

manufacturing costs and simplify logistics, especially in regions where malaria is endemic. Additionally, the adaptability of these immunogens for integration with nanoparticle platforms could further amplify their immunogenicity, paving the way for more robust and lasting protection against malaria. This innovation can potentially transform malaria prevention and control, offering a more effective, stable, and cost-efficient solution to a disease that continues to impact millions worldwide.

This technology is available for licensing for commercial development in accordance with 35 U.S.C. 209 and 37 CFR part 404, as well as for further development and evaluation under a research collaboration.

Potential Commercial Applications

- Stable single-component AMA1–RON2 immunogens hold promise for improving malaria prevention and control efforts in endemic regions around the world.

Competitive Advantages

- No blood-stage malaria vaccine has been approved. This technology offers a competitive edge over other vaccine candidates in development through its easily manufactured single-component AMA1–RON2 design that elicits a potent broadly neutralizing response that is better than competing candidates.

Development Stage

- The efficacy of stable single-component AMA1–RON2 immunogens has been validated in rat and rabbit models. Following identification of the most cost-effective platform for vaccine production, the immunogens will be advanced for virulent parasite challenge studies in *Aotus* monkeys and towards human trials.
