPS standard Federal payment rate cases at the FY 2022 level. Other commenters, while expressing concerns that the FY 2021 claims were atypical, requested CMS to reexamine its methodology and better account for data anomalies.

In its comment letter, MedPAC presented an alternative approach for CMS to consider in which the FY 2023 fixed-loss amount would be established by averaging the outlier fixed-loss amounts calculated with and without COVID–19 cases in the FY 2021 data. MedPAC believes that this approach would be consistent with the approach CMS proposed for calculating the MS–LTC–DRG relative weights and would reflect the assumption that there will be fewer COVID–19 cases in FY 2023 as compared to FY 2021.

Commenters strongly objected to the alternative fixed loss amount we considered in section I.O. of Appendix A of the proposed rule which was calculated using FY 2021 data without any of the methodological changes to account for anticipated declines in COVID–19 cases in FY 2023.

Response: We thank commenters for their feedback. In response to commenters' concerns, we considered recommendations made by commenters on how we could better account for the impact of the COVID–19 PHE on the data used for determining the outlier fixed-loss amount.

We do not agree with commenters who recommend that CMS use it regulatory authority under the PHE to establish an alternative outlier fixed-loss amount or commenters who suggested that CMS lower the outlier-fixed loss amount in response to rising costs at LTCHs. We note that in accordance with § 412.525(a)(2)(ii), which implements section 1886(m)(7)(B) of the Act, CMS must determine a fixed-loss amount for LTCH PPS standard Federal payment rate cases that we project will result in total outlier payments for FY 2023 being equal to 7.975 percent of projected total LTCH PPS payments for LTCH PPS standard Federal payment rate cases. We do not believe that CMS has the statutory authority to establish an outlier fixed-loss amount that does not meet this requirement.

With respect to the commenters who suggested we determine the outlier fixed-loss amount based on an average of the fixed-loss amounts calculated using FY 2019 and FY 2021 data, we continue to recognize that there is uncertainty regarding the utilization and costs that LTCHs will experience in FY 2023. However, based on the information available at this time on the trajectory of the COVID–19 PHE, consistent with the discussion in section I.F. of the preamble to this final rule, we do not believe averaging the fixed-loss amounts calculated using FY 2019 and FY 2021 data is the best approach for determining an outlier fixed-loss amount that will reflect a reasonable estimation of the mix and relative resource use of cases that will be treated at LTCHs in FY 2023. Rather, we believe averaging the outlier-fixed loss thresholds calculated using FY 2021 data including and excluding COVID–19 claims, as suggested by MedPAC, better reflects our belief that it is reasonable to assume there will be fewer COVID–19 hospitalizations among Medicare beneficiaries in LTCHs in FY 2023 than there were in FY 2021 (as discussed in section I.F of the preamble to this final rule). In addition, we agree this approach would be most consistent with the approach we proposed and are finalizing for calculating the MS–LTC–DRG relative weights, as discussed in section VIII.B.3.a. of the preamble to this final rule. As discussed later in this section, we are adopting the approach suggested by MedPAC when determining the FY 2023 outlier fixed loss amount.

With respect to commenters' concerns about data anomalies contributing to a higher outlier fixed-loss amount, we note we recently became aware of an anomaly in the data that contributed to the increase in the proposed outlier fixed-loss amount. Under our existing outlier policy, in general, the CCR from an LTCH's latest settled or tentatively settled cost report is used in determining its outlier payments. In the case of one LTCH, in particular, we observed that its rate-of-charge increases greatly exceed their rate-of-cost increases. In other words, the charges reported on its claims were increasing at a significantly faster pace than their reported costs. Because there is a time lag between the CCR from the latest settled or tentatively settled cost report and current charges, this sizable differential in the rate-of-increases for charges and costs results in CCRs that are too high relative to the actual relationship between the LTCH's charges and costs at the time of the discharge. This in turn results in an overestimation of the LTCH's current costs per case at the time of the discharge, and high amounts of HCO payments. In FY 2021, this LTCH's charges per case increased to extreme levels. In the FY 2021 MedPAR file, we identified over 50 LTCH PPS standard Federal payment rate cases for this LTCH with charges that exceed $9 million. In addition, this LTCH received outlier payments for over 80 percent of its LTCH PPS standard Federal payment rate cases identified in the FY 2021 MedPAR file. As discussed previously, under the HCO policy at § 412.525(a)(4)(iv)(D), the payments for HCO cases are subject to reconciliation (regardless of whether payment is based on the LTCH standard Federal payment rate or the site neutral payment rate). Specifically, any such payments are reconciled at cost report settlement based on the CCR that was calculated for the cost reporting period coinciding with the discharge. Based on information from the provider, we believe that these extreme levels of charges will not persist into FY 2023. For this reason, we do not believe it would be appropriate to include cases for this LTCH (CCN 312024) in our model for determining the FY 2023 outlier fixed-loss amount. Therefore, as discussed later in this section, we are excluding them from our calculations of the FY 2023 outlier fixed-loss amount.

After consideration of all comments received, we are modifying our proposed approach for determining the FY 2023 outlier fixed-loss amount. As discussed, we are adopting the suggested approach to establish the FY 2023 outlier fixed-loss amount based on the average of the outlier-fixed loss thresholds calculated using FY 2021 data including and excluding COVID–19 claims. As discussed, we are also excluding claims from CCN 312024 from the FY 2021 claims data used in determining the FY 2023 outlier fixed-loss amount. As discussed previously, we also are finalizing our proposal to use the charge inflation and CCR adjustment factors determined in the FY 2022 IPPS/LTCH PPS final rule when calculating the FY 2023 outlier fixed-loss amount.

For this final rule, for FY 2023, using the best available data, we calculated a fixed-loss amount that would maintain estimated HCO payments at the projected 7.975 percent of total estimated LTCH PPS payments for LTCH PPS standard Federal payment rate cases (based on the payment rates and policies for these cases presented in this final rule). Based on the full set of LTCH claims

data (including COVID–19 cases) from the March 2022 update of the FY 2021 MedPAR file adjusted for charge inflation and using adjusted CCRs from the March 2022 update of the PSF, we calculated a fixed-loss amount of $37,900. Based on the set of LTCH claims data that excludes COVID–19 cases from the March 2022 update of the FY 2021 MedPAR file adjusted for charge inflation and using adjusted CCRs from the March 2022 update of the PSF, we calculated a fixed-loss amount of $39,135. We identified COVID–19 cases as any claim in the FY 2021 MedPAR file with a principal or secondary diagnosis of COVID–19 (ICD–10–CM diagnosis code U07.1), just as we did for the calculation of the FY 2023 MS–LTC–DRG relative weights. Accordingly, under the broad authority of section 123(a)(1) of the BBRA and section 307(b)(1) of the BIPA, we are establishing a fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2023 of $38,518, which is the average of the fixed-loss amounts calculated from FY 2021 claims data including and excluding COVID–19 cases. We project that this fixed-loss amount will result in estimated outlier payments projected to be equal to 7.975 percent of estimated FY 2023 payments for such cases. We are continuing, as proposed, to make additional HCO payment for the cost of an LTCH PPS standard Federal payment rate case that exceeds the HCO threshold amount that is equal to 80 percent of the difference between the estimated cost of the case and the outlier threshold (the sum of the adjusted LTCH PPS standard Federal payment rate payment and the fixed-loss amount for LTCH PPS standard Federal payment rate cases of $38,518). We note that this revised amount is considerably lower than our proposed fixed-loss amount of $44,182. We also note that if we had not excluded CCN 312024 from our calculations, the averaged fixed-loss amount would have been $39,556.

4. High-Cost Outlier Payments for Site Neutral Payment Rate Cases

When we implemented the application of the site neutral payment rate in FY 2016, in examining the appropriate fixed-loss amount for site neutral payment rate cases issue, we considered how LTCH discharges based on historical claims data would have been classified under the dual rate LTCH PPS payment structure and the CMS' Office of the Actuary projections regarding how LTCHs will likely respond to our implementation of policies resulting from the statutory payment changes. We again relied on these considerations and actuarial projections in FY 2017 and FY 2018 because the historical claims data available in each of these years were not all subject to the LTCH PPS dual rate payment system. Similarly, for FYs 2019 through 2022, we continued to rely on these considerations and actuarial projections because, due to the transitional blended payment policy for site neutral payment rate cases, FY 2018 and FY 2019 claims for these cases were not subject to the full effect of the site neutral payment rate.

For FYs 2016 through 2022, our actuaries projected that the proportion of cases that would qualify as LTCH PPS standard Federal payment rate cases versus site neutral payment rate cases under the statutory provisions would remain consistent with what is reflected in the historical LTCH PPS claims data. Although our actuaries did not project an immediate change in the proportions found in the historical data, they did project cost and resource changes to account for the lower payment rates. Our actuaries also projected that the costs and resource use for cases paid at the site neutral payment rate would likely be lower, on average, than the costs and resource use for cases paid at the LTCH PPS standard Federal payment rate and would likely mirror the costs and resource use for IPPS cases assigned to the same MS–DRG, regardless of whether the proportion of site neutral payment rate cases in the future remains similar to what is found based on the historical data. As discussed in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49619), this actuarial assumption is based on our expectation that site neutral payment rate cases would generally be paid based on an IPPS comparable per diem amount under the statutory LTCH PPS payment changes that began in FY 2016, which, in the majority of cases, is much lower than the payment that would have been paid if these statutory changes were not enacted. In light of these projections and expectations, we discussed that we believed that the use of a single fixed-loss amount and HCO target for all LTCH PPS cases would be problematic.

In addition, we discussed that we did not believe that it would be appropriate for comparable LTCH PPS site neutral payment rate cases to receive dramatically different HCO payments from those cases that would be paid under the IPPS (80 FR 49617 through 49619 and 81 FR 57305 through 57307). For those reasons, we stated that we believed that the most appropriate fixed-loss amount for site neutral payment rate cases for FYs 2016 through 2022 would be equal to the IPPS fixed-loss amount for that particular fiscal year. Therefore, we established the fixed-loss amount for site neutral payment rate cases as the corresponding IPPS fixed-loss amounts for FYs 2016 through 2022. In particular, in FY 2022, we established the fixed-loss amount for site neutral payment rate cases as the FY 2021 IPPS fixed-loss amount of $30,988 (86 FR 45567).

As discussed in section I.F. of the preamble of this final rule, we are finalizing our proposal to use FY 2021 data in the FY 2023 LTCH PPS ratesetting. Section 3711(b)(2) of the CARES Act, which provided a waiver of the application of the site neutral payment rate for LTCH cases admitted during the COVID–19 PHE period, was in effect for the entirety of FY 2021. Therefore, all LTCH PPS cases in FY 2021 were paid the LTCH PPS standard Federal rate regardless of whether the discharge met the statutory patient criteria. Because not all FY 2021 claims in the data used for this final rule were subject to the site neutral payment rate, we continue to rely on the same considerations and actuarial projections used in FYs 2016 through 2022 when developing a fixed-loss amount for site neutral payment rate cases for FY 2023. Our actuaries continue to project that the costs and resource use for FY 2023 cases paid at the site neutral payment rate would likely be lower, on average, than the costs and resource use for cases paid at the LTCH PPS standard Federal payment rate and will likely mirror the costs and resource use for IPPS cases assigned to the same MS–DRG, regardless of whether the proportion of site neutral payment rate cases in the future remains similar to what was found based on the historical data. (Based on the FY 2021 LTCH claims data used in the development of this final rule, if the provisions of the CARES Act had not been in effect, approximately 72 percent of LTCH cases would have been paid the LTCH PPS standard Federal payment rate and approximately 28 percent of LTCH cases would have been paid the site neutral payment rate for discharges occurring in FY 2021.)

For these reasons, we proposed that the most appropriate fixed-loss amount for site neutral payment rate cases for FY 2023 is the IPPS fixed-loss amount for FY 2023. Therefore, consistent with past practice, we proposed that the applicable HCO threshold for site neutral payment rate cases is the sum of the site neutral payment rate for the case and the IPPS fixed-loss amount. That is, we proposed a fixed-loss amount for site neutral payment rate cases of $43,214, which is the same proposed FY 2023 IPPS fixed-loss amount discussed in section II.A.4.j.(1). of the Addendum to the proposed rule. Accordingly, for FY 2023, we proposed to calculate a HCO payment for site neutral payment rate cases with costs that exceed the HCO threshold amount that is equal to 80 percent of the difference between the estimated cost of the case and the outlier threshold (the sum of the site neutral payment rate payment and the fixed-loss amount for site neutral payment rate cases of $43,214).

Comment: Some commenters opposed the proposed fixed-loss amount for site neutral payment rate cases. A commenter stated that increases in the fixed-loss amount for site neutral payment rate cases should be limited to no more than the market basket percent increase. Other commenters stated that CMS should calculate the fixed-loss amount for site neutral payment rate cases using a combination of FY 2019 and FY 2021 data.

Response: As stated earlier, our actuaries continue to project that site neutral payment rate cases in FY 2023 will mirror an IPPS case paid under the same MS–DRG. That is, our actuaries continue to project that the costs and resource use for FY 2023 cases paid at the site neutral payment rate would likely be lower, on average, than the costs and resource use for cases paid at the LTCH PPS standard Federal payment rate and will likely mirror the costs and resource use for IPPS cases assigned to the same MS DRG, on average, regardless of whether the proportion of site neutral payment rate cases in the future remains similar to what was found based on the historical data. For these reasons, we continue to believe that the most appropriate fixed-loss amount for site neutral payment rate cases for FY 2023 is the IPPS fixed-loss amount for FY 2023. With respect to comments on the data used in determining the site neutral fixed-loss amount, we refer the reader to section II.A.4. of the addendum to this final rule for a complete summary and

response to comments received on our proposed use of FY 2021 data and our proposed modifications to our usual methodology when determining the FY 2023 outlier fixed-loss amounts for IPPS cases, which as described later in this section, is the same as the site neutral fixed-loss amount.

In this final rule, after considering public comments on our proposals, we are finalizing our proposals as described previously, without modification. Therefore, for FY 2023, as we proposed, we are establishing that the applicable HCO threshold for site neutral payment rate cases is the sum of the site neutral payment rate for the case and the IPPS fixed loss amount. That is, we are establishing a fixed-loss amount for site neutral payment rate cases of $38,859, which is the same FY 2023 IPPS fixed loss amount discussed in section II.A.4.j.(1). of the Addendum to this final rule. Accordingly, under this policy, for FY 2023, we will calculate a HCO payment for site neutral payment rate cases with costs that exceed the HCO threshold amount, which is equal to 80 percent of the difference between the estimated cost of the case and the outlier threshold (the sum of site neutral payment rate payment and the fixed loss amount) for site neutral payment rate cases of $38,859.

In establishing a HCO policy for site neutral payment rate cases, we proposed a budget neutrality adjustment under § 412.522(c)(2)(i). We proposed this requirement because we believed, and continue to believe, that the HCO policy for site neutral payment rate cases should be budget neutral, just as the HCO policy for LTCH PPS standard Federal payment rate cases is budget neutral, meaning that estimated site neutral payment rate HCO payments should not result in any change in estimated aggregate LTCH PPS payments.

To ensure that estimated HCO payments payable to site neutral payment rate cases in FY 2023 would not result in any increase in estimated aggregate FY 2023 LTCH PPS payments, under the budget neutrality requirement at § 412.522(c)(2)(i), it is necessary to reduce site neutral payment rate payments by 5.1 percent to account for the estimated additional HCO payments payable to those cases in FY 2023. Consistent with our historical practice, we proposed continuing this policy.

As discussed earlier, consistent with the IPPS HCO payment threshold, we estimate the proposed fixed-loss threshold would result in FY 2023 HCO payments for site neutral payment rate cases to equal 5.1 percent of the site neutral payment rate payments that are based on the IPPS comparable per diem amount. As such, to ensure estimated HCO payments payable for site neutral payment rate cases in FY 2023 would not result in any increase in estimated aggregate FY 2023 LTCH PPS payments, under the budget neutrality requirement at § 412.522(c)(2)(i), it is necessary to reduce the site neutral payment rate amount paid under § 412.522(c)(1)(i) by 5.1 percent to account for the estimated additional HCO payments payable for site neutral payment rate cases in FY 2023. To achieve this, for FY 2023, we proposed applying a budget neutrality factor of 0.949 (that is, the decimal equivalent of a 5.1 percent reduction, determined as 1.0 − 5.1/100 = 0.949) to the site neutral payment rate for those site neutral payment rate cases paid under § 412.522(c)(1)(i). We proposed that, consistent with our current policy, this HCO budget neutrality adjustment would not be applied to the HCO portion of the site neutral payment rate amount (81 FR 57309).

Comment: A commenter, in keeping with comments we have received since the inception of the dual rate payment system that created the site neutral payment rate, objected to the proposed site neutral payment rate HCO budget neutrality adjustment. The commenter's objection continues to be based on the belief that, because the IPPS base rates used in the IPPS comparable per diem amount calculation of the site neutral payment rate include a budget neutrality adjustment for IPPS HCO payments (for example, a 5.1 percent adjustment on the operating IPPS standardized amount), a ''second'' budget neutrality factor is unnecessary and duplicative.

Response: We continue to disagree with the commenters that a budget neutrality adjustment for site neutral payment rate HCO payments is unnecessary or duplicative. We have stated such disagreement during each previous rulemaking cycle. We refer readers to 84 FR 42648 through 42649, 83 FR 41737 through 41738, 82 FR 38545 through 38546, 81 FR 57308 through 57309, and 80 FR 49621 through 49622 for a more detailed discussion in response to such comments.

After consideration of public comments, for the reasons discussed previously, we are adopting our proposed site neutral payment rate HCO budget neutrality adjustment as final without modification. Specifically, for FY 2023, as we proposed, we are applying a budget neutrality factor of 0.949 (that is, the decimal equivalent of a 5.1 percent reduction, determined as 1.0 − 5.1/100 = 0.949) to the site neutral payment rate for those site neutral payment rate cases paid under § 412.522(c)(1)(i). We note that, consistent with our current policy, this HCO budget neutrality adjustment will not apply to the HCO portion of the site neutral payment rate amount.

E. Update to the IPPS Comparable Amount To Reflect the Statutory Changes to the IPPS DSH Payment Adjustment Methodology

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50766), we established a policy to reflect the changes to the Medicare IPPS DSH payment adjustment methodology made by section 3133 of the Affordable Care Act in the calculation of the ''IPPS comparable amount'' under the SSO policy at § 412.529 and the ''IPPS equivalent amount'' under the site neutral payment rate at § 412.522. Historically, the determination of both the ''IPPS comparable amount'' and the ''IPPS equivalent amount'' includes an amount for inpatient operating costs ''for the costs of serving a disproportionate share of low-income patients.'' Under the statutory changes to the Medicare DSH payment adjustment methodology that began in FY 2014, in general, eligible IPPS hospitals receive an empirically justified Medicare DSH payment equal to 25 percent of the amount they otherwise would have received under the statutory formula for Medicare DSH payments prior to the amendments made by the Affordable Care Act. The remaining amount, equal to an estimate of 75 percent of the amount that otherwise would have been paid as Medicare DSH payments, reduced to reflect changes in the percentage of individuals who are uninsured and any additional statutory adjustment, is made available to make additional payments to each hospital that qualifies for Medicare DSH payments and that has uncompensated care. The additional uncompensated care payments are based on the hospital's amount of uncompensated care for a given time period relative to the total amount of uncompensated care for that same time period reported by all IPPS hospitals that receive Medicare DSH payments.

To reflect the statutory changes to the Medicare DSH payment adjustment methodology in the calculation of the ''IPPS comparable amount'' and the ''IPPS equivalent amount'' under the LTCH PPS, we stated that we will include a reduced Medicare DSH payment amount that reflects the projected percentage of the payment amount calculated based on the statutory Medicare DSH payment formula prior to the amendments made by the Affordable Care Act that will be paid to eligible IPPS hospitals as empirically justified Medicare DSH payments and uncompensated care payments in that year (that is, a percentage of the operating Medicare DSH payment amount that has historically been reflected in the LTCH PPS payments that are based on IPPS rates). We also stated that the projected percentage will be updated annually, consistent with the annual determination of the amount of uncompensated care payments that will be made to eligible IPPS hospitals. We believe that this approach results in appropriate payments under the LTCH PPS and is consistent with our intention that the ''IPPS comparable amount'' and the ''IPPS equivalent amount'' under the LTCH PPS closely resemble what an IPPS payment would have been for the same episode of care, while recognizing that some features of the IPPS cannot be translated directly into the LTCH PPS (79 FR 50766 through 50767).

For FY 2023, as discussed in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28694) and in greater detail in section V.E.4.b. of the preamble of this final rule, based on the most recent data available, our estimate of 75 percent of the amount that would otherwise have been paid as Medicare DSH payments (under the methodology outlined in section 1886(r)(2) of the Act) is adjusted to 65.71 percent of that amount to reflect the change in the percentage of individuals who are uninsured. The resulting amount is then used to determine the amount available to make uncompensated care payments to eligible IPPS hospitals in FY 2023. In other words, the amount of the Medicare DSH payments that would have been made prior to the amendments made by the Affordable Care Act is adjusted to 49.28 percent (the product of 75 percent and 65.71 percent) and the resulting amount is used to calculate the uncompensated care payments to eligible hospitals. As a result, for FY 2023, we

projected that the reduction in the amount of Medicare DSH payments pursuant to section 1886(r)(1) of the Act, along with the payments for uncompensated care under section 1886(r)(2) of the Act, will result in overall Medicare DSH payments of 74.28 percent of the amount of Medicare DSH payments that would otherwise have been made in the absence of the amendments made by the Affordable Care Act (that is, 25 percent + 49.28 percent = 74.28 percent).

Therefore, for FY 2023, in the FY 2023 IPPS/LTCH PPS proposed rule, we proposed to establish that the calculation of the ''IPPS comparable amount'' under § 412.529 would include an applicable operating Medicare DSH payment amount that is equal to 74.28 percent of the operating Medicare DSH payment amount that would have been paid based on the statutory Medicare DSH payment formula absent the amendments made by the Affordable Care Act. Furthermore, consistent with our historical practice, we proposed that if more recent data became available, we would use that data to determine this factor in the final rule.

We did not receive any public comments in response to our proposal. In addition, there are no more recent data available to use that would affect the calculations determined in the proposed rule. Therefore, we are finalizing our proposal that, for FY 2023, the calculation of the ''IPPS comparable amount'' under § 412.529 would include an applicable operating Medicare DSH payment amount that is equal to 74.28 percent of the operating Medicare DSH payment amount that would have been paid based on the statutory Medicare DSH payment formula absent the amendments made by the Affordable Care Act.

F. Computing the Adjusted LTCH PPS Federal Prospective Payments for FY 2023

Section 412.525 sets forth the adjustments to the LTCH PPS standard Federal payment rate. Under the dual rate LTCH PPS payment structure, only LTCH PPS cases that meet the statutory criteria to be excluded from the site neutral payment rate are paid based on the LTCH PPS standard Federal payment rate. Under § 412.525(c), the LTCH PPS standard Federal payment rate is adjusted to account for differences in area wages by multiplying the labor-related share of the LTCH PPS standard Federal payment rate for a case by the applicable LTCH PPS wage index (the proposed FY 2023 values are shown in Tables 12A through 12B listed in section VI. of the Addendum to this final rule and are available via the internet on the CMS website). The LTCH PPS standard Federal payment rate is also adjusted to account for the higher costs of LTCHs located in Alaska and Hawaii by the applicable COLA factors (the final FY 2023 factors are shown in the chart in section V.C. of this Addendum) in accordance with § 412.525(b). In this final rule, we are establishing an LTCH PPS standard Federal payment rate for FY 2023 of $46,432.77 as discussed in section V.A. of the Addendum to this final rule. We illustrate the methodology to adjust the LTCH PPS standard Federal payment rate for FY 2023, applying our finalized LTCH PPS amounts for the standard Federal payment rate, MS–LTC–DRG relative weights, and wage index in the following example:

Example:

During FY 2023, a Medicare discharge that meets the criteria to be excluded from the site neutral payment rate, that is, an LTCH PPS standard Federal payment rate case, is from an LTCH that is located in CBSA 16984, which has a FY 2023 LTCH PPS wage index value of 1.0437 (as shown in Table 12A listed in section VI. of the Addendum to this final rule). The Medicare patient case is classified into proposed MS–LTC–DRG 189 (Pulmonary Edema & Respiratory Failure), which has a relative weight for FY 2023 of 0.9606 (as shown in Table 11 listed in section VI. of the Addendum to this final rule). The LTCH submitted quality reporting data for FY 2023 in accordance with the LTCH QRP under section 1886(m)(5) of the Act.

To calculate the LTCH's total adjusted Federal prospective payment for this Medicare patient case in FY 2023, we computed the wage-adjusted Federal prospective payment amount by multiplying the unadjusted FY 2023 LTCH PPS standard Federal payment rate ($46,432.77) by the labor-related share (0.680 percent) and the wage index value (1.0437). This wage-adjusted amount was then added to the proposed nonlabor-related portion of the unadjusted proposed LTCH PPS standard Federal payment rate (0.320 percent; adjusted for cost of living, if applicable) to determine the adjusted LTCH PPS standard Federal payment rate, which is then multiplied by the MS–LTC–DRG relative weight (0.9606) to calculate the total adjusted LTCH PPS standard Federal prospective payment for FY 2023 ($45,928.75). The table illustrates the components of the calculations in this example.

Unadjusted LTCH PPS Standard Federal Prospective Payment Rate	$46,432.77
Labor-Related Share	x 0.68
Labor-Related Portion of the LTCH PPS Standard Federal Payment Rate	= $31,574.28
Wage Index (CBSA 16984)	x 1.0437
Wage-Adjusted Labor Share of the LTCH PPS Standard Federal Payment Rate	= $32,954.08
Nonlabor-Related Portion of the LTCH PPS Standard Federal Payment Rate ($46,432.77 x 0.32)	+ $14,858.49
Adjusted LTCH PPS Standard Federal Payment Amount	= $47,812.57
MS-LTC-DRG 189 Relative Weight	x 0.9606
Total Adjusted LTCH PPS Standard Federal Prospective Payment	= $45,928.75

VI. Tables Referenced in This Final Rule Generally Available Through the Internet on the CMS Website

This section lists the tables referred to throughout the preamble of this final rule and in the Addendum. In the past, a majority of these tables were published in the **Federal Register** as part of the annual proposed and final rules. However, similar to FYs 2012 through 2022, for the FY 2023 rulemaking cycle, the IPPS and LTCH PPS tables will not be published in the **Federal Register** in the annual IPPS/LTCH PPS proposed and final rules and will be available through the internet. Specifically, all IPPS tables listed in the final rule, with the exception of IPPS Tables 1A, 1B, 1C, and 1D, and LTCH PPS Table 1E, will generally be available through the internet. IPPS Tables 1A, 1B, 1C, and 1D, and LTCH PPS Table 1E are displayed at the end of this section and will continue to be published in the **Federal Register** as part of the annual proposed and final rules. For additional discussion of the information included in the IPPS and LTCH PPS tables associated with the IPPS/LTCH PPS proposed and final rules, as well as prior changes to the information included in these tables, we refer readers to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45569 through 45571).

In addition, under the HAC Reduction Program, established by section 3008 of the Affordable Care Act, a hospital's total payment may be reduced by 1 percent if it is in the lowest HAC performance quartile. The hospital-level data for the FY 2023 HAC Reduction Program will be made publicly available once it has undergone the review and corrections process.

In the FY 2023 IPPS/LTCH proposed rule (87 FR 28695), we noted that Tables 7A and 7B historically contained the Medicare prospective payment system selected percentile lengths of stay for the MS–DRGs for the prior year and upcoming fiscal year. As discussed in section II.E of the FY 2023 IPPS/LTCH proposed rule (87 FR 28197—28204), we proposed to determine the MS–DRG relative weights for FY 2023 by averaging the relative weights as calculated with and without COVID–19 cases in the FY 2021 data. Because we proposed to use MS–DRG weights based on an average of the relative weights, we stated that the percentile lengths of stay, which are based on separate sets of MS–DRG relative weights prior to averaging are not applicable to the proposed averaged MS–DRG relative weights for FY 2023. The separate percentile lengths of stay statistics are only applicable to the relative weights as calculated with and without COVID–19 cases. Additionally, we also stated that unlike the other files listed as tables in this section of the final rule that typically

contain information/variables relating to a hospital's IPPS claim for payment, Tables 7A and 7B are informational files containing percentile lengths of stay that are not used for claim payment. Therefore, in the FY 2023 IPPS/LTCH proposed rule (87 FR 28695), beginning with the FY 2023 IPPS/LTCH PPS proposed rule, we proposed to instead provide the percentile length of stay information previously included in Tables 7A and 7B in the supplemental AOR/BOR data file, as described in section XII.A. of this final rule, which contains additional data relevant to the MS–DRG relative weights. For FY 2023, because we proposed to average the relative weights, in the proposed rule we provided an AOR/BOR file for the relative weights calculated with COVID–19 cases in the December 2021 update of the FY 2021 MedPAR file and an AOR/BOR file for the relative weights calculated without COVID–19 cases in the December 2021 update of the FY 2021 MedPAR file (we note, for this final rule we used the March 2022 update of the FY 2021 MedPAR file). Therefore, instead of including the percentile lengths of stay that are typically in Tables 7A and 7B (that is, for the proposed rule, the selected percentile lengths of stay based on the MedPAR data and MS–DRGs for the prior year and upcoming fiscal year (for FY 2023, this would be the version 40 GROUPER and version 39 GROUPER)) we proposed to include this statistical information in the AOR/BOR File for the relative weights as calculated with and without COVID–19 cases. The AOR/BOR files can be found on the FY 2023 IPPS final rule home page on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*. We note, as discussed in section II.E of this final rule, after consideration of the public comments, we are finalizing our proposal to determine the MS–DRG relative weights for FY 2023 by averaging the relative weights as calculated with and without COVID–19 cases in the FY 2021 data.

We did not receive any comments on our proposal previously noted. Therefore, we are finalizing as proposed without modification that beginning with the FY 2023 IPPS/LTCH PPS proposed and final rules, to provide the percentile length of stay information previously included in Tables 7A and 7B in the supplemental AOR/BOR data file.

For this FY 2023 IPPS/LTCH final rule, because we are finalizing to average the relative weights, similar to the proposed rule, we are providing an AOR/BOR file for the relative weights calculated with COVID–19 cases in the March 2022 update of the FY 2021 MedPAR file and an AOR/BOR file for the relative weights calculated without COVID–19 cases in the March 2022 update of the FY 2021 MedPAR file. Both of these files will include the percentile lengths of stay that were typically in Tables 7A and 7B.

As was the case for the FY 2022 IPPS/LTCH PPS proposed and final rules, we are no longer including Table 15, which had typically included the fiscal year readmissions payment adjustment factors because hospitals have not yet had the opportunity to review and correct the data before the data are made public under our policy regarding the reporting of hospital-specific data. After hospitals have been given an opportunity to review and correct their calculations for FY 2023, we will post Table 15 (which will be available via the internet on the CMS website) to display the final FY 2023 readmissions payment adjustment factors that will be applicable to discharges occurring on or after October 1, 2022. We expect Table 15 will be posted on the CMS website in the fall of 2022.

Readers who experience any problems accessing any of the tables that are posted on the CMS websites identified in this final rule should contact Michael Treitel at (410) 786–4552.

The following IPPS tables for this final rule are generally available through the internet on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*. Click on the link on the left side of the screen titled ''FY 2023 IPPS Final Rule Home Page'' or ''Acute Inpatient-Files-for Download.'' We refer readers to section I.O. of the Appendix A of this final rule for a discussion of the supplemental data files we are making available based on the use of the FY 2021 data without the modifications to our usual methodologies for the calculation of the FY 2023 MS–DRG and MS–LTC–DRG relative weights or our usual methodologies for the determination of the FY 2023 outlier fixed-loss amount for IPPS cases and LTCH PPS standard Federal payment rate cases for this FY 2023 ratesetting, which we are also making available on the CMS website.

	Rates if Wage Index Greater Than 1		Hospital is a Meaningful EHR User and Wage Index Less Than or Equal to 1 (Update = 3.8)		Hospital is NOT a Meaningful EHR User and Wage Index Less Than or Equal to 1 (Update = 1.75)	
	Labor	Nonlabor	Labor	Nonlabor	Labor	Nonlabor
National[1]	Not Applicable	Not Applicable	$3,952.96	$2,422.78	$3,874.89	$2,374.93

[1] For FY 2023, there are no CBSAs in Puerto Rico with a national wage index greater than 1.

TABLE 1D.—CAPITAL STANDARD FEDERAL PAYMENT RATE—FY 2023

	Rate
National	$483.76

TABLE 1E.—LTCH PPS STANDARD FEDERAL PAYMENT RATE--FY 2023

	Full Update (3.8 Percent)	Reduced Update* (1.8 Percent)
Standard Federal Rate	$46,432.77	$45,538.11

* For LTCHs that fail to submit quality reporting data for FY 2023 in accordance with the LTCH Quality Reporting Program (LTCH QRP), the annual update is reduced by 2.0 percentage points as required by section 1886(m)(5) of the Act.

Appendix A: Economic Analyses

I. Regulatory Impact Analysis

A. Statement of Need

This final rule is necessary in order to make payment and policy changes under the IPPS for Medicare acute care hospital inpatient services for operating and capital-related costs as well as for certain hospitals and hospital units excluded from the IPPS. This final rule also is necessary to make payment and policy changes for Medicare hospitals under the LTCH PPS. Also, as we note later in this Appendix, the primary objective of the IPPS and the LTCH PPS is to create incentives for hospitals to operate efficiently and minimize unnecessary costs, while at the same time ensuring that payments are sufficient to adequately compensate hospitals for their legitimate costs in delivering necessary care to Medicare beneficiaries. In addition, we share national goals of preserving the Medicare Hospital Insurance Trust Fund.

We believe that the changes in this final rule, such as the updates to the IPPS and LTCH PPS rates, and the final policies and discussions relating to applications for new technology add-on payments, are needed to further each of these goals while maintaining the financial viability of the hospital industry and ensuring access to high quality health care for Medicare beneficiaries.

We expect that these changes will ensure that the outcomes of the prospective payment systems are reasonable and provide equitable payments, while avoiding or minimizing unintended adverse consequences.

1. Acute Care Hospital Inpatient Prospective Payment System (IPPS)

a. Update to the IPPS Payment Rates

In accordance with section 1886(b)(3)(B) of the Act and as described in section V.A. of the preamble to this final rule, we updated the national standardized amount for inpatient hospital operating costs by the applicable percentage increase of 3.8 percent (that is, a 4.1 percent market basket update with a reduction of 0.3 percentage point for the productivity adjustment) and by a 0.5 percentage point adjustment required under section 414 of the MACRA. We are also applying the applicable percentage increase (including the market basket update and the productivity adjustment) to the hospital-specific rates.

Hospitals that do not submit quality information under rules established by the Secretary and that are meaningful EHR users under section 1886(b)(3)(B)(ix) of the Act would receive an applicable percentage increase of 2.775 percent. Hospitals that are identified as not meaningful EHR users and do submit quality information under section 1886(b)(3)(B)(viii) of the Act would receive an applicable percentage increase of 0.725 percent.

Hospitals that are identified as not meaningful EHR users under section 1886(b)(3)(B)(ix) of the Act and also do not submit quality data under section 1886(b)(3)(B)(viii) of the Act will receive an applicable percentage increase of −0.3 percent, which reflects a one-quarter percent reduction of the market basket update for failure to submit quality data and a three-quarter percent reduction of the market basket update for being identified as not a meaningful EHR user.

b. Use of FY 2021 Data in the FY 2023 IPPS and LTCH PPS Ratesetting

As discussed in section I.A. of the preamble of this final rule, we believe that it is reasonable to assume that some Medicare beneficiaries will continue to be hospitalized with COVID–19 at IPPS hospitals and LTCHs in FY 2023. Accordingly, we believe it is appropriate to use FY 2021 data, specifically the FY 2021 MedPAR claims file and the FY 2020 HCRIS dataset (which contains data from many cost reports ending in FY 2021 based on each hospital's cost reporting period) as the most recent available data during the period of the COVID–19 PHE, for purposes of the FY 2023 IPPS and LTCH PPS ratesetting. However, we also believe it is reasonable to assume based on the information available at this time that there will be fewer COVID 19 hospitalizations in FY 2023 than in FY 2021 given the more recent trends in the CDC hospitalization data since the Omicron variant peak in January, 2022. Accordingly, because we anticipate Medicare inpatient hospitalizations for COVID–19 will continue in FY 2023 but at a lower level, we are using FY 2021 data for purposes of the FY 2023 IPPS and LTCH PPS ratesetting but with modifications to our usual ratesetting methodologies to account for the anticipated decline in COVID–19 hospitalizations of Medicare beneficiaries at IPPS hospitals and LTCHs as compared to FY 2021.

First, we are modifying the calculation of the FY 2023 MS–DRG and MS LTC DRG relative weights. The final policy to modify the methodology for determining the FY 2023 IPPS MS–DRG relative weights is discussed in section II.E. of the preamble of this final rule. The final policy to modify the methodology for determining the FY 2023 LTCH PPS MS–LTC–DRG relative weights is discussed in greater detail in section VIII.B. of the preamble of this final rule. This modification primarily impacts MS–DRGs and MS–LTC DRGs with larger numbers of COVID–19 cases, for example MS–DRG 870 (Septicemia or Severe Sepsis with MV >96 hours). IPPS hospitals that disproportionately treat high numbers of COVID–19 cases will generally see increased non-outlier payments compared to what those payments would have been had we excluded the COVID–19 cases entirely, and lower payments compared to if we had not made any modifications to our usual methodology for calculating the relative weights. This final policy reflects our belief that there will be fewer COVID–19 cases in FY 2023 than in FY 2021, but there will still be COVID–19 cases in FY 2023.

Second, we also are modifying our methodologies for determining the FY 2023 outlier fixed-loss amount for IPPS cases and LTCH PPS standard Federal payment rate cases. The final policy to modify the methodology for determining the FY 2023 outlier fixed-loss amounts for IPPS cases is discussed in section II.A.4. of the Addendum to this final rule. The final policy to modify the methodology for determining the FY 2023 outlier fixed loss amounts for LTCH PPS standard Federal payment rate cases is discussed in section V.D.3. of the Addendum to this final rule. This modification has a greater impact on hospitals with larger numbers of outlier cases. IPPS hospitals that receive outlier payments will see lower outlier payments compared to what those payments would have been had we excluded the COVID–19 cases entirely, and higher outlier payments compared to if we had not made any modifications to our usual methodology for calculating the outlier fixed loss amount. Again, this final policy reflects our belief that there will be fewer COVID–19 cases in FY 2023 than in FY 2021, but there will still be COVID–19 cases in FY 2023.

c. Cap on Reductions in Medicare Severity Diagnosis-Related Group (MS–DRG) Relative Weights

As described in section II.E.2. of the preamble of this final rule, we have further considered requests made by commenters that we address year-to-year fluctuations in relative weights, particularly for low volume MS–DRGs, and to mitigate the financial impacts of significant fluctuations. As described in section II.E.2. of this final rule, for these low volume MS–DRGs, fluctuations in the volume or mix of cases and/or the presence of a few high cost or low cost cases can have a disproportionate impact on the calculated relative weight, thus resulting in greater year-to-year variation in the relative weights for these MS–DRGs. Consistent with

our statutory authority under section 1886(d)(4)(B) and (C) of the Act to assign and update appropriate weighting factors, beginning in FY 2023, we are finalizing a permanent 10-percent cap on the reduction in a MS–DRG's relative weight in a given fiscal year. This final policy is consistent with our general authority to assign and update appropriate weighting factors as part of our annual reclassifications of the MS–DRGs and recalibration of the relative weights under sections 1886(d)(4)(B) and (C)(i) of the Act, as well as the requirements of section 1886(d)(4)(C)(iii) of the Act, which specifies that the annual DRG reclassification and recalibration of the relative weights be made in a manner that ensures that aggregate payments to hospitals are not affected. In addition, we have authority to implement this cap and the associated budget neutrality adjustment under our special exceptions and adjustments authority at section 1886(d)(5)(I)(i) of the Act, which similarly gives the Secretary broad authority to provide by regulation for such other exceptions and adjustments to the payment amounts under section 1886(d) of the Act as the Secretary deems appropriate. For the vast majority of hospitals, the impact of the 10-percent cap, inclusive of the budget neutrality factor, is less than 0.1 percent. We note that the impact of not finalizing a 10-percent cap for FY 2023, or finalizing a higher cap, such as 15 or 20 percent, would be most marked for hospitals whose case mix includes more MS–DRGs experiencing reductions of greater than 10-percent for FY 2023. The impact of finalizing a lower cap, such as 5 percent, would be increases to hospitals whose case mix includes more MS–DRGs experiencing reductions of between 5 and 10 percent, with a corresponding increase in the budget neutrality adjustment for all hospitals.

d. Add-On Payments for New Services and Technologies

Consistent with sections 1886(d)(5)(K) and (L) of the Act, CMS reviews applications for new technology add-on payments based on the eligibility criteria at 42 CFR 412.87. As set forth in 42 CFR 412.87(e)(1), CMS considers whether a technology meets the criteria for the new technology add-on payment and announces the results as part of its annual updates and changes to the IPPS.

(1) Proposal To Use National Drug Codes (NDCs) for Identification of Certain Therapeutic Agents Approved for New Technology Add-On Payment

In section II.F.8. of the preamble of this final rule, we detail our proposal to use National Drug Codes (NDCs) to identify cases involving use of therapeutic agents approved for new technology add-on payments, and discuss comments received. After consideration of the comments received, including concerns that our proposed use of NDCs for this purpose may impose new administrative burdens to hospitals, we are not finalizing this proposal, and will instead reassess this policy proposal in future rulemaking.

(2) Publicly Post Applications for New Technology Add-On Payments

As discussed in section II.F.9. of the preamble of this final rule, beginning with the FY 2024 application cycle for new technology add-on payments, we are finalizing our proposal to publicly post online the completed application forms and certain related materials, including updated application information submitted subsequent to the initial application submission, with the exception of cost and volume information and certain additional information and materials, as discussed more fully in section II.F.9. of the preamble of this final rule. We have received requests from the public to access and review the new technology add-on payment applications to further facilitate comment on whether a technology meets the new technology add-on payment criteria. Making this information publicly available may also foster greater input from interested parties based on their review of the completed application forms and related materials.

Additionally, we believe that posting the applications online will reduce the risk that we may inadvertently omit or misrepresent relevant information submitted by applicants, or are perceived as misrepresenting such information, in our summaries in the rules. It also will streamline our evaluation process, including the identification of critical questions in the proposed rule, particularly as the number and complexity of the applications have been increasing over time. That is, by making the applications available to the public online, we will afford more time for CMS to process and analyze the supporting data and evidence rather than reiterate parts of the application in the rule.

e. Permanent Cap on Wage Index Decreases

Consistent with section 1886(d)(3)(E) of the Act, we adjust the IPPS standardized amounts for area differences in hospital wage levels by a factor (established by the Secretary) reflecting the relative hospital wage level in the geographic area of the hospital compared to the national average hospital wage level and update the wage index annually based on a survey of wages and wage-related costs of short-term, acute care hospitals. As described in section III.N. of the preamble of this final rule, we have further considered the comments we received during the FY 2022 rulemaking recommending a permanent 5-percent cap policy to prevent large year-to-year variations in wage index values as a means to reduce overall volatility for hospitals. Under the authority at sections 1886(d)(3)(E) and 1886(d)(5)(I)(i) of the Act, for FY 2023 and subsequent years, we proposed to apply a 5-percent cap on any decrease to a hospital's wage index from its wage index in the prior FY, regardless of the circumstances causing the decline. That is, we proposed that a hospital's wage index for FY 2023 would not be less than 95 percent of its final wage index for FY 2022, and that for subsequent years, a hospital's wage index would not be less than 95 percent of its final wage index for the prior FY. We also proposed to apply the proposed wage index cap policy in a budget neutral manner through a national adjustment to the standardized amount under our authority in sections 1886(d)(3)(E) and 1886(d)(5)(I)(i) of the Act. As described in section III.N. of the preamble of this final rule, after consideration of the public comments received, we are finalizing these proposals without modification.

We note that the impact of not finalizing a 5 percent cap, or finalizing a higher cap, such as 10 percent, would be most marked for hospitals who have wage index changes of greater than 5 percent but less than the selected cap level, if any, in a given fiscal year. For example, in FY 2023 if the cap were 10 percent instead of 5 percent, approximately 12 hospitals would qualify vs approximately 125 hospitals under our adopted policy. The impact of finalizing a lower cap would be increases in payment to hospitals with wage index changes between a lower level and 5 percent, with a corresponding increase in the size of the budget neutrality adjustment for all hospitals.

f. Continuation of the Low Wage Index Hospital Policy

To help mitigate wage index disparities between high wage and low wage hospitals, in the FY 2020 IPPS/LTCH PPS rule (84 FR 42326 through 42332), we adopted a policy to increase the wage index values for certain hospitals with low wage index values (the low wage index hospital policy). This policy was adopted in a budget neutral manner through an adjustment applied to the standardized amounts for all hospitals. We also indicated our intention that this policy would be effective for at least 4 years, beginning in FY 2020, in order to allow employee compensation increases implemented by these hospitals sufficient time to be reflected in the wage index calculation. As discussed in section III.G.4. of the preamble of this final rule, for FY 2023, we are continuing the low wage index hospital policy, and are also applying this policy in a budget neutral manner by applying an adjustment to the standardized amounts.

g. Application of the Rural Floor

As discussed in section III.G.1. of the preamble of this final rule, based on the district court's decision in *Citrus HMA, LLC, d/b/a Seven Rivers Regional Medical Center* v. *Becerra,* No. 1:20–cv–00707 (D.D.C.) and the comments we received, we are not finalizing our rural floor wage index policy as proposed, which would have excluded § 412.103 hospitals from the calculation of the rural floor and from the calculation of ''the wage index for rural areas in the State in which the county is located'' as referred to in section 1886(d)(8)(C)(iii) of the Act. Rather, we are finalizing a policy that calculates the rural floor as it was calculated before FY 2020. For FY 2023 and subsequent years, we are finalizing a policy to include the wage data of hospitals that have reclassified from urban to rural under section 1886(d)(8)(E) of the Act (as implemented in the regulations at § 412.103) and have no additional form of reclassification (MGCRB or Lugar) in the calculation of the rural floor, and to include the wage data of such hospitals in the calculation of ''the wage index for rural areas in the State in which the county is located'' as referred to in section 1886(d)(8)(C)(iii) of the Act.

The rural floor, which is budget neutral overall, increases payments to urban

hospitals whose wage index would otherwise be below the rural floor for their state. The policy we are adopting in section III.G.1. of the preamble of this final rule increases the rural floor in some states (for example, Arizona, Utah). This will generally increase payments to some urban hospitals in those states because their wage index will be higher than it otherwise would have been in the absence of this change. After application of the rural floor, we reduce the wage index of all hospitals by applying a budget neutrality factor to offset the increased payments. We note that there is either no increase in the rural floor or the increase in the rural floor is nominal in the majority of states, and the majority of hospitals will only experience payment decreases due to the effect of the increase in the budget neutrality adjustment.

h. Payment Adjustment for Medicare Disproportionate Share Hospitals (DSHs)

In this final rule, as required by section 1886(r)(2) of the Act, we are updating our estimates of the three factors used to determine uncompensated care payments for FY 2023. We are finalizing our proposal to adopt a multiyear averaging methodology to determine Factor 3 of the uncompensated care payment methodology, which will help to mitigate against large fluctuations in uncompensated care payments from year to year. Specifically, we are using a 2-year average of audited data on uncompensated care costs from Worksheet S–10 from the FY 2018 and FY 2019 cost reports to calculate Factor 3 for FY 2023 for all eligible hospitals, including Indian Health Service (IHS) and Tribal hospitals and hospitals located in Puerto Rico. In addition, for FY 2024 and subsequent fiscal years, we will determine Factor 3 for all eligible hospitals using a 3-year average of the data on uncompensated care costs from Worksheet S–10 for the 3 most recent fiscal years for which audited data are available.

We recognize that discontinuing the use of the low-income insured days proxy to calculate Factor 3 in the uncompensated care payment methodology for IHS and Tribal hospitals and Puerto Rico hospitals could result in a significant financial disruption for these hospitals. Accordingly, we are also finalizing our proposal to use our authority under section 1886(d)(5)(I) of the Act to establish a new supplemental payment for these hospitals for FY 2023 and subsequent fiscal years. Refer to section I.H.2. of this Appendix for additional analysis on this new supplemental payment for FY 2023.

In the FY 2023 IPPS/LTCH PPS proposed rule, we proposed to revise our regulation governing the calculation of the Medicaid fraction of the DSH calculation with respect to the treatment of section 1115 demonstration days. As discussed in section IV.F. of the preamble of this final rule, we are not moving forward with the proposed revisions to the regulations relating to the treatment of section 1115 demonstration days for purposes of the DSH adjustment in this final rule. We expect to revisit the issue of section 1115 demonstration days in future rulemaking, and we encourage interested parties to review any future proposal on this issue and to submit their comments at that time.

i. Effects of Implementation of the Rural Community Hospital Demonstration Program in FY 2023

The Rural Community Hospital Demonstration (RCHD) was authorized originally for a 5-year period by section 410A of the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (MMA) (Pub. L. 108–173), and it was extended for another 5-year period by section 3123 and 10313 of the Affordable Care Act (Pub. L. 111–148). Section 15003 of the 21st Century Cures Act (Cures Act) (Pub. L. 114–255) extended the demonstration for an additional 5-year period, and section 128 of the Consolidated Appropriations Act of 2021(Pub. L. 116–159) included an additional 5-year re-authorization through 2028. CMS has conducted the demonstration since 2004, which allows enhanced, cost-based payment for Medicare inpatient services for up to 30 small rural hospitals.

The authorizing legislation imposes a strict budget neutrality requirement. In this final rule, we summarized the status of the demonstration program, and the ongoing methodologies for implementation and budget neutrality.

2. Payments for Graduate Medical Education (GME)

On May 17, 2021, the U.S. District Court for the District of Columbia ruled against CMS's method of calculating direct GME payments to teaching hospitals when those hospitals' weighted full-time equivalent (FTE) counts exceed their direct GME FTE cap. In *Milton S. Hershey Medical Center, et al.* v. *Becerra,* the court ordered CMS to recalculate reimbursement owed, holding that CMS's regulation impermissibly modified the statutory weighting factors.

After reviewing the statutory language regarding the direct GME FTE cap and the court's opinion in *Milton S. Hershey Medical Center, et al.* v. *Becerra,* we are finalizing, as described in greater detail in section V.F.2. of the preamble of this final rule, a modified policy to be applied retroactively and prospectively for all teaching hospitals. Specifically, effective for cost reporting periods beginning on or after October 1, 2001 that are open or reopenable, we specified that if the hospital's unweighted number of FTE residents exceeds the FTE cap, and the number of weighted FTE residents also exceeds that FTE cap, the respective primary care and obstetrics and gynecology weighted FTE counts and other weighted FTE counts are adjusted to make the total weighted FTE count equal the FTE cap. If the number of weighted FTE residents does not exceed that FTE cap, then the allowable weighted FTE count for direct GME payment is the actual weighted FTE count. We estimate the impact of this modified policy to be $170 million for FY 2023.

3. Frontier Community Health Integration Project (FCHIP) Demonstration

The Frontier Community Health Integration Project (FCHIP) demonstration was authorized under section 123 of the Medicare Improvements for Patients and Providers Act of 2008 (Pub. L. 110–275), as amended by section 3126 of the Affordable Care Act (ACA) of 2010 (Pub. L. 114–158), and most recently re-authorized and extended by the Consolidated Appropriations Act of 2021 (Pub. L. 116–159). The legislation authorized a demonstration project to allow eligible entities to develop and test new models for the delivery of health care in order to improve access to and better integrate the delivery of acute care, extended care and other health care services to Medicare beneficiaries in certain rural areas. The FCHIP demonstration initial period was conducted in 10 critical access hospitals (CAHs) from August 1, 2016, to July 31, 2019, and the demonstration ''extension period'' began on January 1, 2022, and run through June 30, 2027.

The authorizing legislation requires the FCHIP demonstration to be budget neutral. In this final rule, we will continue with the budget neutrality approach used in the demonstration initial period for the demonstration extension period—to offset payments across CAHs nationally—should the demonstration incur costs to Medicare.

4. Update to the LTCH PPS Payment Rates

As described in section VIII.C.2. of the preamble of this final rule, in order to update payments to LTCHs using the best available data, we updated the LTCH PPS standard Federal payment rate by 3.8 percent (that is, a 4.1 percent market basket update with a reduction of 0.3 percentage point for the productivity adjustment, as required by section 1886(m)(3)(A)(i) of the Act). LTCHs that failed to submit quality data, as required by 1886(m)(5)(A)(i) of the Act and described in section VIII.C.2. of the preamble of this final rule, will receive an update of 1.8 percent, which reflects a 2.0 percentage points reduction for failure to submit quality data.

5. Hospital Quality Programs

Section 1886(b)(3)(B)(viii) of the Act requires subsection (d) hospitals to report data in accordance with the requirements of the Hospital IQR Program for purposes of measuring and making publicly available information on health care quality, and links the quality data submission to the annual applicable percentage increase. Sections 1886(b)(3)(B)(ix), 1886(n), and 1814(l) of the Act require eligible hospitals and CAHs to demonstrate they are meaningful users of certified EHR technology for purposes of electronic exchange of health information to improve the quality of health care, and links the submission of information demonstrating meaningful use to the annual applicable percentage increase for eligible hospitals and the applicable percent for CAHs. Section 1886(m)(5) of the Act requires each LTCH to submit quality measure data in accordance with the requirements of the LTCH QRP for purposes of measuring and making publicly available information on health care quality, and in order to avoid a 2-percentage point reduction. Section 1886(o) of the Act requires the Secretary to establish a value-based purchasing program under which value-based incentive payments are made in a fiscal year to hospitals that meet the performance standards established on an

announced set of quality and efficiency measures for the fiscal year. The purposes of the Hospital VBP Program include measuring the quality of hospital inpatient care, linking hospital measure performance to payment, and making publicly available information on hospital quality of care. Section 1886(p) of the Act requires a reduction in payment for subsection (d) hospitals that rank in the worst-performing 25 percent with respect to measures of hospital-acquired conditions under the HAC Reduction Program for the purpose of measuring, linking measure performance to payment, and making publicly available information on health care quality. Section 1886(q) of the Act requires a reduction in payment for subsection (d) hospitals for excess readmissions based on measures for applicable conditions under the Hospital Readmissions Reduction Program for the purpose of measuring, linking measure performance to payment, and making publicly available information on health care quality. Section 1866(k) of the Act applies to hospitals described in section 1886(d)(1)(B)(v) of the Act (referred to as ''PPS-Exempt Cancer Hospitals'' or ''PCHs'') and requires PCHs to report data in accordance with the requirements of the PCHQR Program for purposes of measuring and making publicly available information on the quality of care furnished by PCHs, however, there is no reduction in payment to a PCH that does not report data.

6. Other Provisions

a. Codification of the Costs Incurred for Qualified and Non-Qualified Deferred Compensation Plans

As discussed in section X.A. of the preamble of this final rule, we codify in regulation certain general requirements; definitions; requirements for costs of the plans to be allowable under the program; additional requirements for payments to funded defined benefit plans; data and documentation requirements to support payments/contributions to the plans; and allowable administrative and other costs associated with the plans, including costs related to the Pension Benefit Guarantee Corporation.

b. Condition of Participation (CoP) Requirements for Hospitals and CAHs To Continue Reporting Data for COVID–19 and Influenza After the PHE Ends as Determined by the Secretary

Section X.B. of the preamble of this final rule revises the hospital and CAH infection prevention and control CoP requirements to require hospitals and CAHs, after the conclusion of the current COVID–19 PHE, to continue COVID–19 and seasonal influenza related reporting. The revisions will continue to apply upon conclusion of the COVID–19 PHE and will continue until April 30, 2024, unless the Secretary establishes an earlier ending date. In addition, as noted previously, we have withdrawn our proposal to establish additional data reporting requirements to address future PHEs related to epidemics and infectious diseases.

We believe these data will offer the most valuable information during a post-PHE state by continuing to capture critical data on COVID–19 for ongoing surveillance and to inform any potential action to protect patient health and safety. As previously discussed, these data will enable the federal government to monitor the ability of facilities to provide safe care for patients by determining the number of COVID–19 and influenza infections being treated by facilities; the quantity of resources available to facilities and the volume of resources they are using; and facilities' continued capacity to provide safe patient care. In addition, as done throughout the COVID–19 pandemic, local, state, and federal authorities will continue to use these data to identify possible resurgence in cases and outbreaks, for resource allocation purposes, and to update guidance pertaining to the safe provision of patient care.

As discussed in section X.B. of this rule, due to the unpredictable nature of the novel SARS–CoV–2 virus that causes COVID–19, in the event that the PHE declaration ends, we believe that continuing COVID–19-related data reporting through April 2024 is necessary to protect the health and safety of hospital and CAH patients as well as the communities in which the hospitals and CAHs are located. The COVID–19-related data reported by all hospitals and CAHs, have been, and continue to be, important in supporting surveillance of, and response to, COVID–19 and other respiratory illnesses. These data play an important role in evaluating spread of respiratory viruses and infections, including but not limited to COVID–19 and influenza. Retaining the data reporting requirements after the end of the current COVID–19 PHE is an important element of maintaining effective surveillance of this novel virus. Timely and actionable surveillance will enable CMS to continue to respond to facilities in need of additional technical support and oversight, should they experience increased cases or outbreaks of COVID–19 and/or influenza.

As noted, we do not expect continued daily reporting for COVID–19 or influenza outside of a declared PHE. Moreover, the rule allows for the scope of data categories and frequency of data collection and reporting to be reduced and limited, as determined by the Secretary, responsive to evolving clinical and epidemiology circumstances. These requirements will not be implemented and enforced until the current COVID–19 PHE declaration concludes, and CMS will issue guidance indicating such a transition. Reporting frequency and requirements will be communicated to hospitals, stakeholders, and the public following a model similar to that which we used to inform regulated entities at the beginning of the COVID–19 PHE (see *QSO–21–03–Hospitals/CAHs at https://www.cms.gov/files/document/qso-21-03-hospitalscahs.pdf-0*). As discussed in section XII.B. of the preamble of this final rule, Collection of Information Requirements, we expect a burden increase of $38,204,400 or approximately $6,162 per facility annually for weekly reporting (an average response time of 1.5 hours per week for a registered nurse with an average hourly salary of $79). We note that efforts are underway to automate hospital and CAH reporting that have the potential to significantly decrease reporting burden and improve reliability.

B. Overall Impact

We have examined the impacts of this final rule as required by Executive Order 12866 on Regulatory Planning and Review (September 30, 1993), Executive Order 13563 on Improving Regulation and Regulatory Review (January 18, 2011), the Regulatory Flexibility Act (RFA) (September 19, 1980, Pub. L. 96–354), section 1102(b) of the Social Security Act, section 202 of the Unfunded Mandates Reform Act of 1995 (March 22, 1995; Pub. L. 104–4), Executive Order 13132 on Federalism (August 4, 1999), and the Congressional Review Act (5 U.S.C. 804(2)).

Executive Orders 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). Section 3(f) of Executive Order 12866 defines a ''significant regulatory action'' as an action that is likely to result in a rule: (1) having an annual effect on the economy of $100 million or more in any 1 year, or adversely and materially affecting a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or state, local or tribal governments or communities (also referred to as ''economically significant''); (2) creating a serious inconsistency or otherwise interfering with an action taken or planned by another agency; (3) materially altering the budgetary impacts of entitlement grants, user fees, or loan programs or the rights and obligations of recipients thereof; or (4) raising novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive order.

A regulatory impact analysis (RIA) must be prepared for major rules with significant regulatory action/s and/or with economically significant effects ($100 million or more in any 1 year). Based on our estimates, OMB's Office of Information and Regulatory Affairs has determined this rulemaking is ''economically significant'' as measured by the $100 million threshold, and hence also a major rule under Subtitle E of the Small Business Regulatory Enforcement Fairness Act of 1996 (also known as the Congressional Review Act). Accordingly, we have prepared a Regulatory Impact Analysis that to the best of our ability presents the costs and benefits of the rulemaking. OMB has reviewed these finalized regulations, and the Departments have provided the following assessment of their impact.

We estimate that the changes for FY 2023 acute care hospital operating and capital payments will redistribute amounts in excess of $100 million to acute care hospitals. The applicable percentage increase to the IPPS rates required by the statute, in conjunction with other payment changes in this final rule, will result in an estimated $1.4 billion increase in FY 2023 payments, primarily driven by: (a) a combined $2.4 billion increase in FY 2023 operating payments, including uncompensated care payments and supplemental payments; and (b) a combined decrease of $ 1.0 billion resulting from estimated changes in new technology add-on

payments, the change to the GME weighting methodology, the expiration of the low-volume payment adjustment, and FY 2023 capital payments. These changes are relative to payments made in FY 2022. The impact analysis of the capital payments can be found in section I.I. of this Appendix. In addition, as described in section I.J. of this Appendix, LTCHs are expected to experience an increase in payments by approximately $71 million in FY 2023 relative to FY 2022.

Our operating impact estimate includes the 0.5 percentage point adjustment required under section 414 of the MACRA applied to the IPPS standardized amount, as discussed in section II.D. of the preamble of this final rule. In addition, our operating payment impact estimate includes the 3.8 percent hospital update to the standardized amount (which includes the estimated 4.1 percent market basket update reduced by the 0.3 percentage point for the productivity adjustment). The estimates of IPPS operating payments to acute care hospitals do not reflect any changes in hospital admissions or real case-mix intensity, which will also affect overall payment changes.

The analysis in this Appendix, in conjunction with the remainder of this document, demonstrates that this final rule is consistent with the regulatory philosophy and principles identified in Executive Orders 12866 and 13563, the RFA, and section 1102(b) of the Act. This final rule will affect payments to a substantial number of small rural hospitals, as well as other classes of hospitals, and the effects on some hospitals may be significant. Finally, in accordance with the provisions of Executive Order 12866, the Office of Management and Budget has reviewed this final rule.

C. Objectives of the IPPS and the LTCH PPS

The primary objective of the IPPS and the LTCH PPS is to create incentives for hospitals to operate efficiently and minimize unnecessary costs, while at the same time ensuring that payments are sufficient to adequately compensate hospitals for their costs in delivering necessary care to Medicare beneficiaries. In addition, we share national goals of preserving the Medicare Hospital Insurance Trust Fund.

We believe that the changes in this final rule would further each of these goals while maintaining the financial viability of the hospital industry and ensuring access to high quality health care for Medicare beneficiaries. We expect that these changes will ensure that the outcomes of the prospective payment systems are reasonable and equitable, while avoiding or minimizing unintended adverse consequences.

Because this final rule contains a range of policies, we refer readers to the section of the final rule where each policy is discussed. These sections include the rationale for our decisions, including the need for the policy.

D. Limitations of Our Analysis

The following quantitative analysis presents the projected effects of our policy changes, as well as statutory changes effective for FY 2023, on various hospital groups. We estimate the effects of individual policy changes by estimating payments per case, while holding all other payment policies constant. We use the best data available, but, generally unless specifically indicated, we do not attempt to make adjustments for future changes in such variables as admissions, lengths of stay, case mix, changes to the Medicare population, or incentives. In addition, we discuss limitations of our analysis for specific policies in the discussion of those policies as needed.

E. Hospitals Included In and Excluded From the IPPS

The prospective payment systems for hospital inpatient operating and capital-related costs of acute care hospitals encompass most general short-term, acute care hospitals that participate in the Medicare program. There were 25 Indian Health Service hospitals in our database, which we excluded from the analysis due to the special characteristics of the prospective payment methodology for these hospitals. Among other short term, acute care hospitals, hospitals in Maryland are paid in accordance with the Maryland Total Cost of Care Model, and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, 6 short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa) receive payment for inpatient hospital services they furnish on the basis of reasonable costs, subject to a rate-of-increase ceiling.

As of March 2022, there were 3,142 IPPS acute care hospitals included in our analysis. This represents approximately 53 percent of all Medicare-participating hospitals. The majority of this impact analysis focuses on this set of hospitals. There also are approximately 1,425 CAHs. These small, limited service hospitals are paid on the basis of reasonable costs, rather than under the IPPS. IPPS-excluded hospitals and units, which are paid under separate payment systems, include IPFs, IRFs, LTCHs, RNHCIs, children's hospitals, cancer hospitals, extended neoplastic disease care hospital, and short-term acute care hospitals located in the Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa. Changes in the prospective payment systems for IPFs and IRFs are made through separate rulemaking. Payment impacts of changes to the prospective payment systems for these IPPS-excluded hospitals and units are not included in this final rule. The impact of the final update and policy changes to the LTCH PPS for FY 2023 is discussed in section I.J. of this Appendix.

F. Effects on Hospitals and Hospital Units Excluded From the IPPS

As of July 2022, there were 92 children's hospitals, 11 cancer hospitals, 6 short term-acute care hospitals located in the Virgin Islands, Guam, the Northern Mariana Islands and American Samoa, 1 extended neoplastic disease care hospital, and 14 RNHCIs being paid on a reasonable cost basis subject to the rate-of-increase ceiling under § 413.40. (In accordance with § 403.752(a) of the regulation, RNHCIs are paid under § 413.40.) Among the remaining providers, the rehabilitation hospitals and units, and the LTCHs, are paid the Federal prospective per discharge rate under the IRF PPS and the LTCH PPS, respectively, and the psychiatric hospitals and units are paid the Federal per diem amount under the IPF PPS. As stated previously, IRFs and IPFs are not affected by the rate updates discussed in this final rule. The impacts of the changes on LTCHs are discussed in section I.J. of this Appendix.

For the children's hospitals, cancer hospitals, short-term acute care hospitals located in the Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa, the extended neoplastic disease care hospital, and RNHCIs, the update of the rate-of-increase limit (or target amount) is the estimated FY 2023 percentage increase in the 2018-based IPPS operating market basket, consistent with section 1886(b)(3)(B)(ii) of the Act, and §§ 403.752(a) and 413.40 of the regulations. Consistent with current law, based on IGI's second quarter 2022 forecast of the 2018-based IPPS market basket increase, we are estimating the FY 2023 update to be 4.1 percent (that is, the estimate of the market basket rate-of-increase), as discussed in section V.A. of the preamble of this final rule. However, the Affordable Care Act requires a productivity adjustment (0.3 percentage point reduction for FY 2023), resulting in a 3.8 percent applicable percentage increase for IPPS hospitals that submit quality data and are meaningful EHR users, as discussed in section V.A. of the preamble of this rule. Children's hospitals, cancer hospitals, short term acute care hospitals located in the Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa, the extended neoplastic disease care hospital, and RNHCIs that continue to be paid based on reasonable costs subject to rate-of-increase limits under § 413.40 of the regulations are not subject to the reductions in the applicable percentage increase required under the Affordable Care Act. Therefore, for those hospitals paid under § 413.40 of the regulations, the update is the percentage increase in the 2018-based IPPS operating market basket for FY 2023, estimated at 4.1 percent.

The impact of the update in the rate-of-increase limit on those excluded hospitals depends on the cumulative cost increases experienced by each excluded hospital since its applicable base period. For excluded hospitals that have maintained their cost increases at a level below the rate-of-increase limits since their base period, the major effect is on the level of incentive payments these excluded hospitals receive. Conversely, for excluded hospitals with cost increases above the cumulative update in their rate-of-increase limits, the major effect is the amount of excess costs that would not be paid.

We note that, under § 413.40(d)(3), an excluded hospital that continues to be paid under the TEFRA system and whose costs exceed 110 percent of its rate-of-increase limit receives its rate-of-increase limit plus the lesser of: (1) 50 percent of its reasonable costs in excess of 110 percent of the limit; or (2) 10 percent of its limit. In addition, under the various provisions set forth in § 413.40, hospitals can obtain payment adjustments for justifiable increases in operating costs that exceed the limit.

G. Quantitative Effects of the Policy Changes Under the IPPS for Operating Costs

1. Basis and Methodology of Estimates

In this final rule, we are announcing policy changes and payment rate updates for the IPPS for FY 2023 for operating costs of acute care hospitals. The FY 2023 updates to the capital payments to acute care hospitals are discussed in section I.I. of this Appendix.

Based on the overall percentage change in payments per case estimated using our payment simulation model, we estimate that total FY 2023 operating payments will increase by 2.6 percent, compared to FY 2022. In addition to the applicable percentage increase, this amount reflects the +0.5 percentage point permanent adjustment to the standardized amount required under section 414 of MACRA. The impacts do not reflect changes in the number of hospital admissions or real case-mix intensity, which would also affect overall payment changes.

We have prepared separate impact analyses of the changes to each system. This section deals with the changes to the operating inpatient prospective payment system for acute care hospitals. Our payment simulation model relies on the best available claims data to enable us to estimate the impacts on payments per case of certain changes in this final rule. As discussed in section I.F of this final rule, we believe that the FY 2021 claims data is the best available data for purposes of the FY 2023 ratesetting and this impact analysis reflects the use of that data. However, there are other changes for which we do not have data available that would allow us to estimate the payment impacts using this model. For those changes, we have attempted to predict the payment impacts based upon our experience and other more limited data.

The data used in developing the quantitative analyses of changes in payments per case presented in this section are taken from the FY 2021 MedPAR file, as discussed previously in this final rule, and the most current Provider-Specific File (PSF) that is used for payment purposes. Although the analyses of the changes to the operating PPS do not incorporate cost data, data from the best available hospital cost reports were used to categorize hospitals, as also discussed previously in this final rule. Our analysis has several qualifications. First, in this analysis, we do not adjust for future changes in such variables as admissions, lengths of stay, or underlying growth in real case-mix. Second, due to the interdependent nature of the IPPS payment components, it is very difficult to precisely quantify the impact associated with each change. Third, we use various data sources to categorize hospitals in the tables. In some cases, particularly the number of beds, there is a fair degree of variation in the data from the different sources. We have attempted to construct these variables with the best available source overall. However, for individual hospitals, some miscategorizations are possible.

Using cases from the FY 2021 MedPAR file, we simulate payments under the operating IPPS given various combinations of payment parameters. As described previously, Indian Health Service hospitals and hospitals in Maryland were excluded from the simulations. The impact of payments under the capital IPPS, and the impact of payments for costs other than inpatient operating costs, are not analyzed in this section. Estimated payment impacts of the capital IPPS for FY 2023 are discussed in section I.I. of this Appendix.

We discuss the following changes:

- The effects of the application of the applicable percentage increase of 3.8 percent (that is, a 4.1 percent market basket update with a reduction of 0.3 percentage point for the productivity adjustment), and a 0.5 percentage point adjustment required under section 414 of the MACRA to the IPPS standardized amount, and the applicable percentage increase (including the market basket update and the productivity adjustment) to the hospital-specific rates.
- The effects of the changes to the relative weights and MS–DRG GROUPER.
- The effects of the changes in hospitals' wage index values reflecting updated wage data from hospitals' cost reporting periods beginning during FY 2019, compared to the FY 2018 wage data, to calculate the FY 2023 wage index.
- The effects of the geographic reclassifications by the MGCRB (as of publication of this final rule) that will be effective for FY 2023.
- The effects of the rural floor with the application of the national budget neutrality factor to the wage index.
- The effects of the imputed floor wage index adjustment. This provision is not budget neutral.
- The effects of the frontier State wage index adjustment under the statutory provision that requires hospitals located in States that qualify as frontier States to not have a wage index less than 1.0. This provision is not budget neutral.
- The effects of the implementation of section 1886(d)(13) of the Act, as added by section 505 of Public Law 108–173, which provides for an increase in a hospital's wage index if a threshold percentage of residents of the county where the hospital is located commute to work at hospitals in counties with higher wage indexes for FY 2023. This provision is not budget neutral.
- The effects of the expiration of the special payment status for MDHs at the end of FY 2022 under current law as a result of which MDHs that currently receive the higher of payments made based on the Federal rate or the payments made based on the Federal rate plus 75 percent of the difference between payments based on the Federal rate and the hospital-specific rate will be paid based on the Federal rate starting in FY 2023.
- The total estimated change in payments based on the FY 2023 policies relative to payments based on FY 2022 policies.

To illustrate the impact of the FY 2023 changes, our analysis begins with a FY 2022 baseline simulation model using: the FY 2022 applicable percentage increase of 2.0 percent; the 0.5 percentage point adjustment required under section 414 of the MACRA applied to the IPPS standardized amount; the FY 2022 MS–DRG GROUPER (Version 39); the FY 2022 CBSA designations for hospitals based on the OMB definitions from the 2010 Census; the FY 2022 wage index; and no MGCRB reclassifications. Outlier payments are set at 5.1 percent of total operating MS–DRG and outlier payments for modeling purposes.

Section 1886(b)(3)(B)(viii) of the Act, as added by section 5001(a) of Public Law 109–171, as amended by section 4102(b)(1)(A) of the ARRA (Pub. L. 111–5) and by section 3401(a)(2) of the Affordable Care Act (Pub. L. 111–148), provides that, for FY 2007 and each subsequent year through FY 2014, the update factor will include a reduction of 2.0 percentage points for any subsection (d) hospital that does not submit data on measures in a form and manner, and at a time specified by the Secretary. Beginning in FY 2015, the reduction is one-quarter of such applicable percentage increase determined without regard to section 1886(b)(3)(B)(ix), (xi), or (xii) of the Act, or one-quarter of the market basket update. Therefore, hospitals that do not submit quality information under rules established by the Secretary and that are meaningful EHR users under section 1886(b)(3)(B)(ix) of the Act would receive an applicable percentage increase of 2.775 percent. At the time this impact was prepared, 24 hospitals are estimated to not receive the full market basket rate-of-increase for FY 2023 because they failed the quality data submission process or did not choose to participate, but are meaningful EHR users. For purposes of the simulations shown later in this section, we modeled the payment changes for FY 2023 using a reduced update for these hospitals.

For FY 2023, in accordance with section 1886(b)(3)(B)(ix) of the Act, a hospital that has been identified as not a meaningful EHR user will be subject to a reduction of three-quarters of such applicable percentage increase determined without regard to section 1886(b)(3)(B)(ix), (xi), or (xii) of the Act. Therefore, hospitals that are identified as not meaningful EHR users and do submit quality information under section 1886(b)(3)(B)(viii) of the Act would receive an applicable percentage increase of 0.725 percent. At the time this impact analysis was prepared, 158 hospitals are estimated to not receive the full market basket rate-of-increase for FY 2023 because they are identified as not meaningful EHR users that do submit quality information under section 1886(b)(3)(B)(viii) of the Act. For purposes of the simulations shown in this section, we modeled the payment changes for FY 2023 using a reduced update for these hospitals.

Hospitals that are identified as not meaningful EHR users under section 1886(b)(3)(B)(ix) of the Act and also do not submit quality data under section 1886(b)(3)(B)(viii) of the Act would receive an applicable percentage increase of -0.3 percent, which reflects a one-quarter reduction of the market basket update for failure to submit quality data and a three-quarter reduction of the market basket update for being identified as not a meaningful EHR user. At the time this impact was prepared, 20 hospitals are estimated to not receive the full market basket rate-of-increase for FY 2023 because they are identified as not meaningful EHR users that do not submit quality data under section 1886(b)(3)(B)(viii) of the Act.

Each policy change, statutory or otherwise, is then added incrementally to this baseline, finally arriving at an FY 2023 model incorporating all of the changes. This simulation allows us to isolate the effects of each change.

Our comparison illustrates the percent change in payments per case from FY 2022 to FY 2023. Two factors not discussed separately have significant impacts here. The first factor is the update to the standardized amount. In accordance with section 1886(b)(3)(B)(i) of the Act, we are updating the standardized amounts for FY 2023 using an applicable percentage increase of 3.8 percent. This includes the FY 2023 forecasted IPPS operating hospital market basket increase of 4.1 percent with a 0.3 percentage point reduction for the productivity adjustment. Hospitals that fail to comply with the quality data submission requirements and are meaningful EHR users will receive a update of 2.775 percent. This update includes a reduction of one-quarter of the market basket update for failure to submit these data. Hospitals that do comply with the quality data submission requirements but are not meaningful EHR users will receive an update of 0.725 percent, which includes a reduction of three-quarters of the market basket update. Furthermore, hospitals that do not comply with the quality data submission requirements and also are not meaningful EHR users would receive an update of −0.3 percent. Under section 1886(b)(3)(B)(iv) of the Act, the update to the hospital-specific amounts for SCHs is also equal to the applicable percentage increase, or 3.8 percent, if the hospital submits quality data and is a meaningful EHR user.

A second significant factor that affects the changes in hospitals' payments per case from FY 2022 to FY 2023 is the change in hospitals' geographic reclassification status from one year to the next. That is, payments may be reduced for hospitals reclassified in FY 2022 that are no longer reclassified in FY 2023. Conversely, payments may increase for hospitals not reclassified in FY 2022 that are reclassified in FY 2023.

2. Analysis of Table I

Table I displays the results of our analysis of the changes for FY 2023. The table categorizes hospitals by various geographic and special payment consideration groups to illustrate the varying impacts on different types of hospitals. The top row of the table shows the overall impact on the 3,142 acute care hospitals included in the analysis.

The next two rows of Table I contain hospitals categorized according to their geographic location: urban and rural. There are 2,420 hospitals located in urban areas and 722 hospitals in rural areas included in our analysis. The next two groupings are by bed-size categories, shown separately for urban and rural hospitals. The last groupings by geographic location are by census divisions, also shown separately for urban and rural hospitals.

The second part of Table I shows hospital groups based on hospitals' FY 2023 payment classifications, including any reclassifications under section 1886(d)(10) of the Act. For example, the rows labeled urban and rural show that the numbers of hospitals paid based on these categorizations after consideration of geographic reclassifications (including reclassifications under sections 1886(d)(8)(B) and 1886(d)(8)(E) of the Act that have implications for capital payments) are 1,861, and 1,281, respectively.

The next three groupings examine the impacts of the changes on hospitals grouped by whether or not they have GME residency programs (teaching hospitals that receive an IME adjustment) or receive Medicare DSH payments, or some combination of these two adjustments. There are 1,939 nonteaching hospitals in our analysis, 929 teaching hospitals with fewer than 100 residents, and 274 teaching hospitals with 100 or more residents.

In the DSH categories, hospitals are grouped according to their DSH payment status, and whether they are considered urban or rural for DSH purposes. The next category groups together hospitals considered urban or rural, in terms of whether they receive the IME adjustment, the DSH adjustment, both, or neither.

The next six rows examine the impacts of the changes on rural hospitals by special payment groups (SCHs and RRCs) and reclassification status from urban to rural in accordance with section 1886(d)(8)(E) of the Act. Of the hospitals that are not reclassified from urban to rural, there are 148 RRCs, 256 SCHs, and 122 hospitals that are both SCHs and RRCs. Of the hospitals that are reclassified from urban to rural, there are 470 RRCs, 47 SCHs, and 39 hospitals that are both SCHs and RRCs.

The next series of groupings are based on the type of ownership and the hospital's Medicare and Medicaid utilization expressed as a percent of total inpatient days. These data were taken from the most recent available Medicare cost reports.

The next grouping is based on hospitals' reporting of diagnosis codes describing patients experiencing homelessness. This row reflects hospitals whose claims indicate that at least 5 percent of their IPPS cases involve these patients based on the reporting of ICD–10–CM diagnosis code Z59.0 (Homelessness). We note that hospitals are not required to identify these patients on their claims, and reporting this information on the claim does not currently impact Medicare payment. There may be other hospitals with at least 5 percent of their IPPS cases involving these patients, however we are unable to identify these hospitals. We refer the reader to Section II.D.13.d. of this FY 2023 IPPS/LTCH PPS final rule for discussion of the comments we received in response to our request for information on the reporting of social determinants of health diagnosis codes, such as diagnosis code Z59.0 (Homelessness), in the FY 2023 IPPS/LTCH PPS proposed rule (87 FR 28177).

The next grouping concerns the geographic reclassification status of hospitals. The first subgrouping is based on whether a hospital is reclassified or not. The second and third subgroupings are based on whether urban and rural hospitals were reclassified by the MGCRB for FY 2023 or not, respectively. The fourth subgrouping displays hospitals that reclassified from urban to rural in accordance with section 1886(d)(8)(E) of the Act. The fifth subgrouping displays hospitals deemed urban in accordance with section 1886(d)(8)(B) of the Act.

TABLE I.—IMPACT ANALYSIS OF CHANGES TO THE IPPS FOR OPERATING COSTS FOR FY 2023

	Number of Hospitals[1]	Hospital Rate Update and Adjustment under MACRA (1)[2]	FY 2023 Weights and DRG Changes with Application of Budget Neutrality (2)[3]	FY 2023 Wage Data with Application of Wage Budget Neutrality (3)[4]	FY 2023 MGCRB Reclassifications (4)[5]	Rural Floor with Application of National Rural Floor Budget Neutrality (5)[6]	Application of the Imputed Floor, Frontier State Wage Index and Outmigration Adjustment (6)[7]	Expiration of MDH Status (7)[8]	All FY 2023 Changes (8)[9]

[1] Because data necessary to classify some hospitals by category were missing, the total number of hospitals in each category may not equal the national total. Discharge data are from FY 2021, and hospital cost report data are from the latest available reporting periods.

[2] This column displays the payment impact of the hospital rate update and other adjustments, including the 3.8 percent update to the national standardized amount and the hospital-specific rate (the 4.1 percent market basket update reduced by 0.3 percentage point for the productivity adjustment), and the 0.5 percentage point adjustment to the national standardized amount required under section 414 of the MACRA.

[3] This column displays the payment impact of the changes to the Version 40 GROUPER, the changes to the relative weights and the recalibration of the MS-DRG weights based on FY 2021 MedPAR data as the best available data, and the permanent 10-percent cap where the relative weight for a MS-DRG would decrease by more than 10 percent in a given fiscal year. This column displays the application of the recalibration budget neutrality factors of 1.000509and 0.999764.

[4] This column displays the payment impact of the update to wage index data using FY 2019 cost report data and the OMB labor market area delineations based on 2010 Decennial Census data. This column displays the payment impact of the application of the wage budget neutrality factor, which is calculated separately from the recalibration budget neutrality factor. The wage budget neutrality factor is 1.000968.

[5] Shown here are the effects of geographic reclassifications by the Medicare Geographic Classification Review Board (MGCRB). The effects demonstrate the FY 2023 payment impact of going from no reclassifications to the reclassifications scheduled to be in effect for FY 2023. Reclassification for prior years has no bearing on the payment impacts shown here. This column reflects the geographic budget neutrality factor of 0.984399.

[6] This column displays the effects of the rural floor. The Affordable Care Act requires the rural floor budget neutrality adjustment to be a 100 percent national level adjustment. The rural floor budget neutrality factor applied to the wage index is 0.991909.

[7] This column shows the combined impact of (1) the imputed floor for all-urban states (2) the policy that requires hospitals located in frontier States have a wage index no less than 1.0; and (3) the policy which provides for an increase in a hospital's wage index if a threshold percentage of residents of the county where the hospital is located commute to work at hospitals in counties with higher wage indexes. These are not budget neutral policies.

[8] This column displays the impact of the expiration of MDH status for FY 2023, a non-budget neutral payment provision.

[9] This column shows the estimated change in payments from FY 2022 to FY 2023.

a. Effects of the Hospital Update and Other Adjustments (Column 1)

As discussed in section V.A. of the preamble of this final rule, this column includes the hospital update, including the 4.1 percent market basket update reduced by the 0.3 percentage point for the productivity adjustment. In addition, as discussed in section II.D. of the preamble of this final rule, this column includes the FY 2023 +0.5 percentage point adjustment required under section 414 of the MACRA. As a result, we are making a 4.3 percent update to the national standardized amount. This column also includes the update to the hospital-specific rates which includes the 4.1 percent market basket update reduced by the 0.3 percentage point for the productivity adjustment. As a result, we are making a 3.8 percent update to the hospital-specific rates.

Overall, hospitals will experience a 4.2 percent increase in payments primarily due to the combined effects of the hospital update to the national standardized amount and the hospital update to the hospital-specific rate. Hospitals that are paid under the hospital-specific rate will experience a 3.8 percent increase in payments; therefore, hospital categories containing hospitals paid under the hospital-specific rate will experience a lower than average increase in payments.

b. Effects of the Changes to the MS–DRG Reclassifications and Relative Cost-Based Weights With Recalibration Budget Neutrality (Column 2)

Column 2 shows the effects of the changes to the MS–DRGs and relative weights with the application of the recalibration budget neutrality factor to the standardized amounts. Section 1886(d)(4)(C)(i) of the Act requires us annually to make appropriate classification changes in order to reflect changes in treatment patterns, technology, and any other factors that may change the relative use of hospital resources. Consistent with section 1886(d)(4)(C)(iii) of the Act, we calculated a recalibration budget neutrality factor to account for the changes in MS–DRGs and relative weights to ensure that the overall payment impact is budget neutral. As discussed in section VIII.B.3.b. of the preamble of this final rule, we are also establishing a permanent 10-percent cap on the reduction in a MS–DRG's relative weight in a given year and an associated recalibration cap budget neutrality factor to account for the 10-percent cap on relative weight reductions to ensure that the overall payment impact is budget neutral.

As discussed in section II.E. of the preamble of this final rule, the FY 2023 MS–DRG relative weights will be 100 percent cost-based and 100 percent MS–DRGs. For FY 2023, we are calculating the MS–DRGs using the FY 2021 MedPAR data grouped to the Version 40 (FY 2023) MS–DRGs. The reclassification changes to the GROUPER are described in more detail in section II.D. of the preamble of this final rule.

The ''All Hospitals'' line in Column 2 indicates that changes due to the MS–DRGs and relative weights will result in a 0.0 percent change in payments with the application of the recalibration budget neutrality factor of 1.000509 and the recalibration cap budget neutrality factor of 0.999764 to the standardized amount.

c. Effects of the Wage Index Changes (Column 3)

Column 3 shows the impact of the updated wage data, with the application of the wage budget neutrality factor. The wage index is calculated and assigned to hospitals on the basis of the labor market area in which the hospital is located. Under section 1886(d)(3)(E) of the Act, beginning with FY 2005, we delineate hospital labor market areas based on the Core Based Statistical Areas (CBSAs) established by OMB. The current statistical standards used in FY 2023 are based on OMB standards published on February 28, 2013 (75 FR 37246 and 37252), and 2010 Decennial Census data (OMB Bulletin No. 13–01), as updated in OMB Bulletin Nos. 15–01, 17–01, 18–04, and 20–01. (We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 49951 through 49963) for a full discussion on our adoption of the OMB labor market area delineations, based on the 2010 Decennial Census data, effective beginning with the FY 2015 IPPS wage index; to the FY 2017 IPPS/LTCH PPS final rule (81 FR 56913) for a discussion of our adoption of the CBSA updates in OMB Bulletin No. 15–01, which were effective beginning with the FY 2017 wage index; to the FY 2020 IPPS/LTCH PPS final rule (83 FR 41362) for a discussion of our adoption of the CBSA update in OMB Bulletin No. 17–01 for the FY 2020 wage index; to the FY 2021 IPPS/LTCH PPS final rule (85 FR 58743 through 58755) for a discussion of our adoption of the CBSA update in OMB Bulletin No. 18–04 for the FY 2021 wage index; and to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45163) for a discussion of our adoption of the CBSA update in OMB Bulletin No. 20–01 for the FY 2022 wage index.)

Section 1886(d)(3)(E) of the Act requires that, beginning October 1, 1993, we annually update the wage data used to calculate the wage index. In accordance with this requirement, the wage index for acute care hospitals for FY 2023 is based on data submitted for hospital cost reporting periods, beginning on or after October 1, 2018 and before October 1, 2019. The estimated impact of the updated wage data and the OMB labor market area delineations on hospital payments is isolated in Column 3 by holding the other payment parameters constant in this simulation. That is, Column 3 shows the percentage change in payments when going from a model using the FY 2022 wage index, the labor-related share of 67.6 percent, under the OMB delineations and having a 100-percent occupational mix adjustment applied, to a model using the FY 2023 pre-reclassification wage index with the labor-related share of 67.6 percent, under the OMB delineations, also having a 100-percent occupational mix adjustment applied, while holding other payment parameters, such as use of the Version 40 MS–DRG GROUPER constant. The FY 2023 occupational mix adjustment is based on the CY 2019 occupational mix survey.

In addition, the column shows the impact of the application of the wage budget neutrality to the national standardized amount. In FY 2010, we began calculating separate wage budget neutrality and recalibration budget neutrality factors, in accordance with section 1886(d)(3)(E) of the Act, which specifies that budget neutrality to account for wage index changes or updates made under that subparagraph must be made without regard to the 62 percent labor-related share guaranteed under section 1886(d)(3)(E)(ii) of the Act. Therefore, for FY 2023, as proposed, we are calculating the wage budget neutrality factor to ensure that payments under updated wage data and the labor-related share of 67.6 percent are budget neutral, without regard to the lower labor-related share of 62 percent applied to hospitals with a wage index less than or equal to 1.0. In other words, the wage budget neutrality is calculated under the assumption that all hospitals receive the higher labor-related share of the standardized amount. The FY 2023 wage budget neutrality factor is 1.000968 and the overall payment change is 0 percent.

Column 3 shows the impacts of updating the wage data. Overall, the new wage data and the labor-related share, combined with the wage budget neutrality adjustment, will lead to no change for all hospitals, as shown in Column 3.

In looking at the wage data itself, the national average hourly wage will increase 2.7 percent compared to FY 2022. Therefore, the only manner in which to maintain or exceed the previous year's wage index was to match or exceed the 2.7 percent increase in the national average hourly wage. Of the 3,117 hospitals with wage data for both FYs 2022 and 2023, 1,427 or 45.8 percent will experience an average hourly wage increase of 2.7 percent or more.

The following table compares the shifts in wage index values for hospitals due to changes in the average hourly wage data for FY 2023 relative to FY 2022. These figures reflect changes in the ''pre-reclassified, occupational mix-adjusted wage index,'' that is, the wage index before the application of geographic reclassification, the rural floor, the out-migration adjustment, and other wage index exceptions and adjustments. We note that the ''post-reclassified wage index'' or ''payment wage index,'' which is the wage index that includes all such exceptions and adjustments (as reflected in Tables 2 and 3 associated with this final rule) is used to adjust the labor-related share of a hospital's standardized amount, either 67.6 percent or 62 percent, depending upon whether a hospital's wage index is greater than 1.0 or less than or equal to 1.0. Therefore, the pre-reclassified wage index figures in the following table may illustrate a somewhat larger or smaller change than will occur in a hospital's payment wage index and total payment.

The following table shows the projected impact of changes in the area wage index values for urban and rural hospitals.

FY 2023 Percentage Change in Area Wage Index Values	Number of Hospitals	
	Urban	Rural
Increase 10 percent or more	2	0
Increase greater than or equal to 5 percent and less than 10 percent	24	0
Increase or decrease less than 5 percent	2,330	706
Decrease greater than or equal to 5 percent and less than 10 percent	48	7
Decrease 10 percent or more	0	0
Unchanged	1	0

d. Effects of MGCRB Reclassifications (Column 4)

Our impact analysis to this point has assumed acute care hospitals are paid on the basis of their actual geographic location (with the exception of ongoing policies that provide that certain hospitals receive payments on bases other than where they are geographically located). The changes in Column 4 reflect the per case payment impact of moving from this baseline to a simulation incorporating the MGCRB decisions for FY 2023.

By spring of each year, the MGCRB makes reclassification determinations that will be effective for the next fiscal year, which begins on October 1. The MGCRB may approve a hospital's reclassification request for the purpose of using another area's wage index value. Hospitals may appeal denials by the MGCRB of reclassification requests to the CMS Administrator. Further, hospitals have 45 days from the date the IPPS proposed rule is issued in the **Federal Register** to decide whether to withdraw or terminate an approved geographic reclassification for the following year (we refer readers to the discussion of our clarification of this policy in section III.I.2. of the preamble of this final rule.)

The overall effect of geographic reclassification is required by section 1886(d)(8)(D) of the Act to be budget neutral. Therefore, for purposes of this impact analysis, as proposed, we are applying an adjustment of 0.984399 to ensure that the effects of the reclassifications under sections 1886(d)(8)(B) and (C) and 1886(d)(10) of the Act are budget neutral (section II.A. of the Addendum to this final rule).

Geographic reclassification generally benefits hospitals in rural areas. We estimate that the geographic reclassification will increase payments to rural hospitals by an average of 1.0 percent. By region, most rural hospital categories will experience increases in payments due to MGCRB reclassifications.

Table 2 listed in section VI. of the Addendum to this final rule and available via the internet on the CMS website reflects the reclassifications for FY 2023.

e. Effects of the Rural Floor, Including Application of National Budget Neutrality (Column 5)

As discussed in section III.B. of the preamble of the FY 2009 IPPS final rule, the FY 2010 IPPS/RY 2010 LTCH PPS final rule, the FYs 2011 through 2022 IPPS/LTCH PPS final rules, and this FY 2023 IPPS/LTCH PPS final rule, section 4410 of Public Law 105–33 established the rural floor by requiring that the wage index for a hospital in any urban area cannot be less than the wage index applicable to hospitals located in rural areas in the same state. We apply a uniform budget neutrality adjustment to the wage index. Column 5 shows the effects of the rural floor.

The Affordable Care Act requires that we apply one rural floor budget neutrality factor to the wage index nationally. We have calculated an FY 2023 rural floor budget neutrality factor to be applied to the wage index of 0.991909, which would reduce wage indexes by 0.8 percent.

Column 5 shows the projected impact of the rural floor with the national rural floor budget neutrality factor applied to the wage index based on the OMB labor market area delineations. The column compares the post-reclassification FY 2023 wage index of providers before the rural floor adjustment and the post-reclassification FY 2023 wage index of providers with the rural floor adjustment based on the OMB labor market area delineations. Only urban hospitals can benefit from the rural floor. Because the provision is budget neutral, all other hospitals that do not receive an increase to their wage index from the rural floor adjustment (that is, all rural hospitals and those urban hospitals to which the adjustment is not made) would experience a decrease in payments due to the budget neutrality adjustment that is applied to the wage index nationally. (As discussed in section III.G.1. of the preamble of this final rule, based on the district court's decision in *Citrus,* we calculated the rural floor for FY 2023 including the wage data of hospitals that have reclassified as rural under § 412.103.)

We estimate that 275 hospitals will receive the rural floor in FY 2023. All IPPS hospitals in our model will have their wage indexes reduced by the rural floor budget neutrality adjustment of 0.991909. We project that, in aggregate, rural hospitals will experience a 0.2 percent decrease in payments as a result of the application of the rural floor budget neutrality because the rural hospitals do not benefit from the rural floor, but have their wage indexes downwardly adjusted to ensure that the application of the rural floor is budget neutral overall. We project that, in the aggregate, hospitals located in urban areas will experience no change in payments because increases in payments to hospitals benefitting from the rural floor offset decreases in payments to nonrural floor urban hospitals whose wage index is downwardly adjusted by the rural floor budget neutrality factor. Urban hospitals in the New England region would experience a 3.8 percent increase in payments primarily due to the application of the rural floor in Massachusetts.

f. Effects of the Application of the Imputed Floor, Frontier State Wage Index and Out-Migration Adjustment (Column 6)

This column shows the combined effects of the application of the following: (1) the imputed floor under section 1886(d)(3)(E)(iv)(I) and (II) of the Act, which provides that for discharges occurring on or after October 1, 2021, the area wage index applicable to any hospital in an all-urban State may not be less than the minimum area wage index for the fiscal year for hospitals in that State established using the methodology described in § 412.64(h)(4)(vi) as in effect for FY 2018; (2) section 10324(a) of the Affordable Care Act, which requires that we establish a minimum post-reclassified wage index of 1.00 for all hospitals located in ''frontier States;'' and (3) the effects of section 1886(d)(13) of the Act, as added by section 505 of Public Law 108–173, which provides for an increase in the wage index for hospitals located in certain counties that have a relatively high percentage of hospital employees who reside in the county, but work in a different area with a higher wage index.

These three wage index provisions are not budget neutral and will increase payments overall by 0.3 percent compared to the provisions not being in effect.

Section 1886(d)(3)(E)(iv)(III) of the Act provides that the imputed floor wage index for all-urban States shall not be applied in a budget neutral manner. Therefore, the imputed floor adjustment is estimated to increase IPPS operating payments by approximately $124 million. There are an estimated 66 providers in Connecticut, Delaware, Washington DC, New Jersey, and Rhode Island that will receive the imputed floor wage index.

The term ''frontier States'' is defined in the statute as States in which at least 50 percent of counties have a population density less than 6 persons per square mile. Based on these criteria, 5 States (Montana, Nevada, North Dakota, South Dakota, and Wyoming) are considered frontier States and an estimated 44 hospitals located in Montana, North Dakota, South Dakota, and Wyoming would receive a frontier wage index of 1.0000. We note, the rural floor for Nevada exceeds the frontier state wage index of 1.000

and therefore no hospitals in Nevada receive the frontier state wage index. Overall, this provision is not budget neutral and is estimated to increase IPPS operating payments by approximately $71 million.

In addition, section 1886(d)(13) of the Act provides for an increase in the wage index for hospitals located in certain counties that have a relatively high percentage of hospital employees who reside in the county, but work in a different area with a higher wage index. Hospitals located in counties that qualify for the payment adjustment will receive an increase in the wage index that is equal to a weighted average of the difference between the wage index of the resident county, post-reclassification and the higher wage index work area(s), weighted by the overall percentage of workers who are employed in an area with a higher wage index. There are an estimated 210 providers that will receive the out-migration wage adjustment in FY 2023. This out-migration wage adjustment is not budget neutral, and we estimate the impact of these providers receiving the out-migration increase will be approximately $53 million.

g. Effects of the Expiration of MDH Special Payment Status (Column 7)

Column 7 shows our estimate of the changes in payments due to the expiration of MDH status, a nonbudget neutral payment provision. Section 50205 of the Bipartisan Budget Act of 2018 (Pub. L. 115–123, enacted on February 9, 2018) extended the MDH program (which, under previous law, was to be in effect for discharges before October 1, 2017 only) for discharges occurring on or after October 1, 2017, through FY 2022 (that is, for discharges occurring on or before September 30, 2022). Therefore, under current law, the MDH program will expire at the end of FY 2022. Hospitals that qualified to be MDHs receive the higher of payments made based on the Federal rate or the payments made based on the Federal rate amount plus 75 percent of the difference between payments based on the Federal rate and payments based on the hospital-specific rate (a hospital-specific cost-based rate). Because this provision was not budget neutral, the expiration of this payment provision results in a 0.2 percent decrease in payments overall. There are currently 173 MDHs, of which we estimate 91 would have been paid under the blended payment of the Federal rate and hospital-specific rate if the MDH program had not expired. Because those 91 MDHs will no longer receive the blended payment and will be paid only under the Federal rate in FY 2023, it is estimated that those hospitals would experience an overall decrease in payments of approximately $180 million.

h. Effects of All FY 2022 Changes (Column 8)

Column 8 shows our estimate of the changes in payments per discharge from FY 2022 and FY 2023, resulting from all changes reflected in this rule for FY 2023. It includes combined effects of the year-to-year change of the previous columns in the table.

The average increase in payments under the IPPS for all hospitals is approximately 2.6 percent for FY 2023 relative to FY 2022 and for this row is primarily driven by the changes reflected in Column 1. Column 8 includes the annual hospital update of 3.8 percent to the national standardized amount. This annual hospital update includes the 4.1 percent market basket update reduced by the 0.3 percentage point productivity adjustment. As discussed in section II.D. of the preamble of this final rule, this column also includes the +0.5 percentage point adjustment required under section 414 of the MACRA. Hospitals paid under the hospital-specific rate would receive a 3.8 percent hospital update. As described in Column 1, the annual hospital update with the +0.5 percent adjustment for hospitals paid under the national standardized amount, combined with the annual hospital update for hospitals paid under the hospital-specific rates, combined with the other adjustments described previously and shown in Table I, will result in a 2.6 percent increase in payments in FY 2023 relative to FY 2022.

This column also reflects the estimated effect of outlier payments returning to their targeted levels in FY 2023 as compared to the estimated outlier payments for FY 2022 produced from our payment simulation model. As discussed in section II.A.4.j. of the Addendum to this final rule, the statute requires that outlier payments for any year are projected to be not less than 5 percent nor more than 6 percent of total operating DRG payments plus outlier payments, and also requires that the average standardized amount be reduced by a factor to account for the estimated proportion of total DRG payments made to outlier cases. As proposed, we are continuing to use a 5.1 percent target (or an outlier offset factor of 0.949) in calculating the outlier offset to the standardized amount, just as we did for FY 2022. Therefore, our estimate of payments per discharge for FY 2023 from our payment simulation model reflects this 5.1 percent outlier payment target. Our payment simulation model shows that estimated outlier payments for FY 2022 exceed that target by approximately 1.7 percent. Therefore, our estimate of the changes in payments per discharge from FY 2022 and FY 2023 in Column 8 reflects the estimated -1.7 percent change in outlier payments produced by our payment simulation model when returning to the 5.1 percent outlier target for FY 2023. There are also interactive effects among the various factors comprising the payment system that we are not able to isolate, which may contribute to our estimate of the changes in payments per discharge from FY 2022 and FY 2023 in Column 8.

Overall payments to hospitals paid under the IPPS due to the applicable percentage increase and proposed changes to policies related to MS–DRGs, geographic adjustments, and outliers are estimated to increase by 2.6 percent for FY 2023. Hospitals in urban areas will experience a 2.6 percent increase in payments per discharge in FY 2023 compared to FY 2022. Hospital payments per discharge in rural areas are estimated to increase by 2.4 percent in FY 2023.

3. Impact Analysis of Table II

Table II presents the projected impact of the changes for FY 2023 for urban and rural hospitals and for the different categories of hospitals shown in Table I. It compares the estimated average payments per discharge for FY 2022 with the estimated average payments per discharge for FY 2023, as calculated under our models. Therefore, this table presents, in terms of the average dollar amounts paid per discharge, the combined effects of the changes presented in Table I. The estimated percentage changes shown in the last column of Table II equal the estimated percentage changes in average payments per discharge from Column 8 of Table I.

TABLE II.--IMPACT ANALYSIS OF CHANGES FOR FY 2023 ACUTE CARE HOSPITAL OPERATING PROSPECTIVE PAYMENT SYSTEM (PAYMENTS PER DISCHARGE)

	Number of Hospitals (1)	Estimated Average FY 2022 Payment Per Discharge (2)	Estimated Average FY 2023 Payment Per Discharge (3)	FY 2023 Changes (4)
All Hospitals	3,142	15,064	15,453	2.6
By Geographic Location:				
Urban hospitals	2,420	15,450	15,852	2.6
Rural hospitals	722	11,264	11,530	2.4
Bed Size (Urban):				
0-99 beds	653	11,638	11,761	1.1
100-199 beds	700	12,336	12,693	2.9
200-299 beds	411	13,921	14,345	3
300-499 beds	409	15,259	15,677	2.7
500 or more beds	245	19,035	19,492	2.4
Bed Size (Rural):				
0-49 beds	358	9,656	9,743	0.9
50-99 beds	201	10,973	11,118	1.3
100-149 beds	84	10,930	11,312	3.5
150-199 beds	46	12,354	12,740	3.1
200 or more beds	33	12,935	13,372	3.4
Urban by Region:				
New England	107	16,943	17,480	3.2
Middle Atlantic	295	18,132	18,590	2.5
East North Central	373	14,666	15,001	2.3
West North Central	156	14,816	15,140	2.2
South Atlantic	402	13,341	13,659	2.4
East South Central	140	12,824	13,147	2.5
West South Central	362	13,506	13,915	3
Mountain	176	15,343	15,965	4.1
Pacific	359	19,835	20,305	2.4
Puerto Rico	50	9,110	9,461	3.8
Rural by Region:				
New England	19	16,103	16,125	0.1
Middle Atlantic	49	11,001	11,281	2.5
East North Central	113	11,471	11,487	0.1
West North Central	86	11,804	12,144	2.9

H. Effects of Other Policy Changes

In addition to those policy changes discussed previously that we are able to model using our IPPS payment simulation model, we are making various other changes in this final rule. As noted in section I.D. of this Appendix A, our payment simulation model uses the most recent available claims data to estimate the impacts on payments per case of certain changes in this final rule. Generally, we have limited or no specific data available with which to estimate the impacts of these changes using that payment simulation model. For those changes, we have attempted to predict the payment impacts based upon our experience and other more limited data. Our estimates of the likely impacts associated with these other changes are discussed in this section.

1. Effects of Policy Changes Relating to New Medical Service and Technology Add-On Payments

a. FY 2023 Status of Technologies Approved for FY 2022 New Technology Add-On Payments

As discussed in section II.F.5.a. of the preamble of this final rule, we are continuing new technology add-on payments in FY 2023 for the 15 technologies that are still within their newness period. Under § 412.88(a)(2), the new technology add-on payment for each case involving use of an approved technology would be limited to the lesser of: (1) 65 percent of the costs of the new technology (or 75 percent of the costs for technologies designated as Qualified Infectious Disease Products (QIDPs) or approved under the Limited Population Pathway for Antibacterial and Antifungal Drugs (LPAD) pathway); or (2) 65 percent of the amount by which the costs of the case exceed the standard MS–DRG payment for the case (or 75 percent of the amount for technologies designated as QIDPs or approved under the LPAD pathway). Because it is difficult to predict the actual new technology add-on payment for each case, the estimated total payments in this final rule are based on the applicant's estimated cost and volume projections at the time they submitted their original application (unless the applicant provided updated figures in a public comment) and the assumption that every claim that would qualify for a new technology add-on payment would receive the maximum add-on payment.

In the following table, we present estimated total payments for the 15 technologies for which we are continuing to make new technology add-on payments in FY 2023:

FY 2023 Estimates for Technologies Approved for New Technology Add-On Payments in FY 2022			
Technology Name	**Estimated Cases**	**FY 2023 NTAP Amount (65 % or 75 %)**	**Estimated Total FY 2023 Impact**
Rybrevant™	349	$6,405.89	$2,235,655.61
Cosela™	435	$5,612.10	$2,441,263.50
ABECMA®	484	$289,532.75	$140,133,851.00
StrataGraft®	261	$44,200.00	$11,536,200.00
TECARTUS®	15	$259,350.00	$3,890,250.00
VEKLURY®	174,996	$2,028.00	$354,891,888.00
Zepzelca™	778	$9,145.50	$7,115,199.00
aprevo® Intervertebral Body Fusion Device	1,261	$40,950.00	$51,637,950.00
aScope® Duodeno	3,750	$1,296.75	$4,862,812.50
Caption Guidance™	2,592	$1,868.10	$4,842,115.20
Harmony™ Transcatheter Pulmonary Valve (TPV) System	171	$26,975.00	$4,612,725.00
Intercept®	2,296	$2,535.00	$5,820,360.00
ShockWave C2 Intravascular Lithotripsy (IVL) System	3,760	$3,666.00	$13,784,160.00
Fetroja® (HABP/VABP)	379	$8,579.84	$3,251,759.36
Recarbrio™ (HABP/VABP)	928	$9,576.51	$8,887,001.28
Aggregate Estimated Total FY 2023 Impact			**$619,943,190.45**

b. FY 2023 Applications for New Technology Add-On Payments

In sections II.F.6. and 7. of the preamble to this final rule, we discussed 11 technologies for which we received applications for new technology add-on payments for FY 2023. We noted that of the 37 applications (19 alternative and 18 traditional) we received, 23 applicants withdrew their application (11 alternative and 12 traditional) prior to the issuance of this final rule, and 3 technologies (2 alternative and 1 traditional) did not meet the July 1 deadline for FDA approval or clearance of the technology and were therefore ineligible for consideration for new technology add-on payments for FY 2023. As explained in the preamble to this final rule, add-on payments for new medical services and technologies under section 1886(d)(5)(K) of the Act are not required to be budget neutral.

As discussed in section II.F.7. of the preamble of this final rule, under the alternative pathway for new technology add-on payments, new technologies that are medical products with a QIDP designation, approved through the FDA LPAD pathway, or are part of the Breakthrough Device program will be considered not substantially similar to an existing technology for purposes of the new technology add-on payment under the IPPS, and will not need to demonstrate that the technology represents a substantial clinical improvement. These technologies must still be within the 2–3 year newness period, as discussed in II.F.1.a.(1) of this final rule, and must also still meet the cost criterion.

As fully discussed in section II.F.7. of the preamble of this final rule, we are approving or conditionally approving 6 alternative pathway applications for FY 2023 new technology add-on payments, including 5 technologies that received a Breakthrough Device designation from FDA and 1 that was designated as a QIDP by FDA. Based on information from the applicants at the time of the final rule, we estimate that total payments for the 6 technologies approved under the alternative pathway will be approximately $88.45 million for FY 2023. Total estimated FY 2023 payments for new technologies that are designated as a QIDP are approximately $33.9 million, and total estimated FY 2023 payments for new technologies that are part of the Breakthrough Device program are approximately $54.6 million.

In the following table, we present detailed estimates for the six technologies for which we are approving new technology add-on payments under the alternative pathway in FY 2023:

FY 2023 Estimates for New Technology Add-On Payments for Technologies under the Alternative Pathway for FY 2023				
Technology Name	**Pathway (QIDP, LPAD, or Breakthrough Device)**	**Estimated Cases**	**FY 2023 NTAP Amount (65 % or 75 %)**	**Estimated Total FY 2023 Impact**
Cerament® G	Breakthrough Device	1610	$4,918.55	$7,918,865.50
GORE TAG Thoracic Branch Endoprosthesis	Breakthrough Device	386	$27,807.00	$10,733,502.00
iFuse Bedrock Granite Implant System	Breakthrough Device	1,480	$9,828.00	$14,545,440.00
Thoraflex Hybrid Device	Breakthrough Device	800	$22,750.00	$18,200,000.00
ViviStim	Breakthrough Device	135	$23,400.00	$3,159,000.00
DefenCath	QIDP	7726	$4,387.50	$33,897,825.00
Estimated Total FY 2023 Impact				**$88,454,632.50**

As fully discussed in section II.F.6. of the preamble of this final rule, we are approving three technologies that applied under the traditional pathway for new technology add-on payments for FY 2023, and providing new technology add-on payments for one application that is substantially similar to a current NTAP-approved technology. Based on information from the applicants at the time of rulemaking, we estimate that total payments for the four technologies for which we are making new technology add-on payments is approximately $75.16 million for FY 2023.

In the following table, we present detailed estimates for the four technologies for which we are providing new technology add-on payments under the traditional pathway in FY 2023:

FY 2023 Estimates for New Technology Add-On Payments for Technologies under the Traditional Pathway for FY 2023			
Technology Name	**Estimated Cases**	**FY 2023 NTAP Amount (65 % or 75 %)**	**Estimated Total FY 2023 Impact**
Carvykti™	241	$289,532.75	$69,777,392.75
DARZALEX FASPRO®	25	$5,159.41	$128,985.19
Hemolung Respiratory Assist System (RAS)	161	$6,500.00	$1,046,500.00
Livtencity™	129.5	$32,500.00	$4,208,750.00
Aggregate Estimated Total FY 2023 Impact			**$75,161,627.94**

c. Total Estimated Costs for NTAP in FY 2023

In the following table, we present summary estimates for all technologies approved for new technology add-on payments for FY 2023:

FY 2023 Estimates for New Technology Add-On Payments for FY 2023	
Category	**Estimated Total FY 2023 Impact**
Technologies Continuing New Technology Add-on Payments in FY 2023	$619,943,190.45
Alternative Pathway Applications	$88,454,632.50
Traditional Pathway Applications	$75,161,627.94
Aggregate Estimated Total FY 2023 Impact	**$783,559,450.89**

As discussed in section IV.D. of the preamble of this final rule, under section 3133 of the Affordable Care Act, hospitals that are eligible to receive Medicare DSH payments will receive 25 percent of the amount they previously would have received under the statutory formula for Medicare DSH payments under section 1886(d)(5)(F) of the Act. The remainder, equal to an estimate of 75 percent of what formerly would have been paid as Medicare DSH payments (Factor 1), reduced to reflect changes in the percentage of uninsured individuals and any additional statutory adjustment (Factor 2), is available to make additional payments to each hospital that qualifies for Medicare DSH payments and that has uncompensated care. Each hospital eligible for Medicare DSH payments will receive an additional payment based on its estimated share of the total amount of uncompensated care for all hospitals eligible for Medicare DSH payments. The uncompensated care payment methodology has redistributive effects based on the proportion of a hospital's amount of uncompensated care relative to the aggregate amount of uncompensated care for all

hospitals eligible for Medicare DSH payments (Factor 3). The change to Medicare DSH payments under section 3133 of the Affordable Care Act is not budget neutral.

In this final rule, we are establishing the amount to be distributed as uncompensated care payments to DSH eligible hospitals, which for FY 2023 is $6,874,403,459.42. This figure represents 75 percent of the amount that otherwise would have been paid for Medicare DSH payment adjustments adjusted by a Factor 2 of 65.71 percent. For FY 2022, the amount available to be distributed for uncompensated care was $7,192,008,709.70 or 75 percent of the amount that otherwise would have been paid for Medicare DSH payment adjustments adjusted by a Factor 2 of 68.57 percent. In addition, under the new supplemental payment for Indian Health Service (IHS) and Tribal Hospitals and Puerto Rico Hospitals, which we are establishing in this final rule, these hospitals will receive approximately $96.3 million in supplemental payments, as determined based on the difference between each hospital's FY 2022 UCP (reduced by negative 4.4 percent, which is the projected change between the FY 2023 total uncompensated care payment amount and the total uncompensated care payment amount for FY 2022) and its FY 2023 UCP as calculated using the methodology adopted in this final rule for FY 2023. For this final rule, the total uncompensated care payments and supplemental payments equal approximately $6.971 billion. For FY 2023, we are using 2 years of data on uncompensated care costs from Worksheet S–10 of the FY 2018 and 2019 cost reports to calculate Factor 3 for all DSH-eligible hospitals, including IHS/Tribal hospitals and Puerto Rico hospitals. For a complete discussion of the methodology for calculating Factor 3 for FY 2023 and the methodology for calculating the new supplemental payments, we refer readers to sections IV.D. and IV.E. of the preamble of this final rule.

To estimate the impact of the combined effect of the changes in Factors 1 and 2, as well as the changes to the data used in determining Factor 3, on the calculation of Medicare uncompensated care payments along with the new supplemental payment for Puerto Rico hospitals and IHS and Tribal hospitals, which we are establishing using our authority under section 1886(d)(5)(I) of the Act, we compared total uncompensated care payments estimated in the FY 2022 IPPS/LTCH PPS final rule to the combined total of uncompensated care payments and supplemental payments estimated in this FY 2023 IPPS/LTCH PPS final rule. For FY 2022, we calculated 75 percent of the estimated amount that would be paid as Medicare DSH payments absent section 3133 of the Affordable Care Act, adjusted by a Factor 2 of 68.57 percent and multiplied by a Factor 3 calculated using the methodology described in the FY 2022 IPPS/LTCH PPS final rule. For FY 2023, we calculated 75 percent of the estimated amount that would be paid as Medicare DSH payments during FY 2023 absent section 3133 of the Affordable Care Act, adjusted by a Factor 2 of 65.71 percent and multiplied by a Factor 3 calculated using the methodology described previously. For the supplemental payments for IHS/Tribal hospitals and Puerto Rico hospitals, we calculated the difference between the hospital's adjusted base year amount (as determined based on the hospital's FY 2022 uncompensated care payment) and the hospital's FY 2023 uncompensated care payment.

Our analysis included 2,368 hospitals that are projected to be eligible for DSH in FY 2023. It did not include hospitals that had terminated their participation in the Medicare program as of June 3, 2022, Maryland hospitals, new hospitals, and SCHs that are expected to be paid based on their hospital-specific rates. The 26 hospitals that are anticipated to be participating in the Rural Community Hospital Demonstration Program were excluded from this analysis, as participating hospitals are not eligible to receive empirically justified Medicare DSH payments and uncompensated care payments. In addition, the data from merged or acquired hospitals were combined under the surviving hospital's CMS certification number (CCN), and the non-surviving CCN was excluded from the analysis. The estimated impact of the changes in Factors 1, 2, and 3 on uncompensated care payments and of establishing the new supplemental payment for IHS/Tribal hospitals and Puerto Rico hospitals across all hospitals projected to be eligible for DSH payments in FY 2023, by hospital characteristic, is presented in the following table:

Modeled Uncompensated Care Payments* and Supplemental Payments for Estimated FY 2023 DSHs by Hospital Type

Source: Dobson | DaVanzo analysis of 2018 and 2019 Hospital Cost Reports.

*Dollar uncompensated care payments calculated by [0.75 * estimated section 1886(d)(5)(F) payments * Factor 2 * Factor 3]. When summed across all hospitals projected to receive DSH payments, uncompensated care payments are estimated to be $7,192 million in FY 2022 and uncompensated care payments and supplemental payments are estimated to be $6,971 million in FY 2023.

** For IHS/Tribal hospitals and Puerto Rico hospitals, this impact table reflects the supplemental payments.

*** Percentage change is determined as the difference between Medicare uncompensated care payments and supplemental payments modeled for this FY 2023 IPPS/LTCH PPS final rule (column 3) and Medicare uncompensated care payments modeled for the FY 2022 IPPS/LTCH PPS final rule correction notice (column 2) divided by Medicare uncompensated care payments modeled for the FY 2022 IPPS/LTCH PPS final rule correction notice (column 2) times 100 percent.

****Hospitals with missing or unknown Medicare utilization or Medicaid utilization are not shown in the table.

The changes in projected FY 2023 uncompensated care payments and supplemental payments compared to the total uncompensated care payments in FY 2022 are driven by a decrease in Factor 1 and a decrease in Factor 2 and the establishment of a new supplemental payment for DSH-eligible IHS/Tribal hospitals and Puerto Rico hospitals. Factor 1 has decreased from the FY 2022 final rule's Factor 1 of $10.489 billion to this final rule's Factor 1 of $10.461 billion, while the percent change in the percent of individuals who are uninsured (Factor 2) has decreased from 68.57 percent to 65.71 percent. In addition, we note that there is a slight increase in the number of projected DSHs to 2,368 at the time of the development for this final rule compared to the projected 2,365 DSHs in the FY 2022 IPPS/LTCH PPS correction notice (86 FR 58034). Based on the changes, the impact analysis found that, across all projected DSH eligible hospitals, FY 2023 uncompensated care payments and supplemental payments are estimated at approximately $6.971 billion, or a decrease of approximately 3.08 percent from FY 2022 uncompensated care payments (approximately $7.192 billion). While these changes will result in a net decrease in the total amount available to be distributed in uncompensated care payments and supplemental payments, the projected payment decreases vary by hospital type.

This redistribution of payments is caused by changes in Factor 3 and the establishment the new supplemental payment for DSH-eligible IHS/Tribal hospitals and Puerto Rico hospitals. As seen in the previous table, a percent change of less than negative 3.08 percent indicates that hospitals within the specified category are projected to experience a larger decrease in payments, on average, compared to the universe of projected FY 2023 DSH hospitals. Conversely, a percent change greater than negative 3.08 percent indicates that a hospital type is projected to have a smaller decrease in payments or an increase compared to the overall average. The variation in the distribution of overall payments by hospital characteristic is largely dependent on a given hospital's uncompensated care costs as reported on the Worksheet S–10 and used in the Factor 3 computation and whether the hospital is eligible to receive the new supplemental payment.

Rural hospitals, in general, are projected to experience larger decreases in uncompensated care payments and supplemental payments compared to their uncompensated care payments in FY 2022, than their urban counterparts. Overall, rural hospitals are projected to receive a 6.00 percent decrease in payments, which is a greater decrease than the overall hospital average, while urban hospitals are projected to receive a 2.90 percent decrease in payments, which is a slightly smaller decrease than the overall hospital average.

By bed size, larger rural hospitals are projected to receive the smallest decreases in uncompensated care payments and supplemental payments among rural hospitals. Rural hospitals with 250+ beds are projected to receive a 4.52 percent payment decrease, and rural hospitals with 100–249 beds are projected to receive a 6.81 percent decrease. Smaller rural hospitals with 0–99 beds are projected to receive a 5.81 percent payment decrease. Among urban hospitals, the smallest hospitals, those with 0–99 beds, are projected to receive a 6.55 percent decrease in payments, which is a greater decrease than the overall hospital average. In contrast, urban hospitals with 100–249 beds and those with 250+ beds are projected to receive decreases in payments of 2.57 and 2.80 percent, respectively, which are smaller decreases than the overall hospital average.

By region, rural hospitals are generally expected to receive larger than average decreases in uncompensated care payments and supplemental payments in most regions. The exceptions are rural hospitals in the South Atlantic Region, which are projected to receive a smaller than average decrease of 1.81 percent in payments and rural hospitals in the East North Central Region and the Pacific Region, which are projected to receive payment increases of 8.09 and 24.45 percent, respectively. Regionally, urban hospitals are projected to receive a more varied range of payment changes. Urban hospitals in the New England, Middle Atlantic, and South Atlantic Regions, as well as hospitals in Puerto Rico, are projected to receive larger than average decreases in payments. Urban hospitals in the East South Central, West North Central, West South Central, and Mountain Regions are projected to receive smaller than average decreases in payments. Urban hospitals in the East North Central and Pacific Regions are projected to receive increases in average payments of 1.03 percent and 0.52 percent, respectively.

By payment classification, although hospitals in urban payment areas overall are expected to receive a 2.46 percent decrease in uncompensated care payments and supplemental payments, hospitals in large urban payment areas are expected to see a decrease in payments of 1.27 percent, while hospitals in other urban payment areas are projected to receive the largest decrease of 4.76 percent. Hospitals in rural payment areas are expected to receive a decrease in payments of 4.10 percent.

Nonteaching hospitals are projected to receive a payment decrease of 2.82 percent, teaching hospitals with fewer than 100 residents are projected to receive a decrease of 2.40 percent, and teaching hospitals with 100+ residents have a projected payment decrease of 3.88 percent. Proprietary and voluntary hospitals are projected to receive smaller than average decreases of 2.37 and 1.95 percent respectively, while government hospitals are expected to receive a larger than average payment decrease of 5.65 percent. Hospitals with less than 25 percent Medicare utilization and hospitals with 50 to 65 percent Medicare utilization are projected to receive smaller than average payment decreases of 2.94 and 0.38 percent, respectively, while hospitals with 25–50 percent and hospitals with greater than 65 percent Medicare utilization are projected to receive larger than average payment decreases of 3.25 and 23.82 percent, respectively. All hospitals with less than 50 percent Medicaid utilization are projected to receive smaller decreases in uncompensated care payments and supplemental payments than the overall hospital average percent change, while hospitals with 50–65 percent Medicaid utilization are projected to receive larger than average decreases of 10.49 percent. Hospitals with greater than 65 percent Medicaid utilization are projected to receive an increase of 6.67 percent.

The previous impact table reflects the total combined uncompensated care payments and supplemental payments modeled for FY 2023 for IHS/Tribal and Puerto Rico hospitals. In FY 2023, IHS/Tribal hospitals' and Puerto Rico hospitals' aggregate uncompensated care payments are estimated to decrease by approximately $103 million while the aggregate supplemental payments to these hospitals are estimated to be approximately $96 million, a net decrease of approximately $7 million. This difference is primarily attributable to the change in the estimated amount available for uncompensated care payments in FY 2023 and estimated changes in DSH status. We refer readers to the discussion of the methodology for calculating the new supplemental payments in sections IV.E. of the preamble of this final rule. For the estimated impacts on individual IHS/Tribal hospitals and Puerto Rico hospitals, we refer readers to the IPPS Payment Impact File, which can be found on the FY 2023 IPPS final rule home page on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*. We note that the amounts for this final rule differ from the proposed rule amounts primarily due to updated estimates of the amount available for uncompensated care payments for FY 2023.

3. Effects of Changes to Low-Volume Hospital Payment Adjustment Policy

In section V.C. of the preamble of this final rule, we discuss the expiration of the temporary changes to the low-volume hospital payment policy originally provided for by the Affordable Care Act and extended through FY 2022 by subsequent legislation. Effective for FY 2023 and subsequent years, in order to qualify as a low-volume hospital, a subsection (d) hospital must be more than 25 road miles from another subsection (d) hospital and have less than 200 discharges (that is, less than 200 discharges total, including both Medicare and non-Medicare discharges) during the fiscal year. Based upon the best available data at this time, we estimate the expiration of the temporary changes to the low-volume hospital payment policy will decrease aggregate low-volume hospital payments by $437 million in FY 2023 as compared to FY 2022. These payment estimates were determined based on the estimated payments for the 632 providers that are expected to no longer qualify under the criteria that will apply in FY 2023, and were calculated using the same methodology used in developing the quantitative analyses of changes in payments per case discussed previously in section I.G. of this Appendix A.

4. Effects of Reductions Under the Hospital Readmissions Reduction Program for FY 2023

In section V.H of the preamble of this final rule, we discuss our policies for the FY 2023 Hospital Readmissions Reduction Program. This program requires a reduction to a hospital's base operating MS–DRG payment to account for excess readmissions of selected applicable conditions and procedures. The table and analysis in this final rule illustrate the estimated financial impact of the Hospital Readmissions Reduction Program payment adjustment methodology by hospital characteristics. In the proposed rule, for the purpose of modeling the estimated FY 2023 payment adjustment factors that account for the suppression of the pneumonia readmission measure, we used the data from the FY 2022 Hospital Readmissions Reduction Program for the five non-suppressed measures (acute myocardial infarction—AMI, heart failure—HF, chronic obstructive pulmonary disease—COPD, coronary artery bypass graft—CABG, and total hip arthroplasty/total knee arthroplasty—THA/TKA) and the FY 2022 Hospital IPPS Proposed Rule Impact File to analyze results by hospital characteristics. In this final rule, we are updating the estimated financial impact using the estimated payment adjustment factors from the FY 2023 Hospital Readmissions Reduction Program and the FY 2023 Hospital IPPS Proposed Rule Impact File to analyze results by hospital characteristics.

Hospitals are sorted into quintiles based on the proportion of dual-eligible stays among Medicare fee-for-service (FFS) and managed

care stays between July 1, 2018 and December 1, 2019 and July 1, 2020 through June 30, 2021 (that is, the data period used for the FY 2023 Hospital Readmissions Reduction Program). Hospitals' excess readmission ratios (ERRs) are assessed relative to their peer group median and a neutrality modifier is applied in the payment adjustment factor calculation to maintain budget neutrality. In this final rule, we are providing an updated estimate of the financial impact using the proportion of dually-eligible beneficiaries, ERRs, and aggregate payments for each condition/procedure and all discharges for applicable hospitals from the FY 2023 Hospital Readmissions Reduction Program applicable period. We note that for the FY 2023 applicable period, we will only be assessing data from July 1, 2018 through December 1, 2019 and from July 1, 2020 through June 30, 2021 due to the COVID–19 public health emergency (PHE) nationwide Extraordinary Circumstance Exception (ECE) which excluded data from January 1, 2020 through June 30, 2020 from the Hospital Readmissions Reduction Program calculations.[1169]

The results in the table include 2,849 non-Maryland hospitals eligible to receive a penalty during the performance period. Hospitals are eligible to receive a penalty if they have 25 or more eligible discharges for at least one measure between July 1, 2018 through December 1, 2019 and July 1, 2020 through June 30, 2021. The second column in the table indicates the total number of non-Maryland hospitals with available data for each characteristic that have an estimated payment adjustment factor less than 1 (that is, penalized hospitals).

The third column in the table indicates the percentage of penalized hospitals among those eligible to receive a penalty by hospital characteristic. For example, 74.85 percent of eligible hospitals characterized as non-teaching hospitals are expected to be penalized. Among teaching hospitals, 86.77 percent of eligible hospitals with fewer than 100 residents and 88.06 percent of eligible hospitals with 100 or more residents are expected to be penalized.

The fourth column in the table estimates the financial impact on hospitals by hospital characteristic. The table shows the share of penalties as a percentage of all base operating DRG payments for hospitals with each characteristic. This is calculated as the sum of penalties for all hospitals with that characteristic over the sum of all base operating DRG payments for those hospitals between October 1, 2020 through September 30, 2021 (FY 2021). For example, the penalty as a share of payments for non-teaching hospitals is 0.47 percent. This means that total penalties for all non-teaching hospitals are 0.47 percent of total payments for non-teaching hospitals. Measuring the financial impact on hospitals as a percentage of total base operating MS–DRG payments accounts for differences in the amount of base operating MS–DRG payments for hospitals with the characteristic when comparing the financial impact of the program on different groups of hospitals.

[1169] Although the FY 2023 performance period is July 1, 2018 through June 30, 2021, first and second quarter data from CY 2020 is excluded from program calculations due to the nationwide ECE that was granted in response to the COVID–19 PHE. Taking into consideration the 30-day window to identify readmissions, the period for calculating MS–DRG payments will be adjusted to July 1, 2018 through December 1, 2019 and then July 1, 2020 through June 30, 2021. Taking into consideration the 30-day window to identify readmissions, the period for identifying index stays will be adjusted to July 1, 2018 through December 1, 2019 and July 1, 2020 through June 30, 2021.

Estimated Percentage of Hospitals Penalized and Penalty as Share of Payments for FY 2023 Hospital Readmissions Reduction Program by Hospital Characteristic				
Hospital Characteristic	**Number of Eligible Hospitals[a]**	**Number of Penalized Hospitals[b]**	**Percentage of Hospitals Penalized[c] (%)**	**Penalty as a Share of Payments[d] (%)**
All Hospitals	2,849	2,273	79.78	0.42
By Geographic Location (n=2,847)				
Urban hospitals	2,175	1,789	82.25	0.42
1-99 beds	492	320	65.04	0.48
100-199 beds	643	547	85.07	0.48
200-299 beds	403	344	85.36	0.45
300-399 beds	279	255	91.40	0.46
400-499 beds	121	109	90.08	0.42
500 or more beds	237	214	90.30	0.34
Rural hospitals	672	482	71.73	0.44
1-49 beds	300	180	60.00	0.35
50-99 beds	210	155	73.81	0.48
100-149 beds	85	74	87.06	0.41
150-199 beds	41	38	92.68	0.48
200 or more beds	36	35	97.22	0.44
By Teaching Status[e] (n=2,847)				
Non-teaching	1,702	1,274	74.85	0.47
Fewer than 100 residents	877	761	86.77	0.43
100 or more residents	268	236	88.06	0.35
By Ownership Type (n=2,846)				
Government	390	293	75.13	0.35
Proprietary	674	525	77.89	0.58

West North Central	232	168	72.41	0.22
South Atlantic	481	417	86.69	0.49
East South Central	246	202	82.11	0.47
West South Central	430	337	78.37	0.39
Mountain	210	134	63.81	0.36
Pacific	343	259	75.51	0.29

Source: The table results are based on the estimated FY 2023 payment adjustment factors of open, non-Maryland, subsection (d) hospitals. The estimated FY 2023 payment adjustment factors are based on discharges between July 1, 2018 to December 1, 2019 and July 1, 2020 to June 30, 2021 (the FY 2023 Hospital Readmissions Reduction Program performance period). Although data from all subsection (d) and Maryland hospitals are used in calculations of each hospital's ERR, this table does not include results for Maryland hospitals and hospitals that are not open as of the

October 2022 public reporting open hospital list because these hospitals are not eligible for a penalty under the program. Hospitals are sorted into quintiles based on the proportion of Medicare FFS and managed care dual-eligible stays for the multi-year performance period. Hospital characteristics are from the FY 2023 Hospital IPPS proposed rule Impact File.

As discussed in the FY 2022 IPPS/LTCH PPS final rule, CMS will not use claims data representing quarter (Q)1 and Q2 2020 in its calculations for the Hospital Readmissions Reduction Program (86 FR 45260 - 45261). The readmission measures used in the Hospital Readmissions Reduction Program identify readmissions within 30 days of each index stay; therefore, the performance period for the Hospital Readmissions Reduction Program will also not use claims data representing the 30 days before January 1, 2020. The FY 2023 performance period for HRRP is July 1, 2018, to December 1, 2019, and July 1, 2020, to June 30, 2021, so that no claims from Q1 and Q2 2020 are used in the measure or program calculations. As finalized in the FY 2022 IPPS/LTCH PPS final rule, the pneumonia readmission measure is suppressed from FY 2023 Hospital Readmissions Reduction Program payment reduction calculations due to the COVID-19 PHE's substantial impact on this measure (86 FR 45254-45256). The pneumonia measure results do not contribute to FY 2023 Hospital Readmissions Reduction Program calculations.

[a] This column is the number of applicable hospitals within the characteristic that are eligible for a penalty (that is, they have 25 or more eligible discharges for at least one measure).

[b] This column is the number of applicable hospitals that are penalized (that is, they have 25 or more eligible discharges for at least one measure and an estimated payment adjustment factor less than 1) within the characteristic.

[c] This column is the percentage of applicable hospitals that are penalized among hospitals that are eligible to receive a penalty by characteristic.

[d] This column is calculated as the sum of all penalties for the group of hospitals with that characteristic divided by total base operating MS-DRG payments for all those hospitals. MedPAR data from October 1, 2020 through September 31, 2021 (FY 2021) are used to calculate the total base operating MS-DRG payments.

[e] The total number of hospitals with hospital characteristics data may not add up to the total number of hospitals because not all hospitals have data for all characteristics. Not all hospitals had data for geographic location, teaching status, safety-net status, and DSH patient percentage (n=2,847; missing=2 for each), ownership type (n=2,846; missing=3), or MCR percentage (n=2,842; missing=7).

[f] A hospital is considered a teaching hospital if it has an Indirect Medical Education adjustment factor for Operation PPS (TCHOP) greater than zero.

[g] A hospital is considered a safety-net hospital if it is in the top DSH quintile.

[h] DSH patient percentage is the sum of the percentage of Medicare inpatient days attributable to patients eligible for both Medicare Part A and Supplemental Security Income (SSI), and the percentage of total inpatient days attributable to patients eligible for Medicaid but not Medicare Part A.

[i] MCR percent is the percentage of total inpatient stays from Medicare patients.

5. Effects of Changes Under the FY 2023 Hospital Value-Based Purchasing (VBP) Program

In section V.I. of the preamble of this final rule, we discuss the Hospital VBP Program under which the Secretary makes value-based incentive payments to hospitals based on their performance on measures during the performance period with respect to a fiscal year. We are finalizing our proposals to suppress the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) survey and five Healthcare-Associated Infection (HAI) measures, as well as to change the scoring and payment methodologies for the FY 2023 program year, such that hospitals would receive a value-based incentive payment percentage that results in a value-based incentive payment amount that is equal to the applicable percentage (2 percent). Specifically, we are finalizing our proposal such that we would calculate the measure rates for all of the measures we have selected for the FY 2023 program year, but we would not generate achievement or improvement points for any of the measures we are finalizing for suppression. Additionally, we are finalizing our proposal to not award domain scores for the Person and Community Engagement and Safety domains. We are also not awarding hospitals a Total Performance Score (TPS), and will instead award hospitals a payment incentive multiplier that results in a value-based incentive payment amount that is equal to the amount withheld for the fiscal year (2 percent). That is, each hospital will receive a 2-percent reduction to its base operating DRG payment amount for each FY 2023 discharge and will then receive a value-based incentive payment percentage that will result in a value-based incentive payment amount that is equal to the 2 percent withheld. Because we are finalizing these proposals, the impact for every hospital under the Hospital VBP Program will be a net percentage payment adjustment of zero.

In the FY 2023 IPPS/LTCH PPS proposed rule, we provided the estimated impact of the FY 2023 program because those impacts would apply if the proposals discussed previously were not finalized. However, because we are finalizing the policies as proposed, all adjustment factors for all hospitals will reflect a net-neutral payment adjustment for hospitals in accordance with the finalized FY 2023 special scoring policy at § 412.168.

6. Effects of Changes Under the HAC Reduction Program for FY 2023

In the FY 2023 IPPS/LTCH PPS proposed rule, we presented the estimated impact of the FY 2023 Hospital-Acquired Condition (HAC) Reduction Program on hospitals by hospital characteristics in the following table. The table in this section presents the estimated proportion of hospitals in the worst-performing quartile of Total HAC Scores by hospital characteristic and includes 3,119 non-Maryland hospitals that participate in the HAC Reduction Program. The first column presents a breakdown of each characteristic and the second column indicates the number of hospitals for the respective characteristic. The third column in the table indicates the number of hospitals for each characteristic that would be in the worst-performing quartile of Total HAC Scores. The fourth column in the table indicates the proportion of hospitals for each characteristic that would be in the worst performing quartile of Total HAC Scores.

In section V.J.2.b.(2). of this FY 2023 IPPS/LTCH PPS final rule, we are finalizing our proposal to suppress all six measures from the HAC Reduction Program, calculate only measure results for the HAI measures for the FY 2023 program, and not calculate measure scores or Total HAC Scores. Additionally, we are not finalizing our proposal to not calculate measure results for the CMS PSI 90 measure and thus will be calculating measure results for purposes of public reporting for the FY 2023 program.

Accordingly, since we are finalizing the measure suppression proposal, no hospitals will receive a payment reduction in the FY 2023 HAC Reduction Program.[1170] In Table 1, we present the estimated impact of the FY 2023 HAC Reduction Program on hospitals by hospital characteristic for the finalized proposal in section V.J.2.b.(2). whereby FY 2023 HAC Reduction Program measure scores and Total HAC scores are not calculated. Therefore, Table 1 illustrates the number of hospitals participating in the FY 2023 HAC Reduction Program by hospital characteristic; however, the remaining two columns reflect values of zero because no hospital would be in the worst-performing quartile.

[1170] Based on finalizing our suppression proposals, we anticipate reduced savings to the Medicare trust fund that is otherwise estimated at approximately $350 million.

Table 1- Estimated Proportion of Hospitals in the Worst-Performing Quartile (>75th percentile) of the Total HAC Scores for the FY 2023 HAC Reduction Program (by Hospital Characteristic)- Finalizing the Proposal in Section V.J.2.b.(2).			
Hospital Characteristic	**Number of Hospitals**	**Number of Hospitals in the Worst-performing Quartile[a]**	**Percent of Hospitals in the Worst-performing Quartile[b]**

Source: FY 2023 HAC Reduction Program final rule results are based on CDC NHSN HAI results from January 1, 2021 through December 31, 2021. Hospital Characteristics are based on the FY 2023 Proposed Rule Impact File.

[a] This column is the number of non-Maryland hospitals with a Total HAC Score within the corresponding characteristic that are estimated to be in the worst-performing quartile.

[b] This column is the percent of non-Maryland hospitals within each characteristic that are estimated to be in the worst-performing quartile. The percentages are calculated by dividing the number of non-Maryland hospitals with a Total HAC Score in the worst-performing quartile by the total number of non-Maryland hospitals with a Total HAC Score within that characteristic.

[c] The number of non-Maryland hospitals with a FY 2023 Total HAC Score (N = 3,119). Note that not all hospitals have data for all hospital characteristics.

[d] The number of hospitals that had information for geographic location with bed size, Safety-net status, DSH percent, and teaching status (n = 3,089).

[e] A hospital is considered a Safety-net hospital if it is in the top quintile for DSH percent.

[f] The DSH patient percentage is equal to the sum of: (1) the percentage of Medicare inpatient days attributable to patients eligible for both Medicare Part A and Supplemental Security Income; and (2) the percentage of total inpatient days attributable to patients eligible for Medicaid but not Medicare Part A.

[g] A hospital is considered a teaching hospital if it has an IME adjustment factor for Operation PPS (TCHOP) greater than zero.

[h] Not all hospitals had data for Ownership (n = 3,088).

[i] Not all hospitals had data for MCR percent (n = 3,044).

[j] Not all hospitals had data for Region (n = 3,099).

7. Effects of the Changes to IME and Direct GME Payments

a. Change to Direct GME Calculation in Response to Decision in **Milton S. Hershey Medical Center et al** v. **Azar II**

As discussed in section V.F.2. of the preamble of this final rule, we are implementing a modified direct GME payment policy for all teaching hospitals. Specifically, effective for cost reporting periods beginning on or after October 1, 2001, for cost reports that are reopenable or open, if the hospital's unweighted number of FTE residents exceeds the FTE cap, and the number of weighted FTE residents also exceeds that FTE cap, the respective primary care and obstetrics and gynecology weighted FTE counts and other weighted FTE counts are adjusted to make the total weighted FTE count equal the FTE cap. If the number of weighted FTE residents does not exceed that FTE cap, then the allowable weighted FTE count for direct GME payment is the actual weighted FTE count. We have estimated the impact of this change for FY 2023 to be $170 million.

b. Effects of Allowing Medicare GME Affiliation Agreements Within Certain Rural Track FTE Limitations

In section V.F.4. of the preamble of this final rule, we are finalizing a policy to allow urban and rural hospitals that participate in the same separately accredited 1–2 family medicine rural track program and have rural track FTE limitations to enter into ''rural track Medicare GME affiliation agreements'' in order to share those cap slots, and facilitate the cross-training of residents. In addition, the final policy only allows urban and rural hospitals to participate in rural track Medicare GME affiliated groups if they have rural track FTE limitations in place prior to October 1, 2022. Under the final policy, eligible urban and rural hospitals may enter into rural track Medicare GME affiliation agreements effective with the July 1, 2023, academic year. Because no newly funded cap slots will be created, only existing funded cap slots would be shared between the participating affiliated hospitals, there is no financial impact to this provision.

8. Effects of Implementation of the Rural Community Hospital Demonstration Program in FY 2022

In section V.K. of the preamble of this final rule for FY 2023, we discussed our implementation and budget neutrality methodology for section 410A of Public Law 108–173, as amended by sections 3123 and 10313 of Public Law 111–148, by section 15003 of Public Law 114–255, and most recently, by section 128 of Public Law 116–260, which requires the Secretary to conduct a demonstration that would modify payments for inpatient services for up to 30 rural hospitals.

Section 128 of Public Law 116–260 requires the Secretary to conduct the Rural Community Hospital Demonstration for a 15-year extension period (that is, for an additional 5 years beyond the previous extension period). In addition, the statute provides for continued participation for all hospitals participating in the demonstration program as of December 30, 2019.

Section 410A(c)(2) of Public Law 108–173 requires that in conducting the demonstration program under this section, the Secretary shall ensure that the aggregate payments made by the Secretary do not exceed the amount which the Secretary would have paid if the demonstration program under this section was not implemented (budget neutrality). We propose to adopt the general methodology used in previous years, whereby we estimated the additional payments made by the program for each of the participating hospitals as a result of the demonstration, and then adjusted the national IPPS rates by an amount sufficient to account for the added costs of this demonstration. In other words, we have applied budget neutrality across the payment system as a whole rather than across the participants of this demonstration. The language of the statutory budget neutrality requirement permits the agency to implement the budget neutrality provision in this manner. The statutory language requires that aggregate payments made by the Secretary do not exceed the amount which the Secretary would have paid if the demonstration was not implemented, but does not identify the range across which aggregate payments must be held equal.

For this final rule, the resulting amount applicable to FY 2023 is $72,449,896, which we are including in the budget neutrality offset adjustment for FY 2023. This estimated amount is based on the specific assumptions regarding the data sources used, that is, recently available ''as submitted'' cost reports and historical and currently finalized update factors for cost and payment.

In previous years, we have incorporated a second component into the budget neutrality offset amounts identified in the final IPPS rules. As finalized cost reports became available, we determined the amount by which the actual costs of the demonstration for an earlier, given year differed from the estimated costs for the demonstration set forth in the final IPPS rule for the corresponding fiscal year, and we incorporated that amount into the budget neutrality offset amount for the upcoming fiscal year. We have calculated this difference for FYs 2005 through 2016 between the actual costs of the demonstration as determined from finalized cost reports once available, and estimated costs of the demonstration as identified in the applicable IPPS final rules for these years.

With the extension of the demonstration for another 5-year period, as authorized by section 128 of Public Law 116–260, we will continue this general procedure. At the time of the FY 2023 proposed rule, all of the finalized cost reports are available for the 17 hospitals that completed cost report periods beginning in FY 2017 under the demonstration payment methodology; these cost reports show the actual costs of the demonstration for this fiscal year to be $35,989,928. We note that the FY 2017 IPPS final rule included no budget neutrality offset amount for that fiscal year. The final rule for FY 2017 preceded the re-authorization of the demonstration under the Cures Act. Anticipating that the demonstration would end in 2016, we projected no demonstration cost estimate for the upcoming fiscal year, FY 2017, while we stated that we would continue to reconcile actual costs when all finalized cost reports for previous fiscal years under the demonstration became available

(81 FR 57037). Thus, keeping with past practice, for this final rule we are including the actual costs of the demonstration as determined from finalized cost reports for FY 2017 within the budget neutrality offset amount for this upcoming fiscal year.

Therefore, for this FY 2023 IPPS/LTCH PPS final rule, the budget neutrality offset amount for FY 2023 is based on the sum of two amounts:

- The amount representing the difference applicable to FY 2023 between the sum of the estimated reasonable cost amounts that would be paid under the demonstration for covered inpatient services to the 26 hospitals participating in the fiscal year and the sum of the estimated amounts that would generally be paid if the demonstration had not been implemented. This estimated amount is $72,449,896.
- The amount by which the actual costs of the demonstration in FY 2017 (as shown by finalized cost reports from that fiscal year) differ from the amount determined for FY 2017. Since no budget neutrality offset was conducted in FY 2017, the amount of this difference is the actual cost amount for FY 2017 $35,989,928.

We are thus subtracting the sum of these amounts ($108,439,824) from the national IPPS rates for FY 2023.

9. Effects of Continued Implementation of the Frontier Community Health Integration Project (FCHIP) Demonstration

In section VIIB.2. of the preamble of this final rule we discuss the implementation of the FCHIP Demonstration, which allows eligible entities to develop and test new models for the delivery of health care services in eligible counties in order to improve access to and better integrate the delivery of acute care, extended care, and other health care services to Medicare beneficiaries in no more than four States. Section 123 of Public Law 110–275 initially required a 3-year period of performance. The FCHIP Demonstration began on August 1, 2016, and concluded on July 31, 2019 (referred to in this section as the ''initial period''). Section 129 of the Consolidated Appropriations Act (Pub. L. 116–159) extended the FCHIP Demonstration by 5 years (referred to in this section as the ''extension period'' of the demonstration). The FCHIP Demonstration resumed on January 1, 2022 and CAHs participating in the demonstration project during the extension period shall begin such participation in the cost reporting year that begins on or after January 1. Budget neutrality estimates for the demonstration described in the preamble of this final rule are based on the demonstration extension period.

As described in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45323 through 45328), CMS waived certain Medicare rules for CAHs participating in the demonstration initial period to allow for alternative reasonable cost-based payment methods in the three distinct intervention service areas: telehealth services, ambulance services, and skilled nursing facility/nursing facility services. These waivers were implemented with the goal of increasing access to care with no net increase in costs. As we explained in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45323 through 45328), 10 CAHs were selected for participation in the demonstration initial period. Section 129 of Public Law 116–159, stipulates that only the 10 CAHs that participated in the initial period of the FCHIP Demonstration are eligible to participate during the extension period. Among the eligible CAHs, six elected to participate in the extension period. The selected CAHs are located in two states—Montana and North Dakota—and are implementing the three intervention services. In the FY 2022 IPPS/LTCH PPS final rule, CMS concluded that the initial period of the FCHIP Demonstration had satisfied the budget neutrality requirement described in section 123(g)(1)(B) of Public Law 110–275. Therefore, CMS did not apply a budget neutrality payment offset policy for the initial period of the demonstration. In addition, in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45323 through 45328), we finalized a policy to address the budget neutrality requirement for the demonstration initial period. We also discussed this policy in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57064 through 57065), the FY 2018 IPPS/LTCH PPS final rule (82 FR 38294 through 38296), the FY 2019 IPPS/LTCH PPS final rule (83 FR 41516 through 41517), the FY 2020 IPPS/LTCH PPS final rule (84 FR 42427 through 42428) and the FY 2021 IPPS/LTCH PPS final rule (85 FR 58894 through 58996).

As explained in the FY 2022 IPPS/LTCH PPS final rule, we based our selection of CAHs for participation in the demonstration with the goal of maintaining the budget neutrality of the demonstration on its own terms meaning that the demonstration would produce savings from reduced transfers and admissions to other health care providers, offsetting any increase in Medicare payments as a result of the demonstration. However, because of the small size of the demonstration and uncertainty associated with the projected Medicare utilization and costs, the policy we finalized for the demonstration initial period of performance in the FY 2022 IPPS/LTCH PPS final rule provides a contingency plan to ensure that the budget neutrality requirement in section 123 of Public Law 110–275 is met.

For this final rule, we are adopting the same budget neutrality policy contingency plan used during the demonstration initial period to ensure that the budget neutrality requirement in section 123 of Public Law 110–275 is met during the demonstration extension period. If analysis of claims data for Medicare beneficiaries receiving services at each of the participating CAHs, as well as from other data sources, including cost reports for the participating CAHs, shows that increases in Medicare payments under the demonstration during the 5-year extension period is not sufficiently offset by reductions elsewhere, we will recoup the additional expenditures attributable to the demonstration through a reduction in payments to all CAHs nationwide.

Under the policy finalized in the FY 2022 IPPS/LTCH PPS final rule, we adopted the policy finalized in the FY 2017 IPPS/LTCH PPS final rule, in the event the demonstration initial period was found not to have been budget neutral, any excess costs would be recouped over a period of 3 cost reporting years. In the FY 2023 IPPS/LTCH PPS proposed rule, we sought public comment on the proposal, as we proposed to revise an aspect of the policy finalized in the FY 2022 IPPS/LTCH PPS final rule. Our new proposed policy is in the event the demonstration extension period is found not to have been budget neutral, any excess costs would be recouped within 1 fiscal year. We believe our new proposed policy is a more efficient timeframe for the government to conclude the demonstration operational requirements (such as analyzing claims data, cost report data and/or other data sources) to adjudicate the budget neutrality payment recoupment process due to any excess cost that occurred as result of the demonstration extension period. As explained in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45323 through 45328), because of the small scale of the demonstration, we indicated that we did not believe it would be feasible to implement budget neutrality for the demonstration initial period by reducing payments to only the participating CAHs. Therefore, in the event that this demonstration extension period is found to result in aggregate payments in excess of the amount that would have been paid if this demonstration extension period were not implemented, our policy is to comply with the budget neutrality requirement finalized in the FY 2022 IPPS/LTCH PPS final rule, by reducing payments to all CAHs, not just those participating in the demonstration extension period. We stated that we believe it is appropriate to make any payment reductions across all CAHs because the FCHIP Demonstration was specifically designed to test innovations that affect delivery of services by the CAH provider category. As we explained in the FY 2022 IPPS/LTCH PPS final rule, we believe that the language of the statutory budget neutrality requirement at section 123(g)(1)(B) of Public Law 110–275 permits the agency to implement the budget neutrality provision in this manner. The statutory language merely refers to ensuring that aggregate payments made by the Secretary do not exceed the amount which the Secretary estimates would have been paid if the demonstration project was not implemented, and does not identify the range across which aggregate payments must be held equal.

As explained in the FY 2022 IPPS/LTCH PPS final rule, we finalized a policy to address the demonstration budget neutrality methodology and analytical approach for the initial period of the demonstration. Therefore, for the proposed rule, we proposed to adopt the same budget neutrality methodology and analytical approach used during the demonstration initial period to ensure budget neutrality for the extension period. While we expect to use the same methodology that was used to assess the budget neutrality of the FCHIP Demonstration during initial period of the demonstration to assess the financial impact of the demonstration during this extension period, upon receiving data for the extension period, we may update and/or modify the FCHIP budget neutrality methodology and

analytical approach to ensure that the full impact of the demonstration is appropriately captured. Therefore, we did not propose to apply a budget neutrality payment offset to payments to CAHs in FY 2023. This policy will have no impact for any national payment system for FY 2023.

10. Effects of Codification of the Costs Incurred for Qualified and Non-Qualified Deferred Compensation Plans

In section X.A. of the preamble of this final rule, we set forth our provisions to codify the costs incurred for qualified and non-qualified deferred compensation plans. We do not believe that there are any costs associated with the codification of this policy.

11. Effects of Condition of Participation (CoP) Requirements for Hospitals and CAHs To Continue Reporting Data for COVID–19 and Influenza After the PHE Ends as Determined by the Secretary

Section X.B. of the preamble of this final rule revises the hospital and CAH infection prevention and control CoP requirements to require hospitals and CAHs, after the conclusion of the current COVID–19 PHE, to continue COVID–19 and seasonal influenza related reporting. The revisions will continue to apply upon conclusion of the COVID–19 PHE and will continue until April 30, 2024, unless the Secretary establishes an earlier ending date. Reporting frequency and requirements will be communicated to hospitals, stakeholders, and the public following a model similar to that which we used to inform regulated entities at the beginning of the COVID–19 PHE (see *QSO-21-03-Hospitals/CAHs at https://www.cms.gov/files/document/qso-21-03-hospitalscahs.pdf-0*). As discussed in section XII.B. of the preamble of this final rule, Collection of Information Requirements, we expect a burden increase of $38,204,400 or approximately $6,162 per facility annually for weekly reporting. We note that efforts are underway to automate hospital and CAH reporting that have the potential to significantly decrease reporting burden and improve reliability.

Comment: Commenters noted that the data being collected for automating this type of reporting would not generally come from a single system, noting that for example, clinical data might come from the EHR, bed capacity from a bed management system, PPE from inventory systems, and medication and vaccination inventory from pharmacy information. These commenters noted that resources will vary among facilities and that some might use a combination of manual and automated solutions because they may not have (or need) all of these different systems. Commenters also emphasized the importance of IT staff in the deployment and maintenance of such systems. A commenter noted that estimates are available for the initial costs for the development of various interfaces, ranging from $3,000 to $25,000 depending on complexity and features, however did not cite any specific resources. In total, the commenter indicated that the cost for the development of the initial software to support long-term data collection could be as much as $250,000 depending on the specific needs of the facility and that maintenance costs to support the infrastructure could be between 10 and 25 percent of the initial software cost, totaling around $300,000 for a 2-year period. The commenter noted that some of these costs may be offset by the ability of the IT staff to repurpose existing automated solutions, but noted this may only be feasible in larger hospitals with more advanced IT staff and capabilities. Lastly, the commenter indicated that many CAHs have a much lower capacity to support IT innovation and are unable to fund extensive IT departments. Therefore, the costs for this type of innovation are likely to be much higher.

Response: We acknowledge that there are uncertainties in planning for future emergencies, and we understand that there are lots of incentives and pathways to consider with regard to preparedness. These comments are helpful in understanding the actions necessary and effort involved in tracking and investing in infrastructure to be prepared to timely and accurately report in the event of a future PHE declaration. We will consider this feedback as we continue to assess the best way to align and incentivize preparedness, while also reducing ongoing burden and costs on regulated entities, and ensuring flexibility to quickly respond to emergencies.

I. Effects of Changes in the Capital IPPS

1. General Considerations

For the impact analysis presented in this section of the final rule, we used data from the March 2022 update of the FY 2021 MedPAR file and the March 2022 update of the Provider-Specific File (PSF) that was used for payment purposes. Although the analyses of the changes to the capital prospective payment system do not incorporate cost data, we used the March 2022 update of the most recently available hospital cost report data to categorize hospitals. Our analysis has several qualifications and uses the best data available, as described later in this section of the final rule.

Due to the interdependent nature of the IPPS, it is very difficult to precisely quantify the impact associated with each change. In addition, we draw upon various sources for the data used to categorize hospitals in the tables. In some cases (for instance, the number of beds), there is a fair degree of variation in the data from different sources. We have attempted to construct these variables with the best available sources overall. However, it is possible that some individual hospitals are placed in the wrong category.

Using cases from the March 2022 update of the FY 2021 MedPAR file, we simulated payments under the capital IPPS for FY 2022 and the payments for FY 2023 for a comparison of total payments per case. Short-term, acute care hospitals not paid under the general IPPS (for example, hospitals in Maryland) are excluded from the simulations.

The methodology for determining a capital IPPS payment is set forth at § 412.312. The basic methodology for calculating the capital IPPS payments in FY 2023 is as follows:

(Standard Federal rate) × (DRG weight) × (GAF) × (COLA for hospitals located in Alaska and Hawaii) × (1 + DSH adjustment factor + IME adjustment factor, if applicable).

In addition to the other adjustments, hospitals may receive outlier payments for those cases that qualify under the threshold established for each fiscal year. We modeled payments for each hospital by multiplying the capital Federal rate by the geographic adjustment factor (GAF) and the hospital's case-mix. Then we added estimated payments for indirect medical education, disproportionate share, and outliers, if applicable. For purposes of this impact analysis, the model includes the following assumptions:

- The capital Federal rate was updated, beginning in FY 1996, by an analytical framework that considers changes in the prices associated with capital-related costs and adjustments to account for forecast error, changes in the case-mix index, allowable changes in intensity, and other factors. As discussed in section III.A.1. of the Addendum to this final rule, the update to the capital Federal rate is 2.5 percent for FY 2023.
- In addition to the FY 2023 update factor, the FY 2023 capital Federal rate was calculated based on a GAF/DRG budget neutrality adjustment factor of 1.0012, a budget neutrality factor for the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases policy of 0.9972, and a outlier adjustment factor of 0.9448.

2. Results

We used the payment simulation model previously described in section I.I. of Appendix A of this final rule to estimate the potential impact of the changes for FY 2023 on total capital payments per case, using a universe of 3,142 hospitals. As previously described, the individual hospital payment parameters are taken from the best available data, including the March 2022 update of the FY 2021 MedPAR file, the March 2022 update to the PSF, and the most recent available cost report data from the March 2022 update of HCRIS. In Table III, we present a comparison of estimated total payments per case for FY 2022 and estimated total payments per case for FY 2023 based on the FY 2023 payment policies. Column 2 shows estimates of payments per case under our model for FY 2022. Column 3 shows estimates of payments per case under our model for FY 2023. Column 4 shows the total percentage change in payments from FY 2022 to FY 2023. The change represented in Column 4 includes the 2.50 percent update to the capital Federal rate and other changes in the adjustments to the capital Federal rate. The comparisons are provided by: (1) geographic location; (2) region; and (3) payment classification.

The simulation results show that, on average, capital payments per case in FY 2023 are expected to increase 0.6 percent compared to capital payments per case in FY 2022. This expected increase is primarily due to the 2.50 percent update to the capital Federal rate for FY 2023 being partially offset by an expected decrease in capital outlier payments. As discussed in section III.A.2. of the Addendum to this final rule, we estimate for FY 2023 that outlier payments for capital-

related PPS payments would equal 5.52 percent of inpatient capital-related payments. Although in the FY 2022 IPPS/LTCH PPS final rule we estimated for FY 2022 that outlier payments for capital-related PPS payments would equal 5.29 percent of inpatient capital related payments, our payment simulation model for this final rule shows that for FY 2022, estimated outlier payments for capital-related PPS payments are approximately 7.16 percent of inpatient capital-related payments. This difference in our estimate of FY 2022 outlier payments compared to our estimate of FY 2023 outlier payments is reflected in the average change in capital payments per case in FY 2023 as compared to FY 2022. Other factors that contribute to the expected change in average capital payments per case in FY 2023 as compared to FY 2022 include changes in capital DSH payments for hospitals that reclassify from urban to rural under § 412.103. In general, regional variations in estimated capital payments per case in FY 2023 as compared to capital payments per case in FY 2022 are primarily due to the changes in GAFs, and are generally consistent with the projected changes in payments due to changes in the wage index (and policies affecting the wage index), as shown in Table I in section I.G. of this Appendix A.

The net impact of these changes is an estimated 0.6 percent increase in capital payments per case from FY 2022 to FY 2023 for all hospitals (as shown in Table III).

The geographic comparison shows that, on average, hospitals in both urban and rural classifications will experience an increase in capital IPPS payments per case in FY 2023 as compared to FY 2022. Capital IPPS payments per case will increase by an estimated 0.5 percent for hospitals in urban areas while payments to hospitals in rural areas will increase by 0.4 percent in FY 2022 to FY 2023.

The comparisons by region show that the change in capital payments per case from FY 2022 to FY 2023 for urban areas range from a 0.1 percent increase for the New England region to a 1.6 percent increase for the Mountain region. Meanwhile, the change in capital payments per case from FY 2022 to FY 2023 for rural areas range from a 0.7 percent decrease for the Mountain rural region to a 1.2 percent increase for the East South Central rural region. These regional differences are primarily due to the changes in the GAFs and estimated changes in outlier and DSH payments.

The comparison by hospital type of ownership (Voluntary, Proprietary, and Government) shows that proprietary hospitals are expected to experience the highest increase in capital payments per case from FY 2022 to FY 2023 of 0.9 percent. Meanwhile, government hospitals and voluntary hospitals are expected to experience an increase in capital payments per case from FY 2022 to FY 2023 of 0.6 percent and 0.5 percent, respectively.

Section 1886(d)(10) of the Act established the MGCRB. Hospitals may apply for reclassification for purposes of the wage index for FY 2023. Reclassification for wage index purposes also affects the GAFs because that factor is constructed from the hospital wage index. To present the effects of the hospitals being reclassified as of the publication of this final rule for FY 2023, we show the average capital payments per case for reclassified hospitals for FY 2023. Urban reclassified hospitals are expected to experience an increase in capital payments of 0.3 percent; urban nonreclassified hospitals are expected to experience an increase in capital payments of 0.7 percent. The lower expected increase in payments for urban reclassified hospitals compared to urban nonreclassified hospitals is primarily due to estimated decreases in capital DSH payments to urban reclassified hospitals caused by the number of hospitals that reclassify from urban to rural under § 412.103. Rural reclassified hospitals are expected to experience an increase in capital payments of 0.9 percent; rural nonreclassified hospitals are expected to experience a decrease in capital payments of 0.3 percent.

TABLE III.-- COMPARISON OF TOTAL PAYMENTS PER CASE
[FY 2022 PAYMENTS COMPARED TO FY 2023 PAYMENTS]

	Number of Hospitals	Average FY 2022 Payments/Case	Average FY 2023 Payments/Case	Change
All Hospitals	3,142	1,086	1,092	0.6
By Geographic Location:				
Urban hospitals	2,420	1,119	1,125	0.5
Rural hospitals	722	764	767	0.4
Bed Size (Urban):				
0-99 beds	653	883	884	0.1
100-199 beds	700	941	949	0.9
200-299 beds	411	1,035	1,043	0.8
300-499 beds	409	1,105	1,112	0.6
500 or more beds	245	1,326	1,329	0.2
Bed Size (Rural):				
0-49 beds	358	656	655	-0.2
50-99 beds	201	731	734	0.4
100-149 beds	84	742	750	1.1
150-199 beds	46	858	857	-0.1
200 or more beds	33	876	885	1.0
Urban by Region:				
New England	107	1,196	1,197	0.1
Middle Atlantic	295	1,253	1,259	0.5

J. Effects of Payment Rate Changes and Policy Changes Under the LTCH PPS

1. Introduction and General Considerations

In section VII. of the preamble of this final rule and section V. of the Addendum to this final rule, we set forth the annual update to the payment rates for the LTCH PPS for FY 2023. In the preamble of this final rule, we specify the statutory authority for the provisions that are presented, identify the policies for FY 2023, and present rationales for our provisions as well as alternatives that were considered. In this section of Appendix A to this final rule, we discuss the impact of the changes to the payment rate, factors, and other payment rate policies related to the LTCH PPS that are presented in the preamble of this final rule in terms of their estimated fiscal impact on the Medicare budget and on LTCHs.

There are 339 LTCHs included in this impact analysis. We note that, although there are currently approximately 346 LTCHs, for purposes of this impact analysis, we

excluded the data of all-inclusive rate providers consistent with the development of the FY 2023 MS–LTC–DRG relative weights (discussed in section VII.B.3.c. of the preamble of this final rule). Moreover, in the claims data used for this final rule, two of these 339 LTCHs only have claims for site neutral payment rate cases and, therefore, do not affect our impact analysis for LTCH PPS standard Federal payment rate cases.

In the impact analysis, we used the payment rate, factors, and policies presented in this final rule, the 3.8 percent annual update to the LTCH PPS standard Federal payment rate, the update to the MS–LTC–DRG classifications and relative weights, the update to the wage index values and labor-related share, and the best available claims and CCR data to estimate the change in payments for FY 2023.

Under the dual rate LTCH PPS payment structure, payment for LTCH discharges that meet the criteria for exclusion from the site neutral payment rate (that is, LTCH PPS standard Federal payment rate cases) is based on the LTCH PPS standard Federal payment rate. Consistent with the statute, the site neutral payment rate is the lower of the IPPS comparable per diem amount as determined under § 412.529(d)(4), including any applicable outlier payments as specified in § 412.525(a), reduced by 4.6 percent for FYs 2018 through 2026; or 100 percent of the estimated cost of the case as determined under § 412.529(d)(2). In addition, there are two separate high cost outlier targets—one for LTCH PPS standard Federal payment rate cases and one for site neutral payment rate cases. We note that section 3711(b)(2) of the CARES Act has provided a waiver of the application of the site neutral payment rate for LTCH cases admitted during the COVID–19 PHE period. At the time of development of this final rule, the COVID–19 PHE is still in effect. Therefore, all LTCH PPS cases up to this point in FY 2022 have been paid the LTCH PPS standard Federal rate regardless of whether the discharge met the statutory patient criteria. Since the expiration date of the COVID–19 PHE is not yet known, for purposes of this impact analysis, estimates of total LTCH PPS payments for site neutral payment rate cases in FYs 2022 and 2023 were calculated using the site neutral payment rate determined under § 412.522(c) and the provisions of the CARES Act were not considered.

Based on the best available data for the 339 LTCHs in our database that were considered in the analyses used for this final rule, we estimate that overall LTCH PPS payments in FY 2023 will increase by approximately 2.4 percent (or approximately $71 million) based on the rates and factors presented in section VII. of the preamble and section V. of the Addendum to this final rule.

Based on the FY 2021 LTCH cases that were used for the analysis in this final rule, approximately 28 percent of those cases were classified as site neutral payment rate cases (that is, 28 percent of LTCH cases did not meet the statutory patient-level criteria for exclusion from the site neutral payment rate). Our Office of the Actuary currently estimates that the percent of LTCH PPS cases that will be paid at the site neutral payment rate in FY 2023 will not change significantly from the most recent historical data. We estimate IPPS comparable per diem amounts using the prior year's IPPS rates and factors, updated to reflect estimated changes to the IPPS rates and payments finalized for FY 2023. Taking this into account along with other changes that will apply to the site neutral payment rate cases in FY 2023, we estimate that aggregate LTCH PPS payments for these site neutral payment rate cases will increase by approximately 2.8 percent (or approximately $9 million). This projected increase in payments to LTCH PPS site neutral payment rate cases is primarily due to the finalized updates to the IPPS rates and payments reflected in our estimate of the IPPS comparable per diem amount, as well as an estimated increase in costs for these cases determined using the charge and CCR adjustment factors described in section V.D.3.b. of the Addendum to this final rule. We noted, we estimate payments to site neutral payment rate cases in FY 2023 will represent approximately 11 percent of estimated aggregate FY 2023 LTCH PPS payments.

Based on the FY 2021 LTCH cases that were used for the analysis in this final rule, approximately 72 percent of LTCH cases will meet the patient-level criteria for exclusion from the site neutral payment rate in FY 2023, and will be paid based on the LTCH PPS standard Federal payment rate for the full year. We estimate that total LTCH PPS payments for these LTCH PPS standard Federal payment rate cases in FY 2023 will increase approximately 2.3 percent (or approximately $61 million). This estimated increase in LTCH PPS payments for LTCH PPS standard Federal payment rate cases in FY 2023 is primarily due to the 3.8 percent annual update to the LTCH PPS standard Federal payment rate for FY 2023 and the projected 1.2 percent decrease in high cost outlier payments as a percentage of total LTCH PPS standard Federal payment rate payments, which is discussed later in this section of the final rule.

Based on the 339 LTCHs that were represented in the FY 2021 LTCH cases that were used for the analyses in this final rule presented in this Appendix, we estimate that aggregate FY 2022 LTCH PPS payments will be approximately $2.985 billion, as compared to estimated aggregate FY 2023 LTCH PPS payments of approximately $3.056 billion, resulting in an estimated overall increase in LTCH PPS payments of approximately $71 million. We note that the estimated $71 million increase in LTCH PPS payments in FY 2023 does not reflect changes in LTCH admissions or case-mix intensity, which will also affect the overall payment effects of the policies in this final rule.

The LTCH PPS standard Federal payment rate for FY 2022 is $44,713.67. For FY 2023, we are establishing an LTCH PPS standard Federal payment rate of $46,432.77 which reflects the 3.8 percent annual update to the LTCH PPS standard Federal payment rate and the budget neutrality factor for updates to the area wage level adjustment of 1.0004304 (discussed in section V.B.6. of the Addendum to this final rule). For LTCHs that fail to submit data for the LTCH QRP, in accordance with section 1886(m)(5)(C) of the Act, we are establishing an LTCH PPS standard Federal payment rate of $45,538.11. This LTCH PPS standard Federal payment rate reflects the updates and factors previously described, as well as the required 2.0 percentage point reduction to the annual update for failure to submit data under the LTCH QRP.

Table IV shows the estimated impact for LTCH PPS standard Federal payment rate cases. The estimated change attributable solely to the annual update of 3.8 percent to the LTCH PPS standard Federal payment rate is projected to result in an increase of 3.6 percent in payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2022 to FY 2023, on average, for all LTCHs (Column 6). The estimated increase of 3.6 percent shown in Column 6 of Table IV also includes estimated payments for short-stay outlier (SSO) cases, a portion of which are not affected by the annual update to the LTCH PPS standard Federal payment rate, as well as the reduction that is applied to the annual update for LTCHs that do not submit the required LTCH QRP data. For most hospital categories, the projected increase in payments based on the LTCH PPS standard Federal payment rate to LTCH PPS standard Federal payment rate cases also rounds to approximately 3.6 percent.

For FY 2023, we are updating the wage index values based on the most recent available data (data from cost reporting periods beginning during FY 2019 which is the same data used for the FY 2023 IPPS wage index). In addition, we are establishing a labor-related share of 68.0 percent for FY 2023, based on the most recent available data (IGI's second quarter 2022 forecast) on the relative importance of the labor-related share of operating and capital costs of the 2017-based LTCH market basket. We also applying an area wage level budget neutrality factor of 1.0004304 to ensure that the changes to the area wage level adjustment will not result in any change in estimated aggregate LTCH PPS payments to LTCH PPS standard Federal payment rate cases.

For LTCH PPS standard Federal payment rate cases, we currently estimate high cost outlier payments as a percentage of total LTCH PPS standard Federal payment rate payments will decrease from FY 2022 to FY 2023. Based on the FY 2021 LTCH cases that were used for the analyses in this final rule, we estimate that the FY 2022 high cost outlier threshold of $33,015 (as established in the FY 2022 IPPS/LTCH PPS final rule) will result in estimated high cost outlier payments for LTCH PPS standard Federal payment rate cases in FY 2022 that are projected to exceed the 7.975 percent target. Specifically, we currently estimate that high cost outlier payments for LTCH PPS standard Federal payment rate cases will be approximately 9.15 percent of the estimated total LTCH PPS standard Federal payment rate payments in FY 2022. Combined with our estimate that FY 2023 high cost outlier payments for LTCH PPS standard Federal payment rate cases will be 7.975 percent of estimated total LTCH PPS standard Federal payment rate payments in FY 2023, this will result in an estimated decrease in high cost

outlier payments as a percentage of total LTCH PPS standard Federal payment rate payments of approximately 1.2 percent between FY 2022 and FY 2023. We note that, in calculating these estimated high cost outlier payments, we inflated charges reported on the FY 2021 claims by the charge inflation factor in section V.D.3.b. of the Addendum to this final rule. We also note that, in calculating these estimated high cost outlier payments, we estimated the cost of each case by multiplying the inflated charges by the adjusted CCRs that we determined using our finalized methodology described in section V.D.3.b. of the Addendum to this final rule.

Table IV shows the estimated impact of the payment rate and policy changes on LTCH PPS payments for LTCH PPS standard Federal payment rate cases for FY 2023 by comparing estimated FY 2022 LTCH PPS payments to estimated FY 2023 LTCH PPS payments. (As noted earlier, our analysis does not reflect changes in LTCH admissions or case-mix intensity.) We note that these impacts do not include LTCH PPS site neutral payment rate cases for the reasons discussed in section I.J.3. of this Appendix.

Comment: We received comments expressing concern about the 0.7 percent increase in payments to LTCH PPS standard Federal payment rate cases that we projected in the proposed rule. Many commenters stated that this projected increase was insufficient and failed to recognize the impact of increases in healthcare delivery costs on LTCHs. A commenter stated that the inadequacy of Medicare payments would continue to challenge the financial viability of LTCHs and their ability to provide care to Medicare and other patients. Another commenter stated that this projected increase is insufficient and would not allow LTCHs to compete for resources needed to care for patients.

Response: We appreciate commenters' concerns about the proposed 0.7 percent increase in payments to LTCH PPS standard Federal payment rate cases. Based on the finalized payment rates and factors in this final rule, we now project a 2.3 percent increase in payments to LTCH PPS standard Federal payment rate cases for FY 2023. This change in projected payments is primarily being driven by the annual update factor of 3.8 percent (that is, the most recent estimate of the LTCH PPS market basket increase of 4.1 percent less the productivity adjustment of 0.3 percentage point) which is 1.1 percent higher than the proposed annual update factor. As discussed in section VIII.C.2. of the preamble to this final rule, we believe this LTCH market basket increase appropriately reflects the input price growth that LTCHs will incur while providing medical services in FY 2023. We note that the final FY 2023 LTCH market basket growth rate of 4.1 percent is the highest market basket update implemented in an IPPS/LTCH final rule since RY 2004.

Comment: Multiple commenters expressed concern about the immediate, full implementation of the site neutral payment policy following the end of the PHE waiver. Several of these commenters stated their belief that cases paid at the site neutral payment rate will continue to be underpaid as those cases, according to commenters, have on average higher levels of clinical complexity and costs that significantly exceed IPPS-level payment. Some commenters requested that CMS implement transition policies once the PHE ends that would phase in the full implementation of the site neutral payment policy, believing such a transition period would help prevent disruptions to LTCHs' operations. A commenter recommended that CMS pay site neutral cases a blended site neutral and standard Federal payment rate during this transition period.

Response: We acknowledge commenters' concerns about the costs of treating site neutral cases, however, as noted by some commenters and discussed previously, the site neutral payment rate is a statutory requirement and the statutory waiver of the site neutral payment is only authorized for the duration of the COVID–19 PHE. We did not propose any transition policies that would take effect following the end of the PHE waiver. We note that on January 22, 2021, then-acting Secretary of HHS, Norris Cochran, sent a letter to governors announcing that when a decision is made to terminate the public health emergency or let it expire, HHS will provide states with 60 days' notice prior to termination.[1171] Therefore, LTCHs will have at least 60 days' notice before the statutory waiver of the site neutral payment rate expires.

As we discuss in detail throughout this final rule, based on the best available data, we believe that the provisions of this final rule relating to the LTCH PPS, which are projected to result in an overall increase in estimated aggregate LTCH PPS payments, and the resulting LTCH PPS payment amounts, result in appropriate Medicare payments that are consistent with the statute.

2. Impact on Rural Hospitals

For purposes of section 1102(b) of the Act, we define a small rural hospital as a hospital that is located outside of an urban area and has fewer than 100 beds. As shown in Table IV, we are projecting a 2.2 percent increase in estimated payments for LTCH PPS standard Federal payment rate cases for LTCHs located in a rural area. This estimated impact is based on the FY 2021 data for the 17 rural LTCHs (out of 337 LTCHs) that were used for the impact analyses shown in Table IV.

3. Anticipated Effects of LTCH PPS Payment Rate Changes and Policy Changes

a. Budgetary Impact

Section 123(a)(1) of the BBRA requires that the PPS developed for LTCHs ''maintain budget neutrality.'' We believe that the statute's mandate for budget neutrality applies only to the first year of the implementation of the LTCH PPS (that is, FY 2003). Therefore, in calculating the FY 2003 standard Federal payment rate under § 412.523(d)(2), we set total estimated payments for FY 2003 under the LTCH PPS so that estimated aggregate payments under the LTCH PPS were estimated to equal the amount that would have been paid if the LTCH PPS had not been implemented.

Section 1886(m)(6)(A) of the Act establishes a dual rate LTCH PPS payment structure with two distinct payment rates for LTCH discharges beginning in FY 2016. Under this statutory change, LTCH discharges that meet the patient-level criteria for exclusion from the site neutral payment rate (that is, LTCH PPS standard Federal payment rate cases) are paid based on the LTCH PPS standard Federal payment rate. LTCH discharges paid at the site neutral payment rate are generally paid the lower of the IPPS comparable per diem amount, reduced by 4.6 percent for FYs 2018 through 2026, including any applicable high cost outlier (HCO) payments, or 100 percent of the estimated cost of the case, reduced by 4.6 percent.

As discussed in section I.J.2. of this Appendix, we project an increase in aggregate LTCH PPS payments in FY 2023 of approximately $71 million. This estimated increase in payments reflects the projected increase in payments to LTCH PPS standard Federal payment rate cases of approximately $61 million and the projected increase in payments to site neutral payment rate cases of approximately $9 million under the dual rate LTCH PPS payment rate structure required by the statute beginning in FY 2016.

As discussed in section V.D. of the Addendum to this final rule, our actuaries project cost and resource changes for site neutral payment rate cases due to the site neutral payment rates required under the statute. Specifically, our actuaries project that the costs and resource use for cases paid at the site neutral payment rate will likely be lower, on average, than the costs and resource use for cases paid at the LTCH PPS standard Federal payment rate, and will likely mirror the costs and resource use for IPPS cases assigned to the same MS–DRG. While we are able to incorporate this projection at an aggregate level into our payment modeling, because the historical claims data that we are using in this final rule to project estimated FY 2023 LTCH PPS payments (that is, FY 2021 LTCH claims data) do not reflect this actuarial projection, we are unable to model the impact of the change in LTCH PPS payments for site neutral payment rate cases at the same level of detail with which we are able to model the impacts of the changes to LTCH PPS payments for LTCH PPS standard Federal payment rate cases. Therefore, Table IV only reflects changes in LTCH PPS payments for LTCH PPS standard Federal payment rate cases and, unless otherwise noted, the remaining discussion in section I.J.3. of this Appendix refers only to the impact on LTCH PPS payments for LTCH PPS standard Federal payment rate cases. In the following section, we present our provider impact analysis for the changes that affect LTCH PPS payments for LTCH PPS standard Federal payment rate cases.

b. Impact on Providers

The basic methodology for determining a per discharge payment for LTCH PPS standard Federal payment rate cases is

[1171] *https://ccf.georgetown.edu/wp-content/uploads/2021/01/Public-Health-Emergency-Message-to-Governors.pdf.*

currently set forth under §§ 412.515 through 412.533 and 412.535. In addition to adjusting the LTCH PPS standard Federal payment rate by the MS–LTC–DRG relative weight, we make adjustments to account for area wage levels and SSOs. LTCHs located in Alaska and Hawaii also have their payments adjusted by a COLA. Under our application of the dual rate LTCH PPS payment structure, the LTCH PPS standard Federal payment rate is generally only used to determine payments for LTCH PPS standard Federal payment rate cases (that is, those LTCH PPS cases that meet the statutory criteria to be excluded from the site neutral payment rate). LTCH discharges that do not meet the patient-level criteria for exclusion are paid the site neutral payment rate, which we are calculating as the lower of the IPPS comparable per diem amount as determined under § 412.529(d)(4), reduced by 4.6 percent for FYs 2018 through 2026, including any applicable outlier payments, or 100 percent of the estimated cost of the case as determined under existing § 412.529(d)(2). In addition, when certain thresholds are met, LTCHs also receive HCO payments for both LTCH PPS standard Federal payment rate cases and site neutral payment rate cases that are paid at the IPPS comparable per diem amount.

To understand the impact of the changes to the LTCH PPS payments for LTCH PPS standard Federal payment rate cases presented in this final rule on different categories of LTCHs for FY 2023, it is necessary to estimate payments per discharge for FY 2022 using the rates, factors, and the policies established in the FY 2022 IPPS/LTCH PPS final rule and estimate payments per discharge for FY 2023 using the rates, factors, and the policies in this FY 2023 IPPS/LTCH PPS final rule (as discussed in section VII. of the preamble of this final rule and section V. of the Addendum to this final rule). As discussed elsewhere in this final rule, these estimates are based on the best available LTCH claims data and other factors, such as the application of inflation factors to estimate costs for HCO cases in each year. The resulting analyses can then be used to compare how our policies applicable to LTCH PPS standard Federal payment rate cases affect different groups of LTCHs.

For the following analysis, we group hospitals based on characteristics provided in the OSCAR data, cost report data in HCRIS, and PSF data. Hospital groups included the following:

- Location: large urban/other urban/rural.
- Participation date.
- Ownership control.
- Census region.
- Bed size.

c. Calculation of LTCH PPS Payments for LTCH PPS Standard Federal Payment Rate Cases

For purposes of this impact analysis, to estimate the per discharge payment effects of our policies on payments for LTCH PPS standard Federal payment rate cases, we simulated FY 2022 and FY 2023 payments on a case-by-case basis using historical LTCH claims from the FY 2021 MedPAR files that met or would have met the criteria to be paid at the LTCH PPS standard Federal payment rate if the statutory patient-level criteria had been in effect at the time of discharge for all cases in the FY 2021 MedPAR files. For modeling FY 2022 LTCH PPS payments, we used the FY 2022 standard Federal payment rate of $44,713.67 (or $43,836.08 for LTCHs that failed to submit quality data as required under the requirements of the LTCH QRP). Similarly, for modeling payments based on the finalized FY 2023 LTCH PPS standard Federal payment rate, we used the FY 2023 standard Federal payment rate of $46,432.77 (or $45,538.11 for LTCHs that failed to submit quality data as required under the requirements of the LTCH QRP). In each case, we applied the applicable adjustments for area wage levels and the COLA for LTCHs located in Alaska and Hawaii. Specifically, for modeling FY 2022 LTCH PPS payments, we used the current FY 2022 labor-related share (67.9 percent), the wage index values established in the Tables 12A and 12B listed in the Addendum to the FY 2022 IPPS/LTCH PPS final rule (which are available via the internet on the CMS website), the FY 2022 HCO fixed-loss amount for LTCH PPS standard Federal payment rate cases of $33,015 (as reflected in the FY 2022 IPPS/LTCH PPS final rule), and the FY 2022 COLA factors (shown in the table in section V.C. of the Addendum to that final rule) to adjust the FY 2022 nonlabor-related share (32.1 percent) for LTCHs located in Alaska and Hawaii. Similarly, for modeling FY 2023 LTCH PPS payments, we used the FY 2023 LTCH PPS labor-related share (68.0 percent), the FY 2023 wage index values from Tables 12A and 12B listed in section VI. of the Addendum to this final rule (which are available via the internet on the CMS website), the FY 2023 HCO fixed-loss amount for LTCH PPS standard Federal payment rate cases of $38,518 (as discussed in section V.D.3. of the Addendum to this final rule), and the FY 2023 COLA factors (shown in the table in section V.C. of the Addendum to this final rule) to adjust the FY 2023 nonlabor-related share (32.0 percent) for LTCHs located in Alaska and Hawaii. We noted that in modeling payments for HCO cases for LTCH PPS standard Federal payment rate cases, we inflated charges reported on the FY 2021 claims by the charge inflation factors in section V.D.3.b. of the Addendum to this final rule. We also noted that in modeling payments for HCO cases for LTCH PPS standard Federal payment rate cases, we estimated the cost of each case by multiplying the inflated charges by the adjusted CCRs that we determined using our finalized methodology described in section V.D.3.b. of the Addendum to this final rule.

The impacts that follow reflect the estimated ''losses'' or ''gains'' among the various classifications of LTCHs from FY 2022 to FY 2023 based on the payment rates and policy changes applicable to LTCH PPS standard Federal payment rate cases presented in this final rule. Table IV illustrates the estimated aggregate impact of the change in LTCH PPS payments for LTCH PPS standard Federal payment rate cases among various classifications of LTCHs. (As discussed previously, these impacts do not include LTCH PPS site neutral payment rate cases.)

- The first column, LTCH Classification, identifies the type of LTCH.
- The second column lists the number of LTCHs of each classification type.
- The third column identifies the number of LTCH cases expected to meet the LTCH PPS standard Federal payment rate criteria.
- The fourth column shows the estimated FY 2022 payment per discharge for LTCH cases expected to meet the LTCH PPS standard Federal payment rate criteria (as described previously).
- The fifth column shows the estimated FY 2023 payment per discharge for LTCH cases expected to meet the LTCH PPS standard Federal payment rate criteria (as described previously).
- The sixth column shows the percentage change in estimated payments per discharge for LTCH cases expected to meet the LTCH PPS standard Federal payment rate criteria from FY 2022 to FY 2023 due to the annual update to the standard Federal rate (as discussed in section V.A.2. of the Addendum to this final rule).
- The seventh column shows the percentage change in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2022 to FY 2023 for changes to the area wage level adjustment (that is, the updated hospital wage data and labor-related share) and the application of the corresponding budget neutrality factor (as discussed in section V.B.6. of the Addendum to this final rule).
- The eighth column shows the percentage change in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2022 (Column 4) to FY 2023 (Column 5) for all changes.

[1] Estimated FY 2023 LTCH PPS payments for LTCH PPS standard Federal payment rate criteria based on the finalized payment rate and factor changes applicable to such cases presented in the preamble of and the Addendum to this final rule.

[2] Percent change in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2022 to FY 2023 for the annual update to the LTCH PPS standard Federal payment rate.

[3] Percent change in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2022 to FY 2023 for changes due to the changes to the area wage level adjustment under § 412.525(c) (that is., updated hospital wage data and the labor related share).

[4] Percent change in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2022 (shown in Column 4) to FY 2023 (shown in Column 5), including all of the changes to the rates and factors applicable to such cases presented in the preamble and the Addendum to this final rule. We note that this column, which shows the percent change in estimated payments per discharge for all changes, does not equal the sum of the percent changes in estimated payments per discharge for the annual update to the LTCH PPS standard Federal payment rate (Column 6) and the changes due to the changes to the area wage level adjustment with budget neutrality (Column 7) due to the effect of estimated changes in estimated payments to aggregate HCO payments for LTCH PPS standard Federal payment rate cases (as discussed in this impact analysis), as well as other interactive effects that cannot be isolated.

BILLING CODE 4120–01–C

d. Results

Based on the FY 2021 LTCH cases (from 337 LTCHs) that were used for the analyses in this final rule, we have prepared the following summary of the impact (as shown in Table IV) of the LTCH PPS payment rate and policy changes for LTCH PPS standard Federal payment rate cases presented in this final rule. The impact analysis in Table IV shows that estimated payments per discharge for LTCH PPS standard Federal payment rate cases are projected to increase 2.3 percent, on average, for all LTCHs from FY 2022 to FY 2023 as a result of the payment rate and policy changes applicable to LTCH PPS standard Federal payment rate cases

presented in this final rule. This estimated 2.3 percent increase in LTCH PPS payments per discharge was determined by comparing estimated FY 2023 LTCH PPS payments (using the finalized payment rates and factors discussed in this final rule) to estimated FY 2022 LTCH PPS payments for LTCH discharges which will be LTCH PPS standard Federal payment rate cases if the dual rate LTCH PPS payment structure was or had been in effect at the time of the discharge (as described in section I.J.3. of this Appendix).

As stated previously, we are finalizing the update the LTCH PPS standard Federal payment rate for FY 2023 by 3.8 percent. For LTCHs that fail to submit quality data under the requirements of the LTCH QRP, as required by section 1886(m)(5)(C) of the Act, a 2.0 percentage point reduction is applied to the annual update to the LTCH PPS standard Federal payment rate. Consistent with § 412.523(d)(4), we also are applying a budget neutrality factor for changes to the area wage level adjustment of 1.0004304 (discussed in section V.B.6. of the Addendum to this final rule), based on the best available data at this time, to ensure that any changes to the area wage level adjustment will not result in any change (increase or decrease) in estimated aggregate LTCH PPS standard Federal payment rate payments. As we also explained earlier in this section of the final rule, for most categories of LTCHs (as shown in Table IV, Column 6), the estimated payment increase due to the 3.8 percent annual update to the LTCH PPS standard Federal payment rate is projected to result in approximately a 3.6 percent increase in estimated payments per discharge for LTCH PPS standard Federal payment rate cases for all LTCHs from FY 2022 to FY 2023. We note our estimate of the changes in payments due to the update to the LTCH PPS standard Federal payment rate also includes estimated payments for short-stay outlier (SSO) cases, a portion of which are not affected by the annual update to the LTCH PPS standard Federal payment rate, as well as the reduction that is applied to the annual update for LTCHs that do not submit the required LTCH QRP.

(1) Location

Based on the most recent available data, the vast majority of LTCHs are located in urban areas. Only approximately 5 percent of the LTCHs are identified as being located in a rural area, and approximately 4 percent of all LTCH PPS standard Federal payment rate cases are expected to be treated in these rural hospitals. The impact analysis presented in Table IV shows that the overall average percent increase in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2022 to FY 2023 for all hospitals is 2.3 percent. The projected increase for urban and rural hospitals, respectively, is 2.3 and 2.2.

(2) Participation Date

LTCHs are grouped by participation date into four categories: (1) before October 1983; (2) between October 1983 and September 1993; (3) between October 1993 and September 2002; and (4) October 2002 and after. Based on the best available data, the categories of LTCHs with the largest expected percentage of LTCH PPS standard Federal payment rate cases (approximately 41 percent and 44 percent, respectively) are in LTCHs that began participating in the Medicare program between October 1993 and September 2002 and after October 2002. These LTCHs are expected to experience an increase in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2022 to FY 2023 of 2.5 percent and 2.1 percent, respectively. LTCHs that began participating in the Medicare program between October 1983 and September 1993 are projected to experience an increase in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2022 to FY 2023 of 2.6 percent, as shown in Table IV. Approximately 3 percent of LTCHs began participating in the Medicare program before October 1983, and these LTCHs are projected to experience an increase in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2022 to FY 2023 of 1.2 percent.

(3) Ownership Control

LTCHs are grouped into three categories based on ownership control type: voluntary, proprietary, and government. Based on the best available data, approximately 16 percent of LTCHs are identified as voluntary (Table IV). The majority (approximately 81 percent) of LTCHs are identified as proprietary, while government owned and operated LTCHs represent approximately 3 percent of LTCHs. Based on ownership type, proprietary LTCHs are expected to experience an increase in payments to LTCH PPS standard Federal payment rate cases of 2.4 percent. Voluntary LTCHs are expected to experience an increase in payments to LTCH PPS standard Federal payment rate cases from FY 2022 to FY 2023 of 1.6 percent. Meanwhile, government owned and operated LTCHs are expected to experience an increase in payments to LTCH PPS standard Federal payment rate cases from FY 2022 to FY 2023 of 1.9 percent.

(4) Census Region

The comparisons by region show that the changes in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2022 to FY 2023 are projected to range from an increase of 0.9 percent in the West North Central region to a 2.9 percent increase in the Pacific region. These regional variations are primarily due to the changes to the area wage adjustment and estimated changes in outlier payments.

(5) Bed Size

LTCHs are grouped into six categories based on bed size: 0–24 beds; 25–49 beds; 50–74 beds; 75–124 beds; 125–199 beds; and greater than 200 beds. We project that LTCHs with 125–199 beds will experience the lowest increase in payments for LTCH PPS standard Federal payment rate cases, 1.9 percent. LTCHs with 0–24 beds are projected to experience the largest increase in payments of 3.0 percent. The remaining bed size categories are projected to experience an increase in payments in the range of 2.1 to 2.6 percent.

4. Effect on the Medicare Program

As stated previously, we project that the provisions of this final rule will result in an increase in estimated aggregate LTCH PPS payments to LTCH PPS standard Federal payment rate cases in FY 2023 relative to FY 2022 of approximately $61 million (or approximately 2.3 percent) for the 339 LTCHs in our database. Although, as stated previously, the hospital-level impacts do not include LTCH PPS site neutral payment rate cases, we estimate that the provisions of this final rule will result in an increase in estimated aggregate LTCH PPS payments to site neutral payment rate cases in FY 2023 relative to FY 2022 of approximately $9 million (or approximately 2.8 percent) for the 339 LTCHs in our database. (As noted previously, we estimate payments to site neutral payment rate cases in FY 2023 represent approximately 11 percent of total estimated FY 2023 LTCH PPS payments.) Therefore, we project that the provisions of this final rule will result in an increase in estimated aggregate LTCH PPS payments for all LTCH cases in FY 2023 relative to FY 2022 of approximately 71 million (or approximately 2.4 percent) for the 339 LTCHs in our database.

5. Effect on Medicare Beneficiaries

Under the LTCH PPS, hospitals receive payment based on the average resources consumed by patients for each diagnosis. We do not expect any changes in the quality of care or access to services for Medicare beneficiaries as a result of this final rule, but we continue to expect that paying prospectively for LTCH services will enhance the efficiency of the Medicare program. As discussed previously, we do not expect the continued implementation of the site neutral payment system to have a negative impact on access to or quality of care, as demonstrated in areas where there is little or no LTCH presence, general short-term acute care hospitals are effectively providing treatment for the same types of patients that are treated in LTCHs.

K. Effects of Requirements for the Hospital Inpatient Quality Reporting (IQR) Program

In section IX.E. of the preamble of this final rule, we discuss our current requirements and newly finalized requirements for hospitals to report quality data under the Hospital IQR Program to receive the full annual percentage increase for the FY 2023 payment determination and subsequent years.

In this final rule, we are adopting the following measures: (1) Hospital Commitment to Health Equity, beginning with the CY 2023 reporting period/FY 2025 payment determination; (2) Screening for Social Drivers of Health beginning with voluntary reporting in the CY 2023 reporting period and mandatory reporting beginning with the CY 2024 reporting period/FY 2026 payment determination; (3) Screen Positive Rate for Social Drivers of Health beginning with voluntary reporting in the CY 2023 reporting period and mandatory reporting beginning with the CY 2024 reporting period/FY 2026 payment determination; (4) Cesarean Birth electronic clinical quality

measure (eCQM) with inclusion in the eCQM measure set beginning with the CY 2023 reporting period/FY 2025 payment determination, and mandatory reporting beginning with the CY 2024 reporting period/FY 2026 payment determination; (5) Severe Obstetric Complications eCQM with inclusion in the eCQM measure set beginning with the CY 2023 reporting period/FY 2025 payment determination, and mandatory reporting beginning with the CY 2024 reporting period/FY 2026 payment determination; (6) Hospital-Harm—Opioid-Related Adverse Events eCQM with inclusion in the eCQM measure set beginning with the CY 2024 reporting period/FY 2026 payment determination; (7) Global Malnutrition Composite Score eCQM with inclusion in the eCQM measure set beginning with the CY 2024 reporting period/FY 2026 payment determination; (8) Hospital-Level, Risk Standardized Patient-Reported Outcomes Performance Measure (PRO–PM) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA), beginning with two voluntary periods followed by mandatory reporting beginning with the reporting period which runs from July 1, 2025 through June 30, 2026, impacting the FY 2028 payment determination; (9) Medicare Spending Per Beneficiary (MSPB) Hospital beginning with the FY 2024 payment determination; and (10) Hospital-Level Risk-Standardized Complications Rate (RSCR) Following Elective Primary THA/TKA beginning with the FY 2024 payment determination. We are refining two current measures beginning with the FY 2024 payment determination: (1) Hospital-Level, Risk-Standardized Payment Associated with an Episode of Care for Primary Elective THA/TKA; and (2) Excess Days in Acute Care (EDAC) After Hospitalization for Acute Myocardial Infarction (AMI). We are also: (1) Establishing a hospital designation related to maternal care to be publicly-reported on a public-facing website beginning in Fall 2023, and sought comments on other potential associated activities regarding this designation; (2) modifying our eCQM reporting and submission requirements whereby we are increasing the total number of eCQMs to be reported from four to six eCQMs beginning with the CY 2024 reporting period/FY 2026 payment determination; (3) modifying our case threshold exemptions and zero denominator declaration policies for hybrid measures as we believe they are not applicable for those measure types beginning with the FY 2026 payment determination; (4) adopting reporting and submission requirements for PRO–PMs; and (5) modifying our eCQM validation policy to increase the reporting of medical requests from 75 percent of records to 100 percent of records beginning with the FY 2025 payment determination.

As shown in the summary table in section XII.B.4. of the preamble of this final rule, we estimate a total information collection burden increase for 3,150 IPPS hospitals of 746,300 hours at a cost of $23,437,906 annually associated for our finalized policies and updated burden estimates across a 4-year period from the CY 2023 reporting period/FY 2025 payment determination through the CY 2026 reporting period/FY 2028 payment determination, compared to our currently approved information collection burden estimates.

In section IX.E.5.a. of the preamble of this final rule, we are adopting the Hospital Commitment to Health Equity structural measure. In order for hospitals to receive a point for each of the five domains in the measure, affirmative attestations are required for each of the elements within a domain. For hospitals that are unable to attest affirmatively for an element, there are likely to be additional costs associated with activities such as updating hospital policies, engaging senior leadership, participating in new quality improvement activities, performing additional data analysis, and training staff. The extent of these costs will vary from hospital to hospital depending on what activities the hospital is already performing, hospital size, and the individual choices each hospital makes in order to meet the criteria necessary to attest affirmatively.

In section IX.E.5.b.(1). of the preamble of this final rule, we are adopting the Screening for Social Drivers of Health measure. For hospitals that are not currently administering some screening mechanism and elect to begin doing so as a result of this policy, there will be some non-recurring costs associated with changes in workflow and information systems to collect the data. The extent of these costs is difficult to quantify as different hospitals may utilize different modes of data collection (for example paper-based, electronically patient-directed, clinician-facilitated, etc.). In addition, depending on the method of data collection utilized, the time required to complete the survey may add a negligible amount of time to patient visits.

In section IX.E.5.g. of the preamble of this final rule, we are adopting the THA/TKA PRO–PM. For hospitals that are not currently collecting this data and elect to begin doing so as a result of this policy, there will be some non-recurring costs associated with changes in workflow and information systems to collect the data. The extent of these costs is difficult to quantify as different hospitals may utilize different modes of data collection (for example paper-based, electronically patient-directed, clinician-facilitated, etc.). While we assume the majority of hospitals will report data for this measure via the HQR System, we assume some hospitals may elect to submit measure data via a third-party CMS-approved survey vendor, for which there are associated costs. Under OMB control number 0938–0981 for the HCAHPS Survey measure (expiration date September 30, 2024), an estimate of approximately $4,000 per hospital is used to account for these costs. This estimate originates from 2012, therefore, to account for inflation (assuming end of CY 2012 to end of CY 2021), we adjust the price using the Bureau of Labor Statistics Consumer Price Index and estimate an updated cost of approximately $4,856 ($4,000 × 121.4 percent).[1172]

[1172] U.S. Bureau of Labor Statistics. Historical CPI–U data. Accessed on March 10, 2022. Available at: *https://www.bls.gov/cpi/tables/supplemental-files/historical-cpi-u-202112.pdf.*

We note that in sections IX.E.5.c., IX.E.5.d., IX.E.5.e, and IX.E.5.f. of the preamble of this final rule, we are adopting four new eCQMs. Similar to the FY 2019 IPPS/LTCH PPS final rule regarding removal of eCQM measures, while there is no change in information collection burden related to those finalized provisions, we believe that costs are multifaceted and include not only the burden associated with reporting, but also the costs associated with implementing and maintaining Hospital IQR Program measures in hospitals' EHR systems for all of the eCQMs available for use in the Hospital IQR Program (83 FR 41771). Additionally, two of the four eCQMs are mandatory beginning with the CY 2024 reporting period/FY 2026 payment determination and for subsequent years; we account for the burden of collection of information in section XII.B.4. (Collection of Information) in our finalized policy to increase our eCQM reporting and submission requirements from four eCQMs to six eCQMs. Because hospitals are already reporting eCQMs, we do not believe there are any additional costs associated with increasing the number of eCQMs hospitals must report beyond the burden discussed in the collection of information section and the costs previously discussed related to adopting new eCQMs.

Historically, 100 hospitals, on average, that participate in the Hospital IQR Program do not receive the full annual percentage increase in any fiscal year due to the failure to meet all requirements of the Hospital IQR Program. We anticipate that the number of hospitals not receiving the full annual percentage increase will be approximately the same as in past years.

We received no comments on these effects.

L. Effects of Requirements for the PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program

In section IX.F. of the preamble of this final rule, we discuss our policies for the quality data reporting program for PPS-exempt cancer hospitals (PCHs), which we refer to as the PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program. The PCHQR Program is authorized under section 1866(k) of the Act, which was added by section 3005 of the Affordable Care Act. There is no financial impact to PCH Medicare reimbursement if a PCH does not submit data.

In section IX.F.4. of the preamble of this final rule, we are: (1) adopting and codifying a patient safety exception for the measure removal policy; (2) beginning public display of the End-of-Life (EOL) measures with FY 2025 program year data; and (3) beginning public display of the 30-Day Unplanned Readmissions for Cancer Patients measures with FY 2024 program year data. These provisions do not result in additional financial impact beyond the information collection burden of 0 hours discussed in section XII.B.XX of the preamble of this final rule.

We received no comments on these effects.

M. Effects of Requirements for the Long-Term Care Hospital Quality Reporting Program (LTCH QRP)

In section IX.G. of the preamble of this proposed rule, we are soliciting comment on several issues but are not proposing any policy changes. Given that there are no costs for this provision.

N. Effects of Requirements Regarding the Medicare Promoting Interoperability Program

In section IX.H. of this final rule, we are finalizing the following changes for eligible hospitals and critical access hospitals (CAHs) that attest to CMS under the Medicare Promoting Interoperability Program: (1) to require and modify the Electronic Prescribing Objective's Query of PDMP measure while maintaining the associated points at 10 points beginning with the electronic health record (EHR) reporting period in CY 2023 with modification for an additional exclusion based on public comment; (2) to expand the Query of Prescription Drug Monitoring Program (PDMP) measure to include not only Schedule II opioids, but also Schedule III, and IV drugs beginning with EHR reporting periods in CY 2023; (3) to add a new Health Information Exchange (HIE) Objective option, the Enabling Exchange Under Trusted Exchange Framework and Common Agreement (TEFCA) measure (requiring a yes/no response) beginning with EHR reporting periods in CY 2023; (4) to modify the Public Health and Clinical Data Exchange Objective by adding an Antibiotic Use and Resistance (AUR) measure in addition to the current four required measures (Syndromic Surveillance Reporting, Immunization Registry Reporting, Electronic Case Reporting, and Electronic Reportable Laboratory Result Reporting) with modification to begin with EHR reporting periods in CY 2024; (5) to consolidate the current options from three to two levels of active engagement for the Public Health and Clinical Data Exchange Objective and to require the reporting of active engagement for the measures under the objective beginning with EHR reporting periods in CY 2023 with modification to delay the requirement that eligible hospital and CAHs may spend only one EHR reporting period at the Pre-production and Validation level of active engagement per measure until EHR reporting period in CY 2024; (6) to institute public reporting of certain Medicare Promoting Interoperability Program data beginning from the CY 2023 EHR reporting period; (7) to modify the scoring methodology for the Promoting Interoperability Program beginning in the EHR reporting periods in CY 2023; and (8) to remove regulation text for the objectives and measures in the Medicare Promoting Interoperability Program from paragraph (e) under 42 CFR 495.24 and add new paragraph (f) beginning in CY 2023. We are also finalizing adoption of four eCQMs: (1) Severe Obstetric Complications eCQM with inclusion in the eCQM measure set beginning with the CY 2023 reporting period, followed by mandatory reporting beginning with the CY 2024 reporting period; (2) Cesarean Birth (ePC–02) eCQM with inclusion in the eCQM measure set beginning with the CY 2023 reporting period followed by mandatory reporting beginning with the CY 2024 reporting period; (3) Hospital-Harm—Opioid-Related Adverse Events eCQM with inclusion in the eCQM measure set beginning with the CY 2024 reporting period; and (4) Global Malnutrition Composite Score eCQM with inclusion in the eCQM measure set beginning with the CY 2024 reporting period. Lastly, we are finalizing a modification to our eCQM reporting and submission requirements whereby we are increasing the total number of eCQMs to be reported from four to six eCQMs beginning with the CY 2024 reporting period.

As shown in summary table in section XII.B.9.k. of the preamble of this final rule, we estimate a total information collection burden increase for 4,500 eligible hospitals and CAHs of 5,513 hours at a cost of $233,730 annually associated with our finalized policies and updated burden estimates across the CY 2023 and CY 2024 EHR reporting periods compared to our currently approved information collection burden estimates. We refer readers to section XII.B.9. of the preamble of this final rule (information collection requirements) for a detailed discussion of the calculations estimating the changes to the information collection burden for submitting data to the Medicare.

In section IX.H.4. of the preamble of this final rule, we are finalizing to add the Enabling Exchange Under TEFCA measure to the Health Information Exchange Objective. Eligible hospitals and CAHs currently may choose to report the two Support Electronic Referral Loop measures or may choose to report the HIE Bi-Directional Exchange measure. With the addition of this measure, eligible hospitals and CAHs would be able to choose to attest to Enabling Exchange Under TEFCA as an alternative to reporting on other measures in the objective and provide an opportunity for eligible hospitals and CAHs that are already voluntarily connecting to and exchanging information under TEFCA to earn credit for the Health Information Exchange Objective. Because attesting to this measure is voluntary and we assume eligible hospitals and CAHs would already be engaging in the activities necessary to attest ''yes'', we assume no additional financial impact as a result of this policy.

In section IX.H.5.b. of the preamble of this final rule, we are finalizing the adoption of a new Antimicrobial Use and Resistance (AUR) Surveillance measure for eligible hospitals and CAHs under the Promoting Interoperability Program's Public Health and Clinical Data Exchange Objective with associated exclusions with modification to begin in the EHR reporting periods in CY 2024. To attest successfully, an eligible hospital or CAH must be in active engagement with CDC's National Healthcare Safety Network (NHSN) to submit AUR data and receive a report from NHSN indicating their successful submission of AUR data for the EHR reporting period. Participation in NHSN's surveillance requires the purchase or building of an AUR reporting solution. While thousands of hospitals have voluntarily done this to date, for hospitals who would be required to, we estimate the cost to range between $17,000 and $388,500 annually, with a median of $187,400.[1173] We believe these associated costs are outweighed by the more than $4.6 billion in health care costs spent annually treating antibiotic resistance threats.[1174]

In section IX.H.5.c. of the preamble of this final rule, we are finalizing to reduce the number of active engagement options from three to two and combine the ''completed registration to submit data'' option with the ''testing'' and validation option. Because these options were first available in 2016 and the vast majority of eligible hospitals and CAHs have completed the ''completed registration to submit data'' option in the years since, we believe any financial impact associated with this finalized policy to be negligible. Regarding the finalized policy to allow eligible hospitals and CAHs to spend only one EHR reporting period at the Pre-production and Validation phase, because the goal for all eligible hospitals and CAHs has historically been to eventually be at the Validated Data Production option, we do not believe there is any additional financial impact associated with this policy.

In section IX.H.10.a.(2). of the preamble of this final rule, we are finalizing to adopt four new eCQMs. Similar to the FY 2019 IPPS/LTCH PPS final rule regarding removal of eCQM measures, while there is no change in information collection burden related to those finalized provisions, we believe that costs are multifaceted and include not only the burden associated with reporting but also the costs associated with implementing and maintaining program measures in hospitals' EHR systems for all of the eCQMs available for use in the Promoting Interoperability Program (83 FR 41771). Additionally, for two of the four eCQMs being finalized as mandatory beginning with the CY 2024 reporting period and for subsequent years, we account for the burden of collection of information in section XII.B.9.e. (Collection of Information) in our finalized policy to increase our eCQM reporting and submission requirements from four eCQMs to six eCQMs.

We received no comments on these effects.

O. Alternatives Considered

This final rule contains a range of policies. It also provides descriptions of the statutory provisions that are addressed, identifies the finalized policies, and presents rationales for our decisions and, where relevant, alternatives that were considered.

1. Use of FY 2021 Data and Proposed Methodology Modifications for the FY 2023 IPPS and LTCH PPS Ratesetting

In the FY 2022 IPPS/LTCH proposed rule (87 FR 28740), we explained that for the IPPS and LTCH PPS ratesetting, our longstanding goal is to use the best available data. We stated that given the persistence of the effects of the virus that causes COVID–19 in the Medicare FY 2020 data, the Medicare FY 2021 data, and the CDC hospitalization data, coupled with the expectation for future

[1173] *https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5051263/.*

[1174] *https://www.cdc.gov/drugresistance/solutions-initiative/stories/partnership-estimates-healthcare-cost.html.*

variants, we believe that it is reasonable to assume that some Medicare beneficiaries will continue to be hospitalized with COVID–19 at IPPS hospitals and LTCHs in FY 2023. Accordingly, we stated we believe it is appropriate to use FY 2021 data, as the most recent available data during the period of the COVID–19 PHE, for purposes of the FY 2023 IPPS and LTCH PPS ratesetting.

We also stated in the FY 2022 IPPS/LTCH proposed rule (87 FR 28740), we believe it is reasonable to assume based on the information available at this time that there will be fewer COVID 19 hospitalizations in FY 2023 than in FY 2021 given the more recent trends in the CDC hospitalization data since the Omicron variant peak in January, 2022. Accordingly, because we anticipate Medicare inpatient hospitalizations for COVID–19 will continue in FY 2023 but at a lower level, we proposed to use FY 2021 data for purposes of the FY 2023 IPPS and LTCH PPS ratesetting but with the following modifications to our usual ratesetting methodologies to account for the anticipated decline in COVID–19 hospitalizations of Medicare beneficiaries at IPPS hospitals and LTCHs as compared to FY 2021.

- Calculate the relative weights for FY 2023 by first calculating two sets of weights, one including and one excluding COVID–19 claims in the FY 2021 data, and then averaging the two sets of relative weights to determine the proposed FY 2023 relative weight values.
- Modify our methodologies for determining the FY 2023 outlier fixed-loss amount for IPPS cases and LTCH PPS standard Federal payment rate cases to use charge inflation factors based on the increase in charges that occurred from FY 2018 to FY 2019, which is the last 1-year period prior to the COVID–19 PHE and to use CCR adjustment factors based on the change in CCRs that occurred between the March 2019 PSF and the March 2020 PSF, which is the last 1-year period prior to the COVID–19 PHE.

We refer the reader to section II.E.2.c. of the preamble and section II.A.4.j. of the Addendum of this final rule for a complete discussion regarding these proposed modifications to our usual ratesetting methodologies.

Alternatively, we considered not making any of these modifications to our usual methodologies for the calculation of the FY 2023 MS–DRG and MS–LTC–DRG relative weights or the usual methodologies used to determine the FY 2023 outlier fixed-loss amount for IPPS cases and LTCH PPS standard Federal payment rate cases. Specifically, under this alternative approach, we considered to—

- Calculate the relative weights using our usual methodology for FY 2023 by including all COVID–19 claims in the FY 2021 data with no averaging of the relative weights as calculated with and without the COVID–19 cases to determine the FY 2023 relative weight values; and
- Use the same data we would ordinarily use for purposes of this FY 2023 rulemaking to compute the charge inflation factors and CCR adjustment factors in determining the FY 2023 outlier fixed-loss amount for IPPS cases and LTCH PPS standard Federal payment rate cases; specifically:

++ Charge inflation factors based on the increase in charges that occurred from FY 2020 to FY 2021, which is the latest full fiscal year period of MedPAR data available to determine the increase in charges.

++ CCR adjustment factors based on the change in CCRs that occurred between the December 2020 PSF and the December 2021 PSF, which is the latest 1-year period of the PSF to determine the adjustment factors to the CCRs for the proposed rule (for the final rule, we typically use updated PSF data to determine the CCR adjustment factor which for FY 2023 would be based on the change in CCRs that occurred between the March 2021 PSF and the March 2022 PSF).

We note the FY 2023 outlier fixed-loss amount would be significantly higher under this alternative considered.

In order to facilitate comments on this alternative approach as well as comments on our proposed modifications to our usual methodologies, we made available additional files on the CMS website at *https://www.cms.gov/medicare/medicare-fee-for-service-payment/acuteinpatientpps*, along with the data files and information for our proposed FY 2023 IPPS ratesetting. The LTCH PPS specific files were posted the CMS website at *https://www.cms.gov/medicare/medicare-fee-for-service-payment/longtermcarehospitalpps*, along with the data files and information for our proposed FY 2023 LTCH PPS ratesetting.

Public comments were largely supportive of CMS use of FY 2021 data including to determine the FY 2023 MS–DRG relative weights by averaging the relative weights as calculated with and without COVID–19 cases in the FY 2021 data. Some commenters expressed concern about policies that may limit the reimbursement for COVID–19 cases. As discussed in section II.E. of the preamble of this final rule, and following our review of public comments, we are finalizing our proposal to determine the FY 2023 MS–DRG relative weights by averaging the relative weights as calculated with and without COVID–19 cases in the FY 2021 data. We note, the finalization of our proposal to use FY 2021 data and to modify our methodology for determining the FY 2023 LTCH PPS MS–LTC–DRG relative weights is discussed in greater detail in section VIII.B. of the preamble of this final rule.

As discussed in section II.A.4. and section V.D.3. of the addendum to this final rule, we received many comments supportive of our proposed modifications to our usual methodologies for determining the FY 2023 IPPS and LTCH PPS outlier fixed-loss amounts.

As discussed in these sections, after considering comments received, we are finalizing our proposal to inflate the charges on the FY 2021 MedPAR claims using charge inflation factors computed by comparing the average covered charge per case in the March 2019 MedPAR file of FY 2018 to the average covered charge per case in the March 2020 MedPAR file of FY 2019, which is the last 1-year period prior to the COVID–19 PHE. We also finalizing our proposal to adjust the CCRs from the March 2021 update of the PSF by comparing the percentage change in the national average case-weighted CCR from the March 2019 update of the PSF to the national average case-weighted CCR from the March 2020 update of the PSF, which is the last 1-year period prior to the COVID–19 PHE.

We also received many comments that suggested other modifications CMS should make to our usual methodologies for determining the FY 2023 IPPS and LTCH PPS outlier fixed-loss amounts. As also discussed in section II.A.4. and section V.D.3. of the addendum to this final rule, in response to comments received, we are modifying our proposed methodologies for establishing the FY 2023 IPPS and LTCH PPS outlier fixed-loss amounts. We specifically determined the FY 2023 IPPS and LTCH PPS outlier fixed-loss amounts as averages of these fixed-loss amounts calculated including and excluding COVID–19 claims. We believe this adjustment to our proposed methodology will better reflect a reasonable estimation of the case mix for FY 2023 based on the information available at this time and is also consistent with the approach we are finalizing for determining the FY 2023 IPPS MS–DRG and LTCH PPS MS–LTC–DRG relative weights.

In addition, as discussed in section II.A.4 of the addendum to this final rule, in response to comments received, we are further modifying our proposed methodology for establishing the FY 2023 IPPS outlier fixed-loss amount. Specifically, when determining the FY 2023 IPPS outlier fixed-loss amount, we included COVID–19 add-on payments which were not accounted for in our proposed methodology.

P. Overall Conclusion

1. Acute Care Hospitals

Acute care hospitals are estimated to experience an increase of approximately $1.4 billion in FY 2023, including operating, capital, and new technology changes, as well as increased GME payments under our changes in response to *Milton S. Hershey Medical Center, et al.* v. *Becerra* and payments under the new supplemental payment for IHS/Tribal and Puerto Rico hospitals. The estimated change in operating payments is approximately $2.3 billion (discussed in section I.G. and I.H. of this Appendix). The estimated change in capital payments is approximately $0.039 billion (discussed in section I.I. of this Appendix). The estimated change in new technology add-on payments is approximately -$0.747 billion as discussed in section I.H. of this Appendix. The change in new technology add-on payments reflects the net impact of new applications under the alternative pathways and continuing new technology add-on payments. Total may differ from the sum of the components due to rounding.

Table I. of section I.G. of this Appendix also demonstrates the estimated redistributional impacts of the IPPS budget neutrality requirements for the MS–DRG and wage index changes, and for the wage index reclassifications under the MGCRB.

We estimate that hospitals would experience a 0.6 percent increase in capital payments per case, as shown in Table III. of section I.I. of this Appendix. We project that

there would be a $39 million increase in capital payments in FY 2023 compared to FY 2022.

The discussions presented in the previous pages, in combination with the remainder of this final rule, constitute a regulatory impact analysis.

2. LTCHs

Overall, LTCHs are projected to experience an increase in estimated payments in FY 2023. In the impact analysis, we are using the finalized rates, factors, and policies presented in this final rule based on the best available claims and CCR data to estimate the change in payments under the LTCH PPS for FY 2023. Accordingly, based on the best available data for the 339 LTCHs included in our analysis, we estimate that overall FY 2023 LTCH PPS payments will increase approximately $71 million relative to FY 2022 primarily due to the annual update to the LTCH PPS standard Federal rate.

Q. Regulatory Review Cost Estimation

If regulations impose administrative costs on private entities, such as the time needed to read and interpret a rule, we should estimate the cost associated with regulatory review. Due to the uncertainty involved with accurately quantifying the number of entities that would review the final rule, we assumed that the total number of timely pieces of correspondence on this year's proposed rule would be the number of reviewers of the final rule. We acknowledge that this assumption may understate or overstate the costs of reviewing the rule. It is possible that not all commenters reviewed this year's rule in detail, and it is also possible that some reviewers chose not to comment on the proposed rule. For these reasons, we believe that the number of past commenters would be a fair estimate of the number of reviewers of the final rule. We recognize that different types of entities are in many cases affected by mutually exclusive sections of the rule. Thus, for the purposes of our estimate we assume that each reviewer read approximately 50 percent of the proposed rule. Finally, in our estimates, we have used the 1,631 number of timely pieces of correspondence on the FY 2023 IPPS/LTCH PPS proposed rule as our estimate for the number of reviewers of the final rule. We continue to acknowledge the uncertainty involved with using this number, but we believe it is a fair estimate due to the variety of entities affected and the likelihood that some of them choose to rely (in full or in part) on press releases, newsletters, fact sheets, or other sources rather than the comprehensive review of preamble and regulatory text.

Using the wage information from the BLS for medical and health service managers (Code 11–9111), we estimate that the cost of reviewing the final rule is $115.22 per hour, including overhead and fringe benefits (*https://www.bls.gov/oes/current/oes_nat.htm*). Assuming an average reading speed, we estimate that it would take approximately 30.06 hours for the staff to review half of this final rule. For each IPPS hospital or LTCH that reviews this final rule, the estimated cost is $3,463.34 (30.06 hours × $115.22). Therefore, we estimate that the total cost of reviewing this final rule is $5,648,700 ($3,463.34 × 1,631 reviewers).

II. Accounting Statements and Tables

A. Acute Care Hospitals

As required by OMB Circular A–4 (available at *https://www.whitehouse.gov/wp-content/uploads/legacy_drupal_files/omb/circulars/A4/a-4.pdf*), in Table V. of this Appendix, we have prepared an accounting statement showing the classification of the expenditures associated with the provisions of this final rule as they relate to acute care hospitals. This table provides our best estimate of the change in Medicare payments to providers as a result of the changes to the IPPS presented in this final rule. All expenditures are classified as transfers to Medicare providers.

As shown in Table V. of this Appendix, the net costs to the Federal Government associated with the policies in this final rule are estimated at $1.4 billion.

TABLE V.—ACCOUNTING STATEMENT: CLASSIFICATION OF ESTIMATED EXPENDITURES UNDER THE IPPS FROM FY 2022 TO FY 2023

Category	Transfers
Annualized Monetized Transfers	$1.4 billion
From Whom to Whom	Federal Government to IPPS Medicare Providers

B. LTCHs

As discussed in section I.J. of this Appendix, the impact analysis of the payment rates and factors presented in this final rule under the LTCH PPS is projected to result in an increase in estimated aggregate LTCH PPS payments in FY 2023 relative to FY 2022 of approximately $71 million based on the data for 339 LTCHs in our database that are subject to payment under the LTCH PPS. Therefore, as required by OMB Circular A–4 (available at *https://www.whitehouse.gov/wp-content/uploads/legacy_drupal_files/omb/circulars/A4/a-4.pdf*), in Table VI. of this Appendix, we have prepared an accounting statement showing the classification of the expenditures associated with the provisions of this final rule as they relate to the changes to the LTCH PPS. Table VI. of this Appendix provides our best estimate of the estimated change in Medicare payments under the LTCH PPS as a result of the payment rates and factors and other provisions presented in this final rule based on the data for the 339 LTCHs in our database. All expenditures are classified as transfers to Medicare providers (that is, LTCHs).

As shown in Table VI. of this Appendix, the net cost to the Federal Government associated with the policies for LTCHs in this final rule are estimated at $71 million.

TABLE VI.—ACCOUNTING STATEMENT: CLASSIFICATION OF ESTIMATED EXPENDITURES FROM THE FY 2022 LTCH PPS TO THE FY 2023 LTCH PPS

Category	Transfers
Annualized Monetized Transfers	$71 million
From Whom to Whom	Federal Government to LTCH Medicare Providers

III. Regulatory Flexibility Act (RFA) Analysis

The RFA requires agencies to analyze options for regulatory relief of small entities. For purposes of the RFA, small entities include small businesses, nonprofit organizations, and small government jurisdictions. We estimate that most hospitals and most other providers and suppliers are small entities as that term is used in the RFA. The great majority of hospitals and most other health care providers and suppliers are small entities, either by being nonprofit organizations or by meeting the SBA definition of a small business (having

revenues of less than $8.0 million to $41.5 million in any 1 year). (For details on the latest standards for health care providers, we refer readers to page 38 of the Table of Small Business Size Standards for NAIC 622 found on the SBA website at *https://www.sba.gov/sites/default/files/files/Size_Standards_Table.pdf*.)

For purposes of the RFA, all hospitals and other providers and suppliers are considered to be small entities. Because all hospitals are considered to be small entities for purposes of the RFA, the hospital impacts described in this final rule are impacts on small entities. Individuals and States are not included in the definition of a small entity. MACs are not considered to be small entities because they do not meet the SBA definition of a small business.

HHS's practice in interpreting the RFA is to consider effects economically ''significant'' if greater than 5 percent of providers reach a threshold of 3 to 5 percent or more of total revenue or total costs. We believe that the provisions of this final rule relating to IPPS hospitals would have an economically significant impact on small entities as explained in this Appendix. Therefore, the Secretary has certified that this final rule will have a significant economic impact on a substantial number of small entities. For example, the majority of the 3,142 IPPS hospitals included in the impact analysis shown in ''Table I.—Impact Analysis of Proposed Changes to the IPPS for Operating Costs for FY 2023,'' on average are expected to see increases in the range of 2.6 percent, primarily due to the hospital rate update, as discussed in section I.G. of this Appendix. On average, the rate update for these hospitals is estimated to be 4.2 percent.

The 339 LTCH PPS hospitals included in the impact analysis shown in ''Table IV. Impact of Proposed Payment Rate and Policy Changes to LTCH PPS Payments and Policy Changes to LTCH PPS Payments for LTCH PPS Standard Payment Rate Cases for FY 2023 (Estimated FY 2023 Payments Compared to Estimated FY 2022 Payments)'' on average are expected to see an increase of approximately 2.3 percent, primarily due to the 3.8 percent annual update to the LTCH PPS standard Federal payment rate for FY 2023 and the 1.2 percent decrease in high cost outlier payments as a percentage of total LTCH PPS standard Federal payment rate payments, as discussed in section I.J. of this Appendix.

This final rule contains a range of policies. It provides descriptions of the statutory provisions that are addressed, identifies the proposed policies, and presents rationales for our decisions and, where relevant, alternatives that were considered. The analyses discussed in this Appendix and throughout the preamble of this final rule constitutes our regulatory flexibility analysis. We solicited public comments on our estimates and analysis of the impact of our proposals on small entities.

IV. Impact on Small Rural Hospitals

Section 1102(b) of the Act requires us to prepare a regulatory impact analysis for any proposed or final rule that may have a significant impact on the operations of a substantial number of small rural hospitals. This analysis must conform to the provisions of section 604 of the RFA. With the exception of hospitals located in certain New England counties, for purposes of section 1102(b) of the Act, we define a small rural hospital as a hospital that is located outside of an urban area and has fewer than 100 beds. Section 601(g) of the Social Security Amendments of 1983 (Pub. L. 98–21) designated hospitals in certain New England counties as belonging to the adjacent urban area. Thus, for purposes of the IPPS and the LTCH PPS, we continue to classify these hospitals as urban hospitals.

As shown in Table I. in section I.G. of this Appendix, rural IPPS hospitals with 0–49 beds (358 hospitals) and 50–99 beds (201 hospitals) are expected to experience an increase in payments from FY 2022 to FY 2023 of 0.9 percent and 1.3 percent, respectively, primarily driven by the hospital rate update and the expiration of the MDH provision, as discussed in section I.G of this Appendix. We refer readers to Table I. in section I.G. of this Appendix for additional information on the quantitative effects of the policy changes under the IPPS for operating costs.

All rural LTCHs (17 hospitals) shown in Table IV. in section I.J. of this Appendix have less than 100 beds. These hospitals are expected to experience an increase in payments from FY 2022 to FY 2023 of 2.2 percent, primarily due to the 3.8 percent annual update to the LTCH PPS standard Federal payment rate for FY 2023 and the projected 1.2 percent decrease in high cost outlier payments as a percentage of total LTCH PPS standard Federal payment rate payments, as discussed in section I.J. of this Appendix.

V. Unfunded Mandates Reform Act Analysis

Section 202 of the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4) also requires that agencies assess anticipated costs and benefits before issuing any rule whose mandates require spending in any 1 year of $100 million in 1995 dollars, updated annually for inflation. In 2022, that threshold level is approximately $165 million. This final rule would not mandate any requirements that meet the threshold for State, local, or tribal governments, nor would it affect private sector costs.

VI. Executive Order 13132

Executive Order 13132 establishes certain requirements that an agency must meet when it promulgates a proposed rule (and subsequent final rule) that imposes substantial direct requirement costs on state and local governments, preempts state law, or otherwise has federalism implications. This final rule would not have a substantial direct effect on state or local governments, preempt states, or otherwise have a federalism implication.

VII. Executive Order 13175

Executive Order 13175 directs agencies to consult with Tribal officials prior to the formal promulgation of regulations having tribal implications. Section 1880(a) of the Act states that a hospital of the Indian Health Service, whether operated by such Service or by an Indian tribe or tribal organization, is eligible for Medicare payments so long as it meets all of the conditions and requirements for such payments which are applicable generally to hospitals. Consistent with section 1880(a) of the Act, this this final rule contains general provisions also applicable to hospitals and facilities operated by the Indian Health Service or Tribes or Tribal organizations under the Indian Self-Determination and Education Assistance Act.

In the years prior to this rulemaking and during this rulemaking, we have engaged in consultation with Tribal officials on the methodology for determining uncompensated care payments to IHS and Tribal hospitals. Tribal officials have expressed concern over the long-term financial disruption to these hospitals if the use of low-income insured days as a proxy for the uncompensated care costs of IHS and Tribal hospitals were to be discontinued and data on uncompensated care costs from Worksheet S–10 were to be used to determine uncompensated care payments to IHS and Tribal hospitals. As discussed in section IV.D of the preamble of this final rule, beginning in FY 2023, we are discontinuing the use of low-income insured days as a proxy for the uncompensated care costs of IHS and Tribal hospitals and will begin using data on uncompensated care costs from Worksheet S–10 to determine uncompensated care payments to IHS and Tribal hospitals. However, as discussed in section IV.E. of the preamble of this final rule, after considering input received from our consultations with Tribal officials, we are also establishing a new supplemental payment for IHS/Tribal hospitals beginning in FY 2023 to avoid undue long-term financial disruption to these hospitals as a result of discontinuing the use of low-income insured days as a proxy for uncompensated care.

VIII. Executive Order 12866

In accordance with the provisions of Executive Order 12866, the Office of Management and Budget reviewed this final rule.

Appendix B: Recommendation of Update Factors for Operating Cost Rates of Payment for Inpatient Hospital Services

I. Background

Section 1886(e)(4)(A) of the Act requires that the Secretary, taking into consideration the recommendations of MedPAC, recommend update factors for inpatient hospital services for each fiscal year that take into account the amounts necessary for the efficient and effective delivery of medically appropriate and necessary care of high quality. Under section 1886(e)(5) of the Act, we are required to publish update factors recommended by the Secretary in the proposed and final IPPS rules. Accordingly, this Appendix provides the recommendations for the update factors for the IPPS national standardized amount, the hospital-specific rate for SCHs and MDHs, and the rate-of-increase limits for certain hospitals excluded from the IPPS, as well as LTCHs. In prior years, we made a recommendation in the IPPS proposed rule

and final rule for the update factors for the payment rates for IRFs and IPFs. However, for FY 2023, consistent with our approach for FY 2022, we are including the Secretary's recommendation for the update factors for IRFs and IPFs in separate **Federal Register** documents at the time that we announce the annual updates for IRFs and IPFs. We also discuss our response to MedPAC's recommended update factors for inpatient hospital services.

II. Inpatient Hospital Update for FY 2023

A. FY 2023 Inpatient Hospital Update

As discussed in section IV.A. of the preamble to this final rule, for FY 2023, consistent with section 1886(b)(3)(B) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act, we are setting the applicable percentage increase by applying the following adjustments in the following sequence. Specifically, the applicable percentage increase under the IPPS is equal to the rate-of-increase in the hospital market basket for IPPS hospitals in all areas, subject to a reduction of one-quarter of the applicable percentage increase (prior to the application of other statutory adjustments; also referred to as the market basket update or rate-of-increase (with no adjustments)) for hospitals that fail to submit quality information under rules established by the Secretary in accordance with section 1886(b)(3)(B)(viii) of the Act and a reduction of three-quarters of the applicable percentage increase (prior to the application of other statutory adjustments; also referred to as the market basket update or rate-of-increase (with no adjustments)) for hospitals not considered to be meaningful electronic health record (EHR) users in accordance with section 1886(b)(3)(B)(ix) of the Act, and then subject to an adjustment based on changes in economy-wide productivity (the productivity adjustment). Section 1886(b)(3)(B)(xi) of the Act, as added by section 3401(a) of the Affordable Care Act, states that application of the productivity adjustment may result in the applicable percentage increase being less than zero. (We note that section 1886(b)(3)(B)(xii) of the Act required an additional reduction each year only for FYs 2010 through 2019.)

We note that, in compliance with section 404 of the MMA, in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45194 through 45204), we replaced the 2014-based IPPS operating and capital market baskets with the rebased and revised 2018-based IPPS operating and capital market baskets beginning in FY 2022.

In the FY 2023 IPPS/LTCH PPS proposed rule, in accordance with section 1886(b)(3)(B) of the Act, we proposed to base the proposed FY 2023 market basket update used to determine the applicable percentage increase for the IPPS on IGI's fourth quarter 2021 forecast of the 2018-based IPPS market basket rate-of-increase with historical data through third quarter 2021, which was estimated to be 3.1 percent. In accordance with section 1886(b)(3)(B) of the Act, as amended by section 3401(a) of the Affordable Care Act, in section IV.B. of the preamble of the FY 2023 IPPS/LTCH PPS proposed rule, based on IGI's fourth quarter 2021 forecast, we proposed a productivity adjustment of 0.4 percentage point for FY 2023. We also proposed that if more recent data subsequently became available, we would use such data, if appropriate, to determine the FY 2023 market basket update and productivity adjustment for the FY 2023 IPPS/LTCH PPS final rule.

In the FY 2023 IPPS/LTCH PPS proposed rule, based on IGI's fourth quarter 2021 forecast of the 2018-based IPPS market basket update and the productivity adjustment, depending on whether a hospital submits quality data under the rules established in accordance with section 1886(b)(3)(B)(viii) of the Act (hereafter referred to as a hospital that submits quality data) and is a meaningful EHR user under section 1886(b)(3)(B)(ix) of the Act (hereafter referred to as a hospital that is a meaningful EHR user), we presented four applicable percentage increases that could be applied to the standardized amount.

In accordance with section 1886(b)(3)(B) of the Act, as amended by section 3401(a) of the Affordable Care Act, we are establishing the applicable percentages increase for the FY 2023 updates based on IGI's second quarter 2022 forecast of the 2018-based IPPS market basket of 4.1 percent and the productivity adjustment of 0.3 percentage point, as discussed in section V.A of the preamble of this final rule, depending on whether a hospital submits quality data under the rules established in accordance with section 1886(b)(3)(B)(viii) of the Act and is a meaningful EHR user under section 1886(b)(3)(B)(ix) of the Act, as shown in the table in this section.

FY 2023	Hospital Submitted Quality Data and is a Meaningful EHR User	Hospital Submitted Quality Data and is NOT a Meaningful EHR User	Hospital Did NOT Submit Quality Data and is a Meaningful EHR User	Hospital Did NOT Submit Quality Data and is NOT a Meaningful EHR User
Market Basket Rate-of-Increase	4.1	4.1	4.1	4.1
Adjustment for Failure to Submit Quality Data under Section 1886(b)(3)(B)(viii) of the Act	0	0	-1.025	-1.025
Adjustment for Failure to be a Meaningful EHR User under Section 1886(b)(3)(B)(ix) of the Act	0	-3.075	0	-3.075
Productivity Adjustment under Section 1886(b)(3)(B)(xi) of the Act	-0.3	-0.3	-0.3	-0.3
Applicable Percentage Increase Applied to Standardized Amount	**3.8**	**0.725**	**2.775**	**-0.3**

B. Update for SCHs for FY 2023

Section 1886(b)(3)(B)(iv) of the Act provides that the FY 2023 applicable percentage increase in the hospital-specific rate for SCHs equals the applicable percentage increase set forth in section 1886(b)(3)(B)(i) of the Act (that is, the same update factor as for all other hospitals subject to the IPPS).

Under current law, the MDH program is effective for discharges through September 30, 2022, as discussed in the FY 2019 IPPS/LTCH PPS final rule (83 FR 41429 through 41430). Therefore, under current law, the MDH program will expire at the end of FY 2022. We refer readers to section V.D. of the preamble of this final rule for further discussion of the expiration of the MDH program.

As previously stated, the update to the hospital specific rate for SCHs is subject to section 1886(b)(3)(B)(i) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act. Accordingly, depending on whether a hospital submits quality data and is a meaningful EHR user, we are establishing the same four applicable percentage increases in the previous table for the hospital-specific rate applicable to SCHs.

C. FY 2023 Puerto Rico Hospital Update

Because Puerto Rico hospitals are no longer paid with a Puerto Rico-specific standardized amount under the amendments to section 1886(d)(9)(E) of the Act, there is no longer a need for us to make an update to the Puerto Rico standardized amount. Hospitals in Puerto Rico are now paid 100 percent of the national standardized amount and, therefore, are subject to the same update to the national standardized amount discussed under section IV.A.1. of the preamble of this final rule.

In addition, as discussed in section IV.A.2. of the preamble of this final rule, section 602 of Public Law 114–113 amended section 1886(n)(6)(B) of the Act to specify that subsection (d) Puerto Rico hospitals are eligible for incentive payments for the meaningful use of certified EHR technology, effective beginning FY 2016. In addition, section 1886(n)(6)(B) of the Act was amended to specify that the adjustments to the applicable percentage increase under section 1886(b)(3)(B)(ix) of the Act apply to

subsection (d) Puerto Rico hospitals that are not meaningful EHR users, effective beginning FY 2022.

Accordingly, for FY 2022, section 1886(b)(3)(B)(ix) of the Act in conjunction with section 602(d) of Public Law 114–113 requires that any subsection (d) Puerto Rico hospital that is not a meaningful EHR user as defined in section 1886(n)(3) of the Act and not subject to an exception under section 1886(b)(3)(B)(ix) of the Act will have ''three-quarters'' of the applicable percentage increase (prior to the application of other statutory adjustments), or three-quarters of the applicable market basket rate-of-increase, reduced by 33⅓ percent. The reduction to three-quarters of the applicable percentage increase for subsection (d) Puerto Rico hospitals that are not meaningful EHR users increases to 66⅔ percent for FY 2023, and, for FY 2024 and subsequent fiscal years, to 100 percent. In the FY 2019 IPPS/LTCH PPS final rule, we finalized the payment reductions (83 FR 41674).

Based on IGI's fourth quarter 2021 forecast of the 2018-based IPPS market basket update with historical data through third quarter 2021, in the FY 2023 IPPS/LTCH PPS proposed rule, in accordance with section 1886(b)(3)(B) of the Act, as previously discussed, for Puerto Rico hospitals, we proposed a market basket update of 3.1 percent and a productivity adjustment of 0.4 percentage point. Therefore, for FY 2023, depending on whether a Puerto Rico hospital is a meaningful EHR user, we stated that there are two possible applicable percentage increases that can be applied to the standardized amount. Based on these data, we determined the following proposed applicable percentage increases to the standardized amount for FY 2023 for Puerto Rico hospitals:

- For a Puerto Rico hospital that is a meaningful EHR user, we proposed an applicable percentage increase to the FY 2023 operating standardized amount of 2.7 percent (that is, the FY 2023 estimate of the proposed market basket rate-of-increase of 3.1 percent less an adjustment of 0.4 percentage point for the proposed productivity adjustment).
- For a Puerto Rico hospital that is not a meaningful EHR user, we proposed an applicable percentage increase to the operating standardized amount of 1.15 percent (that is, the FY 2023 estimate of the proposed market basket rate-of-increase of 3.1 percent, less an adjustment of 1.55 percentage point (the proposed market basket rate-of-increase of 3.1 percent $\times 0.75 \times (⅔)$ for failure to be a meaningful EHR user), and less an adjustment of 0.4 percentage point for the proposed productivity adjustment).

As noted previously, we proposed that if more recent data subsequently became available, we would use such data, if appropriate, to determine the FY 2023 market basket update and the productivity adjustment for the FY 2023 IPPS/LTCH PPS final rule.

As discussed in section V.A.1. of the preamble of this final rule, based on more recent data available for this FY 2023 IPPS/LTCH PPS final rule (that is, IGI's second quarter 2022 forecast of the 2018-based IPPS market basket rate-of-increase with historical data through the first quarter of 2022), we estimate that the FY 2023 market basket update used to determine the applicable percentage increase for the IPPS is 4.1 percent less a productivity adjustment of 0.3 percentage point. Therefore, in accordance with section 1886(b)(3)(B) of the Act, for this final rule, for Puerto Rico hospitals the more recent update of the market basket update is 4.1 percent and a productivity adjustment of 0.3 percentage point. For FY 2023, depending on whether a Puerto Rico hospital is a meaningful EHR user, there are two possible applicable percentage increases that can be applied to the standardized amount. Based on these data, we determined the following applicable percentage increases to the standardized amount for FY 2023 for Puerto Rico hospitals:

- For a Puerto Rico hospital that is a meaningful EHR user, an applicable percentage increase to the FY 2023 operating standardized amount of 3.8 percent (that is, the FY 2023 estimate of the market basket rate-of-increase of 4.1 percent less an adjustment of 0.3 percentage point for the productivity adjustment).
- For a Puerto Rico hospital that is not a meaningful EHR user, an applicable percentage increase to the operating standardized amount of 1.75 percent (that is, the FY 2023 estimate of the market basket rate-of-increase of 4.1 percent, less an adjustment of 2.05 percentage point (the market basket rate of-increase of 4.1 percent $\times 0.75 \times (⅔)$ for failure to be a meaningful EHR user), and less an adjustment of 0.3 percentage point for the productivity adjustment).

D. Update for Hospitals Excluded From the IPPS for FY 2023

Section 1886(b)(3)(B)(ii) of the Act is used for purposes of determining the percentage increase in the rate-of-increase limits for children's hospitals, cancer hospitals, and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and America Samoa). Section 1886(b)(3)(B)(ii) of the Act sets the percentage increase in the rate-of-increase limits equal to the market basket percentage increase. In accordance with § 403.752(a) of the regulations, religious nonmedical health care institutions (RNHCIs) are paid under the provisions of § 413.40, which also use section 1886(b)(3)(B)(ii) of the Act to update the percentage increase in the rate-of-increase limits.

Currently, children's hospitals, PPS-excluded cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa are among the remaining types of hospitals still paid under the reasonable cost methodology, subject to the rate-of-increase limits. In addition, in accordance with § 412.526(c)(3) of the regulations, extended neoplastic disease care hospitals (described in § 412.22(i) of the regulations) also are subject to the rate-of-increase limits. As discussed in section VII. of the preamble of this final rule, we are finalizing to use the percentage increase in the 2018-based IPPS operating market basket to update the target amounts for children's hospitals, PPS-excluded cancer hospitals, RNHCIs, short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa, and extended neoplastic disease care hospitals for FY 2023 and subsequent fiscal years. Accordingly, for FY 2023, the rate-of-increase percentage to be applied to the target amount for these children's hospitals, cancer hospitals, RNHCIs, extended neoplastic disease care hospitals, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa is the FY 2023 percentage increase in the 2018-based IPPS operating market basket. For this final rule, the current estimate of the IPPS operating market basket percentage increase for FY 2023 is 4.1 percent.

E. Update for LTCHs for FY 2023

Section 123 of Public Law 106–113, as amended by section 307(b) of Public Law 106–554 (and codified at section 1886(m)(1) of the Act), provides the statutory authority for updating payment rates under the LTCH PPS.

As discussed in section V.A. of the Addendum to this final rule, we are establishing an update to the LTCH PPS standard Federal payment rate for FY 2023 of 3.8 percent, consistent with section 1886(m)(3) of the Act which provides that any annual update be reduced by the productivity adjustment described in section 1886(b)(3)(B)(xi)(II) of the Act (that is, the productivity adjustment). Furthermore, in accordance with the LTCHQR Program under section 1886(m)(5) of the Act, we are reducing the annual update to the LTCH PPS standard Federal rate by 2.0 percentage points for failure of a LTCH to submit the required quality data. Accordingly, we are establishing an update factor of 1.038 in determining the LTCH PPS standard Federal rate for FY 2023. For LTCHs that fail to submit quality data for FY 2023, we are establishing an annual update to the LTCH PPS standard Federal rate of 1.8 percent (that is, the annual update for FY 2023 of 3.8 percent less 2.0 percentage points for failure to submit the required quality data in accordance with section 1886(m)(5)(C) of the Act and our rules) by applying a update factor of 1.018 in determining the LTCH PPS standard Federal rate for FY 2023. (We note that, as discussed in section VII.D. of the preamble of this final rule, the update to the LTCH PPS standard Federal payment rate of 3.8 percent for FY 2023 does not reflect any budget neutrality factors.)

III. Secretary's Recommendations

MedPAC is recommending inpatient hospital rates be updated by the amount specified in current law. MedPAC's rationale for this update recommendation is described in more detail in this section of the final rule. As previously stated, section 1886(e)(4)(A) of the Act requires that the Secretary, taking into consideration the recommendations of MedPAC, recommend update factors for inpatient hospital services for each fiscal year

that take into account the amounts necessary for the efficient and effective delivery of medically appropriate and necessary care of high quality. Consistent with current law, depending on whether a hospital submits quality data and is a meaningful EHR user, we are recommending the four applicable percentage increases to the standardized amount listed in the table under section II. of this Appendix B. We are recommending that the same applicable percentage increases apply to SCHs.

In addition to making a recommendation for IPPS hospitals, in accordance with section 1886(e)(4)(A) of the Act, we are recommending update factors for certain other types of hospitals excluded from the IPPS. Consistent with our policies for these facilities, we are recommending an update to the target amounts for children's hospitals, cancer hospitals, RNHCIs, short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa and extended neoplastic disease care hospitals of 4.1 percent.

For FY 2023, consistent with policy set forth in section VII. of the preamble of this final rule, for LTCHs that submit quality data, we are recommending an update of 3.8 percent to the LTCH PPS standard Federal rate. For LTCHs that fail to submit quality data for FY 2023, we are recommending an annual update to the LTCH PPS standard Federal rate of 1.8 percent.

IV. MedPAC Recommendation for Assessing Payment Adequacy and Updating Payments in Traditional Medicare

In its March 2022 Report to Congress, MedPAC assessed the adequacy of current payments and costs, and the relationship between payments and an appropriate cost base. MedPAC recommended an update to the hospital inpatient rates by the amount specified in current law. MedPAC stated that their payment adequacy indicators are mixed but generally positive, and MedPAC anticipates changes caused by the PHE to be temporary. MedPAC anticipates that their recommendation to update the IPPS payment rate by the amount specified under current law in 2023 will be enough to maintain beneficiaries' access to hospital inpatient and outpatient care and keep IPPS payment rates close to the cost of delivering high-quality care efficiently. We refer readers to the March 2022 MedPAC report, which is available for download at *www.medpac.gov*, for a complete discussion on these recommendations.

Response: With regard to MedPAC's recommendation of an update to the hospital inpatient rates equal to the amount specified in current law, section 1886(b)(3)(B) of the Act sets the requirements for the FY 2023 applicable percentage increase. Therefore, consistent with the statute, we are establishing an applicable percentage increase for FY 2023 of 3.8 percent, provided the hospital submits quality data and is a meaningful EHR user consistent with these statutory requirements.

We note that, because the operating and capital payments in the IPPS remain separate, we are continuing to use separate updates for operating and capital payments in the IPPS. The update to the capital rate is discussed in section III. of the Addendum to this final rule.

Part III

Department of Defense
General Services Administration
National Aeronautics and Space Administration

48 CFR Chapter 1
Federal Acquisition Regulations; Final Rule

DEPARTMENT OF DEFENSE

GENERAL SERVICES ADMINISTRATION

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

48 CFR Chapter 1

[Docket No. FAR–2022–0051, Sequence No. 4]

Federal Acquisition Regulation; Federal Acquisition Circular 2022–07; Introduction

AGENCY: Department of Defense (DoD), General Services Administration (GSA), and National Aeronautics and Space Administration (NASA).

ACTION: Summary presentation of a final rule.

SUMMARY: This document summarizes technical amendments to the Federal Acquisition Regulation (FAR) in this Federal Acquisition Circular (FAC) 2022–07. A companion document, the *Small Entity Compliance Guide* (SECG), follows this FAC.

DATES: For the effective date, see the separate document, which follows.

ADDRESSES: The FAC, including the SECG, is available at *https://www.regulations.gov.*

FOR FURTHER INFORMATION CONTACT: For information pertaining to status or publication schedules, contact the Regulatory Secretariat Division at 202–501–4755 or *GSARegSec@gsa.gov.* Please cite FAC 2022–07, Technical Amendments.

RULES LISTED IN FAC 2022–07

Subject
Technical Amendments.

SUPPLEMENTARY INFORMATION: A summary for the FAR rule follows. For the actual technical amendments made by this rule, refer to the specific subject set forth in the document following the summary. FAC 2022–07 amends the FAR as follows:

Technical Amendments

Editorial changes are made at FAR 4.402, 13.003, 17.502–1, 23.704, 51.102, and 52.217–3.

William F. Clark,

Director, Office of Government-wide Acquisition Policy, Office of Acquisition Policy, Office of Government-wide Policy.

Federal Acquisition Circular (FAC) 2022–07 is issued under the authority of the Secretary of Defense, the Administrator of General Services, and the Administrator of National Aeronautics and Space Administration.

Unless otherwise specified, all Federal Acquisition Regulation (FAR) and other directive material contained in FAC 2022–07 is effective August 10, 2022.

John M. Tenaglia,

Principal Director, Defense Pricing and Contracting, Department of Defense.

Jeffrey A. Koses,

Senior Procurement Executive/Deputy CAO, Office of Acquisition Policy, U.S. General Services Administration.

Karla Smith Jackson,

Assistant Administrator for Procurement, Senior Procurement Executive, National Aeronautics and Space Administration.

[FAC 2022–07; Docket No. FAR–2022–0052; Sequence No. 2]

Federal Acquisition Regulation; Technical Amendments

AGENCY: Department of Defense (DoD), General Services Administration (GSA), and National Aeronautics and Space Administration (NASA).

ACTION: Final rule.

SUMMARY: This document makes amendments to the Federal Acquisition Regulation (FAR) in order to make needed editorial changes.

DATES: Effective August 10, 2022.

FOR FURTHER INFORMATION CONTACT: Ms. Lois Mandell, Regulatory Secretariat Division (MVCB), at 202–501–4755 or *GSARegSec@gsa.gov.* Please cite FAC 2022–07, Technical Amendments.

SUPPLEMENTARY INFORMATION: This document makes editorial changes to 48 CFR parts 4, 13, 17, 23, 51, and 52.

List of Subjects in 48 CFR Parts 4, 13, 17, 23, 51, and 52

Government procurement.

William F. Clark,

Director, Office of Government-wide Acquisition Policy, Office of Acquisition Policy, Office of Government-wide Policy.

Therefore, DoD, GSA, and NASA amend 48 CFR parts 4, 13, 17, 23, 51, and 52 as set forth below:

■ 1. The authority citation for 48 CFR parts 4, 13, 17, 23, 51, and 52 continues to read as follows:

Authority: 40 U.S.C. 121(c); 10 U.S.C. chapter 137; and 51 U.S.C. 20113.

PART 4—ADMINISTRATIVE AND INFORMATION MATTERS

4.402 [Amended]

■ 2. In section 4.402 amend paragraph (d)(1) by removing the weblink ''*https://tesseract.cloud.dcsa.mil/nccs*'' and adding ''*https://www.dcsa.mil/is/nccs/*'' in its place.

PART 13—SIMPLIFIED ACQUISITION PROCEDURES

13.003 [Amended]

■ 3. In section 13.003 amend paragraph (h)(3) by removing the phrase ''13.106–2(b)(3)'' and adding ''13.106–2(b)(4)'' in its place.

PART 17—SPECIAL CONTRACTING METHODS

17.502–1 [Amended]

■ 4. Amend section 17.502–1 by—

■ a. In paragraph (a)(1)(i) removing the weblink ''*https://www.whitehouse.gov/sites/whitehouse.gov/files/omb/assets/OMB/procurement/interagency_acq/iac_revised.pdf*'' and adding ''*https://www.whitehouse.gov/wp-content/uploads/legacy_drupal_files/omb/assets/OMB/procurement/interagency_acq/iac_revised.pdf*'' in its place; and

■ b. In paragraph (b) introductory text removing the weblink ''*https://www.whitehouse.gov/sites/whitehouse.gov/files/omb/procurement/memo/development-review-and-approval-of-business-cases-for-certain-interagency-and-agency-specific-acquisitions-memo.pdf*'' and adding ''*https://www.whitehouse.gov/wp-content/uploads/legacy_drupal_files/omb/procurement/memo/development-review-and-approval-of-business-cases-for-certain-interagency-and-agency-specific-acquisitions-memo.pdf*'' in its place.

PART 23—ENVIRONMENT, ENERGY AND WATER EFFICIENCY, RENEWABLE ENERGY TECHNOLOGIES, OCCUPATIONAL SAFETY, AND DRUG-FREE WORKPLACE

■ 5. Amend section 23.704 by revising paragraphs (b)(1)(iv) and (b)(2) to read as follows:

23.704 Electronic product environmental assessment tool.

* * * * *

(b) * * *

(1) * * *

(iv) Are described in more detail at *https://www.epa.gov/greenerproducts/recommendations-specifications-standards-and-ecolabels-federal-purchasing.*

(2) A list of EPEAT® product categories and EPEAT®-registered electronic products that are in conformance with these standards can be found at *https://www.epa.gov/greenerproducts/recommendations-specifications-standards-and-ecolabels-federal-purchasing.*

* * * * *

PART 51—USE OF GOVERNMENT SOURCES BY CONTRACTORS

■ 6. Amend section 51.102 by revising paragraph (c)(3) to read as follows:

51.102 Authorization to use Government supply sources.

* * * * *

(c) * * *

(3) Approval for the contractor to use Department of Veterans Affairs (VA) supply sources from the Executive Director, Office of Acquisition and Logistics (003A), Department of Veterans Affairs, 810 Vermont Avenue NW, Washington DC 20420;

* * * * *

PART 52—SOLICITATION PROVISIONS AND CONTRACT CLAUSES

52.217–3 [Amended]

■ 7. Amend section 52.217–3 by removing from the provision heading the date ''(OCT 1984)'' and adding ''(APR 1984)'' in its place.
