Section 1877(i)(3)(D) of the Act provides that any increase in the number of operating rooms, procedure rooms, and beds for which an applicable hospital is licensed may occur only in facilities on the main campus of the applicable hospital. In the CY 2012 OPPS/ASC final rule, using our rulemaking authority under sections 1871 and 1877(i)(3)(A)(i) of the Act, we extended this limitation on the location of expansion facility capacity to high Medicaid facilities, explaining that we believe that applying the same limitation to applicable hospitals and high Medicaid facilities will result in an efficient and consistent process (76 FR 74524). Citing alignment with the Patients over Paperwork initiative, in the CY 2021 OPPS/ASC final rule, we reversed this program integrity requirement for high Medicaid facilities, noting that the plain language of the statute does not impose the same limitations on the expansion of high Medicaid facilities as it does the expansion of applicable hospitals (85 FR 86257).

2. Proposals

a. Process for Requesting an Exception From the Prohibition on Expansion of Facility Capacity

As described in section X.B.1.b.(1). of the preamble of this proposed rule, in order to satisfy the requirements of the rural provider or whole hospital exception, a hospital must comply with the requirements of section 1877(i) of the Act and existing § 411.362 of our regulations no later than September 23, 2011. Thus, the physician self-referral law would prohibit a referral made on or after September 23, 2011, by a physician who has (or whose immediate family member has) an ownership or investment interest in the hospital if the number of operating rooms, procedure rooms, and beds for which the hospital is licensed (referred to in this proposed rule as ''facility capacity'') at the time of the referral is greater than its baseline number of operating rooms, procedure rooms, and beds (as defined at existing § 411.362(a) and referred to in this proposed rule as ''baseline facility capacity''), unless the hospital has been granted an exception from the prohibition on expansion of facility capacity (referred to in this proposed rule as an ''expansion exception''). The regulations at existing § 411.362(c) set forth the expansion exception process.

We recently reviewed the expansion exception process, including a fresh examination of the statutory language and certain legislative history of the Affordable Care Act. Section 1877(i)(3)(A)(i) of the Act requires the establishment of a process under which an applicable hospital or high Medicaid facility may *apply* for an exception from the prohibition on expansion of facility capacity, and section 1877(i)(3)(C)(i) of the Act imposes certain program integrity restrictions on a hospital *granted* an exception under the process (emphasis added). The Secretary's authority to grant an expansion exception is limited by section 1877(i)(3)(C)(ii) of the Act, which states that the Secretary shall not *permit* an increase in the number of operating rooms, procedure rooms, and beds for which the hospital is licensed that results in a hospital's facility capacity exceeding 200 percent of its baseline facility capacity (emphasis added). In addition, section 1877(i)(3)(H) of the Act requires the Secretary to publish in the **Federal Register** the final *decision* with respect to a hospital's *application* (emphasis added). We interpret this statutory language to mean that, in order to request an expansion exception with respect to which CMS may issue a decision, a hospital must first establish that it meets the criteria for an applicable hospital or high Medicaid facility. We further interpret this statutory language to mean that CMS has discretion to approve or deny a request for an expansion exception even if the requesting hospital meets the criteria for an applicable hospital or high Medicaid facility. Put another way, it is our position that, under section 1877(i)(3)(A)(i) of the Act and existing § 411.362(c)(1), meeting the criteria for an applicable hospital or high Medicaid facility merely makes a hospital eligible to request an expansion exception, but

it does not guarantee approval of such a request. We note that, for purposes of interpreting the statutory provisions, codification in our regulations, and discussion in our rulemakings, we use the term ''request'' in the same way as ''apply'' and ''application,'' and use the term ''approve'' in the same way as ''grant.'' (See 76 FR 74517 (when the statute refers to an ''application,'' we use the term ''request'') and 79 FR 64801 and 64802 (''II. Exception Approval Process'' and ''decision to approve'' a request, respectively).) We note also that section 1877(i)(3)(A)(ii) of the Act requires that the expansion exception process shall provide for community input with respect to an expansion exception request. We interpret the requirement to provide for community input ''with respect to [an] application'' to require CMS to permit *any* input related to the expansion exception request—not just input related to whether the requesting hospital meets the criteria for an applicable hospital or high Medicaid facility. In the CY 2012 OPPS/ASC proposed and final rules, we noted examples of community input, such as documentation demonstrating that the requesting hospital does not satisfy one or more of the data criteria or that the requesting hospital discriminates against beneficiaries of Federal health programs; however, we stated that these are examples only and that we do not restrict the type of community input that may be submitted (76 FR 42352 and 74522). We believe that, if the Congress did not intend for the Secretary to have discretion to approve or deny an expansion exception request from a hospital that meets the criteria for an applicable hospital or high Medicaid facility, the statutorily-required community input would be limited to whether the hospital met such criteria. The plain language of the statute is not so limited.

To clarify our interpretation of the Secretary's authority, ensure that approval of a request to expand a hospital's facility capacity occurs only in appropriate circumstances, and facilitate compliance with the process for requesting an expansion exception, we believe that modification and clarification of our regulations at existing § 411.362(c) is warranted. Therefore, we are proposing to revise the regulations that set forth the expansion exception process and separate them from the requirements that a hospital must satisfy under the rural provider and whole hospital exceptions. Under our proposals, existing § 411.362(c), as well as certain related definitions in existing § 411.362(a), would be renumbered at § 411.363. We believe that having a separate regulation dedicated to the expansion exception process could provide greater transparency and facilitate compliance with the expansion exception process. To provide clarity and transparency for hospitals that wish to request an expansion exception and other interested parties, we are proposing to revise our regulations to clarify that CMS will only consider expansion exception requests from eligible hospitals, clarify the data and information that must be included in an expansion exception request, identify factors that CMS will consider when making a decision on an expansion exception request, and revise certain aspects of the process for requesting an expansion exception.

(1) Relevant Definitions

We are proposing at new § 411.363(a) to include definitions for the terms ''baseline number of operating rooms, procedure rooms, and beds,'' ''external data source,'' ''main campus of the hospital,'' and ''procedure room'' for purposes of the expansion exception process set forth in proposed § 411.363. These definitions are currently included in existing § 411.362(a). Because the terms ''baseline number of operating rooms, procedure rooms, and beds,'' ''external data source,'' and ''main campus of the hospital'' are not used in § 411.362 as it would be revised, we are proposing to remove their definitions from § 411.362(a). Because the term ''procedure room'' is used in both existing § 411.362 and proposed § 411.363, we are proposing to define the term ''procedure room,'' for purposes of new § 411.363(a) to have the meaning set forth at existing § 411.362(a).

(2) Eligibility To Request an Expansion Exception and Publication in the **Federal Register**

We are proposing to revise § 411.362(c)(1) and renumber it at § 411.363(b) to clarify that CMS will not consider an expansion exception request from a hospital that is not eligible to request an expansion exception. To be eligible to request an expansion exception, a hospital must first meet the criteria as either an applicable hospital or high Medicaid facility, which are renumbered at § 411.363(c) and (d), respectively. We are proposing certain clarifying and other revisions to these regulations, which are discussed in sections X.B.2.a.(4). and (6). of the preamble in this proposed rule.

As explained in section X.B.2.b. of the preamble of this proposed rule, we are proposing to reinstate the program integrity restrictions regarding the frequency of expansion exception requests, maximum aggregate expansion of a hospital, and location of expansion facility capacity for hospitals that meet the criteria for a high Medicaid facility. The regulation at proposed § 411.363(b)(2)(i) would implement the statutory restriction on the Secretary's ability to permit an expansion that would result in a hospital's facility capacity exceeding 200 percent of its baseline facility capacity and apply the restriction to any hospital requesting an expansion exception. (See section 1877(i)(C)(ii) of the Act.) Therefore, even if the hospital meets the criteria for an applicable hospital or high Medicaid facility, it would not be eligible to request another expansion exception if CMS has previously approved a request from the hospital that would allow the hospital's facility capacity to reach 200 percent of its baseline facility capacity if the full expansion is utilized. Any prior expansion exception approval(s) must be considered when determining the maximum facility capacity of the hospital if the request is approved. To illustrate, a hospital with a baseline facility capacity of 100 that was granted an expansion exception for 100 additional operating rooms, procedure rooms, and beds would have a potential facility capacity of 200, or 200 percent of its baseline number of operating rooms, procedure rooms, and beds. Consequently, the hospital would not be eligible to request another expansion exception. A hospital with a baseline facility capacity of 100 that was granted an expansion exception for 75 additional operating rooms, procedure rooms, and beds could request to further expand its facility capacity by no more than another 25 operating rooms, procedure rooms, and beds, because CMS would be prohibited under section 1877(i)(3)(C)(ii) of the Act from approving the subsequent expansion exception request if it would allow the hospital's aggregate facility capacity to exceed 200 percent of its baseline facility capacity.

The regulation at proposed § 411.363(b)(2)(ii) would implement section 1877(i)(3)(B) of the Act, which permits an applicable hospital to request an expansion exception up to once every 2 years, and apply the limitation to *any* hospital requesting an expansion exception. In the CY 2012 OPPS/ASC final rule, after receiving no comments on our proposals to allow an

applicable hospital *or high Medicaid facility* to request an expansion exception up to once every 2 years from the date of a CMS decision on the hospital's most recent request, using our authority in sections 1871 and 1877 of the Act, we implemented section 1877(i)(3)(B) of the Act at existing § 411.362(c)(1) (76 FR 74525). We stated that we would consider the date of a CMS decision to be the date of the decision letter sent to the requesting party (*Id.*). As discussed in section X.B.2.b of this proposed rule, in the CY 2021 OPPS/ASC final rule, we reversed the regulatory extension of statutory program integrity restrictions—including the restriction on frequency of expansion exception requests—for hospitals that meet the criteria for a high Medicaid facility (85 FR 86256). Therefore, as of January 1, 2021, a high Medicaid facility is permitted to request an expansion exception at any time, provided that it has not submitted another request for an expansion exception for which CMS has not issued a decision. Even though we reversed the regulatory extension of the restriction on frequency of expansion exception requests for hospitals that meet the criteria for a high Medicaid facility, in CY 2021 OPPS/ASC final rule, we nonetheless limited a high Medicaid facility to applying for expansion exception only when it does not have another expansion exception request pending with CMS. We did so to preserve CMS resources and continue to maintain an orderly and efficient expansion exception process (85 FR 86256). Historically, CMS has worked with requesting hospitals for several weeks or months following the initial submission in order to complete the request so that CMS can publish notice of the request in the **Federal Register**. Depending on the amount of time from submission to publication of the notice of the request in the **Federal Register**, and given the timeframes under the expansion exception process for deeming a request complete, reviewing the request, and publishing CMS's decision regarding a request, it could take well over a year to receive a CMS decision on an expansion exception request. We continue to believe that permitting a hospital to submit a subsequent request before CMS has made a decision on an earlier request would be an improper use of agency resources, could result in confusion to interested parties that wish to provide community input, and would unnecessarily complicate the expansion exception process. Therefore, we are proposing at § 411.363(b)(2)(ii) that a hospital—whether it otherwise meets the criteria for an applicable hospital or high Medicaid facility—would not be eligible to request an expansion exception if it has been less than 2 years from the date of the most recent decision by CMS approving or denying the hospital's most recent (prior) request for an expansion exception.

Under the proposed regulation, CMS would not consider an expansion exception request submitted by a hospital that is not eligible to request the expansion exception. CMS would consider an expansion exception request submitted by a hospital that is eligible to request the expansion exception, provided that the request includes all information required under proposed § 411.363. In processing an expansion exception request, we would first determine whether the requesting hospital is eligible to request the expansion exception. This would include providing an opportunity for community input regarding whether the requesting hospital meets the criteria for an applicable hospital or high Medicaid facility (depending on the specific request). If the hospital meets the criteria for an applicable hospital or high Medicaid facility, and is not otherwise precluded from making an expansion exception request under proposed § 411.363(b), we would then decide whether to approve or deny the request. This would include providing an opportunity for community input regarding, among other things, the factors that CMS will consider in deciding whether to approve or deny the hospital's expansion exception request. (See section X.B.2.a.(3). of the preamble of this proposed rule for a discussion of the factors that CMS considers.) Because community input would be relevant to both the determination that a requesting hospital meets the criteria for an applicable hospital or high Medicaid facility (depending on the specific request) and our decision whether to approve or deny the expansion exception request, we anticipate publication in the **Federal Register** of any expansion exception request that a requesting hospital has not elected to withdraw following its initial submission, provided that the hospital is otherwise eligible to request an expansion exception. In the **Federal Register** notice, we would seek community input on both whether the requesting hospital meets the criteria for an applicable hospital or high Medicaid facility (depending on the specific request) and whether CMS should approve or deny the request. We believe this approach would be the most efficient use of CMS and governmental resources, as well as eliminate the duplication of efforts by individuals and entities in the community that wish to provide input on a hospital's expansion exception request.

Following publication of the notice of the expansion exception request in the **Federal Register**, receipt of community input, and receipt of the requesting hospital's rebuttal notice, if any, CMS would first determine whether the hospital meets the criteria for an applicable hospital or high Medicaid facility (depending on the specific request). We are proposing to codify this part of the process at proposed § 411.363(h). If CMS determines that the requesting hospital meets the criteria for an applicable hospital or high Medicaid facility, CMS would then decide whether to approve or deny the expansion exception request. As previously explained, it is our position that the authority granted to the Secretary in section 1877(i) of the Act provides CMS discretion to approve or deny an expansion exception request. In making its decision whether to approve or deny an expansion exception request, CMS would consider data and information provided by the hospital in its request, included in the community input, if any, and provided by the hospital in its rebuttal statement, if any. CMS may also consider any other data and information relevant to the basis for its decision. We are proposing to codify this part of the process at proposed § 411.363(i)(1). Other data and information relevant to the basis for CMS' decision may include, but is not limited to, data and information that is publicly available, provided to CMS by the requesting hospital or interested parties in other contexts, or provided by CMS' law enforcement partners and other government agencies (whether publicly available or not). For example, CMS may use the internet or other sources to perform an environmental scan of the geographic area of the country in which the requesting hospital is located or intends to expand, identify trends, recent events, or planned events (such as expected population growth or new employers entering the local market), or review information related to the quality of care at the requesting hospital and other hospitals in its community.

We are also proposing a nonsubstantive revision to the introductory language at existing § 411.362(c)(2) and (3). Currently, these regulations state the criteria that an applicable hospital or high Medicaid facility, respectively, must satisfy. To more closely conform to our regulations

in 42 CFR part 411, subpart J, we are proposing to use the word ''meets'' in place of ''satisfies'' in the introductory language of these regulations, which would be renumbered at § 411.363(c) and (d) under our proposal.

(3) CMS Decision To Approve or Deny an Expansion Exception Request

Proposed § 411.363(i)(2) identifies factors that CMS would always consider when deciding whether to approve or deny an expansion exception request. These factors include: (1) the specialty (for example, maternity, psychiatric, or substance use disorder care) of the hospital or the services furnished by or to be furnished by the hospital if CMS approves the request; (2) program integrity or quality of care concerns related to the hospital; (3) whether the hospital has a need for additional operating rooms, procedure rooms, or beds; and (4) whether there is a need for additional operating rooms, procedure rooms, or beds in the county in which the main campus of the hospital is located, any county in which the hospital provides inpatient or outpatient hospital services as of the date the hospital submits the expansion exception request, or any county in which the hospital plans to provide inpatient or outpatient hospital services if CMS approves the request. We believe these factors are especially relevant to CMS' decision whether to approve or deny an expansion exception request; however, proposed § 411.363(i)(2) does not limit CMS to the enumerated factors in making its decision. For example, CMS may also consider any other factors it deems relevant to its decision to approve or deny an expansion exception request, such as program integrity or quality concerns related to other hospitals in the requesting hospital's community or their ability to serve a growing patient population in the community. Expansion exception requests are now and would continue to be assessed on a case-by-case basis, and CMS would base its decision to approve or deny an expansion exception request on the totality of the information available to the agency. Thus, decisions to approve or deny requests from hospitals that appear similar with respect to overall capacity to serve Medicaid and other underserved populations could differ based on factors such as planned expansion of needed psychiatric services instead of general acute care services or whether the requesting hospital seeks an expansion exception to replace operating rooms, procedure rooms, or beds that it has relocated (or intends to relocate) from its main campus to other areas in need of services. (See section X.B.2.a.(4). of this proposed rule for a discussion of the relevance of the specialty of a hospital or the services it provides, and section X.B.2.b. of the preamble of this proposed rule for a discussion of a hospital's ability to relocate ''original'' operating rooms, procedure rooms, and beds from its main campus without triggering the physician self-referral law's referral and billing prohibitions.)

As required in section 1877(i)(3)(H) of the Act, no later than 60 days after receiving a complete request, CMS will publish in the **Federal Register** notice of its final decision with respect to a hospital's expansion exception request. This requirement is codified in our regulations at existing § 411.362(c)(7), which we are proposing to revise for clarity and renumber at § 411.363(k). If CMS determines that the requesting hospital does not meet the criteria for an applicable hospital or high Medicaid facility (depending on the specific request), under proposed § 411.363(b)(1), the hospital would not be eligible to request the expansion exception and CMS would not further consider the request. In that case, the required **Federal Register** notice would address only the determination that the requesting hospital does not meet the criteria for an applicable hospital or high Medicaid facility. If CMS determines that the requesting hospital meets the criteria for an applicable hospital or high Medicaid facility (depending on the specific request), as required by statute, CMS must decide whether to approve or deny the expansion exception request and publish its decision in the **Federal Register**. In that case, the required **Federal Register** notice would address both CMS' determination that the requesting hospital meets the criteria for an applicable hospital or high Medicaid facility (depending on the specific request) and its decision to approve or deny the request.

Section 1877(i)(3)(I) of the Act and our regulation at existing § 411.362(c)(8) state that there shall be no administrative or judicial review under section 1869 of the Act, section 1878 of the Act, or otherwise of the expansion exception process (including the establishment of such process). We interpret the statute to mean that neither the process itself nor CMS' decision whether to approve or deny an expansion exception request are subject to administrative or judicial review. We are proposing to revise the regulation to expressly state that the limitation on review of the expansion exception process under § 411.363 includes any CMS determination or decision under the process. This would include determinations regarding whether a hospital meets the criteria for an applicable hospital or high Medicaid facility and decisions regarding whether to approve or deny a hospital's request. The regulation, if finalized, would be renumbered at § 411.363(l).

(4) Required Information From a Requesting Hospital

Existing § 411.362(c)(4)(ii) sets forth information that must be included in an expansion exception request in order for CMS to consider the request. We are proposing to revise the introductory language of this regulation and renumber it at § 411.363(e)(2) to clarify that inclusion of the required information is a prerequisite to consideration of the request by CMS. We are not proposing any revisions to existing § 411.362(c)(4)(ii)(A), which requires that an expansion exception request must include the name, address, National Provider Identification number(s) (NPI), Tax Identification Number(s) (TIN), and CMS Certification Number(s) (CCN) of the hospital requesting the expansion exception; however, we are proposing to renumber this regulation at § 411.363(e)(2)(i). We are proposing to revise existing § 411.362(c)(4)(ii)(C), which requires that an expansion exception request must include the name, title, address, and daytime telephone number of a contact person who will be available to discuss the request with CMS on behalf of the requesting hospital, to also require an electronic mail address for correspondence with the contact person. We are also proposing to clarify that the request must include an address for receipt of hard copy mail by the contact person. Finally, we are proposing to renumber this regulation at § 411.363(e)(2)(iii).

We are proposing to revise existing § 411.362(c)(4)(ii)(B) and renumber this regulation at § 411.363(e)(2)(ii). As proposed, the request must include the name of the county in which the main campus of the requesting hospital is located and the names of any counties in which the hospital provides inpatient or outpatient hospital services or plans to provide inpatient or outpatient hospital services if CMS approves the request. It is important to our ability to thoroughly consider an expansion exception request to understand where the expansion facility capacity would be located—which would be the main campus of the hospital in all instances if we finalize our proposals to reinstate certain program integrity restrictions as described in section X.B.2.b. of the

preamble of this proposed rule—as well as other counties where the hospital may be relocating ''original'' operating rooms, procedure rooms, and beds from its main campus to expand its inpatient and outpatient services.

Under existing § 411.362(c)(4)(ii)(D), an expansion exception request must include a statement identifying the hospital as an applicable hospital or high Medicaid facility and a detailed explanation with supporting documentation regarding whether and how the hospital satisfies each of the criteria for an applicable hospital or high Medicaid facility. In addition, the request must state that the requesting hospital does not discriminate against beneficiaries of Federal health care programs and does not permit physicians practicing at the hospital to discriminate against such beneficiaries. We are proposing that the first element of existing § 411.362(c)(4)(ii)(D) (identification as an applicable hospital or high Medicaid facility and supporting document regarding satisfaction of the criteria for such) would apply only to the calculations and comparisons required to show that a hospital is an applicable hospital or high Medicaid facility. We are also proposing to renumber this regulation at § 411.363(e)(2)(iv) and replace the word ''satisfies'' with the word ''meets'' to conform to the conventions in our regulations as explained in section X.B.2.a.(2). of the preamble of this proposed rule. We are proposing to move the requirement regarding nondiscrimination to a separate regulation at proposed § 411.363(e)(2)(v) and revise this requirement to state that the expansion exception request must include a statement and, if available, supporting documentation regarding the hospital's compliance with the requirement that it does not discriminate against beneficiaries of Federal health care programs and does not permit physicians practicing at the hospital to discriminate against such beneficiaries. The existing regulation requires only that the expansion exception request must state that the hospital does not discriminate against beneficiaries of Federal health care programs and does not permit physicians practicing at the hospital to discriminate against such beneficiaries. Although we believe that most parties would understand that we require the requesting hospital to show that it meets this criterion for applicable hospitals (proposed § 411.363(c)(3)) and high Medicaid facilities (proposed § 411.363(d)(3)), for clarity, we are proposing to revise the regulation to expressly require a statement that explains *how* the hospital meets the criterion (as opposed to merely stating that it meets the criterion).

The needs of all patients, but especially Medicaid beneficiaries and other underinsured or underserved populations, for specialty care—such as maternity, psychiatric, and substance use disorder care—often go unaddressed. Both the Department and CMS have prioritized improving access to maternal health services, psychiatric care, and substance use disorder treatment. (See, for example, the White House Blueprint for Addressing the Maternal Health Crisis, *https://www.whitehouse.gov/wp-content/uploads/2022/06/Maternal-Health-Blueprint.pdf*, and CMS Behavioral Health Strategy, *https://www.cms.gov/cms-behavioral-health-strategy*.) We believe it is important to understand whether and how a hospital requesting an expansion exception could improve access for underserved populations to these critically necessary services if the request is approved. Therefore, we are proposing to require that, in addition to the documentation supporting the hospital's calculations of its baseline facility capacity, the hospital's current facility capacity, and the number of operating rooms, procedure rooms, and beds by which the hospital is requesting to expand that is currently required at existing § 411.362(c)(4)(ii)(E), the expansion exception request must include information regarding whether and how the hospital has used any previously-approved expansion facility capacity and whether it plans to use expansion facility capacity to provide specialty services if the request is approved. We are proposing to include this revised requirement at § 411.363(e)(2)(vi) (renumbered from existing § 411.362(c)(4)(ii)(E)).

Finally, we are proposing to require at new § 411.363(e)(2)(vii) that an expansion exception request must include information regarding the requesting hospital's need for additional operating rooms, procedure rooms, or beds to serve Medicaid, uninsured, and underserved populations. Under proposed § 411.363(e)(2)(vii), the request must also include information regarding the need (generally) for additional operating rooms, procedure rooms, or beds in the county in which the main campus of the hospital is located, any county in which the hospital provides inpatient or outpatient hospital services as of the date the hospital submits the request, and any county in which the hospital plans to provide inpatient or outpatient hospital services if CMS approves the request. We are not prescribing the data points or other criteria the requesting hospital should or may use to support its assertion of need for expansion facility capacity. We believe that an important purpose of authorizing the Secretary to approve expansion of a hospital's facility capacity is to allow limited growth of grandfathered hospitals in circumstances of clear community need. (See, for example, Conference Committee report, H. Rept. No. 443, 111th Cong., 2nd Sess. 357 (2010) and 76 FR 42353 and 74524.) And, because the criteria to qualify to request an expansion exception (that is, to meet the criteria for an applicable hospital or high Medicaid facility) focus on inpatient admissions under Medicaid, we believe that approved expansion facility capacity should be used, at least in part, to address the need for services to Medicaid and other underserved populations in the community where the hospital's main campus is located. Knowing whether a requesting hospital has used or failed to use previously-approved expansion facility capacity in this way, as well as whether the requesting hospital has previously-approved but unused expansion facility capacity available to it, is pertinent to our decision to approve or deny the current request.

Finally, we are proposing to revise existing § 411.362(c)(4)(i) and renumber it at § 411.363(e)(1) to eliminate the requirement that an original and one copy of a written expansion exception request must be mailed to CMS. Instead, all expansion exception requests would be submitted electronically to CMS according to the instructions specified on the CMS website. This is consistent with current agency practice with respect to other submissions, such as advisory opinion requests and submissions under the CMS Voluntary Self-Referral Disclosure Protocol (SRDP). Similarly, we are proposing at § 411.363(e)(1) to require that the signed certification required under existing § 411.362(c)(4)(iii) and proposed § 411.363(e)(3) must be submitted only in electronic form and according to the instructions specified on the CMS website. For consistency with the SRDP, which also requires specific certifications related to submissions to CMS, we are proposing to revise the definition of ''authorized representative'' at proposed § 411.363(e)(3) to mean the chief executive officer, chief financial officer, or other individual who is authorized by the hospital to make the request.

(5) Community Input

Existing § 411.362(c)(5) implements the mandate at section 1877(i)(3)(A)(ii) of the Act that the expansion exception process provides individuals and entities in the community in which the requesting hospital is located with the opportunity to provide input with respect to the request. We believe that the Congress intended for hospitals, patients, and others that are most likely to be affected by the expansion of the requesting hospital to have input in CMS' decision whether to approve or deny the request, as well as to provide information that may confirm or refute the requesting hospital's claim that it meets the criteria for an applicable hospital or high Medicaid facility. Our current regulations do not define the ''community'' in which the requesting hospital is located. To eliminate uncertainty, we are proposing to define the requesting hospital's ''community'' at proposed § 411.363(f)(3)(ii) to include the geographic area served by the hospital, as defined at § 411.357(e)(2) of our regulations, and the counties in which the requesting hospital's main campus is located, the requesting hospital provides inpatient or outpatient hospital services as of the date the hospital submits the expansion exception request, and the requesting hospital plans to provide inpatient or outpatient hospital services if CMS approves the request. Certain exceptions to the physician self-referral law's prohibitions identify the geographic area served by a hospital to define the location where certain activity may occur (for example, the location of a recruited physician's medical practice). We believe it is desirable to employ a consistent approach to identifying a hospital's service area for purposes of our exceptions and identifying which individuals and entities are eligible to provide input related to an expansion exception request. Under proposed § 411.363(f)(2), the requesting hospital must provide actual notification that it is requesting an expansion exception directly to hospitals whose data are part of the comparisons required to determine whether the hospital meets the criteria for an applicable hospital or high Medicaid facility (depending on the specific request) and to hospitals located in the requesting hospital's community. Thus, individuals and entities in the requesting hospital's community that wish to provide input related to the expansion exception request would be aware of the request. We recognize that, by defining the requesting hospital's ''community,'' input from individuals and entities that are not located in the defined areas could be excluded from consideration by CMS when reviewing a hospital's expansion exception request. If we finalize this proposal, we would encourage parties that wish to have their input considered to address how they are part of the requesting hospital's community in their submissions.

The type of community input that we will accept is not restricted in any way (76 FR 74522). However, to support the two-step process for first determining whether a requesting hospital is eligible to request an expansion exception and, if so, deciding whether to approve or deny the request, we are proposing to revise existing § 411.362(c)(5) and renumber it at § 411.363(f)(3) to state that individuals and entities in the requesting hospital's community may provide input regarding, but not limited to: (i) whether the hospital is eligible to request the expansion exception; and (ii) the factors that CMS will consider in deciding whether to approve or deny an expansion exception request. (See section X.B.2.a.(3). of the preamble of this proposed rule for a discussion of the factors.) We believe that this regulatory language would encourage individuals and entities submitting input with respect to an expansion exception request to provide data and information that confirms or refutes the requesting hospital's eligibility to request an expansion exception, as well as information pertinent to CMS' decision whether to approve or deny the request.

It is our experience that the volume of community input with respect to an expansion exception request can vary greatly. We have not received any community input on some requests and received hundreds of pages of community input on others. If we finalize our proposals to revise the expansion exception process, we believe that the community input would be more robust than what interested parties have historically submitted because language in prior approval notices may have implied that we would not consider input unrelated to whether a requesting hospital met the criteria for an applicable hospital or high Medicaid facility (80 FR 55852). Therefore, to provide adequate time for interested parties to develop and submit community input, we are proposing to revise existing § 411.362(c)(5) and renumber it at § 411.363(f)(3)(iii) to provide a 60-day period following the publication of the notice of the expansion exception request in the **Federal Register** for the submission of community input. We do not believe that an extension of the 30-day period for the requesting hospital to submit a rebuttal statement is necessary, but seek comment regarding whether we should extend this timeframe to 60 days to provide the requesting hospital additional time to review any community input in light of our proposals in this proposed rule.

(6) Permissible Data Sources

When we first established the expansion exception process, we required the use of data from the Healthcare Cost Report Information System (HCRIS) to perform the calculations necessary to show that a hospital meets the criteria for an applicable hospital or high Medicaid facility (76 FR 74518 through 74521). Following the implementation of the expansion exception process in 2012, hospitals and their representatives informed us of certain limitations regarding the required use of HCRIS data, and our own review confirmed that HCRIS was not sufficiently complete for all hospitals that wished to request an expansion exception to have access to the process because, at that time, HCRIS did not capture Medicaid managed care admissions or discharge data. We also recognized that, if all hospitals in the county in which the requesting hospital is located did not have Medicare provider agreements during each of the years for which comparisons are required, the requesting hospital would be unable to show that it met the statutory and regulatory criteria as an applicable hospital or high Medicaid facility (depending on the specific request) because HCRIS contains only the data of hospitals that participate in Medicare (79 FR 66988). To address the limitations regarding the required use of HCRIS data, in the CY 2015 OPPS/ASC final rule, we modified the expansion exception process to permit the use of external data sources for the calculations necessary to estimate inpatient Medicaid admissions (79 FR 66988 through 66993). Around the same time, CMS revised the hospital cost report to require reporting of Medicaid managed care discharges in addition to Medicaid fee-for-service discharges (79 FR 66990). We stated that, as a result of this revision, a correctly completed hospital cost report will include Medicaid managed care discharges; at some point in the future, HCRIS should be sufficiently complete to estimate the percentages of Medicaid inpatient admissions required under the statute and our regulations; and the limitations that led to permitting the use of external data sources will be resolved. Therefore, we modified our regulations at existing

§ 411.362(c)(2)(ii) and (c)(3)(ii) to permit the use of external data sources only until such time that the Secretary determines that HCRIS contains sufficiently complete inpatient Medicaid discharge data.

HCRIS now contains sufficiently complete inpatient Medicaid discharge data to complete the calculations to estimate Medicaid inpatient admissions, both as currently required and as would be required if we finalize our proposals to revise the expansion exception process. Although the regulations at existing § 411.362(c)(2)(ii) and (c)(3)(ii) do not require that the Secretary announce his determination that HCRIS contains sufficiently complete inpatient Medicaid discharge data through notice-and-comment rulemaking, we are nonetheless proposing at § 411.363(c)(2) and (d)(2) to eliminate the use of external data sources for purposes of the expansion exception process with respect to requests submitted on or after October 1, 2023 (the anticipated effective date of the revised regulations if our proposals are finalized). As we stated in the CY 2012 OPPS/ASC final rule, we believe that requiring the use of HCRIS data for all expansion exception requests will result in the use of uniform and consistent data, which will minimize inconsistent application of the criteria for applicable hospitals and high Medicaid facilities (76 FR 74518).

We recognize that requiring the use of HCRIS data for all expansion exception requests would not resolve every issue identified in the CY 2015 OPPS/ASC proposed and final rules (79 FR 66988). For example, all the hospitals to which the requesting hospital must compare itself (the comparison hospitals) may not have participated in Medicare in all years for which comparisons are required. And, as commenters pointed out in response to our proposals in the CY 2015 OPPS/ASC proposed rule, in some states, external data sources may not contain data sufficient for requesting hospitals to make the comparisons required under the statute and our existing regulations because those states do not require all hospitals to report their Medicaid inpatient admission data (79 FR 66991). Even so, we do not believe that it is necessary to continue to permit the use of external data sources for purposes of the expansion exception process. We anticipate that requiring the use of HCRIS data for all comparison calculations would have little practical impact on whether a requesting hospital meets the criteria for an applicable hospital or high Medicaid facility, and do not believe that a requesting hospital would be prejudiced by this requirement. It is unlikely that a hospital that elects not to participate in Medicare would nonetheless participate in its state Medicaid program, and a hospital that participates in Medicaid (which an applicable hospital or high Medicaid facility almost certainly would) should have a higher percentage of Medicaid inpatient admissions than a comparison hospital that does not participate in Medicaid. Therefore, even though sections 1877(i)(3)(E)(ii) and (F)(ii) of the Act necessitate the use of data regarding Medicaid inpatient admissions for each hospital in the county in which the requesting hospital is located, using our authority at sections 1871 and 1877 of the Act, we are proposing that the comparisons required to show that a hospital meets the Medicaid inpatient admissions criteria for an applicable hospital at proposed § 411.363(c)(2) or high Medicaid facility at proposed § 411.363(d)(2) must be made using only data from those hospitals that have a Medicare participation agreement with CMS.

Based on our understanding of congressional intent with respect to the expansion exception process, we do not believe that the Congress anticipated, much less intended, that a hospital willing to expand its number of operating rooms, procedure rooms, and beds in a community in which there is a clear need for additional capacity would be foreclosed from doing so if one or more of the other hospitals in that community did not participate in Medicare or if Medicaid inpatient admissions data was otherwise unavailable for all hospitals in the county in which the requesting hospital is located. We consider our proposal to align with the intent of the Congress in establishing the criteria for applicable hospitals and high Medicaid facilities, and are confident that it would provide a robust comparison that allows CMS to be sure the requesting hospital has a history of and commitment to serving Medicaid beneficiaries, uninsured patients, and other underserved populations. We believe that our proposal to permit only the use of HCRIS data for purposes of the calculations required at proposed § 411.363(c)(2) and (d)(2) while requiring comparisons only to hospitals that have a Medicare provider agreement with CMS strikes the appropriate balance between effectuating the intent of the statute and requiring strict compliance with the exact standards set forth in sections 1877(i)(3)(E)(ii) and (F)(ii) of the Act.

We are also proposing to revise the terminology used in our regulations to describe the comparisons that a hospital requesting an expansion exception must make in order to show that it is an applicable hospital or high Medicaid facility. We are doing so solely for consistency in the terminology; we do not view this as a change to our interpretation of the statutory requirements for the comparisons. Section 1877(i)(3)(E) of the Act defines the term ''applicable hospital'' and section 1877(i)(3)(F) of the Act defines the term ''high Medicaid facility.'' With respect to Medicaid inpatient admissions, an applicable hospital is a hospital whose annual percent of Medicaid inpatient admissions is equal to or greater than the average percent with respect to such admissions for ''all'' hospitals located in the county where the hospital is located, and a high Medicaid facility is a hospital that, with respect to each of the 3 most recent years for which data are available, has an annual percent of Medicaid inpatient admissions that is greater than the percent of Medicaid inpatient admissions for ''any other'' hospital in the county. Our regulations use the terms ''all'' hospitals (with respect to applicable hospitals) and ''every'' hospital (with respect to high Medicaid facilities). In setting forth the permissible data sources to be used for making the required comparisons, our regulations use the term ''all'' hospitals (with respect to applicable hospitals) and ''every other'' hospital (with respect to high Medicaid facilities). We interpret the statute to mean that a hospital requesting an expansion exception as an applicable hospital must use data for itself and each of the other hospitals in the county in which it is located to determine the county average for Medicaid inpatient admissions, and a hospital requesting an expansion exception as a high Medicaid facility must compare itself to each of the other hospitals in the county in which it is located. We do not view the term ''any other''—as used in section 1877(i)(3)(F) of the Act—and the terms ''each,'' ''every,'' and ''every other''—as used in our regulations—to have disparate meanings or refer to different subsets of comparison hospitals. However, for consistency and to eliminate any misinterpretation of the comparison requirements, we are proposing to revise the references in our regulations to refer to ''each'' or ''each other'' hospital (where appropriate). We are not proposing to revise the reference in existing § 411.362(c)(2)(ii) (with respect to applicable hospitals) to the average percent of Medicaid inpatient admissions for ''all'' hospitals located in

the county where the requesting hospital is located, as the existing language is consistent with the required comparison. However, for clarity, we are proposing at renumbered § 411.363(c)(2) to expressly state that the requesting hospital's percent of Medicaid inpatient admissions must be included with the percent of Medicaid inpatient admissions for each of the other hospitals in the county when determining the average percent of Medicaid inpatient admissions for ''all'' hospitals in the county in which the requesting hospital is located.

Under proposed § 411.363(c)(2), to meet the Medicaid inpatient admissions criterion for an applicable hospital, the requesting hospital must have an annual percent of total inpatient admissions under Medicaid that is equal to or greater than the average percent with respect to such admissions for all hospitals (including the requesting hospital) that have Medicare participation agreements with CMS and are located in the county in which the requesting hospital is located during the most recent 12-month period for which data are available as of the date that the hospital submits its request. For purposes of this proposed regulation, the most recent 12-month period for which data are available means the most recent 12-month period for which the data source used contains all data from the requesting hospital and each other hospital that has a Medicare participation agreement with CMS and is located in the county in which the requesting hospital is located. With respect to requests submitted on or after October 1, 2023 (the anticipated effective date of the revised regulations if our proposals are finalized), a hospital may use only filed Medicare hospital cost report data from HCRIS to estimate its annual percent of total inpatient admissions under Medicaid and the average percent with respect to such admissions for all hospitals (including the requesting hospital) in the county in which the hospital is located. Under proposed § 411.363(d)(2), to meet the Medicaid inpatient admissions criterion for a high Medicaid facility, with respect to each of the three most recent 12-month periods for which data are available as of the date the hospital submits its request, the requesting hospital has an annual percent of total inpatient admissions under Medicaid that is estimated to be greater than such percent with respect to such admissions for each other hospital that has a Medicare participation agreement with CMS and is located in the county in which the requesting hospital is located. For purposes of this proposed regulation, the most recent 12-month period for which data are available means the most recent 12-month period for which the data source used contains all data from the requesting hospital and each other hospital that has a Medicare participation agreement with CMS and is located in the county in which the requesting hospital is located. With respect to requests submitted on or after October 1, 2023 (the anticipated effective date of the revised regulations if our proposals are finalized), a hospital may use only filed Medicare hospital cost report data from HCRIS to estimate its annual percent of total inpatient admissions under Medicaid and the average percent with respect to such admissions for each other hospital that has a Medicare participation agreement with CMS and is located in the county in which the hospital is located.

It is possible that a facility that is provider-based to a hospital is located in a county other than the county in which the main campus of the hospital is located. To provide clarity for purposes of completing the necessary calculations to demonstrate that a hospital meets the criteria for an applicable hospital or high Medicaid facility, we are proposing at § 411.363(c)(6) and (d)(4), respectively, to consider the location of a hospital to be the county or State, as applicable, in which the main campus of the hospital is located. This would apply to the requesting hospital and any hospital to which the requesting hospital must compare itself for purposes of the calculations related to percentage increase in population, Medicaid inpatient admissions, average bed capacity, and average bed occupancy rate.

(7) Timing of a Complete Request

In the CY 2015 OPPS/Ambulatory Surgical Center (ASC) final rule, in addition to expanding the permissible data sources a hospital may use to show that it meets the criteria for either an applicable hospital or high Medicaid facility, we also amended the expansion exception process to increase the period of time after which an exception request will be deemed complete when an external data source is used by a requesting hospital or in the public comments to determine whether a hospital meets the criteria for either an applicable hospital or high Medicaid facility, reasoning that it is possible (if not likely) that, when reviewing an expansion exception request, CMS would need to verify the data (and other information, if any) provided by the requesting hospital and any commenters, as well as consider the data in light of the information otherwise available to CMS (79 FR 66995). Because we are proposing that only filed Medicare hospital cost report data from HCRIS may be used to show that the requesting hospital meets the criteria for either an applicable hospital or high Medicaid facility, we do not believe that we would need the full 180 days currently provided for at existing § 411.362(c)(5)(ii) to deem an expansion exception request complete. Therefore, we are proposing to revise and renumber this regulation to deem an expansion exception request complete no later than 90 days after the end of the 60-day comment period if CMS does not receive written comments from the community, or no later than 90 days after the end of the 30-day rebuttal period, regardless of whether the requesting hospital submits a rebuttal statement, if CMS receives written comments from the community. The proposed regulation would be renumbered at § 411.363(g), which would also include our other existing regulations related to the timing of a complete expansion exception request, amended to recognize the proposed increase to a 60-day period for community input. Because the data used for the Medicaid inpatient admissions comparisons, as well as the data for the other calculations required under the expansion exception process, would be maintained by CMS, we believe that 90 days would be sufficient to review the data and information in the expansion exception request, community input (if any), and rebuttal statement (if any) regarding whether the requesting hospital is eligible to request the expansion exception under proposed § 411.363(b) and whether CMS should approve or deny the request. We note that our proposals would not affect expansion exception requests submitted before the effective date of the revised regulations, if finalized.

(8) Summary of the Expansion Exception Process as Proposed

To facilitate comments on the proposals set forth in this section X.B.2.a., we believe it is helpful to provide a brief, high-level summary of the expansion exception process as proposed. We note that, in many respects, the existing expansion exception process includes the same steps. Under our proposals, a hospital would submit its expansion exception request to CMS. CMS would confirm that the request includes all required information and that the hospital is not precluded from requesting the expansion exception under proposed

§ 411.363(b)(2). CMS would confirm the accuracy of the required calculations (as we do currently). If the requesting hospital has performed the required calculations incorrectly, it is CMS' practice to inform the hospital of the error(s) and work with the hospital to ensure the required calculations are performed correctly. We would continue this practice under the proposed expansion exception process. After these steps are completed, if the hospital does not withdraw the expansion exception request, CMS would publish notice of the expansion exception request in the **Federal Register**. Community input could be submitted during the stated comment period. If CMS receives community input on the expansion exception request, it would be provided to the requesting hospital. The hospital would have 30 days to submit a rebuttal statement if it chooses to do so. CMS would then consider the information included in the expansion exception request, community input (if any), and rebuttal statement (if any), as well as other information available to CMS that may be relevant to: (1) its determination whether the hospital meets the criteria for an applicable hospital or high Medicaid facility and (2) its decision whether to approve or deny the expansion exception request. CMS would publish notice of its determination whether the requesting hospital meets the criteria for an applicable hospital or high Medicaid facility in the **Federal Register**. If CMS determines that the requesting hospital meets the criteria for an applicable hospital or high Medicaid facility, CMS would also publish notice of its decision to approve or deny the expansion exception request in the same **Federal Register** notice.

b. Program Integrity Restrictions on Approved Facility Expansion

As discussed in sections X.B.1.b. and X.B.2.a. of the preamble of this proposed rule, in the CY 2012 OPPS/ASC final rule, we issued regulations setting forth the expansion exception process at § 411.362(c) and related definitions at § 411.362(a) (76 FR 74122). Using our rulemaking authority in sections 1871 and 1877(i)(3) of the Act, we extended to high Medicaid facilities certain statutory program integrity restrictions related to the expansion exception process that applied expressly by statute to applicable hospitals. In the CY 2021 OPPS/ASC final rule, we removed the regulatory program integrity restrictions on high Medicaid facilities as noted in sections X.B.1.b. and X.B.2.a. of the preamble of this proposed rule. There, we stated that we continue to believe that our then-current regulations, for which the Secretary appropriately used his authority and which treat high Medicaid facilities the same as applicable hospitals, are consistent with the Congress' intent to prohibit expansion of physician-owned hospitals generally (85 FR 86256). Nevertheless, because the statute does not expressly apply to high Medicaid facilities the program integrity restrictions related to the frequency of permitted requests for exceptions to the prohibition on expansion of facility capacity, the total amount of permitted expansion of facility capacity, or the location of permitted expansion facility capacity, citing the former Patients over Paperwork initiative, we removed these restrictions from our regulations as they applied to high Medicaid facilities (*Id.*).

Section 1877(i)(3)(B) of the Act provides that the expansion exception process shall permit an applicable hospital to apply for an exception to the prohibition on expansion of facility capacity up to once every 2 years. In extending this provision to high Medicaid facilities, we stated that, although the statute provides that an applicable hospital may request an exception up to once every 2 years, we believe that providing a high Medicaid facility the opportunity to request an exception once every 2 years (while also limiting its total growth) balances the Congress' intent to prohibit expansion of physician-owned hospitals with the purpose of the exception to the prohibition on expansion of facility capacity (76 FR 74524). We did not receive any public comments regarding the frequency of exception requests. Until January 1, 2021, under our regulations, both applicable hospitals and high Medicaid facilities could request an exception to the prohibition on expansion of facility capacity up to once every 2 years from the date of a CMS decision on the hospital's most recent request.

Section 1877(i)(3)(C)(ii) of the Act provides that the Secretary shall not permit an increase in an applicable hospital's facility capacity to the extent such increase would result in the number of operating rooms, procedure rooms, and beds for which the applicable hospital is licensed exceeding 200 percent of the applicable hospital's baseline facility capacity. In adopting a parallel limit on the increase in facility capacity that a high Medicaid facility may request, we noted that, in response to our request for comment on whether the 200 percent limit would be sufficient to balance the intent of the general prohibition on facility expansion with the purpose of the exception process—which is to provide the opportunity to expand in areas where a sufficient need for access to high Medicaid facilities is demonstrated—commenters supported our proposal regarding the amount of permitted increase and at least one commenter specifically supported the parallel treatment of high Medicaid facilities (76 FR 74524). Until January 1, 2021, under our regulations, a 200 percent limitation applied to both applicable hospitals and high Medicaid facilities.

Section 1877(i)(3)(D) of the Act provides that any increase in the number of operating rooms, procedure rooms, and beds for which an applicable hospital is licensed may occur only in facilities on the main campus of the applicable hospital. In extending this limitation on the location of expansion facility capacity to high Medicaid facilities, we explained that we believe that applying the same limitation to applicable hospitals and high Medicaid facilities will result in an efficient and consistent process (76 FR 74524). We did not receive any public comments regarding the location of the permitted increase. Until January 1, 2021, under our regulations, expansion facility capacity could occur only in facilities on the hospital's main campus.

In the CY 2021 OPPS/ASC final rule, we revised the regulations that set forth the expansion exception process with respect to high Medicaid facilities to remove certain regulatory restrictions that are not included in section 1877(i) of the Act (85 FR 86256). As of January 1, 2021, a high Medicaid facility may request an exception to the prohibition on expansion of facility capacity more frequently than once every 2 years; may request to expand its facility capacity beyond 200 percent of the hospital's baseline number of operating rooms, procedure rooms, and beds; and, if its request is granted, is not restricted to locating approved expansion facility capacity on the hospital's main campus. Under our existing regulations, an applicable hospital remains subject to the statutory limitation on the frequency of requests for an expansion exception (no more than once every 2 years); may not request to expand its facility capacity beyond 200 percent of the hospital's baseline facility capacity; and, if its request is granted, is restricted to locating approved expansion facility capacity on the hospital's main campus. We remain steadfast in our belief that the Secretary appropriately used his authority in the CY 2012 OPPS/ASC final rule in establishing an expansion

exception process that treated high Medicaid facilities the same as applicable hospitals, and that such treatment is consistent with the Congress' intent to prohibit expansion of physician-owned hospitals generally. As previously noted, the removal of the program integrity restrictions as they apply to high Medicaid facilities was not the result of a determination that they were unnecessary. Rather, the purpose of the regulatory change was to streamline regulations in order to eliminate burden under the former Patients over Paperwork initiative. Commenters opposed to our proposal to remove the program integrity restrictions on high Medicaid facilities highlighted their concern that a hospital that meets the criteria for a high Medicaid facility could expand into markets without large Medicaid patient populations, creating additional campuses far away from the patients the expansion is intended to serve. In addition, commenters asserted that physician-owned hospitals present a risk of program or patient abuse—through cherry-picking patients, avoiding Medicaid and uninsured patients, and treating fewer medically complex patients—and unrestricted expansion of such hospitals could exacerbate the risk (85 FR 86256 through 86257). Despite the program integrity concerns identified by commenters on the CY 2021 OPPS/ASC proposals, the regulations were revised to remove a perceived burden on high Medicaid facilities because the program integrity restrictions are not expressly required in section 1877(i) of the Act.

We recently reviewed the CY 2021 OPPS/ASC regulatory revisions, including the comments on our then-proposals, and considered whether those revisions currently pose a risk of the types of program or patient abuse that the physician self-referral law is intended to thwart. We also reviewed community input related to the expansion of physician-owned hospitals generally that we received in conjunction with an expansion exception request decided after the effective date of the CY 2021 OPPS/ASC final rule. One of the comments included in the community input asserted that the removal of the program integrity restrictions on high Medicaid facilities posed grave risk to the stability and integrity of patient care, and another asserted that removal of the restrictions contravenes and undermines the Congress' intent to strictly limit physician-owned hospital expansion. Following this recent review, we believe that not applying the program integrity restrictions regarding the frequency of expansion exception requests, maximum aggregate expansion of a hospital, and location of expansion facility capacity to high Medicaid facilities poses a significant risk of program or patient abuse. Although we are cognizant that the plain language of section 1877(i) of the Act does not expressly apply these program integrity restrictions to high Medicaid facilities in the same way that they are applied to applicable hospitals, we must balance the risk to patients and the Medicare program against any burden that the program integrity restrictions may impose on high Medicaid facilities. It is our position that protecting the Medicare program and its beneficiaries, as well as Medicaid beneficiaries, uninsured patients, and other underserved populations, from harms such as overutilization, patient steering, cherry-picking, and lemon-dropping outweighs any perceived burden on high Medicaid facilities. In addition, we believe that treating all hospitals the same under the expansion exception process by applying the program integrity restrictions to both applicable hospitals and high Medicaid facilities will promote consistency among decisions to approve or deny expansion exception requests. For these reasons, we are proposing to reinstate the program integrity restrictions regarding the frequency of expansion exception requests, maximum aggregate expansion of a hospital, and location of expansion facility capacity as they apply to high Medicaid facilities.

We are proposing to revise existing § 411.362(c)(6) to reinstate, with respect to high Medicaid facilities, the program integrity restrictions on the maximum aggregate expansion of a hospital and location of expansion facility capacity. We are also proposing to renumber this regulation at § 411.363(j). We note that these program integrity restrictions would not apply to an increase in facility capacity approved by CMS with respect to an expansion exception request submitted by a high Medicaid facility between January 1, 2021 and September 30, 2023 (the day before the anticipated effective date of the revised regulations if our proposals are finalized). We are not proposing any change to these program integrity restrictions with respect to applicable hospitals, which have consistently applied to such hospitals under our regulations since January 1, 2012. In addition to the regulation at proposed § 411.363(j), the program integrity restriction on the maximum aggregate expansion of a hospital is also implemented at proposed § 411.363(b)(2)(i), which provides that a hospital is not eligible to request an expansion exception if CMS has previously approved a request from the hospital that would allow the hospital's facility capacity to reach 200 percent of its baseline facility capacity if the full expansion is utilized. We note that all but two of the expansion exception requests approved to date have permitted an increase in facility capacity that, if fully utilized, would allow the requesting hospital to reach 200 percent of its baseline number of operating rooms, procedure rooms, and beds. (See *https://www.cms.gov/medicare/fraud-and-abuse/physicianselfreferral/physician_owned_hospitals*.) Therefore, those hospitals would be ineligible to submit a future expansion exception request on or after the effective date of the revised regulations if our proposal is finalized. The two hospitals that were approved for expansion facility capacity less than their baseline number of operating rooms, procedure rooms, and beds would not be precluded from submitting a future expansion exception request if they meet the eligibility requirements for making an expansion exception request at proposed § 411.363(b) at the time of the request.

The program integrity restriction on the location of expansion facility capacity at proposed § 411.363(j) would require that any approved expansion occur only on the main campus of the hospital. However, nothing in our existing physician self-referral regulations or our proposals in this section X.B.2.b. would affect a hospital's ability to relocate some or all of the ''original'' operating rooms, procedure rooms, or beds that are part of its baseline facility capacity. On April 18, 2019, we published on the CMS website a Frequently Asked Question (FAQ) regarding this issue (*https://www.cms.gov/Medicare/Fraud-and-Abuse/PhysicianSelfReferral/Downloads/FAQs-Physician-Self-Referral-Law.pdf*). The FAQ states:

Question: Where the Secretary has granted a physician-owned hospital (''POH'') an exception to the prohibition on facility expansion under section 1877(i) of the Social Security Act (the ''Act'') and existing 42 CFR 411.362(c), does the physician self-referral law prohibit the POH from relocating operating rooms, procedure rooms, or beds that were licensed on March 23, 2010, from its main campus to a remote location of the POH before implementing the approved facility expansion on the POH's main campus?

Answer: The physician self-referral law does not prohibit the relocation of operating rooms, procedure rooms, or beds that were licensed on March 23, 2010,[719] from a POH's main campus to a remote location. However, because the regulation at existing 42 CFR 411.362(c)(6) provides that any increase in the number of operating rooms, procedure rooms, or beds permitted by the Secretary through an exception may occur only in facilities on the POH's main campus, any operating rooms, procedure rooms, or beds added as a result of the Secretary's approval can be located only on the main campus of the POH and may not subsequently be relocated from the main campus. We note that all hospitals must comply with applicable Federal and state laws and regulations regarding, among other things, the licensure, location, construction, and use of operating rooms, procedure rooms, and beds. These laws and regulations may impose additional requirements or limitations on a POH that wishes to relocate operating rooms, procedure rooms, or beds from its main campus.

Our policy has not changed since the publication of the FAQ. We reiterate that the physician self-referral law does not prohibit the relocation of ''original'' operating rooms, procedure rooms, or beds from a hospital's main campus to a remote location, but note that a hospital that wishes to expand its service area by locating operating rooms, procedure rooms, or beds in a location beyond its main campus must comply with other Medicare, Federal, and State laws and regulations related to such expansion, which may require that actions occur in a particular sequential order. We also caution that, to avoid the physician self-referral law's referral and billing prohibitions under the rural provider or whole hospital exception, an ownership or investment interest must satisfy the requirements of the applicable exception at the time of the physician's referral, and the hospital must meet the requirements of section 1877(i) of the Act and existing § 411.362 no later than September 23, 2011. Section 1877(i)(1)(A) of the Act and existing § 411.362(b)(1) require that *the* hospital had physician ownership or investment on December 31, 2010, and a provider agreement under section 1866 of the Act on that date (emphasis added). Put another way, for a hospital to bill Medicare (or another individual, entity, or third-party payer) for a designated health service furnished as a result of a physician owner's referral following the relocation of ''original'' operating rooms, procedure rooms, or beds to a location other than the main campus of a hospital, the hospital (including all of its provider-based locations) must remain the *same hospital* that had both physician ownership or investment and a Medicare provider agreement on December 31, 2010. (See 87 FR 44798 for a complete discussion of this requirement.) Parties may request an advisory opinion from CMS regarding whether a hospital is (or would be) ''the *same* hospital'' following the relocation of ''original'' operating rooms, procedure rooms, or beds to a location other than the main campus of a hospital.

Finally, as discussed in section X.B.2.a.(2). of the preamble of this proposed rule, to ensure consistency in the application of the expansion exception process, as well as preserve CMS resources and maintain an orderly and efficient expansion exception process, we are also proposing, with respect to high Medicaid facilities, to reinstate the program integrity restriction on the frequency of expansion exception requests at proposed § 411.363(b)(2)(ii). The proposed regulation provides that a hospital is not eligible to request an expansion exception unless it has been at least 2 calendar years from the date of the most recent decision by CMS approving or denying the hospital's most recent request for an exception from the prohibition on facility expansion. Applicable hospitals have been subject to this limitation under our regulations since the effective date of our CY 2012 OPPS/ASC final rule, and we are not proposing any substantive change to the application of the limitation on applicable hospitals. However, we are proposing to slightly revise the language of existing § 411.362(c)(1) and renumber it at § 411.363(b)(2)(ii) as described in this section X.B.2.b. As noted, the limitation would apply uniformly to all hospitals requesting an expansion exception.

c. Technical and Grammatical Revisions

We are proposing certain technical and grammatical revisions to the existing regulations in § 411.362 and the proposed regulations in § 411.363. First, we are proposing to revise the reference at § 411.362(b)(2) to the expansion exception process by substituting ''§ 411.363'' (the proposed location of the regulations setting forth the expansion exception process) for the current reference to ''paragraph (c) of this section.'' In addition, to conform the terminology regarding approval of a request to that used throughout our proposals in this section X.B.2. of the preamble of this proposed rule, we are also proposing to substitute the word ''approved'' for the current reference to ''granted'' at § 411.362(b)(2). We are proposing to use the same phrasing of ''exception from the prohibition on facility expansion'' wherever that language appears in the regulation. We are proposing to use defined acronyms, such as HCRIS, where those terms appear following the initial designation of the acronym. In addition, we are specifying at proposed § 411.363(l) that the references to section 1869 and 1878 in existing § 411.362(c)(8) are references to the Social Security Act. For consistency with our regulations in this subpart J, we are proposing to revise the term ''Web site'' to ''website'' wherever the term appears in existing § 411.362. We are also proposing to change numbers to words and vice versa where those conventions are correct in the Code of Federal Regulations. Finally, we are proposing minor changes to correct grammatically the wording of certain regulations. For example, we are proposing to restate the regulation at existing § 411.362(c)(2)(iii) and renumber it at § 411.363(b)(3) to read ''*The hospital* does not discriminate against beneficiaries of Federal health programs and does not permit physicians practicing at the hospital to discriminate against beneficiaries.'' Currently, the regulation does not include the words ''The hospital.''

C. Proposed Technical Corrections to 42 CFR 411.353 and 411.357

On November 16, 2020, the Department issued a final rule titled ''Regulatory Clean-up Initiative'' (85 FR 72899) that contained multiple technical corrections to various regulations. Among the changes finalized in that rule was an amendment to 42 CFR 411.353(d) to reflect an updated cross-reference to the definition of ''timely basis'' at 42 CFR 1003.110 (previously § 1003.101), as updated by 81 FR 88334 on December 7, 2016. However, in our December 2, 2020 (85 FR 77492) final rule entitled ''Medicare Program; Modernizing and Clarifying the Physician Self-Referral Regulations'' (hereinafter referred to as the ''MCR final rule''), we inadvertently reverted to the prior regulatory text. There were also additional typographical errors in the text of 42 CFR 411.357(s) introduced in the MCR final rule. We are proposing to correct these technical errors.

[719] In the case of a POH that did not have a provider agreement in effect as of March 23, 2010, but had a provider agreement in effect on December 31, 2010, the response provided in this FAQ would apply to beds, procedure rooms and operating rooms that were licensed on the effective date of such agreement.

Specifically, in § 411.353(d) we are proposing to amend paragraph (d) by removing the parenthetical phrase ''§ 1003.101 of this title.'' and adding in its place ''§ 1003.110 of this title.'' Also, we are also proposing to amend § 411.357 as follows:

- In paragraph (s)(3) by removing the parenthetical phrase ''governing body;'' and adding in its place ''governing body; and''.
- In paragraph (s)(4) by removing the parenthetical phrase ''financial need; and'' and adding in its place ''financial need.''.

D. Safety Net Hospitals—Request for Information

1. Background

Consistent with President Biden's Executive Order 13985 on ''Advancing Racial Equity and Support for Underserved Communities Through the Federal Government,'' [720] and Executive Order 14091 on ''Further Advancing Racial Equity and Support for Underserved Communities Through the Federal Government,'' [721] CMS has made advancing health equity the first pillar in its Strategic Plan. We define health equity as the attainment of the highest level of health for all people, where everyone has a fair and just opportunity to attain their optimal health regardless of race, ethnicity, disability, sexual orientation, gender identity, socioeconomic status, geography, preferred language, and other factors that affect access to care and health outcomes. CMS is working to advance health equity by designing, implementing, and operationalizing policies and programs that support health for all the people served by our programs, eliminating avoidable differences in health outcomes experienced by people who are disadvantaged or underserved, and providing the care and support that our beneficiaries need to thrive.[722]

Among the goals of CMS's health equity pillar is to evaluate policies to determine how CMS can support safety-net providers, partner with providers in underserved communities, and ensure care is accessible to those who need it.[723] Although various approaches exist to identifying ''safety-net providers,'' this term is commonly used to refer to health care providers that furnish a substantial share of services to uninsured and low-income patients.[724] As such, safety-net providers, including acute care hospitals, play a crucial role in the advancement of health equity by making essential services available to the uninsured, underinsured, and other populations that face barriers to accessing healthcare, including people from racial and ethnic minority groups, the LGBTQ+ community, rural communities, and members of other historically disadvantaged groups. Whether located in urban centers or geographically isolated rural areas, safety-net hospitals are often the sole providers in their communities of specialized services such as burn and trauma units, neonatal care and inpatient psychiatric facilities.[725] They also frequently partner with local health departments and other institutions to sponsor programs that address homelessness, food insecurity and other social determinants of health, and offer culturally and linguistically appropriate care to their patients. During the COVID–19 pandemic, safety-net hospitals have provided emergency care to many of the country's most at-risk patients and have leveraged their position as trusted providers to drive vaccine uptake in their communities.[726]

Because they serve many low-income and uninsured patients, safety-net hospitals may experience greater financial challenges compared to other hospitals. Among the factors that negatively impact safety-net hospital finances, MedPAC has pointed specifically to the greater share of patients insured by public programs, which it stated typically pay lower rates for the same services than commercial payers; the increased costs associated with treating low-income patients, whose conditions may be complicated by social determinants of health, such as homelessness and food insecurity; and the provision of higher levels of uncompensated care.[727] Moreover, the financial pressures on many safety-net hospitals have been further exacerbated by the impacts of the COVID–19 pandemic.[728] In response to the challenges posed by COVID–19, HHS has authorized several targeted distributions from the Provider Relief Fund to safety-net hospitals and other hospitals that serve vulnerable populations.[729]

In its June 2022 Report to Congress, MedPAC expressed concern over the financial position of safety-net hospitals.[730] The Commission noted that the limited resources of many safety-net hospitals may make it difficult for them to compete with other hospitals for labor and technology, and observed that ''[t]his disadvantage, in turn, could lead to difficulty maintaining quality of care and even to hospital closure.'' [731] During the earlier phases of the COVID–19 pandemic, for example, studies showed higher rates of mortality among patients who received treatment at certain safety-net hospitals, with researchers citing understaffing and lack of access to advanced therapies as some of the factors that may have contributed to negative health outcomes.[732] Other research shows that the closure of a safety-net hospital can have ripple effects within the community, making it more difficult for disadvantaged patients to access care and shifting uncompensated care costs onto neighboring facilities.[733] [734]

Two of the ways the Medicare statute currently recognizes the additional costs of safety-net hospitals are through disproportionate share hospital (DSH) payments and uncompensated care payments. In its June 2022 Report, however, MedPAC raised concerns about whether these payments appropriately target safety-net

[720] *https://www.federalregister.gov/documents/2021/01/25/2021-01753/advancing-racial-equity-and-support-for-underserved-communities-through-the-federal-government.*

hospitals.[735] The Medicare statute also includes special payment provisions for other hospitals in underserved communities, including sole community hospitals, which are the sole source of care in their areas, as well as Critical Access Hospitals and Rural Emergency Hospitals.

Given the critical importance of safety-net hospitals to the communities they serve, it is important to be able to identify these hospitals for policy purposes. In the next two sections, we discuss two potential approaches: the Safety-Net Index, which MedPAC has developed as a measure of the degree to which a hospital functions as a safety-net hospital; and area-level indices, which are intended to capture local socioeconomic factors correlated with medical disparities and underservice.

2. Methodological Considerations When Identifying Safety Net Hospitals Using the SNI

The Safety-Net Index (SNI) developed by MedPAC is calculated as the sum of—(1) the share of the hospital's Medicare volume associated with low-income beneficiaries; (2) the share of its revenue spent on uncompensated care; and (3) an indicator of how dependent the hospital is on Medicare.

a. Medicare Low-Income Subsidy (LIS) Enrollment Ratio

For the share of the hospital's Medicare volume associated with low-income beneficiaries, MedPAC's definition of low-income beneficiaries includes all those who are dually eligible for full or partial Medicaid benefits, and those who do not qualify for Medicaid benefits in their states but who receive the Part D low-income subsidy (LIS) because they have limited assets and an income below 150 percent of the Federal poverty level. Collectively, MedPAC refers to this population as ''LIS beneficiaries'' because those who receive full or partial Medicaid benefits are automatically eligible to receive the LIS. MedPAC states that its intent in defining low-income beneficiaries in this manner is to reduce the effect of variation in states' Medicaid policies on the share of beneficiaries whom MedPAC considers low-income, but to allow for appropriate variation across states based on the share of beneficiaries who are at or near the Federal poverty level.

To calculate the LIS ratio for a hospital for a fiscal year, we could use the number of inpatient discharges of Medicare beneficiaries who are also LIS beneficiaries during the month of discharge, divided by the total number of inpatient discharges of Medicare beneficiaries. In a similar manner to how we currently use the most recent fiscal year MedPAR claims for ratesetting purposes,[736] we could use the most recent MedPAR claims for the discharge information needed to calculate the LIS ratio. We could merge onto this MedPAR data the LIS beneficiary information needed to calculate the LIS ratio.

b. Uncompensated Care Costs to Total Operating Revenue Ratio

For the share of a hospital's revenue spent on uncompensated care, we could use the ratio of uncompensated care costs to total operating hospital revenue from the most recent available audited cost report data.[737] Specifically, the ratio could be calculated as Worksheet S–10 column 1, line 30 (Total cost of uncompensated care) divided by Worksheet G–3 column 1, line 3 (Net patient revenues) using these existing lines from the most recent available audited cost report data.

c. Medicare Share of Total Inpatient Days

For the indicator of how dependent a hospital is on Medicare, MedPAC's recommendation is to use one-half of the Medicare share of total inpatient days.

In calculating the Medicare share of total inpatient days for a hospital, the most recent available audited cost report data could be used. The numerator could be calculated from existing lines on the cost report as follows: the sum of Worksheet S–3 Part I, column 6, line 2 (MA days and days for individuals enrolled in Medicare cost plans); Worksheet S–3 Part I, column 6, line 14 (Medicare adult and pediatric hospital days excluding SNF and NF swing-bed, observation bed, and hospice days); Worksheet S–3 Part I, column 6, line 32 (total Medicare labor and delivery days); and subtracting Worksheet S–3 Part I, column 6, line 5 (total Medicare adult and pediatric SNF swing bed days) and Worksheet S–3 Part I, column 6, line 6 (total Medicare adult and pediatric NF swing bed days).

The denominator could be calculated from existing lines on the cost report as follows: the sum of Worksheet S–3 Part I, column 8, line 14 (total all patients' adult and pediatric hospital days excluding SNF and NF swing-bed, observation bed, and hospice days); Worksheet S–3 Part I, column 8, line 30 (total all patients' employee discount days); Worksheet S–3 Part I, column 8, line 32 (total all patients' labor room days); and subtracting Worksheet S–3 Part I, column 8, line 5 (total swing-bed SNF patient days) and Worksheet S–3 Part I, column 8, line 6 (total swing-bed NF patient days).

When calculating the SNI, the following circumstances may be encountered: new hospitals (for example, hospitals that begin participation in Medicare program after the available audited cost report data), hospital mergers, hospitals with multiple cost reports and/or cost reporting periods that are shorter or longer than 365 days, cost reporting periods that span fiscal years, and potentially aberrant data. We are soliciting comments on how MedPAC's SNI calculation should address these circumstances and whether the approaches used in the uncompensated care payment methodology might be appropriate. We refer readers to section IV.E.3. of the preamble this proposed rule for a discussion of how these circumstances are addressed in the uncompensated care payment methodology.

For MedPAC's SNI calculation, we are also soliciting comments on whether a multi-year approach using the three most recently available years of data may be appropriate to increase the stability of the index, similar to the approach used in the uncompensated care payment methodology.

3. An Alternative Approach to Identifying Safety Net Hospitals—Area-Level Indices

An alternative to using an SNI approach could be to identify safety-net hospitals using area-level indices. This approach could potentially better target policies to address the social determinants of health as well as address the lack of community resources that may increase risk of poor health outcomes and risk of disease in the population. Recently, the Office of the Assistant Secretary for Planning and Evaluation (ASPE) commissioned three environmental scans of: (1) area-level indices of social risk; (2) measures used in government programs that target areas, providers, or populations with social risk; and (3) existing payment models that incorporate measures of social risk. ASPE suggested that an area-level index could be used to prioritize

[735] *https://www.medpac.gov/wp-content/uploads/2022/06/Jun22_MedPAC_Report_to_Congress_v2_SEC.pdf.*

[736] The most recent fiscal year MedPAR data lag two years behind the rulemaking year (for example, FY 2022 MedPAR data are available for this FY 2024 proposed rule).

[737] The most recent available cost report data for this purpose generally lags four years behind the rulemaking year (for example, FY 2020 cost report data are available for this FY 2024 proposed rule.)

communities for funding and other assistance to improve social determinants of health (SDOH)—such as affordable housing, availability of food stores, and transportation infrastructure. Although ASPE concluded that none of the existing area-level indices are ideal, they concluded that the area deprivation index (ADI) or the Social Deprivation Index (SDI) were the best available choices when selecting an index for addressing health related social needs or social determinants of health.[738]

The ADI was developed by researchers at the National Institutes of Health with the goal of quantifying and comparing social disadvantage across geographic neighborhoods. It is a composite measure derived through a combination of 17 input variables from census data. The ADI measure is intended to capture local socioeconomic factors correlated with medical disparities and underservice. Several peer reviewed research studies demonstrate that neighborhood-level factors for those residing in disadvantaged neighborhoods also have a relationship to worse health outcomes for these residents. Living in an area with an ADI score of 85 or above, a validated measure of neighborhood disadvantage, is shown to be a predictor of 30-day readmission rates, lower rates of cancer survival, poor end-of-life care for patients with heart failure, and longer lengths of stay and fewer home discharges post-knee surgery even after accounting for individual social and economic risk factors.[739] [740] [741] [742] [743]

Many rural areas also have relatively high levels of neighborhood disadvantage and high ADI levels.

Medicare already uses ADI to assess underserved beneficiary populations in the Shared Savings Program. In the CY 2023 PFS final rule, CMS adopted a policy to provide eligible Accountable Care Organizations (ACOs) with an option to receive advanced investment payments (87 FR 69778). Advance investment payments are intended to encourage low-revenue ACOs that are inexperienced with risk to participate in the Shared Savings Program and to provide additional resources to such ACOs in order to support care improvement for underserved beneficiaries (87 FR 69845 through 69849).[744]

Medicare uses ADI to calculate the amount of advance investment payments it will make on a quarterly basis to an ACO. There are two types of advance investment payments: a one-time payment of $250,000 and quarterly payments. When calculating the quarterly payments, CMS first determines the ACO's assigned beneficiary population. CMS then assigns each beneficiary a risk factors-based score as follows: (A) the risk factors-based score will be set to 100 if the beneficiary is enrolled in the Medicare Part D LIS or is dually eligible for Medicare and Medicaid; (B) the risk factors-based score will be set to the ADI national percentile rank matched to the beneficiary's mailing address if the beneficiary is not enrolled in the LIS or is not dually eligible for Medicare and Medicaid and sufficient data is available to match the beneficiary to an ADI national percentile rank; and (C) the risk factors-based score will be set to 50 if the beneficiary is not enrolled in the LIS or is not dually eligible for Medicare and Medicaid and sufficient data is not available to match the beneficiary to an ADI national percentile rank.

The risk-factors based scores assigned to the beneficiaries assigned to the ACO form the basis for determining the quarterly advanced investment payment to the ACO. For additional detail, please see the quarterly payment amount calculation methodology at 42 CFR 425.630(f)(2).

4. Request for Information

We are interested in public feedback on the challenges faced by safety-net hospitals, and potential approaches to help safety-net hospitals meet those challenges. We welcome all feedback on this issue, and ask the following questions to help facilitate that feedback.

- How should safety-net hospitals be identified or defined?
- What factors should not be considered when identifying or defining a safety-net hospital and why?
- What are the different types of safety-net hospitals?
- What are the main challenges facing safety-net hospitals?
- What are particular challenges facing rural safety-net hospitals?
- What new approaches or modifications to existing approaches should be implemented or considered to address these challenges, either for safety-net hospitals in general, or for specific types of safety-net hospitals, including rural safety-net hospitals?
- How helpful is it to have multiple types or definitions of safety-net hospitals that may be used for different purposes or to help address specific challenges?
- For Medicare purposes, would these new or modified approaches require new statutory authority, or could they be accomplished using existing statutory authority? If existing statutory authority, please identify the existing statutory authority.
- Are there specific payment approaches either as previously described or otherwise to consider for rural safety-net hospitals, including acute care hospitals and CAHs, to address challenges?
- For any new or modified approaches, how can specific hospitals be identified as safety-net hospitals, or a type of safety-net hospital, using existing data sources? Are there new data sources that should be developed to better identify these hospitals?
- Is MedPAC's SNI an appropriate basis for identifying safety-net hospitals for Medicare purposes?

++ How might it be improved?

++ Should there be a threshold for identifying safety net hospitals using the SNI?

- Should an area-level index, such as the ADI, be part of an appropriate basis for identifying safety-net hospitals?

++ Would it be appropriate to adapt the risk-factors based scores used in the Shared Savings Program to the identification of safety-net hospitals?

[741] Cheng E, et al., ''Neighborhood and Individual Socioeconomic Disadvantage and Survival Among Patients With Nonmetastatic Common Cancers.'' *JAMA Network Open Oncology.* No. 4(12), pp 1–17, doi: 10.1001/jamanetworkopen.2021.39593 (December 17, 2021), available at *https://jamanetwork.com/journals/jamanetworkopen/fullarticle/2787244.*

[742] Hutchinson RN, et al., ''Rural disparities in end-of-life care for patients with heart failure: Are they due to geography or socioeconomic disparity?'' *The Journal of Rural Health.* No. 38, pp 457–463, doi: 10.1111/jrh.12597 (2022), available at *https://onlinelibrary.wiley.com/doi/epdf/10.1111/jrh.12597.*

[743] Khlopas A, et al., ''Neighborhood Socioeconomic Disadvantages Associated With Prolonged Lengths of Stay, Nonhome Discharges, and 90-Day Readmissions After Total Knee Arthroplasty.'' *The Journal of Arthroplasty.* No. 37(6), pp S37–S43, doi: 10.1016/j.arth.2022.01.032 (June 2022), available at *https://www.sciencedirect.com/science/article/pii/S0883540322000493.*

[744] Under 42 CFR 425.630(g)(1), CMS will recoup advance investment payments made to an ACO from any shared savings the ACO earns until CMS has recouped in full the amount of advance investment payments made to the ACO.

++ How might it be adapted?

• Are there social determinants data collected by hospitals that could be used to inform an approach to identify safety net hospitals? Are there HHS or CMS policies that could support that data collection?

• What challenges do safety-net hospitals face around investments in information technology infrastructure?

++ What are ways that HHS policy could advance more robust investments in infrastructure for safety net hospitals?

++ How could any potential payment adjustments be determined?

• Should safety-net hospitals' reporting burden and compensation be different than other hospitals? If so, how?

• What are the patient demographics at safety-net hospitals? What challenges do patients of safety net hospitals face before and after receiving care at the hospital?

• Given Administration efforts to reduce the patient burden of medical debt, are there ways to develop payment approaches for safety net hospitals that would also support hospital patients that need financial assistance?

E. Disclosures of Ownership and Additional Disclosable Parties Information for Skilled Nursing Facilities and Nursing Facilities—Applicability to Other Providers and Suppliers

In the February 15, 2023 **Federal Register** (88 FR 9820), we published a proposed rule titled ''Disclosures of Ownership and Additional Disclosable Parties Information for Skilled Nursing Facilities and Nursing Facilities'' (hereinafter referred to as the Disclosures proposed rule). The Disclosures proposed rule would implement portions of section 6101 of the Affordable Care Act, which require the disclosure of certain ownership, managerial, and other information regarding Medicare skilled nursing facilities (SNFs) and Medicaid nursing facilities. The Disclosures proposed rule also proposed definitions of the terms ''private equity company'' (PEC) and ''real estate investment trust'' (REIT) (88 FR 9829). Specifically, a private equity company would be defined in 42 CFR 424.502 as a publicly-traded or non-publicly traded company that collects capital investments from individuals or entities (that is, investors) and purchases an ownership share of a provider (for example, SNF, home health agency, etc.). A REIT would be defined in the same regulation as a publicly-traded or non-publicly traded company that owns part or all of the buildings or real estate in or on which the provider operates. The purpose of these definitions was to assist SNFs that complete the Form CMS–855A enrollment application (Medicare Enrollment Application—Institutional Providers; OMB Control No. 0938–0685) in determining whether an owning or managing entity reported in Section 5 of the application must be identified therein as a PEC and REIT.

We outlined in the Disclosures proposed rule our concerns about the quality of care furnished by PEC-owned and REIT-owned SNFs and the consequent need for transparency regarding such owners (88 FR 9822 and 9823). However, these concerns about PEC and REIT are not limited to SNFs but extend to other provider and supplier types. Given the linkage discussed in the Disclosure proposed rule between PEC and REIT ownership and a decline in nursing home quality, we believe it is very important for us to collect this information from all providers and suppliers that complete the Form CMS–855A so as to: (1) determine whether a similar connection exists with respect to non-SNF providers and suppliers; and (2) help us take measures to improve beneficiary quality of care to the extent such connections exist. Indeed, it was with this in mind that we proposed on December 15, 2022 to revise the Form CMS–855A application in a Paperwork Reduction Act submission (87 FR 76626) to require all owning and managing entities listed on any provider's or supplier's Form CMS–855A submission to disclose whether they are a PEC or a REIT.[745]

For the foregoing reasons and to assist these entities in completing the Form CMS–855A, we propose in this FY 2024 IPPS/LTCH PPS proposed rule that the aforementioned definitions of PEC and REIT would apply to all providers and suppliers completing the Form CMS–855A enrollment application. The definitions would not be limited to SNFs; however, as we stated in the Disclosures proposed rule, these definitions may be modestly different from definitions of the same terms used in other settings. Accordingly, we seek comment from all provider and supplier types that complete the Form CMS–855A on the propriety of the PEC and REIT definitions first proposed in the Disclosures proposed rule. We welcome any suggested revisions thereto and particularly seek comment on whether our proposed definition of PEC should include publicly-traded private equity companies. Moreover, we would appreciate public feedback regarding any other types of private ownership besides PECs and REITs about which CMS should consider collecting information from providers and suppliers as part of the enrollment process.

We note that there are two principal categories of legal authorities for this proposal:

• Section 1866(j) of the Act furnishes specific authority regarding the enrollment process for providers and suppliers.

• Sections 1102 and 1871 of the Act provide general authority for the Secretary to prescribe regulations for the efficient administration of the Medicare program.

XI. MedPAC Recommendations and Publicly Available Files

A. MedPAC Recommendations

Under section 1886(e)(4)(B) of the Act, the Secretary must consider MedPAC's recommendations regarding hospital inpatient payments. Under section 1886(e)(5) of the Act, the Secretary must publish in the annual proposed and final IPPS rules the Secretary's recommendations regarding MedPAC's recommendations. We have reviewed MedPAC's March 2023 ''Report to the Congress: Medicare Payment Policy'' and have given the recommendations in the report consideration in conjunction with the policies set forth in this proposed rule. MedPAC recommendations for the IPPS for FY 2024 are addressed in Appendix B to this proposed rule.

For further information relating specifically to the MedPAC reports or to obtain a copy of the reports, contact MedPAC at (202) 653–7226, or visit MedPAC's website at *https://www.medpac.gov*.

B. Publicly Available Files

IPPS-related data are available on the internet for public use. The data can be found on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index*. Following is a listing of the IPPS-related data files that are available.

Commenters interested in discussing any data files used in construction of this proposed rule should contact Michael Treitel at (410) 786–4552.

1. CMS Wage Data Public Use File

This file contains the hospital hours and salaries from Worksheet S–3, parts II and III from FY 2020 Medicare cost reports used to create the proposed FY

[745] *https://www.cms.gov/regulations-and-guidance/legislation/paperworkreductionactof1995/pra-listing/cms-855a.*

2024 IPPS wage index. Multiple versions of this file are created each year. For a discussion of the release of different versions of this file, we refer readers to section III.L. of the preamble of this proposed rule.

Media: internet at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files.html*. Periods Available: FY 2007 through FY 2024 IPPS Update.

2. CMS Occupational Mix Data Public Use File

This file contains the CY 2019 occupational mix survey data to be used to compute the occupational mix adjusted wage indexes. Multiple versions of this file are created each year. For a discussion of the release of different versions of this file, we refer readers to section III.L. of the preamble of this proposed rule.

Media: internet at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files.html*. Period Available: FY 2024 IPPS Update.

3. Provider Occupational Mix Adjustment Factors for Each Occupational Category Public Use File

This file contains each hospital's occupational mix adjustment factors by occupational category. Two versions of these files are created each year to support the rulemaking.

Media: internet at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files.html*.

Period Available: FY 2024 IPPS Update.

4. Other Wage Index Files

CMS releases other wage index analysis files after each proposed and final rule. Media: internet at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files.html*. Periods Available: FY 2005 through FY 2024.

5. FY 2024 IPPS FIPS CBSA State and County Crosswalk

This file contains a crosswalk of State and county codes used by the Federal Information Processing Standards (FIPS), county name, and a list of Core Based Statistical Areas (CBSAs).

Media: internet at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Index.html* (on the navigation panel on the left side of the page, click on the FY 2024 proposed rule home page or the FY 2024 final rule home page) or *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Acute-Inpatient-Files-for-Download.html*.

Period Available: FY 2024 IPPS Update.

6. HCRIS Cost Report Data

The data included in this file contain cost reports with fiscal years ending on or after September 30, 1996. These data files contain the highest level of cost report status.

Media: internet at *https://www.cms.gov/Research-Statistics-Data-and-Systems/Downloadable-Public-Use-Files/Cost-Reports/Cost-Reports-by-Fiscal-Year*.

(We note that data are no longer offered on a CD. All of the data collected are now available free for download from the cited website.)

7. Provider-Specific File

This file is a component of the PRICER program used in the MAC's system to compute DRG/MS–DRG payments for individual bills. The file contains records for all prospective payment system eligible hospitals, including hospitals in waiver States, and data elements used in the prospective payment system recalibration processes and related activities. Beginning with December 1988, the individual records were enlarged to include pass-through per diems and other elements.

Media: internet at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/ProspMedicareFeeSvcPmtGen/psf_text*.

Period Available: Quarterly Update.

8. CMS Medicare Case-Mix Index File

This file contains the Medicare case-mix index by provider number based on the MS–DRGs assigned to the hospital's discharges using the GROUPER version in effect on the date of the discharge. The case-mix index is a measure of the costliness of cases treated by a hospital relative to the cost of the national average of all Medicare hospital cases, using DRG/MS–DRG weights as a measure of relative costliness of cases. Two versions of this file are created each year to support the rulemaking.

Media: internet at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Acute-Inpatient-Files-for-Download.html*, or for the more recent data files, *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Index.html* (on the navigation panel on the left side of page, click on the specific fiscal year proposed rule home page or fiscal year final rule home page desired).

Periods Available: FY 1985 through FY 2024.

9. MS–DRG Relative Weights (Also Table 5—MS–DRGs)

This file contains a listing of MS–DRGs, MS–DRG narrative descriptions, relative weights, and geometric and arithmetic mean lengths of stay for each fiscal year. Two versions of this file are created each year to support the rulemaking.

Media: internet at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Acute-Inpatient-Files-for-Download.html*, or for the more recent data files, *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Index.html* (on the navigation panel on the left side of page, click on the specific fiscal year proposed rule home page or the fiscal year final rule home page desired).

Periods Available: FY 2005 through FY 2024 IPPS Update.

10. IPPS Payment Impact File

This file contains data used to estimate payments under Medicare's hospital inpatient prospective payment systems for operating and capital-related costs. The data are taken from various sources, including the Provider-Specific File, HCRIS Cost Report Data, MedPAR Limited Data Sets, and prior impact files. The data set is abstracted from an internal file used for the impact analysis of the changes to the prospective payment systems published in the **Federal Register**. Two versions of this file are created each year to support the rulemaking.

Media: internet at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Historical-Impact-Files-for-FY–1994-through-Present*, or for the more recent data files, *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Index.html* (on the navigation panel on the left side of page, click on the specific fiscal year proposed rule home page or fiscal year final rule home page desired).

Periods Available: FY 1994 through FY 2024 IPPS Update.

11. AOR/BOR File

This file contains data used to develop the MS–DRG relative weights. It contains mean, maximum, minimum, standard deviation, and coefficient of variation statistics by MS–DRG for length of stay and standardized charges. The BOR file are ''Before Outliers

Removed'' and the AOR file is ''After Outliers Removed.'' (Outliers refer to statistical outliers, not payment outliers.) Two versions of this file are created each year to support the rulemaking.

Media: internet at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Acute-Inpatient-Files-for-Download.html*, or for the more recent data files, *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Index.html* (on the navigation panel on the left side of page, click on the specific fiscal year proposed rule home page or fiscal year final rule home page desired).

Periods Available: FY 2005 through FY 2024 IPPS Update.

12. Prospective Payment System (PPS) Standardizing File

This file contains information that standardizes the charges used to calculate relative weights to determine payments under the hospital inpatient operating and capital prospective payment systems. Variables include wage index, cost-of-living adjustment (COLA), case-mix index, indirect medical education (IME) adjustment, disproportionate share, and the Core-Based Statistical Area (CBSA). The file supports the rulemaking.

Media: internet at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Index.html* (on the navigation panel on the left side of the page, click on the FY 2024 proposed rule home page or the FY 2024 final rule home page) or *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Acute-Inpatient-Files-for-Download.html*.

Period Available: FY 2024 IPPS Update.

13. MS–DRG Relative Weights Cost Centers File

This file provides the lines on the cost report and the corresponding revenue codes that we used to create the 19 national cost center cost-to-charge ratios (CCRs) that we used in the relative weight calculation.

Media: internet at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Index.html* (on the navigation panel on the left side of the page, click on the FY 2024 proposed rule home page or the FY 2024 final rule home page) or *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Acute-Inpatient-Files-for-Download.html*.

Period Available: FY 2024 IPPS Update

14. Hospital Readmissions Reduction Program Supplemental File

The Hospital Readmissions Reduction Program Supplemental File is only available and updated for the final rule, when the most recent data is available. Therefore, we refer readers to the FY 2023 IPPS/LTCH PPS final rule supplemental file, which has the most recent finalized payment adjustment factor components and is the same data as would have been used to create the FY 2024 IPPS/LTCH PPS proposed rule supplemental file.

Media: internet at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Index.html* (on the navigation panel on the left side of the page, click on the FY 2024 proposed rule home page or the FY 2024 final rule home page) or *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Acute-Inpatient-Files-for-Download.html*.

Period Available: FY 2024 IPPS Update.

15. Medicare Disproportionate Share Hospital (DSH) Supplemental File

This file contains information on the calculation of the uncompensated care payments for DSH eligible hospitals as well as the supplemental payments for eligible IHS and Tribal hospitals and hospitals located in Puerto Rico for FY 2024. Variables include the data used to determine a hospital's share of uncompensated care payments, total uncompensated care payments, estimated per claim uncompensated care payment amounts, and if applicable, supplemental payment amounts. The file supports the rulemaking.

Media: internet at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Index.html* (on the navigation panel on the left side of the page, click on the FY 2024 proposed rule home page or the FY 2024 final rule home page) or *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Acute-Inpatient-Files-for-Download.html*.

Period Available: FY 2024 IPPS Update.

16. New Technology Thresholds File

This file contains the cost thresholds by MS–DRG that are generally used to evaluate applications for new technology add-on payments for the fiscal year that follows the fiscal year that is otherwise the subject of the rulemaking. (As discussed in section II.G. of this proposed rule, we use the proposed threshold values associated with the proposed rule for that fiscal year to evaluate the cost criterion for applications for new technology add-on payments and previously approved technologies that may continue to receive new technology add-on payments, if those technologies would be assigned to a proposed new MS–DRG for that same fiscal year.) Two versions of this file are created each year to support rulemaking.

Media: internet at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Index.html* (on the navigation panel on the left side of the page, click on the applicable fiscal year's proposed rule or final rule home page) or *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Acute-Inpatient-Files-for-Download.html*.

Periods Available: For FY 2024 and FY 2025 applications.

XII. Collection of Information Requirements

A. Statutory Requirement for Solicitation of Comments

Under the Paperwork Reduction Act (PRA) of 1995, we are required to provide 60-day notice in the **Federal Register** and solicit public comment before a collection of information requirement is submitted to the Office of Management and Budget (OMB) for review and approval. In order to fairly evaluate whether an information collection should be approved by OMB, section 3506(c)(2)(A) of the PRA of 1995 requires that we solicit comment on the following issues:

- The need for the information collection and its usefulness in carrying out the proper functions of our agency.
- The accuracy of our estimate of the information collection burden.
- The quality, utility, and clarity of the information to be collected.
- Recommendations to minimize the information collection burden on the affected public, including automated collection techniques.

In this proposed rule, we are soliciting public comment on each of these issues for the following sections of this document that contain information collection requirements (ICRs). The following ICRs are listed in the order of appearance within the preamble (see sections II. through X. of the preamble of this proposed rule).

B. Collection of Information Requirements

1. ICRs for the Hospital Wage Index for Acute Care Hospitals

Section III.I.2.a. of the preamble of this proposed rule, FY 2023 Reclassification Application Requirements and Approvals, references the information collection request 0938–0573 which expired on January 31, 2021. A reinstatement of the information collection request (ICR) is currently being developed. The public will have an opportunity to review and submit comments regarding the reinstatement of this ICR through a public notice and comment period separate from this rulemaking.

2. ICRs for Payments for Low-Volume Hospitals

As discussed in section V.E. of the preamble of this proposed rule, under section 1886(d)(12) of the Act, as amended, the low-volume hospital definition and payment adjustment methodology in effect for FYs 2019 through 2022 under section 50204 of the Bipartisan Budget Act of 2018 are extended through FY 2024. Therefore, for FYs 2019 through 2024, in order to qualify as a low-volume hospital, a subsection (d) hospital must be more than 15 road miles from another subsection (d) hospital and have less than 3,800 total discharges during the fiscal year. In that section we also discuss the process for requesting and obtaining the low-volume hospital payment adjustment under § 412.101. Under this previously established process, a hospital makes a written request to its MAC. This request must contain sufficient documentation to establish that the hospital meets the applicable mileage and discharge criteria. The MAC will determine if the hospital qualifies as a low-volume hospital by reviewing the data the hospital submits with its request for low-volume hospital status in addition to other available data. The MAC and CMS may review available data such as the number of discharges, in addition to the data the hospital submits with its request for low-volume hospital status, to determine whether or not the hospital meets the qualifying criteria. The burden associated with this requirement is estimated to be 1 hour per hospital. The burden associated with these requests is the time and effort for the hospital to provide the MAC with evidence that it meets the specified mileage and discharge requirements. The burden associated with this requirement is estimated to be 1 hour per hospital. An accountant and auditor would perform this at the wage rate of $40.37. The wage would be doubled to include overhead. We estimate it would take 650 annual hours (1 hour × 650 hospitals seeking the low-volume payment adjustment). Therefore, the cost is $52,481 (650 hours x $80.74). The information collection request under OMB control number 0938–NEW will be submitted to OMB for approval.

3. ICRs Relating to the Hospital Readmissions Reduction Program

In section V.J. of the preamble of this proposed rule, we discuss proposed policies for the Hospital Readmissions Reduction Program. In this proposed rule, we are not proposing any changes to the Hospital Readmissions Reduction Program for FY 2024. All six of the current Hospital Readmissions Reduction Program's measures are claims-based measures. We believe that continuing to use these claims-based measures would not create or reduce any information collection burden for hospitals because they will continue to be collected using Medicare FFS claims that hospitals are already submitting to the Medicare program for payment purposes.

4. ICRs for the Hospital Value-Based Purchasing (VBP) Program

In section V.K. of the preamble of this proposed rule, we discuss updates to the Hospital VBP Program. Specifically, in this proposed rule, we are proposing to adopt substantial measure updates to the Medicare Spending per Beneficiary (MSPB) measure beginning with the FY 2028 program year and to the Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) measure beginning with the FY 2030 program year. We are also proposing to adopt the Severe Sepsis and Septic Shock measure beginning with the FY 2026 program year. Additionally, we are proposing to adopt technical changes to the to the form and manner of the administration of the HCAHPS Survey measure. We are also proposing a scoring methodology change that adjusts for treating a high proportion of underserved patients, defined by dual eligibility, and rewards hospitals for providing excellent care to this population beginning with the FY 2026 program year. We are also requesting feedback on potential Additional Changes to the Hospital VBP Program that would address health equity. Lastly, we are proposing to modify the Total Performance Score (TPS) maximum to be 110, resulting in numeric score range of 0 to 110.

Data collections for the Hospital VBP Program are associated with the Hospital Inpatient Quality Reporting Program under OMB control number 0938–1022, the National Healthcare Safety Network under OMB control number 0920–0666, and the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) survey under OMB control number 0938–0981. The Hospital VBP Program will use data that are also used to calculate quality measures in other programs and Medicare FFS claims data that hospitals are already submitting to CMS for payment purposes, so therefore the program does not anticipate any change in burden associated with these proposed measures. There is also no change in burden due to the proposed scoring methodology change because the proposal does not require hospitals to submit any additional information but instead changes how hospitals are scored based on the information already being submitted.

5. ICRs Relating to the Hospital-Acquired Condition (HAC) Reduction Program

OMB has currently approved 28,800 hours of burden and approximately $1.2 million under OMB control number 0938–1352 (expiration date November 30, 2025), accounting for information collection burden experienced by 400 subsection (d) hospitals selected for validation each year in the HAC Reduction Program. In this proposed rule, we are not proposing to add or remove any measures from the HAC Reduction Program.

In section V.L.6.a.(2). of the preamble of this proposed rule, we are proposing to provide hospitals the opportunity to request reconsideration of their final validation score prior to HAC Reduction Program scoring beginning with the FY 2025 program year and future years. This reconsideration process would be conducted once per program fiscal year after validation of HAIs for all four quarters of the given fiscal year's data period and after the confidence interval has been calculated. A hospital requesting HAC Reduction Program reconsideration must submit a reconsideration request form. As we previously finalized for purposes of the Hospital IQR Program, information collection requirements imposed subsequent to an administrative action are not subject to the PRA under 5 CFR 1320.4(a)(2) (75 FR 50411). Therefore, there is no change in burden associated with this proposal.

In section V.L.6.a.(3). of the preamble of this proposed rule, we are proposing to modify the validation targeting

criteria to include any hospital with a ERUB of the two-tailed confidence interval that is less than 75 percent and received an extraordinary circumstances exception (ECE) for one or more quarters beginning with the FY 2027 program year. Because we are neither proposing to modify the number of hospitals that will be selected for validation nor the number of records each selected hospital will be required to submit, we are not proposing any changes to our currently approved burden estimates as a result of this proposal.

6. ICRs for the Hospital Inpatient Quality Reporting (IQR) Program

a. Background

Data collections for the Hospital IQR Program are associated with OMB control number 0938–1022. OMB has currently approved 1,772,318 hours of burden and approximately $72 million under OMB control number 0938–1022 (expiration date January 31, 2026), accounting for information collection burden experienced by approximately 3,150 IPPS hospitals and 1,350 non-IPPS hospitals for the FY 2025 payment determination. In this proposed rule, we describe the burden changes regarding collection of information under OMB control number 0938–1022, for IPPS hospitals.

For more detailed information on our proposals for the Hospital IQR Program, we refer readers to section IX.C. of the preamble of this proposed rule. We are proposing to adopt three electronic clinical quality measures (eCQMs) beginning with the CY 2025 reporting period/FY 2027 payment determination: (1) Hospital Harm—Pressure Injury eCQM, (2) Hospital Harm—Acute Kidney Injury eCQM, and (3) Excessive Radiation Dose or Inadequate Image Quality for Diagnostic Computed Tomography (CT) in Adults (Hospital Level—Inpatient) eCQM. We are proposing to modify two measures within the Hospital IQR Program measure set beginning with the performance data from July 1, 2024 through June 30, 2025, impacting the FY 2027 payment determination: the (1) Hybrid Hospital-Wide All-Cause Risk Standardized Mortality measure and (2) the Hybrid Hospital-Wide All-Cause Risk Standardized Readmission measure. We are proposing to modify the COVID–19 Vaccination Coverage among Healthcare Personnel measure beginning with the Q4 2023 reporting period/FY 2025 payment determination. We are proposing to remove the Elective Delivery measure beginning with the CY 2024 reporting period/FY 2026 payment determination. We are proposing to remove two Medicare FFS claims-based measures: the Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) measure beginning with the April 1, 2025 through March 31, 2028 reporting period impacting the FY 2030 payment determination, and the Medicare Spending Per Beneficiary (MSPB)—Hospital measure beginning with the CY 2026 reporting period/FY 2028 payment determination. We are proposing to modify the validation targeting criteria to include any hospital with a two-tailed confidence interval that is less than 75 percent and which submitted less than four quarters of data due to receiving an extraordinary circumstances exception (ECE) for one or more quarters beginning with the FY 2027 payment determination. Lastly, we are proposing to modify data collection and reporting requirements for the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) survey measure beginning with the FY 2027 payment determination.

Our proposal to remove the Elective Delivery measure beginning with the CY 2024 reporting period/FY 2026 payment determination will result in a change of collection of information burden as detailed in this section. The remaining policies being proposed would not affect the information collection burden associated with the Hospital IQR Program.

The most recent data from the Bureau of Labor Statistics reflects a median hourly wage of $22.43 per hour for medical records specialists.[746] We calculated the cost of overhead, including fringe benefits, at 100 percent of the median hourly wage, consistent with previous years. This is necessarily a rough adjustment, both because fringe benefits and overhead costs vary significantly by employer and methods of estimating these costs vary widely in the literature. Nonetheless, we believe that doubling the hourly wage rate ($22.43 × 2 = $44.86) to estimate total cost is a reasonably accurate estimation method. Accordingly, unless otherwise specified, we will calculate cost burden to hospitals using a wage plus benefits estimate of $44.86 per hour throughout the discussion in this section of this rule for the Hospital IQR Program.

In the FY 2023 IPPS/LTCH PPS final rule (86 FR 45507), our burden estimates were based on an assumption of approximately 3,150 IPPS hospitals. For this proposed rule, based on data from the FY 2023 Hospital IQR Program payment determination, which supports this assumption, we will continue to estimate that 3,150 IPPS hospitals will report data to the Hospital IQR Program.

b. Information Collection Burden Estimate for the Proposed Removal of the Elective Delivery Measure Beginning With the CY 2024 Reporting Period/FY 2026 Payment Determination

In section IX.C.7.c of this proposed rule, we discuss the proposal to remove the Elective Delivery measure beginning with the CY 2024 reporting period/FY 2026 payment determination. In the FY 2013 IPPS/LTCH PPS final rule, we finalized a burden of 10 minutes, or 0.167 hours, per record to report this measure (77 FR 53666). The currently approved burden estimate for this measure assumes each IPPS hospital will report 76 records quarterly for this measure. We estimate a total reduction in burden of 51 hours (0.167 hours/record × 76 records × 4 quarters) at a cost of $2,288 (51 hours × $44.86) per IPPS hospital associated with the removal of this measure. For the CY 2024 reporting period and subsequent years, we estimate a total burden decrease of 160,650 hours (51 hours × 3,150 hospitals) at a cost of $7,206,759 (160,650 hours × $44.86) related to this proposal.

c. Information Collection Burden Estimate for the Proposed Adoption of Three eCQMs

Beginning with the CY 2025 Reporting Period/FY 2027 Payment Determination: (1) Hospital Harm—Pressure Injury eCQM; (2) Hospital Harm—Acute Kidney Injury eCQM; and (3) Excessive Radiation Dose or Inadequate Image Quality for Diagnostic Computed Tomography (CT) in Adults (Hospital Level—Inpatient) eCQM.

In sections IX.C.5.a., b., and c. of the preamble of this proposed rule, we are proposing to adopt three new eCQMs: (1) Hospital Harm—Pressure Injury eCQM; (2) Hospital Harm—Acute Kidney Injury eCQM; and (3) Excessive Radiation Dose or Inadequate Image Quality for Diagnostic Computed Tomography (CT) in Adults (Hospital Level—Inpatient) eCQM—beginning with the CY 2025 reporting period/FY 2027 payment determination. Current Hospital IQR Program policy requires hospitals to select three eCQMs from the eCQM measure set on which to report in addition to reporting three mandatory eCQMs for a total of six eCQMs (87 FR 49299 through 49302). In other words, although these new eCQMs are being

[746] U.S. Bureau of Labor Statistics. Occupational Outlook Handbook, Medical Records Specialists. Accessed on January 13, 2023. Available at: *https://www.bls.gov/oes/current/oes292072.htm.*

added to the eCQM measure set, hospitals are not required to report more than a total of six eCQMs. Under OMB control number 0938–1022 (expiration date January 31, 2026) and as finalized in the FY 2023 IPPS/LTCH PPS final rule, the currently approved burden estimate for reporting and submission of eCQM measures is 1 hour per IPPS hospital for all six required eCQM measures (87 FR 49387). The addition of these three eCQMs does not affect the information collection burden of submitting eCQMs under the Hospital IQR Program. As finalized in the FY 2023 IPPS/LTCH PPS final rule, current Hospital IQR Program policy requires hospitals to select six eCQMs from the eCQM measure set on which to report (87 FR 49299 through 49302). In other words, although these new eCQMs are being added to the eCQM measure set, hospitals are not required to report more than a total of six eCQMs.

With respect to any costs/burdens unrelated to data submission, we refer readers to the Regulatory Impact Analysis (section I.L. of Appendix A of this proposed rule).

d. Information Collection Burden Estimate for the Two Hybrid Measure Refinement Proposals

In sections IX.C.6.a. and b. of this proposed rule, we are proposing to modify the: (1) Hybrid Hospital-Wide All-Cause Risk Standardized Mortality measure; and (2) Hybrid Hospital-Wide All-Cause Risk Standardized Readmission measure beginning with the performance data from July 1, 2024 through June 30, 2025, impacting the FY 2027 payment determination.

Although the proposed modifications of both measures would expand the measure cohort to include MA patients, the burden associated with submission of claims data continues to be accounted for under OMB control number 0938–1197 (expiration date October 31, 2023) and the burden associated with submission of eCQM data under OMB control number 0938–1022 (expiration date March 31, 2026) remains unchanged as hospitals will not be required to submit any additional data. Therefore, we are not proposing any changes in burden associated with the proposed modifications of these measures.

e. Information Collection Burden for the Refinement of the COVID–19 Vaccination Coverage Among Healthcare Personnel (HCP) Measure Beginning With the Quarter 4 CY 2023 Reporting Period/FY 2025 Payment Determination

In the FY 2022 IPPS/LTCH PPS final rule, we finalized adoption of the COVID–19 Vaccination Coverage among Healthcare Personnel (HCP) measure for the Hospital IQR Program (86 FR 45374 through 45382). In section IX.B. of this proposed rule, we are proposing to replace the term ''complete vaccination course'' with the term ''up to date'' in the HCP vaccination definition and update the numerator to specify the time frames within which an HCP is considered up to date with recommended COVID–19 vaccines, including booster doses, beginning with the quarter 4 2023 reporting period/FY 2025 payment determination. We previously discussed information collection burden associated with this measure in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45509).

We do not believe that the use of the term ''up to date'' or the update to the numerator will impact information collection or reporting burden because the modification changes neither the amount of data being submitted nor the frequency of data submission. Additionally, because we are not proposing any updates to the form, manner, and timing of data submission for this measure, there would be no increase in burden associated with the proposal. Furthermore, the modified COVID–19 Vaccination Coverage among HCP measure would continue to be calculated using data submitted to the CDC under a separate OMB control number (0920–1317; expiration date March 31, 2026). However, the CDC currently has a PRA waiver for the collection and reporting of vaccination data under section 321 of the National Childhood Vaccine Injury Act of 1986 (Pub. L. 99–660, enacted on November 14, 1986) (NCVIA).

f. Information Collection Burden for the Proposed Removal of Two Claims-Based Measures

In sections IX.C.7.a. and b. of the preamble of this proposed rule, we are proposing to remove two claims-based measures: the Hospital-Level RSCR Following Elective Primary THA/TKA and the MSPB Hospital measures. Because these measures are calculated using Medicare FFS claims that are already reported to the Medicare program for payment purposes, removing these measures would not result in a change to the burden estimates provided in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49384 through 49392).

g. Information Collection Burden for the Proposed Modification of Validation Targeting Criteria Beginning With the FY 2027 Payment Determination

In section IX.C.11.b. of the preamble of this proposed rule, we are proposing to modify the validation targeting criteria to include any hospital with a two-tailed confidence interval that is less than 75 percent and which submitted less than four quarters of data due to receiving an ECE for one or more quarters beginning with the FY 2027 payment determination.

Because we are neither proposing to modify the number of IPPS hospitals that will be selected for validation nor the number of records each selected IPPS hospital will be required to submit, we are not proposing any changes to our currently approved burden estimates as a result of this proposal.

h. Information Collection Burden for the Proposed Modification of Data Collection and Reporting Requirements for the HCAHPS Survey Beginning With the CY 2025 Reporting Period/FY 2027 Payment Determination

In section IX.C.10.h. of the preamble of this proposed rule, we are proposing updates to the data collection and reporting for the HCAHPS survey measure beginning with the CY 2025 reporting period/FY 2027 program year. Specifically, we are proposing to: (1) add three new modes of survey administration (Web-Mail mode, Web-Phone mode, and Web-Mail-Phone mode) in addition to the current Mail Only, Telephone Only and Mail-Phone modes; (2) remove the rule that only the patient may respond to the survey and allow a patient's proxy to respond to the survey; (3) extend the data collection period for the HCAHPS Survey from 42 to 49 days; (4) limit the number of supplemental items that may be added to the HCAHPS survey for quality improvement purposes to 12 items; (5) require hospitals to collect information about the language that the patient speaks while in the hospital (whether English, Spanish, or another language), and that the official Spanish translation of the HCAHPS Survey be administered to all patients who prefer Spanish; and (6) remove two currently available options for administration of the HCAHPS survey that are not used by participating hospitals (Active Interactive Voice Response and Hospitals Administering HCAHPS for Multiple Sites).

With the exception of the proposal to remove two currently available options for administering the survey that are not in use, which CMS estimates to have no effect on the information collections, the remaining proposals are estimated to result in a five percent increase from the 2,313,192 respondents who completed and submitted the HCAHPS survey as part of the Hospital IQR Program, which equates to 115,660 additional respondents (2,313,192 × .05). We do not believe any of these proposals will affect the time required to complete the survey, which is estimated to be 7.25 minutes (0.120833 hours) per respondent, as currently approved under OMB control number 0938–0981 (expiration date September 30, 2024).

We believe that the cost for beneficiaries undertaking administrative and other tasks on their own time is a post-tax wage of $20.71/hr. The Valuing Time in U.S. Department of Health and Human Services Regulatory Impact Analyses: Conceptual Framework and Best Practices identifies the approach for valuing time when individuals undertake activities on their own time.[747] To derive the costs for beneficiaries, a measurement of the usual weekly earnings of wage and salary workers of $998, divided by 40 hours to calculate an hourly pre-tax wage rate of $24.95/hr. This rate is adjusted downwards by an estimate of the effective tax rate for median income households of about 17 percent, resulting in the post-tax hourly wage rate of $20.71/hr. Unlike our State and private sector wage adjustments, we are not adjusting beneficiary wages for fringe benefits and other indirect costs since the individuals' activities, if any, would occur outside the scope of their employment. We therefore estimate a burden increase of 13,976 hours (115,660 respondents × 0.120833 hours) at a cost of $289,443 (13,976 hours × $20.71).

We will submit the revised information collection estimates to OMB for approval under OMB control number 0938–0981.

i. Summary of Information Collection Burden Estimates for the Hospital IQR Program

In summary, under OMB control number 0938–1022 (expiration date January 31, 2026), we estimate that the policies promulgated in this proposed rule will result in a total decrease of 160,650 hours at a savings of $7,206,759 annually for 3,150 IPPS hospitals from the CY 2024 reporting period/FY 2026 payment determination through the CY 2028 reporting period/FY 2030 payment determination. Under OMB control number 0938–0981 (expiration date September 30, 2024), we estimate that the policies promulgated in this proposed rule will result in a total increase of 13,976 hours at a cost of $289,443 annually for 3,150 hospitals beginning with the CY 2025 reporting period/FY 2027 payment determination. We will submit the revised information collection estimates to OMB for approval under OMB control numbers 0938–1022 and 0938–0981.

7. ICRs for PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program

OMB has currently approved 0 hours of burden under OMB control number 0938–1175 (expiration date January 31, 2025), accounting for the annual information collection requirements for 11 PCHs for the PCHQR Program. In this proposed rule, we describe the collection of information impact under the same OMB control number for PPS-exempt cancer hospitals (PCHs).

In the proposed rule, we are proposing to adopt four new measures that we expect to affect our collection of information burden estimates: (1) the Documentation of Goals of Care Discussions Among Cancer Patients measure beginning with the FY 2026 program year; (2) the Facility Commitment to Health Equity measure beginning with the FY 2026 program year; (3) the Screening for Social Drivers of Health measure with voluntary reporting for the FY 2026 program year and mandatory reporting beginning with the FY 2027 program year; and (4) the Screen Positive Rate for Social Drivers of Health measure with voluntary reporting in the FY 2026 program year and mandatory reporting beginning with the FY 2027 program year. We are also proposing updates to the data collection and reporting for the HCAHPS survey measure (NQF #0166) beginning with the FY 2027 program year. Our burden estimates associated with these proposed policies are described later in this section.

We are also proposing policies which will not affect the information collection burden associated with the PCHQR Program. As discussed in section IX.B. of the preamble of this proposed rule, we are proposing to modify the COVID–19 Vaccination Coverage Among Healthcare Personnel (HCP) measure beginning with the FY 2025 program year. In addition, as discussed in section IX.D.9.b. of the preamble of this proposed rule, we are proposing to begin public reporting of the Surgical Treatment Complications for Localized Prostate Cancer (PCH–37) measure with the FY 2025 Program Year.

The most recent data from the Bureau of Labor Statistics reflects a median hourly wage of $22.43 per hour for a medical records specialist.[748] We calculated the cost of overhead, including fringe benefits, at 100 percent of the median hourly wage, consistent with previous years. This is necessarily a rough adjustment, both because fringe benefits and overhead costs vary significantly by employer and methods of estimating these costs vary widely in publicly available literature. Nonetheless, we believe that doubling the hourly wage rate ($22.43 × 2 = $44.86) to estimate total cost is a reasonably accurate estimation method and is consistent with OMB guidance. Accordingly, we will calculate cost burden to PCHs using a wage plus benefits estimate of $44.86 per hour throughout the discussion in this section of this proposed rule for the PCHQR Program.

a. Information Collection Burden Estimate for the Proposed Adoption of the Documentation of Goals of Care Discussions Among Cancer Patients Measure Beginning With the FY 2026 Program Year

In section IX.D.6. of the preamble of this proposed rule, we are proposing to adopt the Documentation of Goals of Care Discussions Among Cancer Patients measure beginning with the FY 2026 program year. PCHs would report data through the Hospital Quality Reporting (HQR) System on annual basis during the submission period.

Similar to other measures reported via the HQR System for the PCHQR program, we estimate a burden of no more than 10 minutes per hospital per year, as each hospital would only be required to report one aggregate numerator and denominator for all patients. Using the estimate of 10 minutes (or 0.167 hours) per PCH per year, and the updated wage estimate as described previously, we estimate that this policy will result in a total annual burden of approximately 2 hours across all PCHs (0.167 hours × 11 PCHs) at a cost of $90 (2 hours × $44.86). With respect to any costs/burdens unrelated to data submission, we refer readers to the Regulatory Impact Analysis (section I.M. of Appendix A of this proposed rule).

b. Information Collection Burden Estimate for the Proposed Facility Commitment to Health Equity Structural Measure Beginning With the FY 2026 Program Year

In section IX.D.3. of the preamble of this proposed rule, we are proposing to adopt the Facility Commitment to Health Equity Structural Measure beginning with the FY 2026 program year. This measure was previously adopted for the Hospital IQR Program in the FY 2023 IPPS/LTCH PPS final rule with an estimated burden of no more than 10 minutes per hospital per year, as it involves attesting to as many as five questions one time per year for a given reporting period (87 FR 49385). We believe the estimated burden would be the same for PCHs.

PCHs would report data through the HQR System on an annual basis during the submission period. Using the estimate of 10 minutes (or 0.167 hours) per PCH per year, and the updated wage estimate as described previously, we estimate that this policy will result in a total annual burden of approximately 2 hours across all PCHs (0.167 hours × 11 PCHs) at a cost of $90 (2 hours × $44.86). With respect to any costs/burdens unrelated to data submission, we refer readers to the Regulatory Impact Analysis (section I.M. of Appendix A of this proposed rule).

c. Information Collection Burden for the Proposed Screening for Social Drivers of Health Measure Beginning With the FY 2026 Program Year

In section IX.D.4. of the preamble of this proposed rule, we are proposing to adopt the Screening for Social Drivers of Health measure beginning with voluntary reporting in the FY 2026 program year followed by mandatory reporting on an annual basis beginning with the FY 2027 program year. This measure was previously adopted for the Hospital IQR Program in the FY 2023 IPPS/LTCH PPS final rule with an estimated burden of 2 minutes (0.033 hours) per patient to conduct this screening and 10 minutes (0.167 hours) per hospital response to transmit the measure data (87 FR 49385 through 49386). We believe the estimated burden for both patient screening and data submission would be the same for PCHs. As discussed in the preamble of this proposed rule, PCHs would be able to collect data and report the measure via multiple methods. We believe that most PCHs will likely collect data through a screening tool incorporated into their electronic health record (EHR) or other patient intake process. For data submission, PCHs would report measure data through the HQR System annually.

We believe that the cost for beneficiaries undertaking administrative and other tasks on their own time is a post-tax wage of $20.71/hr. The Valuing Time in U.S. Department of Health and Human Services Regulatory Impact Analyses: Conceptual Framework and Best Practices identifies the approach for valuing time when individuals undertake activities on their own time. To derive the costs for beneficiaries, a measurement of the usual weekly earnings of wage and salary workers of $998, divided by 40 hours to calculate an hourly pre-tax wage rate of $24.95/hr. This rate is adjusted downwards by an estimate of the effective tax rate for

[748] U.S. Bureau of Labor Statistics. Occupational Outlook Handbook, Medical Records Specialists. Accessed on January 13, 2023. Available at: *https://www.bls.gov/oes/current/oes292072.htm.*

median income households of about 17 percent, resulting in the post-tax hourly wage rate of $20.71/hr. Unlike our State and private sector wage adjustments, we are not adjusting beneficiary wages for fringe benefits and other indirect costs since the individuals' activities, if any, would occur outside the scope of their employment. Based on the most recent patient data from PCHs, approximately 275 patients will be screened annually in each PCH, for a total of 3,025 patients across all 11 PCHs. Similar to our assumptions for the Hospital IQR Program, for the purposes of calculating burden for voluntary reporting in the FY 2026 program year, we assume 50 percent of PCHs would screen 50 percent of patients. For the FY 2027 program year, we assume 100 percent of PCHs would screen 100 percent of patients. For the FY 2026 program year, we estimate that 828 total patients would be screened (6 PCHs × 138 patients) for a total annual burden for patient screening of 28 hours (828 respondents × 0.033 hours) at a cost of $580 (28 hours × $20.71). For data submission for the FY 2026 program year, we estimate a burden of 1 hour (0.167 hours × 6 PCHs) at a cost of $45 (1 hour × $44.86). For the FY 2027 program year, we estimate a total annual burden for patient screening of 101 hours (3,025 respondents × 0.033 hours) at a cost of $2,092 (101 hours × $20.71) across all PCHs. For data submission for the FY 2027 program year, we estimate a total annual burden of approximately 2 hours across all PCHs (0.167 hours × 11 PCHs) at a cost of $90 (2 hours × $44.86/hour).

With respect to any costs/burdens unrelated to data submission, we refer readers to the Regulatory Impact Analysis (section I.M. of Appendix A of this proposed rule).

d. Information Collection Burden for the Proposed Screen Positive Rate for Social Drivers of Health Measure Beginning With the FY 2026 Program Year

In section IX.D.5. of the preamble of this proposed rule, we are proposing to adopt the Screen Positive Rate for Social Drivers of Health measure with voluntary reporting in the FY 2026 program year followed by mandatory reporting on an annual basis beginning with the FY 2027 program year. This measure was previously adopted for the Hospital IQR Program in the FY 2023 IPPS/LTCH PPS final rule with an estimated burden of 10 minutes (0.167 hours) per hospital response to transmit the measure data as we estimate only the additional burden for a hospital reporting via the HQR System since patients would not need to provide any additional information for this measure (87 FR 49386). We believe the estimated burden would be the same for PCHs. Similar to our assumptions for the Hospital IQR Program, for the purposes of calculating burden for voluntary reporting in the FY 2026 program year, we assume 50 percent of PCHs would transmit measure data. For the FY 2027 program year, we assume 100 percent of PCHs would transmit measure data.

We estimate a total burden in the FY 2026 program year of 1 hour (0.167 hours × 6 PCHs) at a cost of $45 (1 hour × $44.86/hour). We estimate a total annual burden beginning with the FY 2027 program year of 2 hours across all PCHs (0.167 hours × 11 PCHs) at a cost of $90 (2 hours × $44.86).

e. Information Collection Burden Estimate for the Proposed Updates to the Data Collection and Reporting for the HCAHPS Survey Measure (NQF #0166) Beginning With the FY 2027 Program Year

In section IX.D.10. of the preamble of this proposed rule, we are proposing updates to the data collection and reporting for the HCAHPS survey measure beginning with the FY 2027 program year. Specifically, we are proposing to: (1) add three new modes of survey administration (Web-Mail mode, Web-Phone mode, and Web-Mail-Phone mode) in addition to the current Mail Only, Telephone Only and Mail-Phone modes; (2) remove the rule that only the patient may respond to the survey and allow a patient's proxy to respond to the survey; (3) extend the data collection period for the HCAHPS Survey from 42 to 49 days; (4) limit the number of supplemental items that may be added to the HCAHPS survey for quality improvement purposes to 12 items; (5) require hospitals to collect information about the language that the patient speaks while in the hospital (whether English, Spanish, or another language), and that the official Spanish translation of the HCAHPS Survey be administered to all patients who prefer Spanish; and (6) remove two currently available options for administration of the HCAHPS Survey that are not used by participating hospitals (Active Interactive Voice Response and Hospitals Administering HCAHPS for Multiple Sites).

With the exception of the proposal to remove two currently available options for administering the survey that are not in use, the remaining proposals are estimated to result in a 5 percent increase from the 13,064 respondents who completed and submitted the HCAHPS survey as part of the PCHQR program, which equates to 653 additional respondents (13,064 × 5 percent). We do not believe any of these proposals will affect the time required to complete the survey, which is estimated to be 7.25 minutes (0.120833 hours) per respondent, as currently approved under OMB control number 0938–0981 (expiration date September 30, 2024). We therefore estimate a burden increase of 79 hours (653 respondents × 0.120833 hours/respondent) at a cost of $1,636 (79 hours × $20.71).

We will submit the revised information collection estimates to OMB for approval under OMB control number 0938–0981.

f. Information Collection Burden Estimate for the Proposal To Modify the COVID–19 Vaccination Coverage Among Healthcare Personnel (HCP) Measure Beginning With the FY 2025 Program Year

In the FY 2022 IPPS/LTCH PPS final rule, we finalized to adopt the COVID–19 Vaccination Coverage Among Healthcare Personnel (HCP) Measure for the PCHQR Program (86 FR 45428 through 45434). In section IX.B. of the preamble of this proposed rule, we are proposing to modify the COVID–19 Vaccination Coverage Among HCP Measure to replace the term ''complete vaccination course'' with the term ''up to date'' in the HCP vaccination definition and update the numerator to specify the time frames within which an HCP is considered up to date with recommended COVID–19 vaccines, including booster doses, beginning with the FY 2025 program year. We previously discussed information collection burden associated with this measure in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45513).

We do not believe that the change in terminology to refer to ''up to date'' instead of ''complete vaccination course'' will impact information collection or reporting burden because the modification changes neither the amount of data being submitted nor the frequency of data submission. Furthermore, the COVID–19 HCP measure will be calculated using data submitted to the CDC under a separate OMB control number (0920–1317; expiration date January 31, 2024).

g. Information Collection Burden Estimate for the Proposal To Begin Public Reporting of the Surgical Treatment Complications for Localized Prostate Cancer (PCH–37) Measure Beginning With the FY 2025 Program Year Data

In section IX.D.9.b. of the preamble of this proposed rule, we are proposing to

begin public reporting of the Surgical Treatment Complications for Localized Prostate Cancer (PCH–37) measure beginning with the FY 2025 program year data. Because this measure was previously finalized for inclusion in the PCHQR Program and we are not requiring PCHs to collect or submit any additional data, we do not estimate any change in information collection burden associated with this proposal.

h. Summary of Information Collection Burden Estimates for the PCHQR Program

In summary, under OMB control number 0938–1175 (expiration date January 31, 2025), we estimate that the policies promulgated in this proposed rule will result in a total increase of 109 hours at a cost of $2,452 annually for 11 PCHs from the FY 2026 program year through the FY 2027 program year. The subsequent tables summarize the total burden changes for each respective FY program year compared to our currently approved information collection burden estimates (the table for the FY 2027 program year reflects the total burden change associated with all proposals). Under OMB control number 0938–0981 (expiration date September 30, 2024), we estimate that the policies promulgated in this proposed rule will result in a total increase of 79 hours at a cost of $1,636 annually for 11 PCHs beginning with the FY 2027 program year. The total increase in burden associated with this information collection is approximately 188 hours at a cost of $4,088. We will submit the revised information collection estimates to OMB for approval under OMB control numbers 0938–1175 and 0938–0981.

8. ICRs for the Long-Term Care Hospital Quality Reporting Program (LTCH QRP)

An LTCH that does not meet the requirements of the LTCH QRP for a fiscal year will receive a 2-percentage point reduction to its otherwise applicable annual update for that fiscal year.

We believe that the burden associated with the LTCH QRP is the time and effort associated with complying with the requirements of the LTCH QRP. In sections IX.C. and IX.E. of the preamble of this proposed rule, we are proposing to modify one measure, adopt two measures and remove two measures from the LTCH QRP, and increase the LTCH QRP data completion thresholds for the LCDS items. The following is a discussion of these information collections, some of which have already received OMB approval.

As stated in section IX.E. of the preamble of this proposed rule, we are proposing that LTCHs submit data on one modified quality measure, the HCP COVID–19 Vaccine measure beginning with the FY 2025 LTCH QRP. LTCHs would be required to report the modified measure data to the CDC's NHSN. The burden associated with the HCP COVID–19 Vaccine measure is accounted for under the CDC PRA package currently approved under OMB control number 0920–1317 (expiration 1/31/2024). Because we are not proposing any updates to the form, manner, and timing of data submission for this measure, there would be no increase in burden associated with the proposal. We refer readers to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45448 through 45449) for these proposed policies.

In section IX.E.4.a. of the preamble of this proposed rule, we propose the DC Function measure beginning with the FY 2025 LTCH QRP. This assessment-based quality measure would be calculated using data from the LCDS that are already reported to the Medicare program for payment and other quality reporting purposes. There would be no additional burden for LTCHs because the proposal would not require LTCHs to report new data elements.

In section IX.E.4.b and IX.E.4.c. of the preamble of this proposed rule, we propose to remove the Application of Functional Assessment/Care Plan and Functional Assessment/Care Plan measures beginning with the FY 2025 LTCH QRP. We estimate that the proposed removal of these two measures would result in a decrease of 0.1 hour (0.6 minutes/60 minutes) minutes of clinical staff time at admission and a decrease of 0.005 hour (0.3 minutes/60 minutes) of clinical staff time at the time of planned discharge beginning with the FY 2025 LTCH QRP. We believe the LCDS items affected by the proposed removal of these two measures are completed by Registered Nurses (RN), Licensed Practical and Licensed Vocational Nurses (LVN), Speech-Language Pathologists (SLP), Occupational Therapists (OT), and/or Physical Therapists (PT) depending on the item. We identified the staff type per item based on past LTCH burden calculations. Our assumptions for staff type were based on the categories generally necessary to perform an assessment. Individual providers determine the staffing resources necessary; therefore, we averaged the national average for these labor types and established a composite cost estimate. This composite estimate was calculated by weighting each salary based on the following breakdown regarding provider types most likely to collect this data: OT 50 percent; PT 40 percent; RN 5 percent; LVN 2.5 percent; SLP 2.5 percent. For the purposes of calculating the costs associated with the collection of information requirements, we obtained mean hourly wages for these staff from the U.S. Bureau of Labor Statistics' May 2021 National Occupational Employment and Wage Estimates.[749] To account for overhead and fringe benefits, we have doubled the hourly wage. These amounts are detailed in Table XII.B.–05.

TABLE XII.B–05: U.S. BUREAU OF LABOR AND STATISTICS' MAY 2021 NATIONAL OCCUPATIONAL EMPLOYMENT AND WAGE ESTIMATES

Occupation title	Occupation code	Mean hourly wage ($/hr)	Overhead and fringe benefit ($/hr)	Adjusted hourly wage ($/hr)
Registered Nurse (RN)	29–1141	$39.78	$39.78	$79.56
Licensed Vocational Nurse (LVN)	29–2061	24.93	24.93	49.86
Speech Language Pathologist (SLP)	29–1127	41.26	41.26	82.52
Physical Therapist (PT)	29–1123	44.67	44.67	89.34
Occupational Therapist (OT)	29–1122	43.02	43.02	86.04

As a result of these two measure removal proposals, the estimated burden and cost for LTCHs for complying with requirements of the FY 2025 LTCH QRP will decrease. We believe that the removal of the measure would result in a decrease of 18 seconds (0.3 min or 0.005 hr) of clinical staff time at admission beginning with the FY 2025 LTCH QRP. We believe that the LCDS item affected by the proposed removal of the Application of Functional Assessment/Care Plan measure is completed by Occupational Therapists (OT), Physical Therapists (PT), Registered Nurses (RN), Licensed Practical and Licensed Vocational Nurses (LVN), and/or Speech-Language Pathologists (SLP) depending on the functional goal selected. We identified the staff type per LCDS item based on past LCDS burden calculations. Our assumptions for staff type were based on the categories generally necessary to perform an assessment, however, individual LTCHs determine the staffing resources necessary. Therefore, we averaged BLS' National Occupational Employment and Wage Estimates (See Table XII.B–05) for these labor types and established a composite cost estimate using our adjusted wage estimates. The composite estimate of $86.2085/hr was calculated by weighting each hourly wage based on the following breakdown regarding provider types most likely to collect this data: OT 45 percent at $86.04/hr; PT 45 percent at $89.34/hr; RN 5 percent at $79.56/hr; LVN 2.5 percent at $49.86/hr; and SLP 2.5 percent at $82.52/hr.

Specifically, we believe that there will be a 0.01 hour decrease in clinical staff time to report data for each LCDS completed at admission and a 0.005 hour decrease in clinical staff time to report data for each LCDS completed for planned discharges. Using data

[749] *https://www.bls.gov/oes/current/oes_nat.htm.*

collected for CY 2021, we estimate 148,088 admissions and 111,251 planned discharges from 330 LTCHs annually. This equates to a decrease of 1,480.88 hours in burden at admission for all LTCHs (0.01 hour × 148,088 admissions), and a decrease of 556.255 hours in burden for planned discharges for all LTCHs (0.005 hour × 111,251 planned discharges).

Given 0.3 minutes of occupational therapist time at $86.04 per hour, 0.24 minutes of physical therapist time at $89.34 per hour, 0.03 minutes registered nurse time at $79.56 per hour, 0.015 minutes of licensed vocational nurse time at $49.86 per hour, and 0.015 minutes of speech language pathologist time at $82.52 per hour to complete an average of 449 LCDS admission assessments and 337 LCDS planned discharge assessments per provider per year, we estimated the total cost will be decreased by $175,610 for all LTCHs annually (1,481 hours at admission + 556 hours at discharge = 2,037 total hours; 2,037 hours × $86.21 composite wage = $175,618.35) or $532.18 per LTCH annually ($175,618.35/330 LTCHs).

In section IX.E.8.a. of the preamble of this proposed rule, we propose that beginning with the FY 2026 payment determination, LTCHs must report 100 percent of the required quality measures data and standardized patient assessment data collected using the LCDS on at least 90 percent of the assessments they submit through the CMS designated submission system. Because LTCHs have been required to submit LCDS assessments in this manner since October 1, 2012, there would be no increase in burden to LTCH providers associated with the proposal.

In section IX.E.4.d. of the preamble of this proposed rule, we propose to adopt the Patient/Resident COVID–19 Vaccine measure beginning with the FY 2026 LTCH QRP. The proposed measure would be collected using the LCDS. The LCDS V5.0 has been approved under OMB control number 0938–1163 (Expiration date: 08/31/2025). One data element would be added to the LCDS in order to allow for collection of this measure and would result in an increase of 0.005 hours (0.3 minutes/60) of clinical staff time at discharge. Using data collected for CY 2021, we estimate a 148,965 total discharges (that is planned, unplanned, and expired) from 330 LTCHs annually. This equates to an increase of 744.825 hours for all LTCHs (148,965 × 0.005 hrs) and 2.26 hours per LTCH.

We believe that the additional COVID–19 vaccine data element will be completed equally by RNs and LVNs. Individual LTCHs determine the staffing resources necessary. We averaged BLS' National Occupational Employment and Wage Estimates (See Table XII.B–05) for these labor types and established a composite cost estimate using our adjusted wage estimates. The composite estimate of $64.71/hr was calculated by weighting each hourly wage equally ([(148,965 assessments × 0.50 = 372.42 hours) × $79.56/hr] + [(148,965 assessments*0.50 = 372.42 hours) × $49.86/hr] = $48,199); ($48,199/744.825 total hours). We estimated the total cost will be increased by $146.05 per LTCH annually, or $48,197.63 for all LTCHs annually.

As described in following table, under OMB control number 0938–1163, we estimate that the policies proposed in this proposed rule for the LTCH QRP will result in an overall decrease of 1,292.31 hours annually for 330 LTCHs. The total cost decrease related to this information collection is approximately $127,420.728. The decrease in burden will be accounted for in a revised information collection request under OMB control number (0938–1163).

	Per LTCH		All LTCHs	
Proposal	Change in Annual Burden Hours	Change in Annual Cost ($)	Change in Annual Burden Hours	Change in Annual Cost ($

9. ICRs for the Medicare Promoting Interoperability Program

a. Historical Background

In section IX.F. of the preamble of this proposed rule, we discuss several proposed policies for the Medicare Promoting Interoperability Program. OMB has currently approved 29,588 hours of burden and approximately $1.3 million under OMB control number 0938–1278 (expiration date August 31, 2025), accounting for information collection burden experienced by approximately 3,150 eligible hospitals and 1,350 CAHs for the EHR reporting period in CY 2023. In this proposed rule, we describe the burden changes regarding collection of information under OMB control number 0938–1278 for eligible hospitals and CAHs. The collection of information burden analysis in this proposed rule focuses on all eligible hospitals and CAHs that could participate in the Medicare Promoting Interoperability Program and attest to the objectives and measures, and report eCQMs, under the Medicare Promoting Interoperability Program for the EHR reporting periods in CY 2024 and CY 2025.

For more detailed information on our proposed policies for the Medicare Promoting Interoperability Program, we refer readers to section IX.F. of the preamble of this proposed rule. We are proposing several policies which will not affect the information collection burden associated with the Medicare Promoting Interoperability Program. We are proposing to adopt three electronic clinical quality measures (eCQMs) beginning with the CY 2025 reporting period: (1) Hospital Harm—Pressure Injury eCQM; (2) Hospital Harm—Acute Kidney Injury eCQM; and (3) Excessive Radiation Dose or Inadequate Image Quality for Diagnostic Computed Tomography (CMT) in Adults eCQM. We are also proposing to modify the SAFER Guides measure to require eligible hospitals and CAHs to submit a ''yes'' attestation to fulfill the measure beginning with the EHR reporting period in CY 2024. Lastly, we are proposing to establish an EHR reporting period of a minimum of any continuous 180-day period in CY 2025.

The most recent data from the Bureau of Labor Statistics reflects a median hourly wage of $22.43 per hour for a medical records specialist.[750] We calculated the cost of overhead, including fringe benefits, at 100 percent of the median hourly wage, consistent with previous years. This is necessarily a rough adjustment, both because fringe benefits and overhead costs vary significantly by employer and methods of estimating these costs vary widely in publicly available literature. Nonetheless, we believe that doubling the hourly wage rate ($22.43 × 2 = $44.86) to estimate total cost is a reasonably accurate estimation method and is consistent with OMB guidance. Accordingly, we will calculate cost burden to hospitals using a wage plus benefits estimate of $44.86 per hour throughout the discussion in this section of this rule for the Medicare Promoting Interoperability Program.

In the FY 2023 IPPS/LTCH PPS final rule (87 FR 49392), our burden estimates were based on an assumption of 4,500 eligible hospitals and CAHs. For this proposed rule, based on data from the EHR reporting period in CY 2021, we continue to estimate 3,150 eligible hospitals and 1,350 CAHs will report data to the Medicare Promoting Interoperability Program, for a total number of 4,500 respondents.

b. Information Collection Burden Estimate for the Proposed Adoption of Three eCQMs Beginning With the CY 2025 Reporting Period: (1) Hospital Harm—Pressure Injury eCQM; (2) Hospital Harm—Acute Kidney Injury eCQM; and (3) Excessive Radiation Dose or Inadequate Image Quality for Diagnostic Computed Tomography (CT) in Adults eCQM

In sections IX.F.7.a.(2). of the preamble of this proposed rule, we are proposing adoption of three new eCQMs beginning with the CY 2025 reporting period: (1) Hospital Harm—Pressure Injury eCQM; (2) Hospital Harm—Acute Kidney Injury eCQM; and (3) Excessive Radiation Dose or Inadequate Image Quality for Diagnostic Computed Tomography (CT) in Adults eCQM.

The addition of these three eCQMs does not affect the information collection burden of submitting eCQMs under the Medicare Promoting Interoperability Program. Current policy requires eligible hospitals and CAHs to select three eCQMs from the eCQM measure set on which to report in addition to reporting three mandatory eCQMs for a total of six eCQMs (87 FR 49365 through 49367). In other words, although these new eCQMs are being added to the eCQM measure set, eligible hospitals and CAHs are not required to report more than a total of six eCQMs.

With respect to any costs/burdens unrelated to data submission, we refer readers to the Regulatory Impact Analysis (section I.O of Appendix A of this proposed rule).

c. Information Collection Burden Estimate for the Proposed Modification to the SAFER Guides Measure

In section IX.F.3. of the preamble of this proposed rule, we are proposing to modify the SAFER Guides measure to require eligible hospitals and CAHs to submit a ''yes'' attestation to fulfill the measure beginning with the EHR reporting period in CY 2024. In the CY 2022 IPPS/LTCH PPS final rule, we adopted the SAFER Guides measure and required eligible hospitals and CAHs to attest ''yes'' or ''no'' as to whether they completed an annual self-assessment on each of the nine SAFER Guides at any point during the calendar year in which their EHR reporting period occurs (86 FR 45479 through 45481).

Because we are not proposing to modify the information that eligible hospitals and CAHs will be required to submit but are instead requiring an attestation of ''yes'', we are not proposing any changes to our currently approved burden estimates as a result of this proposal.

With respect to any costs/burdens unrelated to data submission, we refer readers to the Regulatory Impact Analysis (section I.O. of Appendix A of this proposed rule).

d. Information Collection Burden for the Proposal To Establish an EHR Reporting Period of a Minimum of Any Continuous 180-Day Period in CY 2025

In section IX.F.2.a. of the preamble of this proposed rule, we are proposing to establish an EHR reporting period of a minimum of any continuous 180-day period in CY 2025. Because we are not proposing to modify the type or amount of data each eligible hospital and CAH will be required to submit, we are not proposing any changes to our currently approved burden estimates as a result of this proposal.

e. Summary of Estimates Used To Calculate the Collection of Information Burden

In summary, under OMB control number 0938–1278 (expiration date August 31, 2025), we estimate that the policies in this proposed rule will not result in a change in burden. We continue to estimate an annual burden of 6.6 hours per eligible hospital and CAH as well as an additional 4 hours annually for CAHs to report eCQMs.

10. ICRs Regarding Special Requirements for Rural Emergency Hospitals (REHs) (§ 488.70)

The proposed special requirements for REHs would require an eligible facility (a CAH or a small rural hospital with not more than 50 beds) to submit additional information that must include an action plan containing four specific elements when the facility submits an application for enrollment as an REH. The estimated burden related to this proposed regulation is discussed below.

a. Sources of Data Used in Estimates of Burden Hours and Cost Estimates

For the estimated costs contained in the analysis below, we used data from the U.S. Bureau of Labor Statistics (BLS) to determine the mean hourly wage for the positions used in this analysis.[751] For the total hourly cost, we doubled the mean hourly wage for a 100 percent increase to cover overhead and fringe benefits, according to standard HHS estimating procedures. If the total cost after doubling resulted in 0.50 or more, the cost was rounded up to the next dollar. If it was 0.49 or below, the total cost was rounded down to the next dollar. The total costs used in this analysis are indicated in Table 1.

b. Burden Associated With Submission of Additional Information on the Action and Transition Plans for Enrollment as an REH

We are proposing that an eligible facility that submits an application for enrollment as an REH under section 1866(j) of the Act must also submit additional information as specified in this proposed rule. In accordance with section 1861(kkk)(4)(A)(i) through (iv) of the Act, we specifically propose to require an eligible facility to submit additional information that must include an action plan containing: (1) a plan for initiating REH services (as those services are defined in 42 CFR 485.502, and which must include the provision of emergency department services and observation care); (2) a detailed transition plan that lists the specific services that the provider will retain, modify, add, and discontinue as an

[750] U.S. Bureau of Labor Statistics. Occupational Outlook Handbook, Medical Records and Health Information Technicians. Accessed on January 13, 2023. Available at: *https://www.bls.gov/ooh/healthcare/medical-records-and-health-information-technicians.htm.*

[751] BLS. *May 2020 National Occupational Employment and Wage Estimates United States.* United States Department of Labor. Accessed at *https://www.bls.gov/oes/current/naics4_551100.htm.* Accessed on February 8, 2023.

REH; (3) a detailed description of other outpatient medical and health services that it intends to furnish on an outpatient basis as an REH; and (4) information regarding how the provider intends to use the additional facility payment provided under section 1834(x)(2) of the Act, including a description of the services that the additional facility payment would be supporting, such as the operation and maintenance of the facility and the furnishing of covered services (for example, telehealth services and ambulance services).

We estimate that approximately 68 eligible facilities (that is, CAHs and small rural hospitals with not more than 50 beds) would elect to convert to REHs. This is the same estimate used in the final rule titled ''Medicare Program: Hospital Outpatient Prospective Payment and Ambulatory Surgical Center Payment Systems and Quality Reporting Programs; Organ Acquisition; Rural Emergency Hospitals: Payment Policies, Conditions of Participation, Provider Enrollment, Physician Self-Referral; New Service Category for Hospital Outpatient Department Prior Authorization Process; Overall Hospital Quality Star Rating; COVID–19,'' which was published in the November 23, 2022 **Federal Register** (87 FR 71748).[752]

We estimate that it would take each CAH or small rural hospital 4 hours to prepare this action plan containing the four required elements specified above. We further estimate that the annual time burden across all 68 facilities would be 272 hours (4 hours × 68 facilities).

We believe that the person at the facility who would perform this task would be the hospital administrator or CEO. This person would fall under the U.S. Bureau of Labor Statistics job category of Medical and Health Services Manager. According the U.S. Bureau of Labor Statistics, the mean hourly wage for a Medical and Health Services Manager is $57.61 [753] This wage, adjusted for the employer's fringe benefits and overhead would be $115.

We estimate that the cost burden to each facility for preparing the action plan containing the four required elements would be $460 (4 hours × $115). We further estimate that the cost burden across all CAHs and small rural hospitals converting to REHs would be $31,280 (272 hours × $115 per hour).

It is important to note that this is a one-time burden to the facility. After this task has been completed, this burden will be non-recurring. The information collection request under the OMB control number 0938–NEW will be sent to OMB for approval.

11. ICRs for Physician-Owned Hospitals

As discussed in section X.B. of the preamble of this proposed rule, we are proposing to make changes pertaining to the process for physician-owned hospitals requesting an exception from the prohibition against facility expansion and program integrity restrictions on approved facility expansion.

Specifically, we are proposing to make certain technical and clarifying changes to the information that must be submitted for an expansion exception request. These changes include: (1) providing an email address as well as a hardcopy mailing address for the contact person for the hospital; (2) providing the names of any counties in which the hospital provides inpatient or outpatient hospital services or plans to provide inpatient or outpatient hospital services if CMS approves the request, in addition to the name of the county in which the main campus of the requesting hospital is located; (3) providing a statement and, if available, supporting documentation regarding the hospital's compliance with the requirement that it does not discriminate against beneficiaries of Federal health care programs and does not permit physicians practicing at the hospital to discriminate against such beneficiaries (as opposed to merely stating that it complies with this criterion); (4) providing information regarding whether and how the hospital has used any expansion facility capacity approved in a prior request and whether it plans to use expansion facility capacity to provide specialty services if the request is approved; (5) providing information regarding the requesting hospital's need for additional operating rooms, procedure rooms, or beds to serve Medicaid, uninsured, and underserved populations; and (6) providing information regarding the need for additional operating rooms, procedure rooms, or beds in the county in which the main campus of the hospital is located, any county in which the hospital provides inpatient or outpatient hospital services as of the date the hospital submits the request, and any county in which the hospital plans to provide inpatient or outpatient hospital services if CMS approves the request. In addition, we are proposing to require electronic submission of requests following instructions posted on the CMS website and eliminate the option to mail hard copy requests and the requirement to mail an original hard copy of the signed certification statement to CMS. We are also proposing to eliminate the use of external data sources for determining whether a hospital meets the criteria for an applicable hospital or high Medicaid facility. Finally, we are proposing to reinstate, with respect to high Medicaid facilities, the program integrity restrictions on the frequency of expansion exception requests at proposed § 411.362(c)(1)(ii)(B), which provides that a hospital is not eligible to make an expansion exception request unless it has been at least 2 calendar years from the date of the most recent decision by CMS approving or denying the hospital's most recent request for an exception from the prohibition on facility expansion.

We do not believe any of these proposals would result in any changes in burden under the PRA. The proposed changes to the information being submitted are technical or clarifying in nature, and we do not anticipate that they will meaningfully affect the time needed to prepare and submit a request. In addition, we do not anticipate that the proposed changes will affect the annual number of respondents. We are not proposing any changes to the definitions of an applicable hospital or a high Medicaid facility, and we anticipate that requiring the use of HCRIS data for all comparison calculations would have little practical impact on whether a requesting hospital meets the criteria for an applicable hospital or high Medicaid facility. Also, although our regulations have permitted high Medicaid facilities to request an exception to the prohibition on expansion of facility capacity more frequently than once every 2 years since January 1, 2021, no high Medicaid facility has made a request more frequently than every 2 years.

While the proposed information collection would normally be subject to the PRA, we believe in this instance it is exempt. The universe of potential respondents is extremely small and represents a tiny fraction of the hospital industry. The expansion exception process is available only to ''grandfathered'' hospitals with physician ownership and a Medicare provider agreement on December 31, 2010 that also meet the criteria for an applicable hospital or high Medicaid facility. As stated in the CY 2021 OPPS final rule (85 FR 86255), an applicable hospital means a hospital: (1) that is located in a county in which the percentage increase in the population during the most recent 5-year period (as of the date that the hospital submits its

[752] *https://www.federalregister.gov/d/2022-23918/p-4515.*

[753] *https://www.bls.gov/oes/current/oes119111.htm.*

request for an exception to the prohibition on expansion of facility capacity) is at least 150 percent of the percentage increase in the population growth of the State in which the hospital is located during that period, as estimated by the Bureau of the Census; (2) whose annual percent of total inpatient admissions under Medicaid is equal to or greater than the average percent with respect to such admissions for all hospitals in the county in which the hospital is located during the most recent 12-month period for which data are available (as of the date that the hospital submits its request for an exception to the prohibition on expansion of facility capacity); (3) that does not discriminate against beneficiaries of Federal health care programs and does not permit physicians practicing at the hospital to discriminate against such beneficiaries; (4) that is located in a state in which the average bed capacity in the state is less than the national average bed capacity; and (5) that has an average bed occupancy rate that is greater than the average bed occupancy rate in the State in which the hospital is located. In the same final rule we explained a high Medicaid facility means a hospital that: (1) is not the sole hospital in a county; (2) with respect to each of the three most recent 12-month periods for which data are available, has an annual percent of total inpatient admissions under Medicaid that is estimated to be greater than such percent with respect to such admissions for any other hospital located in the county in which the hospital is located; and (3) does not discriminate against beneficiaries of Federal health care programs and does not permit physicians practicing at the hospital to discriminate against such beneficiaries. These criteria greatly limit the universe of potential respondents. For example, hospitals that provide only specialized services often do not have the same or a higher percentage of Medicaid inpatient admissions as general acute care hospitals in the counties in which they are located and, thus, could not meet the threshold criteria to use the expansion exception process. The number of potential respondents is further reduced to include only those hospitals with the desire and resources to expand their facility capacity, and then limited to those that can meet applicable state or local requirements for expansion (such as certificate of need). Given all of these factors, we estimate that we would receive one expansion exception request per year. This estimate is consistent with our experience with the expansion exception process to date. Since January 1, 2012 (the effective date of the regulations setting forth the expansion exception process), on average, we have received approximately one expansion exception request per year. Therefore, in accordance with the implementing regulations of the PRA at 5 CFR 1320.3(c)(4), the proposed collection would be exempt as it affects less than 10 entities in a 12-month period. Although we believe the proposed information collection would be exempt, we note that we estimate that it takes approximately 6 hours and 45 minutes to prepare an expansion exception request and that a request is prepared by a lawyer. To estimate the cost to prepare a request, we use a 2021 wage rate of $71.17 for lawyers from the Bureau of Labor Statistics,[754] and we double that wage to account for overhead and benefits. The total estimated annual cost is $960.79.

12. ICRs for Disclosures of Ownership and Additional Disclosable Parties Information

As explained in section X.E. of the preamble of this proposed rule, we propose that the private equity company (PEC) and real estate investment trust (REIT) definitions that we proposed in the Disclosures proposed rule (published on February 15, 2023)[755] and referenced in section X.E. of the preamble of this proposed rule apply to all providers and suppliers completing the Form CMS–855A enrollment application (OMB Control No. 0938–0685)), not merely skilled nursing facilities. This is consistent with our proposal on December 15, 2022 to revise the Form CMS–855A application in a Paperwork Reduction Act submission (87 FR 76626) to require all owning and managing entities listed on any provider's or supplier's Form CMS–855A submission to disclose whether they are a PEC or a REIT.[756]

There would be five types of Form CMS–855A transactions via which we believe providers and suppliers would report PEC and REIT data: (1) initial enrollment applications; (2) change of ownership applications; (3) revalidation applications; (4) reactivation applications; and (5) change of information applications.

Form CMS–855A applications are typically completed by the provider's or supplier's office staff. Consequently, we will use the following categories and hourly wage rates from the U.S. Bureau of Labor Statistics' (BLS) May 2021 National Occupational Employment and Wage Estimates for all salary estimates (*http://www.bls.gov/oes/current/oes_nat.htm*):

TABLE XII.B-06: NATIONAL OCCUPATIONAL EMPLOYMENT AND WAGE ESTIMATES

Occupation Title	Occupation Code	Mean Hourly Wage ($/hr)	Fringe Benefits and Overhead ($/hr)	Adjusted Hourly Wage ($/hr)
Office and Administrative Support Workers, All Other	43-9199	20.47	20.47	40.94

Based on our internal data, we estimate that the following number of Form CMS–855A applications would be submitted reporting PEC or REIT data: (1) 6,462 initial applications; (2) 3,105 changes of ownership; (3) 3,133 revalidations; (4) 610 reactivations; and (5) 27,000 changes of information. Furthermore, we project that it would take an average of 12 minutes to furnish the PEC and REIT data, though we recognize that this will vary by Form

[754] U.S. Department of Labor, Bureau of Labor Statistics, May 2021 National Occupational Employment and Wage Estimates United States, *https://www.bls.gov/oes/current/oes_nat.htm.*

[755] Medicare and Medicaid Programs; Disclosures of Ownership and Additional Disclosable Parties Information for Skilled Nursing Facilities and Nursing Facilities (88 FR 9820).

[756] *https://www.cms.gov/regulations-and-guidance/legislation/paperworkreductionactof1995/pra-listing/cms-855a.*

CMS–855A transaction type and the amount of the data the particular provider or supplier must disclose.

We note that while the 12-minute estimate is consistent with our time-per-response projection in the aforementioned Form CMS–855A PRA package, the (1) number of affected providers and suppliers and (2) total hour and cost projections are not. After further consideration, we believe these two estimates we made in the PRA package are significantly too low. In the final PRA package associated with our Form CMS–855A revision, we will revise these numbers to reflect the figures outlined in the previous paragraph, which we believe are more accurate. The reinstated information collection request under the OMB control number 0938–0685 will be sent to OMB for approval.

TABLE XII.B-07: HOUR AND BURDEN ESTIMATES FOR PEC AND REIT PROVISIONS

	OMB Control No.	Number of Respondents	Number of Responses	Burden per Response (hours)	Total Annual Burden (hours)	Hourly Labor Cost of Reporting ($) (includes 100% fringe benefits) *	Total Cost ($)

Addendum—Schedule of Standardized Amounts, Update Factors, Rate-of-Increase Percentages Effective With Cost Reporting Periods Beginning on or After October 1, 2023, and Payment Rates for LTCHs Effective for Discharges Occurring On or After October 1, 2023

I. Summary and Background

In this Addendum, we are setting forth a description of the methods and data we used to determine the proposed prospective payment rates for Medicare hospital inpatient operating costs and Medicare hospital inpatient capital-related costs for FY 2024 for acute care hospitals. We also are setting forth the rate-of-increase percentage for updating the target amounts for certain hospitals excluded from the IPPS for FY 2024. We note that, because certain hospitals excluded from the IPPS are paid on a reasonable cost basis subject to a rate-of-increase ceiling (and not by the IPPS), these hospitals are not affected by the proposed figures for the standardized amounts, offsets, and budget neutrality factors. Therefore, in this proposed rule, we are setting forth the rate-of-increase percentage for updating the target amounts for certain hospitals excluded from the IPPS that would be effective for cost reporting periods beginning on or after October 1, 2023. In addition, we are setting forth a description of the methods and data we used to determine the proposed LTCH PPS standard Federal payment rate that would be applicable to Medicare LTCHs for FY 2024.

In general, except for SCHs and MDHs, for FY 2024, each hospital's payment per discharge under the IPPS is based on 100 percent of the Federal national rate, also known as the national adjusted standardized amount. This amount reflects the national average hospital cost per case from a base year, updated for inflation.

SCHs are paid based on whichever of the following rates yields the greatest aggregate payment: the Federal national rate (including, as discussed in section IV.G. of the preamble of this proposed rule, uncompensated care payments under section 1886(r)(2) of the Act); the updated hospital-specific rate based on FY 1982 costs per discharge; the updated hospital-specific rate based on FY 1987 costs per discharge; the updated hospital-specific rate based on FY 1996 costs per discharge; or the updated hospital-specific rate based on FY 2006 costs per discharge.

Under section 1886(d)(5)(G) of the Act, MDHs historically were paid based on the Federal national rate or, if higher, the Federal national rate plus 50 percent of the difference between the Federal national rate and the updated hospital-specific rate based on FY 1982 or FY 1987 costs per discharge, whichever was higher. However, section 5003(a)(1) of Public Law 109–171 extended and modified the MDH special payment provision that was previously set to expire on October 1, 2006, to include discharges occurring on or after October 1, 2006, but before October 1, 2011. Under section 5003(b) of Public Law 109–171, if the change results in an increase to an MDH's target amount, we must rebase an MDH's hospital specific rates based on its FY 2002 cost report. Section 5003(c) of Public Law 109–171 further required that MDHs be paid based on the Federal national rate or, if higher, the Federal national rate plus 75 percent of the difference between the Federal national rate and the updated hospital specific rate. Further, based on the provisions of section 5003(d) of Public Law 109–171, MDHs are no longer subject to the 12-percent cap on their DSH payment adjustment factor. Under current law, the Medicare-dependent, small rural hospital (MDH) program is effective through FY 2024.

As discussed in section V.A.2. of the preamble of this proposed rule, section 1886(n)(6)(B) of the Act was amended to specify that the adjustments to the applicable percentage increase under section 1886(b)(3)(B)(ix) of the Act apply to subsection (d) Puerto Rico hospitals that are not meaningful EHR users, effective beginning FY 2022. In general, Puerto Rico hospitals are paid 100 percent of the national standardized amount and are subject to the same national standardized amount as subsection (d) hospitals that receive the full update. Accordingly, our discussion later in this section does not include references to the Puerto Rico standardized amount or the Puerto Rico-specific wage index.

As discussed in section II. of this Addendum, we are proposing to make changes in the determination of the prospective payment rates for Medicare inpatient operating costs for acute care hospitals for FY 2024. In section III. of this Addendum, we discuss our proposed policy changes for determining the prospective payment rates for Medicare inpatient capital-related costs for FY 2024. In section IV.

of this Addendum, we are setting forth the rate-of-increase percentage for determining the rate-of-increase limits for certain hospitals excluded from the IPPS for FY 2024. In section V. of this Addendum, we discuss proposed policy changes for determining the LTCH PPS standard Federal rate for LTCHs paid under the LTCH PPS for FY 2024. The tables to which we refer in the preamble of this proposed rule are listed in section VI. of this Addendum and are available on the CMS website.

II. Proposed Changes to Prospective Payment Rates for Hospital Inpatient Operating Costs for Acute Care Hospitals for FY 2024

The basic methodology for determining prospective payment rates for hospital inpatient operating costs for acute care hospitals for FY 2005 and subsequent fiscal years is set forth under § 412.64. The basic methodology for determining the prospective payment rates for hospital inpatient operating costs for hospitals located in Puerto Rico for FY 2005 and subsequent fiscal years is set forth under §§ 412.211 and 412.212. In this section, we discuss the factors we are proposing to use for determining the proposed prospective payment rates for FY 2024.

In summary, the proposed standardized amounts set forth in Tables 1A, 1B, and 1C that are listed and published in section VI. of this Addendum (and available via the CMS website) reflect—

- Equalization of the standardized amounts for urban and other areas at the level computed for large urban hospitals during FY 2004 and onward, as provided for under section 1886(d)(3)(A)(iv)(II) of the Act.
- The labor-related share that is applied to the standardized amounts to give the hospital the highest payment, as provided for under sections 1886(d)(3)(E) and 1886(d)(9)(C)(iv) of the Act. For FY 2024, depending on whether a hospital submits quality data under the rules established in accordance with section 1886(b)(3)(B)(viii) of the Act (hereafter referred to as a hospital that submits quality data) and is a meaningful EHR user under section 1886(b)(3)(B)(ix) of the Act (hereafter referred to as a hospital that is a meaningful EHR user), there are four possible applicable percentage increases that can be applied to the national standardized amount.

We refer readers to section V.B. of the preamble of this proposed rule for a complete discussion on the FY 2024 inpatient hospital update. The table that follows shows these four scenarios:

PROPOSED FY 2024 APPLICABLE PERCENTAGE INCREASES FOR THE IPPS				
FY 2024	**Hospital Submitted Quality Data and is a Meaningful EHR User**	**Hospital Submitted Quality Data and is NOT a Meaningful EHR User**	**Hospital Did NOT Submit Quality Data and is a Meaningful EHR User**	**Hospital Did NOT Submit Quality Data and is NOT a Meaningful EHR User**
Proposed Market Basket Rate-of-Increase	3.0	3.0	3.0	3.0
Proposed Adjustment for Failure to Submit Quality Data under Section 1886(b)(3)(B)(viii) of the Act	0	0	-0.75	-0.75
Proposed Adjustment for Failure to be a Meaningful EHR User under Section 1886(b)(3)(B)(ix) of the Act	0	-2.25	0	-2.25
Proposed Productivity Adjustment under Section 1886(b)(3)(B)(xi) of the Act	-0.2	-0.2	-0.2	-0.2
Proposed Applicable Percentage Increase Applied to Standardized Amount	**2.8**	**0.55**	**2.05**	**-0.2**

We note that section 1886(b)(3)(B)(viii) of the Act, which specifies the adjustment to the applicable percentage increase for ''subsection (d)'' hospitals that do not submit quality data under the rules established by the Secretary, is not applicable to hospitals located in Puerto Rico. In addition, section 602 of Public Law 114–113 amended section 1886(n)(6)(B) of the Act to specify that Puerto Rico hospitals are eligible for incentive payments for the meaningful use of certified EHR technology, effective beginning FY 2016, and also to apply the adjustments to the applicable percentage increase under section 1886(b)(3)(B)(ix) of the Act to subsection (d) Puerto Rico hospitals that are not meaningful EHR users, effective beginning FY 2022. Accordingly, the applicable percentage increase for subsection (d) Puerto Rico hospitals that are not meaningful EHR users for FY 2024 and subsequent fiscal years is adjusted by the proposed adjustment for failure to be a meaningful EHR user under section 1886(b)(3)(B)(ix) of the Act. The regulations at 42 CFR 412.64(d)(3)(ii) reflect the current law for the update for subsection (d) Puerto Rico hospitals for FY 2022 and subsequent fiscal years.

- An adjustment to the standardized amount to ensure budget neutrality for DRG recalibration and reclassification, as provided for under section 1886(d)(4)(C)(iii) of the Act.
- An adjustment to the standardized amount to ensure budget neutrality for the permanent 10 percent cap on the reduction in a MS–DRG's relative weight in a given fiscal year, as discussed in section II.E.2.d. of the preamble of this proposed rule and consistent with our current methodology for implementing DRG recalibration and reclassification budget neutrality under section 1886(d)(4)(C)(iii) of the Act.
- An adjustment to ensure the wage index and labor-related share changes (depending on the fiscal year) are budget neutral, as provided for under section 1886(d)(3)(E)(i) of the Act (as discussed in the FY 2006 IPPS final rule (70 FR 47395) and the FY 2010 IPPS final rule (74 FR 44005)). We note that section 1886(d)(3)(E)(i) of the Act requires that when we compute such budget neutrality, we assume that the provisions of section 1886(d)(3)(E)(ii) of the Act (requiring a 62-percent labor-related share in certain circumstances) had not been enacted.
- An adjustment to ensure the effects of geographic reclassification are budget neutral, as provided for under section 1886(d)(8)(D) of the Act, by removing

the FY 2023 budget neutrality factor and applying a revised factor.

- An adjustment to the standardized amount to implement in a budget neutral manner the increase in the wage index values for hospitals with a wage index value below the 25th percentile wage index value across all hospitals (as described in section III.G. of the preamble of this proposed rule).
- An adjustment to the standardized amount to implement in a budget neutral manner the wage index cap policy (as described in section III.G.5. of the preamble of this proposed rule).
- An adjustment to ensure the effects of the Rural Community Hospital Demonstration program required under section 410A of Public Law 108–173 (as amended by sections 3123 and 10313 of Pub. L. 111–148, which extended the demonstration program for an additional 5 years and section 15003 of Pub. L. 114–255), are budget neutral as required under section 410A(c)(2) of Public Law 108–173.
- An adjustment to remove the FY 2023 outlier offset and apply an offset for FY 2024, as provided for in section 1886(d)(3)(B) of the Act.

For FY 2024, consistent with current law, we are proposing to apply the rural floor budget neutrality adjustment to hospital wage indexes. Also, consistent with section 3141 of the Affordable Care Act, instead of applying a State-level rural floor budget neutrality adjustment to the wage index, we are proposing to apply a uniform, national budget neutrality adjustment to the FY 2024 wage index for the rural floor.

For FY 2024, we are proposing to continue to not remove the Stem Cell Acquisition Budget Neutrality Factor from the prior year's standardized amount and to not apply a new factor. If we removed the prior year's adjustment, we would not satisfy budget neutrality. We believe this approach ensures the effects of the reasonable cost-based payment for allogeneic hematopoietic stem cell acquisition costs under section 108 of the Further Consolidated Appropriations Act, 2020 (Pub. L. 116–94) are budget neutral as required under section 108 of Public Law 116–94. For a discussion of Stem Cell Acquisition Budget Neutrality Factor, we refer the reader to the FY 2021 IPPS/LTCH PPS final rule (85 FR 59032 and 59033).

A. Calculation of the Proposed Adjusted Standardized Amount

1. Standardization of Base-Year Costs or Target Amounts

In general, the national standardized amount is based on per discharge averages of adjusted hospital costs from a base period (section 1886(d)(2)(A) of the Act), updated and otherwise adjusted in accordance with the provisions of section 1886(d) of the Act. The September 1, 1983 interim final rule (48 FR 39763) contained a detailed explanation of how base-year cost data (from cost reporting periods ending during FY 1981) were established for urban and rural hospitals in the initial development of standardized amounts for the IPPS.

Sections 1886(d)(2)(B) and 1886(d)(2)(C) of the Act require us to update base-year per discharge costs for FY 1984 and then standardize the cost data in order to remove the effects of certain sources of cost variations among hospitals. These effects include case-mix, differences in area wage levels, cost-of-living adjustments for Alaska and Hawaii, IME costs, and costs to hospitals serving a disproportionate share of low-income patients.

For FY 2024, we are proposing to continue to use the national labor-related and nonlabor-related shares (which are based on the 2018-based hospital market basket) that were used in FY 2023. Specifically, under section 1886(d)(3)(E) of the Act, the Secretary estimates, from time to time, the proportion of payments that are labor-related and adjusts the proportion (as estimated by the Secretary from time to time) of hospitals' costs which are attributable to wages and wage-related costs of the DRG prospective payment rates. We refer to the proportion of hospitals' costs that are attributable to wages and wage-related costs as the ''labor-related share.'' For FY 2024, as discussed in section III.M. of the preamble of this proposed rule, we are proposing to continue to use a labor-related share of 67.6 percent for the national standardized amounts for all IPPS hospitals (including hospitals in Puerto Rico) that have a wage index value that is greater than 1.0000. Consistent with section 1886(d)(3)(E) of the Act, we are proposing to apply the wage index to a labor-related share of 62 percent of the national standardized amount for all IPPS hospitals (including hospitals in Puerto Rico) whose wage index values are less than or equal to 1.0000.

The proposed standardized amounts for operating costs appear in Tables 1A, 1B, and 1C that are listed and published in section VI. of the Addendum to this proposed rule and are available on the CMS website.

2. Computing the National Average Standardized Amount

Section 1886(d)(3)(A)(iv)(II) of the Act requires that, beginning with FY 2004 and thereafter, an equal standardized amount be computed for all hospitals at the level computed for large urban hospitals during FY 2003, updated by the applicable percentage update. Accordingly, we are proposing to calculate the FY 2024 national average standardized amount irrespective of whether a hospital is located in an urban or rural location.

3. Updating the National Average Standardized Amount

Section 1886(b)(3)(B) of the Act specifies the applicable percentage increase used to update the standardized amount for payment for inpatient hospital operating costs. We note that, in compliance with section 404 of the MMA, we are proposing to use the 2018-based IPPS operating and capital market baskets for FY 2024. As discussed in section IV.B. of the preamble of this proposed rule, in accordance with section 1886(b)(3)(B) of the Act, as amended by section 3401(a) of the Affordable Care Act, we are proposing to reduce the FY 2024 market basket percentage increase (which for this proposed rule is based on IGI's fourth quarter 2022 forecast of the 2018-based IPPS market basket) by the productivity adjustment, as discussed elsewhere in this proposed rule.

Based on IGI's fourth quarter 2022 forecast of the hospital market basket percentage increase (as discussed in Appendix B of this proposed rule), the forecast of the hospital market basket percentage increase for FY 2024 for this proposed rule is 3.0 percent. As discussed earlier, for FY 2024, depending on whether a hospital submits quality data under the rules established in accordance with section 1886(b)(3)(B)(viii) of the Act and is a meaningful EHR user under section 1886(b)(3)(B)(ix) of the Act, there are four possible applicable percentage increases that can be applied to the standardized amount. We refer readers to section V.B. of the preamble of this proposed rule for a complete discussion on the FY 2024 inpatient hospital update to the standardized amount. We also refer readers to the previous table for the four possible applicable percentage increases that would be applied to update the national standardized amount. The proposed standardized amounts shown in Tables 1A through 1C that are published in section VI. of this Addendum and that are available via the internet on the

CMS website reflect these differential amounts.

Although the update factors for FY 2024 are set by law, we are required by section 1886(e)(4) of the Act to recommend, taking into account MedPAC's recommendations, appropriate update factors for FY 2024 for both IPPS hospitals and hospitals and hospital units excluded from the IPPS. Section 1886(e)(5)(A) of the Act requires that we publish our recommendations in the **Federal Register** for public comment. Our recommendation on the proposed FY 2024 update factors is set forth in Appendix B of this proposed rule.

4. Methodology for Calculation of the Average Standardized Amount

The methodology we used to calculate the proposed FY 2024 standardized amount is as follows:

- To ensure we are only including hospitals paid under the IPPS in the calculation of the standardized amount, we applied the following inclusion and exclusion criteria: include hospitals whose last four digits fall between 0001 and 0879 (section 2779A1 of Chapter 2 of the State Operations Manual on the CMS website at: *https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/som107c02.pdf*); exclude CAHs at the time of this proposed rule; exclude hospitals in Maryland (because these hospitals are paid under an all payer model under section 1115A of the Act); and remove PPS excluded- cancer hospitals that have a ''V'' in the fifth position of their provider number or a ''E'' or ''F'' in the sixth position.
- As in the past, we are proposing to adjust the FY 2024 standardized amount to remove the effects of the FY 2023 geographic reclassifications and outlier payments before applying the FY 2024 updates. We then applied budget neutrality offsets for outliers and geographic reclassifications to the standardized amount based on proposed FY 2024 payment policies.
- We do not remove the prior year's budget neutrality adjustments for reclassification and recalibration of the DRG relative weights and for updated wage data because, in accordance with sections 1886(d)(4)(C)(iii) and 1886(d)(3)(E) of the Act, estimated aggregate payments after updates in the DRG relative weights and wage index should equal estimated aggregate payments prior to the changes. If we removed the prior year's adjustment, we would not satisfy these conditions.

Budget neutrality is determined by comparing aggregate IPPS payments before and after making changes that are required to be budget neutral (for example, changes to MS–DRG classifications, recalibration of the MS–DRG relative weights, updates to the wage index, and different geographic reclassifications). We include outlier payments in the simulations because they may be affected by changes in these parameters.

- Consistent with our methodology established in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50422 through 50433), because IME Medicare Advantage payments are made to IPPS hospitals under section 1886(d) of the Act, we believe these payments must be part of these budget neutrality calculations. However, we note that it is not necessary to include Medicare Advantage IME payments in the outlier threshold calculation or the outlier offset to the standardized amount because the statute requires that outlier payments be not less than 5 percent nor more than 6 percent of total ''operating DRG payments,'' which does not include IME and DSH payments. We refer readers to the FY 2011 IPPS/LTCH PPS final rule for a complete discussion on our methodology of identifying and adding the total Medicare Advantage IME payment amount to the budget neutrality adjustments.
- Consistent with the methodology in the FY 2012 IPPS/LTCH PPS final rule, in order to ensure that we capture only fee-for-service claims, we are only including claims with a ''Claim Type'' of 60 (which is a field on the MedPAR file that indicates a claim is an FFS claim).
- Consistent with our methodology established in the FY 2017 IPPS/LTCH PPS final rule (81 FR 57277), in order to further ensure that we capture only FFS claims, we are excluding claims with a ''GHOPAID'' indicator of 1 (which is a field on the MedPAR file that indicates a claim is not an FFS claim and is paid by a Group Health Organization).
- Consistent with our methodology established in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50422 through 50423), we examine the MedPAR file and remove pharmacy charges for anti-hemophilic blood factor (which are paid separately under the IPPS) with an indicator of ''3'' for blood clotting with a revenue code of ''0636'' from the covered charge field for the budget neutrality adjustments. We are proposing to remove organ acquisition charges, except for cases that group to MS–DRG 018, from the covered charge field for the budget neutrality adjustments because organ acquisition is a pass-through payment not paid under the IPPS. Revenue centers 081X–089X are typically excluded from ratesetting, however, we are proposing to not remove revenue center 891 charges from MS–DRG 018 claims during ratesetting because those revenue 891 charges were included in the relative weight calculation for MS–DRG 018, which is consistent with the policy finalized in FY 2021 final rule (85 FR 58600). We note that a new MedPAR variable for revenue code 891 charges was introduced in April 2020.
- For FY 2024, we are continuing to remove allogeneic hematopoietic stem cell acquisition charges from the covered charge field for budget neutrality adjustments. As discussed in the FY 2021 IPPS/LTCH PPS final rule, payment for allogeneic hematopoietic stem cell acquisition costs is made on a reasonable cost basis for cost reporting periods beginning on or after October 1, 2020 (85 FR 58835 through 58842).
- The participation of hospitals under the BPCI (Bundled Payments for Care Improvement) Advanced model started on October 1, 2018. The BPCI Advanced model, tested under the authority of section 3021 of the Affordable Care Act (codified at section 1115A of the Act), is comprised of a single payment and risk track, which bundles payments for multiple services beneficiaries receive during a Clinical Episode. Acute care hospitals may participate in the BPCI Advanced model in one of two capacities: as a model Participant or as a downstream Episode Initiator. Regardless of the capacity in which they participate in the BPCI Advanced model, participating acute care hospitals would continue to receive IPPS payments under section 1886(d) of the Act. Acute care hospitals that are Participants also assume financial and quality performance accountability for Clinical Episodes in the form of a reconciliation payment. For additional information on the BPCI Advanced model, we refer readers to the BPCI Advanced web page on the CMS Center for Medicare and Medicaid Innovation's website at: *https://innovation.cms.gov/initiatives/bpci-advanced/*.

For FY 2024, consistent with how we treated hospitals that participated in the BPCI Advanced Model in the FY 2021 IPPS/LTCH PPS final rule (85 FR 59029 and 59030), we are proposing to include all applicable data from subsection (d) hospitals participating in the BPCI Advanced model in our IPPS payment modeling and ratesetting calculations. We believe it is appropriate to include all applicable data from the subsection (d) hospitals participating in the BPCI Advanced model in our IPPS payment modeling and ratesetting calculations because these hospitals are still

receiving IPPS payments under section 1886(d) of the Act. For the same reasons, we also are proposing to include all applicable data from subsection (d) hospitals participating in the Comprehensive Care for Joint Replacement (CJR) Model in our IPPS payment modeling and ratesetting calculations.

• Consistent with our methodology established in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53687 through 53688), we believe that it is appropriate to include adjustments for the Hospital Readmissions Reduction Program and the Hospital VBP Program (established under the Affordable Care Act) within our budget neutrality calculations.

Both the hospital readmissions payment adjustment (reduction) and the hospital VBP payment adjustment (redistribution) are applied on a claim-by-claim basis by adjusting, as applicable, the base-operating DRG payment amount for individual subsection (d) hospitals, which affects the overall sum of aggregate payments on each side of the comparison within the budget neutrality calculations.

In order to properly determine aggregate payments on each side of the comparison, consistent with the approach we have taken in prior years, for FY 2024, we are proposing to continue to apply a proposed proxy based on the prior fiscal year hospital readmissions payment adjustment (for FY 2024 this would be FY 2023 final adjustment factors from Table 15 of the FY 2023 IPPS/LTCH PPS final rule) and hospital VBP payment adjustment (for FY 2024, this proposed proxy would be an adjustment factor of 1 to reflect our policy for the FY 2023 program year to suppress measures and award each hospital a value-based payment amount that matches the reduction to the base operating DRG payment amount) on each side of the comparison, consistent with the methodology that we adopted in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53687 through 53688). That is, we are proposing to apply a proxy readmissions payment adjustment factor from the prior final rule and a proxy hospital VBP payment adjustment factor on both sides of our comparison of aggregate payments when determining all budget neutrality factors described in section II.A.4. of this Addendum. We refer the reader to section V.H. of the preamble of this proposed rule for a complete discussion on the Hospital Readmissions Reduction Program and section V.G. of the preamble of this proposed rule for a complete discussion on the Hospital VBP Program.

• The Affordable Care Act also established section 1886(r) of the Act, which modifies the methodology for computing the Medicare DSH payment adjustment beginning in FY 2014. Beginning in FY 2014, IPPS hospitals receiving Medicare DSH payment adjustments receive an empirically justified Medicare DSH payment equal to 25 percent of the amount that would previously have been received under the statutory formula set forth under section 1886(d)(5)(F) of the Act governing the Medicare DSH payment adjustment. In accordance with section 1886(r)(2) of the Act, the remaining amount, equal to an estimate of 75 percent of what otherwise would have been paid as Medicare DSH payments, reduced to reflect changes in the percentage of individuals who are uninsured and any additional statutory adjustment, is available to make additional payments to Medicare DSH hospitals based on their share of the total amount of uncompensated care reported by Medicare DSH hospitals for a given time period. In order to properly determine aggregate payments on each side of the comparison for budget neutrality, prior to FY 2014, we included estimated Medicare DSH payments on both sides of our comparison of aggregate payments when determining all budget neutrality factors described in section II.A.4. of this Addendum.

To do this for FY 2024 (as we did for the last 10 fiscal years), we are proposing to include estimated empirically justified Medicare DSH payments that would be paid in accordance with section 1886(r)(1) of the Act and estimates of the additional uncompensated care payments made to hospitals receiving Medicare DSH payment adjustments as described by section 1886(r)(2) of the Act. That is, we are proposing to consider estimated empirically justified Medicare DSH payments at 25 percent of what would otherwise have been paid, and also the estimated additional uncompensated care payments for hospitals receiving Medicare DSH payment adjustments on both sides of our comparison of aggregate payments when determining all budget neutrality factors described in section II.A.4. of this Addendum.

We also are proposing to include the estimated supplemental payments for eligible IHS/Tribal hospitals and Puerto Rico hospitals on both sides of our comparison of aggregate payments when determining all budget neutrality factors described in section II.A.4. of this Addendum.

• When calculating total payments for budget neutrality, to determine total payments for SCHs, we model total hospital-specific rate payments and total Federal rate payments and then include whichever one of the total payments is greater. As discussed in section IV.G. of the preamble to this proposed rule and later in this section, we are proposing to continue to use the FY 2014 finalized methodology under which we take into consideration uncompensated care payments in the comparison of payments under the Federal rate and the hospital-specific rate for SCHs. Therefore, we are proposing to include estimated uncompensated care payments in this comparison.

Similarly, for MDHs, as discussed in section IV.G. of the preamble of this proposed rule, when computing payments under the Federal national rate plus 75 percent of the difference between the payments under the Federal national rate and the payments under the updated hospital-specific rate, we are proposing to continue to take into consideration uncompensated care payments in the computation of payments under the Federal rate and the hospital-specific rate for MDHs.

• We are proposing to include an adjustment to the standardized amount for those hospitals that are not meaningful EHR users in our modeling of aggregate payments for budget neutrality for FY 2024. Similar to FY 2023, we are including this adjustment based on data on the prior year's performance. Payments for hospitals would be estimated based on the proposed applicable standardized amount in Tables 1A and 1B for discharges occurring in FY 2024.

• In our determination of all budget neutrality factors described in section II.A.4. of this Addendum, we used transfer-adjusted discharges.

We note, in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49414 through 49415), we finalized a change to the ordering of the budget neutrality factors in the calculation so that the RCH Demonstration budget neutrality factor is applied after all wage index and other budget neutrality factors. We refer the reader to the FY 2023 IPPS/LTCH PPS final rule for further discussion.

a. Proposed Reclassification and Recalibration of MS–DRG Relative Weights Before Proposed Cap

Section 1886(d)(4)(C)(iii) of the Act specifies that, beginning in FY 1991, the annual DRG reclassification and recalibration of the relative weights must be made in a manner that ensures that aggregate payments to hospitals are not affected. As discussed in section II.E. of the preamble of this proposed rule, we normalized the recalibrated MS–DRG relative weights by an adjustment factor so that the average case relative weight after recalibration is

equal to the average case relative weight prior to recalibration. However, equating the average case relative weight after recalibration to the average case relative weight before recalibration does not necessarily achieve budget neutrality with respect to aggregate payments to hospitals because payments to hospitals are affected by factors other than average case relative weight. Therefore, as we have done in past years, we are proposing to make a budget neutrality adjustment to ensure that the requirement of section 1886(d)(4)(C)(iii) of the Act is met.

For this FY 2024 proposed rule, to comply with the requirement that MS–DRG reclassification and recalibration of the relative weights be budget neutral for the standardized amount and the hospital-specific rates, we used FY 2022 discharge data to simulate payments and compared the following:

- Aggregate payments using the FY 2023 labor-related share percentages, the FY 2023 relative weights, and the FY 2023 pre-reclassified wage data, and applied the proposed proxy FY 2024 hospital readmissions payment adjustments and proposed proxy FY 2024 hospital VBP payment adjustments; and
- Aggregate payments using the FY 2023 labor-related share percentages, the proposed FY 2024 relative weights before applying the 10 percent cap, and the FY 2023 pre-reclassified wage data, and applied the same proposed proxy FY 2024 hospital readmissions payment adjustments and proposed proxy FY 2024 hospital VBP payment adjustments applied previously.

Because this payment simulation uses the proposed FY 2024 relative weights (before applying the 10 percent cap), consistent with our proposal in section IV.I. of the preamble to this proposed rule, we applied the proposed adjustor for certain cases that group to MS–DRG 018 in our simulation of these payments. We note that because the simulations of payments for all of the budget neutrality factors discussed in this section also use the FY 2024 relative weights, we are proposing to apply the adjustor for certain MS–DRG 018 (Chimeric Antigen Receptor (CAR) T-cell and other immunotherapies) cases in all simulations of payments for the budget neutrality factors discussed later in this section. We refer the reader to section IV.I. of the preamble of this proposed rule for a complete discussion on the proposed adjustor for certain cases that group to MS–DRG 018 and to section II.E.2.b. of the preamble of this proposed rule, for a complete discussion of the proposed adjustment to the FY 2024 relative weights to account for certain cases that group to MS–DRG 018.

Based on this comparison, we computed a proposed budget neutrality adjustment factor and applied this factor to the standardized amount. As discussed in section IV. of this Addendum, we are proposing to apply the MS–DRG reclassification and recalibration budget neutrality factor to the hospital-specific rates that are effective for cost reporting periods beginning on or after October 1, 2023. Please see the table later in this section setting forth each of the proposed FY 2024 budget neutrality factors.

b. Proposed Budget Neutrality Adjustment for Reclassification and Recalibration of MS–DRG Relative Weights With Cap

As discussed in section II.E.2.d of this proposed rule, in the FY 2023 IPPS/LTCH PPS final rule (87 FR 48897 through 48900), we finalized a permanent 10-percent cap on the reduction in an MS–DRG's relative weight in a given fiscal year, beginning in FY 2023. As also discussed in section II.E.2.d of the preamble of this proposed rule, and consistent with our current methodology for implementing budget neutrality for MS–DRG reclassification and recalibration of the relative weights under section 1886(d)(4)(C)(iii) of the Act, we apply a budget neutrality adjustment to the standardized amount for all hospitals so that this 10-percent cap on relative weight reductions does not increase estimated aggregate Medicare payments beyond the payments that would be made had we never applied this cap. We refer the reader to the FY 2023 IPPS/LTCH PPS final rule for further discussion.

To calculate this proposed budget neutrality adjustment factor for FY 2024, we used FY 2022 discharge data to simulate payments and compared the following:

- Aggregate payments using the FY 2023 labor-related share percentages, the FY 2024 relative weights before applying the 10-percent cap, and the FY 2023 pre-reclassified wage data, and applied the proposed proxy FY 2024 hospital readmissions payment adjustments and the proposed proxy FY 2024 hospital VBP payment adjustments; and
- Aggregate payments using the FY 2023 labor-related share percentages, the proposed FY 2024 relative weights after applying the 10-percent cap, and the FY 2023 pre-reclassified wage data, and applied the same proposed proxy FY 2024 hospital readmissions payment adjustments and proposed proxy FY 2024 hospital VBP payment adjustments applied previously.

Because this payment simulation uses the FY 2024 relative weights, consistent with our proposal in section IV.I. of the preamble to this proposed rule and our historical policy, and as discussed in the preceding section, we applied the proposed adjustor for certain cases that group to MS–DRG 018 in our simulation of these payments.

In addition, we applied the proposed MS–DRG reclassification and recalibration budget neutrality adjustment factor before the cap (derived in the first step) to the payment rates that were used to simulate payments for this comparison of aggregate payments from FY 2023 to FY 2024. Based on this comparison, we computed a proposed budget neutrality adjustment factor and applied this factor to the standardized amount. As discussed in section IV. of this Addendum, we are proposing to apply this budget neutrality factor to the hospital-specific rates that are effective for cost reporting periods beginning on or after October 1, 2023. Please see the table later in this section setting forth each of the proposed FY 2024 budget neutrality factors.

c. Updated Wage Index—Proposed Budget Neutrality Adjustment

Section 1886(d)(3)(E)(i) of the Act requires us to update the hospital wage index on an annual basis beginning October 1, 1993. This provision also requires us to make any updates or adjustments to the wage index in a manner that ensures that aggregate payments to hospitals are not affected by the change in the wage index. Section 1886(d)(3)(E)(i) of the Act requires that we implement the wage index adjustment in a budget neutral manner. However, section 1886(d)(3)(E)(ii) of the Act sets the labor-related share at 62 percent for hospitals with a wage index less than or equal to 1.0000, and section 1886(d)(3)(E)(i) of the Act provides that the Secretary shall calculate the budget neutrality adjustment for the adjustments or updates made under that provision as if section 1886(d)(3)(E)(ii) of the Act had not been enacted. In other words, this section of the statute requires that we implement the updates to the wage index in a budget neutral manner, but that our budget neutrality adjustment should not take into account the requirement that we set the labor-related share for hospitals with wage indexes less than or equal to 1.0000 at the more advantageous level of 62 percent. Therefore, for purposes of this budget neutrality adjustment, section

1886(d)(3)(E)(i) of the Act prohibits us from taking into account the fact that hospitals with a wage index less than or equal to 1.0000 are paid using a labor-related share of 62 percent. Consistent with current policy, for FY 2024, we are proposing to adjust 100 percent of the wage index factor for occupational mix. We describe the occupational mix adjustment in section III.E. of the preamble of this proposed rule.

To compute a proposed budget neutrality adjustment factor for wage index and labor-related share percentage changes, we used FY 2022 discharge data to simulate payments and compared the following:

- Aggregate payments using the proposed FY 2024 relative weights and the FY 2023 pre-reclassified wage indexes, applied the FY 2023 labor-related share of 67.6 percent to all hospitals (regardless of whether the hospital's wage index was above or below 1.0000), and applied the proposed proxy FY 2024 hospital readmissions payment adjustment and the proposed proxy FY 2024 hospital VBP payment adjustment.
- Aggregate payments using the proposed FY 2024 relative weights and the proposed FY 2024 pre-reclassified wage indexes, applied the proposed labor-related share for FY 2024 of 67.6 percent to all hospitals (regardless of whether the hospital's wage index was above or below 1.0000), and applied the same proposed proxy FY 2024 hospital readmissions payment adjustments and proposed proxy FY 2024 hospital VBP payment adjustments applied previously.

In addition, we applied the proposed MS–DRG reclassification and recalibration budget neutrality adjustment factor before the proposed cap (derived in the first step) and the 10 percent cap on relative weight reductions adjustment factor (derived from the second step) to the payment rates that were used to simulate payments for this comparison of aggregate payments from FY 2023 to FY 2024. Based on this comparison, we computed a proposed budget neutrality adjustment factor and applied this factor to the standardized amount for changes to the wage index. Please see the table later in this section for a summary of the FY 2024 proposed budget neutrality factors.

d. Reclassified Hospitals—Proposed Budget Neutrality Adjustment

Section 1886(d)(8)(B) of the Act provides that certain rural hospitals are deemed urban. In addition, section 1886(d)(10) of the Act provides for the reclassification of hospitals based on determinations by the MGCRB. Under section 1886(d)(10) of the Act, a hospital may be reclassified for purposes of the wage index.

Under section 1886(d)(8)(D) of the Act, the Secretary is required to adjust the standardized amount to ensure that aggregate payments under the IPPS after implementation of the provisions of sections 1886(d)(8)(B) and (C) and 1886(d)(10) of the Act are equal to the aggregate prospective payments that would have been made absent these provisions. We note, as discussed in section III.G.1. of the preamble of this proposed rule, beginning with FY 2024 we are proposing to include hospitals with § 412.103 reclassification along with geographically rural hospitals in all rural wage index calculations, and only to exclude ''dual reclass'' hospitals (hospitals with simultaneous § 412.103 and MGCRB reclassifications) when implicated by the hold harmless provision at section 1886(d)(8)(C)(ii) of the Act. Consistent with the previous proposal, beginning with FY 2024 we are proposing to include the data of all § 412.103 hospitals (including those that have an MGCRB reclassification) in the calculation of ''the wage index for rural areas in the State in which the county is located'' as referred to in section 1886(d)(8)(C)(iii) of the Act. As discussed in section III.G.1. of the preamble of this proposed rule, we acknowledge that these proposals would have significant effects on wage index values. In addition, as a result of this proposed change, the geographic reclassification budget neutrality adjustment is significantly larger than in prior years.

We refer the reader to the FY 2015 IPPS final rule (79 FR 50371 and 50372) for a complete discussion regarding the requirement of section 1886(d)(8)(C)(iii) of the Act. We further note that the wage index adjustments provided for under section 1886(d)(13) of the Act are not budget neutral. Section 1886(d)(13)(H) of the Act provides that any increase in a wage index under section 1886(d)(13) of the Act shall not be taken into account in applying any budget neutrality adjustment with respect to such index under section 1886(d)(8)(D) of the Act. To calculate the proposed budget neutrality adjustment factor for FY 2024, we used FY 2022 discharge data to simulate payments and compared the following:

- Aggregate payments using the proposed FY 2024 labor-related share percentage, the proposed FY 2024 relative weights, and the proposed FY 2024 wage data prior to any reclassifications under sections 1886(d)(8)(B) and (C) and 1886(d)(10) of the Act, and applied the proposed proxy FY 2024 hospital readmissions payment adjustments and the proposed proxy FY 2024 hospital VBP payment adjustments.
- Aggregate payments using the proposed FY 2024 labor-related share percentage, the proposed FY 2024 relative weights, and the proposed FY 2024 wage data after such reclassifications, and applied the same proposed proxy FY 2024 hospital readmissions payment adjustments and the proposed proxy FY 2024 hospital VBP payment adjustments applied previously.

We note that the reclassifications applied under the second simulation and comparison are those listed in Table 2 associated with this proposed rule, which is available via the internet on the CMS website. This table reflects reclassification crosswalks proposed for FY 2024, and applies the proposed policies explained in section III. of the preamble of this proposed rule. Based on this comparison, we computed a proposed budget neutrality adjustment factor and applied this factor to the standardized amount to ensure that the effects of these provisions are budget neutral, consistent with the statute. Please see the table later in this section for a summary of the proposed FY 2024 budget neutrality factors.

The proposed FY 2024 budget neutrality adjustment factor was applied to the proposed standardized amount after removing the effects of the FY 2023 budget neutrality adjustment factor. We note that the proposed FY 2024 budget neutrality adjustment reflects FY 2024 wage index reclassifications approved by the MGCRB or the Administrator at the time of development of this proposed rule. We finally note, in the absence of the proposed policies discussed in section III.G.1 of this proposed rule (to include hospitals with § 412.103 reclassification along with geographically rural hospitals in all rural wage index calculations, and to only exclude ''dual reclass'' hospitals (hospitals with simultaneous § 412.103 and MGCRB reclassifications) when implicated by the hold harmless provision at section 1886(d)(8)(C)(ii) of the Act), the reclassification budget neutrality factor would be 0.985756.

e. Proposed Rural Floor Proposed Budget Neutrality Adjustment

Under § 412.64(e)(4), we make an adjustment to the wage index to ensure that aggregate payments after implementation of the rural floor under section 4410 of the BBA (Pub. L. 105–33) is equal to the aggregate prospective payments that would have been made in

the absence of this provision. Consistent with section 3141 of the Affordable Care Act and as discussed in section III.G. of the preamble of this proposed rule and codified at § 412.64(e)(4)(ii), the budget neutrality adjustment for the rural floor is a national adjustment to the wage index.

Similar to our calculation in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50369 through 50370), for FY 2024, we are proposing to calculate a national rural Puerto Rico wage index. Because there are no rural Puerto Rico hospitals with established wage data, our calculation of the FY 2024 rural Puerto Rico wage index is based on the policy adopted in the FY 2008 IPPS final rule with comment period (72 FR 47323). That is, we use the unweighted average of the wage indexes from all CBSAs (urban areas) that are contiguous (share a border with) to the rural counties to compute the rural floor (72 FR 47323; 76 FR 51594). Under the OMB labor market area delineations, except for Arecibo, Puerto Rico (CBSA 11640), all other Puerto Rico urban areas are contiguous to a rural area. Therefore, based on our existing policy, the proposed FY 2024 rural Puerto Rico wage index is calculated based on the average of the proposed FY 2024 wage indexes for the following urban areas: Aguadilla-Isabela, PR (CBSA 10380); Guayama, PR (CBSA 25020); Mayaguez, PR (CBSA 32420); Ponce, PR (CBSA 38660); San German, PR (CBSA 41900); and San Juan-Carolina-Caguas, PR (CBSA 41980).

We note, as discussed in section III.G.1 of the preamble of this proposed rule, we are proposing to include hospitals with § 412.103 reclassification along with geographically rural hospitals in all rural wage index calculations, and to only exclude ''dual reclass'' hospitals (hospitals with simultaneous § 412.103 and MGCRB reclassifications) when implicated by the hold harmless provision at section 1886(d)(8)(C)(ii) of the Act. Consistent with the previous proposal, beginning with FY 2024 we are proposing to include the data of all § 412.103 hospitals (including those that have an MGCRB reclassification) in the calculation of the rural floor. As discussed in section III.G.1 of this proposed rule, we acknowledge that these proposals would have significant effects on wage index values. In addition, as a result of this proposed change, the rural floor budget neutrality adjustment is significantly larger than in prior years.

To calculate the national rural floor budget neutrality adjustment factor, we used FY 2022 discharge data to simulate payments, and the post-reclassified national wage indexes and compared the following:

- National simulated payments without the rural floor.
- National simulated payments with the rural floor.

Based on this comparison, we determined a proposed national rural floor budget neutrality adjustment factor. The national adjustment was applied to the national wage indexes to produce proposed rural floor budget neutral wage indexes. Please see the table later in this section for a summary of the proposed FY 2024 budget neutrality factors. We note, in the absence of the proposed policies discussed in section III.G.1. of this proposed rule (to include hospitals with § 412.103 reclassification along with geographically rural hospitals in all rural wage index calculations, and to only exclude ''dual reclass'' hospitals (hospitals with simultaneous § 412.103 and MGCRB reclassifications) when implicated by the hold harmless provision at section 1886(d)(8)(C)(ii) of the Act), the rural floor budget neutrality factor would be 0.992537.

As further discussed in section III.G.2. of this proposed rule, we note that section 9831 of the American Rescue Plan Act of 2021 (Pub. L. 117–2), enacted on March 11, 2021 amended section 1886(d)(3)(E)(i) of the Act (42 U.S.C. 1395ww(d)(3)(E)(i)) and added section 1886(d)(3)(E)(iv) of the Act to establish a minimum area wage index (or imputed floor) for hospitals in all-urban States for discharges occurring on or after October 1, 2022. Unlike the imputed floor that was in effect from FY 2005 through FY 2018, section 1886(d)(3)(E)(iv)(III) of the Act provides that the imputed floor wage index shall not be applied in a budget neutral manner. Specifically, section 9831(b) of Public Law 117–2 amends section 1886(d)(3)(E)(i) of the Act to exclude the imputed floor from the budget neutrality requirement under section 1886(d)(3)(E)(i) of the Act. In the past, we budget neutralized the estimated increase in payments each year resulting from the imputed floor that was in effect from FY 2005 through FY 2018. For FY 2022 and subsequent years, in applying the imputed floor required under section 1886(d)(3)(E)(iv) of the Act, we are applying the imputed floor after the application of the rural floor and would apply no reductions to the standardized amount or to the wage index to fund the increase in payments to hospitals in all-urban States resulting from the application of the imputed floor. We refer the reader to section III.G.2. of the preamble of this proposed rule for a complete discussion regarding the imputed floor.

f. Proposed Continuation of the Low Wage index Hospital Policy—Proposed Budget Neutrality Adjustment

As discussed in section III.G.3. of the preamble of this proposed rule, we are proposing to continue for FY 2024 the wage index policy finalized in the FY 2020 IPPS/LTCH PPS final rule to address wage index disparities by increasing the wage index values for hospitals with a wage index value below the 25th percentile wage index value across all hospitals (the low wage index hospital policy). As discussed in section III.G.3. of this proposed rule, consistent with our current methodology for implementing wage index budget neutrality under section 1886(d)(3)(E) of the Act, we are proposing to make a budget neutrality adjustment to the national standardized amount for all hospitals so that the increase in the wage index for hospitals with a wage index below the 25th percentile wage index, is implemented in a budget neutral manner.

To calculate this proposed budget neutrality adjustment factor for FY 2024, we used FY 2022 discharge data to simulate payments and compared the following:

- Aggregate payments using the FY 2024 labor-related share percentage, the proposed FY 2024 relative weights, and the proposed FY 2024 wage index for each hospital before adjusting the wage indexes under the low wage index hospital policy, and applied the proposed proxy FY 2024 hospital readmissions payment adjustments and the proposed proxy FY 2024 hospital VBP payment adjustments; and
- Aggregate payments using the FY 2024 labor-related share percentage, the proposed FY 2024 relative weights, and the proposed FY 2024 wage index for each hospital after adjusting the wage indexes under the low wage index hospital policy, and applied the same proposed proxy FY 2024 hospital readmissions payment adjustments and the proposed proxy FY 2024 hospital VBP payment adjustments applied previously.

This proposed FY 2024 budget neutrality adjustment factor was applied to the standardized amount.

g. Permanent Cap Policy for Wage Index Budget Neutrality Adjustment—Proposed Budget Neutrality Adjustment

As noted previously, in section III.N. of the preamble to this proposed rule, in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49018 through 49021) we finalized a policy to apply a 5-percent

cap on any decrease to a hospital's wage index from its wage index in the prior FY, regardless of the circumstances causing the decline. That is, a hospital's wage index would not be less than 95 percent of its final wage index for the prior FY. We also finalized the application of this permanent cap policy in a budget neutral manner through an adjustment to the standardized amount to ensure that estimated aggregate payments under our wage index cap policy for hospitals that will have a decrease in their wage indexes for the upcoming fiscal year of more than 5 percent will equal what estimated aggregate payments would have been without the permanent cap policy.

To calculate a wage index cap budget neutrality adjustment factor for FY 2024, we used FY 2022 discharge data to simulate payments and compared the following:

- Aggregate payments without the 5-percent cap using the proposed FY 2024 labor-related share percentages, the proposed FY 2024 relative weights, the proposed FY 2024 wage index for each hospital after adjusting the wage indexes under the low wage index hospital policy, and applied the proposed proxy FY 2024 hospital readmissions payment adjustments and the proposed proxy FY 2024 hospital VBP payment adjustments.
- Aggregate payments with the 5-percent cap using the proposed FY 2024 labor-related share percentages, the proposed FY 2024 relative weights, the proposed FY 2024 wage index for each hospital after adjusting the wage indexes under the low wage index hospital policy, and applied the same proposed proxy FY 2024 hospital readmissions payment adjustments and the proposed proxy FY 2024 hospital VBP payment adjustments applied previously.

We note, Table 2 associated with this proposed rule contains the wage index by provider before and after applying the low wage index hospital policy and the proposed cap.

h. Proposed Rural Community Hospital Demonstration Program Adjustment

In section V.L. of the preamble of this proposed rule, we discuss the Rural Community Hospital (RCH) Demonstration program, which was originally authorized for a 5-year period by section 410A of the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (MMA) (Pub. L. 108–173), and extended for another 5-year period by sections 3123 and 10313 of the Affordable Care Act (Pub. L. 111–148). Subsequently, section 15003 of the 21st Century Cures Act (Pub. L. 114–255), enacted December 13, 2016, amended section 410A of Public Law 108–173 to require a 10-year extension period (in place of the 5-year extension required by the Affordable Care Act, as further discussed later in this section). Finally, Division CC, section 128(a) of the Consolidated Appropriations Act of 2021 (Pub. L. 116–260) again amended section 410A to require a 15-year extension period in place of the 10-year period. We make an adjustment to the standardized amount to ensure the effects of the RCH Demonstration program are budget neutral as required under section 410A(c)(2) of Public Law 108–173. We refer readers to section V.M. of the preamble of this proposed rule for complete details regarding the Rural Community Hospital Demonstration.

With regard to budget neutrality, as mentioned earlier, we make an adjustment to the standardized amount to ensure the effects of the Rural Community Hospital Demonstration are budget neutral, as required under section 410A(c)(2) of Public Law 108–173. For FY 2024, based on the latest data for this proposed rule, the total amount that we are applying to make an adjustment to the standardized amounts to ensure the effects of the Rural Community Hospital Demonstration program are budget neutral is $37,658,408. Accordingly, using the most recent data available to account for the estimated costs of the demonstration program, for FY 2024, we computed a factor for the Rural Community Hospital Demonstration budget neutrality adjustment that would be applied to the standardized amount. Please see the table later in this section for a summary of the FY 2024 budget neutrality factors. We refer readers to section V.L. of the preamble of this proposed rule on complete details regarding the calculation of the amount we are applying to make an adjustment to the standardized amounts.

The following table is a summary of the proposed FY 2024 budget neutrality factors, as discussed in the previous sections.

Summary of Proposed FY 2024 Budget Neutrality Factors	
MS-DRG Reclassification and Recalibration Budget Neutrality Factor	1.001376
Cap Policy MS-DRG Weights Budget Neutrality Factor	0.999925
Wage Index Budget Neutrality Factor	1.000943
Reclassification Budget Neutrality Factor	0.980959
*Rural Floor Budget Neutrality Factor	0.981145
Low Wage Index Hospital Policy Budget Neutrality Factor	0.997371
Cap Policy Wage Index Budget Neutrality Factor	0.996562
Rural Demonstration Budget Neutrality Factor	0.999619

*The rural floor budget neutrality factor is applied to the national wage indexes while the rest of the budget neutrality adjustments are applied to the standardized amounts.

i. Proposed Outlier Payments

Section 1886(d)(5)(A) of the Act provides for payments in addition to the basic prospective payments for ''outlier'' cases involving extraordinarily high costs. To qualify for outlier payments, a case must have costs greater than the sum of the prospective payment rate for the MS–DRG, any IME and DSH payments, uncompensated care payments, supplemental payment for eligible IHS/Tribal hospitals and Puerto Rico hospitals, any new technology add-on payments, and the ''outlier threshold'' or ''fixed-loss'' amount (a dollar amount by which the costs of a case must exceed payments in order to qualify for an outlier payment). We refer to the sum of the prospective payment rate for the MS–DRG, any IME and DSH payments, uncompensated care payments, supplemental payment for eligible IHS/Tribal hospitals and Puerto

Rico hospitals, any new technology add-on payments, and the outlier threshold as the outlier ''fixed-loss cost threshold.'' To determine whether the costs of a case exceed the fixed-loss cost threshold, a hospital's CCR is applied to the total covered charges for the case to convert the charges to estimated costs. Payments for eligible cases are then made based on a marginal cost factor, which is a percentage of the estimated costs above the fixed-loss cost threshold. The marginal cost factor for FY 2024 is 80 percent, or 90 percent for burn MS–DRGs 927, 928, 929, 933, 934 and 935. We have used a marginal cost factor of 90 percent since FY 1989 (54 FR 36479 through 36480) for designated burn DRGs as well as a marginal cost factor of 80 percent for all other DRGs since FY 1995 (59 FR 45367).

In accordance with section 1886(d)(5)(A)(iv) of the Act, outlier payments for any year are projected to be not less than 5 percent nor more than 6 percent of total operating DRG payments (which does not include IME and DSH payments) plus outlier payments. When setting the outlier threshold, we compute the percent target by dividing the total operating outlier payments by the total operating DRG payments plus outlier payments. As discussed in the next section, for FY 2024, we are proposing to incorporate an estimate of outlier reconciliation when setting the outlier threshold. We do not include any other payments such as IME and DSH within the outlier target amount. Therefore, it is not necessary to include Medicare Advantage IME payments in the outlier threshold calculation. Section 1886(d)(3)(B) of the Act requires the Secretary to reduce the average standardized amount by a factor to account for the estimated proportion of total DRG payments made to outlier cases. More information on outlier payments may be found on the CMS website at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/outlier.htm*.

(1) Proposed Methodology To Incorporate an Estimate of Outlier Reconciliation in the FY 2024 Outlier Fixed-Loss Cost Threshold

The regulations in 42 CFR 412.84(i)(4) state that any outlier reconciliation at cost report settlement will be based on operating and capital cost-to-charge ratios (CCRs) calculated based on a ratio of costs to charges computed from the relevant cost report and charge data determined at the time the cost report coinciding with the discharge is settled. We have instructed MACs to identify for CMS any instances where: (1) A hospital's actual CCR for the cost reporting period fluctuates plus or minus 10 percentage points compared to the interim CCR used to calculate outlier payments when a bill is processed; and (2) the total outlier payments for the hospital exceeded $500,000.00 for that cost reporting period. If we determine that a hospital's outlier payments should be reconciled, we reconcile both operating and capital outlier payments. We refer readers to section 20.1.2.5 of Chapter 3 of the Medicare Claims Processing Manual (available on the CMS website at: *https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/clm104c03.pdf*) for complete details regarding outlier reconciliation. The regulation at § 412.84(m) further states that at the time of any outlier reconciliation under § 412.84(i)(4), outlier payments may be adjusted to account for the time value of any underpayments or overpayments. Section 20.1.2.6 of Chapter 3 of the Medicare Claims Processing Manual contains instructions on how to assess the time value of money for reconciled outlier amounts.

If the operating CCR of a hospital subject to outlier reconciliation is lower at cost report settlement compared to the operating CCR used for payment, the hospital would owe CMS money because it received an outlier overpayment at the time of claim payment. Conversely, if the operating CCR increases at cost report settlement compared to the operating CCR used for payment, CMS would owe the hospital money because the hospital outlier payments were underpaid.

In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42623 through 42635), we finalized a methodology to incorporate outlier reconciliation in the FY 2020 outlier fixed loss cost threshold. As discussed in the FY 2020 IPPS/LTCH PPS proposed rule (84 FR 19592), we stated that rather than trying to predict which claims and/or hospitals may be subject to outlier reconciliation, we believe a methodology that incorporates an estimate of outlier reconciliation dollars based on actual outlier reconciliation amounts reported in historical cost reports would be a more feasible approach and provide a better estimate and predictor of outlier reconciliation for the upcoming fiscal year. We also stated that we believe the methodology addresses stakeholder's concerns on the impact of outlier reconciliation on the modeling of the outlier threshold. For a detailed discussion of additional background regarding outlier reconciliation, we refer the reader to the FY 2020 IPPS/LTCH PPS final rule.

(a) Incorporating a Proposed Projection of Outlier Payment Reconciliations for the FY 2024 Outlier Threshold Calculation

Based on the methodology finalized in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42623 through 42625), we are proposing to continue to incorporate outlier reconciliation in the FY 2024 outlier fixed loss cost threshold.

As discussed in the FY 2020 IPPS/LTCH PPS final rule, for FY 2020, we used the historical outlier reconciliation amounts from the FY 2014 cost reports (cost reports with a begin date on or after October 1, 2013, and on or before September 30, 2014), which we believed would provide the most recent and complete available data to project the estimate of outlier reconciliation. We refer the reader to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42623 through 42625) for a discussion on the use of the FY 2014 cost report data for purposes of projecting outlier payment reconciliations for the FY 2020 outlier threshold calculation. For FY 2023, we applied the same methodology finalized in FY 2020, using the historical outlier reconciliation amounts from the FY 2017 cost reports (cost reports with a begin date on or after October 1, 2016, and on or before September 30, 2017).

Similar to the FY 2023 methodology, in this proposed rule, we are proposing to determine a projection of outlier payment reconciliations for the FY 2024 outlier threshold calculation, by advancing the methodology by 1 year. Specifically, we are proposing to use FY 2018 cost reports (cost reports with a begin date on or after October 1, 2017, and on or before September 30, 2018).

For FY 2024, we are proposing to use the same methodology from FY 2020 to incorporate a projection of operating outlier payment reconciliations for the FY 2024 outlier threshold calculation.

For this FY 2024 proposed rule, we used the December 2022 HCRIS extract of the cost report data to calculate the proposed percentage adjustment for outlier reconciliation. For the FY 2024 final rule, we propose to use the latest quarterly HCRIS extract that is publicly available at the time of the development of that rule which, for FY 2024, would be the March 2023 extract. While in the past we have considered the use of more recent data that may become available for purposes of projecting the estimate of operating outlier reconciliation used in the calculation of the final outlier threshold, we have also noted that we generally expect historical cost reports for the applicable fiscal year to be

available by March (84 FR 53609). Since the FY 2020 final rule we have worked with our Medicare Administrator Contractors (MACs) so that historical cost reports for the applicable fiscal year can be made available with the March HCRIS update for the final rule, which, as noted, would be the March 2023 HCRIS extract for purposes of projecting the estimate of operating outlier reconciliation used in the calculation of the FY 2024 outlier threshold for the final rule. Information on availability of the HCRIS cost report data can be found at *https://www.cms.gov/Research-Statistics-Data-and-Systems/Downloadable-Public-Use-Files/Cost-Reports*.

The following steps are the same as those finalized in the FY 2020 final rule but with updated data for FY 2024:

Step 1.—Use the Federal FY 2018 cost reports for hospitals paid under the IPPS from the most recent publicly available quarterly HCRIS extract available at the time of development of the proposed and final rules, and exclude sole community hospitals (SCHs) that were paid under their hospital-specific rate (that is, if Worksheet E, Part A, Line 48 is greater than Line 47). We note that when there are multiple columns available for the lines of the cost report described in the following steps and the provider was paid under the IPPS for that period(s) of the cost report, then we believe it is appropriate to use multiple columns to fully represent the relevant IPPS payment amounts, consistent with our methodology for the FY 2020 final rule.

Step 2.—Calculate the aggregate amount of historical total of operating outlier reconciliation dollars (Worksheet E, Part A, Line 2.01) using the Federal FY 2018 cost reports from Step 1. For this FY 2024 proposed rule, based on the December 2022 HCRIS, 5 hospitals had an outlier reconciliation amount recorded on Worksheet E, Part A, Line 2.01 for total operating outlier reconciliation dollars of negative $6,925,967. We note that a negative amount on Worksheet E, Part A, Line 2.01 for outlier reconciliation indicates an amount that was owed by the hospital, and a positive amount indicates this amount was paid to the hospital.

Step 3.—Calculate the aggregate amount of total Federal operating payments using the Federal FY 2018 cost reports from Step 1. The total Federal operating payments consist of the Federal payments (Worksheet E, Part A, Line 1.01 and Line 1.02, plus Line 1.03 and Line 1.04), outlier payments (Worksheet E, Part A, Line 2 and Line 2.02), and the outlier reconciliation payments (Worksheet E, Part A, Line 2.01). The total Federal operating payments based on the December 2022 HCRIS was $88,729,603,026.

Step 4.—Divide the amount from Step 2 by the amount from Step 3 and multiply the resulting amount by 100 to produce the percentage of total operating outlier reconciliation dollars to total Federal operating payments for FY 2018. For FY 2024, the proposed ratio is a negative 0.007806 percent ((-$6,925,967/$88,729,603,026) × 100), which, when rounded to the second digit, is −0.01 percent. This percentage amount would be used to adjust the outlier target for FY 2024 as described in Step 5.

Step 5.—Because the outlier reconciliation dollars are only available on the cost reports, and not in the Medicare claims data in the MedPAR file used to model the outlier threshold, we are proposing to target 5.1 percent minus the percentage determined in Step 4 in determining the outlier threshold. Using the FY 2018 cost reports based on the December 2022 HCRIS extract, because the aggregate outlier reconciliation dollars from Step 2 are negative, we are targeting an amount higher than 5.1 percent for outlier payments for FY 2024 under our proposed methodology. Therefore, for FY 2024, we are proposing to incorporate a projection of outlier reconciliation dollars by targeting an outlier threshold at 5.11 percent [5.1 percent − (− .01 percent)].

When the percentage of operating outlier reconciliation dollars to total Federal operating payments rounds to a negative value (that is, when the aggregate amount of outlier reconciliation as a percent of total operating payments rounds to a negative percent), the effect is a decrease to the outlier threshold compared to an outlier threshold that is calculated without including this estimate of operating outlier reconciliation dollars. In section II.A.4.i.(2). of the Addendum to this proposed rule, we provide the FY 2024 outlier threshold as calculated for this proposed rule both with and without including this proposed percentage estimate of operating outlier reconciliation.

As explained in the FY 2020 IPPS/LTCH PPS proposed rule (84 FR 19593), we would continue to use a 5.1 percent target (or an outlier offset factor of 0.949) in calculating the outlier offset to the standardized amount. Therefore, the proposed operating outlier offset to the standardized amount is 0.949 (1 − 0.051).

We are inviting public comment on our proposed methodology for projecting an estimate of outlier reconciliation and incorporating that estimate into the modeling for the fixed-loss cost outlier threshold for FY 2024.

(b) Proposed Reduction to the FY 2024 Capital Standard Federal Rate by an Adjustment Factor To Account for the Projected Proportion of Capital IPPS Payments Paid as Outliers

We establish an outlier threshold that is applicable to both hospital inpatient operating costs and hospital inpatient capital related costs (58 FR 46348). Similar to the calculation of the adjustment to the standardized amount to account for the projected proportion of operating payments paid as outlier payments, as discussed in greater detail in section III.A.2. of this Addendum, we are proposing to reduce the FY 2024 capital standard Federal rate by an adjustment factor to account for the projected proportion of capital IPPS payments paid as outliers. The regulations in 42 CFR 412.84(i)(4) state that any outlier reconciliation at cost report settlement would be based on operating and capital CCRs calculated based on a ratio of costs to charges computed from the relevant cost report and charge data determined at the time the cost report coinciding with the discharge is settled. As such, any reconciliation also applies to capital outlier payments.

For FY 2024, we are proposing to use the same methodology from FY 2020 to adjust the FY 2024 capital standard Federal rate by an adjustment factor to account for the projected proportion of capital IPPS payments paid as outliers.

For this FY 2024 proposed rule, we used the December 2022 HCRIS extract of the cost report data to calculate the proposed percentage adjustment for outlier reconciliation. For the FY 2024 final rule, we are proposing to use the latest quarterly HCRIS extract that is publicly available at the time of the development of that rule which, for FY 2024, would be the March 2023 extract. While in the past we have considered the use of more recent data that may become available for purposes of projecting the estimate of capital outlier reconciliation used in the calculation of the adjustment to the capital standard Federal rate for the final rule, we have also noted that we generally expect historical cost reports for the applicable fiscal year to be available by March (84 FR 53609). As noted previously, since the FY 2020 final rule we have worked with our Medicare Administrator Contractors (MACs) so that historical cost reports for the applicable fiscal year can be made available with the March HCRIS update for the final rule, which,

as noted, would be the March 2023 HCRIS extract for purposes of projecting the estimate of capital outlier reconciliation used in the calculation of the FY 2024 adjustment to the FY 2024 capital standard Federal rate for the final rule.

Similar to FY 2020, as part of our proposal for FY 2024 to incorporate into the outlier model the total outlier reconciliation dollars from the most recent and most complete fiscal year cost report data, we also are proposing to adjust our estimate of FY 2024 capital outlier payments to incorporate a projection of capital outlier reconciliation payments when determining the adjustment factor to be applied to the capital standard Federal rate to account for the projected proportion of capital IPPS payments paid as outliers. To do so, we are proposing to use the following methodology, which generally parallels the proposed methodology to incorporate a projection of operating outlier reconciliation payments for the FY 2024 outlier threshold calculation.

Step 1.—Use the Federal FY 2018 cost reports for hospitals paid under the IPPS from the most recent publicly available quarterly HCRIS extract available at the time of development of the proposed and final rules, and exclude SCHs that were paid under their hospital-specific rate (that is, if Worksheet E, Part A, Line 48 is greater than Line 47). We note that when there are multiple columns available for the lines of the cost report described in the following steps and the provider was paid under the IPPS for that period(s) of the cost report, then we believe it is appropriate to use multiple columns to fully represent the relevant IPPS payment amounts, consistent with our methodology for the FY 2020 final rule.

Step 2.—Calculate the aggregate amount of the historical total of capital outlier reconciliation dollars (Worksheet E, Part A, Line 93, Column 1) using the Federal FY 2018 cost reports from Step 1. Based on the December 2022 HCRIS, 5 hospitals had an outlier reconciliation amount recorded on Worksheet E, Part A, Line 93 for total capital outlier reconciliation dollars of negative $383,169. We note that a negative amount on Worksheet E, Part A, Line 93 for capital outlier reconciliation indicates an amount that was owed by the hospital, and a positive amount indicates this amount was paid to the hospital.

Step 3.—Calculate the aggregate amount of total capital Federal payments using the Federal FY 2018 cost reports from Step 1. The total capital Federal payments consist of the capital DRG payments, including capital indirect medical education (IME) and capital disproportionate share hospital (DSH) payments (Worksheet E, Part A, Line 50, Column 1) and the capital outlier reconciliation payments (Worksheet E, Part A, Line 93, Column 1). The total Federal capital payments based on the December 2022 HCRIS was $8,027,006,104.

Step 4.—Divide the amount from Step 2 by the amount from Step 3 and multiply the resulting amount by 100 to produce the percentage of total capital outlier reconciliation dollars to total capital Federal payments for FY 2018. For FY 2024, the proposed ratio is a negative .00477 percent ((−$383,169/$8,027,006,104) × 100), which, when rounded to the second digit, is 0.00 percent. This percentage amount would be used to adjust the estimate of capital outlier payments for FY 2024 as described in Step 5.

Step 5.—Because the outlier reconciliation dollars are only available on the cost reports, and not in the specific Medicare claims data in the MedPAR file used to estimate outlier payments, we are proposing that the estimate of capital outlier payments for FY 2024 would be determined by adding the percentage in Step 4 to the estimated percentage of capital outlier payments otherwise determined using the shared outlier threshold that is applicable to both hospital inpatient operating costs and hospital inpatient capital-related costs. (We note that this percentage is added for capital outlier payments but subtracted in the analogous step for operating outlier payments. We have a unified outlier payment methodology that uses a shared threshold to identify outlier cases for both operating and capital payments. The difference stems from the fact that operating outlier payments are determined by first setting a ''target'' percentage of operating outlier payments relative to aggregate operating payments which produces the outlier threshold. Once the shared threshold is set, it is used to estimate the percentage of capital outlier payments to total capital payments based on that threshold. Because the threshold is already set based on the operating target, rather than adjusting the threshold (or operating target), we adjust the percentage of capital outlier to total capital payments to account for the estimated effect of capital outlier reconciliation payments. This percentage is adjusted by adding the capital outlier reconciliation percentage from Step 4 to the estimate of the percentage of capital outlier payments to total capital payments based on the shared threshold.) We note, when the aggregate capital outlier reconciliation dollars from Step 2 are negative, the estimate of capital outlier payments for FY 2024 under our proposed methodology would be lower than the percentage of capital outlier payments otherwise determined using the shared outlier threshold.

For this FY 2024 proposed rule, the estimated percentage of FY 2024 capital outlier payments otherwise determined using the shared outlier threshold is 4.16 percent (estimated capital outlier payments of $280,666,342 divided by (estimated capital outlier payments of $280,666,342 plus the estimated total capital Federal payment of $6,470,989,911)). The proposed ratio in step 4 above is a negative 0.00477 percent ((−$383,169/$8,027,006,104) × 100), which, when rounded to the second digit, is 0.00 percent. Therefore, for FY 2024, taking into account projected capital outlier reconciliation payments under our proposed methodology, there would be no decrease to the estimated percentage of FY 2024 aggregate capital outlier payments.

As discussed in section III.A.2. of this Addendum, we are proposing to incorporate the capital outlier reconciliation dollars from Step 5 when applying the outlier adjustment factor in determining the capital Federal rate based on the estimated percentage of capital outlier payments to total capital Federal rate payments for FY 2024.

We are inviting public comment on our proposed methodology for projecting an estimate of capital outlier reconciliation and incorporating that estimate into the modeling of the estimate of FY 2024 capital outlier payments for purposes of determining the capital outlier adjustment factor.

(2) Proposed FY 2024 Outlier Fixed-Loss Cost Threshold

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50977 through 50983), in response to public comments on the FY 2013 IPPS/LTCH PPS proposed rule, we made changes to our methodology for projecting the outlier fixed-loss cost threshold for FY 2014. We refer readers to the FY 2014 IPPS/LTCH PPS final rule for a detailed discussion of the changes.

As we have done in the past, to calculate the proposed FY 2024 outlier threshold, we simulated payments by applying proposed FY 2024 payment rates and policies using cases from the FY 2022 MedPAR file. As noted in section II.C. of this Addendum, we specify the formula used for actual claim payment which is also used by

CMS to project the outlier threshold for the upcoming fiscal year. The difference is the source of some of the variables in the formula. For example, operating and capital CCRs for actual claim payment are from the PSF while CMS uses an adjusted CCR (as described later in this section) to project the threshold for the upcoming fiscal year. In addition, charges for a claim payment are from the bill while charges to project the threshold are from the MedPAR data with an inflation factor applied to the charges (as described earlier).

In order to determine the proposed FY 2024 outlier threshold, we inflated the charges on the MedPAR claims by 2 years, from FY 2022 to FY 2024. Consistent with the FY 2020 IPPS/LTCH PPS final rule (84 FR 42626 and 42627), we are proposing to use the following methodology to calculate the charge inflation factor for FY 2024:

- Include hospitals whose last four digits fall between 0001 and 0899 (section 2779A1 of Chapter 2 of the State Operations Manual on the CMS website at *https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/som107c02.pdf*); include CAHs that were IPPS hospitals for the time period of the MedPAR data being used to calculate the charge inflation factor; include hospitals in Maryland; and remove PPS-excluded cancer hospitals that have a ''V'' in the fifth position of their provider number or a ''E'' or ''F'' in the sixth position.
- Include providers that are in both periods of charge data that are used to calculate the 1-year average annual rate of-change in charges per case. We note this is consistent with the methodology used since FY 2014.
- We excluded Medicare Advantage IME claims for the reasons described in section I.A.4. of this Addendum. We refer readers to the FY 2011 IPPS/LTCH PPS final rule for a complete discussion on our methodology of identifying and adding the total Medicare Advantage IME payment amount to the budget neutrality adjustments.
- In order to ensure that we capture only FFS claims, we included claims with a ''Claim Type'' of 60 (which is a field on the MedPAR file that indicates a claim is an FFS claim).
- In order to further ensure that we capture only FFS claims, we excluded claims with a ''GHOPAID'' indicator of 1 (which is a field on the MedPAR file that indicates a claim is not an FFS claim and is paid by a Group Health Organization).
- We examined the MedPAR file and removed pharmacy charges for anti-hemophilic blood factor (which are paid separately under the IPPS) with an indicator of ''3'' for blood clotting with a revenue code of ''0636'' from the covered charge field. We also removed organ acquisition charges from the covered charge field because organ acquisition is a pass-through payment not paid under the IPPS. As noted previously, we are proposing to remove allogeneic hematopoietic stem cell acquisition charges from the covered charge field for budget neutrality adjustments. As discussed in the FY 2021 IPPS/LTCH PPS final rule, payment for allogeneic hematopoietic stem cell acquisition costs is made on a reasonable cost basis for cost reporting periods beginning on or after October 1, 2020 (85 FR 58835 through 58842).
- Because this payment simulation uses the proposed FY 2024 relative weights, consistent with our proposal discussed in section IV.I. of the preamble to this proposed rule, we applied the proposed adjustor for certain cases that group to MS–DRG 018 in our simulation of these payments.

In the FY 2023 IPPS/LTCH PPS final rule, due to the impact of the COVID–19 PHE on our ordinary ratesetting data, we finalized modifications to our usual ratesetting methodologies for FY 2023, including the methodology for calculating the FY 2023 outlier threshold. We refer the reader to the FY 2023 IPPS/LTCH PPS final rule (87 FR 49422 through 49428) for a discussion of the FY 2023 outlier threshold and the modifications made to our usual methodologies for calculating the outlier threshold. As discussed in section I.E. of the preamble to this proposed rule, based on the information available at this time, we do not believe there is a reasonable basis for us to assume that there will be a meaningful difference in the number of COVID–19 cases treated at IPPS hospitals and LTCHs in FY 2024 relative to FY 2022, such that modifications to our usual ratesetting methodologies (including the methodology for calculating the outlier threshold) would be warranted. Therefore, we are proposing to calculate the FY 2024 outlier threshold consistent with our historic methodologies, as described further in this section, without modifications.

Our general methodology to inflate the charges computes the 1-year average annual rate-of-change in charges per case which is then applied twice to inflate the charges on the MedPAR claims by 2 years since we typically use claims data for the fiscal year that is 2 years prior to the upcoming fiscal year.

In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42627), we modified our charge inflation methodology. We stated that we believe balancing our preference to use the latest available data from the MedPAR files and stakeholders' concerns about being able to use publicly available MedPAR files to review the charge inflation factor can be achieved by modifying our methodology to use the publicly available Federal fiscal year period (that is, for FY 2020, we used the charge data from Federal fiscal years 2017 and 2018), rather than the most recent data available to CMS which, under our prior methodology, was based on calendar year data. We refer the reader to the FY 2020 IPPS/LTCH PPS final rule for a complete discussion regarding this change.

For the same reasons discussed in that rulemaking, for FY 2024, we are proposing to use the same methodology as FY 2020 to determine the charge inflation factor. That is, for FY 2023, we are proposing to use the MedPAR files for the two most recent available Federal fiscal year time periods to calculate the charge inflation factor, as we did for FY 2020. Specifically, for this proposed rule we are proposing to use the December 2021 MedPAR file of FY 2021 (October 1, 2020 to September 30, 2021) charge data (released for the FY 2023 IPPS/LTCH PPS proposed rule) and the December 2022 MedPAR file of FY 2022 (October 1, 2021 to September 30, 2022) charge data (released for this FY 2024 IPPS/LTCH PPS proposed rule) to compute the proposed charge inflation factor. We are proposing that for the FY 2024 final rule, we would use more recently updated data, that is the MedPAR files from March 2022 for the FY 2021 time period and March 2023 for the FY 2022 time period.

For FY 2024, under this proposed methodology, to compute the 1-year average annual rate-of-change in charges per case, we compared the average covered charge per case of $78,089.49 ($579,065,304,520/7,415,406) from October 1, 2020 through September 30, 2021, to the average covered charge per case of $ 82,583.83 ($574,783,177,187/6,959,997) from October 1, 2021 through September 30, 2022. This rate-of-change was 5.755 percent (1.05755) or 11.8412 percent (1.118412) over 2 years. The billed charges are obtained from the claims from the MedPAR file and inflated by the inflation factor specified previously.

In this proposed rule, we are proposing to establish the FY 2024 outlier threshold using hospital CCRs from the December 2022 update to the Provider-Specific File (PSF), the most recent available data at the time of the development of this proposed rule. We are proposing to apply the following edits to providers' CCRs in the PSF. We believe these edits are appropriate in

order to accurately model the outlier threshold. We first search for Indian Health Service providers and those providers assigned the statewide average CCR from the current fiscal year. We then replace these CCRs with the statewide average CCR for the upcoming fiscal year. We also assign the statewide average CCR (for the upcoming fiscal year) to those providers that have no value in the CCR field in the PSF or whose CCRs exceed the ceilings described later in this section (3.0 standard deviations from the mean of the log distribution of CCRs for all hospitals). We do not apply the adjustment factors described later in this section to hospitals assigned the statewide average CCR. For FY 2024, we are also proposing to continue to apply an adjustment factor to the CCRs to account for cost and charge inflation (as explained later in this section). We also are proposing that, if more recent data become available, we would use that data to calculate the final FY 2024 outlier threshold.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50979), we adopted a new methodology to adjust the CCRs. Specifically, we finalized a policy to compare the national average case-weighted operating and capital CCR from the most recent update of the PSF to the national average case-weighted operating and capital CCR from the same period of the prior year.

Therefore, we are proposing to adjust the CCRs from the December 2022 update of the PSF by comparing the percentage change in the national average case weighted operating CCR and capital CCR from the December 2021 update of the PSF to the national average case weighted operating CCR and capital CCR from the December 2022 update of the PSF. We note that we used total transfer-adjusted cases from FY 2022 to determine the national average case weighted CCRs for both sides of the comparison. As stated in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50979), we believe that it is appropriate to use the same case count on both sides of the comparison because this will produce the true percentage change in the average case-weighted operating and capital CCR from one year to the next without any effect from a change in case count on different sides of the comparison.

Using the proposed methodology, for this proposed rule, we calculated a December 2021 operating national average case-weighted CCR of 0.253006 and a December 2022 operating national average case-weighted CCR of 0.247389. We then calculated the percentage change between the two national operating case-weighted CCRs by subtracting the December 2021 operating national average case-weighted CCR from the December 2022 operating national average case-weighted CCR and then dividing the result by the December 2021 national operating average case-weighted CCR. This resulted in a proposed one-year national operating CCR adjustment factor of 0.977799.

We used this same proposed methodology to adjust the capital CCRs. Specifically, we calculated a December 2021 capital national average case-weighted CCR of 0.0202 and a December 2022 capital national average case-weighted CCR of 0.018054. We then calculated the percentage change between the two national capital case-weighted CCRs by subtracting the December 2021 capital national average case-weighted CCR from the December 2022 capital national average case-weighted CCR and then dividing the result by the December 2021 capital national average case-weighted CCR. This resulted in a proposed one-year national capital CCR adjustment factor of 0.893762.

For purposes of estimating the proposed outlier threshold for FY 2024, we used a wage index that reflects the policies discussed in the proposed rule. This includes the following:

- The proposed frontier State floor adjustments in accordance with section 10324(a) of the Affordable Care Act,
- The proposed out-migration adjustment as added by section 505 of Public Law 108–173,
- Incorporating the proposed FY 2024 low wage index hospital policy (described in section III.G.4 of the preamble of this proposed rule) for hospitals with a wage index value below the 25th percentile, where the increase in the wage index value for these hospitals would be equal to half the difference between the otherwise applicable final wage index value for a year for that hospital and the 25th percentile wage index value for that year across all hospitals.
- Incorporating our policy (described in section III.N. of the preamble of this proposed rule) to apply a 5-percent cap on any decrease to a hospital's wage index from its wage index in the prior FY, regardless of the circumstances causing the decline.

If we did not take the aforementioned into account, our estimate of total FY 2024 payments would be too low, and, as a result, our proposed outlier threshold would be too high, such that estimated outlier payments would be less than our projected 5.1 percent of total payments (which includes outlier reconciliation).

As described in sections V.K. and V.L., respectively, of the preamble of this proposed rule, sections 1886(q) and 1886(o) of the Act establish the Hospital Readmissions Reduction Program and the Hospital VBP Program, respectively. We do not believe that it is appropriate to include the proposed hospital VBP payment adjustments and the hospital readmissions payment adjustments in the proposed outlier threshold calculation or the proposed outlier offset to the standardized amount. Specifically, consistent with our definition of the base operating DRG payment amount for the Hospital Readmissions Reduction Program under § 412.152 and the Hospital VBP Program under § 412.160, outlier payments under section 1886(d)(5)(A) of the Act are not affected by these payment adjustments. Therefore, outlier payments would continue to be calculated based on the unadjusted base DRG payment amount (as opposed to using the base-operating DRG payment amount adjusted by the hospital readmissions payment adjustment and the hospital VBP payment adjustment). Consequently, we are proposing to exclude the estimated hospital VBP payment adjustments and the estimated hospital readmissions payment adjustments from the calculation of the proposed outlier fixed-loss cost threshold.

We note that, to the extent section 1886(r) of the Act modifies the DSH payment methodology under section 1886(d)(5)(F) of the Act, the uncompensated care payment under section 1886(r)(2) of the Act, like the empirically justified Medicare DSH payment under section 1886(r)(1) of the Act, may be considered an amount payable under section 1886(d)(5)(F) of the Act such that it would be reasonable to include the payment in the outlier determination under section 1886(d)(5)(A) of the Act. As we have done since the implementation of uncompensated care payments in FY 2014, for FY 2024, we are proposing to allocate an estimated per-discharge uncompensated care payment amount to all cases for the hospitals eligible to receive the uncompensated care payment amount in the calculation of the outlier fixed-loss cost threshold methodology. We continue to believe that allocating an eligible hospital's estimated uncompensated care payment to all cases equally in the calculation of the outlier fixed-loss cost threshold would best approximate the amount we would pay in uncompensated care payments during the year because, when we make claim payments to a

hospital eligible for such payments, we would be making estimated per-discharge uncompensated care payments to all cases equally.

Furthermore, we continue to believe that using the estimated per-claim uncompensated care payment amount to determine outlier estimates provides predictability as to the amount of uncompensated care payments included in the calculation of outlier payments. Therefore, consistent with the methodology used since FY 2014 to calculate the outlier fixed-loss cost threshold, for FY 2024, we are proposing to include estimated FY 2024 uncompensated care payments in the computation of the proposed outlier fixed-loss cost threshold. Specifically, we are proposing to use the estimated per-discharge uncompensated care payments to hospitals eligible for the uncompensated care payment for all cases in the calculation of the proposed outlier fixed-loss cost threshold methodology.

In addition, consistent with the methodology finalized in the FY 2023 final rule, we are proposing to include the estimated supplemental payments for eligible IHS/Tribal hospitals and Puerto Rico hospitals in the computation of the FY 2024 proposed outlier fixed-loss cost threshold. Specifically, we are proposing to use the estimated per-discharge supplemental payments to hospitals eligible for the supplemental payment for all cases in the calculation of the proposed outlier fixed-loss cost threshold methodology.

Using this methodology, we used the formula described in section I.C.1. of this Addendum to simulate and calculate the Federal payment rate and outlier payments for all claims. In addition, as described in the earlier section to this Addendum, we are proposing to incorporate an estimate of FY 2024 outlier reconciliation in the methodology for determining the outlier threshold. As noted previously, for this FY 2024 proposed rule, the ratio of outlier reconciliation dollars to total Federal Payments (Step 4) is a negative 0.007806 percent, which, when rounded to the second digit, is −0.01 percent. Therefore, for FY 2024, we are proposing to incorporate a projection of outlier reconciliation dollars by targeting an outlier threshold at 5.11 percent [5.1 percent − (− .01 percent)]. Under this proposed approach, we determined a threshold of $40,732 and calculated total outlier payments of $4,259,029,890 and total operating Federal payments of $79,087,551,441. We then divided total outlier payments by total operating Federal payments plus total outlier payments and determined that this threshold matched with the 5.11 percent target, which reflects our proposal to incorporate an estimate of outlier reconciliation in the determination of the outlier threshold (as discussed in more detail in the previous section of this Addendum). We note that, if calculated without applying our proposed methodology for incorporating an estimate of outlier reconciliation in the determination of the outlier threshold, the proposed threshold would be $40,808. We are proposing an outlier fixed-loss cost threshold for FY 2024 equal to the prospective payment rate for the MS–DRG, plus any IME, empirically justified Medicare DSH payments, estimated uncompensated care payment, estimated supplemental payment for eligible IHS/Tribal hospitals and Puerto Rico hospitals, and any add-on payments for new technology, plus $40,732.

(3) Other Proposed Changes Concerning Outliers

As stated in the FY 1994 IPPS final rule (58 FR 46348), we establish an outlier threshold that is applicable to both hospital inpatient operating costs and hospital inpatient capital-related costs. When we modeled the combined operating and capital outlier payments, we found that using a common threshold resulted in a higher percentage of outlier payments for capital-related costs than for operating costs. We project that the threshold for FY 2024 (which reflects our methodology to incorporate an estimate of operating outlier reconciliation) would result in outlier payments that would equal 5.1 percent of operating DRG payments and we estimate that capital outlier payments would equal 4.16 percent of capital payments based on the Federal rate (which reflects our methodology discussed previously to incorporate an estimate of capital outlier reconciliation).

In accordance with section 1886(d)(3)(B) of the Act and as discussed previously, we are proposing to reduce the FY 2024 standardized amount by 5.1 percent to account for the projected proportion of payments paid as outliers.

The proposed outlier adjustment factors that would be applied to the operating standardized amount and capital Federal rate based on the proposed FY 2024 outlier threshold are as follows:

	Operating Standardized Amounts	Capital Federal Rate*
National	0.949	0.958

*The adjustment factor for the capital Federal rate includes an adjustment to the estimated percentage of FY 2024 capital outlier payments for capital outlier reconciliation, as discussed previously and in section III. A. 2 in the Addendum of this proposed rule.

We are proposing to apply the outlier adjustment factors to the FY 2024 payment rates after removing the effects of the FY 2023 outlier adjustment factors on the standardized amount.

To determine whether a case qualifies for outlier payments, we currently apply hospital-specific CCRs to the total covered charges for the case. Estimated operating and capital costs for the case are calculated separately by applying separate operating and capital CCRs. These costs are then combined and compared with the outlier fixed-loss cost threshold.

Under our current policy at § 412.84, we calculate operating and capital CCR ceilings and assign a statewide average CCR for hospitals whose CCRs exceed 3.0 standard deviations from the mean of the log distribution of CCRs for all hospitals. Based on this calculation, for hospitals for which the MAC computes operating CCRs greater than 1.205 or capital CCRs greater than 0.124 or hospitals for which the MAC is unable to calculate a CCR (as described under § 412.84(i)(3) of our regulations), statewide average CCRs are used to determine whether a hospital qualifies for outlier payments. Table 8A listed in section VI. of this Addendum (and available via the internet on the CMS website) contains the proposed statewide average operating CCRs for urban hospitals and for rural hospitals for which the MAC is unable to compute a hospital-specific CCR within the range previously specified. These statewide average ratios would be effective for discharges occurring on or after October 1, 2023 and would replace the statewide average ratios from the prior fiscal year. Table 8B listed in section VI. of this Addendum (and

available via the internet on the CMS website) contains the comparable proposed statewide average capital CCRs. As previously stated, the proposed CCRs in Tables 8A and 8B would be used during FY 2024 when hospital-specific CCRs based on the latest settled cost report either are not available or are outside the range noted previously. Table 8C listed in section VI. of this Addendum (and available via the internet on the CMS website) contains the proposed statewide average total CCRs used under the LTCH PPS as discussed in section V. of this Addendum.

We finally note that section 20.1.2 of chapter three of the Medicare Claims Processing Manual (on the internet at *https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/clm104c03.pdf*) covers an array of topics, including CCRs, reconciliation, and the time value of money. We encourage hospitals that are assigned the statewide average operating and/or capital CCRs to work with their MAC on a possible alternative operating and/or capital CCR as explained in the manual. Use of an alternative CCR developed by the hospital in conjunction with the MAC can avoid possible overpayments or underpayments at cost report settlement, thereby ensuring better accuracy when making outlier payments and negating the need for outlier reconciliation. We also note that a hospital may request an alternative operating or capital CCR at any time as long as the guidelines of the manual are followed. In addition, the manual outlines the outlier reconciliation process for hospitals and Medicare contractors. We refer hospitals to the manual instructions for complete details on outlier reconciliation.

(4) FY 2022 Outlier Payments

Our current estimate, using available FY 2022 claims data, is that actual outlier payments for FY 2022 were approximately 6.73 percent of actual total MS–DRG payments. Therefore, the data indicate that, for FY 2022, the percentage of actual outlier payments relative to actual total payments is higher than we projected for FY 2022. Consistent with the policy and statutory interpretation we have maintained since the inception of the IPPS, we do not make retroactive adjustments to outlier payments to ensure that total outlier payments for FY 2022 are equal to 5.1 percent of total MS–DRG payments. As explained in the FY 2003 Outlier final rule (68 FR 34502), if we were to make retroactive adjustments to all outlier payments to ensure total payments are 5.1 percent of MS–DRG payments (by retroactively adjusting outlier payments), we would be removing the important aspect of the prospective nature of the IPPS. Because such an across-the-board adjustment would either lead to more or less outlier payments for all hospitals, hospitals would no longer be able to reliably approximate their payment for a patient while the patient is still hospitalized. We believe it would be neither necessary nor appropriate to make such an aggregate retroactive adjustment. Furthermore, we believe it is consistent with the statutory language at section 1886(d)(5)(A)(iv) of the Act not to make retroactive adjustments to outlier payments. This section states that outlier payments be equal to or greater than 5 percent and less than or equal to 6 percent of projected or estimated (not actual) MS–DRG payments. We believe that an important goal of a PPS is predictability. Therefore, we believe that the fixed-loss outlier threshold should be projected based on the best available historical data and should not be adjusted retroactively. A retroactive change to the fixed-loss outlier threshold would affect all hospitals subject to the IPPS, thereby undercutting the predictability of the system as a whole.

We note that, because the MedPAR claims data for the entire FY 2023 period would not be available until after September 30, 2023, we are unable to provide an estimate of actual outlier payments for FY 2023 based on FY 2023 claims data in this proposed rule. We will provide an estimate of actual FY 2023 outlier payments in the FY 2025 IPPS/LTCH PPS proposed rule.

5. Proposed FY 2024 Standardized Amount

The adjusted standardized amount is divided into labor-related and nonlabor-related portions. Tables 1A and 1B listed and published in section VI. of this Addendum (and available via the internet on the CMS website) contain the national standardized amounts that we are proposing to apply to all hospitals, except hospitals located in Puerto Rico, for FY 2024. The proposed standardized amount for hospitals in Puerto Rico is shown in Table 1C listed and published in section VI. of this Addendum (and available via the internet on the CMS website). The proposed amounts shown in Tables 1A and 1B differ only in that the labor-related share applied to the standardized amounts in Table 1A is 67.6 percent, and the labor-related share applied to the standardized amounts in Table 1B is 62 percent. In accordance with sections 1886(d)(3)(E) and 1886(d)(9)(C)(iv) of the Act, we are proposing to apply a labor-related share of 62 percent, unless application of that percentage would result in lower payments to a hospital than would otherwise be made. In effect, the statutory provision means that we would apply a labor-related share of 62 percent for all hospitals whose wage indexes are less than or equal to 1.0000.

In addition, Tables 1A and 1B include the proposed standardized amounts reflecting the proposed applicable percentage increases for FY 2024.

The proposed labor-related and nonlabor-related portions of the national average standardized amounts for Puerto Rico hospitals for FY 2024 are set forth in Table 1C listed and published in section VI. of this Addendum (and available via the internet on the CMS website). Similarly, section 1886(d)(9)(C)(iv) of the Act, as amended by section 403(b) of Public Law 108–173, provides that the labor-related share for hospitals located in Puerto Rico be 62 percent, unless the application of that percentage would result in lower payments to the hospital.

The following table illustrates the changes from the FY 2023 national standardized amounts to the proposed FY 2024 national standardized amounts. The second through fifth columns display the changes from the FY 2023 standardized amounts for each proposed applicable FY 2024 standardized amount. The first row of the table shows the updated (through FY 2023) average standardized amount after restoring the FY 2023 offsets for outlier payments, geographic reclassification, rural demonstration, lowest quartile, and wage index cap policy budget neutrality. The MS–DRG reclassification and recalibration wage index, and stem cell acquisition budget neutrality factors are cumulative (that is, we have not restored the offsets). Accordingly, those FY 2023 adjustment factors have not been removed from the base rate in the following table. Additionally, for FY 2024 we have applied the budget neutrality factors for the lowest quartile hospital policy, described previously.

BILLING CODE 4120–01–P

BILLING CODE 4120–01–C

CHANGES FROM FY 2023 STANDARDIZED AMOUNTS TO THE PROPOSED FY 2024 STANDARDIZED AMOUNTS

	Hospital Submitted Quality Data and is a Meaningful EHR User	Hospital Submitted Quality Data and is NOT a Meaningful EHR User	Hospital Did NOT Submit Quality Data and is a Meaningful EHR User	Hospital Did NOT Submit Quality Data and is NOT a Meaningful EHR User
FY 2024 Base Rate after removing: 1. FY 2023 Geographic Reclassification Budget Neutrality (0.984399) 2. FY 2023 Operating Outlier Offset (0.949)	If Wage Index is Greater Than 1.0000: Labor (67.6%): $4,628.54 Nonlabor (32.4%): $2,218.41	If Wage Index is Greater Than 1.0000: Labor (67.6%): $4,628.54 Nonlabor (32.4%): $2,218.41	If Wage Index is Greater Than 1.0000: Labor (67.6%): $4,628.54 Nonlabor (32.4%): $2,218.41	If Wage Index is Greater Than 1.0000: Labor (67.6%): $4,628.54 Nonlabor (32.4%): $2,218.41
3. FY 2023 Rural Demonstration Budget Neutrality Factor (0.998935) 4. FY 2023 Lowest Quartile Budget Neutrality Factor (0.998146) 5. FY 2023 Cap Policy Wage Index Budget Neutrality Factor (0.999689)	If Wage Index is less Than or Equal to 1.0000: Labor (62%): $4,245.11 Nonlabor (38%): $2,601.84	If Wage Index is less Than or Equal to 1.0000: Labor (62%): $4,245.11 Nonlabor (38%): $2,601.84	If Wage Index is less Than or Equal to 1.0000: Labor (62%): $4,245.11 Nonlabor (38%): $2,601.84	If Wage Index is less Than or Equal to 1.0000: Labor (62%): $4,245.11 Nonlabor (38%): $2,601.84
Proposed FY 2024 Update Factor	1.027	1.00375	1.01925	0.996
Proposed FY 2024 MS-DRG Reclassification and Recalibration Budget Neutrality Factor Before Cap	1.001376	1.001376	1.001376	1.001376
Proposed FY 2024 Cap Policy MS-DRG Weight Budget Neutrality Factor	0.999925	0.999925	0.999925	0.999925
Proposed FY 2024 Wage Index Budget Neutrality Factor	1.000943	1.000943	1.000943	1.000943

Proposed FY 2024 Operating Outlier Factor	0.949	0.949	0.949	0.949
Proposed National Standardized Amount for FY 2024 if Wage Index is Greater Than 1.0000; Labor/Non-Labor Share Percentage (67.6/32.4)	**Labor: $4,410.86 Nonlabor: $2,114.08**	**Labor: $4,314.32 Nonlabor: $2,067.81**	**Labor: $4,378.68 Nonlabor: $2,098.66**	**Labor: $4,282.14 Nonlabor: $2,052.39**
Proposed National Standardized Amount for FY 2024 if Wage Index is Less Than or Equal to 1.0000; Labor/Non-Labor Share Percentage (62/38)	**Labor: $4,045.46 Nonlabor: $2,479.48**	**Labor: $3,956.92 Nonlabor: $2,425.21**	**Labor: $4,015.95 Nonlabor: $2,461.39**	**Labor: $3,927.41 Nonlabor: $2,407.12**

B. Proposed Adjustments for Area Wage Levels and Cost-of-Living

Tables 1A through 1C, as published in section VI. of this Addendum (and available via the internet on the CMS website), contain the proposed labor-related and nonlabor-related shares that we are proposing to use to calculate the prospective payment rates for hospitals located in the 50 States, the District of Columbia, and Puerto Rico for FY 2024. This section addresses two types of adjustments to the standardized amounts that are made in determining the prospective payment rates as described in this Addendum.

1. Proposed Adjustment for Area Wage Levels

Sections 1886(d)(3)(E) and 1886(d)(9)(C)(iv) of the Act require that we make an adjustment to the labor-related portion of the national prospective payment rate to account for area differences in hospital wage levels. This adjustment is made by multiplying the labor-related portion of the adjusted standardized amounts by the appropriate wage index for the area in which the hospital is located. For FY 2024, as discussed in section IV.B.3. of the preamble of this proposed rule, we are proposing to apply a labor-related share of 67.6 percent for the national standardized amounts for all IPPS hospitals (including hospitals in Puerto Rico) that have a wage index value that is greater than 1.0000. Consistent with section 1886(d)(3)(E) of the Act, we are proposing to apply the wage index to a labor-related share of 62 percent of the national standardized amount for all IPPS hospitals (including hospitals in Puerto Rico) whose wage index values are less than or equal to 1.0000. In section III. of the preamble of this proposed rule, we discuss the data and methodology for the FY 2024 wage index.

2. Adjustment for Cost-of-Living in Alaska and Hawaii

Section 1886(d)(5)(H) of the Act provides discretionary authority to the Secretary to make adjustments as the Secretary deems appropriate to take into account the unique circumstances of hospitals located in Alaska and Hawaii. Higher labor-related costs for these two States are taken into account in the adjustment for area wages described previously. To account for higher non-labor-related costs for these two States, we multiply the nonlabor-related portion of the standardized amount for hospitals in Alaska and Hawaii by an adjustment factor.

In the FY 2013 IPPS/LTCH PPS final rule, we established a methodology to update the COLA factors for Alaska and Hawaii that were published by the U.S. Office of Personnel Management (OPM) every 4 years (coinciding with the update to the labor related share of the IPPS market basket), beginning in FY 2014. We refer readers to the FY 2013 IPPS/LTCH PPS proposed and final rules for additional background and a detailed description of this methodology (77 FR 28145 through 28146 and 77 FR 53700 through 53701, respectively). For FY 2022, in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45546 through 45547), we updated the COLA factors published by OPM for 2009 (as these are the last COLA factors OPM published prior to transitioning from COLAs to locality pay) using the methodology that we finalized in the FY 2013 IPPS/LTCH PPS final rule. Based on the policy finalized in the FY 2013 IPPS/LTCH PPS final rule, we are continuing to use the same COLA factors in FY 2024 that were used in FY 2023 to adjust the nonlabor-related portion of the standardized amount for hospitals located in Alaska and Hawaii. The following table lists the COLA factors for FY 2024.

FY 2024 Cost-of-Living Adjustment Factors (COLA): Alaska and Hawaii Hospitals

Area	FY 2022 through FY 2024
Alaska:	
City of Anchorage and 80-kilometer (50-mile) radius by road	1.22
City of Fairbanks and 80-kilometer (50-mile) radius by road	1.22
City of Juneau and 80-kilometer (50-mile) radius by road	1.22
Rest of Alaska	1.24
Hawaii:	
City and County of Honolulu	1.25
County of Hawaii	1.22
County of Kauai	1.25
County of Maui and County of Kalawao	1.25

Lastly, as we finalized in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53700 and 53701), we intend to update the COLA factors based on our methodology every 4 years, at the same time as the update to the labor-related share of the IPPS market basket.

C. Calculation of the Proposed Prospective Payment Rates

1. General Formula for Calculation of the Prospective Payment Rates for FY 2024

In general, the operating prospective payment rate for all hospitals (including hospitals in Puerto Rico) paid under the IPPS, except SCHs and MDHs, for FY 2024 equals the Federal rate (which includes uncompensated care payments). Under current law, the MDH program is effective for discharges on or before September 30, 2024.

SCHs are paid based on whichever of the following rates yields the greatest aggregate payment: the Federal national

rate (which, as discussed in section VI.G. of the preamble of this proposed rule, includes uncompensated care payments); the updated hospital-specific rate based on FY 1982 costs per discharge; the updated hospital-specific rate based on FY 1987 costs per discharge; the updated hospital-specific rate based on FY 1996 costs per discharge; or the updated hospital-specific rate based on FY 2006 costs per discharge to determine the rate that yields the greatest aggregate payment.

The prospective payment rate for SCHs for FY 2024 equals the higher of the applicable Federal rate, or the hospital-specific rate as described later in this section. The prospective payment rate for MDHs for FY 2024 equals the higher of the Federal rate, or the Federal rate plus 75 percent of the difference between the Federal rate and the hospital-specific rate as described in this section. For MDHs, the updated hospital-specific rate is based on FY 1982, FY 1987, or FY 2002 costs per discharge, whichever yields the greatest aggregate payment.

2. Operating and Capital Federal Payment Rate and Outlier Payment Calculation

Note: The formula specified in this section is used for actual claim payment and is also used by CMS to project the outlier threshold for the upcoming fiscal year. The difference is the source of some of the variables in the formula. For example, operating and capital CCRs for actual claim payment are from the PSF while CMS uses an adjusted CCR (as described previously) to project the threshold for the upcoming fiscal year. In addition, charges for a claim payment are from the bill while charges to project the threshold are from the MedPAR data with an inflation factor applied to the charges (as described earlier).

Step 1—Determine the MS–DRG and MS–DRG relative weight (from Table 5) for each claim primarily based on the ICD–10–CM diagnosis and ICD–10–PCS procedure codes on the claim.

Step 2—Select the applicable average standardized amount depending on whether the hospital submitted qualifying quality data and is a meaningful EHR user, as described previously.

Step 3—Compute the operating and capital Federal payment rate:

—Federal Payment Rate for Operating Costs = MS–DRG Relative Weight × [(Labor-Related Applicable Standardized Amount × Applicable CBSA Wage Index) + (Nonlabor-Related Applicable Standardized Amount × Cost-of-Living Adjustment)] × (1 + IME + (DSH * 0.25))

—Federal Payment for Capital Costs = MS–DRG Relative Weight × Federal Capital Rate × Geographic Adjustment Fact × (l + IME + DSH)

Step 4—Determine operating and capital costs:

—Operating Costs = (Billed Charges × Operating CCR)

—Capital Costs = (Billed Charges × Capital CCR).

Step 5—Compute operating and capital outlier threshold (CMS applies a geographic adjustment to the operating and capital outlier threshold to account for local cost variation):

—Operating CCR to Total CCR = (Operating CCR)/(Operating CCR + Capital CCR)

—Operating Outlier Threshold = [Fixed Loss Threshold × ((Labor-Related Portion × CBSA Wage Index) + Nonlabor-Related portion)] × Operating CCR to Total CCR + Federal Payment with IME, DSH + Uncompensated Care Payment + supplemental payment for eligible IHS/Tribal hospitals and Puerto Rico hospitals + New Technology Add-On Payment Amount

—Capital CCR to Total CCR = (Capital CCR)/(Operating CCR + Capital CCR)

—Capital Outlier Threshold = (Fixed Loss Threshold × Geographic Adjustment Factor × Capital CCR to Total CCR) + Federal Payment with IME and DSH

Step 6—Compute operating and capital outlier payments:

—Marginal Cost Factor = 0.80 or 0.90 (depending on the MS–DRG)

—Operating Outlier Payment = (Operating Costs − Operating Outlier Threshold) × Marginal Cost Factor

—Capital Outlier Payment = (Capital Costs − Capital Outlier Threshold) × Marginal Cost Factor

The payment rate may then be further adjusted for hospitals that qualify for a low-volume payment adjustment under section 1886(d)(12) of the Act and 42 CFR 412.101(b). The base-operating DRG payment amount may be further adjusted by the hospital readmissions payment adjustment and the hospital VBP payment adjustment as described under sections 1886(q) and 1886(o) of the Act, respectively. Payments also may be reduced by the 1-percent adjustment under the HAC Reduction Program as described in section 1886(p) of the Act. We also make new technology add-on payments in accordance with section 1886(d)(5)(K) and (L) of the Act. Finally, we add the uncompensated care payment and supplemental payment for eligible IHS/Tribal hospitals and Puerto Rico hospitals to the total claim payment amount. As noted in the previous formula, we take uncompensated care payments, supplemental payments for eligible IHS/Tribal hospitals and Puerto Rico hospitals, and new technology add-on payments into consideration when calculating outlier payments.

3. Hospital-Specific Rate (Applicable Only to SCHs and MDHs)

a. Calculation of Hospital-Specific Rate

Section 1886(b)(3)(C) of the Act provides that SCHs are paid based on whichever of the following rates yields the greatest aggregate payment: the Federal rate; the updated hospital-specific rate based on FY 1982 costs per discharge; the updated hospital-specific rate based on FY 1987 costs per discharge; the updated hospital-specific rate based on FY 1996 costs per discharge; or the updated hospital-specific rate based on FY 2006 costs per discharge to determine the rate that yields the greatest aggregate payment. Under current law, the MDH program has been extended for discharges occurring through September 30, 2024.

For a more detailed discussion of the calculation of the hospital-specific rates, we refer readers to the FY 1984 IPPS interim final rule (48 FR 39772); the April 20, 1990 final rule with comment period (55 FR 15150); the FY 1991 IPPS final rule (55 FR 35994); and the FY 2001 IPPS final rule (65 FR 47082).

b. Updating the FY 1982, FY 1987, FY 1996, FY 2002 and FY 2006 Hospital-Specific Rate for FY 2024

Section 1886(b)(3)(B)(iv) of the Act provides that the applicable percentage increase applicable to the hospital-specific rates for SCHs and MDHs equals the applicable percentage increase set forth in section 1886(b)(3)(B)(i) of the Act (that is, the same update factor as for all other hospitals subject to the IPPS). Because the Act sets the update factor for SCHs and MDHs equal to the update factor for all other IPPS hospitals, the update to the hospital-specific rates for SCHs and MDHs is subject to the amendments to section 1886(b)(3)(B) of the Act made by sections 3401(a) and 10319(a) of the Affordable Care Act. Accordingly, the proposed applicable percentage increases to the hospital-specific rates applicable to SCHs and MDHs are the following:

FY 2024	Hospital Submitted Quality Data and is a Meaningful EHR User	Hospital Submitted Quality Data and is NOT a Meaningful EHR User	Hospital Did NOT Submit Quality Data and is a Meaningful EHR User	Hospital Did NOT Submit Quality Data and is NOT a Meaningful EHR User
Proposed Market Basket Rate-of-Increase	3.0	3.0	3.0	3.0
Proposed Adjustment for Failure to Submit Quality Data under Section 1886(b)(3)(B)(viii) of the Act	0	0	-0.75	-0.75
Proposed Adjustment for Failure to be a Meaningful EHR User under Section 1886(b)(3)(B)(ix) of the Act	0	-2.25	0	-2.25
Proposed Productivity Adjustment under Section 1886(b)(3)(B)(xi) of the Act	-0.2	-0.2	-0.2	-0.2
Proposed Applicable Percentage Increase Applied to Standardized Amount	**2.8**	**0.55**	**2.05**	**-0.2**

For a complete discussion of the applicable percentage increase applied to the hospital-specific rates for SCHs and MDHs, we refer readers to section V.B. of the preamble of this proposed rule.

In addition, because SCHs and MDHs use the same MS–DRGs as other hospitals when they are paid based in whole or in part on the hospital-specific rate, the hospital-specific rate is adjusted by a budget neutrality factor to ensure that changes to the MS–DRG classifications and the recalibration of the MS–DRG relative weights are made in a manner so that aggregate IPPS payments are unaffected. Therefore, the hospital specific-rate for an SCH or an MDH is adjusted by the proposed MS–DRG reclassification and recalibration budget neutrality factor, as discussed in section III. of this Addendum and listed in the table in section II. of this Addendum. In addition, as discussed in section II.E.2.d. of the preamble this proposed rule and previously, we are applying a permanent 10-percent cap on the reduction in a MS–DRG's relative weight in a given fiscal year, as finalized in the FY 2023 IPPS/LTCH PPS final rule. Because SCHs and MDHs use the same MS–DRGs as other hospitals when they are paid based in whole or in part on the hospital-specific rate, consistent with the policy adopted in the FY 2023 IPPS/LTCH PPS final rule (87 FR 48897 through 48900 and 49432 through 49433), the hospital specific-rate for an SCH or MDH would be adjusted by the proposed MS–DRG 10-percent cap budget neutrality factor. The resulting rate is used in determining the payment rate that an SCH or MDH would receive for its discharges beginning on or after October 1, 2023.

III. Proposed Changes to Payment Rates for Acute Care Hospital Inpatient Capital-Related Costs for FY 2024

The PPS for acute care hospital inpatient capital-related costs was implemented for cost reporting periods beginning on or after October 1, 1991. The basic methodology for determining Federal capital prospective rates is set forth in the regulations at 42 CFR 412.308 through 412.352. In this section of this Addendum, we discuss the factors that we are proposing to use to determine the capital Federal rate for FY 2024, which would be effective for discharges occurring on or after October 1, 2023.

All hospitals (except ''new'' hospitals under § 412.304(c)(2)) are paid based on the capital Federal rate. We annually update the capital standard Federal rate, as provided in § 412.308(c)(1), to account for capital input price increases and other factors. The regulations at § 412.308(c)(2) also provide that the capital Federal rate be adjusted annually by a factor equal to the estimated proportion of outlier payments under the capital Federal rate to total capital payments under the capital Federal rate. In addition, § 412.308(c)(3) requires that the capital Federal rate be reduced by an adjustment factor equal to the estimated proportion of payments for exceptions under § 412.348. (We note that, as discussed in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53705), there is generally no longer a need for an exceptions payment adjustment factor.) However, in limited circumstances, an additional payment exception for extraordinary circumstances is provided for under § 412.348(f) for qualifying hospitals.

Therefore, in accordance with § 412.308(c)(3), an exceptions payment adjustment factor may need to be applied if such payments are made. Section 412.308(c)(4)(ii) requires that the capital standard Federal rate be adjusted so that the effects of the annual DRG reclassification and the recalibration of DRG weights and changes in the geographic adjustment factor (GAF) are budget neutral.

Section 412.374 provides for payments to hospitals located in Puerto Rico under the IPPS for acute care hospital inpatient capital-related costs, which currently specifies capital IPPS payments to hospitals located in Puerto Rico are based on 100 percent of the Federal rate.

A. Determination of the Proposed Federal Hospital Inpatient Capital-Related Prospective Payment Rate Update for FY 2024

In the discussion that follows, we explain the factors that we are proposing to use to determine the capital Federal rate for FY 2024. In particular, we explain why the proposed FY 2024 capital Federal rate would increase approximately 4.50 percent, compared to the FY 2023 capital Federal rate. As discussed in the impact analysis in Appendix A to this proposed rule, we estimate that capital payments per discharge would increase approximately 6.3 percent during that same period. Because capital payments constitute approximately 10 percent of hospital payments, a 1-percent change in the capital Federal rate yields only approximately a 0.1 percent change in actual payments to hospitals.

1. Projected Capital Standard Federal Rate Update

Under § 412.308(c)(1), the capital standard Federal rate is updated on the basis of an analytical framework that takes into account changes in a capital input price index (CIPI) and several other policy adjustment factors. Specifically, we adjust the projected CIPI rate of change, as appropriate, each year for case-mix index-related changes, for intensity, and for errors in previous

CIPI forecasts. The proposed update factor for FY 2024 under that framework is 3.5 percent based on a projected 2.6 percent increase in the 2018-based CIPI, a proposed 0.0 percentage point adjustment for intensity, a proposed 0.0 percentage point adjustment for case-mix, a proposed 0.0 percentage point adjustment for the DRG reclassification and recalibration, and a proposed forecast error correction of 0.9 percentage point. As discussed in section III.C. of this Addendum, we continue to believe that the CIPI is the most appropriate input price index for capital costs to measure capital price changes in a given year. We also explain the basis for the FY 2024 CIPI projection in that same section of this Addendum. In this proposed rule, we describe the policy adjustments that we are proposing to apply in the update framework for FY 2024.

The case-mix index is the measure of the average DRG weight for cases paid under the IPPS. Because the DRG weight determines the prospective payment for each case, any percentage increase in the case-mix index corresponds to an equal percentage increase in hospital payments.

The case-mix index can change for any of several reasons—

- The average resource use of Medicare patient changes (''real'' case-mix change);
- Changes in hospital documentation and coding of patient records result in higher-weighted DRG assignments (''coding effects''); or
- The annual DRG reclassification and recalibration changes may not be budget neutral (''reclassification effect'').

We define real case-mix change as actual changes in the mix (and resource requirements) of Medicare patients, as opposed to changes in documentation and coding behavior that result in assignment of cases to higher-weighted DRGs, but do not reflect higher resource requirements. The capital update framework includes the same case-mix index adjustment used in the former operating IPPS update framework (as discussed in the May 18, 2004 IPPS proposed rule for FY 2005 (69 FR 28816)). (We no longer use an update framework to make a recommendation for updating the operating IPPS standardized amounts, as discussed in section II. of Appendix B to the FY 2006 IPPS final rule (70 FR 47707).)

For FY 2024, we are projecting a 0.5 percent total increase in the case-mix index. We estimated that the real case-mix increase would equal 0.5 percent for FY 2024. The net adjustment for change in case-mix is the difference between the projected real increases in case mix and the projected total increase in case mix. Therefore, the proposed net adjustment for case-mix change in FY 2024 is 0.0 percentage point.

The capital update framework also contains an adjustment for the effects of DRG reclassification and recalibration. This adjustment is intended to remove the effect on total payments of prior year's changes to the DRG classifications and relative weights, to retain budget neutrality for all case-mix index-related changes other than those due to patient severity of illness. Due to the lag time in the availability of data, there is a 2-year lag in data used to determine the adjustment for the effects of DRG reclassification and recalibration. For example, for this proposed rule, we have the FY 2022 MedPAR claims data available to evaluate the effects of the FY 2022 DRG reclassification and recalibration as part of our update for FY 2024. We assume for purposes of this adjustment, that the estimate of FY 2022 DRG reclassification and recalibration would result in no change in the case-mix when compared with the case mix index that would have resulted if we had not made the reclassification and recalibration changes to the DRGs. Therefore, we are proposing to make a 0.0 percentage point adjustment for reclassification and recalibration in the update framework for FY 2024.

The capital update framework also contains an adjustment for forecast error. The input price index forecast is based on historical trends and relationships ascertainable at the time the update factor is established for the upcoming year. In any given year, there may be unanticipated price fluctuations that may result in differences between the actual increase in prices and the forecast used in calculating the update factors. In setting a prospective payment rate under the framework, we make an adjustment for forecast error only if our estimate of the change in the capital input price index for any year is greater than 0.25 percentage point in absolute terms. There is a 2-year lag between the forecast and the availability of data to develop a measurement of the forecast error. Historically, when a forecast error of the CIPI is greater than 0.25 percentage point in absolute terms, it is reflected in the update recommended under this framework. A forecast error of 0.9 percentage point was calculated for the FY 2022 update, for which there are historical data. That is, current historical data indicate that the forecasted FY 2022 CIPI increase (1.1 percent) used in calculating the FY 2022 update factor is 0.9 percentage point lower than actual realized price increases (2.0 percent). As this exceeds the 0.25 percentage point threshold, we are proposing an adjustment of 0.9 percentage point for the FY 2022 forecast error in the update for FY 2024.

Under the capital IPPS update framework, we also make an adjustment for changes in intensity. Historically, we calculate this adjustment using the same methodology and data that were used in the past under the framework for operating IPPS. The intensity factor for the operating update framework reflects how hospital services are utilized to produce the final product, that is, the discharge. This component accounts for changes in the use of quality-enhancing services, for changes within DRG severity, and for expected modification of practice patterns to remove noncost-effective services. Our intensity measure is based on a 5-year average.

We calculate case-mix constant intensity as the change in total cost per discharge, adjusted for price level changes (the CPI for hospital and related services) and changes in real case-mix. Without reliable estimates of the proportions of the overall annual intensity changes that are due, respectively, to ineffective practice patterns and the combination of quality-enhancing new technologies and complexity within the DRG system, we assume that one-half of the annual change is due to each of these factors. Thus, the capital update framework provides an add-on to the input price index rate of increase of one-half of the estimated annual increase in intensity, to allow for increases within DRG severity and the adoption of quality-enhancing technology.

In this proposed rule, we are proposing to continue to use a Medicare-specific intensity measure that is based on a 5-year adjusted average of cost per discharge for FY 2024 (we refer readers to the FY 2011 IPPS/LTCH PPS final rule (75 FR 0436) for a full description of our Medicare-specific intensity measure). Specifically, for FY 2024, we are proposing to use an intensity measure that is based on an average of cost-per-discharge data from the 5-year period beginning with FY 2017 and extending through FY 2021. Based on these data, we estimated that case-mix constant intensity declined during FYs 2017 through 2021. In the past, when we found intensity to be declining, we believed a zero (rather than a negative) intensity adjustment was appropriate. Consistent with this approach, because we estimated that intensity would decline during that 5-year period, we believe it is appropriate to continue to apply a zero-intensity

adjustment for FY 2024. Therefore, we are proposing to make a 0.0 percentage point adjustment for intensity in the update for FY 2024.

Earlier, we described the basis of the components we used to develop the proposed 3.5 percent capital update factor under the capital update framework for FY 2024, as shown in the following table.

PROPOSED FY 2024 UPDATE FACTOR TO THE CAPITAL FEDERAL RATE

Capital Input Price Index*	2.6
Intensity:	0.0
Case-Mix Adjustment Factors:	
Projected Case-Mix Change	-0.5
Real Across DRG Change	0.5
Subtotal	0.0
Effect of FY 2022 Reclassification and Recalibration	0.0
Forecast Error Correction	0.9
Total Proposed Update	3.5

*The capital input price index represents the 2018-based CIPI.

2. Outlier Payment Adjustment Factor

Section 412.312(c) establishes a unified outlier payment methodology for inpatient operating and inpatient capital-related costs. A shared threshold is used to identify outlier cases for both inpatient operating and inpatient capital-related payments. Section 412.308(c)(2) provides that the standard Federal rate for inpatient capital-related costs be reduced by an adjustment factor equal to the estimated proportion of capital-related outlier payments to total inpatient capital-related PPS payments. The outlier threshold is set so that operating outlier payments are projected to be 5.1 percent of total operating IPPS DRG payments. For FY 2024, we are proposing to incorporate the estimated outlier reconciliation payment amounts into the outlier threshold model, as we did for FY 2023. (For more details on our proposal to incorporate outlier reconciliation payment amounts into the outlier threshold model, please see section II.A. of this Addendum to this proposed rule.)

For FY 2023, we estimated that outlier payments for capital-related PPS payments would equal 5.51 percent of inpatient capital-related payments based on the capital Federal rate. Based on the threshold discussed in section II.A. of this Addendum, we estimate that prior to taking into account projected capital outlier reconciliation payments, outlier payments for capital-related costs would equal 4.16 percent of inpatient capital-related payments based on the proposed capital Federal rate in FY 2024. Using the methodology outlined in section II.A. of this Addendum, we estimate that taking into account projected capital outlier reconciliation payments would not change the estimated percentage of FY 2024 capital outlier payments. Therefore, accounting for estimated capital outlier reconciliation, the estimated outlier payments for capital-related PPS payments would equal 4.16 percent (4.16 percent − 0.00 percent) of inpatient capital-related payments based on the proposed capital Federal rate in FY 2024. Accordingly, we are proposing to apply an outlier adjustment factor of 0.9584 in determining the capital Federal rate for FY 2024. Thus, we estimate that the percentage of capital outlier payments to total capital Federal rate payments for FY 2024 would be lower than the percentage for FY 2023.

The outlier reduction factors are not built permanently into the capital rates; that is, they are not applied cumulatively in determining the capital Federal rate. The proposed FY 2024 outlier adjustment of 0.9584 is a 1.43 percent change from the FY 2023 outlier adjustment of 0.9449. Therefore, the proposed net change in the outlier adjustment to the capital Federal rate for FY 2024 is 1.0143 (0.9584/0.9449) so that the proposed outlier adjustment would increase the FY 2024 capital Federal rate by approximately 1.43 percent compared to the FY 2023 outlier adjustment.

3. Budget Neutrality Adjustment Factor for Changes in DRG Classifications and Weights and the GAF

Section 412.308(c)(4)(ii) requires that the capital Federal rate be adjusted so that aggregate payments for the fiscal year based on the capital Federal rate, after any changes resulting from the annual DRG reclassification and recalibration and changes in the GAF, are projected to equal aggregate payments that would have been made on the basis of the capital Federal rate without such changes.

As discussed in section III.G.3. of the preamble of this proposed rule, in the FY 2020 IPPS/LTCH PPS final rule (84 FR 42325 through 42339), we finalized a policy to help reduce wage index disparities between high and low wage index hospitals by increasing the wage index values for hospitals with a wage index value below the 25th percentile wage index. We stated that this policy will be effective for at least 4 years, beginning in FY 2020. Therefore, as discussed in section III.G.3. of the preamble of this proposed rule, this policy was applied in FYs 2020 through 2023, and we are proposing to continue to apply this policy in FY 2024. In addition, beginning in FY 2023, we finalized a permanent 5-percent cap on any decrease to a hospital's wage index from its wage index in the prior FY regardless of the circumstances causing the decline. That is, under this policy, a hospital's wage index value would not be less than 95 percent of its prior year value (87 FR 49018 through 49021).

We have established a 2-step methodology for computing the budget neutrality factor for changes in the GAFs in light of the effect of those wage index changes on the GAFs. In the first step, we first calculate a factor to ensure budget neutrality for changes to the GAFs due to the update to the wage data, wage index reclassifications and redesignations, and application of the rural floor policy, consistent with our historical GAF budget neutrality factor methodology. In the second step, we calculate a factor to ensure budget neutrality for changes to the GAFs due to our policy to increase the wage index for hospitals with a wage index value below the 25th percentile wage index,

which we are proposing to continue in FY 2024, and our policy to place a 5-percent cap on any decrease in a hospital's wage index from the hospital's final wage index in the prior fiscal year. In this section, we refer to the policy that we applied in FYs 2020 through FY 2023 and are proposing to continue to apply in FY 2024, of increasing the wage index for hospitals with a wage index value below the 25th percentile wage index, as the lowest quartile hospital wage index adjustment. We refer to our policy to place a 5-percent cap on any decrease in a hospital's wage index from the hospital's final wage index in the prior fiscal year as the 5-percent cap on wage index decreases policy.

The budget neutrality factors applied for changes to the GAFs due to the update to the wage data, wage index reclassifications and redesignations, and application of the rural floor policy are built permanently into the capital Federal rate; that is, they are applied cumulatively in determining the capital Federal rate. However, the budget neutrality factor for the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases policy is not permanently built into the capital Federal rate. This is because the GAFs with the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases policy applied from the previous year are not used in the budget neutrality factor calculations for the current year. Accordingly, and consistent with this approach, prior to calculating the proposed GAF budget neutrality factors for FY 2024, we removed from the capital Federal rate the budget neutrality factor applied in FY 2023 for the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases policy. Specifically, we divided the capital Federal rate by the FY 2023 budget neutrality factor of 0.9972 (87 FR 49463). We refer the reader to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45552) for additional discussion on our policy of removing the prior year budget neutrality factor for the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases from the capital Federal rate.

In light of the proposed changes to the wage index and other proposed wage index policies for FY 2024 discussed previously, which directly affect the GAF, we are proposing to continue to compute a budget neutrality adjustment for changes in the GAFs in two steps. We discuss our proposed 2-step calculation of the proposed GAF budget neutrality factors for FY 2024 as follows.

To determine the GAF budget neutrality factors for FY 2024, we first compared estimated aggregate capital Federal rate payments based on the FY 2023 MS–DRG classifications and relative weights and the FY 2023 GAFs to estimated aggregate capital Federal rate payments based on the FY 2023 MS–DRG classifications and relative weights and the proposed FY 2024 GAFs without incorporating the proposed continuation of the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases policy. To achieve budget neutrality for these proposed changes in the GAFs, we calculated an incremental GAF budget neutrality adjustment factor of 0.9977 for FY 2024. Next, we compared estimated aggregate capital Federal rate payments based on the proposed FY 2024 GAFs with and without the proposed continuation of the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases policy. For this calculation, estimated aggregate capital Federal rate payments were calculated using the proposed FY 2024 MS–DRG classifications and relative weights (after application of the 10-percent cap discussed later in this section) and the proposed FY 2024 GAFs (both with and without the proposed continuation of the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases policy). (We note, for this calculation the proposed GAFs included the imputed floor, out-migration and Frontier state adjustments.) To achieve budget neutrality for the effects of the proposed continuation of the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases policy on the proposed FY 2024 GAFs, we calculated an incremental GAF budget neutrality adjustment factor of 0.9934. As discussed earlier in this section, the budget neutrality factor for the lowest quartile hospital wage index adjustment factor and the 5-percent cap on wage index decreases policy is not permanently built into the capital Federal rate. Consistent with this, we present the proposed budget neutrality factor for the proposed continuation of the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases policy calculated under the second step of this 2-step methodology separately from the other proposed budget neutrality factors in the discussion that follows, and this proposed factor is not included in the calculation of the proposed combined GAF/DRG adjustment factor described later in this section. (We note that the proposed FY 2024 GAFs reflect the proposed changes to the rural wage index methodology discussed in section III.G.1. of the preamble to this proposed rule. As discussed, beginning in FY 2024, we are proposing to include hospitals with § 412.103 reclassification along with geographically rural hospitals in all rural wage index calculations, and to only exclude ''dual reclass'' hospitals (hospitals with simultaneous § 412.103 and MGCRB reclassifications) when implicated by the hold harmless provision at section 1886(d)(8)(C)(ii) of the Act. We are also proposing to include the data of all § 412.103 hospitals (including those that have an MGCRB reclassification) in the calculation of the rural floor and the calculation of ''the wage index for rural areas in the State in which the county is located'' as referred to in section 1886(d)(8)(C)(iii) of the Act).

In the FY 2023 IPPS/LTCH PPS final rule, we finalized a permanent 10-percent cap on the reduction in an MS–DRG's relative weight in a given fiscal year, beginning in FY 2023. Consistent with our historical methodology for adjusting the capital standard Federal rate to ensure that the effects of the annual DRG reclassification and the recalibration of DRG weights are budget neutral under § 412.308(c)(4)(ii), we finalized to apply an additional budget neutrality factor to the capital standard Federal rate so that the 10-percent cap on decreases in an MS–DRG's relative weight is implemented in a budget neutral manner (87 FR 49436). Specifically, we augmented our historical methodology for computing the budget neutrality factor for the annual DRG reclassification and recalibration by computing a budget neutrality adjustment for the annual DRG reclassification and recalibration in two steps. We first calculate a budget neutrality factor to account for the annual DRG reclassification and recalibration prior to the application of the 10-percent cap on MS–DRG relative weight decreases. Then we calculate an additional budget neutrality factor to account for the application of the 10-percent cap on MS–DRG relative weight decreases.

To determine the proposed DRG budget neutrality factors for FY 2024, we first compared estimated aggregate capital Federal rate payments based on the FY 2023 MS–DRG classifications and relative weights to estimated aggregate capital Federal rate payments based on the proposed FY 2024 MS–DRG classifications and relative weights prior to the application of the 10-percent cap. For these calculations, estimated aggregate capital Federal rate

payments were calculated using the proposed FY 2024 GAFs without the proposed continuation of the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases policy. The proposed incremental adjustment factor for DRG classifications and changes in relative weights prior to the application of the 10-percent cap is 1.0016. Next, we compared estimated aggregate capital Federal rate payments based on the proposed FY 2024 MS–DRG classifications and relative weights prior to the application of the 10-percent cap to estimated aggregate capital Federal rate payments based on the proposed FY 2024 MS–DRG classifications and relative weights after the application of the 10-percent cap. For these calculations, estimated aggregate capital Federal rate payments were also calculated using the proposed FY 2024 GAFs without the proposed continuation of the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases policy. The proposed incremental adjustment factor for the application of the 10-percent cap on relative weight decreases is 0.9999. Therefore, to achieve budget neutrality for the proposed FY 2024 MS–DRG reclassification and recalibration (including the 10-percent cap), based on the calculations described previously, we are proposing to apply an incremental budget neutrality adjustment factor of 1.0015 (1.0016 × 0.9999) for FY 2024 to the capital Federal rate. We note that all the values are calculated with unrounded numbers.

The proposed incremental adjustment factor for the proposed FY 2024 MS–DRG reclassification and recalibration (1.0015) and for proposed changes in the FY 2024 GAFs due to the proposed update to the wage data, wage index reclassifications and redesignations, and application of the rural floor policy (0.9977) is 0.9992 (1.0015 × 0.9977). This incremental adjustment factor is built permanently into the capital Federal rates. To achieve budget neutrality for the effects of the proposal to continue the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases policy on the FY 2024 GAFs, as described previously, we calculated a proposed budget neutrality adjustment factor of 0.9934 for FY 2024. We refer to this budget neutrality factor for the remainder of this section as the lowest quartile/cap adjustment factor.

We applied the budget neutrality adjustment factors described previously to the capital Federal rate. This follows the requirement under § 412.308(c)(4)(ii) that estimated aggregate payments each year be no more or less than they would have been in the absence of the annual DRG reclassification and recalibration and changes in the GAFs.

The methodology used to determine the recalibration and geographic adjustment factor (GAF/DRG) budget neutrality adjustment is similar to the methodology used in establishing budget neutrality adjustments under the IPPS for operating costs. One difference is that, under the operating IPPS, the budget neutrality adjustments for the effect of updates to the wage data, wage index reclassifications and redesignations, and application of the rural floor policy are determined separately. Under the capital IPPS, there is a single budget neutrality adjustment factor for changes in the GAF that result from updates to the wage data, wage index reclassifications and redesignations, and application of the rural floor policy. In addition, there is no adjustment for the effects that geographic reclassification, the proposed continuation of the lowest quartile hospital wage index adjustment, or the 5-percent cap on wage index decreases policy described previously have on the other payment parameters, such as the payments for DSH or IME.

The proposed incremental GAF/DRG adjustment factor of 0.9992 accounts for the proposed MS–DRG reclassifications and recalibration (including application of the 10-percent cap on relative weight decreases) and for proposed changes in the GAFs that result from proposed updates to the wage data, the effects on the GAFs of FY 2024 geographic reclassification decisions made by the MGCRB compared to FY 2023 decisions, and the application of the rural floor policy. The proposed lowest quartile/cap adjustment factor of 0.9934 accounts for changes in the GAFs that result from our proposal to continue the policy to increase the wage index values for hospitals with a wage index value below the 25th percentile wage index and the 5-percent cap on wage index decreases policy. However, these factors do not account for changes in payments due to changes in the DSH and IME adjustment factors.

4. Proposed Capital Federal Rate for FY 2024

For FY 2023, we established a capital Federal rate of $483.79 (87 FR 49436, as corrected in 87 FR 66563). We are proposing to establish an update of 3.5 percent in determining the FY 2024 capital Federal rate for all hospitals. As a result of this proposed update and the proposed budget neutrality factors discussed earlier, we are proposing to establish a national capital Federal rate of $505.54 for FY 2024. The proposed national capital Federal rate for FY 2024 was calculated as follows:

- The proposed FY 2024 update factor is 1.0350; that is, the proposed update is 3.5 percent.
- The proposed FY 2024 GAF/DRG budget neutrality adjustment factor that is applied to the capital Federal rate for proposed changes in the MS–DRG classifications and relative weights (including application of the 10-percent cap on relative weight decreases) and proposed changes in the GAFs that result from updates to the wage data, wage index reclassifications and redesignations, and application of the rural floor policy is 0.9992.
- The proposed FY 2024 lowest quartile/cap budget neutrality adjustment factor that is applied to the capital Federal rate for changes in the GAFs that result from our proposal to continue to increase the wage index values for hospitals with a wage index value below the 25th percentile wage index and the 5-percent cap on wage index decreases policy is 0.9934.
- The proposed FY 2024 outlier adjustment factor is 0.9584.

We are providing the following chart that shows how each of the proposed factors and adjustments for FY 2024 affects the computation of the proposed FY 2024 national capital Federal rate in comparison to the FY 2023 national capital Federal rate. The proposed FY 2024 update factor has the effect of increasing the capital Federal rate by 3.5 percent compared to the FY 2023 capital Federal rate. The proposed GAF/DRG budget neutrality adjustment factor has the effect of decreasing the capital Federal rate by 0.08 percent. The proposed FY 2024 lowest quartile/cap budget neutrality adjustment factor has the effect of decreasing the capital Federal rate by 0.38 percent compared to the FY 2023 capital Federal rate. The proposed FY 2024 outlier adjustment factor has the effect of increasing the capital Federal rate by 1.43 percent compared to the FY 2023 capital Federal rate. The combined effect of all the proposed changes would increase the national capital Federal rate by approximately 4.50 percent, compared to the FY 2023 national capital Federal rate.

COMPARISON OF FACTORS AND ADJUSTMENTS: FY 2023 CAPITAL FEDERAL RATE AND THE PROPOSED FY 2024 CAPITAL FEDERAL RATE

	FY 2023	Proposed FY 2024	Change	Percent Change
Update Factor[1]	1.0250	1.0350	1.0350	3.50
GAF/DRG Adjustment Factor[1]	1.0012	0.9992	0.9992	-0.08
Quartile/Cap Adjustment Factor[2]	0.9972	0.9934	0.9962	-0.38
Outlier Adjustment Factor[3]	0.9449	0.9584	1.0143	1.43
Capital Federal Rate	$483.79	$505.54	1.0450	4.50[4]

[1] The update factor and the GAF/DRG budget neutrality adjustment factors are built permanently into the capital Federal rate. Thus, for example, the incremental change from FY 2023 to FY 2024 resulting from the application of the proposed 0.9992 GAF/DRG budget neutrality adjustment factor for FY 2024 is a net change of 0.9992 (or -0.08 percent).

[2] The lowest quartile/cap budget neutrality adjustment factor is not built permanently into the capital Federal rate; that is, the factor is not applied cumulatively in determining the capital Federal rate. Thus, for example, the net change resulting from the application of the proposed FY 2024 lowest quartile/cap budget neutrality adjustment factor is 0.9934/0.9972 or 0.9962 (or -0.38 percent).

[3] The outlier reduction factor is not built permanently into the capital Federal rate; that is, the factor is not applied cumulatively in determining the capital Federal rate. Thus, for example, the net change resulting from the application of the proposed FY 2024 outlier adjustment factor is 0.9584/0.9449 or 1.0143 (or 1.43 percent).

[4] Percent change may not sum due to rounding.

B. Calculation of the Proposed Inpatient Capital-Related Prospective Payments for FY 2024

For purposes of calculating payments for each discharge during FY 2024, the capital Federal rate is adjusted as follows: (Standard Federal Rate) × (DRG weight) × (GAF) × (COLA for hospitals located in Alaska and Hawaii) × (1 + DSH Adjustment Factor + IME Adjustment Factor, if applicable). The result is the adjusted capital Federal rate.

Hospitals also may receive outlier payments for those cases that qualify under the threshold established for each fiscal year. Section 412.312(c) provides for a shared threshold to identify outlier cases for both inpatient operating and inpatient capital-related payments. The proposed outlier threshold for FY 2024 is in section II.A. of this Addendum. For FY 2024, a case will qualify as a cost outlier if the cost for the case is greater than the prospective payment rates for the MS–DRG plus IME and DSH payments (including the empirically justified Medicare DSH payment and the estimated uncompensated care payment), estimated supplemental payment for eligible IHS/Tribal hospitals and Puerto Rico hospitals, and any add-on payments for new technology, plus the proposed fixed-loss amount of $40,732.

Currently, as provided under § 412.304(c)(2), we pay a new hospital 85 percent of its reasonable costs during the first 2 years of operation, unless it elects to receive payment based on 100 percent of the capital Federal rate. Effective with the third year of operation, we pay the hospital based on 100 percent of the capital Federal rate (that is, the same methodology used to pay all other hospitals subject to the capital PPS).

C. Capital Input Price Index

1. Background

Like the operating input price index, the capital input price index (CIPI) is a fixed-weight price index that measures the price changes associated with capital costs during a given year. The CIPI differs from the operating input price index in one important aspect—the CIPI reflects the vintage nature of capital, which is the acquisition and use of capital over time. Capital expenses in any given year are determined by the stock of capital in that year (that is, capital that remains on hand from all current and prior capital acquisitions). An index measuring capital price changes needs to reflect this vintage nature of capital. Therefore, the CIPI was developed to capture the vintage nature of capital by using a weighted-average of past capital purchase prices up to and including the current year.

We periodically update the base year for the operating and capital input price indexes to reflect the changing composition of inputs for operating and capital expenses. For this proposed rule, we are proposing to use the IPPS operating and capital market baskets that reflect a 2018 base year. For a complete discussion of this rebasing, we refer readers to section IV. of the preamble of the FY 2022 IPPS/LTCH PPS final rule (86 FR 45194 through 45213).

2. Forecast of the CIPI for FY 2024

Based on IHS Global Inc.'s fourth quarter 2022 forecast, for this proposed rule, we are forecasting the 2018-based CIPI to increase 2.6 percent in FY 2024. This reflects a projected 3.1 percent increase in vintage-weighted depreciation prices (building and fixed equipment, and movable equipment), and a projected 4.2 percent increase in other capital expense prices in FY 2024, partially offset by a projected 1.1 percent decrease in vintage-weighted interest expense prices in FY 2024. The weighted average of these three factors produces the forecasted 2.6 percent increase for the 2018-based CIPI in FY 2024.

We are also proposing that if more recent data become available (for example, a more recent estimate of the percentage increase in the 2018-based CIPI), we would use such data, if appropriate, to determine the FY 2024 percentage increase in the 2018-based CIPI for the final rule.

IV. Proposed Changes to Payment Rates for Excluded Hospitals: Rate-of-Increase Percentages for FY 2024

Payments for services furnished in children's hospitals, 11 cancer hospitals, and hospitals located outside the 50 States, the District of Columbia and Puerto Rico (that is, short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa) that are excluded from the IPPS are paid on the basis of reasonable costs based on the hospital's own historical cost experience, subject to a rate-of-increase ceiling. A per discharge limit (the target amount, as defined in § 413.40(a) of the regulations) is set for each hospital, based on the hospital's own cost experience in its base year, and updated annually by a rate-of-increase percentage specified in § 413.40(c)(3). In addition, as specified in the FY 2018 IPPS/LTCH PPS final rule (82 FR

38536), effective for cost reporting periods beginning during FY 2018, the annual update to the target amount for extended neoplastic disease care hospitals (hospitals described in § 412.22(i) of the regulations) also is the rate-of-increase percentage specified in § 413.40(c)(3). (We note that, in accordance with § 403.752(a), religious nonmedical health care institutions (RNHCIs) are also subject to the rate-of-increase limits established under § 413.40 of the regulations.)

For this FY 2024 IPPS/LTCH PPS proposed rule, based on IGI's 2022 fourth quarter forecast, we estimate that the 2018-based IPPS operating market basket rate-of-increase for FY 2024 is 3.0 percent. Based on this estimate, the proposed FY 2024 rate-of-increase percentage that will be applied to the FY 2023 target amounts in order to calculate the proposed FY 2024 target amounts for children's hospitals, the 11 cancer hospitals, RNCHIs, short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa, and extended neoplastic disease care hospitals will be 3.0 percent, in accordance with the applicable regulations at 42 CFR 413.40. We are also proposing that if more recent data subsequently become available (for example, a more recent estimate of the market basket rate-of-increase), we would use such data, if appropriate, to calculate the final IPPS operating market basket rate-of-increase for FY 2024.

IRFs and rehabilitation distinct part units, IPFs and psychiatric units, and LTCHs are excluded from the IPPS and paid under their respective PPSs. The IRF PPS, the IPF PPS, and the LTCH PPS are updated annually. We refer readers to section VIII. of the preamble and section V. of the Addendum of this proposed rule for the changes to the Federal payment rates for LTCHs under the LTCH PPS for FY 2024. The annual updates for the IRF PPS and the IPF PPS are issued by the agency in separate **Federal Register** documents.

V. Proposed Changes to the Payment Rates for the LTCH PPS for FY 2024

A. Proposed LTCH PPS Standard Federal Payment Rate for FY 2024

1. Overview

In section VIII. of the preamble of this proposed rule, we discuss our annual updates to the payment rates, factors, and specific policies under the LTCH PPS for FY 2024. Under § 412.523(c)(3) of the regulations, for FY 2012 and subsequent years, we updated the standard Federal payment rate by the most recent estimate of the LTCH PPS market basket at that time, including additional statutory adjustments required by sections 1886(m)(3) (citing sections 1886(b)(3)(B)(xi)(II) and 1886(m)(4) of the Act as set forth in the regulations at § 412.523(c)(3)(viii) through (xvii)). (For a summary of the payment rate development prior to FY 2012, we refer readers to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38310 through 38312) and references therein.)

Section 1886(m)(3)(A) of the Act specifies that, for rate year 2012 and each subsequent rate year, any annual update to the standard Federal payment rate shall be reduced by the productivity adjustment described in section 1886(b)(3)(B)(xi)(II) of the Act as discussed in section VIII.C.2. of the preamble of this proposed rule. This section of the Act further provides that the application of section 1886(m)(3)(B) of the Act may result in the annual update being less than zero for a rate year, and may result in payment rates for a rate year being less than such payment rates for the preceding rate year. (As noted in section VIII.C.2. of the preamble of this proposed rule, the annual update to the LTCH PPS occurs on October 1 and we have adopted the term ''fiscal year'' (FY) rather than ''rate year'' (RY) under the LTCH PPS beginning October 1, 2010. Therefore, for purposes of clarity, when discussing the annual update for the LTCH PPS, including the provisions of the Affordable Care Act, we use the term ''fiscal year'' rather than ''rate year'' for 2011 and subsequent years.)

For LTCHs that fail to submit the required quality reporting data in accordance with the LTCH QRP, the annual update is reduced by 2.0 percentage points as required by section 1886(m)(5) of the Act.

2. Development of the Proposed FY 2024 LTCH PPS Standard Federal Payment Rate

Consistent with our historical practice and § 412.523(c)(3)(xvii), for FY 2024 we are proposing to apply the annual update to the LTCH PPS standard Federal payment rate from the previous year. Furthermore, in determining the proposed LTCH PPS standard Federal payment rate for FY 2024, we also are proposing to make certain regulatory adjustments, consistent with past practices. Specifically, in determining the proposed FY 2024 LTCH PPS standard Federal payment rate, we are proposing to apply a budget neutrality adjustment factor for the changes related to the area wage level adjustment (that is, changes to the wage data and labor-related share) as discussed in section V.B.6.of this Addendum to this proposed rule.

In this proposed rule, we are proposing to establish an annual update to the LTCH PPS standard Federal payment rate of 2.9 percent (that is, the most recent estimate of the LTCH PPS market basket increase of 3.1 percent less the proposed productivity adjustment of 0.2 percentage point). Therefore, in accordance with § 412.523(c)(3)(xvii), we are proposing to apply an update factor of 1.029 to the FY 2023 LTCH PPS standard Federal payment rate of $46,432.77 to determine the proposed FY 2024 LTCH PPS standard Federal payment rate. Also, in accordance with § 412.523(c)(3)(xvii) and (c)(4), we are required to reduce the annual update to the LTCH PPS standard Federal payment rate by 2.0 percentage points for LTCHs that fail to submit the required quality reporting data for FY 2024 as required under the LTCH QRP. Therefore, for LTCHs that fail to submit quality reporting data under the LTCH QRP, the proposed 3.1 percent update to the LTCH PPS standard Federal payment rate for FY 2024 would be reduced by the proposed 0.2 percentage point productivity adjustment as required under section 1886(m)(3)(A)(i) of the Act and the additional 2.0 percentage points reduction required by section 1886(m)(5) of the Act. Accordingly, we are proposing to establish an annual update to the LTCH PPS standard Federal payment rate of 0.9 percent (that is, 2.9 percent minus 2.0 percentage points for an update factor of 1.009) for FY 2024 for LTCHs that fail to submit the required quality reporting data for FY 2024 as required under the LTCH QRP. Consistent with § 412.523(d)(4), we are proposing to apply an area wage level budget neutrality factor to the FY 2024 LTCH PPS standard Federal payment rate of 1.0035335, based on the best available data at this time, to ensure that any proposed changes to the area wage level adjustment (that is, the proposed annual update of the wage index (including application of the 5-percent cap on wage index decreases, discussed later in this section), and labor-related share) would not result in any change (increase or decrease) in estimated aggregate LTCH PPS standard Federal payment rate payments. Accordingly, we are proposing to establish an LTCH PPS standard Federal payment rate of $47,948.15 (calculated as $46,432.77 × 1.029 × 1.0035335) for FY 2024. For LTCHs that fail to submit quality reporting data for FY 2024, in accordance with the requirements of the LTCH QRP under section 1866(m)(5) of

the Act, we are proposing to establish an LTCH PPS standard Federal payment rate of $47,016.21 (calculated as $46,432.77 × 1.009 × 1.0035335) for FY 2024.

B. Proposed Adjustment for Area Wage Levels Under the LTCH PPS for FY 2024

1. Background

Under the authority of section 123 of the BBRA, as amended by section 307(b) of the BIPA, we established an adjustment to the LTCH PPS standard Federal payment rate to account for differences in LTCH area wage levels under § 412.525(c). The labor-related share of the LTCH PPS standard Federal payment rate is adjusted to account for geographic differences in area wage levels by applying the applicable LTCH PPS wage index. The applicable LTCH PPS wage index is computed using wage data from inpatient acute care hospitals without regard to reclassification under section 1886(d)(8) or section 1886(d)(10) of the Act.

The proposed FY 2024 LTCH PPS standard Federal payment rate wage index values that would be applicable for LTCH PPS standard Federal payment rate discharges occurring on or after October 1, 2023, through September 30, 2024, are presented in Table 12A (for urban areas) and Table 12B (for rural areas), which are listed in section VI. of the Addendum to this proposed rule and available via the internet on the CMS website.

2. Proposed Geographic Classifications (Labor Market Areas) for the LTCH PPS Standard Federal Payment Rate

In adjusting for the differences in area wage levels under the LTCH PPS, the labor-related portion of an LTCH's Federal prospective payment is adjusted by using an appropriate area wage index based on the geographic classification (labor market area) in which the LTCH is located. Specifically, the application of the LTCH PPS area wage level adjustment under existing § 412.525(c) is made based on the location of the LTCH—either in an ''urban area,'' or a ''rural area,'' as defined in § 412.503. Under § 412.503, an ''urban area'' is defined as a Metropolitan Statistical Area (MSA) (which includes a Metropolitan division, where applicable), as defined by the Executive OMB, and a ''rural area'' is defined as any area outside of an urban area (75 FR 37246).

The geographic classifications (labor market area definitions) currently used under the LTCH PPS, effective for discharges occurring on or after October 1, 2014, are based on the Core Based Statistical Areas (CBSAs) established by OMB, which are based on the 2010 decennial census data. In general, the current statistical areas (which were implemented beginning with FY 2015) are based on revised OMB delineations issued on February 28, 2013 in OMB Bulletin No. 13–01. (We note we have adopted minor revisions and updates in the years between the decennial censuses.) We adopted these labor market area delineations because they were at that time based on the best available data that reflect the local economies and area wage levels of the hospitals that are currently located in these geographic areas. We also believed that these OMB delineations would ensure that the LTCH PPS area wage level adjustment most appropriately accounted for and reflected the relative hospital wage levels in the geographic area of the hospital as compared to the national average hospital wage level. We noted that this policy was consistent with the IPPS policy adopted in FY 2015 under § 412.64(b)(1)(ii)(D) (79 FR 49951 through 49963). (For additional information on the CBSA-based labor market area (geographic classification) delineations currently used under the LTCH PPS and the history of the labor market area definitions used under the LTCH PPS, we refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50180 through 50185).)

In general, it is our historical practice to update the CBSA-based labor market area delineations annually based on the most recent updates issued by OMB. Generally, OMB issues major revisions to statistical areas every 10 years, based on the results of the decennial census. However, OMB occasionally issues minor updates and revisions to statistical areas in the years between the decennial censuses. OMB Bulletin No. 17–01, issued August 15, 2017, established the delineations for the Nation's statistical areas, and the corresponding changes to the CBSA-based labor market areas were adopted in the FY 2019 IPPS/LTCH PPS final rule (83 FR 41731). A copy of this bulletin may be obtained on the website at: *https://www.whitehouse.gov/wp-content/uploads/legacy_drupal_files/omb/bulletins/2017/b-17-01.pdf*.

On April 10, 2018, OMB issued OMB Bulletin No. 18–03, which superseded the August 15, 2017 OMB Bulletin No. 17–01. On September 14, 2018, OMB issued OMB Bulletin No. 18–04, which superseded the April 10, 2018 OMB Bulletin No. 18–03. Historically OMB bulletins issued between decennial censuses have only contained minor modifications to CBSA delineations based on changes in population counts. However, OMB's 2010 Standards for Delineating Metropolitan and Micropolitan Standards created a larger mid-decade redelineation that takes into account commuting data from the American Commuting Survey. As a result, the September 14, 2018 OMB Bulletin No. 18–04 included more modifications to the CBSAs than are typical for OMB bulletins issued between decennial censuses. We adopted the updates set forth in OMB Bulletin No. 18–04 in the FY 2021 IPPS/LTCH PPS final rule (85 FR 59050 through 59051). A copy of the September 14, 2018 OMB Bulletin No. 18–04, may be obtained at *https://www.whitehouse.gov/wp-content/uploads/2018/09/Bulletin-18-04.pdf*.

On March 6, 2020, OMB issued Bulletin No. 20–01, which provided updates to and superseded OMB Bulletin No. 18–04, which was issued on September 14, 2018. The attachments to OMB Bulletin No. 20–01 provided detailed information on the update to statistical areas since September 14, 2018. (For a copy of this bulletin, we refer readers to the following website: *https://www.whitehouse.gov/wp-content/uploads/2020/03/Bulletin-20-01.pdf*.) In OMB Bulletin No. 20–01, OMB announced one new Micropolitan Statistical Area and one new component of an existing Combined Statistical Area. After reviewing OMB Bulletin No. 20–01, we determined that the changes in Bulletin 20–01 encompassed delineation changes that would not affect the CBSA-based labor market area delineations used under the LTCH PPS. Therefore, we adopted the updates set forth in OMB Bulletin No. 20–01 in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45556 through 45557) consistent with our general policy of adopting OMB delineation updates; however, the LTCH PPS area wage level adjustment was not altered as a result of adopting the updates because the CBSA-based labor market area delineations were the same as the CBSA-based labor market area delineations adopted in the FY 2021 IPPS/LTCH PPS final rule based on OMB Bulletin No. 18–04 (85 FR59050 through 59051).

We believe the CBSA-based labor market area delineations, as established in OMB Bulletin 20–01, ensure that the LTCH PPS area wage level adjustment most appropriately accounts for and reflects the relative hospital wage levels in the geographic area of the hospital as compared to the national average hospital wage level based on the best available data that reflect the local economies and area wage levels of the hospitals that are currently located in these geographic areas (81 FR 57298).

Therefore, for FY 2024, we are not proposing any changes to the CBSA-based labor market area delineations as established in OMB Bulletin 20–01 and adopted in the FY 2022 IPPS/LTCH final rule.

CBSAs are made up of one or more constituent counties. For FY 2024, we are continuing to use the Federal Information Processing Standard (FIPS) county codes, maintained by the U.S. Census Bureau, for purposes of crosswalking counties to CBSAs. The current county-to-CBSA crosswalk was adopted under the LTCH PPS in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49439) and is located on the CMS website at *https://www.cms.gov/medicare/medicare-fee-for-service-payment/longtermcarehospitalpps/download*.

3. Proposed Labor-Related Share for the LTCH PPS Standard Federal Payment Rate

Under the payment adjustment for the differences in area wage levels under § 412.525(c), the labor-related share of an LTCH's standard Federal payment rate is adjusted by the applicable wage index for the labor market area in which the LTCH is located. The LTCH PPS labor-related share currently represents the sum of the labor-related portion of operating costs and a labor-related portion of capital costs using the applicable LTCH market basket. Additional background information on the historical development of the labor-related share under the LTCH PPS can be found in the RY 2007 LTCH PPS final rule (71 FR 27810 through 27817 and 27829 through 27830) and the FY 2012 IPPS/LTCH PPS final rule (76 FR 51766 through 51769 and 51808).

For FY 2013, we rebased and revised the market basket used under the LTCH PPS by adopting a 2009-based LTCH market basket. In addition, for FY 2013 through FY 2016, we determined the labor-related share annually as the sum of the relative importance of each labor-related cost category of the 2009-based LTCH market basket for the respective fiscal year based on the best available data. (For more details, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53477 through 53479).) For FY 2017, we rebased and revised the 2009-based LTCH market basket to reflect a 2013 base year. In addition, for FY 2017 through FY 2020, we determined the labor-related share annually as the sum of the relative importance of each labor-related cost category of the 2013-based LTCH market basket for the respective fiscal year based on the best available data. (For more details, we refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 57085 through 57096).) Then, effective for FY 2021, we rebased and revised the 2013-based LTCH market basket to reflect a 2017 base year and determined the labor-related share annually as the sum of the relative importance of each labor-related cost category in the 2017-based LTCH market basket using the most recent available data. (For more details, we refer readers to the FY 2021 IPPS/LTCH PPS final rule (85 FR 58909 through 58926).)

In this proposed rule, consistent with our historical practice, we are proposing that the LTCH PPS labor-related share for FY 2024 is the sum of the FY 2024 relative importance of each labor-related cost category in the LTCH market basket using the most recent available data. Specifically, we are proposing that the labor-related share for FY 2024 would continue to include the sum of the labor-related portion of operating costs from the 2017-based LTCH market basket (that is, the sum of the FY 2024 relative importance shares of Wages and Salaries; Employee Benefits; Professional Fees: Labor-Related; Administrative and Facilities Support Services; Installation, Maintenance, and Repair Services; All Other: Labor-related Services) and a portion of the relative importance of Capital-Related cost weight from the 2017-based LTCH market basket. The relative importance reflects the different rates of price change for these cost categories between the base year (2017) and FY 2024. Based on IHS Global Inc.'s fourth quarter 2022 forecast of the 2017-based LTCH market basket, the sum of the FY 2024 relative importance for Wages and Salaries; Employee Benefits; Professional Fees: Labor-Related; Administrative and Facilities Support Services; Installation, Maintenance, & Repair Services; and All Other: Labor-Related Services is 64.2 percent. The portion of capital-related costs that is influenced by the local labor market is estimated to be 46 percent (that is, the same percentage applied to the 2009-based and 2013-based LTCH market baskets). Since the FY 2024 relative importance for capital-related costs is 9.2 percent based on IHS Global Inc.'s fourth quarter 2022 forecast of the 2017-based LTCH market basket, we took 46 percent of 9.2 percent to determine the labor-related share of capital-related costs for FY 2024 of 4.2 percent. Therefore, we are proposing a total labor-related share for FY 2024 of 68.4 percent (the sum of 64.2 percent for the labor-related share of operating costs and 4.2 percent for the labor-related share of capital-related costs). We are also proposing that if more recent data become available after the publication of this proposed rule and before the publication of the final rule (for example, a more recent estimate of the relative importance of each labor-related cost category of the 2017-based LTCH market basket), we would use such data, if appropriate, to determine the FY 2024 LTCH PPS labor-related share.

4. Proposed Wage Index for FY 2024 for the LTCH PPS Standard Federal Payment Rate

Historically, we have established LTCH PPS area wage index values calculated from acute care IPPS hospital wage data without taking into account geographic reclassification under sections 1886(d)(8) and 1886(d)(10) of the Act (67 FR 56019). The area wage level adjustment established under the LTCH PPS is based on an LTCH's actual location without regard to the ''urban'' or ''rural'' designation of any related or affiliated provider. As with the IPPS wage index, wage data for multicampus hospitals with campuses located in different labor market areas (CBSAs) are apportioned to each CBSA where the campus (or campuses) are located. We also employ a policy for determining area wage index values for areas where there are no IPPS wage data.

Consistent with our historical methodology, to determine the applicable area wage index values for the FY 2024 LTCH PPS standard Federal payment rate, under the broad authority of section 123 of the BBRA, as amended by section 307(b) of the BIPA, we are proposing to continue to employ our historical practice of using the same data we are proposing to use to compute the proposed FY 2024 acute care hospital inpatient wage index, as discussed in section III. of the preamble of this proposed rule (that is, wage data collected from cost reports submitted by IPPS hospitals for cost reporting periods beginning during FY 2020) because these data are the most recent complete data available.

In addition, we are proposing to compute the FY 2024 LTCH PPS standard Federal payment rate area wage index values consistent with the ''urban'' and ''rural'' geographic classifications (that is, the proposed labor market area delineations as previously discussed in section V.B. of this Addendum) and our historical policy of not taking into account IPPS geographic reclassifications under sections 1886(d)(8) and 1886(d)(10) of the Act in determining payments under the LTCH PPS. We are also proposing to continue to apportion the wage data for multicampus hospitals with campuses

located in different labor market areas to each CBSA where the campus or campuses are located, consistent with the IPPS policy. Lastly, consistent with our existing methodology for determining the LTCH PPS wage index values, for FY 2024 we are proposing to continue to use our existing policy for determining area wage index values for areas where there are no IPPS wage data. Under our existing methodology, the LTCH PPS wage index value for urban CBSAs with no IPPS wage data is determined by using an average of all of the urban areas within the State, and the LTCH PPS wage index value for rural areas with no IPPS wage data is determined by using the unweighted average of the wage indices from all of the CBSAs that are contiguous to the rural counties of the State.

Based on the FY 2020 IPPS wage data that we are proposing to use to determine the proposed FY 2024 LTCH PPS area wage index values in this final rule, there are no IPPS wage data for the urban area of Hinesville, GA (CBSA 25980). Consistent with our existing methodology, we calculated the proposed FY 2024 wage index value for CBSA 25980 as the average of the wage index values for all of the other urban areas within the State of Georgia (that is, CBSAs 10500, 12020, 12060, 12260, 15260, 16860, 17980, 19140, 23580, 31420, 40660, 42340, 46660 and 47580), as shown in Table 12A, which is listed in section VI. of the Addendum to this proposed rule.

Based on the FY 2020 IPPS wage data that we are proposing to use to determine the proposed FY 2024 LTCH PPS standard Federal payment rate area wage index values in this proposed rule, there are no rural areas without IPPS hospital wage data. Therefore, it is not necessary to use our established methodology to calculate a proposed LTCH PPS wage index value for rural areas with no IPPS wage data for FY 2024. We note that, as IPPS wage data are dynamic, it is possible that the number of rural areas without IPPS wage data will vary in the future.

5. Permanent Cap on Wage Index Decreases

a. Permanent Cap on LTCH PPS Wage Index Decreases

In the FY 2023 IPPS/LTCH PPS final rule (87 FR 49440 through 49442), we finalized a policy that applies a permanent 5-percent cap on any decrease to an LTCH's wage index from its wage index in the prior year. Consistent with the requirement at § 412.525(c)(2) that changes to area wage level adjustments are made in a budget neutral manner, we include the application of this policy in the determination of the area wage level budget neutrality factor that is applied to the standard Federal payment rate, as is discussed later in section V.B.6. of the Addendum to this proposed rule.

Under this policy, an LTCH's wage index will not be less than 95 percent of its wage index for the prior fiscal year. An LTCH's wage index cap adjustment is determined based on the wage index value applicable to the LTCH on the last day of the prior Federal fiscal year. LTCHs that became operational during the prior Federal fiscal year are subject to the LTCH PPS wage index cap. However, for newly opened LTCHs that become operational on or after the first day of the fiscal year to which this proposed rule would apply, these LTCHs are not subject to the LTCH PPS wage index cap since they were not paid under the LTCH PPS in the prior year. These LTCHs would receive the calculated wage index for the area in which they are geographically located, even if other LTCHs in the same geographic area are receiving a wage index cap. The cap on wage index decreases policy is reflected at § 412.525(c)(1).

For each LTCH we identify in our rulemaking data, we are including in a supplemental data file the wage index values from both fiscal years used in determining its capped wage index. This includes the LTCH's final prior year wage index value, the LTCH's uncapped current year wage index value, and the LTCH's capped current year wage index value. Due to the lag in rulemaking data, a new LTCH may not be listed in this supplemental file for a few years. For this reason, a newly opened LTCH could contact their MAC to ensure that its wage index value is not less than 95 percent of the value paid to it for the prior Federal fiscal year. This supplemental data file for public use will be posted on the CMS website for this proposed rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html.*

b. Permanent Cap on IPPS Comparable Wage Index Decreases

Determining LTCH PPS payments for short-stay-outlier cases (reflected in § 412.529) and site neutral payment rate cases (reflected in § 412.522(c)) requires calculating an ''IPPS comparable amount.'' For information on this ''IPPS comparable amount'' calculation, we refer the reader to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49608 through 49610). Determining LTCH PPS payments for LTCHs that do not meet the applicable discharge payment percentage (reflected in § 412.522(d)) requires calculating an ''IPPS equivalent amount.'' For information on this ''IPPS equivalent amount'' calculation, we refer the reader to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42439 through 42445).

Calculating both the ''IPPS comparable amount'' and the ''IPPS equivalent amount'' requires adjusting the IPPS operating and capital standardized amounts by the applicable IPPS wage index for nonreclassified IPPS hospitals. That is, the standardized amounts are adjusted by the IPPS wage index for nonreclassified IPPS hospitals located in the same geographic area as the LTCH. In the FY 2023 IPPS/LTCH PPS final rule (87 FR 49442 through 49443), we finalized a policy that applies a permanent 5-percent cap on decreases in an LTCH's applicable IPPS comparable wage index from its applicable IPPS comparable wage index in the prior year. Historically, we have not budget neutralized changes to LTCH PPS payments that result from the annual update of the IPPS wage index for nonreclassified IPPS hospitals. Consistent with this approach, the cap on decreases in an LTCH's applicable IPPS comparable wage index is not applied in a budget neutral manner.

Under this policy, an LTCH's applicable IPPS comparable wage index will not be less than 95 percent of its applicable IPPS comparable wage index for the prior fiscal year. An LTCH's applicable IPPS comparable wage index cap adjustment is determined based on the wage index value applicable to the LTCH on the last day of the prior Federal fiscal year. LTCHs that became operational during the prior Federal fiscal year are subject to the applicable IPPS comparable wage index cap. However, for newly opened LTCHs that become operational on or after the first day of the fiscal year to which this proposed rule would apply, these LTCHs are not subject to the applicable IPPS comparable wage index cap since they were not paid under the LTCH PPS in the prior year. This means that these LTCHs would receive the calculated applicable IPPS comparable wage index for the area in which they are geographically located, even if other LTCHs in the same geographic area are receiving a wage cap. The cap on IPPS comparable wage index decreases policy is reflected at § 412.529(d)(4)(ii)(B) and (d)(4)(iii)(B).

Similar to the information we are making available for the cap on the LTCH PPS wage index values (described previously), for each LTCH we identify in our rulemaking data, we are

including in a supplemental data file the wage index values from both fiscal years used in determining its capped applicable IPPS comparable wage index. Due to the lag in rulemaking data, a new LTCH may not be listed in this supplemental file for a few years. For this reason, a newly opened LTCH could contact its MAC to ensure that its applicable IPPS comparable wage index value is not less than 95 percent of the value paid to them for the prior Federal fiscal year. This supplemental data file for public use will be posted on the CMS website for this proposed rule at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html.*

6. Proposed Budget Neutrality Adjustments for Changes to the LTCH PPS Standard Federal Payment Rate Area Wage Level Adjustment

Historically, the LTCH PPS wage index and labor-related share are updated annually based on the latest available data. Under § 412.525(c)(2), any changes to the area wage index values or labor-related share are to be made in a budget neutral manner such that estimated aggregate LTCH PPS payments are unaffected; that is, will be neither greater than nor less than estimated aggregate LTCH PPS payments without such changes to the area wage level adjustment. Under this policy, we determine an area wage level adjustment budget neutrality factor that is applied to the standard Federal payment rate to ensure that any changes to the area wage level adjustments are budget neutral such that any changes to the area wage index values or labor-related share would not result in any change (increase or decrease) in estimated aggregate LTCH PPS payments. Accordingly, under § 412.523(d)(4), we have applied an area wage level adjustment budget neutrality factor in determining the standard Federal payment rate, and we also established a methodology for calculating an area wage level adjustment budget neutrality factor. (For additional information on the establishment of our budget neutrality policy for changes to the area wage level adjustment, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51771 through 51773 and 51809).)

For FY 2024, in accordance with § 412.523(d)(4), we are applying a proposed area wage level budget neutrality factor to adjust the LTCH PPS standard Federal payment rate to account for the estimated effect of the adjustments or updates to the area wage level adjustment under § 412.525(c)(1) on estimated aggregate LTCH PPS payments, consistent with the methodology we established in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51773). As discussed in section V.B.6. of this Addendum to this proposed rule, consistent with, § 412.525(c)(2), we include the application of the 5-percent cap on wage index decreases in the determination of the proposed area wage level budget neutrality factor. Specifically, we are proposing to determine an area wage level adjustment budget neutrality factor that is applied to the LTCH PPS standard Federal payment rate under § 412.523(d)(4) for FY 2024 using the following methodology:

Step 1—Simulate estimated aggregate LTCH PPS standard Federal payment rate payments using the FY 2023 wage index values and the FY 2023 labor-related share of 68.0 percent.

Step 2—Simulate estimated aggregate LTCH PPS standard Federal payment rate payments using the proposed FY 2024 wage index values (including application of the 5 percent cap on wage index decreases) and the proposed FY 2024 labor-related share of 68.4 percent. (As noted previously, the changes to the wage index values based on updated hospital wage data are discussed in section V.B.4. of this Addendum to this proposed rule and the labor-related share is discussed in section V.B.3. of this Addendum to this proposed rule.)

Step 3—Calculate the ratio of these estimated total LTCH PPS standard Federal payment rate payments by dividing the estimated total LTCH PPS standard Federal payment rate payments using the FY 2023 area wage level adjustments (calculated in Step 1) by the estimated total LTCH PPS standard Federal payment rate payments using the proposed FY 2024 updates to the area wage level adjustment (calculated in Step 2) to determine the proposed budget neutrality factor for updates to the area wage level adjustment for FY 2024 LTCH PPS standard Federal payment rate payments.

Step 4—Apply the proposed FY 2024 updates to the area wage level adjustment budget neutrality factor from Step 3 to determine the proposed FY 2024 LTCH PPS standard Federal payment rate after the application of the proposed FY 2024 annual update.

In section I.E. of the preamble of this proposed rule, we discuss our proposal to use the most recent data available for the FY 2024 LTCH PPS ratesetting, including the FY 2022 MedPAR file. Consistent with this proposal, we used claims from the FY 2022 MedPAR file in calculating the proposed FY 2024 LTCH PPS standard Federal payment rate area wage level adjustment budget neutrality factor. We note that, because the area wage level adjustment under § 412.525(c) is an adjustment to the LTCH PPS standard Federal payment rate, consistent with historical practice, we only used data from claims that qualified for payment at the LTCH PPS standard Federal payment rate under the dual rate LTCH PPS to calculate the proposed FY 2024 LTCH PPS standard Federal payment rate area wage level adjustment budget neutrality factor.

In the FY 2023 IPPS/LTCH PPS final rule (87 FR 49448), we discussed an LTCH (CCN 312024) whose abnormal charging practices in FY 2021 led to the LTCH receiving an excessive amount of high cost outlier payments. In that rule, we stated our belief, based on information we received from the provider, that these abnormal charging practices would not persist into FY 2023. Therefore, we did not include its cases in our model for determining the FY 2023 outlier fixed-loss amount. The FY 2022 MedPAR claims also reflect the abnormal charging practices of this LTCH. In the FY 2022 MedPAR file, we identified 164 LTCH PPS standard Federal payment rate cases for this LTCH. Of these 164 cases, 116 of the cases had charges that were exactly or within ten dollars of $10 million. We do not believe these abnormal charging practices will persist into FY 2024. As such, simulating FY 2023 and FY 2024 payments for this LTCH based on their FY 2022 claims results in simulated payment amounts that we do not believe are reasonable approximations of the payment amounts this LTCH will actually receive in FY 2023 and FY 2024. For this reason, we do not believe it would be appropriate to use these claims in determining the FY 2024 LTCH PPS standard Federal payment rate area wage level adjustment budget neutrality factor. Therefore, we are proposing to remove claims from CCN 312024 when determining the FY 2024 LTCH PPS standard Federal payment rate area wage level adjustment budget neutrality factor.

For this proposed rule, using the steps in the methodology previously described, we determined a proposed FY 2024 LTCH PPS standard Federal payment rate area wage level adjustment budget neutrality factor of 1.0035335. Accordingly, in section V.A. of the Addendum to this proposed rule, we applied the proposed area wage level adjustment budget neutrality factor of 1.0035335 to determine the proposed FY 2024 LTCH PPS standard Federal payment rate, in accordance with § 412.523(d)(4).

C. Proposed Cost-of-Living Adjustment (COLA) for LTCHs Located in Alaska and Hawaii

Under § 412.525(b), a cost-of-living adjustment (COLA) is provided for LTCHs located in Alaska and Hawaii to account for the higher costs incurred in those States. Specifically, we apply a COLA to payments to LTCHs located in Alaska and Hawaii by multiplying the nonlabor-related portion of the standard Federal payment rate by the applicable COLA factors established annually by CMS. Higher labor-related costs for LTCHs located in Alaska and Hawaii are taken into account in the adjustment for area wage levels previously described. The methodology used to determine the COLA factors for Alaska and Hawaii is based on a comparison of the growth in the Consumer Price Indexes (CPIs) for Anchorage, Alaska, and Honolulu, Hawaii, relative to the growth in the CPI for the average U.S. city as published by the Bureau of Labor Statistics (BLS). It also includes a 25-percent cap on the CPI-updated COLA factors. Under our current policy, we update the COLA factors using the methodology as previously described every 4 years (at the same time as the update to the labor-related share of the IPPS market basket) and we last updated the COLA factors for Alaska and Hawaii published by OPM for 2009 in FY 2022 (86 FR 45559 through 45560).

We continue to believe that determining updated COLA factors using this methodology would appropriately adjust the nonlabor-related portion of the LTCH PPS standard Federal payment rate for LTCHs located in Alaska and Hawaii. Therefore, in this proposed rule, for FY 2024, under the broad authority conferred upon the Secretary by section 123 of the BBRA, as amended by section 307(b) of the BIPA, to determine appropriate payment adjustments under the LTCH PPS, we are proposing to continue to use the COLA factors based on the 2009 OPM COLA factors updated through 2020 by the comparison of the growth in the CPIs for Anchorage, Alaska, and Honolulu, Hawaii, relative to the growth in the CPI for the average U.S. city as established in the FY 2022 IPPS/LTCH PPS final rule. (For additional details on our current methodology for updating the COLA factors for Alaska and Hawaii and for a discussion on the FY 2022 COLA factors, we refer readers to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45559 through 45560).)

Area	FY 2024
Alaska:	
City of Anchorage and 80-kilometer (50-mile) radius by road	1.22
City of Fairbanks and 80-kilometer (50-mile) radius by road	1.22
City of Juneau and 80-kilometer (50-mile) radius by road	1.22
Rest of Alaska	1.24
Hawaii:	
City and County of Honolulu	1.25
County of Hawaii	1.22
County of Kauai	1.25
County of Maui and County of Kalawao	1.25

D. Proposed Adjustment for LTCH PPS High Cost Outlier (HCO) Cases

1. HCO Background

From the beginning of the LTCH PPS, we have included an adjustment to account for cases in which there are extraordinarily high costs relative to the costs of most discharges. Under this policy, additional payments are made based on the degree to which the estimated cost of a case (which is calculated by multiplying the Medicare allowable covered charge by the hospital's overall hospital CCR) exceeds a fixed-loss amount. This policy results in greater payment accuracy under the LTCH PPS and the Medicare program, and the LTCH sharing the financial risk for the treatment of extraordinarily high-cost cases.

We retained the basic tenets of our HCO policy in FY 2016 when we implemented the dual rate LTCH PPS payment structure under section 1206 of Public Law 113–67. LTCH discharges that meet the criteria for exclusion from the site neutral payment rate (that is, LTCH PPS standard Federal payment rate cases) are paid at the LTCH PPS standard Federal payment rate, which includes, as applicable, HCO payments under § 412.523(e). LTCH discharges that do not meet the criteria for exclusion are paid at the site neutral payment rate, which includes, as applicable, HCO payments under § 412.522(c)(2)(i). In the FY 2016 IPPS/LTCH PPS final rule, we established separate fixed-loss amounts and targets for the two different LTCH PPS payment rates. Under this bifurcated policy, the historic 8-percent HCO target was retained for LTCH PPS standard Federal payment rate cases, with the fixed-loss amount calculated using only data from LTCH cases that would have been paid at the LTCH PPS standard Federal payment rate if that rate had been in effect at the time of those discharges. For site neutral payment rate cases, we adopted the operating IPPS HCO target (currently 5.1 percent) and set the fixed-loss amount for site neutral payment rate cases at the value of the IPPS fixed-loss amount. Under the HCO policy for both payment rates, an LTCH receives 80 percent of the difference between the estimated cost of the case and the applicable HCO threshold, which is the sum of the LTCH PPS payment for the case and the applicable fixed-loss amount for such case.

To maintain budget neutrality, consistent with the budget neutrality requirement at § 412.523(d)(1) for HCO payments to LTCH PPS standard Federal rate payment cases, we also adopted a budget neutrality requirement for HCO payments to site neutral payment rate cases by applying a budget neutrality factor to the LTCH PPS payment for those site neutral payment rate cases. (We refer readers to § 412.522(c)(2)(i) of the regulations for further details.) We note that, during the 4-year transitional period, the site neutral payment rate HCO budget neutrality factor did not apply to the LTCH PPS standard Federal payment rate portion of the blended payment rate at § 412.522(c)(3) payable to site neutral payment rate cases. (For additional details on the HCO policy adopted for site neutral payment rate cases under the dual rate LTCH PPS payment structure, including the budget neutrality adjustment for HCO payments to site neutral payment rate cases, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49617 through 49623).)

2. Determining LTCH CCRs Under the LTCH PPS

a. Background

As noted previously, CCRs are used to determine payments for HCO adjustments for both payment rates under the LTCH PPS and also are used to determine payments for site neutral payment rate cases. As noted earlier, in determining HCO and the site neutral payment rate payments (regardless of whether the case is also an HCO), we generally calculate the estimated cost of the case by multiplying the LTCH's overall CCR by the Medicare allowable charges for the case. An overall CCR is used because the LTCH PPS uses a single prospective payment per discharge that covers both inpatient operating and capital-related costs. The LTCH's overall CCR is generally computed based on the sum of LTCH operating and capital costs (as described in Section 150.24, Chapter 3, of the Medicare Claims Processing Manual (Pub. 100–4)) as compared to total Medicare charges (that is, the sum of its operating and capital inpatient routine and ancillary charges), with those values determined from either the most recently settled cost report or the most recent tentatively settled cost report, whichever is from the latest cost reporting period. However, in certain instances, we use an alternative CCR, such as the statewide average CCR, a CCR that is specified by CMS, or one that is requested by the hospital. (We refer readers to § 412.525(a)(4)(iv) of the regulations for further details regarding CCRs and HCO adjustments for either LTCH PPS payment rate and § 412.522(c)(1)(ii) for the site neutral payment rate.)

The LTCH's calculated CCR is then compared to the LTCH total CCR ceiling. Under our established policy, an LTCH with a calculated CCR in excess of the applicable maximum CCR threshold (that is, the LTCH total CCR ceiling, which is calculated as 3 standard deviations from the national geometric average CCR) is generally assigned the applicable statewide CCR. This policy is premised on a belief that calculated CCRs in excess of the LTCH total CCR ceiling are most likely due to faulty data reporting or entry, and CCRs based on erroneous data should not be used to identify and make payments for outlier cases.

b. Proposed LTCH Total CCR Ceiling

Consistent with our historical practice, we are proposing to use the best available data to determine the LTCH total CCR ceiling for FY 2024 in this proposed rule. Specifically, in this proposed rule, we are proposing to use our established methodology for determining the LTCH total CCR ceiling based on IPPS total CCR data from the December 2022 update of the Provider Specific File (PSF), which is the most recent data available. Accordingly, we are proposing an LTCH total CCR ceiling of 1.287 under the LTCH PPS for FY 2024 in accordance with § 412.525(a)(4)(iv)(C)(*2*) for HCO cases under either payment rate and § 412.522(c)(1)(ii) for the site neutral payment rate. Consistent with our historical practice, we are proposing to use the best available data, if applicable, to determine the LTCH total CCR ceiling for FY 2024 in the final rule. (For additional information on our methodology for determining the LTCH total CCR ceiling, we refer readers to the FY 2007 IPPS final rule (71 FR 48117 through 48119).)

c. Proposed LTCH Statewide Average CCRs

Our general methodology for determining the statewide average CCRs used under the LTCH PPS is similar to our established methodology for determining the LTCH total CCR ceiling because it is based on ''total'' IPPS CCR data. (For additional information on our methodology for determining statewide average CCRs under the LTCH PPS, we refer readers to the FY 2007 IPPS final rule (71 FR 48119 through 48120).) Under the LTCH PPS HCO policy at § 412.525(a)(4)(iv)(C), the SSO policy at § 412.529(f)(4)(iii), and the site neutral payment rate at § 412.522(c)(1)(ii), the MAC may use a statewide average CCR, which is established annually by CMS, if it is unable to determine an accurate CCR for an LTCH in one of the following circumstances: (1) New LTCHs that have not yet submitted their first Medicare cost report (a new LTCH is defined as an entity that has not accepted assignment of an existing hospital's provider agreement in accordance with § 489.18); (2) LTCHs whose calculated CCR is in excess of the LTCH total CCR ceiling; and (3) other LTCHs for whom data with which to calculate a CCR are not available (for example, missing or faulty data). (Other sources of data that the MAC may consider in determining an LTCH's CCR include data from a different cost reporting period for the LTCH, data from the cost reporting period preceding the period in which the hospital began to be paid as an LTCH (that is, the period of at least 6 months that it was paid as a short-term, acute care hospital), or data from other comparable LTCHs, such as LTCHs in the same chain or in the same region.)

Consistent with our historical practice of using the best available data, in this proposed rule, we are proposing to use our established methodology for determining the LTCH statewide average CCRs, based on the most recent complete IPPS ''total CCR'' data from the December 2022 update of the PSF. We are proposing LTCH PPS statewide average total CCRs for urban and rural hospitals that would be effective for discharges occurring on or after October 1, 2023, through September 30, 2024, in Table 8C listed in section VI. of the Addendum to this proposed rule (and available via the internet on the CMS website). Consistent with our historical practice, we also are proposing to use the best available data, if applicable, to determine the LTCH PPS statewide average total CCRs for FY 2024 in the final rule.

Under the current LTCH PPS labor market areas, all areas in Delaware, the District of Columbia, New Jersey, and Rhode Island are classified as urban. Therefore, there are no rural statewide average total CCRs listed for those jurisdictions in Table 8C. This policy is consistent with the policy that we established when we revised our methodology for determining the applicable LTCH statewide average CCRs in the FY 2007 IPPS final rule (71 FR 48119 through 48121) and is the same as the policy applied under the IPPS. In addition, although Connecticut and Nevada have areas that are designated as rural, in our calculation of the LTCH statewide average CCRs, there were no short-term, acute care IPPS hospitals classified as rural or LTCHs located in these rural areas as of December 2022. Therefore, consistent with our existing methodology, we are proposing to use the national average total CCR for rural IPPS hospitals for rural Connecticut and Nevada in Table 8C. While Massachusetts also has rural areas, the statewide average CCR for rural areas in Massachusetts is based on one IPPS provider whose CCR is an atypical 1.105. Because this is much higher than the statewide urban average (0.455) and furthermore implies costs greater than charges, as with Connecticut and Nevada, we are proposing to use the national average total CCR for rural IPPS hospitals for rural Massachusetts in Table 8C. Furthermore, consistent with our existing methodology, in determining the urban and rural statewide average total CCRs for Maryland LTCHs paid under the LTCH PPS, we are proposing to continue to use, as a proxy, the national average total CCR for urban IPPS hospitals and the national average

total CCR for rural IPPS hospitals, respectively. We are proposing to use this proxy because we believe that the CCR data in the PSF for Maryland hospitals may not be entirely accurate (as discussed in greater detail in the FY 2007 IPPS final rule (71 FR 48120)).

d. Reconciliation of HCO Payments

Under the HCO policy at § 412.525(a)(4)(iv)(D), the payments for HCO cases are subject to reconciliation (regardless of whether payment is based on the LTCH standard Federal payment rate or the site neutral payment rate). Specifically, any such payments are reconciled at settlement based on the CCR that was calculated based on the cost report coinciding with the discharge. For additional information on the reconciliation policy, we refer readers to sections 150.26 through 150.28 of the Medicare Claims Processing Manual (Pub. 100–4), as added by Change Request 7192 (Transmittal 2111; December 3, 2010), and the RY 2009 LTCH PPS final rule (73 FR 26820 through 26821).

3. Proposed High-Cost Outlier Payments for LTCH PPS Standard Federal Payment Rate Cases

a. High-Cost Outlier Payments for LTCH PPS Standard Federal Payment Rate Cases

Under the regulations at § 412.525(a)(2)(ii) and as required by section 1886(m)(7) of the Act, the fixed-loss amount for HCO payments is set each year so that the estimated aggregate HCO payments for LTCH PPS standard Federal payment rate cases are 99.6875 percent of 8 percent (that is, 7.975 percent) of estimated aggregate LTCH PPS payments for LTCH PPS standard Federal payment rate cases. (For more details on the requirements for high-cost outlier payments in FY 2018 and subsequent years under section 1886(m)(7) of the Act and additional information regarding high-cost outlier payments prior to FY 2018, we refer readers to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38542 through 38544).)

b. Proposed Fixed-Loss Amount for LTCH PPS Standard Federal Payment Rate Cases for FY 2024

In this section of this Addendum, we discuss our proposed methodology for determining the proposed fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2024. As we state later in this section, the proposed fixed-loss amount we determined for FY 2024 is significantly higher than the fixed-loss amount we finalized for FY 2023 (87 FR 49449). As we explain later in this section, we are soliciting comments on our proposed methodology and the assumptions underlying it, and will consider these comments when finalizing our methodology in the final rule.

When we implemented the LTCH PPS, we established a fixed-loss amount so that total estimated outlier payments are projected to equal 8 percent of total estimated payments (that is, the target percentage) under the LTCH PPS (67 FR 56022 through 56026). When we implemented the dual rate LTCH PPS payment structure beginning in FY 2016, we established that, in general, the historical LTCH PPS HCO policy would continue to apply to LTCH PPS standard Federal payment rate cases. That is, the fixed-loss amount for LTCH PPS standard Federal payment rate cases would be determined using the LTCH PPS HCO policy adopted when the LTCH PPS was first implemented, but we limited the data used under that policy to LTCH cases that would have been LTCH PPS standard Federal payment rate cases if the statutory changes had been in effect at the time of those discharges.

To determine the applicable fixed-loss amount for LTCH PPS standard Federal payment rate cases, we estimate outlier payments and total LTCH PPS payments for each LTCH PPS standard Federal payment rate case (or for each case that would have been an LTCH PPS standard Federal payment rate case if the statutory changes had been in effect at the time of the discharge) using claims data from the MedPAR files. In accordance with § 412.525(a)(2)(ii), the applicable fixed-loss amount for LTCH PPS standard Federal payment rate cases results in estimated total outlier payments being projected to be equal to 7.975 percent of projected total LTCH PPS payments for LTCH PPS standard Federal payment rate cases.

In the FY 2023 IPPS/LTCH PPS final rule (87 FR 49448), we discussed an LTCH (CCN 312024) whose abnormal charging practices in FY 2021 led to the LTCH receiving an excessive amount of high cost outlier payments. In that rule, we stated our belief, based on information we received from the provider, that these abnormal charging practices would not persist into FY 2023. Therefore, we did not include their cases in our model for determining the FY 2023 outlier fixed-loss amount. The FY 2022 MedPAR claims also reflect the abnormal charging practices of this LTCH. In the FY 2022 MedPAR file, we identified 164 LTCH PPS standard Federal payment rate cases for this LTCH. Of these 164 cases, 116 of the cases had charges that were exactly or within ten dollars of $10 million. Due to the abnormal charges reflected in this LTCH's FY 2022 claims, we do not believe it would be appropriate to use these claims in determining the fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2024. Therefore, we are proposing to remove claims from CCN 312024 when determining the fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2024.

(1) Proposed Charge Inflation Factor for Use in Determining the Proposed Fixed-Loss Amount for LTCH PPS Standard Federal Payment Rate Cases for FY 2024

Under the LTCH PPS, the cost of each claim is estimated by multiplying the charges on the claim by the provider's CCR. Due to the lag time in the availability of claims data, when estimating costs for the upcoming payment year we typically inflate the charges from the claims data by a uniform factor.

For greater accuracy in calculating the fixed-loss amount, in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45562 through 45566), we finalized a technical change to our methodology for determining the charge inflation factor. Similar to the method used under the IPPS hospital payment methodology (as discussed in section II.A.4.i.(2). of the Addendum to this proposed rule), our methodology determines the LTCH charge inflation factor based on the historical growth in charges for LTCH PPS standard Federal payment rate cases, calculated using historical MedPAR claims data. In this section of this Addendum, we describe our charge inflation factor methodology.

Step 1—Identify LTCH PPS Standard Federal Payment Rate Cases

The first step in our methodology is to identify LTCH PPS standard Federal payment rate cases from the MedPAR claim files for the two most recently available Federal fiscal year time periods. For both fiscal years, consistent with our historical methodology for determining payment rates for the LTCH PPS, we remove any claims submitted by LTCHs that were all-inclusive rate providers as well as any Medicare Advantage claims. For both fiscal years, we also remove claims from providers that only had claims in one of the fiscal years.

Step 2—Remove Statistical Outliers

The next step in our methodology is to remove all claims from providers whose growth in average charges was a statistical outlier. We remove these statistical outliers prior to calculating the charge inflation factor because we

believe they may represent aberrations in the data that would distort the measure of average charge growth. To perform this statistical trim, we first calculate each provider's average charge in both fiscal years. Then, we calculate a charge growth factor for each provider by dividing its average charge in the most recent fiscal year by its average charge in the prior fiscal year. Then we remove all claims for providers whose calculated charge growth factor was outside 3 standard deviations from the mean provider charge growth factor.

Step 3—Calculate the Charge Inflation Factor

The final step in our methodology is to use the remaining claims to calculate a national charge inflation factor. We first calculate the average charge for those remaining claims in both fiscal years. Then we calculate the national charge inflation factor by dividing the average charge in the more recent fiscal year by the average charge in the prior fiscal year.

Following the methodology described previously, we computed a proposed charge inflation factor based on the most recently available data. Specifically, we used the December 2022 update of the FY 2022 MedPAR file and the December 2021 update of the FY 2021 MedPAR as the basis of the LTCH PPS standard Federal payment rate cases for the two most recently available Federal fiscal year time periods, as described previously in our methodology. Therefore, we trimmed the December 2022 update of the FY 2022 MedPAR file and the December 2021 update of the FY 2021 MedPAR file as described in steps 1 and 2 of our methodology. To compute the 1-year average annual rate-of-change in charges per case, we compared the average covered charge per case of $247,014 ($12,380,602,491/50,121 cases) from FY 2021 to the average covered charge per case of $280,522 ($11,570,133,996/41,245 cases) from FY 2022. This rate-of-change was 13.5651 percent, which results in a 1-year charge inflation factor of 1.135651, and a 2-year charge inflation factor of 1.289703 (calculated by squaring the 1-year factor). We propose to inflate the billed charges obtained from the FY 2022 MedPAR file by this 2-year charge inflation factor of 1.289703 when determining the proposed fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2024.

(2) Proposed CCRs for Use in Determining the Proposed Fixed-Loss Amount for LTCH PPS Standard Federal Payment Rate Cases for FY 2024

For greater accuracy in calculating the fixed-loss amount, in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45562 through 45566), we finalized a technical change to our methodology for determining the CCRs used to calculate the fixed-loss amount. Similar to the methodology used for IPPS hospitals (as discussed in section II.A.4.i.(2). of the Addendum to this proposed rule), our methodology adjusts CCRs obtained from the best available PSF data by an adjustment factor that is calculated based on historical changes in the average case-weighted CCR for LTCHs. We believe these adjusted CCRs more accurately reflect CCR levels in the upcoming payment year because they account for historical changes in the relationship between costs and charges for LTCHs. In this section of this Addendum, we describe our CCR adjustment factor methodology.

Step 1—Assign Providers Their Historical CCRs

The first step in our methodology is to identify providers with LTCH PPS standard Federal payment rate cases in the most recent MedPAR claims file (excluding all-inclusive rate providers and providers with only Medicare Advantage claims). For each of these providers, we then identify the CCR from the most recently available PSF. For each of these providers we also identify the CCR from the PSF that was made available one year prior to the most recently available PSF.

Step 2—Trim Providers With Insufficient CCR Data

The next step in our methodology is to remove from the CCR adjustment factor calculation any providers for which we cannot accurately measure changes to their CCR using the PSF data. We first remove any provider whose CCR was missing in the most recent PSF or prior year PSF. We next remove any provider assigned the statewide average CCR for their State in either the most recent PSF or prior year PSF. We lastly remove any provider whose CCR was not updated between the most recent PSF and prior year PSF (determined by comparing the effective date of the records).

Step 3—Remove Statistical Outliers

The next step in our methodology is to remove providers whose change in their CCR is a statistical outlier. To perform this statistical trim, for those providers remaining after application of Step 2, we calculate a provider-level CCR growth factor by dividing the provider's CCR from the most recent PSF by its CCR in the prior year's PSF. We then remove any provider whose CCR growth factor was outside 3 standard deviations from the mean provider CCR growth factor. These statistical outliers are removed prior to calculating the CCR adjustment factor because we believe that they may represent aberrations in the data that would distort the measure of average annual CCR change.

Step 4—Calculate a CCR Adjustment Factor

The final step in our methodology is to calculate, across all remaining providers after application of Step 3, an average case-weighted CCR from both the most recent PSF and prior year PSF. The provider case counts that we use to calculate the case-weighted average are determined from claims for LTCH standard Federal rate cases from the most recent MedPAR claims file. We note when determining these case counts, consistent with our historical methodology for determining the MS–LTC–DRG relative weights, we do not count short-stay outlier claims as full cases but instead as a fraction of a case based on the ratio of covered days to the geometric mean length of stay for the MS–LTC–DRG grouped to the case. We calculate the national CCR adjustment factor by dividing the case-weighted CCR from the most recent PSF by the case-weighted CCR from the prior year PSF.

Following the methodology described previously, we computed a CCR adjustment factor based on the most recently available data. Specifically, we used the December 2022 PSF as the most recently available PSF and the December 2021 PSF as the PSF that was made available one year prior to the most recently available PSF, as described in our methodology. In addition, we used claims from the December 2022 update of the FY 2022 MedPAR file in our calculation of average case-weighted CCRs described in Step 4 of our methodology. Specifically, following the methodology described previously and, for providers with LTCH PPS standard Federal payment rate cases in the December 2022 update of the FY 2022 MedPAR file, we identified their CCRs from both the December 2021 PSF and December 2022 PSF. After performing the trims outlined in our methodology, we used the LTCH PPS standard Federal payment rate case counts from the FY 2022 MedPAR file (classified using proposed Version 41 of the GROUPER)

to calculate case-weighted average CCRs. Based on this data, we calculated a December 2021 national average case-weighted CCR of 0.235395 and a December 2022 national average case-weighted CCR of 0.229631. We then calculated the proposed national CCR adjustment factor by dividing the December 2022 national average case-weighted CCR by the December 2021 national average case-weighted CCR. This results in a proposed 1-year national CCR adjustment factor of 0.975513. When calculating the proposed fixed-loss amount for FY 2024, we assigned the statewide average CCR for the upcoming fiscal year to all providers who were assigned the statewide average in the December 2022 PSF or whose CCR was missing in the December 2022 PSF. For all other providers, we multiplied their CCR from the December 2022 PSF by the proposed 1-year national CCR adjustment factor of 0.975513.

(3) Proposed Fixed-Loss Amount for LTCH PPS Standard Federal Payment Rate Cases for FY 2024

In this proposed rule, for FY 2024, using the best available data and the steps described previously, we calculated a proposed fixed-loss amount that would maintain estimated HCO payments at the projected 7.975 percent of total estimated LTCH PPS payments for LTCH PPS standard Federal payment rate cases as required by section 1886(m)(7) of the Act and in accordance with § 412.525(a)(2)(ii) (based on the proposed payment rates and policies for these cases presented in this proposed rule). Consistent with our historical practice, we are proposing to use the best available LTCH claims data and CCR data, if applicable, when determining the fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2024 in the final rule. Therefore, based on LTCH claims data from the December 2022 update of the FY 2022 MedPAR file adjusted for charge inflation and adjusted CCRs from the December 2022 update of the PSF, under the broad authority of section 123(a)(1) of the BBRA and section 307(b)(1) of the BIPA, we are proposing a fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2024 of $94,378 that would result in estimated outlier payments projected to be equal to 7.975 percent of estimated FY 2024 payments for such cases. We also are proposing to continue to make an additional HCO payment for the cost of an LTCH PPS standard Federal payment rate case that exceeds the HCO threshold amount that is equal to 80 percent of the difference between the estimated cost of the case and the outlier threshold (the sum of the proposed adjusted LTCH PPS standard Federal payment rate payment and the proposed fixed-loss amount for LTCH PPS standard Federal payment rate cases of $94,378).

The proposed fixed-loss amount for FY 2024 ($94,378) is significantly higher than the fixed-loss amount for FY 2023 ($38,518). Each year the fixed-loss amount is determined prospectively based on the best available data at the time. There is typically a 2-year lag between the ratesetting year and the claims data available for ratesetting. For example, as described previously, we used standard Federal payment rate cases from the FY 2022 MedPAR file to compute the proposed fixed-loss amount for FY 2024. The average estimated cost per discharge for LTCH PPS standard Federal payment rate cases has risen considerably in recent years, primarily due to a significant increase in billed charges. The average charge per standard Federal payment rate case increased approximately 11 percent and 14 percent in FY 2021 and FY 2022, respectively. Using the FY 2021 and FY 2022 MedPAR files, we estimate that actual high cost outlier payments accounted for 11.1 and 11.7 percent of total LTCH PPS standard Federal payment rate payments in FY 2021 and FY 2022, respectively. These percentages are much higher than the budget neutral target of 7.975 percent that we modelled, using the best available data at the time, when determining the FY 2021 fixed-loss amount of $27,195 (85 FR 59056) and the FY 2022 fixed-loss amount of $33,015 (86 FR 45566). Using the FY 2021 and FY 2022 MedPAR files, we currently estimate that for actual high cost outlier payments to have accounted for 7.975 percent of total LTCH PPS standard Federal payment rate payments in FY 2021 and FY 2022, the fixed-loss amounts would have needed to been set at approximately $47,550 and $60,650, respectively. Furthermore, as discussed in Appendix A to this proposed rule, we currently model that high cost outlier payments in FY 2023 will account for 12.7 of total LTCH PPS standard Federal payment rate payments. Based on this model, we estimate that the FY 2023 fixed-loss amount would have needed to have been set at approximately $75,000 to meet the requirement that high cost outlier payments account for 7.975 percent of total LTCH PPS standard Federal payment rate payments in FY 2023.

For the reasons discussed previously, we believe a large increase to the fixed-loss amount is warranted to ensure that estimated outlier payments in FY 2024 return to our statutorily required budget neutral target of 7.975 percent. However, we acknowledge that the proposed increase is substantial. Therefore, we are soliciting comments on our proposed methodology for determining the fixed-loss amount for FY 2024. As described previously, our methodology for modelling the fixed-loss amount requires certain assumptions. For example, through our charge inflation factor, we assume that billed charges will continue to increase, in general, at the rate observed in the most recently available data. Similarly, through our CCR adjustment factor, we assume that CCRs for LTCHs will continue to change, in general, at the rate observed in the most recently available data. We are seeking comments on all aspects of our proposed methodology, including the assumptions underlying the methodology for modelling the fixed-loss amount, and whether there are any modifications to the methodology or the assumptions underlying it that may result in more accurate estimations of the total outlier payments and/or the total LTCH PPS payments for LTCH PPS standard Federal payment rate cases. We remind the reader that we are required by section 1886(m)(7) of the Act to establish a fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2024 that would result in total estimated outlier payments being equal to 7.975 percent of projected total LTCH PPS payments for LTCH PPS standard Federal payment rate cases. We will consider comments received when finalizing our methodology for determining the fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2024 in the final rule.

4. Proposed High-Cost Outlier Payments for Site Neutral Payment Rate Cases

When we implemented the application of the site neutral payment rate in FY 2016, in examining the appropriate fixed-loss amount for site neutral payment rate cases issue, we considered how LTCH discharges based on historical claims data would have been classified under the dual rate LTCH PPS payment structure and the CMS' Office of the Actuary projections regarding how LTCHs will likely respond to our implementation of policies resulting from the statutory payment changes. We again relied on these considerations and actuarial projections in FY 2017 and FY 2018 because the historical claims data available in each of these years were not all subject to the LTCH PPS dual rate

payment system. Similarly, for FYs 2019 through 2023, we continued to rely on these considerations and actuarial projections because, due to the transitional blended payment policy for site neutral payment rate cases and the provisions of section 3711(b)(2) of the CARES Act, the historical claims data available in each of these years were not subject to the full effect of the site neutral payment rate.

For FYs 2016 through 2023, our actuaries projected that the proportion of cases that would qualify as LTCH PPS standard Federal payment rate cases versus site neutral payment rate cases under the statutory provisions would remain consistent with what is reflected in the historical LTCH PPS claims data. Although our actuaries did not project an immediate change in the proportions found in the historical data, they did project cost and resource changes to account for the lower payment rates. Our actuaries also projected that the costs and resource use for cases paid at the site neutral payment rate would likely be lower, on average, than the costs and resource use for cases paid at the LTCH PPS standard Federal payment rate and would likely mirror the costs and resource use for IPPS cases assigned to the same MS–DRG, regardless of whether the proportion of site neutral payment rate cases in the future remains similar to what is found based on the historical data. As discussed in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49619), this actuarial assumption is based on our expectation that site neutral payment rate cases would generally be paid based on an IPPS comparable per diem amount under the statutory LTCH PPS payment changes that began in FY 2016, which, in the majority of cases, is much lower than the payment that would have been paid if these statutory changes were not enacted. In light of these projections and expectations, we discussed that we believed that the use of a single fixed-loss amount and HCO target for all LTCH PPS cases would be problematic. In addition, we discussed that we did not believe that it would be appropriate for comparable LTCH PPS site neutral payment rate cases to receive dramatically different HCO payments from those cases that would be paid under the IPPS (80 FR 49617 through 49619 and 81 FR 57305 through 57307). For those reasons, we stated that we believed that the most appropriate fixed-loss amount for site neutral payment rate cases for FYs 2016 through 2023 would be equal to the IPPS fixed-loss amount for that particular fiscal year. Therefore, we established the fixed-loss amount for site neutral payment rate cases as the corresponding IPPS fixed-loss amounts for FYs 2016 through 2023. In particular, in FY 2023, we established the fixed-loss amount for site neutral payment rate cases as the FY 2023 IPPS fixed-loss amount of $38,788 (87 FR 49450, as corrected in 87 FR 66564).

As discussed in section I.E. of the preamble of this proposed rule, we are proposing to use FY 2022 data in the FY 2024 LTCH PPS ratesetting. Section 3711(b)(2) of the CARES Act, which provided a waiver of the application of the site neutral payment rate for LTCH cases admitted during the COVID–19 PHE period, was in effect for the entirety of FY 2022. Therefore, all LTCH PPS cases in FY 2022 were paid the LTCH PPS standard Federal rate regardless of whether the discharge met the statutory patient criteria. Because not all FY 2022 claims in the data used for this proposed rule were subject to the site neutral payment rate, we continue to rely on the same considerations and actuarial projections used in FYs 2016 through 2023 when developing a fixed-loss amount for site neutral payment rate cases for FY 2024. Our actuaries continue to project that the costs and resource use for FY 2024 cases paid at the site neutral payment rate would likely be lower, on average, than the costs and resource use for cases paid at the LTCH PPS standard Federal payment rate and will likely mirror the costs and resource use for IPPS cases assigned to the same MS–DRG, regardless of whether the proportion of site neutral payment rate cases in the future remains similar to what was found based on the historical data. (Based on the FY 2022 LTCH claims data used in the development of this proposed rule, if the provisions of the CARES Act had not been in effect, approximately 68 percent of LTCH cases would have been paid the LTCH PPS standard Federal payment rate and approximately 32 percent of LTCH cases would have been paid the site neutral payment rate for discharges occurring in FY 2022.)

For these reasons, we continue to believe that the most appropriate fixed-loss amount for site neutral payment rate cases for FY 2024 is the IPPS fixed-loss amount for FY 2024. Therefore, consistent with past practice, we are proposing that the applicable HCO threshold for site neutral payment rate cases is the sum of the site neutral payment rate for the case and the proposed IPPS fixed-loss amount. That is, we are proposing a fixed-loss amount for site neutral payment rate cases of $40,732, which is the same proposed FY 2024 IPPS fixed-loss amount discussed in section II.A.4.i.(2). of the Addendum to this proposed rule. Accordingly, for FY 2024, we are proposing to calculate a HCO payment for site neutral payment rate cases with costs that exceed the HCO threshold amount that is equal to 80 percent of the difference between the estimated cost of the case and the outlier threshold (the sum of the site neutral payment rate payment and the proposed fixed-loss amount for site neutral payment rate cases of $40,732).

In establishing a HCO policy for site neutral payment rate cases, we established a budget neutrality adjustment under § 412.522(c)(2)(i). We established this requirement because we believed, and continue to believe, that the HCO policy for site neutral payment rate cases should be budget neutral, just as the HCO policy for LTCH PPS standard Federal payment rate cases is budget neutral, meaning that estimated site neutral payment rate HCO payments should not result in any change in estimated aggregate LTCH PPS payments.

To ensure that estimated HCO payments payable to site neutral payment rate cases in FY 2024 would not result in any increase in estimated aggregate FY 2024 LTCH PPS payments, under the budget neutrality requirement at § 412.522(c)(2)(i), it is necessary to reduce site neutral payment rate payments by 5.1 percent to account for the estimated additional HCO payments payable to those cases in FY 2024. Consistent with our historical practice, we are proposing to continue this policy.

As discussed earlier, consistent with the IPPS HCO payment threshold, we estimate the proposed fixed-loss threshold would result in FY 2024 HCO payments for site neutral payment rate cases to equal 5.1 percent of the site neutral payment rate payments that are based on the IPPS comparable per diem amount. As such, to ensure estimated HCO payments payable for site neutral payment rate cases in FY 2024 would not result in any increase in estimated aggregate FY 2024 LTCH PPS payments, under the budget neutrality requirement at § 412.522(c)(2)(i), it is necessary to reduce the site neutral payment rate amount paid under § 412.522(c)(1)(i) by 5.1 percent to account for the estimated additional HCO payments payable for site neutral payment rate cases in FY 2024. To achieve this, for FY 2024, we are proposing to apply a budget neutrality factor of 0.949 (that is, the decimal equivalent of a 5.1 percent reduction, determined as $1.0 - 5.1/100 = 0.949$) to the site neutral payment rate for those site neutral payment rate cases

paid under § 412.522(c)(1)(i). We note that, consistent with our current policy, this proposed HCO budget neutrality adjustment would not be applied to the HCO portion of the site neutral payment rate amount (81 FR 57309).

E. Proposed Update to the IPPS Comparable Amount To Reflect the Statutory Changes to the IPPS DSH Payment Adjustment Methodology

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50766), we established a policy to reflect the changes to the Medicare IPPS DSH payment adjustment methodology made by section 3133 of the Affordable Care Act in the calculation of the ''IPPS comparable amount'' under the SSO policy at § 412.529 and the ''IPPS equivalent amount'' under the site neutral payment rate at § 412.522. Historically, the determination of both the ''IPPS comparable amount'' and the ''IPPS equivalent amount'' includes an amount for inpatient operating costs ''for the costs of serving a disproportionate share of low-income patients.'' Under the statutory changes to the Medicare DSH payment adjustment methodology that began in FY 2014, in general, eligible IPPS hospitals receive an empirically justified Medicare DSH payment equal to 25 percent of the amount they otherwise would have received under the statutory formula for Medicare DSH payments prior to the amendments made by the Affordable Care Act. The remaining amount, equal to an estimate of 75 percent of the amount that otherwise would have been paid as Medicare DSH payments, reduced to reflect changes in the percentage of individuals who are uninsured and any additional statutory adjustment, is made available to make additional payments to each hospital that qualifies for Medicare DSH payments and that has uncompensated care. The additional uncompensated care payments are based on the hospital's amount of uncompensated care for a given time period relative to the total amount of uncompensated care for that same time period reported by all IPPS hospitals that receive Medicare DSH payments.

To reflect the statutory changes to the Medicare DSH payment adjustment methodology in the calculation of the ''IPPS comparable amount'' and the ''IPPS equivalent amount'' under the LTCH PPS, we stated that we will include a reduced Medicare DSH payment amount that reflects the projected percentage of the payment amount calculated based on the statutory Medicare DSH payment formula prior to the amendments made by the Affordable Care Act that will be paid to eligible IPPS hospitals as empirically justified Medicare DSH payments and uncompensated care payments in that year (that is, a percentage of the operating Medicare DSH payment amount that has historically been reflected in the LTCH PPS payments that are based on IPPS rates). We also stated that the projected percentage will be updated annually, consistent with the annual determination of the amount of uncompensated care payments that will be made to eligible IPPS hospitals. We believe that this approach results in appropriate payments under the LTCH PPS and is consistent with our intention that the ''IPPS comparable amount'' and the ''IPPS equivalent amount'' under the LTCH PPS closely resemble what an IPPS payment would have been for the same episode of care, while recognizing that some features of the IPPS cannot be translated directly into the LTCH PPS (79 FR 50766 through 50767).

For FY 2024, as discussed in greater detail in section IV.E.2.b. of the preamble of this proposed rule, based on the most recent data available, our estimate of 75 percent of the amount that would otherwise have been paid as Medicare DSH payments (under the methodology outlined in section 1886(r)(2) of the Act) is adjusted to 65.71 percent of that amount to reflect the change in the percentage of individuals who are uninsured. The resulting amount is then used to determine the amount available to make uncompensated care payments to eligible IPPS hospitals in FY 2024. In other words, the amount of the Medicare DSH payments that would have been made prior to the amendments made by the Affordable Care Act is adjusted to 49.28 percent (the product of 75 percent and 65.71 percent) and the resulting amount is used to calculate the uncompensated care payments to eligible hospitals. As a result, for FY 2024, we project that the reduction in the amount of Medicare DSH payments pursuant to section 1886(r)(1) of the Act, along with the payments for uncompensated care under section 1886(r)(2) of the Act, will result in overall Medicare DSH payments of 74.28 percent of the amount of Medicare DSH payments that would otherwise have been made in the absence of the amendments made by the Affordable Care Act (that is, 25 percent + 49.28 percent = 74.28 percent).

Therefore, for FY 2024, we are proposing to establish that the calculation of the ''IPPS comparable amount'' under § 412.529 would include an applicable operating Medicare DSH payment amount that is equal to 74.28 percent of the operating Medicare DSH payment amount that would have been paid based on the statutory Medicare DSH payment formula absent the amendments made by the Affordable Care Act. Furthermore, consistent with our historical practice, we are proposing that, if more recent data became available, we would use that data to determine this factor in the final rule.

F. Computing the Proposed Adjusted LTCH PPS Federal Prospective Payments for FY 2024

Section 412.525 sets forth the adjustments to the LTCH PPS standard Federal payment rate. Under the dual rate LTCH PPS payment structure, only LTCH PPS cases that meet the statutory criteria to be excluded from the site neutral payment rate are paid based on the LTCH PPS standard Federal payment rate. Under § 412.525(c), the LTCH PPS standard Federal payment rate is adjusted to account for differences in area wages by multiplying the labor-related share of the LTCH PPS standard Federal payment rate for a case by the applicable LTCH PPS wage index (the proposed FY 2024 values are shown in Tables 12A through 12B listed in section VI. of the Addendum to this proposed rule and are available via the internet on the CMS website). The LTCH PPS standard Federal payment rate is also adjusted to account for the higher costs of LTCHs located in Alaska and Hawaii by the applicable COLA factors (the proposed FY 2024 factors are shown in the chart in section V.C. of this Addendum) in accordance with § 412.525(b). In this proposed rule, we are proposing to establish an LTCH PPS standard Federal payment rate for FY 2024 of $47,948.15, as discussed in section V.A. of the Addendum to this proposed rule. We illustrate the methodology to adjust the proposed LTCH PPS standard Federal payment rate for FY 2024, applying our proposed LTCH PPS amounts for the standard Federal payment rate, MS–LTC–DRG relative weights, and wage index in the following example:

Example: During FY 2024, a Medicare discharge that meets the criteria to be excluded from the site neutral payment rate, that is, an LTCH PPS standard Federal payment rate case, is from an LTCH that is located in CBSA 16984, which has a proposed FY 2024 LTCH PPS wage index value of 1.0431 (as shown in Table 12A listed in section VI. of the Addendum to this proposed rule). The Medicare patient case is classified into proposed MS–LTC–DRG 189 (Pulmonary Edema & Respiratory Failure), which has a proposed relative

weight for FY 2024 of 0.9410 (as shown in Table 11 listed in section VI. of the Addendum to this proposed rule). The LTCH submitted quality reporting data for FY 2024 in accordance with the LTCH QRP under section 1886(m)(5) of the Act.

To calculate the LTCH's total adjusted proposed Federal prospective payment for this Medicare patient case in FY 2024, we computed the wage-adjusted Federal prospective payment amount by multiplying the unadjusted proposed FY 2024 LTCH PPS standard Federal payment rate ($47,948.15) by the proposed labor-related share (68.4 percent) and the proposed wage index value (1.0431). This wage-adjusted amount was then added to the proposed nonlabor-related portion of the unadjusted proposed LTCH PPS standard Federal payment rate (31.6 percent; adjusted for cost of living, if applicable) to determine the adjusted proposed LTCH PPS standard Federal payment rate, which is then multiplied by the proposed MS–LTC–DRG relative weight (0.9410) to calculate the total adjusted proposed LTCH PPS standard Federal prospective payment for FY 2024 ($46,449.34). The table illustrates the components of the calculations in this example.

Unadjusted Proposed LTCH PPS Standard Federal Prospective Payment Rate	$47,948.15
Proposed Labor-Related Share	x 0.684
Proposed Labor-Related Portion of the LTCH PPS Standard Federal Payment Rate	= $32,796.53
Proposed Wage Index (CBSA 16984)	x 1.0431
Proposed Wage-Adjusted Labor Share of the LTCH PPS Standard Federal Payment Rate	= $34,210.06
Proposed Nonlabor-Related Portion of the LTCH PPS Standard Federal Payment Rate ($47,948.15 x 0.316)	+ $15,151.62
Adjusted Proposed LTCH PPS Standard Federal Payment Amount	= $49,361.68
Proposed MS-LTC-DRG 189 Relative Weight	x 0.9410
Total Adjusted Proposed LTCH PPS Standard Federal Prospective Payment	= $46,449.34

VI. Tables Referenced in This Proposed Rule Generally Available on the CMS Website

This section lists the tables referred to throughout the preamble of this proposed rule and in the Addendum. In the past, a majority of these tables were published in the **Federal Register** as part of the annual proposed and final rules. However, similar to FYs 2012 through 2023, for the FY 2024 rulemaking cycle, the IPPS and LTCH PPS tables will not be published in the **Federal Register** in the annual IPPS/LTCH PPS proposed and final rules and will be on the CMS website. Specifically, all IPPS tables listed in the proposed rule, with the exception of IPPS Tables 1A, 1B, 1C, and 1D, and LTCH PPS Table 1E, will generally be available on the CMS website. IPPS Tables 1A, 1B, 1C, and 1D, and LTCH PPS Table 1E are displayed at the end of this section and will continue to be published in the **Federal Register** as part of the annual proposed and final rules. For additional discussion of the information included in the IPPS and LTCH PPS tables associated with the IPPS/LTCH PPS proposed and final rules, as well as prior changes to the information included in these tables, we refer readers to the FY 2023 IPPS/LTCH PPS final rule (87 FR 49451 through 49453).

Tables 7A and 7B historically contained the Medicare prospective payment system selected percentile lengths of stay for the MS–DRGs for the prior year and upcoming fiscal year. We note, in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49452), we finalized beginning with FY 2023, to provide the percentile length of stay information previously included in Tables 7A and 7B in the supplemental AOR/BOR data file. The AOR/BOR files can be found on the FY 2024 IPPS proposed rule home page on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*.

As discussed in section II.E. of the preamble to this proposed rule, we are making available separate tables listing the ICD–10–CM codes, ICD–10–PCS codes, and/or MS–DRGs related to the analyses of the cost criterion for the FY 2024 new technology add-on payment applications in Table 10 associated with this proposed rule.

After hospitals have been given an opportunity to review and correct their calculations for FY 2024, we will post Table 15 (which will be available via the CMS website) to display the final FY 2024 readmissions payment adjustment factors that will be applicable to discharges occurring on or after October 1, 2023. We expect Table 15 will be posted on the CMS website in the Fall 2023.

Readers who experience any problems accessing any of the tables that are posted on the CMS websites identified in this proposed rule should contact Michael Treitel at (410) 786–4552.

The following IPPS tables for this proposed rule are generally available on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*. Click on the link on the left side of the screen titled ''FY 2024 IPPS Proposed Rule Home Page'' or ''Acute Inpatient-Files-for Download.''

* For LTCHs that fail to submit quality reporting data for FY 2024 in accordance with the LTCH Quality Reporting Program (LTCH QRP), the annual update is reduced by 2.0 percentage points as required by section 1886(m)(5) of the Act.

Appendix A: Economic Analyses

I. Regulatory Impact Analysis

A. Statement of Need

This proposed rule is necessary in order to make payment and policy changes under the IPPS for Medicare acute care hospital inpatient services for operating and capital-related costs as well as for certain hospitals and hospital units excluded from the IPPS. This proposed rule also is necessary to make payment and policy changes for Medicare hospitals under the LTCH PPS. Also, as we note later in this Appendix, the primary objective of the IPPS and the LTCH PPS is to create incentives for hospitals to operate efficiently and minimize unnecessary costs, while at the same time ensuring that payments are sufficient to adequately compensate hospitals for their legitimate costs in delivering necessary care to Medicare beneficiaries. In addition, we share national goals of preserving the Medicare Hospital Insurance Trust Fund.

We believe that the proposed changes in this proposed rule, such as the proposed updates to the IPPS and LTCH PPS rates, and the proposals and discussions relating to applications for new technology add-on payments, are needed to further each of these goals while maintaining the financial viability of the hospital industry and ensuring access to high quality health care for Medicare beneficiaries.

We expect that these proposed changes would ensure that the outcomes of the prospective payment systems are reasonable and provide equitable payments, while avoiding or minimizing unintended adverse consequences.

1. Acute Care Hospital Inpatient Prospective Payment System (IPPS)

a. Proposed Update to the IPPS Payment Rates

In accordance with section 1886(b)(3)(B) of the Act and as described in section V.B. of the preamble to this proposed rule, we are proposing to update the national standardized amount for inpatient hospital operating costs by the proposed applicable percentage increase of 2.8 percent (that is, a 3.0 percent market basket update with a proposed reduction of 0.2 percentage point for the productivity adjustment). We are also proposing to apply the proposed applicable percentage increase (including the market basket update and the proposed productivity adjustment) to the hospital-specific rates.

Subsection (d) hospitals that do not submit quality information under rules established by the Secretary and that are meaningful EHR users under section 1886(b)(3)(B)(ix) of the Act would receive a proposed applicable percentage increase of 2.05 percent. Hospitals that are identified as not meaningful EHR users and do submit quality information under section 1886(b)(3)(B)(viii) of the Act would receive a proposed applicable percentage increase of 0.55 percent.

Hospitals that are identified as not meaningful EHR users under section 1886(b)(3)(B)(ix) of the Act and also do not submit quality data under section 1886(b)(3)(B)(viii) of the Act would receive a proposed applicable percentage increase of -0.2 percent, which reflects a one-quarter percent reduction of the market basket update for failure to submit quality data and a three-quarter percent reduction of the market basket update for being identified as not a meaningful EHR user.

b. Proposed Changes for the Add-On Payments for New Services and Technologies

Consistent with sections 1886(d)(5)(K) and (L) of the Act, we review applications for new technology add-on payments based on the eligibility criteria at 42 CFR 412.87. As set forth in 42 CFR 412.87(e)(1), we consider whether a technology meets the criteria for the new technology add-on payment and announce the results as part of the annual updates and changes to the IPPS.

As discussed in section II.E.8. of this proposed rule, beginning with new technology add-on payment applications for FY 2025, we are proposing, for technologies that are not already market authorized, to require applicants to have a complete and active FDA market authorization request at the time of new technology add-on payment application submission and to provide documentation of FDA acceptance or filing to CMS at the time of application submission. We are also proposing that, beginning with FY 2025 applications, in order to be eligible for consideration for the new technology add-on payment for the upcoming fiscal year, an applicant for new technology add-on payments must have FDA marketing authorization by May 1 rather than July 1 of the year prior to the beginning of the fiscal year for which the application is being considered.

c. Proposed Continuation of the Low Wage Index Hospital Policy

To help mitigate wage index disparities between high wage and low wage hospitals, in the FY 2020 IPPS/LTCH PPS rule (84 FR 42326 through 42332), we adopted a policy to increase the wage index values for certain hospitals with low wage index values (the low wage index hospital policy). This policy was adopted in a budget neutral manner through an adjustment

applied to the standardized amounts for all hospitals. We also indicated our intention that this policy would be effective for at least 4 years, beginning in FY 2020, in order to allow employee compensation increases implemented by these hospitals sufficient time to be reflected in the wage index calculation. As discussed in section III.G.4. of the preamble of this proposed rule, as we only have one year of relevant data at this time that we could use to evaluate any potential impacts of this policy, we believe it is necessary to wait until we have useable data from additional fiscal years before making any decision to modify or discontinue the policy. Therefore, for FY 2024, we are proposing to continue the low wage index hospital policy and the related budget neutrality adjustment.

d. Proposed Modification to the Rural Wage Index Calculation Methodology

As discussed in section III.G.1 of the preamble of this proposed rule, CMS has taken the opportunity to revisit the case law, prior public comments, and the relevant statutory language with regard to its policies involving the treatment of hospitals that have reclassified as rural under section 1886(d)(8)(E) of the Act, as implemented in the regulations under 42 CFR 412.103. After doing so, CMS now agrees that the best reading of section 1886(d)(8)(E) of the Act is that it instructs CMS to treat § 412.103 hospitals the same as geographically rural hospitals for the wage index calculation. Therefore, we believe it is proper to include these hospitals in all iterations of the rural wage index calculation methodology included in section 1886(d) of the Act, including all hold harmless calculations in that provision. Beginning with FY 2024, we are proposing to include hospitals with § 412.103 reclassification along with geographically rural hospitals in all rural wage index calculations, and to exclude ''dual reclass'' hospitals (hospitals with simultaneous § 412.103 and MGCRB reclassifications) implicated by the hold harmless provision at section 1886(d)(8)(C)(ii) of the Act. Changes to the rural wage index which affect the rural floor would be implemented in a budget neutral manner.

e. Payment Adjustment for Medicare Disproportionate Share Hospitals (DSHs)

In this proposed rule, as required by section 1886(r)(2) of the Act, we are proposing to update our estimates of the three factors used to determine uncompensated care payments for FY 2024. Beginning with FY 2023, we adopted a multiyear averaging methodology to determine Factor 3 of the uncompensated care payment methodology, which will help to mitigate against large fluctuations in uncompensated care payments from year to year. Under this methodology, for FY 2024 and subsequent fiscal years, we will determine Factor 3 for all eligible hospitals using a 3-year average of the data on uncompensated care costs from Worksheet S–10 for the 3 most recent fiscal years for which audited data are available. Specifically, we will use a 3-year average of audited data on uncompensated care costs from Worksheet S–10 from the FY 2018, FY 2019 and FY 2020 cost reports to calculate Factor 3 for FY 2024 for all eligible hospitals.

Beginning with FY 2023, we established a supplemental payment for IHS and Tribal hospitals and hospitals located in Puerto Rico to help prevent undue long-term financial disruption to these hospitals due to discontinuing use of the low-income insured days proxy in the uncompensated care payment methodology for these providers.

f. Effects of Implementation of the Rural Community Hospital Demonstration Program in FY 2024

The Rural Community Hospital Demonstration (RCHD) was authorized originally for a 5-year period by section 410A of the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (MMA) (Pub. L 108–173), and it was extended for another 5-year period by section 3123 and 10313 of the Affordable Care Act (Pub. L 111–148). Section 15003 of the 21st Century Cures Act (Cures Act) (Pub. L. 114–255) extended the demonstration for an additional 5-year period, and section 128 of the Consolidated Appropriations Act of 2021 (Pub. L. 116–159) included an additional 5-year re-authorization. CMS has conducted the demonstration since 2004, which allows enhanced, cost-based payment for Medicare inpatient services for up to 30 small rural hospitals.

The authorizing legislation imposes a strict budget neutrality requirement. In this proposed rule, we summarize the status of the demonstration program, and the ongoing methodologies for implementation and budget neutrality.

2. Frontier Community Health Integration Project (FCHIP) Demonstration

The Frontier Community Health Integration Project (FCHIP) demonstration was authorized under section 123 of the Medicare Improvements for Patients and Providers Act of 2008 (Pub. L 110–275), as amended by section 3126 of the Affordable Care Act of 2010 (Pub. L 114–158), and most recently re-authorized and extended by the Consolidated Appropriations Act of 2021 (Pub. L 116–159). The legislation authorized a demonstration project to allow eligible entities to develop and test new models for the delivery of health care in order to improve access to and better integrate the delivery of acute care, extended care and other health care services to Medicare beneficiaries in certain rural areas. The FCHIP demonstration initial period was conducted in 10 critical access hospitals (CAHs) from August 1, 2016, to July 31, 2019, and the demonstration ''extension period'' began on January 1, 2022, to run through June 30, 2027.

The authorizing legislation requires the FCHIP demonstration to be budget neutral. In this proposed rule, we propose to continue with the budget neutrality approach used in the demonstration initial period for the demonstration extension period—to offset payments across CAHs nationally—should the demonstration incur costs to Medicare.

3. Proposed Update to the LTCH PPS Payment Rates

As described in section VIII.C.2. of the preamble of this proposed rule, in order to update payments to LTCHs using the best available data, we are proposing to update the LTCH PPS standard Federal payment rate by 2.9 percent (that is, a 3.1 percent market basket update with a proposed reduction of 0.2 percentage point for the productivity adjustment, as required by section 1886(m)(3)(A)(i) of the Act). LTCHs that failed to submit quality data, as required by 1886(m)(5)(A)(i) of the Act and described in section VIII.C.2. of the preamble of this proposed rule, would receive a proposed update of 0.9 percent, which reflects a 2.0 percentage point reduction for failure to submit quality data.

4. Hospital Quality Programs

Section 1886(b)(3)(B)(viii) of the Act requires subsection (d) hospitals to report data in accordance with the requirements of the Hospital IQR Program for purposes of measuring and making publicly available information on health care quality, and links the quality data submission to the annual applicable percentage increase. Sections 1886(b)(3)(B)(ix), 1886(n), and 1814(l) of the Act require eligible hospitals and CAHs to demonstrate they are meaningful users of certified EHR

technology for purposes of electronic exchange of health information to improve the quality of health care, and links the submission of information demonstrating meaningful use to the annual applicable percentage increase for eligible hospitals and the applicable percent for CAHs. Section 1886(m)(5) of the Act requires each LTCH to submit quality measure data in accordance with the requirements of the LTCH QRP for purposes of measuring and making publicly available information on health care quality, and in order to avoid a 2-percentage point reduction in their annual payment. Section 1886(o) of the Act requires the Secretary to establish a value-based purchasing program under which value-based incentive payments are made in a fiscal year to hospitals that meet the performance standards established on an announced set of quality and efficiency measures for the fiscal year. The purposes of the Hospital VBP Program include measuring the quality of hospital inpatient care, linking hospital measure performance to payment, and making publicly available information on hospital quality of care. Section 1886(p) of the Act requires a reduction in payment for subsection (d) hospitals that rank in the worst-performing 25 percent with respect to measures of hospital-acquired conditions under the HAC Reduction Program for the purpose of measuring HACs linking measure performance to payment, and making publicly available information on health care quality. Section 1886(q) of the Act requires a reduction in payment for subsection (d) hospitals for excess readmissions based on measures for applicable conditions under the Hospital Readmissions Reduction Program for the purpose of measuring readmissions, linking measure performance to payment, and making publicly available information on health care quality. Section 1866(k) of the Act applies to hospitals described in section 1886(d)(1)(B)(v) of the Act (referred to as ''PPS-Exempt Cancer Hospitals'' or ''PCHs'') and requires PCHs to report data in accordance with the requirements of the PCHQR Program for purposes of measuring and making publicly available information on the quality of care furnished by PCHs, however, there is no reduction in payment to a PCH that does not report data.

5. Other Proposed Provisions

a. Rural Emergency Hospitals

Section 125 of Division CC of the CAA was signed into law on December 27, 2020, and establishes REHs as a new Medicare provider-type that receives Medicare payment for services furnished on or after January 1, 2023. Section 125 of the CAA added section 1861(kkk) to the Act, which sets forth the requirements for REHs.

Sections 1861(kkk)(4)(A)(i) through (iv) of the Act requires that an eligible facility that submits an application for enrollment as an REH under section 1866(j) of the Act, must also submit additional information that must include an action plan containing: (1) a plan for initiating REH services (which must include the provision of emergency department services and observation care); (2) a detailed transition plan that lists the specific services that the provider will retain, modify, add, and discontinue as an REH; (3) a detailed description of other outpatient medical and health services that it intends to furnish on an outpatient basis as an REH; and (4) information regarding how the provider intends to use the additional facility payment provided under section 1834(x)(2) of the Act, including a description of the services that the additional facility payment would be supporting, such as the operation and maintenance of the facility and the furnishing of covered services (for example, telehealth services and ambulance services).

On January 26, 2023, CMS issued QSO–23–07–REH (*https://www.cms.gov/files/document/qso-23-07-reh.pdf*) that provided the additional information requirements specified by section 1861(kkk)(4)(A)(i) through (iv) of the Act as well as guidance regarding the REH enrollment and conversion process for eligible facilities. We are proposing to codify those requirements at 42 CFR 488.70. We are also proposing to update the definition of a ''participating hospital'' to include REHs, and to add REHs to the other applicable provisions contained in 42 CFR parts 488 and 489: §§ 488.1, ''Definitions''; 488.2, ''Statutory basis''; 488.18, ''Documentation of findings''; and 489.102, ''Requirements for providers.''

b. Physician-Owned Hospitals

As discussed in section X.B. of the preamble of this proposed rule, we recently reviewed the expansion exception process for hospitals that wish to expand beyond the number of operating rooms, procedure rooms, and beds for which they were licensed at the time of enactment of the Affordable Care Act. To clarify our interpretation of the statutory authority, ensure that approval of a request to expand a hospital's facility capacity occurs only in appropriate circumstances, and facilitate compliance with the process for requesting an expansion exception, we are proposing to revise the regulations to clarify that CMS will only consider expansion exception requests from eligible hospitals, clarify the data and information that must be included in an expansion exception request, identify factors that CMS will consider when making a decision on an expansion exception request, and revise certain aspects of the process for requesting an expansion exception.

Also, we recently reconsidered whether CY 2021 OPPS/ASC regulatory revisions that removed program integrity restrictions regarding the frequency of expansion exception requests, maximum aggregate expansion of a hospital, and location of expansion facility capacity for high Medicaid facilities currently present a risk of the types of program or patient abuse that the physician self-referral law is intended to thwart. Following this review, we believe that not applying these program integrity restrictions poses a significant risk of program or patient abuse. Therefore, we are proposing to reinstate, with respect to high Medicaid facilities, the program integrity restrictions on the frequency of expansion exception requests, maximum aggregate expansion of a hospital, and location of expansion facility capacity that were removed in the CY 2021 OPPS/ASC final rule.

B. Overall Impact

We have examined the impacts of this proposed rule as required by Executive Order 12866 on Regulatory Planning and Review (September 30, 1993), Executive Order 13563 on Improving Regulation and Regulatory Review (January 18, 2011), the Regulatory Flexibility Act (RFA) (September 19, 1980, Pub. L. 96–354), section 1102(b) of the Act, section 202 of the Unfunded Mandates Reform Act of 1995 (March 22, 1995; Pub. L. 104–4), Executive Order 13132 on Federalism (August 4, 1999), and the Congressional Review Act (5 U.S.C. 804(2)).

Executive Orders 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). Section 3(f) of Executive Order 12866 defines a ''significant regulatory action'' as an action that is likely to result in a rule: (1) having an annual effect on the economy of $100 million or more in any 1 year, or adversely and

materially affecting a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or state, local or tribal governments or communities ; (2) creating a serious inconsistency or otherwise interfering with an action taken or planned by another agency; (3) materially altering the budgetary impacts of entitlement grants, user fees, or loan programs or the rights and obligations of recipients thereof; or (4) raising novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive order.

A regulatory impact analysis (RIA) must be prepared for rules with significant regulatory action/s and/or with significant effects as per section 3(f)(1)) greater than $100 million or more in any one year. Based on our estimates, OMB's Office of Information and Regulatory Affairs has determined this rulemaking exceeds the $100 million threshold under section 3(f)(1). Accordingly, we have prepared a Regulatory Impact Analysis that to the best of our ability presents the costs and benefits of the rulemaking. OMB has reviewed these proposed regulations, and the Departments have provided the following assessment of their impact.

We estimate that the proposed changes for FY 2023 acute care hospital operating and capital payments would redistribute amounts in excess of $100 million to acute care hospitals. The proposed applicable percentage increase to the IPPS rates required by the statute, in conjunction with other proposed payment changes in this proposed rule, would result in an estimated $2.7 billion increase in FY 2024 payments, primarily driven by: (a) a combined $3.2 billion increase in FY 2024 operating payments, including uncompensated care payments, low volume hospital payments, and FY 2024 capital payments and (b) a decrease of $ 0.466 million resulting from estimated changes in new technology add-on payments. These proposed changes are relative to payments made in FY 2023. The impact analysis of the capital payments can be found in section I.I. of this Appendix. In addition, as described in section I.J. of this Appendix, LTCHs are expected to experience a decrease in payments by approximately $24 million in FY 2024 relative to FY 2023.

Our operating payment impact estimate includes the proposed 2.8 percent hospital update to the standardized amount (which includes the proposed 3.0 percent market basket update reduced by the proposed 0.2 percentage point for the productivity adjustment). The estimates of IPPS operating payments to acute care hospitals do not reflect any changes in hospital admissions or real case-mix intensity, which will also affect overall payment changes.

The analysis in this Appendix, in conjunction with the remainder of this document, demonstrates that this proposed rule is consistent with the regulatory philosophy and principles identified in Executive Orders 12866 and 13563, the RFA, and section 1102(b) of the Act. This proposed rule would affect payments to a substantial number of small rural hospitals, as well as other classes of hospitals, and the effects on some hospitals may be significant. Finally, in accordance with the provisions of Executive Order 12866, the Office of Management and Budget has reviewed this proposed rule.

C. Objectives of the IPPS and the LTCH PPS

The primary objective of the IPPS and the LTCH PPS is to create incentives for hospitals to operate efficiently and minimize unnecessary costs, while at the same time ensuring that payments are sufficient to adequately compensate hospitals for their costs in delivering necessary care to Medicare beneficiaries. In addition, we share national goals of preserving the Medicare Hospital Insurance Trust Fund.

We believe that the proposed changes in this proposed rule would further each of these goals while maintaining the financial viability of the hospital industry and ensuring access to high quality health care for Medicare beneficiaries. We expect that these proposed changes would ensure that the outcomes of the prospective payment systems are reasonable and equitable, while avoiding or minimizing unintended adverse consequences.

Because this proposed rule contains a range of policies, we refer readers to the section of the proposed rule where each policy is discussed. These sections include the rationale for our decisions, including the need for the proposed policy.

D. Limitations of Our Analysis

The following quantitative analysis presents the projected effects of our proposed policy changes, as well as statutory changes effective for FY 2024, on various hospital groups. We estimate the effects of individual proposed policy changes by estimating payments per case, while holding all other payment policies constant. We use the best data available, but, generally unless specifically indicated, we do not attempt to make adjustments for future changes in such variables as admissions, lengths of stay, case mix, changes to the Medicare population, or incentives. In addition, we discuss limitations of our analysis for specific proposed policies in the discussion of those proposed policies as needed.

E. Hospitals Included in and Excluded From the IPPS

The prospective payment systems for hospital inpatient operating and capital related- costs of acute care hospitals encompass most general short-term, acute care hospitals that participate in the Medicare program. There were 25 Indian Health Service hospitals in our database, which we excluded from the analysis due to the special characteristics of the prospective payment methodology for these hospitals. Among other short term, acute care hospitals, hospitals in Maryland are paid in accordance with the Maryland Total Cost of Care Model, and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, 6 short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa) receive payment for inpatient hospital services they furnish on the basis of reasonable costs, subject to a rate-of-increase ceiling.

As of March 2023, there were 3,130 IPPS acute care hospitals included in our analysis. This represents approximately 53 percent of all Medicare-participating hospitals. The majority of this impact analysis focuses on this set of hospitals. There also are approximately 1,426 CAHs. These small, limited service hospitals are paid on the basis of reasonable costs, rather than under the IPPS. IPPS-excluded hospitals and units, which are paid under separate payment systems, include IPFs, IRFs, LTCHs, RNHCIs, children's hospitals, cancer hospitals, extended neoplastic disease care hospital, and short-term acute care hospitals located in the Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa. Changes in the prospective payment systems for IPFs and IRFs are made through separate rulemaking. Payment impacts of proposed changes to the prospective payment systems for these IPPS-excluded hospitals and units are not included in this proposed rule. The impact of the proposed update and policy changes to the LTCH PPS for FY 2024 is discussed in section I.J. of this Appendix.

F. Quantitative Effects of the Proposed Policy Changes Under the IPPS for Operating Costs

1. Basis and Methodology of Estimates

In this proposed rule, we are announcing proposed policy changes and payment rate updates for the IPPS for FY 2024 for operating costs of acute care hospitals. The proposed FY 2024 updates to the capital payments to acute care hospitals are discussed in section I.I. of this Appendix.

Based on the overall proposed percentage change in payments per case estimated using our payment simulation model, we estimate that total FY 2024 operating payments would increase by 2.8 percent, compared to FY 2023. The impacts do not reflect changes in the number of hospital admissions or real case-mix intensity, which would also affect overall payment changes.

We have prepared separate impact analyses of the proposed changes to each system. This section deals with the proposed changes to the operating inpatient prospective payment system for acute care hospitals. Our payment simulation model relies on the best available claims data to enable us to estimate the impacts on payments per case of certain proposed changes in this proposed rule. As discussed in section I.E. of the preamble to this proposed rule, we believe that the FY 2022 claims data is the best available data for purposes of the proposed FY 2024 ratesetting and this impact analysis reflects the use of that data. However, there are other proposed changes for which we do not have data available that would allow us to estimate the payment impacts using this model. For those proposed changes, we have attempted to predict the payment impacts based upon our experience and other more limited data.

The data used in developing the quantitative analyses of proposed changes in payments per case presented in this section are taken from the FY 2022 MedPAR file, as discussed previously in this proposed rule, and the most current Provider-Specific File (PSF) that is used for payment purposes. Although the analyses of the proposed changes to the operating PPS do not incorporate cost data, data from the best available hospital cost reports were used to categorize hospitals, as also discussed previously in this proposed rule. Our analysis has several qualifications. First, in this analysis, we do not adjust for future changes in such variables as admissions, lengths of stay, or underlying growth in real case-mix. Second, due to the interdependent nature of the IPPS payment components, it is very difficult to precisely quantify the impact associated with each proposed change. Third, we use various data sources to categorize hospitals in the tables. In some cases, particularly the number of beds, there is a fair degree of variation in the data from the different sources. We have attempted to construct these variables with the best available source overall. However, for individual hospitals, some miscategorizations are possible.

Using cases from the FY 2022 MedPAR file, we simulate payments under the operating IPPS given various combinations of payment parameters. As described previously, Indian Health Service hospitals and hospitals in Maryland were excluded from the simulations. The impact of proposed payments under the capital IPPS, and the impact of proposed payments for costs other than inpatient operating costs, are not analyzed in this section. Estimated payment impacts of the capital IPPS for FY 2024 are discussed in section I.I. of this Appendix.

We discuss the following proposed changes:

- The effects of the application of the proposed applicable percentage increase of 2.8 percent (that is, a proposed 3.0 percent market basket update with a proposed reduction of 0.2 percentage point for the productivity adjustment), and the proposed applicable percentage increase (including the proposed market basket update and the proposed productivity adjustment) to the hospital-specific rates.
- The effects of the proposed changes to the relative weights and MS–DRG GROUPER.
- The effects of the proposed changes in hospitals' wage index values reflecting updated wage data from hospitals' cost reporting periods beginning during FY 2020, compared to the FY 2019 wage data, to calculate the proposed FY 2024 wage index.
- The effects of the geographic reclassifications by the MGCRB (as of publication of this proposed rule) that will be effective for FY 2024.
- The effects of the proposed rural floor with the application of the national budget neutrality factor to the wage index and the proposed change to the rural wage index and rural floor methodology.
- The effects of the proposed imputed floor wage index adjustment. This provision is not budget neutral.
- The effects of the proposed frontier State wage index adjustment under the statutory provision that requires hospitals located in States that qualify as frontier States to not have a wage index less than 1.0. This provision is not budget neutral.
- The effects of the implementation of section 1886(d)(13) of the Act, which provides for an increase in a hospital's wage index if a threshold percentage of residents of the county where the hospital is located commute to work at hospitals in counties with higher wage indexes for FY 2024. This provision is not budget neutral.
- The total estimated change in payments based on the proposed FY 2024 policies relative to payments based on FY 2023 policies.

To illustrate the impact of the proposed FY 2024 changes, our analysis begins with a FY 2023 baseline simulation model using: the FY 2023 applicable percentage increase of 3.8 percent; the 0.5 percentage point adjustment required under section 414 of the MACRA applied to the IPPS standardized amount; the FY 2023 MS–DRG GROUPER (Version 40); the FY 2023 CBSA designations for hospitals based on the OMB definitions from the 2010 Census; the FY 2023 wage index; and no MGCRB reclassifications. Outlier payments are set at 5.1 percent of total operating MS–DRG and outlier payments for modeling purposes.

Section 1886(b)(3)(B)(viii) of the Act provides that, for FY 2007 and each subsequent year through FY 2014, the update factor will include a reduction of 2.0 percentage points for any subsection (d) hospital that does not submit data on measures in a form and manner, and at a time specified by the Secretary. Beginning in FY 2015, the reduction is one-quarter of such applicable percentage increase determined without regard to section 1886(b)(3)(B)(ix), (xi), or (xii) of the Act, or one-quarter of the market basket update. Therefore, we are proposing that, hospitals that do not submit quality information under rules established by the Secretary and that are meaningful EHR users under section 1886(b)(3)(B)(ix) of the Act would receive an applicable percentage increase of 2.05 percent. At the time this impact was prepared, 63 hospitals are estimated to not receive the full market basket rate-of-increase for FY 2024 because they failed the quality data submission process or did not choose to participate, but are meaningful EHR users. For purposes of the simulations shown later in this section, we modeled the proposed payment changes for FY 2024 using a reduced update for these hospitals.

For FY 2024, in accordance with section 1886(b)(3)(B)(ix) of the Act, a hospital that has been identified as not a meaningful EHR user will be subject to a reduction of three-quarters of such

applicable percentage increase determined without regard to section 1886(b)(3)(B)(ix), (xi), or (xii) of the Act. Therefore, we are proposing that hospitals that are identified as not meaningful EHR users and do submit quality information under section 1886(b)(3)(B)(viii) of the Act would receive an applicable percentage increase of 0.55 percent. At the time this impact analysis was prepared, 132 hospitals are estimated to not receive the full market basket rate-of-increase for FY 2024 because they are identified as not meaningful EHR users that do submit quality information under section 1886(b)(3)(B)(viii) of the Act. For purposes of the simulations shown in this section, we modeled the proposed payment changes for FY 2024 using a reduced update for these hospitals.

Hospitals that are identified as not meaningful EHR users under section 1886(b)(3)(B)(ix) of the Act and also do not submit quality data under section 1886(b)(3)(B)(viii) of the Act would receive a proposed applicable percentage increase of −0.2 percent, which reflects a one-quarter reduction of the market basket update for failure to submit quality data and a three-quarter reduction of the market basket update for being identified as not a meaningful EHR user. At the time this impact was prepared, 32 hospitals are estimated to not receive the full market basket rate-of-increase for FY 2023 because they are identified as not meaningful EHR users that do not submit quality data under section 1886(b)(3)(B)(viii) of the Act.

Each proposed policy change, statutory or otherwise, is then added incrementally to this baseline, finally arriving at an FY 2024 model incorporating all of the proposed changes. This simulation allows us to isolate the effects of each change.

Our comparison illustrates the proposed percent change in payments per case from FY 2023 to FY 2024. Two factors not discussed separately have significant impacts here. The first factor is the update to the standardized amount. In accordance with section 1886(b)(3)(B)(i) of the Act, we are proposing to update the standardized amounts for FY 2024 using a proposed applicable percentage increase of 2.8 percent. This includes the FY 2024 proposed IPPS operating hospital market basket increase of 3.0 percent with a proposed 0.2 percentage point reduction for the productivity adjustment. Hospitals that fail to comply with the quality data submission requirements and are meaningful EHR users would receive a proposed update of 2.05 percent.

This update includes a reduction of one-quarter of the market basket update for failure to submit these data. Hospitals that do comply with the quality data submission requirements but are not meaningful EHR users would receive a proposed update of 0.55 percent, which includes a reduction of three-quarters of the market basket update. Furthermore, hospitals that do not comply with the quality data submission requirements and also are not meaningful EHR users would receive a proposed update of −0.2 percent. Under section 1886(b)(3)(B)(iv) of the Act, the update to the hospital-specific amounts for SCHs and MDHs is also equal to the applicable percentage increase, or 2.8 percent, if the hospital submits quality data and is a meaningful EHR user.

A second significant factor that affects the proposed changes in hospitals' payments per case from FY 2023 to FY 2024 is the change in hospitals' geographic reclassification status from one year to the next. That is, payments may be reduced for hospitals reclassified in FY 2023 that are no longer reclassified in FY 2024. Conversely, payments may increase for hospitals not reclassified in FY 2023 that are reclassified in FY 2024.

2. Analysis of Table I

Table I displays the results of our analysis of the proposed changes for FY 2024. The table categorizes hospitals by various geographic and special payment consideration groups to illustrate the varying impacts on different types of hospitals. The top row of the table shows the overall impact on the 3,130 acute care hospitals included in the analysis.

The next two rows of Table I contain hospitals categorized according to their geographic location: urban and rural. There are 2,414 hospitals located in urban areas and 716 hospitals in rural areas included in our analysis. The next two groupings are by bed-size categories, shown separately for urban and rural hospitals. The last groupings by geographic location are by census divisions, also shown separately for urban and rural hospitals.

The second part of Table I shows hospital groups based on hospitals' FY 2024 payment classifications, including any reclassifications under section 1886(d)(10) of the Act. For example, the rows labeled urban and rural show that the numbers of hospitals paid based on these categorizations after consideration of geographic reclassifications (including reclassifications under sections 1886(d)(8)(B) and 1886(d)(8)(E) of the Act that have implications for capital payments) are 1,811, and 1,319, respectively.

The next three groupings examine the impacts of the proposed changes on hospitals grouped by whether or not they have GME residency programs (teaching hospitals that receive an IME adjustment) or receive Medicare DSH payments, or some combination of these two adjustments. There are 1,903 nonteaching hospitals in our analysis, 949 teaching hospitals with fewer than 100 residents, and 278 teaching hospitals with 100 or more residents.

In the DSH categories, hospitals are grouped according to their DSH payment status, and whether they are considered urban or rural for DSH purposes. The next category groups together hospitals considered urban or rural, in terms of whether they receive the IME adjustment, the DSH adjustment, both, or neither.

The next six rows examine the impacts of the proposed changes on rural hospitals by special payment groups (SCHs, MDHs, and RRCs) and reclassification status from urban to rural in accordance with section 1886(d)(8)(E) of the Act. Of the hospitals that are not reclassified from urban to rural, there are 127 RRCs, 256 SCHs, 115 MDHs, 120 hospitals that are both SCHs and RRCs, and 20 hospitals that are both MDHs and RRCs. Of the hospitals that are reclassified from urban to rural, there are 492 RRCs, 45 SCHs, 30 MDHs, 41 hospitals that are both SCHs and RRCs, and 12 hospitals that are both MDHs and RRCs.

The next series of groupings are based on the type of ownership and the hospital's Medicare and Medicaid utilization expressed as a percent of total inpatient days. These data were taken from the most recent available Medicare cost reports.

The next grouping concerns the geographic reclassification status of hospitals. The first subgrouping is based on whether a hospital is reclassified or not. The second and third subgroupings are based on whether urban and rural hospitals were reclassified by the MGCRB for FY 2024 or not, respectively. The fourth subgrouping displays hospitals that reclassified from urban to rural in accordance with section 1886(d)(8)(E) of the Act. The fifth subgrouping displays hospitals deemed urban in accordance with section 1886(d)(8)(B) of the Act.

BILLING CODE 4210–01–C

	Number of Hospitals[1]	Proposed Hospital Rate Update (1)[2]	Proposed FY 2024 Weights and DRG Changes with Application of Budget Neutrality (2)[3]	Proposed FY 2024 Wage Data with Application of Wage Budget Neutrality (3)[4]	FY 2024 MGCRB Reclassifications (4)[5]	Proposed Rural Floor with Application of National Rural Floor Budget Neutrality (5)[6]	Application of the Proposed Imputed Floor, Frontier State Wage Index and Outmigration Adjustment (6)[7]	All Proposed FY 2024 Changes (7)[8]
Urban Non-Reclassified Hospitals	1,490	2.8	0.0	0.0	-1.5	0.5	0.7	3.1
Rural Hospitals Reclassified Full Year	304	2.8	0.2	-0.3	2.7	-0.5	0.0	3.3
Rural Non-Reclassified Hospitals Full Year	397	2.6	0.1	-0.3	1.1	-0.4	0.3	3.5
All Section 401 Rural Reclassified Hospitals	660	2.8	0.0	0.0	0.8	-0.5	0.2	2.3
Other Reclassified Hospitals (Section 1886(d)(8)(B))	57	2.7	0.1	-0.4	4.1	-0.7	0.2	3.7

[1] Because data necessary to classify some hospitals by category were missing, the total number of hospitals in each category may not equal the national total. Discharge data are from FY 2022, and hospital cost report data are from the latest available reporting periods.

[2] This column displays the payment impact of the proposed hospital rate update, including the proposed 2.8 percent update to the national standardized amount and the hospital-specific rate (the proposed 3.0 percent market basket update reduced by 0.2 percentage point for the proposed productivity adjustment).

[3] This column displays the payment impact of the proposed changes to the Version 41 GROUPER, the proposed changes to the relative weights and the recalibration of the MS-DRG weights based on FY 2022 MedPAR data as the best available data, and the permanent 10-percent cap where the relative weight for a MS-DRG would decrease by more than ten percent in a given fiscal year. This column displays the application of the proposed recalibration budget neutrality factors of 1.001376 and 0.999925.

[4] This column displays the payment impact of the proposed update to wage index data using FY 2020 cost report data and the OMB labor market area delineations based on 2010 Decennial Census data. This column displays the payment impact of the application of the proposed wage budget neutrality factor. The proposed wage budget neutrality factor is 1.000943.

[5] Shown here are the effects of geographic reclassifications by the Medicare Geographic Classification Review Board (MGCRB). The effects demonstrate the FY 2024 payment impact of going from no reclassifications to the reclassifications scheduled to be in effect for FY 2024. Reclassification for prior years has no bearing on the payment impacts shown here. This column reflects the proposed geographic budget neutrality factor of 0.980959.

[6] This column displays the effects of the proposed rural floor and the proposed change to the rural wage index methodology. The Affordable Care Act requires the rural floor budget neutrality adjustment to be a 100 percent national level adjustment. The proposed rural floor budget neutrality factor applied to the wage index is 0.981145.

[7] This column shows the combined impact of (1) the imputed floor for all-urban states; (2) the policy that requires hospitals located in frontier States have a wage index no less than 1.0; and (3) the policy which provides for an increase in a hospital's wage index if a threshold percentage of residents of the county where the hospital is located commute to work at hospitals in counties with higher wage indexes. These are not budget neutral policies.

[8] This column shows the estimated change in payments from FY 2023 to FY 2024.

a. Effects of the Proposed Hospital Update (Column 1)

As discussed in section V.A. of the preamble of this proposed rule, this column includes the proposed hospital update, including the proposed 3.0 percent market basket update reduced by the proposed 0.2 percentage point for the productivity adjustment. As a result, we are proposing to make a 2.8 percent update to the national standardized amount. This column also includes the proposed update to the hospital-specific rates which includes the proposed 3.0 percent market basket update reduced by the proposed 0.2 percentage point for the productivity adjustment. As a result, we are proposing to make a 2.8 percent update to the hospital-specific rates.

Overall, hospitals would experience a 2.8 percent increase in payments primarily due to the combined effects of the proposed hospital update to the national standardized amount and the proposed hospital update to the hospital-specific rate.

b. Effects of the Proposed Changes to the MS–DRG Reclassifications and Relative Cost-Based Weights With Recalibration Budget Neutrality (Column 2)

Column 2 shows the effects of the proposed changes to the MS–DRGs and relative weights with the application of the proposed recalibration budget neutrality factor to the standardized amounts. Section 1886(d)(4)(C)(i) of the Act requires us annually to make appropriate classification changes in order to reflect changes in treatment patterns, technology, and any other factors that may change the relative use of hospital resources. Consistent with section 1886(d)(4)(C)(iii) of the Act, we calculated a proposed recalibration budget neutrality factor to account for the changes in MS–DRGs and relative weights to ensure that the overall payment impact is budget neutral. We also applied the permanent 10-percent cap on the reduction in a MS–DRG's relative weight in a given year and an associated recalibration cap budget neutrality factor to account for the 10-percent cap on relative weight reductions to ensure that the overall payment impact is budget neutral.

As discussed in section II.E. of the preamble of this proposed rule, for FY 2024, we calculated the proposed MS–DRG relative weights using the FY 2022 MedPAR data grouped to the proposed Version 41 (FY 2024) MS–DRGs. The proposed reclassification changes to the GROUPER are described in more detail in section II.G. of the preamble of this proposed rule.

The ''All Hospitals'' line in Column 2 indicates that proposed changes due to the MS–DRGs and relative weights would result in a 0.0 percent change in payments with the application of the proposed recalibration budget neutrality factor of 1.001376 and the proposed recalibration cap budget neutrality factor of 0.999925 to the standardized amount.

c. Effects of the Proposed Wage Index Changes (Column 3)

Column 3 shows the impact of the proposed updated wage data, with the application of the proposed wage budget neutrality factor. The wage index is calculated and assigned to hospitals on the basis of the labor market area in which the hospital is located. Under section 1886(d)(3)(E) of the Act, beginning with FY 2005, we delineate hospital labor market areas based on the Core Based Statistical Areas (CBSAs) established by OMB. The current statistical standards (based on OMB standards) used in FY 2024 are discussed in section III.A.2. of the preamble of this proposed rule.

Section 1886(d)(3)(E) of the Act requires that, beginning October 1, 1993, we annually update the wage data used to calculate the wage index. In accordance with this requirement, the proposed wage index for acute care hospitals for FY 2024 is based on data submitted for hospital cost reporting periods, beginning on or after October 1, 2019 and before October 1, 2020. The estimated impact of the updated wage data and the OMB labor market area delineations on hospital payments is isolated in Column 3 by holding the other proposed payment parameters constant in this simulation. That is, Column 3 shows the proposed percentage change in payments when going from a model using the FY 2023 wage index, the labor-related share of 67.6 percent, under the OMB delineations and having a 100-percent occupational mix adjustment applied, to a model using the proposed FY 2024 pre-reclassification wage index with the proposed labor-related share of 67.6 percent, under the OMB delineations, also having a 100-percent occupational mix adjustment applied, while holding other payment parameters, such as use of the proposed Version 41 MS–DRG GROUPER constant. The FY 2024 occupational mix adjustment is based on the CY 2019 occupational mix survey.

In addition, the column shows the impact of the application of the proposed wage budget neutrality to the national standardized amount. In FY 2010, we began calculating separate wage budget neutrality and recalibration budget neutrality factors, in accordance with section 1886(d)(3)(E) of the Act, which specifies that budget neutrality to account for wage index changes or updates made under that subparagraph must be made without regard to the 62 percent labor-related share guaranteed under section 1886(d)(3)(E)(ii) of the Act. Therefore, for FY 2023, we are proposing to calculate the proposed wage budget neutrality factor to ensure that payments under updated wage data and the proposed labor-related share of 67.6 percent are budget neutral, without regard to the lower labor-related share of 62 percent applied to hospitals with a wage index less than or equal to 1.0. In other words, the wage budget neutrality is calculated under the assumption that all hospitals receive the higher labor-related share of the standardized amount. The proposed FY 2023 wage budget neutrality factor is 1.000943 and the overall proposed payment change is 0 percent.

Column 3 shows the impacts of updating the wage data. Overall, the new wage data and the proposed labor-related share, combined with the proposed wage budget neutrality adjustment, would lead to no change for all hospitals, as shown in Column 3.

In looking at the wage data itself, the national average hourly wage would increase 5.3 percent compared to FY 2023. Therefore, the only manner in which to maintain or exceed the previous year's wage index was to match or exceed the proposed 5.3 percent increase in the national average hourly wage. Of the 3,071 hospitals with wage data for both FYs 2023 and 2024, 1,337 or 43.5 percent would experience an average hourly wage increase of 5.3 percent or more.

The following chart compares the shifts in wage index values for hospitals due to proposed changes in the average hourly wage data for FY 2024 relative to FY 2023. These figures reflect proposed changes in the ''pre-reclassified, occupational mix-adjusted wage index,'' that is, the wage index before the application of geographic reclassification, the rural floor, the out-migration adjustment, and other wage index exceptions and adjustments. We note that the ''post-reclassified wage index'' or ''payment wage index,'' which is the wage index that includes all such exceptions and adjustments (as reflected in Tables 2 and 3 associated with this proposed rule) is used to adjust the labor-related share of a hospital's standardized amount, either 67.6 percent (as proposed) or 62 percent, depending upon whether a hospital's wage index is greater than 1.0

or less than or equal to 1.0. Therefore, the proposed pre-reclassified wage index figures in the following chart may illustrate a somewhat larger or smaller proposed change than would occur in a hospital's payment wage index and total payment.

The following chart shows the projected impact of proposed changes in the area wage index values for urban and rural hospitals.

Proposed FY 2023 Percentage Change in Area Wage Index Values	Number of Hospitals	
	Urban	Rural
Increase 10 percent or more	7	1
Increase greater than or equal to 5 percent and less than 10 percent	74	0
Increase or decrease less than 5 percent	2,212	685
Decrease greater than or equal to 5 percent and less than 10 percent	79	9
Decrease 10 percent or more	4	0
Unchanged	0	0

d. Effects of MGCRB Reclassifications (Column 4)

Our impact analysis to this point has assumed acute care hospitals are paid on the basis of their actual geographic location (with the exception of ongoing policies that provide that certain hospitals receive payments on bases other than where they are geographically located). The proposed changes in Column 4 reflect the per case payment impact of moving from this baseline to a simulation incorporating the MGCRB decisions for FY 2024.

By spring of each year, the MGCRB makes reclassification determinations that will be effective for the next fiscal year, which begins on October 1. The MGCRB may approve a hospital's reclassification request for the purpose of using another area's wage index value. Hospitals may appeal denials by the MGCRB of reclassification requests to the CMS Administrator. Further, hospitals have 45 days from the date the IPPS proposed rule is issued in the **Federal Register** to decide whether to withdraw or terminate an approved geographic reclassification for the following year.

As discussed in section III.G.1. of this proposed rule, this column also reflects the proposed change to include hospitals with § 412.103 reclassification along with geographically rural hospitals in all rural wage index calculations, and to only exclude ''dual reclass'' hospitals (hospitals with simultaneous § 412.103 and MGCRB reclassifications) when implicated by the hold harmless provision at section 1886(d)(8)(C)(ii) of the Act. Consistent with this proposal, beginning with FY 2024 we are also proposing to include the data of all § 412.103 hospitals (including those that have an MGCRB reclassification) in the calculation of ''the wage index for rural areas in the State in which the county is located'' as referred to in section 1886(d)(8)(C)(iii) of the Act.

The overall effect of geographic reclassification is required by section 1886(d)(8)(D) of the Act to be budget neutral. Therefore, for purposes of this impact analysis, we are proposing to apply an adjustment of 0.980959 to ensure that the effects of the reclassifications under sections 1886(d)(8)(B) and (C) and 1886(d)(10) of the Act are budget neutral (section II.A. of the Addendum to this proposed rule).

Geographic reclassification generally benefits hospitals in rural areas. We estimate that the geographic reclassification would increase payments to rural hospitals by an average of 2.2 percent. By region, rural hospital categories would experience increases in payments due to MGCRB reclassifications.

Table 2 listed in section VI. of the Addendum to this proposed rule and available via the internet on the CMS website reflects the reclassifications for FY 2024.

e. Effects of the Proposed Rural Floor, Including Application of National Budget Neutrality (Column 5)

As discussed in section III.G.1. of the preamble of this FY 2024 IPPS/LTCH PPS proposed rule, section 4410 of Public Law 105–33 established the rural floor by requiring that the wage index for a hospital in any urban area cannot be less than the wage index applicable to hospitals located in rural areas in the same state. We apply a uniform budget neutrality adjustment to the wage index. Column 5 shows the effects of the proposed rural floor.

As discussed in section III.G.1 of this proposed rule, this column also reflects the proposed change to include hospitals with § 412.103 reclassification along with geographically rural hospitals in all rural wage index calculations, and to only exclude ''dual reclass'' hospitals (hospitals with simultaneous § 412.103 and MGCRB reclassifications) when implicated by the hold harmless provision at section 1886(d)(8)(C)(ii) of the Act. Consistent with this proposal, beginning with FY 2024 we are also proposing to include the data of all § 412.103 hospitals (including those that have an MGCRB reclassification) in the calculation of the rural floor. The Affordable Care Act requires that we apply one rural floor budget neutrality factor to the wage index nationally. We have calculated a proposed FY 2024 rural floor budget neutrality factor to be applied to the wage index of 0.981145, which would reduce wage indexes by −1.9 percent compared to the rural floor provision not being in effect.

Column 5 shows the projected impact of the proposed rural floor with the national rural floor budget neutrality factor applied to the wage index based on the OMB labor market area delineations and the projected impact of the proposed change to the rural floor and rural wage index methodology. The column compares the proposed post-reclassification FY 2024 wage index of providers before the rural floor adjustment and the proposed post-reclassification FY 2024 wage index of providers with the rural floor adjustment based on the OMB labor market area delineations and with the proposed change to the rural floor and the rural wage index methodology applied.

We estimate that 596 hospitals would receive the rural floor in FY 2024. All IPPS hospitals in our model would have their wage indexes reduced by the proposed rural floor budget neutrality adjustment of 0.981145. We project that, in aggregate, rural hospitals would experience a 0.5 percent decrease in payments as a result of the application

of the proposed rural floor budget neutrality because the rural hospitals do not benefit from the rural floor, but have their wage indexes downwardly adjusted to ensure that the application of the rural floor is budget neutral overall. We project that, in the aggregate, hospitals located in urban areas would experience no change in payments because increases in payments to hospitals benefitting from the rural floor offset decreases in payments to nonrural floor urban hospitals whose wage index is downwardly adjusted by the rural floor budget neutrality factor. Urban hospitals in the Pacific region would experience a 3.2 percent increase in payments primarily due to the application of the rural floor in California.

f. Effects of the Application of the Proposed Imputed Floor, Proposed Frontier State Wage Index and Proposed Out-Migration Adjustment (Column 6)

This column shows the combined effects of the application of the following: (1) the imputed floor under section 1886(d)(3)(E)(iv)(I) and (II) of the Act, which provides that for discharges occurring on or after October 1, 2021, the area wage index applicable to any hospital in an all-urban State may not be less than the minimum area wage index for the fiscal year for hospitals in that State established using the methodology described in § 412.64(h)(4)(vi) as in effect for FY 2018; (2) section 10324(a) of the Affordable Care Act, which requires that we establish a minimum post-reclassified wage index of 1.00 for all hospitals located in ''frontier States;'' and (3) the effects of section 1886(d)(13) of the Act, which provides for an increase in the wage index for hospitals located in certain counties that have a relatively high percentage of hospital employees who reside in the county, but work in a different area with a higher wage index.

These three wage index provisions are not budget neutral and would increase payments overall by 0.4 percent compared to the provisions not being in effect.

Section 1886(d)(3)(E)(iv)(III) of the Act provides that the imputed floor wage index for all-urban States shall not be applied in a budget neutral manner. Therefore, the imputed floor adjustment is estimated to increase IPPS operating payments by approximately $249 million. There are an estimated 81 providers in Connecticut, Delaware, Washington DC, New Jersey, and Rhode Island that will receive the imputed floor wage index.

The term ''frontier States'' is defined in the statute as States in which at least 50 percent of counties have a population density less than 6 persons per square mile. Based on these criteria, 5 States (Montana, Nevada, North Dakota, South Dakota, and Wyoming) are considered frontier States and an estimated 43 hospitals located in Montana, North Dakota, South Dakota, and Wyoming would receive a frontier wage index of 1.0000. We note, the rural floor for Nevada exceeds the frontier state wage index of 1.000 and therefore no hospitals in Nevada receive the frontier state wage index. Overall, this provision is not budget neutral and is estimated to increase IPPS operating payments by approximately $58 million.

In addition, section 1886(d)(13) of the Act provides for an increase in the wage index for hospitals located in certain counties that have a relatively high percentage of hospital employees who reside in the county, but work in a different area with a higher wage index. Hospitals located in counties that qualify for the payment adjustment would receive an increase in the wage index that is equal to a weighted average of the difference between the wage index of the resident county, post-reclassification and the higher wage index work area(s), weighted by the overall percentage of workers who are employed in an area with a higher wage index. There are an estimated 159 providers that would receive the out-migration wage adjustment in FY 2024. This out-migration wage adjustment is not budget neutral, and we estimate the impact of these providers receiving the out-migration increase would be approximately $46 million.

g. Effects of All FY 2024 Proposed Changes (Column 7)

Column 7 shows our estimate of the proposed changes in payments per discharge from FY 2023 and FY 2024, resulting from all changes reflected in this proposed rule for FY 2024. It includes combined effects of the year-to-year change of the previous columns in the table.

The proposed average increase in payments under the IPPS for all hospitals is approximately 2.8 percent for FY 2024 relative to FY 2023 and for this row is primarily driven by the proposed changes reflected in Column 1. Column 7 includes the proposed annual hospital update of 2.8 percent to the national standardized amount. This proposed annual hospital update includes the proposed 3.0 percent market basket update reduced by the proposed 0.2 percentage point productivity adjustment. Hospitals paid under the hospital-specific rate would receive a 2.8 percent hospital update. As described in Column 1, the proposed annual hospital update for hospitals paid under the national standardized amount, combined with the proposed annual hospital update for hospitals paid under the hospital-specific rates, combined with the other adjustments described previously and shown in Table I, would result in a 2.8 percent increase in payments in FY 2024 relative to FY 2023.

This column also reflects the estimated effect of outlier payments returning to their targeted levels in FY 2024 as compared to the estimated outlier payments for FY 2023 produced from our payment simulation model. As discussed in section II.A.4.j. of the Addendum to this proposed rule, the statute requires that outlier payments for any year are projected to be not less than 5 percent nor more than 6 percent of total operating DRG payments plus outlier payments, and also requires that the average standardized amount be reduced by a factor to account for the estimated proportion of total DRG payments made to outlier cases. We are proposing to continue to use a 5.1 percent target (or an outlier offset factor of 0.949) in calculating the outlier offset to the standardized amount, just as we did for FY 2023. Therefore, our estimate of payments per discharge for FY 2024 from our payment simulation model reflects this 5.1 percent outlier payment target. Our payment simulation model shows that estimated outlier payments for FY 2023 exceed that target by approximately 0.2 percent. Therefore, our estimate of the proposed changes in payments per discharge from FY 2023 and FY 2024 in Column 7 reflects the estimated −0.2 percent change in outlier payments produced by our payment simulation model when returning to the 5.1 percent outlier target for FY 2024. There are also interactive effects among the various factors comprising the payment system that we are not able to isolate, which may contribute to our estimate of the proposed changes in payments per discharge from FY 2023 and FY 2024 in Column 7.

Overall payments to hospitals paid under the IPPS due to the proposed applicable percentage increase and proposed changes to policies related to MS–DRGs, geographic adjustments, and outliers are estimated to increase by 2.8 percent for FY 2024. Hospitals in urban areas would experience a 2.8 percent increase in payments per discharge in FY 2024 compared to FY 2023. Hospital payments per discharge in rural areas are estimated to increase by 3.3 percent in FY 2024.

3. Impact Analysis of Table II

Table II presents the projected impact of the changes for FY 2024 for urban and rural hospitals and for the different categories of hospitals shown in Table I. It compares the estimated average payments per discharge for FY 2023 with the estimated average payments per discharge for FY 2024, as calculated under our models. Therefore, this table presents, in terms of the average dollar amounts paid per discharge, the combined effects of the changes presented in Table I. The estimated percentage changes shown in the last column of Table II equal the estimated percentage changes in average payments per discharge from Column 7 of Table I.

BILLING CODE 4120–01–P

TABLE II.--IMPACT ANALYSIS OF PROPOSED CHANGES FOR FY 2024 ACUTE CARE HOSPITAL OPERATING PROSPECTIVE PAYMENT SYSTEM (PAYMENTS PER DISCHARGE)

	Number of Hospitals (1)	Estimated Average FY 2023 Payment Per Discharge (2)	Estimated Proposed Average FY 2024 Payment Per Discharge (3)	Proposed FY 2024 Changes (4)
All Hospitals	3,130	15,696	16,143	2.8
By Geographic Location:				
Urban hospitals	2,414	16,082	16,535	2.8

BILLING CODE 4120–01–C

4. Impact Analysis of Table III: Provider Deciles by Beneficiary Characteristics

Advancing health equity is the first pillar of CMS's 2022 Strategic Framework.[757] To gain insight into how the IPPS policies could affect health equity, we have added Table III, Provider Deciles by Beneficiary Characteristics, for informational purposes. Table III details providers in terms of the beneficiaries they serve, and shows differences in estimated average payments per case and changes in estimated average payments per case relative to other providers.

As noted in section I.C. of this Appendix, this proposed rule contains a range of policies and there is a section of the proposed rule where each policy is discussed. Each section includes the rationale for our decisions, including the need for the proposed policy. The information contained in Table III is provided solely to demonstrate the quantitative effects of our proposed policies across a number of health equity dimensions and does not form the basis or rationale for the proposed policies.

Patient populations that have been disadvantaged or underserved by the healthcare system may include patients with the following characteristics, among others: members of racial and ethnic minorities; members of federally recognized Tribes, people with disabilities; members of the lesbian, gay, bisexual, transgender, and queer (LGBTQ+) community; individuals with limited English proficiency, members of rural communities, and persons otherwise adversely affected by persistent poverty or inequality. The CMS Framework for Health Equity was developed with particular attention to disparities in chronic and infectious diseases; as an example of a chronic disease associated with significant disparities, we therefore also detail providers in terms of the percentage of their claims for beneficiaries receiving ESRD Medicare coverage.

Because we do not have data for all characteristics that may identify disadvantaged or underserved patient

[757] Available at: *https://www.cms.gov/files/document/2022-cms-strategic-framework.pdf.*

populations, we use several proxies to capture these characteristics, based on claims data from the FY 2022 MedPAR file and Medicare enrollment data from Medicare's Enrollment Database (EDB), including: race/ethnicity, dual eligibility for Medicaid and Medicare, Medicare low income subsidy (LIS) enrollment, a joint indicator for dual or LIS enrollment, presence of an ICD–10–CM Z code indicating a ''social determinant of health'' (SDOH), presence of a behavioral health diagnosis code, receiving ESRD Medicare coverage, qualifying for Medicare due to disability, living in a rural area, and living in an area with an area deprivation index (ADI) greater than or equal to 85. We refer to each of these proxies as characteristics in Table III and the discussion that follows.

For each of these characteristics, the hospitals were classified into groups as follows. First, all discharges at IPPS hospitals (excluding Maryland and IHS hospitals) in the FY 2022 MedPAR file were flagged for the presence of the characteristic, with the exception of race/ethnicity, for which probabilities were assigned instead of binary flags, as described further in this section. Second, the percentage of discharges at each hospital for the characteristic was calculated. Finally, the hospitals were divided into four groups based on the percentage of discharges for each characteristic: decile group 1 contains the 10% of hospitals with the lowest rate of discharges for that characteristic; decile group 2 to 5 contains the hospitals with less than or equal to the median rate of discharges for that characteristic, excluding those in decile group 1; decile group 6 to 9 contains the hospitals with greater than the median rate of discharges for that characteristic, excluding those in decile group 10; and decile group 10 contains the 10% of hospitals with the highest rate of discharges for that characteristic. We note that a supplementary provider-level dataset containing the percentage of discharges at each hospital for each of the characteristics in Table III is available on our website. Column 1 of Table III specifies the beneficiary characteristic; Column 2 specifies the decile group; Column 3 specifies the percentiles covered by the decile group; and Column 4 specifies the percentage range of discharges for each decile group specified in the first column. Columns 5 and 6 present the average estimated payments per discharge for FY 2023 and average estimated payments per discharge for FY 2024, respectively. Column 7 shows the percentage difference between these averages.

a. Race

The first health equity-relevant grouping presented in Table III is race/ethnicity. To assign the race/ethnicity variables used in Table III, we utilized the Medicare Bayesian Improved Surname Geocoding (MBISG) data in conjunction with the MedPAR data. The method used to develop the MBISG data involves estimating a set of six racial and ethnic probabilities (White, Black, Hispanic, American Indian or Alaskan Native, Asian or Pacific Islander, and multiracial) from the surname and address of beneficiaries by using previous self-reported data from a national survey of Medicare beneficiaries, post-stratified to CMS enrollment files. The MBISG method is used by the CMS Office of Minority Health in its reports analyzing Medicare Advantage plan performance on Healthcare Effectiveness Data and Information Set (HEDIS) measures, and is being considered by CMS for use in other CMS programs. To estimate the percentage of discharges for each specified racial/ethnic category for each hospital, the sum of the probabilities for that category for that hospital was divided by the hospital's total number of discharges.

b. Income

The two main proxies for income available in the Medicare claims and enrollment data are dual eligibility for Medicare and Medicaid and Medicare LIS status. Dual-enrollment status is a powerful predictor of poor outcomes on some quality and resource use measures even after accounting for additional social and functional risk factors.[758] Medicare LIS enrollment refers to a beneficiary's enrollment in the low-income subsidy program for the Part D prescription drug benefit. This program covers all or part of the Part D premium for qualifying Medicare beneficiaries and gives them access to reduced copays for Part D drugs. (We note that beginning on January 1, 2024, eligibility for the full low-income subsidy will be expanded to include individuals currently eligible for the partial low-income subsidy.) Because Medicaid eligibility rules and benefits vary by state/territory, Medicare LIS enrollment identifies beneficiaries who are likely to have low income but may not be eligible for Medicaid. Not all beneficiaries who qualify for the duals or LIS programs actually enroll. Due to differences in the dual eligibility and LIS qualification criteria and less than complete participation in these programs, sometimes beneficiaries were flagged as dual but not LIS or vice versa. Hence this analysis also used a ''dual or LIS'' flag as a third proxy for low income. The dual and LIS flags were constructed based on enrollment/eligibility status in the EDB during the month of the hospital discharge.

c. Social Determinants of Health (SDOH)

Social determinants of health (SDOH) are the conditions in the environments where people are born, live, learn, work, play, worship, and age that affect a wide range of health, functioning, and quality-of-life outcomes and risks.[759] These circumstances or determinants influence an individual's health status and can contribute to wide health disparities and inequities. ICD–10–CM contains Z-codes that describe a range of issues related—but not limited—to education and literacy, employment, housing, ability to obtain adequate amounts of food or safe drinking water, and occupational exposure to toxic agents, dust, or radiation. The presence of ICD–10–CM Z-codes in the range Z55–Z65 identifies beneficiaries with these SDOH characteristics. The SDOH flag used for this analysis was turned on if one of these Z-codes was recorded on the claim for the hospital stay itself (that is, the beneficiary's prior claims were not examined for additional Z-codes). Since these codes are not required for Medicare FFS patients and do not currently impact payment under the IPPS, we believe they may be underreported in current claims data and not reflect the actual rates of SDOH. In 2019, 0.11% of all Medicare FFS claims were Z code claims and 1.59% of continuously enrolled Medicare FFS beneficiaries had claims with Z codes.[760] However, we expect the reporting of Z codes on claims may increase over time, because of newer quality measures in the Hospital Inpatient Quality Reporting (IQR) Program that capture screening and identification of patient-level, health-related social needs (MUC21–134 and MUC21–136) (*see* 87 FR 49201 through 49220). We also refer the reader to section II.C.12.c. of the preamble of this

proposed rule, where we discuss our proposal to change the severity level designation for ICD–10–CM diagnosis codes Z59.00 (Homelessness, unspecified), Z59.01 (Sheltered homelessness) and Z59.02 (Unsheltered homelessness) from a non-CC to a CC for FY 2024.

d. Behavioral Health

Beneficiaries with behavioral health diagnoses often face co-occurring physical illnesses, but often experience difficulty accessing care.[761] The combination of physical and behavioral health conditions can exacerbate both conditions and result in poorer outcomes than one condition alone.[762] Additionally, the intersection of behavioral health and health inequities is a core aspect of CMS' Behavioral Health Strategy.[763] We used the presence of one or more ICD–10–CM codes in the range of F01–F99 to identify beneficiaries with a behavioral health diagnosis.

e. Disability

Beneficiaries are categorized as disabled because of medically determinable physical or mental impairment(s) that has lasted or is expected to last for a continuous period of at least 12 months or is expected to result in death.[764] Disabled beneficiaries often have complex healthcare needs and difficulty accessing care. Compared to people without disabilities, people with disabilities generally have less access to health care, have more depression and anxiety, engage more often in risky health behaviors such as smoking, and are less physically active.[765] Beneficiaries were classified as disabled for the purposes of this analysis if their original reason for qualifying for Medicare was disability; this information was obtained from Medicare's EDB. We note that this is likely an underestimation of disability, because it does not account for beneficiaries who became disabled after becoming entitled to Medicare. This metric also does not capture all individuals who would be considered to have a disability under 29 U.S.C. 705(9)(B).

f. ESRD

Beneficiaries with ESRD have high healthcare needs and high medical spending, and often experience comorbid conditions and poor mental health. Beneficiaries with ESRD also experience significant disparities, such as a limited life expectancy.[766] Beneficiaries were classified as ESRD for the purposes of this analysis if they were receiving Medicare ESRD coverage during the month of the discharge; this information was obtained from Medicare's EDB.

g. Geography

Beneficiaries in some geographic areas—particularly rural areas or areas with concentrated poverty—often have difficulty accessing care.[767] [768] For this impact analysis, beneficiaries were classified on two dimensions: from a rural area and from an area with an area deprivation index (ADI) greater than or equal to 85.

Rural status is defined for purposes of this analysis using the primary Rural-Urban Commuting Area (RUCA) codes 4–10 (including micropolitan, small town, and rural areas) corresponding to each beneficiary's zip code. RUCA codes are defined at the census tract level based on measures of population density, urbanization, and daily commuting. The ADI is obtained from a publicly available dataset designed to capture socioeconomic disadvantage at the neighborhood level.[769] It utilizes data on income, education, employment, housing quality, and 13 other factors from the American Community Survey and combines them into a single raw score, which is then used to rank neighborhoods (defined at various levels), with higher scores reflecting greater deprivation. The version of the ADI used for this analysis is at the Census Block Group level and the ADI corresponds to the Census Block Group's percentile nationally. Living in an area with an ADI score of 85 or above, a validated measure of neighborhood disadvantage, is shown to be a predictor of 30-day readmission rates, lower rates of cancer survival, poor end of life care for patients with heart failure, and longer lengths of stay and fewer home discharges post-knee surgery even after accounting for individual social and economic risk factors.[770] [771] [772] [773] [774] The MedPAR discharge data was linked to the RUCA using beneficiaries' five-digit zip code and to the ADI data using beneficiaries' 9-digit zip codes, both of which were derived from Common Medicare Enrollment (CME) files. Beneficiaries with no recorded zip code were treated as being from an urban area and as having an ADI less than 85.

BILLING CODE 4120–01–C

G. Effects of Other Policy Changes

In addition to those proposed policy changes discussed previously that we are able to model using our IPPS payment simulation model, we are proposing to make various other changes in this proposed rule. As noted in section I.D. of this Appendix A, our payment simulation model uses the most recent available claims data to estimate the impacts on payments per case of certain proposed changes in this proposed rule. Generally, we have limited or no specific data available with which to estimate the impacts of these proposed changes using that payment simulation model. For those proposed changes, we have attempted to predict the payment impacts based upon our experience and other more limited data. Our estimates of the likely impacts associated with these other proposed changes are discussed in this section.

1. Effects of Policy Changes Relating to New Medical Service and Technology Add-On Payments

a. Proposed FY 2024 Status of Technologies Approved for FY 2023 New Technology Add-On Payments

In section II.E.5. of the preamble of this proposed rule, we are proposing to continue to make new technology add-on payments for the 11 technologies listed in the following table in FY 2024 because these technologies would still be considered new for purposes of new technology add-on payments. Under § 412.88(a)(2), the new technology add-on payment for each case would be limited to the lesser of: (1) 65 percent of the costs of the new technology (or 75 percent of the costs for technologies designated as Qualified Infectious Disease Products (QIDPs) or approved under the Limited Population Pathway for Antibacterial and Antifungal Drugs (LPAD) pathway); or (2) 65 percent of the amount by which the costs of the case exceed the standard MS–DRG payment for the case (or 75 percent of the amount for technologies designated as QIDPs or approved under the LPAD pathway). Because it is difficult to predict the actual new technology add-on payment for each case, our estimates in this proposed rule are based on the applicant's estimate at the time they submitted their original application and the increase in new technology add-on payments for FY 2024 as if every claim that would qualify for a new technology add-on payment would receive the maximum add-on payment. In the following table are estimates for the 11 technologies for which we are proposing to continue to make new technology add-on payments in FY 2024:

FY 2024 ESTIMATES FOR NEW TECHNOLOGY ADD-ON PAYMENTS PROPOSED TO CONTINUE FOR FY 2024

Technology Name	Estimated Cases	Proposed FY 2024 NTAP Amount (65 % or 75 %)	Estimated Total FY 2024 Impact
Intercept® (PRCFC)	2,296	$2,535.00	$5,820,360.00
Rybrevant™	349	$6,405.89	$2,235,655.61
StrataGraft®	261	$44,200.00	$11,536,200.00
Hemolung Respiratory Assist System (RAS) *(excluding use related to COVID-19)*	161	$6,500.00	$1,046,500.00
aprevo® Intervertebral Body Fusion Device *(TLIF indication)*	1,261	$40,950.00	$51,637,950.00
Livtencity™	129.5	$32,500.00	$4,208,750.00
Thoraflex Hybrid Device	800	$22,750.00	$18,200,000.00
ViviStim	135	$23,400.00	$3,159,000.00
GORE TAG Thoracic Branch Endoprosthesis	386	$27,807.00	$10,733.502.00
Cerament® G	1,610	$4,918.55	$7,918,865.50
iFuse Bedrock Granite Implant System	1,480	$9,828.00	$14,545,440.00
Aggregate Estimated Total FY 2024 Impact			**$131,042,223.11**

b. Proposed FY 2024 Applications for New Technology Add-On Payments

In sections II.E.6. and 7. of the preamble to this proposed rule, we discuss 39 technologies for which we received applications for add-on payments for new medical services and technologies for FY 2024. We note that of the 54 applications (27 alternative and 27 traditional) we received, 15 applicants withdrew their application (7 alternative and 8 traditional) prior to the issuance of this proposed rule. As explained in the preamble to this proposed rule, add-on payments for new medical services and technologies under section 1886(d)(5)(K) of the Act are not required to be budget neutral. As discussed in section II.E.7. of the preamble of this proposed rule, under the alternative pathway for new technology add-on payments, new technologies that are medical products with a QIDP designation, approved through the FDA LPAD pathway, or are designated under the Breakthrough Device program will be considered not substantially similar to an existing technology for purposes of the new technology add-on payment under the IPPS, and will not need to demonstrate that the technology represents a substantial clinical improvement. These technologies must still be within the 2 to 3-year newness period, as discussed in section II.E.1.a.(1). of the preamble this proposed rule, and must also still meet the cost criterion.

As also discussed in section II.E.7. of the preamble of this proposed rule, we are proposing to approve 19 alternative pathway applications submitted for FY 2024 new technology add-on payments. We note, the one technology we are not proposing to approve has not provided an adequate cost analysis and we are therefore unable to determine eligibility for new technology add-on payments.

Based on preliminary information from the applicants at the time of this proposed rule, we estimate that total payments for the 20 technologies that applied under the alternative pathway, if approved, would be in excess of approximately $263 million for FY 2024. Total estimated FY 2024 payments for new technologies that are designated as a QIDP are approximately $213 million, and the total estimated FY 2024 payments for new technologies that are part of the Breakthrough Device program are approximately $50.5 million. Because cost or volume information has not yet been provided for 7 of the 20 technologies under the alternative pathway, including 1 of the

QIDP applicants, we have not included those technologies in the estimate. We did not receive any LPAD applications for add-on payments for new technologies for FY 2024. We note that the estimated payments may be updated in the final rule based on revised or additional information CMS receives prior to the final rule.

We have not yet determined whether any of the 19 technologies that applied under the traditional pathway discussed in section II.E.6. of the preamble of this proposed rule will meet the criteria for new technology add-on payments for FY 2024. Consequently, it is premature to estimate the potential payment impact of these 19 technologies for any potential new technology add-on payments for FY 2024. We note that, as in past years, if any of the technologies that applied under the traditional pathway are found to be eligible for new technology add-on payments for FY 2024, we would discuss the estimated payment impact for FY 2024 in the FY 2024 IPPS/LTCH PPS final rule.

2. Effects of the Proposed Changes to Medicare DSH Uncompensated Care Payments and Supplemental Payments for Indian Health Service Hospitals and Tribal Hospitals and Hospitals Located in Puerto Rico for FY 2024

As discussed in section IV.E. of the preamble of this proposed rule, under section 3133 of the Affordable Care Act, hospitals that are eligible to receive Medicare DSH payments will receive 25 percent of the amount they previously would have received under the statutory formula for Medicare DSH payments under section 1886(d)(5)(F) of the Act. The remainder, equal to an estimate of 75 percent of what formerly would have been paid as Medicare DSH payments (Factor 1), reduced to reflect changes in the percentage of uninsured individuals and any additional statutory adjustment (Factor 2), is available to make additional payments to each hospital that qualifies for Medicare DSH payments and that has uncompensated care. Each hospital eligible for Medicare DSH payments will receive an additional payment based on its estimated share of the total amount of uncompensated care for all hospitals eligible for Medicare DSH payments. The uncompensated care payment methodology has redistributive effects based on the proportion of a hospital's amount of uncompensated care relative to the aggregate amount of uncompensated care of all hospitals eligible for Medicare DSH payments (Factor 3). The change to Medicare DSH payments under section 3133 of the Affordable Care Act is not budget neutral.

In this proposed rule, we are proposing to establish the amount to be distributed as uncompensated care payments (UCP) to DSH eligible hospitals, which is $6,712,960,093.94. This figure represents 75 percent of the amount that otherwise would have been paid for Medicare DSH payment adjustments adjusted by a proposed Factor 2 of 65.71 percent. For FY 2023, the amount available to be distributed for uncompensated care was $6,874,403,459.42 or 75 percent of the amount that otherwise would have been paid for Medicare DSH payment adjustments adjusted by a Factor 2 of 65.71 percent. In addition, eligible IHS/Tribal hospitals and hospitals located in Puerto Rico, are estimated to receive approximately $90.3 million in supplemental payments in FY 2024, as determined based on the difference between each hospital's FY 2022 UCP (reduced by negative 6.70 percent, which is the projected change between the proposed FY 2024 total uncompensated care payment amount and the total uncompensated care payment amount for FY 2022) and its FY 2024 UCP as calculated using the methodology for FY 2024. If this difference is less than or equal to zero, the hospital will not receive a supplemental payment. For this proposed rule, the total uncompensated care payments and supplemental payments equal approximately $6.803 billion. For FY 2024, we are using three years of data on uncompensated care costs from Worksheet S–10 of the FYs 2018, 2019, and 2020 cost reports to calculate Factor 3 for all DSH-eligible hospitals, including IHS/Tribal hospitals and Puerto Rico hospitals. For a complete discussion regarding the methodology for calculating Factor 3 for FY 2024, we refer readers to section IV.E. of the preamble of this proposed rule. For a discussion regarding the methodology for calculating the supplemental payments, we refer readers to section IV.D. of the preamble of this proposed rule.

To estimate the impact of the combined effect of the proposed changes in Factors 1 and 2, as well as the changes to the data used in determining Factor 3, on the calculation of Medicare uncompensated care payments along with changes to supplemental payments for IHS/Tribal hospitals and hospitals located in Puerto Rico, we compared total uncompensated care payments and supplemental payments estimated in the FY 2023 IPPS/LTCH PPS final rule to the combined total of the proposed uncompensated care payments and the proposed supplemental payments estimated in this FY 2024 IPPS/LTCH PPS proposed rule. For FY 2023, we calculated 75 percent of the estimated amount that would be paid as Medicare DSH payments absent section 3133 of the Affordable Care Act, adjusted by a Factor 2 of 65.71 percent and multiplied by a Factor 3 calculated using the methodology described in the FY 2023 IPPS/LTCH PPS final rule. For FY 2024, we calculated 75 percent of the estimated amount that would be paid as Medicare DSH payments during FY 2024 absent section 3133 of the Affordable Care Act, adjusted by a proposed Factor 2 of 65.71 percent and multiplied by a Factor 3 calculated using the methodology described previously. For this proposed rule, the supplemental payments for IHS/Tribal hospitals and Puerto Rico hospitals, are calculated as the difference between the hospital's adjusted base year amount (as determined based on the hospital's FY 2022 uncompensated care payment) and the hospital's FY 2024 uncompensated care payment.

Our analysis included 2,395 hospitals that are projected to be eligible for DSH in FY 2024. It did not include hospitals that had terminated their participation in the Medicare program as of February 3, 2023, Maryland hospitals, new hospitals, and SCHs that are expected to be paid based on their hospital-specific rates. The 26 hospitals that are anticipated to be participating in the Rural Community Hospital Demonstration Program were also excluded from this analysis, as participating hospitals are not eligible to receive empirically justified Medicare DSH payments and uncompensated care payments. In addition, the data from merged or acquired hospitals were combined under the surviving hospital's CMS certification number (CCN), and the non-surviving CCN was excluded from the analysis. The estimated impact of the proposed changes in Factors 1, 2, and 3 on uncompensated care payments and supplemental payments for eligible IHS/Tribal hospitals and Puerto Rico hospitals across all hospitals projected to be eligible for DSH payments in FY 2024, by hospital characteristic, is presented in the following table:

Source: Dobson | DaVanzo analysis of 2018, 2019, and 2020 Hospital Cost Reports.

*Dollar uncompensated care payments calculated by [0.75 * estimated section 1886(d)(5)(F) payments * Factor 2 * Factor 3]. When summed across all hospitals projected to receive DSH payments, uncompensated care payments and supplemental payments are estimated to be $6,971 million in FY 2023 and uncompensated care payments and supplemental payments are estimated to be $6,803 million in FY 2024.

** For IHS/Tribal hospitals and Puerto Rico hospitals, this impact table reflects the supplemental payments.

*** Percentage change is determined as the difference between Medicare uncompensated care payments and supplemental payments modeled for this FY 2024 IPPS/LTCH PPS proposed rule (column 3) and Medicare uncompensated care payments and supplemental payments modeled for the FY 2023 IPPS/LTCH PPS final rule correction notice (column 2) divided by Medicare uncompensated care payments and supplemental payments modeled for the FY 2023 IPPS/LTCH PPS final rule correction notice (column 2) times 100 percent.

****Hospitals with missing or unknown Medicare utilization or Medicaid utilization are not shown in the table.

The changes in projected FY 2024 uncompensated care payments and supplemental payments compared to the total of uncompensated care payments and supplemental payments in FY 2023 are driven by a proposed decrease in Factor 1. The proposed Factor 1 has decreased from the FY 2023 final rule's Factor 1 of $10.461 billion to this proposed rule's Factor 1 of $10.216 billion. The proposed Factor 2 is 65.71 percent, which is the same as the FY 2023 IPPS/LTCH PPS final rule's Factor 2. In addition, we note that there is a slight increase in the number of projected DSH eligible hospitals to 2,395 at the time of the development for this proposed rule compared to the projected 2,368 DSHs in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49472). Based on the proposed changes, the impact analysis found that, across all projected DSH eligible hospitals, proposed FY 2024 uncompensated care payments and proposed supplemental payments are estimated at approximately $6.803 billion, or a proposed decrease of approximately 2.40 percent from FY 2023 uncompensated care payments and supplemental payments (approximately $6.971 billion). While the proposed changes would result in a net decrease in the total amount available to be distributed in uncompensated care payments and supplemental payments, the projected payment decreases vary by hospital type. This redistribution of payments is caused by proposed changes in Factor 3 and the amount of the supplemental payment for DSH-eligible IHS/Tribal hospitals and Puerto Rico hospitals. As seen in the previous table, a percent change of less than negative 2.40 percent indicates that hospitals within the specified category are projected to experience a larger decrease in payments, on average, compared to the universe of projected FY 2024 DSH hospitals. Conversely, a percentage change greater than negative 2.40 percent indicates that a hospital type is projected to have a smaller decrease or an increase compared to the overall average. The variation in the distribution of overall payments by hospital characteristic is largely dependent on a given hospital's uncompensated care costs as reported on the Worksheet S–10 and used in the

Factor 3 computation and whether the hospital is eligible to receive the supplemental payment.

Rural hospitals, in general, are projected to experience an increase in uncompensated care payments compared to the decrease their urban counterparts are projected to experience. Overall, rural hospitals are projected to receive a 1.17 percent increase in payments, while urban hospitals are projected to receive a 2.61 percent decrease in payments, which is a slightly larger decrease than the overall hospital average.

By bed size, rural hospitals with 250+ beds are projected to receive a 7.34 percent payment increase, smaller rural hospitals with 0–99 beds are projected to receive a 2.07 percent payment increase while rural hospitals with 100–249 beds are projected to receive a slightly larger than average decrease of 2.47 percent. Among urban hospitals, the largest urban hospitals, those with 250+ beds, are projected to receive a decrease in payments that is greater than the overall hospital average, at 2.97 percent. In contrast, smaller urban hospitals with 0–99 beds and urban hospitals with 100–249 beds are projected to receive a 0.76 and 1.76 percent decrease in payments, respectively.

By region, rural hospitals are projected to receive a varied range of payment changes. Rural hospitals in the New England, East North Central, West North Central, Mountain, and Pacific regions are projected to receive larger than average decreases in payments. Rural hospitals in the Middle Atlantic, South Atlantic, East South Central, and West South Central regions are projected to receive increases in payments. Regionally, urban hospitals are projected to receive larger than average decreases in uncompensated care payments and supplemental payments in most regions. Urban hospitals in the Middle Atlantic, South Atlantic, East North Central, East South Central, West North Central, and Pacific regions, as well as hospitals located in Puerto Rico are projected to receive larger than average decreases in payments, while urban hospitals in the West South Central and Mountain regions are projected to receive smaller than average decreases in payments. Urban hospitals in New England are projected to receive an increase in payments.

By payment classification, although hospitals in urban payment areas overall are expected to receive a 2.69 percent decrease in uncompensated care payments and supplemental payments, hospitals in large urban payment areas are projected to receive a decrease in payments of 2.60 percent. In contrast, hospitals in rural areas are projected to receive a decrease in payments of 2.00 percent.

Teaching hospitals with fewer than 100 residents are projected to receive a larger than average payment decrease of 3.39 percent. Nonteaching hospitals and teaching hospitals with 100+ residents are projected to receive smaller than average payment decreases of 1.36 percent and 2.20 percent respectively. Proprietary and government hospitals are projected to receive smaller than average decreases of 1.10 and 2.24 percent respectively, while voluntary hospitals are expected to receive a larger than average payment decrease of 2.79 percent. Hospitals with less than 25 percent Medicare utilization and hospitals with 25 to 50 percent Medicare utilization are projected to receive decreases of 3.03 and 1.70 percent, respectively, while hospitals with 50–65 percent and hospitals with greater than 65 percent Medicare utilization are projected to receive increases of 10.54 percent and 1.88 percent, respectively. Hospitals with greater than 65 percent Medicaid utilization are projected to receive increases in uncompensated care payments and supplemental payments of 0.21 percent. Hospitals with less than 25 percent Medicaid utilization and those with 50–65 percent Medicaid utilization are projected to receive lower than average decreases in payments of 1.69 and 0.04 percent respectively, while hospitals with 25–50 percent Medicaid utilization are projected to receive a larger than average decrease of 3.71 percent.

The impact table reflects the modeled FY 2024 uncompensated care payments and supplemental payments for IHS/Tribal and Puerto Rico hospitals. We note that the supplemental payments to IHS/Tribal hospitals and Puerto Rico hospitals are estimated to be approximately $90.3 million in FY 2024.

3. Effects of the Proposed Changes to Indirect Medical Education and Direct Graduate Medical Education Payments

Under section V.G.2. of the preamble of this proposed rule, we are proposing to clarify policy on the Medicare cost report, CMS–Form–2552–10, Worksheet E, Part A, line 20, with regard to the IME calculation. As described in existing § 412.105(a)(1)(i), the numerator of the prior year resident-to bed ratio may be adjusted to reflect an increase in the current cost reporting period's resident-to-bed ratio due to residents in a Medicare GME affiliation agreement (among other limited reasons). We explain how to measure the net increase in FTEs in the ''current year numerator'' as compared to the prior year's numerator when there is a Medicare GME affiliation agreement. We propose to clarify how to determine if the hospital increased its current year allowable FTE count, and to clarify that the phrase ''current year numerator'' on Worksheet E, Part A line 20 refers to line 15 from Worksheet E, Part A. See section II.F.2. of the preamble of this proposed rule for more details on this policy. An increase to one hospital's FTE cap is offset by a decrease to another hospital's FTE cap under the terms of a Medicare GME affiliation agreement. We estimate that there is no impact for this policy clarification, as there continues to be no net change in the overall number of FTEs under the combined caps of the hospitals participating in the affiliation agreement.

4. Effects of Proposed Changes for Reasonable Cost Payments for Nursing and Allied Health Programs

a. Waiver of Cap

Under section V.H. of the preamble of this proposed rule, we propose to implement section 4143 of the CAA 2023 (enacted December 29, 2022), called ''Waiver of Cap on Annual Payments for Nursing and Allied Health Education Payments,'' to state that for portions of cost reporting periods occurring in each of CYs 2010 through 2019, the $60 million payment limit, or payment ''pool,'' shall not apply to the ''total amount of additional payments for nursing and allied health education to be distributed to hospitals'' that, ''as of the date of enactment of this clause, are operating a school of nursing, a school of allied health, or a school of nursing and allied health.'' Section 4143 of the CAA 2023 also provides that in not applying the $60 million limit ''for each of 2010 through 2019, the Secretary shall not take into account any increase in the total amount of such additional payment amounts for such nursing and allied health education for portions of cost reporting periods occurring in the year. . . .'' We have estimated that the impact of this provision for FY 2024 to be approximately $1.8 billion.

b. Training in New REH Facility Type

As discussed in section V.G.3. of the preamble of this proposed rule, section 125 of Division CC of the Consolidated Appropriations Act, 2021 (CAA) added a new section 1861(kkk) of the Act to establish REHs as a new Medicare

provider type, effective January 1, 2023. As part of the comments received in response to the CY 2023 OPPS proposed rule (87 FR 44502) and the proposed rule establishing REH CoPs (87 FR 40350), CMS received the request to designate REHs as graduate medical education (GME) eligible facilities similar to the GME designation for critical access hospitals (CAHs) (87 FR 72164).

As we note in this proposed rule, given the flexibility provided under section 1861(e) of the Act and the fact that an REH is a facility primarily engaged in patient care (see the definition of ''nonprovider setting that is primarily engaged in furnishing patient care'' at section 1886(h)(5)(K) of the Act), we believe that similarly to CAHs, statutory flexibility also exists for REHs to be considered nonprovider settings for GME payment purposes. We believe that increasing access to physicians in rural areas can be supported by a flexible policy which would allow for residency training to continue at CAHs that convert to REHs and begin at other newly designated REHs, which may have not previously trained residents. Therefore, we are proposing that effective for portions of cost reporting periods beginning on or after October 1, 2023, an REH may be considered a nonprovider site and a hospital may include FTE residents training at an REH in its direct GME and IME FTE counts as long as it meets the nonprovider setting requirements included at 42 CFR 412.105(f)(1)(ii)(E) and 413.78(g) and any succeeding regulations. As an alternative to being considered a nonprovider site, we are proposing under the authority of section 1886(k)(2)(D) of the Act, that REHs may decide to incur the costs of training residents in an approved residency training program(s) and receive payment at 100 percent of the reasonable costs for those training costs consistent with section 1861(v)(1)(A) of the Act. If a hospital converts to an REH, Medicare would continue paying for residency training occurring at the REH as long as the residents continue to train in an approved program. GME payments would be made either directly to the REH or to a hospital if the REH is functioning as a nonprovider setting consistent with the regulations at 42 CFR 412.105(f)(1)(ii)(E) and 413.78(g) and any succeeding regulations. To the extent that a CAH that converts to an REH was receiving direct GME payments at 101 percent of reasonable costs, or a new REH would have received those payments had it become a CAH instead, we estimate the impact of this proposal to be negligible.

5. Effects of Requirements Under the Hospital Readmissions Reduction Program for FY 2024

In section V.J. of the preamble of this proposed rule, we note that we are not proposing to add, modify, or remove any policies for the FY 2024 Hospital Readmissions Reduction Program; the policies finalized in FY 2023 IPPS/LTCH PPS final rule (87 FR 49081 through 49094) continue to apply. This program requires a reduction to a hospital's base operating DRG payment to account for excess readmissions of selected applicable conditions and procedures. Table I.G.–01 and the analysis in this proposed rule illustrate the estimated financial impact of the Hospital Readmissions Reduction Program payment adjustment methodology by hospital characteristic. Hospitals are sorted into quintiles based on the proportion of dual-eligible stays among Medicare fee-for-service (FFS) and managed care stays between July 1, 2018, and June 30, 2021 (that is, the FY 2023 Hospital Readmissions Reduction Program's applicable period).[776] Hospitals' excess readmission ratios (ERRs) are assessed relative to their peer group median and a neutrality modifier is applied in the payment adjustment factor calculation to maintain budget neutrality. In the FY 2024 IPPS/LTCH PPS final rule, we will provide an updated estimate of the financial impact using the proportion of dually-eligible beneficiaries, ERRs, and aggregate payments for each condition/procedure and all discharges for applicable hospitals from the FY 2024 Hospital Readmissions Reduction Program applicable period (that is, July 1, 2019, through June 30, 2022).

The results in Table I.G.–01 include 2,910 non-Maryland hospitals estimated as eligible to receive a penalty during the performance period. Hospitals are eligible to receive a penalty if they have 25 or more eligible discharges for at least one measure between July 1, 2018, and June 30, 2021. The second column in Table I.G.–01 indicates the total number of non-Maryland hospitals with available data for each characteristic that have an estimated payment adjustment factor less than 1 (that is, penalized hospitals).

The third column in Table I.G.–01 indicates the percentage of penalized hospitals among those eligible to receive a penalty by hospital characteristic. For example, 80.79 percent of eligible hospitals characterized as non-teaching hospitals are expected to be penalized. Among teaching hospitals, 88.65 percent of eligible hospitals with fewer than 100 residents and 91.18 percent of eligible hospitals with 100 or more residents are expected to be penalized. The fourth column in Table I.G.–01 estimates the financial impact on hospitals by hospital characteristic. Table I.G.–01 shows the share of penalties as a percentage of all base operating DRG payments for hospitals with each characteristic. This is calculated as the sum of penalties for all hospitals with that characteristic over the sum of all base operating DRG payments for those hospitals between October 1, 2020, through September 30, 2021 (FY 2021). For example, the penalty as a share of payments for non-teaching hospitals is 0.60 percent. This means that total penalties for all non-teaching hospitals are 0.60 percent of total payments for non-teaching hospitals. Measuring the financial impact on hospitals as a percentage of total base operating DRG payments accounts for differences in the amount of base operating DRG payments for hospitals with the characteristic when comparing the financial impact of the program on different groups of hospitals.

In the FY 2022 IPPS/LTCH PPS final rule, we finalized suppression of the CMS 30-Day Pneumonia Readmissions measure for the FY 2023 program year (86 FR 45254 through 45256) due to significant impacts of the COVID–19 PHE on the measure. In the FY 2023 IPPS/LTCH PPS final rule (87 FR 49083 through 49086), we finalized that beginning with the FY 2024 program year, the Pneumonia Readmission measure will no longer be suppressed under the Hospital Readmissions Reduction Program and we will resume the use of the measure for FY 2024. Therefore, the CMS 30-Day Pneumonia Readmission measure is included in the data in Table I.G.–01.

[776] Although the FY 2023 performance period is July 1, 2018, through June 30, 2021, we note that first and second quarter data from CY 2020 is excluded from program calculations due to the nationwide ECE that was granted in response to the COVID–19 PHE. Taking into consideration the 30-day window to identify readmissions, the period for calculating DRG payments will be adjusted to July 1, 2018, through December 1, 2019, and July 1, 2020, through June 30, 2021.

TABLE I.G.-01: ESTIMATED PERCENTAGE OF HOSPITALS PENALIZED AND PENALTY AS SHARE OF PAYMENTS FOR FY 2024 HOSPITAL READMISSIONS REDUCTION PROGRAM BY HOSPITAL CHARACTERISTIC

Hospital Characteristic	Number of Eligible Hospitals[a]	Number of Penalized Hospitals[b]	Percentage of Hospitals Penalized[c] (%)	Penalty as a Share of Payments[d] (%)

Mountain	217	154	70.97	0.42
Pacific	348	284	81.61	0.39

Source: The table results are based on the data used to calculate the FY 2023 payment adjustment factors of open, non-Maryland, subsection (d) hospitals only. The FY 2023 payment adjustment factors are based on discharges from July 1, 2018, through December 1, 2019, and July 1, 2020, through June 30, 2021. The shortened data period is due to the COVID-19 public health emergency (PHE) nationwide Extraordinary Circumstances Exception (ECE) which excluded data from January 1, 2020, through

BILLING CODE 4120–01–C

June 30, 2020, from the Hospital Readmissions Reduction Program (HRRP) calculations. Although data from all subsection (d) and Maryland hospitals are used in calculations of each hospital's ERR, this table does not include results for Maryland hospitals and hospitals that are not open as of the October 2022 public reporting open hospital list because these hospitals are not eligible for a penalty under the program. Hospitals are sorted into five peer groups based on the proportion of FFS and managed care dual-eligible stays for the multi-year performance period. Hospital characteristics are from the FY 2023 Hospital Inpatient Prospective Payment System (IPPS) Final Rule Impact File.

For the FY 2024 applicable period, CMS will only be assessing data from July 1, 2019, through December 1, 2019, and July 1, 2020, through June 30, 2022, due to the COVID-19 PHE nationwide ECE which excluded data from January 1, 2020, through June 30, 2020, from the Hospital Readmissions Reduction Program (HRRP) calculations.

[a] This column is the number of applicable hospitals within the characteristic that are eligible for a penalty (that is, they have 25 or more eligible discharges for at least one measure).

[b] This column is the number of applicable hospitals that are penalized (that is, they have 25 or more eligible discharges for at least one measure and an estimated payment adjustment factor less than 1) within the characteristic.

[c] This column is the percentage of applicable hospitals that are penalized among hospitals that are eligible to receive a penalty by characteristic.

[d] This column is calculated as the sum of all penalties for the group of hospitals with that characteristic divided by total base operating DRG payments for all those hospitals. Measuring the financial impact on hospitals as a percentage of total base operating DRG payments in this way allows for comparisons across hospital characteristics that accounts for differences in the amount of base operating DRG payments for different groups of hospitals. MedPAR data from October 1, 2020, through September 31, 2021 (FY 2021), are used to estimate the total base operating DRG payments.

[e] The total number of hospitals with hospital characteristics data may not add up to the total number of hospitals because not all hospitals have data for all characteristics. Not all hospitals had data for geographic location, teaching status, ownership type, safety net status, and DSH patient percentage (n=2,907, missing=3), and MCR percentage (n=2,906; missing=4).

[f] A hospital is considered a teaching hospital if it has an Indirect Medical Education adjustment factor for Operation PPS (TCHOP) greater than zero.

[g] A hospital is considered a safety-net hospital if it is in the top DSH quintile.

[h] DSH patient percentage is the sum of the percentage of Medicare inpatient days attributable to patients eligible for both Medicare Part A and Supplemental Security Income (SSI), and the percentage of total inpatient days attributable to patients eligible for Medicaid but not Medicare Part A.

[i] MCR (Medicare Cost Report) percentage is the percentage of total inpatient stays from Medicare patients.

6. Effects of Proposed Changes Under the Hospital Value-Based Purchasing (VBP) Program

a. Effects for the FY 2024 Program Year

In section V.K. of the preamble of this proposed rule, we discuss the Hospital VBP Program under which the Secretary makes value-based incentive payments to hospitals based on their performance on measures during the performance period with respect to a fiscal year. These incentive payments will be funded for FY 2024 through a reduction to the FY 2024 base operating DRG payment amount for hospital discharges for such fiscal year, as required by section 1886(o)(7)(B) of the Act. The applicable percentage for FY 2024 and subsequent years is 2 percent. The total amount available for value-based incentive payments must be equal to the total amount of reduced payments for all hospitals for the fiscal year, as estimated by the Secretary. In section V.K.1.b. of the preamble of this proposed rule, we estimate the available pool of funds for value-based incentive payments in the FY 2024 program year, which, in accordance with section 1886(o)(7)(C)(v) of the Act, will be 2.00 percent of base operating DRG payments, or a total of approximately $1.7 billion. This estimated available pool for FY 2024 is based on the historical pool of hospitals that were eligible to participate in the FY 2023 program year and the payment information from the December 2022 update to the FY 2022 MedPAR file.

The proposed estimated impacts of the FY 2024 program year by hospital characteristic, found in Table V.G.-05, are based on historical TPSs. We used the FY 2021 program year's TPSs to calculate the proxy adjustment factors used for this impact analysis. These are the most recently available scores that hospitals were given an opportunity to review and correct. The proxy adjustment factors use estimated annual base operating DRG payment amounts derived from the December 2022 update to the FY 2022 MedPAR file. The proxy adjustment factors can be found in Table 16 associated with this proposed rule (available via the internet on the CMS website).

TABLE I.G.-01 IMPACT ANALYSIS of BASE OPERATING DRG PAYMENT AMOUNTS RESULTING FROM THE FY 2024 HOSPITAL VBP PROGRAM

		Number of Hospitals	Average Net Percentage Payment Adjustment
BY GEOGRAPHIC LOCATION:

	Missing	.	.
BY TEACHING STATUS:			
	Non-Teaching	1,418	0.026%
	Teaching	1,108	0.025%

The actual FY 2024 program year's TPSs would not be reviewed and corrected by hospitals until after the FY 2024 IPPS/LTCH PPS final rule has been published. Therefore, the same historical universe of eligible hospitals and corresponding TPSs from the FY 2023 program year would be used for the updated impact analysis in the final rule, if the proposals, as previously described, for FY 2024 are not finalized.

b. Estimated Effects for the FY 2026 Program Year Applying Proposed Scoring Methodology Change

The estimated effects of the proposed Health Equity Adjustment (HEA) bonus points include larger mean changes in payments for both hospitals that receive bonus payments and for those that incur penalties. In a simulated analysis of the impacts of HEA bonus points in the Hospital VBP Program using FY 2023 program year data, the average bonus payment with the HEA bonus points would be $3,724 and the average penalty would be -$4,246. Our analysis finds that the proposed HEA scoring option increases the number of hospitals gaining compared to the existing scoring methodology. ''Gaining'' means both those who are receiving a larger bonus and those who are receiving a smaller penalty under the proposed health equity scoring change than they would receive in the existing scoring methodology. Through these analyses, we found that the hospital-weighted average payment adjustment is positive even though the Program remains revenue neutral. The increase in the number of hospitals gaining occurs primarily among safety net hospitals compared to non-safety net. Additionally, the distribution of Total Performance Scores would be higher after the HEA bonus points are incorporated. These impacts are described further in section V.K.6.b. of the preamble of this proposed rule.

7. Effects of Requirements Under the HAC Reduction Program for FY 2024

We are presenting the estimated impact of the FY 2024 Hospital-Acquired Condition (HAC) Reduction Program on hospitals by hospital characteristic based on previously adopted policies for the program. In this proposed rule, we are not proposing to

add or remove any measures from the HAC Reduction Program, nor are we proposing any changes to reporting or submission requirements which would have any economic impact for the FY 2024 program year or future years. The table in this section presents the estimated proportion of hospitals in the worst-performing quartile of Total HAC Scores by hospital characteristic. Hospitals' CMS Patient Safety and Adverse Events Composite (CMS PSI 90) measure results are based on Medicare fee-for-service (FFS) discharges from July 1, 2019 through December 31, 2019 and January 1, 2021 through June 30, 2021 and version 12.0 of the PSI software. Hospitals' measure results for Centers for Disease Control and Prevention (CDC) Central Line-Associated Bloodstream Infection (CLABSI), Catheter-Associated Urinary Tract Infection (CAUTI), Colon and Abdominal Hysterectomy Surgical Site Infection (SSI), Methicillin-resistant *Staphylococcus aureus* (MRSA) bacteremia, and *Clostridium difficile* Infection (CDI) are derived from standardized infection ratios (SIRs) calculated with hospital surveillance data reported to the CDC's National Healthcare Safety Network (NHSN) for infections occurring between January 1, 2021 and December 31, 2021. To analyze the results by hospital characteristic, we used the FY 2023 Final Rule Impact File. We do not believe the proposals to establish a reconsideration process for data validation as discussed in section V.L.6.a.(2) of the preamble of this proposed rule will result in any significant economic impacts because the reconsideration request form would not be filled out by hospitals on a regular basis and information collection requirements imposed subsequent to an administrative action are not subject to the PRA under 5 CFR 1320.4(a)(2) (75 FR 50411). This form is intended to be submitted by a hospital only in the event a hospital did not meet the HAC Reduction Program data validation requirement and seeks reconsideration from CMS on their data validation results for chart-abstracted measures. We anticipate receiving a small number of reconsideration requests annually as we expect very few, if any, hospitals selected for validation will not have their data successfully validated.

This table includes 2,946 non-Maryland hospitals with a FY 2024 Total HAC Score. Maryland hospitals and hospitals without a Total HAC Score are excluded from the table. The first column presents a breakdown of each characteristic and the second column indicates the number of hospitals for the respective characteristic.

The third column in the table indicates the number of hospitals for each characteristic that would be in the worst-performing quartile of Total HAC Scores. These hospitals would receive a payment reduction under the FY 2024 HAC Reduction Program. For example, with regard to teaching status, 531 hospitals out of 1,756 hospitals characterized as non-teaching hospitals would be subject to a payment reduction. Among teaching hospitals, 152 out of 909 hospitals with fewer than 100 residents and 46 out of 272 hospitals with 100 or more residents would be subject to a payment reduction.

The fourth column in the table indicates the proportion of hospitals for each characteristic that would be in the worst performing quartile of Total HAC Scores and thus receive a payment reduction under the FY 2024 HAC Reduction Program. For example, 30.2 percent of the 1,756 hospitals characterized as non-teaching hospitals, 16.7 percent of the 909 teaching hospitals with fewer than 100 residents, and 16.9 percent of the 272 teaching hospitals with 100 or more residents would be subject to a payment reduction.

Estimated Proportion of Hospitals in the Worst-Performing Quartile (>75th percentile) of the Total HAC Scores for the FY 2024 HAC Reduction Program (by Hospital Characteristic)			
Hospital Characteristic	**Number of Hospitals**	**Number of Hospitals in the Worst-performing Quartile[a]**	**Percent of Hospitals in the Worst-Performing Quartile[b]**
Total[c]	2,946	736	25
By Geographic Location (n = 2,937)[d]			
Urban hospitals	**2,291**	**477**	**20.8**
1-99 beds	572	214	37.4
100-199 beds	664	130	19.6
200-299 beds	403	57	14.1
300-399 beds	288	35	12.2

West South Central	449	144	32.1
Mountain	222	55	24.8
Pacific	378	82	21.7

Source: FY 2024 HAC Reduction Program proposed rule results are based on CMS PSI 90 data from July 1, 2019, through December 31, 2019, and January 1, 2021, through June 30, 2021, and CDC NHSN HAI results from January 1, 2021, through December 31, 2021. Hospital Characteristics are based on the FY 2023 Final Rule Impact File

[a] This column is the number of non-Maryland hospitals with a Total HAC Score within the corresponding characteristic that are estimated to be in the worst-performing quartile.

[b] This column is the percent of non-Maryland hospitals within each characteristic that are estimated to be in the worst-performing quartile. The percentages are calculated by dividing the number of non-Maryland hospitals with a Total HAC Score in the worst-performing quartile by the total number of non-Maryland hospitals with a Total HAC Score within that characteristic.

[c] The number of non-Maryland hospitals with a FY 2024 Total HAC Score (N = 2,946). Note that not all hospitals have data for all hospital characteristics.

[d] The number of hospitals that had information for geographic location with bed size, Safety-net status, DSH percent, teaching status, and Ownership (n = 2,937).

[e] A hospital is considered a Safety-net hospital if it is in the top quintile for DSH percent.

[f] The DSH patient percentage is equal to the sum of: (1) the percentage of Medicare inpatient days attributable to patients eligible for both Medicare Part A and Supplemental Security Income; and (2) the percentage of total inpatient days attributable to patients eligible for Medicaid but not Medicare Part A.

[g] A hospital is considered a teaching hospital if it has an IME adjustment factor for Operation PPS (TCHOP) greater than zero.

[h] Not all hospitals had data for MCR percent (n = 2,931).

[i] All hospitals had data for Region (n = 3,067). For the 6 hospitals that were not in the FY 2023 Proposed Rule Impact File region data were identified using the hospital CCN.

BILLING CODE 4120–01–C

In section V.L.6.a.(3) of the preamble of this proposed rule, we are proposing to update our targeting criteria for validation of hospitals granted an

extraordinary circumstances exception (ECE) in the HAC Reduction Program. Specifically, we are proposing to modify the validation targeting criteria to include any hospital with a two-tailed confidence interval that is less than 75 percent and received an ECE for one or more quarters beginning with the FY 2027 program year. We do not believe the proposal to modify targeting criteria will have any economic impact on the hospitals selected for validation, but will only increase the number of hospitals which are subject to being targeted for validation. Any increase would not exceed the total maximum number of hospitals that would be selected for targeted validation as previously finalized.

8. Effects of Implementation of the Rural Community Hospital Demonstration Program in FY 2024

In section V.K. of the preamble of this proposed rule for FY 2024, we discussed our budget neutrality methodology for section 410A of Public Law 108–173, as amended by sections 3123 and 10313 of Public Law 111–148, by section 15003 of Public Law 114–255, and most recently, by section 128 of Public Law 116–260, which requires the Secretary to conduct a demonstration that would modify payments for inpatient services for up to 30 rural hospitals.

Section 128 of Public Law 116–260 requires the Secretary to conduct the Rural Community Hospital Demonstration for a 15-year extension period (that is, for an additional 5 years beyond the previous extension period). In addition, the statute provides for continued participation for all hospitals participating in the demonstration program as of December 30, 2019.

Section 410A(c)(2) of Public Law 108–173 requires that in conducting the demonstration program under this section, the Secretary shall ensure that the aggregate payments made by the Secretary do not exceed the amount which the Secretary would have paid if the demonstration program under this section was not implemented (budget neutrality). We propose to adopt the general methodology used in previous years, whereby we estimated the additional payments made by the program for each of the participating hospitals as a result of the demonstration, and then adjusted the national IPPS rates by an amount sufficient to account for the added costs of this demonstration. In other words, we have applied budget neutrality across the payment system as a whole rather than across the participants of this demonstration. The language of the statutory budget neutrality requirement permits the agency to implement the budget neutrality provision in this manner. The statutory language requires that aggregate payments made by the Secretary do not exceed the amount which the Secretary would have paid if the demonstration was not implemented, but does not identify the range across which aggregate payments must be held equal.

For this proposed rule, the resulting amount applicable to FY 2024 is $37,658,408, which we are proposing as the budget neutrality offset adjustment for FY 2024. This estimated amount is based on the specific assumptions regarding the data sources used, that is, recently available ''as submitted'' cost reports and historical and currently finalized update factors for cost and payment.

In previous years, we have incorporated a second component into the budget neutrality offset amounts identified in the final IPPS rules. As finalized cost reports became available, we determined the amount by which the actual costs of the demonstration for an earlier, given year differed from the estimated costs for the demonstration set forth in the final IPPS rule for the corresponding fiscal year, and we incorporated that amount into the budget neutrality offset amount for the upcoming fiscal year. We have calculated this difference for FYs 2005 through 2017 between the actual costs of the demonstration as determined from finalized cost reports once available, and estimated costs of the demonstration as identified in the applicable IPPS final rules for these years.

With the extension of the demonstration for another 5-year period, as authorized by section 128 of Public Law 116–260, we will continue this general procedure. At this time, for the FY 2024 proposed rule, not all of the finalized cost reports are available for the 29 hospitals that completed cost report periods beginning in FY 2018 under the demonstration payment methodology. If all of these cost reports are available, we will include in the budget neutrality offset amount in the FY 2024 final rule the amount by which the actual costs of the demonstration, as determined from these cost reports, differed from the estimated costs identified in the FY 2018 final rule.

9. Effects of Continued Implementation of the Frontier Community Health Integration Project (FCHIP) Demonstration

In section VII.B.2. of the preamble of this proposed rule we discuss the implementation of the FCHIP Demonstration, which allows eligible entities to develop and test new models for the delivery of health care services in eligible counties in order to improve access to and better integrate the delivery of acute care, extended care, and other health care services to Medicare beneficiaries in no more than four States. Section 123 of Public Law 110–275 initially required a 3-year period of performance. The FCHIP Demonstration began on August 1, 2016, and concluded on July 31, 2019 (referred to in this section as the ''initial period''). Section 129 of the Consolidated Appropriations Act (Pub. L. 116–159) extended the FCHIP Demonstration by 5 years (referred to in this section as the ''extension period'' of the demonstration). CAHs participating in the demonstration project during the extension period began such participation in their cost reporting year that began on or after January 1, 2022. Budget neutrality estimates for the demonstration described in the preamble of this proposed rule are based on the demonstration extension period.

As described in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49144 through 49147), CMS waived certain Medicare rules for CAHs participating in the demonstration extension period to allow for alternative reasonable cost-based payment methods in the three distinct intervention service areas: telehealth services, ambulance services, and skilled nursing facility/nursing facility services. These waivers were implemented with the goal of increasing access to care with no net increase in costs. As we explained in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49144 through 49147), section 129 of Public Law 116–159 stipulates that only the 10 CAHs that participated in the initial period of the FCHIP Demonstration are eligible to participate during the extension period. Among the eligible CAHs, five elected to participate in the extension period. The selected CAHs are located in two states—Montana and North Dakota—and are implementing the three intervention services.

As explained in the FY 2023 IPPS/LTCH PPS final rule, we based our selection of CAHs for participation in the demonstration with the goal of maintaining the budget neutrality of the demonstration on its own terms meaning that the demonstration would produce savings from reduced transfers and admissions to other health care providers, offsetting any increase in Medicare payments as a result of the demonstration. However, because of the small size of the demonstration and uncertainty associated with the

projected Medicare utilization and costs, the policy we finalized for the demonstration extension period of performance in the FY 2023 IPPS/LTCH PPS final rule provides a contingency plan to ensure that the budget neutrality requirement in section 123 of Public Law 110–275 is met.

In the FY 2023 IPPS/LTCH PPS final rule, we adopted the same budget neutrality policy contingency plan used during the demonstration initial period to ensure that the budget neutrality requirement in section 123 of Public Law 110–275 is met during the demonstration extension period. If analysis of claims data for Medicare beneficiaries receiving services at each of the participating CAHs, as well as from other data sources, including cost reports for the participating CAHs, shows that increases in Medicare payments under the demonstration during the 5-year extension period is not sufficiently offset by reductions elsewhere, we will recoup the additional expenditures attributable to the demonstration through a reduction in payments to all CAHs nationwide.

As explained in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49144 through 49147), because of the small scale of the demonstration, we indicated that we did not believe it would be feasible to implement budget neutrality for the demonstration extension period by reducing payments to only the participating CAHs. Therefore, in the event that this demonstration extension period is found to result in aggregate payments in excess of the amount that would have been paid if this demonstration extension period were not implemented, CMS policy is to comply with the budget neutrality requirement finalized in the FY 2023 IPPS/LTCH PPS final rule, by reducing payments to all CAHs, not just those participating in the demonstration extension period.

In the FY 2023 IPPS/LTCH PPS final rule, we stated that we believe it is appropriate to make any payment reductions across all CAHs because the FCHIP Demonstration was specifically designed to test innovations that affect delivery of services by the CAH provider category. As we explained in the FY 2023 IPPS/LTCH PPS final rule, we believe that the language of the statutory budget neutrality requirement at section 123(g)(1)(B) of Public Law 110–275 permits the agency to implement the budget neutrality provision in this manner. The statutory language merely refers to ensuring that aggregate payments made by the Secretary do not exceed the amount which the Secretary estimates would have been paid if the demonstration project was not implemented, and does not identify the range across which aggregate payments must be held equal.

In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45323 through 45328), CMS concluded that the initial period of the FCHIP Demonstration had satisfied the budget neutrality requirement described in section 123(g)(1)(B) of Public Law 110–275. Therefore, CMS did not apply a budget neutrality payment offset policy for the initial period of the demonstration. As explained in the FY 2022 IPPS/LTCH PPS final rule, we finalized a policy to address the demonstration budget neutrality methodology and analytical approach for the initial period of the demonstration. As stated in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49144 through 49147), our policy for implementing the 5-year extension period for section 129 of Public Law 116–260 follows same budget neutrality methodology and analytical approach as the demonstration initial period methodology. While we expect to use the same methodology that was used to assess the budget neutrality of the FCHIP Demonstration during initial period of the demonstration to assess the financial impact of the demonstration during this extension period, upon receiving data for the extension period, we may update and/or modify the FCHIP budget neutrality methodology and analytical approach to ensure that the full impact of the demonstration is appropriately captured. Therefore, we are not proposing to apply a budget neutrality payment offset to payments to CAHs in FY 2024. This policy will have no impact for any national payment system for FY 2024.

10. Effects of Proposed Changes for Rural Emergency Hospitals

Section X.A. of the preamble of this proposed rule would address the special requirements for REHs that would require an eligible facility (a CAH or a small rural hospital with not more than 50 beds) to submit additional information that must include an action plan containing four specific elements when the facility submits an application for enrollment as an REH. An eligible facility that submits an application for enrollment as an REH under section 1866(j) of the Act must also submit additional information as specified in this proposed rule. In accordance with section 1861(kkk)(4)(A)(i) through (iv) of the Act, we specifically propose to require an eligible facility to submit additional information that must include an action plan containing: (1) a plan for initiating REH services (as those services are defined in 42 CFR 485.502, and which must include the provision of emergency department services and observation care); (2) a detailed transition plan that lists the specific services that the provider will retain, modify, add, and discontinue as an REH; (3) a detailed description of other outpatient medical and health services that it intends to furnish on an outpatient basis as an REH; and (4) information regarding how the provider intends to use the additional facility payment provided under section 1834(x)(2) of the Act, including a description of the services that the additional facility payment would be supporting, such as the operation and maintenance of the facility and the furnishing of covered services (for example, telehealth services and ambulance services).

The RFA requires agencies to analyze options for regulatory relief of small entities, if a rule has a significant impact on a substantial number of small entities. For purposes of the RFA, small entities include small businesses, nonprofit organizations, and small governmental jurisdictions. Most hospitals and most other healthcare providers and suppliers are small entities, either by nonprofit status or by having revenues of less than $8.0 million to $41.5 million in any 1 year. Individuals and states are not included in the definition of a small entity. We estimate that almost all of the new REH facilities are or would be small entities on the basis of legal status, revenues, or both. The North American Industry Classification System Code for the converting hospitals is 622110 (General Medical and Surgical Hospitals), and for the REHs to which they convert the closest Code is 621493 (Freestanding Ambulatory Surgical and Emergency Centers). HHS uses an increase in costs or decrease in revenues of more than 3 percent as its threshold for ''significant economic impact''. Our collection of information estimate is that the 68 facilities converting to REH status would face a one-time cost of about $460 each ($68 \times 460 = $31,280 (COI burden estimate)). The North Carolina Rural Health Research Program estimated that the 68 hospitals it thought most likely to convert to REH status had average patient revenues of $7.3 million.[777] For these facilities, the 3 percent threshold would be about $219,000, nearly 500 times our

[777] ''How Many Hospitals Might Convert to a Rural Emergency Hospital (REH)?'' July 2021. Pink, GH et al. Findings Brief—NC Rural Health Research Program.

estimated cost of information collection. These relationships between revenues and costs would not be substantially different if the number of conversions was substantially fewer or substantially greater in number. More importantly, these facilities would be converting voluntarily to the new program. We expect that the costs any facility faces would be less than the anticipated gains of conversion, or it would not convert. For these reasons, an Initial Regulatory Flexibility Analysis is not required for the proposed Special Requirements for REHs.

11. Effects of Proposed Changes for Physician-Owned Hospitals

The physician-owned hospital provisions are discussed in section X.B. of the preamble of this proposed rule. Section X.B.2.a. of the preamble of this proposed rule describes our proposals to revise the regulations to clarify that CMS will only consider expansion exception requests from eligible hospitals, clarify the data and information that must be included in an expansion exception request, identify factors that CMS will consider when making a decision on an expansion exception request, and revise certain aspects of the process for requesting an expansion exception. We expect that our proposed clarifications and technical revisions along with the proposed factors we will consider when making a decision on an expansion exception request would increase transparency, allow for greater community input, ensure that approval of a request to expand a hospital's facility capacity occurs only in appropriate circumstances, and facilitate compliance with the process for requesting an expansion exception. We anticipate that requiring the use of HCRIS data for all comparison calculations would have little practical impact on whether a requesting hospital meets the criteria for an applicable hospital or high Medicaid facility, nor would a requesting hospital be prejudiced by this requirement.

Section X.B.2.b. of the preamble of this proposed rule describes our proposal to reinstate, with respect to high Medicaid facilities, the program integrity restrictions on the frequency of expansion exception requests, maximum aggregate expansion of a hospital, and location of expansion capacity that were removed in the CY 2021 OPPS/ASC final rule. We believe that not applying these program integrity restrictions poses a significant risk of program or patient abuse that must be addressed despite any potential perceived burden on high Medicaid facilities. We anticipate that treating both applicable and high Medicaid hospitals the same will create consistency and protect the Medicare program and its beneficiaries, as well as Medicaid beneficiaries, uninsured patients, and other underserved populations, from harms such as overutilization, patient steering, cherry-picking, and lemon-dropping.

H. Effects on Hospitals and Hospital Units Excluded From the IPPS

As discussed in section II.A.4. of the Addendum to this proposed rule, consistent with our proposed use of the PSF, there were 96 children's hospitals, 11 cancer hospitals, 6 short term-acute care hospitals located in the Virgin Islands, Guam, the Northern Mariana Islands and American Samoa, 1 extended neoplastic disease care hospital, and 10 RNHCIs being paid on a reasonable cost basis subject to the rate-of-increase ceiling under § 413.40. (In accordance with § 403.752(a) of the regulation, RNHCIs are paid under § 413.40.) Among the remaining providers, the rehabilitation hospitals and units, and the LTCHs, are paid the Federal prospective per discharge rate under the IRF PPS and the LTCH PPS, respectively, and the psychiatric hospitals and units are paid the Federal per diem amount under the IPF PPS. As stated previously, IRFs and IPFs are not affected by the proposed rate updates discussed in this proposed rule. The impacts of the proposed changes on LTCHs are discussed in section I.J. of this Appendix.

For the children's hospitals, cancer hospitals, short-term acute care hospitals located in the Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa, the extended neoplastic disease care hospital, and RNHCIs, the proposed update of the rate-of-increase limit (or target amount) is the estimated FY 2024 percentage increase in the 2018-based IPPS operating market basket, consistent with section 1886(b)(3)(B)(ii) of the Act, and §§ 403.752(a) and 413.40 of the regulations. Consistent with current law, based on IGI's fourth quarter 2022 forecast of the 2018-based IPPS market basket increase, we are estimating the proposed FY 2024 update to be 3.0 percent (that is, the estimate of the market basket rate-of-increase), as discussed in section V.A. of the preamble of this proposed rule. We are proposing that if more recent data become available for the final rule, we would use such data, if appropriate, to calculate the final IPPS operating market basket update for FY 2024. The Affordable Care Act requires a productivity adjustment (proposed 0.2 percentage point reduction for FY 2024), resulting in a proposed 2.8 percent applicable percentage increase for IPPS hospitals that submit quality data and are meaningful EHR users, as discussed in section V.A. of the preamble of this proposed rule. Children's hospitals, cancer hospitals, short term acute care hospitals located in the Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa, the extended neoplastic disease care hospital, and RNHCIs that continue to be paid based on reasonable costs subject to rate-of-increase limits under § 413.40 of the regulations are not subject to the reductions in the applicable percentage increase required under the Affordable Care Act. Therefore, for those hospitals paid under § 413.40 of the regulations, the proposed update is the percentage increase in the 2018-based IPPS operating market basket for FY 2024, estimated at 3.0 percent.

The impact of the proposed update in the rate-of-increase limit on those excluded hospitals depends on the cumulative cost increases experienced by each excluded hospital since its applicable base period. For excluded hospitals that have maintained their cost increases at a level below the rate-of-increase limits since their base period, the major effect is on the level of incentive payments these excluded hospitals receive. Conversely, for excluded hospitals with cost increases above the cumulative update in their rate-of-increase limits, the major effect is the amount of excess costs that would not be paid.

We note that, under § 413.40(d)(3), an excluded hospital that continues to be paid under the TEFRA system and whose costs exceed 110 percent of its rate-of-increase limit receives its rate-of-increase limit plus the lesser of: (1) 50 percent of its reasonable costs in excess of 110 percent of the limit; or (2) 10 percent of its limit. In addition, under the various provisions set forth in § 413.40, hospitals can obtain payment adjustments for justifiable increases in operating costs that exceed the limit.

I. Effects of Changes in the Capital IPPS

1. General Considerations

For the impact analysis presented in this section of this proposed rule, we used data from the December 2022 update of the FY 2022 MedPAR file and the December 2022 update of the Provider-Specific File (PSF) that was used for payment purposes. Although the analyses of the proposed changes to the capital prospective payment system do not incorporate cost data, we used

the December 2022 update of the most recently available hospital cost report data to categorize hospitals. Our analysis has several qualifications and uses the best data available, as described later in this section of this proposed rule.

Due to the interdependent nature of the IPPS, it is very difficult to precisely quantify the impact associated with each proposed change. In addition, we draw upon various sources for the data used to categorize hospitals in the tables. In some cases (for instance, the number of beds), there is a fair degree of variation in the data from different sources. We have attempted to construct these variables with the best available sources overall. However, it is possible that some individual hospitals are placed in the wrong category.

Using cases from the December 2022 update of the FY 2022 MedPAR file, we simulated payments under the capital IPPS for FY 2023 and the proposed payments for FY 2024 for a comparison of total payments per case. Short-term, acute care hospitals not paid under the general IPPS (for example, hospitals in Maryland) are excluded from the simulations. The methodology for determining a capital IPPS payment is set forth at § 412.312. The basic methodology for calculating the capital IPPS payments in FY 2024 is as follows: (Standard Federal rate) × (DRG weight) × (GAF) × (COLA for hospitals located in Alaska and Hawaii) × (1 + DSH adjustment factor + IME adjustment factor, if applicable).

In addition to the other adjustments, hospitals may receive outlier payments for those cases that qualify under the threshold established for each fiscal year. We modeled payments for each hospital by multiplying the capital Federal rate by the geographic adjustment factor (GAF) and the hospital's case-mix. Then we added estimated payments for indirect medical education, disproportionate share, and outliers, if applicable. For purposes of this impact analysis, the model includes the following assumptions:

- The capital Federal rate was updated, beginning in FY 1996, by an analytical framework that considers changes in the prices associated with capital-related costs and adjustments to account for forecast error, changes in the case-mix index, allowable changes in intensity, and other factors. As discussed in section III.A.1. of the Addendum to this proposed rule, the proposed update to the capital Federal rate is 3.5 percent for FY 2024.
- In addition to the proposed FY 2024 update factor, the proposed FY 2024 capital Federal rate was calculated based on a proposed GAF/DRG budget neutrality adjustment factor of 0.9992, a proposed budget neutrality factor for the proposed continuation of the lowest quartile hospital wage index adjustment and the 5-percent cap on wage index decreases policy of 0.9934, and a proposed outlier adjustment factor of 0.9584.

2. Results

We used the payment simulation model previously described in section I.I. of Appendix A of this proposed rule to estimate the potential impact of the proposed changes for FY 2024 on total capital payments per case, using a universe of 3,130 hospitals. As previously described, the individual hospital payment parameters are taken from the best available data, including the December 2022 update of the FY 2022 MedPAR file, the December 2022 update to the PSF, and the most recent available cost report data from the December 2022 update of the FY 2021 HCRIS. In Table III, we present a comparison of estimated total payments per case for FY 2023 and estimated proposed total payments per case for FY 2024 based on the proposed FY 2024 payment policies. Column 2 shows estimates of payments per case under our model for FY 2023. Column 3 shows estimates of proposed payments per case under our model for FY 2024. Column 4 shows the total proposed percentage change in payments from FY 2023 to FY 2024. The change represented in Column 4 includes the proposed 3.50 percent update to the capital Federal rate and other proposed changes in the adjustments to the capital Federal rate. The comparisons are provided by: (1) geographic location; (2) region; and (3) payment classification.

The simulation results show that, on average, capital payments per case in FY 2024 are expected to increase 6.3 percent compared to capital payments per case in FY 2023. This expected increase is primarily due to the 3.50 percent update to the capital Federal rate and an estimated increase in capital DSH payments. As discussed in section VI.D of the preamble to this proposed rule, we are proposing that beginning in FY 2024, hospitals reclassified as rural under § 412.103 will no longer be considered rural for purposes of determining eligibility for capital DSH payments. As such, under this proposal, geographically urban hospitals with 100 or more beds reclassified as rural under § 412.103 would be eligible for capital DSH payments beginning in FY 2024. The CMS' Office of the Actuary estimates this proposed change in policy would increase capital payments $170 million in FY 2024.

In general, regional variations in estimated capital payments per case in FY 2024 as compared to capital payments per case in FY 2023 are primarily due to the proposed changes in GAFs, and are generally consistent with the projected changes in payments due to proposed changes in the wage index (and proposed policies affecting the wage index), as shown in Table I in section I.F. of Appendix A of this proposed rule. We note that the proposed FY 2024 GAFs reflect the proposed changes to the rural wage index methodology. As discussed in section III.G.1. of the preamble to this proposed rule, beginning in FY 2024, we are proposing to include hospitals with § 412.103 reclassification along with geographically rural hospitals in all rural wage index calculations, and to only exclude ''dual reclass'' hospitals (hospitals with simultaneous § 412.103 and MGCRB reclassifications) when implicated by the hold harmless provision at section 1886(d)(8)(C)(ii) of the Act. We are also proposing to include the data of all § 412.103 hospitals (including those that have an MGCRB reclassification) in the calculation of the rural floor and the calculation of ''the wage index for rural areas in the State in which the county is located'' as referred to in section 1886(d)(8)(C)(iii) of the Act.

The net impact of these changes is an estimated 6.3 percent increase in capital payments per case from FY 2023 to FY 2024 for all hospitals (as shown in Table III).

The geographic comparison shows that, on average, hospitals in both urban and rural classifications would experience an increase in capital IPPS payments per case in FY 2024 as compared to FY 2023. Capital IPPS payments per case would increase by an estimated 6.3 percent for hospitals in urban areas while payments to hospitals in rural areas would increase by 5.9 percent in FY 2023 to FY 2024.

The comparisons by region show that the change in capital payments per case from FY 2023 to FY 2024 for urban areas range from a 3.3 percent increase for the Mountain region to a 9.7 percent increase for the Pacific region. Meanwhile, the change in capital payments per case from FY 2023 to FY 2024 for rural areas range from a 2.0 percent increase for the Mountain rural region to a 16.8 percent increase for the Middle Atlantic region. These regional differences are primarily due to the proposed changes in the GAFs, which reflect the proposed changes to the rural wage index methodology, and estimated

changes in capital DSH payments. We note that the proposed changes to the rural wage index methodology are significantly contributing to the larger than average increase in capital payments per case for the rural Middle Atlantic region. The comparison by hospital type of ownership (Voluntary, Proprietary, and Government) shows that voluntary and government hospitals are expected to experience the highest increase in capital payments per case from FY 2023 to FY 2024 of 6.4 percent. Meanwhile, proprietary hospitals are expected to experience an increase in capital payments per case from FY 2023 to FY 2024 of 5.3 percent.

Section 1886(d)(10) of the Act established the MGCRB. Hospitals may apply for reclassification for purposes of the wage index for FY 2024. Reclassification for wage index purposes also affects the GAFs because that factor is constructed from the hospital wage index. To present the effects of the hospitals being reclassified as of the publication of this proposed rule for FY 2024, we show the proposed average capital payments per case for reclassified hospitals for FY 2024. Urban reclassified hospitals are expected to experience an increase in capital payments of 7.8 percent; urban nonreclassified hospitals are expected to experience an increase in capital payments of 4.4 percent. The higher expected increase in payments for urban reclassified hospitals compared to urban nonreclassified hospitals is primarily due to an estimated increase in capital DSH payments to urban reclassified hospitals. As discussed previously, we are proposing a change to our capital DSH policy under which geographically urban hospitals with 100 or more beds reclassified as rural under § 412.103 would be eligible for capital DSH payments beginning in FY 2024. Rural reclassified hospitals are expected to experience an increase in capital payments of 5.7 percent; rural nonreclassified hospitals are expected to experience an increase in capital payments of 6.2 percent.

BILLING CODE 4120–01–C

J. Effects of Proposed Payment Rate Changes and Policy Changes Under the LTCH PPS

1. Introduction and General Considerations

In section VII. of the preamble of this proposed rule and section V. of the Addendum to this proposed rule, we set forth the proposed annual update to the payment rates for the LTCH PPS for FY 2024. In the preamble of this proposed rule, we specify the statutory authority for the proposals that are presented, identify the proposed policies for FY 2024, and present rationales for our proposals as well as alternatives that were considered. In this section of Appendix A to this proposed rule, we discuss the impact of the proposed changes to the payment rate, factors, and other payment rate policies related to the LTCH PPS that are presented in the preamble of this proposed rule in terms of their estimated fiscal impact on the Medicare budget and on LTCHs.

There are 333 LTCHs included in this impact analysis. We note that, although there are currently approximately 341 LTCHs, for purposes of this impact analysis, we excluded the data of all-inclusive rate providers consistent with the development of the FY 2024 MS–LTC–DRG relative weights (discussed in section VII.B.3. of the preamble of this proposed rule). We have also excluded data for CCN 312024 from this impact analysis due to their abnormal charging practices. We note this is consistent with our proposals to remove this LTCH from the calculation of the FY 2024 MS–LTC–DRG relative weights, the area wage level adjustment budget neutrality factor, and the fixed-loss amount for LTCH PPS standard Federal payment rate cases (discussed in section VII.B.3. of the preamble of this proposed rule). Moreover, in the claims data used for this proposed rule, one of these 333 LTCHs only have claims for site neutral payment rate cases and, therefore, do not affect our impact analysis for LTCH PPS standard Federal payment rate cases.

In the impact analysis, we used the proposed payment rate, factors, and policies presented in this proposed rule, the proposed 2.9 percent annual update to the LTCH PPS standard Federal payment rate, the proposed update to the MS–LTC–DRG classifications and relative weights, the proposed update to the wage index values and labor-related share, and the best available claims and CCR data to estimate the change in payments for FY 2024.

Under the dual rate LTCH PPS payment structure, payment for LTCH discharges that meet the criteria for exclusion from the site neutral payment rate (that is, LTCH PPS standard Federal payment rate cases) is based on the LTCH PPS standard Federal payment rate. Consistent with the statute, the site neutral payment rate is the lower of the IPPS comparable per diem amount as determined under § 412.529(d)(4), including any applicable outlier payments as specified in § 412.525(a), reduced by 4.6 percent for FYs 2018 through 2026; or 100 percent of the estimated cost of the case as determined under § 412.529(d)(2). In addition, there are two separate high cost outlier targets—one for LTCH PPS standard Federal payment rate cases and one for site neutral payment rate cases. We note that section 3711(b)(2) of the CARES Act has provided a waiver of the application of the site neutral payment rate for LTCH cases admitted during the COVID–19 PHE period. At the time of development of this proposed rule, the COVID–19 PHE is set to expire on May 11, 2023. As a result, all FY 2023 cases with admission dates on or before the PHE expiration date will be paid the LTCH PPS standard Federal rate regardless of whether the discharge met the statutory patient criteria. However, all FY 2023 and FY 2024 cases with admission dates after the PHE expiration date (that is, admissions occurring on or after May 12, 2023) that do not meet the criteria for exclusion from the site neutral payment rate will be paid the site neutral payment rate determined under § 412.522(c). For purposes of this impact analysis, estimates of total LTCH PPS payments for site neutral payment rate cases in FYs 2023 and 2024 were calculated using the site neutral payment rate determined under § 412.522(c) for all cases and the provisions of the CARES Act were not considered.

Based on the best available data for the 333 LTCHs in our database that were considered in the analyses used for this proposed rule, we estimate that overall LTCH PPS payments in FY 2024 would decrease by approximately 0.9 percent (or approximately $24 million) based on the proposed rates and factors presented in section VII. of the preamble and section V. of the Addendum to this proposed rule.

Based on the FY 2022 LTCH cases that were used for the analysis in this proposed rule, approximately 32 percent of those cases were classified as site neutral payment rate cases (that is, 32 percent of LTCH cases would not meet the statutory patient-level criteria for exclusion from the site neutral payment rate). Our Office of the Actuary currently estimates that the percent of LTCH PPS cases that will be classified as site neutral payment rate cases in FY 2024 will not change significantly from the most recent historical data. We estimate IPPS comparable per diem amounts using the prior year's IPPS rates and factors, updated to reflect estimated changes to the IPPS rates and payments proposed for FY 2024. Taking this into account along with other changes that would apply to the site neutral payment rate cases in FY 2024, we estimate that aggregate LTCH PPS payments for these site neutral payment rate cases would increase by approximately 10.8 percent (or approximately $35 million). This projected increase in payments to LTCH PPS site neutral payment rate cases is primarily due to the proposed updates to the IPPS rates and payments reflected in our estimate of the IPPS comparable per diem amount, as well as an estimated increase in costs for these cases determined using the charge and CCR adjustment factors described in section V.D.3.b. of the Addendum to this proposed rule. We note that we estimate payments to site neutral payment rate cases in FY 2024 will represent approximately 14 percent of estimated aggregate FY 2024 LTCH PPS payments.

Based on the FY 2022 LTCH cases that were used for the analysis in this proposed rule, approximately 68 percent of LTCH cases will meet the patient-level criteria for exclusion from the site neutral payment rate in FY 2024, and will be paid based on the LTCH PPS standard Federal payment rate for the full year. We estimate that total LTCH PPS payments for these LTCH PPS standard Federal payment rate cases in FY 2024 will decrease approximately 2.5 percent (or approximately $59 million). This estimated decrease in LTCH PPS payments for LTCH PPS standard Federal payment rate cases in FY 2024 is primarily due to the projected 4.7 percent decrease in high cost outlier payments as a percentage of total LTCH PPS standard Federal payment rate payments, which is discussed later in this section of the proposed rule.

Based on the 333 LTCHs that were represented in the FY 2022 LTCH cases that were used for the analyses in this proposed rule presented in this Appendix, we estimate that aggregate FY 2023 LTCH PPS payments will be approximately $2.645 billion, as compared to estimated aggregate FY 2024 LTCH PPS payments of approximately $2.622 billion, resulting in an estimated overall decrease in LTCH PPS payments of approximately $24 million. We note that the estimated $24 million decrease in LTCH PPS

payments in FY 2024 does not reflect changes in LTCH admissions or case-mix intensity, which will also affect the overall payment effects of the proposed policies in this proposed rule.

The LTCH PPS standard Federal payment rate for FY 2023 is $46,432.77. For FY 2024, we are proposing to establish an LTCH PPS standard Federal payment rate of $47,948.15 which reflects the proposed 2.9 percent annual update to the LTCH PPS standard Federal payment rate and the budget neutrality factor for updates to the area wage level adjustment of 1.0035335 (discussed in section V.B.6. of the Addendum to this proposed rule). For LTCHs that fail to submit data for the LTCH QRP, in accordance with section 1886(m)(5)(C) of the Act, we are proposing to establish an LTCH PPS standard Federal payment rate of $47,016.21. This proposed LTCH PPS standard Federal payment rate reflects the updates and factors previously described, as well as the required 2.0 percentage point reduction to the annual update for failure to submit data under the LTCH QRP.

Table IV shows the estimated impact for LTCH PPS standard Federal payment rate cases. The estimated change attributable solely to the proposed annual update of 2.9 percent to the LTCH PPS standard Federal payment rate is projected to result in an increase of 2.8 percent in payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2023 to FY 2024, on average, for all LTCHs (Column 6). The estimated increase of 2.8 percent shown in Column 6 of Table IV also includes estimated payments for short-stay outlier (SSO) cases, a portion of which are not affected by the annual update to the LTCH PPS standard Federal payment rate, as well as the reduction that is applied to the annual update for LTCHs that do not submit the required LTCH QRP data. For most hospital categories, the projected increase in payments based on the LTCH PPS standard Federal payment rate to LTCH PPS standard Federal payment rate cases also rounds to approximately 2.8 percent.

For FY 2024, we are proposing to update the wage index values based on the most recent available data (data from cost reporting periods beginning during FY 2020 which is the same data used for the FY 2024 IPPS wage index). In addition, we are proposing to establish a labor-related share of 68.4 percent for FY 2024, based on the most recent available data (IGI's fourth quarter 2022 forecast) of the relative importance of the labor-related share of operating and capital costs of the 2017-based LTCH market basket. We also are proposing to apply an area wage level budget neutrality factor of 1.0035335 to ensure that the proposed changes to the area wage level adjustment would not result in any change in estimated aggregate LTCH PPS payments to LTCH PPS standard Federal payment rate cases.

For LTCH PPS standard Federal payment rate cases, we currently estimate high cost outlier payments as a percentage of total LTCH PPS standard Federal payment rate payments will decrease from FY 2023 to FY 2024. Based on the FY 2022 LTCH cases that were used for the analyses in this proposed rule, we estimate that the FY 2023 high cost outlier threshold of $38,518 (as established in the FY 2023 IPPS/LTCH PPS final rule) will result in estimated high cost outlier payments for LTCH PPS standard Federal payment rate cases in FY 2023 that are projected to exceed the 7.975 percent target. Specifically, we currently estimate that high cost outlier payments for LTCH PPS standard Federal payment rate cases will be approximately 12.7 percent of the estimated total LTCH PPS standard Federal payment rate payments in FY 2023. Combined with our estimate that FY 2024 high cost outlier payments for LTCH PPS standard Federal payment rate cases will be 7.975 percent of estimated total LTCH PPS standard Federal payment rate payments in FY 2024, this will result in an estimated decrease in high cost outlier payments as a percentage of total LTCH PPS standard Federal payment rate payments of approximately 4.7 percent between FY 2023 and FY 2024. We note that, in calculating these estimated high cost outlier payments, we inflated charges reported on the FY 2022 claims by the charge inflation factor in section V.D.3.b. of the Addendum to this proposed rule. We also note that, in calculating these estimated high cost outlier payments, we estimated the cost of each case by multiplying the inflated charges by the adjusted CCRs that we determined using our proposed methodology described in section V.D.3.b. of the Addendum to this proposed rule. We lastly note, as discussed in section V.D.3.b. of the Addendum to this proposed rule, we are soliciting comments on our proposed methodology for determining the fixed-loss amount for FY 2024 and will consider these comments when finalizing our methodology in the final rule.

Table IV shows the estimated impact of the payment rate and policy changes on LTCH PPS payments for LTCH PPS standard Federal payment rate cases for FY 2024 by comparing estimated FY 2023 LTCH PPS payments to estimated FY 2024 LTCH PPS payments. (As noted earlier, our analysis does not reflect changes in LTCH admissions or case-mix intensity.) We note that these impacts do not include LTCH PPS site neutral payment rate cases as discussed in section I.J.3. of this Appendix.

As we discuss in detail throughout this proposed rule, based on the best available data, we believe that the provisions of this proposed rule relating to the LTCH PPS, which are projected to result in an overall decrease in estimated aggregate LTCH PPS payments, and the resulting LTCH PPS payment amounts will result in appropriate Medicare payments that are consistent with the statute.

2. Impact on Rural Hospitals

For purposes of section 1102(b) of the Act, we define a small rural hospital as a hospital that is located outside of an urban area and has fewer than 100 beds. As shown in Table IV, we are projecting a 1.5 percent decrease in estimated payments for LTCH PPS standard Federal payment rate cases for LTCHs located in a rural area, primarily due to a projected decrease in high cost outlier payments. This estimated impact is based on the FY 2022 data for the 18 rural LTCHs (out of 333 LTCHs) that were used for the impact analyses shown in Table IV.

3. Anticipated Effects of the Proposed LTCH PPS Payment Rate Changes and Policy Changes

a. Proposed Budgetary Impact

Section 123(a)(1) of the BBRA requires that the PPS developed for LTCHs ''maintain budget neutrality.'' We believe that the statute's mandate for budget neutrality applies only to the first year of the implementation of the LTCH PPS (that is, FY 2003). Therefore, in calculating the FY 2003 standard Federal payment rate under § 412.523(d)(2), we set total estimated payments for FY 2003 under the LTCH PPS so that estimated aggregate payments under the LTCH PPS were estimated to equal the amount that would have been paid if the LTCH PPS had not been implemented.

Section 1886(m)(6)(A) of the Act establishes a dual rate LTCH PPS payment structure with two distinct payment rates for LTCH discharges beginning in FY 2016. Under this statutory change, LTCH discharges that meet the patient-level criteria for exclusion from the site neutral payment rate (that is, LTCH PPS standard Federal payment rate cases) are paid based on

the LTCH PPS standard Federal payment rate. LTCH discharges paid at the site neutral payment rate are generally paid the lower of the IPPS comparable per diem amount, reduced by 4.6 percent for FYs 2018 through 2026, including any applicable high cost outlier (HCO) payments, or 100 percent of the estimated cost of the case, reduced by 4.6 percent.

As discussed in section I.J.1. of this Appendix, we project a decrease in aggregate LTCH PPS payments in FY 2024 of approximately $24 million. This estimated decrease in payments reflects the projected decrease in payments to LTCH PPS standard Federal payment rate cases of approximately $59 million and the projected increase in payments to site neutral payment rate cases of approximately $35 million under the dual rate LTCH PPS payment rate structure required by the statute beginning in FY 2016.

As discussed in section V.D. of the Addendum to this proposed rule, our actuaries project cost and resource changes for site neutral payment rate cases due to the site neutral payment rates required under the statute. Specifically, our actuaries project that the costs and resource use for cases paid at the site neutral payment rate will likely be lower, on average, than the costs and resource use for cases paid at the LTCH PPS standard Federal payment rate, and will likely mirror the costs and resource use for IPPS cases assigned to the same MS–DRG. While we are able to incorporate this projection at an aggregate level into our payment modeling, because the historical claims data that we are using in this proposed rule to project estimated FY 2024 LTCH PPS payments (that is, FY 2022 LTCH claims data) do not reflect this actuarial projection, we are unable to model the impact of the change in LTCH PPS payments for site neutral payment rate cases at the same level of detail with which we are able to model the impacts of the changes to LTCH PPS payments for LTCH PPS standard Federal payment rate cases. Therefore, Table IV only reflects proposed changes in LTCH PPS payments for LTCH PPS standard Federal payment rate cases and, unless otherwise noted, the remaining discussion in section I.J.3. of this Appendix refers only to the impact on LTCH PPS payments for LTCH PPS standard Federal payment rate cases. In the following section, we present our proposed provider impact analysis for the changes that affect LTCH PPS payments for LTCH PPS standard Federal payment rate cases.

b. Proposed Impact on Providers

The basic methodology for determining a per discharge payment for LTCH PPS standard Federal payment rate cases is currently set forth under §§ 412.515 through 412.533 and 412.535. In addition to adjusting the LTCH PPS standard Federal payment rate by the MS–LTC–DRG relative weight, we make adjustments to account for area wage levels and SSOs. LTCHs located in Alaska and Hawaii also have their payments adjusted by a COLA. Under our application of the dual rate LTCH PPS payment structure, the LTCH PPS standard Federal payment rate is generally only used to determine payments for LTCH PPS standard Federal payment rate cases (that is, those LTCH PPS cases that meet the statutory criteria to be excluded from the site neutral payment rate). LTCH discharges that do not meet the patient-level criteria for exclusion are paid the site neutral payment rate, which we are calculating as the lower of the IPPS comparable per diem amount as determined under § 412.529(d)(4), reduced by 4.6 percent for FYs 2018 through 2026, including any applicable outlier payments, or 100 percent of the estimated cost of the case as determined under existing § 412.529(d)(2). In addition, when certain thresholds are met, LTCHs also receive HCO payments for both LTCH PPS standard Federal payment rate cases and site neutral payment rate cases that are paid at the IPPS comparable per diem amount.

To understand the impact of the changes to the LTCH PPS payments for LTCH PPS standard Federal payment rate cases presented in this proposed rule on different categories of LTCHs for FY 2024, it is necessary to estimate payments per discharge for FY 2023 using the rates, factors, and the policies established in the FY 2023 IPPS/LTCH PPS final rule and estimate payments per discharge for FY 2024 using the proposed rates, factors, and the policies in this proposed rule (as discussed in section VII. of the preamble of this proposed rule and section V. of the Addendum to this proposed rule). As discussed elsewhere in this proposed rule, these estimates are based on the best available LTCH claims data and other factors, such as the application of inflation factors to estimate costs for HCO cases in each year. The resulting analyses can then be used to compare how our proposed policies applicable to LTCH PPS standard Federal payment rate cases affect different groups of LTCHs.

For the following analysis, we group hospitals based on characteristics provided in the OSCAR data, cost report data in HCRIS, and PSF data. Hospital groups included the following:

- *Location:* large urban/other urban/rural.
- Participation date.
- Ownership control.
- Census region.
- Bed size.

c. Proposed Calculation of LTCH PPS Payments for LTCH PPS Standard Federal Payment Rate Cases

For purposes of this impact analysis, to estimate the per discharge payment effects of our policies on payments for LTCH PPS standard Federal payment rate cases, we simulated FY 2023 and proposed FY 2024 payments on a case-by-case basis using historical LTCH claims from the FY 2022 MedPAR files that met or would have met the criteria to be paid at the LTCH PPS standard Federal payment rate if the statutory patient-level criteria had been in effect at the time of discharge for all cases in the FY 2022 MedPAR files. For modeling FY 2023 LTCH PPS payments, we used the FY 2023 standard Federal payment rate of $46,432.77 (or $45,538.11 for LTCHs that failed to submit quality data as required under the requirements of the LTCH QRP). Similarly, for modeling payments based on the proposed FY 2024 LTCH PPS standard Federal payment rate, we used the proposed FY 2024 standard Federal payment rate of $47,948.15 (or $47,016.21 for LTCHs that failed to submit quality data as required under the requirements of the LTCH QRP). In each case, we applied the applicable proposed adjustments for area wage levels and the COLA for LTCHs located in Alaska and Hawaii. Specifically, for modeling FY 2023 LTCH PPS payments, we used the current FY 2023 labor-related share (68.0 percent), the wage index values established in the Tables 12A and 12B listed in the Addendum to the FY 2023 IPPS/LTCH PPS final rule (which are available via the internet on the CMS website), the FY 2023 HCO fixed-loss amount for LTCH PPS standard Federal payment rate cases of $38,518 (as reflected in the FY 2023 IPPS/LTCH PPS final rule), and the FY 2023 COLA factors (shown in the table in section V.C. of the Addendum to that final rule) to adjust the FY 2023 nonlabor-related share (32.0 percent) for LTCHs located in Alaska and Hawaii. Similarly, for modeling proposed FY 2024 LTCH PPS payments, we used the proposed FY 2024 LTCH PPS labor-related share (68.4 percent), the proposed FY 2024 wage index values from Tables 12A and 12B listed in section VI. of the Addendum to this

proposed rule (which are available via the internet on the CMS website), the proposed FY 2024 HCO fixed-loss amount for LTCH PPS standard Federal payment rate cases of $94,378 (as discussed in section V.D.3. of the Addendum to this proposed rule), and the proposed FY 2024 COLA factors (shown in the table in section V.C. of the Addendum to this proposed rule) to adjust the proposed FY 2024 nonlabor-related share (31.6 percent) for LTCHs located in Alaska and Hawaii. We noted that in modeling payments for HCO cases for LTCH PPS standard Federal payment rate cases, we inflated charges reported on the FY 2022 claims by the charge inflation factors in section V.D.3.b. of the Addendum to this proposed rule. We also noted that in modeling payments for HCO cases for LTCH PPS standard Federal payment rate cases, we estimated the cost of each case by multiplying the inflated charges by the adjusted CCRs that we determined using our proposed methodology described in section V.D.3.b. of the Addendum to this proposed rule.

The impacts that follow reflect the estimated ''losses'' or ''gains'' among the various classifications of LTCHs from FY 2023 to FY 2024 based on the payment rates and policy changes applicable to LTCH PPS standard Federal payment rate cases presented in this proposed rule. Table IV illustrates the estimated aggregate impact of the change in LTCH PPS payments for LTCH PPS standard Federal payment rate cases among various classifications of LTCHs. (As discussed previously, these impacts do not include LTCH PPS site neutral payment rate cases.)

- The first column, LTCH Classification, identifies the type of LTCH.
- The second column lists the number of LTCHs of each classification type.
- The third column identifies the number of LTCH cases expected to meet the LTCH PPS standard Federal payment rate criteria.
- The fourth column shows the estimated FY 2023 payment per discharge for LTCH cases expected to meet the LTCH PPS standard Federal payment rate criteria (as described previously).
- The fifth column shows the estimated proposed FY 2024 payment per discharge for LTCH cases expected to meet the LTCH PPS standard Federal payment rate criteria (as described previously).
- The sixth column shows the percentage change in estimated payments per discharge for LTCH cases expected to meet the LTCH PPS standard Federal payment rate criteria from FY 2023 to FY 2024 due to the proposed annual update to the standard Federal rate (as discussed in section V.A.2. of the Addendum to this proposed rule).
- The seventh column shows the percentage change in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2023 to FY 2024 for proposed changes to the area wage level adjustment (that is, the updated hospital wage data and labor-related share) and the application of the corresponding proposed budget neutrality factor (as discussed in section V.B.6. of the Addendum to this proposed rule).
- The eighth column shows the percentage change in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2023 (Column 4) to FY 2024 (Column 5) for all proposed changes.

[1] Estimated FY 2024 LTCH PPS payments for LTCH PPS standard Federal payment rate criteria based on the proposed payment rate and factor changes applicable to such cases presented in the preamble of and the Addendum to this proposed rule.

[2] Percent change in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2023 to FY 2024 for the annual update to the LTCH PPS standard Federal payment rate.

[3] Percent change in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2023 to FY 2024 for changes due to the changes to the area wage level adjustment under § 412.525(c) (that is, updated hospital wage data and the labor related share).

[4] Percent change in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2023 (shown in Column 4) to FY 2024 (shown in Column 5), including all of the changes to the rates and factors applicable to such cases presented in the preamble and the Addendum to this proposed rule. We note that this column, which shows the percent change in estimated payments per discharge for all changes, does not equal the sum of the percent changes in estimated payments per discharge for the annual update to the LTCH PPS standard Federal payment rate (Column 6) and the changes due to the changes to the area wage level adjustment with budget neutrality (Column 7) due to the effect of estimated changes in estimated payments to aggregate HCO payments for LTCH PPS standard Federal payment rate cases (as discussed in this impact analysis), as well as other interactive effects that cannot be isolated.

BILLING CODE 4120–01–C

d. Results

Based on the FY 2022 LTCH cases (from 333 LTCHs) that were used for the analyses in this proposed rule, we have prepared the following summary of the impact (as shown in Table IV) of the LTCH PPS payment rate and proposed policy changes for LTCH PPS standard Federal payment rate cases presented in this proposed rule. The impact analysis in Table IV shows that estimated payments per discharge for LTCH PPS standard Federal payment rate cases are

projected to decrease 2.5 percent, on average, for all LTCHs from FY 2023 to FY 2024 as a result of the proposed payment rate and policy changes applicable to LTCH PPS standard Federal payment rate cases presented in this proposed rule. This estimated 2.5 percent decrease in LTCH PPS payments per discharge was determined by comparing estimated FY 2024 LTCH PPS payments (using the proposed payment rates and factors discussed in this proposed rule) to estimated FY 2023 LTCH PPS payments for LTCH discharges which will be LTCH PPS standard Federal payment rate cases if the dual rate LTCH PPS payment structure was or had been in effect at the time of the discharge (as described in section I.J.3. of this Appendix).

As stated previously, we are proposing an annual update to the LTCH PPS standard Federal payment rate for FY 2024 of 2.9 percent. For LTCHs that fail to submit quality data under the requirements of the LTCH QRP, as required by section 1886(m)(5)(C) of the Act, a 2.0 percentage point reduction is applied to the annual update to the LTCH PPS standard Federal payment rate. Consistent with § 412.523(d)(4), we also are applying a proposed budget neutrality factor for changes to the area wage level adjustment of 1.0035335 (discussed in section V.B.6. of the Addendum to this proposed rule), based on the best available data at this time, to ensure that any proposed changes to the area wage level adjustment would not result in any change (increase or decrease) in estimated aggregate LTCH PPS standard Federal payment rate payments. As we also explained earlier in this section of the proposed rule, for most categories of LTCHs (as shown in Table IV, Column 6), the estimated payment increase due to the proposed 2.9 percent annual update to the LTCH PPS standard Federal payment rate is projected to result in approximately a 2.8 percent increase in estimated payments per discharge for LTCH PPS standard Federal payment rate cases for all LTCHs from FY 2023 to FY 2024. We note our estimate of the changes in payments due to the proposed update to the LTCH PPS standard Federal payment rate also includes estimated payments for short-stay outlier (SSO) cases, a portion of which are not affected by the annual update to the LTCH PPS standard Federal payment rate, as well as the reduction that is applied to the annual update for LTCHs that do not submit data under the requirements of the LTCH QRP.

(1) Location

Based on the most recent available data, the vast majority of LTCHs are located in urban areas. Only approximately 5 percent of the LTCHs are identified as being located in a rural area, and approximately 4 percent of all LTCH PPS standard Federal payment rate cases are expected to be treated in these rural hospitals. The impact analysis presented in Table IV shows that the overall average percent decrease in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2023 to FY 2024 for all hospitals is 2.5 percent. The projected decrease for rural and urban hospitals, respectively, is 1.5 and 2.6.

(2) Participation Date

LTCHs are grouped by participation date into four categories: (1) before October 1983; (2) between October 1983 and September 1993; (3) between October 1993 and September 2002; and (4) October 2002 and after. Based on the best available data, the categories of LTCHs with the largest expected percentage of LTCH PPS standard Federal payment rate cases (approximately 41 percent and 45 percent, respectively) are in LTCHs that began participating in the Medicare program between October 1993 and September 2002 and after October 2002. These LTCHs are expected to experience a decrease in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2023 to FY 2024 of 2.4 percent and 2.7 percent, respectively. LTCHs that began participating in the Medicare program between October 1983 and September 1993 are projected to experience a decrease in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2023 to FY 2024 of 2.2 percent, as shown in Table IV. Approximately 3 percent of LTCHs began participating in the Medicare program before October 1983, and these LTCHs are projected to experience a decrease in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2023 to FY 2024 of 4.7 percent.

(3) Ownership Control

LTCHs are grouped into three categories based on ownership control type: voluntary, proprietary, and government. Based on the best available data, approximately 16 percent of LTCHs are identified as voluntary (Table IV). The majority (approximately 81 percent) of LTCHs are identified as proprietary, while government owned and operated LTCHs represent approximately 3 percent of LTCHs. Based on ownership type, proprietary LTCHs are expected to experience a decrease in payments to LTCH PPS standard Federal payment rate cases of 2.2 percent. Voluntary LTCHs are expected to experience a decrease in payments to LTCH PPS standard Federal payment rate cases from FY 2023 to FY 2024 of 4.7 percent. Meanwhile, government owned and operated LTCHs are expected to experience a decrease in payments to LTCH PPS standard Federal payment rate cases from FY 2023 to FY 2024 of 3.9 percent.

(4) Census Region

The comparisons by region show that the changes in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2023 to FY 2024 are projected to range from a decrease of 6.4 percent in the West North Central region to a decrease of 0.2 percent in the Mountain region. These regional variations are primarily due to the proposed changes to the area wage adjustment and estimated changes in outlier payments.

(5) Bed Size

LTCHs are grouped into six categories based on bed size: 0–24 beds; 25–49 beds; 50–74 beds; 75–124 beds; 125–199 beds; and greater than 200 beds. We project that LTCHs with 125–199 beds would experience the largest decrease in payments for LTCH PPS standard Federal payment rate cases, 3.7 percent. LTCHs with greater than 200 beds are projected to experience the smallest decrease in payments of 0.4 percent. The remaining bed size categories are projected to experience a decrease in payments in the range of 1.9 to 2.9 percent.

4. Effect on the Medicare Program

As stated previously, we project that the provisions of this proposed rule would result in a decrease in estimated aggregate LTCH PPS payments to LTCH PPS standard Federal payment rate cases in FY 2024 relative to FY 2023 of approximately $59 million (or approximately 2.5 percent) for the 333 LTCHs in our database. Although, as stated previously, the hospital-level impacts do not include LTCH PPS site neutral payment rate cases, we estimate that the provisions of this proposed rule would result in an increase in estimated aggregate LTCH PPS payments to site neutral payment rate cases in FY 2024 relative to FY 2023 of approximately $35 million (or approximately 10.8 percent) for the 333 LTCHs in our database. (As noted previously, we

estimate payments to site neutral payment rate cases in FY 2024 represent approximately 14 percent of total estimated FY 2024 LTCH PPS payments.) Therefore, we project that the provisions of this proposed rule would result in a decrease in estimated aggregate LTCH PPS payments for all LTCH cases in FY 2024 relative to FY 2023 of approximately 24 million (or approximately 0.9 percent) for the 333 LTCHs in our database.

5. Effect on Medicare Beneficiaries

Under the LTCH PPS, hospitals receive payment based on the average resources consumed by patients for each diagnosis. We do not expect any changes in the quality of care or access to services for Medicare beneficiaries as a result of this proposed rule, but we continue to expect that paying prospectively for LTCH services will enhance the efficiency of the Medicare program. As discussed previously, we do not expect the continued implementation of the site neutral payment system to have a negative impact on access to or quality of care, as demonstrated in areas where there is little or no LTCH presence, general short-term acute care hospitals are effectively providing treatment for the same types of patients that are treated in LTCHs.

L. Effects of Requirements for the Hospital Inpatient Quality Reporting (IQR) Program

In section IX.C. of the preamble of this proposed rule, we discuss our current requirements and proposed requirements for hospitals reporting quality data under the Hospital IQR Program to receive the full annual percentage increase for the FY 2024 payment determination and subsequent years.

In this proposed rule, we are proposing: (1) removal of the Elective Delivery Prior to 39 Completed Weeks Gestation: Percentage of Babies Electively Delivered Prior to 39 Completed Weeks Gestation (PC–01) measure beginning with the CY 2024 reporting period/FY 2026 payment determination; (2) adoption of the Hospital Harm—Pressure Injury electronic clinical quality measure (eCQM) beginning with the CY 2025 reporting period/FY 2027 payment determination; (3) adoption of the Hospital Harm—Acute Kidney Injury eCQM beginning with the CY 2025 reporting period/FY 2027 payment determination; (4) adoption of the Excessive Radiation Dose or Inadequate Image Quality for Diagnostic Computed Tomography (CT) in Adults (Hospital Level—Inpatient) eCQM beginning with CY 2025 reporting period/FY 2027 payment determination; (5) modification of the Hybrid Hospital-Wide All-Cause Risk Standardized Mortality measure beginning with the performance data from July 1, 2024 through June 30, 2025, impacting the FY 2027 payment determination; (6) modification of the Hybrid Hospital-Wide All-Cause Risk Standardized Readmission measure beginning with the performance data from July 1, 2024 through June 30, 2025, impacting the FY 2027 payment determination; (7) modification of the COVID–19 Vaccination Coverage among Healthcare Personnel (HCP) measure beginning with the Q4 CY 2023 reporting period/FY 2025 payment determination; (8) removal of the Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) measure beginning with the April 1, 2025 through March 31, 2028 reporting period impacting the FY 2030 payment determination; (9) removal of the Medicare Spending Per Beneficiary (MSPB)—Hospital measure beginning with the CY 2026 reporting period/FY 2028 payment determination; (10) modification of the validation targeting criteria to include any hospital with a two-tailed confidence interval that is less than 75 percent and which submitted less than four quarters of data due to receiving an extraordinary circumstances exception (ECE) for one or more quarters beginning with the FY 2027 payment determination; and (11) modification of data collecting and reporting requirements for the Hospital Consumer Assessment of Healthcare providers and Systems (HCAHPS) survey beginning with the FY 2027 payment determination.

As shown in the summary table in section XII.B.6. of the preamble of this proposed rule, we estimate a total information collection burden decrease for 3,150 IPPS hospitals of 146,674 hours at a savings of $6,917,315 annually associated with our proposed policies across a 4-year period from the CY 2024 reporting period/FY 2026 payment determination through the CY 2028 reporting period/FY 2030 payment determination, compared to our currently approved information collection burden estimates.

We note that in sections IX.C.5.a., b., and c. of the preamble of this proposed rule, we are proposing adoption of three new eCQMs. Similar to the FY 2019 IPPS/LTCH PPS final rule regarding removal of eCQMs, while there is no change in information collection burden related to those proposed provisions, we believe that costs are multifaceted and include not only the burden associated with reporting, but also the costs associated with implementing and maintaining Hospital IQR Program measures in hospitals' EHR systems for all of the eCQMs available for use in the Hospital IQR Program (83 FR 41771).

In section IX.B. of this proposed rule, we are proposing to modify the COVID–19 Vaccination Coverage among HCP measure to utilize the term ''up to date'' in the HCP vaccination definition and update the numerator to specify the time frames within which an HCP is considered up to date with recommended COVID–19 vaccines, including booster doses. Although we anticipate this modification may require some facilities to update IT systems or workflow related to maintaining accurate vaccination records for HCP, we assume most facilities are currently recording all necessary information for HCP such that this modification would not require additional information to be collected, therefore, the financial impact of any required updates would be minimal. Finally, we do not estimate any changes to the effects previously discussed in the FY 2022 IPPS/LTCH PPS final rule for the Hospital IQR Program (86 FR 45607 and 45608).

Regarding the remaining proposals to remove or modify existing measures, we do not believe any of these proposals will result in any additional economic impact beyond those discussed in section XII.B.6. (Collection of Information). Similarly, we do not believe the proposal to modify targeting criteria will have any economic impact on the IPPS hospitals selected for validation, but will only increase the number of IPPS hospitals which are subject to being targeted for validation. Any increase would not exceed the total maximum number of hospitals that would be selected for targeted validation as previously finalized.

Historically, 100 hospitals, on average, that participate in the Hospital IQR Program do not receive the full annual percentage increase in any fiscal year due to the failure to meet all requirements of the Hospital IQR Program. We anticipate that the number of hospitals not receiving the full annual percentage increase will be approximately the same as in past years based on review of previous performance.

M. Effects of Requirements for the PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program

In section IX.D of the preamble of this proposed rule, we discuss our policies for the quality data reporting program

for PPS-exempt cancer hospitals (PCHs), which we refer to as the PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program. The PCHQR Program is authorized under section 1866(k) of the Act. There is no financial impact to PCH Medicare reimbursement if a PCH does not submit data.

In section IX.D of the preamble of this proposed rule, we are proposing: (1) adoption of the Documentation of Goals of Care Discussions Among Cancer Patients measure beginning with the FY 2026 program year, (2) adoption of the Facility Commitment to Health Equity measure beginning with the FY 2026 program year; (3) adoption of the Screening for Social Drivers of Health measure with voluntary reporting in the FY 2026 program year and mandatory reporting beginning in the FY 2027 program year; (4) adoption of the Screen Positive Rate for Social Drivers of Health measure with voluntary reporting in the FY 2026 program year and mandatory reporting beginning in the FY 2027 program year; (5) updates to the data collection and reporting for the HCAHPS Survey Measure (NQF #0166) beginning with the FY 2027 program year; (6) modification of the COVID–19 Vaccination Coverage Among Healthcare Personnel (HCP) measure beginning with the FY 2025 program year; and (7) to begin public reporting of the Surgical Treatment Complications for Localized Prostate Cancer (PCH–37) measure. As shown in the summary table in section XII.B.7 of the preamble of this proposed rule, we estimate a total information collection burden increase for 11 PCHs of 188 hours at a cost of $4,088 annually associated with our proposed policies and updated burden estimates beginning with the FY 2027 program year compared to our currently approved information collection burden estimates. We refer readers to section XII.B.7 of the preamble of this proposed rule (Collection of Information) for a detailed discussion of the calculations estimating the changes to the information collection burden for submitting data to the PCHQR Program.

In section IX.D.6 of the preamble of this proposed rule, we are proposing to adopt the Documentation of Goals of Care Discussions Among Cancer Patients measure beginning with the FY 2026 program year. This measure would focus on the essential process of documenting goals of care conversations in the EHR. The intent of this measure is for PCHs to track and improve this documentation to ensure that that such conversations have taken place, have been properly documented in a manner that is retrievable by all members of the healthcare team, and to facilitate the delivery of care that aligns with patients' and families' values and unique priorities. Ideally, these conversations would occur with patients with serious illness, however, definitions of and the means of identifying serious illness may vary widely. This measure is intended to focus on cancer patients who died in the reporting PCH in the measurement period, had a diagnosis of cancer, and had at least 2 eligible contacts at the reporting hospital in the 6 months prior to death. Since we are unable to determine either an exact number of patients who meet these criteria or the extent to which the conversations currently take place, as a maximum, we estimate an average of 275 patients for each of the 11 PCHs, for a total of 3,025 patients for all PCHs. We estimate the time required for this discussion to be approximately 30 minutes (0.5 hours).

To estimate the cost per patient, we use the same methodology as in the Collection of Information section (section XII.B.7.c) and estimate a post-tax hourly wage rate of $20.71/hour. The most recent data from the Bureau of Labor Statistics reflects a median hourly wage of $121.38 per hour for a Physician. We calculate the cost of overhead, including fringe benefits, at 100 percent of the median hourly wage, consistent with previous years. This is necessarily a rough adjustment, both because fringe benefits and overhead costs vary significantly by employer and methods of estimating these costs vary widely in publicly available literature. Nonetheless, we believe that doubling the hourly wage rate ($121.38 × 2 = $242.76) to estimate total cost is a reasonably accurate estimation method and is consistent with OMB guidance. We therefore estimate the total cost associated with a patient and physician discussing goals of care to be $131.74 per patient (0.5 hours × ($20.71/hour + $242.76/hour)). For all 3,025 patients, we estimate a total cost of $398,514 (3,025 patients × $131.74/patient). In section IX.D.3 of the preamble of this proposed rule, we are proposing to adopt the Facility Commitment to Health Equity measure. In order for PCHs to receive a point for each of the five domains in the measure, affirmative attestations are required for each of the elements within a domain. For PCHs that are unable to attest affirmatively for an element, there are likely to be additional costs associated with activities such as updating hospital policies, engaging senior leadership, participating in new quality improvement activities, performing additional data analysis, and training staff. The extent of these costs would vary from PCH to PCH depending on what activities the PCH is already performing, size, and the individual choices each PCH makes in order to meet the criteria necessary to attest affirmatively.

In section IX.D.4 of the preamble of this proposed rule, we are proposing to adopt the Screening for Social Drivers of Health measure with voluntary reporting in the FY 2026 program year and mandatory reporting beginning in the FY 2027 program year. For PCHs that are not currently administering some screening mechanism and elect to begin doing so as a result of this policy, there would be some non-recurring costs associated with changes in workflow and information systems to collect the data. The extent of these costs is difficult to quantify as different PCHs may utilize different modes of data collection (for example, paper-based, electronically patient-directed, clinician-facilitated, etc.). In addition, depending on the method of data collection utilized, the time required to complete the survey may add a negligible amount of time to patient visits.

In section IX.B. of the preamble of this proposed rule, we are proposing to modify the COVID–19 Vaccination Coverage Among HCP Measure to utilize the term ''up to date'' in the HCP vaccination definition and update the numerator to specify the time frames within which an HCP is considered up to date with recommended COVID–19 vaccines, including booster doses, beginning with the FY 2025 program year. Although we anticipate this modification may require some facilities to update IT systems or workflow related to maintaining accurate vaccination records for HCP, we assume most facilities are currently recording all necessary information for HCP such that this modification would not require additional information to be collected, therefore the financial impact of any required updates would be minimal. However, due to the unique nature of each PCH, we are unable to estimate the financial impact for each PCH. We do not estimate any changes to the effects previously discussed in the FY 2022 IPPS/LTCH PPS final rule for the PCHQR Program (86 FR 45608).

We do not believe the remaining proposals will result in any additional economic impact.

N. Effects of Proposed Requirements for the Long-Term Care Hospital Quality Reporting Program (LTCH QRP)

In section IX.G. of the preamble of this proposed rule, we are proposing to modify one measure, adopt two measures and remove two measures from the LTCH QRP. Specifically, we propose to modify the HCP COVID–19 Vaccine measure and adopt the DC Function measure beginning with the FY 2025 LTCH QRP, as well as the Patient/Resident COVID–19 Vaccine measure beginning with the FY 2026 LTCH QRP. We also propose to remove two measures, the Application of Functional Assessment/Care Plan and the Functional Assessment/Care Plan measures beginning with the FY 2025 LTCH QRP. We propose to begin publicly displaying data for the quality measures TOH-Patient, TOH–Provider, DC Function, and Patient/Resident COVID–19 Vaccine measures. We propose to increase the LTCH QRP data completion thresholds for the LCDS items beginning with the FY 2026 LTCH QRP. Finally, we are seeking information on principles for selecting and prioritizing LTCH QRP quality measures and concepts for measure development and provide an update on CMS continued efforts to close the health equity gap.

We note that the CDC would account for the burden associated with the COVID–19 Vaccination Coverage among HCP measure collection under OMB control number 0920–1317 (expiration January 31, 2024). Additionally, because we are not proposing any updates to the form, manner, and timing of data submission for this measure, there would be no increase in burden associated with the proposal.

The effect of the remaining proposals for the LTCH QRP would be an overall decrease in burden for LTCHs participating in the LTCH QRP. As shown in summary table XII.B.8–1 in section XII.B.8. of the preamble of this proposed rule, we estimate a total information collection burden decrease for 330 eligible LTCHs of 1,301 hours for a total cost reduction of $127,048 annually associated with our finalized policies and updated burden estimates across the FY 2025 and FY 2026 program years compared to our currently approved information collection burden estimates. We refer readers to section XII.B.8. of the preamble of this proposed rule, where CMS has provided an estimate of the burden and cost to LTCHs, and note that it will be included in a revised information collection request for 0938–1163.

O. Effects of Requirements Regarding the Medicare Promoting Interoperability Program

In section IX.F. of the preamble of this proposed rule, we are proposing the following changes for eligible hospitals and critical access hospitals (CAHs) that attest to CMS under the Medicare Promoting Interoperability Program: (1) adoption of the Hospital Harm—Pressure Injury electronic clinical quality measure (eCQM) beginning with the CY 2025 reporting period; (2) adoption of the Hospital Harm—Acute Kidney Injury eCQM Hospital Harm—Pressure Injury eCQM beginning with the CY 2025 reporting period; (3) adoption of the Excessive Radiation Dose or Inadequate Image Quality for Diagnostic Computed Tomography (CT) in Adults eCQM beginning with the CY 2025 reporting period; (4) modification of the SAFER Guides measure to require eligible hospitals and CAHs to submit a ''yes'' attestation to fulfill the measure beginning with the EHR reporting period in CY 2024; and (5) establishing an EHR reporting period of a minimum of any continuous 180-day period in CY 2025. As discussed in section XII. of the preamble of this proposed rule, we do not estimate a change in total information collection burden associated with our proposed policies.

In section IX.F.7.a.(2). of the preamble of this proposed rule, we are proposing to adopt three new eCQMs. Similar to the FY 2019 IPPS/LTCH PPS final rule regarding removal of eCQM measures, while there is no change in information collection burden related to those proposed provisions, we believe that costs are multifaceted and include not only the burden associated with reporting but also the costs associated with implementing and maintaining program measures in hospitals' EHR systems for all of the eCQMs available for use in the Medicare Promoting Interoperability Program (83 FR 41771).

In section IX.F.3. of the preamble of this proposed rule, we are proposing to modify the SAFER Guides measure to require eligible hospitals and CAHs to submit a ''yes'' attestation to fulfill the measure beginning with the EHR reporting period in CY 2024. In the CY 2022 IPPS/LTCH PPS final rule, we adopted the SAFER Guides measure and required eligible hospitals and CAHs to attest ''yes'' or ''no'' as to whether they completed an annual self-assessment on each of the nine SAFER Guides during the calendar year in which their EHR reporting period occurs (86 FR 45479 through 45481). If this proposal is finalized, eligible hospitals and CAHs would be required to complete an annual self-assessment on each of the nine SAFER Guides. Because each eligible hospital and CAH is unique and may conduct these self-assessments with varying degrees of rigor, we are unable to accurately estimate the time each eligible hospital or CAH would spend performing each self-assessment or the staff they would utilize. Therefore, we estimate the time required to conduct each self-assessment would range from approximately 30 minutes per guide to approximately 20 minutes per recommendation.[778] Across the nine SAFER Guides and 165 recommendations within them, the estimated time to complete all nine self-assessments would range from a minimum of 4.5 hours to a maximum of 55 hours. Based on the suggested sources of input provided in the SAFER Guides, we assume that eligible hospitals and CAHs will form multi-disciplinary teams composed of 1.0 FTE of a clinical administrator and 0.75 FTE each of a clinician, support staff, EHR developer, and health IT support staff to conduct the self-assessments. Table I.O.-01 provides the detail of our calculated cost to conduct SAFER Guide self-assessments.

[778] Toward More Proactive Approaches to Safety in the Electronic Health Record Era. Available at *https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8136246/*. Accessed December 14, 2022.

[779] *http://www.bls.gov/oes/current/oes_nat.htm.* Accessed December 14, 2022.

Table I.O.-01. Cost Per Eligible Hospital and CAH to Conduct SAFER Guides Self-Assessment

Eligible Hospital/CAH Staff Title	BLS Labor Category (Occupation Code)[1]	Wage Rate*	FTE	Labor Cost
Clinicians	Physicians	$242.76	0.75	$182.07
Support Staff	Medical Record Specialists	$44.86	0.75	$33.65
Clinical Administration	Medical and Health Services Managers	$97.44	1.0	$97.44
EHR Developer	Web Developers	$116.10	0.75	$87.08
Health IT Support Staff	Health Information Technologists and Medical Registrars	$53.42	0.75	$40.07
Total Cost Per Hour of Self-Assessment Team				$440.31
Minimum Cost to Conduct Self-Assessment (4.5 hours x $440.31/hour)				**$1,981**
Maximum Cost to Conduct Self-Assessment (55 hours x $440.31/hour)				**$24,217**

* We calculated the cost of overhead, including fringe benefits, at 100 percent of the median hourly wage, consistent with previous years. This is necessarily a rough adjustment, both because fringe benefits and overhead costs vary significantly by employer and methods of estimating these costs vary widely in the literature. Nonetheless, we believe that doubling the hourly wage rate to estimate total cost is a reasonably accurate estimation method.

Using the cost to complete all nine self-assessments from Table I.O.-01, we estimate all 4,500 eligible hospitals and CAHs would require between 20,250 hours (4.5 hours per hospital/CAHs × 4,500 hospitals/CAHs) and 247,500 hours (55 hours per hospital/CAHs × 4,500 hospitals/CAHs) at a cost between $8,916,278 (20,250 hours × $440.31/hour) and $108,976,725 (247,500 hours × $440.31/hour) in order to attest ''yes'' to the measure. We invite comment on our assumptions regarding the economic impact of the proposed modification to the SAFER Guides measure.

While the cost to conduct a SAFER Guides self-assessment can be high, we believe the cost is outweighed by the potential for improved healthcare outcomes, increased efficiency, reduced risk of data breaches and ransomware attacks, and decreased malpractice premiums.[780]

P. Alternatives Considered

This proposed rule contains a range of policies. It also provides descriptions of the statutory provisions that are addressed, identifies the proposed policies, and presents rationales for our decisions and, where relevant, alternatives that were considered.

1. Alternatives Considered to the Proposed Hospital Wage Index Calculations

As discussed in section III.G.1. of the preamble of this proposed rule, we are proposing to include hospitals with § 412.103 reclassification along with geographically rural hospitals in all rural wage index calculations, and to only exclude ''dual reclass'' hospitals (hospitals with simultaneous § 412.103 and MGCRB reclassifications) when implicated by the hold harmless provision at section 1886(d)(8)(C)(ii) of the Act. Consistent with the previous proposal, beginning with FY 2024 we are proposing to include the data of all § 412.103 hospitals (including those that have an MGCRB reclassification) in the calculation of the rural floor and the calculation of ''the wage index for rural areas in the State in which the county is located'' as referred to in section 1886(d)(8)(C)(iii) of the Act. As also discussed in section III.G.1 of the preamble of this proposed rule, we acknowledge that these proposals would have significant effects on wage index values. In addition, as a result of this proposed change, both the geographic reclassification budget neutrality adjustment and the rural floor budget neutrality adjustment are significantly larger than in prior years.

In the past, such as in response to the FY 2020 IPPS/LTCH PPS proposed rule, commenters have strongly supported policies that ''curb . . . the manipulative practice of some hospitals abusing the rural floor provision to inappropriately influence the rural floor wage index value, which many commenters stated exacerbates the wage index disparity between urban and rural hospitals'' (84 FR 42333). Commenters stated that ''the use of urban to rural reclassifications to artificially inflate the rural floor has stretched the rural floor provision beyond its original intent . . . hospitals should not be penalized and bear the burden of declining reimbursement due to other hospitals manipulating their state wage index (84 FR 42334).

Considering the commenters' support for policies that limited the extent to which hospitals could manipulate the rural floor wage index value, as well as the significant redistributive effects, we therefore considered maintaining our current methodology for calculating the rural wage index, which would not require any modification to the rural floor or the calculation of ''the wage index for rural areas in the State in which the county is located'' as referred to in section 1886(d)(8)(C)(iii) of the Act''. However, given that the Courts have repeatedly held unlawful CMS policies that do not treat § 412.103 hospitals the same as geographically rural hospitals based on section 1886(d)(8)(E)(i) of the Act, the ongoing risk of the pending lawsuits cited previously, and the recognition of the challenge should we need to implement any future remedy in a budget neutral manner, we determined that it was necessary to propose to include hospitals with § 412.103 reclassification along with geographically rural hospitals in all rural wage index calculations, and to exclude ''dual reclass'' hospitals (hospitals with simultaneous § 412.103 and MGCRB reclassifications) implicated by the hold harmless provision at section 1886(d)(8)(C)(ii) of the Act, with the resulting changes to the rural floor and the calculation of ''the wage index for rural areas in the State in which the county is located'' as referred to in section 1886(d)(8)(C)(iii) of the Act.

2. Alternatives Considered to the Proposed HCP COVID–19 Vaccine Measure

With regard to the proposal to modify the HCP COVID–19 Vaccine measure and to add the Patient/Resident COVID–19 Vaccine measure to the LTCH QRP Program, the COVID–19 pandemic has exposed the importance of implementing infection prevention strategies, including the promotion of

[780] *https://www.eisneramper.com/safer-guides-healthcare-organizations-0822/.* Accessed December 14, 2022.

COVID–19 vaccination for healthcare personnel and patients. We believe this measure will encourage healthcare personnel to get up to date with the COVID–19 vaccine and increase vaccine uptake in patients/residents resulting in fewer cases, less hospitalizations, and lower mortality associated with the SARS–CoV–2 virus, but we were unable to identify any alternative methods for collecting the data. An overwhelming public need exists to target quality improvement among LTCHs, as well as provide data to patients and caregivers through transparency of data. Therefore, these proposed measures have the potential to generate actionable data on COVID–19 vaccination rates.

3. Alternatives Considered to the Proposed LTCH QRP Reporting Requirements

With regard to the proposal to increase the data completion threshold for LCDS data submitted to meet the LTCH QRP reporting requirements, the proposed threshold of 90 percent is based on the need for substantially complete records, which allows appropriate analysis of quality measure data for the purposes of updating quality measure specifications. This data is ultimately reported to the public, allowing our beneficiaries to gain a more complete understanding of LTCH performance related to these quality metrics, and helping them to make informed healthcare choices. We considered the alternative of not increasing the data completion threshold, but our data suggest that LTCHs are already in compliance with, or exceeding this proposed threshold.

4. Alternatives Considered for the Proposed Replacement of the Application of Functional Assessment/Care Plan Process Measure

The proposal to replace the topped-out Application of Functional Assessment/Care Plan process measure with the proposed DC Function measure, which has strong scientific acceptability, satisfies the requirement that there be at least one cross-setting function measure in the Post-Acute Care (PAC) QRPs, including the IRF QRP, that uses standardized functional assessment data elements from standardized patient assessment instruments. We considered the alternative of delaying the proposal of adopting the DC function measure. However, given the proposed dc Function measure's strong scientific acceptability, the fact that it provides an opportunity to replace the current Application of Functional Assessment/Care Plan process measure, and uses standardized functional assessment data elements that are already collected, we believe further delay of the dc Function measure is unwarranted. Further, the proposed removal of the Application of Functional Assessment/Care Plan and Functional Assessment measures meets measure removal factors one and six,[781] and no longer provide meaningful distinctions in improvements in performance. Therefore, no alternatives were considered.

As discussed previously, these proposals for the LTCH QRP will result in an overall decrease in burden for LTCHs, and we believe the importance of the information necessitates these provisions.

Q. Overall Conclusion

1. Acute Care Hospitals

Acute care hospitals are estimated to experience an increase of approximately $2.7 billion in FY 2024, including operating, capital, low-volume hospital payments, and new technology changes. The estimated change in operating payments is approximately $2.7 billion (discussed in section I.F. and I.G. of this Appendix). The estimated change in capital payments is approximately $0.446 billion (discussed in section I.I. of this Appendix). The estimated change in new technology add-on payments is approximately −$0.466 billion as discussed in section I.G. of this Appendix. The change in new technology add-on payments reflects the net impact of new applications under the alternative pathways and continuing new technology add-on payments. Total may differ from the sum of the components due to rounding.

Table I. of section I.F. of this Appendix also demonstrates the estimated redistributional impacts of the IPPS budget neutrality requirements for the proposed MS–DRG and wage index changes, and for the wage index reclassifications under the MGCRB.

We estimate that hospitals would experience a 6.2 percent increase in capital payments per case, as shown in Table III. of section I.I. of this Appendix. We project that there would be a $446 million increase in capital payments in FY 2024 compared to FY 2023.

The discussions presented in the previous pages, in combination with the remainder of this proposed rule, constitute a regulatory impact analysis.

2. LTCHs

Overall, LTCHs are projected to experience a decrease in estimated payments in FY 2024. In the impact analysis, we are using the proposed rates, factors, and policies presented in this proposed rule based on the best available claims and CCR data to estimate the change in payments under the LTCH PPS for FY 2024. Accordingly, based on the best available data for the 333 LTCHs included in our analysis, we estimate that overall FY 2024 LTCH PPS payments would decrease approximately $24 million relative to FY 2023 primarily due to the annual update to the LTCH PPS standard Federal rate offset by an estimated decrease in high cost outlier payments.

R. Regulatory Review Cost Estimation

If regulations impose administrative costs on private entities, such as the time needed to read and interpret a rule, we should estimate the cost associated with regulatory review. Due to the uncertainty involved with accurately quantifying the number of entities that will review the rule, we assume that the total number of unique commenters on last year's proposed rule will be the number of reviewers of this proposed rule. We acknowledge that this assumption may understate or overstate the costs of reviewing the rule. It is possible that not all commenters reviewed last year's rule in detail, and it is also possible that some reviewers chose not to comment on the proposed rule. For these reasons, we believe that the number of past commenters would be a fair estimate of the number of reviewers of this rule. We welcome any comments on the approach in estimating the number of entities which will review this proposed rule.

We recognize that different types of entities are in many cases affected by mutually exclusive sections of the rule. Thus, for the purposes of our estimate we assume that each reviewer read approximately 50 percent of the proposed rule. Finally, in our estimates, we have used the 1,631 number of timely pieces of correspondence on the FY 2023 IPPS/LTCH proposed rule as our estimate for the number of reviewers of this rule. We continue to acknowledge the uncertainty involved with using this number, but we believe it is a fair estimate due to the variety of entities affected and the likelihood that some of them choose to rely (in full or in part) on press releases, newsletters, fact sheets, or other sources rather than the comprehensive review of preamble

[781] Code of Federal Regulations, § 412.560(b)(3). Available at: *https://www.ecfr.gov/current/title-42/chapter-IV/subchapter-B/part-412/subpart-O/section-412.560.*

and regulatory text. We seek comments on this assumption.

Using the wage information from the BLS for medical and health service managers (Code 11–9111), we estimate that the cost of reviewing the proposed rule is $115.22 per hour, including overhead and fringe benefits (*https://www.bls.gov/oes/current/oes_nat.htm*). Assuming an average reading speed, we estimate that it would take approximately 22.14 hours for the staff to review half of this proposed rule. For each IPPS hospital or LTCH that reviews this proposed rule, the estimated cost is $2,550.97 (22.14 hours × $115.22). Therefore, we estimate that the total cost of reviewing this proposed rule is $4,160,663.37 ($2,550.97 × 1,631 reviewers).

II. Accounting Statements and Tables

A. Acute Care Hospitals

As required by OMB Circular A–4 (available at *https://www.whitehouse.gov/wp-content/uploads/legacy_drupal_files/omb/circulars/A4/a-4.pdf*), in Table V. of this Appendix, we have prepared an accounting statement showing the classification of the expenditures associated with the provisions of this proposed rule as they relate to acute care hospitals. This table provides our best estimate of the change in Medicare payments to providers as a result of the proposed changes to the IPPS presented in this proposed rule. All expenditures are classified as transfers to Medicare providers.

As shown in Table V. of this Appendix, the net costs to the Federal Government associated with the policies in this proposed rule are estimated at $2.7 billion.

TABLE V.—ACCOUNTING STATEMENT: CLASSIFICATION OF ESTIMATED EXPENDITURES UNDER THE IPPS FROM FY 2023 TO FY 2024

Category	Transfers
Annualized Monetized Transfers	$2.7 billion
From Whom to Whom	Federal Government to IPPS Medicare Providers

B. LTCHs

As discussed in section I.J. of this Appendix, the impact analysis of the payment rates and factors presented in this proposed rule under the LTCH PPS is projected to result in a decrease in estimated aggregate LTCH PPS payments in FY 2024 relative to FY 2023 of approximately $24 million based on the data for 333 LTCHs in our database that are subject to payment under the LTCH PPS. Therefore, as required by OMB Circular A–4 (available at *https://www.whitehouse.gov/wp-content/uploads/legacy_drupal_files/omb/circulars/A4/a-4.pdf*), in Table VI. of this Appendix, we have prepared an accounting statement showing the classification of the expenditures associated with the provisions of this proposed rule as they relate to the changes to the LTCH PPS. Table VI. of this Appendix provides our best estimate of the estimated change in Medicare payments under the LTCH PPS as a result of the payment rates and factors and other provisions presented in this proposed rule based on the data for the 333 LTCHs in our database. All expenditures are classified as transfers to Medicare providers (that is, LTCHs).

As shown in Table VI. of this Appendix, the savings to the Federal Government associated with the policies for LTCHs in this proposed rule are estimated at $24 million.

TABLE VI.—ACCOUNTING STATEMENT: CLASSIFICATION OF ESTIMATED EXPENDITURES FROM THE FY 2023 LTCH PPS TO THE FY 2024 LTCH PPS

Category	Transfers
Annualized Monetized Transfers	-$24 million
From Whom to Whom	Federal Government to LTCH Medicare Providers

III. Regulatory Flexibility Act (RFA) Analysis

The RFA requires agencies to analyze options for regulatory relief of small entities. For purposes of the RFA, small entities include small businesses, nonprofit organizations, and small government jurisdictions. We estimate that most hospitals and most other providers and suppliers are small entities as that term is used in the RFA. The great majority of hospitals and most other health care providers and suppliers are small entities, either by being nonprofit organizations or by meeting the SBA definition of a small business (having revenues of less than $8.0 million to $41.5 million in any 1 year). (For details on the latest standards for health care providers, we refer readers to page 38 of the Table of Small Business Size Standards for NAIC 622 found on the SBA website at *https://www.sba.gov/sites/default/files/files/Size_Standards_Table.pdf*.)

For purposes of the RFA, all hospitals and other providers and suppliers are considered to be small entities. Because all hospitals are considered to be small entities for purposes of the RFA, the hospital impacts described in this proposed rule are impacts on small entities. Individuals and States are not included in the definition of a small entity. MACs are not considered to be small entities because they do not meet the SBA definition of a small business.

HHS's practice in interpreting the RFA is to consider effects economically ''significant'' if greater than 5 percent of providers reach a threshold of 3 to 5 percent or more of total revenue or total costs. We believe that the provisions of this proposed rule relating to IPPS hospitals would have an economically significant impact on small entities as explained in this Appendix. Therefore, the Secretary has certified that this

proposed rule would have a significant economic impact on a substantial number of small entities. For example, the majority of the 3,130 IPPS hospitals included in the impact analysis shown in ''Table I.—Impact Analysis of Proposed Changes to the IPPS for Operating Costs for FY 2024,'' on average are expected to see increases in the range of 2.8 percent, primarily due to the proposed hospital rate update, as discussed in section I.G. of this Appendix. On average, the proposed rate update for these hospitals is estimated to be 2.8 percent.

The 333 LTCH PPS hospitals included in the impact analysis shown in ''Table IV: Impact of Proposed Payment Rate and Policy Changes to LTCH PPS Payments for LTCH PPS Standard Federal Payment Rate Cases for FY 2024 (Estimated FY 2023 Payments Compared to Estimated FY 2024 Payments)'' on average are expected to see a decrease of approximately 2.5 percent, primarily due to the 4.7 percent decrease in high cost outlier payments as a percentage of total LTCH PPS standard Federal payment rate payments, as discussed in section I.J. of this Appendix.

This proposed rule contains a range of proposed policies. It provides descriptions of the statutory provisions that are addressed, identifies the proposed policies, and presents rationales for our decisions and, where relevant, alternatives that were considered. The analyses discussed in this Appendix and throughout the preamble of this proposed rule constitutes our regulatory flexibility analysis. We are soliciting public comments on our estimates and analysis of the impact of our proposals on small entities. Public comments that we receive and our responses will be presented in the final rule.

IV. Impact on Small Rural Hospitals

Section 1102(b) of the Act requires us to prepare a regulatory impact analysis for any proposed or final rule that may have a significant impact on the operations of a substantial number of small rural hospitals. This analysis must conform to the provisions of section 603 of the RFA. With the exception of hospitals located in certain New England counties, for purposes of section 1102(b) of the Act, we define a small rural hospital as a hospital that is located outside of an urban area and has fewer than 100 beds. Section 601(g) of the Social Security Amendments of 1983 (Pub. L. 98–21) designated hospitals in certain New England counties as belonging to the adjacent urban area. Thus, for purposes of the IPPS and the LTCH PPS, we continue to classify these hospitals as urban hospitals.

As shown in Table I. in section I.G. of this Appendix, rural IPPS hospitals with 0–49 beds (362 hospitals) and 50–99 beds (190 hospitals) are expected to experience an increase in payments from FY 2023 to FY 2024 of 2.9 percent and 3.6 percent, respectively, primarily driven by the proposed hospital rate update and the proposed change to the calculation of the rural wage index, as discussed in section I.G of this Appendix. We refer readers to Table I. in section I.G. of this Appendix for additional information on the quantitative effects of the proposed policy changes under the IPPS for operating costs.

All rural LTCHs (18 hospitals) shown in Table IV. in section I.J. of this Appendix have less than 100 beds. These hospitals are expected to experience a decrease in payments from FY 2023 to FY 2024 of 1.5 percent, primarily due to the projected 4.7 percent decrease in high cost outlier payments as a percentage of total LTCH PPS standard Federal payment rate payments, as discussed in section I.J. of this Appendix.

V. Unfunded Mandates Reform Act Analysis

Section 202 of the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4) also requires that agencies assess anticipated costs and benefits before issuing any rule whose mandates require spending in any 1 year of $100 million in 1995 dollars, updated annually for inflation. In 2023, that threshold level is approximately $177 million. This proposed rule would not mandate any requirements that meet the threshold for State, local, or tribal governments, nor would it affect private sector costs.

VI. Executive Order 13132

Executive Order 13132 establishes certain requirements that an agency must meet when it promulgates a proposed rule (and subsequent final rule) that imposes substantial direct requirement costs on state and local governments, preempts state law, or otherwise has federalism implications. This proposed rule would not have a substantial direct effect on state or local governments, preempt states, or otherwise have a federalism implication.

VII. Executive Order 13175

Executive Order 13175 directs agencies to consult with Tribal officials prior to the formal promulgation of regulations having tribal implications. Section 1880(a) of the Act states that a hospital of the Indian Health Service, whether operated by such Service or by an Indian tribe or tribal organization, is eligible for Medicare payments so long as it meets all of the conditions and requirements for such payments which are applicable generally to hospitals. Consistent with section 1880(a) of the Act, this proposed rule contains general provisions also applicable to hospitals and facilities operated by the Indian Health Service or Tribes or Tribal organizations under the Indian Self-Determination and Education Assistance Act. We continue to engage in consultations with Tribal officials on IPPS issues of interest. We will use input received from these consultations, as well as the comments on this proposed rule, to inform this rulemaking.

VIII. Executive Order 12866

In accordance with the provisions of Executive Order 12866, the Office of Management and Budget reviewed this proposed rule.

Appendix B: Recommendation of Update Factors for Operating Cost Rates of Payment for Inpatient Hospital Services

I. Background

Section 1886(e)(4)(A) of the Act requires that the Secretary, taking into consideration the recommendations of MedPAC, recommend update factors for inpatient hospital services for each fiscal year that take into account the amounts necessary for the efficient and effective delivery of medically appropriate and necessary care of high quality. Under section 1886(e)(5) of the Act, we are required to publish update factors recommended by the Secretary in the proposed and final IPPS rules. Accordingly, this Appendix provides the recommendations for the update factors for the IPPS national standardized amount, the hospital-specific rate for SCHs and MDHs, and the rate-of-increase limits for certain hospitals excluded from the IPPS, as well as LTCHs. In prior years, we made a recommendation in the IPPS proposed rule and final rule for the update factors for the payment rates for IRFs and IPFs. However, for FY 2024, consistent with our approach for FY 2023, we are including the Secretary's recommendation for the update factors for IRFs and IPFs in separate **Federal Register** documents at the time that we announce the annual updates for IRFs and IPFs. We also discuss our response

to MedPAC's recommended update factors for inpatient hospital services.

II. Inpatient Hospital Update for FY 2024

A. Proposed FY 2024 Inpatient Hospital Update

As discussed in section IV.A. of the preamble to this proposed rule, for FY 2024, consistent with section 1886(b)(3)(B) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act, we are setting the applicable percentage increase by applying the following adjustments in the following sequence. Specifically, the applicable percentage increase under the IPPS is equal to the rate-of-increase in the hospital market basket for IPPS hospitals in all areas, subject to a reduction of one-quarter of the applicable percentage increase (prior to the application of other statutory adjustments; also referred to as the market basket update or rate-of-increase (with no adjustments)) for hospitals that fail to submit quality information under rules established by the Secretary in accordance with section 1886(b)(3)(B)(viii) of the Act and a reduction of three-quarters of the applicable percentage increase (prior to the application of other statutory adjustments; also referred to as the market basket update or rate-of-increase (with no adjustments)) for hospitals not considered to be meaningful electronic health record (EHR) users in accordance with section 1886(b)(3)(B)(ix) of the Act, and then subject to an adjustment based on changes in economy-wide productivity (the productivity adjustment). Section 1886(b)(3)(B)(xi) of the Act, as added by section 3401(a) of the Affordable Care Act, states that application of the productivity adjustment may result in the applicable percentage increase being less than zero.

We note that, in compliance with section 404 of the MMA, in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45194 through 45204), we replaced the 2014-based IPPS operating and capital market baskets with the rebased and revised 2018-based IPPS operating and capital market baskets beginning in FY 2022.

In this FY 2024 IPPS/LTCH PPS proposed rule, in accordance with section 1886(b)(3)(B) of the Act, we are proposing to base the proposed FY 2024 market basket update used to determine the applicable percentage increase for the IPPS on IGI's fourth quarter 2022 forecast of the 2018-based IPPS market basket rate-of-increase with historical data through third quarter 2022, which is estimated to be 3.0 percent. In accordance with section 1886(b)(3)(B) of the Act, as amended by section 3401(a) of the Affordable Care Act, in section IV.B. of the preamble of this FY 2024 IPPS/LTCH PPS proposed rule, based on IGI's fourth quarter 2022 forecast, we are proposing a productivity adjustment of 0.2 percentage point for FY 2024. We are also proposing that if more recent data subsequently become available, we would use such data, if appropriate, to determine the FY 2024 market basket update and productivity adjustment for the FY 2024 IPPS/LTCH PPS final rule.

Therefore, based on IGI's fourth quarter 2022 forecast of the 2018-based IPPS market basket update and the productivity adjustment, depending on whether a hospital submits quality data under the rules established in accordance with section 1886(b)(3)(B)(viii) of the Act (hereafter referred to as a hospital that submits quality data) and is a meaningful EHR user under section 1886(b)(3)(B)(ix) of the Act (hereafter referred to as a hospital that is a meaningful EHR user), we are proposing four possible applicable percentage increases that could be applied to the standardized amount, as shown in the following table.

FY 2024	Hospital Submitted Quality Data and is a Meaningful EHR User	Hospital Submitted Quality Data and is NOT a Meaningful EHR User	Hospital Did NOT Submit Quality Data and is a Meaningful EHR User	Hospital Did NOT Submit Quality Data and is NOT a Meaningful EHR User
Proposed Market Basket Rate-of-Increase	3.0	3.0	3.0	3.0
Proposed Adjustment for Failure to Submit Quality Data under Section 1886(b)(3)(B)(viii) of the Act	0.0	0.0	-0.75	-0.75
Proposed Adjustment for Failure to be a Meaningful EHR User under Section 1886(b)(3)(B)(ix) of the Act	0.0	-2.25	0.0	-2.25
Proposed Productivity Adjustment under Section 1886(b)(3)(B)(xi) of the Act	-0.2	-0.2	-0.2	-0.2
Proposed Applicable Percentage Increase Applied to Standardized Amount	**2.8**	**0.55**	**2.05**	**-0.2**

B. Proposed FY 2024 SCH and MDH Update

Section 1886(b)(3)(B)(iv) of the Act provides that the FY 2024 applicable percentage increase in the hospital-specific rate for SCHs and MDHs equals the applicable percentage increase set forth in section 1886(b)(3)(B)(i) of the Act (that is, the same update factor as for all other hospitals subject to the IPPS).

Section 4102 of the Consolidated Appropriations Act, 2023 (Public Law 117–328), enacted on December 29, 2022, extended the MDH program through FY 2024 (that is, for discharges occurring on or before September 30, 2024). We refer readers to section V.F. of the preamble of this proposed rule for further discussion of the MDH program.

As previously stated, the update to the hospital specific rate for SCHs and MDHs is subject to section 1886(b)(3)(B)(i) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act. Accordingly, depending on whether a hospital submits quality data and is a meaningful EHR user, we are proposing the same four possible applicable percentage increases in the previous table for the hospital-specific rate applicable to SCHs and MDHs.

C. Proposed FY 2024 Puerto Rico Hospital Update

Because Puerto Rico hospitals are no longer paid with a Puerto Rico-specific standardized amount under the amendments to section 1886(d)(9)(E) of the Act, there is no longer a need for us to make an update to the Puerto Rico standardized amount. Hospitals in Puerto Rico are now paid 100 percent of the national standardized amount and, therefore, are subject to the same update to the national standardized amount

discussed under section IV.A.1. of the preamble of this proposed rule.

In addition, as discussed in section IV.A.2. of the preamble of this proposed rule, section 602 of Public Law 114–113 amended section 1886(n)(6)(B) of the Act to specify that subsection (d) Puerto Rico hospitals are eligible for incentive payments for the meaningful use of certified EHR technology, effective beginning FY 2016. In addition, section 1886(n)(6)(B) of the Act was amended to specify that the adjustments to the applicable percentage increase under section 1886(b)(3)(B)(ix) of the Act apply to subsection (d) Puerto Rico hospitals that are not meaningful EHR users, effective beginning FY 2022.

Section 1886(b)(3)(B)(ix) of the Act in conjunction with section 602(d) of Public Law 114–113 requires that for FY 2024 and subsequent fiscal years, any subsection (d) Puerto Rico hospital that is not a meaningful EHR user as defined in section 1886(n)(3) of the Act and not subject to an exception under section 1886(b)(3)(B)(ix) of the Act will have a reduction of three-quarters of the applicable percentage increase (prior to the application of other statutory adjustments).

Based on IGI's fourth quarter 2022 forecast of the 2018-based IPPS market basket update with historical data through third quarter 2022, for this FY 2024 proposed rule, in accordance with section 1886(b)(3)(B) of the Act, as previously discussed, for Puerto Rico hospitals, we are proposing a market basket update of 3.0 percent and a productivity adjustment of 0.2 percentage point. Therefore, for FY 2024, depending on whether a Puerto Rico hospital is a meaningful EHR user, there are two possible applicable percentage increases that can be applied to the standardized amount. Based on these data, we are proposing the following applicable percentage increases to the standardized amount for FY 2024 for Puerto Rico hospitals:

- For a Puerto Rico hospital that is a meaningful EHR user, we are proposing an applicable percentage increase to the FY 2024 operating standardized amount of 2.8 percent (that is, the FY 2024 estimate of the proposed market basket rate-of-increase of 3.0 percent less an adjustment of 0.2 percentage point for the proposed productivity adjustment).
- For a Puerto Rico hospital that is not a meaningful EHR user, we are proposing an applicable percentage increase to the operating standardized amount of 0.55 percent (that is, the FY 2024 estimate of the proposed market basket rate-of-increase of 3.0 percent, less an adjustment of 2.25 percentage point (the proposed market basket rate-of-increase of 3.0 percent × 0.75 for failure to be a meaningful EHR user), and less an adjustment of 0.2 percentage point for the proposed productivity adjustment).

As noted previously, we are proposing that if more recent data subsequently become available, we would use such data, if appropriate, to determine the FY 2024 market basket update and the productivity adjustment for the FY 2024 IPPS/LTCH PPS final rule.

D. Proposed Update for Hospitals Excluded From the IPPS for FY 2024

Section 1886(b)(3)(B)(ii) of the Act is used for purposes of determining the percentage increase in the rate-of-increase limits for children's hospitals, cancer hospitals, and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and America Samoa). Section 1886(b)(3)(B)(ii) of the Act sets the percentage increase in the rate-of-increase limits equal to the market basket percentage increase. In accordance with § 403.752(a) of the regulations, religious nonmedical health care institutions (RNHCIs) are paid under the provisions of § 413.40, which also use section 1886(b)(3)(B)(ii) of the Act to update the percentage increase in the rate-of-increase limits.

Currently, children's hospitals, PPS-excluded cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa are among the remaining types of hospitals still paid under the reasonable cost methodology, subject to the rate-of-increase limits. In addition, in accordance with § 412.526(c)(3) of the regulations, extended neoplastic disease care hospitals (described in § 412.22(i) of the regulations) also are subject to the rate-of-increase limits. As discussed in section VI. of the preamble of this proposed rule, we are proposing to use the percentage increase in the 2018-based IPPS operating market basket to update the target amounts for children's hospitals, PPS-excluded cancer hospitals, RNHCIs, short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa, and extended neoplastic disease care hospitals for FY 2024 and subsequent fiscal years. Accordingly, for FY 2024, the rate-of-increase percentage to be applied to the target amount for these children's hospitals, cancer hospitals, RNHCIs, extended neoplastic disease care hospitals, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa is the FY 2024 percentage increase in the 2018-based IPPS operating market basket. For this proposed rule, the current estimate of the IPPS operating market basket percentage increase for FY 2024 is 3.0 percent. We are proposing that if more recent data subsequently become available, we would use such data, if appropriate, to determine the FY 2024 market basket update for the FY 2024 IPPS/LTCH PPS final rule.

E. Proposed Update for LTCHs for FY 2024

Section 123 of Public Law 106–113, as amended by section 307(b) of Public Law 106–554 (and codified at section 1886(m)(1) of the Act), provides the statutory authority for updating payment rates under the LTCH PPS.

As discussed in section V.A. of the Addendum to this proposed rule, we are proposing to update the LTCH PPS standard Federal payment rate for FY 2024 by 2.9 percent, consistent with section 1886(m)(3) of the Act which provides that any annual update be reduced by the productivity adjustment described in section 1886(b)(3)(B)(xi)(II) of the Act (that is, the productivity adjustment). Furthermore, in accordance with the LTCH QR Program under section 1886(m)(5) of the Act, we are proposing to reduce the annual update to the LTCH PPS standard Federal rate by 2.0 percentage points for failure of a LTCH to submit the required quality data.

Accordingly, we are proposing to establish an update factor of 1.029 in determining the LTCH PPS standard Federal rate for FY 2024. For LTCHs that fail to submit quality data for FY 2024, we are proposing to establish an annual update to the LTCH PPS standard Federal rate of 0.9 percent (that is, the proposed annual update for FY 2024 of 2.9 percent less 2.0 percentage points for failure to submit the required quality data in accordance with section 1886(m)(5)(C) of the Act and our rules) by applying a proposed update factor of 1.009 in determining the LTCH PPS standard Federal rate for FY 2024. (We note that, as discussed in section VII.D. of the preamble of this proposed rule, the proposed update to the LTCH PPS standard Federal payment rate of 2.9 percent for FY 2024 does not reflect any budget neutrality factors.)

III. Secretary's Recommendations

MedPAC is recommending inpatient hospital rates be updated by the amount specified in current law plus one

percent. MedPAC's rationale for this update recommendation is described in more detail in this section. As previously stated, section 1886(e)(4)(A) of the Act requires that the Secretary, taking into consideration the recommendations of MedPAC, recommend update factors for inpatient hospital services for each fiscal year that take into account the amounts necessary for the efficient and effective delivery of medically appropriate and necessary care of high quality. Consistent with current law, depending on whether a hospital submits quality data and is a meaningful EHR user, we are recommending the four applicable percentage increases to the standardized amount listed in the table under section II. of this Appendix B. We are recommending that the same applicable percentage increases apply to SCHs and MDHs.

In addition to making a recommendation for IPPS hospitals, in accordance with section 1886(e)(4)(A) of the Act, we are recommending update factors for certain other types of hospitals excluded from the IPPS. Consistent with our policies for these facilities, we are recommending an update to the target amounts for children's hospitals, cancer hospitals, RNHCIs, short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa and extended neoplastic disease care hospitals of 3.0 percent.

For FY 2024, consistent with policy set forth in section VII. of the preamble of this proposed rule, for LTCHs that submit quality data, we are recommending an update of 2.9 percent to the LTCH PPS standard Federal rate. For LTCHs that fail to submit quality data for FY 2024, we are recommending an annual update to the LTCH PPS standard Federal rate of 0.9 percent.

IV. MedPAC Recommendation for Assessing Payment Adequacy and Updating Payments in Traditional Medicare

In its March 2023 Report to Congress, MedPAC assessed the adequacy of current payments and costs, and the relationship between payments and an appropriate cost base. MedPAC recommended an update to the hospital inpatient rates by the amount specified in current law plus 1 percent. MedPAC anticipates that their recommendation to update the IPPS payment rate by the amount specified under current law plus 1 percent in 2024 would generally be adequate to maintain beneficiaries' access to hospital inpatient and outpatient care and keep IPPS payment rates close to, if somewhat below, the cost of delivering high-quality care efficiently.

MedPAC stated that their recommended update to IPPS and OPPS payment rates of current law plus 1 percent may not be sufficient to ensure the financial viability of some Medicare safety-net hospitals with a poor payer mix. MedPAC recommends redistributing the current Medicare safety-net payments (disproportionate share hospital and uncompensated care payments) using the MedPAC-developed Medicare Safety-Net Index (MSNI) for hospitals. In addition, MedPAC recommends adding $2 billion to this MSNI pool of funds to help maintain the financial viability of Medicare safety-net hospitals and recommended to Congress transitional approaches for a MSNI policy.

We refer readers to the March 2023 MedPAC report, which is available for download at *www.medpac.gov*, for a complete discussion on these recommendations.

In light of these recommendations, and in particular those concerning safety net hospitals, we look forward to working with Congress and we seek comments on approaches CMS could take. We are proposing an applicable percentage increase for FY 2024 of 2.8 percent as described in section 1886(b)(3)(B) of the Act, provided the hospital submits quality data and is a meaningful EHR user consistent with these statutory requirements. We note that, because the operating and capital payments in the IPPS remain separate, we are continuing to use separate updates for operating and capital payments in the IPPS. The proposed update to the capital rate is discussed in section III. of the Addendum to this proposed rule.

With regard to MedPAC's recommendation for a MSNI policy, we note that a discussion is in section X.C. of the preamble of this proposed rule. We note that section 1886(d)(5)(F) of the Act provides for additional Medicare payments, called Medicare disproportionate share hospital (DSH) payments, to subsection (d) hospitals that serve a significantly disproportionate number of low-income patients. Section 1886(r) of the Act provides that, for FY 2014 and each subsequent fiscal year, the Secretary shall pay each such subsection (d) hospital that is eligible for DSH an empirically justified DSH payment equal to 25 percent of the Medicare DSH adjustment they otherwise would have received. The remaining amount, equal to an estimate of 75 percent of what otherwise would have been paid as Medicare DSH payments, reduced to reflect changes in the percentage of individuals who are uninsured, is available to make additional payments to each hospital that qualifies for Medicare DSH payments and has uncompensated care. We refer readers to section IV. of this proposed rule for a further discussion of Medicare DSH and uncompensated care payments.

V. Response to Comments

Because of the large number of public comments we normally receive on **Federal Register** documents, we are not able to acknowledge or respond to them individually. We will consider all comments we receive by the date and time specified in the **DATES** section of this proposed rule, and, when we proceed with a subsequent document(s), we will respond to those comments in the preamble to that document.

Chiquita Brooks-LaSure, Administrator of the Centers for Medicare & Medicaid Services, approved this document on March 22, 2023.

List of Subjects

42 CFR Part 411

Diseases, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 412

Administrative practice and procedure, Health facilities, Medicare, Puerto Rico, Reporting and recordkeeping requirements.

42 CFR Part 419

Hospitals, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 488

Administrative practice and procedure, Health facilities, Health professions, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 489

Health facilities, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 495

Administrative practice and procedure, Health facilities, Health maintenance organizations (HMO), Health professions, Health records, Medicaid, Medicare, Penalties, Privacy, and Reporting and recordkeeping requirements.

For the reasons set forth in the preamble, the Centers for Medicare and Medicaid Services proposes to amend 42 CFR chapter IV as set forth below:

PART 411—EXCLUSIONS FROM MEDICARE AND LIMITATIONS ON MEDICARE PAYMENT

■ 1. The authority citation for part 411 continues to read as follows:

Authority: 42 U.S.C. 1302, 1395w–101 through 1395w–152, 1395hh, and 1395nn.

§ 411.353 [Amended]

■ 2. Section 411.353 is amended in paragraph (d) by removing the text ''§ 1003.101 of this title'' and adding in its place ''§ 1003.110 of this title''.

§ 411.357 [Amended]

■ 3. Section 411.357 is amended by—
■ a. In paragraph (s)(3), adding the word ''and'' at the end of the paragraph; and
■ b. In paragraph (s)(4), removing ''; and'' and adding in its place a period.

§ 411.362 [Amended]

■ 4. Section 411.362 is amended by—
■ a. In paragraph (a), removing the definitions of ''Baseline number of operating rooms, procedure rooms, and beds,'' ''External data source,'' and ''Main campus of the hospital'';
■ b. In paragraph (b)(2), removing the phrase ''is granted pursuant to paragraph (c) of this section'' and adding in its place the phrase ''is approved under § 411.363''; and
■ c. Removing paragraph (c).
■ 5. Section 411.363 is added to read as follows:

§ 411.363 Process for requesting an exception from the prohibition on facility expansion.

(a) *Definitions.* For purposes of this section—

Baseline number of operating rooms, procedure rooms, and beds means the number of operating rooms, procedure rooms, and beds for which the applicable hospital or high Medicaid facility is licensed as of March 23, 2010 (or, in the case of a hospital that did not have a provider agreement in effect as of March 23, 2010, but does have a provider agreement in effect on December 31, 2010, the date of effect of such agreement). For purposes of determining the number of beds in a hospital's baseline number of operating rooms, procedure rooms, and beds, a bed is included if the bed is considered licensed for purposes of State licensure, regardless of the specific number of beds identified on the physical license issued to the hospital by the State.

External data source means a data source that meets all of following:

(i) Is generated, maintained, or under the control of a State Medicaid agency.

(ii) Is reliable and transparent.

(iii) Maintains data that, for purposes of the process described in paragraph (c) of this section, are readily available and accessible to the requesting hospital, comparison hospitals, and CMS.

(iv) Maintains or generates data that, for purposes of the process described in paragraph (c) of this section, are accurate, complete, and objectively verifiable.

Main campus of the hospital means ''campus'' as defined at § 413.65(a)(2) of this chapter.

Procedure room has the meaning set forth at § 411.362(a).

(b) *Eligibility to request an exception from the prohibition on facility expansion.* (1) CMS will not consider a request for an exception from the prohibition on facility expansion from a hospital that is not eligible to request the exception.

(2) A hospital that meets the criteria for an applicable hospital or a high Medicaid facility is eligible to request an exception from the prohibition on facility expansion for consideration by CMS, provided that—

(i) CMS has not previously approved a request for an exception from the prohibition on facility expansion that would allow the hospital's number of operating rooms, procedure rooms, and beds for which the hospital is licensed to reach 200 percent of the hospital's baseline number of operating rooms, procedure rooms, and beds if the full expansion is utilized; or

(ii) It has been at least 2 calendar years from the date of the most recent decision by CMS approving or denying the hospital's most recent request for an exception from the prohibition on facility expansion.

(c) *Criteria for applicable hospital.* An applicable hospital is a hospital that meets the following criteria:

(1) *Population increase.* The hospital is located in a county that has a percentage increase in population that is at least 150 percent of the percentage increase in population of the State in which the hospital is located during the most recent 5-year period for which data are available as of the date that the hospital submits its request. To calculate State and county population growth, a hospital must use Bureau of the Census estimates.

(2) *Medicaid inpatient admissions.* The hospital has an annual percent of total inpatient admissions under Medicaid that is equal to or greater than the average percent with respect to such admissions for all hospitals (including the requesting hospital) that have Medicare participation agreements with CMS and are located in the county in which the hospital is located during the most recent 12-month period for which data are available as of the date that the hospital submits its request. For purposes of this paragraph (c)(2), the most recent 12-month period for which data are available means the most recent 12-month period for which the data source used contains all data from the requesting hospital and each other hospital that has a Medicare participation agreement with CMS and is located in the county in which the requesting hospital is located.

(i) With respect to requests submitted before October 1, 2023, a hospital may use filed Medicare hospital cost report data from the Healthcare Cost Report Information System (HCRIS) or data from an external data source (as defined in paragraph (a) of this section) to estimate its annual percent of total inpatient admissions under Medicaid and the average percent with respect to such admissions for all hospitals (including the requesting hospital) that have Medicare participation agreements with CMS and are located in the county in which the hospital is located.

(ii) With respect to requests submitted on or after October 1, 2023, a hospital may use only filed Medicare hospital cost report data from HCRIS to estimate its annual percent of total inpatient admissions under Medicaid and the average percent with respect to such admissions for all hospitals (including the requesting hospital) that have Medicare participation agreements with CMS and are located in the county in which the hospital is located.

(3) *Nondiscrimination.* The hospital does not discriminate against beneficiaries of Federal health care programs and does not permit physicians practicing at the hospital to discriminate against such beneficiaries.

(4) *Average bed capacity.* The hospital is located in a State in which the average bed capacity in the State is less than the national average bed capacity during the most recent fiscal year for which HCRIS, as of the date that the hospital submits its request, contains data from a sufficient number of hospitals to determine a State's average bed capacity and the national average bed capacity.

(i) CMS will provide on its website State average bed capacities and the national average bed capacity.

(ii) For purposes of this paragraph (c)(4), *sufficient number* means the number of hospitals, as determined by CMS that would ensure that the determination under this paragraph (c)(4) would not materially change after additional hospital data are reported.

(5) *Average bed occupancy.* The hospital has an average bed occupancy rate that is greater than the average bed occupancy rate in the State in which the

hospital is located during the most recent fiscal year for which HCRIS, as of the date that the hospital submits its request, contains data from a sufficient number of hospitals to determine the requesting hospital's average bed occupancy rate and the relevant State's average bed occupancy rate.

(i) A hospital must use filed hospital cost report data from HCRIS to determine its average bed occupancy rate.

(ii) CMS will provide on its website State average bed occupancy rates. For purposes of this paragraph (c)(5), ''sufficient number'' means the number of hospitals, as determined by CMS that would ensure that the determination under this paragraph (c)(5) would not materially change after additional hospital data are reported.

(6) *Hospital location.* For purposes of paragraph (c) of this section, a hospital is located in the county and State in which the main campus of the hospital is located.

(d) *Criteria for high Medicaid facility.* A high Medicaid facility is a hospital that meets all of the following criteria:

(1) *Sole hospital.* The hospital is not the sole hospital in the county in which the hospital is located.

(2) *Medicaid inpatient admissions.* With respect to each of the three most recent 12-month periods for which data are available as of the date the hospital submits its request, the hospital has an annual percent of total inpatient admissions under Medicaid that is estimated to be greater than such percent with respect to such admissions for each other hospital that has a Medicare participation agreement with CMS and is located in the county in which the hospital is located. For purposes of this paragraph (d)(2), the most recent 12-month period for which data are available means the most recent 12-month period for which the data source used contains all data from the requesting hospital and each other hospital that has a Medicare participation agreement with CMS and is located in the county in which the requesting hospital is located.

(i) With respect to requests submitted before October 1, 2023, a hospital may use filed Medicare hospital cost report data from HCRIS or data from an external data source (as defined in paragraph (a) of this section) to estimate its annual percentage of total inpatient admissions under Medicaid and the annual percentages of total inpatient admissions under Medicaid for each other hospital that has a Medicare participation agreement with CMS and is located in the county in which the hospital is located.

(ii) With respect to requests submitted on or after October 1, 2023, a hospital may use only filed Medicare hospital cost report data from HCRIS to estimate its annual percentage of total inpatient admissions under Medicaid and the annual percentages of total inpatient admissions under Medicaid for each other hospital that has a Medicare participation agreement with CMS and is located in the county in which the hospital is located.

(3) *Nondiscrimination.* The hospital does not discriminate against beneficiaries of Federal health care programs and does not permit physicians practicing at the hospital to discriminate against such beneficiaries.

(4) *Hospital location.* For purposes of paragraph (d) of this section, a hospital is located in the county in which the main campus of the hospital is located.

(e) *Procedure for submitting a request for an exception from the prohibition on facility expansion.* (1) A hospital must submit the request for an exception from the prohibition on facility expansion and the signed certification set forth in paragraph (e)(3) of this section electronically to CMS according to the instructions specified on the CMS website.

(2) For a request for an exception from the prohibition on facility expansion to be considered by CMS, the request must include all of the following information:

(i) All of the following information for the hospital requesting an exception:

(A) Name.

(B) Address.

(C) National Provider Identification number(s) (NPI).

(D) Tax Identification Number(s) (TIN).

(E) CMS Certification Number(s) (CCN).

(ii)(A) The name of the county in which the main campus of the hospital requesting an exception is located; and

(B) The names of any counties in which the hospital provides inpatient or outpatient hospital services or plans to provide inpatient or outpatient hospital services if CMS approves the request.

(iii) The following information for the contact person who will be available to discuss the request with CMS on behalf of the hospital:

(A) Name.

(B) Title.

(C) Address to receive hard copy mail.

(D) Electronic mail address.

(E) Daytime telephone number.

(iv)(A) A statement identifying the hospital as an applicable hospital or high Medicaid facility; and

(B) A detailed explanation with supporting documentation regarding whether and how the hospital meets each of the criteria for an applicable hospital or high Medicaid facility.

(v) A statement and, if available, supporting documentation explaining how the hospital satisfies the criterion in paragraph (c)(3) or (d)(3) of this section that it does not discriminate against beneficiaries of Federal health care programs and does not permit physicians practicing at the hospital to discriminate against such beneficiaries.

(vi) Documentation supporting all of the following:

(A) The hospital's calculations of its baseline number of operating rooms, procedure rooms, and beds.

(B) The hospital's number of operating rooms, procedure rooms, and beds for which the hospital is licensed as of the date that the hospital submits a request for an exception.

(C) Whether and how the hospital has used any expansion facility capacity approved in a prior request.

(D) The additional number of operating rooms, procedure rooms, and beds by which the hospital requests to expand.

(E) Whether the hospital plans to use expansion facility capacity to provide specialty services (for example, maternity or psychiatric services) if the request is approved.

(vii) Information regarding the need for additional operating rooms, procedure rooms, and beds—

(A) For the hospital to serve Medicaid, uninsured, and underserved populations;

(B) In the county in which the main campus of the hospital is located;

(C) In any county in which the hospital provides inpatient or outpatient hospital services as of the date the hospital submits the request; and

(D) In any county in which the hospital plans to provide inpatient or outpatient hospital services if CMS approves the request.

(3) A request for an exception from the prohibition on facility expansion must include the following certification signed by an authorized representative of the hospital: ''With knowledge of the penalties for false statements provided by 18 U.S.C. 1001, I certify that all of the information provided in the request and all of the documentation provided with the request is true and correct to the best of my knowledge and belief.'' An authorized representative is the chief executive officer, chief financial officer, or other individual who is authorized by the hospital to make the request.

(f) *Community input.* (1) Upon submitting a request for an exception from the prohibition on facility expansion and until the hospital receives a CMS decision on the request,

the hospital must disclose on any public website for the hospital that it is requesting an exception from the prohibition on facility expansion.

(2) A hospital submitting a request for an exception from the prohibition on facility expansion must provide actual notification that it is requesting an exception, in either electronic or hard copy form, directly to hospitals whose data are part of the comparisons in paragraphs (c)(2) and (d)(2) of this section and hospitals located in the requesting hospital's community as defined in paragraph (f)(3) of this section.

(3)(i) Individuals and entities in the hospital's community may provide input with respect to the hospital's request for an exception from the prohibition on facility expansion, including, but not limited to, input regarding whether the hospital is eligible to request the expansion exception under paragraph (b) of this section and the factors listed in paragraph (i)(2) of this section that CMS will consider in deciding whether to approve or deny a hospital's request.

(ii) The hospital's community includes the geographic area served by the hospital (as defined at § 411.357(e)(2)) and all of the following:

(A) The county in which the hospital's main campus is located.

(B) The counties in which the hospital provides inpatient or outpatient hospital services as of the date the hospital submits the request.

(C) The counties in which the hospital plans to provide inpatient or outpatient hospital services if CMS approves the request.

(iii) Community input must be received no later than 60 days after CMS publishes notice of the hospital's request in the **Federal Register**.

(A) Such input must take the form of written comments.

(B) The written comments must be submitted according to the instructions in the **Federal Register** notice of the hospital's request.

(C) If CMS receives written comments from the community, the hospital has 30 days after CMS notifies the hospital of the written comments to submit a rebuttal statement.

(g) *Timing of complete request.* (1) If only filed Medicare hospital cost report data from HCRIS are used in the hospital's request for an exception from the prohibition on facility expansion, the written comments, and the hospital's rebuttal statement, a request will be deemed complete no later than 90 days after—

(i) The end of the 60-day comment period if CMS does not receive written comments from the community.

(ii) The end of the 30-day rebuttal period, regardless of whether the hospital submits a rebuttal statement, if CMS receives written comments from the community.

(2) If data from an external data source are used in the hospital's request for an exception from the prohibition on facility expansion, the written comments, or the hospital's rebuttal statement a request will be deemed complete no later than 180 days after the end of—

(i) The 60-day comment period if CMS does not receive written comments from the community.

(ii) The 30-day rebuttal period, regardless of whether the hospital submits a rebuttal statement, if CMS receives written comments from the community.

(h) *Eligibility determination.* Based on the information described in paragraph (e) of this section, CMS will first determine whether the hospital is eligible to make the request for an exception from the prohibition on facility expansion under paragraph (b) of this section.

(i) *CMS decision to approve or deny a request for an exception from the prohibition on facility expansion*—(1) *Data and information for consideration by CMS.* In reviewing a request for an exception from the prohibition on facility expansion, CMS—

(i) Will consider data and information provided by the hospital in its request, included in the community input, if any, and provided by the hospital in its rebuttal statement, if any; and

(ii) May also consider any other data and information relevant to the basis for its decision.

(2) *Basis for decision.* Factors that CMS will consider in deciding whether to approve or deny a hospital's request for an exception from the prohibition on facility expansion include but are not limited to the following:

(i) The specialty (for example, maternity, psychiatric, or substance use disorder care) of the hospital or the services furnished by or to be furnished by the hospital if CMS approves the request.

(ii) Program integrity or quality of care concerns related to the hospital.

(iii) Whether the hospital has a need for additional operating rooms, procedure rooms, or beds.

(iv) Whether there is a need for additional operating rooms, procedure rooms, or beds in the following:

(A) The county in which the main campus of the hospital is located.

(B) Any county in which the hospital provides inpatient or outpatient hospital services as of the date the hospital submits the request.

(C) Any county in which the hospital plans to provide inpatient or outpatient hospital services if CMS approves the request.

(j) *Permitted increase in facility capacity.* (1) Except as provided in paragraph (j)(2) of this section, a permitted increase under this section—

(i) May not result in the number of operating rooms, procedure rooms, and beds for which the hospital is licensed exceeding 200 percent of the hospital's baseline number of operating rooms, procedure rooms, and beds; and

(ii) May occur only in facilities on the hospital's main campus.

(2) The limitations of paragraph (j)(1) of this section do not apply to an increase in facility capacity approved by CMS with respect to a request for an exception from the prohibition on facility expansion submitted by a high Medicaid facility between January 1, 2021, and September 30, 2023.

(k) *Publication of final decisions.* Not later than 60 days after receiving a complete request—

(1) If CMS determines that the hospital is not eligible to make the request for an exception from the prohibition on facility expansion under paragraph (b) of this section, CMS will publish in the **Federal Register** notice of such determination; or

(2) If CMS determines that the hospital is eligible to make the request for an exception from the prohibition on facility expansion under paragraph (b) of this section, CMS will publish in the **Federal Register** notice of such determination and its decision regarding the hospital's request for an exception from the prohibition on facility expansion.

(l) *Limitation on review.* There shall be no administrative or judicial review under section 1869 of the Act, section 1878 of the Act, or otherwise of the process under this section (including the establishment of such process and any CMS determination or decision under such process).

PART 412—PROSPECTIVE PAYMENT SYSTEMS FOR INPATIENT HOSPITAL SERVICES

■ 6. The authority citation for part 412 continues to read as follows:

Authority: 42 U.S.C. 1302 and 1395hh.

■ 7. Section 412.87 is amended by—
■ a. Redesignating paragraph (e) as paragraph (f);
■ b. Adding a new paragraph (e);

■ c. In newly redesignated paragraph (f)(2)—

■ i. Removing the reference ''paragraph (e)(3)'' and adding in its place the reference ''paragraph (f)(3)''; and

■ ii. Removing the phrase ''authorization by July 1 prior'' and adding in its place the phrase ''authorization by May 1 prior''; and

■ d. In newly redesignated paragraph (f)(3), removing the phrase ''by the July 1 deadline specified in paragraph (e)(2) of this section may be conditionally approved for the new technology add-on payment for a particular fiscal year'' and adding in its place the phrase ''by July 1 prior to the particular fiscal year for which the applicant applied for new technology add-on payments may be conditionally approved for the new technology add-on payment for that fiscal year''.

The addition reads as follows:

§ 412.87 Additional payment for new medical services and technologies: General provisions.

* * * * *

(e) *FDA status requirement.* CMS only considers, for add-on payments for a particular fiscal year, an application for which one of the following conditions are met at the time of new technology add-on payment application submission:

(1) The new medical service or technology is FDA market authorized for the indication that is the subject of the new technology add-on payment application.

(2) The new medical service or technology is the subject of a complete and active FDA marketing authorization request and documentation of FDA acceptance or filing of the request is provided to CMS.

* * * * *

§ 412.90 [Amended]

■ 8. Section 412.90 is amended in paragraph (j) by removing the date ''October 1, 2022'' and adding in its place the date ''October 1, 2024''.

■ 9. Section 412.92 is amended by—

■ a. In paragraph (b)(1)(v), removing the term ''forward'' and adding the term ''forwards'' in its place;

■ b. In paragraph (b)(2)(i), removing the second reference to ''paragraph (b)(2)(v) of this section'' and adding in its place the reference ''paragraphs (b)(2)(v) and (vi) of this section''.

■ c. Revising paragraphs (b)(2)(ii)(C) and (b)(2)(iv); and

■ d. Adding paragraph (b)(2)(vi).

The revisions and addition read as follows:

§ 412.92 Special treatment: Sole community hospitals.

* * * * *

(b) * * *

(2) * * *

(ii) * * *

(C) If the hospital's application for sole community hospital status was received on or after October 1, 2018, the effective date is as provided in paragraph (b)(2)(i) of this section.

* * * * *

(iv) For applications received on or before September 30, 2018, a hospital classified as a sole community hospital receives a payment adjustment, as described in paragraph (d) of this section, effective with discharges occurring on or after 30 days after the date of CMS' approval of the classification. For applications received on or after October 1, 2018, a hospital classified as a sole community hospital receives a payment adjustment, as described in paragraph (d) of this section, effective with discharges occurring on or after the effective date as provided in paragraph (b)(2)(i) of this section.

* * * * *

(vi) For applications received on or after October 1, 2023, where eligibility for sole community hospital classification is dependent on the hospital's merger with another hospital, sole community hospital status is effective as of the effective date of the approved merger if, and only if, the date that the Medicare administrative contractor (MAC) receives the complete application is within 90 days of CMS' written notification to the hospital of the approval of the merger.

* * * * *

§ 412.101 [Amended]

■ 10. Section 412.101 is amended by—

■ a. In paragraph (b)(2)(i), removing the phrase ''FY 2010 and FY 2023 and subsequent'' and adding in its place the phrase ''FY 2010 and FY 2025 and subsequent'';

■ b. In paragraph (b)(2)(iii), removing the phrase ''For FY 2019 through FY 2022'' and adding in its place the phrase ''For FY 2019 through FY 2024'';

■ c. In paragraph (c)(1), removing the phrase ''FY 2010 and FY 2023 and subsequent'' and adding in its place the phrase ''FY 2010 and FY 2025 and subsequent''; and

■ d. In paragraph (c)(3) introductory text, removing the phrase ''For FY 2019 through FY 2022'' and adding in its place the phrase ''For FY 2019 through FY 2024''.

■ 11. Section 412.103 is amended by–

■ a. In paragraph (d)(1), removing the reference ''paragraph (d)(2) of this section'' and adding in its place the reference ''paragraphs (d)(2) and (3) of this section''; and

■ b. Adding paragraph (d)(3).

The addition reads as follows:

§ 412.103 Special treatment: Hospitals located in urban areas and that apply for reclassification as rural.

* * * * *

(d) * * *

(3) CMS will consider a hospital that satisfies the criteria set forth in paragraph (a)(3) of this section and which qualifies for sole community hospital status in accordance with the requirements of § 412.92(b)(2)(vi) as being located in the rural area of the State in which the hospital is located as of the effective date set forth in § 412.92(b)(2)(vi).

* * * * *

§ 412.108 [Amended]

■ 12. Section 412.108 is amended by—

■ a. In paragraph (a)(1) introductory text, removing the date ''October 1, 2022'' and adding in its place the date ''October 1, 2024''; and

■ b. In paragraph (c)(2)(iii) introductory text, removing the date ''October 1, 2022'' and adding in its place the date ''October 1, 2024''.

■ 13. Section 412.140 is amended by adding paragraph (g) to read as follows:

§ 412.140 Participation, data submission, and validation requirements under the Hospital Inpatient Quality Reporting (IQR) Program.

* * * * *

(g) *Retention and removal of quality measures under the Hospital IQR Program*—(1) *General rule for the retention of quality measures.* Quality measures adopted for the Hospital IQR Program measure set for a previous payment determination year are retained for use in subsequent payment determination years, except when they are removed, suspended, or replaced as set forth in paragraphs (g)(2) and (3) of this section.

(2) *Immediate measure removal.* For cases in which CMS believes that the continued use of a measure raises specific patient safety concerns, CMS will immediately remove a quality measure from the Hospital IQR Program and will promptly notify hospitals and the public of the removal of the measure and the reasons for its removal through the Hospital IQR Program ListServ and the QualityNet website, as applicable.

(3) *Measure removal, suspension, or replacement through the rulemaking process.* Unless a measure raises specific safety concerns as set forth in paragraph (g)(2) of this section, CMS will use the regular rulemaking process

to remove, suspend, or replace quality measures in the Hospital IQR Program to allow for public comment.

(i) *Factors for consideration of removal of quality measures.* CMS will weigh whether to remove a measure based on the following factors:

(A) *Factor 1.* Measure performance among hospitals is so high and unvarying that meaningful distinctions and improvements in performance can no longer be made (''topped out'' measure).

(B) *Factor 2.* A measure does not align with current clinical guidelines or practice.

(C) *Factor 3.* The availability of a more broadly applicable measure (across settings or populations), or the availability of a measure that is more proximal in time to desired patient outcomes for the particular topic.

(D) *Factor 4.* Performance or improvement on a measure does not result in better patient outcomes.

(E) *Factor 5.* The availability of a measure that is more strongly associated with desired patient outcomes for the particular topic.

(F) *Factor 6.* Collection or public reporting of a measure leads to negative unintended consequences other than patient harm.

(G) *Factor 7.* It is not feasible to implement the measure specifications.

(H) *Factor 8.* The costs associated with a measure outweigh the benefit of its continued use in the program.

(ii) *Criteria to determine topped-out measures.* For the purposes of the Hospital IQR Program, a measure is considered to be topped-out under paragraph (g)(3)(i)(A) of this section when it meets both of the following criteria:

(A) Statistically indistinguishable performance at the 75th and 90th percentiles (defined as when the difference between the 75th and 90th percentiles for a hospital's measure is within 2 times the standard error of the full data set).

(B) A truncated coefficient of variation less than or equal to 0.10.

(iii) *Application of measure removal factors.* The benefits of removing a measure from the Hospital IQR Program will be assessed on a case-by-case basis. Under this case-by-case approach, a measure will not be removed solely on the basis of meeting any specific factor.

■ 14. Section 412.160 is amended by—

■ a. Adding the definitions of ''Health equity adjustment bonus points'' and ''Measure performance scaler'' in alphabetical order;

■ b. Revising the definition of ''Total Performance Score''; and

■ c. Adding the definition of ''Underserved multiplier'' in alphabetical order.

The additions and revision read as follows:

§ 412.160 Definitions for the Hospital Value-Based Purchasing (VBP) Program.

* * * * *

Health equity adjustment bonus points means the product of the measure performance scaler and the underserved multiplier.

* * * * *

Measure performance scaler means the sum of the points awarded to a hospital for each domain based on its unweighted domain score for the domain for the applicable fiscal year as calculated under § 412.165(b)(3).

* * * * *

Total Performance Score means the numeric scores awarded to each hospital based on its performance under the Hospital VBP Program with respect to a fiscal year as follows:

(1) For performance years before FY 2026, ranging from 0 to 100 for program years before FY 2026.

(2) For performance years on or after 2026, ranging from 0 to 110 for program years on or after FY 2026.

Underserved multiplier means a logistic function applied to the proportion of the hospital's patients with dual eligibility status out of the hospital's total Medicare inpatient population during the calendar year that is 2 years prior to the applicable fiscal year.

* * * * *

■ 15. Section 412.162 is amended by revising paragraph (b)(3) to read as follows:

§ 412.162 Process for reducing the base operating DRG payment amount and applying the value-based incentive payment amount adjustment under the Hospital Value-Based Purchasing (VBP) Program.

* * * * *

(b) * * *

(3) *Calculation of the value-based incentive payment percentage.* The value-based incentive payment percentage is calculated as the product of all of the following:

(i) The applicable percent as defined in § 412.160.

(ii)(A) For program years before FY 2026, the hospital's Total Performance Score divided by 100; or

(B) For program years on or after FY 2026, the hospital's Total Performance Score divided by 110.

(iii) The linear exchange function slope.

* * * * *

■ 16. Section 412.164 is amended by adding paragraph (c) to read as follows:

§ 412.164 Measure selection under the Hospital Value-Based Purchasing (VBP) Program.

* * * * *

(c)(1) *Updating of measure specifications.* CMS uses rulemaking to make substantive updates to the specifications of measures used in the Hospital VBP Program. CMS announces technical measure specification updates through the QualityNet website (*https://qualitynet.cms.gov*) and listserv announcements.

(2) *Measure retention.* All quality measures specified under section 1866(o)(2) of the Act for the Hospital VBP Program measure set remain in the measure set unless CMS, through rulemaking, removes or replaces them.

(3) *Measure removal factors*—(i) *General rule.* CMS may remove or replace a measure based on one of the following factors:

(A) *Factor 1.* Measure performance among hospitals is so high and unvarying that meaningful distinctions and improvements in performance can no longer be made (''topped out'' measures), defined as: statistically indistinguishable performance at the 75th and 90th percentiles; and truncated coefficient of variation ≤0.10.

(B) *Factor 2.* A measure does not align with current clinical guidelines or practice.

(C) *Factor 3.* The availability of a more broadly applicable measure (across settings or populations), or the availability of a measure that is more proximal in time to desired patient outcomes for the particular topic.

(D) *Factor 4.* Performance or improvement on a measure does not result in better patient outcomes.

(E) *Factor 5.* The availability of a measure that is more strongly associated with desired patient outcomes for the particular topic.

(F) *Factor 6.* Collection or public reporting of a measure leads to negative unintended consequences other than patient harm.

(G) *Factor 7.* It is not feasible to implement the measure specifications.

(H) *Factor 8.* The costs associated with a measure outweigh the benefit of its continued use in the program.

(ii) *Application of measure removal factors.* The benefits of removing a measure from the Hospital VBP Program will be assessed on a case-by-case basis. Under this case-by-case approach, a measure will not be removed solely on the basis of meeting any specific factor.

(iii) *Patient safety exception.* Upon a determination by CMS that the continued requirement for hospitals to submit data on a measure raises specific patient safety concerns, CMS may elect

to immediately remove the measure from the Hospital VBP measure set. CMS will, upon removal of the measure—

(A) Provide notice to hospitals and the public at the time CMS removes the measure, along with a statement of the specific patient safety concerns that would be raised if hospitals continued to submit data on the measure; and

(B) Provide notice of the removal in the **Federal Register**.

■ 17. Section 412.165 is amended by—

■ a. In paragraph (a)(1), adding a sentence at the end of the paragraph followed by a table;

■ b. Redesignating paragraph (b)(5) as paragraph (b)(6);

■ c. Adding a new paragraph (b)(5); and

■ d. Revising newly redesignated paragraph (b)(6).

The additions and revision read as follows:

§ 412.165 Performance scoring under the Hospital Value-Based Purchasing (VBP) Program.

* * * * *

(a) * * *

(1) * * * The applicable minimum number of cases are set forth as follows:

TABLE 1 TO PARAGRAPH (a)(1)—MINIMUM CASE NUMBER REQUIREMENTS FOR HOSPITAL VBP PROGRAM

Measure short name	Minimum number of cases
Person and Community Engagement Domain	
HCAHPS	Hospitals must report a minimum number of 100 completed Hospital Consumer Assessment of Healthcare providers and Systems (HCAHPS) surveys.
Clinical Outcomes Domain	
MORT–30–AMI	Hospitals must report a minimum number of 25 cases.
MORT–30–HF	Hospitals must report a minimum number of 25 cases.
MORT–30–PN (updated cohort)	Hospitals must report a minimum number of 25 cases.
MORT–30–COPD	Hospitals must report a minimum number of 25 cases.
MORT–30–CABG	Hospitals must report a minimum number of 25 cases.
COMP–HIP–KNEE	Hospitals must report a minimum number of 25 cases.
Safety Domain	
CAUTI	Hospitals have a minimum of 1.000 predicted infections as calculated by the Centers for Disease Control and Prevention (CDC).
CLABSI	Hospitals have a minimum of 1.000 predicted infections as calculated by the CDC.
Colon and Abdominal Hysterectomy SSI	Hospitals have a minimum of 1.000 predicted infections as calculated by the CDC.
MRSA Bacteremia	Hospitals have a minimum of 1.000 predicted infections as calculated by the CDC.
CDI	Hospitals have a minimum of 1.000 predicted infections as calculated by the CDC.
SEP–1	Hospitals must report a minimum number of 25 cases.
Efficiency and Cost Reduction Domain	
MSPB	Hospitals must report a minimum number of 25 cases.

* * * * *

(b) * * *

(5) For program years on or after FY 2026, CMS will determine the health equity adjustment bonus points the hospital has earned for the fiscal year as follows:

(i) CMS will calculate the measure performance scaler by:

(A) Awarding 4 points where the hospital's performance on the domain for the fiscal year meets or exceeds the top third of performance of all hospitals on the domain for the same fiscal year.

(B) Awarding 2 points where the hospital's performance on the domain for the fiscal year meets or exceeds the middle third of performance, but is less than the top third of performance, of all hospitals on the domain for the same fiscal year.

(C) Awarding 0 points where the hospital's performance on the domain is less than the middle third of performance of all hospitals on the domain for the fiscal year.

(D) Sum the points awarded under paragraph (b)(5)(i) of this section.

(ii) CMS will calculate the underserved multiplier for the hospital for the fiscal year.

(iii) CMS will calculate the health equity adjustment bonus points by multiplying the measure performance scaler calculated under paragraph (b)(5)(i) of this section and the underserved multiplier calculated under paragraph (b)(5)(ii) of this section.

(iv) CMS will cap the total number of health equity adjustment bonus points that could be added to a hospital's Total Performance Score for a program year at 10.

(6) After the domain scores are weighted:

(i) For program years before FY 2026, the sum of the weighted domain scores is the hospital's Total Performance Score for the fiscal year.

(ii) For program years on or after FY 2026, the sum of the weighted domain scores and the health equity adjustment bonus points is the hospital's Total Performance Score for the fiscal year.

* * * * *

§ 412.320 [Amended]

■ 18. Section 412.320 is amended in paragraph (a)(1)(iii) by adding the phrase ''and before October 1, 2023,'' after ''October 1, 2006,''.

■ 19. Section 412.560 is amended by revising paragraph (f)(1) to read as follows:

§ 412.560 Requirements under the Long-Term Care Hospital Quality Reporting Program (LTCH QRP).

* * * * *

(f) * * *

(1) Long-term care hospitals must meet or exceed the following data completeness thresholds with respect to a fiscal year:

(i)(A) The threshold set at 100 percent completion of measures data and standardized patient assessment data collected using the LTCH Continuity Assessment Record and Evaluation (CARE) Data Set (LCDS) on at least 80 percent of the assessments LTCHs submit through the CMS designated data submission system for the FY 2014 through the FY 2025 program year.

(B) The threshold set at 100 percent completion of measures data and standardized patient assessment data collected using the LCDS on at least 90 percent of the assessments LTCHs submit through the CMS designated data submission system beginning with the FY 2026 program year.

(ii) The threshold set at 100 percent for measures data collected and submitted using the Centers for Disease Control and Prevention's (CDC) National Healthcare Safety Network (NHSN) for FY 2014 and all subsequent payment updates.

* * * * *

PART 419—PROSECTIVE PAYMENT SYSTEMS FOR HOSPITAL OUTPATIENT DEPARTMENT SERVICES

■ 20. The authority citation for part 419 continues to read as follows:

Authority: 42 U.S.C. 1302, 1395l(t), and 1395hh.

■ 21. Section 419.92 is amended by adding paragraph (d) to read as follows:

§ 419.92 Payment to rural emergency hospitals.

* * * * *

(d) *REH payment for the costs of graduate medical education.* (1) For portions of cost reporting periods beginning on or after October 1, 2023, an REH that incurs costs of training full-time equivalent (FTE) residents that rotate to the REH may receive direct graduate medical education payments for those costs.

(2) Payment is equal to the Medicare reasonable costs that the REH incurs to train the FTE residents that rotate to the REH, as determined in accordance with section 1861(v)(1)(A) of the Act and the applicable principles of cost reimbursement in part 413 of this chapter, except that the following payment principles are excluded:

(i) Lesser of cost or charges.

(ii) Ceilings on hospital operating costs.

(3) An REH that does not incur costs of training FTE residents that rotate to the REH is considered a nonprovider setting for purposes of graduate medical education payments, consistent with §§ 412.105(f)(1)(ii)(E) and 413.78(g) of this chapter.

(4) Direct graduate medical education payments to REHs made under this section are made from the Federal Hospital Insurance Trust Fund.

PART 488—SURVEY, CERTIFICATION, AND ENFORCEMENT PROCEDURES

■ 22. The authority citation for part 488 continues to read as follows:

Authority: 42 U.S.C. 1302 and 1395hh.

§ 488.1 [Amended]

■ 23. Section 488.1 is amended in the definition of ''Provider of services or provider'' by adding the phrase ''rural emergency hospital,'' after ''critical access hospital,''.

■ 24. Section 488.2 is revised to read as follows:

§ 488.2 Statutory basis.

This part is based on the indicated provisions of the following sections of the Act:

TABLE 1 TO § 488.2

Section	Subject
1128	Exclusion of entities from participation in Medicare.
1128A	Civil money penalties.
1138(b)	Requirements for organ procurement organizations and organ procurement agencies.
1814	Conditions for, and limitations on, payment for Part A services.
1819	Requirements for skilled nursing facilities (SNFs).
1820	Requirements for critical access hospitals (CAHs).
1822	Hospice Program survey and enforcement procedures.
1832(a)(2)(C)	Requirements for Organizations that provide outpatient physical therapy and speech language pathology services.
1832(a)(2)(F)	Requirements for ambulatory surgical centers (ASCs).
1832(a)(2)(J)	Requirements for partial hospitalization services provided by community mental health centers (CMHCs).
1861(e)	Requirements for hospitals.
1861(f)	Requirements for psychiatric hospitals.
1861(m)	Requirements for Home Health Services.
1861(o)	Requirements for Home Health Agencies.
1861(p)(4)	Requirements for rehabilitation agencies.
1861(z)	Institutional planning standards that hospitals and SNFs must meet.
1861(aa)	Requirements for rural health clinics (RHCs) and federally qualified health centers (FQHCs).
1861(cc)(2)	Requirements for comprehensive outpatient rehabilitation facilities (CORFs).
1861(dd)	Requirements for hospices.
1861(ee)	Discharge planning guidelines for hospitals.
1861(ff)(3)(A)	Requirements for CMHCs.
1861(ss)(2)	Accreditation of religious nonmedical health care institutions.
1861(kkk)	Requirements for rural emergency hospitals (REHs).
1863	Consultation with state agencies, accrediting bodies, and other organizations to develop conditions of participation, conditions for coverage, conditions for certification, and requirements for providers or suppliers.
1864	Use of State survey agencies.
1865	Effect of accreditation.
1875(b)	Requirements for performance review of CMS-approved accreditation programs.
1880	Requirements for hospitals and SNFs of the Indian Health Service.
1881	Requirements for end stage renal disease (ESRD) facilities.
1883	Requirements for hospitals that furnish extended care services.
1891	Conditions of participation for home health agencies; home health quality.
1902	Requirements for participation in the Medicaid program.

TABLE 1 TO § 488.2—Continued

Section	Subject
1913	Medicaid requirements for hospitals that provide nursing facility (NF) care.
1919	Medicaid requirements for NFs.

§ 488.18 [Amended]

■ 25. Section 488.18 is amended in paragraph (d) by adding the phrase ''or a rural emergency hospital (as defined in section 1861(kkk)(2) of the Act)'' after the parenthetical phrase ''(as defined in section 1861(mm)(1) of the Act)''.

■ 26. Section 488.70 is added to read as follows:

§ 488.70 Special requirements for rural emergency hospitals (REHs).

An eligible facility submitting an application for enrollment under section 1866(j) of the Act to become a rural emergency hospital (REH) (as defined in § 485.502 of this chapter) must also submit an action plan containing the following additional information:

(a) *Plan for provision of services.* The provider must submit an action plan for initiating rural emergency hospital (REH) services (as defined in § 485.502 of this chapter, and which must include the provision of emergency department services and observation care).

(b) *Transition plan.* The provider must submit a detailed transition plan that lists the specific services that the provider will retain, modify, add, and discontinue as an REH.

(c) *Other outpatient medical and health services.* The provider must submit a detailed description of the other medical and health services that it intends to furnish on an outpatient basis as an REH.

(d) *Use of additional facility payment.* The provider must submit information regarding how the provider intends to use the additional facility payment provided in accordance with section 1834(x)(2) of the Act, including a description of the services that the additional facility payment would be supporting, such as the operation and maintenance of the facility and the furnishing of covered services (for example, telehealth services and ambulance services).

PART 489—PROVIDER AGREEMENTS AND SUPPLIER APPROVAL

■ 27. The authority citation for part 489 continues to read as follows:

Authority: 42 U.S.C. 1302, 1395i–3, 1395x, 1395aa(m), 1395cc, 1395ff, and 1395hh.

■ 28. Section 489.102 is amended by—

■ a. In paragraph (a) introductory text, adding the phrase ''rural emergency hospitals,'' after ''critical access hospitals,''; and

■ b. Adding paragraph (b)(5).

The addition reads as follows:

§ 489.102 Requirements for providers.

* * * * *

(b) * * *

(5) In the case of a rural emergency hospital, at the time of the individual's registration as a patient.

* * * * *

PART 495—STANDARDS FOR THE ELECTRONIC HEALTH RECORD TECHNOLOGY INCENTIVE PROGRAM

■ 29. The authority citation for part 495 continues to read as follows:

Authority: 42 U.S.C. 1302 and 1395hh.

■ 30. Section 495.4 is amended in the definition of ''EHR reporting period for a payment adjustment year'' by adding paragraphs (2)(ix) and (3)(ix) to read as follows:

§ 495.4 Definitions.

* * * * *

EHR reporting period for a payment adjustment year. * * *

(2) * * *

(ix) For an eligible hospital in CY 2025, the EHR reporting period is any continuous 180-day period within CY 2025 and applies for the FY 2027 payment adjustment year.

(3) * * *

(ix) For a CAH in CY 2025, the EHR reporting period is any continuous 180-day period within CY 2025 and applies for the FY 2025 payment adjustment year.

* * * * *

■ 31. Section 495.40 is amended by—

■ a. Redesignating paragraphs (b)(2)(i)(H) through (J) as paragraphs (b)(2)(i)(I) through (K); and

■ b. Adding a new paragraph (b)(2)(i)(H).

The addition reads as follows:

§ 495.40 Demonstration of meaningful use criteria.

* * * * *

(b) * * *

(2) * * *

(i) * * *

(H) For CY 2024 and subsequent years, for an eligible hospital or CAH attesting to CMS, satisfied the required objectives and associated measures for meaningful use as defined by CMS.

* * * * *

Dated: April 4, 2023.

Xavier Becerra,

Secretary, Department of Health and Human Services.

10 CFR Parts 429 and 430
Energy Conservation Program: Test Procedure for Fans and Blowers; Final Rule

DEPARTMENT OF ENERGY

10 CFR Parts 429 and 430

[EERE–2021–BT–TP–0021]

RIN 1904–AF17

Energy Conservation Program: Test Procedure for Fans and Blowers

AGENCY: Office of Energy Efficiency and Renewable Energy, Department of Energy.

ACTION: Final rule.

SUMMARY: The U.S. Department of Energy (''DOE'') establishes a test procedure for fans and blowers, including air circulating fans, and incorporates by reference the relevant industry test standards for: measuring the fan electrical input power and determining the fan energy index of fans and blowers other than air-circulating fans; and measuring the fan airflow in cubic feet per minute per watt of electric power input of air-circulating fans. In this final rule, DOE also establishes supporting definitions, requirements for alternative efficiency determination methods, and sampling requirements.

DATES: The effective date of this rule is May 31, 2023. All representations of energy efficiency and energy use, including those made on marketing materials and product labels, must be made in accordance with this test procedure beginning October 30, 2023. To the extent the test procedure established in this document is required only for the evaluation and issuance of newly established efficiency standards, use of the test procedure is not required until the implementation date of such new standards. The incorporation by reference of certain materials listed in the rule is approved by the Director of the Federal Register on May 31, 2023.

ADDRESSES: The docket, which includes **Federal Register** notices, public meeting attendee lists and transcripts, comments, and other supporting documents/materials, is available for review at *www.regulations.gov.* All documents in the docket are listed in the *www.regulations.gov* index. However, not all documents listed in the index may be publicly available, such as those containing information that is exempt from public disclosure.

A link to the docket web page can be found at *www.regulations.gov/docket/EERE-2021-BT-TP-0021.* The docket web page contains instructions on how to access all documents, including public comments, in the docket.

For further information on how to review the docket, contact the Appliance and Equipment Standards Program staff at (202) 287–1445 or by email: *ApplianceStandardsQuestions@ee.doe.gov.*

FOR FURTHER INFORMATION CONTACT:

Mr. Jeremy Dommu, U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, Building Technologies Office, EE–2J, 1000 Independence Avenue SW, Washington, DC 20585–0121. Telephone: (202) 586–9879. Email: *ApplianceStandardsQuestions@ee.doe.gov.*

Ms. Amelia Whiting, U.S. Department of Energy, Office of the General Counsel, GC–33, 1000 Independence Avenue SW, Washington, DC 20585–0121. Telephone: (202) 586–2588. Email: *amelia.whiting@hq.doe.gov.*

SUPPLEMENTARY INFORMATION:

DOE incorporates by reference the following industry standards into 10 CFR part 431:

ANSI/AMCA Standard 210–16 (AMCA 210–16), ''Laboratory Methods of Testing Fans for Certified Aerodynamic Performance Rating,'' August 26, 2016. (Co-published as ASHRAE 51–16).

ANSI/AMCA Standard 214–21 (AMCA 214–21), ''Test Procedure for Calculating Fan Energy Index for Commercial and Industrial Fans and Blowers,'' March 1, 2021.

ANSI/AMCA Standard 230–23 (AMCA 230–23), ''Laboratory Methods of Testing Air Circulating Fans for Rating and Certification,'' February 10, 2023.

ANSI/AMCA Standard 240–15 (AMCA 240–15), ''Laboratory Methods of Testing Positive Pressure Ventilators for Aerodynamic Performance Rating,'' May 9, 2015.

Copies of AMCA 210–16, AMCA 214–21, AMCA 230–23, and AMCA 240–15 can be obtained from the Air Movement and Control Association International (AMCA), 30 West University Drive, Arlington Heights, IL 60004–1893, (847) 394–0150, or by going to *www.amca.org.*

ISO 5801:2017(E), ''Fans—Performance testing using standardized airways,'' Third Edition, September 2017.

I. Authority and Background

On August 19, 2021, DOE published a coverage determination classifying fans and blowers as covered equipment under 42 U.S.C. 6311(2)(A) and 6312(b). 86 FR 46579 (''August 2021 Final Coverage Determination''). DOE does not currently have a test procedure or energy conservation standard for fans and blowers. The following sections discuss DOE's authority to establish a test procedure for fans and blowers and relevant background information regarding DOE's consideration of test procedures for this equipment.

A. Authority

The Energy Policy and Conservation Act, as amended (''EPCA''),[1] authorizes DOE to regulate the energy efficiency of a number of consumer products and certain industrial equipment. (42 U.S.C. 6291–6317) Title III, Part C[2] of EPCA, added by Public Law 95–619, Title IV, section 441(a), established the Energy Conservation Program for Certain Industrial Equipment, which sets forth a variety of provisions designed to improve energy efficiency. EPCA provides that DOE may include a type of industrial equipment, including fans and blowers, as covered equipment if it determines that to do so is necessary to carry out the purposes of Part A–1. (42 U.S.C. 6311(2)(B)(ii) and (iii); 42 U.S.C. 6312(b)) EPCA specifies the types of equipment that can be classified as industrial equipment. (42 U.S.C. 6311(2)(B)) The purpose of Part A–1 is to improve the efficiency of electric motors and pumps and certain other industrial equipment in order to conserve the energy resources of the Nation. (42 U.S.C. 6312(a)) As stated, on August 19, 2021, DOE published a final determination in which DOE determined that fans and blowers meet the three statutory criteria for classifying industrial equipment as covered (42 U.S.C. 6311(2)(A)), because fans and blowers are a type of industrial equipment which: (1) in operation consume, or are designed to consume, energy; (2) are to a significant extent distributed in commerce for industrial or commercial use; [3] and (3) are not covered under 42 U.S.C. 6291(a)(2). 86 FR 46579, 46585–46588. DOE also determined that coverage of fans and blowers is necessary to carry out the purposes of Part A–1. 86 FR 46579, 46588.

The energy conservation program under EPCA consists essentially of four parts: (1) testing, (2) labeling, (3) Federal energy conservation standards, and (4) certification and enforcement procedures. Relevant provisions of EPCA include definitions (42 U.S.C. 6311), test procedures (42 U.S.C. 6314), labeling provisions (42 U.S.C. 6315), energy conservation standards (42 U.S.C. 6313), and the authority to require information and reports from manufacturers (42 U.S.C. 6316; 42 U.S.C. 6296).

The Federal testing requirements consist of test procedures that manufacturers of covered equipment must use as the basis for: (1) certifying to DOE that their equipment complies with the applicable energy conservation standards adopted pursuant to EPCA (42 U.S.C. 6316(a); 42 U.S.C. 6295(s)), and (2) making other representations about the efficiency of that equipment (42 U.S.C. 6314(d)). Similarly, DOE must use these test procedures to determine whether the equipment complies with relevant standards promulgated under EPCA. (42 U.S.C. 6316(a); 42 U.S.C. 6295(s))

Federal energy efficiency requirements for covered equipment established under EPCA generally supersede State laws and regulations concerning energy conservation testing, labeling, and standards. (42 U.S.C. 6316(a); 42 U.S.C. 6297). DOE may, however, grant waivers of Federal preemption for particular State laws or regulations, in accordance with the procedures and other provisions of EPCA. (42 U.S.C. 6316(b)(2)(D))

Under 42 U.S.C. 6314, EPCA sets forth the criteria and procedures DOE must follow when prescribing or amending test procedures for covered equipment. EPCA requires that any test procedures prescribed or amended under this section must be reasonably designed to produce test results which reflect energy efficiency, energy use or estimated annual operating cost of a given type of covered equipment during a representative average use cycle (as determined by the Secretary) and requires that test procedures not be unduly burdensome to conduct. (42 U.S.C. 6314(a)(2))

B. Background

As discussed, on August 19, 2021, DOE published in the **Federal Register** a final coverage determination classifying fans and blowers as covered equipment. 86 FR 46579. DOE determined that the term ''blower'' is interchangeable with the term ''fan.'' 86 FR 46579, 46583. DOE defines a fan (or blower) as a rotary bladed machine used to convert electrical or mechanical power to air power, with an energy output limited to 25 kilojoule (''kJ'') per kilogram (''kg'') of air. It consists of an impeller, a shaft and bearings and/or driver to support the impeller, as well as a structure or housing. A fan (or blower) may include a transmission, driver, and/or motor controller. 10 CFR 431.172.

Prior to the August 2021 Final Coverage Determination, DOE published a notice of intent to establish an Appliance Standards and Rulemaking Federal Advisory Committee (''ASRAC'') Working Group (''Working

[1] All references to EPCA in this document refer to the statute as amended through the Energy Act of 2020, Public Law 116–260 (Dec. 27, 2020), which reflect the last statutory amendments that impact Parts A and A–1 of EPCA.

[2] For editorial reasons, upon codification in the U.S. Code, Part C was redesignated Part A–1 and hereafter referred to as ''Part A–1.''

[3] DOE notes that distribution for residential use does not preclude coverage as covered equipment so long as to a significant extent the equipment is of a type that is also distributed in commerce for industrial and commercial use.

Group'') for fans and blowers. 80 FR 17359 (April 1, 2015). The Working Group [4] commenced negotiations at an open meeting on May 18, 2015, and held 16 meetings and three webinars to discuss scope, metrics, test procedures, and standard levels for fans.[5] The Working Group concluded its negotiations on September 3, 2015, and, by consensus vote,[6] approved a term sheet containing recommendations for DOE on the scope of a test procedure, and energy conservation standards for fans. The term sheet containing the Working Group recommendations (''term sheet'') is available in the fans energy conservation standard rulemaking docket. (Docket No. EERE–2013–BT–STD–0006, No. 179) [7] ASRAC approved the term sheet on September 24, 2015. (Docket No. EERE–2013–BT–NOC–0005, Public Meeting Transcript, No. 58 at p. 29)

On January 10, 2020, DOE received a notice of petition from the Air Movement and Control Association (''AMCA''), Air Conditioning Contractors of America, and Sheet Metal & Air Conditioning Contractors of America (''the Petitioners'') requesting that DOE establish test procedures for certain categories of commercial and industrial fans based on an industry test method in development, AMCA 214. DOE published a notice of this petition with a request for public comment on April 23, 2020; [8] 85 FR 22677 (''April 2020 Notice of Petition''). As part of the April 2020 Notice of Petition, DOE sought data and information pertinent to whether amended test procedures would (1) accurately measure energy efficiency, energy use, or estimated annual operating cost of fans during a representative average use cycle; and (2) not be unduly burdensome to conduct. 85 FR 22677, 22679.

On October 1, 2021, DOE published a request for information pertaining to potential test procedures for fans and blowers. 86 FR 54412 (''October 2021 RFI''). In the October 2021 RFI, DOE identified a variety of issues on which it sought input to determine whether, and if so how, potential test procedures for fans and blowers, including air circulating fans, would: (1) comply with the requirements in EPCA that test procedures be reasonably designed to produce test results that reflect energy use during a representative average use cycle, and (2) not be unduly burdensome to conduct. *Id.* In response to requests from stakeholders,[9] DOE extended the comment period 14 days to November 15, 2021. 86 FR 59308 (Oct. 27, 2021).

DOE published a notice of proposed rulemaking (''NOPR'') for the test procedure on July 25, 2022. 87 FR 44194 (hereafter, the ''July 2022 NOPR''). DOE held a public meeting related to this NOPR on August 2, 2022 (hereafter, the ''NOPR public meeting''). DOE received several comments [10] requesting a comment extension ranging from 15 to 60 days, some commenters also requested a second public meeting/workshop. In particular, the Air-Conditioning, Heating, and Refrigeration Institute (''AHRI'') commented that the complexity of the commercial fans rulemaking warrants additional time for stakeholder feedback and recommended that DOE reconsider the request for an open meeting and reopen the comment period so that all stakeholders have ample opportunity for discourse on the implementation of an incredibly complex rule, adding that the 60-day comment period was not sufficient. (AHRI, No. 40 at pp. 3–4, 5) DOE determined that the length of the comment period provided a meaningful opportunity to comment on the NOPR and did not provide an extension.[11]

DOE received comments in response to the July 2022 NOPR from the interested parties listed in Table I–1.

TABLE I–1—LIST OF COMMENTERS WITH WRITTEN SUBMISSIONS IN RESPONSE TO THE JULY 2022 NOPR

Commenter(s)	Reference in this final rule	Comment No. in the docket	Commenter type
Association of Home Appliance Manufacturers	AHAM	35	Trade Association.
Air-Conditioning, Heating, and Refrigeration Institute	AHRI	40	Trade Association.
Air Movement and Control Association International	AMCA	13, 41	Trade Association.
Appliance Standards Awareness Project, American Council for an Energy-Efficient Economy, Natural Resources Defense Council.	Efficiency Advocates	32	Efficiency Organizations.
California Investor-Owned Utilities: Pacific Gas and Electric Company, San Diego Gas and Electric, and Southern California Edison.	CA IOUs	37	Utilities.
California Energy Commission	CEC	30	Manufacturer.
ebm-papst Inc	ebm-papst	31	Manufacturer.
Greenheck Group	Greenheck	39	Manufacturer.

[4] The Working Group was comprised of representatives from AAON, Inc.; AcoustiFLO LLC; AGS Consulting LLC; AMCA; AHRI, Appliance Standards Awareness Project; Berner International Corp; Buffalo Air Handling Company; Carnes Company; Daikin/Goodman; ebm-papst; Greenheck; Morrison Products Inc.; Natural Resources Defense Council; Newcomb & Boyd; Northwest Energy Efficiency Alliance; CA IOUs; Regal Beloit Corporation; Rheem Manufacturing Company; Smiley Engineering LLC representing Ingersoll Rand/Trane; SPX Cooling Technologies/CTI; The New York Blower Company; Twin City Companies, Ltd; U.S. Department of Energy; and United Technologies/Carrier.

[5] Details of the negotiation sessions can be found in the public meeting transcripts that are posted to the docket for the energy conservation standard rulemaking at: *www.regulations.gov/docket?D=EERE-2013-BT-STD-0006.*

[6] At the beginning of the negotiated rulemaking process, the Working Group defined that before any vote could occur, the Working Group must establish a quorum of at least 20 of the 25 members and defined consensus as an agreement with less than 4 negative votes. Twenty voting members of the Working Group were present for this vote. Two members (Air-Conditioning, Heating, and Refrigeration Institute and Ingersoll Rand/Trane) voted no on the term sheet.

[7] The references are arranged as follows: (commenter name, comment docket ID number, page of that document). If one comment was submitted with multiple attachments, the references are arranged as follows: (commenter name, comment docket ID number. Attachment number, page of that document). The attachment number corresponds to the order in which the attachment appears in the docket. The parenthetical reference provides a reference for information located in DOE Docket No. EERE–2021–BT–TP–0021. If the information was submitted to a different DOE docket, the DOE docket number is additionally specified in the reference.

[8] At the time of the petition, AMCA 214–21 was available as a draft version (AMCA 214).

[9] AMCA requested a 21-day extension (AMCA, No. 2 at p. 1).

[10] AMCA and AHRI, No. 19 at p. 1; AHAM, No. 20 at p. 1; CA IOUs, No. 21 at pp. 1–2; NEEA, No. 22 at p. 1, JCI, No. 23 at p. 1; AHAM, No. 24 at p. 1.

[11] DOE posted a copy of the pre-**Federal Register** publication of the fans and blowers test procedure NOPR on the DOE website and notified stakeholder organizations via email on June 24, 2022, which provided stakeholders approximately 30 days for review of that copy in addition to the 60-day comment period that was announced in the notice published in the **Federal Register** on July 25, 2022. A public meeting was held on August 2, 2022, and the written comment period closed on September 23, 2022.

A parenthetical reference at the end of a comment quotation or paraphrase provides the location of the item in the public record.[12] To the extent that interested parties have provided written comments that are substantively consistent with any oral comments provided during the NOPR public meeting, DOE cites the written comments throughout this final rule. DOE identified one oral comment from Nidec Motor Corporation (''Nidec'') regarding stability determination that is summarized and addressed in section III.E.16.a.; one comment from ASAP generally supporting the test procedure rulemaking summarized and addressed in section III.A; one comment from Daikin related to embedded fans exclusions summarized and addressed in section III.B.3.b; and one comment from Loren Cook Company (''Loren Cook'') related to test burden summarized and addressed in section III.E.12 of this document. All other comments provided during the webinar are substantively addressed by written comments.

In addition, DOE notes that it received several comments [13] that were not related to the test procedure and instead relate to potential energy conservation standards. DOE will address these comments in a separate rulemaking pertaining to energy conservation standards.

On November 21, 2022, AMCA, as well as AMCA members (ebm-papst, Big Ass Fans, Greenheck, New York Blower, and Twin City Fan), ASAP, and NEEA met with DOE to discuss several items related to the fan and blower test procedure during an ex-parte meeting. (AMCA No. 45, at pp. 1–12)

II. Synopsis of the Final Rule

In this final rule, DOE adopts a test procedure for fans and blowers in subpart J of 10 CFR part 431 and modifies 10 CFR part 429, as follows:

- Establishes the scope of the test procedure for fans and blowers as to include standalone and embedded fans and blowers (*i.e.,* fans and blowers incorporated into other equipment) that are either: axial inline fans; axial panel fans; centrifugal housed fans; centrifugal unhoused fans; centrifugal inline fans; radial-housed fans; power roof/wall ventilators (''PRVs''); or air circulating fans with input power greater than or equal to 125 W; and excluding some fans that are embedded in other products or equipment; and excluding radial housed unshrouded fans with a diameter less than 30 inches or a blade width of less than 3 inches; safety fans; induced flow fans; jet fans; cross-flow fans; fans manufactured exclusively to be powered by internal combustion engines; fans that create a vacuum of 30 inches water gauge (''in. wg'') or greater; and fans designed and marketed to operate at or above 482 degrees Fahrenheit (250 degrees Celsius). In addition, for fans and blowers other than air circulating fans, the test procedure only applies to duty points with fan shaft input power equal to or greater than 1 horsepower and fan air power equal to or less than 150 horsepower.
- Defines ''axial inline fan,'' ''axial panel fan,'' ''centrifugal housed fan,'' ''centrifugal unhoused fan,'' ''centrifugal inline fan,'' ''radial-housed fan,'' ''power roof ventilator,'' ''cross-flow fan,'' ''induced flow fan,'' ''jet fan,'' ''basic model,'' ''safety fan,'' ''air circulating fan,'' and related terms.
- Adopts through reference in newly adopted appendix A to subpart J of 10 CFR part 431 (''appendix A'') certain provisions of ANSI/AMCA 214–21, ''Test Procedure for Calculating Fan Energy Index for Commercial and Industrial Fans and Blowers'' (''AMCA 214–21''), with modifications, as the test procedure for determining FEP and FEI of fans and blowers other than circulating fans;
- Adopts through reference in newly adopted appendix B to subpart J of 10 CFR part 431 (''appendix B'') certain provisions of ANSI/AMCA 230–23, ''Laboratory Methods of Testing Air Circulating Fans for Rating and Certification,'' with modifications, as the test procedure for determining efficacy in cubic feet per minute (''CFM'') per watt (''W'') (''CFM/W'');
- Adopts through reference certain provisions of the following industry standards referenced by AMCA 214–21: ANSI/AMCA 210–16, (''AMCA 210–16'') ''Laboratory Methods of Testing Fans for Certified Aerodynamic Performance Rating'' and ISO 5801:2017(E), ''Fans Performance testing using standardized airways'' (ISO 5801:2017).
- Establishes fan and blower sampling requirements and provisions related to determining represented values in 10 CFR 429.69;
- Establishes an alternative efficiency determination method (''AEDM'') for fans and blowers in 10 CFR 429.70; and

The adopted requirements are summarized in Table II–1.

[12] The parenthetical reference provides a reference for information located in the docket of DOE's rulemaking to develop test procedures for fans and blowers. (Docket No. EERE–2021–BT–TP–0021, maintained at *www.regulations.gov.*) The references are arranged as follows: (commenter name, comment docket ID number, page of that document).

TABLE II–1—SUMMARY OF ADOPTED REQUIREMENTS

Topic	Location in CFR	Adopted requirements	Applicable preamble discussion
Scope	10 CFR 431.174	Establish the scope of the test procedure for fans and blowers as to include standalone and embedded fans and blowers (*i.e.,* fans and blowers incorporated into other equipment) that are either: axial inline fans; axial panel fans; centrifugal housed fans; centrifugal unhoused fans; centrifugal inline fans; radial-housed fans; power roof/wall ventilators; or air circulating fans with input power greater than or equal to 125 W; and excluding some fans that are embedded in other products or equipment; and excluding radial housed unshrouded fans with diameter less than 30 inches or a blade width of less than 3 inches; safety fans; induced flow fans; jet fans; cross-flow fans; fans manufactured exclusively to be powered by internal combustion engines; fans that create a vacuum of 30 in. wg or greater; and fans designed and marketed to operate at or above 482 degrees Fahrenheit (250 degrees Celsius). In addition, for fans and blowers other than air circulating fans, the test procedure is applicable to duty points with fan shaft input power equal to or greater than 1 horsepower and fan air power equal to or less than 150 horsepower.	Section III.B.
Definitions	10 CFR 431.172	Define ''axial inline fan,'' ''axial panel fan,'' ''centrifugal housed fan,'' ''centrifugal unhoused fan,'' ''centrifugal inline fan,'' ''radial-housed fan,'' ''power roof ventilator,'' ''cross-flow fan,'' ''induced flow fan,'' ''jet fan,'' ''basic model,'' ''safety fan,'' ''air circulating fan,'' and related terms.	Section III.C.
Test Procedure	10 CFR 431.174	Establish FEI as the metric for fans and blowers other than air circulating fans; incorporate by reference AMCA 214–21, AMCA 210–16, and provide additional instructions for determining the FEI (and other applicable performance characteristics) for fans and blowers other than air circulating fans. Establish the efficacy (CFM/W) as the metric for air circulating fans; incorporate by reference AMCA 230–23 and provide additional instructions for determining the efficacy (and other applicable performance characteristics) for air circulating fans.	Sections III.D, III.E, III.F and III.G.
Sampling Plan	10 CFR 429.69	Specify the minimum number of fans or blowers to be tested to rate a basic model and determine representative values.	Section III.J.
AEDM	10 CFR 429.70	Establish requirements for applying an alternative energy use determination method.	Section III.I.

DOE's test method for fans and blowers includes measurements of pressure, flow rate, and fan shaft or electrical input power, all of which are required to calculate FEP, FEI, and efficacy (CFM/W) as applicable, as well as other quantities to characterize rated fan and blower performance (*e.g.,* speed). DOE has determined that the relevant sections of AMCA 214–21, AMCA 210–16, and AMCA 230–23, in conjunction with the additional provisions adopted in this test procedure, would produce test results that reflect the energy efficiency and energy use of a fan or blower during a representative average use cycle. (42 U.S.C. 6314(a)(2)) Additionally, DOE has determined that the test procedure, which is based on the relevant industry testing standard, would not be unduly burdensome to conduct. (42 U.S.C. 6314(a)(2)) DOE's analysis of the burdens associated with the proposed test procedure is presented in section III.M of this document.

The effective date for the test procedure adopted in this final rule is 30 days after publication of this document in the **Federal Register**. Representations of energy use or energy efficiency must be based on testing in accordance with the test procedure beginning 180 days after the publication of this final rule.

III. Discussion

In the following sections, DOE establishes test procedures and related definitions for fans and blowers in subpart J of part 431, sampling plans for this equipment, an alternative efficiency determination method (''AEDM'') for this equipment, and enforcement provisions for this equipment. In the following sections, DOE provides relevant background information, discusses and responds to relevant public comments, and presents the adopted requirements.

A. General

ASAP commented in general support of the July 2022 NOPR. (Public Meeting transcript, No. 18 at p. 5)

AHRI commented that in the Table of Contents of the NOPR, DOE lists a section ''C. Deviation from the Process Rule;'' however, no such section can be found in the NOPR. AHRI noted that according to Section 3(a) of 10 CFR part 430, subpart C, appendix A, DOE may,

as necessary, deviate from [the Process Rule] to account for specific circumstances of a particular rulemaking, and interested parties will receive notice of the deviation and explanation. AHRI recommended that DOE reopen the comment period to include the missing ''Section C. Deviation from the Process Rule'' that includes an explanation for the deviation so that the public can respond and provide meaningful comments. AHRI stated that DOE has failed to be transparent in the NOPR in providing no notice or explanation of any deviation from the applicable guidance of appendix A. (AHRI, No. 40 at pp. 2–3)

AHAM commented that DOE did not provide notice and explanation for deviations from the Process Rule, although the table of contents included such section. Nevertheless, AHAM noted that it is clear that DOE deviated from the Process Rule at least with regard to the comment period, although DOE did not explain why. AHAM commented that instead of the process rule's required 75-day comment period for test procedures, DOE provided only 60 (which has become DOE's common practice regardless of the particular rulemaking). AHAM stated that DOE declined several parties' requests to extend that comment period despite substantive reasons necessitating more time and reasonable extension requests that would not meaningfully extend DOE's rulemaking process requested. In addition, AHAM commented that a longer comment period was required for manufacturers to test products using DOE's proposed tests. In addition, AHAM noted that AHAM members struggled to understand whether the proposed test procedure would implicate consumer fans and/or fans used in home appliances in the allotted time. AHAM stated that denying reasonable requests for modest comment period extensions will not ultimately streamline DOE's efforts and will result in increased resource needs for the Department to respond to stakeholder meeting requests and supplemental documents, which would lengthen the rulemaking process. AHAM commented that in the future, DOE should allow for reasonable extensions to comment periods in order to increase the quality of responses to its requests for comment and the overall accuracy of its final rules. (AHAM, No. 35 at pp. 7–8)

AMCA noted that incorporating air circulating fans in the test procedure NOPR at a time when AMCA 230 was undergoing revisions added considerable time and efforts in addition to having to review the expected material and AMCA commented that DOE denied multiple stakeholder requests for a 30-day extension. AMCA further commented that an ex-parte meeting after the pre-publication of the NOPR and before the publication of the NOPR would have benefited stakeholders and potentially improved the NOPR. (AMCA No. 41 at p. 2)

DOE did not deviate from 10 CFR part 430, subpart C, appendix A (''appendix A''), applicable to fans and blowers under 10 CFR 431.4, and did not include such discussion in the July 2022 NOPR. DOE notes however that a section title for this section was not deleted from the table of contents and should have been deleted.

In addition, appendix A does not prescribe any mandatory comment period for test procedure NOPRs. A 60-day period is the typical period that DOE provides for all NOPRs, which exceeds the 45-day minimum required by EPCA. (*See* 42 U.S.C. 6314(b)(2)) As previously noted, the pre-publication version of the NOPR was publicly available for 30 days for stakeholders to review prior to publication of the NOPR. As such, the timing and sequence of this rulemaking has been conducted consistent with the provisions in appendix A. Additionally, the intent of the pre-publication version of a document is to provide stakeholders with additional time to review and prepare comments. Further, DOE provided opportunity for written comments and subsequent ex-parte meeting, as previously discussed, and comments from all stakeholders were considered in finalizing this test procedure pertaining to fans and blowers as discussed in section III of this document.

AHRI commented that the proposed test procedure will exacerbate supply chain issues, contradicting Executive Order 14017.[14] AHRI commented that supply chain disruptions have been lowering the competitiveness of the HVAC industry and hindering AHRI manufacturing capabilities. AHRI commented that trade distortions and the COVID–19 pandemic have resulted in shortages of essential components and led to delays and costly inflation at every stage of the manufacturing supply chain. AHRI commented that the immediacy of the implementation of a test procedure change serves to exacerbate near-term supply chain disruptions, and that these issues are made worse with ongoing labor shortages, and added together, disrupt domestic production, and result in temporary shutdowns, reduced sales, increased consumer costs, and delayed delivery of critical products.[15] AHRI further provided a description of current supply issues experienced by its members and commented that such regulatory burdens by DOE and others have left manufacturers in an almost constant state of redesign and testing. AHRI added that innovation is no longer as important as just modifying products to meet what AHRI described as new and ever-changing regulatory burdens. (AHRI, No. 40 at pp. 15–17)

DOE has determined that establishing a test procedure will not impact the availability of current models. The test procedure does not establish any energy conservation standards and does not result in any non-compliant fans. Section III.M of this document discusses DOE's analysis of testing costs and burden as a result of establishing this test procedure.

Morrison commented that the proposed new metric and testing plans was inconsistent with 2015 ASRAC WG term sheet agreement and disregarded the 11 years of work that went into this challenging and groundbreaking rulemaking effort. (Morrison No. 42 at p.1) As discussed in section III.G.1 of this document, DOE did not propose a new metric in the July 2022 NOPR. Further in this final rule, DOE is adopting a minimum sample size of one unit in line with the term sheet as discussed in section III.J of this document.

B. Scope of Applicability

This rulemaking applies to fans and blowers. A fan or blower is defined as a rotary bladed machine that is used to convert electrical or mechanical power to air power with an energy output limited to 25 kilojoule (''kJ'')/kilogram (''kg'') of air. 10 CFR 431.172. It consists of an impeller, a shaft and bearings and/or a driver to support the impeller, as well as a structure or housing. *Id.* A fan or blower may include a transmission, driver, and/or motor controller. *Id.* As discussed, DOE has classified fans and blowers as covered equipment. 86 FR 46579. ''Covered equipment'' consists of certain industrial equipment, which is classified by the Secretary according to section 6312(b) and excludes covered

[14] Executive Order on America's Supply Chains, February 24, 2021. Available at: *www.whitehouse.gov/briefing-room/presidential-actions/2021/02/24/executive-order-on-americas-supply-chains.*

[15] AHRI referenced appendix A of the Supply Chain Disruptions Affect Viability of U.S. Manufacturing Sector white paper, published by AHRI, AHAM, NAFEM, and NEMA. Available at *www.nema.org/docs/default-source/advocacy-document-library/joint-association-supply-chain-white-paper.pdf?sfvrsn=1763ed3b_2.*

products, other than industrial equipment that is a component of a covered product. (42 U.S.C. 6311(1) and (2)(A)(iii)) DOE explained in the coverage determination that fans and blowers, the subjects of this rulemaking, do not include ceiling fans and furnace fans, as defined at 10 CFR 430.2. *See* 86 FR 46579, 46586. DOE also noted that distribution for residential use does not preclude coverage as covered equipment so long as to a significant extent the equipment is of a type that is also distributed in commerce for industrial and commercial use. *Id.* at fn. 26.

In the August 2021 Final Coverage Determination, DOE did not establish definitions for specific categories of fans and blowers. DOE stated that it would consider specific categories of fans and blowers and the scope of applicability of test procedures and energy conservation standards in its respective rulemakings. 86 FR 46579, 46585.

This section discusses the fans and blowers that DOE includes in the scope of applicability of the test procedure, as well as exemptions.

1. Fans and Blowers Inclusions

This section discusses fans and blowers, other than air circulating fans, proposed for inclusion in the scope of applicability of the test procedure. Air circulating fans are discussed in section III.B.4 of this document.

The Working Group recommended that the test procedure be applicable to certain classifications of fans and blowers, listed in Table III–8 of this document. (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #1 at p. 1) The Working Group did not provide definitions for the specified classifications of the fans and blowers identified for inclusion in the scope of a test procedure. AMCA 214–21 provides terms and associated definitions for certain classifications of fans and blowers that correspond to the Working Group recommendation. The Working Group further recommended that the test procedure apply only to the fan operating points (*i.e.,* duty points) with a fan shaft power equal to or greater than 1 horsepower (''hp'') and fan air power [16] equal to or less than 150 hp. The Working Group recommended that air power be calculated using static pressure for unducted fans (''static air power'') and total pressure for ducted fans (''total air power'').[17] (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #5 at p. 4)

In the July 2022 NOPR, DOE noted that on February 24, 2022, the California Energy Commission (''CEC'') published a proposed rulemaking for fans and blowers that includes terms and definitions that correspond to the Working Group recommendations.[18] The CEC proposed to cover the following fan categories: axial inline, axial panel, centrifugal housed, centrifugal unhoused, centrifugal inline, radial housed, and power roof/wall ventilators, and to define these terms largely based on the definitions in AMCA 214–21, with revisions to indicate a fan's intended application and if a fan's inlet or outlet can be (optionally, as applicable) ducted. In addition, the CEC proposal considers fans and blowers that have a rated fan shaft power greater than or equal to 1 horsepower, or, for fans without a rated shaft input power, an electrical input power greater than or equal to 1 kW, and a fan output power less than or equal to 150 horsepower.[19] 87 FR 44194, 44199.

In the July 2022 NOPR, DOE proposed to include all fans and blowers that are included within the scope of AMCA 210–16 (referenced by AMCA 214–21) and proposed that the test procedure would be applicable to the following fans and blowers, with exclusions discussed in sections III.B.2 and III.B.3 of this document: (1) axial inline fan; (2) axial panel fan; (3) centrifugal housed fan; (4) centrifugal unhoused fan; (5) centrifugal inline fan; (6) radial-housed fan; and (7) power roof/wall ventilator (''PRV'').[20] 87 FR 44194, 44200. (See section III.C.1 of this document for definitions of these terms)

AMCA supported the proposed standalone fan inclusions and did not provide comments regarding embedded fans. (AMCA, No. 41 at p. 5) New York Blower commented that the fans and blowers proposed for inclusion in the DOE test procedure are appropriate. (New York Blower, No. 33 at p. 6)

DOE did not receive any other comments on this issue and includes all fans and blowers within the scope of AMCA 210–16 (referenced by AMCA 214–21) in the scope of the DOE test procedure. As such, DOE specifies that the test procedure is applicable to the following fans and blowers, with exclusions discussed in sections III.B.2 and III.B.3 of this document: (1) axial inline fan; (2) axial panel fan; (3) centrifugal housed fan; (4) centrifugal unhoused fan; (5) centrifugal inline fan; (6) radial-housed fan; and (7) PRV.

In the July 2022 NOPR, DOE proposed that the scope of the test procedure cover fans and blowers with a fan shaft input power equal to or greater than 1 horsepower and a fan static or total air power equal to or less than 150 horsepower. DOE proposed the lower 1 hp limit to match the technical applicability of the AMCA 214–21 and AMCA 210–16 test procedures. DOE proposed the upper air power limit at this time because fans that operate above the proposed upper limit are typically custom orders and are too large to be tested in a laboratory setting. In addition, DOE noted that these limits are in line with the Working Group recommendations and the CEC scope. 87 FR 44194, 44200–44201.

In the July 2022 NOPR, DOE tentatively determined that the 1 hp fan shaft power lower limit may not be a practical unit of measurement for all fans because some fans are designed such that the measurement of the shaft input power is not feasible, and the only feasible measurement is the FEP, which is measured in units of kW. For example, some fans incorporate the bare shaft and the motor in the same enclosed housing and do not provide access to the fan shaft (*i.e.,* between the motor and the fan), where the measurement of the fan shaft power would be conducted. DOE relied on the motor efficiency equations provided in section 6.4.2.3 of AMCA 214–21 to convert the fan shaft power into electrical input power [21] and has tentatively determined that 0.89 kW is appropriate to establish a standardized equivalent to the 1 hp fan shaft input power limit. Additionally, section 6.5.3.1.3 ''Fan Efficiency Requirements'' of ANSI/ASHRAE/IES 90.1, ''Energy Standard for Buildings except Low-Rise Residential Buildings (2019)'' (''ASHRAE 90.1–2019'') relies on the value of 0.89 kW as the corresponding

[16] The air power of a fan is the fan's output power. It is proportional to the product of the fan airflow rate and the fan pressure.

[17] The terms ''ducted'' and ''unducted'' refer to the recommended test configuration used when conducting a fan test. Appendix C of the term sheet specifies which fan categories are typically ducted (*i.e.,* tested using a ducted outlet and for which the FEI is calculated on a total pressure basis): axial cylindrical housed, centrifugal housed (excluding inline and radial), inline and mixed flow, radial housed; and which fan types are considered unducted (*i.e.,* tested with a free outlet and for which the FEI is calculated on a static pressure basis): panel, centrifugal unhoused (excluding inline and radial), and power roof ventilators.

[18] All documents related to this rulemaking can be found in the rulemaking Docket 22–AAER–01 accessible at: *www.energy.ca.gov/rules-and-regulations/appliance-efficiency-regulations-title-20/appliance-efficiency-proceedings-11.*

[19] *See* Proposed regulatory language for Commercial and Industrial Fans and Blowers available in the following Docket: 22–AAER–01 at: *efiling.energy.ca.gov/Lists/DocketLog.aspx?docketnumber=22-AAER-01.*

[20] PRVs include: Centrifugal PRV exhaust fans; Centrifugal PRV supply fans; and Axial PRVs, as defined in AMCA 214–21.

[21] The electrical input power is equal to the fan shaft input power divided by the motor efficiency.

threshold to a value of 1 hp of shaft input power. Accordingly, DOE proposed that the test procedure would be applicable to a fan or blower with duty points [22] with the following characteristics: (1) a fan shaft input power equal to or greater than 1 horsepower and a fan static or total air power equal to or less than 150 horsepower, or (2) a FEP equal to or greater than 0.89 kW and a fan static or total air power equal to or less than 150 horsepower. 87 FR 44194, 44200.

In addition, AMCA 214–21 distinguishes between fans that use a total pressure basis [23] and fans that use a static pressure basis.[24] In the July 2022 NOPR, DOE proposed to establish the 150 hp upper limit in terms of total air power for fans and blowers that use a total pressure basis FEI and would be required to be tested with a ducted outlet according to the proposed provisions adopted through reference to AMCA 214–21. For fans and blowers that use a static pressure basis FEI and would be required to be tested using a free outlet under the provisions of AMCA 214–21, DOE proposed to establish the air power limit in terms of static air power. 87 FR 44194, 44200–44201.

Finally, to define total air power, DOE proposed to rely on the definition of ''fan output power'' in AMCA 210–16. DOE proposed to define ''total air power'' as the total power delivered to air by the fan; it is proportional to the product of the fan airflow rate, the fan total pressure, and the compressibility coefficient and is calculated in accordance with section 7.8.1 of AMCA 210–16. *See* the definition of ''fan output power'' in Section 3.1.31 of AMCA 210–16 and calculation formulas in section 7.8.1 of AMCA 210–16. DOE also proposed to define ''static air power'' as the static power delivered to air by the fan; it is proportional to the product of the fan airflow rate, the fan static pressure, and the compressibility coefficient and is calculated in accordance with section 7.8.1 of AMCA 210–16, using static pressure instead of total pressure. 87 FR 44194, 44201.

In response to the July 2022 NOPR, AMCA commented in support of the basis of the proposed power limits based on fan air power, fan shaft input power and fan electrical input power. In terms of scope, AMCA added that fans deliver air power, defined generally as pressure multiplied by volume flow rate. AMCA stated that by limiting the top end of the scope to air power, as opposed to electrical input power, a less efficient fan is not allowed to escape regulation by consuming a larger amount of electrical input power to deliver a similar amount of air power. Regarding the low side of the scope related to power, for bare fans, AMCA commented that shaft input power is the appropriate measure because there is no driver. For fans tested wire-to-air, AMCA commented that the appropriate measure is electrical input power. (AMCA, No. 41 at p. 5)

Morrison commented in support of the proposed power limits (Morrison, No. 42 at p. 2)

New York Blower commented that the proposed power limits were appropriate. New York Blower commented that the limits are configured in a manner that captures products at the low end of fan powers and does not allow less efficient products at the high end to escape regulation by being less efficient. However, New York Blower noted that the July 2022 NOPR implies that if a fan is capable of operating within the scope of regulation, it should be regulated under all possible operating conditions. New York Blower commented that such approach would remove the upper limit of scope considering that practically any fan could be slowed down enough to operate within the proposed scope. Instead, New York Blower commented that for applications that operate at the high end of the proposed scope, fan performance is typically attached to the fan and that these types of fans are not sold as a distributed product—like a fan in a box—but configured and applied to the application. Thus, for these fans, New York Blower recommended that the industry be regulated for fans configured and identified as operating within scope and for identical products operating outside the scope, the product not be regulated. (New York Blower, No. 33 at p. 7)

ebm-papst commented that testing of larger fans becomes exponentially more burdensome and recommended that DOE exempt all fans that have at least one duty point at an air power above 150 horsepower. Otherwise, according to ebm-papst, many speed adjustable industrial fans become subject to this regulation even if just a small portion of the operating map is below 150 hp or air power. (ebm-papst, No. 31 at p. 1)

Robinson commented that they are not in favor of the inclusion of duty points within the power range. Robinson commented that custom fan equipment is often selected at a duty point well beyond the horsepower limitation, but included within the operational requirements are operating duty points that fall within the horsepower range. Robinson asked if the manufacturer is only required to make a representation regarding that single duty point. Robinson added that in some instances, customers cannot obtain a desired duty point through speed control, and therefore duty points must be attained through damper control. Inclusion of these appurtenances in testing will significantly multiply testing requirements to make an assertation regarding FEP, FEI, etc. and result in over-designed fans. (Robinson, No. 43 at p. 4)

The CA IOUs commented that DOE should rely on the best efficiency point (''BEP'') [25] as the criteria for whether a fan falls within the power input range and air horsepower to determine if a fan is within the scope of the test procedure. The CA IOUs commented that DOE proposed that the test procedure applies to a fan or blower with duty points greater than one horsepower and equal to or less than 150 horsepower. Therefore, fans with a single duty point of less than 150 air horsepower would be within the scope of this rulemaking. The CA IOUs asserted that fans with variable speed drives, regardless of size, are bound to have duty points less than 150 horsepower. The CA IOUs also stated that there are also many small fans, particularly forward-curved fans, with a few points and shaft input power greater than one horsepower at the extreme right end of the fan curve. The CA IOUs recommended that DOE change this exclusion to fans where the BEP is less than or equal to one horsepower or greater than 150 hp. (CA IOUs, No. 37 at p. 10)

As noted, the Working Group recommended that the test procedure be only applicable to the fan operating points with a fan shaft power equal to or greater than 1 horsepower (''hp'') and fan air power equal to or less than 150 hp. (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #5 at p. 4) In line with this approach, DOE adopts the power limits as proposed in the July 2022 NOPR and corresponding definitions of static air power (''fan static air power'') and total airpower

[22] A duty point is characterized by a given airflow and pressure and has a corresponding operating speed.

[23] This includes: centrifugal housed fans, radial housed fans, centrifugal inline fans, centrifugal PRVs Supply, and Axial Inline fans. (*See* Table 7.1 of AMCA 214–21.)

[24] This includes: Centrifugal unhoused fans, Centrifugal PRVs Exhaust, Axial Panel fans, Axial PRVs. (*See* Table 7.1 of AMCA 214–21.)

[25] The BEP represents the flow and pressure values at which the fan total efficiency (ratio of total air power to fan shaft input power) is maximized when operating a given speed.

(fan total air power''). DOE further clarifies that the test procedure is only applicable to the fan or blower duty points with the following characteristics: (1) a fan shaft input power equal to or greater than 1 horsepower and a fan static or total air power equal to or less than 150 horsepower, or (2) a FEP equal to or greater than 0.89 kW and a fan static or total air power equal to or less than 150 horsepower. When determining the duty points of a basic model, to establish whether a fan includes duty points that meet the scope requirements in terms of power limit, DOE will refer to published data, marketing literature, and other publicly available information about the range of operation (*i.e.,* flow, speed, and pressure) of each basic model. If the manufacturer only includes 1 single duty point in the fan operating range, then the manufacturer is only required to make a representation at that one point. In addition, DOE follows the Working Group recommendation for establishing the scope power limit as proposed in the July 2022 NOPR. Finally, the limit recommended by the Working Group recommendation was set to capture the design points that represent the majority of the market and therefore corresponds to a limit in terms design point not BEP. (EERE–2013–BT–STD–0006, Public Meeting Transcript, No. 161 at pp. 96, 100–101) In line with this Working Group recommendation, DOE is not relying on BEP to establish the scope of the test procedure.

Regarding fans that are designed to operate outside of the power limits but that may include duty points that fall in the scope, DOE notes that the manufacturer would be required to test such a fan at the duty points that fall in the scope of the test procedure. Regarding testing with accessories, DOE addresses this issue in section III.E.12 of this document.

2. Fans and Blowers Exclusions

The Working Group recommended the exclusion of circulating fans (also known as air circulating fans), induced flow fans, jet fans, and cross-flow fans. (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #2 at pp. 2–3) The Working Group also recommended the exclusion of safety fans due to low operating hours and specific design features that impair efficiency (*e.g.,* high tip clearance), and a subset of radial fans that are used for material handling applications [26] (*e.g.,* to move paper dust, sand, etc.).[27] (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #2 at pp. 2–3) Table III–1 of this document presents the exclusions recommended by the Working Group.

TABLE III–1—FAN CATEGORIES RECOMMENDED FOR EXCLUSION BY THE WORKING GROUP

Fan category recommended for exclusion by the working group *	Definition in AMCA 214–21
Radial housed unshrouded fan with diameter less than 30 inches or a blade width of less than 3 inches.	Included in the definition ''radial housed fan'' as noted in Table III-1.
Safety fan	Not defined in AMCA 214–21.
Induced flow fan	''Induced flow fan'' means a type of laboratory exhaust fan with a nozzle and windband; the fan's outlet airflow is greater than the inlet airflow due to induced airflow. All airflow entering the inlet exits through the nozzle. Airflow exiting the windband includes the nozzle airflow plus the induced airflow.
Jet fan	''Jet fan'' means a fan designed and marketed specifically for producing a high velocity air jet in a space to increase its air momentum. Jet fans are rated using thrust. Inlets and outlets are not ducted but may include acoustic silencers.
Cross-flow fan	''Cross-flow fan'' means a fan with a housing that creates an airflow path through the impeller in a direction at right angles to its axis of rotation and with airflow both entering and exiting the impeller at its periphery. Inlets and outlets can optionally be ducted.**

* **Note:** The Working Group also recommended the exclusion of circulating fans (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #2 at pp. 2–3), which are defined in AMCA 214–21 as a fan that is not a ceiling fan that is used to move air within a space that has no provision for connection to ducting or separation of the fan inlet from its outlet. The fan is designed to be used for the general circulation of air. Circulating fans are discussed in Section III.B.4 of this document.

** Excluded from AMCA 214–21 and defined in ANSI/AMCA Standard 208, ''Calculation of the Fan Energy Index for calculating FEI'' (''AMCA 208–18'').

The Petitioners requested that the scope of any future DOE test procedure be consistent with the scope described in the term sheet and requested the exclusion of fans that cannot be tested per AMCA 210–16 (*i.e.,* the physical test method referenced in AMCA 214–21).[28] The Petitioners also requested that the scope of the test procedure be consistent with ASHRAE 90.1–2019. (Docket No. EERE–2020–BT–PET–0003, The Petitioners, No. 1, attachment ''AMCA Petition to DOE Cover Letter and Petition [sic] 2020110'' at pp. 7–8)

Table III–2 of this document compares the scope exclusions requested by the Petitioners in accordance with the commercial and industrial fan and blower requirements in ASHRAE 90.1–2019 and the scope of exclusions as recommended by the Working Group (other than embedded fans and blowers). In the July 2022 NOPR, DOE reviewed the fan and blower exclusions to section 6.5.3.1.3 of ASHRAE 90.1–2019 ''Fan Efficiency Requirements'' as listed in Table III–2 of this document and tentatively determined that these exclusions are covered by the exclusions recommended by the Working Group. 87 FR 44194, 44201–44202.

[26] Specifically, radial housed unshrouded fans, which means a radial housed fan for which the impeller blades are attached to a backplate and hub (*i.e.,* open radial blade), or to a hub only (*i.e.,* open paddle wheel), and with an open front at the impeller's inlet. These are different than radial shrouded fans, for which the impeller blades are attached to a backplate and to a ring or ''shroud'' at the impeller's inlet.

[27] The discussions of the Working Group related to these exclusions can be found in the meeting transcripts, available in the fan's energy conservation standard rulemaking docket. (Docket No. EERE–2013–BT–STD–0006, Public Meeting Transcript, No. 161 at pp. 63–70; Public Meeting Transcript, No. 85 at pp. 60–62).

[28] For example, circulating fans, ceiling fans, desk fans, jet tunnel fans, and induced flow fans (*e.g.,* used in laboratory exhaust systems). This is consistent with the scope of the term sheet.

TABLE III–2—EXCEPTIONS TO SECTION 6.5.3.1.3 OF ASHRAE 90.1–2019 ''FAN EFFICIENCY REQUIREMENTS''

[Other than for embedded fans and blowers]

Exceptions to section 6.5.3.1.3 of ASHRAE 90.1–2019 ''fan efficiency requirements''	Included in the exclusions recommended by the working group?
Fans that are not embedded fans with a motor nameplate horsepower of less than 1.0 hp or with a fan nameplate electrical input power of less than 0.89 kW.	Yes.
Ceiling fans	Yes (NOTE: ceiling fans are not within the scope of the definition of fans and blowers).
Fans used for moving gases at temperatures above 482 degrees Fahrenheit.	Yes (safety fans).
Fans used for operation in explosive atmospheres	Yes (safety fans).
Reversible fans used for tunnel ventilation	Yes (jet fans, safety fans).
Fans outside the scope of AMCA 208–18	Yes (AMCA 208–18 references the scope of AMCA 210–16).
Fans that are intended to operate only during emergency conditions	Yes (safety fans).

In the July 2022 NOPR, DOE noted that in its proposed rulemaking for commercial and industrial fans and blowers, the CEC proposed to exclude the following categories of fans: (1) safety fans (*see* section III.C.2 of this document for more details on this definition); (2) ceiling fans as defined in 10 CFR 430.2; (3) circulating fans; (4) induced flow fans; (5) jet fans; (6) cross-flow fans; (7) embedded fans as defined in ANSI/AMCA 214–21; [29] (8) fans mounted in or on motor vehicles or other mobile equipment; (9) fans that create a vacuum of 30 in. wg or greater; [30] and (10) air curtain unit.[31] 87 FR 44194, 44202. *See* Table III–3 and section III.B.3 for a discussion of embedded fans and air curtain units and section III.B.5 for a discussion of fans mounted in or on motor vehicles or other mobile equipment.

TABLE III–3—FANS RECOMMENDED FOR EXCLUSION BY THE WORKING GROUP AND THE CORRESPONDING CEC PROPOSED EXCLUSIONS

Fans recommended for exclusion by the working group *	Corresponding term and definition proposed for exclusion in CEC proposed regulatory text
Radial housed unshrouded fan with diameter less than 30 inches or a blade width of less than 3 inches.	Not excluded by the CEC proposed regulatory text.
Safety fan	''Safety Fan'' *See* section III.C.2 of this document.
Induced flow fan	''Induced flow fan'' means a type of laboratory exhaust fan with nozzle and windband; the fan's outlet airflow is greater than the inlet airflow due to induced airflow. All airflow entering the inlet exits through the nozzle. Airflow exiting the windband includes the nozzle airflow as well as the induced airflow.
Jet fan	''Jet fan'' means a fan designed and marketed specifically to produce a high-velocity air jet in a space to increase its air momentum. Jet fans are rated using thrust. Inlets and outlets are not ducted but may include acoustic silencers.
Cross-flow fan	''Cross-flow fan'' means a fan with a housing that creates an airflow path through the impeller, in a direction at right angles to the axis of rotation and with airflow both entering and exiting the impeller at the periphery. Inlets and outlets can optionally be ducted.

* **Note:** The Working Group also recommended the exclusion of circulating fans, which are also excluded from the CEC proposed regulation and defined as a fan that is not a ceiling fan that is used to move air within a space, that has no provision for connection to ducting or separation of the fan inlet from its outlet. The fan is designed to be used for the general circulation of air. Circulating fans are discussed in section III.B.4 of this document.

In the July 2022 NOPR, DOE reviewed the exclusions recommended by the Working Group, the exclusions requested by the Petitioners, the exclusions provided in the proposed CEC regulations, and comments received and proposed to exclude from the proposed DOE test procedure the following fans and blowers: (1) radial housed unshrouded fans with a diameter less than 30 inches or a blade width of less than 3 inches; (2) safety fans; (3) induced flow fans; (4) jet fans; and (5) cross-flow fans. 87 FR 44194, 44202.

AMCA commented in support of the proposed exclusions of (1) radial housed unshrouded fans with a diameter less than 30 inches or a blade width of less than 3 inches; (2) safety fans; (3) induced flow fans; (4) jet fans; and (5) cross-flow fans. AMCA noted that these are consistent with the ASRAC term sheet. (AMCA, No. 41 at p. 6)

DOE did not receive any other comments on these exclusions and thus excludes from the DOE test procedure

[29] As defined in ANSI/AMCA 214–21: ''A fan that is part of a manufactured assembly where the assembly includes functions other than air movement.''

[30] CEC proposed excluding these fans because AMCA 214–21 is not applicable to this equipment. *See* CEC's Initial Statement of Reason, available at *efiling.energy.ca.gov/Lists/DocketLog.aspx?docketnumber=22-AAER-01*.

[31] When the NOPR was issued, the CEC defined an air curtain unit as equipment providing a directionally controlled stream of air moving across the entire height and width of an opening that reduces the infiltration or transfer of air from one side of the opening to the other and/or inhibits the passage of insects, dust, or debris. 87 44194, 44260 fn 25.

the following fans and blowers: (1) radial housed unshrouded fans with a diameter less than 30 inches or a blade width of less than 3 inches; (2) safety fans; (3) induced flow fans; (4) jet fans; and (5) cross-flow fans.

In the July 2022 NOPR, DOE also stated that it was considering including an exclusion, consistent with the findings of the CEC, for fans that create a vacuum of 30 in. wg or greater. DOE tentatively determined that a test using AMCA 210–16 may not result in a measurement of energy use or energy efficiency during a representative average use cycle for fans that are exclusively used to create a vacuum rather than produce airflow. 87 FR 44194, 44203.

In response to the July 2022 NOPR, the CEC recommended excluding fans that create a vacuum of 30 in. wg or greater because these fans have different operating conditions (run in stall) and will require a different way to measure their efficiency. (CEC, No. 30 at p. 2)

The CA IOUs requested that DOE exclude fans that create a vacuum of 30 in. wg or greater from the proposed scope. The CA IOUs explained that typically, fans that create a high vacuum operate in the unstable range and must be reinforced with heavy housings and oversized bearings to handle unstable operating conditions. The CA IOUs stated that DOE may consider the 30 in. wg. too low and if so, requested DOE find an appropriate level. (CA IOUs, No. 37 at . 8)

DOE has determined that a test using AMCA 210–16 may not result in a measurement of energy use or energy efficiency during a representative average use cycle for fans that are exclusively used to create a vacuum rather than produce airflow. As noted by the CEC and the CA IOUs, these fans operate in the stalling region (or unstable range). Further as noted by the CEC, such fans would require a different way to measure their efficiency. Therefore, in this final rule, DOE excludes fans that create a vacuum of 30 in. wg or greater. Additionally, as discussed in section III.C.2 of this document, DOE excludes fans that designed and marketed to operate at or above 482 degrees Fahrenheit (250 degrees Celsius).

3. Embedded Fans and Blowers Exclusions

In addition to the specific exclusions discussed in the prior section, DOE also proposed excluding certain ''embedded'' fans from the scope of the test procedure. Fans can be distributed in commerce as standalone equipment or can be distributed in commerce incorporated into other equipment that requires a fan to operate. 87 FR 44194, 44203.

Section 3.25.3 of AMCA 214–21 defines a ''standalone fan'' as ''a fan in at least a minimum testable configuration. This includes any driver, transmission or motor controller if included in the rated fan. It also includes any appurtenances included in the rated fan, and it excludes the impact of any surrounding equipment whose purpose exceeds or is different than that of the fan.'' [32] Section 3.25.4 of AMCA 214–21 defines the term ''embedded fan'' as ''a fan that is part of a manufactured assembly where the assembly includes functions other than air movement.''

The Working Group recommended excluding certain embedded fans. *See* Table III–4 of this document. (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendations #2 and #3 at pp. 2–4)

TABLE III–4—EMBEDDED FANS RECOMMENDED FOR EXCLUSION BY THE WORKING GROUP

Fans embedded in:
Single-phase central air conditioners and heat pumps rated with a certified cooling capacity less than 65,000 British thermal units per hour (''Btu/h''), that are subject to DOE's energy conservation standard at 10 CFR 430.32(c).
Three-phase, air-cooled, small commercial packaged air-conditioning and heating equipment rated with a certified cooling capacity less than 65,000 Btu/h, that are subject to DOE's energy conservation standard at 10 CFR 431.97(b).
Residential furnaces that are subject to DOE's energy conservation standard at 10 CFR 430.32(y).
Transport refrigeration (*i.e.,* Trailer refrigeration, Self-powered truck refrigeration, Vehicle-powered truck refrigeration, Marine/Rail container refrigerant), and fans exclusively powered by internal combustion engines.
Vacuum cleaners.*
Heat Rejection Equipment:
• Packaged evaporative open circuit cooling towers.
• Evaporative field-erected open circuit cooling towers.
• Packaged evaporative closed-circuit cooling towers.
• Evaporative field-erected closed-circuit cooling towers.
• Packaged evaporative condensers.
• Field-erected evaporative condensers.
• Packaged air-cooled (dry) coolers.
• Field-erected air-cooled (dry) coolers.
• Air-cooled steam condensers.
• Hybrid (water saving) versions of all of the previously listed equipment that contain both evaporative and air-cooled heat exchange sections.
Air curtains.
Air-cooled commercial package air conditioners and heat pumps (CUAC, CUHP) with a certified cooling capacity between 5.5 tons (65,000 Btu/h) and 63.5 tons (760,000 Btu/h) that are subject to DOE's energy conservation standard at 10 CFR 431.97(b).**
Water-cooled and evaporatively-cooled commercial air conditioners and water-source commercial heat pumps that are subject to DOE's energy conservation standard at 10 CFR 431.97(b).**
Single package vertical air conditioners and heat pumps that are subject to DOE's energy conservation standard at 10 CFR 431.97(d).**
Packaged terminal air conditioners (PTAC) and packaged terminal heat pumps (PTHP) that are subject to DOE's energy conservation standard at 10 CFR 431.97(c).**
Computer room air conditioners that are subject to DOE's energy conservation standard at 10 CFR 431.97(e).**

[32] Additionally, AMCA 214–21 defines a minimum testable configuration as ''A fan having at least an impeller; shaft and bearings and/or driver to support the impeller; and its structure or its housing.'' *See* Section 3.53 of AMCA 214–21.

TABLE III–4—EMBEDDED FANS RECOMMENDED FOR EXCLUSION BY THE WORKING GROUP—Continued

Fans embedded in:
Variable refrigerant flow multi-split air conditioners and heat pumps that are subject to DOE's energy conservation standard at 10 CFR 431.97(f).**

* Although the term sheet specifies ''vacuum,'' the term was intended to designate vacuum cleaners. (Docket No. EERE–2013–BT–STD–0006; AHRI, Public Meeting Transcript, No. 166 at p. 11).
** The recommendation only applies to supply and condenser fans embedded in this equipment.

Stated more generally, the exclusions recommended by the Working Group would exclude from the scope of the test procedure fans that are embedded in regulated equipment for which the DOE metric captures the energy consumption of the fan.[33]

The Working Group further recommended for fans embedded in non-regulated equipment, and/or embedded in regulated equipment other than listed in Appendix B of the term sheet, and/or any fans that are not supply and condenser fans in regulated equipment listed in Appendix B of the term sheet, that the first manufacturer of a testable configuration [34] would be responsible for certifying the standalone fan performance to DOE. (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #4 at p. 4) [35]

The Petitioners requested that the scope of any DOE test procedure be consistent with the scope of the term sheet. The Petitioners also requested the test-procedure scope for commercial fans be consistent with ASHRAE 90.1–2019, and additionally exclude embedded fans that are part of equipment listed in section 6.4.1.1 of ASHRAE 90.1–2019. ASHRAE 90.1–2019 (*See* Table III–6 of this document). (Docket No. EERE–2020–BT–PET–0003, The Petitioners, No. 1, attachment ''AMCA Petition to DOE Cover Letter and Petition [sic] 2020110'' at pp. 7–8)

The additional exclusions for embedded fans that are part of equipment listed in section 6.4.1.1 of ASHRAE 90.1–2019 as requested by AMCA are included in the fan and blower exclusions to section 6.5.3.1.3 of ASHRAE 90.1–2019, ''Fan Efficiency Requirements,'' and presented in Table III–5 of this document.

TABLE III–5—EMBEDDED FAN AND BLOWER EXCLUSIONS TO SECTION 6.5.3.1.3 OF ASHRAE 90.1–2019 ''FAN EFFICIENCY REQUIREMENTS''

Embedded fan and blower exclusions to section 6.5.3.1.3 of ASHRAE 90.1–2019, ''fan efficiency requirements''	Included in the exclusion recommended by the working group?
Embedded fans and fan arrays with a combined motor nameplate horsepower of 5 hp or less or with a fan system electrical input power of 4.1 kW or less.	No.
Embedded fans that are part of equipment listed under section 6.4.1.1.	*See* Table III-7.
Embedded fans included in equipment bearing a third party-certified seal for air or energy performance of the equipment package.	No.

TABLE III–6—EQUIPMENT LISTED IN SECTION 6.4.1.1 OF ASHRAE 90.1–2019 ''MINIMUM EQUIPMENT EFFICIENCIES—LISTED EQUIPMENT—STANDARD RATING AND OPERATING CONDITIONS''

Fans embedded in:	Included in the embedded fan exclusions recommended by the working group?
Electrically Operated Unitary Air Conditioners	Partially. This category includes equipment above 760,000 Btu/h. The exclusions in the term sheet apply only to fans embedded in equipment above 65,000 Btu/h and below 760,000 Btu/h (equivalent to 5.5 tons and 63.5 tons, respectively as stated in the term sheet). In addition, the term sheet specifies that the exclusions would apply only to embedded ''supply and condenser fans.''
Electrically Operated Air-Cooled Unitary Heat Pumps	Partially. This category includes equipment above 760,000 Btu/h. The exclusions in the term sheet apply only to fans embedded in equipment below 760,000 Btu/h. In addition, the term sheet specifies that the exclusion would apply only to embedded ''supply and condenser fans.''
Air-, water-, and evaporatively cooled Condensing Units	Yes, these fans are below 1 hp. In addition, it is specified in Table 6.8.1–1 of ASHRAE 90.1–2019 that this category only includes equipment greater than or equal to 135,000 Btu/h.
Water-Chilling Packages	No.
Electrically Operated Packaged Terminal Air Conditioners, Packaged Terminal Heat Pumps, Single-Package Vertical Air Conditioners, and Single-Package Vertical Heat Pumps.	Yes. However, the term sheet specifies that the exclusion would apply only to embedded ''supply and condenser fans.''

[33] The Working Group created a subgroup to propose potential embedded fan exclusions, which were subsequently voted on by the Working Group. The information used by the subgroup to develop the proposal is available in the fans energy conservation standard rulemaking docket. (Docket No. EERE–2013–BT–STD–0006, No. 125.2)

[34] AMCA 214–21 defines the ''minimal testable configuration'' as a fan having at least an impeller; shaft and bearings and/or driver to support the impeller; and its structure or its housing.

[35] As part of this recommendation, the Working Group also recommended that if a manufacturer purchases a standalone fan to incorporate in a product or in equipment, that manufacturer must ensure that the design operating range (or design point) of the embedded fan is within the certified operating range of the standalone fan and disclose the design operating range (or design point) of the embedded fan to the end-user. This issue does not relate to the test procedure and is not discussed in this document.

TABLE III–6—EQUIPMENT LISTED IN SECTION 6.4.1.1 OF ASHRAE 90.1–2019 ''MINIMUM EQUIPMENT EFFICIENCIES—LISTED EQUIPMENT—STANDARD RATING AND OPERATING CONDITIONS''—Continued

Fans embedded in:	Included in the embedded fan exclusions recommended by the working group?
Room Air-conditioners and Air-conditioner Heat pumps	Yes. These fans are below 1 hp.
Warm-Air Furnaces and Combination Warm-Air Furnaces/Air-Conditioning Units, Warm-Air Duct Furnaces, and Unit Heaters.	No.
Gas- and Oil-Fired Boilers	Partially. Some of these fans are below 1 hp.
Heat-Rejection Equipment	Yes.
Electrically Operated Variable-Refrigerant-Flow Air Conditioners	Yes. However, the term sheet specifies that the exclusion would apply only to embedded ''supply and condenser fans.''
Electrically Operated Variable-Refrigerant-Flow and Applied Heat Pumps.	Partially. This category includes ground water source and ground source equipment that is not regulated by DOE and that was not included in the term sheet exclusions. In addition, the term sheet specifies that the exclusion would apply only to embedded ''supply and condenser fans.''
Floor-Mounted Air Conditioners and Condensing Units Serving Computer Rooms.	Partially. This category includes equipment greater than or equal to 760,000 Btu/h, which are not regulated by DOE.
Commercial Refrigerators, Commercial Freezers, and Refrigeration	Yes. These fans are below 1 hp.
Vapor-Compression-Based Indoor Pool Dehumidifiers	Yes. These fans are below 1 hp.
Electrically Operated direct-expansion dedicated outdoor air system Units, Single-Package and Remote Condenser, without Energy Recovery.	No.
Electrically Operated direct-expansion dedicated outdoor air system Units, Single-Package and Remote Condenser, with Energy Recovery.	No.
Electrically Operated Water-Source Heat Pumps	Partially. This category includes ground water source and ground source equipment that is not regulated by DOE and was not included in the term sheet exclusions. In addition, the term sheet specifies that the exclusion would apply only to embedded ''supply and condenser fans.''
Heat Pump and Heat Recovery Chiller Packages	No.
Ceiling-Mounted Computer-Room Air Conditioners	Partially. The term sheet only excludes embedded fans in computer room air conditioners that are subject to DOE energy conservation standards.
Walk-In Cooler and Freezer Display Door	Yes. These fans are below 1 hp.
Walk-In Cooler and Freezer Non-Display Door	Yes. These fans are below 1 hp.
Walk-In Cooler and Freezer Refrigeration System	Yes. These fans are below 1 hp.

In the July 2022 NOPR, DOE noted that in its proposed regulation, the CEC proposed to exclude embedded fans, as defined in AMCA 214–21, including embedded fans in air curtain units.[36] In its staff report, the CEC stated that its proposal would exclude fans embedded in regulated and non-regulated equipment where the main function is other than the movement of air, as long as the fan is not sold or offered for sale as a standalone product.[37] As reasons for exclusion, the CEC stated that these fans are either manufactured by an original equipment manufacturer (OEM), who embeds the fan in a piece of equipment where the main function is something other than the movement of air, or because they are manufactured for the purpose of being embedded into an appliance after market.[38] The CEC also discussed the potential complexity of testing embedded fans and the accuracy of the results. See section III.E.9 of this document for further discussion related to testing 87 FR 44194, 44206–44207.

In the July 2022 NOPR, DOE proposed to exclude fans embedded in equipment listed in Table III–4 of this document, as long as the fan is not distributed in commerce as a standalone product, consistent with the Working Group term sheet scope recommendations related to embedded fans. (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendations #2 and #3 at pp. 2–4) DOE noted that the equipment listed in Table III–4 of this document includes equipment that is separately regulated by DOE (''covered equipment'') as well as non-covered equipment (*i.e.,* transportation refrigeration equipment, vacuum cleaners, heat rejection equipment, and air curtains). 87 FR 44194, 44207. The rest of this section discusses the comments received on each proposed exclusion and DOE's decision for this final rule.

Greenheck commented that DOE should consider adopting the ASAP/NRDC/ACEEE proposal to CEC[39] regarding the issue of embedded fans in equipment. Greenheck commented that the recommendation includes a two-phase rulemaking approach allowing for expeditious rulemaking in phase one for fans, while continuing to provide additional opportunities for energy savings in phase two for built-up equipment that includes embedded fans. Greenheck commented that including embedded fans in the scope adds significant complexity and a two-phase approach would provide time for additional investigation of all impacts for embedded fans. In addition, Greenheck noted that equipment incorporating fans are already tested at a component level, or as an entire system to AHRI test standards, building energy codes, and in some cases, DOE test standards (*e.g.,* dedicated outdoor air systems equipment). Further,

[37] *See* CEC Commercial and Industrial Fans and Blowers Staff Report, Docket No. 22–AAER–01, TN #241951 at p. 16.

[38] *Id.*

[39] *See: efiling.energy.ca.gov/GetDocument.aspx?tn=224830.*

Greenheck commented that it, as well as other manufacturers of equipment that include a combination of fans, heating, cooling, filtration, energy recovery, and/or other components, publishes performance data for embedded fans as installed in the equipment. Greenheck commented that performance data for the fan in the minimum testable configuration is typically not available and to comply with the scope of the DOE NOPR, manufacturers would have to retest embedded fans in their minimum testable configuration. Greenheck commented that the testing burden is significant and will force manufacturers to prioritize their resources on the testing required to comply with this regulation, rather than improving the overall efficiency of the equipment. Greenheck asserted that the embedded fans are only a portion of the overall energy consumption of these products and that regulating the equipment holistically like AHRI 920 for direct-expansion dedicated outdoor air systems (''DX–DOASes'') will result in the largest reduction in energy consumption. (Greenheck, No. 39 at pp. 5–6)

AHAM opposed the development of test procedures, energy conservation standards, and/or certification requirements for categories of commercial and industrial fans and blowers that are component parts of home appliances and supported a finished-product approach to energy efficiency regulation. AHAM commented that expanding the test procedure or coverage to embedded fans used in home appliances could push finished product manufacturers to more expensive components and increase the cost of appliances and equipment, while not necessarily improving the energy performance of the finished product and potentially impacting the efficacy of products such as range hoods. AHAM added that it would significantly increase burden on manufacturers if manufacturers of products that incorporate embedded fans are suddenly forced to certify compliance with standards for component parts, including the testing, paperwork, and record-keeping requirements that accompany certification and the risks associated with enforcement. AHAM commented that the manufacturer additional burden would not be outweighed by a corresponding benefit. Further, AHAM stated a concern that for both for embedded fans and air circulating fans, the proposed efficiency requirements could drive performance challenges due to reduced air flow. AHAM commented that given that many products using fans are used to improve indoor air quality, such as range hoods/downdraft fans, this is an undesirable result, which could impact consumer health and safety for the long term. In addition, for air circulating fans, AHAM commented that this would reduce the performance of the primary function of the fan. AHAM also commented that for covered products, there is no benefit to requiring embedded fans to meet an energy conservation standard or to be tested. AHAM stated that those products are already regulated by DOE and many manufacturers turn to more efficient designs that include components, such as more efficient fans to meet more stringent energy conservation standards. (AHAM, No. 35 at pp. 6–7)

AHRI commented that DOE is proposing changes to the scope of test procedures for commercial fans that would include fans destined for particular applications in finished goods. AHRI stated disagreement with DOE's plan to expand the existing scope of coverage of commercial fans to include these products. AHRI commented that embedded fan testing, and ultimately energy conservation standards, would save minimal, if any, energy and would create needless testing, paperwork, and record-keeping requirements that would raise costs for consumers. In addition, AHRI commented that the foreword of AMCA 214–21 notes, ''AMCA Standard 214 primarily is for fans that are tested alone or with motors and drives; it does not apply to fans tested embedded inside of other equipment.'' AHRI commented that there is no normative procedure for applying a stand-alone fan metric to embedded applications and therefore recommended to only include stand-alone fans in this regulation. (AHRI, No. 40 at p. 8) In addition, AHRI commented that there are a variety of safety standards affected by air flow in addition to the performance standards. AHRI commented that testing of all legacy equipment because of a fan change will be cost and resource prohibitive. AHRI added that if a replacement fan is not compliant then, in most cases, an engineered-to-fit substitution would be required, along with requisite reliability, robustness assurance actions, and safety standard compliance. AHRI commented that costs, risks, and time required to retest heating, ventilation, air-conditioning and refrigeration (''HVACR'') and water heating equipment would all be prohibitive and could be impractical if the HVACR and water heating equipment are out of production. Further, AHRI commented that manufacturers would be forced to rebuild an out-of-production unit solely for the purpose of testing the new fan or risk abandoning a reasonable repair path for consumers. AHRI further stated that there may be instances where such part substitution makes sense, but that is not a reasonable basis for a broad scope to a component's test procedure. (AHRI, No. 40 at pp. 9–10)

JCI commented that the proposed changes will likely result in elimination of current fans for those products ''outside the scope'' of this rulemaking as an unintended consequence as fan manufactures will seek to standardize designs and eliminate options. Therefore, per the recommendation of the term sheet, JCI recommends that all embedded fans be excluded from the scope of this rulemaking. JCI further commented that there also appears to be a major design limitation as there are few if any existing outdoor condenser fan designs, which have a FEI > 1.0. JCI stated that this issue by itself presents a major design and test hurdle as direct drive plenum fans are not designed to be utilized in a traditional outdoor, condenser exhaust configuration such as a rooftop unit. (JCI, No. 34 at p. 2)

DOE notes that this final rule does not establish any certification requirements and energy conservation standards for fans and blowers and would not require any fan replacements or redesigns and would not result in any changes in fan performance, or in the elimination of fan models, or in the need to retest HVARC equipment, or added certification burden. In addition, as discussed in section III.B.3.b of this document, DOE is implementing exclusions for fans embedded in covered equipment where the DOE metric already captures the energy use of the fans, such as supply and condenser fans embedded in DX–DOASes subject to any DOE test procedures in appendix B to subpart F of part 431. Finally, as discussed in section III.E.9 of this document, DOE determined that some fan manufacturers test embedded fans as standalone fans and therefore DOE has determined that there is value in establishing a standardized test method for these fans.

AHRI commented that as DOE has indicated in a prior notice of proposed determination and request for comment on small electric motors, DOE should maintain consistency in its rulemaking process and seek to establish regulatory coverage over equipment rather than the components in such equipment. (AHRI, No. 40 at p. 9)

Trane commented that if changing an embedded fan necessitates the re-optimization or redesign of Trane's

products, it will be forced to make trade-offs within the design of the product itself in order to maintain the most cost-competitive price point. Trane stated that for products which must already meet an energy performance metric that captures the fans, including the majority of fans in large commercial unitary air conditioners and air compressors, this will mean an energy-neutral change to the overall performance of the product. As an example, if a Trane large commercial air conditioner must be redesigned to accommodate a larger supply fan, downgrades to the compressors and/or heat exchangers would have to be made in order to control costs. The new product would have a similar Integrated Energy Efficiency Ratio (IEER)—washing out the energy savings from the supply fan—but would be larger, more expensive, and sub-optimal. (Trane, No. 38 at p. 3)

DOE notes that this final rule does not establish any energy conservation standards for fans and blowers and would not impact the efficiency and performance of fans embedded in covered equipment or products. In addition, EPCA provides that no standard prescribed for small electric motors (*i.e.,* those regulated in 10 CFR part 431, subpart X) shall apply to any such motor that is a component of a covered product under EPCA or of covered equipment under EPCA. (42 U.S.C. 6317(b)(3)) EPCA does not establish any such prohibition for fans and blowers. DOE further notes that EPCA does not establish any such prohibition for electric motors either. *See* 42 U.S.C. 6313(b)(1) (providing that standards for electric motors be applied to electric motors manufactured ''alone or as a component of another piece of equipment'').

AHRI commented that requests have been made to lower the power threshold from less than or equal to 1hp, to less than or equal to 0.25hp, which would include a large swath of fans used in residential products, including residential central air conditioners and heat pumps. AHRI stated that in order to regulate ''industrial equipment articles'' that are component parts of consumer products, DOE must determine that ''such articles are, to a significant extent, distributed in commerce other than as component parts for consumer products.'' (42 U.S.C. 6312(c)(1)) AHRI commented that in general, DOE regulates products as a whole and not by component. Although DOE has previously regulated furnace fans and electric motors, AHRI commented that DOE did so under unique authority provided in the sections of EPCA specific to those products and equipment.[40] AHRI commented that under the general industrial component requirement to show that embedded fans are distributed in commerce other than as component parts in a consumer product, DOE does not have the authority to regulate fans that are embedded in consumer products. (AHRI, No. 40 at pp. 5–6)

As discussed, on August 19, 2021, DOE published a final determination classifying certain fans and blowers as covered equipment and determining that fans and blowers meet the three statutory criteria for classifying industrial equipment as covered (42 U.S.C. 6311(2)(A)), including that fans and blowers are to a significant extent distributed in commerce for industrial or commercial use. *See* 86 FR 46579, 46586–46588. Further, ''covered equipment'' consists of certain industrial equipment, which in turn excludes covered products, other than industrial equipment that is a component of a covered product. (42 U.S.C. 6311(1) and (2)(A)(iii) DOE also noted, in a footnote, that distribution for residential use does not preclude coverage as covered equipment so long as to a significant extent the equipment is of a type that is also distributed in commerce for industrial and commercial use. *See* 86 FR 46579, 46586. As such, DOE disagrees with AHRI's assessment of DOE's authority. DOE can regulate fans and blowers embedded in a covered product.

a. Fans and Blowers Embedded in Non-Covered Equipment

Consistent with the Working Group term sheet scope recommendation (Docket No. EERE–2013–BT–STD–0006–0179, Recommendation #2 at p. 2), DOE proposed to exclude fans that are exclusively embedded in transport refrigeration (*i.e.,* trailer refrigeration, self-powered truck refrigeration, vehicle-powered truck refrigeration, and marine/rail container refrigeration) from the scope of the test procedure. 87 FR 44194, 44207.

In response to the July 2022 NOPR, the CEC recommended excluding fans mounted in motor vehicles or other mobile equipment since the fans are smaller in size and, although they require electricity to operate, the source of electrical power is generated by the engine of the motor and not the public electrical grid. The CEC noted that Table III–8 of the July 2022 NOPR may provide the exclusion for these fans, but that the wording was unclear (CEC, No. 30 at p. 2)

DOE did not receive any additional comments on this exclusion. Further, because DOE is not adopting a definition of ''exclusively embedded fan'' (see section of this III.B.3.c document) in this final rule, DOE excludes fans that are embedded in transport refrigeration and removed the term ''exclusively'' as proposed in the July 2022 NOPR. In addition, DOE discusses the exclusion of fan powered by combustion engines in section III.B.5 of this document.

In the July 2022 NOPR, consistent with the Working Group term sheet scope recommendation (Docket No. EERE–2013–BT–STD–0006–0179, Recommendation #2 at p. 2), DOE proposed to exclude fans exclusively embedded in vacuum cleaners from the scope of the test procedure. 87 FR 44194, 44207.

In response to the July 2022 NOPR, AHAM agreed that fans embedded in consumer/residential vacuum cleaners should be exempt from the scope. (AHAM, No. 35 at p. 5)

AHAM commented that it opposes including fans embedded in consumer home appliances, whether those products are DOE ''covered products'' or not, in the scope of the test procedure and/or energy conservation standards. AHAM noted that fans embedded in most home appliances would not be implicated by DOE's currently proposed definition of embedded fans because most are under 1 horsepower. However, AHAM noted that a lower threshold of 0.25 hp would include fans used in a number of covered products.[41] AHAM added that there are a few products that might use fans that meet DOE's definition and AHAM objects to those fans being considered commercial and industrial fans. AHAM is concerned that coverage of such fans could negatively impact the product performance of products such as range hoods/downdraft fans that are critical for improving indoor air quality in homes. AHAM commented that DOE should exclude embedded fans used in residential products such as range hoods/downdraft fans and hand dryers as well as dryer booster fans and fans used in commercial clothes dryers.

[40] AHRI commented that DOE is required by EPCA to consider and prescribe new energy conservation standards or energy use standards for electricity used for purposes of circulating air through duct work. *Id.* 42 U.S.C. 6295(f)(4)(D); *Id.* 42 U.S.C. 6313(b)(1) (covering electric motors ''alone or as a component of another piece of equipment'').

[41] These products include but are not limited to: residential refrigerator/freezers, clothes washers and dryers, dishwashers, room air conditioners, portable air conditioners, dehumidifiers, and (in the future) room air cleaners.

Additionally, AHAM is concerned that commercial clothes washers could be implicated even by the 1 horsepower limitation and requested that DOE specifically exclude fans used in commercial clothes washers from the scope of its regulation. (AHAM, No. 35 at pp. 4–5)

In this final rule, DOE excludes fans that are embedded in vacuum cleaners from the scope of the test procedure, as proposed. Further because DOE is not adopting a definition of ''exclusively embedded fan'' (see section III.B.3.c of this document), DOE removes the use of the term ''exclusively'' as proposed in the July 2022 NOPR. DOE notes that this final rule establishes a test procedure for fans and blowers and does not adopt any energy conservation standards. This final rule will not have any impacts on the performance of the fan of the larger equipment in which the fan is embedded. In addition, as noted in section III.B of this document, DOE establishes a lower shaft input power limit of 1 hp (0.89 kW of electrical input power) and that the lower power limit of 1 horsepower (0.89 kW) excludes most fans used in regulated and non-regulated consumer products, including range hoods. Finally, as discussed in section III.B.3.b of this document, DOE is implementing exclusions for fans embedded in covered equipment where the DOE metric already captures the energy use of the fans.

In the July 2022 NOPR, consistent with the Working Group term sheet scope recommendations (Docket No. EERE–2013–BT–STD–0006–0179, Recommendation #2 at p. 2), DOE also proposed to exclude fans exclusively embedded in heat rejection equipment from the scope of the test procedure (*See* Table III–4 of this document for a list of the heat rejection equipment). DOE noted that fans used in heat rejection equipment are primarily fabricated in-house by the heat rejection equipment manufacturer and that these fans are not sold in a standalone configuration.[42] 87 FR 44194, 44207.

In response to the July 2022 NOPR, Trane commented that DOE should align with the CEC proposed regulation in which the definition of embedded fans includes fans used in heat rejection equipment. Trane commented that heat rejection fans for HVAC systems are not designed for specific flow of air, and thus a metric based on air flow is not valid for heat rejection fans such as condenser fans. Trane noted that because a heat rejection fan's purpose is to reject heat from a system, these fans are designed in conjunction with a heat exchanger solely for optimizing removal of heat from a system. Trane commented that enforcing fan efficiency requirements on these definite purpose fans will require re-optimization of the heat rejection system that will not impact overall system efficiency and building energy consumption. Trane stated that this would impact manufacturer design cost, manufacturing cost, and end customer cost with no measurable energy benefit or payback. (Trane, No. 38 at p. 2)

Trane added that in order to align with CEC and the definitions of AMCA 214–21, DOE should add to the list of exclusions: (1) Air cooled chillers; and (2) Unitary package units above 760k btu (whose system metric is covered in ASHRAE 90.1–2019). (Trane, No. 38 at p. 2)

The CA IOUs recommended that DOE exclude all condenser fans from the scope of the test procedure. The CA IOUs explained that DOE proposed to accept the Cooling Tower Institute's recommendation to exclude heat rejection fans on various unregulated equipment and agreed with this decision as these fans would be difficult or impossible to test using the underlying procedures. Furthermore, the CA IOUs stated that improving the fan's efficiency would not necessarily improve the system's efficiency because of its embedment in a larger system. The CA IOUs commented that the same logic would apply to condenser fans in other types of equipment (*e.g.,* chillers and unregulated commercial unitary air conditioners). (CA IOUs, No. 37 at p. 10)

Daikin commented that fans used in air-cooled condensers have the same issues as fans used in cooling towers and other heat rejection equipment. (Public Meeting, No. 18 at p. 16) DOE notes that the Working Group did not list chillers and air-cooled condensers, and specifically limited the exemption to regulated commercial unitary air conditioners with a certified cooling capacity between 5.5 tons (65,000 Btu/h) and 63.5 tons (760,000 Btu/h). As previously noted, the embedded fan exclusions recommended by the Working Group would exclude from the scope of the test procedure fans that are embedded in regulated equipment for which the DOE metric captures the energy consumption of the fan. In line with the approach taken by the Working Group, and as discussed in section III.B.3.b of this document, DOE is implementing exclusions for fans embedded in covered equipment where the DOE metric already captures the energy use of the fans. Chillers are currently not a covered equipment and DOE does not regulate commercial unitary air conditioners with a certified cooling capacity above 760,000 Btu/h. Air cooled condensers are also not regulated by DOE. Although fans used in these equipment may face similar issues than fans used in heat rejection equipment, both pieces of equipment were not specifically listed for exemption by the Working Group. Therefore, DOE is not excluding fans used in these categories of equipment. Further, DOE excludes other condenser fans in several types of covered equipment, if the DOE metric captures the energy use of these fans. (*See* section III.B.3.b of this document.) In addition, in this final rule, DOE is not establishing any energy conservation standards and the adoption of a test procedure will not impose fan efficiency requirements. For these reasons, DOE is maintaining the exclusion of fans embedded in heat rejection equipment as proposed in the July 2022 NOPR. Further, because DOE is not adopting a definition of ''exclusively embedded fan'' (see section of this III.B.3.c document), DOE removes the use of the term ''exclusively'' as proposed in the July 2022 NOPR.

In addition, in the July 2022 NOPR, DOE proposed that fans embedded in air curtains be excluded from the scope of the proposed test procedure. 87 FR 44194, 44207. In response to the July 2022 NOPR, The CEC commented in support of the proposed exclusion of air curtains. (CEC, No. 30 at p. 2) DOE did not receive any additional comments on this issue and is excluding fans in air curtains as proposed.

b. Fans and Blowers Embedded in Covered Equipment

In the July 2022 NOPR, DOE also proposed that the test procedure would exclude fans in covered equipment in which the fan energy use is already captured in the equipment specific test procedures. DOE proposed to adopt an exclusion for fans embedded in equipment listed in Table III–4,[43] as long as the fan is not distributed in commerce as a standalone product. DOE proposed to additionally exclude fans embedded in DX–DOASes to reflect the DOE proposed test procedure and metric for DX–DOASes that, if adopted,

[42] In some cases, the heat rejection equipment manufacturer may purchase the impeller and assemble the fan in a housing which is tied to the structure of the heat rejection equipment.

[43] DOE notes that while the Working Group recommended to exclude fans in residential furnaces that are subject to DOE's energy conservation standard at 10 CFR 430.32(y), furnace fans are excluded from the definition of ''fan and blower'' and therefore do not need to be listed as a proposed exclusion.

would incorporate fan energy use.[44] DOE noted that the proposed exclusions were consistent with the recommendations of the Working Group. DOE also noted that the proposed approach would avoid regulating fans for which existing DOE regulations account for their energy use by excluding such fans from the test procedure if distributed exclusively embedded in the listed equipment. DOE proposed that to the extent a fan is distributed in commerce as a stand-alone fan, and therefore is not limited to use in specific equipment, or embedded in equipment in which its energy use is not addressed in a DOE test procedure, such a fan would be subject to the DOE test procedure. 87 FR 44194, 44207. Table III–7 of this document summarizes the embedded fans proposed for exclusion from the scope of the test procedure.

TABLE III–7—EMBEDDED FANS EXCLUDED FROM THE SCOPE OF THE TEST PROCEDURE

Fans embedded in:
DX–DOASes subject to any DOE test procedures in appendix B to subpart F of part 431.*
Single-phase central air conditioners and heat pumps rated with a certified cooling capacity less than 65,000 British thermal units per hour (''Btu/h''), that are subject to DOE's energy conservation standard at 10 CFR 430.32(c).
Three-phase, air-cooled, small commercial packaged air-conditioning and heating equipment rated with a certified cooling capacity less than 65,000 Btu/h, that are subject to DOE's energy conservation standard at 10 CFR 431.97(b).
Transport refrigeration (*i.e.,* Trailer refrigeration, Self-powered truck refrigeration, Vehicle-powered truck refrigeration, Marine/Rail container refrigerant), and fans exclusively powered by combustion engines.
Vacuum cleaners.
Heat Rejection Equipment:
• Packaged evaporative open circuit cooling towers.
• Evaporative field-erected open circuit cooling towers.
• Packaged evaporative closed-circuit cooling towers.
• Evaporative field-erected closed-circuit cooling towers.
• Packaged evaporative condensers.
• Field-erected evaporative condensers.
• Packaged air-cooled (dry) coolers.
• Field-erected air-cooled (dry) coolers.
• Air-cooled steam condensers.
• Hybrid (water saving) versions of all of the previously listed equipment that contain both evaporative and air-cooled heat exchange sections.
Air curtains.
** Air-cooled commercial package air conditioners and heat pumps (CUAC, CUHP) with a certified cooling capacity between 5.5 tons (65,000 Btu/h) and 63.5 tons (760,000 Btu/h) that are subject to DOE's energy conservation standard at 10 CFR 431.97(b).
** Water-cooled and evaporatively-cooled commercial air conditioners and water-source commercial heat pumps that are subject to DOE's energy conservation standard at 10 CFR 431.97(b).
** Single package vertical air conditioners and heat pumps that are subject to DOE's energy conservation standard at 10 CFR 431.97(d).
** Packaged terminal air conditioners (PTAC) and packaged terminal heat pumps (PTHP) that are subject to DOE's energy conservation standard at 10 CFR 431.97(c).
** Computer room air conditioners that are subject to DOE's energy conservation standard at 10 CFR 431.97(e).
** Variable refrigerant flow multi-split air conditioners and heat pumps that are subject to DOE's energy conservation standard at 10 CFR 431.97(f).

** DX–DOASes are not currently subject to a DOE test procedure. However, there is an ongoing rulemaking to establish a test procedure for DX–DOASes that DOE anticipates will be finalized before the final rule of the fans and blowers rulemaking. Information about this rulemaking can be found at *www.regulations.gov* under Docket No. EERE–2017–BT–TP–0018.

* The exclusion only applies to supply and condenser fans embedded in this equipment.

NEEA commented in support of DOE's definitions and scope for inclusion and exemptions of embedded fans, but recommended DOE establish a consistent approach to ensure fan efficiency is accounted for in other regulated products. NEEA commented that this would include a similar methodology for each product, even if the exact conditions are not the same across all products. Conceptually, NEEA stated that this could function as a checklist to ensure fans are appropriately accounted for: (1) the total fan energy use is accounted for in the ''average period of use'' of that product (*e.g.,* economizing fan energy use for CUAC); (2) the testing conditions represent the operating conditions of the fan (*e.g.,* representative static pressure for packaged HVAC); (3) the benefits of variable speed fans and right sizing of a fan are accounted for (*i.e.,* will these energy saving measures increase the regulated rating). (NEEA, No. 36 at pp. 7–8)

DOE accounts for fan energy use on a product-by-product basis. Any consideration of fan energy use in other covered product or equipment would be addressed in the test procedure rulemakings specific to each such product or equipment.

AHRI recommended that DOE exclude fans embedded in commercial water heaters and boilers from the rulemaking. AHRI commented that the metric for commercial water heaters includes the embedded fan's energy, meeting the criteria which was the basis for limited exclusions in regulated products recommended by the Working Group. AHRI commented that the test procedure and energy conservation standards for commercial boilers do not capture the fan power. However, AHRI commented that the actual energy savings potential from applying the proposed fan regulation to a boiler or water heater fan itself is likely to be small and the total energy consumption of the equipment may be increased due to effects on combustion. In addition, AHRI stated that the complexity of integrating a new fan system into a boiler or water heater is considerable as fans are integral parts of the combustion

[44] *See* 86 FR 72874, 72889–72890 (December 23, 2021).

systems, raising costs that are ultimately passed on to consumers. AHRI commented that the appropriate approach is to work through the commercial boiler test standard's consensus process and find a path to incorporate the electrical energy used in a boiler system into the test procedure and the equipment ratings to include electrical power consumption from the fan is currently being drafted. AHRI added that it estimates the market of the commercial boiler and water heater industries is small, with annual shipments of approximately 20,000 boiler units and under 2,000 hot water supply boilers. In addition, AHRI noted that fans used in commercial storage water heaters are virtually all under 1 horsepower and only exceed 1 horsepower in commercial boilers and hot water supply boilers with input rates exceeding two million Btu/h. For hot water supply boilers, AHRI commented that approximately 12 percent of models exceed 2 million Btu/h, or approximately 250 boilers per year nationally.[45] Based on these shipments, AHRI estimated that the potential 30-year electricity savings from commercial boiler fans would be on the order of 0.016 quads nationally and noted a potential that fan changes will result in increased standby losses and reduction in thermal efficiency that would result in a net energy loss. AHRI added that given the small degree of energy savings and the small shipment volume relative to the significant redesign, testing, and certification costs associated with incorporating a new fan, it is highly unlikely that there are significant positive consumer benefits. (AHRI, No. 40 at pp. 11–12)

As noted by AHRI, the metric for commercial water heaters includes the embedded fan's energy, meeting the proposed criteria to identify the embedded fan exemption. However, as AHRI noted, fans in this equipment are below 1 hp shaft power and therefore are already excluded based on the adopted power limits discussed in section III.B.1 of this document. Therefore, DOE did not propose and is not adopting to specifically list this equipment in the list of covered equipment for which the fan is excluded from the test procedure. For embedded fans in commercial boilers, as noted by AHRI, only the larger units would incorporate fans that meet the scope criteria discussed in section III.B.1 of this document. However, as noted by AHRI, the current DOE test procedure for commercial boilers does not capture the fan energy use; therefore, DOE did not propose and is not adopting to list this equipment as part of the covered equipment for which the fan is excluded from the test procedure. Instead, DOE is exempting fans embedded in the equipment listed in Table III–7, as proposed in the July 2022 NOPR and continues to exclude fans in covered equipment in which the fan energy use is already captured in the equipment specific test procedures. Further, because DOE is not adopting a definition of ''exclusively embedded fan'' (see section of this III.B.3.c document), DOE removes the use of the term ''exclusively'' as proposed in the July 2022 NOPR. In addition, DOE notes that this final rule does not adopt energy conservation standards or certification requirements and any impacts from setting potential energy conservation standards (including equipment redesign and consumer benefits) will be analyzed as part of any separate energy conservation standard rule.

Daikin commented that it was appropriate to exempt embedded fans in DOE-regulated products and added that DOE should also exempt fans in equipment that are regulated by IECC and [ASHRAE] 90.1 (Public Meeting transcript, No. 18 at p. 15–16)

As noted previously, DOE is exempting fans embedded in the equipment listed in Table III–7, as proposed in the July 2022 NOPR and continues to exclude fans in covered equipment in which the fan energy use is already captured in the equipment specific test procedures. In addition, DOE is not exempting fans that are in equipment that are regulated by IECC and ASHRAE 90.1, consistent with the term sheet. Instead, DOE excludes fans embedded in equipment listed in Table III–7, consistent with the Working Group term sheet scope recommendations related to embedded fans.

c. Exclusively Embedded Fans

In the July 2022 NOPR, DOE further clarified that DOE proposed to exclude embedded fans that are not distributed in commerce as standalone fans. DOE acknowledged that in a number of instances, a standalone fan purchased by a manufacturer for incorporation into a unit of listed equipment may be indistinguishable based on physical features from a fan that is purchased by a manufacturer for incorporation into non-listed equipment or from a fan used as a standalone fan. DOE noted that during the ASRAC negotiations, AHRI conducted a survey of its members to determine the number of fans purchased versus manufactured by the equipment manufacturer. (Docket No. EERE–2013–BT–STD–0006, AHRI, No. 125.3 at p. 1) AHRI estimated that over 80 percent of all fans that are used as components across all commercial regulated equipment are manufactured by the equipment manufacturer. *Id.* This percentage was higher for commercial air-conditioning and heat pump equipment and was estimated to be between 94 and 99 percent. 87 FR 44194, 44208.

In order to provide additional specificity as to the fans that would be subject to the embedded fan exclusion, in the July 2022 NOPR, DOE proposed to use the term ''exclusively embedded fans'' to designate the fans covered by the embedded fan exclusion. DOE proposed to define ''exclusively embedded fan'' as: a fan or blower that is manufactured and incorporated into a product or equipment manufactured by the same manufacturer and that is exclusively distributed in commerce embedded in another product or equipment. Based on this information, DOE tentatively determined that the vast majority of fans used as components in regulated commercial HVACR equipment would meet the proposed definition of exclusively embedded fan and would not be subject to the test procedure as proposed in the July 2022 NOPR. DOE further provided examples illustrating how the proposed definition of exclusively embedded fan would impact whether a fan must be tested and certified to DOE. 87 FR 44194, 44208.

In response to the July 2022 NOPR, ebm-papst commented that it does not believe it to be common practice that original equipment manufacturers (''OEMs'') fabricate fans in the literal sense. ebm-papst added that very few OEMs, if any, in the U.S. fabricate their own impellers and that in its experience no American OEMs fabricate their own fan motors or their own electronic fan speed controller. However, ebm-papst added that it is common practice for OEMs to purchase major sub-components from independent suppliers, such as ebm-papst. (ebm-papst, No. 31 at p. 6)

Morrison commented that 95 percent of fans it manufactures are used in HVAC equipment. (Morrison, No. 42 at p. 3)

As noted in the July 2022 NOPR, DOE relied on data from AHRI to estimate the share of embedded fans that are manufactured in-house by OEMs vs. purchased and notes that these

[45] AHRI cited U.S. Department of Energy, Technical Support Document: Energy Efficiency Program for Consumer Products and Commercial and Industrial Equipment: Commercial Water Heating Equipment, April 18, 2016, Figure 3.10.26, p. 3–29).

estimates may not reflect individual manufacturer practices.

In response to the July 2022 NOPR, DOE received several comments related to the proposed definition of ''exclusively embedded fan''.

AHRI stated support for the AMCA 214–21 definition of an embedded fan as ''a fan that is part of a manufactured assembly where the assembly includes functions other than air movement.'' (AHRI, No. 40 at p. 8)

NEEA commented in support of DOE's proposals related to embedded fans and supports the definition of exclusively embedded fans, which adds additional clarity to what is included or excluded from regulation. (NEEA, No. 36 at p. 7)

The Efficiency Advocates supported DOE's proposal regarding embedded fans. The Efficiency Advocates commented that generally fans can be sold as standalone products or they may be embedded within a piece of equipment that requires the fan to operate. The Efficiency Advocates commented that in the NOPR, DOE defines ''exclusively embedded'' fans and excludes various types of exclusively embedded fans consistent with the Working Group recommendations. The Efficiency Advocates stated that these exclusions, summarized in Table III–8 of the July 2022 NOPR, essentially apply only to embedded fans in regulated equipment for which the DOE metric captures the energy consumption of the fan. The Efficiency Advocates support this approach to help ensure that inefficient fans are not embedded into products for which energy use is not captured by a DOE efficiency metric. (Efficiency Advocates, No. 32 at p. 2)

Morrison commented that the exclusively embedded fans it manufactures have a clearly identified label with a unique part number and are exclusive per the manufacturer, with full traceability through the sales order process to a ship-to site. Morrison stated a concern about double regulation for parts that are instrumental to the equipment's already existing regulation and now an added layer of regulation that adds to the cost of products but provides no additional energy savings. (Morrison, No. 42 at p. 4) Morrison added that the fans it manufactures are built to order for the customer and are application-specific designs with unique part numbers on the label that identify the customer and location. Morrison stated that all shipments have a unique Sales Order that confirms the ship-to location and part number and would be traceable to the OEM's appliance. Morrison commented that the fans it manufactures are assembled into an appliance and nearly all are in the covered product category that has a metric inclusive of the fan energy. In addition, Morrison pointed out that this proposed added layer of test for standalone fans before embedding amounts to duplicate regulation and double counting of the energy savings, and that these fans are currently tested by the OEMs in the appliance and would not need the added cost of regulation as a fan. (Morrison, No. 42 at p. 3)

AHAM commented that embedded fans used in covered products should be excluded. AHAM commented that it is critical that those fans be excluded regardless of whether they are imported or sold for inclusion in a domestically manufactured product or are imported as part of that product. AHAM requested that should DOE include fans that are embedded in consumer products, DOE ensure that all embedded fans—whether sold for incorporation into the product or imported already in the product—are treated the same. Otherwise, AHAM commented that domestically manufactured products could be at a disadvantage, which is contrary to the Administration's goals to increase domestic manufacturing. (AHAM, No. 35 at p. 5)

AHRI commented that all embedded fans, and replacement fans for these finished goods, regardless of whether they are domestically produced or imported as part of the product, should be exempt. Under DOE's proposal, AHRI commented that finished goods manufactured overseas would be treated differently from those manufactured domestically. AHRI stated that, as proposed, a manufacturer would be able to buy and embed a standalone fan and not be subject to the regulation if the finished product was imported. However, AHRI added, a domestic manufacturer buying a fan for manufacture domestically would be subject to the proposed rule, as written, and DOE has not considered the burden this places on domestic manufacturers. (AHRI, No. 40 at pp. 7–8)

Morrison commented that the exemption for exclusively embedded fans would lead to trade-restrictive issues. Morrison commented that using a scenario of covered equipment with an exempted embedded fan: (1) If the OEM produces the testable fan configuration, then those fans are exempt from fan regulation (2) But if an identical fan construction is delivered as a testable configuration by a supplier to an OEM factory in the U.S., then the fan is considered a standalone fan and therefore will be in the scope of the regulation and testing will be required (3) On the other hand, if the U.S. OEM has a joint venture north or south of the border, then it can receive and install unregulated fans there and sell the unit back in the U.S. without any fan regulation (4) Another scenario is possible with the OEM factory in a foreign country and under that scenario, the embedded fan is exempt from fan regulation. Morrison commented that this would appear to promote the use of offshore production and would not just favor foreign-made equipment but would encourage more use of imported equipment. (Morrison, No. 42 at p. 3) Similarly, ebm-papst did not support the proposed definition of standalone fans in the NOPR and provided the following scenario: If an OEM fabricates the testable fan configuration itself, the fans will be exempt from fan regulation. However, ebm-papst stated, if an identical fan construction is supplied as a testable configuration by a supplier to an OEM factory in the U.S., then the fan will become a standalone fan and therefore will be in the scope of the regulation. ebm-papst added that if the U.S.-based OEM owns a factory outside of the U.S., then it will be permitted to receive and install unregulated fans there, and sell the unit in the U.S. ebm-papst further commented that if the OEM factory is in a foreign country altogether, then the embedded fan will be exempt from the fan regulation. ebm-papst commented that the proposed exclusions would be a restraint of domestic trade, while favoring foreign OEM factories. (ebm-papst, No. 31 at p.2)

ebm-papst requested clarification regarding the proposed approach to exclude embedded fans if they are fabricated by the OEM, while all external fabricators would be burdened by the regulation. (ebm-papst, No. 31 at p. 1) ebm-papst requested that DOE ensure that all embedded fans—whether sold for incorporation into the product or imported already in the product—be treated the same. Otherwise, ebm-papst commented that domestically manufactured products could be at a disadvantage, which is contrary to the Administration's goals to increase domestic manufacturing. Further, ebm-papst commented that there are no unique physical features that could be used to distinguish a fan that is exclusively designed for use in equipment listed in Table III 8 of the NOPR. However, ebm-papst opposes the attempt to treat exclusively embedded fans differently, merely due to potential differences in the fans' supply chains. (*Id.* at p. 6)

As noted previously, the proposed exclusions for certain embedded fans listed in Table III–8 of the July 2022 NOPR, would only apply to fans that are manufactured in-house by the manufacturer of the equipment or to fans that are imported already embedded in equipment listed in Table III–8 of the July 2022. Fans purchased by OEMs in the U.S. to be incorporated into equipment listed in Table III–8 of the July 2022 NOPR would not be excluded, while fans purchased and incorporated by an OEM outside of the U.S. would be excluded. As noted by the stakeholders, the proposed definition of exclusively embedded fans could therefore disadvantage domestic fan suppliers. For this reason, DOE is not establishing a definition of ''exclusively embedded fan''. As this time, DOE is not differentiating the embedded fan listed for exclusion in Table III–7 depending on whether it is exclusively distributed in commerce embedded in another product or equipment listed in that table (*i.e.,* depending on whether it is manufactured and incorporated into a product or equipment manufactured by the same manufacturer). By removing the proposed ''exclusively embedded fan'' definition, all embedded fans, whether sold for incorporation into the product or already incorporated in the product, would be exempted if embedded in equipment listed in Table III–7 of this document. In the future, DOE may consider an approach to provide additional specificity as to how to identify fans that would be sold for incorporation in equipment listed in in Table III–7 of this document.

JCI requested clarifications on how DOE will verify the performance of a fan or blower in a finished-goods unit in the field. JCI asked if the fans would have to be removed from equipment and sent to a lab for testing. (JCI, No. 34 at p. 2)

DOE's regulations apply to the point of manufacture and not to the equipment as installed in the field. If the fan is embedded in another equipment, testing would be performed in accordance with the provisions described in section III.E.9 of the document.

AHAM commented that it does not support an approach that would require OEMs to certify embedded fans used in their finished products and that would hold OEMs responsible for certification, testing and record-keeping for the fans embedded in their products. AHAM commented that the fan manufacturers should bear this burden given that they have the expertise and facilities to conduct the testing, etc. (AHAM, No. 35 at p. 7)

DOE notes that the fan manufacturer would be responsible for testing and certifying the fan. If the OEM is also the fan manufacturer (and fabricates the fan in-house), then that OEM would be responsible for testing and certifying the fan if included in the scope of the test procedure.

4. Air Circulating Fans

In the July 2022 NOPR, DOE noted that AMCA 230–15 (with errata) did not include any limitation in terms of input power of the air circulating fans that can be tested in accordance with the test procedure. DOE further noted that the AMCA committee was considering limiting the scope of AMCA 230–15 (with errata) to air circulating fans with input power of 125 W and above to focus on commercial and industrial fan applications and exclude residential fans, such as tower fans and bladeless fans. 87 FR 44194, 44210.

In the July 2022 NOPR, DOE tentatively determined that the proposed test procedure would provide a representative measurement of energy use or energy efficiency during a representative average use cycle for all air circulating fans. Therefore, at the time, DOE proposed to include all categories of air circulating fans in the scope of the proposed test procedure; *i.e.,* including equipment with input power less than 125 W. DOE noted that should additional information justify excluding fans with input power less than 125 W from the scope (or any other power limit that may be justified), DOE may consider applying a power limit in the final rule as considered by the AMCA committee and supported by stakeholders. In addition, DOE noted that it may consider specifying that 125 W corresponds to the air circulating fan's input power at maximum speed. 87 FR 44194, 44210.

The Efficiency Advocates stated support for including air circulating fans within the test procedure scope, so that published efficiency information for these products is based on a standardized test procedure and to allow DOE to consider future potential energy conservation standards. (Efficiency Advocates, No. 32 at p. 2)

AMCA commented that the stakeholders of residential circulating fans are not represented by AMCA and have not previously been involved in the fans-and-blowers rulemaking. Additionally, AMCA noted that the demarcation of the scope of the AMCA 230 test standard under revision will start above 125 W. AMCA questioned if DOE has alerted stakeholders of residential circulating fans that they are in the process of being regulated as it would be fair to enable them to weigh in on the proposed test procedure. (AMCA, No. 41 at p. 5) AMCA recommended the exclusion of ACFH with less than 125–W nameplate electrical power, which is the demarcation between the published IEC Standard 60879:2019, ''Comfort fans and regulators for household and similar purpose,'' [46] and AMCA 230 (next revision). AMCA commented that fans covered by IEC 60879 generally are mass-produced, mass-imported, mass-sales residential products, which are made by stakeholders that have not been represented in any U.S. fan-regulation activity to date, such as ASRAC, California Title 20, or model/state energy codes. (AMCA, No. 41 at pp. 7–8)

ebm-papst recommended limiting the scope of the circulation fan test procedure to fans with nameplate power ratings of at least 125 W in an effort to keep the focus of this rulemaking on commercial and industrial fans. ebm-papst added that the scope of EU 327/2011 is limited at 125 W and that lower-power circulation fans are in the scope of IEC 60879. (ebm-papst, No. 31 at p. 6)

Since the publication of the July 2022 NOPR, AMCA published AMCA 230–23, and this latest version of the industry standard only covers air circulating fans with input power greater than or equal to 125 W. Further, to date, stakeholders representative of the market of circulating fans with input power less than 125 W s have not commented on this rulemaking. In addition, in the NOPR, DOE did not review IEC 60879:2019, which stakeholders indicated would be the most appropriate industry test procedure for these fans. For these reasons, at this time, DOE is limiting the scope of the test procedures to air circulating fans with input power greater than or equal to 125 W, as measured by the test procedure at high speed.

AHAM commented that consumer fans such as desk fans, box fans, pedestal fans, should not be included in the scope of commercial and industrial fans and blowers. AHAM commented that this would be in direct contradiction to EPCA, and consumer fans have different average representative uses than commercial and industrial fans. AHAM urged DOE

[46] IEC 60879:2019 specifies the performance-measuring methods of comfort fans and regulators for household and similar purposes, including conventional fans, tower fans, and bladeless fans, their rated voltage being not more than 250 V for single-phase fans and 480 V for other fans, and their rated power input being less than 125 W.

to either specifically exclude consumer air circulating fans from the scope of coverage and noted that a 125 W limit would be an effective way to distinguish consumer fans so long as the 125–W threshold applies to the fan rating alone and not to the entire product or the fan and motor. AHAM noted this could implicate products like residential fan-heaters and stated it was unclear whether the relevant definitions in the applicable AMCA and IEC 60879 standards would take the products out of scope. As such, AHAM requested that DOE make it clear that all residential/consumer fans are exempt. AHAM added that it was their understanding that DOE's proposal did not include bladeless circulation fans in the scope of air circulating fans based on the proposed definitions. AHAM agrees that such fans should not be included. AHAM added that DOE should treat other consumer fans the same way, *i.e.,* no consumer fan should be included in the scope of the commercial and industrial fan test procedure or energy conservation standards). (AHAM, No. 35 at p. 6)

AHAM commented against DOE's proposal to include consumer (residential) air circulating fans and embedded fans used in consumer (residential) products in the scope of its commercial and industrial fans and blowers test procedure. AHAM commented that this would be contrary to EPCA, DOE's coverage determination, and essential EPCA public policy. AHAM commented that consumer fans and fans used in consumer products are, by definition, not commercial/industrial fans or blowers. AHAM added that Congress's intent was to include only commercial and industrial fans and blowers under the scope of ''fans'' and ''blowers'' in 42 U.S.C. 6311(2)(B). First, AHAM noted that fans and blowers are listed as types of industrial equipment, which indicates an intent to cover commercial and industrial equipment, not residential/consumer products. Second, AHAM added that in EPCA, fans and blowers are not included in Part A, which is for Consumer Products other than Automobiles. Third, AHAM stated that fans and blowers by definition are industrial equipment, which EPCA defines as equipment that ''to any significant extent, is distributed in commerce for industrial or commercial use, without regard to whether such article is in fact distributed in commerce for industrial or commercial use.'' (42 U.S.C. 6311(2)(A)(ii)) In particular, AHAM commented that residential air circulating fans by definition are clearly consumer products—they are not, ''to any significant extent'' distributed in commerce for industrial or commercial use and are distributed for use in homes. AHAM commented that fans such as desk fans, box fans, and pedestal fans that are used in homes are regularly distributed in commerce for personal use or consumption by individuals. AHAM commented that if particular SKUs are labeled as consumer fans and, in fact, are primarily marketed and distributed into the very different commercial/industrial sectors, then they can be dealt with through compliance and enforcement efforts rather than by over-incorporation of all consumer fans into test procedures and standards. AHAM noted that commercial clothes washers also appear in the same list of ''covered equipment.'' (42 U.S.C. 6311(1)(H)) AHAM commented that despite the fact that commercial and residential clothes washers share similar construction and are often both used by individual consumers, EPCA differentiates them. Thus, AHAM stated it was evident that Congress intended to include only truly commercial/industrial fans and blowers in the scope of industrial equipment. AHAM added that DOE's proposal to include embedded fans used in consumer products and residential/consumer air circulating fans in the scope of the commercial and industrial fans and blowers rulemaking is inconsistent with its previous decision for these products. AHAM commented that DOE's final determination of coverage stated that ''[t]o qualify as 'industrial equipment,' fans and blowers must be, to a significant extent, distributed in commerce for industrial and commercial use.'' (42 U.S.C. 6311(2)(A)(ii)) AHAM noted that in footnote 26 of the final coverage determination, DOE notes that distribution for residential use does not preclude coverage as covered equipment so long as to a significant extent the equipment is of a type that is also distributed in commerce for industrial and commercial use. However, AHAM commented that is not the case with fans embedded in consumer products (whether they are DOE covered products or not) or fans used in homes to circulate air. Thus, AHAM commented that DOE should not be including either type of fan under the scope of the commercial and industrial fans and blowers test procedure or energy conservation standards. AHAM commented that DOE's proposal is not consistent with its own guidance on the consumer/commercial distinction in EPCA.[47] Specifically, AHAM noted that residential/consumer fans are typically smaller than commercial and industrial fans because they are meant to circulate air in smaller spaces and have lower wattage, have different durability requirements, and have different safety requirements. AHAM commented that UL 507: Standard for Electric Fans applies to consumer fans and some commercial fans, but that there are also additional safety requirements for commercial fans (*e.g.,* OSHA requirements) and UL 507 specifically excludes certain fans. AHAM further noted that there are industrial technical guidance requirements such as ISO13348 (''Industrial fans—Tolerances, methods of conversion and technical data presentation'')[48] that distinguish household and industrial fans. Finally, AHAM noted that residential fans as a product type are primarily used in residential applications. AHAM commented that the same was true for fans embedded in consumer products. (AHAM, No. 35 at pp. 1–4)

AMCA commented in support of AHAM's comment regarding the scope of the [air] circulating fan coverage extending below 125 W. (AMCA, No. 41 at p. 4)

DOE notes that air circulating fans are tested in a configuration that measures electrical input power to the fan, inclusive of the motor, and that the existing test procedures (*i.e.,* AMCA 230–23 or IEC 60879:2019) do not allow measuring the mechanical shaft power to the fan, exclusive of the motor. Therefore, DOE has determined that a limit in terms of electrical input power (applicable to the fan and motor) is more appropriate. Regarding DOE's authority to regulate fans and blowers that are distributed in commerce for residential use, as noted previously (*See* section III.B of this document), DOE has determined that distribution for residential use does not preclude coverage as covered equipment so long as to a significant extent the equipment is of a type that is also distributed in commerce for industrial and commercial use. EPCA defines ''industrial equipment'' as any article of equipment[49] ''of a type'' that ''to any

[47] AHAM referenced the following: *www1.eere.energy.gov/buildings/appliance_standards/pdfs/cce_faq.pdf.*

[48] *See www.iso.org/standard/45118.html.*

[49] The types of equipment are ''(in addition to electric motors and pumps, commercial package air conditioning and heating equipment, commercial refrigerators, freezers, and refrigerator-freezers, automatic commercial ice makers, commercial clothes washers, packaged terminal air-conditioners, packaged terminal heat pumps, warm air furnaces, packaged boilers, storage water heaters, instantaneous water heaters, and unfired

significant extent, is distributed in commerce for industrial or commercial use'' and ''is not a covered [consumer] product [ ] without regard to whether such article is in fact distributed in commerce for industrial or commercial use.'' 42 U.S.C. 6311(2)(A). Accordingly, any equipment that meets the definition of air circulating fan, has an input power greater than or equal to 125 W, as measured by the test procedure at high speed, and is of a type that, to any significant extent, is distributed in commerce for industrial or commercial use is included in the scope of the test procedure, regardless of whether it is sold for use in commercial, industrial, or residential settings. In addition, as previously stated, DOE is not setting test procedures for air circulating fans with input power less than 125 W and DOE believes this would exclude most fans used in residential applications.

Morrison commented that air circulating fans should be covered in a separate rulemaking as their utility, function, and testing process are different from other fans and blowers. Morrison added that this should be done so the appropriate fan manufacturers are engaged in this process to reduce adding burden and complexity to this rulemaking. (Morrison, No. 42 at p. 1)

AMCA recommended that air circulating fans that are not ceiling fans be handled with a separate rulemaking. AMCA commented that this would provide stakeholders of covered fans less than 125 W an opportunity to participate and provide separation between residential and commercial/industrial products. (AMCA, No. 41 at p. 17) In addition, AMCA commented that such request seemed practical and fair seem practical and fair, especially for the circulating fan stakeholders that were not in the scope of the ASRAC process, and which are in the final stages of revising the AMCA 230 test standard for circulating fans. AMCA requested DOE to allow that standard committee to complete its work before issuing the final rule on this test procedure. Already, with the final rule for the ceiling fan test procedure causing problems for the AMCA 230 revision, AMCA commented that it would really hurt the standard to have it out of synch with the fans and blowers test procedure sections that cover circulating fans. (AMCA, No. 41 at pp. 3–4

Greenheck commented that the inclusion of air circulating fans in the fans and blowers test procedure is problematic as they are a completely different type of equipment and utilize different industry test standards, procedures, and metrics as defined in AMCA 230–15. Greenheck commented that the inclusion of air circulating fans makes the test procedure rulemaking confusing and contradictory. (Greenheck, No. 39 at p. 8)

DOE notes that although the test procedures for fans and blowers other than air circulating fans, and air circulating fans are combined in a single notice, DOE is adopting separate test procedures for each category of equipment and explicitly indicates the scope of application of each test procedure. In addition, as noted previously, DOE is not setting test procedures for air circulating fans with input power less than 125 W. Therefore, DOE is continuing to include air circulating fans in the same rulemaking docket as fan and blowers. Although DOE is including air circulating fans in the same rulemaking as fans and blowers other than air circulating fans, DOE notes that this final rule establishes the test procedures for fans and blowers other than air circulating fans and the test procedures for air circulating fans as separate appendices. In addition, as previously stated, DOE is not setting test procedures for air circulating fans with input power less than 125 W. In addition, as discussed in section III.D of this document, DOE is incorporating by reference the latest version of AMCA 230–23, which addresses AMCA's concerns about this rulemaking being completed before AMCA 230–23 published.

AHRI commented that DOE expanded the scope of the NOPR to include fans that were not discussed in the 2015 ASRAC negotiations. In addition, AHRI commented that the October 2021 RFI was narrowly limited to one classification of fans, the air circulating fan heads (''ACFH''). (AHRI, No. 40 at pp. 4–5)

DOE notes that neither the term sheet nor the scope of the RFI limits DOE's authority to initiate a rulemaking on additional categories of fans and blowers. DOE proposed a test procedure for air circulating fans in the July 2022 NOPR and considered comments received in response to the NOPR in determining the test procedure established in this final rule.

5. Non-Electric Drivers

Some fans operate with non-electric drivers, such as engines or generators, and such fans may be used in non-stationary applications or stationary applications. The Working Group recommended that DOE exclude fans that are exclusively powered by internal combustion engines from the test procedure and related energy conservation standards. (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #2 at p. 2)

AMCA 214–21 does not provide for the testing of fans and blowers powered by internal combustion engines. In order to measure the energy efficiency or energy use of non-electric drivers during a representative average use cycle, separate test methods would be necessary for each type of driver (*e.g.,* engine, generators). DOE is not currently aware of a relevant industry test procedure and does not have information regarding the test set-up required to test fans powered by internal combustion engines. As such, in the July 2022 NOPR, DOE did not propose test procedures for fans and blowers powered exclusively by an internal combustion engine, [50] regardless of whether such fan or blower is used in a stationary or non-stationary application. 87 FR 44194, 44210.

Certain bare shaft fans can be powered by either electric drivers (*i.e.,* motors) or non-electric drivers. In the July 2022 NOPR, DOE tentatively determined that to the extent such a fan can be powered by an electric driver, the proposed test procedure would provide for measurement of the energy efficiency or energy use during a representative average use cycle when powered by an electric driver. As such, DOE proposed that such a fan would be subject to the test procedure. 87 FR 44194, 44210–44211.

The CEC commented in support of the exclusion of fans that are operated by an internal combustion engine that is used for personal (consumer), commercial, or industrial transportation only. The CEC recommended defining the term ''fan combustion engines,'' since it is unclear if the term ''fan combustion engine'' is meant to be that of a turbo fan engine, a fan driven by an internal combustion engine in any context, or the fans driven by an internal combustion engine used for the purpose of personal (consumer), commercial, or industrial transportation. (CEC, No. 30 at p. 3)

hot water storage tanks) as follows: (i) compressors; (ii) fans; (iii) blowers; (iv) refrigeration equipment; (v) electric lights and lighting power supply circuits; (vi) electrolytic equipment; (vii) electric arc equipment; (viii) steam boilers; (ix) ovens; (x) kilns; (xi) evaporators; (xii) dryers; and (xiii) other motors.'' 42 U.S.C. 6311(2)(B).

[50] DOE notes that the July 2022 NOPR included a typographical error in Table III–8 of the NOPR, stating ''fans exclusively powered by fan combustion engines'' instead of ''fans exclusively powered by an internal combustion engine.''

AMCA stated its support for the exclusion of fans and blowers that are exclusively powered by internal combustion engines from the scope of this test procedure because such fans include Positive Pressure Ventilators (''PPV''), which are portable fans for fire-rescue operations and excluded from having FEI ratings calculated using AMCA 214–21. (AMCA, No. 41 at p. 8)

AMCA noted that to help distinguish fans powered by combustion engines, PPVs are portable tube-axial fans and can be powered by batteries, combustion engines, and hydraulics while having no provisions for duct installations. AMCA added that PPVs sometimes are confused with floor-drying fans, which are housed centrifugal fans, whereas PPVs are not supplied in bare shaft configuration. (AMCA, No. 41 at p. 8)

New York Blower commented that fans with internal combustion engines are extremely rare and not likely to increase due to regulation and that exclusion of these fans seems appropriate. New York Blowers stated that it is possible at lower power ranges that there might be a significant quantity of products and consequently, units driven by internal combustion applications that they are not aware of. Aside from a clutch mechanism to keep the fan disengaged from the motor when idling, New York Blower commented that it does not know of any distinguishing feature of the fan that would indicate the fan would be driven by an internal combustion engine. (New York Blower, No. 33 at p. 9)

Robinson stated a lack of awareness of any physical features of a fan design that would distinguish those as exclusively powered by internal combustion engines other than the presence of an internal combustion engine or potentially a fluid clutch. (Robinson, No. 43 at p. 6)

Morrison commented that many fans for internal combustion engines are specific designs intended for direct attachment to the engine and others have low voltage motors consistent with vehicle electrical systems. Morrison commented that such fans should be part of the equipment regulation (autos, buses, trucks, generators, and heavy equipment) as opposed to being included in this effort as detailed in the ASRAC term sheet. In addition, Morrison noted that these fans have low-voltage motors and heavy construction features. (Morrison, No. 42 at p. 4)

DOE notes that the July 2022 NOPR included a typographical error in Table III–8 of the NOPR, stating ''fans exclusively powered by fan combustion engines'' instead of ''fans exclusively powered by an internal combustion engine.'' In this final rule, consistent with the July 2022 NOPR, and as recommended by stakeholders, DOE excludes fans and blowers powered exclusively by an internal combustion engine, regardless of whether such fan or blower is used in a stationary or non-stationary application from the scope of the test procedure. DOE is not adopting additional definitions as the reference to internal combustion engines clearly specifies the fans excluded from the scope of the test procedure. As noted by stakeholders such fans can be distinguished based on the presence of a clutch mechanism or designs intended for direct attachment to the engine.

6. Replacement Fans and Blowers

The Working Group did not address the issue of replacement parts in the term sheet. (Docket EERE–2013–BT–TP–0055, No. 179, Appendix F at p. 19). In the July 2022 NOPR, DOE proposed to include all fans and blowers that: (1) meet the criteria for scope of inclusion as described in section III.A.1 of that document, and (2) are not proposed for exclusion as listed in section III.A.2 of that document or Table III–8 of the July 2022 NOPR, regardless of whether that fan is a replacement fan. 87 FR 44194, 44211.

Morrison commented that replacement blowers for HVAC appliances need to be fully excluded for safety reasons as appliance limit controls may cause malfunction that could result in loss of life and/or property. (Morrison, No. 42 at p. 2)

AHAM commented that replacement fans, as well as those that are not considered covered products, should be excluded from the scope of the test procedure and applicable standards. (AHAM, No. 35 at p. 5)

AHRI commented that any potential regulation should consider the impact on replacement fans and added that the consequences of a replacement fan made non-compliant because of these new regulations could be catastrophic. AHRI commented that in many cases, such as supply-air fans with air flow through gas fired heat exchangers, hot-water, coils or electric resistance units, a variety of safety standards in addition to performance standards are affected. AHRI commented that the testing of all legacy equipment because of a fan change will be cost- and resource-prohibitive, and that if a replacement fan is not compliant, in most cases, an unsafe, engineered-to-fit substitution would be required. AHRI asserted that the costs, risks, and time required to retest the HVACR and water-heating equipment would all be prohibitive and that testing would also be impractical if the HVACR and water heating equipment is out of production. AHRI added that manufacturers would be forced to rebuild an out-of-production unit solely for the purpose of testing a new fan. AHRI concluded by stating that there may be instances in which such part substitution makes sense, but that is not a reasonable basis for a broad, minimum standard. (AHRI, No. 40 at p. 13)

Trane commented that replacement fans should be exempt if embedded fans fall under regulation. Trane encouraged DOE to align with the CEC regulation that provides an exemption for ''embedded fans as defined in ANSI/AMCA 214–21, including embedded fans sold exclusively for replacement of another embedded fan.'' Trane commented that fans embedded in equipment such as residential or commercial HVAC have downstream or upstream impacts on airflow distribution. Trane commented that many applications of this equipment have heating coils and/or natural gas heat exchangers that are developed, tested and certified for safety. Trane stated that when a fan is changed in the field at the application point, an exact model should be used for replacement to comply with safety requirements to ensure that no equipment failure results that may compromise the safety of the building occupants. Trane commented that, additionally, fan efficiency challenges the ability to replace ''like for like'' fans. Trane commented that more-efficient fans are often larger than less efficient ones and as such, this may increase associated product size. Trane noted that while a similar impeller-diameter fan may be available at a higher efficiency, it is imperative to consider that differing fan types have different non-impeller fan geometries and constraints, such that the overall fan footprint increases dramatically. Trane commented that with space constraints being a constant pressure, new products may be too large to replace smaller existing ones without significant design changes and associated costs that would serve to dissuade building owners from purchasing the more efficient fans contained in new products and instead repair existing, less efficient products. Trane commented that retrofit curbs can be used, but they generally come with associated pressure drop, which negates any efficiency improvement associated with the more efficient fan. (Trane, No. 38 at p. 3)

DOE includes all fans and blowers that meet the criteria for scope inclusion

as described in section III.B.1 of this document and are not listed for exclusion in section III.B.2 of this document or Table III–7 of this document, regardless of whether that fan is a replacement fan. At this time, DOE is not adopting energy conservation standards for fans and blowers, and the test procedure would not impact the availability of current models. The test procedure does not set any energy conservation standards and does not result in any non-compliant fans. DOE will consider the impacts from setting potential energy conservation standards on replacement fans (*e.g.,* costs, design, safety, and availability) as part of any potential energy conservation standards rulemaking.

7. Material Handling and Heavy Industrial Processing Fans and Blowers

In response to the July 2022 NOPR, Robinson commented that fans that provide mass transfer or are subjected to significant wear will not benefit from a switch to highly efficient aerodynamic designs. In fact, stated Robinson, shorter equipment life was highly likely and end use customers would bear the additional cost of replacement. For this reason, Robinson stated it does not support the inclusion of fans that provide mass transfer or are subjected to wear (whether abrasion or corrosion). (Robinson, No. 43 at p. 5)

At this time, DOE is not adopting energy conservation standards for fans and blowers, and the test procedure would not impact the availability of current models. The test procedure does not set any energy conservation standards and does not result in any non-compliant fans. In addition, as noted in the July 2022 NOPR, based on input from AMCA during the ASRAC negotiations, DOE has determined that radial housed unshrouded fans with a diameter less than 30 inches or a blade width of less than 3 inches are designed for materials-handling applications. These fans have specific design features (*e.g.,* built to resist the impact and erosive wear from large quantities of various materials passing through the fan housing) that generally limit the opportunity for improved efficiency. (Docket No. EERE–2013–BT–STD–0006, Public Meeting Transcript, No. 85 at p. 60). 87 FR 44194, 44202–44203. Furthermore, testing these fans based on the test method for clean air fans would not provide a measurement of energy use or energy efficiency that is representative of an average use cycle. For these reasons, as discussed in section III.B.2 of this document, DOE is excluding radial housed unshrouded fans with a diameter less than 30 inches or a blade width of less than 3 inches at this time.

Robinson further commented that the proposed rule would create an extreme challenge for the heavy industrial processing industry (*e.g.,* mining, refining, metal making, rock product processing, food production, chemical processing, and much more) in the United States. Robinson commented that specialty heavy industrial process fans are significantly different from fans used in commercial or light industrial applications as they operate in heavy industrial process facilities that are constrained by significant regulations as well as engineering requirements. Robinson stated that this means that the design of the whole process, which requires each part to play a specific application, is quite complicated and under multiple reviews. Robinson commented that the fans, as part of the process, are often designed to perform at several load points, as the design and then the actual operation of the plant may experience variability. Robinson also noted that the fans are placed throughout the heavy industrial process and, depending upon the role of each specific fan, will be forced to handle particulate, extreme temperatures, dramatic temperature changes, moisture, corrosive matter, and other items in the air stream. Robinson noted that the most efficient fan designs are only able to operate in clean air applications (*i.e.,* where they draw in outside air and blow it into a part of the heavy industrial process) and that the number of clean air fans in any heavy industrial process and the amount of energy they consume, relative to the rest of the process, is small. Instead, Robinson commented that fans handling air movement through the more challenging parts of the process are much more likely to consume more energy, but also deal with variables that limit the efficiency improvement of that fan. Robinson added that these fans are connected to the larger whole of the heavy industrial process in which they operate and are subject to the conditions as they change through the entire system. Further, if the end goal is to require fans to all comply with minimum levels of efficiency, Robinson commented that entire industrial processes will need to be retrofitted to allow all of the fans within the process to be clean air handling fans. Robinson commented that not only would this require the reconstruction of entire heavy industrial processing facilities, but also require that each fan be bigger or that there be more fans, which would draw greater energy and therefore be less efficient. Robinson added that it is necessary for many heavy industrial plant precipitators and baghouses (Air Pollution Control—APC devices) to operate in a positive pressure environment to prevent combustion of pollutants captured and collected in the cleaning device hoppers. In these applications, stated Robinson, it is necessary for the fans to be located upstream (or in the dirty air) of the APC device to minimize the risk of fires that would significantly damage the internals of the APC device. Robinson commented that the repair/replacement cost of these devices alone, if damaged by fire, is in the $5 to $10 million range for each, not including the plant lost production time. Robinson commented that the cost of adding additional particulate collection equipment upstream of the existing heavy industrial process fans and APC devices coupled with the added pressure drop of this equipment will offset any efficiency benefits since the existing fans will need to be replaced with larger horsepower fans. In short, Robinson summarized, it would not be surprising if this forced all heavy industrial processing out of the United States. (Robinson, No. 43 at pp. 2–3)

At this time, DOE is not adopting energy conservation standards for fans and blowers, and the test procedure would not impact the availability of current models. The test procedure does not set any energy conservation standards and does not result in any non-compliant fans or necessary redesigns. Any future energy conservation standard rulemaking would, as part of the analyses conducted to support the rulemaking, analyze the markets in which fans and blowers are used, conduct a technology assessment, and evaluate any potential impacts on technological feasibility, practicability to manufacture, install or service, equipment utility or equipment availability, health, and safety as a result of potential standards. In addition, although DOE is not specifically excluding material handling fans and heavy industrial processing fans, DOE notes that the test procedure is limited to fan design points with air power less than 150 hp. In addition, radial housed unshrouded fan with diameter less than 30 inches or a blade width of less than 3 inches, safety fans and fans that designed and marketed to operate at or above 482 degrees Fahrenheit (250 degrees Celsius) are excluded from the scope of the test procedure. As such, DOE notes that any fan that meets the scope criteria

described in section III.B.1 of this document, and is not listed for exemption as discussed in section III.B.2 and III.B.3 of this document would be in the scope of the test procedure.

C. Definitions

This section discusses DOE's adopted definitions for specific terms used in the test procedure for fans and blowers.

1. Fan and Blower Categories

The classification of fans and blowers recommended by the Working Group for coverage under a test procedure and the corresponding terms and definitions in AMCA 214–21 and the proposed CEC regulations [51] are presented in Table III–8 of this document.

TABLE III–8—SCOPE RECOMMENDED BY THE WORKING GROUP, CORRESPONDING TERMS AND DEFINITIONS

Working group scope recommendations	Corresponding term and definition in AMCA 214–21	Corresponding CEC definitions
Axial cylindrical housed fan.	''Axial inline fan'' means a fan with an axial impeller and a cylindrical housing with or without turning vanes.	''Axial-inline fan'' means a fan with an axial impeller and a cylindrical housing with or without turning vanes. Inlets and outlets can optionally be ducted.
Panel fan	''Axial panel fan'' means an axial fan, without cylindrical housing, that is mounted in a panel, an orifice plate or ring.	''Axial-panel fan'' means a fan with an axial impeller mounted in a short housing, non-cylindrical, that can be a panel, ring, or orifice plate. The housing is typically mounted to a wall separating two spaces, and the fans are used to increase the pressure across this wall. Inlets and outlets are not ducted.
Centrifugal housed fan, excluding inline fan and radial fan.	''Centrifugal housed fan'' means a fan with a centrifugal or mixed flow impeller in which airflow exits into a housing that is generally scroll-shaped to direct the air through a single fan outlet. A centrifugal housed fan does not include a radial impeller*.	''Centrifugal housed fan'' means a fan with a centrifugal or mixed flow impeller in which airflow exits into a housing that is generally scroll-shaped to direct the air through a single fan outlet. Inlets and outlets can optionally be ducted. It does not include a radial impeller.
Centrifugal unhoused fan, excluding radial fan.	''Centrifugal unhoused fan'' means a fan with a centrifugal or mixed flow impeller in which airflow enters through a panel and discharges into free space. Inlets and outlets are not ducted. This fan type also includes fans designed for use in fan arrays that have partition walls separating the fan from other fans in the array**.	''Centrifugal unhoused fan'' means a fan with a centrifugal or mix-flow impeller in which airflow enters through a panel and discharges into free space. Inlets and outlets are not ducted. This fan type also includes fans designed for use in fan arrays that have partition walls separating the fan from other fans in the array.
Inline and mixed-flow fan.	''Centrifugal inline fan'' means a fan with a centrifugal or mixed flow impeller in which airflow enters axially at the fan inlet and the housing redirects radial airflow from the impeller to exit the fan in an axial direction.	''Centrifugal inline fan'' means a fan with a centrifugal or mixed-flow impeller in which airflow enters axially at the fan inlet and the housing redirects radial airflow from the impeller to exit the fan in an axial direction. Inlets and outlets can optionally be ducted.
Radial housed fan	''Radial-housed fan'' means a fan with a radial impeller in which airflow exits into a housing that is generally scroll-shaped to direct the air through a single fan outlet. Inlets and outlets can optionally be ducted.	''Radial-housed fan'' means a fan with a radial impeller in which airflow exits into a housing that is generally scroll-shaped to direct the air through a single fan outlet. Inlets and outlets can optionally be ducted.
Power roof ventilator	''Power roof/wall ventilator (PRV)'' means a fan with an internal driver and a housing to prevent precipitation from entering the building. It has a base designed to fit over a roof or wall opening, usually by means of a roof curb.	''Power roof ventilator (PRV)'' or ''power wall ventilator (PWV)'' means a fan with an internal driver and a housing to prevent precipitation from entering the building. It has a base designed to fit over a roof or wall opening, usually by means of a roof curb.

* The inclusion of ''scroll-shaped'' in this definition excludes inline fans.
** Radial fans are housed and therefore not included in this definition.

In the July 2022 NOPR, DOE proposed to utilize the terminology and definitions specified in AMCA 214–21 to define the categories of fans and blowers proposed in the scope of applicability of the test procedure and tested using AMCA 210–16 as follows: (1) axial inline fan; (2) centrifugal housed fan; (3) centrifugal unhoused fan; (4) centrifugal inline fan; (5) radial-housed fan; and (6) PRVs. DOE proposed to modify the definition of ''axial panel fan'' as provided in AMCA 214–21 to distinguish these fans from air circulating axial panel fans, as follows: an axial panel fan is an axial fan, without cylindrical housing, that includes a panel, orifice plate, or ring with brackets for mounting through a wall, ceiling, or other structure that separates the fan's inlet from its outlet. 87 FR 44194, 44211–44212.

In the July 2022 NOPR, DOE noted that the CEC definitions are similar to the AMCA 214–21 definitions. DOE noted that the inclusion of additional language in the CEC definitions to indicate a fan's intended application or whether a fan's inlet or outlet is (optionally, as relevant) ducted was informative, but did not further distinguish the terms. In addition, for axial panel fans, DOE noted that the CEC definitions specified that the housing is typically mounted to a wall separating two spaces, and the fans are used to increase the pressure across this wall. DOE stated that the CEC description distinguishes axial panel fans from axial air circulating panel fans, which do not have provisions for connection to ducting or separation of the fan inlet from its outlet. However, DOE noted that the CEC distinction was based on how the fan was installed and not on a physical design feature of the fan. Therefore, DOE proposed to rely on physical features and to define axial panel fans instead. 87 FR 44194, 44211–44212.

[51] *See* Proposed regulatory language for Commercial and Industrial Fans and Blowers available in the following Docket: 22–AAER–01 at: *efiling.energy.ca.gov/Lists/DocketLog.aspx?docketnumber=22-AAER-01.*

In addition, to support the exclusions proposed in the July 2022 NOPR and clarify which fans would fall under the proposed exclusions, DOE proposed to adopt definitions of the terms ''induced flow fan'' and ''jet fan'' as established in AMCA 214–21 and ''cross-flow fan'' as defined in AMCA 208–18. *Id.* at 87 FR 44212.

In response to the July 2022 NOPR, New York Blower commented that the definitions in AMCA 214–21 are adequate. (New York Blower, No. 33 at p. 10) AMCA commented in support of the DOE-proposed definitions of axial inline fan, centrifugal housed fan, centrifugal unhoused fan, centrifugal inline fan, radial-housed fan, and power roof ventilator, which are consistent with definitions found in AMCA 214–21. However, AMCA noted that there would be additional alignment with the CEC's resultant definitions for the Title 20 fan regulation if DOE were to add, ''inlets and outlets can optionally be ducted'' to the definitions of axial inline fan, centrifugal housed fan, and centrifugal inline fan. In addition, AMCA commented in support of the DOE-proposed definitions of induced flow fan, jet fan, and cross-flow fan, as they are consistent with definitions found in AMCA 214–21 and AMCA 208–18. (AMCA, No. 41 at p.9)

As noted previously, DOE did not include the additional language for the CEC definitions as DOE notes that although it provides additional description of optional features of the equipment, or of the equipment installation configuration, the additional language does not describe the equipment's unique physical characteristics and therefore does not further distinguish the definitions. Therefore, DOE adopts the definitions of (1) axial inline fan; (2) centrifugal housed fan; (3) centrifugal unhoused fan; (4) centrifugal inline fan; (5) radial-housed fan; (6) PRVs; (7) induced flow fan; (7) jet fan; and (8) cross-flow fan as proposed.

AMCA noted that DOE may want to consider revising the definition of axial panel fan to state, ''without cylindrical or box housing,'' as in the definition of air circulating axial panel fan. (AMCA, No. 41 at p. 9)

DOE agrees with AMCA that adding ''or box housing'' would align the definitions of axial panel fan and air circulating axial panel fan. However, DOE notes that this is not specified in the AMCA 214–21 definitions and unlike for air circulating fans heads where AMCA 230–23 includes a separate definition of box fans and distinguishes these fans from air circulating axial panel fan, AMCA 214–21 does not distinguish box fans using a separate definition. DOE retains the proposed definition to continue to align with AMCA 214–21.

2. Safety Fans

In the July 2022 NOPR, DOE proposed a definition of safety fan to support the exclusion of safety fans from the scope of the test procedure, as discussed in section III.B.2 of this document. 87 FR 44194, 44213.

In the July 2022 NOPR, DOE reviewed the following definition of safety fan as proposed by the CEC: (1) a fan that is designed and marketed to operate only at or above 482 degrees Fahrenheit (250 degrees Celsius); (2) a reversible axial fan in cylindrical housing that is designed and marketed for use in ducted tunnel ventilation that will reverse operations under emergency ventilation conditions; (3) a fan bearing an Underwriter Laboratories (UL) or Electric Testing Laboratories listing for ''Power Ventilators for Smoke Control Systems''; (4) an open discharge exhaust fan with integral discharge nozzles which develop or maintain a minimum discharge velocity of 3,000 feet per minute (''fpm''); (5) a fan constructed in accordance with AMCA type A or B spark resistant construction as defined in ANSI/AMCA Standard 99–16 Standards Handbook; (6) a fan designed and marketed for use in explosive atmospheres and tested and marked according to EN 13463–1:2001 Non-electrical Equipment for Potentially Explosive Atmospheres; or (7) an electric-motor-driven Positive Pressure Ventilator as defined in ANSI/AMCA Standard 240–15 Laboratory Methods of Testing Positive Pressure Ventilators for Aerodynamic Performance Rating.[52] In the July 2022 NOPR, based on a review of the existing industry and regulatory definitions of ''safety fan,'' DOE tentatively determined that the definition proposed by the CEC (at the time) was representative of the equipment considered ''safety fans.'' 87 FR 44194, 44214.

In the July 2022 NOPR, DOE proposed to adopt a definition in line with the definition proposed by the CEC with the following edits. Regarding item (1) of the CEC definition: DOE proposed not to include the term ''only'' from ''a fan that is designed and marketed to operate only at or above 482 degrees Fahrenheit (250 degrees Celsius)'' because DOE tentatively determined that a fan that can operate at or above a certain temperature can also operate below. Regarding item (4) DOE tentatively determined that the definition of safety fans is equivalent to ''laboratory exhaust fans'' as defined in section 3.52 of AMCA 214–21: fans designed and marketed specifically for exhausting contaminated air vertically away from a building using a high-velocity discharge. DOE noted it was considering replacing item (4) with ''laboratory exhaust fans'' and to define it in accordance with AMCA 214–21. DOE also reviewed item (6) and noted that the referenced industry standard is no longer current and has been replaced. In 2008, the International Electrotechnical Commission System for Certification to Standards Relating to Equipment for Use in Explosive Atmospheres replaced EN 13463–1 by ISO 80079–36, ''Explosive atmospheres—Part 36: Non-electrical equipment for explosive atmospheres—Basic method and requirements.'' [53] The latest version of ISO 80079–36 is the 2016 edition. Therefore, DOE proposed to reference ISO 80079–36:2016, instead of EN 13463–1:2001. *Id.*

In response to the July 2022 NOPR, the CEC recommended that DOE incorporate the following definition of safety fan: safety fan means (1) a reversible axial fan in cylindrical housing that is designed and marketed for use in ducted tunnel ventilation that will reverse operations under an emergency ventilation condition; (2) a fan for use in explosive atmospheres tested and marked according to EN ISO Standards 80079–36:2016, Explosive atmospheres—Part 36: Non-electrical equipment for explosive atmospheres—Basic method and requirements; (3) a Positive Pressure Ventilator; or (4) a fan bearing a listing for ''Power Ventilators for Smoke Control Systems'' in compliance with ANSI/UL 705 Power Ventilators (dated August 23, 2021). Specifically, the CEC recommended removing fans that are designed and marketed to operate only at or above 482 degrees Fahrenheit (250 degrees Celsius) from the safety fan definition and instead listed together with the exclusions as proposed in Table III–8 of the July 2022 NOPR. The CEC commented that fans that are designed and marketed to operate only at or above 482 degrees Fahrenheit (250 degrees Celsius) can be designed for uses other than safety and are subject to different performance requirements, for example fans used for industrial processes that require operation at higher temperatures. The CEC also

[52] *See* CEC Docket No. 22–AAER–01, TN #241950, Proposed regulatory language for Commercial and Industrial Fans and Blowers, at pp. 7–8.

[53] *See www.intertek.com/blog/2019-03-14-hazloc/*.

recommended that laboratory exhaust fans not be included in the definition for safety fan, nor be included as a separate exclusion from the proposed scope of applicability of the test procedure. The CEC noted that although laboratory exhaust fans exhaust possible dangerous gasses, the fans are used for routine non-emergency lab procedures and are fully capable of achieving efficient operation without compromising the purpose for which they are installed. (CEC, No. 30 at pp. 2–3)

In response to the July 2022 NOPR, AMCA provided a comparison of the CEC safety fan definition as provided in the Title 20 express terms, noting elements that differed or were consistent with the proposed safety fan definition. AMCA commented that in Title 20 express terms,[54] the CEC removed the high-temperature section from the safety fan definition and inserted it in the list of fan-type exemptions instead. AMCA added that the rationale for this is that high-temperature fans are not always safety-related; they also are specified for commercial-kitchen exhaust and other demanding applications. (AMCA, No. 41 at p. 6, 12) AMCA recommended that DOE move item (1) of the DOE proposed safety fan definition to the list of explicit exemptions. Regarding item (4) of the DOE proposed definition, AMCA noted that it submitted comments to the CEC recommending that the CEC should seek to clean up some of the language because AMCA felt that the 3,000-fpm criterion could provide a loophole for fans that provide 3,000 fpm but are not used for safety purposes and was intended to describe a ''laboratory exhaust fan'' without naming it. AMCA commented that the 3,000-fpm discharge velocity with integral discharge nozzles appears to reference similar verbiage in ANSI/AIHA Z9.5, Laboratory Ventilation, and recommended exhaust velocities for safely exhausting contaminants without re-entrainment and added that laboratory exhaust fans would be considered safety fans regardless of exhaust velocity for the simple fact they service laboratories requiring numerous safety protocols for the protection of occupants and the surrounding area. For this reason, AMCA noted that in its comment to the CEC, AMCA commented that the CEC proposed regulatory language and supporting information indicated laboratory exhaust fans should be excluded and proposed using the term ''laboratory exhaust fan.'' AMCA recommended that the CEC add the ANSI/AMCA Standard 214–21 definition for safety fans: ''Laboratory exhaust fan means a fan designed and marketed specifically for exhausting contaminated air vertically away from a building using a high-velocity discharge.'' AMCA commented that rather than agree to AMCA's attempt to remove perceived loopholes from the proposed exemption, CEC removed the exemption altogether. AMCA commented that it would prefer to have this exemption remain in the DOE test procedure. In addition, AMCA recommended the removal of item (5) of the DOE proposed definition of safety fan. As AMCA commented to CEC, while AMCA recognizes the spark-resistant-construction types defined in ANSI/AMCA Standard 99–16, Standards Handbook, the definitions are not consistent with industry standards, and exempting spark resistant fans also is somewhat of a loophole in that a fan should be able to be designed to different types of spark-resistant construction with no impact on performance. For these reasons, AMCA recommended striking this item, and, if there were no other uses of AMCA 99, striking the citation of ANSI/AMCA Standard 99–16 in the referenced-documents portion of this NOPR. (AMCA, No. 41 at p. 12)

New York Blower stated support for the safety fan definition proposed by AMCA. (New York Blower, No. 33 at p. 10)

Robinson requested clarification regarding why AMCA Class C spark resistant construction was not included. (Robinson, No. 43 at p. 6)

Regarding fans designed and marketed to operate only at or above 482 degrees Fahrenheit (250 degrees Celsius), DOE's research confirms CEC's comment that some fans designed and marketed to operate only at or above 482 degrees Fahrenheit (250 degrees Celsius) can be designed for uses other than safety (*e.g.,* manufacturing). Therefore, in this final rule, DOE is removing this category from the definition of safety fans and listing these fans as a separate exclusion instead. In addition, DOE is adopting its proposal to remove the term ''only'' from ''a fan that is designed and marketed to operate only at or above 482 degrees Fahrenheit (250 degrees Celsius)'' because DOE has determined that a fan that can operate at or above a certain temperature can also operate below.

As discussed in the July 2022 NOPR, DOE tentatively determined that ''open discharge exhaust fans with integral discharge nozzles which develop or maintain a minimum discharge velocity of 3,000 FPM'' as listed in the CEC definition of safety fans are equivalent to ''laboratory exhaust fans'' as defined in section 3.52 of AMCA 214–21: fans designed and marketed specifically for exhausting contaminated air vertically away from a building using a high-velocity discharge. 87 FR 44194, 44214. Therefore, DOE is using the term ''laboratory exhaust fans'' and describes these fans in accordance with the AMCA 214–21 definition. In addition, DOE did not propose to include these fans in the scope of applicability of the test procedure and at this time. See 87 FR 44194, 44214. DOE is keeping these fans in the definition of safety fans, such that they are excluded from the scope of applicability. In addition, as noted in the NOPR, this would align with the recommended definition of safety fan provided in appendix D of the term sheet,[55] which includes fans designed for use in toxic, highly corrosive, or flammable environments [or in environments] with abrasive substances. 87 FR 44194, 44213 For these reasons, although DOE notes that such fans may be used for other in non-emergency situations, DOE is including laboratory exhaust fans as part of safety fans.

DOE reviewed the definition recommended by the CEC and notes that it no longer includes fans constructed in accordance with AMCA type A or B spark resistant construction as defined in the ANSI/AMCA Standard 99–16 Standards Handbook. In addition, as highlighted by CEC, DOE understands that such designations are no longer consistent with industry standards. DOE has determined that spark resistant fans used in explosive atmospheres are already included under fans tested and marked according to EN ISO Standards 80079–36:2016, Explosive atmospheres—Part 36: Non-electrical equipment for explosive atmospheres—Basic method and requirements. Therefore, DOE is removing this category from the definition of safety fans and is not incorporating AMCA 99–16 by reference.

In the July 2022 NOPR, DOE proposed to include fans bearing an Underwriter Laboratories (UL) or Electric Testing Laboratories listing for ''Power Ventilators for Smoke Control Systems'' in the definition of safety fans. 87 FR 44194, 44214. As previously noted, the CEC-recommended safety fan definition

[54] DOE notes that this refers to the CEC Express Terms for Commercial and Industrial Fans and Blowers document available at: *efiling.energy.ca.gov/GetDocument.aspx?tn=245898&DocumentContentId=80074*.

[55] The Working Group stated that the definition recommended in appendix D may be subject to potential edits necessary to accomplish the same intent.

further specifies referencing ANSI/UL 705 Power Ventilators (dated August 23, 2021). DOE has determined that this additional specification included in the CEC definition is necessary to identify fans included in this description. In addition, DOE notes that a more recent ANSI-approved version of ANSI/UL 705 Power Ventilators is available (dated August 19, 2022) and, therefore, DOE is adding this language into the safety fan definition and incorporating by reference the latest version of UL 705 available.

In summary, DOE defines safety fan as: (1) a reversible axial fan with cylindrical housing that is designed and marketed for use in ducted tunnel ventilation that will reverse operation under an emergency ventilation condition; (2) a fan for use in explosive atmospheres tested and marked according to EN ISO Standards 80079–36:2016, Explosive atmospheres—Part 36: Non-electrical equipment for explosive atmospheres—Basic method and requirements; (3) an electric-motor-driven Positive Pressure Ventilator as defined in ANSI/AMCA Standard 240–15, Laboratory Methods of Testing Positive Pressure Ventilators for Aerodynamic Performance Rating; (4) a fan bearing a listing for ''Power Ventilators for Smoke Control Systems'' in compliance with ANSI/UL 705 Power Ventilators (dated August 19, 2022); or (5) a laboratory exhaust fan designed and marketed specifically for exhausting contaminated air vertically away from a building using a high-velocity discharge.

3. Definitions Related To Heat Rejection Equipment

As stated in the July 2022 NOPR, DOE proposed to exclude from the scope of the test procedure fans and blowers embedded in heat rejection equipment, specifically fans and blowers embedded in packaged evaporative open circuit cooling towers; evaporative field-erected open circuit cooling towers; packaged evaporative closed-circuit cooling towers; evaporative field-erected closed-circuit cooling towers; packaged evaporative condensers; field-erected evaporative condensers; packaged air-cooled (dry) coolers; field-erected air-cooled (dry) coolers; air-cooled steam condensers; and hybrid (water saving) versions of such listed equipment that contain both evaporative and air-cooled heat exchange sections. In the July 2022 NOPR, DOE proposed to define each of these equipment types according to the recommendations of the Working Group. 87 FR 44194, 44217. DOE did not receive any comments on these definitions and adopts them as proposed.

4. Air Circulating Fans

In the July 2022 NOPR, DOE proposed definitions for air circulating fans and related terms using the definition being considered by the AMCA 230 committee at the time. DOE proposed to define air circulating fans as ''a fan that has no provision for connection to ducting or separation of the fan inlet from its outlet using a pressure boundary, operates against zero external static pressure loss, and is not a jet fan.'' 87 FR 44194, 44215. Further, DOE proposed to define an unhoused ACFH as follows: ''An air circulating fan without housing, having an axial impeller with a ratio of fan-blade span (in inches) to maximum rate of rotation (in revolutions per minute) less than or equal to 0.06. The impeller may or may not be guarded.'' DOE also proposed to define a housed ACFH as an air circulating fan with an axial or centrifugal impeller, and a housing. 87 FR 44194, 44216.

DOE further proposed definitions for the four categories of housed air circulating fans. DOE proposed to adopt the definitions of air circulating axial panel pan, box fan, cylindrical air circulating fan, and housed centrifugal air circulator as considered by the AMCA 230 committee, with the following clarifications: (1) replace ''air circulating fan'' considered by the AMCA 230 committee by ''housed air circulating fan head'' to explicitly indicate that each of these fans are housed ACFHs; (2) replace the term ''circulator'' as used by the AMCA 230 committee with ''circulating fan'' for consistency in terminology; and (3) remove the examples of additional terms used commonly by industry. *Id.*

In response to the July 2022 NOPR, AMCA commented that it submitted a comment on July 7, 2022, that included definitions of air circulating fans and related terms that were approved by the AMCA 230 committee, and that this submission was not included in the July 2022 NOPR. (AMCA, No. 41 at pp. 12–13) AMCA further commented that the AMCA 230 committee supported the proposal to use the categories defined in revisions under way for the AMCA 230 standard, namely housed ACFH, unhoused ACFH, and ceiling fans. (AMCA, No. 41 at p. 7)

Although AMCA submitted the comment prior to the publication date of the July 2022 NOPR, DOE notes that the comments were not received early enough to be incorporated at the time of drafting and were made on the pre-publication version of the NOPR, which is intended to provide stakeholders additional time to review and prepare comments (see discussion related to this comment in section III.A.).[56] However, DOE reviewed the definitions included in the additional comments provided by AMCA (AMCA, No. 13 at pp. 6–9) and these match the definitions considered by the AMCA 230 committee as discussed in the July 2022 NOPR. In addition, these definitions align with those published in AMCA 230–23. DOE therefore concludes that the proposed definitions align with the latest definitions published in AMCA 230–23 and adopts the definitions of air circulating fans and related terms as proposed.

5. Outlet Area

In the July 2022 NOPR, DOE noted that section 5.5.4 of AMCA 230–15 (with errata) defined the discharge area of an air circulating fan as the area of a circle having a diameter equal to the blade tip diameter. DOE noted that this definition was only applicable to unhoused ACFHs as the discharge area of a housed ACFH is determined based on the surface area at the exit of the housing and is not based on the fan blade tip diameter. DOE proposed a definition for fan outlet area specific to air circulating fans as (*i.e.,* ''air circulating fan outlet area''): (1) for unhoused ACFHs, the area of a circle having a diameter equal to the blade tip diameter; (2) for housed ACFHs, the inside area perpendicular to the airstream, measured at the plane of the opening through which the air exits the fan. In the July 2022 NOPR, DOE further noted that the AMCA 230 committee is considering revising the definition of discharge area to include housed ACFHs, and to replace the term ''discharge area'' by ''fan outlet area,'' which is a more commonly used term. 87 FR 44194, 44217.

Generally, DOE further specified that for all definitions related to air circulating fans, DOE was aware that the revisions being considered by the AMCA 230 committee are subject to change and could further be revised in the next version of AMCA 230. DOE added that should the revised version of AMCA 230 publish prior to the publication of any DOE test procedure final rule, DOE intended, after considering stakeholder feedback received in response to the proposals in the July 2022 NOPR, to revise the definitions in line with the latest AMCA 230 standard, provided the updates in

[56] The comment was submitted on July 6, 2022. See *www.regulations.gov/comment/EERE-2021-BT-TP-0021-0013* and the October 2021 RFI comment period ended on November 15, 2022, as discussed in section I.B of this document.

this standard are consistent with the definitions DOE proposed in the July 2022 NOPR or the updates are related to topics that DOE has discussed and for which DOE has solicited comments in the July 2022 NOPR. *Id.*

AMCA commented that it agreed with DOE's use of outlet area for air circulating fans where the outlet area is smaller than the discharge area, as this solves one potential issue with the discharge-area definition in AMCA 230–15. However, AMCA stated that DOE's proposed use of air circulating-fan outlet area creates an issue with historical test data. AMCA commented that the Bioenvironmental and Structural System (BESS) Laboratory's historical performance data for air circulating-panel, box, and tube fans is based on area determined using impeller diameter (not the cross-sectional outlet area of the housing). As the BESS Lab data is the largest set of publicly available, third-party air circulating-fan performance data, it is likely DOE based much of its analysis on this historical performance data. For all potential future users of the data, the AMCA 230 technical committee proposes the following definitions, which will be included in the upcoming edition of AMCA 230: (1) discharge area: area of a circle having a diameter equal to the blade tip diameter; and (2) fan outlet area: the gross inside area measured at the plane of the outlet opening. In addition, AMCA commented that the revised AMCA 230 would specify that the airflow rate and efficiency calculations for unhoused air circulating fan heads must use the discharge area, while airflow rate and efficiency calculations for housed air circulating fan heads must use the lesser of the values for fan outlet area and discharge area. (AMCA, No. 41 at pp. 13–14)

DOE reviewed the definitions of discharge area and fan outlet area provided by AMCA and concluded that the AMCA definition of discharge area aligns with the proposed definition of outlet area for unhoused air circulating fans and that the definition of fan outlet area aligns with the proposed definition of outlet area for housed air circulating fans. To align with industry terminology, DOE distinguishes between fan discharge area and fan outlet area as characterized by AMCA. DOE notes that the distinction is not based on the presence or absence of housing, but rather in the physical area considered. In addition, to further distinguish between housed and unhoused air circulating fans, DOE is adopting the additional instructions in section 8.4 of AMCA 230–23 to specify that the airflow rate and efficiency calculations for unhoused air circulating fan heads must use the discharge area while airflow rate and efficiency calculations for housed air circulating fan heads must use the lesser of the values for fan outlet area and discharge area. DOE has determined that including this distinction as part of the test instructions, rather than in the definitions ensures alignment with industry terminology and reflects current testing practices.

For fans and blowers other than air circulating fans, in the July 2022 NOPR, DOE noted that Annex H of AMCA 210–16 includes requirements for determining where the fan outlet area is measured for different fan categories and references AMCA 99–16, which includes further diagrams to aid in the determination of the outlet area. DOE tentatively determined that for fans and blowers other than air circulating fans, the current definition in AMCA 214–21 and the existing requirements in Annex H of AMCA 210–16 were sufficient to determine the outlet area and did not propose any edits. 87 FR 44194, 44217.

Robinson commented that the definition of outlet area provided by AMCA 99–16 is the industry standard and that the only time this is potentially questioned was when there is more than one outlet plane. Otherwise, Robinson commented that it did not see an issue with the definition of fan outlet and fan outlet area. (Robinson, No. 43 at p. 7) In this final rule, DOE makes no changes to how the fan outlet area is determined for fans and blowers other than air circulating fans, based on Annex H of AMCA 210–16, which references AMCA 99–16. Robinson noted a potential improvement of the definition may be needed in the case when there is more than one outlet plane. However, Robinson did not provide additional details and at this time, DOE is not changing how the fan outlet area is determined for fans and blowers other than air circulating fans.

6. Air Curtains

In the July 2022 NOPR, DOE proposed to exclude fans and blowers embedded in air curtains and noted that the CEC defined an air curtain unit as equipment providing a directionally controlled stream of air moving across the entire height and width of an opening that reduces the infiltration or transfer of air from one side of the opening to the other and/or inhibits the passage of insects, dust, or debris. However, DOE did not propose a definition for this equipment. 87 FR 44194, 44207–44208 at fn. 25.

The CEC recommends defining ''air curtain unit'' as follows: Air curtain unit means equipment that produces a directionally controlled stream of air with a minimum width-to-depth aspect ratio of 5:1 and a discharge that is not intended to be connected to unitary ductwork. The controlled stream of air is designed to span the height and width of an opening and reduce the infiltration or transfer of air from one side of the opening to the other and/or inhibit the passage of insects, dust, or debris. (CEC, No. 30 at p. 2)

DOE did not propose a definition for air curtain. As noted in the July 2022 NOPR, air curtains are used in entrances to buildings or openings between two spaces conditioned at different temperatures. Air curtains include fans packaged with a motor, filter, outlet section (a nozzle, discharge grille, etc.), and in some cases a mounting plate, and/or an electric heater or water heater. 87 FR 44194, 44207. DOE did not find any ambiguity in identifying this equipment and as such, is not adopting a definition of air curtain at this time.

7. Basic Model

The basic model concept allows manufacturers to group like models for the purpose of making representations of energy efficiency and/or energy use, including for the purpose of demonstrating compliance with DOE's energy conservation standards to the extent DOE has established such standards. The concept of basic model may allow manufacturers to reduce the amount of testing they must do to rate the energy use or efficiency of their products. DOE's current regulations provide equipment-specific basic model definitions, which typically state that models within the same basic model group have ''essentially identical'' energy or water use characteristics; as well as a general definition that provides (with some exceptions noted in the regulatory text) that a basic model means ''all units of a given type of product (or class thereof) manufactured by one manufacturer, having the same primary energy source, and which have essentially identical electrical, physical, and functional characteristics that affect energy consumption, energy efficiency, water consumption, or water efficiency.'' *See for example* 10 CFR 430.2; 431.62, 431.152, 431.192, 431.202, 431.222, and 431.292.

In the July 2022 NOPR, DOE proposed a definition of a basic model specific to fans as follows: ''all units of fans and blowers manufactured by one manufacturer, having the same primary energy source, and having essentially identical electrical, physical, and

functional (*e.g.,* aerodynamic) characteristics that affect energy consumption. In addition: (1) all variations of blade pitches of an adjustable-pitch axial fan may be considered a single basic model; and (2) all variations of impeller widths and impeller diameters of a given full-width impeller and full-diameter impeller centrifugal fan may be considered a single basic model.'' DOE further proposed to define ''full-width impeller'' and ''full-diameter impeller'' as ''the maximum impeller width and the maximum impeller diameter with which a given fan basic model is distributed in commerce.'' 87 FR 44194, 44213.

In general, Morrison commented that the definition of a basic model is acceptable but noted the considerable number of basic models—in the thousands in many categories. (Morrison, No. 42 at p. 4) In general, AMCA stated acceptance of the definition of a basic model, but noted there will be a very large number of basic models being registered in the CCMS. AMCA provided an example of one axial-fan product line, for which 60 basic models resulted from the variety of blade spans, hub diameters, blade counts, and blade pitches. (AMCA, No. 41 at pp. 9–10)

NEEA commented that in the definition of a basic model, DOE assumes that a fan experiences similar impeller trimming to a pump. NEEA commented that in practice, however, fans are rarely if ever trimmed from the full-impeller diameter so identifying this feature is not necessary. NEEA noted that by contrast, features like hub diameter are specific to fans, but do not exist in pumps and DOE should consider them in defining a basic model for fans. (NEEA, No. 36 at p. 6)

Fan and blower manufacturers may offer for sale the same bare shaft fan assembled, packaged, or integrated with different motor, transmission, and control combinations. Based on DOE's proposed basic model definition, the same bare shaft fan, sold with different combinations of motor, transmission, and controls (or as a bare shaft fan) could be grouped under the same basic model. In addition, fan manufacturers would be able to elect to group similar individual fan models within the same basic model under the same ratings to reduce testing burden, provided that all representations regarding the energy use of fans within that basic model are identical and based on the most consumptive unit. *See* 76 FR 12422, 12428–12429 (March 7, 2011).[57] Manufacturers would have the option to certify separate ratings for each combination of bare shaft fan, motor, transmission, and/or control in order to make separate representations of the performance of each specific combination. In view of the substantial number of fans that could be subject to an individual certification requirement for each basic model, DOE notes that the proposed definition of basic model would allow variations of blade pitches of an adjustable-pitch axial fan to be considered a single basic model.

Additionally, DOE proposed that all variations of a given full-size impeller width and full-size impeller diameter may be considered to be part of a single basic model represented by the fan with the full-size impeller width and full-size diameter. 87 FR 44194, 44213. In the July 2022 NOPR, DOE did not propose to group fans with varying hub diameters and is not opting to add this in the definition of basic model at this time and adopts the definition of basic model as proposed in the July 2022 NOPR. See *id.* Further, DOE notes that in comments submitted to the CEC docket, several stakeholders [58] have expressed interest in grouping fans of variations of the same impeller into the same basic model and continues to believe that identifying the variations of impeller in the basic model definition is useful.

The CA IOUs requested that DOE adjust its definition of ''basic model'' to refer to the nominal diameter and width of impellers in place of ''full-width'' and ''full-diameter'' impeller since custom impellers may be adjusted to be larger or smaller than the nominal size. The CA IOUs explained that unlike pumps, fabricated fan impellers have adjustable widths and diameters that can increase or decrease and manufacturers typically make these adjustments to attain precise airflow and pressure at synchronous speed of an induction motor. (CA IOUs, No. 37 at pp. 9–10)

As previously stated, DOE proposed to define ''full-width impeller'' and ''full-diameter impeller'' as ''the maximum impeller width and the maximum impeller diameter with which a given fan basic model is distributed in commerce.'' As such, the impeller would only be adjusted to a smaller size as the larger size would then meet the definition of the full-impeller. Therefore, DOE is not adopting the term ''nominal.''

New York Blower commented that the proposed definition of a basic model for fans, which distinguishes on the basis of energy consumption, contributes to the volume of testing required. Specifically, New York Blower commented that not being able to group a fan series of different sizes and geometric similarity (*i.e.,* ''fan product line'') results in at least each size having to be considered a basic model. New York Blower added that ideally a single size fan or a subset of all the sizes offered to the market could be used to certify an entire fan series. New York Blower commented that this would result in a significant reduction in clerical and administrative activity to report ratings to the DOE to support offering products in the market. New York Blower added that such an approach was used in the Californian Commercial Fans and Blower rulemaking where the ratings of sizes within a product were distinguished as either a tested model or a calculated model. (New York Blower, No. 33 at pp. 5, 10)

New York Blower added that recertifying fans annually that are unlikely to change for years creates an overhead burden to keeping the product on the market, even if a sparse quantity of units are sold into the market. Specifically, New York Blower noted that the fan market, and in particular the industrial fan market, is a build-on-demand market. While there may be some designs that sell a large quantity of units, New York Blower commented that it is more likely that many distinct and different units across the broad spectrum of products and sizes available will be sold and manufactured to the wide variety of customer demands. New York Blower stated that placing an administrative burden and consequent cost on a multitude of products that are rarely sold but needed, valued, and installed efficiently in systems when they are required, created no value to the consumer and provided no energy savings considering the units are infrequently sold. Therefore, New York Blower commented that it would be administratively expedient to be able to reference certification of geometrically similar products to a reference, tested

[57] These provisions would allow manufacturers to group individual models with essentially identical, but not exactly the same, energy performance characteristics into a basic model to reduce testing burden. Under DOE's certification requirements, all the individual models within a basic model identified in a certification report as being the same basic model must have the same certified efficiency rating and use the same test data underlying the certified rating. The March 7, 2011, Final Rule also established that the efficiency rating of a basic model must be based on the least efficient or most energy consuming individual model *(i.e.,* all individual models within a basic model must be at least as energy efficient as the certified rating). 76 FR 12422, 12428–12429.

[58] AMCA and Joint Advocates (ASAP, NEEA, NRDC, ACEEE, and CA IOUs), Comments to the CEC Draft Staff Report, *efiling.energy.ca.gov/GetDocument.aspx?tn=224829* (p.9).)).

fan—similar to the CRP–8 [Certified Rating Program] form and process incorporated in the AMCA CRP program.[59] New York Blower added that an example would be for all sizes of a product line larger than 40 inches in diameter to reference, and be certified by, the 40-inch test results without an AEDM or administrative burden. (New York Blower, No. 33 at p. 10)

Robinson commented that the definition of basic model needs further explanation from the perspective of an industrial process custom fan manufacturer, and that the idea of a basic model makes sense for manufacturers of a standard product line. Robinson commented that it manufactures a number of fan designs that are modified to suit the needs of a customer's specific requirements. In other words, Robinson stated, a given design could operate anywhere between 1 and 150 hp and well beyond with varying efficiency (FEI). Robinson commented that the example provided on page 73 of the NOPR states, ''if a manufacturer offers the same fan model in the following full-impeller sizes: 60, 70, 80 and 90 inches, each full-impeller size would constitute a separate basic model. However, a fan with an impeller trimmed to 69 inches could be grouped with the same 70-inch untrimmed fan.'' Robinson commented that without an AEDM, this sounded like a custom fan manufacturer would have to more or less test everything that falls within the limitations as Robinson does not have catalog equipment. (Robinson, No. 43 at p. 6)

DOE notes that different-size fans would not operate at the same duty points and do not have essentially identical electrical, physical, and functional characteristics that affect energy consumption and energy efficiency. Therefore, an approach as described by New York Blower, where a manufacturer would only certify a subset of sizes within a product line, is not feasible. DOE notes that however, a manufacturer could test a subset of sizes within a product line and apply the fan laws as allowed in Annex E of AMCA 214–21 in order to calculate the performance data of all fans in the same product line without the application of an AEDM, thereby reducing manufacturer burden. With regard to custom fans for which a single made-to-order fan is manufactured, general sampling requirements for all covered equipment at 10 CFR 429.11(b), and § 429.11(b)(2) provides provisions for sampling when only one unit of a basic model is produced.[60] In accordance with these provisions, a single made-to-order product must be tested to ensure it complies with the standard. To reduce testing burden, DOE is adopting AEDM provisions that would allow certification of a made-to-order product in lieu of testing. (See section III.I of this document.) Certification would be based on the test results of the one unit, or AEDM ratings for the model. In addition, DOE notes that this test procedure would not result in any certification requirements.

D. Industry Standards

DOE's established practice is to adopt industry standards as DOE test procedures, unless such methodology would be unduly burdensome to conduct or would not produce test results that reflect the energy efficiency, energy use, water use (as specified in EPCA), or estimated operating costs of that product during a representative average use cycle. 10 CFR 431.4; 10 CFR part 430, subpart C, appendix A, section 8(c).

The Working Group recommended that the test procedure for fans and blowers other than air circulating fans:

(1) For standalone (non-embedded) fans, be based on a physical test performed in accordance with the latest version of AMCA 210 (*i.e.,* available at the time of publication of any test procedure final rule) [61] (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #7 at p. 5);

(2) Establish methods to determine the ''FEP'' either by: the direct measurement of the electrical input power to the fan, or by the measurement of the mechanical input power to the fan (*i.e.,* a fan shaft power test, which captures the performance of the bare shaft fan) [62] and by applying default values (*i.e.,* calculation algorithms) to reflect the additional motor, transmission, or motor controller energy use (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #9 at pp. 5–6); and

(3) Allow the use of equations (''fan laws'') to determine the performance of a bare shaft fan at a non-tested speed, based on the results of a test conducted at a different speed (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #17 at p. 10).

The Working Group also recommended specific test set-up and minimal testable configurations to use for each fan category.[63] (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #7 at p. 5)

The Working Group further made recommendations on calculation algorithms and reference values to use to represent the motor, transmission, and motor controller energy efficiency when testing a fan based on a fan shaft power test. (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendations #10 through #15 at pp. 6–9) Additionally, the Working Group recommended that embedded fans be tested in a standalone fan configuration (*i.e.,* outside of the piece of equipment in which they are embedded). Because some components of embedded fans may not be removable without causing irreversible damage to the equipment, the Working Group recommended non-impeller components of the fan that are geometrically similar to the ones used by the fan as embedded in the larger piece of equipment be used to complete the fan testable configuration. (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #8 at pp. 5–6) The Working Group also recommended calculating FEP as the ratio of the electrical input power of a reference fan (in this case, a fan that is exactly compliant with any future fan energy conservation standards) to the electrical input power of the actual fan for which the FEP is calculated, both established at the same duty point.[64] In addition, the Working Group recommended using either static or total pressure [65] to characterize the duty point of a fan and to calculate the associated reference FEP, depending on the fan category and the test set-up used.[66] (Docket No.

[59] DOE notes that this form is available at *www.amca.org/assets/crpdocument/CRP_8.pdf.*

[60] Section 429.11(b)(2) specifies that if only one unit of the basic model is produced, that unit must be tested and the test results must demonstrate that the basic model performs at or better than the applicable standard(s). If one or more units of the basic model are manufactured subsequently, compliance with the default sampling and representations provisions is required.

[61] Currently the latest version of AMCA 210 is AMCA 210–16.

[62] A bare-shaft fan is a fan without a motor or any other drive.

[63] AMCA 214–21 references AMCA 210–2016 as the physical test method to use for fans and blowers (except ACFHs). AMCA 210–16 describes four fan test set-ups (or ''installation categories'') designated by a letter, depending on the ducting at the inlet and outlet of the fan. ''A'': free inlet, free outlet; ''B'': free inlet, ducted outlet; ''C'': ducted inlet, free outlet; and ''D'': ducted inlet, ducted outlet.

[64] A duty point is characterized by a given airflow and pressure and has a corresponding operating speed.

[65] Fan total pressure is the air pressure that exists by virtue of the state of the air and the rate of motion of the air. It is the sum of velocity pressure and static pressure at a point. If air is at rest, its total pressure will equal the static pressure.

[66] Depending on the fan category, the fan performance is represented using a test set-up with a ducted outlet (*i.e.,* using total pressure) or a free outlet (*i.e.,* using static pressure) to reflect typical usage conditions. Fans with ducts attached to the fan's outlet are typically selected based on their performance at a given airflow and total pressure,

EERE–2013–BT–STD–0006, No. 179, Recommendations #18 and #19 at pp. 10–11) Finally, the Working Group recommended equations and default values to use when calculating the reference FEP of a fan at a given duty point. (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendations #18 through #21 at pp. 10–12)

Since the publication of the term sheet, AMCA has revised and developed test standards consistent with the recommendations of the Working Group:

• In September 2016, AMCA published AMCA 210–16, which updated ANSI/AMCA 210–2007, ''Laboratory Methods of Testing Fans for Certified Aerodynamic Performance Rating,'' to include a wire-to-air test method, which captures the performance of any motor, transmission, or motor controller present in the fan, in addition to the performance of the bare shaft fan (*i.e.,* a measurement of the FEP in kW), in addition to the previously existing methods for conducting laboratory tests to determine fan shaft power in hp, airflow in cubic feet per minute (''CFM''), pressure in in. wg, and at a given speed of rotation in ''RPM.''

• In April 2017, AMCA published ANSI/AMCA Standard 207–2017, ''Fan System Efficiency and Fan System Input Power.'' This publication provides calculation algorithms representing the performance of reference motors, transmissions, and motor controllers. These calculations can be directly applied to the results of a fan shaft power test in accordance with AMCA 210–16 to obtain the FEP of a fan at a given duty point.

• In January 2018, AMCA published ''AMCA 208–18.'' This publication defines FEI as the ratio of the electrical input power of a reference fan to the electrical input power of the actual fan for which FEI is calculated, both established at the same duty point. It provides equations to calculate the FEP of a fan as a function of airflow and pressure (either static or total depending on the fan category considered).

Building on these test standards, AMCA developed a new AMCA 214–21 test method, which was approved by ANSI on March 1, 2021. AMCA 214–21 combines provisions of AMCA 210–16, AMCA 207–17, and AMCA 208–18, as well as portions of AMCA 211–13 (R2018), ''Certified Ratings Program Product Rating Manual for Fan Air Performance'' (''AMCA 211–13'') into a single standard.[67] Consistent with the recommendations of the Working Group, AMCA 214–21 provides methods to establish the FEP either by: (1) the measurement of the electrical input power to the fan (*i.e.,* a ''wire-to-air'' test); or by (2) the measurement of the fan shaft power and the application of calculation algorithms to reflect additional motor, transmission, or control energy use. In each case, the fan power measurements are performed in accordance with AMCA 210–16 or ISO 5801:2017, which is referenced in AMCA 214–21 as an equivalent test procedure to AMCA 210–16. AMCA 214–21 also references laboratory test methods for additional categories of fans such as jet fans, circulating fans, and induced flow fans.[68] Specifically, AMCA 214–21 references AMCA 230–15[69] as the industry test procedure to follow when conducting performance measurements on air circulating fans. In addition, AMCA 214–21 adds specific test instructions to ensure test repeatability and reproducibility. Specifically, AMCA 214–21 defines a single set of test set-ups that must be used when conducting a test to ensure comparability of results (See Table III–9). Further, AMCA 214–21 specifies how to select the speed(s) and duty points at which to conduct the test, as well as which accessories to include in the test (See Table III–10).

TABLE III–9—AMCA 214–21 TEST CONFIGURATIONS

[Table 7.1 of AMCA 214–21]

Fan configuration	Test standard	Required		Optional	
		Test configuration *	FEI pressure basis **	Test configuration	FEI pressure basis
Centrifugal housed	AMCA 210–16	B or D	Total	A or C	Static.
Radial housed	AMCA 210–16	B or D	Total	A or C	Static.
Centrifugal inline	AMCA 210–16	B or D	Total	A or C	Static.
Centrifugal unhoused	AMCA 210–16	A	Static	N/A	N/A.
Centrifugal PRV exhaust	AMCA 210–16	A or C	Static	N/A	N/A.
Centrifugal PRV supply	AMCA 210–16	B	Total	A	Static.
Axial inline	AMCA 210–16	D	Total	C	Static.
Axial panel	AMCA 210–16	A	Static	N/A	N/A.
Axial PRV	AMCA 210–16	A or C	Static	N/A	N/A.
Circulating Fans	AMCA 230–15	E	Total	N/A	N/A.

* Each letter corresponds to a test set-up described in Section 7.1 of AMCA 214–21. A: free inlet, free outlet; B: free inlet, ducted outlet; C: ducted inlet, free outlet; D: ducted inlet, ducted outlet.

** This indicates that reference FEP used in the FEI calculation is established using either static or total pressure as indicated in this table and as determined by the required test configuration.

because both the static pressure and fan velocity pressure are available to overcome system resistance. However, fans with a free outlet are typically selected based on their performance at a given airflow and static pressure, because the velocity pressure cannot be used to overcome system resistance. The Working Group recommended using total pressure for some categories of fans (*i.e.,* axial cylindrical housed fans, centrifugal housed fans, inline and mixed flow fans, and radial housed fans) and static pressure for others (*i.e.,* panel fans, centrifugal unhoused fans, and PRVs).

[67] AMCA 211–13 provides instructions on how to apply fan laws and on how to perform a test when establishing an AMCA-certified rating. Some of these instructions were revised and integrated in AMCA 214.

[68] AMCA 230–15, AMCA 250–12, ''Laboratory Methods of Testing Jet Tunnel Fans for Performance,'' and AMCA 260–20, ''Laboratory Methods of Testing Induced Flow Fans for Rating,'' for testing circulating fans, jet fans, and laboratory exhaust fans with induced flow.

[69] AMCA 230–15 provides methods for conducting laboratory tests to determine the performance characteristics of circulating fans including the FEP in W, speed in RPM, pressure in inches of mercury, airflow in CFM, thrust in pound force (lbf), efficacy in CFM/W, and overall efficiency in lbf/W.

TABLE III–10—AMCA 214–21 TEST OPTIONS

Test description (section 6 of AMCA 214–21)	Driver configuration	Motor controller configuration	Transmission configuration	Test speed(s)	FEP determination method
Wire to air test at all speeds	Motor	With or without a motor controller.	With or without transmission	All speeds**	Section 6.1 of AMCA 214–21.
Wire to air test at selected speeds.	Motor	With or without a motor controller.	With or without transmission	At least two speeds.	Section 6.2 of AMCA 214–21.
Fan shaft power test for fans without a motor*.	None	With or without a motor controller.	Without transmission	At least one speed.	Section 6.3 of AMCA 214–21.
Fan shaft power test for fans with a regulated motor*.	Electric motors subject to standards at 10 CFR 431.25.	With a variable frequency drive in accordance with section 6.4.1.4 of AMCA 214–21 or without a motor controller.	Direct drive, V-belt drive, flexible coupling, or synchronous belt drive.	At least one speed.	Section 6.4 of AMCA 214–21.
Fan shaft power test and motor/motor and controls test*.	Motor	With or without a motor controller.	Direct drive, V-belt drive, flexible coupling, or synchronous belt drive.	At least one speed.	Section 6.5 of AMCA 214–21.

* With or without the use of interpolation or fan laws as provided in Annex E.
** All speeds for which FEP values are generated.

In the July 2022 NOPR, DOE proposed to incorporate by reference AMCA 214–21 as the prescribed test method for evaluating the energy use of fans and blowers, with modifications discussed in section III.E of this document. DOE also proposed to incorporate by reference AMCA 210–16, ISO 5801:2017, and AMCA 230–15 (with errata) (or latest version available at the time of the any final rule),[70] which are the physical test methods referenced in AMCA 214–21 for fans and blowers and air circulating fans. 87 FR 44194, 44121.

In response to the July 2022 NOPR, AMCA commented that AMCA 214–21 itemizes which method of physical testing applies adequately to which fan category and that these physical measurements are perfectly suitable for deriving each of the energy performance ratings considered by this rulemaking. AMCA commented that each of those methods provides for the relevant fan types their fan air performance and input power. AMCA added that AMCA 210 and ISO 5801 were the only appropriate test methods for fans that generate fan static pressure when applied as intended. AMCA added that AMCA 230 is the single appropriate test method for measuring the performance of air circulating fans that operate at zero fan static pressure with at least 125 W electrical input power and noted that air circulating fans below 125 W electrical power are in the scope of IEC 60879, ''Comfort fans and regulators for household and similar purposes.'' AMCA noted that too few AMCA members supply low-power air circulating fans and that AMCA was unable to provide more detailed comments. AMCA added that these industry standards measure input power (W) and that prediction of energy consumption (kWh) requires knowledge of operating hours and load, which are too diverse to develop an average use cycle representing the fan industry at large. AMCA noted that the energy-conservation metric that is being defined by DOE references FEI as defined in AMCA 214–21, and because FEI is calculated for a given duty point, energy consumption is inversely proportional to FEI during any use cycle. (AMCA, No. 41 at pp. 14–15)

AMCA further commented that AMCA 210 and AMCA 230 establish uniform test methods to ensure test procedure repeatability. AMCA added that requirements within the standards, such as maintaining instrument accuracy and calibration, contribute to attaining repeatability. Additionally, to help achieve reproducibility between accredited laboratories, AMCA's laboratory accreditation program requires that AMCA audit instrument calibration, compare air-performance test results from AMCA's laboratory against results obtained in the laboratory under review, and conduct independent readings of certain parameters during the test for verification of instrumentation accuracy. AMCA commented that AMCA 214 specifies calculations based on data from various relevant laboratory methods of test and that AMCA does not recommend any changes to these standards in regard to repeatability and reproducibility. In addition, AMCA noted that: (1) AMCA 210 and ISO 5801 are mature test methods that have been used globally for many years; and (2) thrust-testing per AMCA 230 is straightforward. In addition, AMCA already notes that thrust-testing also is used in the DOE test method for large diameter ceiling fans (LDCFs); and (3) as part of the AMCA Lab accreditation program, the same fan is tested at AMCA accredited labs and retested at the AMCA Lab with strict tolerance limits, similar to what is done in a round robin and AMC added it could provide test data from multiple labs for the same fan. (AMCA, No. 41 at pp. 15–16)

AMCA also noted that AMCA 210–16 will be heading into its ANSI-required review/update cycle later in 2022. AMCA expected this to be a revision cycle, not an affirmation, as affirmations only comprise editorial corrections. AMCA commented that this revision would take some time and recommended that DOE not consider the upcoming revision update to AMCA 210. AMCA commented that since the last revision, public comments have accumulated via AMCA's website; however, AMCA does not recommend any changes with regard to AMCA 214–21 and AMCA 210–16. (AMCA, No. 41 at p. 16)

AMCA also commented that AMCA 230 is nearing the completion of its ANSI-required review/update cycle. AMCA commented that it expects this revision to be completed in the near future. AMCA recommended that DOE reference the updated version of AMCA 230 and advised DOE that AMCA 230's revision is nearing completion with the draft out for committee ballot. AMCA stated it expected AMCA 230 to be published as an ANSI/AMCA standard in late 2022 or early 2023. (AMCA, No. 41 at pp. 16–17)

ebm-papst commented that AMCA 210, ISO 5801, and AMCA 230 (as applicable) provided representative measurements of fan power consumption, which were suitable for determining fan efficiency. ebm-papst recommended adopting AMCA 210–16, AMCA 214–21, and AMCA 230–15

[70] In the July 2022 NOPR, DOE noted that it was aware that AMCA 230–15 is currently undergoing periodic review and may be revised in the future. Should a new version become available at the time of any final rule, DOE would incorporate by reference the latest available version of AMCA 230.

without any changes. (ebm-papst, No. 31 at pp. 7–8)

New York Blower commented that AMCA 214–21 and the corresponding FEI metric reasonably estimated energy efficiency and functioned as a viable measure of changes in energy consumption reflected by differences in the FEI values. New York Blower commented that the representative average use issue had been a troubling one to settle due to the wide variety of applications of fans and an industrial application can easily be considered to be continuous operation at the specified operating conditions for 3,000 hours annually (New York Blower, No. 33 at p. 11)

Trane commented that DOE should reference and adopt AMCA 214–21 as its principal test procedure for commercial fans and blowers. (Trane, No. 38 at p. 2)

Greenheck commented that DOE should adopt the test procedures and standards in AMCA 210,[71] 211, and 214 in lieu of the proposed test procedures detailed in the July 2022 NOPR. Greenheck commented that the proposal by DOE differed from the above AMCA standards in ways that would create an extreme burden on the entire fan industry and result in little benefit to the consumer or a reduction in energy consumption. (Greenheck, No. 39 at pp. 1–2)

Morrison commented that the AMCA 210 and AMCA 214 test procedures captured the performance and energy consumption of fans in a clear manner for the relevant fans other than air circulating fans. (Morrison, No. 42 at p. 4) Morrison commented that AMCA 210 established uniform test methods to ensure test-procedure repeatability and that requirements within the standard, such as maintaining instrument accuracy and calibration, contributed to attaining repeatability. Morrison commented that it does not recommend any changes to these standards in regard to repeatability and reproducibility as AMCA 210 was a mature test method that had been used globally for many years. (*Id.* at p. 5)

As noted by stakeholders, AMCA 210–16, AMCA 214–21, and AMCA 230–23 are established test standards used by industry to establish the performance of fans and blower, including air circulating fans. In addition, as previously noted, AMCA 214–21, which references AMCA 210–16 provides test methods that are consistent with the recommendations of the Working Group for fans and blowers other than air circulating fans. Therefore, in this final rule, DOE incorporates by reference AMCA 210–16 and AMCA 214–21 as proposed in the July 2022 NOPR. In addition, as discussed in the July 2022 NOPR, DOE is replacing the reference to AMCA 230–15 (with errata) with AMCA 230–23.[72] DOE did not propose to incorporate AMCA 211–22, ''Certified Ratings Program Product Rating Manual for Fan Air Performance,'' because it does not specify a test method but rather certification and rating procedures, and thus DOE is not adding this standard. In addition, DOE is modifying certain sections of these industry standards as discussed in section III.E of this document.

In addition, due to the comments received on the proposed metric (*see* section III.G of this document) and the adoption of an efficacy metric in CFM/W rather than FEI for air circulating fans, DOE is only incorporating by reference AMCA 230–23 for air circulating fans instead of referencing both AMCA 230–15 (with errata) and AMCA 214–21 as proposed. As noted in the July 2022 NOPR, AMCA 214–21 references AMCA 210–16 and AMCA 230–15 (with errata) as the physical test method, and further provides provisions for calculating the FEI. 87 FR 44194, 44221. Because DOE is adopting an efficacy metric for air circulating fans and is not opting to determine the FEI of air circulating fans, DOE is no longer referencing AMCA 214–21 for air circulating fans.

As stated, in the July 2022 NOPR, AMCA 214–21 provides methods to establish the FEP of a fan based on fan power measurements which are performed in accordance with AMCA 210–16 or ISO 5801:2017, which is referenced in AMCA 214–21 as an equivalent test procedure to AMCA 210–16. 87 FR 44194, 44218–44219. DOE proposed incorporating by reference AMCA 214–21, which allows testing fans other than air circulating fans in accordance with either AMCA 210–16 or ISO 5801:2017 and DOE requested feedback on whether these test methods produce equivalent test results.[73] 87 FR 44194, 44221–44222.

AMCA commented that the test methods prescribed in ISO 5801 and AMCA 210 produce equivalent results when the appropriate test setup is used. AMCA commented that the technical content of AMCA 210 and ISO 5801 are in agreement. AMCA added that products in AMCA's Certified Ratings Program (CRP) are tested in accordance with both ISO 5801 and AMCA 210, and there is reproducibility between both of these test methods, as has been observed through the CRP over decades. AMCA added that one AMCA member conducted comparative testing in its own ISO 5801 lab (inlet chamber) and compared the results with an AMCA 210 test (inlet chamber/Figure 15) and also with AMCA's labs in Chicago and Malaysia and agreement was excellent between each of these labs. (AMCA, No. 41 at p. 15)

New York Blower commented that it relies on the ISO standard and review process to ensure the purpose of the two standards is to produce a similar result. In general, considering this is a U.S. domestic test procedure, New York Blower recommended the use of AMCA 214–21 as the governing document in the test procedure. (New York Blower, No. 33 at p. 11)

ebm-papst commented that it has conducted intercompany round-robin testing to compare AMCA 210 results with ISO 5801 results and concluded that testing fans by these two standards provides equivalent results. (ebm-papst, No. 31 at p. 8) Similarly, Morrison commented that testing conducted with the same setup in either of these standards produced functionally equivalent results. (Morrison, No. 42 at p. 5)

As noted by AMCA, New York Blower, ebm-papst, and Morrison, AMCA 210–16 and ISO 5801:2017 provide equivalent test results and DOE continues to incorporate by reference AMCA 214–21, which references both AMCA 210–16 and ISO 5801:2017 for testing fans and blowers other than air circulating fans.

In addition, in the July 2022 NOPR, DOE further noted that Section 6.3.1 of AMCA 214–21 provides specific equations to be used for bare shaft fans that can only accommodate a direct-drive transmission (*i.e.,* fans that are directly coupled to the drive) and DOE requested comment on the physical features that could be identified to differentiate bare shaft fans that can accommodate only a direct-drive transmission from other bare shaft fans. 87 FR 44194, 44219, 44222.

AMCA commented that AMCA 99–16, Section 9, can be referenced for common belt and direct-drive fan-drive

[71] DOE notes that Greenheck's comment lists AMCA 210, AMCA 211, and AMCA 214 on page 1 of its comments and seems to include a typo on page 2 where it lists AMCA 11, AMCA 211, and AMCA 214. (Greenheck, No. 39 at pp. 1–2)

[72] In the July 2022 NOPR, DOE noted that it is aware that AMCA 230–15 was undergoing periodic review and may be revised in the future. Should a new version become available at the time of any final rule, DOE would incorporate by reference the latest available version of AMCA 230. 87 FR 44194, 44221.

[73] The July 2022 NOPR included a typographical error in the request for comment on the equivalency of AMCA 210–16 and ISO 5801–2017, which listed AMCA 214–21 instead of AMCA 210–16.

arrangements, auxiliary bearings, shaft(s), and/or pulley(s) typically indicate a belt-drive arrangement. (AMCA, No. 41 at p. 17) Similarly, Morrison commented that common belt and direct-drive fan-drive arrangements could be found in AMCA 99–16. Additionally, the presence of auxiliary bearings, shaft(s), and/or pulley(s) typically indicated a belt-drive arrangement. (Morrison, No. 42 at p. 5)

New York Blower commented that it was possible to convert an arrangement 1 fan (belt drive) to an arrangement 8 fan (direct drive) merely by replacing the drive sheave with a coupling and an extended pedestal to support the motor. New York Blower added that, in reality, the shaft and bearings for the drive system would be redesigned to accommodate the different drive system, but to the casual observer, it would look identical. New York Blower noted that arrangement 4 fans have the impeller mounted directly to the motor and so, technically, it would not be a fan without the motor. In summary, New York Blower commented that it was unable to provide distinguishing physical features to assist in the distinction requested and did not see it conceivable to do so. (New York Blower, No. 33 at p. 12)

DOE concludes that the presence of auxiliary bearings, shaft(s), and/or pulley(s) would indicate a belt drive arrangement and would constitute physical features that would differentiate fans that can operate in a belt drive configuration from bare shaft fans that can only accommodate a direct-drive transmission. Therefore, DOE is not modifying the provisions in section 6.3.1 of AMCA 214–21 which provides specific equations to be used for bare shaft fans that can only accommodate a direct-drive transmission.

E. Adoption and Modification of the Industry Standards

As discussed in section III.D, DOE is adopting through reference certain provisions of AMCA 214–21 and AMCA 230–23 as the prescribed test method for measuring the energy use and energy efficiency of fans and blowers. In the July 2022 NOPR, specifically, for fans and blowers that are not air circulating fans, DOE proposed that testing be performed in accordance with AMCA 214–21, with the modifications discussed in the remainder of this section. For air circulating fans, DOE proposed that testing be performed in accordance with AMCA 230–15 with errata, with the modifications discussed in the rest of this section. 87 FR 44194, 44221–44222

For fans other than air circulating fans, the industry test procedure (AMCA 214–21) provides methods to calculate the FEI and FEP of a fan at each of its duty points based on: (1) the fan electrical input measured by a wire-to-air test; or (2) the fan shaft input power measured by a shaft-to-air test, and the application of calculation algorithms to represents the performance of the motor or motor and controller. The industry test procedure (AMCA 214–21) also provides methods to calculate the FEP or fan shaft input power at untested duty points, based on the performance of test duty points and interpolation methods, including the fan laws. For air circulating fans, the industry test procedure provides methods to calculate the efficacy in CFM/W of a fan at maximum speed based on the fan electrical input measured by a wire-to-air test. The following sections discuss key elements of the test procedure and modifications to AMCA 214–21 and AMCA 230–23.

Regarding AMCA 214–21, AMCA recommended that DOE adopt the speed and size interpolations standardized in AMCA 214–21. (AMCA, No. 41 at p. 16) Morrison recommended that DOE adopt the speed and size interpolations standardized in AMCA 214. Further, Morrison recommended no changes be made to AMCA 214–21 and AMCA 210–16. (Morrison, No. 42 at p. 5) New York Blower requested that fan laws be declared a universally accepted AEDM where no testing would be required to apply these laws to create ratings. (New York Blower, No. 33 at p. 24)

In regards to AMCA, Morrison, and New York Blowers comments, DOE references section 8.2.1 of AMCA 214–21, ''Fan laws and other calculation methods for shaft-to-air testing,'' and section 8.2.3 of AMCA 214–21, ''Calculation to other speeds and densities for wire-to-air testing,'' which allow speed and size interpolations as proposed in the July 2022 NOPR. (*See* 87 FR 44194, 44222.)

Robinson commented that the July 2022 NOPR stated that when applying fan laws, the results of a tested fan are used to calculate the fan shaft power of a non-tested fan at a higher speed or with a larger diameter than the fan tested. Robinson asked whether DOE suggested that compressible fan laws can only be applied to fans that are larger or faster than the tested fan. (Robinson, No. 43 at p. 7)

DOE notes the July 2022 proposed to apply the fan laws as described in section 8.2.1 of AMCA 214–21, ''Fan laws and other calculation methods for shaft-to-air testing,'' which relies on the calculation methods in Annex E of AMCA 214–21.87 FR 44194, 44223. Section E.1.1 specifies the requirements to apply the fan laws including the requirement that the fan must have a greater diameter than the tested fan, (*See* section E.1.1.3 of AMCA 214–21) and must have a fan tip speed that is greater than or equal to the tested fan tip speed.

Motor Efficiency Calculation

For bare shaft fans and fans with an electric motor subject to energy conservation standards at 10 CFR 431.25 (''polyphase regulated motor''), sections 6.3 and 6.4 of AMCA 214–21 specify testing these fans using a shaft-to-air test (*i.e.,* a test that does not include the motor performance). When conducting a shaft-to-air test, the mechanical fan shaft input power is measured and the FEP is then calculated by using a mathematical model to represent the performance of the motor (*i.e.,* its part-load efficiency). The FEP is then used to calculate the FEI of the fan.

AMCA 214–21 provides two different methods to estimate the part-load efficiency of a polyphase regulated motor. A single equation presented in section 5.3 and section 6.3.3 of AMCA 214 is used to calculate the FEP of the reference fan (''FEP_{ref}'') and the actual FEP of bare shaft fans (''FEP_{act}''), while a more complex model based on several equations described in section 6.4.2.3 of AMCA 214 is used to calculate the actual FEP of fans sold with polyphase regulated motors without a variable frequency drive (''VFD''). 87 FR 44194, 44222. DOE proposed to maintain the equation as provided in section 5.3 (which are identical to the equations provided in section 6.3.3 of AMCA 214–21) and in section 6.4.2.3 of AMCA 214–21 to estimate the part-load motor efficiency when calculating FEP_{ref}, FEP_{act} of bare shaft fans,[74] and the FEP_{act} of fans sold with electric motors regulated at 10 CFR 431.25 (and without VFDs). *Id.*

In the July 2022 NOPR, DOE requested comment on the equations provided in section 5.3 and section 6.4.2.3 of AMCA 214–21. Specifically, DOE requested comment on whether applying the method outlined in section 6.4 of AMCA 214–21 and the equations

[74] The NOPR did not explicitly specify ''of bare shaft fans'' in the preamble; however, the discussion did previously mention that the equation in Section 6.3.3 of AMCA 214–21 is identical to the equation in Section 5.3 of AMAC 214–21 and applicable to the calculation of FEP_{act} for bare shaft fans. *See* 87 FR 44194, 44222. In addition, the proposed regulatory text specified testing bare shaft fans per Section 6.3 of AMCA 214–21 (*See* Table 1 to Appendix A to tSubpart J of Part 431), which includes Section 6.3.3 of AMCA 214–21. *See* 87 FR 44194, 44257.

provided in section 6.4.2.3 of AMCA 214–21 could result in a higher value of FEI than the FEI resulting from a wire-to-air test in accordance with Section 6.1 of AMCA 214–21. *Id.*

AMCA supports DOE's proposal to maintain the equations as provided in sections 5.3 and 6.4.2.3 of AMCA 214–21 to estimate the part-load motor efficiency when calculating FEP_{ref}, FEP_{act}, and the FEP_{act} of fans sold with electric motors regulated at 10 CFR 431.25 (and without VFDs). AMCA commented that the method outlined in section 6.4 of AMCA 214–21 will result in slightly higher or slightly lower value of FEI than the one outlined in section 6.1. AMCA agrees with DOE that this difference is extremely small and not significant enough to justify deviating from the established industry test procedure. In addition, AMCA recommended to additionally reference Section 6.3 of AMCA 214–21 and add it to the list of acceptable methods for the case of a bare shaft fan. AMCA stated that because bare shaft fans eventually will be paired with motors compliant with current federal regulations, and DOE has concluded the impact on FEI is not significant, section 6.3 should be mentioned along with section 6.4. AMCA added that if a bare shaft fan is likely to be paired with a regulated motor, the method outlined in AMCA 211–21 Section 6.3 provides a convenient and accurate method of calculating FEI when the specific motor size and type is unknown. (AMCA, No. 41 at pp. 17–18)

Morrison stated its general agreement with AMCA's position that the entire AMCA 214–21 be adopted including use of sections 6.4.2.3 and 6.3 of AMCA 214–21. (Morrison, No. 42 at p. 5)

In the July 2022 NOPR, DOE proposed to rely on Section 6.3 and discusses the equation in section 6.3.3 of AMCA 214–21 for determining the FEP of bare shaft fans. *See* 87 FR 44194, 44223, 44257.

In this final rule, DOE is maintaining the proposed equation as provided in section 5.3 and section 6.3.3 of AMCA 214–21 and maintaining the proposed equations in section 6.4.2.3 of AMCA 214–21 to estimate the part-load motor efficiency when calculating FEP_{ref}, FEP_{act} of bare shaft fans, and the FEP_{act} of fans sold with electric motors regulated at 10 CFR 431.25 (and without VFDs).

1. Combined Motor and Controller Efficiency Calculation

For fans with a polyphase regulated motor and a controller, AMCA 214–21 allows testing these fans using a shaft-to-air test (*i.e.,* a test that does not include the motor and controller performance). When conducting a shaft-to-air test, the mechanical fan shaft input power is measured and the FEP is then calculated by using a mathematical model to represent the performance of the combined motor and controller (*i.e.,* its part-load efficiency). The FEP is then used to calculate the FEI of the fan.

Section 6.4.2.4 of AMCA 214–21, which relies on Annex B, ''Motor Constants if Used With VFD (Normative),'' and Annex C, ''VFD Performance Constants (Normative),'' provides a method to estimate the combined motor and controller part-load efficiency for certain electric motors and controller combinations that meet the requirements in sections 6.4.1.3 and 6.4.1.4 of AMCA 214–21, which specify that the motor must be polyphase regulated motor (*i.e.,* an electric motor subject to energy conservation standards at 10 CFR 431.25).

In the July 2022 NOPR, DOE noted that it had previously developed a similar model to estimate the combined motor and controller part-load performance in support of the commercial and industrial pump test procedure final rule published on January 25, 2016 (''January 2016 Pump TP''), in the case where the motor is a polyphase regulated motor. *See* 81 FR 4086, 4128–4130. As noted in the test procedure NOPR pertaining to commercial and industrial pump published on April 29, 2015 (''April 2015 Pumps NOPR''), the model used in the pump test procedure represents a conservative estimate of part-load motor losses (and efficiency).[75] 80 FR 17585, 17628. As noted in the July 2022 NOPR, DOE noted that such approach minimizes the possibility that using the calculation approach to estimate the motor and controller performance would result in better energy efficiency ratings than when testing the equipment inclusive of the motor and controller. 87 FR 44194, 44223.

In the July 2022 NOPR, DOE compared the motor part-load efficiency resulting from applying the AMCA 214–21 motor and controller equations with the combined motor and controller part-load efficiency obtained when using the equation from the DOE pump test procedure and found that the AMCA model resulted in combined motor and controller part-load efficiency values that were generally higher than the DOE model. In addition, DOE reviewed motor and VFD efficiency data from the AHRI certified product database [76] and found existing motor and VFD combinations that performed at a lower efficiency than predicted by the AMCA 214 model. DOE also reviewed the reference motor and controller (''power drive system'') efficiency provided in IEC 61800–9–2:2017 ''Adjustable speed electrical power drive systems Part 9–2: Ecodesign for power drive systems, motor starters, power electronics and their driven applications—Energy efficiency indicators for power drive systems and motor starters,'' which also provides equations to represent the performance of a motor and controller used with fans, and found that the IEC model predicted values of efficiency that were significantly lower (more than 10 percent on average) than the model included in AMCA 214–21. *Id.*

Based on this analysis, DOE stated its concerns that the equations described in section 6.4.2.4 of AMCA 214–21 may not be appropriately representative, resulting in fan FEI ratings that would be higher than FEI ratings obtained using the wire-to-air test method described in section 6.1 of AMCA 214–21. Therefore, DOE did not propose to allow the use of section 6.4.2.4 of AMCA 214–21. Instead, DOE proposed that fans with a motor and controller be tested in accordance with section 6.1 of AMCA 214–21. DOE indicated that manufacturers would still be able to rely on a mathematical model (including the same mathematical model as described in section 6.4.2.4 of AMCA 214–21, as long as the mathematical model meets the AEDM requirements discussed in Section III.I of this document) in lieu of testing to determine the FEI of a fan with a motor and controller. *Id.*

AMCA commented that, for some manufacturers offering fixed combinations of fan/motor/controller, the testing approach was appropriate and encouraged, while for other manufacturers offering standard fan models that can be paired with any standard, commercially available, regulated motor and standard, commercially available VFD, the testing approach of AMCA 214–21 Section 6.1 was not practical and would inhibit AMCA's ability to offer fan products with high-efficiency motors (above current regulation). AMCA stated its appreciation that DOE would consider AMCA 214–21 section 6.4.2.4 an acceptable method to be used as an AEDM; however, AMCA believed some mistakes were made in DOE's analysis

[75] The efficiency (Eff) of a motor at a given load (x) relates to the motor horsepower (hp) and losses (L) as follows: Eff = (x. hp)/(x.hp + L).)).

[76] AHRI Standard 1210, ''Standard for Performance Rating of Variable Frequency Drives,'' certified data from 2016, 2020, and 202. Available at: *www.ahridirectory.org/NewSearch?programId=71&searchTypeId=3.*

that affected the choice of not directly recognizing the calculation model from this section as an acceptable alternative to testing. AMCA commented that these were mistakes also made previously by AMCA that had not yet been sufficiently publicized to prevent them from recurring. AMCA provided supporting data and analysis to illustrate the representativeness of the equations in section 6.4.2.4. (AMCA, No. 41 at pp. 18–21) Specifically, AMCA commented that the DOE model used in the January 2016 Pump TP represented a conservative estimate of part-load motor losses (and efficiency). AMCA added that the model in AMCA 214–21, section 6.4.2.4, was not intended to be a conservative estimate of losses. Instead, according to AMCA, the model was intended to provide a level playing field between manufacturers that chose to test wire-to-air and those that chose to test fan shaft power and calculate wire-to-air losses. AMCA commented that the model used in the pump test procedure, therefore, should result in higher losses, and AMCA believed DOE's use of the pump model to assess AMCA 214 for the fan rulemaking was not valid. (AMCA, No. 41 at p. 18) Regarding AHRI data, AMCA commented that some motor and efficiency data in the AHRI certified product database previously included VFD models that performed at a lower efficiency than most others in the database. When AMCA interviewed the manufacturer of one of the lower-performing models, the manufacturer confided that the certified efficiency was much lower than the actual tested efficiency, but was intentionally rated lower for unrelated reasons. AMCA analyzed the current AHRI 1210 database and found that 59 percent of AMCA 214 calculations were within +/−1 percent of AHRI data and 96 percent were within +/−3 percent and provided graphical representations comparing the AHRI data to the AMCA 207 model.[77] (AMCA, No. 41 at pp. 18–19) AMCA added that the reference PDS model in IEC 61800–9–2:2017 was not typical of currently available products and that no VFDs nor motors were available at these low efficiency levels in the United States. AMCA noted that the equations representative of typical PDS were available in IEC TS 60034–31:2010, ''Rotating electrical machines—Part 31: Selection of energy-efficient motors including variable speed applications—Application guide.'' AMCA further provided a graphical comparison of its model against the equations available in IEC TS 60034–31:2010 as well as in the Motor Systems Tool published by 4E EMSA and demonstrating alignment between models. (AMCA, No. 41 at pp. 19–20) AMCA added that the next version of IEC 61800–9–2 will be expanded to cover VFD frequencies above 60 Hz which is a common condition for fans. AMCA recommended removing IEC 61800–9–2 from consideration for the CIFB rulemaking until at least Edition 2 of IEC 61800–9–2 has been published. Finally, testing at the AMCA lab and at members' labs has always shown excellent agreement with the AMCA 207 models. Figures 5 and 6 show recent testing on 3 and 10 hp motors covering a vast range of speeds and torques. Again, the AMCA 207 model[78] is labeled as the equivalent ISO 12759–2. (AMCA, No. 41 at p. 21)

New York Blower commented that it supports AMCA's analysis. (New York Blower, No. 33 at p. 13) Morrison stated its general agreement with AMCA's position that the entire AMCA 214–21 be adopted, including use of Section 6.4.2.4 of AMCA 214–21. (Morrison, No. 42 at p. 5)

Greenheck commented in support of including AMCA 214 Section 6.4.2.4 combining motor/controller efficiency. (Greenheck, No. 39 at p. 1) In addition, for embedded fans, Greenheck commented that the requirement for wire-to-air testing poses a specific challenge. Greenheck commented that many products are manufactured without motor controllers/VFDs that are provided by the field. Greenheck commented that the proposed testing requirements would, in these cases, put the certification burden on the installing contractor to validate FEI at that selection as the contractor would be completing the ''fan assembly'' as defined. Greenheck commented that this is an unrealistic expectation and would likely be violated regularly. Greenheck commented that DOE should align the testing procedure with existing AMCA standards that allow for calculation of efficiency for motor transmission and controllers. (Greenheck, No. 39 at p. 6)

Robinson commented that in its experience, the issues with making representative energy efficiency ratings with the presence of VFDs at reduced frequency is difficult without direct torque measurement. Robinson added that motor and VFD suppliers repeatedly refused to provide data to allow for calculation of motor and VFD efficiency and power factor at reduced frequency. (Robinson, No. 43 at p. 8)

As noted in the April 2015 Pumps NOPR, the model used in the pump test procedure represents a conservative estimate of part-load motor losses (and efficiency). 80 FR 17585, 17628. As stated, this approach is intended to minimize the possibility that using the calculation approach to estimate the motor and controller performance would result in better energy efficiency ratings than when testing the equipment inclusive of the motor and controller. As illustrated in AMCA's comment, the model in AMCA 214–21 section 6.4.2.4 was not intended to be a conservative estimate of losses and instead is representative of typical performance. In line with DOE's findings, the analysis provided by AMCA shows that there are many AHRI-certified motor and VFD combinations that have a tested efficiency that is lower than the model in section 6.4.2.4 of AMCA 214–21. Therefore, DOE continues to have concerns that applying the model in section 6.4.2.4 of AMCA 214–21 may result in fan FEI ratings that would be higher than FEI ratings obtained using the wire-to-air test method described in section 6.1 of AMCA 214–21. Therefore, DOE is not allowing the use of section 6.4.2.4 of AMCA 214–21. Instead, DOE requires that fans with motor and controller be tested in accordance with section 6.1 of AMCA 214–21. DOE notes that manufacturers would still be able to rely on a mathematical model (including the same mathematical model as described in section 6.4.2.4 of AMCA 214–21, as long as the mathematical model meets the AEDM requirements discussed in Section III.I of this document) in lieu of testing to determine the FEI of a fan with a motor and controller.

In addition, DOE notes that the fan manufacturer is responsible for certifying the equipment as distributed in commerce and a consumer or installer would not be responsible for additional certification. If a fan manufacturer sells a fan basic model without a controller, they would be responsible for certifying that fan basic model without a controller.

2. Annex A of AMCA 214–21

Annex A provides the reference nominal full-load efficiency values to use for polyphase regulated motors subject to energy conservation standards at 10 CFR 431.25 when calculating the motor part load efficiency in accordance with section 6.4.2.3 of AMCA 214–21. In the July 2022 NOPR, DOE proposed to replace Annex A of AMCA 214–21

[77] The AMCA 207 equations are identical to those found in Section 6.4.2.4 of AMCA 214–21 (*See* discussion in section III.D of this document).).

[78] The AMCA 207 equations are identical to those found in AMCA 214–21 (See discussion in section III.D of this document).)).

with a reference to Table 5 of 10 CFR 431.25. The values in Annex A and Table 5 of 10 CFR 431.25 are identical; however, referencing the Code of Federal Regulations would ensure that the values of polyphase regulated motor efficiencies remain up to date with any potential future updates established by DOE. 87 FR 44194, 44223. DOE did not receive any comment on this issue and is replacing Annex A of AMCA 214–21 by referencing Table 5 of 10 CFR 431.25.

3. Annex E of AMCA 214–21

Annex E of AMCA 214–21 allows a reduction in the number of tests potentially required by allowing the use of fan laws to calculate the fan shaft power of a non-tested fan using results from a fan shaft power test of a fan with a smaller impeller diameter. In the July 2022 NOPR, DOE noted that since the publication of AMCA 214–21, AMCA 211–22, ''Certified Ratings Program Product Rating Manual for Fan Air Performance,'' was published. Annex I of AMCA 211–22 allows the use of fan laws to additionally interpolate the fan shaft power of a non-tested fan using results from a fan shaft power test of two fans with a smaller and larger impeller diameter (*i.e.,* interpolation between two tested sizes). DOE considered adding a reference to Section I.6 of Annex I of AMCA 211–22 and allowing manufacturers to additionally interpolate the fan shaft power of a non-tested fan between two tested fans sizes. Alternatively, DOE considered referencing Annex I of AMCA 211–22 in place of Annex E of AMCA 214–21. In the July 2022 NOPR, DOE requested comments on whether it should add a reference to section I.6 of AMCA 211–22 or replace Annex E of AMCA 214–21 by Annex I of AMCA 211–22. 87 FR 44194, 44223–44224.

In response to the July 2022 NOPR, the CEC commented that it supports the reference of Annex E of AMCA 214–21 only. The CEC recommended that section I.6 of AMCA 211–22 not be added or referenced and recommended that Annex I of AMCA–211–22 not replace Annex E of AMCA 214–21. The CEC stated that although section I.6 of AMCA 211–22 and Annex E of AMCA 214–21 could be used to interpolate and compute the Fan Energy Index (FEI) of the interpolated fan for different diameter fans, Annex E of AMCA 214–22 clearly communicated the requirements for the applicability of the formulas provided in Annex E, including the type of units to be used and its distinct source. Including section I.6 could lead to incorrect data being generated for certification since it lacked clear explanations and would require more information to implement correctly. The CEC added that although Annex I of AMCA 211–22 could replace Annex E of AMCA 214–21, it lacks the detail conditions for the applicability of the formulas presented. The CEC commented that Annex I of AMCA 211–22 lacks connectivity to the main body of the test procedure and does not explain the applicability of the results to sections 6.3, 6.4, and 6.5 of AMCA 214–21. The CEC added that Annex I could lead to incorrect data to be generated for certification and would require more information to implement correctly. For these reasons, the CEC recommended referencing Annex E of AMCA 214–21 only. (CEC, No. 30 at pp. 3–4)

AMCA recommended that DOE add a reference to section I.6 of AMCA 211–22. This section covers interpolation between tested fan sizes when geometric similarity requirements were met and would result in more accurate ratings for non-tested sizes. (AMCA, No. 41 at p. 22) New York Blower stated support for AMCA's analysis of the issue. (New York Blower, No. 33 at p. 13)

As previously stated, DOE is not opting to reference AMCA 214–21 for air circulating fans. DOE reviewed the content of Annex I of AMCA–211–22 and of Annex E of AMCA 214–21 and notes that both appendices include identical equations describing the fan laws, interpolations between tested speeds, and general interpolations between tested fans when a single geometric feature is varied, with the following exceptions: (1) Section I.6 of Annex I of AMCA 211–22 allows the use of fan laws to additionally interpolate the fan shaft power of a non-tested fan using results from a fan shaft power test of two fans with a smaller and larger impeller diameter (*i.e.,* interpolation between two tested sizes), while Section E.3 of Annex E of AMCA 214–21 explicitly prohibits this and requires the use of fan laws instead; (2) the equations in Annex I of AMCA 211–22 include the compressibility coefficients, while the equations in Annex E of AMCA 214–21 assume the flow is incompressible; and (3) the symbols in Annex I of AMCA 211–22 are not consistent with the symbols used in AMCA 214–21. For these reasons, at this time to maintain clarity and consistency with the symbols and terms used through AMCA 214–21, DOE is keeping the reference to Annex E of AMCA 214–21 as proposed in the July 2022 NOPR. In addition, DOE is specifying that the equations in Section E.2 of Annex E of AMCA 214–21 must include the compressibility coefficients as applicable for compressible flows.

4. Section 6.5 of AMCA 214–21 and Annex F

Section 6.5 and Annex F of AMCA 214–21 provide methods to determine the FEP of the actual fan by conducting separate tests for the bare shaft fan and the motor or the combined motor and controller. Annex F specifies the industry test methods [79] to use when testing the motor or the combined motor and controller. As provided in Annex F, the motor and controller, if included, must be tested at the range of speeds and loads over which the fan is to be rated. The measurements result in a map of the input power (kW) versus speed and load and intermediate values can be determined through interpolation (linear interpolation or a polynomial curve fit). The methods in section 6.5 and Annex F of AMCA 214–21 are applicable to any electric motor (including non-DOE regulated motors that meet the definition of electric motor at 10 CFR 431.12) as long as it can be tested per the industry test procedures included in Annex F.

In the July 2022 NOPR, DOE noted that the test procedure for combined motor and controller in AMCA 214–21 deviates from the methods proposed in the December 2021 Electric Motors Test Procedure NOPR. 86 FR 71710, 71743 (December 17, 2021).[80] DOE further noted that for fans combined with regulated motors, the methods described in section 6.5 and Annex F of AMCA 214–21 would be less burdensome than multiple wire-to-air tests; however, it would likely be significantly more burdensome than applying the calculation methods described in section 6.3 of AMCA 24–21, since it would require physical tests of all motors with which the bare shaft fan could be paired. In addition, with the option to allow for an AEDM as discussed in Section III.I of this document, a manufacturer would be able to integrate the methods of Section 6.5 and Annex F of AMCA 214–21 into a mathematical model as long as the proposed AEDM requirements were met. 87 FR 44194, 44224.

Therefore, DOE proposed not to include section 6.5 and Annex F of AMCA 214–21. DOE noted that manufacturers would still be able to rely

[79] CSA C747–09 (R2014), ''Energy efficiency test methods for small motors''; CSA C838–13 (R2018), ''Energy efficiency test methods for three-phase variable frequency drive systems''; IEEE 112–2017, ''IEEE Standard Test Procedure for Polyphase Induction Motors and Generators''; and ANSI/ASHRAE Standard 222–2018, ''Standard Method of Test for Electrical Power Drive Systems.''

[80] Since then, DOE notes that the electric motors test procedure was finalized on October 19, 2022. 87 FR 63588.

on a mathematical model (including potentially the same model as described in section 6.5 of AMCA 214–21, as long as the models meet the AEDM requirements discussed in Section III.I of this document) in lieu of testing to determine the FEI of a fan with a motor or a motor and controller, provided that the mathematical model meets all the AEDM requirements proposed in Section III.I of this document. *Id.*

Greenheck commented that DOE's proposal to not adopt section 6.4.2.4 of AMCA 214–21 [81] invalidated a common practice where manufacturers complete bare shaft testing and combine this data with separate testing of the power drive system (PDS). Greenheck commented that the ability to test a PDS separate from the fan significantly reduced testing burden as a single PDS test could be applied across multiple validation classes and sizes. Greenheck commented that testing a PDS separate from the fan would also necessitate that those manufacturers complete wire-to-air testing for any instances where they wish to demonstrate the improved performance of special motor/drive combinations. According to Greenheck, this exclusion penalized manufacturers for offering a more energy efficient PDS through increased testing requirements. (Greenheck, No. 39 at p. 2)

As noted, the test procedure for combined motor and controller in section 6.5 and Annex F of AMCA 214–21 deviates from the methods finalized by DOE on October 19, 2022. In addition, for fans combined with regulated motors, the methods described in section 6.5 and Annex F of AMCA 214–21 would be less burdensome than multiple wire-to-air tests; however, it would likely be significantly more burdensome than applying the calculation methods described in section 6.3 of AMCA 24–21, since it would require physical tests of all motors with which the bare shaft fan could be paired. In addition, as stated, manufacturers would still be able to rely on a mathematical model (including potentially the same model as described in section 6.5 of AMCA 214–21, as long as the models meet the AEDM requirements discussed in Section III.I of this document) in lieu of testing to determine the FEI of a fan with a motor or a motor and controller, provided that the mathematical model meets all the AEDM requirements proposed in Section III.I of this document. For these reasons, DOE is not including Section 6.5 and Annex F of AMCA 214–21.

5. Annex H and Annex I of AMCA 214–21

Annex H ''Required Reported Values (Normative)'' of AMCA 214–21 provides reporting requirements. In the July 2022 NOPR, DOE did not propose to adopt Annex H. DOE stated that it may consider proposals to establish reporting requirements for fans and blowers under a separate rulemaking. 87 FR 44194, 44224.

Annex I ''Minimum Data Requirements for Published Ratings (Informative)'' provides guidance on what performance information to publish. In the July 2022 NOPR, DOE did not propose to adopt Annex I. DOE proposed to adopt requirements regarding represented values in Section III.J of that document. 87 FR 44194, 44224.

The CEC recommended incorporating by reference Annex H of AMCA 214–21 defining the efficiency boundaries of the fan by maximum airflow, maximum pressure, and maximum fan speed as these terms are defined in that section. (CEC, No. 30 at p. 6)

The CA IOUs commented that they were concerned that DOE's test procedure final rule may preempt aspects of the ongoing Title 20 Appliance Standards rulemaking. Specifically, the CA IOUs noted that DOE did not propose to adopt Annex H ''Required Reported Values (Normative)'' of AMCA 214–21 Test Procedure for Calculating FEI for Commercial and Industrial Fans and Blowers. The CA IOUs commented that DOE stated that it may consider reporting requirements in a separate rulemaking. However, the CA IOUs noted that the CEC has proposed adopting Annex H in its Express Terms to determine Maximum Airflow, Maximum Pressure, and Maximum Fan Speed at which the fan can achieve an FEI greater than or equal to 1.0. Therefore, the CA IOUs requested that DOE adopt appendix H to align with the CEC proposal. (CA IOUs, No. 37 at p. 7)

DOE is not adopting reporting requirements for fans and blowers in this rulemaking. DOE may consider proposals to establish reporting requirements for fans and blowers under a separate rulemaking. DOE notes that 180 days after publication of this final rule, any representations made with respect to energy use or efficiency of fans or blowers must be made based on testing in accordance with the test procedures established in this final rule. Further, in regard to the CA IOUs comments about preemption, EPCA states that section 6297 applies with respect to the equipment described in section 6311(1)(L) beginning on the date on which a final rule establishing an energy conservation standard is issued, except that any State or local standard prescribed or enacted for the equipment before the date on which the final rule is issued shall not be preempted until the energy conservation standard for the equipment takes effect. (42 U.S.C. 6316(a)(10))

6. Section 8.3 of AMCA 214–21

Section 8.3, ''Appurtenances,'' provides guidance on how to characterize fan performance in the case of a fan with additional appurtenances beyond what is required by the test procedure. In the July 2022 NOPR, DOE did not propose to adopt this section as DOE does not propose to establish fan performance with additional appurtenances beyond what is specified in the test procedure.[82] 87 FR 44194, 44224.

DOE did not receive any comment on this issue and is not including section 8.3 of AMCA 214–21, because DOE is not establishing fan performance with additional appurtenances beyond what is required in the test procedure. *See* section III.E.12 of this document.

7. Measurement of PVR Performance

Table 7.1 of AMCA 214–21 requires different test configurations for PRVs that supply air to a building and PRVs that exhaust air from a building. Some PRVs can operate both as supply and exhaust fans. In the July 2022 NOPR, DOE proposed that PRVs that can operate both as supply and exhaust fans be tested in both configurations. 87 FR 44194, 44224.

In response to the July 2022 NOPR, the Efficiency Advocates commented that they support DOE's proposal for PRVs requiring that models capable of operating as both supply and exhaust fans be tested as both as it would help ensure that PRVs are tested and rated in all configurations in which they may be installed. (Efficiency Advocates, No. 32 at p. 3)

AMCA supports testing in both configurations. If a PRV is marketed as being able to operate both as a supply and an exhaust fan, AMCA requires it to be tested and rated as both a supply PRV and an exhaust PRV. (AMCA, No. 41 at p. 22)

New York Blower noted that PRVs that operate both in supply and exhaust

[81] DOE believes this is a typographical error in the comment and should be referencing Section 6.5 of AMCA 214–21 which describes the separate bare shaft fans and PDS testing approach.

[82] Section III.D.7 of the July 2022 NOPR included an erroneous reference to Section 7.3 of AMCA 214–21, which DOE did not propose to adopt at the time. *See* 87 FR 44194, 44224. This error was noted in a comment by AMCA (AMCA, No. 41 at p. 23).

modes clearly display a significant difference in performance, and that it is clearly in the manufacturer's best interest to understand the different performance values. New York Blower added that an unintended consequence of deriving an efficiency level that eliminates a significant portion of a direction of PRV could, as unreasonable as it seems, imply two fans should be installed—each operating in its most efficient direction—to accomplish both supply and exhaust. (New York Blower, No. 33 at p. 13)

DOE requires that PRVs that can operate both as supply and exhaust fans be tested in both configurations. DOE would consider any issues related to efficiency levels, including differences in performance for PRVs that operate both in supply and exhaust modes in its separate energy conservation standards rulemaking.

8. Embedded Fans and Blowers

As discussed in Section III.B.3 of this document, DOE proposed to exclude fans that are embedded in equipment as listed in Table III–7 of this document. DOE explained that other embedded fans were included in the scope of the test procedure to the extent that they meet the test procedure scope criteria presented in Section III.B.1 of this document and do not fall under the exclusions discussed in Section III.B.2 of this document. 87 FR 44194, 44224.

The Working Group recommended that embedded fans be tested in a standalone fan configuration (*i.e.,* outside of the piece of equipment in which they are embedded). (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #8 at p. 5) DOE interprets this recommendation to apply to embedded fans that are not manufactured in a standalone configuration because standalone fans that are purchased by an OEM for incorporation into equipment can be tested prior to being embedded. Because embedded fans included in larger equipment may share structural or functional parts with that equipment, the fan may not be removable without causing irreversible damage to the equipment. To address such embedded fans, the Working Group recommended testing exclusively embedded fans using additional fan components, except for the fan impeller, that are geometrically identical to that of the embedded fan inside the larger piece of equipment. (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #8 at p. 5) In addition, the Working Group recommended that embedded fans be certified over their standalone operating range. (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #4 at p. 4)

In the July 2022 NOPR, DOE stated that fan performance information indicated that OEMs currently test and collect information on embedded fan performance and that OEMs understand a fan's typical operating range in terms of flow and pressure. DOE noted that the AMCA 214–21 foreword states that, ''AMCA Standard 214 primarily is for fans that are tested alone or with motors and drives; it does not apply to fans tested embedded inside of other equipment.'' To test exclusively embedded fans that are not manufactured in a standalone configuration, consistent with the Working Group recommendations, DOE therefore proposed that these fans be tested as standalone fans, outside of the equipment in which they are incorporated. In addition, DOE proposed that if any fan components are not removable without causing irreversible damage to the equipment into which the fan is embedded, the manufacturer must use additional fan components, except for the fan impeller, that are geometrically identical to that of the fan embedded inside the larger piece of equipment for testing. This would result in a range of FEI ratings at every operating point at which the fan is capable of operating, including at the flow and pressure point experienced by the fan when embedded inside the equipment. 87 FR 44194, 44425.

ebm-papst commented that its customers almost exclusively embed all purchased fans into equipment that is currently regulated, slated to be regulated, or not regulated. ebm-papst commented that all fans that it supplies in testable configurations are rated based on wire-to-air tests, either AMCA 210 or ISO 5801. However, ebm-papst commented that fans are often supplied in configurations that are not testable: (1) suppliers other than ebm-papst have supplied forward curve impellers loosely placed in scroll housings, thus initially without bearings/drivers, before the OEM furnishes the motors and thereby finally creates the housed centrifugal fan; (2) forward curve impellers complete with integrated motor supplied without scroll housing, as the eventual housing shape will be part of the larger HVAC unit; or (3) axial propellers complete with integrated motors but without panels, because the OEM has the eventual ''panel'' designed and supplied by the surrounding HVAC unit. Nevertheless, ebm-papst noted that it is common practice and the OEMs' expectation that suppliers document fan air performance. In the case of non-testable configurations, the fans would be tested with inlets, housings, and mounting. (ebm-papst, No. 31 at p. 3)

ebm-papst added that OEM customers expect fan performance representations from their suppliers when they purchase incomplete panel fans and or incomplete plenum fans: (1) motorized propellers are measured and rated in the form of axial panel fans but sold without panels; and (2) motorized impellers are measured and rated in the form of plenum fans but sold without inlet cones/rings and without inlet plates. (*Id.* at p. 7) emb-papst further commented that all ebm-papst fans are rated based on tests in standalone configuration, and that those supplied to OEMs without panels or inlet rings for embedding are tested in their laboratories with standardized components in place. emb-papst commented that the necessary geometries of these necessary peripheral components are comprehensively described for the customers and users. ebm-papst added that fans it supplies incomplete to OEMs can be tested with the missing components, that then are documented. In addition, emb-papst noted that motorized propellers should be tested with fan panels/orifices in place and that motorized impellers should be tested with inlet rings/cones and plates in place. (*Id.* at p. 10)

AMCA commented that fans purchased in a testable configuration typically are tested standalone and rated. According to AMCA, in these cases, a fan supplier can provide performance data of a standalone fan to an OEM. (AMCA, No. 41 at p. 6)

New York Blower commented that its involvement in HVACR equipment is limited. Regardless, New York Blower stated that for applications it had been involved in, New York Blower would consider ventilation and regularly use AMCA 210–16 to conduct the test in a standalone configuration. New York Blower stated that therefore, by reference, AMCA 214–21 would also be applicable. (New York Blower, No. 33 at p. 8)

Morrison commented that embedded fans and replacement fans, especially for HVAC and applications where safety was a consideration, should be excluded from the scope. Morrison added that fans tested as standalone do not have the same performance in the appliance as tested per this test procedure. Morrison stated that testing of fans per AMCA 210 requires many multiples of diameter clear of the inlet and exit to ensure proper airflow development and these conditions are never present in appliances, so optimum performance at the lowest energy may be different than the best FEI selection. (Morrison, No. 42

at p. 2) Morrison added that while fans supplied to HVAC equipment manufacturers may be tested as standalone, many are not as they are custom designed for the appliance and only tested in the appliance. Morrison commented that the goal of fans for HVAC equipment is to have the lowest energy consumed at the desired operating point in the equipment and that will often not correspond with the AMCA 210 or AMCA 214 tested FEI. In other words, according to Morrison, the standalone testing is generally of no value in the effort of identifying the fan with the best efficiency in the appliance. Morrison added that the benefit of standalone testing is very limited as end users need performance of the appliance tested as an appliance ready for customer installation. (*Id.* at pp. 2–3) Morrison further commented that testing embedded fans as standalone fans will add cost but provide no value. Morrison stated that AMCA 210 is a test standard for testing of a fan's performance with no obstruction within recommended distance of the inlet and exit to ensure the fundamental operation of the fan is not changed. Morrison commented this is never the case in embedded fans and in most cases, the most efficient standalone tested fan is not the fan that consumes the lowest energy in an application—this has been presented previously in this rulemaking process and is still a consideration today. Morrison commented that unit level testing or better full system level testing provides greater opportunity for energy savings. (*Id.* at p. 6)

As noted by ebm-papst, it is common practice for OEMs to expect fan performance information from their fan suppliers. As mentioned by ebm-papst and AMCA, fans sold in a testable configuration are tested in a standalone configuration. As specified by ebm-papst, fans supplied incomplete to OEMs can be tested with the missing components (*i.e.,* in a standalone configuration) that then are documented. Such approach aligns with the proposed approach for testing embedded fans that are not manufactured in a standalone configuration and is consistent with common industry practice. Therefore, consistent with the Working Group recommendations, DOE requires that embedded fans that are not manufactured in a standalone configuration be tested as standalone fans, outside of the equipment in which they are incorporated. In addition, in line with the Working Group recommendations and July 2022 NOPR, DOE requires that if any fan components are not removable without causing irreversible damage to the equipment into which the fan is embedded, the manufacturer must use additional fan components, except for the fan impeller, that are geometrically identical to that of the fan embedded inside the larger piece of equipment for testing. This will result in a range of FEI ratings at every operating point at which the fan is capable of operating, including at the flow and pressure point experienced by the fan when embedded inside the equipment. DOE further notes that the July 2022 NOPR omitted the corresponding provisions in the proposed regulatory text and DOE is adding the corresponding provisions in the final regulatory text.

The CA IOUs commented that the proposed test procedure would apply to fans embedded in non-regulated equipment such as air-handlers. The CA IOUs commented that neither proposed regulatory language nor the commentary provided guidance to manufacturers on how to provide fan performance data when the requirements of the NOPR take effect. The CA IOUs commented that Title 24, ASHRAE 90.1, and IECC 2021 require that designers meet a maximum fan system power and that the selected fans meet a minimum FEI. The CA IOUs commented that many manufacturers buy a fan represented as a bare shaft fan and bundle it with a motor, transmission, and/or controller. If the fan manufacturer created this bundle, it would have a different representation than the bare shaft fan. Moreover, many manufacturers build fan arrays (*i.e.,* fans with single-speed motors controlled by a single variable frequency drive controller supplied by the packager). The CA IOUs added that fan arrays are not in the scope of AMCA 214–21. Specifically, the CA IOUs requested clarification on the following issues: (1) Can packaged manufacturers use bare shaft performance data from the fan manufacturer and then apply an AEDM or one of the permitted modeling methods to determine the performance of the package with added motors and controllers? (2) When manufacturers package a fan with a motor, transmission, or speed controller, are they required to perform the same testing as a fan manufacturer? If not, can the manufacturer provide performance data based on testing inside the air handler? (3) How can fan manufacturers present performance data for fan arrays where one controller operates many motors? (CA IOUs, No. 37 at p. 8)

Regarding issue (1), DOE clarifies that if a manufacturer assembles a combined bare shaft fan and motor and controller and chooses to make representations of FEI for the combined equipment that it distributes in commerce, then the manufacturer would need to rate the combined equipment in accordance with DOE test procedures. Regarding items (2) and (3), DOE notes that the test procedure is applicable to the fan tested in a standalone fan configuration and does not apply to fan assemblies.

New York Blower commented that it provides a significant quantity of applications where the fan could be described as embedded in a device or system that provides an end service, such as dust collection and that structural design modifications may be required to install the fan in the resulting system. New York Blower commented that it tests the fan by extracting it from the system, creating a mounting interface to support testing and conduct the test. New York Blower commented that for more integrated systems, such as HVACR applications, this may pose significant challenges. (New York Blower, No. 33 at pp. 13–14)

DOE understands that the example described by New York Blower is of a standalone fan installed in a larger system in the field. Such a fan would be tested in the standalone configuration.

ebm-papst requested clarification regarding an OEM's obligation for air performance testing when a fan is incomplete without components that are part of a surrounding unit. (ebm-papst, No. 31 at p. 1)

As adopted, embedded fans that are not manufactured in a standalone configuration must be tested as standalone fans, outside of the equipment in which they are incorporated. As noted, if any fan components are not removable without causing irreversible damage to the equipment into which the fan is embedded, the manufacturer must use additional fan components, except for the fan impeller, that are geometrically identical to that of the fan embedded inside the larger piece of equipment for testing.

9. Wire-to-Air Performance for Air Circulating Fans

As discussed in the July 2022 NOPR, DOE did not find any circulating fans that were distributed in commerce without an electric motor. However, if an air circulating fan is sold without a motor, it would still meet the definition of an air circulating fan and would be included in the scope of the test procedure. Therefore, in the July 2022 NOPR, DOE proposed that air circulating fans distributed in commerce without an electric motor be tested using an electric motor as recommended

in the manufacturer's catalogs or distributed in commerce with the air circulating fan. If more than one motor is available in a manufacturer's catalogs or distributed in commerce with the air circulating fan, DOE proposed requiring that it be tested using the least efficient motor capable of running the fan at the fan's maximum allowable speed. 87 FR 44194, 44225.

ebm-papst commented that it is not aware of any ACF sold without a motor. (ebm-papst, No. 31 at p. 10)

DOE did not receive any other comments on this topic and thus requires that air circulating fans distributed in commerce without an electric motor be tested using an electric motor as recommended in the manufacturer's catalogs or distributed in commerce with the air circulating fan. If more than one motor is available in manufacturer's catalogs or distributed in commerce with the air circulating fan, DOE requires that it be tested using the least efficient motor capable of running the fan at the fan's maximum allowable speed.

10. Total Pressure Calculation for Air Circulating Fans

In the July 2022 NOPR, DOE noted that AMCA 214–21 specifies that air circulating fans must rely on a FEI based on total pressure (sum of the static pressure and velocity pressure). (*See* Table III–9 of that document.) However, AMCA 230–15 does not specify the measurement or calculation of fan total pressure, which is a required input to the FEI calculation. In the July 2022 NOPR, DOE proposed to add provisions to specify how to calculate fan total pressure and to apply the equations in section A.2 of AMCA 208–18 when calculating the fan total pressure at a given airflow for fans tested per AMCA 230–15. 87 FR 44194, 44225.

ebm-papst commented that complete reports of AMCA 230 tests include all information necessary to calculate fan total pressure of circulation fans. (ebm-papst, No. 31 at p. 10)

As noted by ebm-papst, the information included in an AMCA 230 test report includes all the information needed to calculate the fan total pressure. Although DOE is not adopting FEI as the metric for air circulating fans (which required the determination of total pressure), section 8.7 of AMCA 230–23 includes equations for calculating total pressure (the same as proposed by DOE), and DOE is retaining these provisions by referencing section 8.7 of AMCA 230–23.

11. Appurtenances

Section 7.3 of AMCA 214–21 provides instructions on which appurtenances to include as part of the tested fan. It distinguishes between appurtenances that improve or reduce performance. For appurtenances that improve fan performance (including but not limited to inlet bells, diffusers, stators, or guide vanes), AMCA 214–21 specifies that these appurtenances should be included if always supplied with the fan when distributed in commerce. For appurtenances that reduce fan performance, which include, but are not limited to, safety guards, dampers, filters, or weather hoods, AMCA 214–21 states that if the appurtenance is always supplied with the fan when distributed in commerce, then it shall be tested with the fan. If the appurtenance is not always supplied with the fan when distributed in commerce, it shall not be tested with the fan.

For circulating fans, in the July 2022 NOPR, DOE noted that the AMCA 230 committee was considering adding the following provisions as part of the revised version of AMCA 230: any appurtenances sold with the fan shall be included in the minimum testable configuration. 87 FR 44194, 44225.

In the July 2022 NOPR, DOE reviewed the provisions related to accessories in AMCA 214–21 and as considered by the AMCA 230 committee and tentatively determined that testing using the provisions discussed by the AMCA 230 committee would provide results that are more representative of field conditions because consumers are likely to use the fan with the appurtenances they purchase. Therefore, for fans and blowers, including air circulating fans, DOE proposed to specify that any appurtenances sold with the fan must be included during the test. In the July 2022 NOPR, DOE requested comment on the proposed provisions related to the consideration of appurtenances when testing fans and blowers, including air circulating fans.[83] *Id.*

In response to the July 2022 NOPR, for air circulating fans, AMCA commented that if an air circulating fan is sold or supplied with a guard or other appurtenances, then it should be tested with the guard or other appurtenances, and if the fan is sold or supplied without a guard or appurtenances, then it should be tested without a guard or appurtenances. AMCA added that each combination of circulating fan and appurtenances would be a separate basic model or conservative ratings could be used to combine multiple basic models. AMCA commented that this was feasible due to the relatively limited number of air circulating fan models and combinations of guards/appurtenances offered by manufacturers. (AMCA, No. 41 at p. 23)

For fans and blowers other than air circulating fans, AMCA recommended that DOE use the provisions in section 7.3 of AMCA 214–21. AMCA explained that including appurtenances in the scope of testing would add burden on fan manufacturers. AMCA commented that historical data, in general, has been developed without appurtenances being tested with the fan, so that including appurtenances would negate the validity of all the historical data and the basic models would need to be tested again with multiple samples as proposed. AMCA added that some appurtenances are mutually exclusive, and that numerous accessories can be applied to fans, but it may not be possible, or reasonable, to apply all available appurtenances to a fan for testing. AMCA added that appurtenances that negatively impact fan air performance would clearly, at the margin, reduce the compliant region of the fan-performance map, *i.e.,* the FEI bubble would shrink. AMCA commented that one option might be for manufacturers to create different basic models, *i.e.,* model numbers for those that include certain appurtenances and separate model numbers for those that do not—a solution that would clearly add complexity and significant testing and AEDM costs. Finally, AMCA commented that DOE's analyses to date, such as those in the notice of data availability,[84] have been done without accessories and that changing the basis of analysis to include appurtenances would require the analyses to be completely redone to reasonably estimate the cost impacts and energy savings in a subsequent energy standard. Most importantly, this proposal would alter the definition of minimum testable configuration in AMCA 214–21, which is a ''fan having at least an impeller; shaft and bearings and/or driver to support the impeller; and its structure or its housing.'' AMCA

[83] As previously stated, Section III.D.7 of the July 2022 NOPR included an erroneous reference to Section 7.3 of AMCA 214–21, which DOE did not propose to adopt in the July 2022 NOPR. Instead, as described in Section III.D.12 of the July 2022 NOPR, and consistent with the proposed regulatory text, DOE proposed to apply the same provisions related to appurtenances as considered by the AMCA 230 committee for air circulating fans: any appurtenances sold with the fan shall be included in the minimum testable configuration.

[84] On November 1, 2016, DOE published a notice of data availability that presented an analysis based on the scope and metric recommendations of the term sheet. 81 FR 75742.

recommended that fans be tested in their minimum testable configuration—with considerations for appurtenances that are consistent with section 7.3 of AMCA 214–21. (AMCA, No. 41 at pp. 23–24)

New York Blower commented that adding appurtenances to the fan for the test procedure will increase testing costs. New York Blower added that not all appurtenances can be applied to a fan simultaneously and the proposal to include appurtenances would multiply the number of basic models and result in a high number of fan models offered to the market with different combinations of appurtenances. New York Blower noted the challenge represented by the complexity that would be generated from the multiple product configurations, testing, and administrative burden to support product certification. New York Blower added that the fan is the prime mover from an energy conversion perspective, and that it is unlikely a fan will be redesigned to be more efficient based on the addition of an appurtenance. In addition, New York Blower noted that many appurtenances are not manufactured by fan manufacturers and that it would be an additional burden for a fan manufacturer to engage in appurtenance redesign for a product it may not manufacture. New York Blower added that all the market impact analysis done to date was accomplished using appurtenance-free fan data and cannot be used to draw conclusions on the performance of appurtenance-laden fans in the future. Further, New York Blower commented adding appurtenances adds significant complexity. (New York Blower, No. 33 at pp. 5–6)

In addition, New York Blower commented that the inclusion of appurtenances when testing fans and blowers will increase the required testing to a degree that is unsupportable by the majority of manufacturers in the fan industry. New York Blower added that the fan is the prime energy conversion device and that redesigning the fan to improve efficiency to accommodate appurtenances is unlikely to achieve acceptable results. New York Blower added that the test should be limited to the minimum testable configuration as described in AMCA 214–21 with the appropriate modifications to the fan to represent the fan operating in a system. One example of such, stated New York Blower, would be the installation of an inlet bell to represent an inlet duct. (*Id.* at p. 14)

JCI stated that it shared AMCA's comments regarding the rejection of the currently accepted section 6.4.2.4 [85] of AMCA 214–21 on handling appurtenances, which invalidates industry's significant volume of historical testing. (JCI, No. 34 at p. 2)

Morrison commented that fans and blowers should be tested in their minimum testable configuration and consistent with the considerations for appurtenances that are found in section 7.3 of AMCA 214–21. (Morrison, No. 42 at p. 6)

Robinson commented that the testing procedure expectation placed on the manufacturers of heavy industrial process fans and blowers is burdensome and impracticable. Robinson commented that the challenge is pronounced for heavy industrial process fan manufacturers when it comes to testing with appurtenances. Robinson explained that most heavy industrial processes require several subprocesses, often over the stretch of significant acreage of an industrial plant facility (*i.e.,* paper mill, petroleum refinery, pharmaceutical plant, mining facility, chemical plant, food production plant, etc.). Robinson commented that the air movement equipment required to operate these processes and subprocesses is robust, designed and engineered specifically for each application and installation, and also connected to and affected by all of the appurtenances of the plant's system. Robinson commented it is unknown how a fan manufacturer would test the fan with its appurtenances at any point before full installation and by that time, the fan is fully constructed and sold. Robinson stated that the location and timing of the testing will also be difficult as fans are often sold as part of a new subprocess in the midst of construction or as a replacement for a fan currently operating, which when shut down requires the idling of an entire industrial process. Robinson commented it is unclear to what extent industrial fan manufacturers will have to go in order to comply with this part of the rule. Further, Robinson stated that all historical testing, done over l00 years, has been done without appurtenances, and this rule would render all of that testing useless. (Robinson, No. 43 at p. 3) Robinson added that the inclusion of appurtenances when testing fans and blowers will add exponentially to the testing required. Robinson pointed out that it is customary to certify designs or fan performance based off of test block conditions or with appurtenances in their least restrictive settings. Robinson commented that information provided by suppliers of appurtenances is often inadequate to establish losses at conditions other than design, and for industrial process custom fan manufacturers, this would be a very significant burden as each unique configuration and basic model would be either tested or validated. Robinson added that the addition of appurtenances also brings system effect factors into play, which create significant complications. Robinson added that the test should be limited to the fan only (with or without a motor or drive system) (*Id.* at p. 9)

Greenheck commented that DOE did not propose to adopt the AMCA 214–21 Section 7.3 provisions for appurtenances and has provided a confusing stance on what is to be tested. Greenheck commented that there are several appurtenances, and combinations of appurtenances, available on fan products. Greenheck added that many appurtenances are mutually exclusive and should not or cannot be tested together. Greenheck further commented that appurtenances are generally intended to aid the end customer in accommodating building limitations or overall system design requirements and are not part of the basic fan performance. As currently written, stated Greenheck, the DOE rulemaking appears to require two-sample tests for each appurtenance and appurtenance combination, which represents an additional, significant testing burden for all manufacturers. Greenheck further provided an example to illustrate the high number of appurtenances for a single model, where with the combination of a two-sample test and wire-to-air testing, appurtenances would lead to 6,336 tests for a fan series with 11 sizes. (Greenheck, No. 39 at pp. 2–3)

NEEA commented that the treatment of appurtenances in the definition of a basic model is unclear in the current NOPR. In addition, NEEA noted that in Section III.C.5 of the NOPR, DOE proposed to adopt section 7.3 of AMCA 214–21. However, NEEA noted that DOE used language inconsistent with section 7.3 of AMCA 214–21 and in the proposed regulatory text included in Section VI, DOE provided text that ''replaces the provisions in section 7.3 of AMCA 214–21.'' NEEA commented that DOE's current language has the potential of dramatically increasing the number of basic models, as it does not clearly identify how appurtenances impact a basic model. (NEEA, No. 36 at p. 3)

[85] Although JCI references Section 6.4.2.4 of AMCA 214–21, DOE notes that the appurtenances are addressed in Section 7.3 of AMCA 214–21.

Loren Cook Company commented that there is a burden associated to testing any appurtenances sold on a fan. Loren Cook added that it has several products each with many sizes and have a dozen or more accessories that could affect performance and would result in excessive amount of testing required. (Public Meeting Transcript, No. 18 at pp. 65–66)

For fans and blowers other than air circulating fans, in view of the substantially high number and combinations of appurtenances as noted by AMCA, New York Blower, JCI and Greenheck, and to remain consistent with the definitions of minimum testable configurations as described in AMCA 214–21 [86] as noted by AMCA, DOE requires testing in accordance with section 7.3 of AMCA 214–21, which distinguishes between appurtenances that improve or reduce performance. As such, DOE is no longer replacing the provisions in Section 7.3 of AMCA 214–21. For appurtenances that improve fan performance, which include, but are not limited to inlet bells, diffusers, stators, or guide vanes, AMCA 214–21 specifies that these appurtenances should be included if always supplied with the fan when distributed in commerce. For appurtenances that reduce fan performance, which include, but are not limited to, safety guards, dampers, filters, or weather hoods, AMCA 214–21 states that if the appurtenance is always supplied with the fan when distributed in commerce, then it shall be tested with the fan. If the appurtenance is not always supplied with the fan when distributed in commerce, it shall not be tested with the fan. To align with the adopted definition of ''minimum testable configuration,'' DOE requires testing in accordance with section 7.3 of AMCA 214–21. In addition, DOE clarifies that its regulations would apply to the fan as distributed in commerce and would not account for any potential additional appurtenances added in the field. As noted by AMCA, such approach would permit the preservation of historical data and reduces test burdens.

For air circulating fans, in line with the provisions in Section 6.3 of AMCA 230–23, DOE requires that any appurtenances sold with the fan shall be included in the minimum testable configuration, as proposed.

In addition, in the July 2022 NOPR, DOE noted that for air circulating fans, the AMCA 230 committee was considering additional provisions to include in the next version of AMCA 230 to describe what should be considered as part of the test (*i.e.,* the ''minimum testable configuration''). The committee was considering the following: (1) If sold with the fan, an on/off switch or speed control device would be included in the minimum testable configuration. The power consumption of the on/off switch or speed control device would be included in the active and standby mode power measurements. (2) If multiple control devices are sold with the fan, only the standard fan control device would be used for testing. (3) Optional product features not related to generating air movement would not be energized for the purpose of testing. Optional product features not related to generating air movement include, but are not limited to, misting kits, external sensors not required to operate the fan, and communication devices not required to operate the fan. 87 FR 44194, 44225.

For air circulating fans, in the July 2022 NOPR, DOE tentatively determined that it is unlikely that additional features not related to air movement would remain in the on-position unless intended by the consumer. As such, requiring testing in their ''as-shipped'' configuration would not provide a more representative measure of energy use for air circulating fans. DOE proposed to add clarification that additional features not related to air movement be installed, but either powered off or set at the lowest energy-consuming mode during testing. Further, to avoid confusion as to which controller is used for testing in the case where multiple advanced controllers are offered, DOE proposed to add additional clarification to its specifications for appurtenances. Specifically, DOE proposed to clarify that if the air circulating fan is offered with a default controller, testing would be conducted using the default controller. If the air circulating fan is offered with multiple controllers, testing would be conducted using the minimally functional controller (*i.e.,* ''standard controller''). Testing using the minimally functional controller is consistent with the direction to test with additional features not energized during the power consumption measurement. Controller functions other than the minimal functions (*i.e.,* the functions necessary to operate the air circulating fan blades) are akin to additional features that do not relate to the air circulating fan's ability to create airflow. This proposed addition clarifies which controller to select. These proposals were in line with the additional provisions considered by the AMCA 230 committee at the time. *Id.* at 87 FR 44225–44226.

DOE did not receive any comments on these specific proposals.

Since then, AMCA 230–23 has incorporated these provisions in section 6.3. DOE is referencing the provisions in section 6.3 of AMCA 230–23.

12. Voltage, Phase, and Frequency

This section is only applicable to fans with a motor that are tested wire-to-air, where the electrical power supplied to the fan needs to be specified.

Regarding frequency, fans and blowers can be rated to operate at 50 or 60 Hz, be supplied by single-phase or multi-phase electricity, and can operate at a single rated voltage (*e.g.,* 115 V) or within one or more rated voltage ranges, or a combination of both (*e.g.,* 115/208–230 V). In the July 2022 NOPR, DOE stated that section 7.8 of AMCA 214–21 specifies that for fan electrical power measurement (when conducting a wire-to-air test), the fan must be operated using a 60 Hz supply unless that frequency conflicts with nameplate values. The voltage during the test shall match the highest allowable value that corresponds with the relevant nameplate. 87 FR 44194, 44226.

In the United States, 60 Hz frequency is the most representative, and DOE tentatively determined that fans rated for operation with only 60 Hz power supply would be tested with 60 Hz electricity and that fans capable of operating with 50 Hz and 60 Hz electricity would also be tested with 60 Hz electricity. DOE tentatively determined that it does not need to consider fans rated for operation with only 50 Hz power, since these fans are not relevant in the U.S. market. *Id.*

Regarding the phase to select for testing, DOE proposed to clarify which phase to use during the test as follows. DOE proposed to specify to test fans and blowers, including circulating fans, rated for operation with only a single- or multi-phase power supply with single- or multi-phase electricity, respectively. For fans and blowers, including circulating fans, capable of operating with single- and multi-phase electricity, DOE proposed that such fans must be tested using a multi-phase power supply, which is the most common power supply for industrial and commercial equipment. *Id.*

Regarding the voltage to select for testing, DOE proposed to clarify which voltage to use during the test as follows. For fans and blowers other than air circulating fans, DOE proposed to retain the provisions in section 7.8 of AMCA

[86] DOE is incorporating by reference AMCA 214–21 and relies on the definitions included in Sections 3 of AMCA 214–21, including the definition of minimum testable configuration as proposed in the July 2022 NOPR. *See* 87 FR 44194, 44257.

214–21 to specify testing at the highest rated voltage and align with existing industry standards. *Id.* For air circulating fans, DOE reviewed the provisions related to the supply voltage in the ceiling fan test procedure, which are also tested based on AMCA 230–15 (with errata). Section 3.4.3 and 3.4.4 of 10 CFR part 430, appendix U. DOE proposed the same provisions for air circulating fans that it uses for ceiling fans, with additional language to distinguish how to select the supply voltage for fans tested using single-phase and multi-phase electricity. Specifically, DOE proposed that the supply voltage must be: (1) for air circulating fans tested with single-phase electricity, the supply voltage would be (a) 120 V if the air circulating fan's minimum rated voltage is 120 V or the lowest rated voltage range contains 120 V, (b) 240 V if the air circulating fan's minimum rated voltage is 240 V or the lowest rated voltage range contains 240 V, or (c) the air circulating fan's minimum rated voltage (if a voltage range is not given) or the mean of the lowest rated voltage range, in all other cases; (2) for air circulating fans tested with multi-phase electricity, the supply voltage would be (a) 240 V if the air circulating fan's minimum rated voltage is 240 V or the lowest rated voltage range contains 240 V, or (b) the air circulating fan's minimum rated voltage (if a voltage range is not given) or the mean of the lowest rated voltage range, in all other cases. *Id.*

ebm-papst stated that the electrical power supply (frequency, phase, and voltage) are specified by the fan supplier. ebm-papst commented that any surveillance testing for enforcement of a regulation should be performed at the supplier-specified electrical conditions. ebm-papst commented that DOE restrictions on the permitted power supply would potentially limit the usability of fan performance data for specific projects due the very diverse nature of the fan industry. (ebm-papst, No. 31 at p. 10)

For fans supplied for use in the United States, AMCA advised that the frequency, phase, and voltage be 60 Hz, 1- or 3-phase, and 110 VAC or 230/460 VAC, respectively. AMCA added that the test procedure should conform to U.S. standards for fans sold in the United States. Additionally, AMCA stated that because these are the most prevalent electrical properties of fans sold in the market, the test procedure should be based on those properties. Additionally, AMCA stated support for the adoption of section 7.8 of AMCA 214 and not ''consider[ing] other options such as specifying a voltage for test similar to that proposed . . . for air circulating fans.'' AMCA noted that doing otherwise could negate historical fan data that was tested in accordance with AMCA 214. (AMCA, No. 41 at p. 24)

New York Blower commented in support of testing at 60 Hz. New York Blower commented that fans with application motors can be configured regularly with 1- or 3-phase voltage configurations at a variety of voltage levels. New York Blower stated that if the fan is rated and offered for sale at a variety of motors that require different voltages and phases, then it should be tested as offered. New York Blower added that bare fans can be driven by a torque meter. (New York Blower, No. 33 at p. 15)

Morrison commented that it supports the use of voltage, phase, and frequency for U.S.-targeted products be 110 VAC or 230/460 VAC, 60 Hz, and 1- or 3-phase. (Morrison, No. 42 at p. 6)

Nidec requested clarity on the voltages to consider in the test procedure. (Public Meeting Transcript, No. 18, at p. 56)

The frequency, voltage, and phase selected for testing can impact the determination of the input power and in turn the determination of the FEI or CFM/W metrics. Therefore, DOE specifies how manufacturers must select the frequency, phase, and voltage when testing in accordance with the DOE test procedure and cannot permit testing each fan and at the supplier-specified electrical conditions.

Regarding the frequency, DOE requires that fans rated for operation with only 60 Hz power supply be tested with 60 Hz electricity and that fans capable of operating with 50 Hz and 60 Hz electricity also be tested with 60 Hz electricity. DOE is not adopting provisions for fans rated for operation with only 50 Hz power supply, as these are not relevant to the U.S. market.

Regarding the phase to select for testing, DOE clarifies which phase to use during the test as proposed in the July 2022 NOPR. DOE requires testing fans and blowers, including circulating fans, rated for operation with only a single- or multi-phase power supply with single- or multi-phase electricity, respectively. For fans and blowers, including circulating fans, capable of operating with single- and multi-phase electricity, DOE requires testing using multi-phase power supply, the most common power supply for industrial and commercial equipment.

Regarding the voltage to select for testing, DOE specifies which voltage to use during the test as proposed in the July 2022 NOPR. For fans and blowers other than air circulating fans, DOE retains the provisions in section 7.8 of AMCA 214–21. For air circulating fans, DOE adopts the same provisions as proposed in the July 2022 NOPR, to distinguish how to select the supply voltage for fans using single-phase and multi-phase electricity. DOE's provisions related to voltage are similar to those used for ceiling fans and DOE believes these provide sufficient clarity on how to select the voltage for testing based on the voltage(s) of the air circulating fan as rated by the manufacturer.

13. Test Speeds for Air Circulating Fans

In the July 2022 NOPR, for single speed air circulating fans, DOE proposed to require that testing be conducted at the single available speed. For multi-speed fans with discrete operating speeds, and for variable-speed fans with continuously adjustable speeds, while DOE believed it is preferable to align the DOE test procedure with the accepted industry test procedures—in this case AMCA 230—as much as possible, DOE explained that it did not have data to determine the typical field operating speed(s) of air circulating fans and DOE tentatively determined that testing at each discrete speed (for multi-speed fans) or at each of the five speeds currently specified in AMCA 230–15 (with errata), rather than only requiring testing at the maximum speed, may provide a more holistic representation of an air circulating fan's performance over a range of service levels, which may in turn facilitate easier comparisons for consumers. In addition, DOE proposed to clarify that for variable-speed air circulating fans with a minimum speed that is greater than 20 percent of the maximum speed, the performance data would be captured and reported in five speeds evenly spaced throughout the speed range, including at minimum and maximum speeds.[87] 87 FR 44194, 44227.

In the July 2022 NOPR, DOE added that it was considering several alternative options for specifying the test speeds at which fans with multiple or variable speeds should be tested, including testing a high speed only, or testing in accordance with the speed requirements for large diameter ceiling fans in section 3.5 of 10 CFR part 430, appendix U, which specifies that testing must be conducted at maximum speed and at 40-percent speed or the nearest

[87] If the fan's maximum speed is 1000 RPM and the fan's minimum speed is 400 RPM, then the following speeds should be reported: 400, 550, 700, 850, and 1000 where each speed is equally spaced of 150 RPM or (1000–400)/4.

speed that is not less than 40-percent speed. DOE noted that regardless of the proposed tested speeds, performance data at additional speeds may be captured and reported to better define the shape of the fan performance curve (for example, additional measurements at 20, 60, and 80 percent of maximum speed). *Id.*

AMCA commented that AMCA currently does not have usage data for air circulating fans in the United States. AMCA noted that the AMCA 230 committee recommends rating air circulating fans at only maximum speed. AMCA commented that some small air circulating fans are supplied with solid-state controllers (SSC) for fan-speed reduction and recently, direct-drive air circulating fans with variable-speed EC motors have entered the market. However, AMCA commented that the current market for air circulating fans is predominantly single speed fans. AMCA added that there is no common number of available speeds (2, 3, 4, etc. speed fans) and the discrete speeds vary greatly (~95 to 60 percent of maximum speed). AMCA recommended that only the highest speed be used for the air circulating fan metric because consumers will benefit from comparing fans at a standardized condition and that using the highest speed is the only equitable way to do this for air circulating fans. AMCA stated that rating fans at different non-maximum speeds will cause consumers to be confused and potentially purchase significantly less efficient fans. AMCA provided an example comparison of a single speed fan (Fan 1) and a variable speed model (Fan 2) where both fans are used in agricultural applications and generate the same amount of airflow at maximum speed and Fan 1 consumes half the power of Fan 2 at high speed. AMCA commented that as currently defined in the NOPR, Fan 1 and Fan 2 would have the same proposed ACFEI rating of 1.01. (See Table III–11)

TABLE III–11—AIR CIRCULATING FAN PERFORMANCE COMPARISON

% Max RPM	36%	52%	68%	84%	100%
Airflow (CFM)	2,440	3,145	3,851	4,556	5,262
Fan 1 Power (W)	.....	.....	.....	.....	297.6
Fan 2 Power (W)	38.8	107.6	220	381.4	595.2
Fan 1 ACFEI (proposed)	*	*	*	*	1.01
Fan 2 ACFEI (proposed)	2.15	1.07	0.74	0.59	0.51
Fan 1 (CFM/W)**	.....	.....	.....	.....	17.68
Fan 2 (CFM/W)**	62.89	29.23	17.50	11.95	8.84

* **Note:** the AMCA comment included values at different speeds. However, for a single speed fan, only one speed is applicable.
** DOE added the CFM/W row for additional comparison.

AMCA commented that since air circulating fan heads in agricultural applications are often purchased to generate relatively high air speeds to cool large mammals (cows require 200–400+ fpm of air speed for cooling), the air circulating fans are very likely to run at higher speeds for the majority of their operating hours. In this instance, according to AMCA, the efficiency metric would mislead the consumer to believe that the single speed fan would consume the same amount of electricity as the highly inefficient variable speed fan. (AMCA, No. 41 at p. 26) AMCA added that similar to high-speed small diameter (HSSD) ceiling fans, air circulating fan heads are typically either single speed or do not have common discrete speeds, so speeds other than high speed may not be well defined. Additionally, stated AMCA, there are no data available to estimate a distribution of time spent at speeds other than high speed for use in an efficiency metric. AMCA commented that the operating speed(s) and time spent at each speed will vary greatly based on the application and potentially on the local weather conditions. Finally, commented AMCA, unlike ceiling fans where low speed operation can be used for destratification, the only utility of an air circulating fan is generating elevated air speed, which takes place at higher fan speeds. Therefore, AMCA recommended that similar to HSSD fans, DOE only rate air circulating fans at maximum speed. (AMCA, No. 41 at pp. 25–26)

Big Ass Fan commented that an [air circulating] fan with an ACFEI of 1 at full speed could have a ACFEI of 10 to 20 when the speed is reduced to the 20 to 30 percent range. Big Ass Fan commented that such approach would inflate the ACFEI metric such that a fan could have a ACFEI of 1 at full speed and a weighted average ACFEI of 7. In addition, Big Ass Fan commented that operating at 20 percent speed does not provide any utility as these fans are primarily designed to create air speed to increase the rate of heat loss off the human body, or off of an animal. As such Big Ass fan stated that the ACFEI metric as proposed would be rewarding to speeds that provide no utility and would not represent how the product is used. (Public Meeting Transcript, No. 18 at p. 55)

DOE collected additional speed data on air circulating fan performance data from the BESS certification database [88] and observed that over 80 percent of models are rated at high speed only. While DOE cannot confirm if these fans are single speed, the data seems to indicate that the market is predominantly single speed as stated by AMCA. In addition, as noted by AMCA and Big Ass Fans, a weighted average metric across different speeds may have unintended consequences, inflate the ACFEI metric, and disproportionally favor multi-and variable-speed fans, which would show significantly better ratings even when performing relatively worse than a similar single speed fan at the same airflow and maximum speed. In addition, the latest version of AMCA 230–23 (section 7.2.4.1 of AMCA 230–23) was revised to require testing at the highest speed only (maximum speed). Therefore, at this time, DOE is requiring testing at maximum speed only, which DOE believes is most representative of an average use cycle and would not be unduly burdensome for manufacturers to conduct. DOE notes that for multi-and variable-speed air circulating fans, section 7.2.4.1 of AMCA 230–23 provides that performance data at additional speeds may be captured to better define the shape of the fan performance curve (for example, additional measurements at 20, 60, and 80 percent of maximum speed). DOE adopts to reference these provisions and allows optional representations at lower speeds as allowed in AMCA 230–23.

In the July 2022 NOPR, DOE noted that AMCA 214–21 has provisions to

[88] Additional speed data collected in September 2022 included 435 models of air circulating fans with the following information: Manufacturer, Power Supply, Model Number, Style (*i.e.,* basket, box, panel, or tube), Size (in) (*i.e.,* impeller diameter), Guard configuration, Airflow (CFM), efficacy (CFM/W), Thrust (lbf), Input power (kW), Thrust Efficiency ratio (lbf/kW), 5D Centerline Velocity (fpm), and Speed (high, med, low, % of max). *See bess.illinois.edu.*

calculate performance data at non-tested speeds based on wire-to-air test results at different speeds. *See* section 6.2 of AMCA 214–21, ''Calculated Ratings Based on Wire to Air Testing,'' which references section 8.2.3, ''Calculation to other speeds and densities for wire-to-air testing'' and Annex G, ''Wire-to-Air Measurement—Calculation to Other Speeds and Densities (Normative).'' For air circulating fans, DOE tentatively determined that these sections do not apply because air circulating fans have a more limited range of operating speeds and DOE proposed to test at each speed where performance data is required. In the July 2022 NOPR, DOE noted that AMCA 214–21 also includes an annex that only applies to shaft-to-air tests and allows interpolating performance between tested speeds (Annex E of AMCA 214–21). For air circulating fans, DOE tentatively determined that these sections do not apply because air circulating fans are tested wire-to-air. 87 FR 44194, 44227.

In response to the July 2022 NOPR, AMCA commented that for ACF, only G.2.3 airflow and G.2.5.2 electrical power at zero static pressure apply. (AMCA, No. 41 at p. 27) AMCA commented that Annex E is not needed for air circulating fans because air circulating fans are tested and sold inclusive of motors. *Id.*

As previously stated, DOE is no longer referencing AMCA 214–21 for air circulating fans and DOE is not opting to reference sections 6.2 of AMCA 214–21, which references section 8.2.3 and Annex G; or Annex E of AMCA 214–21.

14. Run-In Requirements

In the July 2022 NOPR, DOE stated that section 7.4 of AMCA 214–21 specifies that all fans shall be run-in for not less than 15 minutes prior to the commencement of data collection and that the AMCA 230 committee was considering similar provisions for air circulating fans. DOE proposed that the minimum run-in requirement of 15 minutes for fans and blowers be applied to air circulating fans. 87 FR 44194, 44235.

Since then, AMCA 230–23 became available and sections 7.1.3 and 7.3 of AMCA 230–23 include a minimum run-in requirement of 15 minutes.

New York Blower commented that the proposed run-in requirements seem appropriate and are similar to current procedures and practices. (New York Blower, No. 33 at p. 17)AMCA and Morrison recommended that the minimum run-in time for any fan should be at least 15 minutes, which is consistent with DOE's proposal. (AMCA, No. 41 at pp. 28–30; Morrison, No. 42 at p. 7)

In this final rule, DOE is requiring that all fans shall be run-in for no less than 15 minutes prior to the commencement of data collection.

15. Determination of Equilibrium and Test Stability

As discussed in the July 2022 NOPR, both AMCA 210–16 and AMCA 230–15 require that steady readings must be obtained prior to the start of test; however, neither test standard provides specific variables with associated tolerances within which equilibrium can be quantified. To ensure repeatable and reproducible results from a test method, it is necessary to specify consistent requirements for determining when a fan is and is not at equilibrium before the commencement of testing. It is also necessary to specify a duration over which equilibrium must be established. 87 FR 44194, 44227–44228.

a. Fans and Blowers Other Than Air Circulating Fans

As discussed in the July 2022 NOPR, DOE reviewed the test chamber and test equipment accuracy requirements listed in section 6 of AMCA 210–16 to determine equilibrium requirements for fans and blowers other than air circulating fans. 87 FR 44194, 44229. DOE proposed that calculations of ambient air density, and measurements of input power (as measured by a reaction dynamometer, torque meter, calibrated motor, or electrical meter), and fan speed would need to fall within the tolerance window listed in Table III–12 prior to initiating the test. *Id.* In DOE's proposal, input power stability would be required on a single input power device. DOE proposed that fan system equilibrium would need to be verified over at least 5 minutes, with measurements for each variable recorded at a maximum of 5 seconds. *Id.*

TABLE III–12—TOLERANCE REQUIREMENTS FOR MEASURED VARIABLES TO ESTABLISH STABILITY FOR FANS AND BLOWERS THAT ARE NOT AIR CIRCULATING FANS AS PROPOSED IN THE JULY 2022 NOPR

Variable	Equilibrium tolerance
Ambient air density	±1 percent of mean.
Input power by reaction dynamometer.	±4 percent of mean.
Input power by torque meter.	±4 percent of mean.
Input power by calibrated motor.	±4 percent of mean.
Input power by electrical meter.	±2 percent of mean or 1 W, whichever is greater.
Fan speed	±1 percent of mean or 1 rpm, whichever is greater.

In the July 2022 NOPR, DOE discussed that ISO 5801 includes more stringent stability tolerance requirements for fan speed; however, DOE stated that since it was proposing requirements for both fan speed and input power, it was suggesting a less stringent tolerance on fan speed. *Id.* DOE requested comment on its proposal for determining if a fan that is not an air circulating fan has reached equilibrium prior to initiating testing, on the minimum duration and maximum interval over which equilibrium would need to be verified, and on which variables proposed in Table III–12 that, if not stable prior to test, would have the greatest impact on measured fan performance. 87 FR 44194, 44229.

During the public meeting associated with the July 2022 NOPR, Nidec commented that motor test methods require [motor] temperature stabilization and that the July 2022 NOPR did not discuss temperature stabilization. (Public Meeting Transcript, No. 18, p. 57) In the July 2022 NOPR, DOE stated that section 7.4 of AMCA 214–21 specifies that all fans shall be run-in for not less than 15 minutes prior to the commencement of data collection. 87 FR 44194, 44235. As discussed in section III.E.15, DOE is requiring that all fans shall be run-in for no less than 15 minutes prior to the commencement of data collection. The purpose of this requirement is to ensure the motor tested with the fan is appropriately warmed up and stable. While DOE has not provided specific temperature stabilization requirements for the motor, DOE expects that laboratories will sufficiently run-in the motor to avoid lengthy testing to demonstrate fan stability. ebm-papst commented that AMCA 210 and ISO 5801 testing has not caused them concerns about equilibrium. (ebm-papst, No. 31 at p. 11)

New York Blower commented that the signals being measured for larger fans have inherent instability. (New York Blower, No. 33 at p. 12) New York Blower also commented that a 5-minute interval between each test determination seems excessive,

particularly based on their experience of testing industrial fans; however, they understand if this is necessary for air circulating fans. (New York Blower, No. 33 at p. 16) In response, DOE notes that its intent in the July 2022 NOPR was that a fan would be considered stable if it met the proposed tolerance requirements over a 5-minute ''stability test'', not that each test would be 5 minutes in duration.

Robinson stated that the equilibrium requirements are reasonable; however, they added that not all laboratories are temperature controlled and therefore the density requirement may not be attainable for the duration of the test. Robinson commented that specifying equilibrium for density as it applies to centrifugal housed or radial housed fans would create a need for laboratories to add climate control systems or increase the sizes of their existing laboratories to maintain a density equilibrium. If this is only meant as a measure of starting a test that may be acceptable, but for the duration of a test a 1 percent change in density is unlikely to be maintained particularly as testing a fan will take several hours or span over more than one day. (Robinson, No. 43 at p. 7) Additionally, Robinson commented that they do not see a need for a tight restriction on speed variation if the data can be corrected to a common condition. (Robinson, No. 43 at p. 10) In response, DOE notes that the purpose of setting a tolerance on fan speed is to ensure stability prior to testing, and prior to correcting to a common condition.

Of the variables listed in Table III–12, calculated ambient air density, which is a function of dry bulb temperature, wet bulb temperature and barometric pressure, impacts the fan's test environment. It is important to ensure that the lab environment is stable, while fan stability is being assessed. Calculated air density for fans and blowers that are not air circulating fans is determined from the dry bulb temperature at plane 0 (T_{d0}), the wet bulb temperature at plane 0 (T_{w0}), and the barometric pressure, where plane 0 is defined in Table 2 of AMCA 210–16 as the general test area. Regarding Robinson's comment that it may be difficult to maintain calculated air density within ±1 percent of the mean over the duration of the test, DOE clarifies that the air density tolerance proposed in the July 2022 NOPR applies only to the determination of fan stability and that section 6.2.4.1 of AMCA 210–16 includes temperature and pressure measurement requirements when environmental conditions are varying. DOE would not expect temperature, relative humidity, and barometric pressure to vary outside of the ranges listed above over the timeframe necessary to determine stability, even in a building without climate control. However, DOE notes that since air density is used to determine fan performance, air density must be captured during each test run.

Greenheck recommended not including additional equilibrium or stabilization procedures because once the dynamometer or calibrated motor is initially warmed up, no additional benefit is gained by waiting to stabilize. (Greenheck, No. 39 at . 6) To substantiate its position, Greenheck provided example test data for housed centrifugal fans at a constant rpm that showed no difference in brake horsepower versus airflow when the test was completed with cold bearings, warmed bearing or running each duty point for 5 minutes before taking the test measurement. (Greenheck, No. 39 at p. 7, Figure 2) Greenheck also provided a plot of energy use as a function of airflow for an axial fan using a calibrated motor. (Greenheck, No. 39 at p. 8, Figure 3) Although data values were not provided, Greenheck stated that all power readings within the usable portion of the fan curve are within 1 percent whether the motor was warmed up and data collected, the motor was warmed up and data was corrected to 1200 rpm, or the motor was warmed up and data was taken after running for 5 minutes. (Greenheck, No. 39 at p. 7, Figure 2)

Section 6.1.2 of AMCA 210–16 states that ''statistically stable conditions shall be established before each determination'' and that ''trial observations shall be made until steady readings are obtained.'' This section of AMCA 210–16 provides no provisions for determining stable readings and provides no requirements for evaluating if conditions are statistically stable. Comments from AMCA and fan and blower manufacturers suggest that there are multiple ways a manufacturer may verify that a fan under test is considered stable prior to testing. Based on the data provided by Greenheck, ensuring that the dynamometer or calibrated motor is warmed up may be sufficient to ensure fan stability during test. However, DOE notes that it is required to ensure that its test procedures are repeatable—ensuring repeatability becomes especially important if enforcement testing is warranted to evaluate compliance with any potential energy efficiency standards.

AMCA and Morrison stated that there is a need to ensure both equilibrium prior to testing and stability during testing, and that DOE did not sufficiently differentiate between the two. (AMCA No. 41 at pp. 28–30; Morrison, No. 42 at p. 7) In the following sections, DOE discusses the test stability requirements that it is adopting for fans and blowers that are not air circulating fans. DOE notes that the purpose of these stability provisions is to clarify section 6 of AMCA 210–16 to improve overall repeatability and reproducibility of the test procedure. DOE does not expect these requirements to obsolete historical testing completed by the industry.

In its comments, AMCA recommended using the same approach for determining stability of air circulating fans and fans and blowers that are not air circulating fans. Specifically, AMCA stated that all measured values will fluctuate over time, and recommended averaging these values over a 120-second duration to ensure test repeatability. (AMCA, No. 41 at p. 28) AMCA also commented that these fluctuations may trend upward or downward, or may fluctuate around an average value, and provided two examples, one where measured power increases with time over a measurement interval of 300 seconds, and the second where measured power varies, but does not increase over the same measurement interval. (AMCA, No. 41 at pp. 28–29) AMCA further recommended that instrument filtering should be used to minimize measurement fluctuations and provided examples of how a measurement instrument could be set up to do this. (AMCA, No. 41 at p. 29) AMCA also suggested that fan speed stability would be established when the averaged results from two successive readings differ by no more than 1 percent or 1 rpm, whichever is greater, and that electrical input power stability would be established when the averaged results from two successive readings differ by no more than 1 percent or 1 watt, whichever is greater. *Id.* DOE interprets AMCA's comments to suggest that filtered fan speed and input power or torque measurements should be averaged over 120-second intervals and that the average over this interval should be compared to previous 120-second intervals to determine whether these variables meet the tolerance requirements discussed above. (*See* AMCA, No. 41 at p. 29, recommendation 3) But AMCA also stated that fan stability occurs much more quickly for fans and blowers that are not air circulating fans since they are tested against pressure and in a duct or in a chamber. (AMCA, No. 41 at p. 29) Additionally, for fans and blowers that

are not air circulating fans, AMCA suggested a different time interval for determining the test measurement value, specifically taking the average over a 15 second interval, but increasing the averaging duration to 60 seconds if individual measurements fluctuate by more than ±2 percent of the average over the 15-second interval. (AMCA, No. 41 at p. 30) For testing, Morrison Products suggested a similar approach, but with shorter time intervals, specifically, test measurement values would be determined by averaging over 10 seconds; however, if individual measurements fluctuate by more than ±2 percent of the mean, the duration over which the average should be taken would increase to 30 seconds. (Morrison Products, No. 47 at p. 7)

DOE agrees with AMCA that determination of fan stability should be a comparison of averages over successive time durations. However, because DOE expects that fans and blowers that are not air circulating fans will reach stability more quickly than air circulating fans, it believes determining average input power and fan speed over 120-second intervals may filter the data too much and may unnecessarily increase the time to confirm equilibrium. Instead, DOE has determined that ensuring the average fan speed and average input power over successive 60-second data intervals (*i.e.,* average of data points collected at least every 5 seconds over 60 seconds) are within the tolerances listed in Table III–12 is appropriate for determining fan speed and input power equilibrium. The 60-second data interval is consistent with the interval recommended by AMCA as a secondary option if filtered measurements fluctuate by more than ±2 percent over a 15-second test interval. (AMCA, No. 41 at p. 30) While AMCA's suggestion was specific for testing, DOE believes that a consistent data collection interval for both equilibrium determination and testing reduces the complexity of the test procedure and reduces test procedure burden since the last sampling interval for determining equilibrium interval may be used as a test measurement.

In its comments, AMCA provided a figure showing input power trending upward over a 300-second measurement interval. (AMCA, No. 41 at p. 29, Figure 7) DOE understands this figure to suggest that comparing average values between successive data collection intervals may not capture instances where fan speed or input power are consistently trending upward or downward over time. Upward or downward trends in fan speed or input power over successive test intervals indicate that the fan system has not reached stability and that stability data must be collected over additional 60-second time intervals until data within the measured time intervals are no longer consistently increasing or decreasing. Comparing the slope of the individual data within each time interval, in addition to ensuring required tolerances are met, provides information on whether the measured value is stable, or consistently increasing or decreasing over time. For example, a positive slope calculated for three consecutive time intervals indicates a consistent upward trend in the measured variable suggesting that the fan has not reached stability and additional intervals must be run until a negative slope is achieved. As a second example, if a positive, negative, and positive slope are determined for fan speed and input power over three consecutive intervals, these variables are likely stable.

As such, DOE has determined to add further specificity to the stability requirements outlined in section 6.1.2 of AMCA 210–16. Specifically, stability will be evaluated and confirmed over at least three 60-second data collection intervals. DOE believes that at least three data collection intervals are necessary to ensure that slope is not consistently increasing or decreasing for each successive test duration. Fan speed and input power shall be monitored at least every 5 seconds over each 60-second data collection interval. The following two requirements must be met for a fan to be considered stable and for testing to commence:

(1) The average of fan speed from one data collection interval to the next must be within ±1 percent or 1 rpm, whichever is greater; and the average input power by reaction dynamometer, torque meter or calibrated motor must be ±4 percent, or the average input power by electrical meter must be ±2 percent of the mean or 1 watt, whichever is greater. These values are consistent with those proposed in the July 2022 NOPR; however, the interval over which average speed and average input power is determined, and the comparison between these intervals has been further clarified.

(2) The slope of fan speed and the slope of fan input power over 60 seconds from one data collection interval to the next shall not be trending upward or trending downward. Specifically, if the slope of 3 or more successive data collection intervals are all positive or all negative, additional data collection intervals must be run until a negative or positive slope, respectively, is achieved.

For testing (*i.e.,* after equilibrium has been verified), Morrison recommended sampling and statistically averaging test measurements over 10 seconds and that if filtered measurements fluctuate by more than 2 percent of the average value, the averaging time shall be increased to 30 seconds. (Morrison, No. 42 at p. 7) AMCA, as discussed previously, recommended statistically averaging test measurements over 15 seconds and if filtered measurements fluctuate by more than 2 percent of the average value, the averaging time would be increased to 60 seconds. (AMCA, No. 41 at p. 29–30)

First, DOE clarifies that the tolerances specified in Table III–12, excluding the air density tolerance, should be maintained throughout the test. Second, average values from two successive 60-second sampling intervals meet the tolerance requirements specified in Table III–12 (excluding air density). DOE expects that maintaining the same data collection requirements for equilibrium determination and testing (*i.e.,* 60 seconds) will simplify the test and ultimately reduce test burden, since the last equilibrium measurement could be used as a valid test point. However, DOE also recognizes that laboratories may be able to achieve the specified tolerance on fan speed and input power over a shorter time interval, as suggested by Morrison. Therefore, in this final rule, DOE is specifying only that the sampling interval to determine average test values should not exceed 60 seconds, consistent with the sampling interval used to determine equilibrium.

Regarding AMCA's comment on data filtering, or damping, DOE recognizes that data filtering helps reduce noise or measurement fluctuation. DOE's requirement that data taken every 5 seconds must be averaged over a 60-second duration effectively filters the data with a time constant of 5 seconds.

b. Air Circulating Fans

In the July 2022 NOPR, DOE discussed the equilibrium options considered by the AMCA 230 committee. At the time, the committee was considering choosing three or four of the following values to determine equilibrium: fan speed, system input power, barometric pressure, and load differential. The committee was also considering that these variables would need to meet a specified tolerance after at least 5 minutes of the fan running, with measurements taken at least every 5 seconds. 87 FR 44194, 44228.

Furthermore, DOE had tentatively determined that the ambient air density, extraneous airflow (*i.e.,* test room ventilation), system input voltage,

system input current, system input power, fan speed, load, and load differential would impact test results. *Id.* Therefore, DOE proposed that measurements of these values would need to fall within a specified tolerance window listed in Table III–13 prior to initiating a test for air circulating fans. *Id.* DOE also proposed that measurements for each of the variables would be taken at least every 5 seconds over at least 5 minutes, providing a minimum of 60 data points from which equilibrium can be verified. *Id.*

TABLE III–13—TOLERANCE REQUIREMENTS FOR MEASURED VARIABLES TO ESTABLISH STABILITY FOR AIR CIRCULATING FANS AS PROPOSED IN THE JULY 2022 NOPR

Variable	Equilibrium tolerance
Calculated air density	±1 percent of mean.
System input voltage	±2 percent of mean.
System input current	±2 percent of mean.
System input power	±2 percent of mean or 1 W, whichever is greater.
Fan speed	±1 percent of mean or 1 rpm, whichever is greater.
Load	±1 percent of mean.
Load differential	±1 percent of mean.

DOE proposed that air density, as determined from dry bulb temperature, dew point, and barometric pressure measured over at least 5 minutes, would remain within one percent of the mean air density to establish equilibrium prior to fan testing. *Id.* The system input voltage, system input current, system input power, load, and load differential tolerances for evaluating equilibrium that DOE proposed were two times the equipment accuracy tolerances specified in AMCA 230–15 and identical to those discussed by the AMCA 230 committee working group at the time. *Id.* Additionally, DOE proposed that fan speed would be within ±1 percent of the mean rpm or 1 rpm, whichever is highest over at least a 5-minute duration to establish equilibrium prior to testing. *Id.*

Furthermore, in the July 2022 NOPR, DOE discussed possibly prioritizing the variables such that equilibrium must always be demonstrated for a specific number of the highest priority variables. *Id.* Alternately, DOE discussed possibly specifying a subset of the variables proposed, similar to what had been discussed by the AMCA 230 committee at the time. *Id.*

DOE requested comment on its proposal for determining that an air circulating fan has reached equilibrium prior to initiating testing, on the minimum duration and maximum interval over which equilibrium would need to be verified, and on the variables it proposed. 87 FR 44194, 44228–44229.

As discussed, AMCA recommended using the same approach for determining stability of air circulating fans and fans and blowers that are not air circulating fans and AMCA's comments are summarized in the previous section. For air circulating fans, AMCA stated that the AMCA 230 committee proposed the following requirements for equilibrium that will be included in the next edition of AMCA 230: readings shall be recorded when both speed and electrical power have stabilized; readings shall be recorded at least 15 minutes after start-up; the averaged results from two successive readings of electrical input power shall differ by not more than 1 percent or 1 watt, whichever is greater; and the averaged results from two successive readings of fan speed shall differ by not more than 1 percent or 1 rpm, whichever is greater. (AMCA, No. 41 at p. 28, 30)

Greenheck recommended that DOE adopt the run-in period and filtering methodology in the latest revision of AMCA 230 and that DOE handle air circulating fans in a separate rulemaking. (Greenheck, No. 39 at p. 8)

In the July 2022 NOPR, DOE stated that should the revised version of AMCA 230 publish prior to the publication of any DOE test procedure final rule, DOE intends to revise its test procedure provisions in line with the latest AMCA 230 standard, provided the updates to the AMCA 230 standard are related to topics that DOE has discussed and for which DOE solicited comments. 87 FR 44194, 44228. Sections 7.1 and 7.3 of AMCA 230–23 include provisions for run-in and determination of fan stability prior to test, specifically:

(1) Run-in shall be conducted for no less than 15 minutes prior to the commencement of data collection;

(2) Ambient conditions shall be measured prior to startup and throughout the test, as specified;

(3) Load differential, measured electrical input power and fan speed measurements shall be averaged for a minimum of 120 seconds;

(4) Measured electrical input power stability is established when the averaged results from two successive readings differ by not more than 1 percent or 1 watt, whichever is greater; and

(5) Fan speed stability is established when the averaged results from two successive readings differ by not more than 1 percent or 1 rpm, whichever is greater.

Based on its review of AMCA 230–23, review of the comments received to the July 2022 NOPR, and additional evaluation of DOE test data for air circulating fans, DOE is generally adopting the fan stability provisions in AMCA 230–23, with additional clarification, as discussed below.

Regarding the determination of ambient conditions, DOE notes that AMCA 230–23 does not provide additional specifications for determining ambient conditions. Of the variables listed in Table III–13, input voltage and room air density, which is a function of dry bulb temperature, wet bulb temperature and barometric pressure, impact the fan's test environment. It is important to ensure that environmental stability is achieved to minimize changes that impact fan performance, and that stability is maintained during the test to ensure test repeatability. DOE proposed in the July 2022 NOPR that calculated air density must remain within ±1 percent of the mean and input voltage must remain within ±2 percent of the mean over a period of 5 minutes with data collected at least every 5 seconds. 87 FR 44194, 44228. DOE received no comments from stakeholders regarding stability determination or proposed tolerance criteria for either input voltage or room air density. Therefore, DOE is adopting the equilibrium tolerance criteria for input voltage and calculated air density as proposed in the July 2022 NOPR. However, based on comments received regarding determining fan stability (*i.e.,* fan speed and load differential) and the language in AMCA 230–23, DOE is instead requiring that input voltage and room air density must meet the specified tolerance requirements over the full duration of a test, including the time it takes to demonstrate fan stability. While DOE proposed that determining equilibrium over at least 5 minutes, DOE recognizes that achieving equilibrium and capturing test data will vary depending on the fan, and has therefore opted to not specify a minimum time requirement for data capture. Finally, as discussed for fans and blowers that are not air circulating fans, since air circulating fans may be tested in facilities without climate control, ambient condition data collection may start after the run-in period has been completed, but before commencement of stability testing. In summary, this final rule specifies that input voltage shall be captured at least every 5 seconds and shall not vary by more than ±2 percent over the duration of each test (including stability determination) and calculated air

density shall not vary by more than ±1 percent over the duration of each test (including stability determination).

AMCA 230–23 specifies that stability must be established for electrical input power and fan speed; however, DOE notes that section 7.2 of AMCA 230–23 requires reporting of load differential. Since measurement of load differential is a required value, and used in later calculations, DOE has determined that stability must also be demonstrated for load differential, in addition to electrical input power and fan speed. DOE notes that it proposed a tolerance of ±1 percent of the mean for load differential in the July 2022 NOPR. 87 FR 44194, 44228.

While AMCA's comments to the July 2022 NOPR are consistent with the language in AMCA 230–23, AMCA's comments additionally suggest that comparing average values between successive data collection intervals may not capture an upward or downward trend in fan speed, input power, or load differential. (AMCA, No. 41 at p. 29, Figure 7) A lab may observe an upward or downward trend in these variables over successive data collection intervals if the fan has not been run-in for enough time and/or is not at equilibrium.

To account for continuous upward or downward trends in slope over multiple 120-second measurement intervals, and to address AMCA's comment, DOE is adding further specificity to the stability requirements outlined in section 7.3 of AMCA 230–23. Specifically, stability will be evaluated and confirmed over at least three 120-second data collection intervals. The 120-second data collection interval is consistent with the provisions in section 7.3 of AMCA 230–23 for determining fan stability. However, AMCA 230–23 and AMCA's comments to the July 2022 NOPR do not recommend a minimum number of data collection intervals for determining stability. DOE believes that at least three data collection intervals are necessary to ensure a mix of positive and negative slopes calculated for the data collected over successive 120-second intervals. If the slope for each of three intervals either all increase or all decrease, the variable being measured is trending up or trending down, respectively, and the fan is not at equilibrium (see similar discussion in the previous section for fans and blowers that are not air circulating fans). While more than a minimum of three data collection intervals would provide greater assurance that fan speed, input power, and load are stable, DOE selected a minimum of three test intervals to minimize test burden, while still ensuring that a laboratory can validate that slopes are not consistently positive or negative. Additionally, DOE expects that if a fan is appropriately run-in prior to testing, laboratories should be able to demonstrate speed, input power and load stability with the minimum of three test intervals. Fan speed, input power, and load differential shall be monitored at least every 5 seconds over each 120-second data collection interval. The following two requirements must be met for a fan to be considered stable and for testing to commence:

(1) The average of fan speed from one data collection interval to the next must be within ±1 percent or 1 rpm, whichever is greater; the average fan input power from one data collection interval to the next must be ±1 percent or 1 watt, whichever is greater; and the average load differential from one data collection interval to the next must be ±1 percent. The tolerance requirements for fan speed and load differential are the same as those proposed in the July 2022 NOPR (see Table III–13); however, DOE has tightened its tolerance criteria for fan input power from ±2 percent of the mean or 1 W, whichever is greater, to ±1 percent of the mean or 1 W, whichever is greater, to be consistent with section 7.3 of AMCA 230–23.

(2) The slope of fan speed, input power, and load differential over 120 seconds from one data collection interval to the next shall not be monotonic. Specifically, if the slope of 3 or more successive data collection intervals are all positive or all negative, additional data collection intervals must be run until a negative or positive slope, respectively, is achieved.

16. Test Figures for Air Circulating Fans

In the July 2022 NOPR, DOE noted that AMCA 230–15 (with errata) describes the test set-up that can be used to test various categories of air circulating fans and specifies that air circulating fan heads and table fans, which correspond to unhoused ACFHs, must be tested according to test figures 2A, 2B1, and 2B2. AMCA 230–15 (with errata) and also specifies that box fans and personnel coolers, which are both housed ACFHs, must be tested using test figures 3A and 3B. DOE noted that the AMCA 230 committee reviewed the existing text figures and was considering revising the allowable test figures to reflect that housed air circulating fans could also be tested using test figures 2A, 2B1, and 2B2, and unhoused air circulating fans would be tested using figures 3A and 3B. 87 FR 44194, 44229.

In the July 2022 NOPR, DOE tentatively determined that test figures 2A, 2B1, 2B2, 3A and 3B are appropriate for all air circulating fans. As such, DOE proposed to specify that any test figures that are specified in AMCA 230–15 (with errata) can be used for testing air circulating fans. *Id.*

Since then, AMCA 230–23 became available and specifies that test figures 2A, 2B1, 2B2, 3A and 3B [89] are appropriate for all air circulating fan in section 6.1 of AMCA 230–23.

AMCA commented that AMCA 230–23 will include slight refinement of the test figures from the 2015 version. Nevertheless, stated AMCA, each test figure is applicable to the fans in the scope of AMCA 230, which means that figures 2A, 2B1, 2B2, 3A, and 3B are applicable to all air circulating fans. (AMCA, No. 41 at p. 27)

As proposed, DOE specifies that any test figures specified in AMCA 230–23 can be used for testing air circulating fans.

17. Location of External Airflow Measurement

In the July 2022 NOPR, DOE noted that section 8.1.2 of AMCA 230–15 (with errata) specifies that the air velocity in the test room, not generated by the test air circulating fan, shall not exceed 0.25 m/s (50 fpm) prior to, during, and after the test. Velocity measurements shall be taken immediately before and immediately after the test to ensure that this condition is met. In addition, AMCA 230–15 (with errata) specifies the location of the extraneous airflow measurement shall be directly under the center of the fan at an elevation of 1701.8 mm (67 in.) above the floor. DOE noted that this provision is only applicable to fans tested according to Figure 1 of AMCA 230–15 (with errata) and that there is no location specified for extraneous airflow measurement for fans tested according to Figures 2A, 2B1, 2B2, 3A and 3B. 87 FR 44194, 44234–44235.

In the July 2022 NOPR, DOE noted that the AMCA committee was considering adding the following provisions to specify the location of the extraneous airflow measurement and to move these provisions from section 8.1.2 of AMCA 230–15 (with errata) into each of the figures. For Figure 1 of AMCA 230–15, the location of extraneous airflow measurement would be directly under the center of the fan at an elevation of 1.7m (67 in.) above the floor. For figures 2A, 2B1, 2B2, 3A and 3B, the location of extraneous airflow measurement should be at the center of

[89] In AMCA 230–23. These figures were re-numbered 10.2A, 20.2B1, 10.2B2, 10.3A and 10.3B

the fan at a distance of 1.5m (5 ft) downstream of the fan impeller. DOE agreed that these additional specifications were necessary to ensure test procedure repeatability, and therefore proposed to add these additional provisions as considered by the AMCA 230 committee. 87 FR 44194, 44235.

AMCA commented that it supports the proposed location, adding that positions to measure extraneous airflow were added to AMCA 230 toward its revision. AMCA commented that the positions are the same as noted in the NOPR. (AMCA, No. 41 at p. 28)

Since publication of the July 2022 NOPR, the test figures of AMCA 230–23 have been updated to specify the positions to measure extraneous airflow as proposed. In this final rule, DOE is directly referencing the test figures in AMCA 230–23 which include the location of the extraneous airflow measurement as proposed.

18. Transducer Type Barometer

In the July 2022 NOPR, DOE noted that section 6.5.2.1 of AMCA 230–15 (with errata) specifies that transducer type barometers shall be calibrated for each test. DOE stated that the AMCA 230 committee was considering removing this requirement from the revised version. DOE noted that it was also considering not including this requirement as it may be sufficient to require that the barometer be calibrated against a mercury column barometer with a calibration that is traceable to National Institute of Standards and Technology (''NIST'') or other national physical measures recognized as equivalent by NIST, without having to repeat calibration before each test. 87 FR 44194, 44235.

AMCA commented that calibration of transducer-type barometers for each test should be removed. AMCA commented that mercury-column barometers are discouraged and have often been removed from labs for safety reasons, but that transducers are very stable and are calibrated annually. AMCA commented that the AMCA 230 technical committee proposed the following change to barometer calibration, which will be included in section 6.5.2.1 ''Calibration'' of the 2022 edition of AMCA 230: ''barometers shall be calibrated and calibration traceable to NIST or other national physical measures recognized as equivalent by NIST. Barometers shall be maintained in good condition. All equipment used to measure psychometric data shall be calibrated with uncertainties by an ISO 17025 accredited calibration laboratory.'' (AMCA, No. 41 at p. 30)

Robinson commented that it does not recommend adding a requirement to calibrate transducer-type barometers for each test. (Robinson, No. 43 at p. 10)

Since publication of the July 2022 NOPR, section 5.5.2.1 of AMCA 230–23 removed the requirement for calibration of transducer-type barometers for each test. As noted by AMCA, it is sufficient to require that the barometer be calibrated with a calibration that is traceable to National Institute of Standards and Technology (''NIST'') or other national physical measures recognized as equivalent by NIST, without having to repeat calibration before each test. DOE adopts to reference the provisions in section 5.5.2.1 of AMCA 230–23, and to not require calibration of transducer-type barometers for each test as recommended by Robinson.

19. Reference Fan Electric Input Power Calculation for Air Circulating Fans

In the July 2022 NOPR, DOE proposed to rely on an FEI metric for air circulating fans. 87 FR 44194, 44237–44238. Section 4 of AMCA 214–21defines the FEI as the fan electrical input power of a reference fan (FEP_{ref}) divided by the fan electrical input power of the fan being rated at the same flow and total pressure conditions (FEP_{act}). Similar to how the FEP_{ref} of fans and blowers other than air circulating fans is calculated, DOE proposed to calculate the FEP_{ref} for air circulating fans based on:

- A reference fan shaft input power equation, used to calculate the reference fan shaft input power at a given duty point. This equation relies on a flow constant (Q_0) and a pressure constant (P_0), which represent how efficiency varies as a function of flow and pressure and an efficiency target, which was set to represent a market reference efficiency fan;
- A reference fan transmission efficiency equation, which calculates the reference fan transmission as a function of the reference shaft input power and represents a typical belt drive. *See* section 5.2 of AMCA 214–21; and
- A reference motor equation as described in section III.E.1 of this document.

DOE collected air circulating fan performance data from the BESS certification database [90] and performed regression analyses to determine the appropriate flow, pressure, and efficiency target constants for air circulating fans. DOE proposed to rely on the following constants: Q_0 = 3,210 CFM (rounded to the nearest 10); P_0 = 0 in.wg; and an efficiency target of 0.38 (38 percent). 87 FR 44194, 44231–44234.

In addition, DOE noted that it was considering using the term ''Air Circulating Fan FEI'' or ''ACFEI'' to differentiate the proposed FEI for air circulating fans from the FEI as it applies to fans and blowers that are not air circulating fans and from the CFEI as it applies to ceiling fans. 87 FR 44194, 44238

As noted in Section III.G of this document, DOE is not adopting the FEI or ACFEI as the metric for air circulating fans. Therefore, DOE is not opting to specify a calculation of FEP_{ref} for air circulating fans. Comments received on the air circulating fan FEI also relate to the metrics and are discussed in Section III.G of this document.

20. Rounding

As discussed in the July 2022 NOPR, AMCA 214–21 provides a method for calculating fan performance using the FEI metric; however, AMCA 214–21 does not provide normative rounding requirements for FEI. 87 FR 44194, 44234. DOE also discussed that it would consider referencing any rounding requirements in the updated version of AMCA 230, if those requirements were consistent with the rounding provisions that DOE proposed and solicited comments on in the July 2022 NOPR.[91] *Id.* DOE received no comments regarding standardization of rounding with the newest version of AMCA 230. DOE notes that AMCA 230–23 provides rounding provisions for blade span and tip speed but does not include rounding provisions in Section 8, calculations. While not discussed in the July 2022 NOPR, DOE notes that AMCA 230–15

[90] Data collected on March 22, 2022, included 507 models of air circulating fans with the following information: Manufacturer, Power Supply, Model Number, Style (*i.e.,* basket, box, panel, or tube), Size (in) (*i.e.,* impeller diameter), Guard configuration, Airflow (CFM), efficacy (CFM/W), Thrust (lbf), Input power (kW), Thrust Efficiency ratio (lbf/kW), 5D Centerline Velocity (fpm). *See bess.illinois.edu.*

[91] There is an error in section III.D.18 (Rounding) in the July 2022 NOPR. In the following sentence, it should have stated ''reporting'' instead of appurtenances, ''Should the revised version of AMCA 230 publish prior to the publication of any DOE test procedure final rule, DOE intends, after considering stakeholder feedback received in response to the proposals in this document, to revise the provisions related to appurtenances in line with the latest AMCA 230 standard, provided the updates in this standard are consistent with the provisions DOE is proposing in this NOPR, or the updates are related to topics that DOE has discussed and for which DOE has solicited comments to in this NOPR. Since the section title is ''rounding'', DOE has determined that, despite the error, and given that DOE received no comments the context of this sentence is clear.

also does not provide rounding requirements.

FEI is specified to the hundredths place in section 6.5.3.1.3 of ASHRAE 90.1–2019 (Fan Efficiency). Additionally, the DOE energy conservation standard for large diameter ceiling fans is the Ceiling Fan Energy Index (''CFEI''), where the CFEI metric is calculated according to AMCA 208–18, is specified to the hundredths place (*i.e.,* CFEI must be greater than or equal to 1.00 at high speed and 1.31 at 40 percent speed, or the nearest speed that is not less than 40 percent speed). 10 CFR 430.32.(s)(2)(ii). Additionally, Annex I of AMCA 214–21 (informative) specifies rounding the FEI to the hundredth place.

Therefore, in the July 2022 NOPR, DOE proposed rounding represented values of FEI to the hundredths place. *Id.* For consistency, DOE also proposed that represented values for FEP would be rounded to the hundredths place. *Id.*

How inputs to the calculation of FEI are rounded can impact the represented FEI (or FEP value). DOE reviewed the provisions related to rounding in the ceiling fans test procedure, which states that all measurements should be recorded at the resolution of the test instrumentation and that calculations shall be rounded to the number of significant digits present at the resolution of the test instrumentation. Section 3.1.1 of 10 CFR part 430, appendix U; 87 FR 44194, 44234.

In the July 2022 NOPR, DOE tentatively concluded that the rounding provisions in section 3.1.1 of 10 CFR part 430, appendix U are reasonable and that recording measurements at the resolution of the test instrumentation would provide sufficient significant digits for accurately calculating representative values of FEI and FEP. *Id.* Therefore, DOE proposed that all measurements would be recorded at the resolution of the test instrumentation and that calculations would be rounded to the number of significant digits present at the resolution of the test instrumentation. *Id.*

ebm-papst, New York Blower, AMCA, and Morrison agreed that rounding FEI to the hundredths place is reasonable. (ebm-papst, No. 31 at p. 11; New York Blower, No. 33 at p. 17, AMCA, No. 41 at p. 28; Morrison, No. 42 at p. 6). Additionally, New York Blower, AMCA and Morrison supported DOE's to round FEP to the nearest hundredth of a kW. (New York Blower, No. 33 at p. 17, AMCA, No. 41 at p. 28; Morrison, No. 42 at p. 6) AMCA and Morrison did, however, suggest that if the FEP is less than 1 kW, the value should be rounded to the nearest thousandth of a kW. (AMCA, No. 41 at p. 28; Morrison, No. 42 at p. 6) DOE received no comment on measurements being recorded at the resolution of the test instrument and calculations being rounded to the number of significant digits present at the resolution of the test instrument.

DOE is adopting the requirement to round the FEI to the nearest hundredths place. DOE considered stakeholder feedback on the rounding requirements for FEP and is specifying that FEP should be rounded to three significant digits. Therefore, if FEP is greater than 1 kW, the value would be rounded to the nearest hundredth of a kW and if the FEP is less than 1 kW, the value would be rounded to the nearest thousandth of a kW. DOE is additionally specifying that all measurements shall be recorded at the resolution of the test instrument and that calculations shall be rounded to the number of significant digits present at the resolution of the test instrument, consistent with its proposal in the July 2022 NOPR.

As discussed in detail in section III.G of this document, DOE is adopting an efficacy metric, reported in CFM/W, for air circulating fans. Although DOE discussed the possibility of adopting a CFM/W metric for air circulating fans in the July 2022 NOPR (87 FR 44194, 44234), DOE did not discuss or propose any rounding requirements for this metric. As such, DOE expects to propose rounding provisions for air circulating fans in a future certification rule.

F. Distinguishing Between Fans and Blowers and Air Circulating Fans

In the July 2022 NOPR, DOE noted that some manufacturers offer the same fan model with different mounting configurations. Depending on the mounting configuration, the same fan could either meet the definition of a fan tested per AMCA 210–15 or meet the definition of an air circulating fan and be tested per AMCA 230–15. DOE identified that air circulating fans with housing (*i.e.,* axial panel air circulating fans and box fans) can also be distributed in commerce as with brackets for mounting through a wall, ceiling, or other structure that separates the fan's inlet from its outlet and marketed as ''exhaust fans.'' In this case, DOE tentatively concluded these fans would be tested per AMCA 210–16 as they would meet the definition of an axial panel fan. DOE added that manufacturers who distribute these fans in commerce in both configurations and market the fans both for air circulation and exhaust applications typically test the fan using both AMCA 230–15 (with errata) and AMCA 210–16. DOE proposed that fan models that meet both the definition of an axial panel fan and the definition of an air circulating fan depending on the presence or absence of brackets for mounting through a wall, ceiling, or other structure that separates the fan's inlet from its outlet be tested according to both the test procedures for fans and blowers, excluding air circulating fans, and the test procedure for air circulating fans. 87 FR 44194, 44235.

AMCA commented that fan owners often apply fans differently from how manufacturers intended them to be used and that fan manufacturers did not have control over how panel fans are employed. AMCA noted that the presence or absence of brackets may not deter the use of a fan for the user's desired application. AMCA recommended that the criterion for the DOE-relevant test method is the fan nameplate information and coinciding technical marketing material and installation instructions. AMCA commented that if a fan is presented both as an air circulating fan and a fan and blower other than an air circulating fan by the manufacturer, then it shall be rated both ways, supported by both type of test reports. AMCA added that if a fan is a circulating panel fan, it should be required to be tested only as a circulating panel fan; if it is a panel fan, it should be required to be tested only as a panel fan; and if the fan can be used as either a circulating panel fan or a panel fan, it should be tested as both. (AMCA, No. 41 at pp. 30–31)

ebm-papst commented that the NOPR does not provide sufficient clarification of the distinguishing mounting features. Therefore, ebm-papst stated that an axial panel fan should be rated at least either as a ventilation fan or as a circulation fan. ebm-papst commented that rating of the same fan as per a second category should remain the choice of the fan suppliers, because they have to serve a diverse market with many unique fan selection criteria. (ebm-papst, No. 31 at p. 12)

The Efficiency Advocates commented in support of DOE's proposal that fans meeting the definition of both axial panel fans and air circulating fans be tested as both. The Efficiency Advocates commented that some manufacturers offer the same fan model with different mounting configurations. For example, stated the Efficiency Advocates, housed air circulating fans may also be sold with brackets for mounting through a wall or ceiling for use as an exhaust fan. The Efficiency Advocates added that this would reduce the potential for a loophole wherein a less efficient fan could be sold with different mounting configurations as a means of being

subject to a less stringent standard. (Efficiency Advocates, No. 32 at pp. 2–3)

DOE recognizes that manufacturers do not have control over how users ultimately decide to install their equipment. As a general matter, DOE's authority applies to products as manufactured and not at point of installation. (*See* generally 42 U.S.C. 6302.) DOE considers whether a fan is distributed in commerce with or without the presence or absence of brackets for mounting through a wall, ceiling, or other structure that separates the fan's inlet from its outlet. DOE requires that a fan that meets the definition of an axial panel fan and is distributed in commerce with components that enable it to be mounted through a wall, ceiling, or other structure that separates the fan's inlet from its outlet be tested in accordance with the test procedure for fans and blowers, excluding air circulating fans. DOE requires that a fan that meets the definition of an axial panel air circulating fan or box fan and is not distributed in commerce with components that enable it to be mounted through a wall, ceiling, or other structure that separates the fan's inlet from its outlet, be tested in accordance with the test procedure for air circulating fans. DOE requires that a fan that meets the definitions of both an axial panel fan and an air circulating fan (*i.e.,* axial panel air circulating fans and box fans) and is distributed in commerce with and without components that enable it to be mounted through a wall, ceiling, or other structure that separates the fan's inlet from its outlet be tested according to both the test procedures for fans and blowers, excluding air circulating fans, and the test procedure for air circulating fans.

In addition, AMCA commented that the current definitions used for certain air circulating fans, including axial panel fans, will lead to market confusion and the potential elimination of a significant number of products from the marketplace due to the product class assigned by DOE to the fan. AMCA provided an example of two essentially identical fans, except for the size of the fan. AMCA stated that per the current definitions, the first fan would be classified as an axial panel fan/air circulating axial panel fan and will likely remain available to consumers. However, AMCA commented that per the current DOE definitions, the second fan is a belt-driven ceiling fan, which requires the fan to meet the design requirements, including the capability of reverse operation and energy conservation standard, for ceiling fans. AMCA added that as Fan 2 is commonly applied, reversing the fan provides no benefit and the addition of the capability to reverse would reduce the efficiency of the fan at an added first cost to the consumer. In addition, stated AMCA, the second fan (assuming a common method of test) uses less energy to move the same volume of air, hence has a higher efficiency than Fan 1. AMCA finds it difficult to believe that consumers, retailers, and customs officials will be able to differentiate between DOE's axial panel Fan 1 and ceiling Fan 2. (AMCA, No. 41, p.31)

DOE notes that the requirement to include the capability of reversible action is not required for all ceiling fans s manufactured on or after January 1, 2007, and DOE included three exceptions for fans sold for industrial applications, fans sold for outdoor applications, and cases in which safety standards would be violated by the use of the reversible mode. 42 U.S.C. 6295(ff)(1)(A)(iii)) Further, as previously stated, the definition of ''fan and blower'' includes air circulating fans and excludes ceiling fans. Therefore, equipment that meets the definition of a ceiling fan would be excluded from the scope of equipment included under ''fan and blower.'' Any fan that is distributed in commerce with components that enable it to be suspended from a ceiling, and that meets the ceiling fan definition (*see* 10 CFR 430.2) in terms of being a non-portable device and for circulating air via the rotation of fan blades, is a ceiling fan. 87 FR 50396, 50402 (August 16, 2022). DOE will address any comments and concerns regarding the energy conservation standards for ceiling fans under a separate ceiling fan rulemaking.[92]

G. Metric

This section discusses the metrics adopted for fans and blowers other than air circulating fans and for air circulating fans.

1. Metric for Fans and Blowers Other Than Air Circulating Fans

AMCA 214–21 provides uniform methods to determine the FEP and FEI of a fan at a given duty point.[93] As explained, FEP describes the electrical input power of a fan in kW. AMCA 214–21 defines FEI as the ratio of the electrical input power of a reference fan to the electrical input power of the actual fan for which the FEI is calculated, both established at the same duty point. As stated, FEI is a dimensionless index for evaluating a fan's performance against a reference fan. Section 5 of AMCA 214–21 provides the equations to calculate the reference fan electrical input power as a function of airflow and pressure.

For fans other than circulating fans, the Working Group recommended using FEP as the primary fan metric and to allow using FEI for additional representation of energy use. The Working Group also recommended calculating FEI using the FEP of a fan that is exactly compliant with any future fan energy conservation standards. (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #6 at p. 5). The Working Group further recommended that the metric be evaluated at each operating point as specified by the manufacturer. (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendations #18 and #27 at pp. 10–11, 13–14). DOE explained that under this approach, for each basic model of fan, a manufacturer would have to determine the FEP of the fan at each operating point.

In the July 2022 NOPR, DOE also noted another metric called ''Fan Efficiency Grade'' or FEG, which is a numerical rating that represents the ratio of air power produced by the fan divided by the fan shaft power and is defined as a function of fan impeller diameter. FEG ratings are defined in discrete ''bands'' (*e.g.,* FEG 85, FEG 80, FEG 75, etc.) and are established in accordance with AMCA 205–12, ''Energy Efficiency Classification for Fans.'' [94] DOE noted that as defined in AMCA 205–12, the FEG rating is representative of only the maximum efficiency of the fan. As a result, depending on the actual operating conditions, a fan with a higher peak efficiency and FEG rating could consume more energy in a particular application than a fan with a lower peak efficiency and FEG rating. In addition, the FEG metric does not capture the performance of the motor, transmission, or motor controllers and does not differentiate among fans with motors, transmissions, and motor controllers with differing efficiency levels. DOE further noted that in its proposed regulation, the CEC is proposing to use

[92] *See* Docket No. EERE–2021–BT–STD–0011.

[93] As previously described, a duty point is characterized by a given airflow and pressure and has a corresponding operating speed. The collection of all duty points associated with a given speed is referred to as a ''fan curve.'' AMCA 214–21 provides methods to establish the FEP and FEI at any point within the operating range of the fan.

[94] *See* AMCA white paper available at: *www.amca.org/assets/resources/public/userfiles/file/Nospreads_FanEfficGrades.pdf*.

the FEI metric for fans and blowers.[95] Since the publication of the term sheet and of AMCA 214–21, a number of incentive programs and model energy codes and standards used in State energy codes rely on the FEI metric.[96] 87 FR 44194, 44237.

In the July 2022 NOPR, DOE proposed to apply FEI as the efficiency metric for fans and blowers. DOE stated that FEI would provide for evaluation of the efficiency of a fan or blower across a range of operating conditions, would capture the performance of the motor, transmission, or motor controllers (if any), and would allow for the differentiation of fans with motors, transmissions, and motor controllers with differing efficiency levels. In addition, the use of FEI would align with the industry test standard (AMCA 214–21) and drive better fan selections. 87 FR 44194, 44237.

In addition, DOE proposed that fan FEI would be evaluated in accordance with the DOE proposed test procedure at each of the fan's operating points within the range of air power and shaft input power proposed in scope (*i.e.,* at each duty point, as specified by the manufacturer within the range of air power and shaft input power in scope, *see* Section III.B.1 of this document). This approach is consistent with the term sheet recommendations and would require the determination of the FEI at each duty point as specified by the manufacturer. With this approach, the test procedure would not prescribe particular operating conditions at which the FEI is to be evaluated in order to calculate the FEI metric; instead, the FEI is determined at each duty point. Further, if DOE were to establish any potential energy conservation standards, compliance with that standard would be required at each duty point specified by the manufacturer within the range of air power and shaft input power proposed in scope (*i.e.,* operating range or ''bubble''), and for which the manufacturer publishes performance data. Manufacturers would not be allowed to publish performance data at non-compliant operating points. 87 FR 44194, 44237.

DOE further explained that in order to allow manufacturers to continue to publish performance data at any duty point, DOE also considered an alternative metric approach where the metric would be evaluated at set duty point(s) specified in the test procedure instead of having the FEI metric evaluated at each duty point as proposed. As a potential consideration, DOE provided an example of three duty points identified relative to the fan's BEP [97] at maximum speed and provided an example of a weighted average FEI metric (''WFEI'') established as the average FEI across all three duty points (*i.e.,* duty points of 100, 75, and 50 percent flow relative to BEP) and using a reference system curve in the case of multi- and variable-speed fans. DOE did not propose use of the WFEI metric in the July 2022 NOPR but requested comment on this alternative approach. 87 FR 44194, 44237–44238.

In response to the July 2022 NOPR, the CA IOUs commented in support of the proposed publication of the FEI and FEP at each duty point. (CA IOUs, No. 37 at p. 1)

ebm-papst stated support for the use of FEI for fans in the scope of this NOPR, other than air circulating fans. (ebm-papst, No. 31 at p. 12)

Greenheck commented that DOE should follow the recommendations of the term sheet, specifically in terms of the metric. (Greenheck, No. 39 at p. 2) Greenheck further recommended DOE utilize FEI as its efficiency metric as defined in AMCA 214–21 and required by ASHRAE 90. (Greenheck, No. 39 at p. 3)

Morrison commented that FEI is an appropriate metric to use in this proposed regulation for fans (that are not circulating fans). Morrison noted that ASHRAE and ICC energy codes, and States such as California, Oregon, and Florida, have adopted FEI in their State energy codes. The CEC is using FEI in its Title 20 regulation and that FEI is consistent with the term sheet. (Morrison, No. 42 at p. 7)

AMCA commented that FEI at maximum fan speed is the regulated metric for fans and blowers. AMCA commented that fan manufacturers and many other stakeholders have invested in determining and publishing FEI in lieu of FEG, FMEG,[98] and other efficiency metrics. (AMCA, No. 41 at p. 16) Further, AMCA commented that FEI is the most appropriate metric to use for a regulation for fans that are not air circulating fans. AMCA commented that FEI has been the metric used in ASHRAE and ICC energy codes since 2019, and States such as California, Oregon, and Florida have FEI in their State energy codes. AMCA further stated that the CEC is using FEI in its Title 20 regulation, which underwent extensive internal and public review—Title 20 is slated to take effect on Nov. 1, 2023.[99] AMCA further noted that the 2015 ASRAC term sheet has FEP as the regulatory metric and allowed for FEI to be used for marketing and other purposes. AMCA commented that since ASRAC, while code-change processes for ASHRAE 90.1, IECC, Title 20, and Title 24 were under way, industry and regulators agreed that FEI was a superior metric for regulating fans; hence these code/regulatory bodies settled on FEI and the AMCA 214 standard was developed around FEI as the regulatory metric. AMCA commented that the AMCA Certified Ratings Program evolved to certify manufacturer selection software ratings for FEI.[100] Also, stated AMCA, electric utility incentive programs have been developed around FEI for fans and blowers other than air circulating fans. AMCA also noted that for large-diameter ceiling fans, a derivative of FEI, Ceiling Fan Energy Index (CFEI), was developed to replace the average CFM/W metric DOE had previously used to regulate these products. (AMCA, No. 41 at pp. 31–32)

NEEA recommended that DOE establish the design point metric FEI as the regulatory metric for fans and blowers other than air circulating fans as it is an easy-to-understand rating (the higher the FEI value is, the better that fan is for a customer's specific application), accounts for one of the

[95] *See* Proposed regulatory language for Commercial and Industrial Fans and Blowers available in the following Docket: 22–AAER–01 at: *efiling.energy.ca.gov/Lists/DocketLog.aspx?docketnumber=22-AAER-01.*

[96] ANSI/ASHRAE/IES 90.1–2019, Energy Standard for Buildings Except Low-Rise Residential Buildings; ANSI/ASHRAE/ICC/USGBC/IES 189.1–2020, Standard for the Design of High-Performance; Green Buildings Except Low-Rise Residential Buildings; 2021 International Energy Conservation Code; 2021 International Green Construction Code; 2020 Florida Building Code: Energy Conservation; 2021 Oregon Energy Efficiency Specialty Code; 2022 California Building Energy Efficiency Standards (Title 24); incentive programs presently offered or under development by Seattle City Light, ComEd, and Xcel Energy *See* AMCA FEI Advocacy Brief available at: *www.amca.org/assets/resources/public/assets/uploads/0621-FEI_Advocacy_Brief_V3-20210715.pdf.*

[97] The BEP represents the flow and pressure values at which the fan total efficiency (ratio of total air power to fan shaft input power) is maximized when operating a given speed. Prior to the use of FEI, energy codes required selecting a fan with an efficiency within 10–15 percentage points of the BEP efficiency. *See* International Green Construction Code (2012); ANSI/ASHRAE/IES 90.1, Energy Standard for Buildings Except Low-Rise Residential Buildings (2013); ANSI/ASHRAE/USGBC/IES 189.1, Standard for the Design of High-Performance Green Buildings Except Low-Rise Residential Buildings (2014); International Energy Conservation Code (2015).

[98] DOE notes that FMEG refers to the Fan Motor Efficiency Grade metric used in Europe and determined in accordance with ISO 12759:2010, ''Fans—Efficiency classification for fans.''

[99] DOE notes that the CEC has since finalized its rulemaking. *See www.energy.ca.gov/rules-and-regulations/appliance-efficiency-regulations-title-20/appliance-efficiency-proceedings-11.*

[100] AMCA noted that a complete list of manufacturers with AMCA-certified ratings, is available at *www.amca.org/find-FEI.*

major drivers of fan energy use (fan sizing and specification) and will result in significant energy savings and better-sized fans for the end user. NEEA added that although FEI is a new metric, the fan market is ready and willing to adopt this metric for regulation as demonstrated by the development of an industry standard for FEI (AMCA 214–21), by manufacturers beginning to rate their fans using FEI, and by energy codes and utility incentive programs establishing requirements based on FEI. (NEEA, No. 36 at p. 2)

New York Blower stated support for AMCA's recommendations regarding the FEI metric. (New York Blower, No. 33 at p. 20) New York Blower added that FEI, as proposed in AMCA 214–21 provides a variety of utility, accurately represents efficiency, and provides energy consumption comparison between fans operating at the same duty point and that New York Blower is not aware of a better metric that represents energy consumption or the opportunity for energy savings. (*Id.* at p. 18)

In this final rule, DOE is applying FEI as the efficiency metric for fans and blowers other than air circulating fans. In addition, consistent with the term sheet recommendations, DOE is requiring that the FEI be evaluated in accordance with the DOE test procedure at each of the fan's operating points within the range of air power and shaft input power with thein scope (*i.e.,* at each duty point, as specified by the manufacturer within the range of air power and shaft input power in scope; *see* Section III.B.1 of this document). This approach requires the determination of the FEI at each duty point as specified by the manufacturer.

In response to the July 2022 NOPR, several stakeholders commented on the consideration of a WFEI metric for fans and blowers other than air circulating fans. The CA IOUs commented that while they support the proposed FEI metric, they equally support the concept of an alternate WFEI metric. However, the CA IOUs recommended revising the recommended alternative test points for fans without motor controllers because two of the points would fall in the unstable or stall operating region of the fan curve and provided illustrative examples (*i.e.,* the 75 percent and 50 percent of BEP airflow). Instead, the CA IOUS suggested a WFEI calculation using operating points based on pressure (*e.g.,* 80 and 60 percent of the BEP pressure). In addition, the CA IOUs suggested refining the definition of ''maximum speed.'' The CA IOUs commented that maximum speed is ambiguous and could refer to: (1) the maximum structural speed; (2) the maximum speed for which the manufacturer provides ratings; (3) the maximum speed the motor can sustain; (4) the maximum speed at which the motor controller allows the fan to operate; or (5) the maximum speed at which the fan can operate with a particular belt-drive transmission. The CA IOUs noted that interpreting maximum speed according to the last definition could provide an opportunity to evade any future standard as a manufacturer could certify performance at the speed resulting from operation with the fixed pulleys, which may incentivize some manufacturers to use a pulley set that results in a low speed or an adjustable pulley set to the lowest speed. The CA IOUs recommended the following framework to create a definition of maximum speed: (1) for bare shaft fans, the maximum speed shall be the maximum permitted speed of the fan as published by the manufacturer; (2) for fans sold with single-speed motors and direct-drive or flexible coupling transmissions, the certified speed shall be the speed achieved at each test point; [101] (3) for fans sold with single-speed motors and belt-drive transmissions, the fan shall be tested with a configuration that provides a speed the lesser of (a) the maximum speed that can be sustained by the motor or (b) the maximum structural speed published by the manufacturer; (4) for fans sold with a motor, speed controller, and direct-drive or flexible coupling transmissions, the tested point shall be the lesser of: (a) the maximum permitted speed of the fan as published by the manufacturer, (b) the maximum speed that can be sustained by the motor along the best efficiency curve, or (c) the maximum speed allowed by the controller and cannot be increased by a consumer; (5) for fans sold with a motor, speed controller, and belt-drive transmissions, the tested point shall be the lesser of: (a) the maximum permitted speed of the fan as published by the manufacturer, or (b) the maximum speed that can be sustained by the motor at its rated output along the best efficiency curve, using a transmission configuration that allows the motor to operate at its rated output. (CA IOUs, No. 37 at pp. 3–7)

ebm-papst commented that WFEI has no benefit over any of the other, much more deeply evaluated, fan efficiency metrics. In addition, ebm-papst stated opposition to the establishment of a reference system curve. ebm-papst commented that the fans it manufactures serve vastly different applications and this prevents usage of one or a few reference system curves for developing valid kWh predictions. (ebm-papst, No. 31 at p. 12)

Greenheck commented that the alternative WFEI metric would allow fan selections that use additional energy compared to a more energy-efficient fan for a given duty point and provided an illustrative example. (Greenheck, No. 39 at p. 4)

The CEC commented that a WFEI could result in an invalid representation of the efficiency range of the fan because it may reside in an area of operation where the fan stalls and is therefore not tested by manufacturers nor operated once installed. The CEC commented that when comparing the WFEI of two fans and assuming all three points to be used for the analysis reside in an area of operation where the fan will not stall, the WFEI generated will be heavily dependent on non-efficient operating conditions. Instead, the CEC recommended maintaining the FEI metric. (CEC, No. 30 at pp. 4–6)

NEEA commented against the use of WFEI as the regulatory metric as it does not align with the term sheet recommendation and would be an abrupt change to the current momentum behind FEI in the fan industry and energy codes. NEEA further noted some issues with the duty points considered for calculating the WFEI, which may be in the stall or surge region of the fan. NEEA also noted a lack of market information on the expected WFEI rating. NEEA further commented on the similarities between PEI (Pump Energy Index) and the WFEI metric and commented that while pump performance curves, which are used to calculate PEI, are readily available and did not represent an increase in burden for the industry to provide, fan manufacturers do not commonly publish performance data in this way, so there would be increased burden to produce these data, in addition to the testing required for certification. (NEEA, No. 36 at pp. 4–6)

Morrison commented that a WFEI metric would change the intent of the discussions and spirit of the ASRAC agreement and noted the following issues with such a metric: (1) WFEI is another version of FEG, which the Working Group rejected as a less than ideal metric for fans; (2) WFEI in most circumstances cannot be calculated using the points specified in the NOPR because some duty points may fall in the stall or surge region; (3) the WFEI for fixed-speed fans and variable-speed fans would have vastly differing values for the same fan and nothing related to their

[101] The CA IOUs noted that for many single-speed induction motor fans, the speed will change along the flow-pressure curve.

effect on energy use. Morrison further added that a FEG-style rating was considered by all involved in the ASRAC as inferior to the FEI rating method. Morrison added that the WFEI is an adjusted FEG and not at all like the FEI/FEP metrics proposed and agreed to in the term sheet. (Morrison, No. 42 at pp. 7–8)

Robinson commented on the unlikelihood that using a weighted average measure will result in the intended energy conservation sought by the proposed rule. Robinson added that the heavy industrial fan selection process includes several realities that may not be part of selection of a commercial fan. Robinson stated that heavy industrial process fans often operate on several data points and often require their own permitting process prior to installation. Robinson commented that heavy industrial process fans are subject to unique challenges in operation: they may have acid in the air stream; they may have rock product in the air stream; they may be subjected to high heat, etc. Robinson commented that the unique challenges of the operation of the HIP fan often drive fan selection more than the efficiency of the fan. Robinson commented that the understood, desired end result of implementing a weighted average measure is to force consumers to purchase more efficient fans. However, Robinson concluded, because of the factors described above (and others) it's unlikely that heavy industrial process operators will choose a specific fan type because of its efficiency rating alone. (Robinson, No. 43 at p. 4)

AHRI commented that DOE's consideration of an alternative metric, WFEI to replace Fan Energy Index (FEI)—the metric derived by industry test procedure AMCA 214–21—could constitute a proposal that is contradictory to the National Technology Transfer and Advancement Act of 1995 (NTTA), Public Law 104–113, and the Office of Management and Budget (OMB) Circular A–119, Federal Participation in the Development and Use of Voluntary Consensus Standards and in Conformity Assessment Activities. AHRI commented that both documents direct Federal agencies to adopt voluntary consensus standards unless they are inconsistent with applicable law or otherwise impracticable, as noted by DOE. (86 FR 70892, 70910, at fn 15 (Dec. 13, 2021)) AHRI commented that WFEI is a separate metric with a distinct calculation procedure that has not been evaluated by either fan manufacturers or their customers. (AHRI, No. 40 at p. 4) AHRI added that DOE has not presented supporting documentation that WFEI achieves the differentiation sought. (AHRI, No. 40 at p. 4) AHRI expressed its concern that the introduction of a WFEI metric did not undergo public comment in the October 2021 RFI. AHRI added that due to the lengthy history and complexity of commercial and industrial fans and the introduction of WFEI, stakeholders should be given additional time to review and ask DOE questions in order to provide meaningful comments that will assist DOE in this rulemaking process. (AHRI, No. 40 at p. 5) AHRI further commented that the proposed WFEI metric does not align with the term sheet and is not an appropriate metric. (*Id.* at p. 6)

AMCA commented that the WFEI was a deviation from the ASRAC term sheet which required the industry and advocates to expend time and resources to research and analyze a whole new metric (AMCA, No. 41 at p.2) AMCA added that there were numerous problems with using a WFEI metric. First, AMCA noted that the duty points considered in the NOPR to evaluate the WFEI would fall in regions where many fans would operate in stall or surge. Therefore, AMCA commented that if a weighted average value of BEP flow were used, different duty points would need to be chosen and noted that an optimal selection point for a backward-inclined fan typically is at 95 percent of peak pressure. In addition, AMCA commented that the considered WFEI metric would encourage fan designers to target higher efficiency at lower airflow, which would not result in energy savings. AMCA commented that fans are more often selected for operation at airflows greater than the BEP airflow and fan designers should be encouraged to improve efficiency at these greater airflows where fans are often applied. AMCA also included an example in Table 5 to illustrate how WFEI values for different sizes of the same fan model will remain approximately the same, which would drive fan selections toward the smaller, less-efficient sizes, which are less expensive. AMCA further identified additional issues with the potential consideration of a WFEI metric for fixed-speed fans and variable-speed fans related to the risk of having the duty points located in the stall/surge regions, as well as system effects and the noted that air-system curves are not necessarily quadratic parabolas through the origin due to filters, coils, and other devices which tend to introduce a linear component to the system resistance curve. Further, AMCA commented that it does not believe a WFEI would result in any net energy savings based on rating calculation. AMCA noted that the WFEI metric would assume the fan with a VFD will be selected because it has a higher rating than a fan without a VFD. However, AMCA commented, that would not guarantee the fan will be operated at varying speeds and if the fan is run at constant speed, the fan with the VFD will consume more energy because of additional drive losses in the VFD. Therefore, AMCA commented that the WFEI approach does not accurately reflect the presumed energy savings in application. In addition, AMCA commented that using a WFEI metric would change FEI from a duty-point metric to a product-based metric similar to FEG. AMCA noted the significant history revolving around the shortcomings of the FEG metric and how fans of similar FEG ratings can consume vastly different amounts of energy at specific duty points while a FEI metric would accommodate and identify these differences in energy consumption. (AMCA, No. 41 at pp. 32–34)

JCI stated that it shares AMCA's comments regarding the use of a new metric, weighted average (WFEI), versus the established FEP/FEI metrics which is also not in alignment with the 2015 term sheet. (JCI, No. 34 at p. 2)

New York Blower commented that the challenges of applying a product-based efficiency metric for fans (such as WFEI) because fans adapt to the system in which it is installed and the same fan can operate at high efficiency in one system and perform poorly in a different system. New York Blower commented that the FEI metric was developed to drive fan selections to peak efficiency and yield the greatest energy savings. (New York Blower, No. 33 at p. 2) New York Blower commented that the calculation of the WFEI would select duty points in the stall region for many fans. New York Blower added that they examined different ways to select duty points that could be combined into a WFEI metric and were unable to find an algorithm that could be employed across all fan categories without forcing selection of unacceptable duty points. Instead, New York Blower suggests that the BEP at maximum operating speed should be chosen as a single value to compute the WFEI. In addition, New York Blower commented that fans with variable speed drives would have an artificially high WFEI rating even if that fan is never operated away from a single speed and would allow less efficient fans marketed with a controller to remain in the market. New York Blower added that in the industrial market, a majority of applications are not operated

at or applied in a variable speed solution. Instead, there have seen an increase in cyclic activity in fans over the recent years (*i.e.,* the fans are being turned off when not operated). (New York Blower, No. 33 at p. 3) If DOE's intent is to promote variable speed drive installation, New York Blower commented that then either a direct credit to the required FEI performance requirement, or an installation credit at the time of calculations to overcome the insertion loss of the variable speed drive is appropriate. (New York Blower, No. 33 at p. 19) Finally, New York Blower commented that a product-based metric will, ultimately, result in product elimination from the market if efficiency requirements are raised high enough. Because of the vast performance range of a fan, New York Blower stated that it is unlikely the energy savings would be realized in proportion to the products eliminated from the market. Instead, New York Blower commented customers would lose utility from the loss of product availability. New York Blower commented on the complexity of implementing an application-based metric (such as FEI), acknowledging that a product-based metric (such as WFEI) is clearly an easier path to declaring an industry regulated. However, New York Blower recommended that DOE consider the value of saving energy be balanced with the urgency to complete a regulatory effort. (New York Blower, No. 33 at p. 4)

In the July 2022 NOPR, DOE did not propose to adopt the WFEI as the metric for fans and blowers other than air circulating fans. The WFEI metric was considered in the July 2022 NOPR in order to provide a potential alternative metric that would allow manufacturers to publish ratings at operating points with a potentially non-compliant FEI, should DOE establish energy conversation standards for fans and blowers other than air circulating fans. 87 FR 44194, 44237–44238. As noted by the CA IOUs, the CEC, Morrison, New York Blower and AMCA, the determination of such metric is challenging as some the operating points used in the calculation of the WFEI could fall in the stalling operating region of the fan. In addition, as highlighted by NEEA, Morrison, and AHRI such metric would not align with the term sheet recommendations. Further as stated by Greenheck, AMCA, New York Blower and Robinson, a fan with a higher WFEI may not necessarily result in less energy use. As noted previously, DOE establishes the FEI as the metric for fans and blowers other than air circulating fans, consistent with the term sheet recommendations and industry practice. Therefore, DOE is not adopting a definition of maximum speed and is not adopting to specify operating points for the calculation of the WFEI.

In response to the July 2022 NOPR, and regarding the ability to publish performance data for non-compliant duty points, the Efficiency Advocates commented that they continue to support the development of a fan efficiency metric and regulatory framework that drives better fan selections, but they encourage DOE to consider how this goal can be achieved while accommodating the potential need for manufacturers to show certain non-compliant operating points. The Efficiency Advocates commented that the original framework for improving fan selection was to limit the range of operating points, as shown in manufacturer literature and selection software, only to compliant operating points. They added that manufacturers have raised concerns regarding the need to show certain non-compliant operating points for safety reasons. Therefore, they encourage DOE to explore options for a regulatory framework for fans that would drive better fan selections, while accommodating the potential need for additional published information. For example, DOE could consider the feasibility of limiting fan selections returned in manufacturer selection software to those that are compliant at the specified operating point while allowing manufacturers to show certain non-compliant operating points (*e.g.,* in the high pressure, low airflow operating range) for those compliant fan selections. (Efficiency Advocates, No. 32 at p. 1)

Greenheck commented that it remained neutral on the topic of showing noncompliant points on the fan curve after a compliant fan is selected from a list of potential fan options. Greenheck added that this concept was not part of the proposed rulemaking and was suggested as an alternative to the flawed WFEI metric. Greenheck commented that the display of noncompliant points for safety or retrofit applications is an issue for the Energy Regulators, Advocates and built-up equipment manufacturers to discuss and determine the impact upon the industry and the potential value or burden of not showing those values. (Greenheck, No. 39 at p. 5)

NEEA recommended that DOE works together with stakeholders to determine the compliance, certification and enforcement approach for FEI. NEEA stated that NEEA and industry partners are in active collaboration to address DOE's concerns about compliance, certification and enforcement and expect to present additional comments with specific proposals after the comment period has closed. (NEEA, No. 36 at p. 3) NEEA commented in support of allowing manufacturers to publish non-compliant fan information stating that manufacturers need to be able to publish information on non-compliant installations of a fan to inform sizing. If this information is published, NEEA recommended that DOE provide direction on how manufacturers should make it clear that non-compliant fans should not be selected—such as different or grayed-out coloring for visual representations of fan performance. NEEA added that DOE could also require that manufacturer's selection software provide clear warnings and not allow the purchase of fans with FEI less than 1.0. (NEEA, No. 36 at p. 4) NEEA further commented that the process for compliance will be different for FEI compared to other regulated metrics. NEEA suggested two options: (1) Software compliance: Manufacturers could certify compliance of their selection software—the system a user interacts with when selecting a fan for purchase (NEEA noted that this recommendation aligned with Recommendation #26 of the term sheet); and (2) Compliant mapping: For each model, NEEA commented that DOE could require manufacturers to submit the operating conditions that resulted in a compliant FEI. These operating conditions could be organized in a ''compliant window'' or mapping similar to a fan operating curve; DOE could confirm that this window was correct when they review the CCMS submission. (NEEA, No. 36 at pp. 3–4)

In this final rule, DOE is not establishing energy conservation standards for fans and blowers and therefore this final rule would not result in any complaint window or non-complaint operating points as noted in Greenheck and NEEA's comments. DOE will consider issues related to representations and compliance to any potential energy conservation standard in a separate energy conservation standards rulemaking.[102]

2. Metric for Air Circulating Fans

In the July 2022 NOPR, DOE proposed to incorporate by reference AMCA 214–21 for air circulating fans, which relies on the FEP and FEI metrics (''wire-to-air metrics'') for air circulating fans. DOE also presented comments from AHRI,

[102] *See* rulemaking docket: EERE–2022–BT–STD–0002.

AMCA, ASAP, ACEEE, NRDC, and the CA IOUs in support of a FEI metric for air circulating fans.[103] Specifically, ASAP, ACEEE, NRDC cited advantages for FEI such as representativeness of energy use, straightforward interpretation by consumers, ability to account for efficiency differences between fans of the same diameter that deliver the same airflow, consistency with other fan metrics [104] while the CA IOUS mentioned the ability to account for air velocity.[105] [106] 87 FR 44194, 44236–44237.

In addition, to account for variations in fan speeds, DOE proposed the following, depending on the air circulating fan's speed capability: for single speed fans, DOE proposed that the FEI be evaluated at the single available speed and corresponding duty point. For multi-speed fans and variable speed fans, in the absence of data to characterize typical operating speeds, DOE proposed to calculate the FEI based on the weighted average FEI at each of the tested fan speeds, and that each speed be apportioned an equal weight. (*e.g.,* if the FEI is calculated at five speeds, each speed is given 20 percent in the calculation of the weighted average FEI). DOE tentatively determined that while DOE has not found data to characterize the field operating speeds of air circulating fans, a more representative FEI can be calculated by using a weighted average across multiple speeds and weighting all those speeds equally (when compared to calculating the efficiency at only high speed). DOE noted that it would still allow manufacturers to make representations of performance using CFM/W. 87 FR 44194, 44238.

DOE also stated that AMCA 230–15 provides methods to determine FEP of air circulating fans as well as efficacy (*i.e.,* amount of flow per unit of electrical input power produced in CFM/W) and overall efficiency (*i.e.,* amount of thrust per unit of electrical input power produced in lbf/W). *Id.* at 87 FR 44237. In the July 2022 NOPR, DOE indicated that it was aware that the AMCA 230 committee may consider specifying which metric to use in the updated version of AMCA 230 when evaluating the energy performance of air circulating fans. While the NOPR proposed to rely on FEI, DOE stated it was considering alternative metrics such as CFM/W, including weighted average CFM/W for multi- and variable-speed fans, as well as alternative weights for multi- and variable-speed fans. In addition, DOE discussed potentially using the abbreviation ''ACFEI'' (air circulating fan FEI) to distinguish this metric from the FEI specific to fans and blowers other than air circulating fans. 87 FR 44194, 44238–44239.

Since the publication of the July 2022 NOPR, AMCA 230–23 was published and section 7.2.4.1 includes revised provisions regarding test speeds to require testing at maximum speed only, with additional optional tests at lower speeds.

As discussed in section III.E.20 of this document, for the July 2022 NOPR, DOE collected air circulating fan performance data from the BESS certification database and performed regression analysis to determine the appropriate flow, pressure, and efficiency target constants for air circulating fans needed to calculate the FEI metric. DOE proposed to rely on the following constants: Q_0 = 3,210 CFM (rounded to the nearest 10); P_0 = 0 in. wg; and an efficiency target of 0.38 (38 percent). 87 FR 44194, 44230.

In response to the July 2022 NOPR, the Efficiency Advocates commented in support of using FEI as the metric for air circulating fans because it is both representative of energy usage and straightforward for purchasers to interpret (for example, a FEI of 1.1 represents about a 10 percent reduction in energy usage in comparison to an FEI of 1). Importantly, the Efficiency Advocates commented that the FEI accounts for inherent efficiency differences between fans of the same diameter that deliver different airflows. The Efficiency Advocates added that using FEI for air circulating fans would provide consistency with the other non-air circulating fans fan categories included within the scope of the proposed test procedure. In addition, the Efficiency Advocates commented in support of testing variable- and multi-speed air circulating fans at multiple, discrete speeds. They agree with DOE that testing and rating multi-speed fans at a range of speeds will better inform purchasers about fan efficiency across a range of operating speeds. They are also concerned that testing multi-speed air circulating fans only at high speed could result in lower ratings relative to single speed fans due to additional control losses. In other words, while a multi-speed fan may save energy in real-world applications, a rating only at high speed could make it appear less efficient than a comparable single speed fan. Thus, the Efficiency Advocates support DOE's proposal to test variable-/multi-speed fans at multiple speeds. (Efficiency Advocates, No. 32 at p. 2)

ebm-papst commented that FEI provides no benefit with ACFs. Instead, ebm-papst supports making CFM/W the regulated metric because this metric has served users of ACFs well. (ebm-papst, No. 31 at pp. 11, 13)

The CA IOUs commented that BESS Laboratories, an important certifying body for the agricultural fan market, uses a CFM/W metric. The CA IOUs commented that DOE used data from BESS Laboratories to inform its NOPR and similarly, many state utility programs use the BESS Laboratories data to provide rebates incentivizing farmers to use energy-efficient circulating fans. Although a FEI-based metric for circulating fans is likely superior, it would disrupt the market if CFM/W were not allowed to be used 180 days after the final publication of this rule. The CA IOUs recommended that DOE allow the publication of CFM/W and remove it in a future rulemaking (CA IOUs, No. 37 at p. 10) In addition, the CA IOUs commented that DOE should gather additional air circulating fan performance data to develop a new FEI-based metric. The CA IOUs noted that BESS certification database only represents a portion of the air circulating fan market. Specifically, the CA IOUs noted that the air circulating fans tested by BESS Laboratories are among the most efficient in the market and that manufacturers typically will only send their best-performing fans to qualify for utility rebates. The CA IOUs commented that the basis for the new equation should include sampling from the vastly larger air circulating fan market, including commodity fans sold in the retail market. For this reason, the CA IOUs recommended that DOE continue gathering information on the larger market and base the new metric on that data. (CA IOUs, No. 37 at p. 11)

AHRI commented that DOE did not provide data to characterize the field operating speeds of air circulating fans. However, DOE proposed that a more representative FEI can be calculated by using a weighted average across multiple speeds and weighting all those speeds equally (when compared to calculating the efficiency at only high speed) without offering substantiation of this conclusion. Further, AHRI commented that DOE also stated that CFM/W can continue to be used to represent performance of air circulating fan heads; however, this is absent in the proposed regulatory text. (AHRI, No. 40 at p. 4)

AMCA recommended efficacy (in CFM/W) as the regulated efficiency

[103] (AHRI, No. 10 at p. 2; AMCA, No. 6 at p. 9; ASAP, ACEEE, NRDC, No. 7 at p. 2; CA IOUs, No. 9 at p. 2).

[104] (ASAP, ACEEE, NRDC, No. 7 at p. 2).

[105] (CA IOUs, No. 9 at p. 2).

[106] See also (AHRI, No. 10 at p. 2; AMCA, No. 6 at p. 9).

metric for air circulating fans because air circulating fans are rated at only one volumetric flow rate (speed) at zero fan static pressure. AMCA commented that FEI does not add any advantages over simpler metrics for air circulating fans. (AMCA, No. 41 at p. 28) However, AMCA commented that users have for years selected and compared air circulating fans based on CFM/W ratings. AMCA commented that a change of the metric would cause confusion among many stakeholders. In addition, AMCA commented that requiring testing at multiple speeds would negate nearly all historical test data, provide an efficiency metric that confuses consumers, and create an inequitable market that rewards inefficient multiple speed fans that lack consumer utility. (AMCA, No. 41 at pp. 16–17) AMCA added that all considered air circulating-fan metrics (efficacy, thrust efficiency, and single-speed ACFEI) are based on measured fan thrust and fan air density and that legacy data of fully documented tests permit accommodation of future fan ratings as efficacy, thrust efficiency, or single-speed ACFEI these metrics can be calculated from raw test data. AMCA added that there would be little or no impact to the testing cost itself (only recalculation of ratings using the same test data are needed). However, any metric using blended or weighted ratings would invalidate all existing ACF ratings. Most air circulating fans would require new laboratory testing. (AMCA, No. 41 at p. 35) AMCA added that fan manufacturers must accommodate several distinct types of users, including agricultural markets, which generally do not seem to be well-considered in the fan rulemaking. For air circulating fans, the use of the FEI metric may be an issue for agricultural circulating fans (livestock cooling) because BESS labs has been using CFM/W for its certified ratings. These ratings also are used in agricultural electricity-savings incentive programs. However, AMCA commented that a switch to another metric would not be too difficult if historical test results could still be used for calculating new ratings. (AMCA, No. 41 at p. 36) Finally, AMCA commented that the upcoming AMCA 230 will not have an ACFEI metric in the standard. AMCA commented that if DOE ultimately adopts the ACFEI metric, then AMCA recommends using the following constants derived from analyses performed by the AMCA 230 committee: Q_0 = 0.2454 cubic meters per second (1,500 CFM); P_0 = 0.6719 Pa (0.0027 in. wg); and Fan Efficiency target of 38 percent. However, AMCA noted that there was insufficient analytical support for this metric at this time and that the current draft of AMCA 230 does not include ACFEI as a ratings metric. *Id.*

As noted by ebm-papst, the CA IOUs, and AMCA, the fan efficacy in CFM/W is the industry established metric and DOE has concerns over the readiness of an ACFEI metric. In addition, as stated by AMCA, there is insufficient analytical support and DOE acknowledges the uncertainty regarding the values of Q_0 and P_0 that should be used. Therefore, DOE concludes that, at this time, the advantages of the FEI or ACFEI metric identified in the July 2022 NOPR and discussed previously (*i.e.,* representativeness of energy use, straightforward interpretation by consumers, ability to account for efficiency differences between fans of the same diameter that deliver the same airflow, consistency with other fan metrics and ability to account for air velocity) are not significant enough to justify deviating from the established industry efficacy metric (CFM/W) given that the FEI or ACFEI metric have not yet been adopted by industry. In addition, the latest industry test procedure (AMCA 230–23) relies on an efficacy metric and does not rely on the FEI metric. Therefore, at this time, DOE is establishing an efficacy metric in CFM/W for air circulating fans.

In addition, given the uncertainty and lack of data regarding operation at speeds less than the maximum speed, as discussed in section III.E.14 of this document, DOE evaluates the efficacy metric at the highest speed (or ''maximum speed'') only for all air circulating fans regardless of their speed configuration.

H. Control Credit Approach for Fans and Blowers Other Than Air Circulating Fans

For fans and blowers other than air circulating fans, the Working Group recommended that the FEP of a fan with dynamic continuous control be calculated with an additional credit to offset the losses inherent to the control. (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #16 at p. 9)

As stated in the July 2022 NOPR, DOE analyzed the control credit in the European Commission Regulation No. EU 327/2011 and observed that the value of the credit is equivalent to about 5 to 10 percent of the fan electrical input power for a fan with controls with an electrical input power less than 5 kW, but that it decreases to 4 percent for fans at or above 5 kW. Since the term sheet publication, AMCA established the FEI calculation method in AMCA 214–21. DOE also reviewed the calculation of FEP for fans with variable speed controls in AMCA 214–21, which does not provide for any control credit (*i.e.,* motor controller credit). (*See* section 6.4.2 of AMCA 214–21.) In its proposed rulemaking for commercial and industrial fans and blowers, the CEC did not propose a credit when establishing the FEI of fans with controllers and did not specify a different minimum FEI level when proposing energy conservation standards for fans with a controller.[107] Instead, the CEC highlighted that fans with a controller will have a larger FEI-compliant performance capability compared to fans that are single speed.[108] 87 FR 44194, 44240.

Consistent with industry practice, DOE proposed to adopt the FEP and FEI calculation as specified in AMCA 214–21 and did not propose to develop a control credit for fans with a controller. As stated, EPCA requires the DOE test procedures be reasonably designed to produce test results, which reflect energy efficiency and energy use during a representative average use cycle and not be unduly burdensome to conduct. (42 U.S.C. 6314(a)(2)) To the extent use of a dynamic continuous control impacts the energy use characteristics of a fan or blower, the test procedure should account for such impact and appropriate consideration of any such impact would be part of the evaluation of potential energy conservation standards. *Id.*

AMCA supports DOE's proposal to not include a control credit in the test procedure. AMCA explained that the majority of AMCA members are not in the motor/controller business and frequently do not have influence over the choice of motor control. AMCA commented that should a credit be applied for motor controllers; it should be done at the efficiency-requirement level and not within the FEI calculation. (AMCA, No. 41 at p. 36)

Robinson commented that should DOE not include a credit, as it would cause differentiation from the European calculations and could impact the ability of U.S. manufacturers to compete against European or non-U.S. manufacturers. (Robinson, No. 43 at p. 11)

---

[107] *See* Proposed regulatory language for Commercial and Industrial Fans and Blowers available in the following Docket: 22-AAER-01 at: *efiling.energy.ca.gov/Lists/DocketLog.aspx?docketnumber=22-AAER-01.*

[108] *See* Staff Report, pp. 36–37 for Commercial and Industrial Fans and Blowers available in the following Docket: 22-AAER-01 at: *efiling.energy.ca.gov/Lists/DocketLog.aspx?docketnumber=22-AAER-01.*

Morrison commented that variable frequency drive (''VFD'') control provides a good method to achieve part load operation dynamically in order to promote energy savings. Morrison stated that since the FEP calculation metric penalizes the use of VFDs, providing at a minimum an equivalent bonus factor is appropriate to gain back the losses in the calculation. Morrison commented that operating at part load saves significantly more energy than any other efficiency change. (Morrison, No. 42 at p. 8)

New York Blower commented against a credit in the FEP and FEI calculation for fans with a motor controller. However, in the context of a WFEI metric which overestimates energy savings obtained merely by selling the fan with a motor controller, New York Blower commented that a credit to cover an insertion loss of the motor controller would be more tolerable and representative of system performance than the energy consumption calculation as currently proposed in the WFEI. While not supported with much data, New York Blower commented that a 5 percent credit would be acceptable. New York Blower commented that based on limited published data, they estimate that motor controllers can operate at roughly 97 percent efficiency at optimal conditions. New York Blower further stated that a 5 percent credit would give the motor controller an additional 2 percent credit above typical insertion loss—which should be included in the FEI calculation—in the overall FEI representation. Again, New York Blower commented that they would accept criticism in their estimates from those more knowledgeable of the subject matter of motor controllers. New York Blower commented that they believe this proposal is reasonable in intent and execution considering the imposition of a WFEI metric. (New York Blower, No. 33 at pp. 20–21)

As stated previously, DOE is not adopting WFEI as the metric for fans and blowers. Consistent with industry practice, for fans and blowers other than air circulating fans, DOE is adopting the FEP and FEI metric as specified in AMCA 214–21 and is not including a control credit for fans with a motor controller. As stated, EPCA requires the DOE test procedures be reasonably designed to produce test results, which reflect energy efficiency and energy use during a representative average use cycle and not be unduly burdensome to conduct. (42 U.S.C. 6314(a)(2)) As stated by Morrison, the FEP calculation metric penalizes the use of VFDs, as it incorporates the losses from the VFD and appropriate consideration of any such impact would be part of the evaluation of potential energy conservation standards.

I. Alternative Energy Determination Method (AEDM)

For certain covered equipment, DOE permits the use of an AEDM subject to the requirements at 10 CFR 429.70. An AEDM is a mathematical model based on the covered equipment design, and mitigates the potential cost associated with having to physically test units. AEDMs are permitted in instances in which the model can reasonably predict the equipment's energy efficiency performance.

Although specific requirements vary by product or equipment, use of an AEDM entails development of a mathematical model that estimates energy efficiency or energy consumption characteristics of the basic model, as would be measured by the applicable DOE test procedure. 10 CFR 429.70(c)(1)(i). The AEDM must be based on engineering or statistical analysis, computer simulation or modeling, or other analytic evaluation of performance data. 10 CFR 429.70(c)(1)(ii). A manufacturer must validate an AEDM by demonstrating that its predicted efficiency performance of the evaluated equipment agrees with the performance as measured by actual testing in accordance with the applicable DOE test procedure. 10 CFR 429.70(c)(1)(iii). The validation procedure and requirements, including the statistical tolerance, number of basic models, and number of units tested, vary by product. 10 CFR 429.70.

Once developed, an AEDM may be used for representations of the performance of untested basic models in lieu of physical testing. The manufacturer, by using an AEDM, bears the responsibility and risk of the validity of the ratings, including cases where the manufacturer receives and relies on performance data for certain components from a component manufacturer.

AEDMs, when properly developed, can provide a straightforward and accurate means to predict the energy usage or efficiency characteristics of a basic model of a given covered product or equipment and reduce the burden and cost associated with testing. Where authorized by regulation, AEDMs enable manufacturers to rate and certify the compliance of their basic models by using the projected energy use or energy efficiency results derived from these simulation models in lieu of testing.

The Working Group recommended allowing the use of an AEDM to generate the represented values of FEP and FEI of a fan basic model. (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendations #23 through #25 at pp. 12–13)

As proposed in the July 2022 NOPR, DOE allows the use of an AEDM in lieu of testing to determine fan performance, which would mitigate the potential cost associated with having to physically test units. Comments received on this issue are discussed in the remainder of this section. 87 FR 44194, 44241.

1. Validation

Validation is the process by which a manufacturer demonstrates that an AEDM meets DOE's requirements for use as a certification tool by physically testing a certain number of basic models and comparing the test results to the output of the AEDM. Before using an AEDM, a manufacturer must validate the AEDM's accuracy and reliability as follows.

A manufacturer must select a minimum number of basic models from each validation class to which the AEDM applies. To validate an AEDM, the specified number of basic models from each validation class must be tested in accordance with the DOE test procedure and sampling plan in effect at the time those basic models used for validation are distributed in commerce. Testing may be conducted at a manufacturer's testing facility or a third-party testing facility. The resulting rating is directly compared to the result from the AEDM to determine the AEDM's validity. A manufacturer may develop multiple AEDMs per equipment category, and each AEDM may span multiple validation classes; however, the minimum number of basic models must be validated per equipment category for every AEDM that a manufacturer chooses to develop. An AEDM may be applied to any basic model within the applicable equipment category at the manufacturer's discretion. All documentation of testing, the AEDM results, and subsequent comparisons to the AEDM would be required to be maintained as part of both the test data underlying the certified rating and the AEDM validation package pursuant to 10 CFR 429.71.

The Working Group recommended that the AEDM be validated by the testing of at least two basic models, compliant with any potential energy conservation standards for each equipment class.[109] In addition, the

[109] DOE uses validation classes for AEDMs. While validation classes may not directly align with equipment classes, validation classes are consistent

Working Group recommended that if an AEDM was used to simulate a wire-to-air test method, then the basic models used to validate the AEDM had to be tested using the wire-to-air test method. (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #24 at p. 13).

In the July 2022 NOPR, DOE proposed to include fan and blower validation classes at 10 CFR 429.70(k) and to require that two basic models per validation class be tested using the relevant proposed test procedure. This number of basic models is consistent with the number of basic models required for most DOE-regulated equipment that utilize AEDMs. In addition, DOE proposed that at least one basic model selected for validation testing would be required to include a motor, or a motor and controller of each topology (*e.g.,* induction, permanent magnet, electronically commutated motor) included in the AEDM. DOE also proposed that if the AEDM is intended to represent the wire-to-air test method, then the testing of the basic models used to validate the AEDM must be performed according to the wire-to-air test method. Similarly, if the AEDM is intended to represent the fan shaft power test method, DOE proposed that the testing of the basic models used to validate the AEDM be performed according to the fan shaft power test method. 87 FR 44194, 44241.

Morrison commented that they continue to support the recommendation 24 of the term sheet and support a plan that has manufacturers using testing results from two units to prove an AEDM but using the sampling plan per Recommendation #23 of the ASRAC term sheet. The sampling plan should be removed from the AEDM validation testing requirements. (Morrison, No. 42 at p. 9)

AMCA commented that they support Working Group Recommendation #24. However, AMCA commented that Recommendation #24 varies from the NOPR in that the NOPR calls for the testing to be done compliant with the test procedure and sampling plan, which currently calls for two units per basic model. AMCA accepts testing two units to prove an AEDM but using the sampling plan per Recommendation #23 of the ASRAC term sheet. (AMCA, No. 41 at p. 37)

New York Blower commented that to require two units to validate an AEDM seems reasonable, but when the tests must be executed in accordance with a sampling requirement attached to it, the AEDM development processed appears overly complicated. (New York Blower, No. 33 at p. 21)

Robinson commented that the AEDM approach for fans and blowers is an imperative as testing costs will be overwhelming in the absence of an AEDM. Robinson commented that the requirement for two samples to validate an AEDM will preclude the term sheet agreement of using historical testing data which is developed from a single fan. (Robinson, No. 43 at p. 11)

DOE includes fan and blower validation classes at 10 CFR 429.70(m) and requires that two basic models per validation class be tested using the relevant proposed test procedure. As stated, the number of basic models is consistent with the number of basic models required for most DOE-regulated equipment that utilize AEDMs. In addition, DOE requires that at least one basic model selected for validation testing would be required to include a motor, or a motor and controller of each topology (*e.g.,* induction, permanent magnet, electronically commutated motor) included in the AEDM. DOE also requires that if the AEDM is intended to represent the wire-to-air test method, then the testing of the basic models used to validate the AEDM must be performed according to the wire-to-air test method. Similarly, if the AEDM is intended to represent the fan shaft power test method, DOE requires that the testing of the basic models used to validate the AEDM be performed according to the fan shaft power test method. In addition, as discussed in section III.J of this document, DOE requires testing at least one unit per basic model in accordance with the sampling plan per Recommendation #23 of the ASRAC term sheet.

DOE's proposed validation classes for fans and blowers are listed as follows: (1) centrifugal housed; (2) radial housed; (3) centrifugal inline; (4) centrifugal unhoused; (5) centrifugal PRV exhaust; (6) centrifugal PRV supply; (7) axial inline; (8) axial panel; (9) axial PRV; (10) unhoused ACFH; (11) air circulating axial panel fan; (12) box fan; (13) cylindrical air circulating fan; and (14) housed centrifugal air circulating fan. 87 FR 44194, 44241. Per the current draft of the revised AMCA 230 standard, AMCA recommends replacing the proposed validation classes (10) through (14) with ''(10) Air circulating fan heads.'' [110] Additionally, AMCA recommends an 11th class for laboratory exhaust fans that are not induced flow fans per its recommendation for the definition of safety fans and lab exhaust fans that are not induced flow fans.[111] (AMCA, No. 41 at p. 37)

DOE did not receive any comments related to the proposed validation classes (1) through (9) and is adopting them as proposed. Regarding laboratory exhaust fans, as stated previously (*see* section III.C.2 of this document), DOE is not including laboratory exhaust fans in the scope of the test procedure and therefore is not adding a validation class for this equipment. Regarding validation classes for air circulating fans, AMCA recommended using unique validation classes for all categories of air circulating fans. DOE has concerns that such an approach, keeping with the 2 basic models per validation class, would not allow development of a model that is sufficiently representative of impeller designs and housing configurations. In addition, AMCA did not provide supporting information other than stating consistency with AMCA 230–23 (which does not include AEDM requirements). Therefore, at this time, DOE is reducing the number of validation classes for air circulating fans by grouping all housed ACFHs with axial impellers (*i.e.,* air circulating axial panel fans, box fans, and cylindrical air circulating fans) under the same validation class (''axial housed ACFH'') and to establish the following validation classes: unhoused ACFH, axial housed ACFH, and housed centrifugal air circulating fan.

New York Blower estimated that three fans would need to be tested to support ratings for 12 sizes and that the performance of the remaining sizes could be estimated using an AEDM. New York Blower commented that once the AEDM inventory in the industry is created, maintenance would be

with equipment classes. DOE would propose equipment classes in a future energy conservation standards rulemaking for fans and blowers.

[110] In their comments, AMCA uses the acronym ACFH to designate air circulating fan heads. Air circulating fans includes both housed and unhoused ACFHs and DOE considers the term ACFH equivalent to air circulating fan.

[111] DOE notes that AMCA also noted that their recommended changes would alter the regulatory text as follows: (i) Select basic models. For each fan or blower validation class listed as follows: centrifugal housed fan; radial housed fan; centrifugal inline fan; centrifugal unhoused fan; centrifugal power roof ventilator exhaust fan; centrifugal power roof ventilator supply fan; axial inline fan; axial panel fan; axial centrifugal power roof ventilator fan; unhoused ACFH; air circulating axial panel fan; housed air circulating fan head; lab exhaust fan to which the AEDM is applied. (AMCA, No. 41 at p. 37) DOE notes that the draft regulatory text provided by AMCA and the comment do not align. In their comments, AMCA recommends replacing the proposed validation classes (10) through (14) with ''(10) Air circulating fan heads'' while in the regulatory text they recommend replacing the proposed validation classes (12) through (14) with ''(10) Air circulating fan heads.'' (AMCA, No. 41 at p. 37) DOE interprets that comment as taking precedent over the draft regulatory text provided as the validation classes listed by AMCA in the draft regulatory text provided do not match the comment otherwise.

lessened, but to get started would clearly take extensively longer than any compliance period currently proposed. New York Blower commented that having to document AEDMs and certify every size, on an annual basis, would be an incredible burden to the fan industry and result in added cost paid by consumers. (New York Blower, No. 33 at p. 5)

DOE is not establishing any certification requirements in this final rule; however, DOE notes that beginning 180 days after publication of this final rule, any voluntary representations of FEI for fans that are not air circulating fans or CFM/W for air circulating fans that are within the scope of this test procedure would be required to be based on the DOE test procedure. This requirement is further discussed in section III.L.

The Working Group recommended adding a tolerance of 5 percent to the results of the AEDM for the basic models used for validation of the AEDM. The Working Group recommended that the predicted FEP using the AEDM may not be more than five percent less than the FEP determined from the test according to the DOE test procedure for the basic models used to validate an AEDM. (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #25 at p. 13).

The Working Group recommendation would require that the FEP calculated by an AEDM must be greater than or equal to 95 percent of the FEP determined testing the basic models used to validate the AEDM. This is equivalent to requiring that the FEI determined using the FEP calculated by an AEDM must be less than or equal to 100/0.95 percent or approximately 105 percent of the FEI calculated using the FEP determined from testing the basic models used to validate the AEDM.[112]

In the July 2022 NOPR, DOE proposed to apply the 5 percent tolerance to the FEI because FEI is the proposed metric. DOE proposed that the FEI calculated by an AEDM must be less than or equal to 105 percent of the FEI determined from the test of the basic models used to validate the AEDM. 87 FR 44194, 44241.

In response to the July 2022 NOPR, Robinson requested clarification on whether there is a positive margin on the AEDM for predicted FEP. (Robinson, No. 43 at p. 11) DOE notes that there is a positive margin, as stated in the previous paragraph.

DOE did not receive any additional comments on this proposal and therefore is requiring that the FEI calculated by an AEDM must be less than or equal to 105 percent of the FEI determined from the test of the basic models used to validate the AEDM. For air circulating fans, DOE is applying a 5 percent tolerance as proposed, but to the adopted efficacy metric in CFM/W.

2. Additional AEDM Requirements

In the July 2022 NOPR, consistent with provisions for other commercial and industrial equipment, DOE proposed to require that, if requested by DOE, a manufacturer must perform at least one of the following activities: (1) conduct a simulation before a DOE representative to predict the performance of particular basic models of the equipment to which the AEDM was applied; (2) provide analysis of previous simulations conducted by the manufacturer; or (3) conduct certification testing of basic model(s) selected by DOE. 87 FR 44194, 44241–44242.

In addition, DOE proposed that when making representations of values other than FEI (*e.g.,* FEP, fan shaft power) for a basic model that relies on an AEDM, all other representations would be required to be based on the same AEDM results used to generate the represented value of FEI. *Id.* at 87 FR 44242.

In response to the July 2022 NOPR, Robinson commented that it objects to the requirement of providing copies of AEDM calculations because the Robinson companies are privately held. (Robinson, No. 43 at p.11) DOE notes that manufacturers initially must certify whether basic model performance was determined with an AEDM or not. If DOE has questions on the AEDM used for a given basic model, DOE contacts the manufacturer for this information. DOE considers all AEDM data provided by manufacturers to be confidential. These data would not be publicly available. Additionally, DOE notes that use of an AEDM and AEDM representations are voluntary.

DOE did not receive any additional comments on these issues and requires that when making representations of values other than FEI (*e.g.,* FEP, fan shaft power) or efficacy (as applicable) for a basic model that relies on an AEDM, all other representations would be required to be based on the same AEDM results used to generate the represented value of FEI or efficacy.

3. AEDM Verification Testing

In the July 2022 NOPR, consistent with the provisions for certain commercial and industrial equipment, DOE proposed to include provisions related to AEDM verification testing for fans and blowers in 10 CFR 429.70(k), including: (1) selection of units from retail if available, or otherwise from a manufacturer, (2) independent, third-party testing if available, or otherwise at a manufacturer's facility, (3) testing performed without manufacturer representatives on site, (4) testing in accordance with the DOE test procedure, any active test procedures, any guidance issued by DOE, and lab communication with the manufacturer only if DOE organizes it, (5) notification of manufacturer if a model tests worse than its certified rating by an amount exceeding a 5 percent tolerance with opportunity for the manufacturer to respond, (6) potential finding of the rating for the model to be invalid, and (7) specifications regarding when a manufacturer's use of an AEDM may be restricted due to prior invalid represented values and how a manufacturer could regain the privilege of using an AEDM for rating. 87 FR 44194, 44242. DOE did not receive any comments related to these proposals and DOE is adopting these provisions as proposed.

4. Engineered-To-Order

In response to the July 2022 NOPR, New York Blower requested clarification regarding engineered-to-order products. Specifically, New York Blower requested clarification regarding what defines a product as an engineered-to-order product and whether that would impact sampling and AEDM requirements. New York Blower commented that engineered-to-order better describes custom fans which contain a design, but no distinct sizes. New York Blower commented that the sizes are dynamically created when the customer provides the specification and the fan is then designed and built once, for a single use. New York Blower requested clarification on whether this type of product is required to follow the sampling and testing requirements. New York Blower recommended that custom fan designs be certified at a single size and that at the time of order, the data from the tested size would be rescaled through an AEDM, built, and shipped. New York Blower further recommended that the certification of the original tested fan would be carried to the designed fan and no further sampling or testing would be required. New York Blower commented that this is how

[112] The FEI is equal to the reference FEP (FEP_{ref}) divided by the FEP of the actual fan. Therefore, if the FEP calculated using the AEDM (FEP–AEDM) is greater than or equal to 95 percent of the FEP (FEP-test) determined through testing, the FEP_{ref}/FEP–AEDM is less than or equal to 1/0.95 * FEP_{ref}/FEP-test.

custom fans have been designed for as long as the affinity laws have been understood. New York Blower noted that such approach would conflict with the definition of the basic model as each instance of the custom fan design is likely to consume a significantly different amount of energy from the tested fan and therefore would need to be considered a different basic model. In summary, New York Blower requested that DOE allow custom fan designs to be certified through a single certification for each design. (New York Blower, No. 33 at pp. 23–24)

As stated in section III.E of this document, DOE references section 8.2.1 of AMCA 214–21, ''Fan laws and other calculation methods for shaft-to-air testing,'' and section 8.2.3 of AMCA 214–21, ''Calculation to other speeds and densities for wire-to-air testing,'' as proposed in the July 2022 NOPR. (*See* 87 FR 44194, 44222.) Section 8.2.3 of AMCA 214–21 includes provisions which allow speed and size interpolations. In addition, as discussed in this section, DOE allows the use of AEDM in lieu of testing. For engineered-to-order equipment, manufacturers would have the option to determine the FEI of the engineered-to-order basic model through physical testing, application of the fan laws (in accordance with the test procedure), or application of an AEDM. Manufacturers would be required to certify the basic model.

As discussed in section III.C.7 of this document, with regards to custom fans for which a single made-to-order fan is manufactured, general sampling requirements for all covered equipment at 10 CFR 429.11(b), and § 429.11(b)(2) provides provisions for sampling when only one unit of a basic model is produced.[113] In accordance with these provisions, a single engineered-to-order product must be tested to ensure it complies with the standard. To reduce testing burden, DOE is adopting AEDM provisions that would allow certification using such AEDM, in lieu of testing (*i.e.,* physical testing or application of the fan laws as in accordance with the test procedure) and would apply to any basic model, including made-to-order products. Certification would be based on the test results of the one unit, or the AEDM ratings for the model.

J. Sampling Plan

DOE provides sampling provisions for determining represented values of energy use or energy efficiency of a covered product or equipment. *See* generally, 10 CFR part 429. These sampling provisions provide uniform statistical methods that require testing a sample of units that is large enough to account for reasonable manufacturing variability among individual units of a basic model, or variability in the test methodology, such that the test results for the overall sample will be reasonably representative of the efficiency of that basic model.

The general sampling requirement currently applicable to all covered products and equipment provides that a sample of sufficient size must be randomly selected and tested and that, unless otherwise specified, a minimum of two units must be tested to certify a basic model. 10 CFR 429.11. This minimum is implicit in the requirement to calculate a mean—an average—which requires at least two values. Manufacturers can increase their sample size to narrow the margin of error. The design of the sampling plan is intended to determine an accurate assessment of product or equipment performance, within specified confidence limits, without imposing an undue testing or economic burden on manufacturers. Different samples from the same population will generate different values for the sample average. An interval estimate quantifies this uncertainty in the sample estimate by computing lower and upper confidence limits (''LCL'' and ''UCL'') of an interval (centered on the average of the sample) which will, with a given level of confidence, contain the population average. Instead of a single estimate for the average of the population (*i.e.,* the average of the sample), a confidence interval generates a lower and upper limit for the average of the population. The interval estimate gives an indication of how much uncertainty there is in the estimate of the average of the population.[114] Confidence limits are expressed in terms of a confidence coefficient. For covered equipment and products, the confidence coefficient typically ranges from 90 to 99 percent.[115] The confidence coefficient 97.5 percent, for example, means that if an infinite number of samples are collected, and the confidence interval computed, 97.5 percent of these intervals would contain the average of the population: *i.e.,* although the average of the entire population is not known, there is a high probability (97.5 percent confidence level) that it is greater than or equal to the LCL and less than or equal to the UCL.

To ensure that the represented value of efficiency is no greater than the population average, the sampling plans for determination of the represented value typically consist of testing a representative sample to ensure that . . . (ii) Any represented value of energy efficiency[116] . . . shall be no greater than the lower of (A) the average of the sample () or (B) the lower XX confidence limit of the true mean divided by K, where the values for XX and K vary with product or equipment type. XX, the confidence limit, typically ranges from 90 to 99 percent, while K, an adjustment factor, typically ranges from 0.9 to 0.99. The specific values for XX and K for a particular product or equipment are selected based on an expected level of variability in product performance and measurement uncertainty. 10 CFR 429.14 through 10 CFR 429.66. Requiring that the represented value be less than or equal to the LCL would ensure that the represented value of efficiency is no greater than the population average. DOE divides the LCL by K to provide additional tolerance to account for variability in product performance and measurement uncertainty.[117] The comparison with the average of the sample further ensures that if LCL divided by K is greater than , the represented value is established using the average of the sample. In addition, DOE relies on a one-sided confidence limit to provide the option for manufacturers to rate more conservatively.

The Working Group recommended that a represented value of FEP of a basic model be based on a minimum of one test, where the represented value of FEP must be less than or equal to any energy conservation standard level, and greater than or equal to the tested value of FEP.[118] The Working Group did not

[113] Section 429.11(b)(2) specifies that if only one unit of the basic model is produced, that unit must be tested, and the test results must demonstrate that the basic model performs at or better than the applicable standard(s). If one or more units of the basic model are manufactured subsequently, compliance with the default sampling and representations provisions is required.

[114] NIST/SEMATECH e-Handbook of Statistical Methods, *www.itl.nist.gov/div898/handbook/eda/section3/eda352.htm.*

[115] Part 429 in 10 CFR outlines sampling plans for certification testing for product or equipment covered by EPCA.

[116] Or any other metric for which the consumer will favor a higher value, such as FEI.

[117] For example, if DOE expects that the variability for measured performance is within a margin of 3 percent, DOE will use a K value of 0.97. *See* for example 79 FR 32019, 32037 (June 3, 2014).

[118] DOE notes that this requirement can be converted into the FEI metric as follows: the represented value of FEI of the basic model must be based on a minimum of one test, where the represented value of FEI must be greater than or

Continued

provide recommendations to address a situation in which a manufacturer chooses to increase their test sample size. (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #23 at p. 12) The Petitioners also requested that manufacturers be allowed to establish FEP and FEI ratings of a fan basic model based on testing of a single unit. (Docket No. EERE–2020–BT–PET–0003, The Petitioners, No. 1.3 at p. 8)

In the July 2022 NOPR, DOE proposed that a minimum sample size of two units would be used when making representations of FEP, FEI, and fan shaft power, as applicable. This proposal is consistent with the statistical sampling requirements in place for other commercial and industrial equipment regulated by DOE.[119] 87 FR 44194, 44243. In addition, DOE proposed that the FEI be rounded to the nearest hundredth. *Id.* at 87 FR 44243.

AMCA commented that a 2-sample test was a deviation from the ASRAC term sheet, which required the industry and advocates to expend time and resources to research and analyze the implication of losing the historical record of fan tests. (AMCA, No. 41 at p. 2) AMCA commented that sample sizes of one unit must be allowed, as stipulated in Recommendation #23 of the term sheet. AMCA further cited the example of commercial packaged boilers as a covered product for which DOE allows a single unit sample (10 CFR 429.60). AMCA commented that, if DOE does not allow a single unit sample, much of the historical data for the fan industry would be eliminated. AMCA added that the industry does not have the financial or logistical resources to retest all products with two-sample tests. In addition, AMCA commented that AMCA 214–21 defines how to calculate the FEP and FEI at a single duty point or point of operation which consists of values of flow rate, pressure, power, and density. AMCA noted that the proposed statistics included in the NOPR imply FEP and FEI values can be averaged over multiple tests. However, AMCA commented that when considering multiple samples, the tests would have to have an identical number of sampled duty points and each duty point would have to be at the same flow, pressure, and density.[120] AMCA commented that while tests can be corrected to have all data points represented at the same density, it is highly unlikely each collected data point will be at the same flow and pressure. AMCA commented that there is no known methodology to combine multiple sets of test data to compute an expected mean value of performance [121] and commented that DOE would need to provide some methodology. AMCA added that the proposed statistics would function accurately under the following conditions: (1) A single value of performance (metric) was derived from the test (for example, the WFEI); or (2) The value from the test was captured at some specific operating condition that is repeatable across tests (for example at BEP). AMCA commented that the proposed test procedure is such that historical data would not pass the current test-procedure requirements and requiring two units to be tested will double the expense for manufacturers and lead to excessive testing burden. AMCA commented that units that are built for test cannot be placed back into stock and sold as new or offered for sale and all tested units would be an unrecoverable expense. AMCA commented that in addition to the costs, the time required to test two units of every basic model would span well beyond the compliance time period and could exceed 10 years. Instead, AMCA recommended to follow the guidelines of AMCA 214 and allow a single test where the FEP and FEI is calculated at each duty point (corrected to uniform speed and density as appropriate), and this data becomes the basis for the efficiency values presented in the market. (AMCA, No. 41 at pp. 38–40)

JCI and Morrison commented in support of AMCA's comments regarding the proposed sampling plan. (JCI, No. 34 at p. 2; Morrison, No. 42 at pp. 9–12)

NEEA recommends DOE work with AMCA to understand the burden associated with testing two units to certify a basic model and clarify DOE's stance on allowing the use of historic testing to be used in certifying fans. (NEEA, No. 36 at p. 3)

New York Blower commented that the sampling and statistics built into 10 CFR parts 429 and 431 will function as expected for a product-based metric. However, New York Blower added that the FEI metric is designed to be applicable to an entire fan performance envelope (flow, pressure, density, and power) and that there is no agreed upon methodology that allows for the combining of two or more fan curves into a representation of performance for a population. (New York Blower, No. 33 at p. 3) New York Blower added that requiring two-sample testing will double the costs of testing compared to creating ratings for a series of sizes within a product line from a single test. (New York Blower, No. 33 at p. 5)

New York Blower further commented that for a product-based metric where statistical representation of a population is required, a two sample minimum is appropriate. New York Blower added that a two-sample minimum could impose significant restrictions on the manufacturer, by amplifying any deviation between samples to predict population performance. New York Blower commented that a Weighted Average FEI value could be calculated from a single test. Presuming this would represent minimum energy consumption or maximum efficiency of the population of products would require the manufacturer to estimate any deviations from future samples and incorporate it in the ratings calculation. While not statistically supportable, it would be a method to create ratings and certify products from a single test. (New York Blower, No. 33 at p. 22)

Robinson commented that the two-sample minimum causes great concern for heavy industrial processing fans. Robinson commented that heavy industrial processing fans are uniquely designed and engineered for each installation and application. The material and parts are ordered specific to the job and only after the engineering and drawing of the individual product are complete. The NOPR indicates that the DOE would attempt to require two of each fan to be built to test its efficiency. Considering the number of heavy industrial processing fans and blowers sold in a year, Robinson commented that this will add a significant time and financial burden even if it were possible to design an AEDM. In the case of custom engineered equipment, Robinson stated that an accurate AEDM will be difficult and expensive to develop, requiring significant engineering expertise. (Robinson, No. 43 at pp. 3–4)

In addition, Robinson requested clarifications regarding the sampling process and noted that it is not unusual for a custom fan manufacturer to not

equal to any energy conservation standard and less than or equal to the tested value of FEI.

[119] The general sampling requirement currently applicable to all covered products and equipment provides that a sample of sufficient size must be randomly selected and tested to ensure compliance and that, unless otherwise specified, a minimum of two units must be tested to certify a basic model as compliant. *See* 10 CFR 429.11.

[120] At a given density, each duty point is defined as a value of pressure and flow at a given speed, and the test procedure provides methods to determine the electrical or FEP at that duty point.

[121] AMCA commented that AMCA 211 provides a method of comparing fan-performance data to a reference rating and an interpolation method for estimating performance between two sets of performance data but does not provide a method of combining more than one set of test data to provide average prediction of performance. (AMCA, No. 41 at p. 39)

make a particular size for years depending on the needs of the market. Robinson commented it was their understanding that one test would be required to certify a design as custom fan manufacturers would have historical design data available regarding the original design. Robinson commented that the definition of basic models and varying full width size classes suggests that an extraordinary amount of testing would need to be conducted to certify basic models. (Robinson, No. 43 at p. 12)

Greenheck commented that the proposed two-test requirement is disruptive and an extreme burden to the industry. Greenheck commented that the fan test procedure and certified ratings program (''CRP''), developed by AMCA and utilized by the fan industry, requires a single-sample precertification test and recurring surveillance audits. Greenheck commented that a two-sample requirement will not focus the industry on development of higher efficiency products and support energy savings. Instead, it will eliminate currently available fan performance data and shackle manufacturers with years of recertification of existing products. Greenheck commented that the improved accuracy of two-sample testing provides no value or energy savings for products already following the AMCA CRP program. Greenheck recommended that DOE accept AMCA CRP historical data and allow single unit performance data following AMCA 210 and AMCA 211 moving forward. (Greenheck, No. 39 at pp. 2–3)

AHRI commented that the Working Group explicitly recommended that a represented value of a basic model be based on a minimum of one test, where the tested value must be less than the represented value. AHRI commented that this was deemed appropriate by the Working Group after lengthy discussion about the substantial burden retesting on the industry. AHRI commented that the ratings and sampling methods embodied in AMCA Publication 211, ''Certified Ratings Program Product Rating Manual for Fan Air Performance,'' have long been used and have been offered for regulatory purposes. AHRI does not support DOE's proposal that a minimum sample size of two units would be used when making representations of FEP, FEI, and BHP, as applicable, be required when that was explicitly recommended against by the cognizant Working Group. AHRI added that DOE has offered no data or analysis that the agreed upon methodology would be insufficient or deviate substantially from current practices. (AHRI, No. 40 at p. 7)

ebm-papst commented that they were unable to see through the complexities and important nuances of the AEDM and the statistical procedures that the NOPR proposed to implement. Instead, ebm-papst recommended adoption of AMCA 211 certification program into this fan rulemaking. (ebm-papst, No. 31 at p. 13)

Rheem commented that having multiple samples can be beneficial (Public Meeting Transcript, No 42 at pp. 85–86)

For fans and blowers other than air circulating fans, DOE is following the recommendation of the Working Group (Docket No. EERE–2013–BT–STD–0006, No. 179, Recommendation #23 at p. 12) and providing the option to test a minimum of one unit, where the tested value must be less than the represented value. If, however, a fan manufacturer chooses to certify compliance of a basic model based on the test result of a single unit, DOE notes that it may consider using a minimum sample size of one unit for enforcement testing, and if a single unit of this fan basic model does not meet the applicable Federal energy conservation standard, the fan basic model will be considered non-compliant. If a manufacturer chooses to certify compliance of a basic model based on the test result of a sample of more than one unit, DOE may consider performing enforcement testing based on a sample of more than one unit. As discussed in section III.K, DOE is not adopting enforcement provisions in this document and will address enforcement provisions in a future energy conservations standards rulemaking.

As stated, the Working Group did not provide recommendations to address a situation in which a manufacturer chooses to increase their test sample size, specifically in terms of the methodology to use when averaging the FEI of two or more duty points, which may not be exactly at the same flow and pressure due to testing variations. To address the situation where a manufacturer may choose to increase the test sample, DOE adds provisions to clarify how to perform the average FEI calculation: for each speed and flow value for which the manufacturer chooses to make a representation, the average FEI is the average of the FEI determined by each test and the duty point is defined as the value of speed, flow, and average of the pressures determined by each test. DOE notes that AMCA 214–22 provides methods to convert performance data from one speed to another speed (*see* Annex G and Annex H of AMCA 214–22 as well as section 7.9.1 of AMCA 210–216), as well as interpolation methods to determine the performance along the fan curve (*i.e.,* at any flow value) at a given speed.[122] Therefore, separate test results can be converted to the same flow and speed. The remaining pressure value would then be averaged to provide the average duty point pressure.

Regarding the use of historical test data, DOE understands that manufacturers of fans and blowers likely have historical test data which were developed with methods consistent with the DOE test procedure being adopted in this final rule. DOE does not expect manufacturers to regenerate all of the historical test data unless the rating resulting from the historical methods, which is based on the same methodology being adopted in this final rule, would no longer be valid.

Regarding the use of AMCA 211–22, DOE develops its own certification, compliance, and enforcement provisions and will consider the provisions in AMCA 211–22 to the extent possible in a separate certification-focused rulemaking.

AHAM commented that deviation from an agreed-upon term sheet diminished the value of participating in ASRAC negotiations and could result in reduced interest in participating in such negotiations in the future. AHAM stated that stakeholders from all perspectives (*e.g.,* manufacturers, efficiency advocates, States, and utilities) and DOE alike see value in that process. AHAM commented that they are a strong supporter of negotiated standards—both through the ASRAC process and through ''private'' negotiations among stakeholders with various points of view. (AHAM, No. 35 at p. 9)

AMCA commented that, DOE always reserves and retains the right to diverge from the ASRAC consensus, but in the interest of encouraging future participation in a process generally acknowledged to be a classic example of good regulatory policy and practice, DOE last-minute divergence in fundamental ways from the ASRAC consensus (especially where that consensus has been used as a guide for the more rapidly developed related regulation in California) will only serve as a disincentive for future parties to participate in ASRAC negotiations. (AMCA No. 41 at p. 3)

DOE notes that the adopted provisions to allow a sample of at least one unit aligns with the term sheet. As noted throughout the notice, DOE aligned with the recommendations of

[122] Sections 7.13.1 and 7.13.2 of AMCA 214–22 state: ''If needed, duty points between laboratory tested points (determinations), are obtained by fitting a cubic polynomial based on the four closest determinations.''

the term sheet except on the metric (FEI vs. FEP), where DOE aligned with the latest industry standard. *See* section III.G.1 of this document. DOE established the ASRAC in an effort to further improve DOE's process of establishing energy efficiency standards for certain appliances and commercial equipment. ASRAC allows DOE to use negotiated rulemaking as a means to engage all interested parties, gather data, and attempt to reach consensus on establishing energy-efficiency standards.

For air circulating fans, DOE did not receive any comments specific to the sampling plan. For air circulating fans, the metric is evaluated at a single operating point (*i.e.,* maximum speed, *See* Section III.G.2 of this document) and each basic model's performance is represented by a single rating. This metric approach is different from the one used for fans blowers other than air circulating fans where the metric is evaluated at each of the fan's operating points within the range of air power and shaft input power in scope (*i.e.,* at each duty point, as specified by the manufacturer within the range of air power and shaft input power in scope; *see* Section III.B.1 of this document) and requires the determination of the FEI at each duty point as specified by the manufacturer, resulting in multiple FEI ratings for the same basic model. For this reason, DOE believe it is appropriate to allow a minimum of one unit for fans and blowers other than air circulating fans, and to require a minimum of two units for air circulating fans. Thus, DOE is requiring a minimum of two units, as proposed in the July 2022 NOPR. As noted, a minimum of two units is consistent with the statistical sampling requirements in place for other commercial and industrial equipment regulated by DOE.[123]

K. Enforcement Provisions

In the July 2022 NOPR, DOE proposed to add specific enforcement testing provisions for fans and blowers at 10 CFR 429.110 and proposed that DOE would use an initial sample size of not more than four units and would determine compliance based on the arithmetic mean of the sample. This is similar to existing enforcement testing provisions for pumps and HVACR equipment. DOE also proposed to add product-specific enforcement provisions for fans and blowers other than air circulating fans to specify that: (1) geometric similarity of two or more fans will be verified by requiring that the manufacturer provides all fan design dimensions as described in Annex K of AMCA 214–21; and (2) DOE will test each fan basic model according to the test method (specified by the manufacturer in any certification report (*i.e.,* based on section 6.1, 6.2, 6.3, or 6.4 of AMCA 214–21). 87 FR 44194, 44243.

DOE did not receive any comments specific to this issue. In this final rule, DOE is not adopting enforcement provisions as proposed in the July 2022 NOPR. At this time, DOE has not established any energy conservation standards for fans and blowers and will consider establishing enforcement provisions as part of any future energy conservation standards rulemaking.

L. Effective and Compliance Dates

The effective date for the adopted test procedure will be 30 days after publication of this final rule in the **Federal Register**. EPCA prescribes that all representations of energy efficiency and energy use, including those made on marketing materials and product labels, for certain equipment, including fans and blowers, must be made in accordance with an amended test procedure, beginning 180 days after publication of the final rule in the **Federal Register**. (42 U.S.C. 6314(d)(1)) EPCA provides an allowance for individual manufacturers to petition DOE for an extension of the 180-day period if the manufacturer may experience undue hardship in meeting the deadline. (42 U.S.C. 6314(d)(2)) To receive such an extension, petitions must be filed with DOE no later than 60 days before the end of the 180-day period and must detail how the manufacturer will experience undue hardship. (*Id.*)

AMCA commented that if DOE's test procedure results in a comprehensive need for industry testing, there would not be sufficient throughput to meet, for example, a 180-calendar-day deadline. In actuality, it would likely take years for industry to retest everything. (AMCA No. 41, at p. 40)

JCI stated that it shares AMCA's comments regarding the 180-day compliance window between rule finalization and the effective date which is not possible for a product sector being regulated for the first time under the proposed NOPR requirements; either the proposed test procedures need to be revised or the time period needs to be extended to 6 years. (JCI, No. 34 at p. 2)

DOE understands that manufacturers of fans and blowers likely have historical test data which were developed with methods consistent with the DOE test procedure being adopted in this final rule. DOE notes that it does not expect manufacturers to regenerate all of the historical test data, unless the rating resulting from the historical methods, which is based on the same methodology being adopted in this final rule, would no longer be valid. EPCA provides a 180-day timeline for all representations regarding energy consumption or the cost of energy consumed by fans and blowers to be made according to the DOE test procedure. (42 U.S.C. 6314(d)(1)) This is a statutory requirement and not a timeline chosen by DOE.

AHRI commented that once the test procedure is finalized, fan manufacturers will have 180 days to comply with the new procedure. AHRI commented that this is an unrealistic timeline. AHRI commented that component fans that were once available for a product's full operating range may no longer be available and OEMs will not have the information about market availability of new component fans until well after the motor has been tested and certified. AHRI added that after assessing the availability on the market, OEMs may have to redesign equipment to accommodate for a different motor size, which could also negatively impact performance and efficiency. AHRI stated that redesign and testing take years to complete, and the information required for this equipment assessment will not be available until after fan manufacturers are actually complying with the test procedure. (AHRI, No. 40 at p. 9) AHRI added detailed descriptions and estimates of the costs to incorporate a redesigned fan into an OEM equipment. (AHRI, No. 40 at pp. 9–10)

As discussed previously, EPCA prescribes that all representations for fans and blowers must be made in accordance with an amended test procedure, beginning 180 days after publication of the final rule in the **Federal Register**. (42 U.S.C. 6314(d)(1)) At this time, DOE is not adopting energy conservation standards for fans and blowers, and the test procedure would not impact the availability of current models. The test procedure does not set any energy conservation standards and does not result in any non-compliant fans.

M. Test Procedure Costs and Impacts

As previously discussed, DOE is establishing a test procedure for fans and blowers at 10 CFR part 431, subpart J and a new appendix A and appendix

[123] The general sampling requirement currently applicable to all covered products and equipment provides that a sample of sufficient size must be randomly selected and tested to ensure compliance and that, unless otherwise specified, a minimum of two units must be tested to certify a basic model as compliant. *See* 10 CFR 429.11.

B. Additionally, DOE is (1) adopting through reference the test methods in AMCA 214–21 and AMCA 230–23, with certain modifications; (2) adopting through reference certain test procedure provisions in AMCA 210–16; and (3) specifying FEP and FEI, based on AMCA 214–21, and CFM/W, based on AMCA 230–23, as the relevant metrics. DOE is also adding section 69 to 10 CFR part 429, which adds fan and blower sampling requirements and provisions related to determining represented values, and is adding paragraph (n) to 10 CFR 429.70, which specifies alternative efficiency determination method requirements. DOE has determined that the test procedure would impact testing costs as discussed in the following paragraphs.

By adopting industry standards, DOE has determined that the test procedure in this final rule would be reasonably designed to produce test results that reflect energy efficiency and energy use of fans and blowers during a representative average use cycle and that would not be unduly burdensome for manufacturers to conduct. In the July 2022 NOPR, DOE presented costs associated with performing testing according to the proposed test procedure at third-party testing facilities (*i.e.,* facilities that are not operated by the manufacturer whose product is being tested). 87 FR 44194, 44243.

In the July 2022 NOPR, DOE assumed that both AMCA and non-AMCA members could test products at the AMCA testing facilities, with non-AMCA member costs being double the cost of AMCA members. 87 FR 44194, 44243. DOE has since learned that it is uncommon for the AMCA testing facility to test non-AMCA member products. In the July 2022 NOPR, DOE had estimated that 40 percent of fan manufacturers are not AMCA members. *Id.*

In the July 2022 NOPR, DOE had expected that manufacturers could have substantial initial capital costs if they established a test laboratory capable of testing to the proposed test procedure; however, DOE had anticipated that the cost to perform a test would be less for in-house testing than for third-party testing. *Id.* In other words, DOE had expected that over the lifetime of a new test laboratory, the initial capital costs would be less than the total cost of third-party testing.

In the July 2022 NOPR, DOE provided estimated costs for testing fans at third-party laboratories; however, based on stakeholder comments, DOE anticipates that the cost to perform a test would be less for in-house testing than for third-party testing. *Id.* DOE requested feedback on its assumption that it would cost an average of $4,200 to test one fan for both general fans and air circulating fans. DOE also requested feedback on the method described for estimating manufacturer per-model testing costs of general fans and air circulating fans. Additionally, DOE requested feedback and data on the total testing costs per basic model for testing at third-party facilities and on third-party laboratory testing costs (other than AMCA). *Id.*

AMCA commented that testing for air circulating fans per AMCA 230 would cost $1,420 per fan with an added cost of $350 per fan speed. (AMCA, No. 41 at p. 35) Additionally, AMCA provided an estimated cost of $6,300 to test a general fan. (AMCA, No. 41 at p. 40) New York Blower commented that the third-party testing costs were reasonable. (New York Blower, No. 33 at p. 22). AMCA, New York Blower, and Morrison commented that DOE did not consider the cost to ship fans to third-party facilities in its estimated test costs. (AMCA, No. 41 at p. 40; New York Blower, No. 33 at p. 22; Morrison, No. 42 at p. 12).

AMCA also commented that BESS Labs traditionally tests circulating fans; however, AMCA's policy is not to report on other organizations' pricing, so it did not provide details on BESS Labs and its testing programs. (AMCA, No. 41 at p. 40). JCI commented that there are limited laboratory facilities available for testing. (JCI, No. 34 at p. 1) DOE recognizes that third-party testing is currently not widely available and is not aware of any third-party testing facilities that can accommodate both general fans and air circulating fans aside from AMCA's testing facilities; therefore, DOE has updated its cost estimates to recognize that some fan manufacturers may need to build a test lab to test and certify fans according to the DOE test procedure.

Based on DOE's additional evaluation, and from stakeholder comments, in this final rule, DOE presents costs for building an in-house test facility to obtain representative efficiency values for fans and blowers according to the test procedure. As such, DOE has assumed that the in-house facilities would be connected to or within reasonable distance to the manufacturer production facility to eliminate the need to ship fans to the test lab. DOE has worked to minimize testing burden while maintaining the rigor of the test procedure is this final rule by: (1) requiring a minimal certification sample size of one unit per basic model, reduced from a minimum of two proposed in the July 2022 NOPR (87 FR 44194, 44243); (2) requirements for testing with appurtenances is now consistent with AMCA 210–16 and AMCA 230–23, which allows manufacturers to use historical data; (3) clarifying the definition of a basic model that was proposed in the July 2022 NOPR (87 FR 44194, 44213); and (4) allowing the use of AEDMs in lieu of testing. DOE addresses cumulative costs and burden and discusses its estimated test costs in detail in the following sections. Ultimately, DOE has determined that the costs to conduct the test procedure in this final rule do not outweigh the benefits and that the text procedure is not unduly burdensome for manufacturers to conduct.

1. Cumulative Costs and Burden

In response to the July 2022 NOPR, stakeholders commented that cumulative testing costs and burden would be significant based on the proposed test procedure.

Morrison commented that they estimate testing to take from 3 to 5 years and would require expanding lab operation and personnel. (Morrison, No. 42 at p. 12) Morrison additionally stated that they would need to test each of their thousands of basic models two times. *Id.* Additionally, Morrison stated that by dedicating more time to testing, they would not be able to dedicate as much time to customer development or research and design. *Id.* AMCA commented that it would take longer than 180 days, and most likely years, for the industry to retest all fans, either at a third-party lab or at an in-house laboratory. (AMCA, No. 41 at pp. 40–41) AMCA also stated that the amount of time required to test fans is dependent on the number of basic models. *Id.* JCI stated that they expect the cumulative test cost to be in the tens of millions of dollars and to take 6 years to complete. (JCI, No. 34 at p.1) AHRI commented that it would likely take fan manufacturers longer than 180 days after the test procedure is finalized to begin certifying fans. (AHRI, No. 40 at pp. 9–11) New York Blower commented that the cumulative testing burden would be significant when the number of basic models, samples, and appurtenances are considered. (New York Blower, No. 33 at p. 4)

New York Blower additionally commented that the proposed test procedure would not allow manufacturers to use historical test data and that manufacturers need to use historical test data to comply with standards in time. (New York Blower, No. 33 at p. 4)

DOE understands the comments from stakeholders to be in response to DOE's

proposal in the July 2022 NOPR to require a minimum of two samples to rate a basic model. 87 FR 44194, 44243. Additionally, DOE recognizes that the concerns over test costs and burden may be in response to DOE's proposals for testing with appurtenances (87 FR 44194, 44226), testing air circulating fans at multiple speeds (87 FR 44194, 44227), and DOE's consideration of a WFEI metric for fans and blowers that are not air circulating fans (87 FR 44194, 44237–44238) in the July 2022 NOPR.

In response to stakeholder concerns regarding cumulative test costs and burden, DOE is providing the option to test a minimum of one unit, rather than two units, for rating and certification (see Section III.J). As discussed in section III.E.12, DOE is aligning the provisions for testing with appurtenances with industry test standards AMCA 214–21 and AMCA 230–23. Finally, DOE is requiring that air circulating fans be tested at a single speed, as discussed in section III.E.14 of this document. As a result, DOE expects that manufacturers may use historical test results and the cumulative test cost and the time required to test products will be substantially decreased.

Furthermore, DOE notes that the deadline for manufacturers to comply with the test procedure 180 days after it is published is for voluntary representations, which is further discussed in section III.L of this document. If DOE were to set standards for general fans and air circulating fans, certification based on the sampling plan discussed in section III.J would be required on the compliance date of the standard, which could be between 3 and 5 years after the publication date of the energy conservation standards final rule.

JCI commented that the cost of testing was underestimated and that DOE did not consider the cost of building prototypes for test. (JCI, No. 34 at p. 1) Robinson stated that DOE did not consider the cost of building a custom fan in duplicate to test (Robinson, No. 43 at p. 12). The test procedure that DOE is adopting is non-destructive, meaning that test does not alter the operation and performance of the fan; therefore, DOE does not see a reason for that a prototype or duplicate fan needs to be produced solely for testing DOE is not including the cost of the fan in its updated test procedure cost estimates.

2. Estimated Costs for Building and Testing of Fans and Blowers Other Than Air Circulating Fans at an In-House Facility

a. Capital Costs

In the maximum-burden case where a fan manufacturer would be required to construct a test lab from scratch, manufacturers would be required to make capital outlays to acquire or build a testing facility and purchase test equipment. DOE has estimated costs for fans based on the AMCA 210–16 industry standard that DOE is referencing in this final test procedure. DOE estimated minimum and maximum costs, then used these two values to determine an average cost.

To estimate the costs to build an in-house testing facility, DOE assumed a single-story building built in the U.S. using 2022 costs. DOE estimated test facility square footage by using information from manufacturers and by evaluating outlet duct setups in AMCA 210–16, with length and width buffers applied. DOE estimated an average floor area of 3,450 square feet.[124] Using this average square footage value, DOE estimated a one-time building cost for warehouse and storage to be $321,000.[125]

DOE has identified that the test structure to test in accordance with AMCA 210–16 would consist of a traverse pitot duct and a main chamber. DOE has estimated that the average one-time cost for the traverse pitot duct and the main chamber would be $1,800.

The test procedure for fans and blowers other than air circulating fans, which aligns with AMCA 210–16, requires pressure, flow, power, and air density to be measured or calculated by equipment with specific calibrations and accuracies. The cost of this test equipment is considered as a one-time cost. The pressure measurement requires a manometer and a pitot-static tube. DOE has estimated the average cost of a manometer to be $590 and the average cost of a pitot-static tube to be $290. Flow can also be measured with the pitot-static tube. According to AMCA 210–16, power can be determined indirectly or directly. The indirect determination of power requires force or torque measurements by either a reaction dynamometer or torque meter, respectively, and power is calculated using equations in AMCA 210–16. The direct measurement of power requires either a calibrated motor or an electric meter. DOE has assumed that a testing facility would have all equipment necessary to determine power either directly or indirectly (*i.e.,* a reaction dynamometer, torque meter, calibrated motor and electric meter) to provide testing flexibility. This assumption is also the most conservative. DOE has estimated the average costs of a reaction dynamometer to be $5,700, a torque meter to be $1,600, a calibrated motor to be $1,700, and an electric meter to be $9,700. The air density is calculated using measurements of air temperature with a thermometer and pressure with a barometer. DOE has estimated the average costs of a thermometer to be $600 and a barometer to be $330. In sum, DOE has estimated that the cost to acquire all of the necessary test equipment to perform the general fans test procedure is, on average, $20,500.

In total, DOE has estimated the average capital cost of building an in-house testing facility for fans as $343,300. DOE notes that some fan manufacturers have indicated they already have existing facilities and equipment to test general fans according to AMCA 210–16, which DOE references in this final test procedure.

b. Annual Costs

DOE has estimated annual costs for operating a testing facility, which include utilities and equipment calibration. DOE has estimated that the annual utilities costs would be $8,000,[126] based on the average floor area discussed in the previous section. Equipment would need to be calibrated

[124] DOE used the AMCA 2012 general fans database to estimate the maximum diameter of a general fan. DOE then used the maximum diameter to determine the floor area necessary to build a main chamber and ductwork in accordance with the test set-ups in AMCA 210–16 with a buffer of 5 times the estimated area. DOE calculated the average floor area to be 6,500 square feet, which DOE then used as the maximum square footage value. DOE used 400 square feet as the minimum floor area, which DOE determined from communication with manufacturers. DOE calculated the average of these two values to estimate an average floor area of 3,450 square feet ((6,500 + 400) ÷ 2 = 3,450).

[125] DOE estimated the building cost for warehouse and storage based on the RSMeans Facilities Construction Cost Data (2011). DOE then used the Federal Reserve Economic Data's ''Producer Price Index by Industry: Fan, Blower, Air Purification Equipment Manufacturing'' to account for inflation to 2022 prices. (*https://fred.stlouisfed.org/series/PCU333413333413*)

[126] DOE estimated the commercial utility costs to be $0.1122/kWh using data from EIA's ''2021 Average Monthly Bill'' and commercial utility use to be 20.70 kWh/square foot using EIA's ''2018 Commercial Buildings Energy Consumption Survey'' (*www.eia.gov/electricity/sales_revenue_price/pdf/table5_b.pdf; https://www.eia.gov/consumption/commercial/data/2018/pdf/CBECS%202018%20CE%20Release%202%20Flipbook.pdf*). DOE then calculated total average commercial utility costs to be $8,000 ($0.1122/kWh × 20.70 kWh/square foot × 3,450 square feet = $8,013).

each year, which DOE has estimated to be $21,500 [127] based on 2016 calibration price lists from the National Institute of Standards and Technology (''NIST'').

In total, DOE has estimated the annual cost of operating an in-house testing facility for general fans as approximately $29,500.

c. Testing Costs

This final rule includes requirements regarding the sampling plan and representations for covered fans at subpart B of 10 CFR part 429. The sampling plan requirements require a minimum sample size of one unit per general fan basic model be tested when determining representative values of FEI, as well as other fan performance metrics.

Fan test costs include the cost of labor to set-up, test, and disassemble the fan. DOE estimated that it would take an average of 4 hours to set-up and disassemble a general fan and 2 hours to test a general fan, resulting in a total of 6 hours of labor per test. DOE has also assumed that a mechanical engineering technician would set-up and perform the testing. Based on wage and salary data from the Bureau of Labor Statistics (''BLS''), DOE has estimated a fully burdened hourly mechanical engineering technician wage of $43.[128] DOE has calculated the total cost of labor for testing a general fan to be approximately $260 per basic model, assuming one fan is tested per basic model.

d. AEDM Costs

As previously discussed, an AEDM is a mathematical model developed by a manufacturer that estimates the energy efficiency or energy consumption characteristics of a basic model as measured by the applicable DOE test procedure. Before using an AEDM, a fan manufacturer must validate the AEDM's accuracy and reliability by physically testing two basic models and comparing the test results to the output of the AEDM (see discussion in III.I.3 of this document).

In the July 2022 NOPR, DOE assumed a mechanical engineer would develop and validate a new AEDM. 87 FR 44194, 44243. DOE estimated that it would take 24 labor hours per validation class for an engineer to develop and validate an AEDM using existing simulation tools. *Id.* 87 FR at 44243–44244. DOE assumed a mechanical technician would implement an AEDM once it is developed. *Id.* DOE estimated that it would take a mechanical technician 1 hour to determine the representative values necessary to certify a basic model using an AEDM. *Id.*

In response to the July 2022 NOPR, several stakeholders commented that DOE underestimated the time it would take to develop an AEDM and to develop certified ratings from that AEDM. AMCA provided a list of steps required to validate an AEDM and estimated that it would take 56 working hours to develop an AEDM and 24 working hours to develop certified ratings. (AMCA, No. 41 at . 42) New York Blower commented that it would take between 100 and 200 working hours to develop an AEDM and 3 hours to develop certified ratings because using computational fluid dynamics to estimate fan performance is complex. (New York Blower, No. 33 at p. 23) Robinson suggested that it would take on the order of several days to weeks to develop an AEDM (Robinson, No. 43 at p. 12) Morrison commented that it would take at least 80 working hours to develop an AEDM. (Morrison, No. 42 at p. 13) Additionally, the same stakeholders commented that the development of certified ratings from an AEDM would need to be done by a mechanical engineer, not a mechanical technician. (AMCA, No. 41 at . 42; New York Blower, No. 33 at p. 23; Robinson, No. 43 at p. 12; Morrison, No. 42 at p. 12)

After considering stakeholder comments, DOE has updated the costs to develop, validate, and implement an AEDM. DOE used the values provided in stakeholder comments to estimate the labor hours required to develop, validate, and implement an AEDM. Additionally, DOE has updated its estimates to reflect stakeholder comments that a mechanical engineer would be required to complete all stages of the AEDM.

For this final rule, DOE assumes a mechanical engineer would develop, validate, and implement a new AEDM. Based on wage and salary data from the BLS, DOE estimated the fully burdened hourly mechanical engineering wage to be approximately $66.[129] Considering the values provided in stakeholder comments, DOE estimates an average of 128 labor hours per validation class for an engineer to develop and validate an AEDM for general fans using existing simulation tools. Therefore, DOE estimates the cost of a fully burdened mechanical engineer as approximately $8,500 per validation class. As discussed in section III.J.1, testing of two basic models is required to validate an AEDM for a specific validation class while one unit must be tested per basic model in order to validate an AEDM. Therefore, two physical tests on two different basic models are required for validation of a AEDM for general fans. As discussed previously, DOE estimates the labor cost per test to be $260. Therefore, the total estimated manufacturer labor cost to develop and validate an AEDM for a single validation class is estimated to be $9,020 which is the cost to perform one test on two basic models ($520) plus the fully burdened cost of a mechanical engineer's time to develop and validate the AEDM ($8,500).

DOE also assumes a mechanical engineer will implement an AEDM once it is developed. Using the values provided in stakeholder comments, DOE estimates that it would take a mechanical engineer an average of 14 labor hours to determine the representative values necessary to certify a basic model using an AEDM. Therefore, the estimated cost to implement an AEDM to develop certified ratings is $950 per basic model.

In response to the July 2022 NOPR, AMCA and Robinson commented that not all manufacturers have the simulation tools necessary to validate and implement an AEDM. (AMCA, No. 41 at . 42; Robinson, No. 43 at pp. 11–12) DOE acknowledges that computational fluid dynamics (''CFD'') software is necessary to validate and implement an AEDM for fans and blowers and has concluded that the cost to purchase the software should be included as an AEDM one-time cost.

[127] DOE estimated the NIST calibration fee from *www.nist.gov/system/files/documents/2016/10/31/FeeSchedule-2016.pdf.* However, this catalog does not list calibration prices for the following equipment: manometer, pitot-static tube, and barometer; therefore, DOE used similar thermodynamic and mechanical type instruments that measure velocity of airflow and pressure from NIST.

[128] DOE estimated the hourly wage using data from BLS's ''Occupational Employment and Wages, May 2021'' publication. DOE used the ''Mechanical Engineering Technologies and Technicians'' mean hourly wage of $30.47 to estimate the hourly wage rate (*www.bls.gov/oes/current/oes173027.htm*). Last accessed on April 3, 2023. DOE then used BLS's ''Employer Costs for Employee Compensation—December 2022'' to estimate that wages and salary account for approximately 70.5 of employer labor costs for private industry workers. (*www.bls.gov/news.release/pdf/ecec.pdf*). Last accessed on April 3, 2023. Therefore, DOE estimated a fully-burdened labor rate of $43 ($30.47 ÷ 0.705 = $43.21).

[129] DOE estimated the hourly wage using data from BLS's ''Occupational Employment and Wages, May 2021'' publication. DOE used the ''Mechanical Engineers'' mean hourly wage of $46.64 to estimate the hourly wage rate (*www.bls.gov/oes/current/oes172141.htm*). Last accessed on April 3, 2023. DOE then used BLS's ''Employer Costs for Employee Compensation—December 2022'' to estimate that wages and salary account for approximately 70.5 percent of employer labor costs for private industry workers. (*www.bls.gov/news.release/pdf/ecec.pdf*). Last accessed on April 3, 2023. Therefore, DOE estimated a fully-burdened labor rate of $66 ($46.64 ÷ 0.705 = $66.16).

Robinson estimated that the investment in hardware and software would be on the order of $125,000. (Robinson, No. 43 at p. 11)DOE reviewed CFD prices online and found a CFD free of cost,[130] so used $0 as its minimum CFD cost and the estimate from Robinson as the maximum cost for CFD software. DOE averaged these two values to determine an average CFD software cost of $62,500. DOE estimated the cost of a workstation with the necessary system requirements to run CFD software to be $3,000, with a minimum of $1,000 and a maximum of $5,000; however, DOE notes that many CFD software packages are cloud-and license-based. DOE has estimated the average cost of CFD software and compatible hardware to be $65,500 (62,500 + 3,000 = 65,500).

3. Estimated Costs for Building and Testing Air Circulating Fans at an In-House Facility

In response to the July 2022 NOPR, DOE only received comment from AMCA containing cost estimates for testing air circulating fans at a third-party laboratory. To estimate the costs for testing air circulating fans, DOE used the comment received, its own testing experience with these fans, information provided by manufacturers during interviews, and in some cases made assumptions relative to the values estimated for general fans.

a. Capital Costs

In the maximum-burden case where ACF manufacturers would have to construct a test lab from scratch, manufacturers would be required to make capital outlays to acquire or construct a test facility and purchase test equipment. DOE has estimated its test costs for ACFs based on the AMCA 230–23 industry standard that DOE is referencing in this final rule. DOE estimated a minimum and maximum costs, then used these two values to determine an average cost.

To estimate building costs of an in-house testing facility, DOE assumed a single-story building in the U.S. using 2022 costs. DOE estimated test facility square footage by using information from manufacturers and by evaluating standard setups in AMCA 230–23, with length and width buffers applied. DOE estimated an average floor area 315 square feet.[131] Using this average square footage value, DOE has estimated one-time building cost for warehouse and storage to be $29,300.

DOE has identified that the test structure to test in accordance with AMCA 230–23 would consist of a lever arm and a test station. DOE has estimated that the average one-time cost for the lever arm and the test station would be $400.

The test procedure for ACFs, which aligns with AMCA 230–23, requires thrust, power, and air density to be measured or calculated by equipment with specific calibrations and accuracies. The cost of this test equipment is considered as a one-time cost. According to the test procedure, thrust can be measured with a load cell or standard weights. DOE has assumed that a testing facility should be equipped with both equipment types to accommodate various testing configurations and to take a conservative approach. DOE has estimated the cost of a load cell to be $1,500 and a set of standard weights to be $1,300. The power measurement is taken directly from an electric meter, which DOE has estimated to cost $9,700. The air density is calculated using measurements of air temperature with a thermometer and pressure with a barometer. DOE has estimated the costs of a thermometer to be $600 and a barometer to be $330. In sum, DOE has estimated that the cost to acquire all the necessary test equipment to perform the ACF test procedure is, on average, $13,430.

In total, DOE has estimated the capital cost of building an in-house testing facility for ACFs, on average, as $43,130. DOE notes that some fan manufacturers have indicated they already have existing facilities and equipment to test ACFs according to AMCA 230–23, which DOE references in this final test procedure.

b. Annual Costs

DOE has estimated annual costs for operating a testing facility, which include utilities and equipment calibration. DOE has estimated that the annual utilities costs would be $730,[132] based on the average floor area discussed in the previous section. Equipment would need to be calibrated each year, which DOE has estimated to be $16,600 based on 2016 calibration price lists from NIST.[133]

In total, DOE has estimated the annual cost of operating an in-house testing facility for ACFs as approximately $17,330.

c. Testing Costs

This final rule includes requirements regarding the sampling plan and representations for covered air circulating fans at subpart B of 10 CFR part 429. The sampling plan requires a minimum sample size of one unit per ACF basic model be tested when determining representative values of CFM/W, as well as other general fan performance metrics. Test costs include the cost of labor to set-up, test, and disassemble the fan. DOE estimated that it would take an average of 4 hours to set-up and disassemble a fan and 2 hours to test a fan, resulting in a total of 6 hours of labor per test. DOE has also assumed that a mechanical engineering technician would set-up and perform the testing. Based on wage and salary data from the BLS, DOE has estimated a fully burdened mechanical engineering technician wage of $44 per hour.[134] DOE has calculated the total cost of labor for testing an ACF to be approximately $260 per basic model.

d. AEDM Costs

As discussed previously in section III.M.2.d of this document, DOE assumes that a mechanical engineer would develop, validate, and implement a new AEDM. Based on wage and salary data from the BLS, DOE estimated the fully burdened mechanical engineering wage to be approximately $66 per

[130] *openfoam.org/*

[131] DOE used its air circulating fan database to estimate the average and maximum diameter of an ACF to be 40 inches and 61 inches, respectively. DOE then used these diameters to determine the floor area necessary to build a test structure for each fan in accordance with the test set-ups in AMCA 230–23 with a buffer of 1.2. DOE calculated the average floor area to be 180 square feet and the maximum floor area to be 430 square feet. DOE then took the average of these two values to estimate that the average floor area would be 315 square feet ((180 + 430) ÷ 2 = 315).

[132] DOE estimated the commercial utility costs to be $0.11/kWh using data from EIA's ''2021 Average Monthly Bill'' and commercial utility use to be 20.70 kWh/square foot using EIA's ''2018 Commercial Buildings Energy Consumption Survey'' (*www.eia.gov/electricity/sales_revenue_price/pdf/table5_b.pdf; www.eia.gov/consumption/commercial/data/2018/ppt/CBECS%202018%20C&E%20Flipbook.ppt*). DOE then calculated total average commercial utility costs to be $730 ($0.1122/kWh × 20.70 kWh/square foot × 315 square feet = $731).

[133] DOE estimated the NIST calibration fee from *www.nist.gov/system/files/documents/2016/10/31/FeeSchedule-2016.pdf.* However, this catalog does not list calibration prices for barometers; therefore, DOE used pricing for similar thermodynamic instruments.

[134] DOE estimated the hourly wage using data from BLS's ''Occupational Employment and Wages, May 2021'' publication. DOE used the ''Mechanical Engineering Technologies and Technicians'' mean hourly wage of $30.47 to estimate the hourly wage rate (*www.bls.gov/oes/current/oes173027.htm*). Last accessed on April 3, 2023. DOE then used BLS's ''Employer Costs for Employee Compensation—December 2022'' to estimate that wages and salary account for approximately 70.5 percent of employer labor costs for private industry workers. (*www.bls.gov/news.release/pdf/ecec.pdf*). Last accessed on April 3, 2023. Therefore, DOE estimated a fully-burdened labor rate of $43 ($30.47 ÷ 0.705 = $43.21).

hour.[135] Since product lines for air circulating fans are less complex than those for general fans, DOE also estimates that it would take roughly half the time to develop an AEDM for ACFs than it would to develop an AEDM for general fans; therefore, DOE assumed 62 labor hours per validation class for an engineer to develop and validate an AEDM for ACFs fans using existing simulation tools. Therefore, DOE estimates the cost of a fully burdened mechanical engineer as approximately $4,100 per validation class. As discussed in section III.I.1, testing of two basic models is required to validate an AEDM for a specific validation class. One unit must be tested per basic model in order to validate an AEDM. Therefore, two physical tests on two different basic models are required for validation of an ACF AEDM. As discussed in the previous section, DOE estimates the labor cost per test to be $260. Therefore, the total estimated manufacturer labor cost to develop and validate an AEDM for a single validation class is estimated to be $4,620, which is the cost to perform one test on two basic models ($520) plus the fully burdened cost of a mechanical engineer's time to develop and validate the AEDM ($4,100).

DOE also assumes a mechanical engineer would implement an AEDM once it is developed. DOE estimates that it would take a mechanical engineer 7 labor hours to determine the representative values necessary to certify a basic model using an AEDM. Therefore, the estimated cost to implement an AEDM to develop certified ratings for ACFs is $460 per basic model.

Additionally, DOE acknowledges that computational fluid dynamics software is necessary to validate and implement an AEDM and has concluded that the cost to purchase the software should be included as a one-time cost to use AEDMs. Software and hardware requirements and estimated cost are expected to be similar to that estimated for general fans (*i.e.,* $63,000).

[135] DOE estimated the hourly wage using data from BLS's ''Occupational Employment and Wages, May 2021'' publication. DOE used the ''Mechanical Engineers'' mean hourly wage of $46.64 to estimate the hourly wage rate (*www.bls.gov/oes/current/oes172141.htm*). DOE then used BLS's ''Employer Costs for Employee Compensation—June 2022'' to estimate that wages and salary account for approximately 70.5 percent of employer labor costs for private industry workers. (*www.bls.gov/news.release/pdf/ecec.pdf*). Last accessed on April 3, 2023. Therefore, DOE estimated a fully-burdened labor rate of $66 ($46.64 ÷ 0.705 = $66.16).

e. Voluntary Representations

Manufacturers of fans included within the scope of the test procedure adopted in this final rule would not be required to test fans and blowers in accordance with the DOE test procedure until the compliance date of a final rule adopting new energy conservation standards for fans and blowers. If manufacturers are currently reporting FEI for fans and blowers that are not air circulating fans or CFM/W for air circulating fans, they would need to ensure that the product is tested using the DOE test procedure and any representations in their marketing materials disclose the results of such test.[136] Although DOE is not requiring manufacturers to report FEI for fans and blowers that are not air circulating fans or CFM/W for air circulating fans prior to the compliance date of any new efficiency standards, DOE is assuming that manufactures may incur additional costs to remove or add FEI or CFM/W to their marketing materials to effect voluntary representations prior to the compliance date and independent of any new efficiency standards.

DOE anticipates that manufacturers currently making voluntary representations would update their online selection software, online catalogs, and product labels to remove or update efficiency representations in accordance with the DOE test procedure. DOE assumes that manufacturers would only need to update future print marketing materials, rather than create new materials as a result of the test procedure. DOE estimates that this effort would consist of no more than an hour of time for a graphic designer, along with two hours of time for a web developer, and one hour for a mechanical engineering technician—for a cost of approximately $195.01—per manufacturer.[137] If manufacturers decide to voluntarily test their products to provide an updated representation, manufacturers would incur the previously estimated testing costs along with this marketing materials related cost.

[136] If manufacturers voluntarily make representations regarding the FEI of fans and blowers that are not air circulating fans or CFM/W of air circulating fans, they would be required to test according to the DOE test procedure. *See* 42 U.S.C 6314(d)(1)

[137] Graphic designer salary of $28.83 per hour, web developer salary of $39.09 per hour, and mechanical technician salary of $29.07 per hour. Wages account for 70.5 percent of employer labor costs. DOE estimated the hourly wage using data from BLS's ''Occupational Employment and Wages, May 2021'' publication for each occupation (*www.bls.gov/oes/current/oes172141.htm*). Last accessed on April 3, 2023. DOE then used BLS's ''Employer Costs for Employee Compensation—December 2022'' to estimate that wages and salary account for approximately 70.5 percent of employer labor costs for private industry workers. (*www.bls.gov/news.release/pdf/ecec.pdf*). Last accessed on April 3, 2023. ($28.83 + $39.09 * 2 + $30.47)/0.705 = $195.01.

IV. Procedural Issues and Regulatory Review

A. Review Under Executive Orders 12866 and 13563

Executive Order (''E.O.'')12866, ''Regulatory Planning and Review,'' as supplemented and reaffirmed by E.O. 13563, ''Improving Regulation and Regulatory Review, 76 FR 3821 (Jan. 21, 2011) and E.O. 14094, ''Modernizing Regulatory Review,'' 88 FR 21879 (April 11, 2023), requires agencies, to the extent permitted by law, to (1) propose or adopt a regulation only upon a reasoned determination that its benefits justify its costs (recognizing that some benefits and costs are difficult to quantify); (2) tailor regulations to impose the least burden on society, consistent with obtaining regulatory objectives, taking into account, among other things, and to the extent practicable, the costs of cumulative regulations; (3) select, in choosing among alternative regulatory approaches, those approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages; distributive impacts; and equity); (4) to the extent feasible, specify performance objectives, rather than specifying the behavior or manner of compliance that regulated entities must adopt; and (5) identify and assess available alternatives to direct regulation, including providing economic incentives to encourage the desired behavior, such as user fees or marketable permits, or providing information upon which choices can be made by the public. DOE emphasizes as well that E.O. 13563 requires agencies to use the best available techniques to quantify anticipated present and future benefits and costs as accurately as possible. In its guidance, the Office of Information and Regulatory Affairs (''OIRA'') in the Office of Management and Budget (''OMB'') has emphasized that such techniques may include identifying changing future compliance costs that might result from technological innovation or anticipated behavioral changes. For the reasons stated in the preamble, this final regulatory action is consistent with these principles.

Section 6(a) of E.O. 12866 also requires agencies to submit ''significant regulatory actions'' to OIRA for review. OIRA has determined that this final

regulatory action does not constitute a ''significant regulatory action'' under section 3(f) of E.O. 12866. Accordingly, this action was not submitted to OIRA for review under E.O. 12866.

B. Review Under the Regulatory Flexibility Act

The Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*) requires preparation of a final regulatory flexibility analysis (FRFA) for any final rule where the agency was first required by law to publish a proposed rule for public comment, unless the agency certifies that the rule, if promulgated, will not have a significant economic impact on a substantial number of small entities. As required by Executive Order 13272, ''Proper Consideration of Small Entities in Agency Rulemaking,'' 67 FR 53461 (August 16, 2002), DOE published procedures and policies on February 19, 2003, to ensure that the potential impacts of its rules on small entities are properly considered during the DOE rulemaking process. 68 FR 7990. DOE has made its procedures and policies available on the Office of the General Counsel's website: *www.energy.gov/gc/office-general-counsel.* DOE reviewed this final rule under the provisions of the Regulatory Flexibility Act and the procedures and policies published on February 19, 2003.

DOE has determined that the only non-voluntary costs imposed by this test procedure would be changes to marketing materials for companies currently making efficiency representations—constituting $195.01 per manufacturer as estimated previously. This cost is not expected to differ between small and large manufacturers. The testing costs estimated previously would either be imposed following possible new energy conservation standards on covered fans and blowers or voluntarily undertaken by manufacturers. As such, DOE has concluded that there would not be significant economic impact on small entities as a result of this test procedure. Still, although such is not currently required, DOE has recently conducted a focused inquiry into small business manufacturers of the fans and blowers covered by this rulemaking in relation to the test procedure related costs that would be imposed as a result of possible future energy conservation standards.

DOE used the Small Business Administration (SBA) size standards to determine whether any small entities would be subject to the requirements of the proposed rule. The small business size standards are listed by North American Industry Classification System (''NAICS'') code as well as by industry description and are available at *www.sba.gov/document/support--table-size-standards.* Manufacturing commercial and industrial fans and blowers is classified under NAICS 333413, ''Industrial and Commercial Fan and Blower and Air Purification Equipment Manufacturing.'' The SBA sets a threshold of 500 employees or fewer for an entity to be considered as a small business for this category. DOE used a combination of publicly available information and a private stakeholder database to create a list of potential manufacturers. DOE additionally referenced manufacturer lists for similar products derived from Compliance Certification Database.[138] Once DOE created a list of potential manufacturers, DOE used market research tools to determine whether any met the SBA's definition of a small entity, based on the total number of employees for each company including parent, subsidiary, and sister entities.

Based on DOE's analysis, over 200 companies potentially selling commercial and industrial fans and blowers covered by this proposed test procedure were identified. DOE screened out companies that do not meet the small entity definition and additionally screened out companies that are largely or entirely foreign owned and operated. Of the identified companies, 51 were further identified as a potential small business manufacturing commercial and industrial fans and blowers. Through a review of each business' respective website DOE established that 20 of the 51 businesses were distinct OEMs directly producing covered equipment. Below is a discussion of the various potential testing costs associated with these small manufacturers and potential future energy conservation standards for fans and blowers.

1. Creation of Testing Facility—General Fans

DOE does not expect costs for a test facility to differ between large and small businesses. As outlined in section III.M of this document, DOE estimated the capital investment for a new general fan testing facility and equipment to be $343,300 along with approximately $8,000 in yearly utility costs and $21,500 in yearly calibration costs.

2. AEDM Creation and Testing Costs—General Fans

DOE likewise does not expect that general fan per model in-house testing costs or AEDM creation costs would differ between large and small manufacturers. As outlined in section III.M, DOE estimated the average total labor cost of testing a covered general fan to be $260 per model (Which will need to be done for two basic models per validation class) and approximately $8,700 to develop the AEDM for a validation class—for a total of $9,220.

Due to the lack of a model database and the large number of potential small businesses, DOE reviewed the websites and, where available, the product catalogs of each of the small businesses manufacturers. While detailed product information was not availiable for three of the sampled small businesses, DOE identified, maximally, 2,709 models of commercial and industrial fans and blowers that are covered by the proposed test procedure across the remaining 17 small businesses. The number of models identified ranged from 7 to 636 across the applicable manufacturers, for an average of 159 and a median of 40 models per manufacturer. Across all 20 small business manufacuters, DOE estimates that 65 AEDMs would be required—with manufacturers offering between one and six of the general fans categories covered by this rulemaking, for a median value of two. Accordingly, DOE has estimated that total unit testing and AEDM creation costs would be $599,300 for all small businesses.

3. Creation of Testing Facility—Air Circulating Fans

DOE does not expect costs for a test facility for air circulating fans to differ between large and small businesses. As outlined in section III.M of this document, DOE estimated the capital investment for a new air circulating fans testing facility and equipment to be $43,130 on average, along with approximately $730 in yearly utility costs and $16,660 in yearly calibration costs.

4. AEDM Creation and Testing Costs—Air Circulating Fans

DOE likewise does not expect that air circulating fans per model in-house testing costs or AEDM creation costs would differ between large and small manufacturers. As outlined in section III.M of this document, DOE estimated the average total labor cost of testing a covered general fan to be $260 per model (Which will need to be done for two basic models per validation class) and approximately $4,100 to develop the AEDM for a validation class—for a total of $4,620.

Out of the 20 small business manufacturers identified, four produce

[138] U.S. Department of Energy Compliance Certification Database, available at *www.regulations.doe.gov/certification-data/products.html.*

covered air circulating fans in addition to general fans. The number of models offered range from four to 30 and each of these small businesses only offers one validation category of air circulating fan. Accordingly, all four small businesses would incur an aggregate additional $18,480 in testing and AEDM creation costs.

5. Total Costs

Total potential costs to the identified small businesses would be approximately $7,244,000 and the average cost would be approximately $381,260. 16 of the small businesses would also incur an average of $8,000 in yearly utility costs and $21,500 in yearly calibration costs and four of small businesses would incur around $8,730 in yearly utility costs and $38,160 in yearly calibration costs. DOE was able to find annual revenue estimates for 19 of the small businesses. Estimated one-time testing costs as a pecentage of estimated annual revenue range widely—from less than one 0.4 percent to 44.6 percent—for an average of approximately 7.7 percent. Additionally, Manufacturers would not be required to test their products according to the DOE test procedure unless and until possible new energy conservation standards are established. Manufacturers would need to test their products according to the DOE test procedure if they wish to make representations about efficiency in their marketing material—as mentioned previously, updating marketing materials is expected to cost $195.01.

6. Certification Statement

As noted previously, almost no non-voluntary costs are anticipated as a result of this rulemaking—since testing would not be required unless and until new energy conservation standards are established for covered fans and blowers. Based on the de minimis cost impacts, DOE certifies that this final rule does not have a ''significant economic impact on a substantial number of small entities,'' and determined that the preparation of a FRFA is not warranted. DOE will transmit a certification and supporting statement of factual basis to the Chief Counsel for Advocacy of the Small Business Administration for review under 5 U.S.C. 605(b).

C. Review Under the Paperwork Reduction Act of 1995

Although no energy conservation standards have been established for fans and blowers as of the publication of this final rule, manufacturers of fans and blowers would need to certify to DOE that their products comply with any potential future applicable energy conservation standards. To certify compliance, manufacturers must first obtain test data for their equipment according to the DOE test procedures, including any amendments adopted for those test procedures. DOE has established regulations for the certification and recordkeeping requirements for all covered consumer products and commercial equipment, including fans and blowers. (*See* generally 10 CFR part 429.) The collection-of-information requirement for the certification and recordkeeping is subject to review and approval by OMB under the Paperwork Reduction Act (''PRA''). This requirement has been approved by OMB under OMB control number 1910–1400. Public reporting burden for the certification is estimated to average 35 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information.

Certification data will be required for fans and blowers; however, DOE is not establishing certification or reporting requirements for fans and blowers in this final rule. Instead, DOE may consider proposals to establish certification requirements and reporting for fans and blowers under a separate rulemaking regarding appliance and equipment certification. DOE will address changes to OMB Control Number 1910–1400 at that time, as necessary.

Notwithstanding any other provision of the law, no person is required to respond to, nor shall any person be subject to a penalty for failure to comply with, a collection of information subject to the requirements of the PRA, unless that collection of information displays a currently valid OMB Control Number.

D. Review Under the National Environmental Policy Act of 1969

In this final rule, DOE establishes test procedure amendments that it expects will be used to develop and implement future energy conservation standards for fans and blowers. DOE has determined that this rule falls into a class of actions that are categorically excluded from review under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 *et seq.*) and DOE's implementing regulations at 10 CFR part 1021. Specifically, DOE has determined that adopting test procedures for measuring energy efficiency of consumer products and industrial equipment is consistent with activities identified in 10 CFR part 1021, appendix A to subpart D, A5 and A6. Accordingly, neither an environmental assessment nor an environmental impact statement is required.

E. Review Under Executive Order 13132

Executive Order 13132, ''Federalism,'' 64 FR 43255 (August 4, 1999), imposes certain requirements on agencies formulating and implementing policies or regulations that preempt State law or that have federalism implications. The Executive order requires agencies to examine the constitutional and statutory authority supporting any action that would limit the policymaking discretion of the States and to carefully assess the necessity for such actions. The Executive order also requires agencies to have an accountable process to ensure meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications. On March 14, 2000, DOE published a statement of policy describing the intergovernmental consultation process it will follow in the development of such regulations. 65 FR 13735. DOE examined this final rule and determined that it will not have a substantial direct effect on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. EPCA governs and prescribes Federal preemption of State regulations as to energy conservation for the products that are the subject of this final rule. States can petition DOE for exemption from such preemption to the extent, and based on criteria, set forth in EPCA. (42 U.S.C. 6297(d)) No further action is required by Executive Order 13132.

F. Review Under Executive Order 12988

Regarding the review of existing regulations and the promulgation of new regulations, section 3(a) of Executive Order 12988, ''Civil Justice Reform,'' 61 FR 4729 (Feb. 7, 1996), imposes on Federal agencies the general duty to adhere to the following requirements: (1) eliminate drafting errors and ambiguity; (2) write regulations to minimize litigation; (3) provide a clear legal standard for affected conduct rather than a general standard; and (4) promote simplification and burden reduction. Section 3(b) of Executive Order 12988 specifically requires that Executive agencies make every reasonable effort to ensure that the regulation (1) clearly specifies the preemptive effect, if any; (2) clearly specifies any effect on existing Federal law or regulation; (3) provides a clear legal standard for affected conduct

while promoting simplification and burden reduction; (4) specifies the retroactive effect, if any; (5) adequately defines key terms; and (6) addresses other important issues affecting clarity and general draftsmanship under any guidelines issued by the Attorney General. Section 3(c) of Executive Order 12988 requires Executive agencies to review regulations in light of applicable standards in sections 3(a) and 3(b) to determine whether they are met or it is unreasonable to meet one or more of them. DOE has completed the required review and determined that, to the extent permitted by law, this final rule meets the relevant standards of Executive Order 12988.

G. Review Under the Unfunded Mandates Reform Act of 1995

Title II of the Unfunded Mandates Reform Act of 1995 (''UMRA'') requires each Federal agency to assess the effects of Federal regulatory actions on State, local, and Tribal governments and the private sector. Public Law 104–4, sec. 201 (codified at 2 U.S.C. 1531). For a regulatory action resulting in a rule that may cause the expenditure by State, local, and Tribal governments, in the aggregate, or by the private sector of $100 million or more in any one year (adjusted annually for inflation), section 202 of UMRA requires a Federal agency to publish a written statement that estimates the resulting costs, benefits, and other effects on the national economy. (2 U.S.C. 1532(a), (b)) The UMRA also requires a Federal agency to develop an effective process to permit timely input by elected officers of State, local, and Tribal governments on a proposed ''significant intergovernmental mandate,'' and requires an agency plan for giving notice and opportunity for timely input to potentially affected small governments before establishing any requirements that might significantly or uniquely affect small governments. On March 18, 1997, DOE published a statement of policy on its process for intergovernmental consultation under UMRA. 62 FR 12820; also available at *www.energy.gov/gc/office-general-counsel.* DOE examined this final rule according to UMRA and its statement of policy and determined that the rule contains neither an intergovernmental mandate, nor a mandate that may result in the expenditure of $100 million or more in any year, so these requirements do not apply.

H. Review Under the Treasury and General Government Appropriations Act, 1999

Section 654 of the Treasury and General Government Appropriations Act, 1999 (Pub. L. 105–277) requires Federal agencies to issue a Family Policymaking Assessment for any rule that may affect family well-being. This final rule will not have any impact on the autonomy or integrity of the family as an institution. Accordingly, DOE has concluded that it is not necessary to prepare a Family Policymaking Assessment.

I. Review Under Executive Order 12630

DOE has determined, under Executive Order 12630, ''Governmental Actions and Interference with Constitutionally Protected Property Rights'' 53 FR 8859 (March 18, 1988), that this regulation will not result in any takings that might require compensation under the Fifth Amendment to the U.S. Constitution.

J. Review Under Treasury and General Government Appropriations Act, 2001

Section 515 of the Treasury and General Government Appropriations Act, 2001 (44 U.S.C. 3516 note) provides for agencies to review most disseminations of information to the public under guidelines established by each agency pursuant to general guidelines issued by OMB. OMB's guidelines were published at 67 FR 8452 (Feb. 22, 2002), and DOE's guidelines were published at 67 FR 62446 (Oct. 7, 2002). Pursuant to OMB Memorandum M–19–15, Improving Implementation of the Information Quality Act (April 24, 2019), DOE published updated guidelines which are available at *www.energy.gov/sites/prod/files/2019/12/f70/DOE%20Final%20Updated%20IQA%20Guidelines%20Dec%202019.pdf.* DOE has reviewed this final rule under the OMB and DOE guidelines and has concluded that it is consistent with applicable policies in those guidelines.

K. Review Under Executive Order 13211

Executive Order 13211, ''Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use,'' 66 FR 28355 (May 22, 2001), requires Federal agencies to prepare and submit to OMB, a Statement of Energy Effects for any significant energy action. A ''significant energy action'' is defined as any action by an agency that promulgated or is expected to lead to promulgation of a final rule, and that (1) is a significant regulatory action under Executive Order 12866, or any successor order; and (2) is likely to have a significant adverse effect on the supply, distribution, or use of energy; or (3) is designated by the Administrator of OIRA as a significant energy action. For any significant energy action, the agency must give a detailed statement of any adverse effects on energy supply, distribution, or use if the regulation is implemented, and of reasonable alternatives to the action and their expected benefits on energy supply, distribution, and use.

This regulatory action is not a significant regulatory action under Executive Order 12866. Moreover, it would not have a significant adverse effect on the supply, distribution, or use of energy, nor has it been designated as a significant energy action by the Administrator of OIRA. Therefore, it is not a significant energy action, and, accordingly, DOE has not prepared a Statement of Energy Effects.

L. Review Under Section 32 of the Federal Energy Administration Act of 1974

Under section 301 of the Department of Energy Organization Act (Pub. L. 95–91; 42 U.S.C. 7101), DOE must comply with section 32 of the Federal Energy Administration Act of 1974, as amended by the Federal Energy Administration Authorization Act of 1977. (15 U.S.C. 788; ''FEAA'') Section 32 essentially provides in relevant part that, where a proposed rule authorizes or requires use of commercial standards, the notice of proposed rulemaking must inform the public of the use and background of such standards. In addition, section 32(c) requires DOE to consult with the Attorney General and the Chairman of the Federal Trade Commission (''FTC'') concerning the impact of the commercial or industry standards on competition.

The modifications to the test procedure for fans and blowers adopted in this final rule incorporates testing methods contained in certain sections of the following commercial standards: AMCA 214–21, AMCA 210–16, AMCA 230–23, AMCA 240–15, ISO 5801:2017, ISO 80079–36:2016, and UL 705. DOE has evaluated these standards and is unable to conclude whether it fully complies with the requirements of section 32(b) of the FEAA (*i.e.,* whether it was developed in a manner that fully provides for public participation, comment, and review.) DOE has consulted with both the Attorney General and the Chairman of the FTC about the impact on competition of using the methods contained in these standards and has received no comments objecting to their use.

M. Congressional Notification

As required by 5 U.S.C. 801, DOE will report to Congress on the promulgation of this rule before its effective date. The report will state that it has been determined that the rule is not a ''major rule'' as defined by 5 U.S.C. 804(2).

N. Description of Materials Incorporated by Reference

In this final rule, DOE incorporates by reference the following test standards:

AMCA 214–21 is an industry-accepted test procedure that provides methods to determine fan electrical shaft power and/or electrical power, flow, and pressure and calculate the fan energy index (FEI) and is applicable to product sold in North America. AMCA 214–21 specifies testing conducted in accordance with other industry-accepted test procedures (also proposed for incorporation by reference). The test procedure established by this final rule references various sections of AMCA 214–21 that address test setup, test conduct, and calculation of the FEI for fans and blowers other than air circulating fans.

AMCA 210–16 and AMCA 230–23 are industry-accepted test procedures that provides methods of tests for fans and blowers other than air circulating fans, and air circulating fans, respectively, in the United States. These methods are referenced in AMCA 214–21.

AMCA 240–15 is an industry-accepted test procedure that provides definitions and methods of tests for positive pressure ventilator.

Copies of AMCA 214–21, AMCA 210–16, AMCA 230–23, and AMCA 240–15, may be purchased from AMCA International at 30 West University Drive, Arlington Heights, IL 60004–1893, or by going to *www.amca.org.*

ISO 5801:2017 is the industry-accepted test procedure that provides methods of tests for fans and blowers that are not air circulating fans, internationally.

ISO 80079–36:2016, specifies the method and requirements for design, construction, testing and marking of non-electrical equipment intended for use in potentially explosive atmospheres.

Copies of ISO 5801:2017 and ISO 80079–36:2016 may be purchased from International Organization for Standardization, Chemin de Blandonnet 8, CP 401, 1214 Vernier, Geneva, Switzerland, or by going to *www.iso.org.*

UL 705–22 provides safety requirements for power ventilators.

Copies of UL 705–2022 can be obtained from UL, 333 Pfingsten Road, Northbrook, IL, 60062 or *www.shopulstandards.com.*

V. Approval of the Office of the Secretary

The Secretary of Energy has approved publication of this final rule.

List of Subjects

10 CFR Part 429

Administrative practice and procedure, Confidential business information, Energy conservation, Household appliances, Imports, Intergovernmental relations, Reporting and recordkeeping requirements, Small businesses.

10 CFR Part 431

Administrative practice and procedure, Confidential business information, Energy conservation test procedures, Incorporation by reference, and Reporting and recordkeeping requirements.

Signing Authority

This document of the Department of Energy was signed on April 20, 2023, by Francisco Alejandro Moreno, Acting Assistant Secretary for Energy Efficiency and Renewable Energy, pursuant to delegated authority from the Secretary of Energy. That document with the original signature and date is maintained by DOE. For administrative purposes only, and in compliance with requirements of the Office of the Federal Register, the undersigned DOE Federal Register Liaison Officer has been authorized to sign and submit the document in electronic format for publication, as an official document of the Department of Energy. This administrative process in no way alters the legal effect of this document upon publication in the **Federal Register**.

Signed in Washington, DC, on April 20, 2023.

Treena V. Garrett,

Federal Register Liaison Officer, U.S. Department of Energy.

For the reasons stated in the preamble, DOE amends parts 429 and 431 of Chapter II of Title 10, Code of Federal Regulations as set forth below:

PART 429—CERTIFICATION, COMPLIANCE, AND ENFORCEMENT FOR CONSUMER PRODUCTS AND COMMERCIAL AND INDUSTRIAL EQUIPMENT

■ 1. The authority citation for part 429 continues to read as follows:

Authority: 42 U.S.C. 6291–6317; 28 U.S.C. 2461 note.

§ 429.11 [Amended]

■ 2. Section 429.11 is amended in paragraphs (a) and (b)(1) by removing ''429.68'' and adding in its place ''429.69''.

■ 3. Add § 429.69 to subpart B to read as follows:

§ 429.69 Fans and blowers.

(a) *Determination of represented values of fans and blowers other than air circulating fans.* A manufacturer must determine the represented values for each basic model, either by testing in conjunction with the applicable sampling provisions or by applying an AEDM as set forth in this section and in § 429.70(n). Manufacturers must update represented values to account for any change in the applicable motor standards in Table 5 of § 431.25 of this chapter and certify amended values as of the next annual certification (as applicable).

(1) *Testing.* (i) If the represented values for a given basic model are determined through testing, a sample of at least one unit must be selected and the requirements of § 429.11 apply.

(ii) If only one unit is tested, at each duty point characterized by a flow and speed value, any represented value of fan electrical input power (''FEP''), fan shaft input power, or other measure of energy consumption of a basic model for which consumers would favor lower values shall be greater than or equal to the tested value. Represented values must be rounded to the nearest hundredth.

(iii) If only one unit is tested, at each duty point characterized by a flow and speed value, any represented value of fan electrical input power (''FEI''), or other measure of energy consumption of a basic model for which consumers would favor higher values shall be less than or equal to the tested value. Represented values must be rounded to the nearest hundredth.

(iv) If more than one unit is tested, at each duty point characterized by a flow and speed value, any represented value of fan electrical input power (''FEP''), fan shaft input power, or other measure of energy consumption of a basic model for which consumers would favor lower values shall be greater than or equal to the higher of:

(A) The mean of the sample, where

$$\bar{x} = \frac{1}{n}\sum_{i=1}^{n} x_i$$

Where is $\bar{x}$ the sample mean; n is the number of samples, and x_i is the i^{th} sample. Or,

(B) The upper 95 percent confidence limit (UCL) of the true mean divided by 1.05, where:

$$UCL = \bar{x} + t_{0.95}\left(\frac{s}{\sqrt{n}}\right)$$

and $\bar{x}$ is the sample mean; s is the sample standard deviation; n is the number of samples; and $t_{0.95}$ is the t statistic for a 95 percent one-tailed confidence interval with n-1 degrees of freedom (from appendix A of subpart B of this part). Represented values must be rounded to the nearest hundredth.

(v) If more than one unit is tested, any represented value of the fan energy index (''FEI''), or other measure of energy consumption of a basic model for which consumers would favor higher values shall be less than or equal to the lower of:

(A) The mean of the sample, where

$$\bar{x} = \frac{1}{n}\sum_{i=1}^{n} x_i$$

Where $\bar{x}$ is the sample mean; n is the number of samples, and x_i is the i^{th} sample. Or,

(B) The lower 95 percent confidence limit (LCL) of the true mean divided by 0.95, where:

$$LCL = \bar{x} - t_{0.95}\left(\frac{s}{\sqrt{n}}\right)$$

and $\bar{x}$ is the sample mean; s is the sample standard deviation; n is the number of samples; and $t_{0.95}$ is the t statistic for a 95 percent one-tailed confidence interval with n-1 degrees of freedom (from appendix A of subpart B of this part). Represented values must be rounded to the nearest hundredth.

(vi) At each duty point characterized by a flow and speed value, the representative value of static or total pressure of a basic model of must be the mean of the tested static or total pressure for each tested unit. If only one unit is tested, the representative value of static or total pressure at the duty point of a basic model is the tested value.

(2) *Alternative efficiency determination methods.* In lieu of testing, the represented values for a basic model must be determined through the application of an AEDM pursuant to the requirements of § 429.70(n) and the provisions of this section, where: the represented values of any basic model used to validate an AEDM must be calculated under paragraph (b)(1) of this section.

(b) *Determination of represented values for air circulating fans.* A manufacturer must determine the represented values for each basic model, either by testing in conjunction with the applicable sampling provisions or by applying an AEDM as set forth in this section and in § 429.70(n).

(1) *Testing.* (i) If the represented values for a given basic model are determined through testing, the requirements of § 429.11 apply.

(ii) Any represented value of fan electrical input power (''W_E''), or other measure of energy consumption of a basic model for which consumers would favor lower values shall be greater than or equal to the higher of:

(A) The mean of the sample, where

$$\bar{x} = \frac{1}{n}\sum_{i=1}^{n} x_i$$

Where $\bar{x}$ is the sample mean; n is the number of samples, and x_i is the i^{th} sample. Or,

(B) The upper 95 percent confidence limit (UCL) of the true mean divided by 1.05, where:

$$UCL = \bar{x} + t_{0.95}\left(\frac{s}{\sqrt{n}}\right)$$

and $\bar{x}$ is the sample mean; s is the sample standard deviation; n is the number of samples; and $t_{0.95}$ is the t statistic for a 95 percent one-tailed confidence interval with n-1 degrees of freedom (from appendix A of subpart B of this part). Represented values must be rounded to the nearest hundredth.

(iii) Any represented value of efficacy (Eff_{circ}) or other measure of energy consumption of a basic model for which consumers would favor higher values shall be less than or equal to the lower of:

(A) The mean of the sample, where

$$\bar{x} = \frac{1}{n}\sum_{i=1}^{n} x_i$$

Where $\bar{x}$ is the sample mean; n is the number of samples, and x_i is the i^{th} sample. Or,

(B) The lower 95 percent confidence limit (LCL) of the true mean divided by 0.95, where:

$$LCL = \bar{x} - t_{0.95}\left(\frac{s}{\sqrt{n}}\right)$$

and $\bar{x}$ is the sample mean; s is the sample standard deviation; n is the number of samples; and $t_{0.95}$ is the t statistic for a 95 percent one-tailed confidence interval with n-1 degrees of freedom (from appendix A of subpart B of this part). Represented values must be rounded to the nearest hundredth.

(2) *Alternative efficiency determination methods.* In lieu of testing, the represented values for a basic model must be determined through the application of an AEDM pursuant to the requirements of § 429.70(n) and the provisions of this section, where: the represented values of any basic model used to validate an AEDM must be calculated under paragraph (b)(1) of this section.

■ 4. Amend § 429.70 is amended by:

■ a. In paragraph (a), removing ''429.65'' and, adding its place, ''429.69''; and

■ b. Adding paragraph (n).

The additions reads as follows:

§ 429.70 Alternative methods for determining energy efficiency or energy use.

* * * * *

(n) *Alternative efficiency determination method (AEDM) for fans and blowers.* (1) *Criteria an AEDM must satisfy.* A manufacturer is not permitted to apply an AEDM to a basic model of fan or blower to determine represented values pursuant to this section unless:

(i) The AEDM is derived from a mathematical model that estimates the energy use characteristics of the basic model as measured by the applicable DOE test procedure and accurately represents the performance characteristics of that basic model;

(ii) The AEDM is based on engineering or statistical analysis, computer simulation or modeling, or other analytic evaluation of actual performance data; and

(iii) The manufacturer has validated the AEDM in accordance with paragraph (n)(2) of this section.

(2) *Validation of an AEDM.* Before using an AEDM, the manufacturer must validate the AEDM's accuracy and reliability by comparing the simulated FEI, or simulated efficacy, as applicable, to the tested FEI or tested efficacy, as applicable (determined by testing), as follows.

(i) *Select basic models.* For each fan or blower validation class listed as follows: centrifugal housed fan; radial housed fan; centrifugal inline fan; centrifugal unhoused fan; centrifugal power roof ventilator exhaust fan; centrifugal power roof ventilator supply fan; axial inline fan; axial panel fan; axial centrifugal power roof ventilator fan; unhoused ACFH; axial housed ACFH; and housed centrifugal air circulating fan to which the AEDM is applied, a manufacturer must select at least two basic models compliant with any energy conservation standards in subpart J of part 431 of this chapter. In addition, at least one basic model selected for validation testing should include a motor, or a motor and controller if the AEDM is applied to a basic model with a motor or to a basic model with a motor and controller.

(ii) *Apply the AEDM* to the selected basic models. Using the AEDM,

calculate the simulated FEI, or efficacy, as applicable, for each of the selected basic models.

(iii) *Testing.* Test a sample of units of each of the selected basic models in accordance with 10 CFR 431.174 and determine the FEI or efficacy, as applicable, in accordance with § 429.69(a)(1) and (b)(1) as applicable.

(iv) *Compare.* The simulated FEI or simulated efficacy, as applicable, for each basic model must be less than or equal to 105 percent of the FEI or efficacy, as applicable, determined in paragraph (n)(2)(iii) of this section through testing.

(v) *Additional AEDM requirements.* When making representations of values other than FEI (*e.g.,* FEP, fan shaft power) or efficacy (as applicable) for a basic model that relies on an AEDM, all other representations are required to be based on the same AEDM results used to generate the represented value of FEI or efficacy.

(3) *Verification of an AEDM*—(i) *Periodic review*s. Each manufacturer must periodically select basic models representative of those to which it has applied an AEDM. The manufacturer must select a sufficient number of basic models to ensure the AEDM maintains its accuracy and reliability. For each basic model selected for verification: subject at least one unit to testing in accordance with 10 CFR 431.174. The provisions in paragraph (n)(2)(iv) of this section must be met.

(ii) *Inspection records.* Each manufacturer that has used an AEDM under this section must have available for inspection by the Department of Energy records showing:

(A) The method or methods used to develop the AEDM;

(B) The mathematical model, the engineering or statistical analysis, computer simulation or modeling, and other analytic evaluation of performance data on which the AEDM is based;

(C) Complete test data, equipment information, and related information that the manufacturer has generated or acquired pursuant to paragraphs (n)(2) and (3) of this section; and

(D) The calculations used to determine the simulated FEI or simulated weighted-average FEI, as applicable, of each basic model to which the AEDM was applied.

(iii) *Simulations.* If requested by the Department, the manufacturer must:

(A) Conduct simulations to predict the performance of particular basic models of electric motors specified by the Department;

(B) Provide analyses of previous simulations conducted by the manufacturer; and/or

(C) Conduct testing of basic models selected by the Department.

PART 431—ENERGY EFFICIENCY PROGRAM FOR CERTAIN COMMERCIAL AND INDUSTRIAL EQUIPMENT

■ 5. The authority citation for part 431 continues to read as follows:

Authority: 42 U.S.C. 6291–6317; 28 U.S.C. 2461 note.

■ 6. Section 431.172 is revised to read as follows:

§ 431.172 Definitions.

Air circulating axial panel fan means an axial housed air circulating fan head without a cylindrical housing or box housing that is mounted on a panel, orifice plate or ring.

Air circulating fan means a fan that has no provision for connection to ducting or separation of the fan inlet from its outlet using a pressure boundary, operates against zero external static pressure loss, and is not a jet fan.

Air circulating fan discharge area: area of a circle having a diameter equal to the blade tip diameter.

Air circulating fan outlet area means the gross inside area measured at the plane of the outlet opening.

Air-cooled steam condenser means a device for rejecting heat to the atmosphere through the indirect condensing of steam inside air-cooled finned tubes.

Axial inline fan means a fan with an axial impeller and a cylindrical housing with or without turning vanes.

Axial panel fans means an axial fan, without cylindrical housing, that includes a panel, orifice plate, or ring with brackets for mounting through a wall, ceiling, or other structure that separates the fan's inlet from its outlet.

Basic model, with respect to fans and blowers, means all units of fans and blowers manufactured by one manufacturer, having the same primary energy source, and having essentially identical electrical, physical, and functional (*e.g.,* aerodynamic) characteristics that affect energy consumption. In addition:

(1) All variations of blade pitches of an adjustable-pitch axial fan may be considered a single basic model; and

(2) All variations of impeller widths and impeller diameters of a given full-width impeller and full-diameter impeller centrifugal fan may be considered a single basic model.

Box fan means an axial housed air circulating fan head without a cylindrical housing that is mounted on a panel, orifice plate or ring and is mounted in a box housing.

Centrifugal housed fan means a fan with a centrifugal or mixed flow impeller in which airflow exits into a housing that is generally scroll-shaped to direct the air through a single fan outlet. A centrifugal housed fan does not include a radial impeller.

Centrifugal inline fan means a fan with a centrifugal or mixed flow impeller in which airflow enters axially at the fan inlet and the housing redirects radial airflow from the impeller to exit the fan in an axial direction.

Centrifugal unhoused fan means a fan with a centrifugal or mixed flow impeller in which airflow enters through a panel and discharges into free space. Inlets and outlets are not ducted. This fan type also includes fans designed for use in fan arrays that have partition walls separating the fan from other fans in the array.

Cross-flow fan means a fan or blower with a housing that creates an airflow path through the impeller in a direction at right angles to its axis of rotation and with airflow both entering and exiting the impeller at its periphery. Inlets and outlets can optionally be ducted.

Cylindrical air circulating fan means an axial housed air circulating fan head with a cylindrical housing that is not a Positive Pressure Ventilator as defined in AMCA 240–15 (incorporated by reference, see § 431.173).

Evaporative field erected closed-circuit cooling tower means a structure which rejects heat to the atmosphere through the indirect cooling of a process fluid stream to a lower temperature by partial evaporation of an external recirculating water flow.

Evaporative field erected open-circuit cooling tower means a structure which rejects heat to the atmosphere through the direct cooling of a water stream to a lower temperature by partial evaporation.

Fan or *blower* means a rotary bladed machine used to convert electrical or mechanical power to air power, with an energy output limited to 25 kilojoule (kJ)/kilogram (kg) of air. It consists of an impeller, a shaft and bearings and/or driver to support the impeller, as well as a structure or housing. A fan or blower may include a transmission, driver, and/or motor controller.

Fan static air power means the static power delivered to air by the fan or blower; it is proportional to the product of the fan airflow rate, the fan static pressure and the compressibility coefficient and is calculated in accordance with section 7.8.1 of AMCA 210–16 (incorporated by reference, see § 431.173), using static pressure instead of total pressure.

Fan total air power means the total power delivered to air by the fan or blower; it is proportional to the product of the fan airflow rate, the fan total pressure and the compressibility coefficient and is calculated in accordance with section 7.8.1 of AMCA 210–16 (incorporated by reference, see § 431.173).

Field erected air-cooled (dry) cooler means a structure which rejects heat to the atmosphere from a fluid, either liquid, gas or a mixture thereof, flowing through an air-cooled internal coil.

Field erected evaporative condenser means a structure which rejects heat to the atmosphere through the indirect condensing of a refrigerant in an internal coil by partial evaporation of an external recirculating water flow.

Full-diameter impeller means maximum impeller diameter with which a given fan or blower basic model is distributed in commerce.

Full-width impeller means the maximum impeller width with which a given fan or blower basic model is distributed in commerce.

Housed air circulating fan head means an air circulating fan with an axial or centrifugal impeller, and a housing.

Housed centrifugal air circulating fan means a housed air circulating fan head with a centrifugal or radial impeller in which airflow exits into a housing that is generally scroll shaped to direct the air through a single, narrow fan outlet.

Induced flow fan means a type of laboratory exhaust fan with a nozzle and windband; the fan's outlet airflow is greater than the inlet airflow due to induced airflow. All airflow entering the inlet exits through the nozzle. Airflow exiting the windband includes the nozzle airflow plus the induced airflow.

Jet fan means a fan designed and marketed specifically for producing a high velocity air jet in a space to increase its air momentum. Jet fans are rated using thrust. Inlets and outlets are not ducted but may include acoustic silencers.

Packaged air-cooled (dry) cooler means a device which rejects heat to the atmosphere from a fluid, either liquid, gas or a mixture thereof, flowing through an air-cooled internal coil.

Packaged evaporative closed-circuit cooling tower means a device which rejects heat to the atmosphere through the indirect cooling of a process fluid stream in an internal coil to a lower temperature by partial evaporation of an external recirculating water flow.

Packaged evaporative condenser means a device which rejects heat to the atmosphere through the indirect condensing of a refrigerant in an internal coil by partial evaporation of an external recirculating water flow.

Packaged evaporative open-circuit cooling tower means a device which rejects heat to the atmosphere through the direct cooling of a water stream to a lower temperature by partial evaporation.

Power roof ventilator means a fan with an internal driver and a housing to prevent precipitation from entering the building. It has a base designed to fit over a roof or wall opening, usually by means of a roof curb.

Radial-housed fan means a fan with a radial impeller in which airflow exits into a housing that is generally scroll-shaped to direct the air through a single fan outlet. Inlets and outlets can optionally be ducted.

Safety Fan means:

(1) A reversible axial fan in cylindrical housing that is designed and marketed for use in ducted tunnel ventilation that will reverse operation under emergency ventilation conditions;

(2) A fan for use in explosive atmospheres tested and marked according to the English version of ISO 80079–36:2016 (incorporated by reference, see § 431.173);

(3) An electric-motor-driven-Positive Pressure Ventilator as defined in AMCA 240–15 (incorporated by reference, see § 431.173);

(4) A fan bearing a listing for ''Power Ventilators for Smoke Control Systems'' in compliance with UL 705 (incorporated by reference, see § 431.173); or

(5) A laboratory exhaust fan designed and marketed specifically for exhausting contaminated air vertically away from a building using a high-velocity discharge.

Unhoused air circulating fan head means an air circulating fan without a housing, having an axial impeller with a ratio of fan-blade span (in inches) to maximum rate of rotation (in revolutions per minute) less than or equal to 0.06. The impeller may or may not be guarded.

■ 7. Section 431.173 is added to read as follows:

§ 431.173 Materials incorporated by reference.

(a) Certain material is incorporated by reference into this subpart with the approval of the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. To enforce any edition other than that specified in this section, DOE must publish a document in the **Federal Register** and the material must be available to the public. All approved incorporation by reference (IBR) material is available for inspection at DOE, and at the National Archives and Records Administration (NARA). Contact DOE at: the U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, Building Technologies Program, 1000 Independence Ave. SW, EE–5B, Washington, DC 20585, (202) 586–9127, *Buildings@ee.doe.gov*, *https://www.energy.gov/eere/buildings/building-technologies-office.* For information on the availability of this material at NARA, visit *www.archives.gov/federal-register/cfr/ibr-locations.html* or email: *fr.inspection@nara.gov.* The material may be obtained from the sources in the following paragraphs of this section.

(b) *AMCA.* Air Movement and Control Association International, Inc., 30 West University Drive, Arlington Heights, IL 60004–1893; (847) 394–0150; *www.amca.org.*

(2) [Reserved].

■ 8. Section 431.174 is added to read as follows:

§ 431.174 Test Procedure for fans or blowers.

(a) *Scope for fans and blowers other than air circulating fans.* A fan or blower, other than an air circulating fan is subject to the test procedure in this section if it meets the following criteria:

(1) Is a centrifugal housed fan; radial housed fan; centrifugal inline fan; centrifugal unhoused fan; centrifugal power roof ventilator exhaust fan; centrifugal power roof ventilator supply fan; axial inline fan; axial panel fan; or axial centrifugal power roof ventilator fan;

(2) Is not:

(i) A radial housed unshrouded fan with blade diameter at tip less than 30 inches or a blade width of less than 3 inches;

(ii) A safety fan;

(iii) An induced flow fan;

(iv) A jet fan;

(v) A cross-flow fan;

(vi) A fan manufactured exclusively to be powered by internal combustion engines;

(vii) A fan that create a vacuum of 30 inches water gauge or greater;

(viii) A fan that is designed and marketed to operate at or above 482 degrees Fahrenheit (250 degrees Celsius); or

(ix) A fan and blower embedded in the equipment listed in paragraph (a)(3) of this section;

(3) Is not an embedded fan subject to the following exclusions:

(i) The test procedure in this section does not apply to fans or blowers that are embedded in:

(A) Single phase central air conditioners and heat pumps rated with a certified cooling capacity less than 65,000 British thermal units per hour (''Btu/h'') cooling capacity, that are subject to DOE's energy conservation standard at 10 CFR 430.32(c);

(B) Three phase, air-cooled, small commercial packaged air-conditioning and heating equipment rated with a certified cooling capacity less than 65,000 Btu/h cooling capacity, that are subject to DOE's energy conservation standard at § 431.97(b);

(C) Transport refrigeration (*i.e.,* Trailer refrigeration, Self-powered truck refrigeration, Vehicle-powered truck refrigeration, Marine/Rail container refrigerant);

(D) Vacuum cleaners;

(E) Heat Rejection Equipment: Packaged evaporative open-circuit cooling towers; Evaporative field-erected open-circuit cooling towers; Packaged evaporative closed-circuit cooling towers; Evaporative field-erected closed-circuit cooling towers; Packaged evaporative condensers; Field-erected evaporative condensers; Packaged air-cooled (dry) coolers; Field-erected air-cooled (dry) cooler; Air-cooled steam condensers; Hybrid (water saving) versions of all of the previously listed equipment that contain both evaporative and air-cooled heat exchange sections;

(F) Air curtains; and

(G) Direct expansion-dedicated outdoor air system that are subject to any of DOE's test procedures in appendix B to subpart F of this part.

(ii) The test procedure in this section does not apply to supply or condenser fans or blowers that are embedded in:

(A) Air-cooled commercial package air conditioners and heat pumps (''CUAC,'' ''CUHP'') with a certified cooling capacity between 5.5 ton (65,000 Btu/h) and 63.5 ton (760,000 Btu/h) that are subject to DOE's energy conservation standard at § 431.97(b);

(B) Water-cooled and evaporatively-cooled commercial air conditioners that are subject to DOE's energy conservation standard at § 431.97(b);

(C) Water-source heat pumps that are subject to DOE's energy conservation standard at § 431.97(b);

(D) Single package vertical air conditioners and heat pumps that are subject to DOE's energy conservation standard at § 431.97(d);

(E) Packaged terminal air conditioners (''PTAC'') and packaged terminal heat pumps (PTHP) that are subject to DOE's energy conservation standard at § 431.97(c);

(F) Computer room air conditioners that are subject to DOE's energy conservation standard at § 431.97(e); and

(G) Variable refrigerant flow multi-split air conditioners and heat pumps that are subject to DOE's energy conservation standard at § 431.97(f); and

(4) In addition, the test procedure is only applicable to fan or blower duty points with the following characteristics, measured or calculated in accordance with the test procedure set forth in appendix A of this subpart:

(i)(A) Fan shaft input power equal to or greater than 1 horsepower; or

(B) Fan electrical input power equal to or greater than 0.89 kW; and

(ii)(A) Fan static air power equal to or less than 150 horsepower for fans using a static pressure basis fan energy index (''FEI'') in accordance with the required test configuration listed in table 7.1 of AMCA 214–21 (incorporated by reference, see § 431.173); or

(B) Fan total air power equal to or less than 150 horsepower for fans using a total pressure basis FEI in accordance with the required test configuration listed in table 7.1 of AMCA 214–21;

(b) *Scope for air circulating fans.* The test procedure in this section applies to all air circulating fans with input power greater than or equal to 125W at maximum speed.

(c) *Testing and calculations for fans and blowers other than air circulating fans.* Determine the FEI, the fan electrical input power (''FEP''), and fan shaft power (as applicable) at each duty point, as specified by the manufacturer, using the test procedure set forth in appendix A of this subpart.

(d) *Testing and calculations for air circulating fan.* Determine the FEI and the fan electrical input power (''FEP'') or the weighted-average FEI and weighted-average FEP as applicable, using the test procedure set forth in appendix B of this subpart.

■ 9. Add appendix A to subpart J of part 431 to read as follows:

Appendix A to Subpart J of Part 431—Uniform Test Method for the Measurement of Energy Consumption of Fans and Blowers Other Than Air Circulating Fans

After October 30, 2023, any representations made with respect to energy use or efficiency of fans and blowers subject to testing pursuant to § 431.174 must be made in accordance with this appendix. Any optional representations of fan energy index in the optional test configuration listed in table 7.1 of AMCA 214–21 ($FEI_{optional}$) must be accompanied by a representation of fan energy index in the required test configuration listed in table 7.1 of AMCA 214–21 (FEI).

0. Incorporation by Reference

In § 431.173, DOE incorporated by reference the entire standard for AMCA 210–16, AMCA 214–21, and ISO 5801:2017; however, only enumerated provisions of those documents are applicable as follows. In cases where there is a conflict, the language of this appendix takes precedence over those documents.

0.1 AMCA 210–16:

(a) Section 3, ''Definitions/Units of Measure/Symbols'';

(b) Section 4, ''Instruments and Methods of Measurement'' ;

(c) Section 5, ''Test Setups and Equipment'';

(d) Section 6, ''Observation and Conduct of Test'';

(e) Section 7, ''Calculations'' excluding Section 7.9.2, ''Conversion to other rotational speeds and air densities with compressible

flow'' and Section 7.9.3, ''Conversion formulae for new densities and new rotational speeds'';

0.2. AMCA 214–21:

(a) Section 2, ''References (Normative),'' as referenced in section 2.2 of this appendix;

(b) Section 3, ''Definitions,'' as referenced in section 1 of this appendix;

(c) Section 4, ''Calculation of the FEI for a Single Duty Point,'' as referenced in section 2.6 of this appendix;

(d) Section 5, ''Reference Fan Electrical Power (FEP_{ref}),'' as referenced in section 2.6 of this appendix;

(e) Section 6.1, ''Wire-to-Air Testing at the Required Duty Point,'' as referenced in section 2.2 of this appendix;

(f) Section 6.2, ''Calculated Ratings Based on Wire-to-Air Testing,'' as referenced in section 2.2 of this appendix;

(g) Section 6.3, ''Bare Shaft Fans,'' as referenced in section 2.2 of this appendix;

(h) Section 6.4, ''Fans with Polyphase Regulated Motor'', excluding Section 6.4.1.4, ''Requirements for the VFD, if included'' and Section 6.4.2.4, ''Combined motor-VFD efficiency'' as referenced in section 2.2 of this appendix;

(i) Section 7, ''Testing,'' as referenced in sections 2.2 and 2.3 of this appendix;

(j) Section 8, ''Rating Development'', excluding Section 8.2.2, ''Separate Fan and Motor Tests'' and Section 8.3, ''Appurtenances'' as referenced in section 2.2 of this appendix;

(k) Annex D, ''Motor Performance Constants (Normative),'' as referenced in section 2.2 of this appendix;

(l) Annex E, ''Calculation Methods for Fans Tested Shaft-to-Air,'' as referenced in section 2.2 of this appendix;

(m) Annex G, ''Wire-to-Air Measurement—Calculation to Other Speeds and Densities (Normative),'' as referenced in section 2.2 of this appendix;

(n) Annex J, ''Other data and calculations to be retained,'' as referenced in section 2.2 of this appendix; and

(o) Annex K, ''Proportionality and Dimensional Requirements (Normative),'' as referenced in section 2.2 of this appendix.

0.3. ISO 5801:2017:

(a) Section 3, ''Terms and Definitions'';

(b) Section 4, ''Symbols, Abbreviated Terms and Subscripts'';

(c) Section 5, ''General'';

(d) Section 6, ''Test Configurations'';

(e) Section 7, ''Carrying out the Test'';

(f) Section 8, ''Airways for Duct Configuration'';

(g) Section 9, ''Standardized Test Chambers'';

(h) Section 10, ''Various Component Parts for a Laboratory Setup'';

(i) Section 11, ''Standard Test Configurations'';

(j) Section 12, ''Measurements'';

(k) Section 13, ''Reference Conditions'';

(l) Section 15, ''Calculations'';

(m) Section 16, ''Fan Characteristic Curves''; and

(n) Section 17, ''Uncertainty Analysis''.

1. Definitions

The definitions applicable to this appendix are defined in § 431.172 and in section 3, ''Definitions,'' of AMCA 214–21. In cases where there is a conflict, the definitions in § 431.172 take precedence over AMCA 214–21.

2. Test Procedure for Fans and Blowers Other Than Air Circulating Fans

2.1. General.

This section describes the test procedure for fans and blowers other than air circulating fans. In cases where there is a conflict, the provisions in this appendix take precedence over AMCA 214–21. Where AMCA 214–21 refers to Annex A, ''Polyphase Regulated Motor Efficiencies (Normative),'' of AMCA 214–21, Table 5 of § 431.25 must be used instead.

2.2. Testing

2.2.1. General.

The fan electrical input power (FEP_{act}) in kilowatts must be determined at every duty point specified by the manufacturer in accordance with one of the test methods listed in Table 1, and the following sections of AMCA 214–21: Section 2, ''References (Normative)''; Section 7, ''Testing,'' including the referenced provisions to AMCA 210–16 and ISO 5801:2017 as listed in sections 2.2.2 and 2.2.3 of this appendix; Section 8.1, ''Laboratory Measurement Only'' (as applicable); and Annex J, ''Other data and calculations to be retained.''

TABLE 1 TO APPENDIX A TO SUBPART J OF PART 431

Driver	Motor controller present?	Transmission configuration?	Test method	Applicable section(s) of AMCA 214–21
Electric motor	Yes or No	Any	Wire-to-air	6.1 ''Wire-to-Air Testing at the Required Duty Point''.
Electric motor	Yes or No	Any	Calculation based on Wire-to-air testing.	6.2 ''Calculated Ratings Based on Wire to Air Testing'' (references Section 8.2.3, ''Calculation to other speeds and densities for wire-to-air testing,'' and Annex G, ''Wire-to-Air Measurement—Calculation to Other Speeds and Densities (Normative)'').
Regulated polyphase motor	No	Direct drive, V-belt drive, flexible coupling or synchronous belt drive.	Shaft-to-air	6.4 ''Fans with Polyphase Regulated Motors,'' (references Annex D, ''Motor Performance Constants (Normative)'')*.
None or non-electric	No	None	Shaft-to-air	Section 6.3, ''Bare Shaft Fans''.
Regulated polyphase motor	No	Direct drive, V-belt drive, flexible coupling or synchronous belt drive.	Calculation based on Shaft-to-air testing.	Section 8.2.1, ''Fan laws and other calculation methods for shaft-to-air testing'' (references Annex D, ''Motor Performance Constants (Normative),'' Annex E, ''Calculation Methods for Fans Tested Shaft-to-Air,'' and Annex K, ''Proportionality and Dimensional Requirements (Normative)'').
None or non-electric	No	None	Calculation based on Shaft-to-air testing.	Section 8.2.1, ''Fan laws and other calculation methods for shaft-to-air testing'' (references Annex E, ''Calculation Methods for Fans Tested Shaft-to-Air,'' and Annex K, ''Proportionality and Dimensional Requirements (Normative)'').

*Excluding Section 6.4.1.4, ''Requirements for the VFD, if included'' and Section 6.4.2.4, ''Combined motor-VFD efficiency.''

Testing must be performed in accordance with the required test configuration listed in table 7.1 of AMCA 214–21. The following values must be determined in accordance with this appendix at each duty point specified by the manufacturer: fan airflow in cubic feet per minute; fan air density; fan total pressure in inches of water gauge for fans using a total pressure basis FEI in accordance with Table 7.1 of AMCA 214–21; fan static pressure in inches of water gauge for fans using a static pressure basis FEI in atcordance with table 7.1 of AMCA 214–21; fan speed in revolutions per minute; and fan shaft input power in horsepower for fans tested in accordance with sections 6.3, 6.4 or 6.5 of AMCA 214–21.

In addition, if applying the equations in Section E.2 of Annex E of AMCA 214–21 for compressible flows, the compressibility coefficients must be included in the equations as applicable.

All measurements must be recorded at the resolution of the test instrumentation and calculations must be rounded to the number of significant digits present at the resolution of the test instrumentation.

In cases where there is a conflict, the provisions in AMCA 214–21 take precedence over AMCA 210–16 and ISO 5801:2017. In addition, the provisions in this appendix apply.

2.2.2 Power Roof Ventilators

Centrifugal Power Roof Ventilators that are both supply and exhaust must be tested in both supply and exhaust configurations as listed in table 7.1 of AMCA 214–21.

2.2.3 Embedded Fans

Embedded fans that are not manufactured in a standalone configuration must be tested in a standalone configuration. If some components of the bare shaft fan are not removable without causing irreversible damage to the equipment into which the fan is embedded, testing must be performed using additional fan components, except for the fan impeller, that are geometrically identical to that of the fan embedded inside the larger piece of equipment for testing.

2.3. Power Supply

Any wire-to-air testing must be conducted at the supply frequency, phase, and voltages specified in this section. The frequency and voltage must be selected in accordance with section 7.8. of AMCA 214–21. Fans and blowers rated for operation for single- or multi-phase power supply must be tested with single- or multi-phase electricity, respectively. Fans and blowers, capable of operating with single- and multi-phase power supply, must be tested using multi-phase electricity.

2.4. Stability Conditions.

The following conditions must be met to establish system stability prior to collecting test data:

(a) Barometric pressure, dry bulb temperature and wet bulb temperature in the general test area must be captured at least every five seconds after the run-in period is completed and the ambient air density calculated from these values shall not vary by more than ±1 percent during verification of fan speed and fan input power stability.

(b) After the fan has been run-in, record the fan speed in rpm and the input power (in pound-force, pound-force-in, or watts) at least every 5 seconds for at least three 60-second intervals. Readings shall be made simultaneously. Repeat these measurements over 60-second intervals until:

(1) The average fan speed from the last 60-second interval varies by less than the absolute value of 1 percent or 1 rpm, whichever is greater, when compared to the average fan speed measured during the previous 60-second test interval;

(2) The average input power from the last 60-second interval varies by less than the absolute value of 1 percent, whichever is greater, compared to the average input power measured during the previous 60-second test interval; and

(3) The slopes calculated from the individual data collected for fan speed and input power during at least three 60-second sampling intervals include both positive and negative values (*e.g.,* two positive and one negative slope value or one positive and two negative slope values). If three positive or three negative slopes are determined in succession, additional sampling intervals are required until slopes from three successive sampling intervals include both positive and negative values.

2.5. Sampling Intervals for Testing.

A test measurement must meet the following conditions:

(a) The sampling interval over which average test values are determined shall not exceed 60 seconds;

(b) The average fan speed from the most recent 60-second interval varies by less than the absolute value of 1 percent or 1 rpm, whichever is greater, when compared to the average fan speed measured during the previous 60-second test interval; and

(c) the average input power from the last 60-second interval by reaction dynamometer, torque meter or calibrated motor must be ±4 percent, or the average input power by electrical meter must be ±2 percent of the mean or 1 watt, whichever is greater, compared to the average input power measured during the previous 60-second test interval.

2.6. FEI calculation

The FEI must be determined at every duty point in accordance with Section 4, ''Calculation of the FEI for a single duty point,'' and Section 5, ''Reference Fan Electrical Power (FEP_{ref})'' of AMCA 214–21. In addition, the FEI must be rounded to the nearest hundredths place; FEP must be rounded to three significant figures; and all measurements must be recorded at the resolution of the test instrument.

■ 10. Add appendix B to subpart J of part 431 to read as follows:

Appendix B to Subpart J of Part 431—Uniform Test Method for the Measurement of Energy Consumption of Air Circulating Fans

After October 30, 2023, any representations made with respect to energy use or efficiency of air circulating fans subject to testing pursuant to § 431.174 must be made in accordance with this appendix. Any optional representations of air circulating fan efficacy at speeds less than the air circulating fan's maximum speed must be accompanied by a representation of the air circulating fan efficacy at maximum speed.

0. Incorporation by Reference

In § 431.173, DOE incorporated by reference the entire standard for AMCA 230–23; however, only enumerated provisions of those documents are applicable as follows. In cases where there is a conflict, the language of this appendix takes precedence over those documents.

0.1 AMCA 230–23:

(a) Section 4, ''Definitions/Units of Measurement/Symbols,'' as referenced in section 1 and 2.2.2 of this appendix;

(b) Section 5, ''Instruments and Methods of Measurement,'' as referenced in section 2.2.2 of this appendix;

(c) Section 6, ''Equipment and Setup,'' as referenced in section 2.2.2 of this appendix;

(d) Section 7, ''Observations and Conduct of Test,'' as referenced in section 2.2.2 of this appendix;

(e) Section 8, ''Calculations,'' as referenced in section 2.2.2 of this appendix; and

(f) Section 9, ''Report and Results of Test,'' as referenced in section 2.2.2 of this appendix.

1. Definitions

The definitions applicable to this appendix are defined in § 431.172 and in Section 4, ''Definitions/Units of Measurement/Symbols,'' of AMCA 230–23. In cases where there is a conflict, the definitions in § 431.172 take precedence over AMCA 230–23.

2. Test Procedure for Air Circulating Fans

2.1. General

This section describes the test procedure for air circulating fans.

2.2. Testing

2.2.1. General

The air circulating fan efficacy (Eff_{circ}) in cubic feet per minute (''CFM'') per watt (''W'') (''CFM/W'') at maximum speed must be determined in accordance with the applicable sections of AMCA 230–23 as listed in section 2.2.2 of this appendix. In addition, testing must be conducted in accordance with the provisions in sections 2.3 through 2.5 of this appendix. Optional testing speeds lower than maximum speed is permitted. Speeds less than maximum speeds must be expressed at a percentage of maximum speed (*e.g.,* 50 percent) and the air circulating fan efficacy at lower speed must include the speed percentage in its subscript (*e.g.,* $Eff_{circ,50}$).

All measurements must be recorded at the resolution of the test instrumentation and calculations must be rounded to the number of significant digits of the resolution of the test instrumentation.

2.2.2. AMCA 230–23, Applicable Sections.

The following sections of AMCA 230–23 are applicable: Section 4, ''Definitions/Unit of Measurement/Symbols''; Section 5, ''Instruments and Methods of Measurement''; Section 6, ''Instruments and Methods of Measurement''; Section 7, ''Observations and Conduct of Test''; Section 8, ''Calculations''; and Section 9, ''Report and Results of Test.''

2.3. Air circulating fans without motors

Air circulating fans distributed in commerce without an electric motor must be tested using an electric motor as recommended in the manufacturer's catalogs or distributed in commerce with the air circulating fan. If more than one motor is available in manufacturer's catalogs or distributed in commerce with the air circulating fan, testing must be conducted using the least efficient motor capable of running the fan at the fan's maximum allowable speed.

2.4. Power Supply.

The test must be conducted at the frequency, phase, and voltages specified in this section.

2.4.1. Frequency.

Air circulating fans rated for operation with only 60 Hz power supply must be tested with 60 Hz electricity. Air circulating fans capable of operating with 50 Hz and 60 Hz electricity must be tested with 60 Hz electricity.

2.4.2. Phase.

Air circulating fans rated for operation for single- or multi-phase power supply must be tested with single- or multi-phase power electricity, respectively. Air circulating fans, capable of operating with single- and multi-phase power supply, must be tested using multi-phase electricity.

2.4.3. Voltage.

Select the supply voltage as follows:

(a) For air circulating fans tested with single-phase electricity, the supply voltage must be:

(1) 120 V if the air circulating fan's minimum rated voltage is 120 V or the lowest rated voltage range contains 120 V,

(2) 240 V if the air circulating fan's minimum rated voltage is 240 V or the lowest rated voltage range contains 240 V, or

(3) The air circulating fan's minimum rated voltage (if a voltage range is not given) or the mean of the lowest rated voltage range, in all other cases.

(b) For air circulating fans tested with multi-phase electricity, the supply voltage must be

(1) 240 V if the air circulating fan's minimum rated voltage is 240 V or the lowest rated voltage range contains 240 V, or

(2) The air circulating fan's minimum rated voltage (if a voltage range is not given) or the mean of the lowest rated voltage range, in all other cases.

2.5. Stability Conditions.

In addition to the test requirements specified in sections 7.1 and 7.3 of AMCA 230–23, the following conditions must be met to establish system stability prior to collecting test data:

(a) Test voltage shall be captured at least every five seconds and shall not vary by more than +/−1 percent during each test. Barometric pressure, dry bulb temperature and wet bulb temperature in the general test area for calculation of air density must be captured at least every five seconds and the calculated ambient air density shall not vary by more than +/−1 percent during each test.

(b) After a run-in time of at least 15 minutes, record the fan speed in rpm, the input power in watts, and load differential in pound-force for at least 3 120-second intervals. Repeat these measurements over additional 120-second intervals until:

(1) The average fan speed of the last 120-second interval varies by less than the absolute value of 1 percent or 1 rpm, whichever is greater, when compared to the average fan speed measured during the previous 120-second test interval;

(2) The average input power of the last 120-second interval varies by less than the absolute value of 1 percent or 1 watt, whichever is greater, compared to the average input power measured during the previous 120-second test interval;

(3) The average load differential of the last 120-second interval varies by less than the absolute value of 1 percent, whichever is greater, compared to the average load differential during the previous 120-second test interval; and

(4) The slopes calculated from the individual data collected for fan speed, input power, and load differential during at least three 120-second intervals include both positive and negative values (*e.g.,* two positive and one negative value or one positive and two negative values). If three positive or three negative slopes are determined in succession, additional sampling intervals are required until slopes from three successive intervals include both positive and negative values.

TABLE OF EFFECTIVE DATES AND TIME PERIODS—MAY 2023

This table is used by the Office of the Federal Register to compute certain dates, such as effective dates and comment deadlines, which appear in agency documents. In computing these dates, the day after publication is counted as the first day.

When a date falls on a weekend or holiday, the next Federal business day is used. (See 1 CFR 18.17)

A new table will be published in the first issue of each month.
