The EPA believes a fPM emission limit of 0.010 lb/MMBtu appropriately takes into consideration the costs of controls. The EPA evaluated the costs to improve current PM control systems and the cost to install better performing PM controls (*i.e.,* a new FF) to achieve a more stringent emission limit. Costs of PM upgrades are much lower than the EPA estimated in 2012, and the Agency revised its costs assumptions as described in the 2024 Technical Memo, available in the docket. Table 4 of this document summarizes the updated cost effectiveness of the three fPM emission limits considered in the 2023 Proposal for the existing coal-fired fleet. For the purpose of estimating cost effectiveness, the analysis presented in this table, described in detail in the 2023 and 2024 Technical Memos, is based on the observed emission rates of all existing coal-fired EGUs except for those that have announced plans to retire by the end of 2028. The analysis presented in table 4 estimated the costs associated for each unit to upgrade their existing PM controls to meet a lower fPM standard. In the cases where existing PM controls would not achieve the necessary reductions, unit-specific FF install costs were estimated. Unlike the cost and benefit projections presented in the RIA, the estimates in this table do not account for any future changes in the composition of the operational coal-fired EGU fleet that are likely to occur by 2028 as a result of other factors affecting the power sector, such as the IRA, future regulatory actions, or changes in economic conditions. For example, of the more than 14 GW of coal-fired capacity that the EPA estimates would require control improvements to achieve the final fPM rate, less than 12 GW is projected to be

exposure to cause adverse acute (or short-term) noncancer health effects.

operational in 2028 (see section 3 of the RIA for this final rule).

BILLING CODE 6560–50–P

Table 4. Summary of the Updated Cost Effectiveness Analysis for Three Potential fPM Limits[1]

	Potential fPM emission limit (lb/MMBtu)		
	0.015	0.010	0.006
Affected Units (Capacity, GW)	11 (4.7)	33 (14.1)	94 (41.3)
Annual Cost ($M, 2019 dollars)	38.8	87.2	398.8
fPM Reductions (tpy)	1,258	2,526	5,849
Total Non-Hg HAP Metals Reductions (tpy)	3.0	8.3	22.7
Total Non-Hg HAP Metals Cost Effectiveness ($k/ton)	13,050	10,500	17,500
Total Non-Hg HAP Metals Cost Effectiveness ($/lb)	6,500	5,280	8,790

[1] This analysis used reported fPM compliance data for 296 coal-fired EGUs to develop unit-specific average and lowest achieved fPM rate values to determine if the unit, with existing PM controls, could achieve a lower fPM limit. Using the compliance data, the EPA evaluated costs to upgrade existing PM controls, or if necessary, install new controls in order to meet a lower fPM limit.

BILLING CODE 6560–50–C

The EPA has updated its costs analyses for this final rule based on comments received and additional data review, which is described in more detail in the 2024 Technical Memo available in the docket. In response to commenters stating that the use of the lowest quarter's 99th percentile, or the lowest achievable fPM rate, is not indicative of overall EGU operation and emission performance, the EPA added a review of average fPM rates. In these updated analyses, both the lowest quarter's 99th percentile and the average fPM rate must be below the potential fPM limit for the EPA to assume no additional upgrades are needed to meet a revised limit. If an EGU has previously demonstrated an ability to meet a potential lower fPM limit, but the average fPM rate is greater than the potential limit, the analysis for the final rule has been updated to assume increased bag replacement frequency (for units with FFs) or operation and maintenance costing $100,000/year (2022$). This additional cost represents increased vigilance in maintaining ESP performance and includes technician labor to monitor performance of the ESP and to periodically make typical repairs (*e.g.,* replacement of failed insulators, damaged electrodes or other internals that may fail, repairing leaks in the ESP casing, ductwork, or expansion joints, and periodic testing of ESP flow balance and any needed adjustments).

Additionally, the Agency received comments that the PM upgrade costs estimated at proposal were too high on a dollar per ton basis and these costs have been updated and are provided in the 2024 Technical Memo. Specifically, commenters demonstrated that the observed percent reductions in fPM attributable to ESP upgrades were significantly greater than the percent reductions that the EPA had assumed for the proposed rule. Additionally, commenters demonstrated that ESP performance guarantees for coal-fired utility boilers were much lower than the EPA was aware of at proposal. These updates, as well as improving our methodology which increases the number of EGUs estimated to need PM upgrades, slightly lower the dollar per ton estimates from what was presented in the 2023 Proposal.

The EPA considers costs in various ways, depending on the rule and affected sector. For example, the EPA has considered, in previous CAA section 112 rulemakings, cost effectiveness, the total capital costs of proposed measures, annual costs, and costs compared to total revenues (*e.g.,* cost to revenue ratios).[52] As much of the

[52] See, *e.g., National Emission Standards for Hazardous Air Pollutants: Mercury Cell Chlor-Alkali Plants Residual Risk and Technology Review,* 87 FR 27002, 27008 (May 6, 2022) (considered annual costs and average capital costs per facility in technology review and beyond-the-floor analysis); *National Emission Standards for Hazardous Air Pollutants: Primary Copper Smelting Residual Risk and Technology Review and Primary Copper Smelting Area Source Technology Review,*

fleet is already reporting fPM emission rates below 0.010 lb/MMBtu, both the total costs and non-Hg HAP metal reductions of the revised limit are modest in context of total PM upgrade control costs and emissions of the coal fleet. The cost-effectiveness estimate for EGUs reporting average fPM rates above the final fPM emission limit of 0.010 lb/MMBtu is $10,500,000/ton of non-Hg HAP metals, slightly lower than the range presented in the 2023 Proposal.

Further, the EPA finds that costs for facilities to meet the revised fPM emission limit represent a small fraction of typical capital and total expenditures for the power sector. In the 2022 Proposal (reaffirming the appropriate and necessary finding), the EPA evaluated the compliance costs that were projected in the 2012 MATS Final Rule relative to the typical annual revenues, capital expenditures, and total (capital and production) expenditures.[53] 87 FR 7648–7659 (February 9, 2022); 80 FR 37381 (June 30, 2015). Using electricity sales data from the U.S. Energy Information Administration (EIA), the EPA updated the analysis presented in the 2022 Proposal. We find revenues from retail electricity sales increased from $333.5 billion in 2000 to a peak of $429.6 billion in 2008 (an increase of about 29 percent during this period) and slowly declined since to a post-2011 low of $388.6 billion in 2020 (a decrease of about 10 percent from its peak during this period) in 2019 dollars.[54] Revenues increased in 2022 to nearly the same amount as the 2008 peak ($427.8 billion). The annual control cost estimate for the final fPM standard based on the cost-effectiveness analysis in table 4 (see section 1c of the 2024 Technical Memo) of this document is a very small share of total power sector sales (about 0.03 percent of the lowest year over the 2000 to 2019 period). Making similar comparisons of the estimated capital and total compliance costs to historical trends in sector-level capital and production costs, respectively, would yield similarly small estimates. Therefore, as in previous CAA section 112 rulemakings, the EPA considered costs in many ways, including cost effectiveness, the total capital costs of proposed measures, annual costs, and costs compared to total revenues to determine the appropriateness of the revised fPM standard under the CAA section 112(d)(6) technology review, and determined the costs are reasonable.

In this final rule, the EPA finds that costs of the final fPM standard are reasonable, and that the revised fPM standard appropriately balances the EPA's obligation under CAA section 112 to achieve the maximum degree of emission reductions considering statutory factors, including costs. Further, the EPA finds that its consideration of costs is consistent with D.C. Circuit precedent, which has found that CAA section 112(d)(2) expressly authorizes cost consideration in other aspects of the standard-setting process, such as CAA section 112(d)(6), *see Association of Battery Recyclers, Inc.* v. *EPA,* 716 F.3d 667, 673–74 (D.C. Cir. 2013), and that CAA section 112 does not mandate a specific method of cost analysis in an analogous situation when considering the beyond-the-floor review. *See NACWA* v. *EPA,* 734 F.3d 1115, 1157 (D.C. Cir. 2013) (finding the statute did not ''mandate a specific method of cost analysis''); *see also NRDC* v. *EPA,* 749 F.3d 1055, 1060–61 (D.C. Cir. 2014).

As discussed in section IV.C.1. in response to comments regarding the relatively higher dollar per ton cost effectiveness of the final fPM standard, the EPA finds that in the context of this industry and this rulemaking, the updated standards are an appropriate exercise of the EPA's standard setting authority pursuant to the CAA section 112(d)(6) technology review. As commenters rightly note, the EPA routinely considers the cost effectiveness of potential standards where it can consider costs under CAA section 112, *e.g.,* in conducting beyond-the-floor analyses and technology reviews, to determine the achievability of a potential control option. And the D.C. Circuit recognized that the EPA's interpretation of costs as ''allowing consideration of cost effectiveness was reasonable.'' *NRDC* v. *EPA,* 749 F.3d 1055, 1060–61 (D.C. Cir. 2014) (discussing the EPA's consideration of cost effectiveness pursuant to a CAA section 112(d)(2) beyond-the-floor analysis). However, cost effectiveness is not the sole factor that the EPA considers when determining the achievability of a potential standard in conducting a technology review, nor is cost effectiveness the only value that the EPA considers with respect to costs.[55] Some commenters pointed to other rulemakings (which are discussed in section IV.C.1. above) where the EPA determined not to pursue potential control options with relatively higher cost-effectiveness estimates as compared to prior CAA section 112 rulemakings. However, there were other factors that the EPA considered, in addition to cost effectiveness, that counseled against pursuing such updates. In this rulemaking, the EPA finds that several factors discussed throughout this record make promulgation of the new fPM standard appropriate under CAA section 112(d)(6). First, a wide majority of units have invested in the most-effective PM controls and are already demonstrating compliance with the new fPM standard and at lower costs than assumed during promulgation of the original MATS fPM emission limit. Of the 33 EGUs that the EPA estimated would require control improvements to meet a 0.010 lb/MMBtu fPM standard, only two are not using the most effective PM control technologies available. The EPA assumed that these two units would need to install FFs to achieve the 0.010 lb/MMBtu emission standard, and the cost of those FF retrofits accounts for 42 percent of the total annualized costs presented in table 4. Further, 11 EGUs that the EPA assumed would require different levels of ESP upgrades to meet the 0.010 lb/MMBtu emission standard (all of which have announced retirement dates between 2031 and 2042 resulting in shorter assumed amortization periods) account for about 57 percent of the total annualized costs. The remaining 1 percent of the total annualized costs are associated with 10 EGUs with existing FFs that the EPA

87 FR 1616, 1635 (proposed January 11, 2022) (considered total annual costs and capital costs, annual costs, and costs compared to total revenues in proposed beyond-the-floor analysis); *Phosphoric Acid Manufacturing and Phosphate Fertilizer Production RTR and Standards of Performance for Phosphate Processing,* 80 FR 50386, 50398 (August 19, 2015) (considered total annual costs and capital costs compliance costs and annualized costs for technology review and beyond the floor analysis); *National Emissions Standards for Hazardous Air Pollutants: Ferroalloys Production,* 80 FR 37366, 37381 (June 30, 2015) (considered total annual costs and capital costs, annual costs, and costs compared to total revenues in technology review); *National Emission Standards for Hazardous Air Pollutants: Off-Site Waste and Recovery Operations,* 80 FR 14248, 14254 (March 18, 2015) (considered total annual costs and capital costs, and average annual costs and capital costs and annualized costs per facility in technology review); *National Emission Standards for Hazardous Air Pollutant Emissions: Hard and Decorative Chromium Electroplating and Chromium Anodizing Tanks; and Steel Pickling-HCl Process Facilities and Hydrochloric Acid Regeneration Plants,* 77 FR 58220, 58226 (September 19, 2012) (considered total annual costs and capital costs in technology review); *Oil and Natural Gas Sector: New Source Performance Standards and National Emission Standards for Hazardous Air Pollutants Reviews,* 77 FR 49490, 49523 (August 16, 2012) (considered total capital costs and annualized costs and capital costs in technology review). *C.f. NRDC* v. *EPA,* 749 F.3d 1055, 1060 (D.C. Cir. 2014).

[53] See Cost TSD for 2022 Proposal at Document ID No. EPA–HQ–OAR–2018–0794–4620 at *https://www.regulations.gov.*

[54] 2019 dollars were used for consistency with the 2023 Proposal.

[55] See note 50, above, for examples of other costs metrics the EPA has considered in prior CAA section 112 rulemakings.

assumes will require bag upgrades or increased bag changeouts and 10 EGUs that are assumed to need additional operation and maintenance of existing ESPs, which is further explained in the 2024 Technical Memo. Since only a small handful of units emit significantly more than peer facilities, the Agency finds these upgrades appropriate. Additionally, the size and unique nature of the coal-fired power sector, and the emission reductions that will be achieved by the new standard, in addition to the costs, make promulgation of the new standard appropriate under CAA section 112(d)(6).

The power sector also operates differently than other industries regulated under CAA section 112.[56] For example, the power sector is publicly regulated, with long-term decision-making and reliability considerations made available to the public; it is a data-rich sector, which generally allows the EPA access to better information to inform its regulation; and the sector is in the midst of an energy generation transition leading to plant retirements that are independent of EPA regulation. Because of the relative size of the power sector, while cost effectiveness of the final standard is relatively high as compared to prior CAA section 112 rulemakings involving other industries, costs represent a much smaller fraction of industry revenue. In the likely case that the power sector's transition to lower-emitting generation is accelerated by the IRA, for example, the total costs and emission reductions achieved by each final fPM standard in table 4 of this document would also be an overestimate.

As demonstrated in the proposal, the power sector, as a whole, is achieving fPM emission rates that are well below the 0.030 lb/MMBtu standard from the 2012 Final MATS Rule, with the exception of a few outlier facilities. The EPA estimates that only one facility (out of the 151 evaluated coal-fired facilities), which does not have the most modern PM pollution controls and has been unable to demonstrate an ability to meet a lower fPM limit, will be required to install the most-costly upgrade to meet the revised standards, which significantly drives up the cost of this final rule. However, the higher costs for one facility to install demonstrated improvements to its control technology should not prevent the EPA from establishing achievable standards for the sector under the EPA's CAA section 112(d)(6) authority. Instead, the EPA finds that it is consistent with its CAA section 112(d)(6) authority to consider the performance of the industry at large. The average fPM emissions of the industry demonstrate the technical feasibility of higher emitting facilities to meet the new standard and shows there are proven technologies that if installed at these units will allow them to significantly lower fPM and non-Hg HAP metals emissions.

In this rulemaking, the EPA also determined not to finalize a more stringent standard for fPM emissions, such as a limit of 0.006 lb/MMBtu or lower, which the EPA took comment on in the 2023 Proposal. The EPA declines to finalize an emission standard of 0.006 lb/MMBtu or lower primarily due to technical limitations in using PM CEMS for compliance demonstration purposes described in the next section. The EPA has determined that a fPM emission standard of 0.010 lb/MMBtu is the lowest that would also allow the use of PM CEMS for compliance demonstration. Additionally, the EPA also considered the overall higher costs associated with a more stringent standard as compared to the final standard, which the EPA considered under the technology review.

Additionally, compliance with a fPM emission limit of 0.006 lb/MMBtu could only be demonstrated using periodic stack testing that would require test run durations longer than 4 hours [57] and would not provide the source, the public, and regulatory authorities with continuous, transparent data for all periods of operation. Establishing a fPM limit of 0.006 lb/MMBtu while maintaining the current compliance demonstration flexibilities of quarterly ''snapshot'' stack testing would, theoretically, result in greater emission reductions; however, the measured emission rates are only representative of rates achieved at optimized conditions at full load. While coal-fired EGUs have historically provided baseload generation, they are being dispatched much more as load following generating sources due to the shift to more available and cheaper natural gas and renewable generation. As such, traditional generation assets—such as coal-fired EGUs—will likely continue to have more startup and shutdown periods, more periods of transient operation as load following units, and increased operation at minimum levels, all of which can produce higher PM emission rates. Maintaining the status quo with quarterly stack testing will likely mischaracterize emissions during these changing operating conditions. Thus, while a fPM emission limit of 0.006 lb/MMBtu paired with use of quarterly stack testing may appear to be more stringent than the 0.010 lb/MMBtu standard paired with use of PM CEMS that the EPA is finalizing in this rule, there is no way to confirm emission reductions during periods in between quarterly tests when emission rates may be higher. Therefore, the Agency is finalizing a fPM limit of 0.010 lb/MMBtu with the use of PM CEMS as the only means of compliance demonstration. The EPA has determined that this combination of fPM limit and compliance demonstration represents the most stringent available option taking into account the statutory considerations.

The EPA also determined not to finalize a fPM standard of 0.015 lb/MMBtu, which the EPA took comment on in the 2023 Proposal, because the EPA determined that a standard of 0.010 lb/MMBtu is appropriate for the reasons discussed above.

In this rule, the EPA is also reaching a different conclusion from the 2020 Technology Review with respect to the fPM emission standard and requirements to utilize PM CEMS. As discussed in section II.D. above, the 2020 Technology Review did not consider developments in the cost and effectiveness of proven technologies to control fPM as a surrogate for non-Hg HAP metals emissions, nor did the EPA evaluate the current performance of emission reduction control equipment and strategies at existing MATS-affected EGUs. In this rulemaking, in which the EPA reviewed the findings of the 2020 Technology Review, the Agency determined there are important developments regarding the emissions performance of the coal-fired EGU fleet, and the costs of achieving that performance that are appropriate for the EPA to consider under its CAA section 112(d)(6) authority, and which are the basis for the revised emissions standards the EPA is promulgating through this final rule.

The 2012 MATS Final Rule contains emission limits for both individual and total non-Hg HAP metals (*e.g.,* lead, arsenic, chromium, nickel, and cadmium), as well as emission limits for fPM. Those non-Hg HAP metals

[56] This is a fact which Congress recognized in requiring the EPA to first determine whether regulation of coal-fired EGUs was ''appropriate and necessary'' under CAA section 112(n)(1)(A) before proceeding to regulate such facilities under CAA section 112's regulatory scheme.

[57] Run durations greater than 4 hours would ensure adequate sample collection and lower random error contributions to measurement uncertainty for a limit of 0.006 lb/MMBtu. The EPA aims to keep run durations as short as possible, generally at least one but no more than 4 hours in length, in order to minimize impacts to the facility (*e.g.,* overall testing campaign testing costs, employee focused attention and safety).

emission limits serve as alternative emission limits because fPM was found to be a surrogate for either individual or total non-Hg HAP metals emissions. While EGU owners or operators may choose to demonstrate compliance with either the individual or total non-Hg HAP metals emission limits, the EPA is aware of just one owner or operator who has provided non-Hg HAP metals data—both individual and total—along with fPM data, for compliance demonstration purposes. This is for a coal refuse-fired EGU with a generating capacity of 46.1 MW. Given that owners or operators of all the other EGUs that are subject to the requirements in MATS have chosen to demonstrate compliance with only the fPM emission limit, the EPA proposed to remove the total and individual non-Hg HAP metals emission limits from all existing MATS-affected EGUs and solicited comment on our proposal. In the alternative, the EPA took comment on whether to retain total and/or individual non-Hg HAP metals emission limits that have been lowered proportionally to the revised fPM limit (*i.e.,* revised lower by two-thirds to be consistent with the revision of the fPM standard from 0.030 lb/MMBtu to 0.010 lb/MMBtu).

Commenters urged the EPA to retain the non-Hg HAP metals limits, arguing it is incongruous for the EPA to eliminate the measure for the pollutants that are the subject of regulation under CAA section 112(d)(6), notwithstanding the fact that the fPM limit serves as a more easily measurable surrogate for these HAP metals. Additionally, some commenters stated that the inability to monitor HAP metals directly will significantly impair the EPA's ability to revise emission standards in the future.

After considering comments, the EPA determined to promulgate revised total and individual non-Hg HAP metals emission limits for coal-fired EGUs that are lowered proportionally to the revised fPM standard. Just as this rule requires owners or operators to demonstrate continuous compliance with fPM limits, owners or operators who choose to demonstrate compliance with these alternative limits will need to utilize approaches that can measure non-Hg HAP metals on a continuous basis—meaning that intermittent emissions testing using Reference Method 29 will not be a suitable approach. Owners or operators may petition the Administrator to utilize an alternative test method that relies on continuous monitoring (*e.g.,* multi-metal CMS) under the provisions of 40 CFR 63.7(f). The EPA disagrees with the suggestion that failure to monitor HAP metals directly could impair the ability to revise those standards in the future.

2. Rationale for the Final Compliance Demonstration Options

In the 2023 Proposal, the EPA proposed to require that coal- and oil-fired EGUs utilize PM CEMS to demonstrate compliance with the fPM standard used as a surrogate for non-Hg HAP metals. The EPA proposed the requirement for PM CEMS based on its assessment of costs of PM CEMS versus stack testing, and the many other benefits of using PM CEMS including increased transparency and accelerated identification of anomalous emissions. In particular, the EPA noted the ability for PM CEMS to provide continuous feedback on control device and plant operations and to provide EGU owners and operators, regulatory authorities, and members of nearby communities with continuous assurance of compliance with emissions limits as an important benefit. Further, the EPA explained in the 2023 Proposal that PM CEMS are currently in use by approximately one-third of the coal-fired fleet, and that PM CEMS can provide low-level measurements of fPM from existing EGUs.

After considering comments and conducting further analysis,[58] the EPA is finalizing the use of PM CEMS for compliance demonstration purposes for coal- and oil-fired EGUs pursuant to its CAA section 112(d)(6) authority. As discussed in section IV.D.1. above, Congress intended for CAA section 112 to achieve significant reductions in HAP, which it recognized as particularly harmful pollutants. The EPA finds that the benefits of PM CEMS to provide real-time information to owners and operators (who can promptly address any problems with emissions control equipment), to regulators, to adjacent communities, and to the general public, further Congress's goal to ensure that emission reductions are consistently maintained. The EPA determined not to require PM CEMS for existing IGCC EGUs, described in section VI.D., due to technical issues calibrating CEMS on these types of EGUs due to the difficulty in preparing a correlation range because these EGUs are unable to de-tune their fPM controls and their existing emissions are less than one-tenth of the final emission limit. Further, the EPA finds additional authority to require the use of PM CEMS under CAA section 114(a)(1)(C), which allows that the EPA may require a facility that ''may have information necessary for the purposes set forth in this subsection, or who is subject to any requirement of this chapter'' to ''install, use, and maintain such monitoring equipment'' on a ''on a one-time, periodic or continuous basis.'' 114(a)(1)(C).

From the EPA's review of PM CEMS, the Agency determined that a fPM standard of 0.010 lb/MMBtu with adjusted QA criteria—used to verify consistent correlation of CEMS data initially and over time—is the lowest fPM emission limit possible at this time with use of PM CEMS.[59] PM CEMS correlated using these values will ensure accurate measurements—either above, at, or below this emission limit. As discussed in section IV.D.1. above, one of the reasons the EPA determined not to finalize a more stringent standard for fPM is because it would prove challenging to verify accurate measurement of fPM using PM CEMS. Specifically, as mentioned in the *Suitability of PM CEMS Use for Compliance Determination for Various Emission Levels,* memorandum, available in the docket, no fPM standard more stringent than 0.010 lb/MMBtu with adjusted QA criteria is expected to have acceptable passing rates for the QA checks or acceptable random error for reference method testing.

At proposal, the EPA estimated that the EUAC of PM CEMS was $60,100 (88 FR 24873). Based on comments the EPA received on the costs and capabilities of PM CEMS and additional analysis the EPA conducted, the EPA determined that the revised EUAC of PM CEMS is higher than estimated at proposal. The EPA now estimates that the EUAC of non-beta gauge PM CEMS is $72,325, which is 17 percent less than what was estimated for the 2012 MATS Final Rule. That amount is somewhat greater than the revised estimated costs of infrequent emission testing (generally quarterly)—the revised average estimated costs of such infrequent emissions testing using EPA Method 5I[60] is $60,270.[61]

In choosing a compliance demonstration requirement, the EPA considers multiple factors, including

[58] The EPA explains additional analyses of PM CEMS in the memos titled *Suitability of PM CEMS Use for Compliance Determination for Various Emissions Levels* and *Summary of Review of 36 PM CEMS Performance Test Reports versus PS11 and Procedure 2 of 40 CFR part 60, appendices B and F, respectively,* which are available in the docket.

[59] The EPA notes that the fPM standard [0.010 lb/MMBtu] is based on hourly averages obtained from PM CEMS over 30 boiler operating days [see 40 CFR 63.10021(b)].

[60] Method 5I is one of the EPA's reference test methods for PM. See 40 CFR part 60, appendix A.

[61] See *Revised Estimated Non-Beta Gauge PM CEMS and Filterable PM Testing Costs* memorandum, available in the docket.

costs, benefits of the compliance technique, technical feasibility and commercial availability of the compliance method, ability of personnel to conduct the compliance method, and continuity of data used to assure compliance. PM CEMS are readily available and in widespread use by the electric utility industry, as evidenced by the fact that over 100 EGUs already utilize PM CEMS for compliance demonstration purposes. Moreover, the electric utility industry and its personnel have demonstrated the ability to install, operate, and maintain numerous types of CEMS—including PM CEMS. As mentioned earlier, EGU owners and/or operators who chose PM CEMS for compliance demonstration have attested in their submitted reports to the suitability of their PM CEMS to measure at low emission levels, certifying fPM emissions lower than 0.010 lb/MMBtu with their existing correlations developed using emission levels at 0.030 lb/MMBtu. The EPA conducted a review of eight EGUs with varying fPM control devices that rely on PM CEMS that showed certified emissions ranging from approximately 0.002 lb/MMBtu to approximately 0.007 lb/MMBtu. The EPA's review analyzed 30 boiler operating day rolling averages obtained from reports posted to WebFIRE for the third quarter of 2023 from these eight EGUs.[62]

As described in the *Summary of Review of 36 PM CEMS Performance Test Reports versus PS11 and Procedure 2 of 40 CFR part 60, Appendices B and F* memorandum, available in the docket, the EPA investigated how well a sample of EGUs using PM CEMS for compliance purposes would meet initial and ongoing QA requirements at various emission limit levels, even though no change in actual EGU operation occurred. As described in the aforementioned *Suitability of PM CEMS Use for Compliance Determination for Various Emission Levels* memorandum, as the emission limit is lowered, the ability to meet both components necessary to correlate PM CEMS—acceptable random error and QA passing rate percentages—becomes more difficult. Based on this additional analysis and review, the EPA determined to finalize requirements to use PM CEMS with adjusted QA criteria and a 0.010 lb/MMBtu fPM emission limit as the most stringent limit possible with PM CEMS.

Use of PM CEMS can provide EGU owners or operators with an increased ability to detect and correct potential problems before degradation of emission control equipment, reduction or cessation of electricity production, or exceedances of regulatory emission standards. As mentioned in the *Ratio of Revised Estimated Non-Beta Gauge PM CEMS EUAC to 2022 Average Coal-Fired EGU Gross Profit* memorandum, using PM CEMS can be advantageous, particularly since their EUAC is offset if their use allows owners or operators to avoid 3 or more hours of generating downtime per year.

In deciding whether to finalize the proposal to use PM CEMS as the only compliance demonstration method for non-IGCC coal- and oil-fired EGUs, the Agency assessed the costs and benefits afforded by requiring use of only PM CEMS as compared to continuing the current compliance demonstration flexibilities (*i.e.,* allowing use of either PM CEMS or infrequent PM emissions stack testing). As mentioned above, the average annual cost for quarterly stack testing provided by commenters is about $12,000 less than the EUAC for PM CEMS. While no estimate of quantified benefits was provided by commenters, the EPA recognizes that the 35,040 15-minute values provided by a PM CEMS used at an EGU operating during a 1-year period is over 243 times as much information as is provided by quarterly testing with three 3-hour run durations. This additional, timely information provided by PM CEMS affords the adjacent communities, the general public, and regulatory authorities with assurances that emission limits and operational processes remain in compliance with the rule requirements. It also provides EGU owners or operators with the ability to quickly detect, identify, and correct potential control device or operational problems before those problems become compliance issues. When establishing emission standards under CAA section 112, the EPA must select an approach to compliance demonstration that best assures compliance is being achieved.

The continuous monitoring of fPM required in this rule provides several benefits which are not quantified in this rule, including greater certainty, accuracy, transparency, and granularity in fPM emissions information than exists today. Continuous measurement of emissions accounts for changes to processes and fuels, fluctuations in load, operations of pollution controls, and equipment malfunctions. By measuring emissions across all operations, power plant operators and regulators can use the data to ensure controls are operating properly and to assess compliance with relevant standards. Because CEMS enable power plant operators to quickly identify and correct problems with pollution control devices, it is possible that continuous monitoring could lead to lower fPM emissions for periods of time between otherwise required intermittent testing, currently up to 3 years for some units.

To illustrate the potentially substantial differences in fPM emissions between intermittent and continuous monitoring, the EPA analyzed emissions at several EGUs for which both intermittent and continuous monitoring data are available. This analysis is provided in the 2024 Technical Memo, available in the rulemaking docket. For example, one 585-MW bituminous-fired EGU, with a cold-side ESP for PM control, has achieved LEE status for fPM and is currently required to demonstrate compliance with an emission standard of 0.015 lb/MMBtu using intermittent stack testing every 3 years. In the most recent LEE compliance report, submitted on February 25, 2021, the unit submitted the result of an intermittent stack test with an emission rate of 0.0017 lb/MMBtu. In the subsequent 36 months over which this unit is currently not subject to any further compliance testing, continuous monitoring demonstrates that the fPM emission rate increased substantially. At one point, the continuously monitored 30-day rolling average emissions rate[63] was nine times higher than the intermittent stack test average, reaching the fPM LEE limit of 0.015 lb/MMBtu. In this example, the actual continuously monitored daily average emissions rate over the February 2021 to April 2023 period ranged from near-zero to 0.100 lb/MMBtu. Emissions using either the stack test average or hourly PM CEMS data were calculated for 2022 for this unit. Both approaches indicate fPM emissions well below the allowable levels for a fPM limit of 0.010 lb/MMBtu, while estimates using PM CEMS are about 2.5 times higher than the stack test estimate. Additional examples of differences between intermittent stack testing and continuous monitoring are provided in the 2024 Technical Memo, including for periods when PM CEMS data is lower

[62] See Third Quarter 2023 p.m. CEMS Thirty Boiler Operating Day Rolling Average Reports for Iatan Generating Station units 1 and 2, Missouri; Marshall Steam Station units 1 and 3, North Carolina; Kyger Creek Station unit 3, Ohio; Virginia City Hybrid Energy Center units 1 and 2, Virginia; and Ghent Generating Station unit 1, Kentucky. These reports are available electronically by searching in the WebFIRE Report Search and Retrieval portion of the Agency's WebFIRE internet website at *https://cfpub.epa.gov/webfire/reports/esearch.cfm.*

[63] The 30-day rolling average emission rate was calculated by taking daily fPM rate averages over a 30-day operating period while filtering out hourly fPM data during periods of startup and shutdown.

than the stack test averages,[64] which further illustrate real-life scenarios in which fPM emissions for compliance methods may be substantially different.

The potential reduction in fPM and non-Hg HAP metals emission resulting from the information provided by continuous monitoring coupled with corrective actions by plant operators could be sizeable over the total capacity that the EPA estimates would install PM CEMS under this rule (nearly 82 GW). Furthermore, the potential reduction in non-Hg HAP metal emissions would likely reduce exposures to people living in proximity to the coal-fired EGUs potentially impacted by the amended fPM standards. The EPA has found that populations living near coal-fired EGUs have a higher percentage of people living below two times the poverty level than the national average.

In addition to significant value of further pollution abatement, the CEMS data are transparent and accessible to regulators, stakeholders, and the public, fostering greater accountability. Transparency of EGU emissions as provided by PM CEMS, along with real-time assurance of compliance, has intrinsic value to the public and communities as well as instrumental value in holding sources accountable. This transparency is facilitated by a requirement for electronic reporting of fPM emissions data by the source to the EPA. This emissions data, once submitted, becomes accessible and downloadable—along with other operational and emissions data (*e.g.,* for SO_2, CO_2, NO_X, Hg, *etc.*) for each covered source.

On balance, the Agency finds that the benefits of emissions transparency and the continuous information stream provided by PM CEMS coupled with the ability to quickly detect and correct problems outweigh the minor annual cost differential from quarterly stack testing. The EPA is finalizing, as proposed, the use of PM CEMS to demonstrate compliance with the fPM emission standards for coal- and oil-fired EGUs (excluding IGCC units and limited-use liquid-oil-fired EGUs).

More information on the proposed technology review can be found in the 2023 Technical Memo (Document ID No. EPA–HQ–OAR–2018–0794–5789), in the preamble for the 2023 Proposal (88 FR 24854), and the 2024 Technical Memo, available in the docket. For the reasons discussed above, pursuant to CAA section 112(d)(6), the EPA is finalizing, as proposed, the use of PM CEMS (with adjusted QA criteria as a result of review of comments) for the compliance demonstration of the fPM emission standard (as a surrogate for non-Hg HAP metal) for coal- and oil-fired EGUs, and the removal of the fPM and non-Hg HAP metals LEE provisions.

V. What is the rationale for our final decisions and amendments to the Hg emission standard for lignite-fired EGUs from review of the 2020 Technology Review?

A. What did we propose pursuant to CAA section 112(d)(6) for the lignite-fired EGU subcategory?

In the 2012 MATS Final Rule, the EPA finalized a Hg emission standard of 4.0E-06 lb/MMBtu (4.0 lb/TBtu) for a subcategory of existing lignite-fired EGUs.[65] The EPA also finalized a Hg emission standard of 1.2E-06 lb/MMBtu (1.2 lb/TBtu) for coal-fired EGUs not firing lignite (*i.e.,* for EGUs firing anthracite, bituminous coal, subbituminous coal, or coal refuse); and the EPA finalized a Hg emission output-based standard for new lignite-fired EGUs of 0.040 lb/GWh and a Hg emission output-based standard for new non-lignite-fired EGUs of 2.0E-04 lb/GWh. In 2013, the EPA reconsidered the Hg emission standard for new non-lignite-fired EGUs and revised the output-based standard to 0.003 lb/GWh (see 78 FR 24075).

As explained in the 2023 Proposal, Hg emissions from the power sector have declined since promulgation of the 2012 MATS Final Rule with the installation of Hg-specific and other control technologies and as more coal-fired EGUs have retired or reduced utilization. The EPA estimated that 2021 Hg emissions from coal-fired EGUs were 3 tons (a 90 percent decrease compared to pre-MATS levels). However, units burning lignite (or permitted to burn lignite) accounted for a disproportionate amount of the total Hg emissions in 2021. As shown in table 5 in the 2023 Proposal (88 FR 24876), 16 of the top 20 Hg-emitting EGUs in 2021 were lignite-fired EGUs. Overall, lignite-fired EGUs were responsible for almost 30 percent of all Hg emitted from coal-fired EGUs in 2021, while generating about 7 percent of total 2021 megawatt-hours. Lignite accounted for 8 percent of total U.S. coal production in 2021.

Prior to the 2023 Proposal, the EPA assembled information on developments in Hg emission rates and installed controls at lignite-fired EGUs from operational and emissions information that is provided routinely to the EPA for demonstration of compliance with MATS and from information provided to the EIA. In addition, the EPA's final decisions were informed by information that was submitted as part of a CAA section 114 information survey (2022 ICR). The EPA also revisited information that was used in establishing the emission standards in the 2012 Final MATS Rule and considered information that was submitted during the public comment period for the 2023 Proposal. From that information, the EPA determined, as explained in the 2023 Proposal, that there are available cost-effective control technologies and improved methods of operation that would allow existing lignite-fired EGUs to achieve a more stringent Hg emission standard. As such, the EPA proposed a revised Hg emission standard for existing EGUs firing lignite (*i.e.,* for those in the ''units designed for low rank virgin coal'' subcategory). Specifically, the EPA proposed that such lignite-fired units must meet the same emission standard as existing EGUs firing other types of coal (*e.g.,* anthracite, bituminous coal, subbituminous coal, and coal refuse), which is 1.2 lb/TBtu (or an alternative output-based standard of 0.013 lb/GWh). The EPA did not propose to revise the Hg emission standards either for existing EGUs firing non-lignite coal or for new non-lignite coal-fired EGUs.[66]

B. How did the technology review change for the lignite-fired EGU subcategory?

The outcome of the technology review for the Hg standard for existing lignite-fired EGUs has not changed since the 2023 Proposal. However, in response to comments, the EPA expanded its review to consider additional coal compositional data and the impact of sulfur trioxide (SO_3) in the flue gas.

[64] See Case Study 2 in the 2024 Technical Memo, which shows long time periods of PM CEMS data below the most recent RRA. Note this unit uses PM CEMS for compliance with the fPM standard, so the RRA is used as an indicator of stack test results.

[65] The EPA referred to this subcategory in the final rule as ''units designed for low rank virgin coal.'' The EPA went on to specify that such a unit is designed to burn and is burning non-agglomerating virgin coal having a calorific value (moist, mineral matter-free basis) of less than 19,305 kJ/kg (8,300 Btu/lb) and that is constructed and operates at or near the mine that produces such coal. The EPA also finalized an alternative output-based emission standard of 0.040 lb/GWh. Currently, the approximately 22 units that are permitted as lignite-fired EGUs are located exclusively in North Dakota, Texas, and Mississippi.

[66] As stated in the 2023 Proposal, when proposed revisions to existing source emission standards are more stringent than the corresponding new source emission standard, the EPA proposes to revise the corresponding new source standard to be at least as stringent as the proposed revision to the existing source standard. This is the case with the Hg emission standard for new lignite-fired sources, which will be adjusted to be as stringent as the existing source standard.

C. What key comments did we receive on the Hg emission standard for lignite-fired EGUs, and what are our responses?

The Agency received both supportive and critical comments on the proposed revision to the Hg emission standard for existing lignite-fired EGUs. Some commenters agreed with the EPA's decision to not propose revisions to the Hg emission standards for non-lignite-fired EGUs, while others disagreed. Significant comments are summarized below, and the Agency's responses are provided.

Comment: Several commenters stated that industry experience confirms that stringent limits on power plant Hg emissions can be readily achieved at lower-than-predicted costs and thus should be adopted nationally through CAA section 112(d)(6). They said that at least 14 states have, for years, enforced state-based limits on power plant Hg emissions, and nearly every one of those states has imposed more stringent emission limits than those proposed in this rulemaking or in the final 2012 MATS Final Rule. The commenters said that these lower emissions limits have resulted in significant and meaningful Hg emission reductions, which have proven to be both achievable and cost-effective.

Some commenters recommended that the EPA revise the Hg limits to levels that are much more stringent than existing or proposed standards for both EGUs firing non-lignite coals and those firing lignite. They claimed that more stringent Hg emission standards are supported by developments in practices, processes, and control technologies. They pointed to a 2021 report by Andover Technology Partners, which details advances in control technologies that support more stringent Hg standards for all coal-fired EGUs.[67] These advances include advanced activated carbon sorbents with higher capture capacity at lower injection rates and carbon sorbents that are tolerant of flue gas species.

Response: The EPA has taken these comments and the referenced information into consideration when establishing the final emission standards. The EPA disagrees that the Agency should, in this final rule, revise the Hg limits for all coal-fired EGUs to levels more stringent than the current or proposed standards. The Agency did not propose in the 2023 Proposal to revise the Hg emission standard for ''not-low-rank coal units'' (*i.e.,* those EGUs that are firing on coals other than lignite) and did not suggest an emission standard for lignite-fired EGUs more stringent than the 1.2 lb/TBtu emission standard that was proposed. However, the EPA will continue to review emission standards and other rule requirements as part of routine CAA section 112(d)(6) technology reviews, which are required by statute to be conducted at least every 8 years. If we determine in subsequent CAA section 112(d)(6) technology reviews that further revisions to Hg emission standards (or to standards for other HAP or surrogate pollutants) are warranted, then we will propose revisions at that time. We discuss the rationale for the final emission standards in section V.D. of this preamble and in more detail in the 2024 Technical Memo.

Comment: Several commenters challenged the data that the EPA used in the CAA 112(d)(6) technology review. Commenters stated that the information collected by the EPA via the CAA section 114 request consisted of 17 units each submitting two 1-week periods of data and associated operational data preselected by the EPA, and that only a limited number of the EGUs reported burning only lignite. Other EGUs reported burning primarily refined coal, co-firing with natural gas, and firing or co-firing with large amounts of subbituminous coal (referencing table 7 in the 2023 Proposal). Commenters stated that if the EPA's intent was to assess the Hg control performance of lignite-fired EGUs, then the EGUs evaluated should have burned only lignite, not refined coal, subbituminous coal, or natural gas.

Response: The EPA disagrees with the commenters' argument that the Agency should have only considered emissions and operational data from EGUs that were firing only lignite. The EPA's intent was to evaluate the Hg emission control performance of units that are permitted to burn lignite and are thus subject to a Hg emission standard of 4.0 lb/TBtu. According to fuel use information supplied to EIA on form 923,[68] 13 of 22 EGUs that were designed to burn lignite utilized ''refined coal'' to some extent in 2021, as summarized in table 7 in the 2023 Proposal preamble (88 FR 24878). EIA form 923 does not specify the type of coal that is ''refined'' when reporting boiler or generator fuel use. For the technology review, the EPA assumed that the facilities utilized ''refined lignite,'' as reported in fuel receipts on EIA form 923. In any case, firing of refined lignite or subbituminous coal or co-firing with natural gas or fuel oil are considered to be Hg emission reduction strategies for a unit that is subject to an emission standard of 4.0 lb/TBtu, which was based on the use of lignite as its fuel.

In a related context, in *U.S. Sugar Corp.* v. *EPA,* the D.C. Circuit held that the EPA could not exclude unusually high performing units within a subcategory from the Agency's determination of MACT floor standards for a subcategory pursuant to CAA section 112(d)(3). 830 F.3d 579, 631–32 (D.C. Cir. 2016) (finding ''an unusually high-performing source should be considered[,]'' in determining MACT floors for a subcategory, and that ''its performance suggests that a more stringent MACT standard is appropriate.''). While the technology review at issue here is a separate and distinct analysis from the MACT floor setting requirements at issue in *U.S. Sugar* v. *EPA,* similarly here the EPA finds it is appropriate to consider emissions from all units that are permitted to burn lignite and are therefore subject to the prior Hg emission standard of 4.0 lb/TBtu and are part of the lignite-fired EGU subcategory, for the purposes of determining whether more stringent standards are appropriate under a technology review. However, while the EPA has considered the emissions performance of all units within the lignite-fired EGU subcategory, it is not the performance of units that are firing or co-firing with other non-lignite fuels that provide the strongest basis for the more stringent standard. Rather, the most convincing evidence to support the more stringent standard is that there are EGUs that are permitted to fire lignite—and are only firing lignite—that have demonstrated an ability to meet the more stringent standard of 1.2 lb/TBtu.

Comment: Several commenters claimed that, rather than using actual measured Hg concentrations in lignite that had been provided in the CAA section 114 request responses (and elsewhere), the EPA used Integrated Planning Model (IPM) data to assign inlet Hg concentrations to various lignite-fired EGUs. Some commenters asserted that the actual concentration of Hg in lignite is higher than those assumed by the EPA and that there is considerable variability in the concentration of Hg in the lignite used in these plants. As a result, the commenters claimed, the percent Hg capture needed to achieve the proposed 1.2 lb/TBtu emission standard would be higher than that assumed by the EPA in the 2023 Proposal.

[67] Analysis of PM and Hg Emissions and Controls from Coal-Fired Power Plants. Andover Technology Partners. August 19, 2021. Document ID No. EPA–HQ–OAR–2018–0794–4583.

[68] *https://www.eia.gov/electricity/data/eia923/.*

Response: In the 2023 Proposal, the EPA assumed a Hg inlet concentration (*i.e.,* concentration of Hg in the fuel) that reflected the maximum Hg content of the range of feedstock coals that the EPA assumes is available to each of the plants in the IPM. In response to comments received on the proposal, the EPA has modified the Hg inlet concentration assumptions for each unit to reflect measured Hg concentrations in lignite using information provided by commenters and other sources, including measured Hg concentrations in fuel samples from the Agency's 1998 Information Collection Request (1998 ICR). This is explained in additional detail below in section V.D.1. and in a supporting technical memorandum titled *1998 ICR Coal Data Analysis Summary of Findings.* However, this adjustment in the assumed concentration of Hg in the various fuels did not change the EPA's overall conclusion that there are available controls and improved methods of operation that will allow lignite-fired EGUs to meet a more stringent Hg emission standard of 1.2 lb/TBtu.

Comment: Some commenters claimed that the Agency failed to account for compositional differences in lignite as compared to those of other types of coal—especially in comparison to subbituminous coal.

Response: The EPA disagrees with these commenters. In the 2023 Proposal, the EPA emphasized the similarities between lignite and subbituminous coal—especially regarding the fuel properties that most impact the control of Hg. The EPA noted that lignite and subbituminous coal are both low rank coals with low halogen content and explained that the halogen content of the coal—especially chlorine—strongly influences the oxidation state of Hg in the flue gas stream and, thereby, directly influences the ability to capture and contain the Hg before it is emitted into the atmosphere. The EPA further noted that the fly ashes from lignite and subbituminous coals tend to be more alkaline (relative to that from bituminous coal) due to the lower amounts of sulfur and halogen and to the presence of a more alkaline and reactive (non-glassy) form of calcium in the ash. Due to the natural alkalinity, subbituminous and lignite fly ashes can effectively neutralize the limited free halogen in the flue gas and prevent oxidation of gaseous elemental Hg vapor (Hg^0). This lack of free halogen in the flue gas challenges the control of Hg from both subbituminous coal-fired EGUs and lignite-fired EGUs as compared to the Hg control of EGUs firing bituminous coal. The EPA noted in the 2023 Proposal, however, that control strategies and control technologies have been developed and utilized to introduce halogens to the flue gas stream, and that EGUs firing subbituminous coals have been able to meet (and oftentimes emit at emission rates that are considerably lower than) the 1.2 lb/TBtu emission standard in the 2012 MATS Final Rule. Therefore, while the EPA acknowledges that there are differences in the composition of the various coal types, there are available control technologies that allow EGUs firing any of those coal types to achieve an emission standard of 1.2 lb/TBtu. The EPA further notes that North Dakota and Texas lignites are much more similar in composition and in other properties to Wyoming subbituminous coal than either coal type is to eastern bituminous coal. Both lignite and subbituminous coal are lower heating value fuels with high alkaline content and low natural halogen. In contrast, eastern bituminous coals are higher heating value fuels with high natural halogen content and low alkalinity. But while Wyoming subbituminous coal is much more similar to lignite than it is to eastern bituminous coals, EGUs firing subbituminous coal must meet the same Hg emission standard (1.2 lb/TBtu) as EGUs firing bituminous coal. The EPA further acknowledges the differences in sulfur content between subbituminous coal and lignite and its impact is discussed in the following comment summary and response.

Comment: Some commenters claimed that the EPA did not account for the impacts of the higher sulfur content of lignite as compared to that of subbituminous coal, and that such higher sulfur content leads to the presence of additional SO_3 in the flue gas stream. The commenters noted that the presence of SO_3 is known to negatively impact the effectiveness of activated carbon for Hg control.

Response: The EPA agrees with the commenters that the Agency did not fully address the potential impacts of SO_3 on the control of Hg from lignite-fired EGUs in the 2023 Proposal. However, in response to these comments, the EPA conducted a more robust evaluation of the impact of SO_3 in the flue gas of lignite-fired EGU and determined that it does not affect our previous determination that there are control technologies and methods of operation that are available to EGUs firing lignite that would allow them to meet a Hg emission standard of 1.2 lb/TBtu—the same emission standard that must be met by EGUs firing all other types of coal. As discussed in more detail below, the EPA determined that there are commercially available advanced ''SO_3 tolerant'' Hg sorbents and other technologies that are specifically designed for Hg capture in high SO_3 flue gas environments. These advanced sorbents allow for capture of Hg in the presence of SO_3 and other challenging flue gas environments at costs that are consistent with the use of conventional pre-treated activated carbon sorbents.[69] The EPA has considered the additional information regarding the role of flue gas SO_3 on Hg control and the information on the availability of advanced ''SO_3 tolerant'' Hg sorbents and other control technologies and finds that this new information does not change the Agency's determination that a Hg emission standard of 1.2 lb/TBtu is achievable for lignite-fired EGUs.

Comment: Several commenters noted the EPA made improper assumptions to reach the conclusion that the revised Hg emissions limit is achievable and claimed that none of the 22 lignite-fired EGUs are currently in compliance with the proposed 1.2 lb/TBtu Hg emission standard and that the EPA has not shown that any EGU that is firing lignite has demonstrated that it can meet the proposed Hg emission standard.

Response: The EPA disagrees with commenters' assertion and maintains that the Agency properly determined that the proposed, more stringent Hg emission standard can be achieved, cost-effectively, using available control technologies and improved methods of operation. Further, the EPA notes that, contrary to commenters' claim, there are, in fact, EGUs firing lignite that have demonstrated an ability to meet the more stringent 1.2 lb/TBtu Hg emission standard. Twin Oaks units 1 and 2 are lignite-fired EGUs operated by Major Oak Power, LLC, and located in Robertson County, Texas. In the 2023 Proposal (see 88 FR 24879 table 8), we showed that 2021 average Hg emission rates for Twin Oaks 1 and 2 (listed in the table as Major Oak #1 and Major Oak #2) were 1.24 lb/TBtu and 1.31 lb/TBtu, respectively, which are emission rates that are just slightly above the final emission limit. Both units at Major Oak have qualified for LEE status for Hg. To demonstrate LEE status for Hg an EGU owner/operator must conduct an initial EPA Method 30B test over 30 days and follow the calculation procedures in the final rule to document a potential to emit (PTE) that is less than 10 percent of the applicable Hg emissions limit (for

[69] See Tables 8 and 9 from ''Analysis of PM and Hg Emissions and Controls from Coal-Fired Power Plants'', Andover Technology Partners (August 2021); available in the rulemaking docket at Docket ID: EPA–HQ–OAR–2018–4583.

lignite-fired EGUs this would be a rate of 0.40 lb/TBtu) *or* less than 29 lb of Hg per year. If an EGU qualifies as a LEE for Hg, then the owner/operator must conduct subsequent performance tests on an annual basis to demonstrate that the unit continues to qualify. In their most recent compliance reports [70] (dated November 14, 2023), Major Oak Power, LLC, summarized the performance testing. Between August 1 and September 19, 2023, Major Oak Power, LLC, personnel performed a series of performance tests for Hg on Twin Oaks units 1 and 2. The average Hg emissions rate for the 30-boiler operating day performance tests was 1.1 lb/TBtu for unit 1 and 0.91 lb/TBtu for unit 2. The EGUs demonstrated LEE status by showing that each of the units has a Hg PTE of less than 29 lb per year. Further, in LEE demonstration testing for the previous year (2022), Major Oak Power, LLC, found that the average Hg emissions rate for the 30-boiler operating day performance test was 0.86 lb/TBtu for unit 1 and 0.63 lb/TBtu for unit 2.

In the 2023 LEE demonstration compliance report, Twin Oaks unit 1 was described as a fluidized bed boiler that combusts lignite and is equipped with fluidized bed limestone (FBL) injection for SO_2 control, selective non-catalytic reduction (SNCR) for control of nitrogen oxides (NO_X), and a baghouse (FF) for PM control. In addition, unit 1 has an untreated activated carbon injection (UPAC) system as well as a brominated powdered activated carbon (BPAC) injection system for absorbing vapor phase Hg in the effluent upstream of the baghouse. Twin Oaks unit 2 is described in the same way.

Similarly, Red Hills units 1 and 2, located in Choctaw County, Mississippi,[71] also demonstrated 2021 annual emission rates while firing lignite from an adjacent mine of 1.33 lb/TBtu and 1.35 lb/TBtu, which are reasonably close to the proposed Hg emission standard of 1.2 lb/TBtu to demonstrate achievability. In 2022, average Hg emission rates for Red Hills unit 1 and unit 2, again while firing Mississippi lignite, were 1.73 lb/TBtu and 1.75 lb/TBtu, respectively. The EPA also notes that, as shown below in table 5, lignite mined in Mississippi has the highest average Hg content—as compared to lignites mined in Texas and North Dakota.

The performance of Twin Oaks units 1 and 2 and Red Hills Generating Facility units 1 and 2 clearly demonstrate the achievability of the proposed 1.2 lb/TBtu emission standard by lignite-fired EGUs. However, even if there were no lignite-fired EGUs that are meeting (or have demonstrated an ability to meet) the more stringent Hg emission standard, that would not mean that the more stringent emission standard was not achievable. Most Hg control technologies are ''dial up'' technologies—for example, sorbents or chemical additives have injection rates that can be ''dialed'' up or down to achieve a desired Hg emission rate. In response to the EPA's 2022 CAA section 114 information request, some responding owners/operators indicated that sorbent injection rates were set to maintain a Hg emission rate below the 4.0 lb/TBtu emission limit. In some instances, operators of EGUs reported that they were not injecting any Hg sorbent and were able to meet the less stringent emission standard. Most units that are permitted to meet a Hg emission standard of 4.0 lb/TBtu have no reason to ''over control'' since doing so by injecting more sorbent would increase their operating costs. So, it is unsurprising that many units that are permitted to fire lignite have reported Hg emission rates between 3.0 and 4.0 lb/TBtu.

While most lignite-fired EGUs have no reason to ''over control'' beyond their permitted emission standard of 4.0 lb/TBtu, Twin Oaks units 1 and 2 do have such motivation. As mentioned earlier, those sources have achieved LEE status for Hg (by demonstrating a Hg PTE of less than 29 lb/yr) and they must conduct annual performance tests to show that the units continue to qualify. According to calculations provided in their annual LEE certification, to maintain LEE status, the units could emit no more than 1.79 lb/TBtu and maintain a PTE of less than 29 lb/TBtu. So, the facilities are motivated to over control beyond 1.79 lb/TBtu (which, as described earlier in this preamble, they have consistently done).

Comment: To highlight the difference in the ability of lignite-fired and subbituminous-fired EGUs to control Hg, one commenter created a table to show a comparison between the Big Stone Plant (an EGU located in South Dakota firing subbituminous coal) and Coyote Station (an EGU located in North Dakota firing lignite). Additionally, the commenter included figures showing rolling 30-boiler operating day average Hg emission rates and the daily average ACI feed rates for Big Stone and Coyote EGUs for years 2021–2022. Their table showed that Big Stone and Coyote are similarly configured plants that utilize the same halogenated ACI for Hg control. The commenters said, however, that Coyote Station's average sorbent feed rate on a lb per million actual cubic feet (lb/MMacf) basis is more than three times higher than that for Big Stone, yet Coyote Station's average Hg emissions on a lb/TBtu basis are more than five times higher than Big Stone.

Response: The EPA agrees that the Big Stone and Coyote Station units referenced by the commenter are similarly sized and configured EGUs, with the Big Stone unit in South Dakota firing subbituminous coal and the Coyote Station unit in North Dakota firing lignite. However, there are several features of the respective units that can have an impact on the control of Hg. First, and perhaps the most significant, the Big Stone unit has a selective catalytic reduction (SCR) system installed for control of NOx. The presence of an SCR is known to enhance the control of Hg—especially in the presence of chemical additives. The Coyote Station EGU does not have an installed SCR. Further, both EGUs have a dry FGD scrubber and FF baghouse installed for SO_2/acid gas and fPM control. The average sulfur content of North Dakota lignite is approximately 2.5 times greater than that of Wyoming subbituminous coal. However, the average SO_2 emissions from the Coyote Station EGU (0.89 lb/MMBtu) were approximately 10 times higher than the SO_2 emissions from the Big Stone EGU (0.09 lb/MMBtu). The Big Stone dry scrubber/FF was installed in 2015; while the dry scrubber/FF at Coyote Station was installed in 1981—approximately 31 years earlier. So, considering the presence of an SCR—which is known to enhance Hg control—and newer and better performing downstream controls, it is unsurprising that there are differences in the control of Hg at the two EGUs. In addition, since the Coyote Station has been subject to a Hg emission standard of 4.0 lb/TBtu, there would be no reason for the operators to further optimize its control system to achieve a lower emission rate. And, as numerous commenters noted, the Hg content of North Dakota is higher than that of Wyoming subbituminous coal.

Comment: Some commenters claimed that the EPA has not adequately justified a reversal in the previous policy to establish a separate subcategory for lignite-fired EGUs.

---

[70] See page 1–1 of the 2023 Compliance Reports for Twin Oaks 1 and 2 available in the rulemaking docket at EPA–HQ–OAR–2018–0794.

[71] Choctaw Generation LP leases and operates the Red Hills Power Plant. The plant supplies electricity to the Tennessee Valley Authority (TVA) under a 30-year power purchase agreement. The lignite output from the adjacent mine is 100 percent dedicated to the power plant. *https://www.purenergyllc.com/projects/choctaw-generation-lp-red-hills-power-plant/#page-content.*

Response: In developing the 2012 Final MATS Rule, the EPA examined the EGUs in the top performing 12 percent of sources for which the Agency had Hg emissions data. In examining that data, the EPA observed that there were no lignite-fired EGUs among the top performing 12 percent of sources for Hg emissions. The EPA then determined that this indicated that there is a difference in the Hg emissions from lignite-fired EGUs when compared to the Hg emissions from EGUs firing other coal types (that were represented among the top performing 12 percent). That determination was not based on any unique property or characteristic of lignite—only on the observation that there were no lignite-fired EGUs among the best performing 12 percent of sources (for which the EPA had Hg emissions data). In fact, as noted in the preamble for the 2012 Final MATS Rule, the EPA ''believed at proposal that the boiler size was the cause of the different Hg emissions characteristics.'' See 77 FR 9378.

The EPA ultimately concluded that it is appropriate to continue to base the subcategory definition, at least in part, on whether the EGUs were ''designed to burn and, in fact, did burn low rank-virgin coal'' (*i.e.,* lignite), but that it is not appropriate to continue to use the boiler size criteria (*i.e.,* the height-to-depth ratio). However, the EPA ultimately finalized the ''unit designed for low rank virgin coal'' subcategory based on the characteristics of the EGU—not on the properties of the fuel. ''We are finalizing that the EGU is considered to be in the ''unit designed for low rank virgin coal'' subcategory if the EGU: (1) meets the final definitions of ''fossil fuel-fired'' and ''coal-fired electric utility steam generating unit;'' and (2) is designed to burn and is burning non-agglomerating virgin coal having a calorific value (moist, mineral matter-free basis) of less than 19,305 kJ/kg (8,300 Btu/lb) and that is constructed and operates at or near the mine that produces such coal.'' See 77 FR 9369.

While, in the 2012 MATS Final Rule, the EPA based the lignite-fired EGU subcategory on the design and operation of the EGUs, the EPA did not attribute the observed differences in Hg emissions to any unique characteristic(s) of lignite. As the EPA clearly noted in the 2023 Proposal, there are, in fact, characteristics of lignite that make the control of Hg more challenging. These include the low natural halogen content, the high alkalinity of the fly ash, the sulfur content, the relatively higher Hg content, and the relatively higher variability of Hg content. However, as the EPA has explained, these characteristics that make the control of Hg more challenging are also found in non-lignite fuels. Subbituminous coals also have low natural halogen content and high fly ash alkalinity. Eastern and central bituminous coals also have high sulfur content. Bituminous and anthracitic waste coals (coal refuse) have very high and variable Hg content. EGUs firing any of these non-lignite coals have been subject to—and have demonstrated compliance with—the more stringent Hg emission standard of 1.2 lb/TBtu.

The EPA has found it appropriate to reverse the previous policy because the decision to subcategorize ''units designed for low rank virgin coal'' in the 2012 MATS Final Rule was based a determination that there were differences in Hg emissions from lignite-fired EGUs as compared to EGUs firing non-lignite coals. That perceived difference was based on an observation that there were no lignite-fired EGUs in the top performing 12 percent of EGUs for which the Agency had Hg emissions data and on an assumption that the perceived difference in emissions was somehow related to the design and operation of the EGU. The EPA is unaware of any distinguishing features of EGUs that were designed to burn lignite that would impact the emissions of Hg. Further, the EPA does not now view the fact that there were no lignite-fired EGUs in the population of the best-performing 12 percent of EGUs for which the Agency had Hg emissions data to represent a ''difference in emissions.''

But, on re-examination of the data, the EPA has concluded that the Hg emissions from the 2010 ICR for the lignite-fired EGUs were not clearly distinctive from the Hg emissions from EGUs firing non-lignite coal. In setting the emission standards for the 2012 MATS Final Rule, the EPA had available and useable Hg emissions data from nearly 400 coal-fired EGUs (out of the 1,091 total coal-fired EGUs operating at that time). However, the EPA only had available and useable data from nine lignite-fired EGUs with reported floor Hg emissions ranging from 1.0 to 10.9 lb/TBtu. But these were not outlier emission rates. EGUs firing bituminous coal reported Hg emissions as high as 30.0 lb/TBtu; and those firing subbituminous coal reported Hg emissions as high as 9.2 lb/TBtu.

D. What is the rationale for our final approach and decisions for the lignite-fired EGU Hg standard?

In the 2023 Proposal, the EPA proposed to determine that there are developments in available control technologies and methods of operation that would allow lignite-fired EGUs to meet a more stringent Hg emission standard of 1.2 lb/TBtu—the same Hg emission standard that must be met by coal-fired EGUs firing non-lignite coals (*e.g.,* anthracite, bituminous coal, subbituminous coal, coal refuse, *etc.*). After consideration of public comments received on the proposed revision of the Hg emission standard, the EPA continues to find that the evidence supports that there are commercially available control technologies and improved methods of operation that allow lignite-fired EGUs to meet the more stringent Hg emission standard that the EPA proposed. As noted above, lignite-fired EGUs also comprise some of the largest sources of Hg emissions within this source category and are responsible for a disproportionate share of Hg emissions relative to their generation. While previous EPA assessments have shown that current modeled exposures [of Hg] are well below the reference dose (RfD), we conclude that further reductions of Hg emissions from lignite-fired EGUs covered in this final action should further reduce exposures including for the subsistence fisher sub-population. This anticipated exposure is of particular importance to children, infants, and the developing fetus given the developmental neurotoxicity of Hg. Therefore, in this final action, the EPA is revising the Hg emission standard for lignite-fired EGUs from the 4.0 lb/TBtu standard that was finalized in the 2012 MATS Final Rule to the more stringent emission standard of 1.2 lb/TBtu, as proposed. The rationale for the Agency's final determination is provided below.

In this final rule, the EPA is also reaching a different conclusion from the 2020 Technology Review with respect to the Hg emission standard for lignite-fired EGUs. As discussed in section II.D. above, the 2020 Technology Review did not evaluate the current performance of emission reduction control equipment and strategies at existing lignite-fired EGUs. Nor did the 2020 Technology Review specifically address the discrepancy between Hg emitted from lignite-fired EGUs and non-lignite coal-fired EGUs or consider the improved performance of injected sorbents or chemical additives, or the development of SO_3-tolerant sorbents. Based on the EPA's review in this rulemaking which considered such information, the Agency determined that there are available control technologies that allow EGUs firing lignite to achieve an emission standard of 1.2 lb/TBtu,

consistent with the Hg emission standard required for non-lignite coal-fired EGUs, which the EPA is finalizing pursuant to its CAA section 112(d)(6) authority.

1. Mercury Content of Lignite

For analyses supporting the proposal, the EPA assumed ''Hg Inlet'' levels (*i.e.,* Hg concentration in inlet fuel) that are consistent with those assumed in the Agency's power sector model (IPM) and then adjusted accordingly to reflect the 2021 fuel blend for each unit. Several commenters indicated that the Hg content of lignite fuels is much higher and has greater variability than the EPA assumed.

To support the development of the NESHAP for the Coal- and Oil-Fired EGU source category, the Agency conducted a 2-year data collection effort which was initiated in 1998 and completed in 2000 (1998 ICR). The ICR had three main components: (1) identifying all coal-fired units owned and operated by publicly owned utility companies, federal power agencies, rural electric cooperatives, and investor-owned utility generating companies; (2) obtaining accurate information on the amount of Hg contained in the as-fired coal used by each electric utility steam generating unit with a capacity greater than 25 MW electric, as well as accurate information on the total amount of coal burned by each such unit; and (3) obtaining data by coal sampling and stack testing at selected units to characterize Hg reductions from representative unit configurations.

The ICR captured the origin of the coal burned, and thus provided a pathway for linking emission properties to coal basins. The 1998–2000 ICR resulted in more than 40,000 data points indicating the coal type, sulfur content, Hg content, ash content, chlorine content, and other characteristics of coal burned at coal-fired utility boilers greater than 25 MW.

Annual fuel characteristics and delivery data reported on EIA form 923 also provide continual data points on coal heat content, sulfur content, and geographic origin, which are used as a check against characteristics initially identified through the 1998 ICR.

For this final rule, the EPA re-evaluated the 1998 ICR data.[72] Specifically, the EPA evaluated the coal Hg data to characterize the Hg content of lignite, which is mined in North Dakota, Texas, and Mississippi, and to characterize by seam and by coal delivered to a specific plant.[73] The results are presented as a range of Hg content of the lignites as well as the mean and median Hg content. The EPA also compared the fuel characteristics of lignites mined in North Dakota, Texas, and Mississippi against coals mined in Wyoming (subbituminous coal), Pennsylvania (mostly upper Appalachian bituminous coal), and Kentucky (mostly lower Appalachian bituminous coal). The Agency also included in the re-evaluation, coal analyses that were submitted in public comments by North American Coal (NA Coal). In addition to the Hg content, the analysis included the heating value and the sulfur, chlorine, and ash content for each coal that is characterized.

The analysis showed that lignite mined in North Dakota had a mean Hg content of 9.7 lb/TBtu, a median Hg content of 8.5 lb/TBtu, and a Hg content range of 2.2 to 62.1 lb/TBtu. Other characteristics of North Dakota lignite include an average heating value (dry basis) of 10,573 Btu/lb, an average sulfur content of 1.19 percent, an average ash content of 13.5 percent, and an average chlorine content of 133 parts per million (ppm). In response to comments on the 2023 Proposal, for analyses supporting this final action, the EPA has revised the assumed Hg content of lignite mined in North Dakota to 9.7 lb/TBtu versus the 7.81 lb/TBtu assumed in the 2023 Proposal.

Similarly, the analysis showed that lignite mined in Texas had a mean and median Hg content of 25.0 lb/TBtu and 23.8 lb/TBtu, respectively, and a Hg content range from 0.7 to 92.0 lb/TBtu. Other characteristics include an average heating value (dry basis) of 9,487 Btu/lb, an average sulfur content of 1.42 percent, an average ash content of 24.6 percent, and an average chlorine content of 233 ppm. In response to comments on the 2023 Proposal, for analyses supporting this final action, the EPA has revised the assumed Hg content of lignite mined in Texas to 25.0 lb/TBtu versus the range of 14.65 to 14.88 lb/TBtu that was assumed for the 2023 Proposal.

Lignite mined in Mississippi had the highest mean Hg content at 34.3 lb/TBtu and the second highest median Hg emissions rate, 30.1 lb/TBtu. The Hg content ranged from 3.6 to 91.2 lb/TBtu. Lignite from Mississippi had an average heating value (dry basis) of 5,049 Btu/lb and a sulfur content of 0.58 percent. In response to comments submitted on the 2023 Proposal, for analyses supporting this final action, the EPA assumed a Hg content of 34.3 lb/TBtu for lignite mined in Mississippi versus the 12.44 lb/TBtu assumed for the proposal.

The EPA 1998 ICR dataset did not contain information on lignite from Mississippi, which resulted in a smaller number of available data points (227 in Mississippi lignite versus 864 for North Dakota lignite and 943 for Texas lignite). Table 5 of this document more fully presents the characteristics of lignite from North Dakota, Texas, and Mississippi.

[72] Technical Support Document ''*1998 ICR Coal Data Analysis Summary of Findings*'' available in the rulemaking docket at EPA–HQ–OAR–2018–0794.

[73] In 2022, over 99 percent of all lignite was mined in North Dakota (56.2 percent), Texas (35.9 percent), and Mississippi (7.1 percent). Small amounts (less than 1 percent) of lignite were also mined in Louisiana and Montana. See Table 6. ''Coal Production and Number of Mines by State and Coal Rank'' from EIA Annual Coal Report, available at *https://www.eia.gov/coal/annual/.*

Table 5. Characteristics of Lignite mined in North Dakota, Texas, and Mississippi from the EPA 1998 ICR Dataset

	North Dakota	Texas	Mississippi
Number of data points	864	943	227
Range of Hg content (lb/TBtu)	2.2 – 62.1	0.7 – 92.0	3.6 – 91.2
Mean Hg content (lb/TBtu)	9.7	25.0	34.3
Median Hg content (lb/TBtu)	8.5	23.8	30.1
Heating value average (Btu/lb, dry)	10,573	9,486	5,049
Sulfur content average (%, dry)	1.12	1.42	0.58
Ash content average (%, dry)	13.54	24.60	N/A
Chlorine content average (ppm, dry)	133	232	N/A

Coals mined in Kentucky, Pennsylvania, and Wyoming were also analyzed for comparison. The types of coal (all non-lignite) included bituminous, bituminous-high sulfur, bituminous-low sulfur, subbituminous, anthracite, waste anthracite, waste bituminous, and petroleum coke. Bituminous coal accounted for 92 percent of the data points from Kentucky and 75 percent of the data points from Pennsylvania. Subbituminous coal accounted for 96 percent of the data points from Wyoming.

Bituminous coals from Kentucky had a mean Hg emissions content of 7.2 lb/TBtu (ranging from 0.7 to 47.4 lb/TBtu), an average heating value (dry basis) of 13,216 Btu/lb, an average sulfur content of 1.43 percent, an average ash content of 10.69 percent, and an average chlorine content of 1,086 ppm.

Bituminous coals from Pennsylvania had a mean Hg emissions rate of 14.5 lb/TBtu (ranging from 0.1 to 86.7 lb/TBtu), an average heating value (dry basis) of 13,635 Btu/lb, an average sulfur content of 1.88 percent, an average ash content of 10.56 percent, and an average chlorine content of 1,050 ppm.

Subbituminous coals from Wyoming had a mean Hg rate of 5.8 lb/TBtu, an average heating value (dry basis) of 12,008 Btu/lb, an average sulfur content of 0.44 percent, an average ash content of 7.19 percent, and an average chlorine content of 127 ppm. Table 6 of this document shows the characteristics of bituminous coal from Kentucky and Pennsylvania and subbituminous coal from Wyoming.

Table 6. Characteristics of Bituminous and Subbituminous Coals mined in Kentucky, Pennsylvania, and Wyoming from the EPA 1998 ICR Dataset

	Kentucky (Bituminous)	Pennsylvania (Bituminous)	Wyoming (Subbituminous)
Number of data points	5,340	3,072	6,467
Range of Hg content (lb/TBtu)	0.7 – 47.4	0.1 – 86.7	0.7 – 40.7
Mean Hg content (lb/TBtu)	7.2	14.5	5.8
Median Hg content (lb/TBtu)	6.7	9.7	2.4
Heating value average (Btu/lb, dry)	13,216	13,635	12,008
Sulfur content average (%, dry)	1.43	1.88	0.44
Ash content average (%, dry)	10.69	10.56	7.19
Chlorine content average (ppm, dry)	1,086	1,050	127

Several commenters claimed that one of the factors that contributes to the challenge of controlling Hg emissions from EGUs firing lignite is the variability of the Hg content in lignite. However, as can be seen in table 5 and table 6 of this document, all coal types examined by the EPA contain a variable content of Hg. The compliance demonstration requirements in the 2012 MATS Final Rule were designed to accommodate the variability of Hg in coal by requiring compliance with the respective Hg emission standards over a 30-operating-day rolling average period. When examining the Hg emissions for EGUs firing on the various coal types (including those firing Wyoming subbituminous coal, which has the lowest mean and median Hg content and the narrowest range of Hg content), daily emissions often exceed the applicable emission standard (sometimes considerably). However, averaging emissions over a rolling 30-operating-day period effectively dampens the impacts of fuel Hg content

variability. For example, in figure 1 (a graph) of this document, the 2022 Hg emissions from Dave Johnston unit BW41, a unit firing subbituminous coal, are shown. The graph shows both the daily Hg emissions and the 30-operating-day rolling average Hg emissions. As can be seen in the graph, the daily Hg emissions very often exceed the 1.2 lb/TBtu emission rate; however, the 30-operating-day rolling average is consistently below the emission limit (the annual average emission rate is 0.9 lb/TBtu).

BILLING CODE 6560–50–P

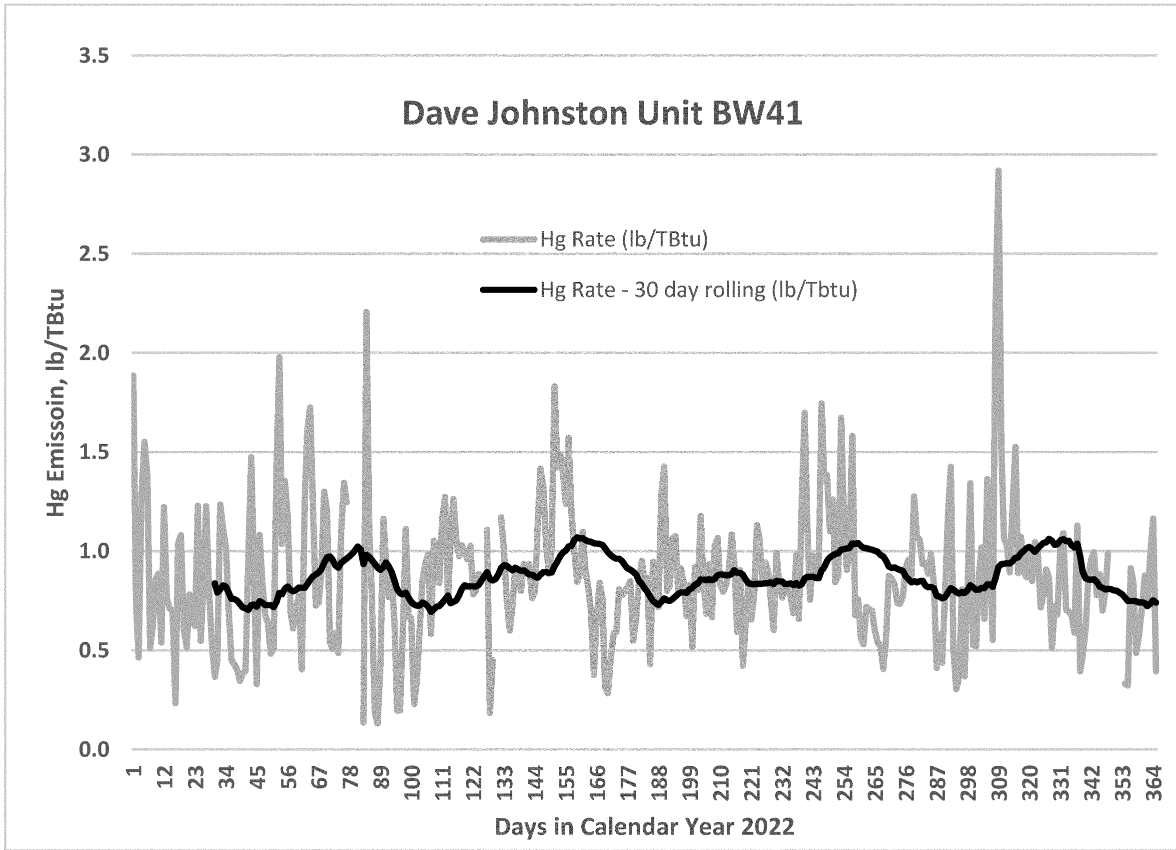

Figure 1. 2022 Daily and 30-Day Rolling Average Hg Emission Rates (lb/TBtu)

From Dave Johnston Unit BW41, a subbituminous-fired EGU in Wyoming.

A similar effect can be seen with the 2022 daily and 30-operating-day rolling average Hg emissions from Leland Olds unit 1, an EGU firing North Dakota lignite, shown in figure 2 of this document.

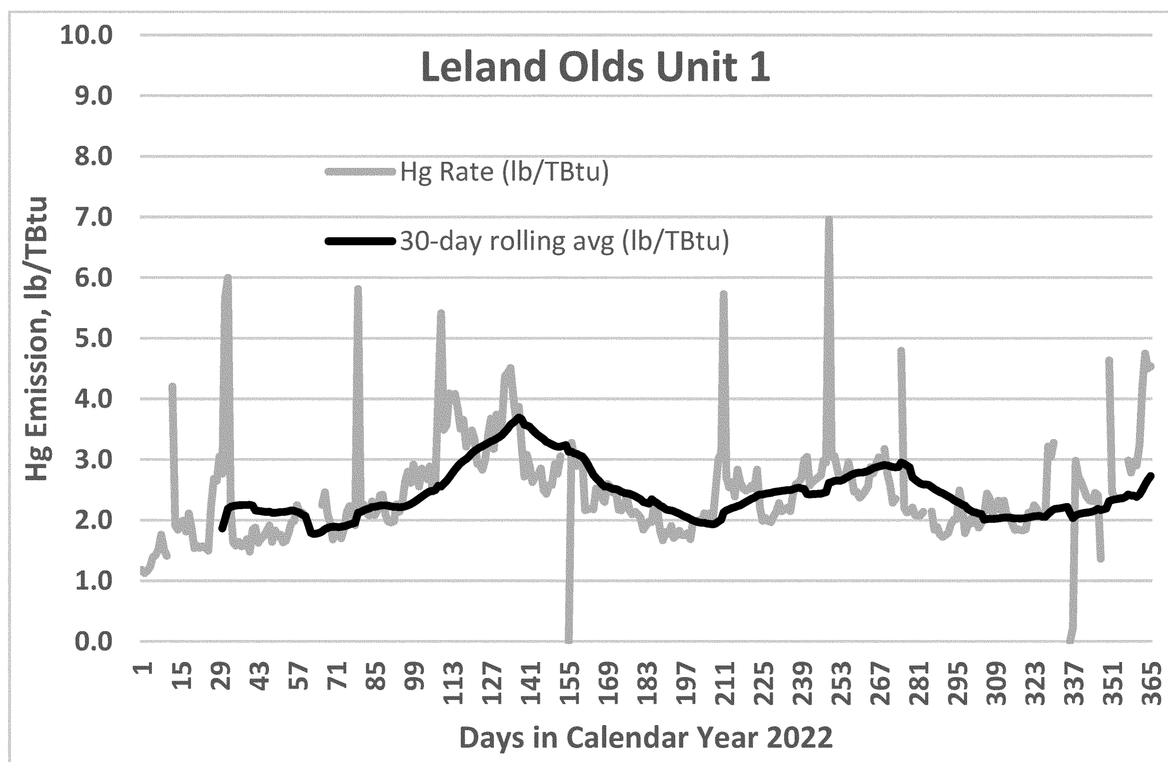

Figure 2. Daily and 30-Day Rolling Average Hg Emission Rates (lb/TBtu) from Leland Olds Unit 1, lignite-fired EGU in North Dakota.

BILLING CODE 6560–50–C

As with the EGU firing subbituminous coal, the daily Hg emissions very often exceed the emission limit (in this case 4.0 lb/TBtu); however, the 30-operating-day rolling average is consistently below the applicable emission limit (the 2022 annual average emission rate for Leland Olds unit 1 is 2.3 lb/TBtu).

2. The Impact of Halogen Content of Lignite on Hg Control

In the 2023 Proposal, the EPA explained that during combustion of coal, the Hg contained in the coal is volatilized and converted to Hg^0 vapor in the high-temperature regions of the boiler. Hg^0 vapor is difficult to capture because it is typically nonreactive and insoluble in aqueous solutions. However, under certain conditions, the Hg^0 vapor in the flue gas can be oxidized to divalent Hg (Hg^{2+}). The Hg^{2+} can bind to the surface of solid particles (*e.g.,* fly ash, injected sorbents) in the flue gas stream, often referred to as ''particulate bound Hg'' (Hg_p) and be removed in a downstream PM control device. Certain oxidized Hg compounds that are water soluble may be further removed in a downstream wet scrubber. The presence of chlorine in gas-phase equilibrium favors the formation of mercuric chloride ($HgCl_2$) at flue gas cleaning temperatures. However, Hg^0 oxidation reactions are kinetically limited as the flue gas cools, and as a result Hg may enter the flue gas cleaning device(s) as a mixture of Hg^0, Hg^{2+} compounds, and Hg_p.

This partitioning into various species of Hg has considerable influence on selection of Hg control approaches. In tables 5 and 6 of this document, the chlorine content of bituminous coals mined in Kentucky and Pennsylvania averaged 1,086 ppm and 1,050 ppm, respectively. In comparison, the average chlorine content of Wyoming subbituminous coal is 127 ppm; while the chlorine contents of lignite mined in North Dakota and Texas are 133 ppm and 232 ppm, respectively. In general, because of the presence of higher amounts of halogen (especially chlorine) in bituminous coals, most of the Hg in the flue gas from bituminous coal-fired boilers is in the form of Hg^{2+} compounds, typically $HgCl_2$, and is more easily captured in downstream control equipment. Conversely, both subbituminous coal and lignite have lower natural halogen content compared to that of bituminous coals, and the Hg in the flue gas from boilers firing those fuels tends to be in the form of Hg^0 and is more challenging to control in downstream control equipment.

While some bituminous coal-fired EGUs require the use of additional Hg-specific control technology, such as injection of a sorbent or chemical additive, to supplement the control that these units already achieve from criteria pollutant control equipment, these Hg-specific control technologies are often required as part of the Hg emission reduction strategy at EGUs that are firing subbituminous coal or lignite. As described above, the Hg in the flue gas for EGUs firing subbituminous coal or lignite tends to be in the nonreactive Hg^0 vapor phase due to lack of available free halogen to promote the oxidation reaction. To alleviate this challenge, activated carbon and other sorbent providers and control technology vendors have developed methods to introduce halogen into the flue gas to improve the control of Hg emissions from EGUs firing subbituminous coal and lignite. This is primarily through the injection of pre-halogenated (often pre-brominated) activated carbon sorbents or through the injections of halogen-containing chemical additives along with conventional sorbents. In the

2022 CAA section 114 information collection, almost all the lignite-fired units reported use of some sort of halogen additive or injection as part of their Hg control strategy by using refined coal (which typically has added halogen), bromide or chloride chemical additives, pre-halogenated sorbents, and/or oxidizing agents. Again, low chlorine content in the fuel is a challenge that is faced by EGUs firing either subbituminous coals or lignite, and EGUs firing subbituminous coal have been subject to a Hg emission standard of 1.2 lb/TBtu since the MATS rule was finalized in 2012.

3. The Impact of SO_3 on Hg Control

Some commenters noted that the EPA did not account for the impacts of the higher sulfur content of lignite as compared to that of subbituminous coal, and that such higher sulfur content leads to the presence of additional SO_3 in the flue gas stream. As shown in table 5 and table 6 of this document, while the halogen content of subbituminous coal and lignite is similar, the average sulfur content of lignite is more like that of bituminous coal mined in Kentucky and Pennsylvania.

During combustion, most of the sulfur in coal is oxidized into SO_2, and only a small portion is further oxidized to SO_3 in the boiler. In response to environmental requirements, many EGUs have installed SCR systems for NO_X control and FGD systems for SO_2 control. One potential consequence of an SCR retrofit is an increase in the amount of SO_3 in the flue gas downstream of the SCR due to catalytic oxidation of SO_2. Fly ash and condensed SO_3 are the major components of flue gas that contribute to the opacity of a coal plant's stack emissions and the potential to create a visible sulfuric acid ''blue plume.'' In addition, higher SO_3 levels can adversely affect many aspects of plant operation and performance, including corrosion of downstream equipment and fouling of the air preheater (APH). This is primarily an issue faced by EGUs firing bituminous coal. EGUs fueled by subbituminous coal and lignite do not typically have the same problem with blue plume formation. Of the EGUs that are designed to fire lignite, only Oak Grove units 1 and 2, located in Texas, have an installed SCR for NO_X control. Several lignite-fired EGUs utilize SNCR systems for NO_X control, which are less effective for NO_X control as compared to SCR systems. Several commenters claimed that SCR is not a viable NO_X control technology for EGUs firing North Dakota lignite because of catalyst fouling from the high sodium content of the fuel and resulting fly ash.

Coal fly ash is typically classified as acidic (pH less than 7.0), mildly alkaline (pH greater than 7.0 to 9.0), or strongly alkaline (pH greater than 9.0). The pH of the fly ash is usually determined by the calcium/sulfur ratio and the amount of halogen. The ash from bituminous coals tends to be acidic due to the relatively higher sulfur and halogen content and the glassy (nonreactive) nature of the calcium present in the ash. Conversely, the ash from subbituminous coals and lignite tends to be more alkaline due to the lower amounts of sulfur and halogen and a more alkaline and reactive (non-glassy) form of calcium—and, as noted by commenters—the presence of sodium compounds in the ash. The natural alkalinity of the subbituminous and lignite fly ash may effectively neutralize the limited free halogen in the flue gas and prevent oxidation of the Hg^0. However, the natural alkalinity also helps to minimize the impact of SO_3, because a common control strategy for SO_3 is the injection of alkaline sorbents (dry sorbent injection, DSI).

Still, as commenters correctly noted, the presence of SO_3 in the flue gas stream is also known to negatively impact the effectiveness of sorbent injection for Hg control. This impact has been known for some time, and control technology researchers and vendors have developed effective controls and strategies to minimize the impact of SO_3.[74] As noted above, coal-fired EGUs utilizing bituminous coal—which also experience significant rates of SO_3 formation in the flue gas stream—have also successfully demonstrated the application of Hg control technologies to meet a standard of 1.2 lb/TBtu.

The AECOM patented SBS Injection™ (''sodium-based solution'') technology has been developed for control of SO_3, and co-control of Hg has also been demonstrated. A sodium-based solution is injected into the flue gas, typically ahead of the APH or, if present, the SCR. By removing SO_3 prior to these devices, many of the adverse effects of SO_3 can be successfully mitigated. AECOM has more recently introduced their patented HBS Injection™ technology for effective Hg oxidation and control.[75] This new process injects halogen salt solutions into the flue gas, which react in-situ to form halogen species that effectively oxidize Hg. The HBS Injection™ can be co-injected with the SBS Injection™ for effective SO_3 control and Hg oxidation/control.

Other vendors also offer technologies to mitigate the impact of SO_3 on Hg control from coal combustion flue gas streams. For example, Calgon Carbon offers their ''sulfur tolerant'' Fluepac ST, which is a brominated powdered activated carbon specially formulated to enhance Hg capture in flue gas treatment applications with elevated levels of SO_3.[76] In testing in a bituminous coal combustion flue gas stream containing greater than 10 ppm SO_3, the Fluepac ST was able to achieve greater than 90 percent Hg control at injection rates of a third or less as compared to injection rates using the standard brominated sorbent.

Babcock & Wilcox (B&W) offers dry sorbent injection systems that remove SO_3 before the point of activated carbon sorbent injection to mitigate the impact of SO_3.[77] Midwest Energy Emissions Corporation (ME_2C) offers ''high-grade sorbent enhancement additives—injected into the boiler in minimal amounts'' that work in conjunction with proprietary sorbent products to ensure maximum Hg capture. ME_2C claims that their Hg control additives and proprietary sorbent products are ''high-sulfur-tolerant and SO_3-tolerant sorbents.'' [78]

Cabot Norit Activated Carbon is the largest producer of powdered activated carbon worldwide.[79] Cabot Norit offers different grades of their DARCO® powdered activated carbon (PAC) for Hg removal at power plants. These grades include non-impregnated PAC which are ideal when most of the Hg is in the oxidized state; impregnated PAC for removing oxidized and Hg^0 from flue gas; special impregnated PAC used in conjunction with DSI systems (for control of acid gases); and special impregnated ''sulfur resistant'' PAC for flue gases that contains higher concentrations of acidic gases like SO_3.

[74] The mention of specific products by name does not imply endorsement by the EPA. The EPA does not endorse or promote any particular control technology. The EPA mentions specific product names here to emphasize the broad range of products and vendors offering sulfur tolerant Hg control technologies.

Similarly, ADA–ES offers FastPAC™ Platinum 80,[80] an activated carbon sorbent that was specifically engineered for SO_3 tolerance and for use in applications where SO_3 levels are high. So, owner/operators of lignite-fired EGUs can choose from a range of technologies and technology providers that offer Hg control options in the presence of SO_3. The EPA also notes that SO_3 is more often an issue with EGUs firing eastern bituminous coal—as those coals typically have higher sulfur content and lower ash alkalinity. Those bituminous coal-fired EGUs are subject to—and have demonstrated compliance with—an emission standard of 1.2 lb/TBtu.

4. Cost Considerations for the More Stringent Hg Emission Standard

From the 2022 CAA section 114 information survey, most lignite-fired EGUs utilized a control strategy that included sorbent injection coupled with chemical additives (usually halogens). In the beyond-the-floor analysis in the 2012 MATS Final Rule, we noted that the results from various demonstration projects suggested that greater than 90 percent Hg control can be achieved at lignite-fired units using brominated activated carbon sorbents at an injection rate of 2.0 lb/MMacf (*i.e.,* 2.0 pounds of sorbent injected per million actual cubic feet of flue gas) for units with installed FFs for PM control and at an injection rate of 3.0 lb/MMacf for units with installed ESPs for PM control. As shown in table 7 of this document, all units (in 2022) would have needed to control their Hg emissions to 95 percent or less to meet an emission standard of 1.2 lb/TBtu. Based on this, we expect that the units could meet the final, more stringent, emission standard of 1.2 lb/TBtu by utilizing brominated activated carbon at the injection rates suggested in the beyond-the-floor memorandum from the 2012 MATS Final Rule.

* These units, which are permitted to fire lignite, utilized primarily subbituminous coal in 2022.

BILLING CODE 6560–50–C

To determinethe cost effectiveness of that strategy, we calculated the cost per lb of Hg controlled for a model 800 MW lignite-fired EGU, as described in the 2024 Technical Memo. We calculated the cost of injecting brominated activated carbon sorbent at injection rates suggested in the beyond-the-floor memorandum from the 2012 MATS Final Rule (*i.e.,* 2.0 lb/MMacf and 3.0 lb/MMacf) and at a larger injection rate of 5.0 lb/MMacf to achieve an emission rate of 1.2 lb/TBtu. We also calculated the incremental cost to meet the more stringent emission rate of 1.2 lb/TBtu versus the cost to meet an emission rate of 4.0 lb/TBtu using non-brominated activated carbon sorbent at an emission rate of 2.5 lb/MMacf. For an 800 MW lignite-fired EGU, the cost effectiveness of using the brominated carbon sorbent at an injection rate of 3.0 lb/MMacf was $3,050 per lb of Hg removed while the incremental cost effectiveness was $10,895 per incremental lb of Hg removed at a brominated activated carbon injection rate of 3.0 lb/MMacf. The cost effectiveness of using the brominated carbon sorbent at an injection rate of 5.0 lb/MMacf was $5,083 per lb of Hg removed while the incremental cost effectiveness was $28,176 per incremental lb of Hg removed. The actual cost effectiveness is likely lower than either of these estimates as it is unlikely that sources will need to inject brominated activated carbon sorbent at rates as high as 5.0 lb/MMacf (from the 2022 CAA section 114 information collection, the Oak Grove units were injecting less than 0.5 lb/MMacf) and is either well below or reasonably consistent with the cost effectiveness that the EPA has found to

[81] Estimated Hg inlet values are based on fuel use data from EIA Form 923 and assumed Hg content of coals as shown in Table 5 and Table 6 in this preamble.

be acceptable in previous rulemakings for Hg controls.[82]

In addition to cost effectiveness, the EPA finds that the revised Hg emission standard for lignite-fired units appropriately considers the costs of controls, both total costs and as a fraction of total revenues, along with other factors that the EPA analyzed pursuant to its CAA section 112(d)(6) authority. Similar to the revised fPM emission standard (as a surrogate for non-Hg HAP metals) discussed in section IV. of this preamble, the EPA anticipates that the total costs of controls (which consists of small annual incremental operating costs) to comply with the revised Hg emission standard will be a small fraction of the total revenues for the impacted lignite-fired units. The EPA expects that sources will be able to meet the revised emission standard using existing controls (*e.g.,* using existing sorbent injection equipment), and that significant additional capital investment is unlikely. If site-specific conditions necessitate minor capital improvements to the ACI control technology, it is important to note that any incremental capital would be small relative to ongoing sorbent costs accounted for in this analysis. Further, in addition to the EPA finding that costs are reasonable for the revised Hg standard for lignite-fired EGUs, the revised standard will also bring these higher emitting sources of Hg emission in line with Hg emission rates that are achieved by non-lignite-fired EGUs. As mentioned earlier in this preamble, in 2021, lignite-fired EGUs were responsible for almost 30 percent of all Hg emitted from coal-fired EGUs while generating about 7 percent of total megawatt-hours.

Despite the known differences in the quality and composition of the various coal types, the EPA can find no compelling reasons why EGUs that are firing lignite cannot meet the same emission limit as EGUs that are firing other types of coal (*e.g.,* eastern and western bituminous coal, subbituminous coal, and anthracitic and bituminous waste coal). Each of the coal types/ranks has unique compositions and properties. Low halogen content in coal is known to make Hg capture more challenging. But, both lignites and subbituminous coals have low halogen content with higher alkaline content. Lignites tend to have average higher Hg content than subbituminous and bituminous coals—especially lignites mined in Mississippi and Texas. However, waste coals (anthracitic and bituminous coal refuse) tend to have the highest average Hg content. Lignites tend to have higher sulfur content than that of subbituminous coals and the sulfur in the coal can form SO_3 in the flue gas. This SO_3 is known to make Hg capture using sorbent injection more challenging. However, bituminous coals and waste coals have similar or higher levels of sulfur. The formation of SO_3 is more significant with these coals. Despite all the obstacles and challenges presented to EGUs firing non-lignite coals, all of those EGUs have been subject to the more stringent Hg emission limit of 1.2 lb/TBtu—and emit at or below that emission limit since the rule was fully implemented. Advanced, better performing Hg controls—including ''SO_3 tolerant'' sorbents—are available to allow lignite-fired EGUs to also emit at or below the more stringent Hg emission limit of 1.2 lb/TBtu. As mentioned earlier in this preamble, in 2021, lignite-fired EGUs were responsible for almost 30 percent of all Hg emitted from coal-fired EGUs while generating about 7 percent of total megawatt-hours.

VI. What is the rationale for our other final decisions and amendments from review of the 2020 Technology Review?

A. What did we propose pursuant to CAA section 112(d)(6) for the other NESHAP requirements?

The EPA did not propose any changes to the organic HAP work practice standards, acid gas standards, continental liquid oil-fired EGU standards, non-continental liquid oil-fired EGUs, limited-use oil-fired EGU standards, or standards for IGCC EGUs. The EPA proposed to require that IGCC EGUs use PM CEMS for compliance demonstration with their fPM standard.

The EPA did note in the 2023 Proposal that there have been several recent temporary and localized increases in oil combustion at continental liquid oil-fired EGUs during periods of extreme weather conditions, such as the 2023 polar vortex in New England. As such, the EPA solicited comment on whether the current definition of the limited-use liquid oil-fired subcategory remains appropriate or if, given the increased reliance on oil-fired generation during periods of extreme weather, a period other than the current 24-month period or a different threshold would be more appropriate for the current definition. The EPA also solicited comment on the appropriateness of including new HAP standards for EGUs subject to the limited use liquid oil-fired subcategory, as well as on the means of demonstrating compliance with the new HAP standards.

B. How did the technology review change for the other NESHAP requirements?

The technology review for the organic HAP work practice standards, acid gas standards, and standards for oil-fired EGUs has not changed from the proposal.

The proposed technology review with respect to the use of PM CEMS for compliance demonstration by IGCC EGUs has changed due to comments received on the very low fPM emission rates and on technical challenges with certifying PM CEMS on IGCC EGUs. Therefore, the Agency is not finalizing the required use of PM CEMS for compliance demonstration with the fPM emission standard at IGCC EGUs.

C. What key comments did we receive on the other NESHAP requirements, and what are our responses?

Comment: Commenters urged the EPA to retain the current definition of the limited-use liquid oil-fired subcategory and not to impose new HAP standards on EGUs in this subcategory, given that there are already limits on the amount of fuel oil that can be burned. Commenters noted that the Agency has not identified any justification for the costs required for implementation and compliance with new HAP standards for limited-use liquid oil-fired EGUs. Some commenters alleged that any changes to the existing HAP standards for EGUs in the limited-use liquid oil-fired subcategory may complicate reliability management during cold winter spells or other extreme weather events.

Response: The Agency did not propose changes to the limited-use liquid oil-fired EGU subcategory or to the requirements for such units. To evaluate the potential HAP emission impact of liquid oil-fired EGUs[83] during extreme weather events, the Agency reviewed the 2022 fPM emissions of 11 liquid oil-fired EGUs in the Northeast U.S. that were operated during December 2022 Winter Storm Elliot, as described in the 2024 Technical Memo. The review found that total non-Hg HAP metal emissions during 2022 from the 11 oil-fired EGUs in New England were very small—approximately 70 times lower than the non-Hg HAP metal emissions estimated from oil-fired units

[82] For example, the EPA proposed that $27,500 per lb of Hg removed was cost-effective for the Primary Copper RTR (87 FR 1616); and approximately $27,000 per lb of Hg ($2021) was found to be cost-effective in the beyond-the-floor analysis supporting the 2012 MATS Final Rule.

[83] Oil-fired EGUs burning residual fuel oil have generally higher emission rates of HAP compared to that from the use of other types of fuel.

in Puerto Rico, which were among the facilities with the highest (but acceptable) residual risk in the 2020 Residual Risk Review.[84] The EPA will continue to monitor the emissions from the dispatch of limited-use liquid oil-fired EGUs—especially during extreme weather events.

In addition, the Agency reviewed the performance of PM CEMS for compliance demonstration at oil-fired EGUs. Given the higher emission rates and limits from this subcategory of EGUs, the Agency did not find any of the correlation issues with the use of PM CEMS with oil-fired EGUs similar to those that were discussed earlier for coal-fired EGUs. Moreover, the benefits of PM CEMS use that were described earlier (*i.e.,* emissions transparency, operational feedback, *etc.*) translate well to oil-fired EGUs; therefore, the EPA is finalizing the requirement for oil-fired EGUs (excluding limited-use liquid oil-fired EGUs) to use PM CEMS for compliance demonstration, as proposed.

Comment: One commenter recommended that units involved with carbon capture and sequestration (CCS) projects retain the option to use stack testing for compliance demonstration. They said that PM emissions would be measured from the stack downstream of the carbon capture system (they specifically mentioned the carbon capture system being contemplated to be built to capture CO_2 emission from the Milton R. Young Station facility in North Dakota). The commenters said that PM CEMS correlation testing will cause operational impacts on the CCS operations due to operational changes or reduced control efficiencies that temporarily increase PM emissions for long time periods, resulting in CCS operations being adversely affected or even shut down for long periods.

Response: The Agency disagrees with the commenter's recommendation that units utilizing a carbon capture system should be able to continue to use periodic stack testing for compliance demonstration. At the present time, the many ways that CCS can be employed and deployed at coal-fired EGUs supports the use of PM CEMS for compliance purposes. For example, measures (such as a bypass stack) are available that would minimize the operational impacts on the carbon capture system and would allow for proper PM CEMS correlations. Furthermore, the Agency finds that the increased transparency and the improved ability to detect and correct potential control or operational problems offered by PM CEMS, as well as the greater assurance of continuous compliance, outweigh the minor operational impacts potentially experienced. To the extent that a specific coal- or oil-fired EGU utilizing CCS wishes to use an alternative test method for compliance demonstration purposes, its owner or operator may submit a request to the Administrator under the provisions of 40 CFR 63.7(f).

D. What is the rationale for our final approach and decisions regarding the other NESHAP requirements?

The Agency did not receive comments that led to any changes in the outcome of the technology review for other NESHAP requirements as presented in the 2023 Proposal. The Agency did not propose any changes for the current requirements for organic HAP work practice standards, acid gas standards, or standards for oil-fired EGUs and therefore no changes are being finalized.

The EPA is aware of two existing IGCC facilities that meet the definition of an IGCC EGU. The Edwardsport Power Station, located in Knox County, Indiana, includes two IGCC EGUs that had 2021 average capacity factors of approximately 85 percent and 67 percent. These EGUs have LEE qualification for PM, with most current test results of 0.0007 and 0.0003 lb/MMBtu, respectively. The Polk Power Station, located in Polk County, Florida, had a 2021 average capacity factor of approximately 70 percent but burned only natural gas in 2021 (*i.e.,* operating essentially as a natural gas combined cycle turbine EGU). Before this EGU switched to pipeline quality natural gas as a fuel, it qualified for PM LEE status in 2018; to the extent that the EGU again operates as an IGCC, it could continue to claim PM LEE status. While this subcategory has a less stringent fPM standard of 0.040 lb/MMBtu (as compared to that of coal-fired EGUs), recent compliance data indicate fPM emissions well below the most stringent standard option of 0.006 lb/MMBtu that was evaluated for coal-fired EGUs.

The EPA is not finalizing the required use of PM CEMS for compliance demonstration for IGCC EGUs due to technical limitations expressed by commenters. For example, commenters noted that due to differences in stack design, the only possible installation space for a PM CEMS on an IGCC facility is on a stack with elevated grating, exposing the instrument to the elements, which would impact the sensitivity and accuracy of a PM CEMS. Additionally, there are no PM control devices at an IGCC unit available for de-tuning, which is necessary for establishing a correlation curve under PS–11. The EPA has considered these comments and agrees with these noted challenges to the use of PM CEMS at IGCC EGUs and, for those reasons, the EPA is not finalizing the proposed requirement for IGCCs to use PM CEMS for compliance demonstration, thus IGCCs will continue to demonstrate compliance via fPM emissions testing. As a result of comments we received on coal-fired run durations and our consideration on those comments, along with the low levels of reported emissions, the EPA determined that owners or operators of IGCCs will need to ensure each run has a minimum sample volume of 2 dscm or a minimum mass collection of 3 milligrams. In addition, IGCC EGUs will continue to be able to obtain and maintain PM LEE status.

VII. Startup Definition for the Coal- and Oil-Fired EGU Source Category

A. What did we propose for the Coal- and Oil-Fired EGU source category?

In the 2023 Proposal, the EPA proposed to remove the alternative work practice standards, *i.e.,* those contained in paragraph (2) of the definition of "startup" in 40 CFR 63.10042 from the rule based on a petition for reconsideration from environmental groups that was remanded to the EPA in *Chesapeake Climate Action Network* v. *EPA,* 952 F.3d 310 (D.C. Cir. 2020), and responding in part to a separate petition for reconsideration from environmental groups, that sought the EPA's reconsideration of certain aspects of the 2020 Residual Risk Review.[85] The first option under paragraph (1) defines startup as either the first-ever firing of fuel in a boiler for the purpose of producing electricity, or the firing of fuel in a boiler after a shutdown event for any purpose. Startup ends when any of the steam from the boiler is used to generate electricity for sale over the grid or for any other purpose, including onsite use. In the second option, startup is defined as the period in which operation of an EGU is initiated for any purpose, and startup begins with either the firing of any fuel in an EGU for the purpose of producing electricity or useful thermal energy (such as heat or steam) for industrial, commercial, heating, or cooling purposes (other than the first-ever firing of fuel in a boiler following construction of the boiler) or for any other purpose after a shutdown

[84] See *Residual Risk Assessment for the Coal- and Oil-Fired EGU Source Category in Support of the 2019 Risk and Technology Review Proposed Rule* (Docket ID No. EPA–HQ–OAR–2018–0794–0014).

[85] See Document ID No. EPA–HQ–OAR–2018–0794–4565 at *https://www.regulations.gov.*

event. Startup ends 4 hours after the EGU generates electricity that is sold or used for any purpose (including onsite use), or 4 hours after the EGU makes useful thermal energy for industrial, commercial, heating, or cooling purposes, whichever is earlier.

As described in the 2023 Proposal, the Agency proposed to remove paragraph (2) of the definition of ''startup'' as part of our obligation to address the remand on this issue. In addition, as the majority of EGUs currently rely on work practice standards under paragraph (1) of the definition of ''startup,'' we believe this change is achievable by all EGUs and would result in little to no additional expenditures, especially since the additional reporting and recordkeeping requirements associated with use of paragraph (2) would no longer apply. Lastly, the time period for engaging PM or non-Hg HAP metal controls after non-clean fuel use, as well as for full operation of PM or non-Hg HAP metal controls, is expected to be reduced when transitioning to paragraph (1), therefore increasing the duration in which pollution controls are employed and lowering emissions.

B. How did the startup provisions change for the Coal- and Oil-Fired EGU source category?

The EPA is finalizing the amendment to remove paragraph (2) from the definition of ''startup'' as proposed.

C. What key comments did we receive on the startup provisions, and what are our responses?

We received both supportive and adverse comments on the proposed removal of paragraph (2) of the definition of ''startup.'' The summarized comments and the EPA's responses are provided in the *National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review Proposed Rule Response to Comments* document. The most significant adverse comments and the EPA's responses are provided below.

Comment: Commenters recommended that the 4-hour startup definition should continue to be allowed as removing it for simplicity is not an adequate justification. They said the EPA is conflating the MACT standard-setting process with this RTR process. Although the EPA notes that the best performing 12 percent of sources do not need this alternative startup definition, commenters stated that this change is beyond the scope of the technology review. Commenters asserted that the EPA's determination that only eight EGUs are currently using that option is insufficient justification for eliminating the definition. Given that the 2023 Proposal did not identify any flaws with the current definition, the commenters stated that the EPA should explain why elimination of the 4-hour definition from MATS is appropriate when there are units currently relying on it. Commenters also stated that the EPA should consider providing reasonable exemptions for the EGUs that currently use that definition, thus gradually phasing out the definition without imposing any additional compliance burdens. The commenters also argued that with potentially lower fPM standards, more facilities may need the additional flexibility allowed by this definition of startup as their margin of compliance is reduced. They noted that startup or non-steady state operation is not conducive to CEMS accuracy and that it may create false reporting of emissions data biased either high or low depending on the actual conditions.

Commenters stated that several facilities are currently required to use the 4-hour startup definition per federal consent decrees or state agreements. They said such a scenario provides clear justification for a limited exemption, as MATS compliance should not result in an EGU violating its consent decree. Commenters noted other scenarios where state permits have special conditions with exemptions from emission limits during ramp-up or ramp-down periods. They said many facilities alleviate high initial emissions by using alternate fuels to begin the combustion process, which has been demonstrated as a Best Management Practice and to lower emissions. Commenters noted that the permit modification process, let alone any physical or operational modifications to the facility, could take significantly longer than the 180-day compliance deadline, depending on public comments, meetings, or contested hearing requests made during the permit process.

Commenters stated the startup definition paragraph (2) has seen limited use due to the additional reporting requirements that the EPA imposed on sources that chose to use the definition, which they believe are unnecessary and should be removed from the rule. The commenters said that the analysis the EPA conducted during the startup/shutdown reconsideration in response to *Chesapeake Climate Action Network* v. *EPA,* 952 F.3d 310 (D.C. Cir. 2020) showed that the definition was reasonable, and they argued that the definition may be needed if the EPA further reduces the limits, given the transitory nature of unit and control operation during these periods. Commenters also stated that the startup definition paragraph (2) is beneficial to units that require extended startups. They said including allowances for cold startup conditions could allow some EGUs to continue operation until more compliant generation is built, which would help facilitate a smooth transition to newer plants that meet the requirements without risking the reliability of the electric grid. Commenters also noted that some control devices, such as ESPs, may not be operating fully even when the plant begins producing electricity.

Commenters stated that the EPA should consider allowing the use of diluent cap values from 40 CFR part 75. As these are limited under MATS, commenters noted that startup and shutdown variations are more pronounced than if diluent caps were to be allowed. They said that with a lower emissions limitation, the diluent cap would mathematically correct for calculation inaccuracies inherent in emission rate calculation immediately following startup. Commenters stated that relative accuracy test audits (RATA) must be conducted at greater than 50 percent load under 40 CFR part 60 and at normal operating load under 40 CFR part 75. They said that it is not reasonable to require facilities to certify their CEMS, including PM CEMS, at greater than 50 percent capacity and use it for compliance at less than 50 percent capacity. Commenters stated that startups have constantly changing flow and temperatures that do not allow compliance tests to be conducted during these periods.

Response: The Agency disagrees with the commenters who suggest that the 4-hour startup duration should be retained. As mentioned in the 2023 Proposal (88 FR 24885), owners or operators of coal- and oil-fired EGUs that generated over 98 percent of electricity in 2022 have made the requisite adjustments, whether through greater clean fuel capacity, better tuned equipment, better trained staff, a more efficient and/or better design structure, or a combination of factors, to be able to meet the requirements of paragraph (1) of the startup definition. This ability points out an improvement in operation that all EGUs should be able to meet at little to no additional expenditure, since the additional recordkeeping and reporting provisions associated with the work practice standards of paragraph (2) of the startup definition were more expensive than the requirements of paragraph (1) of the definition. As mentioned with respect to gathering

experience with PM CEMS, the Agency believes owners or operators of the 8 EGUs relying on the 4-hour startup period can build on their startup experience gained since finalization of the 2012 MATS Final Rule, along with the experience shared by some of the other EGUs that have been able to conform with startup definition paragraph (1), as well as the experience to be obtained in the period yet remaining before compliance is required; such experience could prove key to aiding source owners or operators in their shift from reliance on startup definition paragraph (2) to startup definition paragraph (1). Should EGU owners or operators find that their attempts to rely on startup definition (1) are unsuccessful after application of that experience, they may request of the Administrator the ability to use an alternate non-opacity standard, as described in the NESHAP general provisions at 40 CFR 63.6(g). Before the Administrator's approval can be granted, the EGU owner or operator's request must appear in the **Federal Register** for the opportunity for notice and comment by the public, as required in 40 CFR 63.6(g)(1).

Regarding consent decrees or state agreements for requirements other than those contained in this rule, while the rule lacks the ability to revise such agreements, the EPA recommends that EGU owners or operators contact the other parties to see what, if any, revisions could be made. Nonetheless, the Agency expects EGU source owners or operators to comply with the revised startup definition by the date specified in this rule. Given the concern expressed by the commenters for some sources, the Agency expects such source owners or operators to begin negotiations with other parties for other non-rule obligations to begin early enough to be completed prior to the compliance date specified in this rule.

The Agency disagrees with the commenters' suggestions that startup definition paragraph (2)'s reporting requirements were too strict to be used. That suggestion is not consistent with the number of commenters who claimed to need to use paragraph (2) of the startup definition, even though only 2.5 percent of EGUs currently rely on this startup definition. The Agency's experience is that almost all EGU source owners or operators have been able to adjust their unit operation such that adherence to startup definition paragraph (1) reduced, if not eliminated, the concern by some about use of startup definition paragraph (1). As mentioned earlier in this document, the better performers in the coal-fired EGU source category no longer need to have, or use, paragraph (2) of the startup definition after gaining experience with using paragraph (1).

The Agency disagrees with the commenter's suggestion that the diluent cap values allowed for use by 40 CFR part 75 be included in the rule, because diluent cap values are already allowed for use during startup and shutdown periods per 40 CFR 63.10007(f)(1). Note that while emission values are to be recorded and reported during startup and shutdown periods, they are not to be used in compliance calculations per 40 CFR 63.10020(e). In addition to diluent cap use during startup and shutdown periods, section 6.2.2.3 of appendix C to 40 CFR part 63, subpart UUUUU allows diluent cap use for PM CEMS during any periods when oxygen or CO_2 values exceed or dip below, respectively, the cap levels. Diluent cap use for other periods from other regulations are not necessary for MATS. The Agency does not understand the commenter's suggestion concerning the load requirement for a RATA. The Agency believes the commenter may have mistaken HCl CEMS requirements, which use RATAs but were not proposed to be changed, with PM CEMS requirements, which do not use RATAs. Since PM CEMS are not subject to RATAs and the Agency did not propose changes to requirements for HCl CEMS, the comment on RATAs being conducted at greater than 50 percent load is moot. The EPA is finalizing the removal of startup definition paragraph (2), as proposed.

D. What is the rationale for our final approach and final decisions for the startup provisions?

The EPA is finalizing the removal of paragraph (2) of the definition of ''startup'' in 40 CFR 63.10042 consistent with reasons described in the 2023 Proposal. As the majority of EGUs are already relying on the work practice standards in paragraph (1) of the startup definition, the EPA finds that such a change is achievable within the 180-day compliance timeline by all EGUs at little to no additional expenditure since the additional reporting and recordkeeping provisions under paragraph (2) were more expensive than paragraph (1). Additionally, the time period for engaging pollution controls for PM or non-Hg HAP metals is expected to be reduced when transitioning to paragraph (1), therefore increasing the duration in which pollution controls are employed and lowering emissions.

VIII. What other key comments did we receive on the proposal?

Comment: Some commenters argued that it is well-established that cost is a major consideration in rulemakings reviewing existing NESHAP under CAA section 112(d)(6). In particular, commenters cited to *Michigan* v. *EPA,* 576 U.S. 743, 759 (2015), to support the argument that the EPA must consider the costs of the regulation in relation to the benefits intended by the statutory requirement mandating this regulation, that is, the benefits of the HAP reductions. Commenters stated that the EPA should not seek to impose the excessive costs associated with this action as there would be no benefit associated with reducing HAP. The commenters said that the EPA certainly should not do so for an industry that is rapidly reducing its emissions because it is on the way to retiring most, if not all, units in the source category in little over a decade. The commenters also claimed that as *Michigan* held that cost and benefits must be considered in determining whether it is ''appropriate'' to regulate EGUs under CAA section 112 in the first place, it necessarily follows that the same threshold must also apply when the EPA subsequently reviews the standards.

Response: The EPA agrees that it is appropriate to take costs into consideration in deciding whether it is necessary to revise an existing NESHAP under CAA section 112(d)(6). As explained in the 2023 Proposal and this document, the EPA has carefully considered the costs of compliance and the effects of those costs on the industry. Although the commenters seem to suggest that the EPA should weigh the costs and benefits of the revisions to the standard, we do not interpret the comments as arguing that the EPA should undertake a formal benefit cost analysis but rather the commenters believe that the EPA should instead limit its analysis supporting the standard to HAP emission reductions. Our consideration of costs in this rulemaking is consistent with the Supreme Court's direction in *Michigan* where the Court noted that ''[i]t will be up to the Agency to decide (as always, within the limits of reasonable interpretation) how to account for cost,'' 576 U.S. 743, 759 (2015), and with comments arguing that the EPA should focus its decision-making on the standard on the anticipated reductions in HAP.

In *Michigan,* the Supreme Court concluded that the EPA erred when it concluded it could not consider costs when deciding as a threshold matter

whether it is ''appropriate and necessary'' under CAA section 112(n)(1)(A) to regulate HAP from EGUs, despite the relevant statutory provision containing no specific reference to cost. 576 U.S. at 751. In doing so, the Court held that the EPA ''must consider cost—including, most importantly, cost of compliance—before deciding whether regulation is appropriate and necessary'' under CAA section 112. *Id.* at 759. In examining the language of CAA section 112(n)(1)(A), the Court concluded that the phrase ''appropriate and necessary'' was ''capacious'' and held that ''[r]ead naturally in the present context, the phrase 'appropriate and necessary' requires at least some attention to cost.'' *Id.* at 752. As is clear from the record for this rulemaking, the EPA has carefully considered cost in reaching its decision to revise the NESHAP in this action.

The EPA has also taken into account the numerous HAP-related benefits of the final rule in deciding to take this action. These benefits include not only the reduced exposure to Hg and non-Hg HAP metals, but also the additional transparency provided by PM CEMS for communities that live near sources of HAP, and the assurance PM CEMS will provide that the standards are being met on a continuous basis. As discussed in section II.B.2., and section IX.E. many of these important benefits are not able to be monetized. Although this rule will result in the reduction of HAP, including Hg, lead, arsenic, chromium, nickel, and cadmium, data limitations prevent the EPA from assigning monetary value to those reductions. In addition, there are several benefits associated with the use of PM CEMS which are not quantified in this rule.

While the Court's examination of CAA section 112(n)(a)(1) in *Michigan* considered a different statutory provision than CAA section 112(d)(6) under which the EPA is promulgating this rulemaking, the EPA has nonetheless satisfied the Court's directive to consider costs, both in the context of the individual revisions to MATS (as directed by the language of the statute) and in the context of the rulemaking as a whole. Moreover, while the EPA is not required to undertake a ''formal cost benefit analysis in which each advantage and disadvantage [of a regulation] is assigned a monetary value,'' *Michigan,* 576 U.S. at 759, the EPA has contemplated and carefully considered both the advantages and disadvantages of the revisions it is finalizing here, including qualitative and quantitative benefits of the regulation and the costs of compliance.

IX. Summary of Cost, Environmental, and Economic Impacts and Additional Analyses Conducted

The following analyses of costs and benefits, and environmental, economic, and environmental justice impacts are presented for the purpose of providing the public with an understanding of the potential consequences of this final action. The EPA notes that analysis of such impacts is distinct from the determinations finalized in this action under CAA section 112, which are based on the statutory factors the EPA discussed in section II.A. and sections IV. through VII.

The EPA's obligation to conduct an analysis of the potential costs and benefits under Executive Order 12866, discussed in this section and section X.A., is distinct from its obligation in setting standards under CAA section 112 to take costs into account. As explained above, the EPA considered costs in multiple ways in choosing appropriate standards consistent with the requirements of CAA section 112. The benefit-cost analysis is performed to comply with Executive Order 12866. The EPA, however, did not rely on that analysis in choosing the appropriate standard here, consistent with the Agency's longstanding interpretation of the statute. As discussed at length in section II.B.2. above and in the EPA's 2023 final rulemaking finalizing the appropriate and necessary finding (88 FR 13956), historically there have been significant challenges in monetizing the benefits of HAP reduction. Important categories of benefits from reducing HAP cannot be monetized, making benefit-cost analysis ill-suited to the EPA's decision making on regulating HAP emissions under CAA section 112. Further, there are also unquantified emission reductions anticipated from installing PM CEMS, as discussed in section IX.E. For this reason, combined with Congress's recognition of the particular dangers posed by HAP and consequent direction to the EPA to reduce emissions of these pollutants to the ''maximum degree,'' the EPA does not at this time believe it is appropriate to rely on the results of the monetized benefit-cost analysis when setting the standards.

As noted in section X.A. below, the EPA projects that the net monetized benefits of this rule are negative. Many of the benefits of this rule discussed at length in this section and elsewhere in this record, however, were not monetized. This rule will result in the reduction of HAP, including Hg, lead, arsenic, chromium, nickel, and cadmium,[86] consistent with Congress's direction in CAA section 112 discussed in section II.A. of this final rule. At this time, data limitations prevent the EPA from assigning monetary value to those reductions, as discussed in section II.B.2. above.[87] In addition, the benefits of the additional transparency provided by the requirement to use PM CEMS for communities that live near sources of HAP, and the assurance PM CEMS provide that the standards are being met on a continuous basis were not monetized due to data limitations. While the EPA does not believe benefit-cost analysis is the right way to determine the appropriateness of a standard under CAA section 112, the EPA notes that when all of the costs and benefits are considered (including non-monetized benefits), this final rule is a worthwhile exercise of the EPA's CAA section 112(d)(6) authority.

A. What are the affected facilities?

The EPA estimates that there are 314 coal-fired EGUs [88] and 58 oil-fired EGUs that will be subject to this final rule by the compliance date.

B. What are the air quality impacts?

The EPA estimated emission reductions under the final rule for the years 2028, 2030, and 2035 based upon IPM projections. The quantified emissions estimates were developed with the EPA's Power Sector Modeling Platform 2023 using IPM, a state-of-the-art, peer-reviewed dynamic, deterministic linear programming model of the contiguous U.S. electric power sector. IPM provides forecasts of least-cost capacity expansion, electricity dispatch, and emission control strategies while meeting electricity demand and various environmental, transmission, dispatch, and reliability constraints. IPM's least-cost dispatch

[86] As of 2023, three of the HAP metals or their compounds emitted by EGUs (arsenic, chromium, and nickel) are classified as carcinogenic to humans. More details are available in section II.B.2. and Chapter 4.2.2 of the RIA.

[87] *See also National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units—Revocation of the 2020 Reconsideration and Affirmation of the Appropriate and Necessary Supplemental Finding,* 88 FR 13956, 13970–73 (March 6, 2023) (for additional discussion regarding the limitations to monetizing and quantifying most benefits from HAP reductions in the 2023 rulemaking finalizing the appropriate and necessary finding).

[88] The number of coal-fired affected EGUs is larger than the 296 coal-fired EGUs assessed for the fPM standard in section IV. because it includes four EGUs that burn petroleum coke (which are a separate subcategory for MATS) and 14 EGUs without fPM compliance data available on the EPA's Compliance and Emissions Data Reporting Interface (CEDRI), *https://www.epa.gov/electronic-reporting-air-emissions/cedri.*

solution is designed to ensure generation resource adequacy, either by using existing resources or through the construction of new resources. IPM addresses reliable delivery of generation resources for the delivery of electricity between the 78 IPM regions, based on current and planned transmission capacity, by setting limits to the ability to transfer power between regions using the bulk power transmission system. The model includes state-of-the-art estimates of the cost and performance of air pollution control technologies with respect to Hg and other HAP controls.

The quantified emission reduction estimates presented in the RIA include reductions in pollutants directly covered by this rule, such as Hg, and changes in other pollutants emitted from the power sector as a result of the compliance actions projected under this final rule. Table 8 of this document presents the projected emissions under the final rule. Note that, unlike the cost-effectiveness analysis presented in sections IV. and V. of this preamble, the projections presented in table 8 are incremental to a projected baseline which reflects future changes in the composition of the operational coal-fired EGU fleet that are projected to occur by 2035 as a result of factors affecting the power sector, such as the IRA, promulgated regulatory actions, or changes in economic conditions.

BILLING CODE 6560–50–P

Table 8. Projected EGU Emissions in the Baseline and Under the Final Rule: 2028, 2030, and 2035[a]

		Total Emissions			
	Year	Baseline	Final Rule	Change from Baseline	% Change
Hg (lb)	2028	6,129	5,129	-999	-16%
	2030	5,863	4,850	-1,013	-17%
	2035	4,962	4,055	-907	-18%
$PM_{2.5}$ (thousand tons)	2028	70.5	69.7	-0.8	-1.1%
	2030	66.3	65.8	-0.5	-0.8%
	2035	50.7	50.2	-0.5	-0.9%
PM_{10} (thousand tons)	2028	79.5	77.4	-2.1	-2.6%
	2030	74.5	73.1	-1.3	-1.8%
	2035	56.0	54.8	-1.2	-2.1%
SO_2 (thousand tons)	2028	454.3	454.0	-0.3	-0.1%
	2030	333.5	333.5	0.0	0.0%
	2035	239.9	239.9	0.0	0.0%
Ozone-season NO_x (thousand tons)	2028	189.0	188.8	-0.165	-0.09%
	2030	174.9	175.4	0.488	0.28%
	2035	116.9	119.1	2.282	1.95%
Annual NO_x (thousand tons)	2028	460.5	460.3	-0.283	-0.06%
	2030	392.8	392.7	-0.022	-0.01%
	2035	253.4	253.5	0.066	0.03%
HCl (thousand tons)	2028	2.5	2.5	0.0	0.0%
	2030	2.2	2.2	0.0	0.0%
	2035	1.5	1.5	0.0	0.1%
CO_2 (million metric tons)	2028	1,158.8	1,158.7	-0.1	0.0%
	2030	1,098.3	1,098.3	0.0	0.0%
	2035	724.2	724.1	-0.1	0.0%

[a] This analysis is limited to the geographically contiguous lower 48 states.

BILLING CODE 6560–50–C

In addition to the projected emissions impacts presented in table 8, we also estimate that the final rule will reduce at least 7 tons of non-Hg HAP metals in 2028, 5 tons of non-Hg HAP metals in 2030, and 4 tons of non-Hg HAP metals in 2035. These reductions are composed of reductions in emissions of antimony, arsenic, beryllium, cadmium,

chromium, cobalt, lead, manganese, nickel, and selenium.[89]

Importantly, the continuous monitoring of fPM required in this rule will likely induce additional emissions reductions that we are unable to quantify. Continuous measurements of emissions accounts for changes to processes and fuels, fluctuations in load, operations of pollution controls, and equipment malfunctions. By measuring emissions across all operations, power plant operators and regulators can use the data to ensure controls are operating properly and to assess compliance with relevant standards. Because CEMS enable power plant operators to quickly identify and correct problems with pollution control devices, it is possible that fPM emissions could be lower than they otherwise would have been for up to 3 months—or up to 3 years if testing less frequently under the LEE program—at a time. This potential reduction in fPM and non-Hg HAP metals emission resulting from the information provided by continuous monitoring coupled with corrective actions by plant operators could be sizeable over the existing coal-fired fleet and is not quantified in this rulemaking.

Section 3 of the RIA presents a detailed discussion of the emissions projections under the regulatory options as described in the RIA. Section 3 also describes the compliance actions that are projected to produce the emission reductions in table 8 of this preamble. Please see section IX.E. of this preamble and section 4 of the RIA for detailed discussions of the projected health, welfare, and climate benefits of these emission reductions.

C. What are the cost impacts?

The power industry's compliance costs are represented in this analysis as the change in electric power generation costs between the baseline and policy scenarios. In other words, these costs are an estimate of the increased power industry expenditures required to implement the final requirements of this rule. The compliance cost estimates were mainly developed using the EPA's Power Sector Modeling Platform 2023 using IPM. The incremental costs of the final rule's PM CEMS requirement were estimated outside of IPM and added to the IPM-based cost estimate presented here and in section 3 of the RIA.

We estimate the present value (PV) of the projected compliance costs over the 2028 to 2037 period, as well as estimate the equivalent annual value (EAV) of the flow of the compliance costs over this period. All dollars are in 2019 dollars. We estimate the PV and EAV using 2, 3, and 7 percent discount rates.[90] Table 9 of this document presents the estimates of compliance costs for the final rule.

Table 9. Projected Compliance Costs of the Final Rule, 2028 through 2037 (Millions 2019$, Discounted to 2023)[a]

	2% Discount Rate	3% Discount Rate	7% Discount Rate
PV	860	790	560
EAV	96	92	80

[a] Values have been rounded to two significant figures.

The PV of the compliance costs for the final rule, discounted at the 2 percent rate, is estimated to be about $860 million, with an EAV of about $96 million. At the 3 percent discount rate, the PV of the compliance costs of the final rule is estimated to be about $790 million, with an EAV of about $92 million. At the 7 percent discount rate, the PV of the compliance costs of the rule is estimated to be about $560 million, with an EAV of about $80 million.

We note that IPM provides the EPA's best estimate of the costs of the rules to the electricity sector and related energy sectors (*i.e.,* natural gas, coal mining). These compliance cost estimates are used as a proxy for the social cost of the rule. For a detailed description of these compliance cost projections, please see section 3 of the RIA, which is available in the docket for this action.

D. What are the economic impacts?

The Agency estimates that this rule will require additional fPM and/or Hg removal at less than 15 GW of operable capacity in 2028, which is about 14 percent of the total coal-fired EGU capacity projected to operate in that year. The units requiring additional fPM and/or Hg removal are projected to generate less than 2 percent of total generation in 2028. Moreover, the EPA does not project that any EGUs will retire in response to the standards promulgated in this final rule.

Consistent with the small share of EGUs required to reduce fPM and/or Hg emissions rates, this final action has limited energy market implications. There are limited impacts on energy prices projected to result from this final rule. On a national average basis,

[89] Note that modeled projections include total PM_{10} and total $PM_{2.5}$. The EPA estimated non-Hg HAP metals reductions by multiplying the ratio of non-Hg HAP metals to fPM by modeled projections of total PM_{10} reductions under the rule. The ratios of non-Hg HAP metals to fPM were based on analysis of 2010 MATS Information Collection Request (ICR) data. As there may be substantially more fPM than PM_{10} reduced by the control techniques projected to be used under this rule, these estimates of non-Hg HAP metals reductions are likely underestimates. More detail on the estimated reduction in non-Hg HAP metals can be found in the docketed memorandum *Estimating Non-Hg HAP Metals Reductions for the 2024 Technology Review for the Coal-Fired EGU Source Category.*

[90] Results using the 2 percent discount rate were not included in the proposal for this action. The 2003 version of OMB's Circular A–4 had generally recommended 3 percent and 7 percent as default rates to discount social costs and benefits. The analysis of the proposed rule used these two recommended rates. In November 2023, OMB finalized an update to Circular A–4, in which it recommended the general application of a 2 percent rate to discount social costs and benefits (subject to regular updates). The Circular A–4 update also recommended consideration of the shadow price of capital when costs or benefits are likely to accrue to capital. As a result of the update to Circular A–4, we include cost and benefits results calculated using a 2 percent discount rate.

delivered coal, natural gas, and retail electricity prices are not projected to change. The EPA does not project incremental changes in existing operational capacity to occur in response to the final rule. Coal production for use in the power sector is not projected to change significantly by 2028.

The short-term estimates for employment needed to design, construct, and install the control equipment in the 3-year period before the compliance date are also provided using an approach that estimates employment impacts for the environmental protection sector based on projected changes from IPM on the number and scale of pollution controls and labor intensities in relevant sectors. Finally, some of the other types of employment impacts that will be ongoing are estimated using IPM outputs and labor intensities, as reported in section 5 of the RIA.

E. What are the benefits?

The RIA for this action analyzes the benefits associated with the projected emission reductions under this rule. This final rule is projected to reduce emissions of Hg and non-Hg HAP metals, as well as $PM_{2.5}$, SO_2, NO_X and CO_2 nationwide. The potential impacts of these emission reductions are discussed in detail in section 4 of the RIA. The EPA notes that the benefits analysis is distinct from the statutory determinations finalized herein, which are based on the statutory factors the EPA is required to consider under CAA section 112. The assessment of benefits described here and in the RIA is presented solely for the purposes of complying with Executive Order 12866, as amended by Executive Order 14094, and providing the public with a complete depiction of the impacts of the rulemaking.

Hg is a persistent, bioaccumulative toxic metal emitted from power plants that exists in three forms: gaseous elemental Hg, inorganic Hg compounds, and organic Hg compounds (*e.g.,* methylmercury). Hg can also be emitted in a particle-bound form. Elemental Hg can exist as a shiny silver liquid, but readily vaporizes into air. Airborne elemental Hg does not quickly deposit or chemically react in the atmosphere, resulting in residence times that are long enough to contribute to global scale deposition. Oxidized Hg and particle-bound Hg deposit quickly from the atmosphere impacting local and regional areas in proximity to sources. Methylmercury is formed by microbial action in the top layers of sediment and soils, after Hg has precipitated from the air and deposited into waterbodies or land. Once formed, methylmercury is taken up by aquatic organisms and bioaccumulates up the aquatic food web. Larger predatory fish may have methylmercury concentrations many times that of the concentrations in the freshwater body in which they live.

All forms of Hg are toxic, and each form exhibits different health effects. Acute (short-term) exposure to high levels of elemental Hg vapors results in central nervous system (CNS) effects such as tremors, mood changes, and slowed sensory and motor nerve function. Chronic (long-term) exposure to elemental Hg in humans also affects the CNS, with effects such as erethism (increased excitability), irritability, excessive shyness, and tremors. The major effect from chronic ingestion or inhalation of low levels of inorganic Hg is kidney damage.

Methylmercury is the most common organic Hg compound in the environment. Acute exposure of humans to very high levels of methylmercury results in profound CNS effects such as blindness and spastic quadriparesis. Chronic exposure to methylmercury, most commonly by consumption of fish from Hg contaminated waters, also affects the CNS with symptoms such as paresthesia (a sensation of pricking on the skin), blurred vision, malaise, speech difficulties, and constriction of the visual field. Ingestion of methylmercury can lead to significant developmental effects, such as IQ loss measured by performance on neurobehavioral tests, particularly on tests of attention, fine motor-function, language, and visual spatial ability. In addition, evidence in humans and animals suggests that methylmercury can have adverse effects on both the developing and the adult cardiovascular system, including fatal and non-fatal ischemic heart disease (IHD). Further, nephrotoxicity, immunotoxicity, reproductive effects (impaired fertility), and developmental effects have been observed with methylmercury exposure in animal studies.[91] Methylmercury has some genotoxic activity and can cause chromosomal damage in several experimental systems. The EPA has concluded that mercuric chloride and methylmercury are possibly carcinogenic to humans.[92 93]

The projected emissions reductions of Hg are expected to lower deposition of Hg into ecosystems and reduce U.S. EGU attributable bioaccumulation of methylmercury in wildlife, particularly for areas closer to the effected units subject to near-field deposition. Subsistence fishing is associated with vulnerable populations. Methylmercury exposure to subsistence fishers from lignite-fired units is below the current RfD for methylmercury neurodevelopmental toxicity. The EPA considers exposures at or below the RfD for methylmercury unlikely to be associated with appreciable risk of deleterious effects across the population. However, the RfD for methylmercury does not represent an exposure level corresponding to zero risk; moreover, the RfD does not represent a bright line above which individuals are at risk of adverse effects. Reductions in Hg emissions from lignite-fired facilities should further reduce exposure to methylmercury for subsistence fisher sub-populations located in the vicinity of these facilities, which are all located in North Dakota, Texas, and Mississippi.

In addition, U.S. EGUs are a major source of HAP metals emissions including selenium, arsenic, chromium, nickel, and cobalt, cadmium, beryllium, lead, and manganese. Some HAP metals emitted by U.S. EGUs are known to be persistent and bioaccumulative and others have the potential to cause cancer. Exposure to these HAP metals, depending on exposure duration and levels of exposures, is associated with a variety of adverse health effects. The emissions reductions projected under this final rule are expected to reduce human exposure to non-Hg HAP metals, including carcinogens.

Furthermore, there is the potential for reductions in Hg and non-Hg HAP metal emissions to enhance ecosystem services and improve ecological outcomes. The reductions will potentially lead to positive economic impacts although it is difficult to estimate these benefits and, consequently, they have not been included in the set of quantified benefits.

As explained in section IX.B., the continuous monitoring of fPM required in this rule may induce further reductions of fPM and non-Hg HAP metals than we project in the RIA for

[91] Agency for Toxic Substances and Disease Registry (ATSDR). Toxicological Profile for Mercury. Public Health Service, U.S. Department of Health and Human Services, Atlanta, GA. 2022.

[93] U.S. Environmental Protection Agency. Integrated Risk Information System (IRIS) on Mercuric Chloride. National Center for Environmental Assessment, Office of Research and Development, Washington, DC. 1995.

this action. As a result, there may be additional unquantified beneficial health impacts from these potential reductions. The continuous monitoring of fPM required in this rule is also likely to provide several additional benefits to the public which are not quantified in this rule, including greater certainty, accuracy, transparency, and granularity in fPM emissions information than exists today.

The rule is also expected to reduce emissions of direct $PM_{2.5}$, NO_X, and SO_2 nationally throughout the year. Because NO_X and SO_2 are also precursors to secondary formation of ambient $PM_{2.5}$, reducing these emissions would reduce human exposure to ambient $PM_{2.5}$ throughout the year and would reduce the incidence of $PM_{2.5}$-attributable health effects. The rule is also expected to reduce ozone-season NO_X emissions nationally in most years of analysis. In the presence of sunlight, NO_X, and volatile organic compounds (VOCs) can undergo a chemical reaction in the atmosphere to form ozone. Reducing NO_X emissions in most locations reduces human exposure to ozone and reduces the incidence of ozone-related health effects, although the degree to which ozone is reduced will depend in part on local concentration levels of VOCs.

The health effect endpoints, effect estimates, benefit unit values, and how they were selected, are described in the technical support document titled *Estimating $PM_{2.5}$ minus; and Ozone-Attributable Health Benefits* (2023). This document describes our peer-reviewed approach for selecting and quantifying adverse effects attributable to air pollution, the demographic and health data used to perform these calculations, and our methodology for valuing these effects.

Because of projected changes in dispatch under the final requirements, the rule is also projected to impact CO_2 emissions. The EPA estimates the climate benefits of CO_2 emission reductions expected from the final rule using estimates of the social cost of carbon (SC–CO_2) that reflect recent advances in the scientific literature on climate change and its economic impacts and that incorporate recommendations made by the National Academies of Science, Engineering, and Medicine.[94] The EPA published and used these estimates in the RIA for the December 2023 Natural Gas Sector final rule titled *Standards of Performance for New, Reconstructed, and Modified Sources and Emissions Guidelines for Existing Sources: Oil and Natural Gas Sector Climate Review* (2023 Oil and Natural Gas NSPS/EG).[95] The EPA solicited public comment on the methodology and use of these estimates in the RIA for the Agency's December 2022 Oil and Natural Gas Sector supplemental proposal[96] that preceded the 2023 Oil and Natural Gas NSPS/EG and has conducted an external peer review of these estimates. The response to public comments document and the response to peer reviewer recommendations can be found in the docket for the 2023 Oil and Natural Gas NSPS/EG action. Complete information about the peer review process is also available on the EPA's website.[97]

Section 4.4 within the RIA for this final rulemaking provides an overview of the methodological updates incorporated into the SC–CO_2 estimates used in this final RIA.[98] A more detailed explanation of each input and the modeling process is provided in the final technical report, *EPA Report on the Social Cost of Greenhouse Gases: Estimates Incorporating Recent Scientific Advances.*[99]

The SC–CO_2 is the monetary value of the net harm to society associated with a marginal increase in CO_2 emissions in a given year, or the benefit of avoiding that increase. In principle, SC–CO_2 includes the value of all climate change impacts both negative and positive, including, but not limited to, changes in net agricultural productivity, human health effects, property damage from increased flood risk and natural disasters, disruption of energy systems, risk of conflict, environmental migration, and the value of ecosystem services. The SC–CO_2, therefore, reflects the societal value of reducing emissions of CO_2 by one metric ton and is the theoretically appropriate value to use in conducting benefit-cost analyses of policies that affect CO_2 emissions. In practice, data and modeling limitations restrain the ability of SC–CO_2 estimates to include all physical, ecological, and economic impacts of climate change, implicitly assigning a value of zero to the omitted climate damages. The estimates are, therefore, a partial accounting of climate change impacts and likely underestimate the marginal benefits of abatement.

Table 10 of this document presents the estimated PV and EAV of the projected health and climate benefits across the regulatory options examined in the RIA in 2019 dollars discounted to 2023.

BILLING CODE 6560–50–P

Table 10. Projected Benefits of the Final Rule, 2028 through 2037 (Millions 2019$, Discounted to 2023)[a]

Present Value (PV)			
	2% Discount Rate	3% Discount Rate	7% Discount Rate
Health Benefits[c]	300	260	180
Climate Benefits[d]	130	130	130
Total Monetized Benefits[e]	420	390	300
Equivalent Annual Value (EAV)[b]			
	2% Discount Rate	3% Discount Rate	7% Discount Rate
Health Benefits[c]	33	31	25
Climate Benefits[d]	14	14	14
Total Monetized Benefits[e]	47	45	39
Non-Monetized Benefits	Benefits from reductions of about 900 to 1000 pounds of Hg annually		
	Benefits from reductions of at least 4 to 7 tons of non-Hg HAP metals annually		
	Benefits from improved water quality and availability		
	Benefits from the increased transparency, compliance assurance, and accelerated identification of anomalous emission anticipated from requiring PM CEMS		

[a] Values have been rounded to two significant figures. Rows may not appear to sum correctly due to rounding.

[b] The EAV of benefits are calculated over the 10-year period from 2028 to 2037.

[c] The projected monetized air quality-related benefits include those related to public health associated with reductions in $PM_{2.5}$ and ozone concentrations. The projected health benefits are associated with several point estimates and are presented at real discount rates of 2, 3, and 7 percent.

[d] Monetized climate benefits are based on reductions in CO_2 emissions and are calculated using three different estimates of the social cost of carbon dioxide (SC-CO_2) (under 1.5 percent, 2.0 percent, and 2.5 percent near-term Ramsey discount rates). For the presentational purposes of this table, we show the climate benefits associated with the SC-CO_2 at the 2 percent near-term Ramsey discount rate. Please see section 4 of the RIA for the full range of monetized climate benefit estimates.

[e] The list of non-monetized benefits does not include all potential non-monetized benefits. See table 4-8 of the RIA for a more complete list.

BILLING CODE 6560–50–C

This final rule is projected to reduce $PM_{2.5}$ and ozone concentrations, producing a projected PV of monetized health benefits of about $300 million, with an EAV of about $33 million discounted at 2 percent. The projected PV of monetized climate benefits of the final rule is estimated to be about $130 million, with an EAV of about $14 million using the SC–$CO_2$ discounted at 2 percent.[100] Thus, this final rule would

[100] Monetized climate benefits are discounted using a 2 percent discount rate, consistent with the EPA's updated estimates of the SC–CO_2. The 2003 version of OMB's Circular A–4 had generally recommended 3 percent and 7 percent as default discount rates for costs and benefits, though as part of the Interagency Working Group on the Social Cost of Greenhouse Gases, OMB had also long recognized that climate effects should be discounted only at appropriate consumption-based discount rates. In November 2023, OMB finalized an update to Circular A–4, in which it recommended the general application of a 2 percent discount rate to costs and benefits (subject to regular updates), as well as the consideration of the shadow price of capital when costs or benefits are likely to accrue to capital (OMB 2023). Because the SC–CO_2 estimates reflect net climate change damages in terms of reduced consumption (or monetary consumption equivalents), the use of the social rate of return on capital (7 percent under

generate a PV of monetized benefits of $420 million, with an EAV of $47 million discounted at a 2 percent rate.

At a 3 percent discount rate, this final rule is expected to generate projected PV of monetized health benefits of $260 million, with an EAV of about $31 million discounted at 3 percent. Climate benefits remain discounted at 2 percent in this benefits analysis and are estimated to be about $130 million, with an EAV of about $14 million using the SC–$CO_2$. Thus, this final rule would generate a PV of monetized benefits of $390 million, with an EAV of $45 million discounted at a 3 percent rate.

At a 7 percent discount rate, this final rule is expected to generate projected PV of monetized health benefits of $180 million, with an EAV of about $25 million discounted at 7 percent. Climate benefits remain discounted at 2 percent in this benefits analysis and are estimated to be about $130 million, with an EAV of about $14 million using the SC–$CO_2$. Thus, this final rule would generate a PV of monetized benefits of $300 million, with an EAV of $39 million discounted at a 7 percent rate.

The benefits from reducing Hg and non-Hg HAP metals and from unquantified improvements in water quality were not monetized and are therefore not directly reflected in the monetized benefit-cost estimates associated with this rulemaking. Potential benefits from the increased transparency and accelerated identification of anomalous emission anticipated from requiring PM CEMS were also not monetized in this analysis and are therefore also not directly reflected in the monetized benefit-cost comparisons. We nonetheless consider these impacts in our evaluation of the net benefits of the rule and find that, if we were able to monetize these beneficial impacts, the final rule would have greater net benefits than shown in table 11 of this document.

F. What analysis of environmental justice did we conduct?

For purposes of analyzing regulatory impacts, the EPA relies upon its June 2016 ''Technical Guidance for Assessing Environmental Justice in Regulatory Analysis,'' which provides recommendations that encourage analysts to conduct the highest quality analysis feasible, recognizing that data limitations, time, resource constraints, and analytical challenges will vary by media and circumstance. The Technical Guidance states that a regulatory action may involve potential EJ concerns if it could: (1) create new disproportionate impacts on communities with EJ concerns; (2) exacerbate existing disproportionate impacts on communities with EJ concerns; or (3) present opportunities to address existing disproportionate impacts on communities with EJ concerns through this action under development.

The EPA's EJ technical guidance states that ''[t]he analysis of potential EJ concerns for regulatory actions should address three questions: (A) Are there potential EJ concerns associated with environmental stressors affected by the regulatory action for population groups of concern in the baseline? (B) Are there potential EJ concerns associated with environmental stressors affected by the regulatory action for population groups of concern for the regulatory option(s) under consideration? (C) For the regulatory option(s) under consideration, are potential EJ concerns created or mitigated compared to the baseline?'' [101]

The environmental justice analysis is presented for the purpose of providing the public with as full as possible an understanding of the potential impacts of this final action. The EPA notes that analysis of such impacts is distinct from the determinations finalized in this action under CAA section 112, which are based solely on the statutory factors the EPA is required to consider under that section. To address these questions in the EPA's first quantitative EJ analysis in the context of a MATS rule, the EPA developed a unique analytical approach that considers the purpose and specifics of this rulemaking, as well as the nature of known and potential disproportionate and adverse exposures and impacts. However, due to data limitations, it is possible that our analysis failed to identify disparities that may exist, such as potential EJ characteristics (*e.g.,* residence of historically red-lined areas), environmental impacts (*e.g.,* other ozone metrics), and more granular spatial resolutions (*e.g.,* neighborhood scale) that were not evaluated. Also due to data and resource limitations, we discuss HAP and climate EJ impacts of this action qualitatively (section 6 of the RIA).

For this rule, we employ two types of analysis to respond to the previous three questions: proximity analyses and exposure analyses. Both types of analysis can inform whether there are potential EJ concerns in the baseline (question 1).[102] In contrast, only the exposure analyses, which are based on future air quality modeling, can inform whether there will be potential EJ concerns after implementation of the regulatory options under consideration (question 2) and whether potential EJ concerns will be created or mitigated compared to the baseline (question 3). While the exposure analysis can respond to all three questions, several caveats should be noted. For example, the air pollutant exposure metrics are limited to those used in the benefits assessment. For ozone, that is the maximum daily 8-hour average, averaged across the April through September warm season (AS–MO3) and for $PM_{2.5}$ that is the annual average. This ozone metric likely smooths potential daily ozone gradients and is not directly relatable to the National Ambient Air Quality Standards (NAAQS), whereas the $PM_{2.5}$ metric is more similar to the long-term $PM_{2.5}$ standard. The air quality modeling estimates are also based on state and fuel level emission data paired with facility-level baseline emissions and provided at a resolution of 12 square kilometers. Additionally, here we focus on air quality changes due to this rulemaking and infer post-policy ozone and $PM_{2.5}$ exposure burden impacts. Note, we discuss HAP and climate EJ impacts of this action qualitatively (section 6 of the RIA).

Exposure analysis results are provided in two formats: aggregated and distributional. The aggregated results provide an overview of potential ozone exposure differences across populations at the national- and state-levels, while the distributional results show detailed information about ozone concentration changes experienced by everyone within each population.

In section 6 of the RIA, we utilize the two types of analysis to address the three EJ questions by quantitatively evaluating: (1) the proximity of affected facilities to various local populations with potential EJ concerns (section 6.4); and (2) the potential for disproportionate ozone and $PM_{2.5}$ concentrations in the baseline and concentration changes after rule implementation across different demographic groups on the basis of race, ethnicity, poverty status, employment status, health insurance status, life expectancy, redlining, Tribal land, age, sex, educational attainment,

OMB Circular A–4 (2003)) to discount damages estimated in terms of reduced consumption would inappropriately underestimate the impacts of climate change for the purposes of estimating the SC–CO_2. See Section 4.4 of the RIA for more discussion.

[101] See *https://www.epa.gov/environmentaljustice/technical-guidance-assessing-environmental-justice-regulatory-analysis.*

[102] The baseline for proximity analyses is current population information, whereas the baseline for ozone exposure analyses are the future years in which the regulatory options will be implemented (*e.g.,* 2023 and 2026).

and degree of linguistic isolation (section 6.5). It is important to note that due to the small magnitude of underlying emissions changes, and the corresponding small magnitude of the ozone and $PM_{2.5}$ concentration changes, the rule is expected to have only a small impact on the distribution of exposures across each demographic group. Each of these analyses should be considered independently of each other, as each was performed to answer separate questions, and is associated with unique limitations and uncertainties.

Baseline demographic proximity analyses can be relevant for identifying populations that may be exposed to local environmental stressors, such as local NO_2 and SO_2 emitted from affected sources in this final rule, traffic, or noise. The baseline analysis indicates that on average the populations living within 10 kilometers of coal plants potentially impacted by the amended fPM standards have a higher percentage of people living below two times the poverty level than the national average. In addition, on average the percentage of the American Indian population living within 10 kilometers of lignite plants potentially impacted by the amended Hg standard is higher than the national average. Assessing these results, we conclude that there may be potential EJ concerns associated with directly emitted pollutants that are affected by the regulatory action (*e.g.,* SO_2) for various population groups in the baseline (question 1). However, as proximity to affected facilities does not capture variation in baseline exposure across communities, nor does it indicate that any exposures or impacts will occur, these results should not be interpreted as a direct measure of exposure or impact.

As HAP exposure results generated as part of the 2020 Residual Risk Review were below both the presumptive acceptable cancer risk threshold and noncancer health benchmarks and this regulation should further reduce exposure to HAP, there are no ''disproportionate and adverse effects'' of potential EJ concern. Therefore, we did not perform a quantitative EJ assessment of HAP risk. However, the potential reduction in non-Hg HAP metal emissions would likely reduce exposures to people living nearby coal plants potentially impacted by the amended fPM standards.

This rule is also expected to reduce emissions of direct $PM_{2.5}$, NO_X, and SO_2 nationally throughout the year. Because NO_X and SO_2 are also precursors to secondary formation of ambient $PM_{2.5}$ and because NO_X is a precursor to ozone formation, reducing these emissions would impact human exposure. Quantitative ozone and $PM_{2.5}$ exposure analyses can provide insight into all three EJ questions, so they are performed to evaluate potential disproportionate impacts of this rulemaking. Even though both the proximity and exposure analyses can potentially improve understanding of baseline EJ concerns (question 1), the two should not be directly compared. This is because the demographic proximity analysis does not include air quality information and is based on current, not future, population information.

The baseline analysis of ozone and $PM_{2.5}$ concentration burden responds to question 1 from the EPA's EJ technical guidance more directly than the proximity analyses, as it evaluates a form of the environmental stressor targeted by the regulatory action. Baseline $PM_{2.5}$ and ozone exposure analyses show that certain populations, such as residents of redlined census tracts, those linguistically isolated, Hispanic, Asian, those without a high school diploma, and the unemployed may experience higher ozone and $PM_{2.5}$ exposures as compared to the national average. American Indian, residents of Tribal Lands, populations with higher life expectancy or with life expectancy data unavailable, children, and insured populations may also experience disproportionately higher ozone concentrations than the reference group. Hispanic, Black, below the poverty line, and uninsured populations may also experience disproportionately higher $PM_{2.5}$ concentrations than the reference group. Therefore, also in response to question 1, there likely are potential EJ concerns associated with ozone and $PM_{2.5}$ exposures affected by the regulatory action for population groups of concern in the baseline. However, these baseline exposure results have not been fully explored and additional analyses are likely needed to understand potential implications. Due to the small magnitude of the exposure changes across population demographics associated with the rulemaking relative to the magnitude of the baseline disparities, we infer that post-policy EJ ozone and $PM_{2.5}$ concentration burdens are likely to remain after implementation of the regulatory action or alternative under consideration (question 2).

Question 3 asks whether potential EJ concerns will be created or mitigated as compared to the baseline. Due to the very small magnitude of differences across demographic population post-policy ozone and $PM_{2.5}$ exposure impacts, we do not find evidence that potential EJ concerns related to ozone and $PM_{2.5}$ concentrations will be created or mitigated as compared to the baseline.[103]

X. Statutory and Executive Order Reviews

Additional information about these statutes and Executive Orders can be found at *https://www.epa.gov/laws-regulations/laws-and-executive-orders.*

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 14094: Modernizing Regulatory Review

This action is a ''significant regulatory action,'' as defined under section 3(f)(1) of Executive Order 12866, as amended by Executive Order 14094. Accordingly, the EPA submitted this action to the Office of Management and Budget (OMB) for Executive Order 12866 review. Documentation of any changes made in response to the Executive Order 12866 review is available in the docket. The EPA prepared an analysis of the potential costs and benefits associated with this action. This analysis, *Regulatory Impact Analysis for the Final National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units Review of the Residual Risk and Technology Review* (Ref. EPA–452/R–24–005), is briefly summarized in section IX. of this preamble and here. This analysis is also available in the docket.

Table 11 of this document presents the estimated PV and EAV of the monetizable projected health benefits, climate benefits, compliance costs, and net benefits of the final rule in 2019 dollars discounted to 2023. The estimated monetized net benefits are the projected monetized benefits minus the projected monetized costs of the final rule.

Under Executive Order 12866, the EPA is directed to consider all of the costs and benefits of its actions, not just those that stem from the regulated pollutant. Accordingly, the projected monetized benefits of the final rule include health benefits associated with projected reductions in $PM_{2.5}$ and ozone concentration. The projected monetized benefits also include climate benefits due to reductions in CO_2 emissions. The projected health benefits are associated with several point estimates and are presented at real discount rates of 2, 3, and 7 percent. The projected climate

[103] Please note that results for ozone and $PM_{2.5}$ exposures should not be extrapolated to other air pollutants that were not included in the assessment, including HAP. Detailed EJ analytical results can be found in section 6 of the RIA.

benefits in this table are based on estimates of the SC–CO_2 at a 2 percent near-term Ramsey discount rate and are discounted using a 2 percent discount rate to obtain the PV and EAV estimates in the table. The power industry's compliance costs are represented in this analysis as the change in electric power generation costs between the baseline and policy scenarios. In simple terms, these costs are an estimate of the increased power industry expenditures required to implement the finalized requirements and represent the EPA's best estimate of the social cost of the final rulemaking.

BILLING CODE 6560–50–P

Table 11. Projected Monetized Benefits, Compliance Costs, and Net Benefits of the Final Rule, 2028 through 2037 (Millions 2019$, Discounted to 2023)[a]

	Present Value (PV)		
	2% Discount Rate	3% Discount Rate	7% Discount Rate
Health Benefits[c]	300	260	180
Climate Benefits[d]	130	130	130
Compliance Costs	860	790	560
Net Benefits	-440	-400	-260
	Equal Annualized Value (EAV)[b]		
	2% Discount Rate	3% Discount Rate	7% Discount Rate
Health Benefits[c]	33	31	25
Climate Benefits[d]	14	14	14
Compliance Costs	96	92	80
Net Benefits	-49	-47	-41
Non-Monetized Benefits[e]	Benefits from reductions of about 900 to 1000 pounds of Hg annually		
	Benefits from reductions of at least 4 to 7 tons of non-Hg HAP metals annually		
	Benefits from improved water quality and availability		
	Benefits from the increased transparency, compliance assurance, and accelerated identification of anomalous emission anticipated from requiring PM CEMS		

[a] Values have been rounded to two significant figures. Rows may not appear to sum correctly due to rounding.
[b] The EAV of costs and benefits are calculated over the 10-year period from 2028 to 2037.
[c] The projected monetized air quality related benefits include those related to public health associated with reductions in $PM_{2.5}$ and ozone concentrations. The projected health benefits are associated with several point estimates and are presented at real discount rates of 2, 3, and 7 percent.
[d] Monetized climate benefits are based on reductions in CO_2 emissions and are calculated using three different estimates of the SC-CO_2 (under 1.5 percent, 2.0 percent, and 2.5 percent near-term Ramsey discount rates). For the presentational purposes of this table, we show the climate benefits associated with the SC-CO_2 at the 2 percent near-term Ramsey discount rate. Please see section 4 of the RIA for the full range of monetized climate benefit estimates.
[e] The list of non-monetized benefits does not include all potential non-monetized benefits. See table 4-8 of the RIA for a more complete list.

BILLING CODE 6560–50–C

As shown in table 11 of this document, this rule is projected to reduce $PM_{2.5}$ and ozone concentrations, producing a projected PV of monetized health benefits of about $300 million, with an EAV of about $33 million discounted at 2 percent. The rule is also projected to reduce greenhouse gas emissions in the form of CO_2, producing

a projected PV of monetized climate benefits of about $130 million, with an EAV of about $14 million using the SC–$CO_2$ discounted at 2 percent. Thus, this final rule would generate a PV of monetized benefits of $420 million, with an EAV of $47 million discounted at a 2 percent rate. The PV of the projected compliance costs are $860 million, with an EAV of about $96 million discounted at 2 percent. Combining the projected benefits with the projected compliance costs yields a net benefit PV estimate of −$440 million and EAV of −$49 million.

At a 3 percent discount rate, this rule is expected to generate projected PV of monetized health benefits of $260 million, with an EAV of about $31 million. Climate benefits remain discounted at 2 percent in this net benefits analysis. Thus, this final rule would generate a PV of monetized benefits of $390 million, with an EAV of $45 million discounted at a 3 percent rate. The PV of the projected compliance costs are $790 million, with an EAV of $92 million discounted at 3 percent. Combining the projected benefits with the projected compliance costs yields a net benefit PV estimate of −$400 million and an EAV of −$47 million.

At a 7 percent discount rate, this rule is expected to generate projected PV of monetized health benefits of $160 million, with an EAV of about $23 million. Climate benefits remain discounted at 2 percent in this net benefits analysis. Thus, this final rule would generate a PV of monetized benefits of $300 million, with an EAV of $39 million discounted at a 3 percent rate. The PV of the projected compliance costs are $560 million, with an EAV of $80 million discounted at 7 percent. Combining the projected benefits with the projected compliance costs yields a net benefit PV estimate of −$260 million and an EAV of −$41 million.

The potential benefits from reducing Hg and non-Hg HAP metals and potential improvements in water quality and availability were not monetized and are therefore not directly reflected in the monetized benefit-cost estimates associated with this final rule. Potential benefits from the increased transparency and accelerated identification of anomalous emission anticipated from requiring CEMS were also not monetized in this analysis and are therefore also not directly reflected in the monetized benefit-cost comparisons. We nonetheless consider these impacts in our evaluation of the net benefits of the rule and find, if we were able to quantify and monetize these beneficial impacts, the final rule would have greater net benefits than shown in table 11 of this preamble.

B. Paperwork Reduction Act (PRA)

The information collection activities in this rule have been submitted for approval to the OMB under the PRA. The ICR document that the EPA prepared has been assigned EPA ICR number 2137–12. You can find a copy of the ICR in the docket for this rule, and it is briefly summarized here. The information collection requirements are not enforceable until OMB approves them. OMB has previously approved the information collection activities contained in the existing regulations and has assigned OMB control number 2060–0567.

The information collection activities in this rule include continuous emission monitoring, performance testing, notifications and periodic reports, recording information, monitoring and the maintenance of records. The information generated by these activities will be used by the EPA to ensure that affected facilities comply with the emission limits and other requirements. Records and reports are necessary to enable delegated authorities to identify affected facilities that may not be in compliance with the requirements. Based on reported information, delegated authorities will decide which units and what records or processes should be inspected. The recordkeeping requirements require only the specific information needed to determine compliance. These recordkeeping and reporting requirements are specifically authorized by CAA section 114 (42 U.S.C. 7414). The burden and cost estimates below represent the total burden and cost for the information collection requirements of the NESHAP for Coal- and Oil-Fired EGUs, not just the burden associated with the amendments in this final rule. The incremental cost associated with these amendments is $2.4 million per year.

Respondents/affected entities: The respondents are owners or operators of coal- and oil-fired EGUs. The North American Industry Classification System (NAICS) codes for the coal- and oil-fired EGU industry are 221112, 221122, and 921150.

Respondent's obligation to respond: Mandatory per 42 U.S.C. 7414 *et seq.*

Estimated number of respondents: 192 per year.[104]

Frequency of response: The frequency of responses varies depending on the burden item. Responses include daily calibrations, monthly recordkeeping activities, semiannual compliance reports, and annual reports.

Total estimated burden: 447,000 hours (per year). Burden is defined at 5 CFR part 1320.3(b).

Total estimated cost: $106,600,000 (per year), includes $53,100,000 in annual labor costs and $53,400,000 annualized capital and operation and maintenance costs.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for the EPA's regulations in 40 CFR are listed in 40 CFR part 9. When OMB approves this ICR, the Agency will announce that approval in the **Federal Register** and publish a technical amendment to 40 CFR part 9 to display the OMB control number for the approved information collection activities contained in this final rule.

C. Regulatory Flexibility Act (RFA)

The EPA certifies that this action will not have a significant economic impact on a substantial number of small entities under the RFA. In the 2028 analysis year, the EPA identified 24 potentially affected small entities operating 45 units at 26 facilities, and of these 24, only one small entity may experience compliance cost increases greater than one percent of revenue under the final rule. Details of this analysis are presented in section 5 of the RIA, which is in the public docket.

D. Unfunded Mandates Reform Act (UMRA)

This action does not contain an unfunded mandate of $100 million or more (adjusted for inflation) as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. The costs involved in this action are estimated not to exceed $100 million or more (adjusted for inflation) in any one year.

E. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications as specified in Executive

[104] Each facility is a respondent and some facilities have multiple EGUs.

Order 13175. The Executive order defines tribal implications as ''actions that have substantial direct effects on one or more Indian tribes, on the relationship between the Federal Government and Indian tribes.'' The amendments in this action would not have a substantial direct effect on one or more tribes, change the relationship between the Federal Government and tribes, or affect the distribution of power and responsibilities between the Federal Government and Indian tribes. Thus, Executive Order 13175 does not apply to this action.

Although this action does not have tribal implications as specified in Executive Order 13175, the EPA consulted with tribal officials during the development of this action. On September 1, 2022, the EPA sent a letter to all federally recognized Indian tribes initiating consultation to obtain input on this action. The EPA did not receive any requests for consultation from Indian tribes. The EPA also participated in the September 2022 National Tribal Air Association EPA Air Policy Update Call to solicit input on this action.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

Executive Order 13045 directs Federal agencies to include an evaluation of the health and safety effects of the planned regulation on children in federal health and safety standards and explain why the regulation is preferable to potentially effective and reasonably feasible alternatives. This action is subject to Executive Order 13045 because it is a significant regulatory action under section 3(f)(1) of Executive Order 12866. Accordingly, we have evaluated the potential for environmental health or safety effects from exposure to HAP, ozone, and $PM_{2.5}$ on children. The EPA believes that, even though the 2020 residual risk assessment showed all modeled exposures to HAP to be below thresholds for public health concern, the rule should reduce HAP exposure by reducing emissions of Hg and non-Hg HAP with the potential to reduce HAP exposure to vulnerable populations, including children. The action described in this rule is also expected to lower ozone and $PM_{2.5}$ in many areas, including those areas that struggle to attain or maintain the NAAQS, and thus mitigate some pre-existing health risks across all populations evaluated, including children. The results of this evaluation are contained in the RIA and are available in the docket for this action.

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This action is not a ''significant energy action'' because it is not likely to have a significant adverse effect on the supply, distribution, or use of energy. For 2028, the compliance year for the standards, the EPA does not project a significant change in retail electricity prices on average across the contiguous U.S., coal-fired electricity generation, natural gas-fired electricity generation, or utility power sector delivered natural gas prices. Details of the projected energy effects are presented in section 3 of the RIA, which is in the public docket.

I. National Technology Transfer and Advancement Act (NTTAA) and 1 CFR Part 51

The following standards appear in the amendatory text of this document and were previously approved for the locations in which they appear: ANSI/ASME PTC 19.10–1981, ASTM D6348–03(R2010), and ASTM D6784–16.

J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations and Executive Order 14096: Revitalizing Our Nation's Commitment to Environmental Justice for All

The EPA believes that the human health or environmental conditions that exist prior to this action result in or have the potential to result in disproportionate and adverse human health or environmental effects on communities with environmental justice concerns. For this rule, we employ the proximity demographic analysis and the $PM_{2.5}$ and ozone exposure analyses to evaluate disproportionate and adverse human health and environmental effects on communities with EJ concerns that exist prior to the action. The proximity demographic analysis indicates that on average the population living within 10 kilometers of coal plants potentially impacted by the fPM standards have a higher percentage of people living below two times the poverty level than the national average. In addition, on average the percentage of the American Indian population living within 10 kilometers of lignite-fired plants potentially impacted by the Hg standard is higher than the national average. Baseline $PM_{2.5}$ and ozone and exposure analyses show that certain populations, such as residents of redlined census tracts, those linguistically isolated, Hispanic, Asian, those without a high school diploma, and the unemployed may experience disproportionately higher ozone and $PM_{2.5}$ exposures as compared to the national average. American Indian, residents of Tribal Lands, populations with higher life expectancy or with life expectancy data unavailable, children, and insured populations may also experience disproportionately higher ozone concentrations than the reference group. Hispanics, Blacks, those below the poverty line, and uninsured populations may also experience disproportionately higher $PM_{2.5}$ concentrations than the reference group.

The EPA believes that this action is not likely to change existing disproportionate and adverse effects on communities with environmental justice concerns. Only the exposure analyses, which are based on future air quality modeling, can inform whether there will be potential EJ concerns after implementation of the final rule, and whether potential EJ concerns will be created or mitigated. We infer that baseline disparities in ozone and $PM_{2.5}$ concentration burdens are likely to remain after implementation of the final regulatory option due to the small magnitude of the exposure changes across population demographics associated with the rulemaking relative to the baseline disparities. We also do not find evidence that potential EJ concerns related to ozone or $PM_{2.5}$ exposures will be exacerbated or mitigated in the final regulatory option, compared to the baseline due to the very small differences in the magnitude of post-policy ozone and $PM_{2.5}$ exposure impacts across demographic populations. Additionally, the potential reduction in Hg and non-Hg HAP metal emissions would likely reduce exposures to people living nearby coal plants potentially impacted by the amended fPM standards.

The information supporting this Executive Order review is contained in section IX.F. of this preamble and in section 6, Environmental Justice Impacts of the RIA, which is in the public docket (EPA–HQ–OAR–2018–0794).

K. Congressional Review Act (CRA)

This action is subject to the CRA, and the EPA will submit a rule report to each House of the Congress and to the Comptroller General of the United States. This action meets the criteria set forth in 5 U.S.C. 804(2).

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedures, Air pollution control, Hazardous

substances, Incorporation by reference, Intergovernmental relations, Reporting and recordkeeping requirements.

Michael S. Regan,

Administrator.

For the reasons set forth in the preamble, 40 CFR part 63 is amended as follows:

PART 63—NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart A—General Provisions

■ 2. In § 63.14, paragraph (f)(1) is amended by removing the text ''tables 4 and 5 to subpart UUUUU'' and adding, in its place, the text ''table 5 to subpart UUUUU''.

Subpart UUUUU—National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units

■ 3. Section 63.9991 is amended by revising paragraph (a)(2) to read as follows:

§ 63.9991 What emission limitations, work practice standards, and operating limits must I meet?

(a) * * *

(2) Before July 6, 2027, you must meet each operating limit in Table 4 to this subpart that applies to your EGU.

* * * * *

■ 4. Amend § 63.10000 by:

■ a. Revising paragraph (c)(1)(i) and paragraph (c)(1)(i)(A);

■ b. Redesignating paragraph (c)(1)(i)(C) as paragraph (c)(1)(i)(D);

■ c. Adding new paragraph (c)(1)(i)(C);

■ d. Revising paragraph (c)(1)(iv);

■ e. Adding new paragraphs (c)(1)(iv)(A) through (C);

■ f. Revising paragraphs (c)(2)(i) and (ii);

■ g. Revising paragraph (d)(5)(i); and

■ h. Revising paragraph (m) introductory text.

The revisions and additions read as follows:

§ 63.10000 What are my general requirements for complying with this subpart?

* * * * *

(c) * * *

(1) * * *

(i) For a coal-fired or solid oil-derived fuel-fired EGU or IGCC EGU, you may conduct initial performance testing in accordance with § 63.10005(h), to determine whether the EGU qualifies as a low emitting EGU (LEE) for one or more applicable emission limits, except as otherwise provided in paragraphs (c)(1)(i)(A) through (C) of this section:

(A) Except as provided in paragraph (c)(1)(i)(D) of this section, you may not pursue the LEE option if your coal-fired, IGCC, or solid oil-derived fuel-fired EGU is equipped with a main stack and a bypass stack or bypass duct configuration that allows the effluent to bypass any pollutant control device.

* * * * *

(C) On or after July 6, 2027, you may not pursue the LEE option for filterable PM, total non-Hg HAP metals, or individual non-Hg HAP metals for coal-fired and solid oil-derived fuel-fired EGUs.

* * * * *

(iv)(A) Before July 6, 2027, if your coal-fired or solid oil derived fuel-fired EGU does not qualify as a LEE for total non-mercury HAP metals, individual non-mercury HAP metals, or filterable particulate matter (PM), you must demonstrate compliance through an initial performance test and you must monitor continuous performance through either use of a particulate matter continuous parametric monitoring system (PM CPMS), a PM CEMS, or, for an existing EGU, compliance performance testing repeated quarterly.

(B) On and after July 6, 2027, you may not pursue or continue to use the LEE option for your coal-fired or solid oil derived fuel-fired EGU for filterable PM or for non-mercury HAP metals. You must demonstrate compliance through an initial performance test, and you must monitor continuous performance with the applicable filterable PM emissions limit through the use of a PM CEMS or HAP metals CMS.

(C) If your IGCC EGU does not qualify as a LEE for total non-mercury HAP metals, individual non-mercury HAP metals, or filterable PM, you must demonstrate compliance through an initial performance test and you must monitor continuous performance through either use of a PM CPMS, a PM CEMS, or, for an existing EGU, compliance performance testing repeated quarterly.

* * * * *

(2) * * *

(i) For an existing liquid oil-fired unit, you may conduct the performance testing in accordance with § 63.10005(h), to determine whether the unit qualifies as a LEE for one or more pollutants. For a qualifying LEE for Hg emissions limits, you must conduct a 30-day performance test using Method 30B at least once every 12 calendar months to demonstrate continued LEE status. For a qualifying LEE of any other applicable emissions limits, you must conduct a performance test at least once every 36 calendar months to demonstrate continued LEE status. On or after July 6, 2027, you may not pursue the LEE option for filterable PM, total non-Hg HAP metals, or individual non-Hg HAP metals.

(ii) Before July 6, 2027, if your liquid oil-fired unit does not qualify as a LEE for total HAP metals (including mercury), individual metals (including mercury), or filterable PM you must demonstrate compliance through an initial performance test and you must monitor continuous performance through either use of a PM CPMS, a PM CEMS, or, for an existing EGU, performance testing conducted quarterly. On and after July 6, 2027, you may not pursue or continue to use the LEE option for your liquid oil-fired EGU for filterable PM or for non-mercury HAP metals. You must demonstrate compliance through an initial performance test, and you must monitor continuous performance with the applicable filterable PM emissions limit through the use of a PM CEMS or HAP metals CMS.

(d) * * *

(5) * * *

(i) Installation of the CMS or sorbent trap monitoring system sampling probe or other interface at a measurement location relative to each affected process unit such that the measurement is representative of control of the exhaust emissions (*e.g.,* on or downstream of the last control device). See § 63.10010(a) for further details. For PM CPMS installations (which with the exception of IGCC units, are only applicable before July 6, 2027), follow the procedures in § 63.10010(h).

* * * * *

(m) Should you choose to rely on paragraph (2) of the definition of ''startup'' in § 63.10042 for your EGU (only allowed before January 2, 2025), on or before the date your EGU is subject to this subpart, you must install, verify, operate, maintain, and quality assure each monitoring system necessary for demonstrating compliance with the work practice standards for PM or non-mercury HAP metals controls during startup periods and shutdown periods required to comply with § 63.10020(e). On and after January 2, 2025 you will no longer be able to choose paragraph (2) of the ''startup'' definition in § 63.10042.

* * * * *

■ 5. Amend § 63.10005 by revising paragraphs (a)(1), (b) introductory text, (c), (d)(2) introductory text, (h) introductory text, and (h)(1) introductory text to read as follows:

§ 63.10005 What are my initial compliance requirements and by what date must I conduct them?

(a) * * *

(1) To demonstrate initial compliance with an applicable emissions limit in Table 1 or 2 to this subpart using stack testing, the initial performance test generally consists of three runs at specified process operating conditions using approved methods. Before July 6, 2027, if you are required to establish operating limits (see paragraph (d) of this section and Table 4 to this subpart), you must collect all applicable parametric data during the performance test period. On and after July 6, 2027, the requirements in Table 4 are not applicable, with the exception of IGCC units. Also, if you choose to comply with an electrical output-based emission limit, you must collect hourly electrical load data during the test period.

* * * * *

(b) *Performance testing requirements.* If you choose to use performance testing to demonstrate initial compliance with the applicable emissions limits in Tables 1 and 2 to this subpart for your EGUs, you must conduct the tests according to 40 CFR 63.10007 and Table 5 to this subpart. Notwithstanding these requirements, when Table 5 specifies the use of isokinetic EPA test Method 5, 5I, 5D, 26A, or 29 for a stack test, if concurrent measurement of the stack gas flow rate or moisture content is needed to convert the pollutant concentrations to units of the standard, separate determination of these parameters using EPA test Method 2 or EPA test Method 4 is not necessary. Instead, the stack gas flow rate and moisture content can be determined from data that are collected during the EPA test Method 5, 5I, 5D, 6, 26A, or 29 test (*e.g.,* pitot tube (delta P) readings, moisture collected in the impingers, etc.). For the purposes of the initial compliance demonstration, you may use test data and results from a performance test conducted prior to the date on which compliance is required as specified in 40 CFR 63.9984, provided that the following conditions are fully met:

* * * * *

(c) *Operating limits.* In accordance with § 63.10010 and Table 4 to this subpart, you may be required to establish operating limits using PM CPMS and using site-specific monitoring for certain liquid oil-fired units as part of your initial compliance demonstration. With the exception of IGCC units, on and after July 6, 2027, you may not demonstrate compliance with applicable filterable PM emissions limits with the use of PM CPMS or quarterly stack testing, you may only use PM CEMS.

* * * * *

(d) * * *

(2) For affected coal-fired or solid oil-derived fuel-fired EGUs that demonstrate compliance with the applicable emission limits for total non-mercury HAP metals, individual non-mercury HAP metals, total HAP metals, individual HAP metals, or filterable PM listed in Table 1 or 2 to this subpart using initial performance testing and continuous monitoring with PM CPMS (with the exception of IGCC units, the use of PM CPMS is only allowed before July 6, 2027):

* * * * *

(h) *Low emitting EGUs.* The provisions of this paragraph (h) apply to pollutants with emissions limits from new EGUs except Hg and to all pollutants with emissions limits from existing EGUs. With the exception of IGCC units, on or after July 6, 2027 you may not pursue the LEE option for filterable PM. You may pursue this compliance option unless prohibited pursuant to § 63.10000(c)(1)(i).

(1) An EGU may qualify for low emitting EGU (LEE) status for Hg, HCl, HF, filterable PM, total non-Hg HAP metals, or individual non-Hg HAP metals (or total HAP metals or individual HAP metals, for liquid oil-fired EGUs) if you collect performance test data that meet the requirements of this paragraph (h) with the exception that on or after July 6, 2027, you may not pursue the LEE option for filterable PM, total non-Hg HAP metals, or individual non-Hg HAP metals for any existing, new or reconstructed EGUs (this does not apply to IGCC units), and if those data demonstrate:

* * * * *

■ 6. Amend § 63.10006 by revising paragraph (a) to read as follows:

§ 63.10006 When must I conduct subsequent performance tests or tune-ups?

(a) For liquid oil-fired, solid oil-derived fuel-fired and coal-fired EGUs and IGCC units using PM CPMS before July 6, 2027 to monitor continuous performance with an applicable emission limit as provided for under § 63.10000(c), you must conduct all applicable performance tests according to Table 5 to this subpart and § 63.10007 at least every year. On or after July 6, 2027 you may not use PM CPMS to demonstrate compliance for liquid oil-fired, solid oil-derived fuel-fired and coal-fired EGUs. This prohibition against the use of PM CPMS does not apply to IGCC units.

* * * * *

■ 7. Amend § 63.1007 by revising paragraphs (a)(3) and (c) to read as follows:

§ 63.10007 What methods and other procedures must I use for the performance tests?

(a) * * *

(3) For establishing operating limits with particulate matter continuous parametric monitoring system (PM CPMS) to demonstrate compliance with a PM or non-Hg metals emissions limit (the use of PM CPMS is only allowed before July 6, 2027 with the exception of IGCC units), operate the unit at maximum normal operating load conditions during the performance test period. Maximum normal operating load will be generally between 90 and 110 percent of design capacity but should be representative of site specific normal operations during each test run.

* * * * *

(c) If you choose the filterable PM method to comply with the PM emission limit and demonstrate continuous performance using a PM CPMS as provided for in § 63.10000(c), you must also establish an operating limit according to § 63.10011(b), § 63.10023, and Tables 4 and 6 to this subpart. Should you desire to have operating limits that correspond to loads other than maximum normal operating load, you must conduct testing at those other loads to determine the additional operating limits. On and after July 6, 2027, you must demonstrate continuous compliance with the applicable filterable PM emission standard through the use of a PM CEMS (with the exception that IGCC units are not required to use PM CEMS and may continue to use PM CPMS). Alternatively, you may demonstrate continuous compliance with the non-Hg metals emission standard if you request and receive approval for the use of a HAP metals CMS under § 63.7(f).

* * * * *

■ 8. Amend § 63.10010 by revising paragraphs (a) introductory text, (h) introductory text, (i) introductory text, (j), and (l) introductory text to read as follows:

§ 63.10010 What are my monitoring, installation, operation, and maintenance requirements?

(a) Flue gases from the affected units under this subpart exhaust to the atmosphere through a variety of

different configurations, including but not limited to individual stacks, a common stack configuration or a main stack plus a bypass stack. For the CEMS, PM CPMS (which on or after July 6, 2027 you may not use PM CPMS for filterable PM compliance demonstrations unless it is for an IGCC unit), and sorbent trap monitoring systems used to provide data under this subpart, the continuous monitoring system installation requirements for these exhaust configurations are as follows:

* * * * *

(h) If you use a PM CPMS to demonstrate continuous compliance with an operating limit (only applicable before July 6, 2027 unless it is for an IGCC unit), you must install, calibrate, maintain, and operate the PM CPMS and record the output of the system as specified in paragraphs (h)(1) through (5) of this section.

* * * * *

(i) If you choose to comply with the PM filterable emissions limit in lieu of metal HAP limits (which on or after July 6, 2027 you may not use non-mercury metal HAP limits for compliance demonstrations for existing EGUs unless you request and receive approval for the use of a HAP metals CMS under § 63.7(f)), you may choose to install, certify, operate, and maintain a PM CEMS and record and report the output of the PM CEMS as specified in paragraphs (i)(1) through (8) of this section. With the exception of IGCC units, on or after July 6, 2027 owners/operators of existing EGUs must comply with filterable PM emissions limits in Table 2 of this subpart and demonstrate continuous compliance using a PM CEMS unless you request and receive approval for the use of a HAP metals CMS under § 63.7(f). Compliance with the applicable PM emissions limit in Table 1 or 2 to this subpart is determined on a 30-boiler operating day rolling average basis.

* * * * *

(j) You may choose to comply with the metal HAP emissions limits using CMS approved in accordance with § 63.7(f) as an alternative to the performance test method specified in this rule. If approved to use a HAP metals CMS, the compliance limit will be expressed as a 30-boiler operating day rolling average of the numerical emissions limit value applicable for your unit in tables 1 or 2. If approved, you may choose to install, certify, operate, and maintain a HAP metals CMS and record the output of the HAP metals CMS as specified in paragraphs (j)(1) through (5) of this section.

(1)(i) Install, calibrate, operate, and maintain your HAP metals CMS according to your CMS quality control program, as described in § 63.8(d)(2). The reportable measurement output from the HAP metals CMS must be expressed in units of the applicable emissions limit (*e.g.,* lb/MMBtu, lb/MWh) and in the form of a 30-boiler operating day rolling average.

(ii) Operate and maintain your HAP metals CMS according to the procedures and criteria in your site specific performance evaluation and quality control program plan required in § 63.8(d).

(2) Collect HAP metals CMS hourly average output data for all boiler operating hours except as indicated in section (j)(4) of this section.

(3) Calculate the arithmetic 30-boiler operating day rolling average of all of the hourly average HAP metals CMS output data collected during all nonexempt boiler operating hours data.

(4) You must collect data using the HAP metals CMS at all times the process unit is operating and at the intervals specified in paragraph (a) of this section, except for required monitoring system quality assurance or quality control activities, and any scheduled maintenance as defined in your site-specific monitoring plan.

(i) You must use all the data collected during all boiler operating hours in assessing the compliance with your emission limit except:

(A) Any data collected during periods of monitoring system malfunctions and repairs associated with monitoring system malfunctions. You must report any monitoring system malfunctions as deviations in your compliance reports under 40 CFR 63.10031(c) or (g) (as applicable);

(B) Any data collected during periods when the monitoring system is out of control as specified in your site-specific monitoring plan, repairs associated with periods when the monitoring system is out of control, or required monitoring system quality assurance or quality control activities conducted during out-of-control periods. You must report any out of control periods as deviations in your compliance reports under 40 CFR 63.10031(c) or (g) (as applicable);

(C) Any data recorded during required monitoring system quality assurance or quality control activities that temporarily interrupt the measurement of emissions (*e.g.,* calibrations, certain audits, routine probe maintenance); and

(D) Any data recorded during periods of startup or shutdown.

(ii) You must record and report the results of HAP metals CMS system performance audits, in accordance with 40 CFR 63.10031(k). You must also record and make available upon request the dates and duration of periods when the HAP metals CMS is out of control to completion of the corrective actions necessary to return the HAP metals CMS to operation consistent with your site-specific performance evaluation and quality control program plan.

* * * * *

(l) Should you choose to rely on paragraph (2) of the definition of ''startup'' in § 63.10042 for your EGU (only allowed before January 2, 2025), you must install, verify, operate, maintain, and quality assure each monitoring system necessary for demonstrating compliance with the PM or non-mercury metals work practice standards required to comply with § 63.10020(e). On and after January 2, 2025 you will no longer be able to choose paragraph (2) of the ''startup'' definition in § 63.10042 for your EGU.

* * * * *

■ 9. Amend § 63.10011 by revising paragraphs (b), (g)(3), and (4) introductory text to read as follows:

§ 63.10011 How do I demonstrate initial compliance with the emissions limits and work practice standards?

* * * * *

(b) If you are subject to an operating limit in Table 4 to this subpart, you demonstrate initial compliance with HAP metals or filterable PM emission limit(s) through performance stack tests and you elect to use a PM CPMS to demonstrate continuous performance (with the exception of existing IGCC units, on or after July 6, 2027 you may not use PM CPMS for compliance demonstrations with the applicable filterable PM limits and the Table 4 p.m. CPMS operating limits do not apply), or if, for an IGCC unit, and you use quarterly stack testing for HCl and HF plus site-specific parameter monitoring to demonstrate continuous performance, you must also establish a site-specific operating limit, in accordance with § 63.10007 and Table 6 to this subpart. You may use only the parametric data recorded during successful performance tests (*i.e.,* tests that demonstrate compliance with the applicable emissions limits) to establish an operating limit. On or after July 6, 2027 you may not use PM CPMS for compliance demonstrations with the applicable filterable PM limits and the Table 6 procedures for establishing PM CPMS operating limits do not apply unless it is an IGCC unit.

* * * * *

(g) * * *

(3) You must report the emissions data recorded during startup and shutdown. If you are relying on paragraph (2) of the definition of startup in 40 CFR 63.10042 (only allowed before January 2, 2025), then for startup and shutdown incidents that occur on or prior to December 31, 2023, you must also report the applicable supplementary information in 40 CFR 63.10031(c)(5) in the semiannual compliance report. For startup and shutdown incidents that occur on or after January 1, 2024, you must provide the applicable information in 40 CFR 63.10031(c)(5)(ii) and 40 CFR 63.10020(e) quarterly, in PDF files, in accordance with 40 CFR 63.10031(i).

(4) If you choose to use paragraph (2) of the definition of ''startup'' in § 63.10042 (only allowed before January 2, 2025), and you find that you are unable to safely engage and operate your particulate matter (PM) control(s) within 1 hour of first firing of coal, residual oil, or solid oil-derived fuel, you may choose to rely on paragraph (1) of definition of ''startup'' in § 63.10042 or you may submit a request to use an alternative non-opacity emissions standard, as described below.

* * * * *

■ 10. Section 63.10020 is amended by revising paragraphs (e) introductory text and (e)(3)(i) introductory text to read as follows:

§ 63.10020 How do I monitor and collect data to demonstrate continuous compliance?

* * * * *

(e) Additional requirements during startup periods or shutdown periods if you choose to rely on paragraph (2) of the definition of ''startup'' in § 63.10042 for your EGU (only allowed before January 2, 2025).

* * * * *

(3) * * *

(i) Except for an EGU that uses PM CEMS or PM CPMS to demonstrate compliance with the PM emissions limit, or that has LEE status for filterable PM or total non-Hg HAP metals for non-liquid oil-fired EGUs (or HAP metals emissions for liquid oil-fired EGUs), or individual non-mercury metals CMS (except that unless it is for an IGCC unit, on or after July 6, 2027 you may not use PM CPMS for compliance demonstrations with the applicable filterable PM emissions limits, and you may not purse or continue to use the LEE option for filterable PM, total non-Hg HAP metals, or individual non-Hg HAP metals), you must:

* * * * *

■ 11. Section 63.10021 is amended by revising paragraphs (c) introductory text and (i) to read as follows:

§ 63.10021 How do I demonstrate continuous compliance with the emission limitations, operating limits, and work practice standards?

* * * * *

(c) If you use PM CPMS data (only allowed before July 6, 2027 unless it is for an IGCC unit) to measure compliance with an operating limit in Table 4 to this subpart, you must record the PM CPMS output data for all periods when the process is operating and the PM CPMS is not out-of-control. You must demonstrate continuous compliance by using all quality-assured hourly average data collected by the PM CPMS for all operating hours to calculate the arithmetic average operating parameter in units of the operating limit (*e.g.,* milliamps, PM concentration, raw data signal) on a 30 operating day rolling average basis, updated at the end of each new boiler operating day. Use Equation 9 to determine the 30 boiler operating day average. On or after July 6, 2027 you may not use PM CPMS for compliance demonstrations unless it is for an IGCC unit.

$$30\ boiler\ operating\ day\ average = \frac{\sum_{i=1}^{n} Hpv_i}{n} \quad (Eq.\ 9)$$

Where:

Hpv_i is the hourly parameter value for hour i and n is the number of valid hourly parameter values collected over 30 boiler operating days.

* * * * *

(i) Before January 2, 2025, if you are relying on paragraph 2 of the definition of startup in 40 CFR 63.10042, you must provide reports concerning activities and periods of startup and shutdown that occur on or prior to January 1, 2024, in accordance with 40 CFR 63.10031(c)(5), in your semiannual compliance report. For startup and shutdown incidents that occur on and after January 1, 2024, you must provide the applicable information referenced in 40 CFR 63.10031(c)(5)(ii) and 40 CFR 63.10020(e) quarterly, in PDF files, in accordance with 40 CFR 63.10031(i). On or after January 2, 2025 you may not use paragraph 2 of the definition of startup in 40 CFR 63.10042.

■ 12. Section 63.10022 is amended by revising paragraphs (a)(2) and (3) to read as follows:

§ 63.10022 How do I demonstrate continuous compliance under the emissions averaging provision?

(a) * * *

(2) For each existing unit participating in the emissions averaging option that is equipped with PM CPMS, maintain the average parameter value at or below the operating limit established during the most recent performance test. On or after July 6, 2027 you may not use PM CPMS for filterable PM compliance demonstrations unless it is for an IGCC unit;

(3) For each existing unit participating in the emissions averaging option venting to a common stack configuration containing affected units from other subcategories, maintain the appropriate operating limit for each unit as specified in Table 4 to this subpart that applies. Since on or after July 6, 2027 you may not use PM CPMS, unless it is for an IGCC unit, for compliance demonstrations with the applicable filterable PM limits, the Table 4 p.m. CPMS operating limits do not apply.

* * * * *

■ 13. Section 63.10023 is amended by adding introductory text to the section to read as follows:

§ 63.10023 How do I establish my PM CPMS operating limit and determine compliance with it?

The provisions of this section § 63.10023 are only applicable before July 6, 2027 unless it is for an IGCC unit. On or after July 6, 2027 you may not use PM CPMS, unless it is an IGCC unit, for demonstrating compliance with the filterable PM emissions limits of this subpart.

* * * * *

■ 14. Section 63.10030 is amended by revising paragraphs (e)(3), (8) introductory text, and (8)(i) introductory text to read as follows:

§ 63.10030 What notifications must I submit and when?

* * * * *

(e) * * *

(3) Identification of whether you plan to demonstrate compliance with each applicable emission limit through performance testing; fuel moisture analyses; performance testing with operating limits (*e.g.,* use of PM CPMS—which on or after July 6, 2027—you may not use for filterable PM compliance demonstrations, unless it is for an IGCC unit); CEMS; or a sorbent trap monitoring system.

* * * * *

(8) Identification of whether you plan to rely on paragraph (1) or (2) of the definition of ''startup'' in § 63.10042. On or after January 2, 2025 you may not use paragraph (2) of the definition of startup in § 63.10042.

(i) Before January 2, 2025 should you choose to rely on paragraph (2) of the definition of ''startup'' in § 63.10042 for your EGU, you shall include a report that identifies:

* * * * *

■ 15. Section 63.10031 is amended by revising paragraphs (a)(4), (c)(5) introductory text, (f)(2), (i), and (k) to read as follows:

§ 63.10031 What reports must I submit and when?

(a) * * *

(4) Before July 6, 2027, if you elect to demonstrate continuous compliance using a PM CPMS, you must meet the electronic reporting requirements of appendix D to this subpart. Except for IGCC units, on or after July 6, 2027 you may not use PM CPMS for compliance demonstrations. Electronic reporting of the hourly PM CPMS output shall begin with the later of the first operating hour on or after January 1, 2024; or the first operating hour after completion of the initial performance stack test that establishes the operating limit for the PM CPMS.

(c) * * *

(5) Should you choose to rely on paragraph (2) of the definition of ''startup'' in § 63.10042 for your EGU (only allowed before January 2, 2025), for each instance of startup or shutdown you shall:

* * * * *

(f) * * *

(2) If, for a particular EGU or a group of EGUs serving a common stack, you have elected to demonstrate compliance using a PM CEMS, an approved HAP metals CMS, or a PM CPMS (on or after July 6, 2027 you may not use PM CPMS for compliance demonstrations, unless it is for an IGCC unit), you must submit quarterly PDF reports in accordance with paragraph (f)(6) of this section, which include all of the 30-boiler operating day rolling average emission rates derived from the CEMS data or the 30-boiler operating day rolling average responses derived from the PM CPMS data (as applicable). The quarterly reports are due within 60 days after the reporting periods ending on March 31st, June 30th, September 30th, and December 31st. Submission of these quarterly reports in PDF files shall end with the report that covers the fourth calendar quarter of 2023. Beginning with the first calendar quarter of 2024, the compliance averages shall no longer be reported separately, but shall be incorporated into the quarterly compliance reports described in paragraph (g) of this section. In addition to the compliance averages for PM CEMS, PM CPMS, and/or HAP metals CMS, the quarterly compliance reports described in paragraph (g) of this section must also include the 30- (or, if applicable 90-) boiler operating day rolling average emission rates for Hg, HCl, HF, and/or SO_2, if you have elected to (or are required to) continuously monitor these pollutants. Further, if your EGU or common stack is in an averaging plan, your quarterly compliance reports must identify all of the EGUs or common stacks in the plan and must include all of the 30- (or 90-) group boiler operating day rolling weighted average emission rates (WAERs) for the averaging group.

* * * * *

(i) If you have elected to use paragraph (2) of the definition of ''startup'' in 40 CFR 63.10042 (only allowed before January 2, 2025), then, for startup and shutdown incidents that occur on or prior to December 31, 2023, you must include the information in 40 CFR 63.10031(c)(5) in the semiannual compliance report, in a PDF file. If you have elected to use paragraph (2) of the definition of ''startup'' in 40 CFR 63.10042, then, for startup and shutdown event(s) that occur on or after January 1, 2024, you must use the ECMPS Client Tool to submit the information in 40 CFR 63.10031(c)(5) and 40 CFR 63.10020(e) along with each quarterly compliance report, in a PDF file, starting with a report for the first calendar quarter of 2024. The applicable data elements in paragraphs (f)(6)(i) through (xii) of this section must be entered into ECMPS with each startup and shutdown report.

* * * * *

(k) If you elect to demonstrate compliance using a PM CPMS (on or after July 6, 2027 you may not demonstrate compliance with filterable PM emissions limits using a PM CPMS, unless it is for an IGCC unit) or an approved HAP metals CMS, you must submit quarterly reports of your QA/QC activities (*e.g.,* calibration checks, performance audits), in a PDF file, beginning with a report for the first quarter of 2024, if the PM CPMS or HAP metals CMS is used for the compliance demonstration in that quarter. Otherwise, submit a report for the first calendar quarter in which the PM CPMS or HAP metals CMS is used to demonstrate compliance. These reports are due no later than 60 days after the end of each calendar quarter. The applicable data elements in paragraph (f)(6)(i) through (xii) of this section must be entered into ECMPS with the PDF report.

■ 16. Section 63.10032 is amended by revising paragraphs (a) introductory text and (f)(2) introductory text to read as follows:

§ 63.10032 What records must I keep?

(a) You must keep records according to paragraphs (a)(1) and (2) of this section. If you are required to (or elect to) continuously monitor Hg and/or HCl and/or HF and/or PM emissions, or if you elect to use a PM CPMS (unless it is for an IGCC unit, you may only use PM CPMS before July 6, 2027), you must keep the records required under appendix A and/or appendix B and/or appendix C and/or appendix D to this subpart. If you elect to conduct periodic (*e.g.,* quarterly or annual) performance stack tests, then, for each test completed on or after January 1, 2024, you must keep records of the applicable data elements under 40 CFR 63.7(g). You must also keep records of all data elements and other information in appendix E to this subpart that apply to your compliance strategy.

* * * * *

(f) * * *

(2) Should you choose to rely on paragraph (2) of the definition of ''startup'' in § 63.10042 for your EGU (on or after January 2, 2025 you may not use paragraph (2) of the definition of startup in § 63.10042), you must keep records of:

* * * * *

■ 17. Section 63.10042 is amended by revising the definition ''Startup'' to read as follows:

§ 63.10042 What definitions apply to this subpart?

* * * * *

Startup means:

(1) The first-ever firing of fuel in a boiler for the purpose of producing

electricity, or the firing of fuel in a boiler after a shutdown event for any purpose. Startup ends when any of the steam from the boiler is used to generate electricity for sale over the grid or for any other purpose (including on-site use). Any fraction of an hour in which startup occurs constitutes a full hour of startup.

(2) Alternatively, prior to January 2, 2025, the period in which operation of an EGU is initiated for any purpose. Startup begins with either the firing of any fuel in an EGU for the purpose of producing electricity or useful thermal energy (such as heat or steam) for industrial, commercial, heating, or cooling purposes (other than the first-ever firing of fuel in a boiler following construction of the boiler) or for any other purpose after a shutdown event. Startup ends 4 hours after the EGU generates electricity that is sold or used for any other purpose (including on site use), or 4 hours after the EGU makes useful thermal energy (such as heat or steam) for industrial, commercial, heating, or cooling purposes (16 U.S.C. 796(18)(A) and 18 CFR 292.202(c)), whichever is earlier. Any fraction of an hour in which startup occurs constitutes a full hour of startup.

* * * * *

■ 18. Revise table 1 to subpart UUUUU of part 63 to read as follows:

Table 1 to Subpart UUUUU of Part 63—Emission Limits for New or Reconstructed EGUs

As stated in § 63.9991, you must comply with the following applicable emission limits:

If your EGU is in this subcategory . . .	For the following pollutants . . .	You must meet the following emission limits and work practice standards . . .	Using these requirements, as appropriate (*e.g.,* specified sampling volume or test run duration) and limitations with the test methods in Table 5 to this Subpart . . .
1. Coal-fired unit not low rank virgin coal	a. Filterable particulate matter (PM).	9.0E–2 lb/MWh [1]	Collect a minimum catch of 6.0 milligrams or a minimum sample volume of 4 dscm per run.
	OR	OR	
	Total non-Hg HAP metals.	6.0E–2 lb/GWh	Collect a minimum of 4 dscm per run.
	OR	OR	
	Individual HAP metals:.		Collect a minimum of 3 dscm per run.
	Antimony (Sb)	8.0E–3 lb/GWh.	
	Arsenic (As)	3.0E–3 lb/GWh.	
	Beryllium (Be)	6.0E–4 lb/GWh.	
	Cadmium (Cd)	4.0E–4 lb/GWh.	
	Chromium (Cr)	7.0E–3 lb/GWh.	
	Cobalt (Co)	2.0E–3 lb/GWh.	
	Lead (Pb)	2.0E–2 lb/GWh.	
	Manganese (Mn)	4.0E–3 lb/GWh.	
	Nickel (Ni)	4.0E–2 lb/GWh.	
	Selenium (Se)	5.0E–2 lb/GWh.	
	b. Hydrogen chloride (HCl).	1.0E–2 lb/MWh	For Method 26A at appendix A–8 to part 60 of this chapter, collect a minimum of 3 dscm per run. For ASTM D6348–03(Reapproved 2010) [2] or Method 320 at appendix A to part 63 of this chapter, sample for a minimum of 1 hour.
	OR		
	Sulfur dioxide (SO_2) [3].	1.0 lb/MWh	SO_2 CEMS.
	c. Mercury (Hg)	3.0E–3 lb/GWh	Hg CEMS or sorbent trap monitoring system only.
2. Coal-fired units low rank virgin coal	a. Filterable particulate matter (PM).	9.0E–2 lb/MWh [1]	Collect a minimum catch of 6.0 milligrams or a minimum sample volume of 4 dscm per run.
	OR	OR	
	Total non-Hg HAP metals.	6.0E–2 lb/GWh	Collect a minimum of 4 dscm per run.
	OR	OR	
	Individual HAP metals:.		Collect a minimum of 3 dscm per run.
	Antimony (Sb)	8.0E–3 lb/GWh.	
	Arsenic (As)	3.0E–3 lb/GWh.	
	Beryllium (Be)	6.0E–4 lb/GWh.	
	Cadmium (Cd)	4.0E–4 lb/GWh.	
	Chromium (Cr)	7.0E–3 lb/GWh.	
	Cobalt (Co)	2.0E–3 lb/GWh.	
	Lead (Pb)	2.0E–2 lb/GWh.	
	Manganese (Mn)	4.0E–3 lb/GWh.	
	Nickel (Ni)	4.0E–2 lb/GWh.	
	Selenium (Se)	5.0E–2 lb/GWh.	
	b. Hydrogen chloride (HCl).	1.0E–2 lb/MWh	For Method 26A, collect a minimum of 3 dscm per run For ASTM D6348–03(Reapproved 2010) [2] or Method 320, sample for a minimum of 1 hour.
	OR		
	Sulfur dioxide (SO_2) [3].	1.0 lb/MWh	SO_2 CEMS.

If your EGU is in this subcategory . . .	For the following pollutants . . .	You must meet the following emission limits and work practice standards . . .	Using these requirements, as appropriate (*e.g.,* specified sampling volume or test run duration) and limitations with the test methods in Table 5 to this Subpart . . .
	c. Mercury (Hg)	Before July 8, 2024: 4.0E–2 lb/GWh; On or after July 8, 2024: 1.3E–2 lb/GWh.	Hg CEMS or sorbent trap monitoring system only.
3. IGCC unit	a. Filterable particulate matter (PM).	7.0E–2 lb/MWh [4] 9.0E–2 lb/MWh [5].	Collect a minimum catch of 3.0 milligrams or a minimum sample volume of 2 dscm per run.
	OR	OR	
	Total non-Hg HAP metals.	4.0E–1 lb/GWh	Collect a minimum of 1 dscm per run.
	OR	OR	
	Individual HAP metals:.		Collect a minimum of 2 dscm per run.
	Antimony (Sb)	2.0E–2 lb/GWh.	
	Arsenic (As)	2.0E–2 lb/GWh.	
	Beryllium (Be)	1.0E–3 lb/GWh.	
	Cadmium (Cd)	2.0E–3 lb/GWh.	
	Chromium (Cr)	4.0E–2 lb/GWh.	
	Cobalt (Co)	4.0E–3 lb/GWh.	
	Lead (Pb)	9.0E–3 lb/GWh.	
	Manganese (Mn)	2.0E–2 lb/GWh.	
	Nickel (Ni)	7.0E–2 lb/GWh.	
	Selenium (Se)	3.0E–1 lb/GWh.	
	b. Hydrogen chloride (HCl).	2.0E–3 lb/MWh	For Method 26A, collect a minimum of 1 dscm per run; for Method 26 at appendix A–8 to part 60 of this chapter, collect a minimum of 120 liters per run. For ASTM D6348–03(Reapproved 2010) [2] or Method 320, sample for a minimum of 1 hour.
	OR		
	Sulfur dioxide (SO_2) [3].	4.0E–1 lb/MWh	SO_2 CEMS.
	c. Mercury (Hg)	3.0E–3 lb/GWh	Hg CEMS or sorbent trap monitoring system only.
4. Liquid oil-fired unit—continental (excluding limited-use liquid oil-fired subcategory units).	a. Filterable particulate matter (PM).	3.0E–1 lb/MWh [1]	Collect a minimum of 1 dscm per run.
	OR	OR	
	Total HAP metals	2.0E–4 lb/MWh	Collect a minimum of 2 dscm per run.
	OR	OR	
	Individual HAP metals:.		Collect a minimum of 2 dscm per run.
	Antimony (Sb)	1.0E–2 lb/GWh.	
	Arsenic (As)	3.0E–3 lb/GWh.	
	Beryllium (Be)	5.0E–4 lb/GWh.	
	Cadmium (Cd)	2.0E–4 lb/GWh.	
	Chromium (Cr)	2.0E–2 lb/GWh.	
	Cobalt (Co)	3.0E–2 lb/GWh.	
	Lead (Pb)	8.0E–3 lb/GWh.	
	Manganese (Mn)	2.0E–2 lb/GWh.	
	Nickel (Ni)	9.0E–2 lb/GWh.	
	Selenium (Se)	2.0E–2 lb/GWh.	
	Mercury (Hg)	1.0E–4 lb/GWh	For Method 30B at appendix A–8 to part 60 of this chapter sample volume determination (Section 8.2.4), the estimated Hg concentration should nominally be <½ the standard.
	b. Hydrogen chloride (HCl).	4.0E–4 lb/MWh	For Method 26A, collect a minimum of 3 dscm per run. For ASTM D6348–03(Reapproved 2010) [2] or Method 320, sample for a minimum of 1 hour.
	c. Hydrogen fluoride (HF).	4.0E–4 lb/MWh	For Method 26A, collect a minimum of 3 dscm per run. For ASTM D6348–03 (Reapproved 2010) [2] or Method 320, sample for a minimum of 1 hour.
5. Liquid oil-fired unit—non-continental (excluding limited-use liquid oil-fired subcategory units).	a. Filterable particulate matter (PM).	2.0E–1 lb/MWh [1]	Collect a minimum of 1 dscm per run.
	OR	OR	
	Total HAP metals	7.0E–3 lb/MWh	Collect a minimum of 1 dscm per run.
	OR	OR	
	Individual HAP metals:.		Collect a minimum of 3 dscm per run.
	Antimony (Sb)	8.0E–3 lb/GWh.	

If your EGU is in this subcategory . . .	For the following pollutants . . .	You must meet the following emission limits and work practice standards . . .	Using these requirements, as appropriate (*e.g.,* specified sampling volume or test run duration) and limitations with the test methods in Table 5 to this Subpart . . .
	Arsenic (As)	6.0E–2 lb/GWh.	
	Beryllium (Be)	2.0E–3 lb/GWh.	
	Cadmium (Cd)	2.0E–3 lb/GWh.	
	Chromium (Cr)	2.0E–2 lb/GWh.	
	Cobalt (Co)	3.0E–1 lb/GWh.	
	Lead (Pb)	3.0E–2 lb/GWh.	
	Manganese (Mn)	1.0E–1 lb/GWh.	
	Nickel (Ni)	4.1E0 lb/GWh.	
	Selenium (Se)	2.0E–2 lb/GWh.	
	Mercury (Hg)	4.0E–4 lb/GWh	For Method 30B sample volume determination (Section 8.2.4), the estimated Hg concentration should nominally be <½ the standard.
	b. Hydrogen chloride (HCl).	2.0E–3 lb/MWh	For Method 26A, collect a minimum of 1 dscm per run; for Method 26, collect a minimum of 120 liters per run. For ASTM D6348–03 (Reapproved 2010) [2] or Method 320, sample for a minimum of 1 hour.
	c. Hydrogen fluoride (HF).	5.0E–4 lb/MWh	For Method 26A, collect a minimum of 3 dscm per run. For ASTM D6348–03 (Reapproved 2010) [2] or Method 320, sample for a minimum of 1 hour.
6. Solid oil-derived fuel-fired unit	a. Filterable particulate matter (PM).	3.0E–2 lb/MWh [1]	Collect a minimum of 1 dscm per run.
	OR	OR	
	Total non-Hg HAP metals.	6.0E–1 lb/GWh	Collect a minimum of 1 dscm per run.
	OR	OR	
	Individual HAP metals:.		Collect a minimum of 3 dscm per run.
	Antimony (Sb)	8.0E–3 lb/GWh.	
	Arsenic (As)	3.0E–3 lb/GWh.	
	Beryllium (Be)	6.0E–4 lb/GWh.	
	Cadmium (Cd)	7.0E–4 lb/GWh.	
	Chromium (Cr)	6.0E–3 lb/GWh.	
	Cobalt (Co)	2.0E–3 lb/GWh.	
	Lead (Pb)	2.0E–2 lb/GWh.	
	Manganese (Mn)	7.0E–3 lb/GWh.	
	Nickel (Ni)	4.0E–2 lb/GWh.	
	Selenium (Se)	6.0E–3 lb/GWh.	
	b. Hydrogen chloride (HCl).	4.0E–4 lb/MWh	For Method 26A, collect a minimum of 3 dscm per run. For ASTM D6348–03 (Reapproved 2010) [2] or Method 320, sample for a minimum of 1 hour.
	OR		
	Sulfur dioxide (SO_2) [3].	1.0 lb/MWh	SO_2 CEMS.
	c. Mercury (Hg)	2.0E–3 lb/GWh	Hg CEMS or Sorbent trap monitoring system only.

[1] Gross output.
[2] Incorporated by reference, see § 63.14.
[3] You may not use the alternate SO_2 limit if your EGU does not have some form of FGD system (or, in the case of IGCC EGUs, some other acid gas removal system either upstream or downstream of the combined cycle block) and SO_2 CEMS installed.
[4] Duct burners on syngas; gross output.
[5] Duct burners on natural gas; gross output.

■ 19. Revise table 2 to subpart UUUUU of part 63 to read as follows:

Table 2 to Subpart UUUUU of Part 63—Emission Limits for Existing EGUs

As stated in § 63.9991, you must comply with the following applicable emission limits: [1]

If your EGU is in this subcategory . . .	For the following pollutants . . .	You must meet the following emission limits and work practice standards . . .	Using these requirements, as appropriate (*e.g.,* specified sampling volume or test run duration) and limitations with the test methods in Table 5 to this Subpart . . .
1. Coal-fired unit not low rank virgin coal	a. Filterable particulate matter (PM).	Before July 6, 2027: 3.0E–2 lb/MMBtu or 3.0E–1 lb/MWh [2].	Before July 6, 2027: Collect a minimum of 1 dscm per run.

If your EGU is in this subcategory . . .	For the following pollutants . . .	You must meet the following emission limits and work practice standards . . .	Using these requirements, as appropriate (*e.g.,* specified sampling volume or test run duration) and limitations with the test methods in Table 5 to this Subpart . . .
		On or after July 6, 2027: 1.0E–2 lb/MMBtu or 1.0E–1 lb/MWh [2].	On or after July 6, 2027: Collect a minimum catch of 6.0 milligrams or a minimum sample volume of 4 dscm per run.
	OR	OR	On or after July 6, 2027 you may only demonstrate compliance with the following total non-Hg HAP metals emission limit if you request and receive approval for the use of a non-Hg HAP metals CMS under 40 CFR 63.7(f).
	Total non-Hg HAP metals.	Before July 6, 2027: 5.0E–5 lb/MMBtu or 5.0E–1 lb/GWh. On or after July 6, 2027: 1.7E–5 lb/MMBtu or 1.7E–1 lb/GWh.	Collect a minimum of 1 dscm per run.
	OR	OR	On or after July 6, 2027 you may only demonstrate compliance with the following individual HAP metals emissions limits if you request and receive approval for the use of a non-Hg HAP metals CMS under 40 CFR 63.7(f).
	Individual HAP metals:.	....	Collect a minimum of 3 dscm per run.
	Antimony (Sb)	Before July 6, 2027: 8.0E–1 lb/TBtu or 8.0E–3 lb/GWh. On or after July 6, 2027: 2.7E–1 lb/TBtu or 2.7E–3 lb/GWh.	
	Arsenic (As)	Before July 6, 2027: 1.1E0 lb/TBtu or 2.0E–2 lb/GWh. On or after July 6, 2027: 3.7E–1 lb/TBtu or 6.7E–3 lb/GWh.	
	Beryllium (Be)	Before July 6, 2027: 2.0E–1 lb/TBtu or 2.0E–3 lb/GWh. On or after July 6, 2027: 6.7E–2 lb/TBtu or 6.7E–4 lb/GWh.	
	Cadmium (Cd)	Before July 6, 2027: 3.0E–1 lb/TBtu or 3.0E–3 lb/GWh. On or after July 6, 2027: 1.0E–1 lb/TBtu or 1.0E–3 lb/GWh.	
	Chromium (Cr)	Before July 6, 2027: 2.8E0 lb/TBtu or 3.0E–2 lb/GWh. On or after July 6, 2027: 9.3E–1 lb/TBtu or 1.0E–2 lb/GWh.	

If your EGU is in this subcategory . . .	For the following pollutants . . .	You must meet the following emission limits and work practice standards . . .	Using these requirements, as appropriate (*e.g.,* specified sampling volume or test run duration) and limitations with the test methods in Table 5 to this Subpart . . .
	Cobalt (Co)	Before July 6, 2027: 8.0E–1 lb/TBtu or 8.0E–3 lb/GWh. On or after July 6, 2027: 2.7E–1 lb/TBtu or 2.7E–3 lb/GWh.	
	Lead (Pb)	Before July 6, 2027: 1.2E0 lb/TBtu or 2.0E–2 lb/GWh. On or after July 6, 2027: 4.0E–1 lb/TBtu or 6.7E–3 lb/GWh.	
	Manganese (Mn)	Before July 6, 2027: 4.0E0 lb/TBtu or 5.0E–2 lb/GWh. On or after July 6, 2027: 1.3E0 lb/TBtu or 1.7E–2 lb/GWh.	
	Nickel (Ni)	Before July 6, 2027: 3.5E0 lb/TBtu or 4.0E–2 lb/GWh. On or after July 6, 2027: 1.2E0 lb/TBtu or 1.3E–2 lb/GWh.	
	Selenium (Se)	Before July 6, 2027: 5.0E0 lb/TBtu or 6.0E–2 lb/GWh. On or after July 6, 2027: 1.7E0 lb/TBtu or 2.0E–2 lb/GWh.	
	b. Hydrogen chloride (HCl).	2.0E–3 lb/MMBtu or 2.0E–2 lb/MWh.	For Method 26A at appendix A–8 to part 60 of this chapter, collect a minimum of 0.75 dscm per run; for Method 26, collect a minimum of 120 liters per run. For ASTM D6348–03 (Reapproved 2010) [3] or Method 320 at appendix A to part 63 of this chapter, sample for a minimum of 1 hour.
	OR		
	Sulfur dioxide (SO_2) [4].	2.0E–1 lb/MMBtu or 1.5E0 lb/MWh.	SO_2 CEMS.
	c. Mercury (Hg)	1.2E0 lb/TBtu or 1.3E–2 lb/GWh.	LEE Testing for 30 days with a sampling period consistent with that given in section 5.2.1 of appendix A to this subpart per Method 30B at appendix A–8 to part 60 of this chapter run or Hg CEMS or sorbent trap monitoring system only.
		OR	
		1.0E0 lb/TBtu or 1.1E–2 lb/GWh.	LEE Testing for 90 days with a sampling period consistent with that given in section 5.2.1 of appendix A to this subpart per Method 30B run or Hg CEMS or sorbent trap monitoring system only.
2. Coal-fired unit low rank virgin coal	a. Filterable particulate matter (PM).	Before July 6, 2027: 3.0E–2 lb/MMBtu or 3.0E–1 lb/MWh [2]. On or after July 6, 2027: 1.0E–2 lb/MMBtu or 1.0E–1 lb/MWh [2].	Before July 6, 2027: Collect a minimum of 1 dscm per run. On or after July 6, 2027: Collect a minimum catch of 6.0 milligrams or a minimum sample volume of 4 dscm per run.

If your EGU is in this subcategory . . .	For the following pollutants . . .	You must meet the following emission limits and work practice standards . . .	Using these requirements, as appropriate (*e.g.,* specified sampling volume or test run duration) and limitations with the test methods in Table 5 to this Subpart . . .
	OR	OR	On or after July 6, 2027 you may only demonstrate compliance with the following total non-Hg HAP metals emission limit if you request and receive approval for the use of a non-Hg HAP metals CMS under 40 CFR 63.7(f).
	Total non-Hg HAP metals.	Before July 6, 2027: 5.0E–5 lb/MMBtu or 5.0E–1 lb/GWh. On or after July 6, 2027: 1.7E–5 lb/MMBtu or 1.7E–1 lb/GWh.	Collect a minimum of 1 dscm per run.
	OR	OR	On or after July 6, 2027 you may only demonstrate compliance with the following individual HAP metals emissions limits if you request and receive approval for the use of a non-Hg HAP metals CMS under 40 CFR 63.7(f).
	Individual HAP metals:.	....	Collect a minimum of 3 dscm per run.
	Antimony (Sb)	Before July 6, 2027: 8.0E–1 lb/TBtu or 8.0E–3 lb/GWh. On or after July 6, 2027: 2.7E–1 lb/TBtu or 2.7E–3 lb/GWh.	
	Arsenic (As)	Before July 6, 2027: 1.1E0 lb/TBtu or 2.0E–2 lb/GWh. On or after July 6, 2027: 3.7E–1 lb/TBtu or 6.7E–3 lb/GWh.	
	Beryllium (Be)	Before July 6, 2027: 2.0E–1 lb/TBtu or 2.0E–3 lb/GWh. On or after July 6, 2027: 6.7E–2 lb/TBtu or 6.7E–4 lb/GWh.	
	Cadmium (Cd)	Before July 6, 2027: 3.0E–1 lb/TBtu or 3.0E–3 lb/GWh. On or after July 6, 2027: 1.0E–1 lb/TBtu or 1.0E–3 lb/GWh.	
	Chromium (Cr)	Before July 6, 2027: 2.8E0 lb/TBtu or 3.0E–2 lb/GWh. On or after July 6, 2027: 9.3E–1 lb/TBtu or 1.0E–2 lb/GWh.	
	Cobalt (Co)	Before July 6, 2027: 8.0E–1 lb/TBtu or 8.0E–3 lb/GWh. On or after July 6, 2027: 2.7E–1 lb/TBtu or 2.7E–3 lb/GWh.	

If your EGU is in this subcategory . . .	For the following pollutants . . .	You must meet the following emission limits and work practice standards . . .	Using these requirements, as appropriate (*e.g.,* specified sampling volume or test run duration) and limitations with the test methods in Table 5 to this Subpart . . .
	Lead (Pb)	Before July 6, 2027: 1.2E0 lb/TBtu or 2.0E–2 lb/GWh. On or after July 6, 2027: 4.0E–1 lb/TBtu or 6.7E–3 lb/GWh.	
	Manganese (Mn)	Before July 6, 2027: 4.0E0 lb/TBtu or 5.0E–2 lb/GWh. On or after July 6, 2027: 1.3E0 lb/TBtu or 1.7E–2 lb/GWh.	
	Nickel (Ni)	Before July 6, 2027: 3.5E0 lb/TBtu or 4.0E–2 lb/GWh. On or after July 6, 2027: 1.2E0 lb/TBtu or 1.3E–2 lb/GWh.	
	Selenium (Se)	Before July 6, 2027: 5.0E0 lb/TBtu or 6.0E–2 lb/GWh. On or after July 6, 2027: 1.7E0 lb/TBtu or 2.0E–2 lb/GWh.	
	b. Hydrogen chloride (HCl).	2.0E–3 lb/MMBtu or 2.0E–2 lb/MWh.	For Method 26A, collect a minimum of 0.75 dscm per run; for Method 26 at appendix A–8 to part 60 of this chapter, collect a minimum of 120 liters per run. For ASTM D6348–03 (Reapproved 2010) [3] or Method 320, sample for a minimum of 1 hour.
	OR	OR	
	Sulfur dioxide (SO_2) [4].	2.0E–1 lb/MMBtu or 1.5E0 lb/MWh.	SO_2 CEMS.
	c. Mercury (Hg)	Before July 6, 2027: 4.0E0 lb/TBtu or 4.0E–2 lb/GWh. On or after July 6, 2027: 1.2E0 lb/TBtu or 1.3E–2 lb/GWh.	LEE Testing for 30 days with a sampling period consistent with that given in section 5.2.1 of appendix A to this subpart per Method 30B run or Hg CEMS or sorbent trap monitoring system only.
3. IGCC unit	a. Filterable particulate matter (PM).	4.0E–2 lb/MMBtu or 4.0E–1 lb/MWh [2].	Before July 6, 2027: Collect a minimum of 1 dscm per run. On or after July 6, 2027: Collect a minimum catch of 3.0 milligrams or a minimum sample volume of 2 dscm per run.
	OR	OR	
	Total non-Hg HAP metals.	6.0E–5 lb/MMBtu or 5.0E–1 lb/GWh.	Collect a minimum of 1 dscm per run.
	OR	OR	
	Individual HAP metals:.	....	Collect a minimum of 2 dscm per run.
	Antimony (Sb)	1.4E0 lb/TBtu or 2.0E–2 lb/GWh.	
	Arsenic (As)	1.5E0 lb/TBtu or 2.0E–2 lb/GWh.	
	Beryllium (Be)	1.0E–1 lb/TBtu or 1.0E–3 lb/GWh.	
	Cadmium (Cd)	1.5E–1 lb/TBtu or 2.0E–3 lb/GWh.	
	Chromium (Cr)	2.9E0 lb/TBtu or 3.0E–2 lb/GWh.	

If your EGU is in this subcategory . . .	For the following pollutants . . .	You must meet the following emission limits and work practice standards . . .	Using these requirements, as appropriate (*e.g.,* specified sampling volume or test run duration) and limitations with the test methods in Table 5 to this Subpart . . .
	Cobalt (Co)	1.2E0 lb/TBtu or 2.0E–2 lb/GWh.	
	Lead (Pb)	1.9E+2 lb/TBtu or 1.8E0 lb/GWh.	
	Manganese (Mn)	2.5E0 lb/TBtu or 3.0E–2 lb/GWh.	
	Nickel (Ni)	6.5E0 lb/TBtu or 7.0E–2 lb/GWh.	
	Selenium (Se)	2.2E+1 lb/TBtu or 3.0E–1 lb/GWh.	
	b. Hydrogen chloride (HCl).	5.0E–4 lb/MMBtu or 5.0E–3 lb/MWh.	For Method 26A, collect a minimum of 1 dscm per run; for Method 26, collect a minimum of 120 liters per run. For ASTM D6348–03 (Reapproved 2010) [3] or Method 320, sample for a minimum of 1 hour.
	c. Mercury (Hg)	2.5E0 lb/TBtu or 3.0E–2 lb/GWh.	LEE Testing for 30 days with a sampling period consistent with that given in section 5.2.1 of appendix A to this subpart per Method 30B run or Hg CEMS or sorbent trap monitoring system only.
4. Liquid oil-fired unit—continental (excluding limited-use liquid oil-fired subcategory units).	a. Filterable particulate matter (PM).	3.0E–2 lb/MMBtu or 3.0E–1 lb/MWh [2].	Collect a minimum of 1 dscm per run.
	OR	OR	On or after July 6, 2027 you may only demonstrate compliance with the following total non-Hg HAP metals emission limit if you request and receive approval for the use of a non-Hg HAP metals CMS under 40 CFR 63.7(f).
	Total HAP metals	8.0E–4 lb/MMBtu or 8.0E–3 lb/MWh.	Collect a minimum of 1 dscm per run.
	OR	OR	On or after July 6, 2027 you may only demonstrate compliance with the following individual HAP metals emissions limits if you request and receive approval for the use of a non-Hg HAP metals CMS under 40 CFR 63.7(f).
	Individual HAP metals:.	....	Collect a minimum of 1 dscm per run.
	Antimony (Sb)	1.3E+1 lb/TBtu or 2.0E–1 lb/GWh.	
	Arsenic (As)	2.8E0 lb/TBtu or 3.0E–2 lb/GWh.	
	Beryllium (Be)	2.0E–1 lb/TBtu or 2.0E–3 lb/GWh.	
	Cadmium (Cd)	3.0E–1 lb/TBtu or 2.0E–3 lb/GWh.	
	Chromium (Cr)	5.5E0 lb/TBtu or 6.0E–2 lb/GWh.	
	Cobalt (Co)	2.1E+1 lb/TBtu or 3.0E–1 lb/GWh.	
	Lead (Pb)	8.1E0 lb/TBtu or 8.0E–2 lb/GWh.	
	Manganese (Mn)	2.2E+1 lb/TBtu or 3.0E–1 lb/GWh.	
	Nickel (Ni)	1.1E+2 lb/TBtu or 1.1E0 lb/GWh.	
	Selenium (Se)	3.3E0 lb/TBtu or 4.0E–2 lb/GWh.	
	Mercury (Hg)	2.0E–1 lb/TBtu or 2.0E–3 lb/GWh.	For Method 30B sample volume determination (Section 8.2.4), the estimated Hg concentration should nominally be <½ the standard.
	b. Hydrogen chloride (HCl).	2.0E–3 lb/MMBtu or 1.0E–2 lb/MWh.	For Method 26A, collect a minimum of 1 dscm per run; for Method 26, collect a minimum of 120 liters per run. For ASTM D6348–03 (Reapproved 2010) [3] or Method 320, sample for a minimum of 1 hour.
	c. Hydrogen fluoride (HF).	4.0E–4 lb/MMBtu or 4.0E–3 lb/MWh.	For Method 26A, collect a minimum of 1 dscm per run; for Method 26, collect a minimum of 120 liters per run. For ASTM D6348–03 (Reapproved 2010) [3] or Method 320, sample for a minimum of 1 hour.
5. Liquid oil-fired unit—non-continental (excluding limited-use liquid oil-fired subcategory units).	a. Filterable particulate matter (PM).	3.0E–2 lb/MMBtu or 3.0E–1 lb/MWh [2].	Collect a minimum of 1 dscm per run.

If your EGU is in this subcategory . . .	For the following pollutants . . .	You must meet the following emission limits and work practice standards . . .	Using these requirements, as appropriate (*e.g.,* specified sampling volume or test run duration) and limitations with the test methods in Table 5 to this Subpart . . .
	OR	OR	On or after July 6, 2027 you may only demonstrate compliance with the following total non-Hg HAP metals emission limit if you request and receive approval for the use of a non-Hg HAP metals CMS under 40 CFR 63.7(f).
	Total HAP metals ..	6.0E–4 lb/MMBtu or 7.0E–3 lb/MWh.	Collect a minimum of 1 dscm per run.
	OR	OR	On or after July 6, 2027 you may only demonstrate compliance with the following individual HAP metals emissions limits if you request and receive approval for the use of a non-Hg HAP metals CMS under 40 CFR 63.7(f).
	Individual HAP metals:.	....	Collect a minimum of 2 dscm per run.
	Antimony (Sb)	2.2E0 lb/TBtu or 2.0E–2 lb/GWh.	
	Arsenic (As)	4.3E0 lb/TBtu or 8.0E–2 lb/GWh.	
	Beryllium (Be)	6.0E–1 lb/TBtu or 3.0E–3 lb/GWh.	
	Cadmium (Cd)	3.0E–1 lb/TBtu or 3.0E–3 lb/GWh.	
	Chromium (Cr)	3.1E+1 lb/TBtu or 3.0E–1 lb/GWh.	
	Cobalt (Co)	1.1E+2 lb/TBtu or 1.4E0 lb/GWh.	
	Lead (Pb)	4.9E0 lb/TBtu or 8.0E–2 lb/GWh.	
	Manganese (Mn) ...	2.0E+1 lb/TBtu or 3.0E–1 lb/GWh.	
	Nickel (Ni)	4.7E+2 lb/TBtu or 4.1E0 lb/GWh.	
	Selenium (Se)	9.8E0 lb/TBtu or 2.0E–1 lb/GWh.	
	Mercury (Hg)	4.0E–2 lb/TBtu or 4.0E–4 lb/GWh.	For Method 30B sample volume determination (Section 8.2.4), the estimated Hg concentration should nominally be <½ the standard.
	b. Hydrogen chloride (HCl).	2.0E–4 lb/MMBtu or 2.0E–3 lb/MWh.	For Method 26A, collect a minimum of 1 dscm per run; for Method 26, collect a minimum of 120 liters per run. For ASTM D6348–03 (Reapproved 2010)[3] or Method 320, sample for a minimum of 2 hours.
	c. Hydrogen fluoride (HF).	6.0E–5 lb/MMBtu or 5.0E–4 lb/MWh.	For Method 26A, collect a minimum of 3 dscm per run. For ASTM D6348–03 (Reapproved 2010)[3] or Method 320, sample for a minimum of 2 hours.
6. Solid oil-derived fuel-fired unit	a. Filterable particulate matter (PM).	8.0E–3 lb/MMBtu or 9.0E–2 lb/MWh[2].	Before July 6, 2027: Collect a minimum of 1 dscm per run. On or after July 6, 2027: Collect a minimum catch of 6.0 milligrams or a minimum sample volume of 4 dscm per run.
	OR	OR	On or after July 6, 2027 you may only demonstrate compliance with the following total non-Hg HAP metals emission limit if you request and receive approval for the use of a non-Hg HAP metals CMS under 40 CFR 63.7(f).
	Total non-Hg HAP metals.	4.0E–5 lb/MMBtu or 6.0E–1 lb/GWh.	Collect a minimum of 1 dscm per run.
	OR	OR	On or after July 6, 2027 you may only demonstrate compliance with the following individual HAP metals emissions limits if you request and receive approval for the use of a non-Hg HAP metals CMS under 40 CFR 63.7(f).
	Individual HAP metals:.	....	Collect a minimum of 3 dscm per run.
	Antimony (Sb)	8.0E–1 lb/TBtu or 7.0E–3 lb/GWh.	
	Arsenic (As)	3.0E–1 lb/TBtu or 5.0E–3 lb/GWh.	

If your EGU is in this subcategory . . .	For the following pollutants . . .	You must meet the following emission limits and work practice standards . . .	Using these requirements, as appropriate (*e.g.,* specified sampling volume or test run duration) and limitations with the test methods in Table 5 to this Subpart . . .
	Beryllium (Be)	6.0E–2 lb/TBtu or 5.0E–4 lb/GWh.	
	Cadmium (Cd)	3.0E–1 lb/TBtu or 4.0E–3 lb/GWh.	
	Chromium (Cr)	8.0E–1 lb/TBtu or 2.0E–2 lb/GWh.	
	Cobalt (Co)	1.1E0 lb/TBtu or 2.0E–2 lb/GWh.	
	Lead (Pb)	8.0E–1 lb/TBtu or 2.0E–2 lb/GWh.	
	Manganese (Mn)	2.3E0 lb/TBtu or 4.0E–2 lb/GWh.	
	Nickel (Ni)	9.0E0 lb/TBtu or 2.0E–1 lb/GWh.	
	Selenium (Se)	1.2E0 lb/TBtu or 2.0E–2 lb/GWh.	
	b. Hydrogen chloride (HCl).	5.0E–3 lb/MMBtu or 8.0E–2 lb/MWh.	For Method 26A, collect a minimum of 0.75 dscm per run; for Method 26, collect a minimum of 120 liters per run. For ASTM D6348–03 (Reapproved 2010)[3] or Method 320, sample for a minimum of 1 hour.
	OR	OR	
	Sulfur dioxide (SO_2)[4].	3.0E–1 lb/MMBtu or 2.0E0 lb/MWh.	SO_2 CEMS.
	c. Mercury (Hg)	2.0E–1 lb/TBtu or 2.0E–3 lb/GWh.	LEE Testing for 30 days with a sampling period consistent with that given in section 5.2.1 of appendix A to this subpart per Method 30B run or Hg CEMS or sorbent trap monitoring system only.
7. Eastern Bituminous Coal Refuse (EBCR)-fired unit.	a. Filterable particulate matter (PM).	Before July 6, 2027: 3.0E–2 lb/MMBtu or 3.0E–1 lb/MWh[2]. On or after July 6, 2027: 1.0E–2 lb/MMBtu or 1.0E–1 lb/MWh[2].	Before July 6, 2027: Collect a minimum of 1 dscm per run. On or after July 6, 2027: Collect a minimum catch of 6.0 milligrams or a minimum sample volume of 4 dscm per run.
	OR	OR	On or after July 6, 2027 you may only demonstrate compliance with the following total non-Hg HAP metals emission limit if you request and receive approval for the use of a non-Hg HAP metals CMS under 40 CFR 63.7(f).
	Total non-Hg HAP metals.	Before July 6, 2027: 5.0E–5 lb/MMBtu or 5.0E–1 lb/GWh. On or after July 6, 2027: 1.7E–5 lb/MMBtu or 1.7E–1 lb/GWh.	Collect a minimum of 1 dscm per run.
	OR	OR	On or after July 6, 2027 you may only demonstrate compliance with the following individual HAP metals emissions limits if you request and receive approval for the use of a non-Hg HAP metals CMS under 40 CFR 63.7(f).
	Individual HAP metals:.	....	Collect a minimum of 3 dscm per run.
	Antimony (Sb)	Before July 6, 2027: 8.0E–1 lb/TBtu or 8.0E–3 lb/GWh. On or after July 6, 2027: 2.7E–1 lb/TBtu or 2.7E–3 lb/GWh.	

If your EGU is in this subcategory . . .	For the following pollutants . . .	You must meet the following emission limits and work practice standards . . .	Using these requirements, as appropriate (*e.g.,* specified sampling volume or test run duration) and limitations with the test methods in Table 5 to this Subpart . . .
	Arsenic (As)	Before July 6, 2027: 1.1E0 lb/TBtu or 2.0E–2 lb/GWh. On or after July 6, 2027: 3.7E–1 lb/TBtu or 6.7E–3 lb/GWh.	
	Beryllium (Be)	Before July 6, 2027: 2.0E–1 lb/TBtu or 2.0E–3 lb/GWh. On or after July 6, 2027: 6.7E–2 lb/TBtu or 6.7E–4 lb/GWh.	
	Cadmium (Cd)	Before July 6, 2027: 3.0E–1 lb/TBtu or 3.0E–3 lb/GWh. On or after July 6, 2027: 1.0E–1 lb/TBtu or 1.0E–3 lb/GWh.	
	Chromium (Cr)	Before July 6, 2027: 2.8E0 lb/TBtu or 3.0E–2 lb/GWh. On or after July 6, 2027: 9.3E–1 lb/TBtu or 1.0E–2 lb/GWh.	
	Cobalt (Co)	Before July 6, 2027: 8.0E–1 lb/TBtu or 8.0E–3 lb/GWh. On or after July 6, 2027: 2.7E–1 lb/TBtu or 2.7E–3 lb/GWh.	
	Lead (Pb)	Before July 6, 2027: 1.2E0 lb/TBtu or 2.0E–2 lb/GWh. On or after July 6, 2027: 4.0E–1 lb/TBtu or 6.7E–3 lb/GWh.	
	Manganese (Mn)	Before July 6, 2027: 4.0E0 lb/TBtu or 5.0E–2 lb/GWh. On or after July 6, 2027: 1.3E0 lb/TBtu or 1.7E–2 lb/GWh.	
	Nickel (Ni)	Before July 6, 2027: 3.5E0 lb/TBtu or 4.0E–2 lb/GWh. On or after July 6, 2027: 1.2E0 lb/TBtu or 1.3E–2 lb/GWh.	

If your EGU is in this subcategory . . .	For the following pollutants . . .	You must meet the following emission limits and work practice standards . . .	Using these requirements, as appropriate (*e.g.,* specified sampling volume or test run duration) and limitations with the test methods in Table 5 to this Subpart . . .
	Selenium (Se)	Before July 6, 2027: 5.0E0 lb/TBtu or 6.0E–2 lb/GWh. On or after July 6, 2027: 1.7E0 lb/TBtu or 2.0E–2 lb/GWh.	
	b. Hydrogen chloride (HCl).	4.0E–2 lb/MMBtu or 4.0E–1 lb/MWh.	For Method 26A at appendix A–8 to part 60 of this chapter, collect a minimum of 0.75 dscm per run; for Method 26, collect a minimum of 120 liters per run. For ASTM D6348–03 (Reapproved 2010)[3] or Method 320 at appendix A to part 63 of this chapter, sample for a minimum of 1 hour.
	OR		
	Sulfur dioxide (SO_2)[4].	6E–1 lb/MMBtu or 9E0 lb/MWh.	SO_2 CEMS.
	c. Mercury (Hg)	1.2E0 lb/TBtu or 1.3E–2 lb/GWh.	LEE Testing for 30 days with a sampling period consistent with that given in section 5.2.1 of appendix A to this subpart per Method 30B at appendix A–8 to part 60 of this chapter run or Hg CEMS or sorbent trap monitoring system only.
	OR		
		1.0E0 lb/TBtu or 1.1E–2 lb/GWh.	LEE Testing for 90 days with a sampling period consistent with that given in section 5.2.1 of appendix A to this subpart per Method 30B run or Hg CEMS or sorbent trap monitoring system only.

[1] For LEE emissions testing for total PM, total HAP metals, individual HAP metals, HCl, and HF, the required minimum sampling volume must be increased nominally by a factor of 2. With the exception of IGCC units, on or after July 6, 2027 you may not pursue the LEE option for filterable PM, total non-Hg metals, and individual HAP metals and you may not comply with the total non-Hg HAP metals or individual HAP metals emissions limits for all existing EGU subcategories unless you request and receive approval for the use of a HAP metals CMS under § 63.7(f).

[2] Gross output.

[3] Incorporated by reference, *see* § 63.14.

[4] You may not use the alternate SO_2 limit if your EGU does not have some form of FGD system and SO_2 CEMS installed.

■ 20. Revise table 3 to subpart UUUUU of part 63 to read as follows:

Table 3 to Subpart UUUUU of Part 63—Work Practice Standards

As stated in § 63.9991, you must comply with the following applicable work practice standards:

If your EGU is . . .	You must meet the following . . .
1. An existing EGU	Conduct a tune-up of the EGU burner and combustion controls at least each 36 calendar months, or each 48 calendar months if neural network combustion optimization software is employed, as specified in § 63.10021(e).
2. A new or reconstructed EGU	Conduct a tune-up of the EGU burner and combustion controls at least each 36 calendar months, or each 48 calendar months if neural network combustion optimization software is employed, as specified in § 63.10021(e).
3. A coal-fired, liquid oil-fired (excluding limited-use liquid oil-fired subcategory units), or solid oil-derived fuel-fired EGU during startup.	a. Before January 2, 2025 you have the option of complying using either of the following work practice standards in paragraphs (1) and (2). On or after January 2, 2025 you may not choose to use paragraph (2) of the definition of startup in § 63.10042 and the following associated work practice standards in paragraph (2).

If your EGU is . . .	You must meet the following . . .
	(1) If you choose to comply using paragraph (1) of the definition of "startup" in § 63.10042, you must operate all CMS during startup. Startup means either the first-ever firing of fuel in a boiler for the purpose of producing electricity, or the firing of fuel in a boiler after a shutdown event for any purpose. Startup ends when any of the steam from the boiler is used to generate electricity for sale over the grid or for any other purpose (including on site use). For startup of a unit, you must use clean fuels as defined in § 63.10042 for ignition. Once you convert to firing coal, residual oil, or solid oil-derived fuel, you must engage all of the applicable control technologies except dry scrubber and SCR. You must start your dry scrubber and SCR systems, if present, appropriately to comply with relevant standards applicable during normal operation. You must comply with all applicable emissions limits at all times except for periods that meet the applicable definitions of startup and shutdown in this subpart. You must keep records during startup periods. You must provide reports concerning activities and startup periods, as specified in § 63.10011(g) and § 63.10021(h) and (i). If you elect to use paragraph (2) of the definition of startup in 40 CFR 63.10042, you must report the applicable information in 40 CFR 63.10031(c)(5) concerning startup periods as follows: For startup periods that occur on or prior to December 31, 2023, in PDF files in the semiannual compliance report; for startup periods that occur on or after January 1, 2024, quarterly, in PDF files, according to 40 CFR 63.10031(i). (2) If you choose to comply using paragraph (2) of the definition of "startup" in § 63.10042, you must operate all CMS during startup. You must also collect appropriate data, and you must calculate the pollutant emission rate for each hour of startup. For startup of an EGU, you must use one or a combination of the clean fuels defined in § 63.10042 to the maximum extent possible, taking into account considerations such as boiler or control device integrity, throughout the startup period. You must have sufficient clean fuel capacity to engage and operate your PM control device within one hour of adding coal, residual oil, or solid oil-derived fuel to the unit. You must meet the startup period work practice requirements as identified in § 63.10020(e). Once you start firing coal, residual oil, or solid oil-derived fuel, you must vent emissions to the main stack(s). You must comply with the applicable emission limits beginning with the hour after startup ends. You must engage and operate your PM control(s) within 1 hour of first firing of coal, residual oil, or solid oil-derived fuel. You must start all other applicable control devices as expeditiously as possible, considering safety and manufacturer/supplier recommendations, but, in any case, when necessary to comply with other standards made applicable to the EGU by a permit limit or a rule other than this subpart that require operation of the control devices. b. Relative to the syngas not fired in the combustion turbine of an IGCC EGU during startup, you must either: (1) Flare the syngas, or (2) route the syngas to duct burners, which may need to be installed, and route the flue gas from the duct burners to the heat recovery steam generator. c. If you choose to use just one set of sorbent traps to demonstrate compliance with the applicable Hg emission limit, you must comply with the limit at all times; otherwise, you must comply with the applicable emission limit at all times except for startup and shutdown periods. d. You must collect monitoring data during startup periods, as specified in § 63.10020(a) and (e). You must keep records during startup periods, as provided in §§ 63.10021(h) and 63.10032. You must provide reports concerning activities and startup periods, as specified in §§ 63.10011(g), 63.10021(i), and 63.10031. Before January 2, 2025, if you elect to use paragraph (2) of the definition of startup in 40 CFR 63.10042, you must report the applicable information in 40 CFR 63.10031(c)(5) concerning startup periods as follows: For startup periods that occur on or prior to December 31, 2023, in PDF files in the semiannual compliance report; for startup periods that occur on or after January 1, 2024, quarterly, in PDF files, according to 40 CFR 63.10031(i). On or after January 2, 2025 you may not use paragraph (2) of the definition of startup in § 63.10042.
4. A coal-fired, liquid oil-fired (excluding limited-use liquid oil-fired subcategory units), or solid oil-derived fuel-fired EGU during shutdown.	You must operate all CMS during shutdown. You must also collect appropriate data, and you must calculate the pollutant emission rate for each hour of shutdown for those pollutants for which a CMS is used. While firing coal, residual oil, or solid oil-derived fuel during shutdown, you must vent emissions to the main stack(s) and operate all applicable control devices and continue to operate those control devices after the cessation of coal, residual oil, or solid oil-derived fuel being fed into the EGU and for as long as possible thereafter considering operational and safety concerns. In any case, you must operate your controls when necessary to comply with other standards made applicable to the EGU by a permit limit or a rule other than this subpart and that require operation of the control devices. If, in addition to the fuel used prior to initiation of shutdown, another fuel must be used to support the shutdown process, that additional fuel must be one or a combination of the clean fuels defined in § 63.10042 and must be used to the maximum extent possible, taking into account considerations such as not compromising boiler or control device integrity. Relative to the syngas not fired in the combustion turbine of an IGCC EGU during shutdown, you must either: (1) Flare the syngas, or (2) route the syngas to duct burners, which may need to be installed, and route the flue gas from the duct burners to the heat recovery steam generator.

If your EGU is . . .	You must meet the following . . .
	You must comply with all applicable emission limits at all times except during startup periods and shutdown periods at which time you must meet this work practice. You must collect monitoring data during shutdown periods, as specified in § 63.10020(a). You must keep records during shutdown periods, as provided in §§ 63.10032 and 63.10021(h). Any fraction of an hour in which shutdown occurs constitutes a full hour of shutdown. You must provide reports concerning activities and shutdown periods, as specified in §§ 63.10011(g), 63.10021(i), and 63.10031. Before January 2, 2025, if you elect to use paragraph (2) of the definition of startup in 40 CFR 63.10042, you must report the applicable information in 40 CFR 63.10031(c)(5) concerning shutdown periods as follows: For shutdown periods that occur on or prior to December 31, 2023, in PDF files in the semiannual compliance report; for shutdown periods that occur on or after January 1, 2024, quarterly, in PDF files, according to 40 CFR 63.10031(i). On or after January 2, 2025 you may not use paragraph (2) of the definition of startup in § 63.10042.

■ 21. Revise table 4 to subpart UUUUU of part 63 to read as follows:

Table 4 to Subpart UUUUU of Part 63—Operating Limits for EGUs

Before July 6, 2027, as stated in § 63.9991, you must comply with the applicable operating limits in table 4. However, on or after July 6, 2027 you may not use PM CPMS for compliance demonstrations, unless it is for an IGCC unit.

If you demonstrate compliance using . . .	You must meet these operating limits . . .
PM CPMS	Maintain the 30-boiler operating day rolling average PM CPMS output determined in accordance with the requirements of § 63.10023(b)(2) and obtained during the most recent performance test run demonstrating compliance with the filterable PM, total non-mercury HAP metals (total HAP metals, for liquid oil-fired units), or individual non-mercury HAP metals (individual HAP metals including Hg, for liquid oil-fired units) emissions limitation(s).

■ 22. Revise table 5 to subpart UUUUU of part 63 to read as follows:

Table 5 to Subpart UUUUU of Part 63—Performance Testing Requirements

As stated in § 63.10007, you must comply with the following requirements for performance testing for existing, new or reconstructed affected sources:[1]

BILLING CODE 6560–50–P

To conduct a performance test for the following pollutant . . .	Using . . .	You must perform the following activities, as applicable to your input- or output-based emission limit . . .	Using . . .[2]
1. Filterable Particulate matter (PM)	Emissions Testing	a. Select sampling ports location and the number of traverse points	Method 1 at appendix A-1 to part 60 of this chapter.
		b. Determine velocity and volumetric flow-rate of the stack gas	Method 2, 2A, 2C, 2F, 2G or 2H at appendix A-1 or A-2 to part 60 of this chapter.
		c. Determine oxygen and carbon dioxide concentrations of the stack gas	Method 3A or 3B at appendix A-2 to part 60 of this chapter, or ANSI/ASME PTC 19.10-1981.[3]
		d. Measure the moisture content of the stack gas	Method 4 at appendix A-3 to part 60 of this chapter.
		e. Measure the filterable PM concentration	Methods 5 and 5I at appendix A-3 to part 60 of this chapter. For positive pressure fabric filters, Method 5D at appendix A-3 to part 60 of this chapter for filterable PM emissions. Note that the Method 5 or 5I front half temperature shall be 160° ±14 °C (320° ±25 °F).
		f. Convert emissions concentration to lb/MMBtu or lb/MWh emissions rates	Method 19 F-factor methodology at appendix A-7 to part 60 of this chapter, or calculate using mass emissions rate and gross output data (see § 63.10007(e)).
	OR	OR	
	PM CEMS	a. Install, certify, operate, and	Performance Specification 11 at appendix B to part 60 of this chapter and Procedure 2 at appendix F to part 60 of this chapter.

		maintain the PM CEMS	
		b. Install, certify, operate, and maintain the diluent gas, flow rate, and/or moisture monitoring systems	Part 75 of this chapter and § 63.10010(a), (b), (c), and (d).
		c. Convert hourly emissions concentrations to 30 boiler operating day rolling average lb/MMBtu or lb/MWh emissions rates	Method 19 F-factor methodology at appendix A-7 to part 60 of this chapter, or calculate using mass emissions rate and gross output data (see § 63.10007(e)).
2. Total or individual non-Hg HAP metals	Emissions Testing	a. Select sampling ports location and the number of traverse points	Method 1 at appendix A-1 to part 60 of this chapter.
		b. Determine velocity and volumetric flow-rate of the stack gas	Method 2, 2A, 2C, 2F, 2G or 2H at appendix A-1 or A-2 to part 60 of this chapter.
		c. Determine oxygen and carbon dioxide concentrations of the stack gas	Method 3A or 3B at appendix A-2 to part 60 of this chapter, or ANSI/ASME PTC 19.10-1981.[3]
		d. Measure the moisture content of the stack gas	Method 4 at appendix A-3 to part 60 of this chapter.
		e. Measure the HAP metals emissions concentrations and determine	Method 29 at appendix A-8 to part 60 of this chapter. For liquid oil-fired units, Hg is included in HAP metals and you may use Method 29, Method 30B at appendix A-8 to part 60 of this chapter; for Method 29, you must

		each individual HAP metals emissions concentration, as well as the total filterable HAP metals emissions concentration and total HAP metals emissions concentration	report the front half and back half results separately. When using Method 29, report metals matrix spike and recovery levels.
		f. Convert emissions concentrations (individual HAP metals, total filterable HAP metals, and total HAP metals) to lb/MMBtu or lb/MWh emissions rates	Method 19 F-factor methodology at appendix A-7 to part 60 of this chapter, or calculate using mass emissions rate and gross output data (see § 63.10007(e)).
3. Hydrogen chloride (HCl) and hydrogen fluoride (HF)	Emissions Testing	a. Select sampling ports location and the number of traverse points	Method 1 at appendix A-1 to part 60 of this chapter.
		b. Determine velocity and volumetric flow-rate of the stack gas	Method 2, 2A, 2C, 2F, 2G or 2H at appendix A-1 or A-2 to part 60 of this chapter.
		c. Determine oxygen and carbon dioxide concentrations of the stack gas	Method 3A or 3B at appendix A-2 to part 60 of this chapter, or ANSI/ASME PTC 19.10-1981.[3]
		d. Measure the moisture content of the stack gas	Method 4 at appendix A-3 to part 60 of this chapter.
		e. Measure the HCl and HF	Method 26 or Method 26A at appendix A-8 to part 60 of this chapter or Method 320 at

		emissions concentrations	appendix A to part 63 of this chapter or ASTM D6348-03 Reapproved 2010[3] with
			(1) the following conditions when using ASTM D6348-03 Reapproved 2010:
			(A) The test plan preparation and implementation in the Annexes to ASTM D6348-03 Reapproved 2010, Sections A1 through A8 are mandatory;
			(B) For ASTM D6348-03 Reapproved 2010 Annex A5 (Analyte Spiking Technique), the percent (%) R must be determined for each target analyte (see Equation A5.5);
			(C) For the ASTM D6348-03 Reapproved 2010 test data to be acceptable for a target analyte, %R must be 70% ≥R ≤130%; and
			(D) The %R value for each compound must be reported in the test report and all field measurements corrected with the calculated %R value for that compound using the following equation: $\text{Reported Result} = \frac{(\text{Measured Concentration in Stack})}{\%R} x\ 100$
			(2) spiking levels nominally no greater than two times the level corresponding to the applicable emission limit.
			Method 26A must be used if there are entrained water droplets in the exhaust stream.
		f. Convert emissions concentration to lb/MMBtu or lb/MWh emissions rates	Method 19 F-factor methodology at appendix A-7 to part 60 of this chapter, or calculate using mass emissions rate and gross output data (see § 63.10007(e)).
	OR	OR	
	HCl and/or HF CEMS	a. Install, certify, operate, and maintain the HCl or HF CEMS	Appendix B of this subpart.
		b. Install, certify, operate, and maintain the diluent gas, flow rate, and/or moisture	Part 75 of this chapter and § 63.10010(a), (b), (c), and (d).

		monitoring systems	
		c. Convert hourly emissions concentrations to 30 boiler operating day rolling average lb/MMBtu or lb/MWh emissions rates	Method 19 F-factor methodology at appendix A-7 to part 60 of this chapter, or calculate using mass emissions rate and gross output data (see § 63.10007(e)).
4. Mercury (Hg)	Emissions Testing	a. Select sampling ports location and the number of traverse points	Method 1 at appendix A-1 to part 60 of this chapter or Method 30B at Appendix A-8 for Method 30B point selection.
		b. Determine velocity and volumetric flow-rate of the stack gas	Method 2, 2A, 2C, 2F, 2G or 2H at appendix A-1 or A-2 to part 60 of this chapter.
		c. Determine oxygen and carbon dioxide concentrations of the stack gas	Method 3A or 3B at appendix A-1 to part 60 of this chapter, or ANSI/ASME PTC 19.10-1981.[3]
		d. Measure the moisture content of the stack gas	Method 4 at appendix A-3 to part 60 of this chapter.
		e. Measure the Hg emission concentration	Method 30B at appendix A-8 to part 60 of this chapter, ASTM D6784,[3] or Method 29 at appendix A-8 to part 60 of this chapter; for Method 29, you must report the front half and back half results separately.
		f. Convert emissions concentration to lb/TBtu or lb/GWh emission rates	Method 19 F-factor methodology at appendix A-7 to part 60 of this chapter, or calculate using mass emissions rate and gross output data (see § 63.10007(e)).
	OR	OR	
	Hg CEMS	a. Install, certify, operate, and	Sections 3.2.1 and 5.1 of appendix A of this subpart.

		maintain the CEMS	
		b. Install, certify, operate, and maintain the diluent gas, flow rate, and/or moisture monitoring systems	Part 75 of this chapter and § 63.10010(a), (b), (c), and (d).
		c. Convert hourly emissions concentrations to 30 boiler operating day rolling average lb/TBtu or lb/GWh emissions rates	Section 6 of appendix A to this subpart.
	OR	OR	
	Sorbent trap monitoring system	a. Install, certify, operate, and maintain the sorbent trap monitoring system	Sections 3.2.2 and 5.2 of appendix A to this subpart.
		b. Install, operate, and maintain the diluent gas, flow rate, and/or moisture monitoring systems	Part 75 of this chapter and § 63.10010(a), (b), (c), and (d).
		c. Convert emissions concentrations to 30 boiler operating day rolling average lb/TBtu or lb/GWh	Section 6 of appendix A to this subpart.

		emissions rates	
	OR	OR	
	LEE testing	a. Select sampling ports location and the number of traverse points	Single point located at the 10% centroidal area of the duct at a port location per Method 1 at appendix A-1 to part 60 of this chapter or Method 30B at Appendix A-8 for Method 30B point selection.
		b. Determine velocity and volumetric flow-rate of the stack gas	Method 2, 2A, 2C, 2F, 2G, or 2H at appendix A-1 or A-2 to part 60 of this chapter or flow monitoring system certified per appendix A of this subpart.
		c. Determine oxygen and carbon dioxide concentrations of the stack gas	Method 3A or 3B at appendix A-1 to part 60 of this chapter, or ANSI/ASME PTC 19.10-1981,[3] or diluent gas monitoring systems certified according to part 75 of this chapter.
		d. Measure the moisture content of the stack gas	Method 4 at appendix A-3 to part 60 of this chapter, or moisture monitoring systems certified according to part 75 of this chapter.
		e. Measure the Hg emission concentration	Method 30B at appendix A-8 to part 60 of this chapter; perform a 30 operating day test, with a maximum of 10 operating days per run (*i.e.,* per pair of sorbent traps) or sorbent trap monitoring system or Hg CEMS certified per appendix A of this subpart.
		f. Convert emissions concentrations from the LEE test to lb/TBtu or lb/GWh emissions rates	Method 19 F-factor methodology at appendix A-7 to part 60 of this chapter, or calculate using mass emissions rate and gross output data (see § 63.10007(e)).
		g. Convert average lb/TBtu or lb/GWh Hg emission rate to lb/year, if you are attempting to meet the 29.0 lb/year threshold	Potential maximum annual heat input in TBtu or potential maximum electricity generated in GWh.

5. Sulfur dioxide (SO_2)	SO_2 CEMS	a. Install, certify, operate, and maintain the CEMS	Part 75 of this chapter and § 63.10010(a) and (f).
		b. Install, operate, and maintain the diluent gas, flow rate, and/or moisture monitoring systems	Part 75 of this chapter and § 63.10010(a), (b), (c), and (d).
		c. Convert hourly emissions concentrations to 30 boiler operating day rolling average lb/MMBtu or lb/MWh emissions rates	Method 19 F-factor methodology at appendix A-7 to part 60 of this chapter, or calculate using mass emissions rate and gross output data (see § 63.10007(e)).

BILLING CODE 6560–50–C

[1] Regarding emissions data collected during periods of startup or shutdown, see §§ 63.10020(b) and (c) and 63.10021(h). With the exception of IGCC units, on or after July 6, 2027: You may not use quarterly performance emissions testing to demonstrate compliance with the filterable PM emissions standards and for existing EGUs you may not choose to comply with the total or individual HAP metals emissions limits unless you request and receive approval for the use of a HAP metals CMS under § 63.7(f).

[2] See tables 1 and 2 to this subpart for required sample volumes and/or sampling run times.

[3] Incorporated by reference, see § 63.14.

■ 23. Revise table 6 to subpart UUUUU of part 63 to read as follows:

Table 6 to Subpart UUUUU of Part 63—Establishing PM CPMS Operating Limits

Before July 6, 2027, as stated in § 63.10007, you must comply with the following requirements for establishing operating limits in table 6. However, on or after July 6, 2027 you may not use PM CPMS for compliance demonstrations, unless it is for an IGCC unit.

If you have an applicable emission limit for . . .	And you choose to establish PM CPMS operating limits, you must . . .	And . . .	Using . . .	According to the following procedures . . .
Filterable Particulate matter (PM), total non-mercury HAP metals, individual non-mercury HAP metals, total HAP metals, or individual HAP metals for an EGU.	Install, certify, maintain, and operate a PM CPMS for monitoring emissions discharged to the atmosphere according to § 63.10010(h)(1).	Establish a site-specific operating limit in units of PM CPMS output signal (*e.g.,* milliamps, mg/acm, or other raw signal).	Data from the PM CPMS and the PM or HAP metals performance tests.	1. Collect PM CPMS output data during the entire period of the performance tests. 2. Record the average hourly PM CPMS output for each test run in the performance test. 3. Determine the PM CPMS operating limit in accordance with the requirements of § 63.10023(b)(2) from data obtained during the performance test demonstrating compliance with the filterable PM or HAP metals emissions limitations.

■ 24. Revise table 7 to subpart UUUUU of part 63 to read as follows:

Table 7 to Subpart UUUUU of Part 63—Demonstrating Continuous Compliance

As stated in § 63.10021, you must show continuous compliance with the emission limitations for affected sources according to the following:

If you use one of the following to meet applicable emissions limits, operating limits, or work practice standards . . .	You demonstrate continuous compliance by . . .
1. CEMS to measure filterable PM, SO_2, HCl, HF, or Hg emissions, or using a sorbent trap monitoring system to measure Hg.	Calculating the 30- (or 90-) boiler operating day rolling arithmetic average emissions rate in units of the applicable emissions standard basis at the end of each boiler operating day using all of the quality assured hourly average CEMS or sorbent trap data for the previous 30- (or 90-) boiler operating days, excluding data recorded during periods of startup or shutdown.
2. PM CPMS to measure compliance with a parametric operating limit. (On or after July 6, 2027 you may not use PM CPMS for compliance demonstrations, unless it is for an IGCC unit.).	Calculating the 30- (or 90-) boiler operating day rolling arithmetic average of all of the quality assured hourly average PM CPMS output data (*e.g.,* milliamps, PM concentration, raw data signal) collected for all operating hours for the previous 30- (or 90-) boiler operating days, excluding data recorded during periods of startup or shutdown.
3. Site-specific monitoring using CMS for liquid oil-fired EGUs for HCl and HF emission limit monitoring.	If applicable, by conducting the monitoring in accordance with an approved site-specific monitoring plan.
4. Quarterly performance testing for coal-fired, solid oil derived fired, or liquid oil-fired EGUs to measure compliance with one or more non-PM (or its alternative emission limits) applicable emissions limit in Table 1 or 2, or PM (or its alternative emission limits) applicable emissions limit in Table 2. (On or after July 6, 2027 you may not use quarterly performance testing for filterable PM compliance demonstrations, unless it is for an IGCC unit.).	Calculating the results of the testing in units of the applicable emissions standard.
5. Conducting periodic performance tune-ups of your EGU(s)	Conducting periodic performance tune-ups of your EGU(s), as specified in § 63.10021(e).
6. Work practice standards for coal-fired, liquid oil-fired, or solid oil-derived fuel-fired EGUs during startup.	Operating in accordance with Table 3.
7. Work practice standards for coal-fired, liquid oil-fired, or solid oil-derived fuel-fired EGUs during shutdown.	Operating in accordance with Table 3.

■ 25. Revise table 8 to subpart UUUUU of part 63 to read as follows:

Table 8 to Subpart UUUUU of Part 63—Reporting Requirements

[In accordance with 40 CFR 63.10031, you must meet the following reporting requirements, as they apply to your compliance strategy]

You must submit the following reports . . .
1. The electronic reports required under 40 CFR 63.10031 (a)(1), if you continuously monitor Hg emissions.
2. The electronic reports required under 40 CFR 63.10031 (a)(2), if you continuously monitor HCl and/or HF emissions.
Where applicable, these reports are due no later than 30 days after the end of each calendar quarter.
3. The electronic reports required under 40 CFR 63.10031(a)(3), if you continuously monitor PM emissions.
Reporting of hourly PM emissions data using ECMPS shall begin with the first operating hour after: January 1, 2024, or the hour of completion of the initial PM CEMS correlation test, whichever is later.
Where applicable, these reports are due no later than 30 days after the end of each calendar quarter.
4. The electronic reports required under 40 CFR 63.10031(a)(4), if you elect to use a PM CPMS (on or after July 6, 2027 you may not use PM CPMS for compliance demonstrations, unless it is for an IGCC unit).
Reporting of hourly PM CPMS response data using ECMPS shall begin with the first operating hour after January 1, 2024, or the first operating hour after completion of the initial performance stack test that establishes the operating limit for the PM CPMS, whichever is later.
Where applicable, these reports are due no later than 30 days after the end of each calendar quarter.
5. The electronic reports required under 40 CFR 63.10031(a)(5), if you continuously monitor SO_2 emissions.
Where applicable, these reports are due no later than 30 days after the end of each calendar quarter.
6. PDF reports for all performance stack tests completed prior to January 1, 2024 (including 30- or 90-boiler operating day Hg LEE test reports and PM test reports to set operating limits for PM CPMS), according to the introductory text of 40 CFR 63.10031(f) and 40 CFR 63.10031(f)(6).
For each test, submit the PDF report no later than 60 days after the date on which testing is completed.
For a PM test that is used to set an operating limit for a PM CPMS, the report must also include the information in 40 CFR 63.10023(b)(2)(vi).
For each performance stack test completed on or after January 1, 2024, submit the test results in the relevant quarterly compliance report under 40 CFR 63.10031(g), together with the applicable reference method information in sections 17 through 31 of appendix E to this subpart.
7. PDF reports for all RATAs of Hg, HCl, HF, and/or SO_2 monitoring systems completed prior to January 1, 2024, and for correlation tests, RRAs and/or RCAs of PM CEMS completed prior to January 1, 2024, according to 40 CFR 63.10031(f)(1) and (6).
For each test, submit the PDF report no later than 60 days after the date on which testing is completed.
For each SO_2 or Hg system RATA completed on or after January 1, 2024, submit the electronic test summary required by appendix A to this subpart or part 75 of this chapter (as applicable) together with the applicable reference method information in sections 17 through 30 of appendix E to this subpart, either prior to or concurrent with the relevant quarterly emissions report.

You must submit the following reports . . .
For each HCl or HF system RATA, and for each correlation test, RRA, and RCA of a PM CEMS completed on or after January 1, 2024, submit the electronic test summary in accordance with section 11.4 of appendix B to this subpart or section 7.2.4 of appendix C to this part, as applicable, together with the applicable reference method information in sections 17 through 30 of appendix E to this subpart.
8. Quarterly reports, in PDF files, that include all 30-boiler operating day rolling averages in the reporting period derived from your PM CEMS, approved HAP metals CMS, and/or PM CPMS (on or after July 6, 2027 you may not use PM CPMS, unless it is for an IGCC unit), according to 40 CFR 63.10031(f)(2) and (6). These reports are due no later than 60 days after the end of each calendar quarter.
The final quarterly rolling averages report in PDF files shall cover the fourth calendar quarter of 2023.
Starting with the first quarter of 2024, you must report all 30-boiler operating day rolling averages for PM CEMS, approved HAP metals CMS, PM CPMS, Hg CEMS, Hg sorbent trap systems, HCl CEMS, HF CEMS, and/or SO_2 CEMS (or 90-boiler operating day rolling averages for Hg systems), in XML format, in the quarterly compliance reports required under 40 CFR 63.10031(g).
If your EGU or common stack is in an averaging plan, each quarterly compliance report must identify the EGUs in the plan and include all of the 30- or 90-group boiler operating day WAERs for the averaging group.
The quarterly compliance reports must be submitted no later than 60 days after the end of each calendar quarter.
9. The semiannual compliance reports described in 40 CFR 63.10031(c) and (d), in PDF files, according to 40 CFR 63.10031(f)(4) and (6). The due dates for these reports are specified in 40 CFR 63.10031(b).
The final semiannual compliance report shall cover the period from July 1, 2023, through December 31, 2023.
10. Notifications of compliance status, in PDF files, according to 40 CFR 63.10031(f)(4) and (6) until December 31, 2023, and according to 40 CFR 63.10031(h) thereafter.
11. Quarterly electronic compliance reports, in accordance with 40 CFR 63.10031(g), starting with a report for the first calendar quarter of 2024. The reports must be in XML format and must include the applicable data elements in sections 2 through 13 of appendix E to this subpart.
These reports are due no later than 60 days after the end of each calendar quarter.
12. Quarterly reports, in PDF files, that include the applicable information in 40 CFR 63.10031(c)(5)(ii) and 40 CFR 63.10020(e) pertaining to startup and shutdown events, starting with a report for the first calendar quarter of 2024, if you have elected to use paragraph 2 of the definition of startup in 40 CFR 63.10042 (see 40 CFR 63.10031(i)). On or after January 2, 2025 you may not use paragraph 2 of the definition of startup in 40 CFR 63.10042.
These PDF reports shall be submitted no later than 60 days after the end of each calendar quarter, along with the quarterly compliance reports required under 40 CFR 63.10031(g).
13. A test report for the PS 11 correlation test of your PM CEMS, in accordance with 40 CFR 63.10031(j).
If, prior to November 9, 2020, you have begun using a certified PM CEMS to demonstrate compliance with this subpart, use the ECMPS Client Tool to submit the report, in a PDF file, no later than 60 days after that date.
For correlation tests completed on or after November 9, 2020, but prior to January 1, 2024, submit the report, in a PDF file, no later than 60 days after the date on which the test is completed.
For correlation tests completed on or after January 1, 2024, submit the test results electronically, according to section 7.2.4 of appendix C to this subpart, together with the applicable reference method data in sections 17 through 31 of appendix E to this subpart.
14. Quarterly reports that include the QA/QC activities for your PM CPMS (on or after July 6, 2027 you may not use PM CPMS, unless it is for an IGCC unit) or approved HAP metals CMS (as applicable), in PDF files, according to 40 CFR 63.10031(k).
The first report shall cover the first calendar quarter of 2024, if the PM CPMS or HAP metals CMS is in use during that quarter. Otherwise, reporting begins with the first calendar quarter in which the PM CPMS or HAP metals CMS is used to demonstrate compliance.
These reports are due no later than 60 days after the end of each calendar quarter.

■ 26. In appendix C to subpart UUUUU:

■ a. Revise sections 1.2, 1.3, 4.1, and 4.1.1.

■ b. Add sections 4.1.1.1 and 4.2.3.

■ c. Revise sections 5.1.1, 5.1.4, and the section heading for section 6.

The revisions and additions read as follows:

Appendix C to Subpart UUUUU of Part 63—PM Monitoring Provisions

1. General Provisions

* * * * *

1.2 *Initial Certification and Recertification Procedures.* You, as the owner or operator of an affected EGU that uses a PM CEMS to demonstrate compliance with a filterable PM emissions limit in Table 1 or 2 to this subpart must certify and, if applicable, recertify the CEMS according to Performance Specification 11 (PS–11) in appendix B to part 60 of this chapter. Beginning on July 6, 2027, when determining if your PM CEMS meets the acceptance criteria in PS–11, the value of 0.015 lb/MMBtu is to be used in place of the applicable emission standard, or emission limit, in the calculations.

1.3 *Quality Assurance and Quality Control Requirements.* You must meet the applicable quality assurance requirements of Procedure 2 in appendix F to part 60 of this chapter. Beginning on July 6, 2027, when determining if your PM CEMS meets the acceptance criteria in Procedure 2, the value of 0.015 lb/MMBtu is to be used in place of the applicable emission standard, or emission limit, in the calculations.

* * * * *

4. Certification and Recertification Requirements

4.1 *Certification Requirements.* You must certify your PM CEMS and the other CMS used to determine compliance with the applicable emissions standard before the PM CEMS can be used to provide data under this subpart. However, if you have developed and are using a correlation curve, you may continue to use that curve, provided it continues to meet the acceptance criteria in PS–11 and Procedure 2 as discussed below. Redundant backup monitoring systems (if used) are subject to the same certification requirements as the primary systems.

4.1.1 PM CEMS. You must certify your PM CEMS according to PS–11 in appendix B to part 60 of this chapter. A PM CEMS that has been installed and certified according to PS–11 as a result of another state or federal regulatory requirement or consent decree prior to the effective date of this subpart shall be considered certified for this subpart if you can demonstrate that your PM CEMS meets the acceptance criteria in PS–11 and Procedure 2 in appendix F to part 60 of this chapter.

4.1.1.1 Beginning on July 6, 2027, when determining if your PM CEMS meets the acceptance criteria in PS–11 and Procedure 2 the value of 0.015 lb/MMBtu is to be used in place of the applicable emission standard, or emission limit, in the calculations.

* * * * *

4.2 Recertification.

* * * * *

4.2.3 Beginning on July 6, 2027 you must use the value of 0.015 lb/MMBtu in place of the applicable emission standard, or emission limit, in the calculations when determining if your PM CEMS meets the acceptance criteria in PS–11 and Procedure 2.

* * * * *

5. Ongoing Quality Assurance (QA) and Data Validation

* * * * *

5.1.1 Required QA Tests. Following initial certification, you must conduct periodic QA testing of each primary and (if applicable) redundant backup PM CEMS. The required QA tests and the criteria that must be met are found in Procedure 2 of appendix F to part 60 of this chapter

(Procedure 2). Except as otherwise provided in section 5.1.2 of this appendix, the QA tests shall be done at the frequency specified in Procedure 2.

* * * * *

5.1.4 RCA and RRA Acceptability. The results of your RRA or RCA are considered acceptable provided that the criteria in section 10.4(5) of Procedure 2 in appendix F to part 60 of this chapter are met for an RCA or section 10.4(6) of Procedure 2 in appendix F to part 60 of this chapter are met for an RRA. However, beginning on July 6, 2027 a value of 0.015 lb/MMBtu is to be used in place of the applicable emission standard, or emission limit, when determining whether the RCA and RRA are acceptable.

* * * * *

6. Data Reduction and Calculations

* * * * *

■ 27. Appendix D to subpart UUUUU of part 63 is amended by adding introductory text to the appendix to read as follows:

Appendix D to Subpart UUUUU of Part 63—PM CPMS Monitoring Provisions

On or after July 6, 2027 you may not use PM CPMS for compliance demonstrations with the applicable filterable PM emissions limits, unless it is for an IGCC unit.

* * * * *

[FR Doc. 2024–09148 Filed 5–6–24; 8:45 am]

BILLING CODE 6560–50–P

FEDERAL REGISTER

Vol. 89 Tuesday,

No. 89 May 7, 2024

Part V

Department of Agriculture

Animal and Plant Health Inspection Service

7 CFR Part 354

User Fees for Agricultural Quarantine and Inspection Services; Final Rule

DEPARTMENT OF AGRICULTURE

Animal and Plant Health Inspection Service

7 CFR Part 354

[Docket No. APHIS–2022–0023]

RIN 0579–AE71

User Fees for Agricultural Quarantine and Inspection Services

AGENCY: Animal and Plant Health Inspection Service, USDA.

ACTION: Final rule.

SUMMARY: We are amending the user fee regulations associated with the agricultural quarantine and inspection (AQI) program. Specifically, we are adjusting the fees for certain AQI services that are provided in connection with certain commercial vessels, commercial trucks, commercial railroad cars, commercial aircraft, and international passengers arriving at ports in the customs territory of the United States or precleared or preinspected at a site outside the customs territory of the United States; adjusting the caps on prepaid fees associated with commercial trucks and commercial railroad cars; and removing certain fee exemptions that are no longer justifiable based upon pathway analyses of risk. We are also revising requirements pertaining to remittances and statements. Specifically, we will require monthly rather than quarterly remittances for the commercial aircraft fee, international air passenger fee, and international cruise passenger fee, clarify our requirements, and provide for electronic payments and statements. We are also including in the regulations information on agents responsible for ensuring compliance with paying the user fees and the requirement for entities to notify the Animal and Plant Health Inspection Service in the event they have a change in personnel responsible for fee payments. These changes are necessary to recover the costs of the current level of AQI activity, to account for actual and projected increases in the cost of doing business, to increase fee payer accountability, and to more accurately align fees with the costs associated with each fee service.

DATES: This rule is effective October 1, 2024, except for the removal of section § 354.3(e)(2)(iv), which is effective on April 1, 2025.

FOR FURTHER INFORMATION CONTACT: Mr. George Balady, Senior Regulatory Policy Specialist, PPQ, APHIS, 4700 River Road, Unit 36, Riverdale, MD 20737; (301) 851–2338; *aqi.user.fees@usda.gov.*

  - Treatment Monitoring

Background

Section 2509(a) of the Food, Agriculture, Conservation, and Trade (FACT) Act of 1990 (21 U.S.C. 136a) authorizes the Animal and Plant Health Inspection Service (APHIS) to prescribe and collect user fees for agricultural quarantine and inspection (AQI) services. Congress amended the FACT Act on April 4, 1996, and May 13, 2002.

The FACT Act, as amended, authorizes APHIS to prescribe and collect user fees for AQI services provided in connection with the arrival, at a port in the customs territory of the United States, of certain commercial vessels, commercial trucks, commercial railroad cars, commercial aircraft, and international passengers. According to the FACT Act, as amended, these user fees should be ''sufficient'' ''to cover the cost of'':

- Providing AQI services ''in connection with the arrival at a port in the customs territory of the United States'' of the conveyances and the passengers listed above;
- Providing ''preclearance or preinspection at a site outside the customs territory of the United States'' to the conveyances and the passengers listed above; and
- Administering 21 U.S.C. 136a, concerning the ''collection of fees for inspection services.''

In addition, the FACT Act, as amended, contains the following requirements:

- The amount of the fees shall be ''commensurate with the costs of [AQI] services with respect to the class of persons or entities paying the fees.''
- The cost of AQI services ''with respect to passengers as a class'' shall ''include the cost of related inspections of the aircraft or other vehicle.''

The user fees for the AQI activities described above are contained in 7 CFR 354.3, ''User fees for certain international services.'' APHIS' regulations regarding user fees relating to imports and exports, as well as overtime services, are found in 7 CFR part 354.

On August 11, 2023, we published in the **Federal Register** (88 FR 54796–54827, Docket No. APHIS–2022–0023) a proposal[1] to amend the user fee regulations by adjusting the fees for certain AQI services that are provided in connection with certain commercial vessels, commercial trucks, commercial railroad cars, commercial aircraft, and international passengers arriving at ports in the customs territory of the United States; adjusting the caps on prepaid fees associated with commercial trucks and commercial railroad cars; removing certain fee exemptions that are no longer justifiable based upon pathway analyses of risk; and restructuring the treatment monitoring fee.

We also proposed to revise requirements pertaining to remittances and statements. Specifically, we proposed to require monthly rather than quarterly remittances for the commercial aircraft fee, international air passenger fee, and international cruise passenger fee, clarify our requirements, and provide for electronic payments and statements. We also proposed to include in the regulations information on agents responsible for ensuring compliance with paying the user fees and the requirement for entities to notify APHIS in the event they have a change in personnel responsible for fee payments.

We proposed these changes to recover the costs of the current level of AQI activity, to account for actual and projected increases in the cost of doing business, to increase fee payer accountability, and to more accurately align fees with the costs associated with each fee service.

We solicited comments concerning our proposal for 60 days ending October 10, 2023. We received 70 comments by that date. They were from airlines, shipping companies, treatment providers, industry associations, and private citizens. Eighteen commenters generally supported the proposed rule, while 15 generally opposed it. The remaining commenters, while commenting on the provisions of the

[1] To view the proposed rule, supporting documents, and the comments we received, go to *www.regulations.gov.* Enter APHIS–2022–0023 in the Search field.

proposed rule, did not articulate a position in favor or against it. The comments are discussed below by topic.

Based on the comments that we received, we have made the following modifications to the proposed rule in this final rule:

- We have lowered the fees for commercial vessels, commercial aircraft, and international air passengers based on our determination that, while aggregate cost was correct (the numerator for the fee rate), there were more instances in which AQI services were provided in these modes (the denominator for the fee rate) than we had initially calculated.
- We have established a commercial vessel fee specific to commercial vessels operating within the Great Lakes or in the region along the coastline from Alaska to Oregon, provided that certain conditions are met.
- We have decided not to revise our regulations governing the treatment monitoring fee at this time.
- We have decided not to specify the method by which airlines and cruise ships must refund passenger user fees assessed for trips not taken.

General Issues

Several commenters who supported the proposed rule agreed with the proposed rule that additional personnel were needed at ports of entry to reduce workload on individual employees. One of these commenters stated that port personnel at certain ports of entry currently routinely must work overtime to conduct inspections.

As we stated in the proposed rule, the increased fees will provide for additional staffing at ports of entry.

One of these commenters also said that APHIS' regulations governing reimbursable overtime also needed to be updated.

Changes to APHIS' regulations governing reimbursable overtime are outside of the scope of this rulemaking. However, we do note that our user fee model did consider staffing at ports in order to address the staffing shortages highlighted by the commenter and reduce the need for individual employees to work overtime to conduct inspections. We discuss the staffing model at greater length below.

Several commenters, while supportive of the proposed rule, took the view that the regulations imposed a protective tariff on imports. Similarly, several other commenters stated that they were domestic producers who supported the proposal and construed the regulations as a mechanism to reduce import volume.

User fees are not tariffs, nor are they intended as a mechanism to reduce import volume. Although the AQI user fees pertain to international trade, user fees are a cost-recovery mechanism employed more broadly than just in the international trade context. They are a fee that a party charges to an entity receiving a service in order to recover the costs associated with providing the service. User fees are often imposed by a government, but not always. For example, a toll collected on a privately owned toll road would fit the definition of a user fee. As we highlighted in the preamble of the proposed rule (88 FR 54799, August 11, 2023), user fees are currently used throughout the Federal Government to recover the costs of many Federal services, both international and domestic.

Several domestic producers stated that the services funded by the fees are necessary in order to keep plant pests, noxious weeds, and pests and diseases of livestock from being introduced into or further disseminated within the United States. We agree. AQI services are essential to protect American agriculture and natural resources from the introduction or further dissemination of plant pests, noxious weeds, and pests and diseases of livestock. Furthermore, as we mentioned in the proposed rule, programs to control or eradicate pests once they become established in the United States can be costly for the Agency to administer.

One commenter construed the proposed rule to include a notice-based process by which the fees would be adjusted after October 1, 2028. We did not propose to establish a notice-based process to adjust the fees in the proposed rule. We did state in the proposed rule that we intend to initiate a separate rulemaking to propose notice-based adjustments to the fees to be implemented after October 1, 2028.

One commenter stated that the exact language of paragraph (a)(1)(A) of the FACT Act provides authority to recover the cost of AQI services provided to ''an international passenger, commercial vessel, commercial aircraft, commercial truck, or railroad car,'' while our proposed rule stated that it provided authority to recover the cost of services provided to commercial vessels, commercial trucks, commercial railroad cars, commercial aircraft, and international passengers. The commenter argued that the word ''international'' in the FACT Act could be read to apply to all the commercial means of conveyance listed, and not just passengers.

Insofar as the services are provided to the listed means of conveyance that are entering the United States from outside the United States, the services are provided to the listed means of conveyance that are operating ''internationally'' in the standard dictionary definition of that term. (Merriam-Webster's online dictionary, for example, defines ''international'' to mean, among other things, ''of, relating to, or affecting two or more nations.'')[2] Accordingly, whether or not the term ''international'' in the FACT Act is read restrictively to refer solely to passengers or more generally to apply to both passengers and the listed means of conveyance *does not change the approach in this final rule.*

The same commenter stated that inspection of animals, animal products, plants, and plant products that enter the United States from Canada may violate trade agreements between the two countries. The commenter did not specify which trade agreements it considered to be violated.

APHIS is unaware of any trade agreement that precludes either the United States or Canada from conducting sanitary or phytosanitary inspection and quarantine services. To the contrary, the U.S.-Mexico-Canada Agreement, or USMCA, allows for inspection of imported commodities among the three nations.

Several commenters stated that our proposed implementation date of January 1, 2024, would be difficult or impossible for their businesses to absorb, and requested more time to allow for adequate budget planning and adjustment of contracts with customers. Two commenters suggested that, regardless of what fiscal year is chosen for implementation, the implementation date should be within the June to November timeframe to minimize disruption to service contracts for that year.

Because the publication of this final rule occurred after January 1, 2024, we have elected to set October 1, 2024, as our implementation date. In the proposed rule, this was the date that the second phase of the increased fees was scheduled to take effect. The October 1 date corresponds to the beginning of APHIS' fiscal year (FY), and it occurs within the June to November timeframe requested by the commenters. In general, on October 1, 2024, we will revise the fees to set them at the level specified in the proposed rule beginning on that date. That is, for most fee classes, we are starting at phase 2 of the

[2] *https://www.merriam-webster.com/dictionary/international.*

proposed fees, but otherwise finalizing them as proposed. However, for reasons discussed below, the user fees for commercial vessels, commercial aircraft, international air passengers, and treatment monitoring will differ from those proposed.

The same commenters who asked that the implementation date be within the June to November time frame asked for at least a 1-year delay in the implementation of this rulemaking to allow for budget planning.

As noted in the proposed rule, the AQI program ran an average deficit of over $166 million annually for FY 2017 through FY 2019. During the COVID–19 pandemic, decreased international travel further exacerbated these deficits, and the program had to rely on emergency appropriated supplemental funds to cover program costs. Even in a post-pandemic environment, current revenue projections indicate that the fees must be raised by the outset of FY 2025 to avoid possible disruptions to program delivery due to insufficient funds. Due to these exigencies, we cannot delay the implementation of the new fees for such a prolonged period. We note, however, that we have elected to have a later effective date of April 1, 2025, for the removal of a provision exempting commercial aircraft with 64 or fewer seats meeting certain conditions from paying the user fee for their mode of conveyance. We have determined that this later effective date can be implemented without disruption to program delivery.

Two commenters stated that the fee increases should be phased in over a 5-to-10-year period.

We note that we are phasing in the fee increases; the final fee increase will occur more than 4 years after the issuance of this final rule. A more prolonged phase-in schedule would adversely impact cost recovery and is not feasible to sustain program operations.

Commenters stated that the proposed increases are not warranted in the current inflation/recession prone environment and associated impacts to industry.

The fee increases are necessary to help achieve full cost recovery for the AQI services provided to the parties subject to the fees. AQI user fee-funded activities operated at a substantial deficit before the COVID–19 pandemic, and the pandemic exacerbated this deficit to the extent that emergency supplemental appropriations were needed to cover program costs. Moreover, APHIS notes that the AQI program is subject to the same inflationary pressures as other sectors of the economy. Costs associated with AQI personnel compensation and benefits, equipment and materials, rents, leases, utilities, contracts, and other direct and indirect costs have all increased since APHIS last adjusted the AQI user fees in December 2015. Since December 2015, the consumer price index for all urban consumers has increased over 30 percent,[3] and the AQI program is unsustainable at the current fee rates. Finally, we note that a commenter, a small business owner, indicated that businesses routinely factor the impact of compliance with Federal, State, and local laws and regulations into their business models, and take into account changes in compliance costs. The commenter's contention that this is a common business practice was supported by several commenters who represented regulated entities and indicated they would need to adjust billing and contracts depending on the implementation date of a final rule.

Several commenters stated that instead of raising user fees, APHIS should find alternate funding sources (for example, appropriated funds) for AQI activities.

As we explained in the proposed rule, the FACT Act of 1990 was passed by Congress and signed by the President for the express purpose of the AQI program becoming self-funding through the prescription and collection of user fees. While emergency appropriated supplemental funds were provided during the COVID–19 pandemic to mitigate low balances in the accounts, Congress indicated in the appropriations bills that they were to address pandemic-related exigencies, and we cannot depend on appropriations to cover the cost of AQI activities on a routine and ongoing basis.

Many commenters asked accounting questions relating to how the fees were developed. We will address specific comments below by topic. In general, these questions are answered in the APHIS AQI cost model data that was cited in the proposed rule and made available on the APHIS website at: *https://www.aphis.usda.gov/aphis/ourfocus/business-services/aqi-user-fees/aqi-fee-types/aqi-user-fee-reports.* This data was comprehensive; for example, the FY 2017 commercial aircraft rollup report contains over 190,000 lines of highly detailed cost data. To that end, we also provided a dedicated AQI cost model video instructing the public on how to properly read the data; these video instructions were also available at *https://www.aphis.usda.gov/aphis/ourfocus/business-services/aqi-user-fees/aqi-fee-types/aqi-user-fee-reports.* APHIS also referenced the data in stakeholder webinars conducted during the comment period; information about the dates and subjects of these webinars is available on the APHIS website at *https://www.aphis.usda.gov/aphis/ourfocus/business-services/aqi-user-fees/aqi-fee-types/aqi-userfee-proposed-rule-webinars* as are links to recordings of the webinars. The data availability and link also were provided via stakeholder announcement and, as previously mentioned, further explained via a dedicated AQI cost model video and corresponding stakeholder announcement. APHIS web analytics showed an increase in AQI cost model data web traffic following each of the above engagements.

Several commenters stated that APHIS should have discussed any cost-cutting measures we had identified or considered in addition to the proposed fee increases.

To address the current challenges, the AQI program has implemented ways to increase efficiency. These efficiencies reduced AQI program costs, and these cost savings were realized in the FY 2017 through FY 2019 period. As a result, the cost data that APHIS used to develop the AQI user fee rates in this rulemaking, and which serve as the ''baseline,'' include these program cost savings. The most significant way we have increased inspection efficiency is by using Risk Based Sampling (RBS). RBS is an advanced statistical approach that adapts to increase inspection rates of higher risk products and reduce inspection rates of proven lower risk products. Table 1 below shows the time savings for our trade and U.S. Customs and Border Protection (CBP) inspectors across all monitored pathways, without compromising agriculture safeguarding efforts. APHIS and CBP redirect this saved time to intensive activities with greater phytosanitary risk, such as physical inspections and regulated garbage monitoring.

[3] The CPI Inflation Calculator is available on the Bureau of Labor Statistics website at *https://www.bls.gov/.*

Table 1: Estimated RBS Time Savings

Commodity	Trade	CBP
Celery	26%	23%
Avocado	93%	77%
Broccoli	58%	52%
Date	38%	34%
Papaya	85%	73%
Mushroom	85%	81%
Carrot	88%	76%
Overall	77%	67%

The AQI program has identified other ways to increase efficiency in recent years. For example, CBP, through various initiatives, has increased its targeting efficiency rates to approximately 63 percent. In doing so, CBP deployed new approaches that significantly improved their ability to identify and inspect non-compliant material compared to random selection. APHIS and CBP have also facilitated more timely clearance of agricultural cargo by improving our processes to grant authority to inspectors and pest identifiers to make regulatory decisions at ports, rather than by national specialists in other locations. We also implemented advanced digital imaging to expedite pest identifications that in the past would have required physically shipping specimens, shaving days off of the pest identification process.

APHIS also increased its electronic capacity to process cargo. Of all the government agencies that set import requirements, APHIS had the greatest number of forms and documents required to clear cargo. APHIS joined CBP's Automated Commercial Environment single window initiative, making it easier for importers to electronically provide information critical for AQI clearance prior to importation, reducing expense and clearance time. Additionally, we have structured regulatory requirements into an advanced database, and automated permit issuance to reduce the processing time for most Plants and Plant Products permits from 5 to 7 days to 1 day or less. APHIS eFile issues up to 85 percent of the Plants and Plant Products permits to applicants in less than 1 minute.

Program and process efficiencies are just one aspect of the AQI program's efforts to become more effective and efficient at a lower cost. Personnel compensation and benefits are the single largest cost in the AQI program, and so effective use of personnel time is essential to keep costs down without compromising the mission. CBP found that their Agriculture Specialists were increasingly spending time on administrative activities, taking them away from core inspection and regulatory functions. To address this, CBP piloted using technicians (full performance level GS–08) to free Agriculture Specialists (full performance level GS–12) to spend more time on inspection-related activities. CBP's staffing and workload analysis found that adding one technician frees up 1.49 CBP Agriculture Specialists. The 731 Technicians in CBP's staffing plan free up the equivalent of 1,089 Agriculture Specialists, resulting in a cost savings of nearly $81 million per year.

Despite these efforts to increase efficiencies, anticipated AQI operational costs would far surpass AQI anticipated revenue unless the fees are raised in the manner specified in this final rule.

A commenter stated that APHIS should provide greater transparency for capital costs. The commenter expressed concerns over what was included in the capital costs, the allocation of those costs, and capital costs associated with non-AQI programs. The commenter stated that the proposed rule should have explained how capital costs were factored into fee calculations.

We disagree with the commenter. As we explained in the proposed rule, there is no reserve component in the fee rates in this proposed rule. Rather, the fee rates in the proposed rule were set at levels intended only to result in fee collections that cover the cost of providing agricultural quarantine and inspection services and the costs of administering the program, and personnel and capital planning cost components have been added to the cost model.[4] Adding these cost components to the model ensures that the program can be fully staffed in future years and ensures that future-looking capital costs can be offset as they are actualized, without recourse to use of a general-purpose reserve to pay for these costs. In the AQI cost model that accompanied the proposed rule, we included capital costs in the cost model at level 26 for APHIS and level 27 for CBP, all cost objects with an identification code starting with "26" or "27" are planned capital spending costs. Likewise, we note that an overall summary of planned capital spending costs could also be found in the supporting document at *https://www.regulations.gov/document/APHIS-2022-0023-0035* that was made available during the comment period. As an additional measure, APHIS has included the planned capital expenditure costs in a series of summary tables in this document.

Capital costs include items such as facility design, development and maintenance costs; new information technology and equipment costs, and AQI program outreach expansion and

[4] The programmatic need and legal basis for the application of fees to capital costs was discussed in further detail in the proposed rule, the relevant sections of which the agency incorporates by reference here. See 88 FR 54797–98, 54800–801.

improvement costs. The AQI Program's top 10 capital projects are:

1. Design and construct two new plant inspection stations;
2. Design and construct a new multi-function laboratory and containment facility;
3. Upgrades and updates to the eFile system;
4. Beltsville facility infrastructure improvements;
5. Design and construct new plant pathogen diagnostic methods lab;
6. Design and construct new national plant germplasm greenhouse;
7. Design and construct new identification laboratory;
8. New Preclearance and Offshore Programs IT System;
9. Engage in an outreach campaign, Clean Clears Quicker, to emphasize the importance of regulatory compliance; and
10. Establish Federal oversight of the existing Don't Pack A Pest outreach campaign.

APHIS has treated capital costs as an overhead cost and allocated capital costs according to frontline Full Time Equivalent (FTE) hours because any capital projects would support the AQI program proportionately to frontline AQI FTEs. With respect to shared facilities, that is, facilities which house or support both AQI and non-AQI functions—the planned capital costs in the AQI activity-based cost model only include those costs attributable to the AQI program. Moreover, a portion of those costs are allocated to non-fee areas. Non-fee areas are those AQI activities for which there is no fee. The largest non-fee areas are privately owned vehicle (POV) and POV passenger clearance, and pedestrians. The AQI program allocates costs to non-fee areas for the express purpose of ensuring that the payers of AQI user fees do not pay for the costs associated with non-fee areas. Rollup reports associated with non-fee areas are available to the public on the APHIS website at *https://www.aphis.usda.gov/aphis/ourfocus/business-services/aqi-user-fees/aqi-fee-types/aqi-user-fee-reports* alongside the rollup reports for the fee areas. CBP's appropriation covers CBP's costs associated with AQI activities in non-fee areas. The rest are covered by trust funds that we have entered into pursuant to regulations issued under authority of the Plant Protection Act (7 U.S.C. 7711 *et seq.*), such as those in 7 CFR 319.37–22 for plants for planting and those in 7 CFR 319.56–6 for fruits and vegetables, or are part of other APHIS programs and appropriations and are not included in costs factored into the AQI User Fees.

We note, additionally, that the commenter assumed that the AQI program is fully funded and staffed currently, which is not the case.

A commenter stated that they worked with CBP personnel who were underused at a port of entry, and questioned whether additional CBP staffing was warranted in light of their experience. While not directly challenging the validity of this claim, several other commenters asserted that, at other ports of entry, throughput is substantial and CBP employees often work overtime to ensure timely delivery of services. One commenter stated that some ports of entry only currently employ a single inspector to conduct AQI inspections.

Our data does not support the commenter's anecdotal experience that CBP personnel are underused. CBP's staffing models, which are addressed at greater length directly below, evaluated workload and throughputs at ports of entry throughout the United States. CBP's staffing models underscore that many ports of entry have workload demands that currently exceed regular FTE hours.

Several commenters noted that a significant amount of each fee would go to staffing. The commenters stated that it was not clear from the proposed rule how the additional staffing levels needed were arrived at, and how they would be used in providing AQI services.

Additional staffing costs were included in the AQI cost model at level 35 and level 451 for APHIS and level 452 for CBP; all cost objects with an identification code starting with ''35'' or ''45'' are additional staffing costs. We summarized CBP's additional staffing requirements by fee area in table 1 of the proposed rule, which we have reproduced as table 2 below.

Table 2. CBP Staffing

CBP FTEs			
Pathway/Conveyance	Total FTEs as of FY 2019	Additional FTEs Required	Total Projected FY 2028 FTE
Air Passengers	1,324	341	1,665
Commercial Aircraft	819	438	1,257
Commercial Vessel	356	247	603
Commercial Truck	155	258	413
Commercial Rail	33	74	107
Cruise Vessel Passenger	22	6	28
Other (Non-Fee Areas)	362	70	432
Totals	3,071	1,434	4,505

CBP uses two statistical workload models to determine AQI staffing needs by environment. The Agriculture Specialist Resource Allocation Model [5] (AgRAM) calculates staffing needs for CBP Agriculture Specialists, and the Mission Operations Support Resource Allocation Model (MOSRAM) calculates the staffing needs for support positions such as CBP Agriculture Technicians and other support positions.

CBP's staffing models calculated additional personnel needs based on estimated throughput as calculated in light of actual workload, in order to ensure that bottlenecks do not occur in port operations. APHIS summarized its additional personnel needs by fee area in table 2 of the proposed rule, which we have reproduced as table 3 below. The bulk of additional APHIS personnel are field positions, including botany, entomology and plant pathology identifiers, veterinary medical officers, and plant health safeguarding specialists. Increased frontline staffing also requires additional support staff to accommodate additional workload in areas such as human resources, financial management, and employee training. Finally, some additional policy and operational personnel will also be needed to accommodate the additional throughput. Our data in tables 2 and 3 account for these factors.

Table 3. APHIS Staffing

APHIS FTEs			
Pathway/Conveyance	Total FTEs as of FY 2019	Additional FTEs Required	Total Projected FY 2028 FTE
Commercial Aircraft	392	200	592
Commercial Vessel	208	91	299
Air Passengers	193	93	286
Commercial Truck	153	62	215
Treatments	57	55	112
Commercial Rail	34	14	48
Cruise Vessel Passenger	6	4	10
Other (AQI Non-Fee Areas)	43	25	68
Totals	1,086	544	1,630

A commenter noted that the proposed rule was based on cost data from FY 2017 through FY 2019 and asked how budget shortfalls or surpluses in FY 2013 through FY 2016 and FY 2020 through FY 2022 may have impacted the setting of the AQI user fees.

APHIS does not set AQI user fees based upon prior year shortfalls or surpluses. Under an activity-based costing methodology, APHIS uses actual program costs per fiscal year plus anticipated costs for capital planning and additional staffing allocated to each fee and non-fee area, then takes the total costs in each fee area and divides that total cost by the number of projected units (a unit being a commercial vessel, commercial truck, commercial railroad car, commercial aircraft, an international air or cruise passenger, or a treatment). The unit costs for 3 consecutive fiscal years are adjusted for inflation to today's dollars (in this rulemaking, June 2022), and then these adjusted unit costs are averaged. Finally, APHIS adjusted the average unit cost (that is, June 2022 dollars) for projected inflation, (that is, future dollars) for FY 2025 through FY 2028.[6] As we explained above, non-fee areas are those AQI activities for which there is no fee. The largest non-fee areas are privately owned vehicle (POV) and POV passenger clearance, and pedestrians. The AQI program allocates costs to non-fee areas for the express purpose of ensuring that the payers of AQI user fees do not pay for the costs associated with non-fee areas. Rollup reports associated with non-fee areas are available to the public on the APHIS website at *https://www.aphis.usda.gov/aphis/ourfocus/business-services/aqi-user-fees/aqi-fee-types/aqi-user-fee-reports* alongside the rollup reports for the fee areas. CBP's appropriation covers most of the costs associated with non-fee areas.

The same commenter stated that it appeared that cost data from FY 2014 through FY 2016 and FY 2020 through FY 2022 had a role in the proposed fees, although it was difficult to discern exactly to what degree.

APHIS did not use cost data from FY 2014 through FY 2016 for the proposed rule because we had newer cost data on which to rely. APHIS also did not use cost data for FY 2020 through FY 2022 because, as we suggested in the proposed rule, these fiscal years were not a period of normal operations.

A commenter stated that the proposed fees did not appear to follow the inflation rate since the fees were last updated. The commenter stated that, were the fees calculated in such a manner, they would be significantly lower than proposed.

The fees were not calculated solely by applying intervening inflation. APHIS used actual cost data for FY 2017 through FY 2019 by user class, future costs for planned capital expenditures, and additional staffing, and divided that by the number of users per fiscal year to arrive at a unit cost. We then adjusted those unit costs to June 2022 dollars, averaged the unit costs across the 3 fiscal years, and finally adjusted that average unit cost for projected inflation.

[5] This model is described in the document "Agriculture Resource Optimization: Fiscal Year 2020 Report to Congress" available on CBP's website at *https://www.dhs.gov/sites/default/files/publications/cbp_-_agriculture_resource_optimization_0.pdf.*

[6] See the document titled "Projected Fees for Agricultural Quarantine Inspections, FY 2024–2028" which we made available with the proposed rule at *https://www.regulations.gov/document/APHIS-2022-0023-0010.*

We made comprehensive rollup reports for the cost components of each fee available as supplemental documents for the proposed rule. The reports are available on the APHIS website at *https://www.aphis.usda.gov/aphis/ourfocus/business-services/aqi-user-fees/aqi-fee-types/aqi-user-fee-reports.* In addition, we have included summary tables for each fee area below as a quick visual reference regarding fee development.

A commenter stated that all AQI user fees should be capped.

Capping all AQI user fees would undermine full cost recovery, one of the aims of the FACT Act. As we indicated in the proposed rule, while we cap fees for two AQI modes, prepaid commercial railroad cars and prepaid commercial truck crossings (transponder), this is due to their unique operational exigencies. For example, we pointed out that in the absence of a commercial truck transponder, CBP personnel would have to collect the fee at border crossings 11 million times annually, which is operationally untenable.

Several commenters suggested that APHIS should tier user fees based on the sanitary and phytosanitary risk presented by different modes of conveyance (*e.g.,* commercial aircraft versus commercial vessel) or different conveyance types within that mode (*e.g.,* containerized ship versus non-containerized ship).

APHIS' current user fee structure does charge different fees based on the mode of conveyance. This is done to preclude cross-subsidization, and to ensure that the fees correlate to the AQI services that each mode receives.

We generally do not consider it possible to tier fees within a mode of conveyance. This is because it is not usually possible to assign a particular level of sanitary and phytosanitary risk, and corresponding AQI services, to a conveyance type that is unique to the type. To use an example within the commercial vessel mode, while agricultural cargo is often carried in containerized ships, certain types of agricultural cargo, such as citrus, bananas, and pineapples, are routinely shipped in break bulk shipments, in which the individual boxes are placed within a commercial vessel's cargo hull, rather than in containers. In both instances, CBP personnel need to offload and inspect the cargo for plant pests, noxious weeds, and overall compliance with APHIS' regulations. Likewise, a containerized ship may carry cargo with a low sanitary and phytosanitary risk during one shipment, and a higher sanitary and phytosanitary risk in a later shipment. The climates of different ports of export can be unique, and a vessel departing from one port of export during a particular shipment may face exposure risks to hitchhiking pests that it does not experience when departing from a different port. For a similar reason, the route chosen and the time of year during which the shipment takes place may also contribute to exposure risks.

In instances in which we have determined that the level of sanitary and phytosanitary risk is such that AQI services are not warranted for a particular conveyance type, we can and do exempt certain conveyance types from our user fees. For example, while we charge commercial railroad cars a user fee, the regulations have exempted and will continue to exempt locomotives and cabooses from the railroad car fee. Likewise, we do not charge a commercial vessel fee for vessels of less than 100 net tons.

Finally, we do note that CBP's staffing model accounts for sanitary and phytosanitary risk, so ports of entry that routinely inspect means of conveyance and cargo with a high phytosanitary and sanitary risk are assigned more personnel than ports of entry that do not.

Several commenters suggested that APHIS could establish different user fee tiers for methods of conveyance that carry agricultural cargo versus those that do not; while other commenters suggested a base fee, plus additional fees for extended service based on cargo carried.

The current method by which APHIS calculates the AQI user fees, in which aggregate costs of providing AQI services are divided by number of instances in which those services are provided, generally does not currently allow for such a distinction between conveyances carrying agricultural cargo and those that do not carry agricultural cargo. To that end, we note that sanitary and phytosanitary inspections are not only conducted of the cargo carried by a method of conveyance, but also the method of conveyance itself. We also note that non-agricultural cargo may present sanitary and phytosanitary risks; for example, gypsy moth (*Lymantria dispar,* also known commonly as spongy moth) is known to infest stone and quarry products.

As noted above, cargo is not the sole factor contributing to the sanitary and phytosanitary risk associated with a particular means of conveyance, and the AQI services required for that means of conveyance. Port of export, route, and time of year of the shipment may also all contribute to increased risk and extend the AQI services required. As a result, if we were to establish a base fee, with additional surcharges based on cargo carried, this would not take all these risk factors into consideration.

A commenter suggested that fees should be tiered based on handling volume at a particular port of entry.

The commenter provided no information regarding why handling volume, that is, the number of instances in which AQI services were provided at the port, should be considered indicative of the level of AQI services provided to individual arrivals and would provide a better basis for setting fees than the basis articulated in the proposed rule. A single, huge container shipment of cargo that has a significant sanitary or phytosanitary risk may take as long to inspect, if not longer, as several smaller shipments of low-risk cargo. We also note that variances throughout the year in handling volume at particular ports would require the fee rate to be dynamic, which would lead to unpredictability in terms of what fee would be assessed from arrival to arrival, as well as concomitant unpredictability in APHIS and CBP's revenue stream. It also could lead to staffing and resource allocation issues at ports of entry, particularly if owners and operators began to seek out ports with the lowest current fee.

A commenter asked how APHIS will monitor expenditures to ensure the increased fees are used appropriately.

APHIS employs multiple safeguards to ensure user fee funds are used appropriately. For example, from an operational perspective, APHIS maintains all AQI fees we collect in distinct accounts, carefully monitors the balances in these accounts, and only uses these funds to pay for our actual costs for providing these distinct services. In addition, APHIS will continue to maintain, evaluate, and ensure that our internal controls, which include our expenditure-related accounts and processes, are operating properly and in compliance with Office of Management and Budget (OMB) Circular A–123, Management's Responsibility for Enterprise Risk Management and Internal Control requirements. Examples of APHIS internal controls include verifications, reconciliations, authorizations and approvals, and supervisory control activities. APHIS also complies with Federal audit requirements which include audit of expenditure-related processes and accounts under the Chief Financial Officers Act of 1990 (CFO Act) (Pub. L. 101–576), as amended, the Government Management Reform Act of 1994 (GMRA) (Pub. L. 103–356), as amended, and the Federal Financial

Management Improvement Act of 1996 (FFMIA) (Pub. L. 104–208, title VIII), as amended.

A commenter stated that APHIS should amend the regulations to assess a penalty on airlines and cruise lines that is equivalent to the amount airlines and cruise lines have failed to lawfully remit to passengers.

APHIS has no statutory authority to assess such penalties, nor is this request within the scope of this rulemaking.

One commenter asked how airline passengers can assess that their fee was appropriately set by APHIS when they are greeted and inspected not by APHIS, but by CBP.

The Homeland Security Act of 2002 created the Department of Homeland Security and transferred the function for AQI clearance of international passengers and certain other AQI functions from APHIS to CBP.[7] CBP Officers review passenger manifests, passenger documentation and interview arriving international passengers. CBP Officers also refer passengers of interest to the AQI program to CBP Agriculture Specialists who are funded by AQI user fees for secondary inspection. As stated previously, rollup reports from the activity-based cost model are available for public review on the APHIS website at *https://www.aphis.usda.gov/aphis/ourfocus/business-services/aqi-user-fees/aqi-fee-types/aqi-user-fee-reports.* For example, there are over 92,000 lines of highly detailed cost data in the FY 2017 international air passenger rollup report.

Finally, several commenters requested that APHIS extend the comment period for the proposed rule.

One of these commenters posed a series of questions that, the commenter asserted, APHIS needed to respond to for the public to provide informed comments on the proposed rule. These included questions about whether there were budget shortfalls or surpluses in the years 2013–2016 and 2020–2022, if such shortfalls or surpluses were factored into the cost-benefit analysis for the rulemaking, and whether adjustments for inflation would have resulted in shortfalls or surpluses in the years 2016 to the present. The commenter also asked why the aircraft fee is increasing if the number of aircraft arrivals has not changed and if there was a breakdown of how APHIS estimated the costs of capital costs and staffing and how capital costs were allocated in airport or non-airport environments.

We disagree with the commenter that APHIS' responses to the commenter's questions were necessary to evaluate the merits of the proposed rule. APHIS provided all information necessary to evaluate the proposed rule to the public in the proposed rule itself and its supporting documentation. This included, for example, documentation regarding how the fee model was selected and why it was appropriate, the cost components that led to the proposed fees using that model, the rationale for revising particular fee caps, and the basis for our proposed removal of exemptions. We note that, between September 12, 2023, and September 18, 2023, APHIS hosted webinars for the industries affected by the rulemaking. During the webinars, we allowed for a question-and-answer period. We also recorded the webinars and made them publicly available on the APHIS website at *https://www.aphis.usda.gov/aphis/ourfocus/business-services/aqi-user-fees/aqi-fee-types/aqi-userfee-proposed-rule-webinars.* During the webinar for the commercial aircraft fee, which the commenter attended, we responded to each of the commenter's questions.

Two commenters who requested extension of the comment period stated that APHIS provided no information regarding how the fees were calculated.

We made comprehensive rollup reports for the cost components of each fee available as supplemental documents for the proposed rule. They were and are available on the APHIS website at *https://www.aphis.usda.gov/aphis/ourfocus/business-services/aqi-user-fees/aqi-fee-types/aqi-user-fee-reports.*

One commenter who requested extension of the comment period stated that APHIS provided no indication of how the fees would be used.

We disagree. The proposed rule discussed at length the direct and indirect costs associated with providing the AQI services funded by the user fees.

Economic Comments

Commenters raised several issues concerning the Regulatory Impact Analysis that accompanied the proposed rule. These are addressed in the final Regulatory Impact Analysis that accompanies this final rule.

Revisions to Regulatory Definitions

We proposed to revise some existing definitions and to add new ones to § 354.3(a). Specifically, we proposed to amend the definitions for *commercial railroad car* and *commercial truck;* to replace the definition of *Customs* with one for a definition for *Customs and Border Protection (CBP);* and to add definitions for the terms *passenger, reconditioning,* and *restacking.* We received no comments on these revisions and additions and will adopt most of them accordingly. However, as discussed below, we have decided not to finalize proposed revisions to our AQI treatment monitoring fee that would have, among other things, charged parties for restacking and reconditioning services provided in connection with AQI treatment services. Because the terms *restacking* and *reconditioning* will not appear in the regulations as a result of this decision, there is no longer a need to define these terms and we have not done so in this final rule.

Additionally, for reasons that we discuss below under the section heading ''Commercial Vessels,'' we are adding two definitions to the regulations in this final rule, for the terms *Great Lakes* and *Cascadia.* The revisions to the commercial vessel fee described below removed the term *barge* from the regulations; as a result, we no longer need a regulatory definition for the term and are removing it accordingly.

Commercial Vessels

The AQI program inspects, with some exceptions, commercial vessels of 100 net tons or more arriving at ports of entry into the customs territory of the United States. AQI user fees for inspection of commercial vessels are listed in § 354.3(b)(1). We proposed to increase the user fee per arrival.

We also proposed to eliminate the exemption for barges from Canada; the exemption is currently found in § 354.3(b)(2)(vi). As discussed in the pathway analysis that accompanied the proposed rule, we determined that barges entering the United States from Canada pose a phytosanitary risk similar to barges entering the United States from origins other than Canada and to other types of vessels entering from Canada. Barges from origins other than Canada and other types of vessels from Canada are not exempt from AQI user fees. Other vessels from Canada are required to pay user fees even when travelling the same routes and carrying the same cargo as exempt barges.

Finally, we proposed that the commercial vessel fee would also not apply to commercial cruise (passenger) vessels that carry passengers paying the international passenger fees under § 354.3(f), because the cost of inspecting the entirety of the vessel is included in the international cruise passenger fee. That broad proposed exemption would replace the existing limited exemption in § 354.3(b)(2)(i) for certain foreign passenger vessels. In this respect, the treatment of commercial vessels is

[7] 6 U.S.C. 231.

distinct from that of international aircraft carrying passengers, which are not exempt from the commercial aircraft user fee.

We received 28 comments on these proposed changes to the commercial vessel fee. All the commenters were generally opposed to the proposed changes.

Most commenters noted that we proposed to increase the commercial vessel fee from the current fee of $825 to $3,557.18 in 2028, which was a higher percent increase than any other fee.

Several of the commenters stated that they would support the fee if it was correlated to service received. The commenters asserted that the fees appeared higher than the level of AQI services they received at ports of entry.

As we discussed in the proposed rule, our revised cost model for the proposed fees was based on aggregate full-time equivalent (FTE) hours spent providing services, such as inspections, for a particular user fee class.

Similarly, a commenter suggested that APHIS should begin to analyze FTE hours worked by vessel type and revise the commercial vessel fee based on these findings before issuing a final rule to revise the commercial vessel fee.

As we noted above, vessel type is not necessarily a reliable indicator of the level of effort needed to provide AQI services. Cargo, port of departure, route, time of the year in which the shipment occurs, and port of arrival all play a contributing role to determining the sanitary and phytosanitary risk associated with the vessel and the commensurate level of services warranted. Because these can vary significantly from shipment to shipment, if we were to conduct such an assessment, it would be difficult to extrapolate generalized, defensible conclusions about different vessel types from our current data set, which is limited to aggregate hours worked providing AQI services for the commercial vessel user fee class as a whole and number of instances of providing those services. Our current data is therefore insufficiently granular to observe those variances. Moreover, as we mentioned in the proposed rule, cargo from commercial vessels is routinely offloaded into a joint holding area, and inspected en masse. We mention this in order to underscore that the assessment requested by the commenter would need to be conducted *de novo,* and cannot be extracted from the existing data used to calculate the fee rates, and that it would require a fundamental reorientation in the manner in which cargo inspections are conducted. It is impracticable to conduct such an assessment at this time, particularly in light of resource constraints (as noted above, overtime is common at some ports of entry just to meet core inspection functions) and the economic exigencies facing the AQI program. To execute the sort of assessment requested by the commenter, we would need to hire additional port-specific analytical and billing support, which requires raising the fees to support the additional personnel.

One commenter stated that, based on data that the commenter obtained, APHIS had appeared to undercount the number of arrivals of commercial vessels. The commenter requested that APHIS use a data set from CBP that they considered to be more accurate in terms of characterizing arrivals.

APHIS used the same CBP data set as the commenter to calculate the commercial vessel fee. In reviewing the commenter's concerns, however, we realized that coastwise arrivals had been inadvertently filtered out of the data set. Coastwise arrivals refer to arrivals of the same vessel at a different port of entry, for which AQI services are provided; for example, a commercial vessel offloading cargo at the port of Philadelphia, then subsequently offloading at the port of Wilmington, Delaware, would be making coastwise arrivals. CBP's vessel arrival fee is set out in their regulations at 19 CFR 24.22(b). That fee is collected from vessels of 100 net tons or more for each arrival regardless of the number of arrivals taking place in the course of a single voyage, with a cap currently set at $5,955 per calendar year. Because AQI services are provided at each port of entry, an AQI user fee is charged for each coastwise arrival, though we do not have a cap on those fees. APHIS charges AQI user fees for each arrival because a sizable component of the fees is the inspection of the cargo, usually after it has been offloaded and is in a joint inspection area. Some vessels offload large volumes of cargo at multiple ports-of-entry during a single voyage. If the AQI vessel fee were charged on first arrival only, we would need to increase the fee even more to recover costs. We charge at each arrival to be more equitable to single port-of-entry arrivals versus multiple port-of-entry arrival voyages.

Accordingly, the proposed user fees should have been calculated by including coastwise arrivals within total arrivals. Total program costs, however, were accurate. When these costs are divided by the updated arrivals (including coastwise arrivals), the user fee is correspondingly lower; the numerator (costs) has not changed while the denominator (number of arrivals) has. Accordingly, in this final rule, the commercial vessel fee has been lowered as shown in table 4 below.

Table 4: Commercial Vessel Fee

FY 2025	FY 2026	FY 2027	FY 2028
$2,903.73	$2,981.17	$3,059.61	$3,139.06

This discovery led APHIS to evaluate all other data sets in the proposed rule to ensure that all instances in which the fee had been assessed were accurate. We discovered that, for two other proposed fee increases, those for commercial aircraft and those for international air passengers, filtering had also occurred to remove inspections that occur during preclearance. We discuss this below, in the relevant sections of the preamble for those fees.

Several commenters opposed the fee increase because it would have a disproportionate impact on vessels that are not ultra large container vessels.[8]

We acknowledge that the fees may often have a greater impact on smaller vessels than larger vessels, but we disagree that smaller vessels merit a lower fee just because they are smaller. Furthermore, we disagree that the existence of smaller vessels did not factor into the fee calculation. The commenters often stated as an assumption that ultra large container vessels necessitate more intensive AQI services than commercial vessels that are not ultra large container vessels. While this is sometimes the case, size of vessel is not the sole determinant of the level of AQI services warranted for a particular vessel. As we noted above, cargo, port of departure, route, time of the year in which the shipment occurs,

[8] See the graph for Container Ship Fleet Categories at *https://agtransport.usda.gov/stories/s/Ocean-Container-Fleet-Dashboard/pjaw-nxa9.*

and port of arrival all play a contributing role to determining the sanitary and phytosanitary risk associated with the vessel and the commensurate level of services warranted. APHIS also notes that the rise of ultra large container vessels was not the sole factor contributing to this fee increase. The change in cost allocation methodology from number of arrivals to FTE hours was also a significant factor. As discussed above, APHIS develops fees using the average unit cost across 3 fiscal years. In the case of the commercial vessel fee, the unit cost is the arrival of a vessel in foreign trade, including coastwise arrivals, during a single voyage. The arrivals of vessels in foreign trade that were not ultra large container vessels brought this average cost per arrival down to the rates in this final rule. If APHIS had based the new vessel fee rates exclusively on ultra large container vessel arrivals, the commercial vessel fee would have been considerably higher.

Summary tables 5 and 6 for commercial vessel fee calculation below show that APHIS used actual cost data for FY 2017 through FY 2019 for commercial vessels, future costs for planned capital expenditures, and additional staffing, divided by number of users per fiscal year to arrive at a unit cost. We then adjusted those unit costs to June 2022 dollars, averaged the unit costs across the 3 fiscal years, and finally adjusted that average unit cost for projected inflation. The discussion of fee rates relative to other costs of doing business was to illustrate relative economic impact of the fee, and not to serve as the basis for fee development.

We included the summary tables to be used as a quick reference regarding fee development. For more comprehensive cost data information please see the full rollup reports from the APHIS AQI activity-based cost model. As we explained above, these questions are answered in the APHIS AQI cost model data that was cited in the proposed rule and made available on the APHIS website at: *https://www.aphis.usda.gov/aphis/ourfocus/business-services/aqi-user-fees/aqi-fee-types/aqi-user-fee-reports.*

For October 1, 2024, October 1, 2025, October 1, 2026, fee rates, APHIS subtracted the January 1, 2024 rate from the October 1, 2027 rate, and divided by 4. This amount became the per phase increase. The per phase increase was then added to the previous phase amount until reaching the October 1, 2027 rate.

Table 6: AQI Commercial Vessel Fee Calculation – October 1, 2027 Phase Development ($3,139.06 Fee Rate)[1]

	FY 2017	FY 2018	FY 2019
APHIS AQI FTEs + Additional FTEs required by FY 2028	-	-	299
Total APHIS AQI Program Cost (Level 501)	$60,364,906.55	$60,565,653.83	$64,170,544.01
APHIS Capital Planning/Expenditure Future Costs (Level 26) included in total program cost above	$6,914,630.65	$7,023,455.57	$7,207,822.32
APHIS Additional Staffing Future Costs (Levels 35 and 451) included above	$4,924,381.32	$5,063,832.52	$5,217,115.69
CBP AQI FTEs	-	-	603
Total CBP AQI Program Cost (Level 502)	$93,959,909.17	$97,907,047.01	$107,864,763.34
CBP Capital Planning/Expenditure Future Costs (Level 27) included in total program cost above	$765,983.90	$776,039.26	$786,094.63
CBP Additional Staffing Future Costs (Level 452) included above	$13,378,307.63	$13,553,929.83	$13,729,552.04
Total AQI Costs (APHIS AQI Costs + CBP AQI Costs)	$154,324,815.72	$158,472,700.84	$172,035,307.35
Number of Commercial Vessels	61,417	63,521	61,745
Calculated Unit Cost (Total AQI Costs divided by Number of Commercial Vessels)	$2,512.74	$2,494.81	$2,786.22
Unit Cost inflated to June 2022 dollars[2]	$2,826.83	$2,755.72	$3,026.57
Average of Unit Costs in June 2022 dollars (fee basis)	$2,869.70	-	-
Inflation Projected to FY 2028 dollars	$3,139.06	-	-

[1] Within this table, “level” refers to the level in the APHIS AQI Cost Model.
[2] As described in: https://www.regulations.gov/document/APHIS-2022-0023-0010.

BILLING CODE 3410–34–C

Notwithstanding the above discussion, we have determined that certain commercial vessels that operate within the Great Lakes, or in the region along the coastline between Alaska and Oregon, are uniquely situated and have created a new commercial vessel fee that is lower than that for other commercial vessels. This will provide a degree of regulatory relief for such vessels that is also aligned with the sanitary and phytosanitary risk that the vessels present. We discuss these changes below.

Several commenters stated that they operated barges or other shipping vessels within the Great Lakes, or in the region along the coastline between Alaska and Oregon. The commenters stated that they were uniquely situated and that assumptions that APHIS articulated in the proposed rule about

the commercial vessel industry as a whole did not apply to them. While we stated in the proposed rule that total cargo capacity of the global fleet expanded by more than 63 percent from 2011 through 2020, the commenters stated that their vessels had not increased in size. In fact, vessel operators within the Great Lakes stated that the average size of vessels operating within the Great Lakes had not increased since the 1970s. Similarly, we stated in the proposed rule that far fewer vessels had arrived internationally from 2011 through 2020 than APHIS had predicted, but the commenters stated that their average number of arrivals per year had remained relatively constant. Further, we stated in the proposed rule that individual vessels now took much longer to inspect than they previously had, but the commenters stated that they had experienced no significant increase in the amount of time inspections took.

Several commenters stated that visual inspection of their vessels was often brief, and a few barge operators stated that CBP had never boarded their vessels. Several commenters also questioned whether the proposed fees significantly exceeded the level of AQI services provided to vessels within the Great Lakes and in the region along the coastline between Alaska and Oregon. Two commenters stated that, at face value, the fee levels appeared to be set significantly above the level of inspection services currently provided, which would be inconsistent with the FACT Act. Several operators stated that they seldom, if ever, carried agricultural cargo. Finally, the commenters stated that, because they operated solely within distinct geographical areas between the United States and Canada, they pose little to no phytosanitary risk. (As discussed in this document, the geographic area covered by the port of departure, the route, and the port of arrival all do contribute to the risk profile associated with a particular commercial vessel. However, they are not the sole factors; for example, the cargo carried may itself present a sanitary or phytosanitary risk.) To that end, several commenters stated that Great Lakes vessels often are too large to fit through the St. Lawrence seaway lock system and cannot leave the Great Lakes; one commenter stated that, even if they could leave the Great Lakes, many Great Lakes vessels are not certified by the United States Coast Guard to enter the ocean.

Commenters proposed multiple options to address these stated differences. One option proposed was to entirely exempt vessels operating within the Great Lakes or in the region along the coastline between Alaska and Oregon from the commercial vessel fee. This exemption would apply to all vessels operating within the regions, including container vessels, break bulk vessels, barges, and all other commercial vessels. A second option proposed was to retain the current exemption for certain Canadian barges. A third option proposed was to apply the fee only to vessels carrying agricultural cargo, and to exempt commercial vessels that did not carry agricultural cargo. A fourth option proposed was to retain the existing commercial vessel fee for vessels operating within the Great Lakes or in the region along the coastline between Alaska and Oregon, provided that the vessels were not currently exempt from paying the fee (*e.g.,* barges), but to add an additional per-container surcharge or otherwise scale it in accordance with ship size. Finally, a fifth option proposed was to retain the existing fee, but to adjust it for intervening inflation. The commenters who provided the fifth option stated that the cost to inspect commercial vessels operating within the Great Lakes or in the region along the coastline between Alaska and Oregon should not have increased above the rate of inflation since the previous fees were put in place.

After reviewing the comments and available information, including data from CBP and the U.S. Army Corps of Engineers, as well as information maintained by the shipping industry in the regions themselves, we agree that the vessels operating within the Great Lakes, or in the region along the coastline between Alaska and Oregon, merit additional consideration. The commenters presented information that they operate in a distinct geographical area that they seldom depart from, and sometimes are not physically able to leave. They also presented information indicating that their departures and arrivals are often more frequent than those of other commercial vessels, and publicly available information indicates that the vessels often take the same or substantially similar routes per shipment and sometimes carry the same or substantially similar cargo per shipment. Based on the risk factors identified above, the risk from these vessels is often, although not always, more well defined. The port of departure, route, and port of arrival are often the same or substantially similar: Many vessels are running out and back trips across the Great Lakes or along the coastline between Alaska and Oregon, sometimes multiple times a week.

However, as we discuss below, we would not say that these vessels are always less risky. Cargo can be a significant risk factor. For example, several areas in Canada are quarantined for European cherry fruit fly. Cherries from such areas could present a phytosanitary risk and vessels carrying such cargo would likewise present a risk. For this reason, we disagree with the first option that proposed to exempt all such vessels entirely from the commercial vessel fee. We currently inspect the vessels for possible sanitary and phytosanitary risks, and such vessels can carry cargo with significant risks. This is true even if the cargo is not agricultural cargo; as noted above, gypsy moth or spongy moth (*Lymantria dispar*) is known to infest stone and quarry products, so quarry products from an area of Canada that is infested with the moth do present a phytosanitary risk. For this reason, the third option also is not viable, because vessels that do not carry agricultural cargo may still merit AQI inspections.

Insofar as barge operators did not provide verifiable, supporting information that they only carry cargo with no sanitary or phytosanitary risk, and do not merit inspection of the vessel itself, and in light of our aim to achieve full cost recovery, we have decided not to retain the barge exemption, the second option proposed by commenters.

We also disagree with the fourth option to assess a per container surcharge; among other things, this option would incentivize the use of break bulk vessels, which do not carry containers, to carry agricultural products between Canada and the United States, because the vessels would be subject to a lower user fee. Because of their agricultural cargo, however, these vessels would still need an equivalent rate of phytosanitary inspection. Accordingly, over time, we consider it likely that this incentivization would compromise full cost recovery.

For a similar reason, we also cannot scale the fee based solely on ship size; a smaller ship containing break bulk agricultural products may pose a higher phytosanitary risk and thus require more intensive inspection services than a larger container ship containing no agricultural products or known host material for plant pests and noxious weeds. (That being said, as we mentioned previously in this document, commercial vessels of less than 100 net tons have been, and will continue to be, exempt from the commercial vessel fee.

This is true regardless of whether they originate from Canada or any other foreign country.)

We see merit in the fifth option, however. The commenters presented significant information suggesting that the commercial vessel fee, as proposed, may not be appropriate for or commensurate with the level of AQI services provided to them. This option would allow APHIS to account for the differences stated by the commenters, and allow APHIS to further assess the appropriate fee in a future rulemaking. In so doing, it would effectively keep the current fee for such vessels, with an allowance, adjustment for inflation, that the commenters suggested and that we agree is appropriate.

However, we do not think this solution can be applied unilaterally to all arrivals within the Great Lakes or in the region along the coastline between Alaska and Oregon, particularly if the vessel carries cargo that may present a significant sanitary or phytosanitary risk.

Accordingly, in this final rule, we are pursuing the fifth option, with appropriate modifications to address the foregoing considerations. Commercial vessels traveling solely between the United States and Canada and either within the Great Lakes or along the coastline between Alaska and Oregon (which we are terming ''Cascadia'' out of recognition of the Cascadian bioregion in which the coastline is located) would be assessed the following fee, provided that certain conditions, set forth below, are met: $837.51 in FY 2025, $850.03 in FY 2026, $862.54 in FY 2027, and $875.06 in FY 2028.

To qualify for the lower fee rate, a vessel must meet the following requirements:

• Is not carrying cargo originating from countries other than the United States or Canada.

• Is not carrying plants or plant products.

• Is not carrying animals or animal products.

• Is not carrying soil or quarry products from areas in Canada listed in 7 CFR 319.77–3 as being infested with gypsy moth. That section of the regulations governs the importation of gypsy moth host material.

• Is not carrying wood packaging material as defined under 7 CFR 319.40–1. In this section of the regulations, ''wood packaging material'' is defined as ''Wood or wood products (excluding paper products) used in supporting, protecting or carrying a commodity (includes dunnage).''

All the above types of cargo may present a sanitary or phytosanitary risk, and, in instances in which a vessel carries such cargo, the level of AQI services provided to address this possible risk would merit the full commercial vessel fee.

To clarify to which vessels the reduced fee could apply, in this final rule, we are adding definitions for *Great Lakes* and *Cascadia* to the regulations. We have also prepared maps depicting the Great Lakes and Cascadia regions and are making them available as supporting documents with this final rule.

We are defining *Great Lakes* as ''the Great Lakes of North America and the waters of the St. Lawrence River west of a rhumb line drawn from Cap de Rosiers to West Point, Anticosti Island, and west of a line along 63° W longitude from Anticosti Island to the north shore of the St. Lawrence River.'' This is consistent with the U.S. Coast Guard definition of the region in their regulations found in 46 CFR 42.05–40.

We are defining *Cascadia* as ''British Columbia and those ports of entry into the United States lying south of 59°26′59.316″ N, north of 43°23′34.152″ N, west of 122°20′31.2″ W, and east of 135°20′2.4″ W.'' CBP's regulations in 19 CFR 101.3 designate United States ports of entry, and the following ports of entry fall within the area we are defining as Cascadia:

• Alaska—Juneau;
• Alaska—Ketchikan;
• Alaska—Sitka;
• Alaska—Skagway;
• Alaska—Wrangell;
• Washington—Aberdeen;
• Washington—Anacortes (Puget Sound);
• Washington—Friday Harbor (Puget Sound);
• Washington—Longview;
• Washington—Port Angeles (Puget Sound);
• Washington—Seattle (Puget Sound);
• Washington—Tacoma (Puget Sound);
• Oregon—Astoria;
• Oregon—Coos Bay;
• Oregon—Newport; and
• Oregon—Portland.

Two commenters stated that they operated container vessels between New Jersey and Bermuda, with the majority of arrivals into the United States being unloaded containers that previously contained cargo. The commenters requested a lower fee for their vessels and similarly situated operators.

The commenters did not provide sufficient information to characterize their operation as uniquely situated or similarly situated to the Great Lakes and Cascadian vessels described above. To cite a few examples, it was not clear whether the containers ever contained agricultural cargo, and, if so, whether the empty containers were cleared of all agricultural debris before return to the United States. The commenters also did not mention whether the routes were direct, and what route was used. Based on the absence of information necessary to evaluate the commenter's claims, we cannot make the determination that a lower vessel fee is appropriate for the commenters operating container vessels between New Jersey and Bermuda. APHIS is, however, open to receiving additional information on this topic and would consider proposing a revision in the future.

Finally, one commenter encouraged APHIS to explore means for electronic remittance of the commercial vessel fee.

CBP collects the commercial vessel fee on APHIS' behalf and offers electronic remittance through its eCBP portal (*e.cbp.dhs.gov*) and its Mobile Receipts and Collections (MCR) solution (*cbp.gov/trade/priority-issues/revenue/revenue-modernization/automation-368-and-1002-receipts/mcr-faq*).

In summary, in response to comments, we have lowered the commercial vessel fee overall to account for coastwise arrivals and have created a separate commercial vessel fee for certain vessels operating within the Great Lakes or along the coast between Alaska and Oregon.

Commercial Trucks

AQI user fees for inspection of commercial trucks entering the customs territory of the United States are listed in § 354.3(c)(1). The current fee had been set at $7.29 per truck arrival, with an option, under paragraph (c)(3), to prepay an amount 40 times the single-arrival fee to obtain a transponder. We proposed to adjust the fees in that paragraph and to set the corresponding prepaid (transponder) user fees at an amount 60 times the unrounded fee rates for each arrival. We further proposed to clarify that prepayments for purchases of transponders may be made at any time during a calendar year. The proposed rule did not provide, however, for prorating of the prepayment cost or allowing credit for individual crossings made prior to prepayment if the operator of the commercial truck elects to prepay during a calendar year. This is consistent with CBP's handling of their truck transponder fee in 19 CFR 24.22(c)(2), and we stated in the proposed rule that the intent of the proposed change was to better align our prepayment requirements with those of CBP.

We also proposed to add a sentence to paragraph (c)(1) stating that the AQI user fee would apply to all commercial trucks, regardless of what they are carrying, including empty trucks and truck cabs. This addition is already codified under the current definition of *commercial truck,* but the existing regulations in paragraph (c)(1) do not state the requirement explicitly; this revision was intended to clarify application of the fee.

We received two comments from one commenter on the proposed changes to the fees for commercial trucks.

In the supporting documentation that accompanied the proposed rule, we indicated that the data that we had obtained from the Department of Transportation (DOT) regarding freight volume per truck between the years 2006 and 2021 suggested a 79 percent increase in the number of tons per truck during that time. The commenter stated that this truck crossing and freight data did not completely match its own data and calculations. Specifically, the commenter indicated that its data indicated lower carrying capacity per truck in 2021 (9.63 tons) and an average of 22,376 more truck crossings per year between 2006 and 2016. Assuming truck crossings to be the denominator by which we determined average freight volume, the commenter stated that its data indicated that average freight volume was in fact lower in 2006 through 2016 than we had presented it to be. While the commenter conceded that carrying capacity per truck had increased between 2006 and 2021, the commenter stated that carrying capacity had not increased to the magnitude presented by APHIS, and that these discrepancies resulted in an overestimation of agricultural risk. The commenter stated that this overestimation of agricultural risk had resulted in CBP erroneously believing that additional personnel were needed to inspect commercial trucks, and that the fee would be lower were it adjusted to reflect actual freight volume.

The commenter did cite data that differs from the data APHIS cited in the supporting documentation that accompanied the proposed rule, and the data in that supporting documentation may have been in error. However, the data the commenter presented does not directly or indirectly impact how the fee was set. Neither the disputed numbers nor the supporting document itself served as the basis for the fee, nor the analysis of fee impacts in the initial economic analysis. The fee for this conveyance is not derived from the performance of the industry, nor did we use cargo capacity as a proxy for the level of effort needed to inspect trucks. As with the other fees, the commercial truck fee results from total AQI commercial truck program costs divided by the number of truck crossings for FY 2017 through FY 2019 to arrive at the base unit cost.

The commenter itself noted that both its data and APHIS' data reported the same number of truck crossings per year from 2017 to 2020. As noted above, the supporting document that the commenter disputed did not serve as a basis for the fee. It was intended only to indicate that the freight volume for commercial trucks had increased since 2006, a contention that the commenter did not dispute in principle, only in degree. The purpose of the supporting document is to contextualize the changes in the carrying capacity in the industry, as well as illustrate the relative size and impact that the fee might have on the conveyance as a whole. To that end, though, we do note that the commenter's data does suggest that commercial trucks may have lower cargo capacity than our supporting documentation suggested. We have evaluated the economic analysis that accompanies this final rule in light of that information but determined that its assumptions and conclusions still hold.

Additionally, this supporting document was not used as the basis for the additional CBP staffing needs. As indicated previously in this document, CBP's staffing models calculated additional personnel needs based on estimated throughput as calculated in light of actual workload, in order to ensure that bottlenecks do not occur in port operations.

The commenter also expressed concerns about the transponder cost increasing from 40 to 60 times the per arrival fee. The commenter asked how we would continue to incentivize transponder use.

As we stated in the proposed rule and the supporting document, APHIS determined that the average truck transponder is used 90 times per year, cross-referencing truck border-crossing data and truck transponder purchase data. Charging 60 times the per crossing fee is still a 33.3 percent discount, compared to average transponder use. We consider a 33.3 percent discount compared to average transponder use a sufficient incentive for transponder use.

The same commenter stated that, because the percentage of increase for the transponder fee would significantly surpass the percentage increase for the individual per-crossing fee, the transponder would no longer be incentivized, and commercial truck operators could abandon the transponder in favor of the single arrival fee.

The CBP Transponder system does not track the individual number of crossings per transponder; instead, it tracks the total number of crossings. Collections for single payer and transponder crossings are separate. The number of single payer crossings is determined by dividing single payer collections by the fee rate. Single payer crossings are subtracted from total crossings to determine transponder crossings. We determined average transponder crossings by dividing total transponder crossings by total transponders purchased (transponder collections divided by transponder fee). Given that APHIS found that the average transponder is used 90 times a year, charging 60 times the per crossing fee still significantly incentivizes the transponder over the per crossing fee for the average commercial truck operator, despite the differences in percent increase between the two fees. It is possible that some truck operators who make fewer than 60 crossings will decide to pay the per crossing fee as a result of this rulemaking; however, we do not foresee the transponder being generally abandoned in the manner suggested by the commenter.

We acknowledge that we proposed to raise both the per arrival commercial truck fee and the multiple that results in the transponder fee. Additionally, while we proposed to phase in the increases to the per arrival fee, we did not propose to phase in the increase to the multiple: We proposed that the multiple would immediately increase from 40 times to 60 times. To help facilitate transponder use in the first year of implementation of the revised fee, we will set the fee at a multiple of 50 times the individual crossing fee for the period between October 1, 2024 and September 30, 2025. We have revised the regulatory text accordingly.

The commenter stated that APHIS should work with our counterparts in Canada and Mexico to develop policies that will mitigate the risk of pest importation or other potential threats while reducing, exempting, or eliminating fees and other regulatory costs impacting North America trade.

APHIS works collaboratively with our colleagues in Canada and Mexico to develop harmonized polices to mitigate the risk of pest importation. For example, APHIS is the United States' representative to the North American Plant Protection Organization, or NAPPO, a regional plant protection organization. Created in 1976, NAPPO coordinates the efforts among the United States, Canada, and Mexico to

protect their plant resources from the entry, establishment, and spread of harmful plant pests, while facilitating safe intra- and inter-regional trade. Through NAPPO, APHIS works closely with its regional counterparts and industries to develop harmonized regional standards and approaches for managing pest threats.

Additionally, outside of the auspices of NAPPO, APHIS works closely with our North American National Plant Protection Organization (NPPO) counterparts, the Canadian Food Inspection Agency (CFIA) and Mexico's Servicio Nacional de Sanidad, Inocuidad y Calidad Agroalimentaria, to harmonize our approaches to phytosanitary risk to the extent possible. Examples of this collaboration include the United States-Canada Greenhouse-Grown Plant Certification Program (GCP) and the Netherlands bulb preclearance program. The GCP has been active since 1996 and allows greenhouse-grown indoor houseplants and outdoor bedding plants to move between Canada and the United States using a certification label in lieu of a phytosanitary certificate (PC), provided the plants meet the phytosanitary import requirements of both Canada and the United States. The GCP certification label eliminates the cost of a PC for certified nurseries. For the Netherlands bulb preclearance program, APHIS and CFIA have harmonized our operational workplan for imports since 2008.

Finally, as discussed previously in this document, APHIS has pursued measures to improve efficiencies and reduce costs associated with the AQI program.

However, the commenter's assumption that North American trade presents little or no sanitary and phytosanitary risk that merits AQI services is incorrect; under APHIS' regulations in titles 7 and 9 of the Code of Federal Regulations, there are numerous restrictions on the importation of animals, animal products, plants, and plant products from Canada and Mexico.

We note also that North American trade is no longer exclusively North American; for example, APHIS is aware that 194 countries send United States-bound freight through Canada seaports, and then across the border via truck and rail. The increased risk posed by commodities arriving through our North American trading partners makes it necessary to increase our level of effort to safeguard United States agriculture. This increased effort requires additional personnel, equipment, and facilities and, therefore, incurs additional costs. The AQI program must adjust the fees to recover these costs. In short, the elimination or exemption of AQI user fees for North American trade would significantly adversely impact full cost recovery because we would still need to provide AQI services to address the sanitary and phytosanitary risks posed by such trade.

The commenter stated that the information and data provided by APHIS does not explain how the proposed fee increases were calculated based upon the various services performed by APHIS inspectors. The commenter expressed concern that APHIS did not calculate the proposed fees based upon the current and future needs of the agency, but rather upon what they assume motor carriers can afford according to operating cost data.

The summary tables for the commercial truck fee calculation (tables 7 and 8 below) show that APHIS used actual cost data for fiscal years 2017 through 2019 for commercial truck, future costs for planned capital expenditures, and additional staffing, divided by number of truck arrivals per fiscal year to arrive at a unit cost. We then adjusted those unit costs to June 2022 dollars, averaged the unit costs across the 3 fiscal years, and finally adjusted that average unit cost for projected inflation. The discussion of fee rates relative to other costs of doing business was to illustrate relative economic impact of the fee, and not to serve as the basis for fee development.

The summary tables are intended to be a quick reference regarding fee development. For more comprehensive cost data information please see the full rollup reports from the APHIS AQI activity-based cost model on the APHIS website at *https://www.aphis.usda.gov/aphis/ourfocus/business-services/aqi-user-fees/aqi-fee-types/aqi-user-fee-reports.* As we explained above, these questions regarding how the fees were arrived at are answered in the APHIS AQI cost model data that was cited in the proposed rule and made available on the APHIS website at the link above.

For October 1, 2024, October 1, 2025, October 1, 2026, fee rates, APHIS subtracted the January 1, 2024 rate from the October 1, 2027 rate, and divided by 4. This amount became the per phase increase. The per phase increase was then added to the previous phase amount until reaching the October 1, 2027 rate.

[3] As described in https://www.regulations.gov/document/APHIS-2022-0023-0010.

BILLING CODE 3410–34–C

In summary, in response to comments regarding the commercial truck fee, we have lowered the cost of a transponder to 50 times the per arrival fee for the period between October 1, 2024 and September 30, 2025. The fees are otherwise being finalized as proposed.

Commercial Railroad Cars

Fees for inspection of loaded commercial railroad cars arriving at land ports in the United States are listed in current § 354.3(d)(1). The current fee is $2 per loaded railroad car arrival, with an option to prepay an amount 20 times the single-arrival fee for all arrivals of a commercial railroad car during a calendar year. We proposed to increase the user fee per arrival and to set the corresponding prepaid user fees at an amount 48 times the AQI user fee for each arrival.

As noted above, the existing regulations in § 354.3(d)(1) refer to AQI fees for inspection of *loaded* commercial railroad cars. In addition to the fee changes, we proposed to amend § 354.3(d)(1) to remove the references to loaded cars. We proposed this change

because APHIS does not collect AQI user fees for unloaded railroad cars under the current regulations; however, CBP inspects all commercial railroad cars, loaded and unloaded. We received no comments on this proposed change and will adopt it accordingly.

We also proposed to revise paragraph (d)(4) to provide for submission of remittance not only by The Association of American Railroads (AAR), and the National Railroad Passenger Corporation (AMTRAK), as is the case in the current regulations, but by individual railroad companies as well. This revision would more closely align our requirements pertaining to railroad car user fees with those of CBP as set out in 19 CFR 24.22(d).

We received two comments from one commenter on the proposed changes to the fees for commercial railroad cars.

The commenter opposed the proposed fee increases in general and the increase to the prepaid railroad car fee in particular. The commenter noted that, in the economic analysis that accompanied the proposed rule, we indicated that the number of railroad car arrivals has remained relatively steady, averaging approximately 3.5 million from 2014 to 2022. The commenter questioned why the per arrival fee and prepaid fee would increase significantly if arrivals had not commensurately increased.

The per arrival fee was derived by dividing the actual programs costs plus planned capital expenditures and additional staffing costs (adjusted for inflation) associated with providing AQI services for railroad cars by the number of anticipated arrivals. Accordingly, an increase or decrease in the forecasted number of arrivals would not itself have caused the fee to change, if aggregate costs remained correlated with arrivals. However, as stated in the proposed rule, the main reason for the per arrival fee increase for commercial railroad cars is that what falls under the definition of a railroad car as set forth in CBP's regulations in 19 CFR 24.22(d)(1) is now much larger than what the current inspection fee is designed to cover. The fees were designed to cover inspection costs for a railroad car that is essentially a single box on wheels. The typical railroad car in use today, however, consists of a multi-unit chassis with double stacked containers on wheels. This, in turn, has increased the amount of cargo in general arriving into the United States by rail. In sum, although arrivals have remained relatively constant, costs have increased significantly due to the change in size of railroad cars.

With regard to the increased cost of the prepaid fee, as stated in the proposed rule, based upon analysis of collections and arrival data, the average railroad car arrives 48.32 times per year. A prepaid multiple of 48 brings us significantly closer to full cost recovery than the present multiple of 20 times the per arrival fee. APHIS notes, however, that the prepaid railroad car user fee is optional, and, as we noted in the proposed rule, very few railroad companies use the prepaid option. If an entity determines that paying per arrival fee is more advantageous, they may do so.

The commenter stated that it was not clear that the fee increases are directly linked to the need for more resources and staff to inspect railroad cars specifically. The commenter noted that while costs for staffing and capital resources are noted generally, it is not clear if those costs are based on deficits experienced by the agency due to railroad car inspection duties.

APHIS made available a high-level cost summary as a supporting document with the proposed rule,[9] and comprehensive rollup reports directly from the APHIS AQI cost model were available with the proposed rule on the APHIS website at *https://www.aphis.usda.gov/aphis/ourfocus/business-services/aqi-user-fees/aqi-fee-types/aqi-user-fee-reports*.[10] Moreover, the summary tables for commercial railroad car fee calculation (tables 9 and 10 below) show that APHIS used actual cost data for fiscal years 2017 through 2019 for railroad cars, future costs for planned capital expenditures and additional staffing, divided by number of users per fiscal year to arrive at a unit cost. APHIS adjusted those unit costs to June 2022 dollars, averaged the unit costs across the 3 fiscal years, and finally adjusted that average unit cost for projected inflation. The summary tables are intended to be a quick reference regarding fee development. For more comprehensive cost data information please see the full rollup reports from the APHIS AQI activity-based cost model.

For October 1, 2024, October 1, 2025, October 1, 2026, fee rates, APHIS subtracted the January 1, 2024 rate from the October 1, 2027 rate, and divided by 4. This amount became the per phase increase. The per phase increase was then added to the previous phase amount until reaching the October 1, 2027 rate.

Number of Commercial Railroad Cars	3,435,666	3,603,205	3,755,351
Calculated Unit Cost (Total AQI Costs divided by Number of Railroad Cars)	$7.53	$7.59	$6.51
Unit Cost inflated to June 2022 dollars[2]	$8.47	$8.39	$7.07
Average of Unit Costs in June 2022 dollars (fee basis)	$7.98	-	-
Inflation Projected to FY 2028 dollars	$8.72	-	-

[1] Within this table, "level" refers to the level in the APHIS AQI Cost Model.
[2] As described in: https://www.regulations.gov/document/APHIS-2022-0023-0010.

BILLING CODE 3410–34–C

The commenter stated that the proposed rule did not appear to consider the use of technology by APHIS to reduce inspection costs, in lieu of raising fees, though the commenter did not specify what kinds of technology APHIS might use to reduce inspection costs.

As we discussed above, the AQI program has made significant efforts to reduce program costs while maintaining a robust agricultural safeguarding program. APHIS also notes that the evaluation, procurement, maintenance, and upgrading of technology also carries a cost, as well as the cost of training personnel or the hiring of new personnel skilled in handling the technology.

In summary, we are finalizing the commercial railroad car fee as proposed.

Commercial Aircraft

APHIS inspects international commercial aircraft arriving at airports in the customs territory of the United

States. These inspections cover commercial aircraft capable of carrying cargo and passengers, regardless of whether cargo or passengers are on a particular flight. AQI user fees for inspection of commercial aircraft per arrival are listed in § 354.3(e)(1). The current fee is $225 per arrival. We proposed to adjust the fee in that paragraph to increase the user fee per arrival.

In addition to the proposed fee changes, we proposed to remove paragraph (e)(2)(iv) to eliminate the current fee exemption for aircraft with 64 or fewer seats.

We also proposed to require monthly, rather than quarterly, remittances for the commercial aircraft fee, clarify our remittance requirements, and provide for electronic payments and statements. We further proposed to include in the regulations information on agents responsible for ensuring compliance with paying the user fees and a requirement for entities to notify APHIS in the event they have a change in personnel responsible for fee payments.

We received five comments on these proposed changes. All the commenters were generally opposed to the proposed changes.

A commenter stated that we needed to disclose the number of aircraft inspected per inspector and number of plant pests or noxious weeds found during these inspections per day, month, or year, in order to validly assess the efficacy of the current inspections and the need for the fee increases.

The number of aircrafts inspected per inspector is materially irrelevant to evaluating the base costs for the proposed fee. In the AQI cost model used to set the proposed fee, we evaluated the aggregate time currently needed to conduct all commercial aircraft inspections, whether they were conducted by one inspector or multiple inspectors at a particular port of entry. We do note, however, that CBP's staffing model indicated that additional staff were needed to inspect aircraft and air cargo to match personnel to throughputs and workload.

As we discussed above, a host of factors can contribute to the sanitary and phytosanitary risk associated with a particular arrival. This includes the cargo, the country of departure, the route chosen, the port of entry, and the time of year when the shipment takes place. Furthermore, the sanitary and phytosanitary risk in foreign regions that ship to the United States is not static and past import history is not necessarily indicative of future trends. A disease or pest of concern not previously known to exist in the country could be introduced; climatic conditions for a particular season could be especially conducive to pest populations (this is becoming increasingly common due to the climatic volatility associated with climate change); industry downturns could reduce monitoring and suppression efforts at places of production; or regime change could downsize the foreign government's sanitary and phytosanitary efforts. Sometimes multiple factors can occur simultaneously.

It is important to note, however, that the introduction and establishment of plant pests within the United States has significant economic consequences both for APHIS and for the affected industries. As we discussed in the proposed rule, APHIS has spent more than $1.3 billion on the eradication and quarantine of wood, tree, and forest pests such as Asian Longhorn Beetle, Emerald Ash Borer, and Spotted Lantern Fly, in addition to the direct and indirect losses experienced by the affected industries themselves. Even plant pest outbreaks in a single State can prove quite costly: APHIS recently had to request $103.5 million in emergency funding to address the effects of fruit fly outbreaks in California.

The same commenter stated that the proposed rule appeared to state that APHIS uses the commercial aircraft fee and international passenger fee to cross-subsidize other fee areas. The commenter specifically cited the following from the preamble of the proposed rule: ''Collections from the air sector (commercial aircraft and commercial air passenger) are a combined annual average of over 85 percent of total AQI collections. If this final rule is adopted as proposed, APHIS estimates that by FY 2028 the combined air sector would account for approximately 68 percent of total collections, assuming future arrivals match average arrivals for FY 2017 through FY 2019.'' The commenter asserted that APHIS failed to explain the anticipated reduction in percentage of total collections paid by the air sector, and whether this indicates that the air sector industry overpaid in FY 2017 through FY 2019 and thus cross-subsidized other user fee areas.

As discussed in the proposed rule, APHIS updated its AQI cost model to allocate certain costs based upon the number of frontline FTE hours. In contrast, in the 2015 rulemaking, the cost model allocated those costs based upon the number of arrivals. Our updated model resulted in more accurate cost allocations based upon level of effort in each area, and the percentage of total collections associated with the air sector shifted accordingly. No cross-subsidization of other modes occurred between FY 2017 and FY 2019. Revenue from other fees will increase more than aircraft and air passenger fees, making the relative revenue from aircraft and air passengers a smaller percentage of total revenue. We disagree with the commenters' interpretation of our statements in the proposed rule.

A commenter stated that APHIS did not recognize fundamental changes since 2020 to CBP's customs clearance process, specifically for e-Commerce-driven parcel processing and de minimis (Entry Type 86) shipments.

APHIS did not propose to charge a fee for individual parcels. We note, however, that entry type has no bearing on sanitary or phytosanitary risk.

A commenter stated that international mail shipments already pay customs fees.

The customs fees mentioned by the commenter are unrelated to AQI services, but rather other customs services provided by CBP. International mail shipments pay specific Customs entry fees to CBP, but those are not for AQI inspections. APHIS does not charge an AQI user fee specifically for international mail shipments. Rather, those costs are allocated to the fee for commercial aircraft. While the AQI program is related to the customs entry process, funds collected by CBP through their various fees do not fund AQI activities. AQI cargo activities are funded through AQI user fees and not CBP fees.

A commenter stated that users were asked to accept the proposed fees at face value without any means to review how APHIS arrived at the proposed user fees outlined in the proposed rule.

We disagree. APHIS AQI has prioritized transparency in this rulemaking and gone to great lengths to make its data available. As we explained above, the APHIS AQI cost model data was cited in the proposed rule and made available on the APHIS website. We also referenced the data in the stakeholder webinars. We also provided the data and link via stakeholder announcement, and we further explained via a dedicated AQI cost model video and corresponding stakeholder announcement. APHIS web analytics showed an increase in AQI cost model data traffic following each of the above engagements. At least one stakeholder specifically referenced the data in their comment, making it clear the data was available and usable by stakeholders for the purpose of notice

and comment. Moreover, the summary tables for commercial aircraft fee calculation (tables 11 and 12 below) show that APHIS used actual cost data for FY 2017 through FY 2019 for commercial aircraft, future costs for planned capital expenditures and additional staffing, divided by number of commercial aircraft arrivals per fiscal year to arrive at a unit cost. APHIS adjusted those unit costs to June 2022 dollars, averaged the unit costs across the 3 fiscal years, and finally adjusted that average unit cost for projected inflation. The summary tables are intended to be a quick reference regarding fee development. For more comprehensive cost data information please see the full rollup reports from the APHIS AQI activity-based cost model available on the APHIS website at *https://www.aphis.usda.gov/aphis/ourfocus/business-services/aqi-user-fees/aqi-fee-types/aqi-user-fee-reports.*

For October 1, 2024, October 1, 2025, October 1, 2026, fee rates, APHIS subtracted the January 1, 2024 rate from the October 1, 2027 rate, and divided by 4. This amount became the per phase increase. The per phase increase was then added to the previous phase amount until reaching the October 1, 2027 rate.

BILLING CODE 3410–34–C

A commenter stated that APHIS excluded data showing potential AQI program surpluses from 2016 to the present, if AQI fees had been adjusted for inflation in the 2015 rulemaking.

The 2015 rulemaking did not adjust the fees for inflation, and positing a counterfactual scenario in which it did is materially irrelevant to assessing the proposed fees. The fees in this proposed rule were based on actual costs for 3 fiscal years, plus capital planning and future staffing costs, all adjusted for inflation. The fees were developed using Activity Based Costing to support full cost recovery.

A commenter stated that the fee exemption for aircraft with 64 or fewer seats should remain because the commenter claimed that our study was predicated on a misunderstanding of the reason for the exemption. The commenter stated that, in the 1992 rule that had established the exemption, APHIS had cited two bases for the exemption to the fee. The first was that such aircraft required little to no phytosanitary inspection. The second was that such an exemption was predicated on the per-passenger cost differential that made it ''difficult for small commuter airlines to compete with larger airlines for business.'' The commenter further contended that our study had assumed that exempted aircraft had an increased exposure risk to plant pests since the 1992 exemption was established, without identifying the actual increased phytosanitary risk now associated with such aircraft, which the commenter stated could only be substantiated through pest detections on exempted aircraft. Finally, the commenter stated that if AQI services are not being provided for such exempted aircraft, removing the exemption would charge a user fee in the absence of services provided, and thus violate the FACT Act.

[11] As described in: *https://www.regulations.gov/document/APHIS-2022-0023-0010.*

In 1991, when this fee exemption was first established it exempted aircraft with 30 or fewer seats which are not carrying cargo and are not equipped to offer inflight food service. We explained that we exempted those aircraft because we did not provide AQI services to the aircraft (56 FR 37483, August 7, 1991). In 1992, when we proposed to expand the fee exemption to aircraft with 64 or fewer seats, we explained that this was intended to exempt commuter aircraft that require little or no inspection from the per aircraft inspection fee (57 FR 56862, December 1, 1992). In other words, the initial exemption for aircraft with 30 or fewer seats was based on our determination that no AQI services were being provided for such aircraft, and the expansion to 64 or fewer seats was based on an assumption that such aircraft were commuter in nature and would not require such an inspection.

It is worth noting that the 1992 proposed rule did not also predicate the exemption on the per-passenger cost differential between small commuter airlines and larger airlines. The language cited by the commenter was articulated in the section of the preamble that evaluated the economic impacts of the rule pursuant to Executive Order 12291 (since rescinded) and the Regulatory Flexibility Act. We were characterizing the effects of the rulemaking on small entities, not articulating a basis for the rulemaking.

Now, 30 years after that rulemaking, CBP does in fact conduct inspections on aircraft with 64 or fewer seats. These inspections incur costs on the part of the AQI program. The FACT Act specifically authorizes us to prescribe and collect fees sufficient to cover the cost of providing AQI services in connection with the arrival of commercial aircraft at a port in the customs territory of the United States (21 U.S.C. 136a(a)(1)(A)).

To address whether such inspections are warranted, we re-evaluated the sanitary and phytosanitary risks posed by aircraft with 64 or fewer seats and the results of this pathway analysis indicated that aircraft with 64 or fewer seats do pose phytosanitary risk to the United States. Specifically, we found that the variety of aircraft origins worldwide (countries/airports) and destinations in the United States (States/airports) for aircraft with 64 or fewer seats was similar to or slightly higher than those of aircraft with 65 or more seats. For comparison and context, between FY 2016 and FY 2018, aircraft with 65 seats or more averaged 2,272 routes. With an average of 1,224 flight routes from calendar years 2016 to 2018, aircraft with 64 or fewer seats had many risks of exposure to hitchhiking pests, as well as many risks to expose pests to a large variety of environments in the United States. Exposure risk was used in order to characterize sanitary and phytosanitary risk because pest detections on commercial aircraft are not categorized based on whether the aircraft has 65 or more or 64 or fewer seats. In sum, while inspection may not have been necessary based on phytosanitary conditions in 1993, when we originally established the exemption, that is no longer the case today.

A commenter stated that our basis for removing the exemption was to create an additional funding stream for the AQI program.

Our basis for removing the exemption, as articulated in the proposed rule and its supporting documentation, and reiterated above, is to fulfill our agricultural safeguarding mandate and achieve full cost recovery. Our articulated assumptions for the exemption in 1991 and 1992, respectively, are no longer indicative of air travel conducted by planes with 64 or fewer seats, and the current operational dynamics of such travel carry a sanitary and phytosanitary risk that merits AQI services.

In light of the fact that small commercial aircraft have not previously been subject to the fee, APHIS believes that additional time is warranted to allow operators to come into compliance. Accordingly, APHIS is delaying the effective date for removal of the exemption for aircraft with 64 or fewer seats until April 1, 2025.

Two commenters stated that APHIS should not change from quarterly to monthly fee remittances, because it would increase the paperwork burden on airlines. Another commenter stated that monthly remittance would increase the burden on express carriers and would be out of step with other user fees they remit, which are almost all done quarterly.

We do not consider, and the commenters did not provide any evidence, that the revised remittance procedures to be more burdensome than the current procedures. Under the proposed rule, payments would be remitted on a monthly basis after a 90-day grace period—for example, January fees would be remitted to APHIS at the end of April, February fees at the end of May. Nonetheless, monthly remittance itself is necessary. Without the authority to prescribe and collect fees to maintain a reasonable balance in the AQI account, APHIS needs to move to a monthly remittance schedule to ensure smoother and more stable cash flow. In terms of paperwork burden, we expect a negligible difference between quarterly and monthly reporting, because the proposed rule does not change the information required for an individual month. For example, remittance reporting for the month of October is identical regardless of reporting only for October or whether issuing a quarterly report for October, November, and December of any given year.

In addition, we note that the revised procedures should make aspects of reconciliation and remittance easier, rather than harder. For example, the new monthly remittance schedule provides for a 90-day reconciliation period for each month, whereas the current quarterly remittance schedule provides a 90-day reconciliation period for the first month of the quarter, a 60-day reconciliation period for the second month of the quarter, and only a 30-day reconciliation period for the third month of the quarter.

BILLING CODE 3410–34–P

Table 13: AQI User Fee Remittance/Collection Schedule Changes[1]

AQI User Fee Category	Current Remittance/Collection Schedule (Through September 30, 2024)	New Remittance/Collection Schedule (Beginning October 1, 2024)
Commercial Vessel	Paid on arrival	No change
Commercial Truck	Paid on arrival	No change
Commercial Truck (Transponder)	Prepaid with the purchase of a transponder	No change
Commercial Railroad Car	Due 60 days after the end of each calendar month	Due 90 days after the end of each calendar month (see table 1)
Commercial Railroad Car (Prepaid)	Prepaid for each railroad car for a calendar year	No change
Commercial Aircraft	Due 31 days after the close of the calendar quarter	Due 90 days after the end of each calendar month (see table 1)
International Air Passenger	Due 31 days after the close of the calendar quarter	Due 90 days after the end of each calendar month (see table 1)
International Cruise (Sea) Passenger	Due 31 days after the close of the calendar quarter	Due 90 days after the end of each calendar month (see table 1)
Treatment Monitoring	Due 31 days after the close of the calendar quarter	No change

[1] Refer to 7 CFR 354.3, “User fees for certain international services.” for specific guidance.

Table 14: New Remittance/Collection Schedule (Beginning October 1, 2024) for the Commercial Aircraft, Commercial Railroad Car, International Air Passenger, and International Cruise Passenger Fee Categories

Month of Collection/Arrival/Treatment	Reconciliation Period	Due Date
January	February - April	April 30
February	March - May	May 31
March	April - June	June 30
April	May - July	July 31
May	June - August	August 31
June	July - September	September 30
July	August - October	October 31
August	September - November	November 30
September	October - December	December 31
October	November - January	January 31
November	December - February	February 28
December	January - March	March 31

BILLING CODE 3410–34–C

Another commenter noted that our proposed rule required the use of remittance worksheets as part of remittance procedures. The commenter expressed opposition to the use of the remittance worksheet as burdensome.

Our intent in proposing to require the use of the worksheet was primarily as a service to regulated entities in order to facilitate remittance; as noted in the proposed rule, entities currently submit remittance in a variety of formats, and some entities submit more information than is necessary. We believed that use of the worksheet would facilitate remittance processes for regulated entities by making them more standardized and streamlined.

Given the comments received that stated that the worksheet could be more burdensome than the status quo, however, we are stating in this final rule that the remittance worksheet is not mandatory. Entities may elect to use it depending on whether or not they find it less burdensome than current remittance practices. However, APHIS again notes that while the worksheet is not mandatory, there is mandatory information that must be provided in remittance statements, and also notes that many entities provide information in their remittance statements that goes beyond APHIS' requirements. For those entities that choose to use existing

remittance statements rather than the worksheet, the remittance worksheet serves as a guide for the remittance statement, even if an entity chooses not to use the worksheet itself.

The same commenter stated that APHIS had not made the remittance worksheet available for review as part of the supporting documents for the proposed rule. Without viewing the worksheet, the commenter stated that they could not ascertain whether it would be less burdensome or more burdensome than the status quo. The commenter also stated that we had an obligation to make the worksheet available during the comment period in order for commenters to provide informed comments on the accuracy of the estimate of burden articulated in the Paperwork Reduction Act section of the proposed rule.

While it is true that APHIS omitted the worksheet from the specific suite of supporting documents associated with the proposed rule, the remittance worksheet has been available on the APHIS website at *https://www.aphis.usda.gov/mrpbs/userfees/remittance-form.pdf* since well before the proposed rule was published and has been used by some entities for more than 15 years.

Nonetheless, as previously stated, in this final rule, use of the remittance worksheet is not mandatory.

Finally, as noted above, in reviewing the data on which the proposed fee increases were based, we noticed that the total costs associated with commercial aircraft were accurate, but the denominator (number of commercial aircraft arrivals) was not accurate, and did not include precleared aircraft. APHIS has corrected this error, resulting in lower commercial aircraft fees than proposed. In this final rule, the commercial aircraft fees are as follows: $281.39 for FY 2025, $300.78 for FY 2026, $320.61 for FY 2027, and $340.90 for FY 2028. As noted above, we also are not requiring the use of a worksheet for the remittance of the fees.

International Passengers Arriving at Airports and Seaports

AQI user fees for inspection of commercial air passengers are listed in § 354.3(f)(1). The current fee is $3.83 per arrival. We proposed to adjust the AQI user fee per arrival for commercial air passengers. The commercial air passenger fee will increase relative to the current fee.

Similarly, the AQI user fee for inspection of commercial cruise vessel passenger fee is also listed in § 354.3(f)(1). The current fee is $1.68 per arrival. We proposed to adjust the AQI user fee for inspection of commercial cruise passengers. The commercial cruise vessel passenger fee will decrease relative to the current fee. The change in the cruise passenger fee owes mainly to the change in allocation criteria from number of inspection events (passengers) to FTE hours.

We also proposed several clarifications in paragraph (f) of § 354.3 related to applicability, payment, and handling of international passenger user fees collected and remitted for trips not taken. In proposed paragraph (f)(1), we added language to clarify that infants, traveling with or without documents, whether in assigned seats or held in an adult passenger's lap, are subject to AQI user fees, as they are subject to the same inspection as other passengers. This harmonizes APHIS regulations with CBP regulations in 19 CFR 24.22(g), and CBP's definition of *passenger* in 19 CFR 24.22(g)(1)(v). As noted above, we also proposed to add a definition of *passenger* to help clarify these requirements.

In proposed changes to paragraphs (f)(5) and (6), we shortened the period for payment of international passenger fees and submission of remittance reports from quarterly to monthly, in order to recover the costs of inspecting international passengers in a timely manner, as discussed above with respect to the commercial aircraft fee. Also as discussed above in relation to paragraph (e) of § 354.3, operators would have 90 days to reconcile their books for each month. Airlines and cruise lines would remit passenger fees to APHIS on a monthly basis (12 times per year) versus the current quarterly basis (four times per year) and would have 90 days to reconcile their books for each month, as opposed to the current 31-day period after the close of the quarter. For example, under this final rule, remittance of fees collected in January of a given year would occur at the end of April of that year (90 days after the close of January); remittance of fees for February of a given year would occur at the end of May of that year; remittance of fees for October of a given year would occur at the end of January of the following year, etc.

We proposed to add new paragraphs (f)(5)(v) and (vi), which would cover the handling of international passenger AQI user fees collected and remitted for trips not taken. Proposed paragraph (f)(5)(v) stated that the entity issuing the ticket or travel document (*e.g.,* air or sea carriers, travel agents, tour wholesalers, or other entities) has a responsibility to make refunds of the international passenger AQI user fees in the original form of payment to the purchaser for trips not taken.

Proposed paragraph (f)(5)(vi) described the process for requesting a credit from APHIS for international passenger AQI user fees collected and remitted prior to refunding a ticket purchaser for an international passenger AQI user fee for a trip that was not taken. In such cases, the ticket issuing entity would have to submit a revised remittance worksheet or written statement. In keeping with other proposed changes to remittance timeframes, the revised remittance worksheet or written statement would be completed and filed for each month during which the ticket or travel document-issuing entity certifies that there was a decrease in the number of passengers and international passenger AQI user fees collected.

We received three comments about the proposed changes to the remittance procedures. The commenters generally opposed the proposed changes.

One commenter agreed with the intent of proposed paragraph (f)(5)(vi), which would allow airlines to request a credit from APHIS. The commenter stated that in such instances, AQI services are not actually provided, so a mechanism of recovering the remitted user fee for those services is warranted. The commenter also noted that the paragraph could be construed to mean that airlines must remit all fees collected to APHIS, and then only subsequently revise the remittance by requesting credit for flights not taken. The commenter stated that in instances when the flight is not taken and a refund occurs before an initial remittance of the fee is due to the Agency, airlines should be authorized to reconcile this in the initial remittance, rather than a subsequent revision.

The commenter strongly objected to proposed paragraph (f)(5)(v), however. In addition to citing numerous logistical obstacles with its implementation, the commenter stated that, in proposing to prescribe the method by which airlines must refund fees to passengers, APHIS had exceeded its statutory authority under the FACT Act.

After reviewing this comment, we acknowledge that the commenter raised points that merit further consideration. APHIS has therefore elected not to finalize paragraph (f)(5)(v).

We will retain the substance of paragraph (f)(5)(vi), though we have renumbered to paragraph (f)(5)(v). We have modified the proposed provisions of that paragraph in order to reflect the fact that the use of a remittance worksheet will be optional. Additionally, we clarify that the provision applies only in instances when an airline requests credit after it

remitted the fee to APHIS. If an airline has reconciled a trip not taken with the customer prior to remittance to APHIS, no subsequent action is needed.

Finally, based on a review of data, the fee for commercial air passengers will be lower than originally proposed. The total costs associated with commercial air passengers was accurate; however, the denominator, that is, the number of air passengers, did not include precleared air passengers at certain ports of departure. APHIS corrected this error, resulting in a lower air passenger fee than proposed. In this final rule, the fees are as follows: $3.71 in FY 2025, $3.84 in FY 2026, $3.98 in FY 2027, and $4.12 in FY 2028.

The summary tables for AQI International Air Passenger Fee Calculation (tables 15 and 16 below) show that APHIS used actual cost data for FY 2017 through FY 2019 international air passengers, future costs for planned capital expenditures and additional staffing, divided by number of international air passengers per fiscal year to arrive at a unit cost. APHIS adjusted those unit costs to June 2022 dollars, averaged the unit costs across the 3 fiscal years, and finally adjusted that average unit cost for projected inflation. The summary tables are intended to be a quick reference regarding fee development. For more comprehensive cost data information please see the full rollup reports from the APHIS AQI activity-based cost model available on the APHIS website at *https://www.aphis.usda.gov/aphis/ourfocus/business-services/aqi-user-fees/aqi-fee-types/aqi-user-fee-reports.*

For October 1, 2024, October 1, 2025, October 1, 2026, fee rates, APHIS subtracted the January 1, 2024 rate from the October 1, 2027 rate, and divided by 4. This amount became the per phase increase. The per phase increase was then added to the previous phase amount until reaching the October 1, 2027 rate.

BILLING CODE 3410–34–P

Table 15: AQI International Air Passenger Fee Calculation – January 1, 2024 Phase Development ($3.58 Fee Rate)[1]

	FY 2017	FY 2018	FY 2019
APHIS AQI FTEs	-	-	193
Total APHIS AQI Program Cost (Level 501)	$47,533,932.90	$45,901,895.95	$51,021,447.61
APHIS Capital Planning/Expenditure Future Costs (Level 26) included in total program cost above	$7,449,956.65	$7,185,938.07	$7,497,507.88

[1] Within this table, "level" refers to the level in the APHIS AQI Cost Model.

[2] As described in: https://www.regulations.gov/document/APHIS-2022-0023-0010.

We received no comments on the AQI cruise vessel passenger fee and are finalizing it as proposed.

The summary tables for AQI Cruise Vessel Passenger Fee Calculation (tables 17 and 18 below) show that APHIS used actual cost data for FY 2017 through FY 2019 by user class, future costs for planned capital expenditures and additional staffing, divided by number of users per fiscal year to arrive at a unit cost. APHIS adjusted those unit costs to June 2022 dollars, averaged the unit costs across the 3 fiscal years, and finally adjusted that average unit cost for projected inflation. The summary tables are intended to be a quick reference regarding fee development. For more comprehensive cost data information please see the full rollup reports from the APHIS AQI activity-based cost model available on the APHIS website at *https://www.aphis.usda.gov/aphis/ourfocus/business-services/aqi-user-fees/aqi-fee-types/aqi-user-fee-reports.*

For October 1, 2024, October 1, 2025, October 1, 2026, fee rates, APHIS subtracted the January 1, 2024 rate from the October 1, 2027 rate, and divided by 4. This amount became the per phase increase. The per phase increase was then added to the previous phase amount until reaching the October 1, 2027 rate.

BILLING CODE 3410–34–PC

AQI Treatment Monitoring

AQI treatments are performed on some agricultural goods as a condition of entry, and additional treatments are performed when an actionable pest (*i.e.,* a plant pest that should not be allowed to be introduced into or disseminated within the United States) is detected during a port-of-entry inspection. Currently, these treatments are charged on a per-treatment basis; that is, if two or more consignments are treated together, only a single fee will be charged, and if a single consignment is split or must be retreated, a fee will be charged for each separate treatment conducted. The current fees are set out in § 354.3(h). APHIS reevaluated assessing AQI treatment monitoring fees on a per-enclosure basis, and we proposed an hourly rate instead.

We received seven comments about the proposed changes to the treatment monitoring fee. The commenters generally opposed the proposed changes.

Commenters were generally opposed to this proposed change. They raised a number of concerns about moving to an hourly charge, including the magnitude of the fee increases for certain treatment types, uncertainty over how the hourly rate would be applied given nonuniform standards of service and if new efficiencies (*e.g.,* remote monitoring) could be used. The commenters also stated that the proposed hourly billing process would present challenges in terms of providing customers with timely invoices. The commenters further stated that for certain low-value commodities, the hourly rate would exceed the value of the import.

After reviewing the comments, we agree with the commenters that these issues merit further consideration before making changes to the AQI treatment monitoring fees. We have therefore decided not to proceed with amending § 354.3(h) at this time. We will address the restructuring of the AQI treatment monitoring fees in a future rulemaking. APHIS will keep the per-enclosure fee in place.

However, we received no comments, and are aware of no evidence, that treatment monitoring services are not subject to inflationary forces. Therefore, we are incorporating annual adjustments for projected inflation [12] as follows, using the current fee of $237 per enclosure as the basis:

Table 19: Treatment Monitoring Fee with Projected Inflation Adjustment

	October 1, 2024	October 1, 2025	October 1, 2026	October 1, 2027
Treatments (per enclosure)	$240.60	$244.19	$247.79	$251.38

Records Retention

To improve monitoring, compliance, and enforcement of this regulation, we proposed to add a new paragraph (j), which would contain records retention requirements related to AQI user fees. Proposed paragraph (j)(1) provided that entities responsible for collecting and paying the fees and their agents would be responsible for maintaining all records required under § 354.3, as well as legible copies of contracts and other agreements made between responsible persons and their agents. Under proposed paragraph (j)(2), all parties responsible for collecting and paying the fees would have to maintain sufficient documentation for APHIS, CBP, and authorized representatives to verify the accuracy of the fee collections and remittance worksheets or written statements. Such information would have to be made available for inspection upon APHIS and CBP's demand. Such documentation would be required to be maintained in the United States for a period of 5 years from the date of remittance calculation. Each entity covered by this proposed requirement would have to provide to APHIS and CBP the name, address, and telephone number of a responsible officer who is able to verify any statements or records required to be filed or maintained under this section and to promptly notify APHIS and CBP of any changes in the identifying information previously submitted. Currently, CBP conducts U.S. Government Accountability Office yellow book standard audits of the commercial aircraft fee and international air passenger fee on APHIS' and CBP's behalf. APHIS seeks to expand this arrangement to include audits of the AQI program's commercial railroad car fee and international cruise passenger fee.

Commenters stated that the proposed 5-year record retention period does not align with current airline industry practice and other Federal agency policies (*e.g.,* FAA requires certain records be retained for 3 years).

This change is being made to harmonize APHIS regulations with CBP's Consolidated Omnibus Budget Reconciliation Act of 1985 (COBRA) fee regulations in 19 CFR 24.22(g)(7), which require a 5-year retention period. As we explained in the proposed rule, CBP audits the AQI aircraft and international air passenger fee collections on APHIS' behalf. CBP requires the 5-year-retention period because the statute of limitations for litigation purposes is 6 years. The 5-year-retention period gives us the time needed to state what is owed in the event of non-payment as well as time to bring legal action if necessary to collect. APHIS will implement these changes in this final rule.

Severability

We proposed to add a new § 354.3(k), "Severability," to address the possibility that this final rule, or portions of this final rule, may be challenged in litigation. It is APHIS' intent that the individual sections of this final rule be severable from each other, and that if any sections or portions of the regulations are stayed or invalidated, the validity of the remainder of the sections shall not be affected and shall continue to be operative. We received no comments on this proposed addition and will implement it in this final rule.

Therefore, for the reasons given in the proposed rule and in this document, we are adopting the proposed rule as a final rule, with the changes discussed in this document.

Executive Orders 12866, 13563, 14094 and Regulatory Flexibility Act

This final rule has been determined to be significant under section 3(f)(1) of Executive Order 12866, as amended by Executive Order 14094, "Modernizing Regulatory Review," and, therefore, has been reviewed by the Office of Management and Budget.

We have prepared an economic analysis for this rulemaking. The economic analysis provides a cost-benefit analysis, as required by Executive Orders 12866 and 13563, which direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, and equity). Executive Order 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. The economic analysis also provides a final regulatory flexibility analysis that examines the potential economic effects of this final rule on small entities, as required by the Regulatory Flexibility Act. The economic analysis is summarized below. Copies of the full analysis are available on the *Regulations.gov* website (see footnote 1 in this document for a link to *Regulations.gov*) or by contacting the person listed under **FOR FURTHER INFORMATION CONTACT**.

The Food, Agriculture, Conservation and Trade (FACT) Act of 1990 (as amended) [21 U.S.C. 136a] authorizes the Secretary of Agriculture to prescribe and collect fees sufficient to cover the cost of providing agricultural quarantine and inspection services in connection with the arrival at a port in the customs territory of the United States, or the preclearance or pre-inspection at a site outside the customs territory of the United States, of an international passenger, commercial vessel, commercial aircraft, commercial truck, or commercial railroad car, and to cover the cost of administering the AQI program. The United States Department of Agriculture's (USDA's) Animal and Plant Health Inspection Service (APHIS) Plant Protection and Quarantine (PPQ) is responsible for developing and setting the Agricultural Quarantine and Inspection (AQI) user fee schedule, and related regulatory policy. Periodically, APHIS updates the schedule of rates paid by users via the rulemaking process. Due to a variety of factors, the current AQI fee schedule results in

[12] As described in: *https://www.regulations.gov/document/APHIS-2022-0023-0010.*

insufficient collections to achieve full cost recovery.

APHIS is making a number of revisions to the regulations that govern the user fee rates, and related regulatory requirements for maritime vessels, commercial trucks, commercial railroad cars, commercial aircraft, and international passengers on airlines and cruise ships. The revisions make adjustments to the cost model that is used to calculate the fees. Those revisions incorporate inflation into the user fees, including the fee for treatment monitoring.

This final rule will also eliminate an exemption from the commercial aircraft fee that currently applies to commercial aircraft with 64 or fewer seats that meet certain regulatory requirements; eliminate an exemption from the commercial vessel fee that currently applies to commercial barges operating between Canada and the United States that meet certain regulatory requirements; increase the ''per arrival'' multiple used to calculate the fee for a multiple-use transponder for commercial trucks; as well as increase the ''per arrival'' multiple used to calculate the prepaid railroad car fee and apply the fee to all arriving railroad cars.

APHIS has decided not to restructure the treatment fee in this final rule. Rather, we are retaining the per-enclosure treatment fee, while incorporating annual inflation adjustments for this fee. Additionally, based on comments received, APHIS has created a reduced user fee rate for commercial vessels operating solely between the United States and Canada and within either the Great Lakes or a region along the coastline between Alaska and Oregon, provided that the vessels meet certain requirements.

This final rule will also update remittance procedures to facilitate timely submission of fees. Finally, we have made editorial revisions in order to clarify intent in the regulations.

The Agricultural Quarantine and Inspection (AQI) Program implements a continuum of exclusion strategies and activities that mitigate the plant and animal health risks associated with the spread of pests and diseases due to global trade, international travel, or the smuggling of prohibited agricultural and related products. APHIS uses an Activity-Based Cost (ABC) Model to calculate the individual user fees. First, costs are allocated to a series of activities. Next, the costs assigned to those activities are allocated to the fee areas based on the level of effort associated with each fee area. For example, the costs associated with the cargo inspection activity (which include the costs of providing the service, as well as the administrative and overhead costs associated with providing the service) are allocated to the commercial vessel, truck, railroad car, and aircraft fees, based on the level of effort in each of those fee areas. This cost allocation approach avoids cross-subsidization (*e.g.,* cargo inspection costs do not get assigned to passengers or treatment users).

When the cost of providing AQI services and the fees paid to fund these services do not align, adjustments are a necessary step in reaching the goal of full cost recovery. Services in the AQI program must be provided, but when the user fee is not covering the costs, the user of the service is not bearing the true cost of providing the service. This final rule will benefit the public by continuing to ensure that the fees received from users for providing necessary AQI services align with the expenditures associated with providing those services.

AQI services protect American agriculture and natural resources from sanitary and phytosanitary risks. The spread of invasive species harms domestic agricultural producers and damages the natural environment. Imported freight constitutes a major phytosanitary risk. The wide diversity of origins and commodities present multiple opportunities for pests to infest a product or wood packing material. AQI services are provided to mitigate such phytosanitary risks. To ensure that the expenditures on AQI services and the fees applied to those services align, adjustments to the fees are necessary. Those most likely to be impacted by this final rule are international air and sea passengers, businesses within the truck, rail, sea, and air transportation sectors, and providers of treatment services. While users of AQI services do incur costs in the form of user fees, these user fees enable the government to recover the costs of providing AQI services. However, the associated revenues do not currently align with the costs of providing these AQI services and administering the AQI program.

Individual importers or passengers may experience some financial burden from the establishment of or increase in user fees (or relief when a fee is reduced), but the AQI services are already being provided and thus are already counted as government costs. The revenue from user fees for services provided are intended to cover the expenditures for those services, a concept known as transfer payments. Examples of transfer payments include fees paid to government agencies for services provided by the agency. Federal regulations with transfer payments are assumed to have a one-to-one effect, balancing benefits and costs.[13] The benefits and costs, as well as the annualized transfer payments are summarized in table A.

BILLING CODE 3410–34–P

[13] Transfer payments are noted by the Office of Management and Budget to include ''Fees to government agencies for goods or services provided by the agency (monetary transfers from fee payers to the government—the goods and services are already counted as government costs and including them as private costs would entail double counting).'' Federal regulations with transfer payments are assumed to have a one-to-one effect on benefits and costs. See: Regulatory Impact Analysis: A Primer, page 8. *https://www.reginfo.gov/public/jsp/Utilities/circular-a-4_regulatory-impact-analysis-a-primer.pdf.*

Table A. Accounting statement of costs, benefits, and transfers associated with the rule.

Benefits		
Non-Quantified Benefits	This final rule will better align AQI expenditures and revenues by class. Transfer payments balance the costs and benefits of the program.	
Costs		
Non-Quantified Costs	Realigned AQI user fees are intended to cover the costs of providing AQI services. User fees transfer the cost of those services from the government to the users.	
Transfers		
Annualized Transfers by user class [1,2]	7% discount rate	3% discount rate
Air Passengers	$479,900,000	$480,800,000
Commercial Aircraft	$296,400,000	$297,300,000
Commercial Rail	$27,150,000	$27,270,000
Commercial Truck [3]	$118,300,000	$118,700,000
Commercial Vessel	$187,600,000	$187,800,000
Cruise Vessel Passenger	$20,520,000	$20,560,000
Treatments ($/Hr.)	$8,750,000	$8,760,000
Total [4]	$1,139,000,000	$1,141,000,000

[1] Annualized value of transfers from FY 2025 through FY 2028; discounted at 7 and 3 percent, 2022 dollars.
[2] Estimates of user fee collections (transfers) based on individual fee levels for each year of the implementation schedule (see table B) multiplied by an estimate of the activity level in each fee category. This activity level estimate is based on the average number of each category of arrivals from FY 2017-2019, the 3 years for which clean data are available.
[3] This estimate is based on truck arrivals from FY 2017-2019. To account for the change in both the fee level and transponder cap, the estimate uses a distribution of 1,000,000 single payer crossings and 125,000 transponders.
[4] Totals may not sum due to rounding.

The fee schedule will better reflect the costs of AQI services provided to commercial vessels, commercial trucks, commercial railroad cars, commercial aircraft, and international air and sea passengers arriving at U.S. ports (table B).

Table B. Current and scheduled AQI user fee rates (dollars)

Fee Area		AQI User Fee Schedule			
	Current Fee	October 1, 2024	October 1, 2025	October 1, 2026	October 1, 2027
Air Passenger	3.83	3.71	3.84	3.98	4.12
Commercial Aircraft[1]	225.00	281.39	300.78	320.61	340.90
Commercial Vessel	825.00	2,903.73	2,981.17	3,059.61	3,139.06
Commercial Vessel-Great Lakes/Cascadia	N/A [2]	837.51	850.03	862.54	875.06
Commercial Truck	7.29	12.40	13.45	14.50	15.55
Commercial Railroad Car	2.00	6.51	7.23	7.97	8.72
Cruise Vessel Passenger	1.68	1.25	1.29	1.34	1.39
Treatment [3]	237	240.60	244.19	247.79	251.38

[1] We are delaying implementation of the commercial aircraft user fee for aircraft with 64 or fewer seats until April 1, 2025.

[2] This geographically limited fee rate does not exist under the current fee schedule; however, certain vessels in this category do currently pay the current commercial vessel fee.

[3] per enclosure

BILLING CODE 3410–34–C

Air Passengers

The air passenger fee will increase from $3.83 to $4.12 in FY 2028. The total fee increase of $0.29 will be approximately a 7.6 percent increase from current fees, but only a 0.05 percent increase in the average price of an international round-trip airfare.[14] These changes in the effective cost for international air travel are extremely small, and seem unlikely to significantly change consumer purchasing behavior. Limitations in the amount and nature of data available on such small fee changes make it difficult for the agency to draw specific conclusions as to how these small changes in airfare will affect international air travel overall. However, any change in international air travel due to a change of less than one dollar in the price of international airfare is likely to be small.

Commercial Aircraft

The commercial aircraft fee will increase from $225 to $340.90 per arrival in FY 2028. This increase of $115.90 will be about a 51.5 percent increase from the current fees. Between 2013 and 2019 the volume of imports into the United States by air increased by eight percent (82 million kg) and the value increased by 57 percent in constant dollars. Even after the 51.5 percent increase, the commercial aircraft fee is still the equivalent of 0.05 percent of the value of goods being imported by air. In terms of the cargo alone, the 2028 commercial aircraft fee rate under this rulemaking represents approximately $0.069 in dollars-per-kilogram imported by air generally. In addition, the commercial aircraft user fee constitutes a small portion of the expenses associated with commercial aircraft. And moreover, most international arrivals have passenger airfares as a primary revenue source. Even with the commercial aircraft fee increasing by $115.90 by 2028, the commercial aircraft user fee is equivalent to approximately five minutes of operating costs for aircraft.[15] Like all AQI user fees, this fee is based solely on the actual cost of AQI services provided for this mode of conveyance between FY 2017 and FY 2019, plus forecasted staffing and capital costs, adjusted for inflation. The fee for this conveyance is not derived from the financial performance of the industry. Limitations in the internal industry performance data available to the agency make it difficult to develop specific conclusions as to how such a fee change will affect the commercial aircraft industry overall. This information, however, is used to contextualize the scale of the collections and illustrate the relative size and impact that the fee might have on the conveyance as a whole. However, the increase in the AQI commercial aircraft fee is likely to have a limited impact on aircraft operators.

Small Aircraft Exemption

The commercial aircraft user fee is not currently applied to the international arrivals of certain commercial aircraft with 64 or fewer seats. Commercial aircraft with 64 or fewer seats comprised approximately 10 percent of arriving international flights from 2016 to 2018. This final rule will result in the removal of this exemption.

In light of the fact that small commercial aircraft have not previously been subject to the fee, APHIS believes that additional time is warranted to allow operators to come into compliance. Accordingly, APHIS is delaying the effective date for removal of the exemption for aircraft with 64 or fewer seats until April 1, 2025.

The commercial aircraft fee is based on the average cost of clearing commercial aircraft and their cargo. The cost associated with any specific aircraft, whether small or large, also depends on a variety of other factors because the phytosanitary risk posed by a particular aircraft is based upon the country of origin, countries transited, type and volume of cargo, country of origin of the cargo, and environmental conditions at point of origin and final

[14] Damodaran, A., Consumer Airfare Index Report—May 2021. *As travel demand returns and more Americans are vaccinated, what does it mean for airfare prices?* May 18, 2021.

[15] Federal Aviation Administration. Economic Values for Investment and Regulatory Decisions—Chapter 4: Aircraft Operating Costs. March 2021 Update. Retrieved on June 8, 2022, from *https://www.faa.gov/sites/faa.gov/files/regulations_policies/policy_guidance/benefit_cost/econ-value-section-4-op-costs.pdf.*

destination. These costs are not currently borne by all operators of commercial aircraft with fewer than 65 seats arriving internationally.

Domestic flights are not subject to the commercial aircraft fee. For most operators of small commercial aircraft, domestic flights are the greatest portion of their operations and associated revenue. The removal of the exemption only affects international arrivals of aircraft with fewer than 65 seats. The commercial aircraft fee is not derived from the financial performance of the industry. Like all AQI user fees, this fee is based solely on the cost of providing AQI services for this mode of conveyance between FY 2017 and FY 2019, plus forecasted staffing and capital costs, adjusted for inflation. Because we do not have explicit data on the per-flight revenue, profit margins, and competitive landscape affecting international arrivals of commercial aircraft with 64 or fewer seats, we cannot make specific conclusions as to how the collection of this user fee will affect individual businesses. Approximately 7 percent of the flights of the top 5 small aircraft operators, and less than 5 percent of the flights of the top 10 operators, are international arrivals. This provides context for the scale of the collections and illustrates the impact that the fee might have on the affected entities.

Commercial Vessels

The commercial vessel fee will increase from $825 to $3,139.06 by FY 2028. Some vessels operating in the Great Lakes or Cascadia areas will be eligible to pay a reduced commercial vessel fee. A variety of factors contributed to the commercial vessel fee increase. Among these were an increase in the cost of AQI services across the pathway, an expansion of the average ship cargo capacity, and an increase in the level of effort required to inspect the average vessel. Even with the commercial vessel fee increasing by up to 280 percent to $3,139.06 by FY 2028, the commercial vessel fee remains very small relative to other vessel operating expenses. It is equivalent to approximately 2 percent of a single day's fuel consumption for a moderately sized container ship.[16] The fee for this conveyance is not derived from the financial performance of the industry. Like all AQI user fees, this fee is based solely on the costs for providing AQI services for this mode of conveyance between FY 2017 and FY 2019, plus forecasted staffing and capital costs, adjusted for inflation. The change to the commercial vessel fee seems likely to have a limited impact on the operations of commercial vessels.

Canadian Barge Exemption

From 2016 through 2018, an annual average of 1,405 commercial barges arrived from Canada into the United States, most of which are exempt from the current commercial vessel AQI fee. Vessel companies and ports facilitating the movement of currently exempted barge shipments from Canada and the United States will be affected. APHIS has concluded that barges from Canada that are currently exempted do pose a phytosanitary risk and require inspection and payment of the associated fee. Barges operating in the Great Lakes and Cascadia areas also require inspection and a payment of a fee. However, those meeting certain additional conditions will be eligible to pay a reduced fee, provided their cargo meets the requirements. The reduced fee represents approximately $.00025 per kilogram imported by barge. These fees are not derived from the financial performance of the industry. This information provides context for the scale of the collections and illustrates the impact that the fee might have on the affected entities. Because we do not have explicit data on international barge traffic revenue, profit margins, and the competitive landscape affecting arrivals of currently-exempt barges from Canada, we cannot make specific conclusions as to how the collection of this user fee will affect individual entities.

Commercial Trucks

The commercial truck fee will increase from $7.29 to $15.55 [17] by 2028, an increase of $8.26 per truck arrival. In addition, commercial truck operators have the option to prepay for an unlimited number of arrivals (per year) by purchasing a transponder, the price of which will increase from the equivalent of 40 arrivals to 50 arrivals in the period between October 1, 2024 and October 1, 2025, and thereafter to 60 arrivals.[18] Between 2013 and 2019 imports into the United States by truck increased by 397 million kilograms. Even after a 114 percent increase, the user fee of $15.55 in 2028 for a commercial truck entering the U.S. will be the equivalent of 0.034 percent of the average value of goods imported by truck. The user fee in 2028 in dollars-per-kilogram for truck cargo is approximately $0.0014. In addition, this user fee is roughly the equivalent of the operating expenditures of a truck transporting goods about nine miles. The fee for this conveyance is not derived from the financial performance of the industry. Limitations in the internal industry performance data available to the agency make it difficult to develop specific conclusions as to how such a fee change will affect the commercial truck industry overall. This information, however, is used to contextualize the scale of the collections and illustrate the relative size and impact that the fee might have on the conveyance as a whole. The impact of this fee change on the operations of commercial trucks seems likely to be limited. Because of the efficiencies gained by both the program and users of the AQI services, APHIS will also continue to provide an incentive to purchase the transponder in the form of a cap.

Commercial Railroad Cars

The commercial railroad car fee will increase from $2 to $8.72 per arriving railroad car by 2028, a total increase of $6.72. Between 2013 and 2019, imports into the United States by rail remained relatively constant, but technology improvements have allowed for a reduction in the number of railroad cars assessed the commercial railroad car fee. Even after a total increase of approximately 337 percent, the commercial railroad car fee is approximately 0.029 percent of the value of goods being imported on by railroad car. The user fee in 2028 in dollars-per-kilogram for commercial railroad cars generally is approximately $0.0004. Limitations in the amount and nature of data available to the agency make it difficult to develop specific conclusions as to how these fee changes will affect international commercial railroad car arrivals overall. Like all AQI user fees, this fee is based solely on the cost of providing AQI services for this mode of conveyance between FY 2017 and FY 2019, plus forecasted staffing and capital costs, adjusted for inflation.

(*https://www.morethanshipping.com/fuel-costs-ocean-shipping*); $3139.06/$900 (per ton of fuel) = 3.5 tons of fuel. Average fuel consumption is 200 tons/day. 3.5 tons/200 tons = 1.75%

[17] $15.59 rounded down to the nearest $0.05 (five-cent) increment. At CBP's request, we rounded down to the next $0.05 (five-cent) increment to facilitate operations at the border. CBP has indicated that making change at the penny level for single-payer trucks would have a negative impact on wait times at the land border.

[18] In addition, commercial truck operators have the option to prepay for an unlimited number of arrivals (per year) by purchasing a transponder, the price of which will increase from the equivalent of 40 arrivals to 50 arrivals in the period between October 1, 2024 and October 1, 2025, and thereafter to 60 arrivals.

Industry information is used to contextualize the scale of the collections and illustrate the relative size and impact that the fee might have on the conveyance as a whole. The change to this user fee seems likely to have a limited impact on commercial railroad car operations.

International Cruise Vessel Passengers

The international cruise vessel passenger fee will decline by 31 percent initially, and still be 21 percent lower than the current fee by 2028, an overall decline of $0.29 per passenger arrival. Limitations in the amount and nature of data available to the agency make it difficult to develop specific conclusions as to how small fee changes will affect international cruise passenger arrivals overall. However, a decrease of $0.29 in the fee represents less than a 0.02 percent decrease in the cost of a 7-day cruise.

Treatment Monitoring

APHIS monitors phytosanitary treatments to ensure that they are conducted as prescribed. APHIS proposed to shift the treatment monitoring fee to an hourly basis rather than a per-enclosure basis, and to make adjustments to the remittance practices for the treatment monitoring fee. Based on the comments received, we have decided not to make that structural revision to our AQI treatment monitoring fee or the remittance practices in this final rule. APHIS will keep the per-enclosure fee in place with annual adjustments for projected inflation, and the remittance practices will remain unchanged at this time.

APHIS estimates the total annualized cost of the paperwork and recordkeeping associated with this final rule to be $70,061. Reporting and recordkeeping requirements associated with this final rule are discussed under the heading ''Paperwork Reduction Act.''

The Small Business Administration has set small-entity standards for the transportation sectors. Small entities make up between 92 percent and 99 percent of each of the regulated industries, though the size data do not distinguish between transportation firms that operate internationally and those firms that only operate within the United States. The impacts of this final rule are likely to be limited for all entities within the affected industries, including small entities. While most businesses that will be affected by this final rule are likely to be small, for the reasons discussed further in the Final Regulatory Flexibility Analysis, we believe that the changes set forth in this final rule satisfactorily accomplish the regulatory objectives while minimizing impact on small entities. The provisions of this final rule are consistent with ensuring a level of AQI services commensurate with that required to safeguard American agriculture and natural resources from sanitary and phytosanitary risks.

Executive Order 12988

This final rule has been reviewed under Executive Order 12988, Civil Justice Reform. This rule: (1) Preempts all State and local laws and regulations that are inconsistent with this rule; (2) has no retroactive effect; and (3) does not require administrative proceedings before parties may file suit in court challenging this rule.

Executive Order 13175

This final rule has been reviewed in accordance with the requirements of Executive Order 13175, ''Consultation and Coordination with Indian Tribal Governments.'' Executive Order 13175 requires Federal agencies to consult and coordinate with Tribes on a government-to-government basis on policies that have Tribal implications, including regulations, legislative comments or proposed legislation, and other policy statements or actions that have substantial direct effects on one or more Indian Tribes, on the relationship between the Federal Government and Indian Tribes or on the distribution of power and responsibilities between the Federal Government and Indian Tribes.

The Puyallup Tribe has requested Tribal consultation regarding this final rule. APHIS will coordinate with the Office of Tribal Relations to ensure that meaningful consultation occurs.

Congressional Review Act

Pursuant to subtitle E of the Small Business Regulatory Enforcement Fairness Act of 1996, also known as the Congressional Review Act (5 U.S.C. 801 *et seq.*), the Office of Information and Regulatory Affairs determined that this rule meets the criteria set forth in 5 U.S.C. 804(2).

Paperwork Reduction Act

In accordance with section 3507(d) of the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 *et seq.*), some of the reporting and recordkeeping requirements in the proposed rule and this final rule have been submitted for approval to the Office of Management and Budget (OMB) control number 0579–0055, APHIS Credit and User Fee Accounts. The remaining reporting and recordkeeping requirements that were solely associated with this final rule were submitted to OMB as a new information collection and assigned OMB comment-filed number 0579–0489. After approval, this information collection will be merged into 0579–0055 in the future.

New information collection requirements created by the regulations of this final rule include information collection, reporting, and recordkeeping requirements in the form of paper, electronic submissions, and information systems. In conjunction with the changes to provide for cost recovery for services, we have considered each change and their impact(s) on these burdens. These changes concern adjusting fee amounts, adjusting caps on certain prepaid fees, removing exemptions, and providing electronic payments and statement options. Estimates include additional respondents, responses, and burden estimates across all activities affected by this rule.

As described above, APHIS received several public comments on the proposed rule, and the following changes were made to the final rule:

- We have lowered the fees for commercial vessels, commercial aircraft, and international air passengers based on our determination that, while aggregate cost was correct (the numerator for the fee rate), there were more instances in which AQI services were provided in these modes (the denominator for the fee rate) than we had initially calculated.
- We have established a commercial vessel fee specific to commercial vessels operating within the Great Lakes or in the region along the coastline from Alaska to Oregon, provided that certain conditions are met.
- We have decided not to revise our regulations governing the treatment monitoring fee at this time.
- We have decided not to specify the method by which airlines and cruise ships must refund passenger user fees assessed for trips not taken.

With these changes, there are corresponding updates in the related recordkeeping burdens (Applications for Credit Account and Request for Services, User Fees for International Air Passengers—Remittance and Statements, and Fees for Conducting and Monitoring Treatments) between the proposed and final rules. There was no impact on burden assumptions between the proposed and final rules due to the first two bulleted items above. The estimated burden on commercial vessels, commercial aircraft, and international aircraft customers has not changed. In addition, the volumes of payers of the new commercial vessel fee

specific to commercial vessels operating within the Great Lakes or in the region along the coastline from Alaska to Oregon is a subset of the original burdens vessel user fee-related burdens included in the proposed rule, so there is no change in the estimated burden between the proposed and final rules. Because the revisions to the treatment user fees in the proposed rule would have created new burdens, the decision not to revise the regulations governing the treatment monitoring user fees has lowered the assumed burdens between the proposed and this the final rule in four ways:

- The proposed rule assumed there would be 2,844 new treatments (1,190 heat treatments and 1,654 irradiation treatments) with an estimated 5 minutes per treatment burden yielding 237 respondent burden hours per year. With the removal of the treatment fee changes from the final rule, we reduced the burden estimate between the proposed and final rules accordingly.
- The proposed rule included a new billing process for treatment monitoring, and in the proposed rule, we assumed half of the approximate 50 treatment facilities would want to be billed. 25 facilities x 8.4 minutes per facility (the estimated time for a facility to complete an application for an account based on timed trials) = 3.5 respondent burden hours for treatment facilities to manage being billed. With the removal of the treatment fee changes from the final rule, we reduced the burden estimate between the proposed and final rules accordingly.
- The proposed rule included consequences for late payment of AQI treatment monitoring user fees and estimated there would be six treatment facilities incurring an increased time burden of 20 minutes per facility for an estimated increase in respondent burden of 2 hours. We removed these 2 hours from our estimated burden with the removal of the treatment fee changes from the final rule.
- The proposed rule included a reduction in the need for facilities to create new business procedures to hold fees in trust estimating it would save 50 treatment facilities 4.75 hours per year for a total of 237 reduction in respondent burden hours each year for individuals and 237 reduction in respondent burden hours each year for businesses. With the removal of the treatment fee changes from the final rule, the treatment facilities remain holding fee collections in trust. For this change between the proposed rule and final rule, we added 237 respondent burden hours into the total number of respondent burden hours between the proposed and final rules.

In addition, the decision not to specify the method by which airlines and cruise ships must refund passenger user fees assessed for trips not taken has also lowered the assumed burdens between the proposed rule and the final rule. The proposed rule assumed one third of the estimated 331 airlines would be required to submit revised remittance sheets each month. ⅓ of 331 airlines = 110 airlines. We estimated those 110 airlines would be required to submit 12 additional remittances per year taking 3 minutes each at 66 hours of additional burden per year. With the decision not to specify the passenger user fee refund methods, we have reduced the overall respondent burden estimate between the proposed and final rule by this amount.

With the changes to the final rule, the estimated number of respondents has decreased by 392, the estimated number of responses has decreased by 9,881, and the estimated burden has decreased by 781 hours.

E-Government Act Compliance

The Animal and Plant Health Inspection Service is committed to compliance with the E-Government Act to promote the use of the internet and other information technologies, to provide increased opportunities for citizen access to Government information and services, and for other purposes. For information pertinent to E-Government Act compliance related to this final rule, please contact Mr. Joseph Moxey, APHIS' Paperwork Reduction Act Coordinator, at (301) 851–2533.

Unfunded Mandates Reform Act of 1995

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA), Public Law 104.4, establishes requirements for Federal agencies to assess the effects of their regulatory actions on State, local, tribal governments, and the private sector. Under section 101 of the UMRA, APHIS generally must prepare a written statement, including a cost-benefit analysis, for proposed and final rules with ''Federal mandates'' that may result in expenditures by State, local, or tribal governments, in the aggregate, or by the private sector, of $100 million or more in any one year. When such a statement is needed for a rule, section 205 of the UMRA generally requires APHIS to identify and consider a reasonable number of regulatory alternatives and adopt the least costly, more cost-effective, or least burdensome alternative that achieves the objectives of the rule.

This rule contains no Federal mandates (under the regulatory provisions of Title II of the UMRA) that may result in expenditures by State, local, and tribal governments, in the aggregate, or by the private sector, of $100 million or more in any one year. Thus, this rule is not subject to the requirements of sections 202 and 205 of the UMRA.

Executive Order 13132

APHIS has reviewed this rule in accordance with Executive Order 13132 regarding Federalism and has determined that it does not have ''federalism implications.'' The rule does not ''have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government.''

List of Subjects in 7 CFR Part 354

Exports, Government employees, Plant diseases and pests, Quarantine, Reporting and recordkeeping requirements, Travel and transportation expenses.

As discussed in the preamble, APHIS is amending 7 CFR part 354 as follows:

PART 354—OVERTIME SERVICES RELATING TO IMPORTS AND EXPORTS; AND USER FEES

■ 1. The authority citation for part 354 continues to read as follows:

Authority: 7 U.S.C. 7701–7772, 7781–7786, and 8301–8317; 21 U.S.C. 136 and 136a; 49 U.S.C. 80503; 7 CFR 2.22, 2.80, and 371.3.

■ 2. Revise § 354.3 to read as follows:

§ 354.3 User fees for certain international services.

(a) *Definitions.* Whenever in this section the following terms are used, unless the context otherwise requires, they shall be construed, respectively, to mean:

APHIS. The Animal and Plant Health Inspection Service of the United States Department of Agriculture (USDA).

Arrival. Arrival at a port of entry, as listed in 19 CFR 101.3 or as defined by 19 CFR 101.1, in the customs territory of the United States or at any place serviced by any such port of entry.

Calendar year. The period from January 1 to December 31, inclusive, of any particular year.

Cascadia. British Columbia and those ports of entry into the United States lying south of 59°26′59.316″ N, north of 43°23′34.152″ N, west of 122°20′31.2″ W, and east of 135°20′2.4″ W.''

Certificate. Any certificate issued by or on behalf of APHIS describing the condition of a shipment of plants or plant products for export, including but not limited to Phytosanitary Certificate (PPQ Form 577), Export Certificate for Processed Plant Products (PPQ Form 578), and Phytosanitary Certificate for Reexport (PPQ Form 579).

Commercial aircraft. Any aircraft used to transport persons or property for compensation or hire.

Commercial purpose. The intention of receiving compensation or making a gain or profit.

Commercial railroad car. Any carrying vehicle, measured from coupler to coupler and designed to operate on railroad tracks, other than a locomotive or a caboose.

Commercial shipment. A shipment for gain or profit.

Commercial truck. Any self-propelled vehicle, including an empty vehicle or a truck cab without a trailer, which is designed and used for the transportation of commercial merchandise or for the transportation of non-commercial merchandise on a for-hire basis.

Commercial vessel. Any watercraft or other contrivance used or capable of being used as a means of transportation on water to transport property for compensation or hire, with the exception of any aircraft or ferry.

Customs and Border Protection (CBP). U.S. Customs and Border Protection, U.S. Department of Homeland Security.

Customs territory of the United States. The 50 States, the District of Columbia, and Puerto Rico.

Designated State or county inspector. A State or county plant regulatory official designated by the Secretary of Agriculture to inspect and certify to shippers and other interested parties as to the phytosanitary condition of plant products inspected under the Plant Protection Act (7 U.S.C. 7701 *et seq.*).

Great Lakes. The Great Lakes of North America and the waters of the St. Lawrence River west of a rhumb line drawn from Cap de Rosiers to West Point, Anticosti Island, and west of a line along 63° W. longitude from Anticosti Island to the north shore of the St. Lawrence River.

Passenger. A natural person for whom transportation is provided, including infants, whether a separate ticket or travel document is issued for the infant, or the infant or toddler occupies a seat, or the infant or toddler is held or carried by another passenger.

Person. An individual, corporation, partnership, trust, association, or any other public or private entity, or any officer, employee, or agent thereof.

(b) *Fee for inspection of commercial vessels of 100 net tons or more.* (1) Except as provided in paragraphs (b)(2) and (3) of this section, the master, licensed deck officer, or purser of any commercial vessel which is subject to inspection under part 330 of this chapter or 9 CFR chapter I, subchapter D, and which is either required to make entry at the customs house under 19 CFR 4.3 or is a U.S.-flag vessel proceeding coastwise under 19 CFR 4.85, shall, upon arrival, proceed to CBP and pay an agricultural quarantine and inspection (AQI) user fee. The base AQI user fee for each arrival is shown in table 1. The fee will be paid for each arrival regardless of the number of arrivals taking place in the course of a single voyage.

TABLE 1 TO PARAGRAPH (b)(1)—FEE FOR INSPECTION OF COMMERCIAL VESSELS OF 100 NET TONS OR MORE

Effective date	Amount
October 1, 2024	$2,903.73
October 1, 2025	2,981.17
October 1, 2026	3,059.61
October 1, 2027	3,139.06

(2) The following categories of commercial vessels are exempt from paying an AQI user fee:

(i) Commercial cruise vessels carrying passengers paying fees under paragraph (f) of this section;

(ii) Any vessel which, at the time of arrival, is being used solely as a tugboat;

(iii) Vessels used exclusively in the governmental service of the United States or a foreign government, including any agency or political subdivision of the United States or a foreign government, so long as the vessel is not carrying persons or merchandise for commercial purposes;

(iv) Vessels arriving in distress or to take on fuel, sea stores, or ship's stores;

(v) Tugboats towing vessels on the Great Lakes; and

(vi) Vessels returning to the United States after traveling to Canada solely to take on fuel.

(3) If not otherwise exempt from paying the fee, a vessel traveling solely between the United States and Canada and within the Great Lakes or Cascadia may pay the AQI user fee for each arrival as the fee is shown in table 2, provided that the vessel:

(i) Is not carrying cargo originating from countries other than the United States or Canada.

(ii) Is not carrying plants or plant products.

(iii) Is not carrying animals or animal products.

(iv) Is not carrying soil or quarry products from areas in Canada listed in § 319.77–3 of this chapter as being infested with gypsy moth.

(v) Is not carrying wood packaging material as defined under § 319.40–1 of this chapter.

TABLE 2 TO PARAGRAPH (b)(3)—FEE FOR INSPECTION OF COMMERCIAL VESSELS TRAVELING SOLELY BETWEEN THE UNITED STATES AND CANADA AND WITHIN THE GREAT LAKES OR CASCADIA, AND NOT OTHERWISE EXEMPT

Effective date	Amount
October 1, 2024	$837.51
October 1, 2025	850.03
October 1, 2026	862.54
October 1, 2027	875.06

(c) *Fee for inspection of commercial trucks*—(1) *On-arrival payment.* Upon arrival at a CBP port of entry, the driver or other person in charge of a commercial truck that is subject to inspection under part 330 of this chapter or under 9 CFR chapter I, subchapter D, must tender the AQI user fees to CBP, unless they have been prepaid as provided for in paragraph (c)(2) of this section. APHIS strongly encourages electronic remittance of fees. The fee applies to all commercial trucks, regardless of what they are carrying, as well as empty trucks and truck cabs (see table 3).

TABLE 3 TO PARAGRAPH (c)(1)—FEE FOR INSPECTION OF COMMERCIAL TRUCKS

Effective date	Amount (per arrival)	Amount (prepaid annual fees)
October 1, 2024	$12.40	$622.00
October 1, 2025	13.45	808.20
October 1, 2026	14.50	870.60
October 1, 2027	15.55	935.40

Note: The per arrival fee has been rounded down to the next $0.05 (five-cent) increment to facilitate border operations. Additionally, the prepaid fees are set at 50 times the unrounded fee rate of $12.44, and 60 times the unrounded fee rates of $13.47, $14.51, and $15.59, respectively.

(2) *Prepayment.* (i) The owner, their agent, or person in charge of a commercial vehicle may at any time prepay the commercial truck AQI fee as defined in paragraph (c)(1) of this section for all arrivals of that vehicle during a calendar year or any remaining portion of a calendar year. The prepayment transponder fee is set at 50 times the unrounded per arrival fee for the period between October 1, 2024 and September 30, 2025, and 60 times the unrounded per arrival fee thereafter. Prepayment of the AQI fee must be made in accordance with the procedures and payment methods set forth in 19 CFR 24.22. The following information must be provided, together with the prepayment amount for each arrival:

(A) Vehicle make, model, and model year;

(B) Vehicle Identification Number (VIN);

(C) License numbers issued by State, Province, or country; and

(D) Owner's name and address.

(ii) Purchases of transponders may be made at any time during a calendar year; APHIS will not prorate for the portion of the calendar year already elapsed, nor refund single-crossing fees already paid.

(d) *Fee for inspection of commercial railroad cars*—(1) *General requirement.* Except as provided in paragraph (d)(2) of this section, an AQI user fee will be charged for each commercial railroad car (loaded or empty) which is subject to inspection under part 330 of this chapter or under 9 CFR chapter I, subchapter D, upon each arrival, as indicated in table 4. The railroad company receiving a railroad car in interchange at a port of entry or, barring interchange, the company moving a car in line haul service into the customs territory of the United States, will be responsible for payment of the fee. Payment of the fee must be made in accordance with the procedures set forth in paragraph (d)(3) or (4) of this section. For purposes of this paragraph (d), the term "railroad car" means any carrying vehicle, measured from coupler to coupler and designed to operate on railroad tracks. If the AQI user fee is prepaid for all arrivals of a commercial railroad car during a calendar year or any remaining portion of a calendar year, the AQI user fee is an amount 48 times the AQI user fee for each arrival.

TABLE 4 TO PARAGRAPH (d)(1)—FEE FOR INSPECTION OF COMMERCIAL RAILROAD CARS

Effective date	Amount (per arrival)	Amount (prepaid)
October 1, 2024	$6.51	$312.48
October 1, 2025	7.23	347.04
October 1, 2026	7.97	382.56
October 1, 2027	8.72	418.56

(2) *Exemptions.* The following categories of commercial railroad cars are exempt from paying an AQI user fee:

(i) Any commercial railroad car that is part of a train whose journey originates and terminates in Canada, if:

(A) The commercial railroad car is part of the train when the train departs Canada; and

(B) No passengers board or disembark from the commercial railroad car, and no cargo is loaded or unloaded from the commercial railroad car, while the train is within the United States.

(ii) Any commercial railroad car that is part of a train whose journey originates and terminates in the United States, if:

(A) The commercial railroad car is part of the train when the train departs the United States; and

(B) No passengers board or disembark from the commercial railroad car, and no cargo is loaded or unloaded from the commercial railroad car, while the train is within any country other than the United States; and

(iii) Locomotives and cabooses.

(3) *Prepayment.* The owner, agent, or person in charge of a railroad company may at any time prepay the commercial railroad car AQI fee as defined in paragraph (d)(1) of this section for all arrivals of that railroad car during a calendar year or any remaining portion of a calendar. This payment must be remitted in accordance with paragraph (d)(4)(iii) of this section.

(4) *Remittance procedures.* The Association of American Railroads (AAR), the National Railroad Passenger Corporation (AMTRAK), and railroad companies acting individually shall file monthly written statement with USDA, APHIS, FMD, within 90 days after the end of each calendar month. Each written statement shall indicate:

(i) The number of commercial railroad cars entering the customs territory of the United States during the relevant period by railroad company;

(ii) The total monthly AQI user fees due from each railroad company; and

(iii) In the case of prepayments to cover all annual arrivals of certain railroad car(s) in accordance with paragraph (d)(3) of this section; include the number of railroad cars being prepaid for, railroad car number(s) covered by the prepayment and the calendar year to which the prepayment applies.

(iv) Railroad companies may include the written statement with their mailed payment as directed in this paragraph (d)(4). For all other payment types, the companies must email the written

statement to *ABSHelpline@usda.gov.* Individual railroad companies must submit a written statement for periods with no fees collected. Detailed remittance instructions are located at *https://www.aphis.usda.gov/aphis/ourfocus/business-services/aqi-user-fees.* Questions and correspondence may be directed to *ABSHelpline@usda.gov* or (612) 336–3400 (fax) or (877) 777–2128 (phone).

(5) *Payment procedures.* (i) If the railroad company intends to pay monthly, the owner, agent or person in charge of an individual railroad company shall pay the AQI user fees calculated by the Association of American Railroads (AAR), the National Railroad Passenger Corporation (AMTRAK), or the individual railroad company itself within 90 days after the end of each calendar month in which commercial railroad cars entered the customs territory of the United States.

(ii) If the owner, agent or person in charge of an individual railroad company intends to prepay for railroad car(s) for the entire calendar year, as specified in paragraph (d)(3) of this section, prepayment may be made at any time during a calendar year; APHIS will not prorate for the portion of the calendar year already elapsed, nor refund or credit per arrival fees already paid.

(iii) Written statements as described in paragraph (d)(4) of this section, are required to accompany all payments. Detailed payment instructions are located at *https://www.aphis.usda.gov/aphis/ourfocus/business-services/aqi-user-fees.* Questions and correspondence may be sent to *ABSHelpline@usda.gov,* fax (612) 336–3400 or phone (877) 777–2128.

(6) *Compliance.* (i) AAR, AMTRAK, and each railroad company responsible for making AQI user fee payments must allow APHIS, CBP, and authorized representatives to verify the accuracy of AQI user fees collected and remitted and otherwise determine compliance with 21 U.S.C. 136a and this paragraph (d). The AAR, AMTRAK, and each railroad company responsible for making AQI user fee payments must advise the USDA, APHIS, FMD of the name, address, and telephone number of an agent or other responsible person who is authorized to verify AQI user fee calculations, collections, and written statements, payments, as well as any changes in the identifying information submitted.

(ii) The agent or other responsible person for a payment remains the agent or responsible person until the railroad company notifies APHIS of a transfer of responsibility. The agent or responsible person must contact APHIS to initiate any transfer by contacting *ABSHelpline@usda.gov.* The new agent or responsible person assumes all responsibilities for ensuring compliance for meeting the requirements of this part.

(e)(1) *Fee for inspection of commercial aircraft.* Except as provided in paragraph (e)(2) of this section, an AQI user fee will be charged for each commercial aircraft which is arriving, or which has arrived and is proceeding from one United States airport to another under a CBP ''Permit to Proceed,'' as specified in 19 CFR 122.81 through 122.85, or an ''Agricultural Clearance or Safeguard Order'' (PPQ Form 250), used pursuant to § 330.400 of this chapter and 9 CFR 94.5, and which is subject to inspection under part 330 of this chapter or 9 CFR chapter I, subchapter D. Each carrier or their agent is responsible for paying the AQI user fee. The AQI user fee for each arrival is shown in table 5:

TABLE 5 TO PARAGRAPH (e)(1)—FEE FOR INSPECTION OF COMMERCIAL AIRCRAFT

Effective date	Amount
October 1, 2024	$281.39
October 1, 2025	300.78
October 1, 2026	320.61
October 1, 2027	340.90

(2) *Exemptions.* The following categories of commercial aircraft are exempt from paying an AQI user fee:

(i) [Reserved]

(ii) Any aircraft used exclusively in the governmental services of the United States or a foreign government, including any Agency or political subdivision of the United States or a foreign government, as long as the aircraft is not carrying persons or merchandise for commercial purposes;

(iii) Any aircraft making an emergency or forced landing when the original destination of the aircraft was a foreign port;

(iv) [Reserved]

(v) Any aircraft moving from the U.S. Virgin Islands to Puerto Rico; and

(vi) Any aircraft making an in-transit stop at a port of entry, during which the aircraft does not proceed through any portion of the Federal clearance process, such as inspection or clearance by APHIS or CBP, no cargo is removed from or placed on the aircraft, no passengers get on or off the aircraft, no crew members get on or off the aircraft, no food is placed on the aircraft, and no garbage is removed from the aircraft.

(3) *Remittance and payment procedures.* (i) The carrier or their agent must pay the appropriate fees for receipt no later than 90 days after the close of the month in which the aircraft arrivals occurred. APHIS strongly encourages electronic payment of fees. To set up electronic payment refer to our detailed instructions at *https://www.aphis.usda.gov/mrpbs/userfees/aqi-payment*-types.pdf or for further information relative to electronic remittance, or for further information relative to electronic remittance, contact *ABSHelpline@usda.gov.* In the event electronic remission is impractical, a check or money order can be mailed to the Agency lock box following detailed payment instructions at *https://www.aphis.usda.gov/mrpbs/userfees/aqi-payment-types.pdf.* Questions and correspondence may be directed to *ABSHelpline@usda.gov* or to (612) 336–3400 (fax) or (877) 777–2128 (phone). For payment information, refer to our detailed payment instructions at *https://www.aphis.usda.gov/aphis/ourfocus/business-services/aqi-user-fees.* Late payments will be subject to interest, penalty, and a charge to cover the cost of processing and handling a delinquent claim as provided in the Debt Collection Act of 1982, as amended by the Debt Collection Improvement Act of 1996 (31 U.S.C. 3717).

(ii) The carrier or their agent must provide a written statement each month stating the fees that are due for the month. Carriers or their agents must include a hard copy of the written statement with any mailed payment. For all other payment types, including for months with no fees collected, the carriers must email the written statement to *ABSHelpline@usda.gov.*

(iii) The written statement must include the following information:

(A) Name and address of the person making the payment;

(B) Calendar month covered by the payment;

(C) Amount being paid, or a written statement stating that no fees were collected.

(iv) All fee payments required under this section must be made in U.S. dollars. For all payment types accepted, please visit *https://www.aphis.usda.gov/aphis/ourfocus/business-services/aqi-user-fees.*

(4) *Compliance.* Each carrier subject to this section must allow APHIS, CBP, and authorized representatives to verify the accuracy of the AQI user fees paid and to otherwise determine compliance in accordance with this paragraph (e) and 21 U.S.C. 136a. Each carrier must advise USDA, APHIS, FMD, FOB of the name, address, and telephone number of an agent or responsible person who is authorized to verify AQI user fee

calculations, payments, and written statements as well as any changes in the identifying information submitted. The agent or responsible person for a payment remains the agent or responsible person until the carrier notifies APHIS of a transfer of responsibility. The carrier or their agent or responsible person must contact APHIS at *https://www.aphis.usda.gov/aphis/ourfocus/planthealth/ppq-program-overview/ppq-cbp-aqi-user-fees-contacts* to initiate any transfer. The new agent or responsible person assumes all responsibilities for ensuring compliance for meeting the requirements of this part.

(5) *Limitations on charges.* (i) Airlines will not be charged reimbursable overtime for inspection of aircraft if the aircraft is subject to the AQI user fee for arriving aircraft as prescribed by this section.

(ii) Airlines will not be charged reimbursable overtime for inspection of cargo from an aircraft if:

(A) The aircraft is subject to the AQI user fee for arriving aircraft as prescribed by this section; and

(B) The cargo is inspected between 8 a.m. and 4:30 p.m., Monday through Friday; or

(C) The cargo is inspected concurrently with the aircraft.

(f)(1) *Fee for inspection of international passengers.* Except as specified in paragraph (f)(2) of this section, each passenger aboard a commercial aircraft or cruise ship who is subject to inspection under part 330 of this chapter or 9 CFR chapter I, subchapter D, upon arrival from a place outside of the customs territory of the United States, must pay an AQI user fee. The fee covers one individual arriving into a port of entry within the customs territory of the United States from a foreign port. Each air or sea carrier, travel agent, tour wholesaler, or other party issuing a ticket or travel document for transportation into the customs territory of the United States is responsible for collecting from the passenger the applicable fee specified in this section, including the fee applicable to any infants or toddlers traveling without a separate ticket or travel document, whether in assigned seats or held in an adult passenger's lap. In the event that the air or sea carrier, travel agent, tour wholesaler, or other party issuing a ticket or travel document does not collect the AQI user fee when tickets are sold, the air carrier or cruise line must collect the user fee that is applicable at the time of departure from the passenger upon departure. The AQI user fee will apply to tickets purchased beginning October 1, 2024. The fees are shown in tables 6 and 7:

TABLE 6 TO PARAGRAPH (f)(1)—INTERNATIONAL AIR PASSENGER

Effective date	Amount
October 1, 2024	$3.71
October 1, 2025	3.84
October 1, 2026	3.98
October 1, 2027	4.12

TABLE 7 TO PARAGRAPH (f)(1)—INTERNATIONAL CRUISE (SEA) PASSENGER

Effective date	Amount
October 1, 2024	$1.25
October 1, 2025	1.29
October 1, 2026	1.34
October 1, 2027	1.39

(2) *Exemptions.* The following categories of passengers are exempt from paying an AQI user fee:

(i) Crew members onboard for purposes related to the operation of the vessel;

(ii) Crew members who are on duty on a commercial aircraft;

(iii) Airline employees, including "deadheading" crew members, who are traveling on official airline business;

(iv) Diplomats, except for U.S. diplomats, who can show that their names appear on the accreditation listing maintained by the U.S. Department of State. In lieu of the accreditation listing, an individual diplomat may present appropriate proof of diplomatic status to include possession of a diplomatic passport or visa, or diplomatic identification card issued by a foreign government;

(v) Passengers departing and returning to the United States without having touched a foreign port or place;

(vi) Passengers arriving on any commercial aircraft used exclusively in the governmental service of the United States or a foreign government, including any agency or political subdivision of the United States or a foreign government, so long as the aircraft is not carrying persons or merchandise for commercial purposes. Passengers on commercial aircraft under contract to the U.S. Department of Defense (DOD) are exempted if they have been precleared abroad under the joint DOD/APHIS Military Inspection Program;

(vii) Passengers arriving on an aircraft due to an emergency or forced landing when the original destination of the aircraft was a foreign port;

(viii) Passengers transiting the United States and not subject to inspection; and

(ix) Passengers moving from the U.S. Virgin Islands to Puerto Rico.

(3) *Circumstances of user fee collections.* AQI user fees shall be collected under the following circumstances:

(i) When through tickets or travel documents are issued indicating travel to the customs territory of the United States that originates in any foreign country; and

(ii) When passengers arrive in the customs territory of the United States in transit from a foreign country and are inspected by APHIS or CBP.

(4) *Responsibility for collection of fees.* (i) Any air or sea carrier, travel agent, tour wholesaler, or other party issuing a ticket or travel document on or after May 13, 1991, is responsible for collecting the AQI user fee from all passengers transported into the customs territory of the United States to whom the AQI user fee applies.

(A) Tickets or travel documents must be marked by the person who collects the AQI user fee to indicate that the required AQI user fee has been collected from the passenger.

(B) If the AQI user fee applies to a passenger departing from the United States and if the passenger's tickets or travel documents were issued on or after May 13, 1991, but do not reflect collection of the AQI user fee at the time of issuance, then the carrier transporting the passenger from the United States must collect the AQI user fee upon departure.

(C) AQI user fees collected from international passengers pursuant to this paragraph (f) shall be held in trust for the United States by the person collecting such fees, by any person holding such fees, or by the person who is ultimately responsible for remittance of such fees to APHIS. AQI user fees collected from international passengers shall be accounted for separately and shall be regarded as trust funds held by the person possessing such fees as agents, for the beneficial interest of the United States. All such user fees held by any person shall be property in which the person holds only a possessory interest and not an equitable interest. As compensation for collecting, handling, and remitting the AQI user fees for international passengers, the person holding such user fees shall be entitled to any interest or other investment return earned on the user fees between the time of collection and the time the user fees are due to be remitted to APHIS under this section. Nothing in this section shall affect APHIS' right to collect interest for late remittance.

(ii) [Reserved]

(5) *Remittance and payment procedures.* (i) The air or sea carrier, travel agent, tour wholesaler, or other party issuing a ticket or travel document or their own non-carrier related tickets or travel documents, must remit collections of AQI user fees from the passengers to APHIS.

(ii) The air or sea carrier, travel agent, tour wholesaler, or other party issuing a ticket or travel document must remit the passengers' fees to APHIS no later than 90 days after the close of the calendar month in which the ticket issuer collected the AQI user fees from the passengers. Late payments will be subject to interest, penalties, and a charge to cover the cost of processing and handling a delinquent claim as provided in the Debt Collection Act of 1982, as amended by the Debt Collection Improvement Act of 1996 (31 U.S.C. 3717).

(iii) All fee payments required under this section must be made in U.S. dollars. For payment types accepted please visit *https://www.aphis.usda.gov/aphis/ourfocus/business-services/aqi-user-fees.* APHIS strongly encourages electronic remittance of fees. To set up electronic remittance refer to our detailed payment instructions at *https://www.aphis.usda.gov/mrpbs/userfees/aqi-payment-types.pdf* or for further information relative to electronic remittance, contact *ABSHelpline@usda.gov.* In the event electronic remission is impractical, a check or money order can be mailed to the Agency lock box following detailed payment instructions at *https://www.aphis.usda.gov/sites/default/files/aqi-payment-types.pdf.* Questions and correspondence may be sent to *ABSHelpline@usda.gov* or fax (612) 336–3400 or (877) 777–2128. For payment information, refer to our detailed payment instructions at *https://www.aphis.usda.gov/sites/default/files/aqi-payment-types.pdf.*

(iv) The air or sea carrier, travel agent, tour wholesaler, or other party issuing a ticket or travel document must provide a written statement each month stating the passenger fees that are due for the month or stating that no payments are due. The air or sea carrier, travel agent, tour wholesaler, or other party issuing a ticket or travel document must include the written statement with their mailed payment. For all other payment types, they must email the written statement separately to *ABSHelpline@usda.gov.* The written statement must include the following information:

(A) Name and address of the person remitting payment;

(B) Calendar month covered by the payment; and

(C) Amount collected and remitted.

(v) Refunds by a remitter of AQI user fees collected in conjunction with unused tickets or travel documents shall be netted against the next subsequent remittance. The ticket or travel document-issuing entity must submit a revised written statement indicating the revised number of passengers and international passenger AQI user fees amount collected. The revised written statement must be completed and filed for each month during which the ticket or travel document-issuing entity certifies that there was a decrease in the number of passengers and international passenger AQI user fees collected.

(6) *Notification.* Carriers contracting with U.S.-based tour wholesalers are responsible for notifying the USDA, APHIS, FMD, FOB at *https://www.aphis.usda.gov/aphis/ourfocus/planthealth/ppq-program-overview/ppq-cbp-aqi-user-fees-contacts* of all journeys contracted, the number of spaces contracted for, and the name, address, and taxpayer identification number of the United States-based tour wholesaler, within 90 days after the close of the calendar month in which such a journey occurred; *except that,* carriers are not required to make notification if tickets, marked to show collection of the AQI user fee, are issued for the individual contracted spaces.

(7) *Compliance.* Each carrier, travel agent, U.S.-based tour wholesaler, or other entity subject to this section must allow APHIS, CBP, and authorized representatives to verify the accuracy of the AQI user fees collected and remitted and to otherwise determine compliance with 21 U.S.C. 136a and this paragraph (f). Each carrier, travel agent, U.S.-based tour wholesaler, or other entity must advise USDA, APHIS, FMD, at *https://www.aphis.usda.gov/aphis/ourfocus/planthealth/ppq-program-overview/ppq-cbp-aqi-user-fees-contacts* of the name, address, and telephone number of a responsible officer who is authorized to verify AQI user fee calculations, payments, and remittance, as well as any changes in the identifying information submitted. The responsible person for a payment remains the responsible person until the air or sea carrier, travel agent, tour wholesaler, or other party issuing a ticket or travel document notifies APHIS of a transfer of responsibility. The responsible person must contact APHIS to initiate any transfer. The new responsible person assumes all responsibilities for ensuring compliance for meeting the requirements of this part.

(8) *Limitation on charges.* Airlines and cruise lines will not be charged reimbursable overtime for passenger inspection services required for any aircraft or cruise ship on which a passenger arrived who has paid the international passenger AQI user fee for that flight or cruise.

(g) *Fees for export certification of plants and plant products.* (1) For each certificate issued by APHIS personnel, the recipient must pay the applicable AQI user fee at the time and place the certificate is issued.

(2) When the work necessary for the issuance of a certificate is performed by APHIS personnel on a Sunday or holiday, or at any other time outside the regular tour of duty of the APHIS personnel issuing the certificate, in addition to the applicable user fee, the recipient must pay the applicable overtime rate in accordance with § 354.1.

(3)(i) Each exporter who receives a certificate issued on behalf of APHIS by a designated State or county inspector must pay an administrative user fee, as shown in table 8. The administrative fee can be remitted by the exporter directly to APHIS through the Phytosanitary Certificate Issuance and Tracking System (PCIT), provided that the exporter has a PCIT account and submits the application for the export certificate through the PCIT. If the PCIT is not used, the State or county issuing the certificate is responsible for collecting the fee and remitting it monthly to the U.S. Bank, United States Department of Agriculture, APHIS, AQI, P.O. Box 979043, St. Louis, MO 63197–9000.

TABLE 8 TO PARAGRAPH (g)(3)(i)—ADMINISTRATIVE USER FEE

Effective dates	Amount per shipment	
	PCIT used	PCIT not used
October 1, 2009, through September 30, 2010	$3	$6
October 1, 2010, through September 30, 2011	6	12

TABLE 8 TO PARAGRAPH (g)(3)(i)—ADMINISTRATIVE USER FEE—Continued

Effective dates	Amount per shipment	
	PCIT used	PCIT not used
Beginning October 1, 2011	6	12

(ii) The AQI user fees for an export or reexport certificate for a commercial shipment are shown in table 9.

TABLE 9 TO PARAGRAPH (g)(3)(ii)—EXPORT OR REEXPORT CERTIFICATE FOR COMMERCIAL SHIPMENT

Effective dates	Amount per shipment
October 1, 2009, through September 30, 2010	$77
October 1, 2010, through September 30, 2011	104
Beginning October 1, 2011	106

(iii) The AQI user fees for an export or reexport certificate for a low-value commercial shipment are shown in table 10. A commercial shipment is a low-value commercial shipment if the items being shipped are identical to those identified on the certificate; the shipment is accompanied by an invoice which states that the items being shipped are worth less than $1,250; and the shipper requests that the user fee charged be based on the low value of the shipment.

TABLE 10 TO PARAGRAPH (g)(3)(iii)—EXPORT OR REEXPORT CERTIFICATE FOR LOW-VALUE COMMERCIAL SHIPMENT

Effective dates	Amount per shipment
October 1, 2009, through September 30, 2010	$42
October 1, 2010, through September 30, 2011	60
Beginning October 1, 2011	61

(iv) The AQI user fees for an export or reexport certificate for a noncommercial shipment are shown in table 11.

TABLE 11 TO PARAGRAPH (g)(3)(iv)—EXPORT OR REEXPORT CERTIFICATE FOR NONCOMMERCIAL SHIPMENT

Effective dates	Amount per shipment
October 1, 2009, through September 30, 2010	$42
October 1, 2010, through September 30, 2011	60
Beginning October 1, 2011	61

(v) The AQI user fees for replacing any certificate are shown in table 12.

TABLE 12 TO PARAGRAPH (g)(3)(v)—REPLACEMENT FEE

Effective dates	Amount per certificate
October 1, 2009, through September 30, 2010	$11
October 1, 2010, through September 30, 2011	15
Beginning October 1, 2011	15

(4) If a designated State inspector issues a certificate, the State where the certificate is issued may charge for inspection services provided in that State.

(5) Any State which wishes to charge a fee for services it provides to issue certificates must establish fees in accordance with one of the following guidelines:

(i) *Calculation of a "cost-per-certificate" fee.* The State must:

(A) Estimate the annual number of certificates to be issued;

(B) Determine the total cost of issuing certificates by adding together

delivery, [1] support, [2] and administrative costs; [3] and

(C) Divide the cost of issuing certificates by the estimated number of certificates to be issued to obtain a ''raw'' fee. The State may round the ''raw'' fee up to the nearest quarter, if necessary for ease of calculation, collection, or billing; or

(ii) *Calculation of a ''cost-per-hour'' fee.* The State must:

(A) Estimate the annual number of hours taken to issue certificates by adding together delivery, [4] support, [5] and administrative [6] hours;

(B) Determine the total cost of issuing certificates by adding together delivery,[1] support,[2] and administrative costs; and

(C) Divide the cost of issuing certificates by the estimated number of hours taken to issue certificates to obtain a ''cost-per-hour'' fee. The State may round the ''cost-per-hour'' fee up to the nearest quarter, if necessary for ease of calculation, collection, or billing.

(6) For payment of any of the AQI user fees required in this paragraph (g), we will accept personal checks for amounts less than $100, and checks drawn on commercial accounts, cashier's checks, certified checks, traveler's checks, and money orders for any amount. All payments must be for the exact amount due.

(h)(1) *Fee for conducting and monitoring treatments.* (1) Each importer of a consignment of articles that require treatment upon arrival from a place outside of the customs territory of the United States, either as a preassigned condition of entry or as a remedial measure ordered following the inspection of the consignment, must pay an AQI user fee. The AQI user fee is charged on a per-treatment basis, *i.e.,* if two or more consignments are treated together, only a single fee will be charged, and if a single consignment is split or must be retreated, a fee will be charged for each separate treatment conducted. The AQI user fee for each treatment is shown in table 13:

TABLE 13 TO PARAGRAPH (h)(1)—FEE FOR CONDUCTING AND MONITORING TREATMENTS

Effective date	Amount
October 1, 2024	$240.60
October 1, 2025	244.19
October 1, 2026	247.79
October 1, 2027	251.38

(2) *Treatment provider.* (i) Private entities that provide AQI treatment services to importers are responsible for collecting the AQI treatment user fee from the importer for whom the service is provided. Treatment providers must collect the AQI treatment fee applicable at the time the treatment is applied.

(ii) When AQI treatment services are provided by APHIS, APHIS will collect the AQI treatment fee applicable at the time the treatment is applied from the person receiving the services. Remittances must be made by check or money order, payable in United States dollars, through a United States bank, to ''The Animal and Plant Health Inspection Service.''

(3) *Collection of fees.* (i) In cases where APHIS is not providing the AQI treatment and collecting the associated fee, AQI user fees collected from importers pursuant to this paragraph (h) shall be held in trust for the United States by the person collecting such fees, by any person holding such fees, or by the person who is ultimately responsible for remittance of such fees to APHIS. AQI user fees collected from importers shall be accounted for separately and shall be regarded as trust funds held by the person possessing such fees as agents, for the beneficial interest of the United States. All such user fees held by any person shall be property in which the person holds only a possessory interest and not an equitable interest. As compensation for collecting, handling, and remitting the AQI treatment user fees, the person holding such user fees shall be entitled to any interest or other investment return earned on the user fees between the time of collection and the time the user fees are due to be remitted to APHIS under this section. Nothing in this section shall affect APHIS' right to collect interest from the person holding such user fees for late remittance.

(ii) [Reserved]

(4) *Remittance and statement procedures.* (i) The treatment provider that collects the AQI treatment user fee must remit the fee to USDA, APHIS, AQI, PO Box 979044, St. Louis, MO 63197–9000.

(ii) AQI treatment user fees must be remitted for receipt no later than 31 days after the close of the calendar quarter in which the AQI user fees were collected. Late payments will be subject to interest, penalty, and handling charges as provided in the Debt Collection Act of 1982, as amended by the Debt Collection Improvement Act of 1996 (31 U.S.C. 3717).

(iii) The remitter must mail with the remittance a written statement to USDA, APHIS, AQI, PO Box 979044, St. Louis, MO 63197–9000. The statement must include the following information:

(A) Name and address of the person remitting payment;

(B) Taxpayer identification number of the person remitting payment;

(C) Calendar quarter covered by the payment; and

(D) Amount collected and remitted.

(iv) Remittances must be made by check or money order, payable in United States dollars, through a United States bank, to ''The Animal and Plant Health Inspection Service.''

(i) *Consequences for nonpayment or late payment of user fees*—(1) *Unpaid debt.* In cases of delinquent debts, the government is required to charge and collect interest, penalties, and costs. See 31 U.S.C. 3717(a) (interest); 3717(e)(1) (costs); and 3717(e)(2) (penalties). If any person for whom the service is provided fails to pay when due any debt to APHIS, including any user fee due under chapter I or chapter III of this title, then:

(i) *Subsequent user fee payments.* Payment must be made for subsequent user fees before the service is provided if:

(A) For unbilled fees, the user fee is unpaid 60 days after the date the pertinent regulatory provision indicates payment is due;

[1] Delivery costs are costs such as employee salary and benefits, transportation, per diem, travel, purchase of specialized equipment, and user fee costs associated with maintaining field offices. Delivery hours are similar hours taken by inspectors, including travel time, inspection time, and time taken to complete paperwork.

[2] Support costs are costs at supervisory levels which are similar to delivery costs, and user fee costs such as training, automated data processing, public affairs, enforcement, legal services, communications, postage, budget and accounting services, and payroll, purchasing, billing, and collecting services. Support hours are similar hours taken at supervisory levels, as well as hours taken in training, automated data processing, enforcement, legal services, communication, budgeting and accounting, payroll purchasing, billing, and collecting.

[3] Administrative costs are costs incurred as a direct result of collecting and monitoring Federal phytosanitary certificates. Administrative hours are hours taken as a direct result of collecting and monitoring Federal phytosanitary certificates.

[4] Delivery costs are costs such as employee salary and benefits, transportation, per diem, travel, purchase of specialized equipment, and user fee costs associated with maintaining field offices. Delivery hours are similar hours taken by inspectors, including travel time, inspection time, and time taken to complete paperwork.

[5] Support costs are costs at supervisory levels which are similar to delivery costs, and user fee costs such as training, automated data processing, public affairs, enforcement, legal services, communications, postage, budget and accounting services, and payroll, purchasing, billing, and collecting services. Support hours are similar hours taken at supervisory levels, as well as hours taken in training, automated data processing, enforcement, legal services, communication, budgeting and accounting, payroll purchasing, billing, and collecting.

[6] Administrative costs are costs incurred as a direct result of collecting and monitoring Federal phytosanitary certificates. Administrative hours are hours taken as a direct result of collecting and monitoring Federal phytosanitary certificates.

(B) For billed fees, the user fee is unpaid 60 days after date of bill;

(C) The person for whom the service is provided or the person requesting the service has not paid the late payment penalty charges, interest charges, or charges for the cost of processing and handling the delinquent bill on any delinquent APHIS user fee; or

(D) Payment has been dishonored.

(ii) *Resolution of difference between estimate and actual.* APHIS will estimate the user fee to be paid; any difference between the estimate and the actual amount owed to APHIS will be resolved as soon as reasonably possible following the delivery of the service, with APHIS returning any excess to the payor or billing the payor for the additional amount due.

(iii) *Prepayment form.* The prepayment must be in guaranteed form of payment, such as money order or certified check. Prepayment in guaranteed form will continue until the debtor pays the delinquent debt.

(iv) *Denied service.* Service will be denied until the debt is paid if:

(A) For unbilled fees, the user fee is unpaid 90 days after date the pertinent regulatory provision indicates payment is due;

(B) For billed fees, the user fee is unpaid 90 days after date of bill;

(C) The person for whom the service is provided or the person requesting the service has not paid the late payment penalty charges, interest charges, or charges for the cost of processing and handling the delinquent bill on any delinquent APHIS user fee; or

(D) Payment has been dishonored.

(2) *Unpaid debt during service.* If APHIS is in the process of providing a service for which an APHIS user fee is due, and the user has not paid the fee within the time required, or if the payment offered by the user is inadequate or unacceptable, then APHIS will take the following action: If regulated articles in quarantine at a treatment facility cannot be released from quarantine, APHIS may seize and dispose of them, as determined by the Administrator, and may recover all expenses of handling the articles from persons liable for user fees under paragraph (h)(1) of this section. If regulated articles can be released from quarantine, the articles will be released, and any unpaid debt will be handled in accordance with procedures for unpaid debt in this section.

(3) *Late payments.* If for unbilled user fees, the user fees are unpaid 30 days after the date the pertinent regulatory provisions indicates payment is due, or if billed, are unpaid 30 days after the date of the bill, APHIS will impose late payment penalty charges, interest charges, and charges for the cost of processing and handling the delinquent bill in accordance with 31 U.S.C. 3717.

(4) *Dishonored payment.* User fees paid with dishonored forms of payment, such as a check returned for insufficient funds, will be subject to interest and penalty charges in accordance with 31 U.S.C. 3717. Administrative charges will be assessed at $20.00 per dishonored payment to be paid in addition to the original amount owed. Payment must be in guaranteed form, such as a money order or certified check.

(5) *Debt collection management.* In accordance with applicable debt collection law, the following provisions apply:

(i) *Taxpayer identification number.* APHIS will collect a taxpayer identification number from all persons, other than Federal agencies, who are liable for a user fee.

(ii) *Offset.* APHIS takes appropriate action to collect debts through offset under applicable law, including by notifying the Department of the Treasury of debts that are over 120 days delinquent for the purposes of offset through the Treasury Offset Program. Through the Treasury Offset Program, the Department of the Treasury will offset eligible Federal and State payments to satisfy the debt to APHIS.

(iii) *Cross-servicing.* APHIS will transfer debts that are over 120 days delinquent to the Department of the Treasury's Cross-Servicing program. Through the Cross-Servicing program, the Department of the Treasury will collect debts on behalf of APHIS. Exceptions may be made for debts that meet certain requirements, for example, debts that are already at a collection agency or in payment plans.

(6) *Report delinquent debt.* APHIS will report all unpaid debts to credit reporting bureaus.

(*j*) *Recordkeeping and record retention.* (1) Entities responsible for paying AQI user fees and their agents are required to establish, keep, and make available to APHIS the following records:

(i) Records and reports required under this section, including written statements, if applicable; and

(ii) Legible copies of contracts (including amendments to contracts) between the responsible entity or their agents and agents that conduct activities subject to this part for the responsible entity, and copies of documents relating to agreements made without a written contract.

(2) Responsible entities or their agents must maintain sufficient documentation for APHIS, CBP, and representatives to verify the accuracy of the fee collections and, if applicable, written statements. Such information must be made available for inspection upon APHIS and CBP's demand. Such documentation shall be maintained in the United States for a period of 5 years from the date of remittance calculation, unless a longer retention period is determined to be needed by the Administrator. Each such affected entity shall provide to APHIS and CBP the name, address, and telephone number of a responsible officer who is able to verify any statements or records required to be filed or maintained under this section and shall promptly notify APHIS and CBP of any changes in the identifying information previously submitted.

(k) *Severability.* The sections of this part are separate and severable from one another. If any section or portion therein is stayed or determined to be invalid, or the applicability of any section to any person or entity is held invalid, it is the APHIS' intention that the validity of the remainder of those parts shall not be affected, with the remaining sections to continue in effect.

(Approved by the Office of Management and Budget under control numbers 1651–0019, 0579–0052, 0579–0094, and 0579–0489).

Done in Washington, DC, this 25th day of April 2024.

Jennifer Moffitt,

Undersecretary, Marketing and Regulatory Programs.

Vol. 89 Tuesday,
No. 89 May 7, 2024

Part VI

Surface Transportation Board

49 CFR Part 1145
Reciprocal Switching for Inadequate Service; Final Rule

SURFACE TRANSPORTATION BOARD

49 CFR Part 1145

[Docket No. EP 711 (Sub-No. 2)]

Reciprocal Switching for Inadequate Service

AGENCY: Surface Transportation Board (the Board or STB).

ACTION: Final rule.

SUMMARY: The Board adopts new regulations that provide for the prescription of reciprocal switching agreements as a means to promote adequate rail service through access to an additional line haul carrier. Under the new regulations, eligibility for prescription of a reciprocal switching agreement will be determined in part using objective performance standards that address reliability in time of arrival, consistency in transit time, and reliability in providing first-mile and last-mile service. The Board will also consider, in determining whether to prescribe a reciprocal switching agreement, certain affirmative defenses and the practicability of a reciprocal switching agreement. To help implement the new regulations, the Board will require all Class I railroads to submit certain service data on an ongoing and standardized basis, which will be generalized and publicly accessible. Railroads will also be required to provide individualized, machine-readable service data to a customer upon a written request from that customer.

DATES: The rule will be effective on September 4, 2024.

FOR FURTHER INFORMATION CONTACT: Valerie Quinn at (202) 740–5567. If you require accommodation under the Americans with Disabilities Act, please call (202) 245–0245.

Introduction

In a decision served on September 7, 2023, the Board issued a new notice of proposed rulemaking that would provide for the prescription of reciprocal switching agreements with emphasis on how to address inadequate rail service. *Reciprocal Switching for Inadequate Serv.* (*NPRM*), 88 FR 63897 (proposed Sept. 18, 2023).[1] The Board explained that, given the major service problems that occurred subsequent to the 2016 proposal in Docket No. EP 711 (Sub–No. 1) and the history of recurring service problems that continue to plague the industry, it is appropriate, at this time, to focus reciprocal switching reform on service-related issues. *NPRM,* 88 FR at 63899.

As discussed in the *NPRM,* reciprocal switching agreements provide for the transfer of a rail shipment between Class I rail carriers or their affiliated companies within the terminal area in which the shipment begins or ends its journey on the rail system. *Id.* at 63898. In a typical case, the incumbent rail carrier either (1) moves the shipment from the point of origin in the terminal area to a local yard, where an alternate carrier picks up the shipment to provide the line haul; or (2) picks up the shipment at a local yard where an alternate carrier placed the shipment after providing the line haul, for movement to the final destination in the terminal area. *Id.* The alternate carrier might pay the incumbent carrier a fee for providing that service. *Id.* The fee is often incorporated in some manner into the alternate carrier's total rate to the shipper. *Id.* A reciprocal switching agreement thus enables an alternate carrier to offer its own single-line rate or joint-line through rate for line-haul service, even if the alternate carrier's lines do not physically reach the shipper/receiver's facility. *Id.*

The regulations as proposed in the *NPRM* would provide for the prescription of a reciprocal switching agreement when service to a terminal-area shipper or receiver failed to meet one or more objective performance standards and when other conditions to a prescription were met. *Id.* The proposed standards addressed: (1) a rail carrier's failures to meet its original estimated time of arrival (OETA), *i.e.,* to provide sufficiently reliable line-haul service; (2) a deterioration in the time it takes a rail carrier to deliver a shipment (transit time); and (3) a rail carrier's failures to provide local pick-ups or deliveries of cars (also known as first-mile/last-mile service (FMLM)), as measured by the carrier's success in meeting an ''industry spot and pull'' (ISP) standard. *Id.* at 63901. The proposed regulations also addressed regulatory procedures, affirmative defenses, and practicability. *Id.* at 63908–10. In addition to proposing to provide for the prescription of a reciprocal switching agreement when the foregoing conditions were met, the Board sought comment on what methodology the Board should use in setting the fee for switching under a prescribed agreement, in the event that the affected carriers did not reach agreement on compensation within a reasonable time. *Id.* at 63909–10.

The proposed regulations would impose certain data requirements to aid in implementation of those regulations. In part, the proposed regulations would require a Class I carrier to provide to a customer, upon written request, that customer's own individualized service data. In addition, to ensure that the Board would have an informed view of service issues across the network, the proposed regulations would (1) make permanent the filing of certain data that is similar to the data the Board had collected on a temporary basis in *Urgent Issues in Freight Rail Service—Railroad Reporting,* Docket No. EP 770 (Sub–No. 1); and (2) require consistency in reporting that data. *NPRM,* 88 FR at 63910–11.

The Board solicited comments on the *NPRM* by October 23, 2023, and replies by November 21, 2023. *NPRM,* 88 FR at 63897. In response to requests for extensions, these dates were extended to November 7, 2023, and December 20, 2023, respectively. *Reciprocal Switching for Inadequate Serv.*, EP 711 (Sub-No. 2)(STB served Sept. 29, 2023, and Nov. 20, 2023).

The Board received many comments and replies from interested parties, including public officials, railroads, shippers, trade organizations, and others.[2] As discussed below, overall, shippers and their supporting trade organizations strongly favor the Board's proposal, although many seek minor modifications or, in some instances,

[1] The Board also closed a sub-docket involving an earlier notice of proposed rulemaking from 2016. *Reciprocal Switching,* 88 FR 63917 (published Sept. 18, 2023) (closure of Docket No. EP 711 (Sub–No. 1)).

[2] A Table of Commenters with abbreviations the Board uses in the text and citations is provided below.

significant expansions to the scope of the proposed rule. The railroads and their trade organizations generally object to the Board's legal foundation for the proposed regulations and otherwise suggest significant changes to those regulations.

After reviewing the record, the Board is adopting a version of part 1145 that reflects certain modifications to the proposal in the *NPRM.* With respect to the performance standards in part 1145, some of the key modifications are as follows. First, based on numerous shipper comments and the data the Board had been collecting since 2022 in Docket No. EP 770 (Sub-No. 1), the Board is increasing the OETA standard for delivering within 24 hours of the OETA from 60% to 70% and the standard for performing ISP from 80% to 85%. Second, the Board is adopting a proposal whereby railcars that are delivered more than 24 hours before the OETA will count in assessing the rail carrier's performance. Third, the Board is establishing an absolute floor for the service consistency standard and will modify that standard to provide that certain deteriorations in transit time over a three-year period would also count as a failure. Fourth, the Board is withdrawing its proposal to combine lanes; the service reliability standard and the service consistency standard will be applied only to each individual lane of traffic to/from the petitioner's facility. Finally, in response to public comments, the Board makes other modifications to each performance standard. As discussed in the *NPRM,* the performance standards apply only to petitions under part 1145; the standards do not by themselves establish whether a carrier's operations are otherwise appropriate. The Board does not view it as appropriate to apply or draw from the standards when regulating or enforcing the common carrier obligation. *See NPRM,* 88 FR at 63902. Likewise, the performance standards do not define what constitutes adequate rail service. This also means that whether a carrier meets or fails to meet the standards in part 1145 is not determinative of whether a service-related prescription might be justified under part 1144 or part 1147 of the Board's regulations.

The Board is also clarifying issues concerning Class II and Class III rail carriers. Part 1145 pertains to shippers and receivers that have practical physical access to only one Class I rail carrier or its affiliated company. The affiliated company might be a Class II or Class III railroad. Part 1145 otherwise does not apply to Class II and Class III railroads.

As discussed in the *NPRM,* the Board will initiate an ongoing collection of data similar to a subset of the data that it had collected on a temporary basis in Docket No. EP 770 (Sub-No. 1). That data must now be submitted using a standardized template to be developed by the agency. The Board will continue to require Class I railroads to provide data to a customer within seven days of receiving a request, but the Board is providing more clarity and specificity in regard to that requirement, as the original proposal could have impeded carriers' ability to provide timely responses. Based on comments, the Board also clarifies and modifies in certain respects the proposed provisions on affirmative defenses. The Board is also increasing the minimum duration of a prescribed reciprocal switching agreement from two years to three years and the maximum duration of a prescribed reciprocal switching agreement from four years to five years.

With respect to traffic that is or was moved under a transportation contract under 49 U.S.C. 10709, the Board explains that it will not prescribe a reciprocal switching agreement under part 1145 based on performance that occurs during the term of the contract. Concerning exempt commodities, the Board will not consider pre-revocation performance as the basis for a prescription under part 1145 but intends to prioritize petitions for partial revocation filed in furtherance of part 1145 cases in order to resolve expeditiously those petitions for partial revocation. The Board also intends to explore at a later date whether it should partially revoke exemptions on its own initiative to allow for reciprocal switching petitions, as is currently the case for the boxcar exemption. *See* 49 CFR 1039.14(b)(3) (expressly allowing for regulation of reciprocal switching for rail transportation of commodities in boxcars).

These issues, as well as numerous others, are discussed below. After considering the record, the Board hereby adopts the proposed regulations, with modifications as indicated below, as part 1145 of its regulations.

Various entities have asked that the Board take additional steps in this proceeding such as adopting a fourth performance standard that would measure whether the incumbent carrier reasonably met the customer's local operational and service requirements, (PCA Comments 12; *see also* PRFBA Comments 9 n.4; EMA Comments 8–9 n.4; NSSGA Comments 9 n.3; Olin Comments 6), or adopting a performance standard that would apply specifically to grain shippers, (USDA Comments 5–6). USDA and others ask the Board to grant terminal trackage rights based on a carrier's failure to meet the ISP standard, (USDA Comments 8; NGFA Comments 7; NSSGA Comments 9; ACD Comments 5; NMA Comments 6), or to open a new docket concerning terminal trackage rights, (Coal. Ass'ns Comments 8).

Others seek more sweeping reform, including: expanding part 1145 to all bottleneck segments (Coal. Ass'ns Comments 8); overturning the ''anti-competitive conduct'' test in *Midtec Paper Corp.* v. *Chicago & North Western Transportation Co.* (*Midtec*), 3 I.C.C.2d 171 (1986) (Coal. Ass'ns Comments 8; DOT/FRA Comments 3; ILWA Comments 1; FRCA/NCTA Comments 2; Celanese Comments 2; PCA Comments 4–7; Olin Comments 6–8; NMA Comments 4); adopting rules in *Petition for Rulemaking to Adopt Rules Governing Private Railcar Use by Railroads,* Docket No. EP 768, (NGFA Comments 9); and further delineating the scope of the common carrier obligation, (TTD Comments 3). The Coalition Associations, with support from ACD, also assert that, if the Board concludes it cannot consider the performance of contract traffic, the agency should reopen *Reciprocal Switching,* Docket No. EP 711 (Sub-No. 1), to adopt that proposal with several proposed modifications. (Coal. Ass'ns Reply 47–52; ACD Reply 3.)

The Board appreciates the Coalition Associations' efforts as well as the numerous additional suggestions from others about possible Board actions outside of this docket. However, the Board would like to gauge the effectiveness of this new rule before considering other ways to pursue the objectives of section 11102(c). As noted in the *NPRM,* in choosing to focus reciprocal switching reform on service issues at this time, the Board does not intend to suggest that consideration of additional reforms geared toward increasing competitive options is foreclosed. *Id.* at 63900. And, even with the adoption of part 1145, shippers may still pursue access to an alternate rail carrier under parts 1144 and 1147, and advocate for continued development, including, as appropriate, development by the Board of adjudicatory policies and the appropriate application of those rules in individual cases. *Id.*

The Board expects part 1145 to be a significant step in incentivizing Class I railroads through competition to achieve and maintain higher service levels on an ongoing basis. The objective and transparent standards, defenses, and definitions in this rule should also provide greater certainty

than the status quo. The Board also expects the new data collection to help ensure that it has an informed view of service issues across the network.

Legal Framework

Design of Part 1145

As discussed in the NPRM, part 1145 implements the Board's authority under 49 U.S.C. 11102(c) to prescribe reciprocal switching agreements when ''practicable and in the public interest.'' *NPRM,* 88 FR at 63899. There is a clear public interest in adequate rail service—a matter of fundamental concern under the Interstate Commerce Act. *See United States* v. *Lowden,* 308 U.S. 225, 230 (1939); 49 U.S.C. 10101 (in various policies referencing an ''efficient'' and ''sound'' rail system that can ''meet the needs of the public''); *see also* House Report No. 96–1430: Staggers Rail Act of 1980, Report of the Committee on Conference on S. 1946 at 80 (Sept. 29, 1980). Inadequate rail service can substantially impair rail customers' ability to operate their businesses, resulting in substantial harm to the United States economy as a whole. *NPRM,* 88 FR at 63899–900 (citing 49 U.S.C. 10101). The Board's decision to adopt part 1145 grows out of the Board's recognition that inadequate rail service can critically and adversely affect the national economy, yet the Board's existing regulations do not necessarily provide a sufficient response. *NPRM,* 88 FR at 63900 & n.7. Part 1145 addresses these concerns by providing a reasonably predictable and efficient path toward a prescription under section 11102(c) while, at the same time, providing for regulatory intervention only when there are sufficient, service-related signs of a public interest in intervention and when there would be no undue impairment to rail carriers' operations or ability to service other customers.

Part 1145 is designed specifically to promote the provision of adequate rail service to terminal-area customers that have practical physical access to only one Class I rail carrier or affiliate. *NPRM,* 88 FR at 63899. Under part 1145, upon petition by a shipper or receiver, the Board will prescribe a time-limited reciprocal switching agreement when (1) the prescription is in a terminal area and the petitioner has practical physical access to only one Class I rail carrier or affiliate, *see* 49 CFR 1145.1 (definition of ''reciprocal switching agreement''), 1145.6(a)(1); (2) the incumbent rail carrier failed to meet one or more performance standards, *see* 49 CFR 1145.2, 1145.6(a)(2); (3) that failure was not excused by an affirmative defense, *see* 49 CFR 1145.3, 1145.6(a)(3); (4) transfers under the reciprocal switching agreement would be operationally feasible and would not unduly impair service to other customers, *see* 49 CFR 1145.6(b); and (5) resulting line-haul arrangements would be operationally feasible and would not unduly impair a participating rail carrier's ability to serve its other customers, *see id.*

The performance standards in part 1145, which can be easily understood by shippers and carriers, address three fundamental aspects of adequate rail service: reliable timing in the arrival of line-haul shipments, consistent shipment times, and on-time local pick-ups and deliveries. The standards are set at levels such that performance below the standards would not meet many shippers' (and carriers') service expectations. *See* Performance Standards. Upon a petitioner's demonstration of such a failure and in the absence of an incumbent or alternate carrier's demonstration of an affirmative defense, infeasibility, or undue impairment as provided for in part 1145, *see* 49 CFR 1145.3, 1145.6(b), the Board would prescribe a reciprocal switching agreement, which would give the petitioner the opportunity to obtain line-haul service from an alternate carrier that may be able to provide better service. The prescription of a reciprocal switching agreement does not necessarily mean that the incumbent carrier would lose line-haul service because the incumbent carrier would continue to have the opportunity to compete to serve the petitioner. *NPRM,* 88 FR at 63901. The initial term of any prescribed agreement is for a limited duration of three to five years. 49 CFR 1145.6(c).

Part 1145 will promote the provision of adequate rail service, not only to a successful petitioner, but on a broader network basis. By providing a clearer set of conditions and procedures for the Board to prescribe reciprocal switching agreements, part 1145 will create an incentive for rail carriers to provide adequate service to terminal-area customers that lack another rail option. Part 1145 will also reduce regulatory risk and burdens under section 11102(c) by (1) enhancing the predictability of regulatory outcomes, (2) enabling potential petitioners to evaluate the costs and potential benefits of seeking a prescription, and (3) helping to contain the time and cost of petitioning for a prescription. *NPRM,* 88 FR at 63901. At the same time—because part 1145 provides for an appropriately defined and scoped switching agreement prescription only after careful consideration of affirmative defenses, infeasibility, and undue impairment—part 1145 will not result in the prescription of a reciprocal switching agreement when there is an insufficient basis or when the prescription would be unwise as a matter of policy. *See Midtec Paper Corp.* v. *United States,* 857 F.2d 1487, 1499 (D.C. Cir. 1988).

Comments

Class I rail carriers claim that adoption of part 1145 would exceed the scope of the Board's legal authority. These carriers assert that, as a condition to prescribing a reciprocal switching agreement, the Board must undertake a case-by-case analysis that would be far more elaborate than what is called for under part 1145. According to carriers, the Board must find that: (1) the incumbent carrier consistently provides inadequate service to the petitioner; (2) the incumbent carrier failed to cure the inadequacy after being given notice and a reasonable opportunity to cure; (3) the inadequacy continues to exist at the time of the Board's prescription; (4) service to the petitioner is worse than service to other customers; (5) the petitioner has a compelling need for alternate rail service, as indicated by demonstrated harm to the petitioner's planning and business needs; (6) alternate service would not impose greater harm on other stakeholders; (7) the alternate service would be safe and practicable; and (8) the alternate service would actually remedy the inadequate service. (*See* AAR Comments 2, 5, 8, 13, 17–18, 20–22, 62; *see also* CN Comments 16, 21; CN Reply 3–4; NSR Comments 8–10; CSXT Comments 10–12; CSXT Reply 4–5.)

In attempting to find a legal foundation for their approach, rail carriers look past the text of section 11102(c) to three cases in which the Board's predecessor, the Interstate Commerce Commission (ICC or Commission), applied the public interest standard: *Jamestown Chamber of Commerce* v. *Jamestown, Westfield, & Northwestern Railroad,* 195 I.C.C. 289 (1933); *Central States Enterprises, Inc.* v. *Seaboard Coast Line Railroad,* NOR 38891 (ICC served May 15, 1984), *aff'd sub nom., Central States Enterprises* v. *ICC,* 780 F.2d 664 (7th Cir. 1985); and *Delaware & Hudson Railway* v. *Consolidated Rail Corp.,* 367 I.C.C. 718 (1983). According to carriers, these cases indicate that, to find that a reciprocal switching agreement would be in the public interest, the Board must find that the petitioner has a ''compelling need'' for the agreement. (*See, e.g.,* AAR Comments 12–14.) AAR also relies on a statement in the legislative history suggesting that the

''practicable and in the public interest'' standard in section 11102(c) is ''the same standard the Commission has applied for many years in considering whether to order the joint use of terminal facilities.'' (*See* AAR Comments 14 (citing H.R. Rep. No. 1430 at 116 (1980)).)

Shippers respond that carriers' ''compelling need'' test misstates the law. According to NSSGA, the outcome in *Jamestown* (in which the ICC denied a request to prescribe terminal trackage rights) rested in part on the fact that the incumbent carrier there provided exceptionally good service. (NSSGA Reply 1–2.) Similarly, WCTL argues that *Jamestown* was premised in part on the fact that the proposed service arrangement was sought to aid a financially weak rail carrier. (WCTL Reply 10.) PCA asserts that any ''compelling need'' test would improperly impose an extra-statutory limitation on the Board's authority to prescribe reciprocal switching agreements. (PCA Reply 2, 5 (describing *Jamestown* as inapposite and stating that an ''actual necessity/compelling reason'' standard is found nowhere in the governing statute).) The Coalition Associations assert that the carriers' proposed ''compelling need'' test is overly narrow. They argue that the in-depth inquiry that carriers propose under the ''compelling need'' test would, as a practical matter, limit the availability of prescribed reciprocal switching agreements. According to the Coalition Associations, there is sufficient need for part 1145 given the public interest in creating an incentive to provide adequate rail service. (Coal. Ass'ns Reply 15–18.) The Coalition Associations add that the Board's authority to enact part 1145 flows not only from the ''practicable and in the public interest'' standard but also from the ''competitive rail service'' standard in section 11102(c). (*Id.* at 15–16.)

Class I carriers assert, not only that the Board must undertake a detailed case-by-case investigation as described above, but that, as a condition to prescribing a reciprocal switching agreement, the Board must find that the petitioner lacks an adequate intermodal transportation option (i.e., a transportation option via a mode other than rail). Carriers reason that, when there is an intermodal option, there is unlikely to be a compelling need for an alternate rail option. (*See* AAR Comments 78–79; *see also* BNSF Comments 14–15.) The Coalition Associations respond that intermodal options are not a realistic incentive to provide adequate rail service, reasoning that a customer might have structured its facilities and business model around rail transportation. (*See* Coal. Ass'ns Reply 22–23; *see also* AF&PA/ISRI Reply 7–8.)

On a separate tack, AAR asserts that part 1145 would inappropriately amount to direct regulation of the quality of rail service. AAR bases its assertion on the rule's use of defined performance standards. According to AAR, direct regulation of quality of service would contradict congressional policy to minimize the need for federal regulatory control over the rail transportation system. (AAR Comments 14–15.)

Finally, CPKC argues that the Board is precluded by the doctrine of legislative ratification from undertaking the approach taken in part 1145. Citing a statement in *Midtec Paper Corp.* v. *United States,* 857 F.2d at 1507, that Congress did not intend the agency to undertake a radical restructuring of the rail sector through its switching authority, CPKC asserts that Congress ratified what CPKC calls the ''limited scope of the statute'' by not passing any of eighteen bills that, according to CPKC, would have relaxed the approach in *Midtec.* CPKC concludes on that basis that the Board may prescribe a reciprocal switching agreement only as a direct remedy to an inadequacy that is demonstrated on a case-by-case basis considering all relevant factors. (CPKC Reply 5 n.2.)

The Board's Assessment

Part 1145 reasonably implements the Board's authority to prescribe reciprocal switching agreements when practicable and in the public interest. Class I rail carriers' arguments to the contrary rest on a misinterpretation of the public interest standard in section 11102(c)—a misinterpretation that would effectively replace the statutory standard with a ''compelling need'' standard that, as interpreted by the carriers, would leave the Board little room to fashion its implementation of the public interest standard and the underlying congressional objectives according to the circumstances at hand. The carriers' generalized concerns about the prescription of reciprocal switching agreements are also misguided. Finally, because part 1145 is amply justified under the ''practicable and in the public interest'' standard, it is unnecessary to consider here whether part 1145 is also justified under the ''competitive rail service'' standard in section 11102(c), as some commenters have argued.

Governing Principles

The public interest standard in section 11102(c) gives the Board broad discretion to determine when to prescribe reciprocal switching agreements. In other contexts in which Congress has used the public interest standard, the United States Supreme Court has described the standard as ''expansive.'' *Nat'l Broad. Co.* v. *United States,* 319 U.S. 190, 219 (1943). The public interest standard serves as a ''supple instrument'' for the exercise of discretion by the expert body that Congress charged with carrying out legislative policy. *FCC* v. *Pottsville Broad. Co.,* 309 U.S. 134, 137–38 (1940); *see also McManus* v. *Civil Aeronautics Bd.,* 286 F.2d 414, 419–20 (1960) (citing *Sunshine Anthracite Coal Co.* v. *Adkins,* 310 U.S. 381, 396 (1940)). The public interest standard allows the agency to respond to changes in the industry and to the interplay of complex factors, consistent with policy objectives that Congress established by statute. *Gen. Tel. Co. of Cal.* v. *FCC,* 413 F.2d 390, 398 (D.C. Cir. 1969); *Huawei Techs. USA, Inc.* v. *FCC,* 2 F.4th 421, 439 (5th Cir. 2021). In addition, both before and after the Staggers Act, there has been a recognition that the public interest in adequate transportation could be served through the introduction of another rail carrier. *See, e.g., Pa. Co.* v. *United States,* 236 U.S. 351 (1915) (pre-Staggers); 49 U.S.C. 11102(c); *Del. & Hudson,* 367 I.C.C. at 723 (post-Staggers).

In implementing the public interest standard in section 11102(c), the Board's discretion is to be guided by the policy objectives that Congress established through section 10101 (previously section 10101a) of the Act (the Rail Transportation Policy or RTP)). *Midtec Paper Corp.* v. *United States,* 857 F.2d at 1499–500; *see also N.Y. Cent. Sec. Corp.,* 287 U.S. 24–25 (1932) (establishing that an agency's implementation of broad statutory authority is to be guided by policies set forth by Congress). Depending on the facts at hand, relevant considerations may include the potential to secure lower rates and/or better service, the expansion of shipping options, and possible detriments to affected carriers. *See, e.g., Del. & Hudson,* 367 I.C.C. at 723–24, 726. As needed, in considering whether a proposed action would advance the statutory objectives in section 10101, the Board weighs and balances the various elements of the RTP to ''arrive at a reasonable accommodation of the conflicting policies'' in the Act. *Ass'n of Am. R.Rs.* v. *STB,* 306 F.3d 1108, 1111 (D.C. Cir. 2002); *Midtec Paper Corp.* v. *United States,* 857 F.2d at 1497, 1500; *see also Vill. of Palestine* v. *ICC,* 936 F.2d 1335

(D.C. Cir. 1991) (agency looks to relevant and pertinent rail transportation policies).

Implementation of the Public Interest Standard Through Part 1145

Part 1145 advances the statutory goal of developing and continuing a sound rail transportation system. 49 U.S.C. 10101(4). Part 1145 does so by striking an appropriate balance between, on one hand, the shipping public's interest in securing better rail service and, on the other hand, the interest of rail carriers. *See* 49 U.S.C. 10101(1), (3), (4) and (5); *NPRM,* 88 FR at 63901. Part 1145 strikes this balance by providing for the introduction of an alternate rail carrier via an appropriately defined and scoped switching agreement prescription only when there are sufficient indications, based on the incumbent carrier's performance, that the introduction of a competing carrier would create the possibility of an improved service environment and when the affected carriers have not demonstrated that the proposed prescription would unduly impair their operations or ability to serve their other customers. As the ICC indicated in *Delaware & Hudson,* the introduction of an alternate rail carrier provides the potential to achieve better service. *Del. & Hudson,* 367 I.C.C. at 723; *see also NPRM,* 88 FR at 63901 (noting that part 1145 would ''advance the policies in § 10101 of having a rail system that meets the public need, of ensuring effective competition among rail carriers, of minimizing the need for regulatory control, and of reaching regulatory decisions on a fair and expeditious basis'').

The design of part 1145 takes into account carriers' need to earn adequate revenues. *See* 49 U.S.C. 10101(3). Its built-in limitations ensure that a prescription will not be issued if carriers demonstrate that a particular proposed prescription would unduly impair the carrier's ability to serve its existing customers. Other relevant considerations include that the rule does not apply to traffic moving under contract and that the initial duration of a prescription under part 1145 is limited to three to five years. While it is possible that a particular prescription could result in some reduction in an incumbent carrier's revenues (because a shipper chooses to use the alternate carrier after considering the service offerings of both the incumbent and the alternative carrier) such a potential concern is outweighed by the public interest in securing reliable and consistent rail service through an expeditious regulatory process for prescribing a reciprocal switching agreement when, as provided for in part 1145, no undue impairment would result. Part 1145 also balances consideration of the impact on non-petitioning shippers, as the Board will consider carrier arguments, if raised, about the impact on other shippers in determining whether a petition should be granted. Even with the potential concerns that any particular prescribed switch might raise, Congress expressly provided that the Board should have the authority to determine when such switches are ''practicable and in the public interest'' and part 1145 reasonably includes analysis of those statutory factors.

Part 1145 also gives reasonable effect to the statutory objectives of minimizing the need for federal regulation and of providing for efficient and fair regulatory proceedings. *See* 49 U.S.C. 10101(2), (15). First, part 1145 allows rail carriers to retain sufficient operational flexibility. While part 1145 could lead to some alterations in a carrier's operations, those alterations would be based largely on how the carrier chooses to respond to the potential of an alternate carrier, as part 1145 does not establish a service level for purposes of assessing common carrier or other statutory violations and remedies. *See NPRM,* 88 FR at 63902. Second, with respect to efficient and fair proceedings, part 1145 advances that interest through a targeted, service-based approach to regulatory intervention based on readily obtainable and understood information. The performance standards themselves are largely based on data that carriers and shippers use in the ordinary course of business and the assessment of performance is straightforward to calculate. Part 1145 provides specific affirmative defenses, which help to narrow the scope of a proceeding, and also allows for case-by-case consideration of other relevant issues when warranted. This ease of administration is an important policy goal, particularly where there have been concerns expressed about the efficiency of the Board's existing processes. *See, e.g., NPRM,* 88 FR at 63900 n.7.

In addition, as a condition to regulatory intervention under part 1145, there must be sufficient indications, in the form of the incumbent carrier's failure to meet a service-based performance standard and the absence of an affirmative defense or demonstration of undue impairment, that the introduction of an alternate rail carrier via an appropriately defined and scoped switching agreement prescription could be valuable in bringing about better rail service. *See* 49 CFR 1145.6. Part 1145 will lead to regulatory intervention only when, on balance, such intervention is specifically warranted and therefore does not implicate the D.C. Circuit's opinion in *Midtec Paper Corp.* v. *United States* about a radical restructuring of the rail sector. *See Midtec Paper Corp.* v. *United States,* 857 F.2d at 1507. And even when that regulatory intervention occurs, given part 1145's express recognition of the incumbent rail carrier's ability to continue to compete for a successful petitioner's traffic even when a switch is prescribed, the rule furthers section 10101(4)'s goal of relying appropriately on competition among rail carriers. A shipper that obtains a prescribed switch after careful Board analysis will have the ability to elect the service provider that best addresses its needs. *See NPRM,* 88 FR at 63901; *see also Del. & Hudson,* 167 I.C.C. at 723 (''Additional rail competition is a clear public benefit . . . , one which is endorsed by rail transportation policy announced in the Staggers Act.'').

The Carriers' Proposed Approach Is Not Required by Law

The elaborate, case-by-case approach that rail carriers advocate is not required by law and, at the same time, would undermine the policy goals that the Board seeks to advance here. In the carriers' view, as a condition to prescribing a reciprocal switching agreement, the Board would need (1) to compare the quality of service to the petitioner versus the quality of service to other customers, (2) to assess whether any differences in the quality of service were reasonable, (3) to identify the petitioner's business needs, (4) to identify the level of transportation service that would reasonably meet those needs, and (5) to determine which rail carrier could provide better service. (*See, e.g.,* AAR Comments 19–23.) If this approach were required by law, as alleged by carriers, then the Board would lose the discretion that is inherent in section 11102(c)—the discretion to respond to different types of needs and to changing needs by prioritizing different objectives in section 10101 as appropriate to meet those needs. *See Midtec Paper Corp.* v. *United States,* 857 F.2d at 1497, 1500 (stating that the question is whether the agency arrived at a reasonable accommodation of the conflicting policies in its governing statute).

The most glaring deficiency in carriers' argument is that nothing in the text of section 11102(c) suggests that the Board's discretion is limited to where the Board undertakes carriers' elaborate

approach. Likewise, none of the cases that the carriers cite suggest that the carriers' approach is required by law. In *Jamestown,* the petitioners sought the prescription of terminal trackage rights under what is now section 11102(a). The requested prescription would have required the incumbent rail carrier to construct terminal-area facilities to enable the petitioners to directly reach another rail carrier (as it stood, the petitioners drayed their shipments to the other carrier). *Jamestown,* 195 I.C.C. at 289–91. In denying the prescription, the ICC noted that the prescription would have caused distortions by requiring the incumbent carrier to invest in facilities for the benefit of its weaker competitor. *Id.* at 291. The ICC concluded therefore that, while the prescription would have provided a convenience to the petitioners, more was needed to meet the public interest standard. To outweigh the harm that the prescription would cause, the petitioners would had to have shown more than a mere convenience:

> Where something substantial is to be taken away from a carrier for the sole benefit of [the petitioners], and with no corresponding benefit to the carrier, as in this case, we are inclined to the view that some actual necessity or compelling reason must be shown before we can find such action in the public interest.

Id.

The circumstances that led the ICC to look for a compelling need in *Jamestown* have no meaningful parallel to circumstances that could arise under part 1145. A prescription under part 1145 would not require the incumbent carrier to make investments for the benefit of a competitor, involves a limited form of intervention, and would be granted only if the carriers did not adequately demonstrate infeasibility or undue impairment to their operations or ability to serve other customers, among other limitations and protections under this rule. Of critical note, the *NPRM* made clear that a carrier's loss of a customer's business as a result of a prescription based on a failed performance standard is not a loss that needs to be redressed, (*see NPRM,* 88 FR at 63909), and part 1145 includes protections to avoid any associated undue impairment to the carrier's ability to service other customers, thus minimizing any potential concerns. Indeed, an incumbent carrier's financial losses in such a case would largely reflect its own service failure—it failed to meet one of three performance standards, and the carrier cannot offer an affirmative defense to excuse the service failure—and the shipper's election of the alternate carrier once given the option to choose rail providers. For these reasons, in the present context, there is no need for the Board to find, as a condition to a prescription, a heightened need that would outweigh harm to the incumbent carrier. As indicated by the ICC in *Delaware & Hudson,* the interest of the shipping public in securing better service is not a mere convenience. *Del. & Hudson,* 367 I.C.C. at 723 (stating that there is a light burden under the statute for a petitioner that seeks the potential to secure better rail service through the introduction of an additional rail carrier).

Like carriers' reliance on *Jamestown,* carriers' reliance on *Central States* is misplaced. There, the petitioner sought the prescription of either trackage rights or a reciprocal switching agreement so that the petitioner could have a shipment moved from the terminus of one carrier's tracks to a destination on another carrier's tracks 1.4 miles away. The ICC found that the proposed arrangement was intended to achieve business purposes unrelated to the adequacy of rail service and, moreover, would have threatened the affected carrier's already weak financial standing. The ICC denied the petition, reasoning that, in light of that harm, the public interest required more than a showing that the prescription would provide a convenience to the petitioner. *Cent. States,* 780 F.2d at 670–71, 679.

As with *Jamestown,* the circumstances that led the ICC to look for a compelling need in *Central States* have no meaningful parallel under part 1145. The harm that would have arisen in *Central States*—substantial harm to the affected carrier's already weak financial standing—is unlikely to arise under part 1145 because today each of the Class I carriers' financial standing is significantly stronger, *see R.R. Revenue Adequacy—2022 Determination,* Docket No. EP 552 (Sub-No. 27) (STB served Sept. 5, 2023); because a prescription under part 1145 would, at most, result in the incumbent carrier's loss of the petitioner's business for the limited duration of the prescription; and because of the numerous other protections and limitations in this rule. *See, e.g.,* 49 CFR 1145.6. For example, if the incumbent carrier were to demonstrate that a prescription under part 1145 would unduly impair operations or its ability to serve other customers, then the Board would not grant the prescription as provided for in 49 CFR 1145.6(b). Accordingly, the introduction of an alternate carrier through a prescription under part 1145 would only occur when there are potential public benefits and, given the Board's consideration of relevant issues, the risk of cognizable negative impacts is greatly minimized.

The ICC's decision in *Delaware & Hudson,* while cited by carriers, directly contradicts carriers' narrow approach to implementing the public interest standard in section 11102(c). There the ICC cited *Jamestown* for the proposition that the agency must find "some actual necessity or compelling reason" to prescribe a reciprocal switching agreement. At the same time, the ICC indicated the potential benefits of competition are not merely something convenient or desirable to a petitioner, as those benefits are normally presumed to be in the public interest. *Del. & Hudson,* 367 I.C.C. at 723. The ICC prescribed a reciprocal switching agreement in *Delaware & Hudson* based on these benefits plus the expansion of shipping options to customers in the terminal area and the lack of substantial harm to the complaining carrier. *Id.* at 723–24, 726.

In contrast, the ICC did not make the findings that AAR asserts are necessary pre-conditions to prescription of a reciprocal switching agreement. The ICC did not examine whether customers had a compelling need for the prescription as evidenced by regulatory determinations that customers had experienced consistently inadequate service or that the inadequacy persisted. The ICC did not examine whether customers' businesses had been harmed by existing service and whether any such harm was proportionally greater than harm to other customers. Finally, the ICC did not examine whether an inadequacy in service would be cured by alternate rail service. If anything, part 1145 is more conservative than the ICC's approach in *Delaware & Hudson* given that, under part 1145, prescription of a reciprocal switching agreement is available only if the incumbent carrier failed a performance standard and the other conditions to a prescription under part 1145 were met.[3]

[3] The approach and goals in part 1147 of the Board's regulations differ from those in part 1145 as well as from those in part 1144 of the Board's regulations. Part 1147 ("Temporary Relief Under 49 U.S.C. 10705 and 11102 for Service Inadequacies") was issued in conjunction with the Board's issuance of regulations on emergency service orders in 1998. Part 1147 was designed to create a regulatory option to address a service-based issue that was longer-term than an emergency service order (and distinct from the permanent prescription of access to an alternate carrier as provided for in part 1144). Part 1147 was designed specifically to replace an incumbent carrier for the duration of a service inadequacy. *See Expedited Relief for Serv. Inadequacies,* 3 S.T.B. 968 (1998), 63 FR 71396, 71396–97 (published Dec. 28, 1998). Therefore, part

Continued

All that remains of carriers' legal argument is an unremarkable statement in the legislative history that the ''practicable and in the public interest'' standard in section 11102(c) is ''the same standard the Commission has applied for many years in considering whether to order the joint use of terminal facilities.'' *See* H.R. Rep. No. 1430 at 116; *see also* 125 Cong. Rec. 15309, 15319 (1979). Without support, carriers contend that this general statement implies a host of restrictions on the Board's statutory authority. Properly understood, however, the statement merely points out a parallel between section 11102(a) on terminal trackage rights and section 11102(c) on reciprocal switching: both provisions use the ''practicable and in the public interest'' standard. Nothing in Congress's mere observation of that parallel suggests that henceforth, in implementing the public interest standard, the agency was to be bound by policy decisions or approaches that the agency had adopted in the past.

Rail carriers' interpretation of the ''same standard'' language fails on another level. Carriers imply that Congress meant to equate the public interest standard with the ''compelling need'' that the ICC looked for in *Jamestown,* even though neither the statutory text nor the legislative history includes any reference to a compelling need or to *Jamestown.* In fact, the ICC's inquiry in *Jamestown* grew out of the peculiar facts of that case; in other pre-Staggers cases in which the ICC applied the public interest standard, the ICC said nothing about a compelling need. *See, e.g., Seaboard Air Line R.R.—Terminal Facilities of Fla. E. Coast Ry.,* 327 I.C.C. 1, 7–8 (1965) (finding that the proposed service arrangement was in the public interest based on anticipated operating efficiencies, without reference to whether there was a compelling need for the arrangement).

Finally, even if a compelling need were required under the public interest standard in section 11102(c), a prescription under part 1145 would meet that standard. Part 1145 promotes adequate rail service both by introducing an alternate rail carrier via an appropriately defined and scoped reciprocal switching agreement when there have been sufficient indications of service issues (without the establishment of an affirmative defense or undue impairment) and by more broadly creating an incentive for rail carriers to provide adequate service. This approach—both for individual cases and at a broader systemic level—will help to mitigate the substantial harm that inadequate rail service imposes on the national economy. *NPRM,* 88 FR at 63900. At the same time and as noted throughout this decision, the Final Rule contains numerous protections against undue impairment, infeasibility, and operational impairment, including about carriers' investments and the ability to raise capital to the extent that results in undue impairment or an inability to serve other shippers. *See* Analytical Justification. Part 1145 further promotes adequate rail service by providing a clearer path to a prescription under section 11102(c), whereas carriers' approach would impose undue barriers.

Intermodal Competition

Carriers erroneously assert that, as a condition to prescribing a reciprocal switching agreement, the Board must find that the petitioner lacks an adequate option via another mode of transportation. (*See, e.g.,* AAR Comments 78–79; BNSF Comments 14–15.) Neither the text of section 11102(c) nor the legislative history suggests that the Board's discretion to prescribe a reciprocal switching agreement is limited to where there is an absence of intermodal competition.[4] *See Del. & Hudson Ry.* v. *Consol. Rail Corp.,* 366 I.C.C. 845, 854 (1982), *affirmed,* 367 I.C.C. at 727 (finding that the agency's authority to prescribe a reciprocal switching agreement is not limited to where there is an absence of intermodal competition). The presence or absence of intermodal competition might be relevant for purposes of part 1144, given that part 1144 seeks to remedy or prevent an act that is contrary to the competition policies of section 10101 or is otherwise anticompetitive. In that context, a finding of intermodal competition might inform whether the incumbent carrier could have abused market power for purposes of part 1144. *See Midtec Paper Corp.* v. *United States,* 857 F.2d at 1513. As is well established, though, part 1144 does not reflect the full breadth of the Board's discretion under section 11102(c). The statute itself does not require a finding of conduct that is anticompetitive or contrary to the competition policies of section 10101, much less a finding that the incumbent carrier holds or abused market power. *See also* 49 CFR part 1147 (providing for a prescription without regard to whether the incumbent carrier holds or abused market power).

Here, there is no need either to find that the petitioner lacks an intermodal option or that the incumbent carrier holds or abused market power in serving the petitioner. To require those findings would be inconsistent with the specific concerns that the Board seeks to address through part 1145. The types of service-related problems that part 1145 seeks to address—insufficient reliability and excessive transit times—might reflect an abuse of market power vis-à-vis the petitioner but might also reflect broader management or operating decisions that are not well directed toward the development of a sound rail system. Part 1145 creates an incentive to avoid service issues, to the benefit of the rail system at large, by providing for the introduction of an alternate carrier in individual cases as would enable the shipper to choose a more efficient and responsive rail carrier.[5]

The Ratification Doctrine Does Not Preclude Adoption of Part 1145

CPKC's ratification argument—that, by not acting on legislative proposals after *Midtec Paper Corp.* v. *United States,* Congress mandated a narrow

1147 calls for the Board to (1) examine whether there has been a substantial, measurable deterioration or other demonstrated inadequacy in the incumbent carrier's service, and (2) consider whether another rail carrier is committed to providing alternate service. *See* 49 CFR 1147.1(a), (b)(iii).

While part 1147 is thus similar in some respects to the approach that AAR advocates here, part 1147 does not require several findings that AAR claims are required by statute. As examples, part 1147 does not require a finding of disproportionate harm to the petitioner or a finding that service to the petitioner is worse than service to other customers. But more importantly, as discussed above, none of part 1147, part 1144, and part 1145 seeks to define the absolute limits of the Board's discretion in implementing section 11102(c). The approach under each regulation is designed to address a specific concern; each approach reflects a particular prioritization or balancing of legislative objectives as reasonably appropriate to addressing the specific concern at hand. *See Midtec Paper Corp.* v. *United States,* 857 F.2d at 1497, 1500. The range of approaches across the Board's regulations and the case law underscores AAR's error in asserting that, by law, the Board's discretion to advance the public interest through section 11102(c) is limited to the overly restrictive approach that AAR advocates.

[4] The absence of a requirement in section 11102(c) to consider intermodal competition stands in contrast to other sections where Congress has expressly required the Board to consider intermodal competition. *See, e.g.,* 49 U.S.C. 10707 (requiring the Board to consider competition from other rail carriers and other modes of transportation when making market dominance determinations).

[5] It is beyond the scope of this proceeding to address whether, for the duration of a reciprocal switching agreement under part 1145, a carrier that served the petitioner necessarily would lack market dominance within the meaning of section 10707 and therefore would not be subject to rate review with respect to that carrier's line-haul rate to the petitioner. (*See, e.g.,* BNSF Reply 16; Coal. Ass'ns Comments 60; Coal. Ass'ns Reply 22–23.) The question of market dominance could be presented for consideration on a case-by-case basis, under the standards in section 10707, in the context of any challenge to the relevant line-haul rate.

interpretation of section 11102, (*see* CPKC Reply 5 n.2)—is unfounded. First, CPKC mischaracterizes the D.C. Circuit's decision in *Midtec Paper Corp.* v. *United States.* When the court suggested that Congress did not envision a radical restructuring of the rail sector, *see* 857 F.2d at 1507, the court did not suggest that the agency's discretion under the statute was limited to application of the standards in part 1144. To the contrary, the court noted that, through part 1144, *the agency* had narrowed its discretion. *Id.* at 1500; *see also Balt. Gas & Elec.,* 817 F.2d at 115 (leaving open the question whether a broader approach to implementing the agency's reciprocal switching authority would meet the objectives of the Staggers Act). CPKC's vague assertion that *Midtec Paper Corp.* v. *United States* confirmed ''the limited scope of the statute'' ignores the court's actual language.

Second, as relevant to part 1145, no reasonable inference can be drawn from legislative inaction on bills that were introduced after *Midtec Paper Corp.* v. *United States.* To find that Congress ratified or acquiesced to the interpretation of a statute, there must be *overwhelming* evidence that Congress considered and rejected the *precise* issue at hand. *See Rapanos* v. *United States,* 547 U.S. 715, 750 (2016). CPKC has failed to meet that burden, offering nothing to suggest that Congress has ever considered much less rejected an approach similar to the approach in part 1145. The inability to draw any relevant inference from legislative inaction after *Midtec Paper Corp.* v. *United States* is underscored by the lack of connection between part 1145 and the concern that the D.C. Circuit identified in *Midtec Paper Corp.* v. *United States.* Under part 1145, a prescription is not warranted merely by the fact that the petitioner has direct physical access to only one Class I carrier. A time-limited prescription would not be issued under part 1145 unless the shipper is only served by one Class I carrier, only in a terminal area, and only after the carrier failed to meet one of three performance standards, no affirmative defenses were established, and infeasibility or undue impairment were not demonstrated. The fact that part 1145 does not implicate the D.C. Circuit's concern about a radical restructuring further undermines CPKC's dubious theory that, by not acting after *Midtec Paper Corp.* v. *United States,* Congress precluded the approach in part 1145.

Finally, it would be unreasonable to conclude that—through inaction, with no indication of legislative intent—Congress reversed its affirmative decision to grant the agency broad authority to prescribe reciprocal switching agreements. If anything, Congress' reenactment of the public interest standard in section 11102(c) confirms the agency's broad authority in this context. *See Reciprocal Switching* (*2016 NPRM*), Docket No. EP 711 (Sub-No. 1) slip op. at 11–13 (STB served July 27, 2016), 81 FR 51149 (published Aug. 3, 2016).

Analytical Justification

Class I rail carriers suggest that the Board has failed to adequately support promulgation of part 1145. First, the carriers suggest that the Board must go farther than it does in analyzing the effects that the rule might bring about. Second, the carriers suggest that the levels of the performance standards in part 1145 are not adequately supported by record evidence. The following discussion addresses each argument in turn, explaining why each lacks merit.

Scope of Analysis

Comments

AAR asserts that, under principles of reasoned decision making, the Board must assess the cumulative advantages and disadvantages of promulgating part 1145 and must find that the advantages outweigh the disadvantages, even if the Board would later consider advantages and disadvantages in applying the rule on a case-by-case basis. (*See* AAR Comments 113–15 (citing *Michigan* v. *EPA,* 576 U.S. 743, 753 (2015)).)

AAR then directs a broad challenge at any rule that provides for the prescription of reciprocal switching agreements, without regard to the specific provisions of that rule. (*See* AAR Comments 113–15.) According to AAR, the promulgation of any such rule would create numerous disadvantages. First, in AAR's view, any expansion of ''forced switching'' would directly impair investment by increasing operational burdens, reducing resiliency, increasing costs, and reducing profits. (*Id.* at 115–21.) Second, in AAR's view, so-called ''sweeping'' switching requirements would distort the market for transportation service, in contradiction of congressional policy to achieve sound economics in transportation. AAR states that, where switching is economically efficient, it is likely to occur voluntarily. (*Id.* at 116–19, 123; *id.,* V.S. Orszag & Eilat at 14 (market distortions could result from regulatory intervention where there has been no demonstration of a deviation from efficient market outcomes); *see also* AAR Comments 9, 24–25 (asserting that, under part 1145, shippers could seek prescription of a reciprocal switching agreement, not because they needed alternate service, but as a means to extract rate concessions at others' expense).)

Third, in AAR's view, sweeping switching requirements would undermine the use of differential pricing, which AAR characterizes as critical to the health of the rail network. (*Id.* at 122 (citing *Pet. For Rulemaking to Adopt Revised Competitive Switching Rules* (*2012 Rulemaking*), EP 711, slip op. at 7 (STB served July 25, 2012)).) Additional disadvantages alleged by AAR include inefficient routing, increased congestion, environmental costs that are associated with increased use of fuel and emissions, train delays, higher risk of service failure due to increased ''touches,'' depressed incentives for future investment with resulting reductions in the quality of service, operational inefficiencies, safety risks, and threats to carriers' ability to recover the costs of their entire networks and to maintain financial viability. (AAR Comments 113.)

While naming a litany of alleged disadvantages, AAR asserts that provision for the prescription of reciprocal switching agreements would provide no public benefit. AAR suggests that the only benefit would be any benefit that accrued to the successful petitioner and that this benefit would impose burdens on others—for example, by causing disruptions or inefficiencies in rail service on a system-wide basis. (*Id.* at 119.)

AAR suggests that the alleged disadvantages of promulgating part 1145 can to some extent be quantified. (*Id.* at 114.) According to AAR, the Board has recognized the need for data-driven rulemaking. (*Id.* (citing *2012 Rulemaking,* EP 711).)

The Board's Assessment

The Board has engaged in reasoned decision-making, and AAR's arguments to the contrary lack merit. First, AAR mischaracterizes the standard for reasoned decision-making that applies in the present context. Second, the disadvantages that AAR alleges in connection with promulgation of part 1145 do not reflect the actual regulation.

AAR Mischaracterizes the Applicable Standard

An agency engages in reasoned decision making under the Administrative Procedure Act, 5 U.S.C. 551–559, when the agency reaches a logical conclusion based on relevant factors. *Motor Vehicle Mfrs. Ass'n* v. *State Farm Mut. Auto. Ins. Co.,* 463 U.S. 29, 42–43 (1983). The factors that the

agency must consider are defined by the governing statute. *See Michigan* v. *EPA,* 576 U.S. 743. As discussed above, the relevant factors in implementing section 11102(c) are the RTP factors, which the Board has weighed as discussed in Legal Framework.

AAR errs in suggesting that, under *Michigan* v. *EPA,* the Board must go farther than it does in addressing the impact of part 1145. In *Michigan* v. *EPA,* the EPA decided to subject power plants to certain minimum, regulatory standards under the Clean Air Act. The Court found that, under the ''appropriate and necessary'' standard in the Clean Air Act, the EPA should have considered what it would cost power plants to comply with the regulatory standards in question. The Court reasoned that, within the statutory framework, the ''appropriate and necessary'' standard was properly interpreted as calling for consideration of the cost of compliance. The Court relied in this respect on the fact that related provisions of the Act expressly directed the EPA to consider the cost of compliance. *Michigan* v. *EPA,* 576 U.S. at 749–54. The Court's assessment of the factors that the EPA needed to consider rested specifically on the relevant provisions of the Clean Air Act. *Id.*

Michigan v. *EPA* therefore does not suggest that other agencies, in implementing other statutory provisions, must consider the same factors. *See Env't Comm. of Fla.* v. *EPA,* 94 F.4th 77, 97–98 (D.C. Cir. 2024). Of equal significance, *Michigan* v. *EPA* left in place the principle that agencies have broad discretion in *how* to consider relevant factors.[6] Even in *Michigan* v. *EPA,* where the Court held that the agency must consider quantifiable costs, the Court declined to hold that the EPA must conduct a particular type of cost-based analysis: ''It will be up to the Agency to decide (as always, within the limits of reasonable interpretation) how to account for costs.'' *Michigan* v. *EPA,* 576 U.S. at 759. Here, neither section 11102(c) nor any related statutory provision indicates that the Board must undertake a particular form of analysis when implementing section 11102(c).

Michigan v. *EPA* likewise does not suggest that the Board must speculate on the cumulative impacts of part 1145. As noted above, part 1145 establishes a framework for case-by-case consideration of the ''practicable and in the public interest'' standard in section 11102(c) in the context of a petition for prescription of a reciprocal switching agreement. While the Board expects that the number of petitions under part 1145 will not be significant, the actual number will depend on factors that the Board cannot now predict—factors that, among other things, will include rail carriers' management and operating decisions. Whether the Board grants a given petition will also depend on factors that the Board cannot now predict, such as whether the incumbent carrier had an affirmative defense and whether the carriers could demonstrate undue impairment as provided for under part 1145. Unlike part 1145, the regulatory scheme in *Michigan* v. *EPA* did not involve case-by-case consideration. The future action that the EPA contemplated would have imposed more stringent standards on power plants, beyond the minimum standards that resulted from the EPA's original decision to regulate. *Michigan* v. *EPA,* 576 U.S. at 756–57. *Michigan* v. *EPA* therefore does not suggest that—when a rule establishes requirements that will be implemented only on a case-by-case basis, and when the outcomes in individual cases will turn on variable facts that the agency cannot reasonably predict—the agency must nevertheless speculate on outcomes as a condition to promulgating the rule. In any event, as discussed in Legal Framework, the Board has considered the many positive impacts this regulation will have on the incentive for carriers to provide adequate service and the concerns that may arise from particular switching orders. The Board has found that the qualitative advantages of part 1145 under the RTP outweigh those concerns and, in reaching this conclusion, has appropriately considered the relevant factors.

AAR's reliance on the *2012 Rulemaking*—for the proposition that the Board should conduct a more data-driven analysis here—is similarly unpersuasive. Pending before the Board at that time was a proposal by the National Industrial Transportation League (NITL). NITL's proposal was to provide, by rule, for the prescription of a reciprocal switching agreement when four conditions were met: (1) the shipper was served by a single Class I rail carrier; (2) there was no effective intermodal or intramodal competition for the relevant line-haul movement; (3) there was or could be ''a working interchange'' within a ''reasonable distance'' of the shipper's facility; and (4) switching would be safe and feasible, with no adverse effect on existing service. The proposal would have established conclusive presumptions for when the second and third elements of the four-part test were met. For example, the Board would conclusively presume that there was no effective intermodal or intramodal competition for a movement if the incumbent carrier's associated revenues exceeded its variable costs by a given ratio or if the incumbent carrier had handled a given amount of the relevant traffic. *See 2012 Rulemaking,* EP 711, slip. op. at 4.

The Board found that these conclusive presumptions would tend to make only certain types of shippers eligible for a prescription and, indeed, would result more or less automatically in prescriptions on behalf of those shippers. *Id.* The Board expressed concern that—if those shippers obtained lower rates on a widespread basis, due to the widespread prescription of reciprocal switching agreements on their behalf—then other shippers (those that remained captive) might bear an excessive portion of system costs. *Id.* at 7. The Board therefore sought empirical evidence on three impacts of NITL's proposal: (1) the impact on rates and service for qualifying shippers; (2) the impact on rates and service for captive shippers that would not qualify; and (3) the impacts on the financial condition of the rail industry and on the efficiency of the industry's operations. *Id.* at 2.

In 2016, the Board rejected NITL's proposal, concluding that the proposal would unduly favor certain shippers. The Board decided, as part of the same decision, to propose a different approach to reciprocal switching—an approach that, rather than relying on conclusive presumptions, left the prescription of reciprocal switching agreements almost entirely to case-by-case basis evaluation. *See 2016 NPRM,* EP 711 et al., slip. op. at 13–15, 16, 20. Given the difference in the approach in the 2016 proposal, the Board did not call for empirical evidence on the impact of that proposal.

The Board called for a particular type of analysis in considering NITL's proposal because, due to the nature of the proposal, it seemed likely that the proposal would have a discernible and predictable impact on rates and service. The Board did not call for a comparable analysis in considering the 2016 proposal, which left implementation almost entirely to the Board's discretion on a case-by-case basis. It would have been impractical, in that context, to attempt to predict the impact of the proposal on rates or service. Part 1145

[6] *See Stilwell* v. *Off. of Thrift Supervision,* 569 F.3d 516, 519 (D.C. Cir. 2009) (''The [Administrative Procedure Act] imposes no general obligation on agencies to produce empirical evidence.''); *Sacora* v. *Thomas,* 628 F.3d 1059, 1067 (9th Cir. 2010) (an agency is entitled to rely on its own expertise in promulgating a regulation); *see also Northport Health Servs. of Ark.* v. *U.S. Dep't of Health & Hum. Servs.,* 14 F.4th 856, 874 (8th Cir. 2021) (an agency is entitled to rely on anecdotal evidence in promulgating a regulation).

is like the 2016 proposal in this sense. Under part 1145, the Board will prescribe a reciprocal switching agreement only on a case-by-case basis and only upon making specific determinations under the ''practicable and in the public interest'' standard.

AAR Mischaracterizes the Impact of Part 1145

The Board finds unpersuasive AAR's claim that promulgation of part 1145 would impose significant disadvantages. AAR's list of alleged disadvantages is notably directed at *any* regulation that the Board might promulgate on reciprocal switching, no matter what standards the Board established through that regulation. (*See* AAR Comments 113.) On that level alone, AAR's list of alleged disadvantages is flawed as a basis for challenging promulgation of part 1145; AAR has failed to establish a sufficient nexus between its list of alleged disadvantages and promulgation of part 1145.

Of particular note, a prescription under part 1145 would not ''force'' the incumbent carrier to relinquish the petitioner's shipment to another rail carrier. A prescription under part 1145 would merely establish the legal foundation for the petitioner's shipment to be transferred to the other rail carrier should the shipper elect to take service from that carrier. Whether a transfer actually occurred would be determined by the petitioner, who could choose between competitive options—the services of the incumbent railroad and those of the alternate carrier. Within this regulatory scheme, particularly in light of the numerous protections in the rule, a carrier that desires more certainty, for example with respect to its capital investment decisions, can ensure that it provides high level service, can negotiate suitable contracts when appropriate, and can otherwise work with its customers to avoid regulatory intervention under part 1145.

Nor will part 1145 result in ''sweeping switching requirements,'' given numerous limitations that are built into part 1145. First, under part 1145, the Board will prescribe a reciprocal switching agreement only on behalf of a shipper or receiver that is served by a single Class I rail carrier (or affiliate), only in a terminal area, and only after the incumbent carrier failed to meet one of three performance standards. Second, a prescription would not be available under part 1145 for movements that occur under valid transportation contracts or for movements of exempt commodities. As explained below, a shipper of an exempt commodity would need to obtain revocation of the exemption before obtaining prescription of a reciprocal switching agreement under part 1145. *See* Contract Traffic and Exempt Traffic. As a result of these limitations, only a relatively small portion of all Class I movements are even potentially eligible for a prescription under part 1145. *See* ''Freight Rail Pricing,'' Report to Congressional Committees by the U.S. Government Accountability Office, GAO–17–166 at 5 (December 2016). Third, under part 1145, the Board will not prescribe a reciprocal switching agreement when there is demonstrated infeasibility or undue impairment to a carrier's operation or ability to serve other customers as provided for in part 1145. Fourth, a reciprocal switching agreement that is prescribed under part 1145 would remain in place after its initial duration only to the extent that the carrier failed to meet standards for termination or chose not to seek termination. Fifth, the rule allows incumbent carriers to offer affirmative defenses regarding a failure to meet a performance standard. It not only specifically enumerates multiple affirmative defenses but also allows a carrier to offer additional affirmative defenses on a case-by-case basis. In all, due to the reasonably tailored approach in part 1145, there is no basis to assume that part 1145 will lead to significant adverse overall impacts.

Besides lacking a sufficient nexus to part 1145, AAR's list is flawed on another fundamental level. Underlying the list is a mischaracterization of the nature of reciprocal switching. Under the proper characterization, reciprocal switching is merely an incidental movement to the line-haul movement. When a customer chooses to rely on a reciprocal switching agreement, the incumbent carrier simply moves the customer's shipment to/from the alternate carrier's switching yard for the customer's terminal area rather than to/from the incumbent's yard for that terminal area. These types of movements are routine in the rail industry and are governed by applicable safety and related regulations. In addition, as described throughout this decision, part 1145 includes protections against infeasibility and undue operational impairment. Any change in fuel use or emissions would be minimal; shippers have incentives to select the route that is overall most efficient, which may often be the route that is most fuel efficient. (*See* AAR Comments, 113–21; *id.,* V.S. Orszag & Eilat at 15–17.) By extension, given that an individual prescription is unlikely to impose adverse impacts in these respects, it is unlikely that promulgation of part 1145 will impose meaningful cumulative, adverse impacts in these respects.

The protections that are built into part 1145 also will allow carriers to raise concerns about investments and the ability to attract capital (*see id.,* V.S. Orszag & Eilat at 6), in that the Board would consider arguments in individual cases that a proposed prescription would impair investments to the point of unduly impairing operations or the ability to serve other customers. Limited eligibility under part 1145 (for example, the fact that a prescription would be available under part 1145 only for points of origin or final destination in a terminal area) also protects against substantial, cumulative adverse impacts on carriers' revenues, ability to attract capital, and ability to engage in differential pricing.

Finally, the Board disagrees that the introduction of an alternate rail carrier under this framework, especially when there are sufficient indications that sub-optimal service was provided, could substantially distort the market. (*See, e.g.,* AAR Comments, V.S. Orszag & Eilat at 10 (suggesting that the Board's intervention when service dips below a certain threshold level could result in market distortions); *id.* at 14 (''Cases in which switching has not happened by voluntary agreement require an explanation for why that is the case if switching is indeed the operationally and economically efficient outcome.''); AAR Comments 123.) A voluntary agreement between carriers to transfer a shipment from one carrier to another might enable the carriers to maximize their profits, but that outcome does not necessarily determine whether the carriers have made efficient investment and operating decisions from the perspective of the rail network as a whole.

Levels of the Performance Standards

Part 1145 relies on conservative performance standards—standards that are set below common service expectations and goals—as indicators of where it might be beneficial, consistent with the purposes of part 1145, to introduce an alternate rail carrier via an appropriately defined and scoped reciprocal switching agreement. As described in the *NPRM,* 88 FR at 63900, the Board has used two points of reference in setting the levels of the performance standards in part 1145. The first point of reference is customers' service expectations. Through public hearings in early 2022 and through numerous ''ex parte'' meetings since then, the Board has collected extensive

information about customers' service expectations. *See, e.g.,* Hr'g Tr. 64:5 to 64:9, Apr. 26, 2022, *Urgent Issues in Freight Rail Serv.,* EP 770; Ex Parte Mtg. Summary, Mar. 31, 2022, *Reciprocal Switching,* EP 711 (Sub–No. 1). The record shows that, when customers expressed heightened concern about carriers' performance, carriers' performance was falling dramatically.[7] There is also significant consistency among customers in their service expectations.[8] These factors provide sufficient confidence in the context of part 1145, given its specific design and purposes, that the service expectations that customers have identified in these proceedings generally reflect a level of rail service that is needed for customers to conduct their businesses on a reasonably efficient basis. While the performance standards in part 1145 are set with reference to customers' service expectations, the standards are set at or below the level of service that many customers have said is needed to avoid serious disruptions in their operations. A carrier's failure to meet one or more of the performance standards therefore is strongly indicative that the introduction of another carrier (which would allow market forces to address those concerns, subject to appropriate protections) could be beneficial.

The Board's second point of reference in setting the levels of the performance standards is the evidence that the Board collected in 2022 and 2023 in reviewing the performance of Class I rail carriers. That evidence corroborates the service expectation levels that are suggested by customers. The Board began its recent service oversight during the early 2020s, when it was widely recognized that delays and other deficiencies in the transportation of freight were substantially impairing the national economy.[9] Due to the pervasiveness of poor rail service, testimony during a public hearing in March 2022—a hearing in Docket No. EP 711 (Sub–No. 1) that was meant to explore competitive access on a more general level—often turned to customers' need for better service. *See, e.g.,* Hr'g Tr. 105:4 to 105:17, Mar. 15, 2022, *Reciprocal Switching,* EP 711 (Sub–No. 1) et al. At roughly the same time as that hearing, the Board received several reports—including from the Secretary of Agriculture, U.S. Senator Shelley Moore Capito, and stakeholders—about the serious impact that poor service was having on rail customers. *See Urgent Issues in Freight Rail Serv.,* EP 770, slip op. at 2 n.1 (STB served Apr. 7, 2022) (citing Honorable Thomas J. Vilsack, USDA Letter, Mar. 30, 2022, *Reciprocal Switching,* EP 711 (Sub–No. 1); Letter from Honorable Shelley Moore Capito, to Board Members Martin J. Oberman, Michelle A. Schultz, Patrick J. Fuchs, Robert E. Primus, & Karen J. Hedlund (Mar. 29, 2022), available at *www.stb.gov* (open tab ''News & Communications'' & select ''Non-Docketed Public Correspondence''); Letter from NGFA to Board Members Martin J. Oberman, Michelle A. Schultz, Patrick J. Fuchs, Robert E. Primus, & Karen J. Hedlund (Mar. 24, 2022), available at *www.stb.gov* (open tab ''News & Communications'' & select ''Non-Docketed Public Correspondence''); Letter from SMART–TD to Chairman Martin J. Oberman (Apr. 1, 2022), available at *www.stb.gov* (open tab ''News & Communications'' & select ''Non-Docketed Public Correspondence'')).

These concerns led the Board to establish a new docket, *Urgent Issues in Freight Rail Service,* Docket No. EP 770, and to hold a hearing in that docket in April 2022. Through that hearing and subsequent meetings, the Board sought to understand customers' need for service and to examine decisions by rail carriers that had contributed to carriers' failure to meet that need. *See Urgent Issues in Freight Rail Serv.,* EP 770 (STB served Apr. 7, 2022). Shortly after the April 2022 hearing, the Board began to collect data on Class I carriers' performances both in completing line hauls and in providing local service on a timely basis. *See Urgent Issues in Freight Rail Serv.—R.R. Reporting,* EP 770 (Sub–No. 1) (STB served May 6, 2022); *see also NPRM,* 88 FR at 63904.

The evidence that the Board collected reveals that Class I carriers' system-average performances varied significantly from time period to time period and from carrier to carrier during the early 2020s. *NPRM,* 88 FR at 63903–04, 63906. The evidence does more, though, than reveal carriers' faltering and erratic service during those years. It identifies the level of service that Class I carriers themselves set as their short-term performance goals to bring them out of the crisis period.[10] For example, the 70% reliability standard in part 1145 is set above the average level of Class I carriers' system-wide performances during the early 2020s yet generally below the carriers' own performance targets. This evidence reinforces the conclusion that the reliability standard is set at a modest level that balances the public interest in adequate rail service with a measured approach to regulatory intervention. Application of the reliability standard would provide a reasonable basis to conclude that intervention here—the prescription of an appropriately defined and scoped reciprocal switching agreement—could be beneficial (provided that the affected carriers did not demonstrate an affirmative defense, infeasibility, or undue impairment to their ability to serve other customers).

The same is true of the service consistency standard in part 1145. It is clear from the carriers' reports that a 20% increase in transit time can indicate the presence of significant service issues. In Docket No. EP 770 (Sub–No. 1), the Board required BNSF, CSXT, NSR, and UP to report a target system velocity for the period coming

[7] *See e.g.,* Hr'g Tr. 544:21 to 545:4, Apr. 27, 2022, *Urgent Issues in Freight Rail Serv.,* EP 770. The evidence underscores the critical need for improved rail service reliability. When the Board held its hearing in EP 770, CSXT and UP had 69% and 63% OETA for manifest traffic, respectively. *See* CSXT Performance Data at Row 163, May 18, 2022, and UP Performance Data at Row 182, May 18, 2022, available at *www.stb.gov/reports-data/railservice-data/.* In addition, according to 10–K filings made with the U.S. Securities and Exchange Commission (SEC), CSXT had carload trip plan compliance of 64% in the 2022 fiscal year, and UP had manifest/automotive car trip plan compliance of 59% in the 2022 fiscal year, but 71% in fiscal year 2020. These SEC filings are available at *www.sec.gov* (open tab ''Filings'', select ''Search for Company Filings'', and then select ''EDGAR full text search'').

[10] *See, e.g.,* BNSF Status Report, Interim Update 7, Dec. 2, 2022, *Urgent Issues in Freight Rail Serv.—R.R. Reporting,* EP 770 (Sub–No. 1) (Merchandise OTP = 65% and ISP (referred to as ''Local Service Performance'') = 91%); CSXT Status Report Interim Update 3, Dec. 2, 2022, *Urgent Issues in Freight Rail Serv.—R.R. Reporting,* EP 770 (Sub–No. 1) (Manifest TPC w/in 24 Hours = 82% and ISP/FMLM = 87%); NSR Status Report, Interim Update 5, Dec. 2, 2022, *Urgent Issues in Freight Rail Serv.—R.R. Reporting,* EP 770 (Sub–No. 1) (Merchandise TPC = 82% and ISP (referred to as Local Operating Plan Adherence) = 78%); and UP Status Report, Interim Update 4, Dec. 2, 2022, *Urgent Issues in Freight Rail Serv.—R.R. Reporting,* EP 770 (Sub–No. 1) (TPC Manifest = 70% and ISP (referred to as FMLM) = 91%). *See also NPRM,* 88 FR at 63901 (the carriers recognized that their performance during the early 2020s fell below reasonable service expectations).

out of the crisis of the early 2020s.[11] The data that the Board has collected on train speed informs the reasonableness of the service consistency standard, even though that standard measures increases in transit time rather than decreases in train speed.[12] For each carrier, a 20% drop from the carrier's target velocity [13] would correspond to service as bad as or worse than the carrier's service during what clearly were highly problematic periods on the network, as indicated by average train speeds that the carriers reported for those periods. *See United States Rail Service Issues—Performance Data Reporting,* EP 724 (Sub–No. 5) and data submitted to the Board pursuant to 49 CFR part 1250.[14] Even where velocity was reduced by less than 20% from the carrier's target velocity, the carriers recognized that the reduction in velocity imposed significant burdens on shippers.[15]

This evidence is corroborated by testimony of shippers in Docket No. EP 770, which shows that shippers were complaining about drops in velocity of less than 20% during the early 2020s.[16] When a shipper uses railcars that the shipper supplies itself, any significant reduction in the velocity of those cars through the system means that the cars are substantially less productive, resulting in adverse impacts on the shipper's costs, revenues, or both. *See, e.g.,* Hr'g Tr. 551:6 to 551:14, 568:12 to 569:9, Apr. 27, 2022, *Urgent Issues in Freight Rail Serv.,* EP 770. Shippers that rely on carrier-supplied cars may not have the same concern about fleet productivity but, as with other shippers, would still be impacted by the inventory cost of undelivered freight. A significant reduction in velocity might also be associated with reduced availability of carrier-supplied cars, to a shipper's detriment.

In all, record evidence indicates the conservative nature of the service consistency standard in part 1145, which reserves federal intervention for an increase in transit time of more than 20%. In the absence of a proven affirmative defense, such an increase in transit time provides sufficient indicia of service problems that are inconsistent with meeting customer and carrier expectations. In effect, such an increase points sufficiently to the potential value of introducing an additional line haul carrier.

To the extent that some commenters argue that the performance standards in part 1145 might be overinclusive, *i.e.,* counting as a ''failure'' service that would not prove to be inadequate in the market, the public interest is protected both by the provisions in part 1145 for consideration of factors that could work against a prescription and by the specific and limited nature of regulatory intervention under part 1145. Regulatory intervention—again, the prescription of an appropriately defined and scoped reciprocal switching agreement—would give the petitioner a service option when there is a factual predicate for concluding that intervention is warranted. Petitioners have the incentive to select, over the duration of the prescribed agreement, the more efficient and responsive carrier. To the extent that the performance standards might be underinclusive, counting as a ''pass'' service that would have proven to be inadequate in the market, the public interest is protected by the opportunity for the affected shipper or receiver to seek a prescription under the Board's other regulations. In all cases, the public interest is protected not only by the performance standards themselves, but also by the opportunity that carriers would have, on a case-by-case basis, to demonstrate an affirmative defense, infeasibility, or undue impairment to their ability to serve other customers. By ensuring that application of the performance standards is not the end of the inquiry, part 1145 precludes a prescription when sufficient countervailing public interest has been

[11] The target system velocities that the carriers reported are as follows: BNSF—Overall Velocity = 26 mph (BNSF Status Report, Interim Update 7, Dec. 2, 2022, *Urgent Issues in Freight Rail Serv.—R.R. Reporting*); CSXT—(STB LOR Velocity = 24.2 mph (CSXT Status Report Interim Update 3, Dec. 2, 2022, *Urgent Issues in Freight Rail Serv.—R.R. Reporting*); NSR—System Velocity = 22 mph (NSR Status Report, Interim Update 5, Dec. 2, 2022, *Urgent Issues in Freight Rail Serv.—R.R. Reporting*); and UP—Car Velocity = 207 (Status Report, Interim Update 4, Dec. 2, 2022, *Urgent Issues in Freight Rail Serv.—R.R. Reporting* (note that UP reports its velocity as measuring the average daily miles a car moves on UP's network)).

[12] Train speed is based on the time that it took a train to cover the distance *between* two terminals. *See* 49 CFR 1250.2(a)(1). A reduction in train speed means that the train sat idle for a longer time between terminals, without saying anything about how long the train sat idle at a terminal. In contrast, an increase in transit time could arise out of increased delays at a terminal and/or increased delays between terminals. It is reasonable to conclude therefore that, during periods when a carrier's average train speeds were reduced by a significant percentage, transit times over the carrier's system likely increased by the same percentage or a higher percentage.

[13] The Board recognizes these velocity figures are system averages, and it explains below how its service consistency standard accounts for variability across lanes.

[14] For example, a 20% drop for BNSF from its target would be 20.8 mph. The lowest average train speed BNSF has experienced since reporting began under 49 CFR part 1250 occurred in the March 29, 2019 reporting week with a system velocity of 22.3 mph. This was due to extreme flooding in the Midwest at that time. *See* ''Railroads' flood-ravaged Midwestern tracks trigger emergency declaration,'' Progressive Railroading (Mar. 21, 2019), *www.progressiverailroading.com/class_is/news/Railroads-flood-ravaged-Midwestern-tracks-trigger-FRA-emergency-declaration—57161.* Even during the service problems of the early 2020s, BNSF's lowest average train speed was 24 mph—a drop of only 7.69% from BNSF's target velocity. For CSXT, a 20% drop from its target would be 19.36 mph. The lowest average train speed CSXT has experienced since reporting began under 49 CFR part 1250 occurred in the August 16, 2017 reporting week with a system velocity of 18.4 mph. The Board held a hearing on CSXT's service issues at this time. *See Public Listening Session Regarding CSXT's Rail Serv. Issues,* EP 742 (STB served Aug. 24, 2017). A 20% drop for NSR from its target would be 17.6 mph. NSR had an average train speed of 17.6 mph in the November 5, 2021 reporting week and 17.0 mph in the November 24, 2021 reporting week. The 17.0 mph is the lowest recorded average train speed for NSR since reporting began. For UP, its average train speed was 24 mph for the reporting week of May 5, 2023. A 20% drop from UP from this level would be 19.2 mph. The lowest average train speed that UP has experienced since reporting began in under 49 CFR part 1250 occurred in the March 29, 2019 reporting week with a system velocity of 21.3 mph. As with BNSF, this low velocity was due to extreme flooding in the Midwest at that time. Even during the service problems of the early 2020s, UP's lowest average train speed was 22.8 mph—a drop of only about 5% from UP's target velocity. To access data filed pursuant to 49 CFR part 1250 visit *www.stb.gov/reports-data/rail-service-data/* (in table under ''Individual Carrier Performance Data'' select the individual railroad; then click the most current hyperlink; then filter by date, average train speed, and carrier).

[15] For example, during the week of April 15, 2022, UP had an average train speed of 22.8 mph—only 5% below UP's target of 24 mph. *See id.* During the Board's hearing in April 2022, UP acknowledged that even that reduction in velocity represented a failure to meet reasonable public demand. *See* testimony of Eric Gehringer VP of Operations at UP at the Apr. 27, 2022 Urgent Issues hearing and Testimony of Steve Bobb Chief Marketing Officer at BNSF Hr'g Tr. 805:8–813:19, and 813:11–17, Apr. 27, 2022, *Urgent Issues in Freight Rail Serv.,* EP 770 (''We know we are not currently meeting our customer's expectations. I want to reinforce our commitment to restoring network velocity so that we can deliver the quality of service our customers have come to expect, and position ourselves to grow with our customers, long-term.'') *See also* UP's 10–K filing with the SEC, which is available at *www.sec.gov* (open tab ''Filings'', select ''Search for Company Filings'', and then select ''EDGAR full text search'').

[16] At the April 2022 hearing in Docket No. EP 770, several shippers testified about the burdens associated with increased transit times. *See, e.g.,* Hr'g Tr. 73:7–13, Apr. 26, 2022, *Urgent Issues in Freight Rail Serv.,* EP 770 (Cargill testifying that rail service deterioration since the fourth quarter of 2021 resulted in a 15% increase in transit time for its private fleet); Hr'g Tr. 364:18 to 367:15, Apr. 26, 2022, *Urgent Issues in Freight Rail Serv.,* EP 770 (increased transit days resulting from rail service issues ''has had a huge financial impact'' on Molson Coors); Hr'g Tr. 551:6–8, Apr. 27, 2022, *Urgent Issues in Freight Rail Serv.,* EP 770 (NITL testifying that ''transit times in the first quarter this year have increased by 15% over pre-pandemic levels due to crew and power shortages''); Hr'g Tr. 558:12–18, Apr. 27, 2022, *Urgent Issues in Freight Rail Serv.,* EP 770 (ASLRRA testifying that, since the fourth quarter of 2020, one member company ''experienced significant deterioration in rail service'' including transit times that increased by six days and variability of transit that made it ''impossible for shippers to plan their business'').

demonstrated. In addition, as discussed in Legal Framework, the Board's paramount interest in establishing an expeditious process for addressing service-based reciprocal switching petitions and fostering a sound rail transportation system is best supported by a process that does not require protracted litigation.

Carriers' Objections

According to Class I rail carriers, the levels of the performance standards in part 1145 are not adequately supported by record evidence. The carriers allege several errors in this respect. First, according to AAR, the levels of the standards were inappropriately derived from data in Docket No. EP 770 (Sub–No. 1) that shows system-average performance. According to AAR, system-average performance does not necessarily indicate the level of performance that constitutes adequate service over a given lane or at a given time. (AAR Comments 46–50; *see also* CPKC Reply at 2, 8; R.V.S. Workman & Nelson at 19–23.) In addition, according to AAR, system-average performance does not distinguish between common carriage service and contract service. AAR suggests that this distinction is relevant because, according to AAR, contract customers might have agreed to different levels of service. (AAR Comments 9, 49–50; V.S. Orszag/Eilat 7, 21–24; *see also* CN Comments 5–6; CSXT Comments 14–15.)

Second, according to UP, it is inappropriate to rely on the data in Docket No. EP 770 (Sub–No. 1) because UP used one-week periods to measure its performance (*i.e.,* UP reported for each week the percentage of shipments that it delivered on time during that week). UP asserts that a carrier's level of performance over one-week periods cannot reasonably be used to extrapolate a reasonable level of performance over 12-week periods as provided for in part 1145. (UP Comments 4–5.)

Third, according to UP, it is problematic to base the levels of the performance standards on the data in Docket No. EP 770 (Sub–No. 1) because the carriers did not necessarily report their performance in the same way that compliance with the performance standards in part 1145 will be measured. For example, UP considered itself to have succeeded in completing a line haul on time if UP met its original trip plan as adjusted to account for delays encountered en route. In contrast, under part 1145, a rail carrier will be considered to have succeeded only if it came within 24 hours of the original estimated time of arrival, without adjustment for delays encountered en route. UP implies that, due to how carriers reported their performance in Docket No. EP 770 (Sub–No. 1), the data there overstates actual performance as compared to how performance will be measured under part 1145. (UP Comments 6.)

Finally, in its attempt to show that the performance standards in part 1145 are not adequately supported, AAR conducted a study of transit times. AAR submitted the study in its reply comments, as a result of which other parties did not have the opportunity to comment on the study. The study was based on transit times for all movements over Class I rail carriers from 2020 to 2023, with some exclusions. (AAR Reply, R.V.S. Baranowski & Zebrowski at 5–6.) The study purported to show that a year-over-year decrease in velocity of 20% would capture about 53.9% of the movements in 2020, about 76.6% of the movements in 2021, about 82.5% of the movements during 2022, and about 65.5% of the movements during 2023. (*Id.* at 7.) AAR concludes, based on its study, that it is typical for shipments to experience increases (and decreases) in transit time from one year to the next and that therefore the transit time standard does not capture only inadequate service. (*Id.* at 4–5.) AAR adds that its analysis showed no difference between consistency in serving captive customers and consistency in serving other customers. AAR concludes on that basis that the prescription of a reciprocal switching agreement would not necessarily cure an increase in transit time. (*Id.* at 5–6.)

The Board's Assessment

The Board rejects each of the foregoing arguments. First, contrary to carriers' suggestion, it is reasonable for system-average performance to inform the levels of the performance standards in part 1145. In the Board's experience, system-average performance is a strong indicator of the capability of the rail system to meet the public need for transportation service. While there is heterogeneity in lanes and traffic, and while variations can impact different geographies and businesses differently, the specific performance measurements under part 1145 largely factor in these differences. For example, the reliability standard in part 1145 is based on the estimated time of arrival that the carrier originally predicted. In setting the OETA, the carrier can account for the characteristics of the given lane (and, by extension, the characteristics of the shipper's traffic [17]) and likely delays. As a result, this type of measurement essentially controls for lane and traffic characteristics, so service over one lane is no more likely than service over another lane to fail the reliability standard. The consistency standard in part 1145 is based on how long it took the carrier to deliver the shipment over the same lane and over the same 12-week period during the previous year. This approach essentially controls for differences between service over a lane that has a longer-than-average transit time and service over other lanes.

A similar analysis applies to seasonal variations in rail service. For example, because a railroad can account for likely delays in setting OETA, service in one season is no more likely than service in another season to fail the reliability standard. In the case of an extreme weather-related event, that event could provide an affirmative defense to the extent that the event could not reasonably be predicted or mitigated. As for the fact that the system-wide data in Docket No. EP 770 (Sub–No. 1) included service to contract customers, the Board finds that detail to be irrelevant. In the Board's experience, most contracts do not establish standards for quality of service and, in any event, the EP 770 data does not establish whether carriers were providing service consistent with any contractual commitments that might have applied.

Second, contrary to UP's suggestion, it is reasonable to use system-average performance as reported for one-week periods as the basis for assessing performance over a 12-week period. The Board has accounted for any volatility that might have resulted from week-to-week reporting by using records of system-average performance over the course of several years and by relying heavily on customers' reasonable service expectations and carriers' performance targets.

Third, the ''apples to oranges'' problem that UP describes is both substantially overstated and ultimately irrelevant. As would be expected, in Docket No. EP 770 (Sub–No. 1), railroads that adjusted their original trip plans for delays that they encountered en route appeared to perform better than carriers that did not make those adjustments. The incremental difference between the two groups of rail carriers

[17] Under the definition of the term ''lane,'' the Board states that ''shipments of the same commodity that have the same point of origin and the same designated destination are deemed to travel over the same lane, regardless of which route(s) the rail carrier uses to move the shipments from origin to destination.'' 49 CFR 1145.1. Through this definition, the Board is eliminating potentially flawed comparisons between traffic of different characteristics (*e.g.,* differences by commodity) and between traffic with different origin-destination pairs.

tended to be fairly constant.[18] As a result, the Board can reasonably discern what system-average performance would have been across the industry if all carriers had reported their performance on the same basis.

Of equal importance are the details of the reliability standard in part 1145. A carrier would fail to meet the reliability standard only if, over a 12-week period, the carrier fell below 70% in meeting its OETA plus or minus 24 hours. The general range of the reliability standard recognizes that, in the ordinary course of rail service, a shipment might encounter a certain number of unanticipated delays en route. The specific percentage (70%) provides an additional cushion between ordinary service and the possibility of regulatory intervention, as suggested by the data that the Board collected in Docket No. EP 770 (Sub–No. 1)—data that was largely collected during the major service problems of the early 2020s. The Board reasonably expects that rail service in the ordinary course will be better than rail service during that period. The 24-hour grace period provides even more cushion. In effect, the reliability standard in part 1145 provides for regulatory intervention on a conservative basis. The 70% standard is not as conservative as the 60% standard that the Board inquired about in the *NPRM* but—in the Board's judgment, based on comments and further analysis—provides appropriate ground for considering whether to prescribe a reciprocal switching agreement. *See* Performance Standards.

Finally, AAR's study of transit times does not persuade the Board that the performance standards in part 1145 would capture typical rail service. One of the glaring deficiencies in AAR's study is that it compared transit times from year to year during the early 2020s, when rail service was faltering and erratic. It would be unreasonable to conclude that increases in transit times during that period reflected variations in transit times that might be expected in the ordinary course of rail operations; if the Board were to accept AAR's study, the Board would implicitly and unreasonably conclude that the years that AAR used in its study provide the proper baseline for assessing changes in transit time.

Performance Standards

Service Reliability: Original Estimated Time of Arrival

As discussed in the *NPRM,* the proposed service reliability standard would measure a Class I rail carrier's success in delivering a shipment near its OETA, *i.e.,* the estimated time of arrival that the rail carrier provided when the shipper tendered the bill of lading for shipment. *NPRM,* 88 FR at 63903. The OETA would be compared to when the car was delivered to the designated destination. *Id.* Application of the service reliability standard would be based on all shipments that the shipper tendered to the carrier over a given lane over 12 consecutive weeks. *Id.*[19]

Using data that Class I carriers provided in Docket No. EP 770 (Sub–No. 1) as a reasonable starting point, the agency proposed a reliability standard of 60%, where a carrier would meet the standard if, over a period of 12 consecutive weeks, the carrier delivered at least 60% of the relevant shipments within 24 hours of the OETA. *Id.* at 63903–04. The Board also suggested that the reliability standard could be set by rule to escalate one year after the rule took effect. *Id.* at 63904. The Board sought comment on the percentage at which the reliability standard should be set, what the applicable grace period should be, and other matters relevant to the reliability standard. *Id.* at 63903–04.

Reasonableness of Using OETA

CPKC questions whether OETA is a meaningful reference point. According to CPKC, nearly half of its shipments arrive a day or more after the OETA. CPKC claims that it is infeasible to try to provide a more accurate OETA because, according to CPKC, there are too many routine factors that contribute to variations from the company's original trip plan. (*See* CPKC Reply, R.V.S. Workman & Nelson 15–16.)

Contrary to CPKC's suggestion, it is reasonable to use OETA data over a 12-week period to provide indicia of the overall reliability of a carrier's service for purposes of part 1145. Rail carriers bring their considerable expertise to the task of developing OETAs. Carriers typically study the factors that affect transit time over a lane, account for those factors through seasonal or other appropriate tolerances, and apply those tolerances in setting OETAs. CPKC, which is the only carrier to question use of OETA, has failed to convince the Board that the company cannot adopt a similar approach.

OETA Percentage

Many shipper organizations ask the Board to set the reliability standard (when based on a 24-hour grace period) at more than 60%. For example, the Coalition Associations ask the Board to set the percentage at 70%. (Coal. Ass'ns Comments 22.) They claim that the 70% threshold is attainable, is more consistent with Class I carriers' own expectations of the quality of service that they should provide, and better reflects the threshold at which poor service reliability has significant operational consequences for rail customers. (*Id.* at 24.)

LyondellBasell urges the Board to adopt the 70% standard proposed by the Coalition Associations. (LyondellBasell Comments 2.) It asserts that the higher standard is more in line with the level of service customers require to conduct their business. (*Id.*) LyondellBasell notes that, when railroads fail to deliver shipments close to the OETA, it incurs: (1) increased costs from diverting traffic to other sub-optimal modes of transportation; (2) lack of products at distribution facilities, which in turn has required LyondellBasell to use inefficient distribution sites and means of transportation; and (3) reduced production rates, shutdowns, or both for its own and its customers' facilities. (*Id.*) Even at reliability levels at or above 70%, according to LyondellBasell, the company incurs a substantial burden on its operations. (*Id.*) For example, because most polymer plants produce materials coming off the production line directly into railcars as the storage receptacle, LyondellBasell will likely have already reduced its production rates at such polymer sites. (*Id.* at 2–3.)

Other shipper groups ask the Board either to set the reliability standard at more than 70% at the outset or eventually to escalate the standard to above 70%. (DCPC Comments 6–8 (80% in year 1 and 90% in year 2); NGFA

[18] For example, the Board observes a reasonably strong linear association between UP's reliability data and BNSF's reliability data as reported in Docket No. EP 770. UP and BNSF operate in similar geographical environments, with approximately the same route miles and employment levels. In reporting reliability, UP adjusted its estimated time of arrival to reflect delays that UP encountered en route when those delays were not caused by UP. (*See* UP Comments at 6.) BNSF did not do so. During 85 weeks of the reporting period (May 13, 2022 to December 22, 2023), there was a correlation of 0.55 between reliability data for UP and reliability data for BNSF. The magnitude of the difference between the two carriers was fairly constant after adjusting for natural shocks (such as weather-related incidents) that each carrier may individually have experienced; for 55 of the 85 weeks of the difference in the two carriers' reliability data fell within a 2.9% to 12.1% range. Overall, UP had 77 weeks of better performance than BNSF. The consistency of the difference indicates that the difference was due to the difference in how the two carriers reported their reliability data.

[19] Under part 1145, once a carrier has communicated an OETA to a customer, that time will not be changed to reflect any subsequent change to the original trip plan of the car, no matter the cause of that change. As a result, a carrier will be deemed to miss the OETA for cars that are delayed due to a cancelled or annulled train if cars are not delivered within 24 hours of the original estimated time of arrival.

Comments 12 (supports ''closer to 100%''); PRFBA Comments 7 (80%); GISCC Comments 5 (80%); AFPM Comments 8–9 (65% in year 1, 70% in year 2, 75% in year 3, and 80% in year 4).) API argues that the second-year standard should be set at 80% to 85% and that, even at higher levels of performance by rail carriers, there are adverse impacts on the public interest. (API Comments 3–4.) API adds that service levels affect labor decisions made by the shipper, and that late shipments result in lost production time; overtime labor; increased transportation costs, demurrage, administrative burden, storage costs, and private railcar fleets; and loss of business opportunities. (*Id.* at 4.) NSSGA and EMA, which seek a reliability standard of 80% or higher, claim that at 60% their members would need to curtail operations or ship by truck. (NSSGA Comments 6–7; EMA Comments 6.) EMA adds that, for some of its members, trucking is not an option at all. (EMA Comments 6.)

Railroads oppose the 60% reliability standard as well as any other reliability standard, arguing that there is insufficient record evidence to support such a standard. Railroads otherwise do not comment on the level at which the reliability standard should be set. As explained in the Analytical Justification section above, however, the Board has sufficient justification for setting its standards based on credible evidence of reasonable service expectations and evidence that the Board has collected since 2022 in investigating the performance of Class I rail carriers. AAR adds that what a customer perceives as service that best meets its individual ''needs and requirements'' may run counter to the interests of other shippers and the health of the overall network that serves many shippers. (AAR Reply 39.) According to AAR, a standard that bypasses consideration of other shippers or the network as a whole—or the question whether a switch would remedy the shipper's service concerns—would not be consistent with the approach Congress directed. (*Id.*)

The Board will set the reliability standard at 70%.[20] Although several shippers support a higher OETA standard based on the argument that it would be ''attainable'' by the railroads, that is not the basis for the Board's decision here. The reliability standard, like the other metrics, grows out of shippers' reasonable service expectations, carriers' performance records, and carriers' performance goals without specifically rendering judgment on the level of reliability that rail carriers might in theory attain. As discussed above, many shippers have commented that a reliability standard of 60% is too low, as service even above that level exposes shippers to significant problems, including increased costs and production delays. A number of shipper organizations indicate that their members are impacted by poor service even when the carrier provides service above 60% reliability (measured as OETA + 24 hours). For example, PRFBA explains:

> [T]hat 60%, and indeed even 70%, represent far too low a bar for service reliability. Under the proposed rule, even those carriers who meet the standard with 60% nearly on-time performance would force some PRFBA members to shut down their plants and still others frantically to seek out alternative transport by truck. There are not enough trucks or truck drivers to keep up with that demand, to say nothing of the greater expense passed onto the consumer and drastically greater polluting emissions caused by trucking goods as compared with rail shipping. Moreover, for some PRFBA members, trucking goods simply is not an option altogether. Also, all PRFBA members suffer from the underutilization of their railcars whenever service is poor.

(PRFBA Comments 6–7.)

The Board specifically requested that shippers identify the point at which there are negative business impacts from poor reliability in rail service, *see NPRM,* 88 FR at 63904, and the information provided by shippers supports a finding at this point that a 70% level of reliability is reasonable as a reflection of service expectations.

The 60% standard in the *NPRM* was also a conservative proposal. As the Board explained, much of the underlying Docket No. EP 770 (Sub–No. 1) data in the *NPRM* reflected a challenging service period. Indeed, overall on-time performance for BNSF, CSXT, NSR, and UP had fallen from a pre-pandemic average of 85% in May 2019 to just 67% in the last week of May 2022, as crew shortages plagued rail service. *See* Stephens, Bill, Data Reported to Federal Regulators Reveal Extent of Deterioration in Rail Service—Trains (June 9, 2022). The Board found that 60% was a reasonable potential starting point for determining the reliability standard because it reflected a level that even the carriers acknowledged was far below expectations, but the Board also proposed an alternate standard that would escalate to 70% one year after the effective date of the rule, reflecting the view that service during that challenging time might not be the appropriate long-term measure for service performance for purposes of part 1145. Not only is that view supported by shippers' comments detailing the negative impact of service even above the 60% reliability standard, Docket No. EP 770 (Sub–No. 1) data from last December does in fact show that carriers are performing better. Indeed, data for the week ending December 22, 2023, indicates overall on-time performance of the four carriers averaging 80.1%. *See Urgent Issues in Freight Rail Serv.—R.R. Reporting,* EP 770 (Sub–No. 1), slip op. at 4 (STB served Jan. 31, 2024). Considering this data, the comments from shippers about negative impacts to their businesses, and the overall framework in which failure to meet a service standard acts as a mechanism—with appropriate protections—for switching (as opposed to a different, more intrusive, or more severe form of regulatory intervention), a 70% standard is therefore reasonable.

A 70% standard is also consistent with railroads' stated, near-term performance goals as reported in Docket No. EP 770. As noted in the *NPRM,* BNSF, CSXT, NSR, and UP each identified a target for its systemwide weekly percentage of manifest railcars placed within 24 hours of OETA (as reported in Docket No. EP 770 (Sub–No. 1)) that the carrier would meet beginning May 2023, and these targets average approximately 74%. *NPRM,* 88 FR at 63903. The 70% reliability standard in the final rule remains below that average [as well as the average in more recent Docket No. EP 770 (Sub–No. 1) reports]. *See* Analytical Justification.

While the current record supports a finding that a reliability standard of 70% is reasonable, the Board declines at this time to set the reliability standard at a higher level or to provide by rule for escalation of that standard as requested by some shipper interests. The Board concludes that the better course of action is to gain experience under the 70% standard and gauge the effectiveness of part 1145 before considering whether to raise the standard above 70%.

Observation Period

Several shipper groups ask that a petitioner be allowed to rely on less than 12 weeks of data. (EMA Comments 6 (six weeks); PRFBA Comments 7 (six weeks); GPI Comments 3 (eight weeks); GISCC Comments 5 (four to six weeks).) According to NSSGA, which requests a six-week period, 12 weeks of bad service would have a ''devastating

[20] As discussed later in this decision, the 70% reliability standard will apply not only to cars that arrive more than 24 hours after the OETA but also those that arrive more than 24 hours *earlier* than the OETA.

impact'' on NSSGA members' operations. (NSSGA Comments 7.) Similarly, AFPM asserts that allowing poor service to continue for even six weeks would severely hurt refiners and petrochemical manufacturers, causing curtailments in output and even shutdowns. (AFPM Comments 9.) AAR responds that the record before the Board provides no basis to conclude that any of those changes would help the Board accurately and effectively identify situations where a service inadequacy exists and warrants regulatory intervention. (AAR Reply 41.) According to AAR, such changes would significantly complicate the proposed rule's operation and risk generating a large number of false positives. (*Id.*)

The Board will use an observation period of 12 weeks as proposed in the *NPRM.* Using a 12-week observation period means that the OETA standard will not be triggered by a service problem of relatively short duration, unless the problem is of such severity that it nevertheless results in failure to meet the 70% standard over the 12-week period. This approach will tend to reserve regulatory intervention under part 1145 for cases in which there had been a more chronic problem in serving the petitioner. A chronic but not necessarily acute problem is the type of problem that, compared to other types of service problems, is more likely to benefit from the introduction of rail-to-rail competition as provided for in part 1145. For acute service problems, shippers may seek relief under parts 1146 and 1147, without waiting for a 12-week observation period to end.

NSR recommends measuring performance under the reliability standard over quarters of the calendar year, rather than over a rolling 12-week period. According to NSR, using a rolling 12-week period would allow shippers to petition for a prescription based on performance that did not reflect the carrier's typical performance or indicate an ongoing service problem. (NSR Comments, V.S. Israel 3, 14; *see also* UP Comments 19 (encouraging an approach based on the last calendar quarter to mitigate the burden of data production).) The Board declines to adopt NSR's recommendation. To use quarters of the calendar year as the observation period would make the standard less likely to identify service for which the public interest would be served by introducing an alternate rail carrier (*e.g.,* a carrier could miss the OETA for 22 weeks and would not fail the standard if half of those weeks were in one quarter and the other half were in the next quarter).

The Definition of OETA

AAR notes that the definition of OETA in the *NPRM* differs from the definition of OETA in the demurrage setting and asserts that the definition in part 1145 should conform to the definition that is used for purposes of demurrage. (AAR Comments 51–52.) Under proposed § 1145.1, OETA is provided upon tender of a bill of lading. *NPRM,* 88 FR at 63912–13. For purposes of demurrage billing, OETA is provided after the shipment is physically released to the carrier or received by the carrier in interchange and is based on the first movement of the origin carrier. *See* 49 CFR 1333.4(d)(1). AAR claims that having two different definitions creates risk of confusion and would lead to duplicative efforts. (AAR Comments 51–52.) Individual railroads also call for OETA to be measured at time of release. (CN Comments 45; UP Comments 6.)

The Board will not change the definition of OETA under part 1145. The demurrage OETA definition, while appropriate for part 1333's ''minimum'' informational purposes, does not meet the goals of this rulemaking. As noted by the Coalition Associations, to use the OETA that is based on the carrier's first movement of the shipment rather than tender of the bill of lading would not capture a carrier's delay in picking up a car that had been tendered for shipment. (Coal. Ass'ns Reply 29.) And, if the carrier failed the reliability standard due to the shipper's delay in releasing the car, that could be raised as an affirmative defense. *See* Affirmative Defenses.

Delivery at Interchange

In the *NPRM,* the Board proposed that, in the case of interline service where the shipment is transferred between line-haul carriers at an interchange en route, the shipment is deemed to be delivered when the receiving carrier acknowledges receipt of that shipment. *NPRM,* 88 FR at 63904, 63912. Several commenters raised concerns with this approach.

CN asserts that this approach fails to account for cases in which the shipment arrived at the interchange but the receiving carrier is unable to accept the shipment. (CN Comments 48–49.) UP similarly asserts that a car should be deemed to be delivered upon ''delivery in interchange.'' According to UP, ''delivery in interchange'' occurs when a railroad moves the car past a designated automatic equipment identification reader or places the car on a designated interchange track, depending on the specific interchange that is involved. (UP Comments 7.) UP claims that a car can potentially sit on an interchange track for several days after delivery and before the subsequent carrier acknowledges receipt, when the matter is out of the delivering carrier's control. (*Id.; see also* API Comments 4 (suggesting that the gap between delivery and receipt can last for several hours).) The Coalition Associations respond that no carrier offers a practical solution to address concerns about a gap, but that AAR's own rules for assigning responsibility for car hire provide a clear and appropriate framework for determining when interchange occurs, including in situations where the receiving carrier causes an interchange delay. (Coal. Ass'ns Reply 43.)

The Board will define ''delivery'' at the interchange using UP's proposal. Although the Board suggested that in case of a dispute about a gap at the interchange it would be guided by interchange rules, *NPRM,* 88 FR at 63903, UP's approach is superior. While the car hire data is more accurate, it is more difficult to retrieve and can only be used after any disputes are resolved. In contrast, Delivery in Interchange data is routinely reported to the shipper on a real time basis. As such, based on UP's approach, a car will be deemed delivered at an interchange when it is moved past a designated automatic equipment identification reader or placed on a designated interchange track, depending on the specific interchange location involved. However, if there are disputes about the accuracy of a delivery time by either the customer or the receiving railroad, the Board can use car hire accounting records to decide the issue.

Delivery at Customer's Facility

For deliveries to a customer's facility, the Board proposed to define ''delivery'' as when a shipment either is actually placed at the designated destination or, in given circumstances, is constructively placed at a local yard that is convenient to the designated destination. *NPRM,* 88 FR at 63912.

UP notes that for traffic it delivers to customer facilities, UP's Trip Plan Compliance (TPC) measure for manifest traffic measures compliance based on when the car is delivered to the customer facility, regardless of whether it spends time in constructive placement. (UP Comments 8.) For ''order in'' customers—customers who by prior agreement have UP hold cars in serving yards pending the recipient's request for delivery—UP ''stops the clock'' during the time a car spends in constructive placement for purposes of measuring TPC. (*Id.*) If ''spot on arrival''

customers—customers with facilities where railcars may be placed without placement instructions—cannot accept delivery when their cars arrive, UP puts the cars into a hold status then adjusts the time of arrival under UP's trip plan when the car is released from that status. UP asserts that its calculation method reflects the customer's role in the delivery schedule and the full journey of the railcar. (*Id.*) UP asks that the Board conform to the railroad's practice. (*Id.*)

The Board will retain its approach from the *NPRM* and not adopt UP's proposal to define delivery as being at a customer's facility. The proposed definition of delivery takes into account both situations described by UP. For ''order in'' customers, the car would be ''delivered'' for purposes of OETA when the car is constructively placed at a local yard that is convenient to the designated destination, which is the time it arrives in the local serving yard and is ready for local service in accordance with the rail carrier's established protocol. *See NPRM,* 88 FR at 63903 n.17. The same would be true for ''spot on arrival'' customers that are not able to accept delivery at the designated destination. If the customer is not able to accept delivery, the car is ''delivered'' at the time it arrives in the local serving yard and is ready for local service in accordance with the rail carrier's established protocol. The Board recognizes that each carrier may currently define its trip plan compliance-like metric differently, but one of the objectives of this rule is to standardize the metrics that will be used for part 1145 so that they may be easily understood by shippers, carriers, the Board, and the public. The approach from the *NPRM* accomplishes this. *See also* Data Production to an Eligible Customer.

Unit Trains and Intercity Passenger Trains

The Board proposed to apply the reliability standard only to shipments that are moving in manifest service, not to unit trains. *NPRM,* 88 FR at 63904. The Board explained that, in its experience, deliveries of unit trains do not give rise to the same type of concerns with respect to meeting OETA. *Id.*

A number of shipper groups ask the Board to include unit trains. (API Comments 3; AFPM Comments 9 n.15; NSSGA Comments 7; *see also* FRCA/NCTA Comments 3.) NGFA disagrees that unit trains do not have the same need as manifest trains to be delivered on time. It adds that the failure of Class I carriers to deliver unit trains on time can result in significant harm to the shipper/receiver and the shipper's/receiver's customers. (NGFA Comments 12.)

The Coalition Associations recommend including unit trains and using a higher reliability standard (of 90%) for those trains. (Coal. Ass'ns Comments 31.) According to the Coalition Associations, a 90% standard would better reflect the nature of unit trains, which tend to go through few if any interchanges. (*Id.*) In addition, according to the Coalition Associations, a 90% reliability standard for unit trains would better reflect the fact that the early or late arrival of a unit train (which might consist of 80 or more cars) can have a proportionally greater adverse effect on the customer. (*Id.*)

The Board will not apply a reliability standard to unit trains for purposes of part 1145. Based on Board experience, while manifest traffic runs on scheduled trains, unit trains generally do not have schedules. They run at various, usually irregular times. And, although some railroads have trip plans based on the unique schedule for each unit train that are applied to each car on the train, CN, CSXT, and NSR do not currently produce trip plans for unit trains. (*See* CN Comments 44); *Urgent Issues in Freight R.R. Serv.—R.R. Reporting,* EP 770 (Sub–No. 1), slip op. 5 n.16, 6 n.19 (STB served Jan. 31, 2024). It would be unduly burdensome to require those carriers to produce trip plans (including an OETA) for unit trains for purposes of the reliability standard under part 1145, factoring in that problems with the delivery of unit trains can also be captured by the service consistency standard in part 1145.

One commenter asks the Board to apply the reliability standard to intercity passenger trains. (Ravnitzky Comments 1.) The performance of intercity passenger trains is beyond the scope of this proceeding. As proposed in the *NPRM,* part 1145 applies only to Class I freight carriers and their affiliates and provides only for the prescription of a reciprocal switching agreement, a regulatory action that would not be meaningful for intercity passenger trains. Regardless, other statutory provisions address on-time performance issues of intercity passenger trains. *See* 49 U.S.C. 24308(f); *Compl. & Pet. of Nat'l R.R. Passenger Corp. Under 49 U.S.C. § 24308(f)—for Substandard Performance of Amtrak Sunset Ltd. Trains 1 & 2,* NOR 42175, slip op. at 1 (STB served July 11, 2023).

Severity of Delay

The Coalition Associations suggest significant additions to the OETA + 24 hours model. They ask the Board to establish graduated reliability standards, where the standard would increase as the differential between the OETA and the time of delivery increased. Under the Coalition Associations' approach, the reliability standard would be set at 70% at OETA + 24 hours, 80% at OETA + 48 hours, and 90% at OETA + 72 hours. (Coal. Ass'ns Comments 4; *see also* ACD Comments 4.) The Coalition Associations also ask the Board to base the standards for the 24-, 48-, and 72-hour time bands on the average systemwide performance of all Class I carriers for those respective bands. (Coal. Ass'ns Comments 4.) According to the Coalition Associations, these standards would provide a strong incentive to railroads to achieve a reasonable level of service reliability that is consistent with changing industry conditions. (*Id.*)

Others raise concerns that the reliability standard, when based on OETA + 24 hours, does not measure the severity of deficiencies in the carrier's performance. For example, CSXT suggests that, under the reliability standard, a delivery 25 hours after OETA would be treated the same as a delivery 25 days after OETA. (CSXT Comments 17–18.) NSR recommends replacing OETA + 24 hours with a standard that measures both whether a delay has occurred and the severity of delay. (NSR Comments, V.S. Israel 13.) NSR specifically recommends use of a service reliability ratio, which would measure by what percent of the actual duration of the shipment the carrier missed OETA + 24 hours. (*Id.*)

The Board will not at this time change the reliability standard to account for the severity of a delay. The Board appreciates that its approach does not distinguish between failed deliveries that are just past the 24-hour mark and cars that are many days past that mark, but the Board would like to gauge the effectiveness of its basic concept of OETA + 24 hours before considering changes or refinements to account for degrees of severity. And, if extremely late deliveries are frequent, that could result in the service consistency standard not being met. Part 1145 is also not the only course of action a shipper will be able to pursue. In the case of more egregious delays, the shipper could petition under part 1147 without waiting the 12 week-observation period provided by part 1145. Where appropriate, the shipper could also pursue a separate action based on the common carrier obligation.

Early Cars

The Coalition Associations ask the Board to clarify that shipments that arrive more than 24 hours early do not count as being delivered on time. The Coalition Associations suggest that this approach will remove any incentive for rail carriers to ''game'' the reliability standard by artificially inflating OETAs and note that early cars can cause congestion at a shipper's facility. (Coal. Ass'ns Comments 4, 29; *see also* Olin Comments 5.) AAR opposes application of the reliability standard to early arrivals and asserts that early deliveries were not addressed in the *NPRM.* (AAR Reply 46–47.) AAR argues that shippers and railroads should be able to work together to manage flow into a customer facility, including by using constructive placement. (*Id.*) AAR adds that applying the reliability standard to early deliveries could encourage carriers to slow down the movement of traffic through their systems. (*Id.*)

The Board will adopt the proposal and clarify that cars arriving more than 24 hours before the OETA will count against the carrier for purposes of the service reliability standard. While delivering cars excessively early could potentially disrupt a carrier's system, it remains a possibility that a carrier could seek to avoid failing the standard through such practices. The Board is also persuaded by the Coalition Associations' assertion that unexpected early deliveries can have significant economic and operational consequences for rail customers. (Coal. Ass'ns Comments 29.) When railcars arrive unexpectedly early at a rail customer's facility, they can cause congestion at the facility that can impair operations. (*Id.; see also* Dow Reply 2 (noting that when raw materials customers order from Dow by rail are delayed or arrive excessively early, the customers can experience production slowdowns or downtime or may not have appropriate staffing to handle the delivery).) Even if a customer has a yard or even some extra capacity, it may simply not be ready to accept that car for various reasons. And, if the customer does not have the infrastructure to accept an early delivery, the customer usually must incur demurrage or storage charges. (Coal. Ass'ns Comments 30.)

AAR claims that constructive placement prevents the problems that early arrivals can cause for customers, (AAR Reply 46–47), but the Coalition Associations' complaint suggests that constructive placement is not solving the problems the shipper groups identify. In the Board's experience, railroads usually only begin constructive placement of cars to a spot-on-arrival customer once that shipper's facility is full of cars and no more cars can be actually placed. *See Capitol Materials Inc.—Pet. for Declaratory Ord.—Certain Rates & Pracs. of Norfolk S. Ry.,* NOR 42068, slip op. at 10 (STB served Apr. 12, 2004); (*see also* Coal. Ass'ns Comments 29). Constructive placement is therefore often not a solution for a customer who is faced with an early arrival.

While the Board did not specifically propose to cover early deliveries in the *NPRM,* it made clear that it was open to approaches to assessing reliability other than the approaches that were specifically discussed in the *NPRM. See NPRM,* 88 FR at 63904. The *NPRM* stated that OETA ''would . . . promote the completion of line hauls near the original estimated time of arrival. The on-time completion of line hauls allows the shipper to conduct its operations on a timely basis while permitting effective coordination between rail service and other modes of transportation.'' *NPRM,* 88 FR at 63903. It was therefore foreseeable that the Board might consider early arrivals as a circumstance that could negatively affect shippers' operations and coordination, as reflected in the Coalition Associations' comments. Other parties had full opportunity to respond to the Coalition Associations' proposal. *See Logansport Broad. Corp.* v. *United States,* 210 F.2d 24, 28 (D.C. Cir. 1954); *Int'l Harvester Co.* v. *Ruckelshaus,* 478 F.2d 615, 632 n.51 (D.C. Cir. 1973).

Cross-Border Traffic

CN raises concerns about the application of part 1145 to movements that cross into or out of the United States; CN suggests that part 1145 should apply only to movements that take place entirely within the United States. (CN Comments 49–50.) CN also argues that system-wide reporting should exclude cross-border traffic and notes that it only reported on domestic U.S. trains as part of its reporting for Docket No. EP 770 (Sub–No. 1). (*Id.*)

The Board will not exclude this traffic from either the service reliability standard or the service consistency standard. The Board's jurisdiction includes rail transportation ''in the United States between a place in . . . the United States and another place in the United States through a foreign country; or . . . the United States and a place in a foreign country.'' 49 U.S.C. 10501(a)(2)(E)-(F). As to cross-border traffic, the Board has jurisdiction to determine the reasonableness of a joint through rate covering international transportation in the United States and in a foreign country. *E.g., Can. Packers, Ltd.* v. *Atchison, Topeka & Santa Fe R.R.,* 385 U.S. 182, 184 (1966). However, the Board does not have jurisdiction over operations outside of the United States. *See* 49 U.S.C. 10501(a)(2) (the Board's jurisdiction ''applies only to transportation in the United States''). Given the Board's jurisdiction, retaining part 1145's coverage of such traffic furthers the rule's underlying goal of incentivizing carriers to provide a level of service that best meets the need of the public.

However, the Board will limit action under part 1145 to situations where there is a distinguishable movement in the United States, specifically when the carrier records receipt or delivery at or near the U.S. border (including where the shipment is transferred between affiliated rail carriers at that point).[21] At this time, CPKC does not record an event for the U.S.-only portions of moves into or out of Canada. (CPKC Comments 13.) And it does not appear that requiring CPKC to do so would advance the purposes of the rule because, for moves into or out of Canada, the record before the Board does not indicate that the border has operational significance to customers in terms of service reliability. However, if a customer is concerned about service for cross-border movements within the Board's jurisdiction but without a separately measured U.S. component, the customer could seek relief under other statutes or regulations (*e.g.,* part 1147).

Multiple Lanes

In the *NPRM,* the Board explained that the service reliability standard generally would apply individually to each lane of traffic to/from the petitioner's facility. *NPRM,* 88 FR at 63904. Nonetheless, in certain circumstances, the Board proposed that it would prescribe a reciprocal switching agreement that governs multiple lanes of traffic to/from the petitioner's facility, each of which has practical physical access to only one Class I carrier, when (1) the average of the incumbent rail carrier's success rates for the relevant lanes fell below the applicable performance standard, (2) the Board determines that a prescription would be practical and efficient only when the prescription governs all of those lanes; and (3) the petition meets all other conditions to a prescription. *Id.* The petitioner could choose which lanes to/from its facility to include in

[21] Kansas City Southern historically has used such an approach for movements with an origin or destination in Mexico. (CPKC Comments 13.)

determining the incumbent rail carrier's average success rate. *Id.*

AAR raises various concerns about this approach, including that it (1) would not satisfy the ''actual necessity or compelling reason'' standard, (2) would undermine the Board's goal of predictability, (3) would present serious complexities to the Board, (4) would undermine carriers' abilities to plan and invest, and (5) would allow the petitioner to use reciprocal switching only for some of the lanes even though the Board had found that the reciprocal switching agreement would be ''practical and efficient'' only if it governed all of the lanes. (AAR Comments 66–69 (quoting *NPRM,* 88 FR at 63904, 63914).) AAR therefore asks the Board to apply the performance standards in part 1145 only to individual lanes. (AAR Comments 69.) AAR adds that a shipper could aggregate lanes in its petition, as a means to increase efficiency in proceedings before the Board, provided again that the performance standards applied only to each lane individually. (*Id.; see also* CN Comments 20–21.)

The proposal to allow prescriptions that cover multiple lanes has raised a number of questions, (*see* AAR Comments 68–69), and drew no explicit support from shippers. Therefore, in order to keep the procedures under part 1145 simple and predictable, the Board will withdraw this proposal. Thus, the service reliability standard and service consistency standard will only apply individually to each lane of traffic to/from the petitioner's facility. This, however, does not foreclose the possibility that a petitioner could make a case for switching irrespective of particular lanes under another part of the Board's regulations, *e.g.,* part 1147.

Additional Proposals

NSR asserts that the Board should modify the reliability standard to incorporate data on rail performance from competitive markets, which NSR asserts could include movements of exempt commodities and movements of boxcars. NSR suggests that, by incorporating that data, the Board would have a more useful benchmark to evaluate the quality of service to a petitioner. (NSR Comments, V.S. Israel 15–18.) Under NSR's proposal, the reliability standard would be replaced with a standard that measured deviations from system-wide average performance in competitive markets. (*Id.,* V.S. Israel 17.)

The Board will not adopt NSR's proposal, which would undermine predictability and ease of administration by potentially requiring multiple OETA standards, the identification of the particular competitive movement(s) that would provide a benchmark for the petitioner's movement, and periodic revisions to the OETA standard(s). NSR's proposal is also flawed insofar as it suggests that the Board should not prescribe a reciprocal switching agreement when service falls below reasonable expectations and performance goals unless the carrier has singled out one or more captive shippers in failing to meet those expectations and goals. In effect, NSR's proposal is based on the incorrect premise that the Board's discretion to introduce an alternate carrier is limited to situations in which the carrier is engaged in a demonstrated abuse of market power.

UP argues that the reliability standard should allow adjustments for delays that are not service related, such as a customer's request while a car is en route to have the car delivered to a different destination. (UP Comments 6.) It is not necessary to incorporate such a ''time-out'' into the reliability standard. The Board has provided, in part 1145, for affirmative defenses, which can include that a shipment was diverted en route based on a customer's request. The Board can judge the merits of such a defense in the context of a specific case and it seems unlikely that a petitioner would bring a petition if its service were routinely affected by that issue in any given 12-week period.

CSXT raises concerns that part 1145 does not require evidence that the customer relied on the OETA to its detriment or even that the customer was aware of OETA. CSXT also suggests that railroads should get credit for providing updated OETAs. (CSXT Comments 17–18.) CSXT's concerns fail to grapple with the purpose of the reliability standard, which is to promote on-time deliveries vis-à-vis the schedule that the carrier originally provides unless an affirmative defense applies. As noted by the Coalition Associations, accurate OETAs help avoid supply disruptions. (Coal. Ass'ns Reply 33.) They submit that, without an accurate OETA, a rail customer cannot effectively plan its shipments, operations, and fleet needs to avoid a supply disruption at the destination. (*Id.*) As a result, rail customers must maintain additional storage and railcar fleet capacity to prevent transportation delays from causing supply disruptions. Moreover, ETA updates do not make up for inaccurate OETAs. (*Id.*) The Coalition Associations explain that, while an updated ETA may be helpful to allow a rail customer to mitigate the impacts of transit variability to OETA, mitigating delays while a shipment is in transit is challenging, and mitigation options typically dwindle as the shipment progresses to the destination. (*Id.*) Thus, ETA updates do not resolve the root problem or provide the additional inventory and railcars necessary to address delays. (*Id.*)

The Board appreciates that updated ETAs remain important to customers so that the actual status of the car and probable date of arrival are known. With that said, shippers have pointed to numerous valid reasons why failure to meet OETA is problematic for customers and harmful to business operations. Given the goal of part 1145, it is reasonable to hold a railroad accountable for its original trip plan. To not hold the railroad accountable would undermine one of the Board's goals of incentivizing carriers to provide service that meets their own and shippers' expectations and needs. The Board will therefore not modify the rule as suggested by CSXT.

Summary

In conclusion, the Board will adopt the service reliability standard in the *NPRM* with the following changes: (1) the reliability standard will increase to 70%; (2) the definition of ''delivery'' will be clarified for purposes of interchange; (3) the reliability standard will measure early arrivals as well as late arrivals, in each case with a 24-hour grace period; (4) the reliability standard will be clarified for cross-border traffic; and (5) the reliability standard will only apply individually to each lane of traffic to/from the petitioner's facility.

Service Consistency: Transit Time [22]

As discussed in the *NPRM,* the service consistency standard would measure a rail carrier's success in maintaining, over time, the carrier's efficiency in moving a shipment through the rail system. *NPRM,* 88 FR at 63905. Based on the Board's understanding of the rail network and available data, the Board proposed that, for loaded manifest cars and loaded unit trains, a rail carrier would fail the service consistency standard if the carrier's average transit time for a shipment over a 12-week period increased by either 20% or 25% (to be determined in the final rule) as compared to the carrier's average transit time for that shipment over the same 12-

[22] As noted in the Delivery at Interchange section above, the Board is changing the definition of ''delivery'' for purposes of a movement that involves an interchange between carriers en route. This change also applies to the service consistency standard. Moreover, as discussed above in Cross-Border Traffic, the Board is clarifying how its service reliability and service consistency standard will apply to cross-border traffic.

week period during the previous year. *Id.* Deliveries of empty system cars and empty private cars could also result in a failure to meet the service consistency standard. *Id.* The Board sought comment on what level of increase in transit time should be used in the service consistency standard and whether the Board should adopt a different standard—in lieu of the proposed service consistency standard—that captures prolonged transit time problems, to the extent those problems would not be captured by the reliability standard or ISP standard. *Id.*

Whether To Adopt the Service Consistency Standard

Some carriers question the usefulness of the service consistency standard. For example, CSXT asserts that fluctuations in transit time for individual lanes are normal on a dynamic network and not meaningful indicia of a service problem. (CSXT Comments 18.) CSXT adds that a year-over-year comparison does not consider other events affecting velocity such as track work, capacity improvements, volume surges in other traffic, slowdowns on another railroad network, and service design changes. (*Id.* at 19–20.) Similarly, CPKC warns that, unless the service consistency standard is carefully aligned with real world facts and data pertaining to the normal functioning of manifest carload networks, the standard would misidentify normal variations in service outcomes as service failures rather than spotlighting only those situations that represent real service inadequacies. (CPKC Reply 10.) In CSXT's view, this would lead to wasteful expenditures on proceedings that are triggered by misaligned thresholds and, moreover, would cause operational inefficiencies. CSXT also claims that the service consistency standard could lead railroads ''to shun traffic that does not fit into repeatable network operations.'' (*Id.*)

Using a rolling 12-week observation period at a 20% service consistency standard, AAR's consultants project a high likelihood—65.5%—that any given carload would not meet the service consistency standards. (AAR Reply, R.V.S. Baranowski & Zebrowski 7, tbl. 2.) AAR argues that this study confirms that there are substantial natural variations in transit time, such that nearly any lane, observed enough times, could trigger the service consistency standard. (AAR Reply 50.)

Based on data that AAR submitted in its reply comments, NSR asserts that the service consistency standard is seriously flawed as a measure of inadequate service. Rather than identifying potential service problems, the standard (according to NSR) captures the majority of rail traffic, where normal variations in transit time do not indicate inadequate service. (NSR Reply 9–15.) NSR argues that, if the Board wishes to use a service consistency standard, the Board should suspend this proceeding to more carefully study transit time data, so that any service consistency standard is empirically supported. (*Id.* at 2.) NSR also suggests, as an alternative, that the Board request supplemental evidence in support of the service consistency standard. (*Id.*) CN makes a similar recommendation. (CN Reply 8.)

The Board will retain the service consistency standard. Taken at face value, Baranowski and Zebrowski's results seem to indicate normal variability in transit times. But that appearance is misleading. A majority of the analysis period primarily covers the pandemic and supply chain crises years (2020, 2021, 2022).[23] If those years included one ''fast'' year because shipments were down and then one ''slow'' year because the carriers had decreased their staff numbers, it would follow that a significant amount of traffic would have been captured under this standard. In any case, what Baranowski and Zebrowski show is that the service consistency standard may indeed capture a crisis on a carrier's system. The Board does not find that outcome to be problematic. Such a carrier crisis is among the problems that the Board wishes to address through this rulemaking. *See also* Analytical Justification.

The railroads have pushed our sites to take on more expense and change operations to match the new process and operating strategies. We have had to increase our railcar fleet by over 10 percent in the past couple of years solely due to inconsistency in the rail service and increased transit time. And we're about to increase our fleet again in the next six months by approximately seven to eight percent. This is again due to the inconsistency in the service and transit time.

Hr'g Tr. 792:19 to 793:6, Mar. 16, 2022, *Reciprocal Switching,* EP 711 (Sub–No. 1). Another shipper commented: ''Our plant in the Northeast lost production of over 57 million pounds during the first two months of 2022 mostly due to increased transit time and railroad delays resulting from crew shortages.'' *Id.,* Hr'g Tr. 795:7 to 795:10, Mar. 16, 2022.

Furthermore, as explained in the *NPRM,* the service consistency standard promotes the public interest in various ways. For example, it helps to prevent the possibility that a rail carrier would increase the OETA for a shipment for the sole purpose of meeting the OETA performance standard—a practice that could obscure inadequate service. *NPRM,* 88 FR at 63901. The standard also provides an incentive for carriers to maintain velocity through the rail system. *Id.* Declines in velocity can require shippers to procure more railcars. (LyondellBasell Comments 3.) Increased fleets are a burden on railroads, shippers, and the system as a whole. As UP explained at the Board's hearing concerning reciprocal switching in Docket No. EP 711 (Sub–No. 1), ''if we assume the cycle times for manifest traffic increase by 24 hours, then customers would need to increase their fleets by 3,200 railcars. A chemical customer shared that a one-day increase in transit time would translate to an additional railcar lease cost of $100,000 annually, and $350,000 in annual inventory carrying costs.'' Hr'g Tr. 287:9 to 287:16, Mar. 15, 2022, *Reciprocal Switching,* EP 711 (Sub–No. 1).

NSR itself notes that transit time data is a useful tool:

[T]ransit time data is important to its customers, and it is important to NS—NS monitors transit time and uses it as a tool to diagnose and problem-solve network issues as part of its commitment to providing safe, reliable service to its customers. As such, NS believes transit time data can be valuable for monitoring service.

(NSR Reply 9.)

The Board appreciates the carriers' concerns that normal variants could be captured by the metric under certain challenging operating periods like those that occurred during the pandemic. But just because a situation is ''normal'' or has occurred before does not mean it is excusable or acceptable. That said, part 1145 has also left the door open to other affirmative defenses such as, for example, a velocity problem that was due to scheduled maintenance and capital improvement projects.[24] And,

[23] At the March 2022 hearing in *Reciprocal Switching,* EP 711 (Sub–No. 1), the Board heard testimony from shippers about the following types of problems encountered during this period:

[24] As discussed in the Affirmative Defenses section, the Board will consider ''scheduled maintenance and capital improvement projects'' on a case-by-case basis. The Board does not intend the rule to disincentivize capital investment and in fact expects that this rule will help promote investments necessary for adequate service. However, the nature of ''scheduled'' maintenance and capital improvement projects suggests that carriers have a degree of control over their execution, and the Board intends to ensure that carriers exercise that

Continued

any time that is customer-controlled time is not counted in computation of the velocity and not counted against a railroad.

Percentage

A number of shipper groups ask the Board to set the service consistency standard at a level that would capture smaller reductions in velocity from one year to the next. For example, based on member feedback, the Coalition Associations urge the Board to reduce the standard to 15%. (Coal. Ass'ns Comments 32.) They assert that a sustained 15% increase in transit times would mean that shippers must purchase or lease additional railcars and would incur additional railcar maintenance costs. (Coal. Ass'ns Comments 32.) And, as shippers rely on more and more railcars to address longer transit times, these additional railcars can create network congestion that increases transit times even more, thereby requiring the shipper to acquire even more railcars. (*Id.*) Also, as shippers' railcar fleets swell to address transit-time increases above 15%, corresponding rail infrastructure requirements increase. (*Id.* at 33.) Rail customers would need additional railcar storage capacity to ensure they have enough spare railcars available, because increased transit times increase demand for railcars in transit as well as spares. (*Id.*)

Other shipper groups also support a more rigorous service consistency standard. ACD agrees that the standard should be set at 15%, (ACD Comments 5), while NGFA believes the Board should intervene except where transit time is nearly equal to transit time during the preceding year, (NGFA Comments 12–13). Olin adds that a service consistency standard in the 10% to 15% range is appropriate because service has been especially bad in the last few years and hence the ''base'' transit times have already been skewed downwards. (Olin Comments 6.)

AAR responds that none of the proposed service consistency standards are supported by data and that therefore none of the proposed standards identify where prescription of a reciprocal switching agreement could relieve inadequate service. (AAR Reply 49; *see also* CPKC Reply 6–7 (asserting that the proposed service consistency standards are not based on data concerning fluctuations in transit time from year to year).)

The Board proposed in the *NPRM* to set the percentage at either 20% or 25%. *NPRM,* 88 FR at 63905. Based on the comments received, the Board will set the standard at 20%. The Board must guard against making the standard too lenient, as at 25%, and thus not intervening before problems with poor velocity become severe and clog a carrier's system with cars. As acknowledged by railroads themselves, poor velocity can trigger a vicious cycle that is harmful to shippers, the incumbent railroad, and the network as a whole. *See* Hr'g Tr. 287:9 to 287:16, Mar. 15, 2022, *Reciprocal Switching,* EP 711 (Sub–No. 1); Hr'g Tr. 787:1 to 787:13, Apr. 27, 2022, *Urgent Issues in Rail Freight Serv.,* EP 770. On the other hand, the standard should not be too strict, as that could capture situations not warranting regulatory intervention under part 1145. Weighing these considerations, the Board finds that 20% is currently appropriate here.[25] The Board appreciates that a 20% standard is conservative given that some of the testimony considered in making this proposal referred to 15% drops in velocity, and given commenters' subsequent calls for a standard that is not met when a decrease is above 15%. However, the Board finds as a policy matter that, at this point, it would be preferable to use a standard that reserves part 1145 for somewhat more significant concerns about patterns of decreased velocity over time. This approach is reinforced by the Board's decision to capture, in the final rule, gradual increases in transit time as discussed below. The Board reiterates that stakeholders will continue to have access to other relief for service inadequacies, including under parts 1144, 1146, and 1147. And, while the railroads assert that the Board's general support for the part 1145 standards percentage is insufficient and not supported by data, as discussed in the Analytical Justification section, those arguments fail to adequately consider the purpose and built-in limitations of the rule and the reasonableness of the indicators that the Board has chosen based on record evidence. Here, not only has the Board considered data submitted by the carriers, the Board has testimony from shippers as well as comments from numerous shippers upon which to inform its decision.

Observation Period

As with the reliability standard, a number of shipper groups ask the Board to decrease the observation period for the service consistency standard. NSSGA submits that 12 weeks is too long a period of bad service, claiming that it could potentially ruin its members' businesses. (NSSGA Comments 8.) NSSGA instead proposes a six-week period. (*Id.; see also* PRFBA Comments 10 (six weeks); AFPM Comments 10–11 (six weeks).) EMA also suggests that the Board adopt a six-week period rather than 12 weeks so that carriers ''have less time to obscure what level of service they truly are providing.'' (EMA Comments 7–8, 9.)

The Board will retain the 12-week observation period. As noted early in the service reliability section, a shorter observation period would not as clearly signal the public interest in introducing an alternate rail carrier via switching as the means to allow the petitioner to choose the carrier that better met its needs. And, as noted earlier, stakeholders will continue to have access to other Board relief, including parts 1144, 1146, and 1147—without needing to wait for a 12-week observation period to end.

Empty Railcars

Various carriers claim that the service consistency standard should not be triggered by decreases in velocity for movements of empty railcars. According to CN, application of the service consistency standard to movements of empty railcars could give a shipper access to an alternate line-haul carrier for loaded cars when the incumbent carrier is performing well in delivering those cars. In that case, according to CN, the shipper's petition would not meet the ''actual necessity or compelling reason'' standard that carriers contend should apply. (CN Comments 47; *see also* AAR Comments 56–57.)[26] CN further asserts that there are differences in how empty cars are managed and moved and that these differences affect transit times for those movements. (CN Comments 46–47.) CN notes that variables such as car supply, customer behavior, diversions, and other effects unrelated to service performance can result in high variability in transit time for empty private cars. (*Id.* at 47.) CSXT makes similar arguments, noting that

control with reasonable consideration of shippers' service levels.

[25] The Board rejects CPKC's argument that normal fluctuations in transit time are so significant as to ''swamp'' a 20% change in transit time. (*See* CPKC Reply, R.V.S. Workman & Nelson at 19–23.) CPKC's argument fails to account for how the service consistency standard works. The standard assesses changes from year to year in the average transit time over a lane over the same 12-week period. This approach inherently accounts for normal fluctuations in transit time over the lane in question, identifying a failure to meet the service consistency standard only when the average transit time over that lane increased from one year to the next by more than 20%.

[26] As discussed in Legal Framework, the carriers' claims concerning the appropriate standard lack merit.

empty cars do not cycle between the same origin and destination and are often diverted. (CSXT Comments 36–37.)

The Coalition Associations urge the Board to reject railroad arguments that oppose considering empty-car movements under the service consistency standard. They assert that railroad concerns about the differences in how loaded and empty cars move are overstated. (Coal. Ass'ns Reply 35.) Even though empty railcars might not cycle between the same origins and destinations, the Coalition Associations note that railroads can still measure transit times on empty cars that do move between the same empty origin and empty destination, which the Coalition Associations claim is a substantial number of private cars. (*Id.* at 36.) The Coalition Associations add that transit time increases involving empty-car movements can have a significant impact on rail customers, and allowing transit time increases on empty railcar movements to justify reciprocal switching prescriptions for both the empty movement and the associated loaded movement is a practical solution to discourage inadequate service involving empty movements. (*Id.* at 36–37.)

The Board will continue to include movements of empty cars in applying the service consistency standard. Consistent transit time in returning private/leased empties to the original place of loading is critical to having cars available for loading at that location. Indeed, if a year ago a shipper's fleet cycled at the rate of two roundtrips per month and that deteriorated to, for example, 1.4 roundtrips per month while demand remained constant, the customer would be faced with either obtaining more equipment or reducing its delivery of product. As AFPM explains, increased transit times for empty railcars can interrupt a rail customer's supply of cars needed to support operations, deprive a rail customer of empty cars that it may need for the goods it produces, and ultimately prevent a rail customer from fulfilling its own customers' orders. (AFPM Comments 11.) In the direst situations, a disruption in empty-car supply may cause severe facility backups, requiring a reduction of or even stalling operations. (*Id.*) The Board will therefore provide for a prescription based on the velocity of empty cars. However, customer behavior and customer-ordered diversions could constitute an affirmative defense to a service consistency failure arising from empty-car movements. Finally, similar to loaded cars (as discussed below), the Board will apply the three-year, 25% standard and 36-hour floor to empty cars.

Lanes vs. Routes

UP asserts that the Board should apply the service consistency standard to routes as opposed to lanes. (UP Comments 9–10.)[27] UP claims that comparing transit times for a given route from year to year, as opposed to comparing transit times for a given lane from year to year, is necessary to avoid distorted results. UP appears to reason that, by comparing transit times for a given route, the Board could better account for unanticipated events that occurred over a given segment of the rail system. (*Id.*)

The Board will continue to apply the service consistency standard to lanes, not routes. It is true that different routes can have different run times and lead to different delivery dates. But those changes nonetheless can affect a shipper's or receiver's business. If a railroad has decided to downgrade a route and condense volume on a core route and that decision adds miles and days to the transit time, then there might be grounds to prescribe access to another line haul carrier, subject to other requirements in part 1145. As noted by the Coalition Associations, UP's proposal would not capture increases in transit time that resulted from the incumbent carrier's routing decisions. (Coal. Ass'ns Comments 39.) If a routing decision is a function of, for example, a bridge washing out, the Board has provided an affirmative defense for extraordinary circumstances, and the carrier has other affirmatives defenses available in other circumstances.

DCPC recommends making a customer's facility open to reciprocal switching for all lanes, presumably as long as the incumbent carrier failed to meet a performance standard for at least one of those lanes and as long as the other conditions to a prescription were met. (DCPC Comments 4.) The company reasons that otherwise the customer and the carriers would need to closely monitor which cars from the facility were eligible for reciprocal switching and which cars from the facility were not. (*Id.* at 3–4.)

The Board declines at this time to adopt DCPC's approach, which would represent a major change to the framework the Board proposed in the *NPRM.* Its approach could make reciprocal switching available for movements that were not necessarily implicated by the carrier's failure to meet a performance standard. As a result, this approach would go beyond the current design and purpose of part 1145. DCPC also asks what would happen if a carrier created a new lane and whether a petitioner would need to refile with the Board to seek to add that lane to any prescription. (DCPC Comments 3–4.) As noted in Multiple Lanes, however, the Board has decided not to allow petitioners to combine lanes.

Shorter Lanes

Several carriers raise the concern that the service consistency standard will disproportionately affect traffic that has relatively short running times. CN reasons that, for trips of twelve hours, the addition of only a few hours in transit time from year to year could mean failing to meet the service consistency standard. (CN Comments 46.) CPKC raises a similar concern, noting that a 24-hour or greater delay–occasioned for example by a single missed connection–over a shipment that is scheduled to arrive in four days would exceed the 20% service consistency standard. (CPKP Reply 26.) CPKC argues that establishing a minimum absolute value for downward movement in average transit times of ''perhaps 36 hours'' would help to address this flaw. (CPKC Reply 26, 41.)

The Coalition Associations respond that the service consistency standard should be based on a percentage of transit time. They reason (1) that increases in cycle time require proportional increases in the size of the fleet that the shipper needs to maintain the same delivery rate to the destination, and (2) that this increase in the required size of the fleet imposes significant economic consequences on shippers. Having said that, the Coalition Associations suggest that the Board could adopt a 24-hour floor for the service consistency standard because its shippers typically plan fleet needs based on days in transit rather than hours in transit. (*See* Coal. Ass'ns Reply at 38–39.)

The Board will adopt an absolute floor of 36 hours, meaning that an increase in transit time over a 12-week period will fail the service consistency standard only if the increase is more than 36 hours. This approach is grounded in practical considerations and the specific goals of part 1145. A reciprocal switching movement itself might add roughly 24 hours to a trip. It is therefore unlikely that it would serve the public interest to prescribe a reciprocal switching agreement under

[27] Movement over a lane (transportation from a given point of origin to a given destination) often can be accomplished over a variety of routes.

part 1145, as a means to introduce an additional line-haul carrier, based on an increase in transit time of 36 hours or less.[28] The 36-hour floor applies only under part 1145. A shipper would be free to seek to demonstrate under part 1144 or part 1147 that an increase in transit time of 36 hours or less justified prescription of a reciprocal switching agreement.

Calls To Measure the Entire Move

Some shipper groups raise concerns that the service consistency standard applies only to the incumbent carrier's portion of an interline movement and therefore does not account for increases in transit time over the entire interline movement. (PRFBA Comments 10; EMA Comments 9.) NSSGA suggests that applying the standard only to the incumbent carrier's portion is, in effect, to apply the standard to an ''arbitrary subset'' of the entire movement. (NSSGA Comments 8.) The Board disagrees that it is arbitrary to apply the service consistency standard only to the incumbent carrier's portion of the interline movement, given that the incumbent carrier has the most direct control over its portion of the movement. If the incumbent carrier provided sufficiently consistent transit times over its portion, yet there was an excessive decline in transit times over the entire movement, then this would very likely be due to factors beyond the incumbent carrier's reasonable control. Given this high likelihood, the Board sees no value in requiring the incumbent carrier to demonstrate, as an affirmative defense, that a decline in transit time over the entire movement was beyond the incumbent carrier's reasonable control.

Volume

AAR notes that the service consistency standard requires comparing transit time performance in a particular lane between two windows of time. (AAR Comments 56.) To make this an ''apples-to-apples'' comparison, it asks the Board to clarify that the selected windows must have seen reasonably equivalent volumes shipped, with shipments moving under non-exempt common carrier service in both windows. (*Id.*) AAR asserts that volume can significantly affect transit time for a variety of operational and economic reasons and that large blocks of cars will often move through the network faster than single carloads. (*Id.*) The Board will not adopt AAR's clarification. Requiring a shipper to compare volumes as well as observation periods would be more difficult to apply, and affirmative defenses provide an adequate and appropriate path for an incumbent carrier to address transit-time increases that primarily result from volume changes, including where the likelihood of this occurring is not clear or predictable. (Coal. Ass'ns Comments 37.)

Gradual Increases in Transit Time

A number of parties claim that comparing transit time from one year to the next might not capture a significant increase in transit time that develops over a period of several years. For example, AFPM notes that, using the standard's proposed 20% or 25% year-over-year increase for a shipment that takes 14 days today could result in an increase to 17.5 days in the first year and nearly 22 days in the second year, continuing to grow exponentially in perpetuity, nearly doubling its 14-day transit time to more than 27 days after just three years. (AFPM Comments 11; *see also* FRCA/NCTA Comments 3.) To avoid the compounding effect of increases in transit time, the Coalition Associations ask the Board to adopt an additional threshold that would make reciprocal switching available if transit time increases by more than 25% during the prior three years. (Coal. Ass'ns Comments 4, 31–32; V.S. Crowley/Fapp, Ex. 2 at 5; *see also* Dow Reply 3.) Although AAR also made this point in its comments, (AAR Comments, V.S. Orszag/Eilat 18), it later argues that a multi-year approach would not be useful because, according to AAR, it would still capture normal variations in transit time. (AAR Reply, R.V.S. Baranowski & Zebrowski 9.)

To capture a slow increase in transit time that becomes substantial over time, the Board will modify the transit time measure to include an additional metric, which a carrier would not meet if a petitioner's transit time over the lane increased by more than 25% over the prior three years. *See* 49 CFR 1145.2(b)(2). For example, if the base year average transit time over a twelve-week period in the summer was 20 days, the incumbent carrier would fail to meet the standard if in years one through three, the average transit time for the corresponding 12-week period in any of those three years increased by five days or more, *i.e.,* to 25 days or more. A rail customer would qualify for a reciprocal switching agreement if it demonstrated that the incumbent carrier did not meet either the one-year or three-year threshold. As the Board explained in the *NPRM,* part 1145 ''would provide for the prescription of a reciprocal switching agreement to address deteriorating efficiency in Class I carriers' movements, specifically when the incumbent rail carrier failed to meet an objective standard for consistency, over time, in the transit time for a line haul.'' *NPRM,* 88 FR at 63901. The Board's modification of the transit time measure is consistent with that approach.

Summary

The Board will adopt the service consistency standard that was proposed in the *NPRM* using a 20% standard. The Board will also: (1) change the definition of delivery to an interchange and customer facility; (2) clarify how it measures transit time performance on international lanes; (3) modify the transit time measure to add a measure for a 25% increase in transit time over the prior three years; (4) create an absolute floor for both the one-year and three-year measure of 36 hours; and (5) provide that the service reliability standard only applies individually to each lane of traffic to/from the petitioner's facility.

Inadequate Local Service: Industry Spot and Pull

The third performance standard—ISP—would measure a rail carrier's success in performing local deliveries (''spots'') and pick-ups (''pulls'') of loaded railcars and unloaded private or shipper-leased railcars during the planned service window. *NPRM,* 88 FR at 63905. Under the *proposed rule,* a rail carrier would fail the ISP standard if the carrier had a success rate of less than 80% over a period of 12 consecutive weeks in performing local deliveries and pick-ups during the planned service window. *Id.* The success rate would compare (A) the number of planned service windows during which the carrier successfully completed the requested placements or pick-ups to (B) the number of planned service windows for which the shipper or receiver, by the applicable cut-off time, requested a placement or pick-up. *Id.* The carrier would be deemed to have missed the planned service window if the carrier did not pick up or place all the cars requested by the shipper or receiver by the applicable cut-off time. *Id.* Subject to affirmative defenses, this would include situations in which the carrier has ''embargoed'' the shipper or receiver as a result of congestion or other fluidity issues on the carrier's network, which results in reduced service to the shipper or receiver. *Id.* Below are responses on these matters as well as other issues that drew significant comment.

[28] For the same reason the 36-hour floor also will be applied to the three-year standard.

The Board proposed the 80% standard based on data submitted in Docket No. EP 770 (Sub-No. 1). *Id.* at 63906. As with the service reliability standard, the Board requested that stakeholders and shippers/receivers provide evidence and comment on the appropriateness of this percentage and whether it should be higher or lower. *Id.* The Board also sought comment on a number of other points, including two possible service windows. *Id.* at 63906–07.

Whether To Adopt the ISP Standard

A number of carriers challenge the appropriateness of the ISP standard. For example, CN asserts that the Board should eliminate the ISP standard from § 1145.2 on the ground that the prescription of a reciprocal switching agreement is not an effective remedy for inadequate local service. CN reasons that, even where the petitioner chose the alternate carrier for line-haul service, the incumbent carrier would continue to provide local service to the petitioner. (CN Comments 36.) AAR agrees, adding that the petitioner's choice to rely on the alternate carrier for line-haul service might exacerbate the inadequate local service. (AAR Comments 57–58.) AAR suggests that a more appropriate response to poor local service might be the prescription of terminal trackage rights. AAR adds, however, that providing for the prescription of terminal trackage rights in this proceeding would exceed the scope of the *NPRM.* (*Id.* at 58.)

AAR asserts that, if the Board retains the ISP standard, the Board should establish a technical working group to study and consider the matter. AAR reasons that there is significant technical complexity related to how carriers provide local service. (*Id.* at 109.) CPKC goes further and argues that local services are too complex and require too much on-the-ground operating discretion and flexibility to warrant the Board's application of a universal performance standard for local service. CPKC suggests that, if the Board might wish to adopt standards for local service, then the agency should first examine in appropriate detail all of the complexities and potential adverse impacts associated with any such standard. (CPKC Reply 28.)

The Board will retain the ISP standard. The record in this proceeding demonstrates a significant public interest in promoting adequate local service. As discussed below, a number of shipper groups advocate for higher standards for service. (*See, e.g.,* ACD Comments 5 (noting that the group is supportive of this performance standard as first-mile/last-mile service has been a significant issue for shippers for decades); *see also* NSSGA Comments 9; AFPM Comments 12; EMA Comments 8; PRFBA Comments 9; DCPC Comments 10; API Comments 5; NGFA Comments 13; FRCA/NCTA Comments 2.) The Class I carriers agree that local service is critical to meeting customers' needs and that nevertheless, due to a variety of operating decisions by those carriers, the quality of local service is not at times where it should be. The public interest in adequate local service is effectively advanced by providing for the introduction of an alternate rail carrier for purposes of line-haul service when, through the subpar quality of the local service that it provides, the incumbent carrier failed to meet reasonable service expectations. The incumbent carrier's potential loss of the line haul creates an appropriate incentive to meet local service expectations given that provision of the line haul is the carrier's main source of revenue. Indeed, due to the economics of providing local service, the incumbent carrier might be indifferent to losing that service if it retained the line haul. Potential loss of the line haul also reflects the fact that overall operation of the network is more fluid when local service and line-haul service are well-coordinated, for example, when a local drop-off occurs within a reasonable time of when the line haul is completed. While the Board supports the carriers' goal of retaining flexibility in how they provide local service, as a means to maximize efficiency, it is vital that their less successful experimentation not threaten the fluidity of the network. An incumbent carrier that had to coordinate with an alternate line haul carrier would be more pressed to provide adequate local service.

The Board declines to convene a working group to consider complexities and variations in the provision of local service. From the customer's perspective, what matters is whether the carrier delivers and picks up cars when it says it will. The Board expects that each carrier will take into account the complexities of its operations when making those communications to the customer.

Calls To Measure by Railcar and for a No-Show Standard

Under the ISP standard proposed in the *NPRM,* a rail carrier would be deemed to have missed the planned service window for purposes of the ISP standard if the carrier did not pick up or place all the cars requested by the shipper or receiver by the applicable cut-off time. *NPRM,* 88 FR at 63906–07. Several commenters recommend modifying that approach.

The Coalition Associations propose two standards for local service. One standard would measure how many cars, out of the cars that were scheduled to be delivered or picked up during a planned service window, were not delivered or picked up. (Coal. Ass'ns Comments 4–5.) The other standard would measure how many planned service windows during the observation period were ''no shows,'' where the carrier failed to provide any local service during the planned service window. (*Id.*) The Coalition Associations assert that these different types of failure have different impacts on customers. (*Id.*) Under the Coalition Associations' proposed measure, the threshold would be tripped if the carrier failed to perform at least 80% of scheduled spots (deliveries) and pulls (pick-ups) during the planned service window and did not perform the remaining spots and pulls within the service window that immediately followed the planned service window. (*Id.* at 5, 36.) The Coalition Associations' proposed ''no-show'' standard would require a carrier to provide local service during at least 90% of the planned service windows over the 12-week observation period and not to miss two consecutive service windows. (*Id.* at 5, 37–38.)

AAR asserts that any standard for local service should be based on the number of cars that were spotted or pulled as scheduled within the planned service window. (AAR Comments 59.) AAR claims that the approach in the *NPRM* (which would credit the carrier with a ''hit'' only if the carrier spotted and pulled all scheduled cars during the planned service window) would overstate the impact of a carrier's failure to perform a small portion of the scheduled spots and pulls during the planned service window. (*Id.* at 23, 57–59, 109; *id.,* V.S. Orszag/Eilat 13.) CN agrees. (CN Comments 40.) CN states that it tracks local performance on a per-car basis. According to CN, this approach provides better insight into its performance and into the reasons for any misses. (*Id.* at 40–41; *see also* CSXT Comments 23; UP Comments 11.)

The Board will retain the approach to local service that was proposed in the *NPRM.* This approach is straightforward, avoids the complexity of the Coalition Associations' proposal, and provides an appropriate incentive to provide adequate local service. Not showing up at all counts as a ''miss'' under the Board's simpler approach and, in some circumstances, could be

captured by the service consistency and service reliability standards the Board is also adopting in part 1145. With respect to AAR's approach based on the number of cars spotted and pulled within any service window, the Board finds that the Board's approach is not only simpler to measure and consistent with the expeditious and efficient handling of proceedings but also properly reflects the relative impacts that local service failures have on customers. For these reasons, while the Board recognizes AAR's observation that service windows might include varying numbers of cars, the Board finds that AAR's concerns regarding overstatement are not persuasive. Under this rule, a carrier has flexibility to establish protocols governing their local service, including when to constructively place cars, when and how to establish cut-off times, and other actions important to formulating a work order that they should execute.

Percentage

Several shipper groups ask the Board to increase the threshold percentage used in the ISP standard. NSSGA argues that 80% is too low—that local service at that level causes a backup of products at the facilities of NSSGA members. (NSSGA Comments 9.) NSSGA asserts that 90% would be a more appropriate standard, which, if achieved, could protect against such backups. (*Id.*) AFPM also supports a 90% standard based on the adverse impacts that late or missed local service, as well as the spot or pull of incorrect cars, have on plant production and revenues. (AFPM Comments 12.) Others support setting the local service standard either at 90%, (EMA Comments 8; PRFBA Comments 9; DCPC Comments 10), or at 80% and providing by rule for an increase up to 85% or 90% after two years, (API Comments 5 (initial standard of 80% but 85% or 90% after two years)). NGFA recommends setting the standard at the ''high end of the interim performance targets'' from Docket No. EP 770 (Sub-No. 1). (NGFA Comments 13.) FRCA/NCTA recommend setting the standard at 85%. (FRCA/NCTA Comments 2.) AAR opposes these calls to increase the standard, asserting that the data does not support an increase. (AAR Reply 51.)

The Board will increase the local service standard. The 80% standard that was proposed in the *NPRM* would not have been triggered for many shippers until, on average over a 12-week period, the carrier had failed to fulfill a local work order for that shipper more than once per week. (EMA Comments 8.) The 80% figure, however, was too low to provide a useful indication of when it might be in the public interest to introduce an additional line-haul carrier through a prescription under part 1145. This point is clear both from shippers' comments and from data that the Board collected in Docket No. EP 770 (Sub-No. 1). The Rail Service Data page on the Board's website shows that, from May 13, 2022, to December 22, 2023, three of the four carriers that reported data for that period had average weekly ISP performance of between 89% and 91%, with highs between 93% and 97%. *See www.stb.gov/reports-data/rail-service-data/#Urgent%20Issues%20Rail%20Service%20Data.* While ISP performance was measured somewhat differently in Docket No. EP 770 (Sub-No. 1) as compared to how it will be measured under part 1145, the performance data from Docket No. EP 770 (Sub-No. 1) shows the high level of reliability that carriers seek to provide, and that customers expect, even during periods of major problems on the network. With this in mind, an 80% ISP standard would provide insufficient incentive for carriers to provide adequate local service. An 85% standard better reflects a level of service that is below what customers have consistently reported as their service expectations and what carriers appear to aim for in their service. *See id.* Although some shippers ask the Board to set a higher threshold, the agency would like to implement part 1145 before considering whether to increase the percentage.

Observation Period

AFPM argues that the 12-week observation period for the local service standard is too long for refiners and petrochemical manufacturers, adding that poor local service over such a sustained period will ''dramatically hurt'' their operations. (AFPM Comments 12.) For the reasons discussed above in the Observation Period sections concerning the service reliability standard and the service consistency standard, the Board will retain the 12-week observation for the local service standard.

Rebuttable Presumption

CSXT is concerned that the local service standard does not account for missed spots or pulls that were caused by the customer or resulted from the customer's request for service that exceeded the capacity of the customer's facility. (CSXT Comments 22.) CSXT asserts that the carrier should not be required to prove to the Board, after the event, that the miss was caused by the customer, arguing that the local crew's recorded determination at the time of the miss should be treated as presumptive evidence on that point. (*Id.* at 22–23.)

As stated in the *NPRM,* a miss caused by the customer would not be counted against the incumbent rail carrier. *NPRM,* 88 FR at 36907. The Coalition Associations asks the Board to include the phrase ''except due to a variation in its traffic,'' (Coal. Ass'ns Reply 44), but that suggestion will not be adopted. It is not clear without context why a miss caused by a variation in a customer's traffic should count against a carrier, but the Board can consider the relevance of the variation if presented as an affirmative defense.

The Board will not adopt CSXT's proposal to treat the local crew's determination of the cause of a miss as presumptive evidence of the cause. The burden should be on the railroad to provide persuasive evidence of the cause of the miss, given that the railroad would have the most direct knowledge of the cause. Persuasive evidence might include the local crew's determination at the time and can be provided by the railroad. The Board will consider this evidence but might find, based on the facts at hand, that the local crew's determination was insufficient.

Adjustment to the Local Service Standard Based on Reductions in Service

The Board proposed in the *NPRM* that, if a carrier unilaterally chooses to reduce the frequency of the local work that it makes available to a customer, based on considerations other than a commensurate drop in local customer demand, then the local service standard would become 90% for a period of one year. *NPRM,* 88 FR at 63907.

The Board will adopt this proposal in the final rule. AAR claims that an increase based on a reduction in the frequency of local service would limit carriers' flexibility and would make railroads more cautious to experiment with increased local service levels. (AAR Comments 59.) While the Board supports efforts to optimize rail service, it is important to disincentivize carrier efforts that, without collaboration with the shipper, reduce the quality of service to a shipper or receiver without corresponding increases in efficiency. A reduction in the frequency of local service can have substantial adverse effects on a shipper or receiver, especially if it does not reflect coordination with the shipper. For example, a shipper might need to build additional plant trackage to accommodate reduced pulls by the carrier. However, the Board may consider the impact of all customer

demand in the local serving area, not just that of petitioner, in considering whether a petitioner qualifies for this provision. The carrier will bear the burden to demonstrate that the drop in customer demand necessitated the reduction in local service.

The Board will extend to two years the period during which the increased local standard would apply. As the Coalition Associations explain, the burden of mitigating the risk of missed spots and pulls is significant and its members indicate that the infrastructure and fleet design changes necessary to implement these mitigation measures can take two years to fully implement. (Coal. Ass'ns Comments 41.) Although AFPM suggests a 95% standard, claiming that it recognizes some disruptions may occur while protecting shippers from service reductions that would result in poor ISP performance, (AFPM Comments 13), the Board will not adopt such a high standard. A 90% standard achieves the Board's goals, recognizing the high degree of accuracy that is appropriate in the context of local service while reserving the Board's introduction of an additional line-haul carrier for relatively significant local service issues.

The *NPRM* made clear, however, that the agency might find that the 90% ISP standard should not apply in a case. *NPRM,* 88 FR at 63907. The Board may consider, among other things, whether the carrier is offering more service during periods of seasonal or unusual demand to accommodate the demands of a shipper and whether such circumstances invalidate use of the 90% ISP standard. *Id.* Arguments such as these could be considered as affirmative defenses in response to a petition.

Service Window

The Board sought comment on two alternatives for what service window to use in applying the local service standard. *NPRM,* 88 FR at 63906. Under one alternative, the Board would use a standardized service window of 12 hours (the maximum duration that a crew is allowed to work), starting from the relevant serving crew's scheduled on-duty time. *Id.* Under the second alternative, the Board would use the service window that the rail carrier specified according to the carrier's established protocol, provided that the window did not exceed 12 hours. *Id.* at 63906–07.

The Coalition Associations recommend using service windows that comply with the carrier's established protocol rather than a standardized 12-hour window. (Coal. Ass'ns Comments 42.) They assert that using service windows that comply with the carriers' established protocol will encourage rail carriers to provide local service that meets the expectations that flow from the protocol, thus reducing disruptions to shippers. (*Id.*) The Coalition Associations note that when local service is unreliable, many customers stage cars for service the day before the service window and wait long after their service window for the carrier to pull staged cars. (*Id.* at 43.) At many facilities, this extended staging impairs or prohibits facility operations because it uses track space that the facility needs to operate and can lead to extra labor costs. (*Id.*)

The Board finds that, on balance, it is best to use a standardized 12-hour window for purposes of applying the local service standard. In response to the Coalition Associations' concern, the Board emphasizes that the 12-hour window that is used for purposes of the local service standard is not meant to override the rail carrier's protocols or to excuse carriers from complying with those protocols. The benefit of using a standardized 12-hour window for purposes of the local service standard is that it will result in uniform understanding of the point at which the Board would consider regulatory intervention. To use a carrier's shorter window would impose costs that the carrier might not have accounted for in setting that shorter window; the carrier might therefore be encouraged to lengthen the window beyond the window that is otherwise most efficient for that carrier. That outcome is inconsistent with the Board's intent, as it would undermine the public interest in efficient operation as well as the interests of the individual shipper or receiver. Likewise, for the sake of uniformity across railroads, the Board will decline AFPM's proposal to use a window that extends from two hours before to two hours after the estimated service time that was specified in the local crew's job plan. (AFPM Comments 13.)

Advance Notice

The Board sought comment from stakeholders on whether a rail carrier should be required to provide notice to the customer before the carrier changes the on-duty time for the local crew that serves the customer—at least for the purposes of regulatory measurement—and, if so, how much advance notice should be required. *NPRM,* 88 FR at 63906.

The Coalition Associations ask the Board to require carriers to provide 60 days' notice of a change to the service window. (Coal. Ass'ns Comments 43–44.) AFPM goes further and argues that railroads should not be allowed to unilaterally change a service window without (1) agreement from a customer, or (2) going through a formal mediation process. (AFPM Comments 13.)

The Board will not adopt these measures, which seem unnecessarily rigid and do not directly relate to the purpose and design of part 1145. The Board notes, though, that regular or unreasonably abrupt changes to a customer's service window might be relevant considerations under parts 1144 or 1147 of the Board's regulations.

Clarification for Spot on Arrival Cars

Per the Coalition Associations' request, the Board clarifies that the spot and pull standard includes ''spot on arrival'' railcars. (Coal. Ass'ns Comments 42.) However, failure to spot ''spot on arrival'' railcars for a planned service window results in a missed service window only if the railcars arrived at the local yard that services the customer and are ready for local service before the cut-off time applicable to the customer and in accordance with the carrier's established protocol.

Clarification of Applicable Traffic

CN asks the Board to clarify that the local service standard does not apply to unit trains or intermodal traffic. (CN Comments 43.) CN states that unit trains are not handled through the same process as manifest traffic—that unit trains are often staged in yards upstream from the destination while CN coordinates with the customer to determine the appropriate time for service. (*Id.* at 43–44.) Further, according to CN, the needs of unit train customers differ from those of manifest customers, as CN generally works to ensure that a certain number of unit trains are delivered based on monthly demand, as opposed to ensuring that unit trains are delivered according to planned service windows. (*Id.* at 44.) CN claims that intermodal traffic is not compatible with the local service standard because intermodal traffic presents unique factors and challenges associated with the transloading process. (*Id.*) With intermodal traffic, according to CN, containers are typically unloaded at an intermodal facility and then stacked at the facility until trucks arrive ingate to pick up the containers. (*Id.*)

The Board did not propose to apply the local service standard to unit trains or intermodal traffic and will not do so in the final rule. Unit trains are not switched or spotted and pulled in the same manner as other carload shipments. Similarly, when traffic is

transferred between a rail carrier and another mode of transportation, those transfers do not involve local service in the same manner as local traffic. The Board will clarify the exclusion of unit trains and intermodal traffic in the text of the adopted regulation, § 1145.2(e).

Summary

The Board will adopt the local service standard that was proposed in the *NPRM* using a 12-hour work window. The Board will also: (1) increase the local service standard to 85%; (2) extend the period during which a 90% standard would apply when a rail carrier unilaterally reduces service; (3) clarify how success in spotting ''spot on arrival'' railcars will be measured; and (4) clarify that the local service standard does not apply to unit trains or intermodal traffic. The Board also makes technical modifications, including reordering paragraphs and using more consistent terminology to describe service windows.

Data Production to the Board and Implementation

The Board proposed in the *NPRM* to continue to collect certain data that is relevant to service reliability and local service and similar to the data being collected on a temporary basis in Docket No. EP 770 (Sub-No. 1). *NPRM,* 88 FR at 36911. *See Urgent Issues in Freight Rail Serv.—R.R. Reporting,* EP 770 (Sub-No. 1), slip op. at 6 (STB served May 6, 2022) (items 5 and 7). The Board's ongoing collection of this data under part 1145 would be adapted to the design of part 1145.

It is true that the Board did not extend the temporary data reporting as defined in Docket No. EP 770 (Sub-No. 1) because overall performance data, especially with regard to service, showed improvement and because BNSF, CSXT, NSR, and UP were meeting the majority of their one-year service targets. *See Urgent Issues in Freight Rail Serv.—R.R. Reporting,* EP 770 (Sub-No. 1), slip op. at 2–3 (STB served Mar. 14, 2024). However, as noted in the *NPRM,* the collection of the data as defined in part 1145 will assist with general oversight and facilitate implementation of part 1145. *NPRM,* 88 FR at 63911. As a general matter, this material would also allow a reciprocal switching petitioner to compare its service to that of the industry or the incumbent carrier's service on a system and regional level to see whether service problems are systemic and/or worsening. *Id.* at 63902. FRA and DOT support an ongoing collection, noting that it provides them with ''invaluable insight into factors that affect the safety, reliability, and efficiency of railroad operations.'' (DOT/FRA Comments 3.) Additionally, they assert that the Board's proposed data requirements would promote transparency among rail customers and the broader public. (*Id.*) Other groups also support ongoing reporting. (*See, e.g.,* PRFBA Comments 4.)

The Board will therefore adopt the data collection it proposed in the *NPRM.* As discussed below, all six Class I rail carriers must begin reporting based on the new, standardized definitions of OETA and ISP by September 4, 2024. The Board's Office of Public Assistance, Governmental Affairs, and Compliance (OPAGAC) will provide the Class I rail carriers with a standardized template for these new reporting requirements.

Technical Working Group

AAR agrees with the Board that reporting service data by individual rail carriers is ''helpful to understanding conditions on the rail network.'' (AAR Comments 106.) However, it asserts that there are some details and considerations that need to be worked through before the Board requires permanent reporting. (*Id.* at 107.) It notes that the reporting for part 1145 will be standardized, unlike the temporary reporting for Docket No. EP 770 (Sub-No. 1). AAR also raises a number of issues purportedly requiring a technical conference, including OETA matters the Board already discussed in the Performance Standards section, the technical complexities of ISP, as well as questions about empty cars, routing instructions, and bad order cars. (*Id.* at 107–09.) According to AAR, those and other such considerations would benefit from consideration by a working group. (*Id.* at 109.) AAR claims that doing so will allow Board staff and interested parties to better understand the issues, work out necessary details, and build a more complete record of the technical issues for the Board to consider as it finalizes a rule. (*Id.*)

Similarly, CPKC seeks a technical conference or other process for undertaking a more systematic evaluation of real-world lane-specific service data before implementing a rule that could have sweeping consequences for the railroad operations and the incentives railroads confront in designing services that meet shipper needs. (CPKC Reply 1, 3, 24, 40–41.)

The Board will not establish a technical working group or hold a conference before implementing the final rule. The Class I carriers have had experience reporting data in Docket No. EP 770 (Sub-No. 1) and in *Demurrage Billing Requirements,* Docket No. EP 759. Although the Board is standardizing the definition of OETA and ISP, these measures are not significantly different from the type of reporting required of the railroads in Docket No. EP 770 (Sub-No. 1). If specific issues arise, the Board can address those issues as needed. AAR's other concerns also do not warrant a technical conference. The Board addresses AAR's OETA and ISP points in the Performance Standards section. And, AAR's questions about bad orders or problems with routing instructions can be examined in the context of a particular case. Finally, the Board is rejecting in the Analytical Justification and Legal Framework sections the notion that the agency must develop per-lane performance standards.

Calls for More Data

A number of entities ask the Board to require the rail carriers to provide additional data. For example, FRA and DOT suggest that the Board consider maintaining intermodal traffic data as a reporting requirement, stating that, while intermodal is not rate-regulated traffic, it is a valuable metric to monitor supply chain efficiency. (DOT/FRA Comments 3.) The Board will not require the Class I rail carriers to report this data because the railroads measure this traffic differently from other traffic, and standardizing intermodal service measurement is not one of the purposes of this regulation. Intermodal traffic is also typically a one-train event from origin to destination with no terminal switching events at origin, intermediate points, or destination.

API encourages the agency to collect regional-level data. It claims that this data will better inform the Board as to what and where FMLM issues exist. (API Comments 8.) Similarly, USDA argues that the Board should also collect regional data for transit time. (USDA Comments 3.) It notes that data is critical to well-functioning markets. (*Id.* at 8.) Although the Board appreciates these comments, it will collect ISP data on an operating division basis, which will provide similar granularity to regional data. The Board will therefore not expand the collection of data to the regional level but may seek more data at a later point, if necessary.

Implementation

AAR claims that because the proposed rule's service metrics are new, railroads need time to modify their systems to conform to the new standards and to build new systems to support their obligations. (AAR Comments 111.) CSXT raises a similar point and adds that it would need to

build a process to respond to customer requests, which could take one year. (CSXT Reply 15–16; *see id.,* R.V.S. Maio.) CSXT discusses this issue because ''the Board should be aware of the likely realistic timeline for creating a new regulatory regime in which bespoke lane-by-lane performance metrics would need to be produced on demand for any of CSXT's more than 5,000 customers and 60,000 lanes in a matter of days.'' (CSXT Reply 16; *see also* CPKC Comments 10.) And, UP argues that time is necessary (1) to create a new systems for Board reporting, which UP claims would take one to two years, and (2) to design, program, test, and implement new methods for developing arrival-time estimates that would be consistent with the methods used to determine compliance with OETA standard. (UP Comments 18.) UP estimates that between one and two years would be required to complete the design, programming, and testing of such systems before they could be implemented, and ''not the 10-person/days estimated in the NPRM.'' (*Id.*)

CPKC adds that unique to it is the challenge of preparing to comply with the proposed rule at a time when the separate rail carriers that are part of the CPKC network continue to maintain separate systems that have yet to be fully integrated. (CPKC Comments 11.) In CPKC's judgment, the systems of its predecessors will require modification to be able to provide petitioners the data on a lane-specific basis from different 12-week periods in the way the proposed rule contemplates. (*Id.*) It notes that the Board has taken similar considerations into account when imposing new disclosure requirements on carriers. *See, e.g., Released Rates of Motor Common Carriers of Household Goods,* RR 999 (Amendment No. 5), slip op. at 2–3 (STB served Mar. 9, 2012) (extending by six weeks the original three-month period from issuance of decision to effectiveness, ''in order to provide additional time for affected parties to come into compliance, and in order to allow consumers to benefit from the changes as soon as possible.'').

The Board disagrees with UP's stated concern that an entirely new system will be needed to meet the reporting requirements of this rule and similarly disagrees with CSXT's assertion that it will take a year to update its existing software. While the Board recognizes that implementation of this new rule may require some software programming changes, the railroads fail to support their burden arguments. Specifically, the railroads do not adequately explain how the variances in measuring OETA using their current definitions would require such a significant reprogramming based on the definition of OETA the Board is adopting for part 1145. They also do not make such a showing as to modifying the definition of ISP and the underlying metrics in their systems.

Additionally, while CSXT raises a concern about building a reporting platform, the Board finds this claim to be overstated. CSXT's current platform already has a module, ''Trip Plan Performance,'' which ''provides customers with information on how well CSXT is complying with the trip schedules it generates for each container, trailer, and carload shipped by CSXT at the system, location, and lane level.'' CSXT Comments 6, Dec. 17, 2021, *First Mile/Last Mile Serv.,* EP 767. Similarly, CPKC's concerns also appear unfounded as CP appears to have had a sophisticated system for its customers. *See* Canadian Pac. Comments 2, Nov. 6, 2019, *Demurrage Billing Requirements,* EP 759 (''CP, as well as other railroads, already provide or make readily available a plethora of data that meet these [demurrage] objectives. Detailed data is accessible to the customer on a real time basis and in downloadable form.''). The Board will therefore not unduly delay implementation of part 1145. To promote a smooth transition though, railroads will have until September 4, 2024, the effective date of the final rule, to modify their software.

Additionally, AAR argues that, in light of policy and fairness concerns, the Board should not order a switching prescription based on a carrier's performance before the date on which any final rule is promulgated. (AAR Comments 111.) The Board finds this reasonable. Cases can therefore only be brought under part 1145 based on service occurring after the rule becomes effective.

Interline Traffic

AAR argues that the Board should gain experience applying performance standards to single-line traffic before applying performance standards to interline traffic, given the greater complexities with interline traffic. (AAR Comments 11.) The Board disagrees. There is no need to apply the rule first to single-line movements and then to interline movements as the standards measure an individual carrier's success in performing its own movement. However, as discussed in the Performance Standards section, the Board appreciates that there can be problems at an interchange and has adjusted its definition of when a shipment is delivered there.

CPKC also argues that the Board should defer application of part 1145 to interline movements based on similar concerns. (CPKC Comments 8; CPKC Reply 39–40.) When the Board does apply the rule to interline movements, CPKC seeks two modifications based on its fear that a petitioner could be incentivized to seek an alternate carrier to convert an interline movement into a single-line movement when an incumbent carrier only handles traffic for a minority of the origin to destination routing. (CPKC Comments 8.) One proposed modification involves limiting the eligibility of certain alternate carriers, and the second involves limiting the duration of the prescription. (*Id.* at 9.)[29] CPKC claims that both could be implemented in a manner that would preserve the central feature and purpose of the Board's rule as a service remedy while minimizing the potential for overreach. (*Id.*)

The Board will not adopt these adjustments concerning interline traffic. A prescription would be available under part 1145 with respect to the incumbent carrier's portion of an interline movement only if the requirements of part 1145 were met with respect to that movement. The prescription in that case would be consistent with the Board's goals in enacting part 1145. There is no cause, within this framework, to consider the petitioner's motivation in seeking access to an alternate carrier for the incumbent carrier's portion of the interline movement. To the extent that the incumbent carrier believed that the proposed prescription would cause undue impairment as provided for in part 1145, the Board would consider the carrier's objection in deciding whether to grant the prescription.

[29] The first approach would disqualify a proposed alternate carrier from switching access if (a) the incumbent serves only a minority of full origin-to-destination routes, (b) the alternate carrier's network would serve the entire origin-to-destination route after being granted switching access, and (c) the alternate carrier is not the only other Class I rail carrier serving the pertinent terminal. (CPKC Comments 9.)

The second approach could be applied in cases where the only available alternate carrier would serve the entire route after being granted switching rights. In those situations, according to CPKC, the Board should avoid an overreaching restructuring of the shipper's rail service options by limiting the duration of the order to that necessary to enable the incumbent to demonstrate that it can provide adequate service. According to CPKC, an appropriate limit might be that the order is effective initially for three months, during which time the incumbent would be entitled to demonstrate that its service had risen to an adequate level thereby terminating the alternate carrier's access. (*Id.*)

Data Production to an Eligible Customer

In the *NPRM,* the Board proposed to require Class I carriers to provide, within seven days of receiving a related written request from a shipper or receiver, all individualized performance records necessary for that shipper or receiver to file a petition under part 1145. 88 FR at 63902, 63910–11. The incumbent carrier would be required to record that data and, upon request from a shipper or receiver, would be required provide it to that customer. *Id.* at 63911.[30] The Board stated that the data disclosure requirement would facilitate implementation of part 1145 and provide customers with records ''necessary to ascertain whether a carrier did not meet the OETA, transit time, and/or ISP standards'' in order to bring a case at the Board. *Id.* at 63898, 63902. The Board also stated that railroads would be required to provide the shipper or receiver with machine-readable data, as defined in *Demurrage Billing Requirements,* EP 759, slip op. at 3 (STB served Apr. 6, 2021). *NPRM,* 88 FR at 63911 (inviting stakeholders to comment on what format and fields would be useful). The Board also sought comment on (1) whether carriers could be required to disclose data about past service to a shipper or receiver when a different entity paid for the service, and (2) whether the entity that paid for such service should be given an opportunity to seek confidential treatment of that service data. *Id.* at 63911 n.40.

CN and CSXT oppose the data disclosure proposal, arguing that it amounts to pre-petition discovery and that it improperly departs from both traditional litigation and standard Board practice. (CN Comments 32–22; CSXT Comments 38–39.) The carriers also argue that the *NPRM* did not identify a source of statutory authority that would allow the Board to require data disclosure outside the context of a Board proceeding and that neither section 11102 nor section 1321 support the data disclosure proposal. (CN Comments 33–34; CSXT Comments 39–40.) UP argues that shippers should not need data from the incumbent rail carrier to decide whether they are receiving inadequate service that justifies filing a petition under part 1145. (UP Reply 1–3 (stating that UP customers have online access to data allowing the customer to track and quantify UP's performance); *see also* CSXT Comments 40–41 (stating that CSXT already provides certain data to shippers).)

CN, CSXT, and UP also argue that the proposed data disclosure regulation at § 1145.8(a) is vague and overly broad. (CN Comments 31–32; CSXT Comments 39; UP Reply 2; *see also* AAR Comments 106–07 (urging the Board to provide details about the reporting requirements).) CN and CSXT state that the proposed regulation would not limit who can request data. They also raise concerns about the extent and potential frequency of data requests. (CN Comments 31; CSXT Comments 38–39 (arguing that requiring railroads to disclose information to parties not eligible for relief under part 1145 ''would serve no clear regulatory purpose'').) UP asserts that it is unclear whether a railroad will be ''expected to scour its records to identify any 12-week period in which standards were not met in a given lane'' and whether a carrier would satisfy the data disclosure requirement by producing no records if it determines that a standard was not violated. (UP Reply 2; *see* CN Comments 31–32.) These rail carriers suggest that the Board should instead require railroads to disclose certain performance records to customers only after that customer has filed a petition under part 1145. (CN Comments 35 (noting that the petitioner should also file a protective order); CSXT Comments 39 (stating that metrics could be provided through either the discovery process or an initial disclosure process); UP Reply 3 (suggesting an ''expedited discovery process'' following the filing of a petition).)

The Coalition Associations oppose requiring shippers to file a petition under part 1145 before a rail carrier is required to disclose individualized performance data. The Coalition Associations argue that such a procedure would require shippers to file a petition before knowing whether data demonstrates a service inadequacy that supports a petition under part 1145. (Coal. Ass'ns Reply 25.) As an alternative to the proposal to require a petition to be filed before a railroad would be required to disclose data, the Coalition Associations propose that shippers submit a 30-day pre-filing notice, after which the incumbent rail carrier would have five business days to provide the requisite service data for the six-month period preceding the pre-filing notice. (*Id.* at 25–26.) In contrast, NGFA argues that shippers and receivers should be able to request and receive data as often as they believe it would be beneficial and that shippers should be able to challenge the data that the carrier provides. (NGFA Comments 4.)

The Board declines to adopt proposals that would require railroads to disclose performance data to a shipper or receiver only after the shipper or receiver has filed a petition under part 1145. Section 1321(a) gives the Board broad authority to fashion means to carry out its duties under Chapter 13 and Subtitle IV of the Interstate Commerce Act, including the Board's duty to exercise its discretion under section 11102(c) in furtherance of the public interest. Indeed, as expressly provided in section 1321(a), the enumeration of particular powers in Chapter 13 and Subtitle IV does not exclude other powers that the Board may have in carrying out those provisions. More generally as well, the Board has broad discretion to fashion means to carry out its duties, even when those means are not expressly enumerated in the Act. *See ICC* v. *Am. Trucking Ass'ns,* 467 U.S. 354, 364–65 (1984) (citing *Trans Alaska Pipeline Rate Cases,* 436 U.S. 631 (1978)) (stating that the ICC may exercise powers that are not expressly enumerated when those powers are legitimate, reasonable, and directly adjunct to the agency's express statutory powers); *Zola* v. *ICC,* 889 F.2d 508, 516 (3d Cir. 1989). Therefore, the Board is not persuaded that, absent express authorization in section 1321 or section 11102 to require railroads to disclose information to third parties, the Board lacks such authority. (CN Comments 34.) Such a narrow reading of the Board's authority would unduly hinder implementation of section 11102(c) by blocking the availability of information that the Board has determined is relevant to the public interest thereunder.

Here, the data disclosure requirement is a reasonable exercise of the Board's discretion and is narrowly tailored to implement a particular procedure under section 11102(c) effectively. As stated in the *NPRM,* the data disclosure requirement is intended to provide customers with records that are necessary to ascertain whether a carrier has met the OETA, transit time, and/or ISP standards. *NPRM,* 88 FR at 63902. In the context of part 1145, the requirement that rail carriers provide this information to shippers/receivers about their own traffic ensures that these customers have basic eligibility information that is otherwise in the hands of the carriers. In this way, the data disclosure requirement differs from traditional discovery. Without the data, a shipper or receiver may have difficulty in determining whether, if the shipper or receiver submitted a petition, the

[30] As explained in the *NPRM,* the data in question would include all of the customer's data on traffic that was assigned OETAs and local service windows, along with corresponding time stamps indicating performance. *NPRM,* 88 FR at 63911.

shipper or receiver could establish a failure to meet a performance standard. Ensuring that a shipper or receiver has access to evaluate basic eligibility before filing a petition will help to facilitate the Board's implementation of part 1145 and is consistent with the Board's authority under section 11102(c)(1), as it will reduce unnecessary litigation and facilitate the expeditious handling and resolutions of petitions for prescription of a reciprocal switching agreement. By promoting efficient regulatory proceedings and sound regulatory decisions, the data disclosure requirement is reasonably adjunct to the Board's statutory responsibilities while advancing the purposes of section 1321(b) and the RTP. *See* 49 U.S.C. 10101(2), (15).

Moreover, although some rail carriers argue that shippers already have access to carriers' online platforms containing data necessary to file a petition, rail users have complained that railroads often provide data in a way that is ''incomprehensible to even seasoned industry veterans.'' [31] Given the variability of individual carrier online platforms and current metric-related methodologies, the data disclosure requirement will ensure that shippers and receivers have access to standardized data clearly correlating to the standards in part 1145. Carriers remain free, however, to maintain their existing platforms and customer interfaces as long as they are also able to provide the standardized part 1145 data to shippers upon request.

Contrary to CN's argument, it would not be inconsistent with the Board's practices to require data disclosure before a regulatory proceeding. For example, the Board requires carriers to include specific information on demurrage bills to allow customers to more readily gauge whether to challenge their demurrage assessments. *See* 49 CFR 1333.4; *see Demurrage Billing Requirements,* EP 759, slip op. at 1, 9.

The Board also rejects the Coalition Associations' proposal to require a potential petitioner to submit a prefiling notice, with that notice serving as the basis for the potential petitioner to obtain data from its incumbent carrier. The purpose of the data disclosure requirement is to enable a potential petitioner to assess *before* initiating regulatory proceedings whether to initiate those proceedings. That objective would be undermined by requiring a potential petitioner to submit a pre-filing notice as a condition to obtaining relevant information. A pre-filing notice would be an additional step, one that could even discourage some shippers or receivers from moving forward under part 1145. At the same time, a pre-filing notice is not required as a matter of law. As discussed above, the Board has ample authority to require data disclosure without regard to whether related regulatory proceedings are pending.

However, the Board is persuaded that greater specificity in § 1145.8(a) would facilitate timely responses by carriers to requests for individualized performance records. The proposed regulatory text will be modified to require a response by the carrier when a shipper or receiver has practical physical access to only one Class I rail carrier with respect to the lane(s) in question and when the request identifies the relevant lane(s), the range of dates for which records are requested, and the performance standard(s) in question. The Board will also define ''individualized performance records'' as OETA, transit times, and/or ISP data related to the shipper or receiver's traffic, along with the corresponding time stamps.

The Board will not, as some rail carriers suggest, place limitations on the frequency of requests for individualized performance records or the time period during which data can be requested. (*See* CSXT Comments 38–39.) The record indicates that most, if not all, shippers already have access to similar data from carrier online platforms that provide performance information, though not on a standardized basis. (*See id.* at 40–41; UP Reply 2.) Therefore, the Board is not persuaded that the carriers' concerns about receiving voluminous requests for data are likely to come to bear, as shippers may choose not to formally request this information from railroads unless they are close to initiating a proceeding. (*See* CSXT Comments 38–39.) For the same reason, the Board finds that seven days is adequate for the incumbent rail carrier to provide individualized performance records upon written request from a shipper or receiver, given that the carriers already track this information in the ordinary course of business.[32]

However, the data production is intended to implement part 1145, and the Board expects shippers and receivers to request individualized performance records based on a good faith belief that the Class I rail carrier has provided service that does not meet at least one performance standard in part 1145. In response to such a request, a carrier shall provide records for the identified standard(s). In a petition for prescription of a reciprocal switching agreement, a shipper or receiver may also challenge the veracity of the data provided.

Additionally, and as proposed in the *NPRM,* the Board will adopt a requirement that the data be machine-readable, ''meaning 'data in an open format that can be easily processed by computer without human intervention while ensuring no semantic meaning is lost.''' *NPRM,* 88 FR at 63911 (citing *Demurrage Billing Requirements,* EP 759, slip op. at 3 n.9). As noted above, some rail users state that data provided by railroads is often incomprehensible. (NSSGA Comments 4; AFPM Comments 6.) A machine-readable data requirement will ensure that rail users have access to data that allows them to ascertain whether their individualized performance records meet the standards for a petition under part 1145. The Board will give Class I carriers the discretion to determine how to provide rail users with access to machine-readable data, including through a customized link, electronic file, or other similar option. In addition, to provide greater clarity as requested by carriers and more generally to facilitate the implementation of the rule, the Board will require Class I carriers to retain all data necessary to respond to requests for individualized performance records for a minimum of four years. (*See* AAR Comments 107; CPKC Comments 11.)

[31] (NSSGA Comments 4; *see also* AFPM Comments 6 (stating that rail carriers have a ''history of technically providing data that were extremely difficult to understand''); CSXT Comments 15–16 (noting that the Board's definition of OETA is ''similar'' to CSXT's TPP, which CSXT reports on ShipCSXT); UP Comments 6 (noting that in assessing a car's compliance with its trip plan, UP's TPC measure for manifest traffic adjusts for the impact of various events that delay or change a car's arrival time but are not caused by UP service issues).)

[32] CN argues that the data disclosure requirement raises confidentiality concerns. CN appears to suggest that, when the shipper or receiver that requests data is not the payor, the payor may wish to seek confidential treatment of the data. (CN Comments 34–35.) CN also asks the Board to consider 49 U.S.C. 11904, which prohibits rail carriers from disclosing certain information to persons other than the shipper or consignee without consent. (CN Comments 34.) CN suggests that the Board instead require data disclosure only in the context of a formal regulatory proceeding, after a petition has been filed and the Board has issued a protective order. (*Id.*) The Board rejects CN's suggestion. If the payor is concerned that the shipper or receiver will disclose the requested data to an unauthorized third party, the payor may address that concern through its agreement with the shipper or receiver. There is no need for the Board to initiate a regulatory proceeding to protect the payor's interest. As for the prohibition on carriers' disclosure of certain service-related data to parties other than the shipper or consignee under section 11904, that prohibition is not implicated by the data disclosure requirement. As clarified in the final rule, a carrier need only provide to a shipper or receiver data that pertains to the carrier's service to that shipper or receiver, which is already permissible under section 11904.

This approach will ensure that the Board, shippers, and receivers have available data that is relevant to implementation of part 1145, including the multi-year transit time standard in § 1145.2(b)(2).

Terminal Areas

In this proceeding, the Board proposed a rule that would permit shippers and receivers to seek prescription of a reciprocal switching agreement for a movement that begins or ends within a terminal area. The reciprocal switching agreement would provide for the shipment to be transferred within the terminal area in which the shipment begins or ends its journey on the rail system. *NPRM,* 88 FR at 63902;[33] *id.* at 63898 (''The newly proposed regulations would provide for the prescription of a reciprocal switching agreement when service to a terminal-area shipper or receiver fails to meet certain objective performance standards.''). As discussed below, some commenters urge the Board to go further and institute broader competitive-access initiatives, while others request clarification or express views on how various terms should be understood. Some assert that the rule should not include a definition of ''terminal area'' but, rather, should simply rely on existing case precedent. However, no commenter questions the permissibility or practicality of a terminal-based approach. In AAR's view, a terminal-area limitation ''is good policy'' because it is likely to eliminate from consideration a number of potential switching arrangements that would be ''highly impractical and inefficient.'' (AAR Comments 27.)

The Coalition Associations—joined by Celanese and AF&PA/ISRI—state that they support the Board's proposed definition of ''terminal area'' (the area in which a shipper or receiver must be located to be eligible for prescription of a reciprocal switching agreement under part 1145) because ''[t]he function-based definition is consistent with precedent'' and constrains carriers' ability to undermine the proposal by seeking to establish ''narrow geographic boundaries.'' (Coal. Ass'ns Comments 5, 45; *accord* Celanese Comments 2; AF&PA/ISRI Comments 2.) USDA suggests that the Board consider providing a non-exhaustive list of ''terminal areas'' to which the rule would apply. (USDA Comments 7.)

Several commenters approve of the overall switching proposal in the *NPRM* but state that it should not be limited to terminal areas. For example, NGFA (joined by three other organizations)[34] supports the policy underlying the *NPRM*—to provide incentives for railroads to provide adequate service—but states that the proposed rule ''could prove to be too narrow in scope to be of use to many agricultural shippers by applying only to 'service to a terminal area shipper or receiver.''' (NGFA Comments 2, 8–9 (noting that its members are often captive to Class I rail carriers at locations that are outside of ''terminal areas'' as the Board would define that term in proposed § 1145.1).) EMA echoes this view, asserting that a rule limited to ''terminal areas'' would leave many rural EMA members who are captive shippers without a remedy for poor service. (EMA Comments 9–10; *accord* NMA Comments 6 (calling for access remedies for rail customers not located within terminal areas).) Olin and PCA assert that limiting reciprocal switching to ''terminal areas'' as defined in the *NPRM* is unduly restrictive because the statute does not require such a limitation. (Olin Comments 4–5; PCA Comments 3, 13–14.) WCTL and the Coalition Associations express a similar view. (WCTL Comments 9–10; Coal. Ass'ns Reply 19–20.) WCTL also states that the scope of reciprocal switching relief should be assessed on a case-by-case basis that allows for consideration of the facts and circumstances of the particular case, rather than ''strict, geographic limits.'' (WCTL Comments 10.) These commenters and others urge the Board to return to the proposal in Docket No. EP 711 (Sub-No. 1),[35] or take other action to broaden the impact of reciprocal switching prescriptions.[36]

Conversely, AAR asserts that any prescription of reciprocal switching must be limited to traffic within a terminal area because ''the terminal-area limitation is required by statute.'' (AAR Comments 25–26; *accord, e.g.,* CN Comments 8.) AAR further suggests that ''[t]he Proposed Rule will most effectively embody the Board's intent to limit switching arrangements to terminal areas'' if it relies on case precedent to define a terminal area and ''makes clear in the regulatory text that the Board will prescribe switching *only* in such areas.'' (AAR Comments 29.)

As stated in the *NPRM,* the Board proposed a rule that ''would provide for the prescription of a reciprocal switching agreement when service to a terminal-area shipper or receiver fails to meet certain objective performance standards.'' *NPRM,* 88 FR at 63898. The proposed rule's focus on terminal-area shippers and receivers is consistent with prior cases on reciprocal switching. As a policy matter, the Board concludes that the same approach is appropriate to this rule. In the case of terminal-area shippers and receivers, access to another rail carrier tends to be limited by the difficulty of constructing even the minimal amount of new track that would allow the other carrier to reach the shipper or receiver directly. The new regulations in part 1145 are intended to address this relatively discrete need by focusing on terminal-area shippers and receivers. They are not intended to address circumstances in which, due to the shipper or receiver's location outside of a terminal area, a regulatory introduction of an alternate rail carrier to address service issues might have different policy implications.[37] Accordingly, the Board

[33] The *NPRM* proposed defining a ''terminal area,'' as a commercially cohesive area in which two or more railroads collect, classify, and distribute rail shipments for purposes of line-haul service. A terminal area is characterized by multiple points of loading/unloading and yards for local collection, classification, and distribution. A terminal area (as opposed to main-line track) must contain and cannot extend significantly beyond recognized terminal facilities such as freight or classification yards. The proposed definition further clarified that a point of origin or final destination on the rail system that is not integrated into or, using existing facilities, reasonably cannot be integrated into the incumbent carrier's terminal-area operations would not be suitable for a prescribed switching arrangement. 88 FR 63913.

[34] NGFA's comments are supported by the North American Millers' Association, Agricultural Retailers Association, and the National Council of Farmer Cooperatives. (NGFA Comments 2.)

[35] (*E.g.,* Olin Comments 4–5; PCA Comments 3, 13–14.)

[36] (*E.g.,* NGFA Comments 3, 9–11 (calling for the Board to resume or take final action under multiple dockets); EMA Comments 9–10 (broaden definition or develop new rule to protect EMA members who are remote rural captive shippers); Coal. Ass'ns Comments 46–47 (initiate proceeding to expand the rule to shippers outside terminal areas pursuant to 49 U.S.C. 10705(a)(2)(c)); Coal. Ass'ns Reply 19–20 (include common stations where the two carriers currently interchange traffic); Ravnitzky Comments 2 (establish a default interchange point based on the nearest feasible location where both railroads can access each other's tracks).) GPI encourages the Board to be attentive to any concerns expressed from rural captive shippers after the rule goes into effect to help ensure that these shippers are not disadvantaged as Class I rail carriers ''focus their priorities in more competitive areas of the country.'' (GPI Comments 3.)

With respect to NGFA's comment concerning action in other dockets, the Board notes that a final rule was issued earlier this year in Docket No. EP 762 amending the emergency service regulations at part 1146; among other things, the new rule establishes a more streamlined and accelerated process for entertaining emergency service petitions under 49 U.S.C. 11123 and clarifies the Board's use of its regulations when acting on its own initiative to direct emergency service. *See Expedited Relief for Serv. Emergencies,* EP 762.

[37] *See* Laurits R. Christensen Assoc., Inc., A Study of Competition in the U.S. Freight Railroad Industry and Analysis of Proposals That Might Enhance Competition, 22–13 (rev. 2009) (discussing economic implications of different forms of regulatory intervention); *Midtec Paper Corp.* v.

will not adopt commenter proposals to reopen Docket No. EP 711 (Sub-No. 1) or expand the scope of part 1145 to shippers and receivers outside of terminal areas as defined in part 1145. This decision does not leave such customers without recourse for poor service; parts 1144 and 1147 both cover trackage rights and through routes as well as reciprocal switching agreements, and both parts can provide a remedy for poor service when the conditions therein are met.[38] Given that the Board has chosen as a policy matter to limit part 1145 to terminal-area shippers and receivers, it is unnecessary to resolve here whether 49 U.S.C. 11102(c) would accommodate a more expansive approach. Below, the Board addresses commenters' claims and contentions about the significance of various facts in determining what constitutes a ''terminal area,'' and other remarks or requests pertaining to this subject.

The Board underscores at the outset that, consistent with case precedent, the Board has taken a functional approach to defining ''terminal area'' for purposes of this rule. The agency has long understood ''terminal area'' in such functional terms: as a commercially cohesive area in which two or more railroads engage in the local collection, classification, and distribution of rail shipments for purposes of line-haul service, characterized by multiple points of loading/unloading and yards for such local collection, classification, and distribution. *NPRM,* 88 FR at 63902 (citing cases). A terminal area (as opposed to main-line track) must contain, and cannot extend significantly beyond, recognized terminal facilities, such as freight or classification yards. *Id.* at n.11. In other words, a ''terminal area'' is defined by the scope and nature of its functions, rather than, for example, distance limits, and the assessment of related issues may be fact-specific.[39] For this reason, the Board agrees with AAR that it would not be practical or productive to publish a list of ''terminal areas'' (as USDA suggests).[40]

While the regulatory text does not incorporate a list, the Board notes that, as a general matter, a normal revenue interchange point on the Open and Pre-Pay Stations List is often located within a ''terminal area.'' AAR asserts that inclusion on that list ''does not suggest there is'' a terminal area as described in the *NPRM.* (AAR Comments 29–30.) As the Board indicated in the *NPRM,* inclusion on the list as a normal revenue interchange point would be relevant (albeit not dispositive) evidence in identifying a terminal area. The list is a useful tool that could assist shippers and receivers in assessing whether their facilities are within a terminal area. Carriers would remain free to present—and the Board would also consider—evidence and argument that the area does not possess the attributes needed to qualify as a terminal area.

The Board also notes that the types of equipment and crew used to accomplish a movement that is incidental to a line-haul move do not dictate whether a particular origin or destination point is within a ''terminal area.'' AAR's suggestion to the contrary is misplaced.[41] *See, e.g., Midtec,* 3 I.C.C.2d at 179 (rejecting incumbent carrier's contention that the service it provided to the shipper was line-haul service—not switching—because it used road trains and crews rather than the switch engines and yard crews generally used in switching or terminal operations). The case law allows the Board to consider whether movements from the customer's facility are integrated into the incumbent carrier's local terminal area operations, whether service is performed within a cohesive commercial area, and other relevant characteristics. *See, e.g., Rio Grande Indus.,* FD 31505, slip op. at 10–11 (collecting cases).[42] As has long been the case, these questions will be assessed on a case-by-case basis in the event of a dispute. *See, e.g., Midtec,* 3 I.C.C.2d at 179 (''The questions of what is a terminal area and what is switching are factual ones requiring consideration of all the circumstances surrounding a particular case.'').

For similar reasons, AAR's suggestion that a terminal area does not exist if one carrier serves all the industries in an area and ''must carry traffic on a line haul'' to reach the other carrier for purposes of the switch, (AAR Comments 26 n.3), is misguided. The Board would consider, on a case-by-case basis, taking into account all the pertinent facts, whether a particular switching interchange could be considered to be within a terminal area for purposes of this rule. FRCA/NCTA point out that ''[t]here are areas where a single railroad provides the terminal service for itself as well as its competitor(s),'' and assert that ''the requirement that two carriers perform terminal services in a given area appears overly restrictive.'' (FRCA/NCTA Comments 2.) The Board will maintain the two-carrier requirement in the final rule, without dictating what it would mean, in an individual case, for two carriers to perform terminal-area services. Consistent with the principles discussed above, in the event of a dispute, the resolution of whether a particular carrier or activity satisfies the rule's definition would be made based on case-by-case analysis.

Finally, it is unnecessary to amend the regulatory text of proposed §§ 1145.2(c) and 1145.6(a) to state, as suggested by AAR, that reciprocal switching will be prescribed only within a terminal area. (AAR Comments 27–28.) The existing definition of ''reciprocal switching agreement'' is clear—as are the *NPRM* and this final

United States, 857 F.2d 1487, 1502 (D.C. Cir. 1988) (describing the use of terminal trackage rights as a more intrusive remedy than switching).

[38] As stated in the *NPRM,* shippers may still pursue access to an alternate rail carrier that goes beyond reciprocal switching under 49 CFR parts 1144 and 1147, which also allow for continued development, including, as appropriate, the Board's reassessment of adjudicatory policies and the appropriate application of those rules in individual cases. *NPRM,* 88 FR at 63900. Moreover, the Board's action in this docket is not intended to suggest that consideration of additional reforms directed towards increasing competitive options will be foreclosed in other proceedings. *Id.*

[39] *See Midtec,* 3 I.C.C.2d at 179 (''The questions of what is a terminal area and what is switching are factual ones requiring consideration of all the circumstances surrounding a particular case.''). Commenters recognize the merit of a flexible, functional approach. (*See, e.g.,* Coal. Ass'ns Comments 5, 45 (stating that the function-based definition is consistent with precedent and forecloses carriers from evading accountability by establishing artificial geographic boundaries for terminal areas); AAR Comments 27 (acknowledging that distance is a poor indicator of whether a switch will be operationally feasible or can be integrated into existing operations); CN Comments 8–9 (noting agency's ''long history'' of assessing terminal area issues on a case-by-case basis in light of the many types of factors that are considered).)

[40] (*See* USDA Comments 7 (suggesting that the Board publish a non-exhaustive list of ''terminal areas'' to which the proposed rule would apply); AAR Reply 32–33 (explaining why USDA's proposal would be time-consuming and difficult to implement).) VPA's request for a broad ''declar[ation] that ports are terminal areas,'' (VPA Comments 1, 12), will not be granted for similar reasons. (*See, e.g.,* AAR Reply 33 n.11.)

[41] (AAR Comments 28 (stating that industries ''served by road switchers from the terminal complex'' should not be covered by the proposed rule).) Conversely, whether a shipper or receiver can be ''reached by a local train dispatched from a freight yard'' does not determine the scope of a terminal area, and the agency has properly rejected suggestions to this effect. *See Rio Grande Indus.—Purchase & Related Trackage Rts.—Soo Line R.R.,* FD 31505, slip op. at 11 (ICC served Nov. 15, 1989). As discussed above, and consistent with long-standing practice, the Board would consider the totality of pertinent facts in determining whether a particular origin or destination point is located within a terminal area. The Board anticipates that, in most instances, determining whether that point is located in a terminal area should not be time consuming or controversial.

[42] The definition of ''terminal area'' proposed and adopted in this rule is not intended to exclude from consideration all areas across the network that have some portion of main-line track, if that track is used for local movements that are incidental to a line-haul move and other requirements for a terminal area are met. *See, e.g., Midtec,* 3 I.C.C.2d at 179–80.

rule—that prescriptions will be limited to terminal areas.[43]

Some commenters state that the final rule should omit a definition of ''terminal area.'' AAR asserts that the rule does not need to define this term because agency precedent already describes how to identify a terminal area; AAR maintains that adding a definition by rule could create confusion. (AAR Comments 28–29.) CN reiterates this view. (CN Comments 30.) Some shippers also favor omitting the definition. (*See, e.g.,* Olin Comments 4 (stating that the statute does not define ''terminal area'' and that such matters ''are determined on a case-by-case basis''); PCA Comments 13–14 (same; also stating that proposed definition is unnecessary and unduly restrictive).) The Board finds that it is useful and appropriate to provide stakeholders with a concise, readily accessible definition of ''terminal area'' in the regulation itself. Accordingly, the Board will reject suggestions to omit the definition. The Board notes that this definition relies on case precedent that reflects the functional, multi-factored approach the agency has long taken in considering issues involving terminal areas, and that these determinations turn on their particular facts. *See, e.g., Midtec,* 3 I.C.C.2d at 179 (agency must consider ''all the circumstances surrounding a particular case''). The Board thus finds unpersuasive AAR's claim about the risk of ''unnecessarily (and potentially erroneously) unsettling that existing body of law.'' (AAR Comments 29.) At the same time, including a concise, accessible definition in the rule does not mean the Board will depart from its long-standing practice of conducting a case-specific analysis of the pertinent facts in each proceeding, as CN, Olin, and PCA suggest the Board should—and the Board will—continue to do. (*See* CN Comments 8–9 (referencing agency's ''long history'' of considering terminal area issues on a case-by-case basis); Olin Comments 4; PCA Comments 13.)

CN additionally expresses confusion about the meaning of the last sentence of the proposed definition of ''terminal area'' in § 1145.1. (CN Comments 29.) As proposed, that sentence states: ''A point of origin or final destination on the rail system is not suitable for a prescribed switching arrangement if the point is not integrated into *or, using existing facilities, reasonably cannot be integrated into* the incumbent rail carrier's terminal-area operation.'' *See NPRM,* 88 FR at 63913 (emphasis added). According to CN, the italicized clause might be read to suggest that a point outside of a terminal area could, in some circumstances, be suitable for a prescribed reciprocal switching agreement. As discussed above, prescriptions under part 1145 will be limited to points of origin or final destination that are located within terminal areas. The Board will revise the regulatory text to make this point clear.

The *NPRM* invited comments as to whether the reciprocal switching tariff of an alternate carrier applicable to shippers in the same area should be considered as evidence that the area is a terminal area. *NPRM,* 88 FR at 63902 n.12. AAR asserts that ''[t]here are many reasons that the existence of a tariff describing switching is not evidence of the geography of a terminal area.'' (AAR Comments 30.) Specifically, AAR says, the existence of a tariff that is not used (in AAR's terms, a ''legacy'' tariff) ''would not speak to the operational realities that define a terminal area'' because, according to AAR, it would not be indicative of ''actual switching practice that the capabilities of infrastructure within a commercially cohesive area support.'' (*Id.*) AAR also remarks that tariffs may be labeled ''reciprocal switching'' that ''do not reflect 'reciprocal switching' in the statutory sense (*i.e.,* in a terminal area).'' (*Id.*) Finally, AAR argues that even reciprocal switching tariffs that ''otherwise align with the statutory definition of reciprocal switching'' may not support the conclusion that a particular location is within a terminal area. (*Id.* at 30–31 (commenting that these tariffs ''may exist more as a matter of historical happenstance than current economic and operational reality,'' or ''may have limited scope as to shippers, destinations, commodities, or number of railcars to which they apply'').) AAR maintains that construing such tariffs as evidence of a terminal area ''risks sweeping in areas that cannot meet the Board's established definition of that term.'' (*Id.* at 31.)

To the extent that AAR is arguing that the Board should not consider the existence of such a tariff as relevant evidence at all, the Board disagrees.[44] As the Coalition Associations point out, an alternate carrier's tariff plainly is relevant. (Coal. Ass'ns Comments 46.) The publication of a reciprocal switching tariff may indicate that the carriers have the ability to engage in transfers that are incidental to a line-haul move—which could constitute useful evidence pertinent to determining whether there is a terminal area for purposes of this rule. Furthermore, carriers would always have the opportunity to demonstrate that a particular location should not be considered part of a ''terminal area,'' that a particular prescription would not be practicable (which appears to be at the core of AAR's concern), or that regulatory requirements under the rule were not otherwise met. For these reasons, the Board concludes that it is appropriate to consider the existence of a reciprocal switching tariff, applicable to shippers or receivers in the same area, in determining what constitutes a terminal area. Similarly, the Board would consider evidence, apart from the publication of a tariff, that carriers in that area were engaged in reciprocal switching arrangements.

The Board also invited comments on how to reconcile inconsistencies in tariffs. *NPRM,* 88 FR at 63902 n.12. AAR states that it is not aware of any systematic issue relating to inconsistencies that would be amenable to treatment in a general rule; it suggests that any such issues would need to be addressed on a case-by-case basis. (AAR Comments 31.) The Coalition Associations maintain that inconsistencies between incumbent and alternate carrier tariffs are only a concern when no reciprocal switching is occurring between any facilities in the terminal area—in which case, they state the Board should examine the history of interchanges between the carriers within that terminal. (Coal. Ass'ns Comments 46.) The Coalition Associations suggest that inconsistencies should otherwise be resolved in favor of a presumption that any point within the terminal area could qualify for a prescription. (*Id.*) Based on the comments received, the Board concurs with AAR that any issues that may arise concerning tariff

[43] A reciprocal switching agreement is an agreement for the transfer of rail shipments between one Class I rail carrier or its affiliated company and another Class I rail carrier or its affiliated company *within the terminal area* in which the rail shipment begins or ends its rail journey. Service under a reciprocal switching agreement may involve one or more intermediate transfers to and from yards *within the terminal area. NPRM,* 88 FR at 63913 (emphasis added); *see also, e.g., id.* at 63915 (proposed § 1145.6(b), describing switching service under the agreement as ''the process of transferring the shipment between carriers within the terminal area''); *id.* at 63909 (stating that switching service under a reciprocal switching agreement under part 1145 would occur within a terminal area).

[44] Contrary to AAR's implication, (AAR Comments 31–32), the Board is not suggesting that the publication of a tariff would be dispositive in defining the existence or scope of a terminal area. It is one piece of evidence, among others, that the Board would consider. Indeed, AAR appears to acknowledge that tariffs are useful in defining the scope of reciprocal switching services, (*id.* at 31), which is one factor, among others, that would bear upon the Board's assessment of the existence and scope of a terminal area.

inconsistencies should be resolved on a case-by-case basis.

Practicability

The Board stated in the *NPRM* that, because switching service under a prescribed reciprocal switching agreement would occur within a terminal area,[45] there is reason to conclude that those agreements would be practicable under section 11102(c). *NPRM,* 88 FR at 63909. The Board added, however, that, should a legitimate practicability concern arise, it would consider whether the switching service could be provided without unduly impairing the rail carriers' operations. *Id.* The Board also stated that it would consider an objection by the alternate rail carrier or incumbent rail carrier that the alternate rail carrier's provision of line-haul service to the petitioner would be infeasible or would unduly hamper the objecting rail carrier's ability to serve its existing customers.[46] As explained in the *NPRM,* the objecting rail carrier would have the burden of proof of establishing infeasibility or undue impairment. *NPRM,* 88 FR at 63909.[47] The Board further proposed that, if the carriers had an existing reciprocal switching arrangement in the petitioner's terminal area, the incumbent carrier would bear a heavy burden in demonstrating why the proposed reciprocal switching agreement would be operationally infeasible. *See id.* at 63902, 63915.[48]

AAR and CSXT argue that a petitioner under part 1145 should be required to address practicability in its petition. According to AAR, the Board has recognized that shippers must affirmatively address feasibility concerns in other access proceedings.[49] AAR argues that the Board should take a similar approach here and require the petition to address practicability. (AAR Comments 63–64.) AAR also states that the Board would be prevented from making ''an affirmative finding'' with respect to practicability if this issue is not addressed in the petition. (*Id.* at 63.) CSXT asserts that ''the burden is on the petitioner to prove practicability, as the advocate of agency action.'' (CSXT Comments 44.)[50] CSXT itself recognizes, however, that rail carriers are often in the best position to opine on safety and feasibility. (*Id.*)[51] CSXT suggests therefore that the Board require rail carriers to inform the petitioner during the pre-petition negotiation period whether the carriers will contest practicability and, if they intend to do so, permit the petitioner to conduct limited discovery on that issue. (CSXT Comments 44.)

The Board rejects the suggestion that practicability must be addressed in a petition filed under part 1145. Under the rule, the prescription would only occur in a terminal area, thereby lowering the likelihood of infeasibility and undue operational impact (as compared to a more expansive form of potential regulatory intervention). If an objection to practicability were raised, it would be, therefore, reasonable to require the objecting rail carrier to bear the burden of proof of showing that transfers under the proposed agreement would be infeasible. Placing this obligation on the rail carrier would also promote the RTP by allowing efficient and expeditious handling of a petition under part 1145. *See* 49 U.S.C. 10101(2), (15). The same is true with respect to carriers' obligation to demonstrate that resulting line-haul arrangements would be infeasible or would unduly impair the ability to serve other customers. For both the switching services and line-haul arrangements, the carriers—not the petitioner—would have direct knowledge of the relevant information. Notwithstanding the aforementioned, however, a petitioner may seek discovery on practicability issues after the filing of a petition—in anticipation of an objection to practicability from either the incumbent or alternate rail carrier—and the Board itself can require additional information from carriers in particular cases. There is therefore no need to provide for pre-petition discovery on practicability issues, which would create an unnecessary hurdle and delay for potential petitioners. Moreover, although AAR suggests that the Board would be prevented from making ''an affirmative finding'' with respect to practicability if this issue is not addressed in the petition, (*see* AAR Comments 63), this assertion is mistaken. Any final decision, including findings on practicability, if raised, would be issued at the conclusion of the proceeding, based on the full record before the Board. Further, due to the characteristics of a switching arrangement, as explained above and as defined and scoped by this rule, in a case where no party raised practicability as an issue, the Board would be justified in ''find[ing] [the] agreement[ ] to be practicable'' as required by the statute. 49 U.S.C. 11102(c).

Nor is it necessary for part 1145 to follow the approach in part 1147, which does require that an initial petition discuss practicability. A petition filed under part 1147 requires an advance commitment from another available railroad to provide the alternative service, *see* 49 CFR 1147.1(b)(1)(iii)—meaning the petitioner there would have direct access to information bearing on practicability considerations before the petition is filed. The advance commitment requirement is not a feature of part 1145, making it less likely that the petitioner will have access to such information at the beginning of a case.

---

[45] As discussed above, *see* Terminal Areas, the last sentence of the definition of ''terminal area'' in § 1145.1 will be modified to promote clarity. However, because that modification does not expand the definition of terminal area beyond the *NPRM* or precedent, it does not impact the discussion below.

[46] *Id.; see id.* at 63915 (proposed § 1145.6(b), stating that notwithstanding paragraph (a), the Board will not prescribe a reciprocal switching agreement if the objecting carrier demonstrates that switching service under the agreement ''could not be provided without unduly impairing either carrier's operations; or the alternate carrier's provision of line-haul service to the petitioner would be infeasible or would unduly hamper the incumbent carrier or the alternate carrier's ability to serve its existing customers''). For purposes of consistency, § 1145.6(b) will be modified to replace ''*unduly hamper*'' with ''*unduly impair*'' (emphasis added). This modification does not substantively change the regulatory text; the terms as used in the final rule are essentially the same. ''Hamper'' is defined to mean ''to interfere with the operation of'' or ''to restrict the movement of'' and ''impair'' is defined to mean to ''diminish in function, ability, or quality.'' *See* Hamper, Merriam-Webster Dictionary, available at *www.merriam-webster.com/dictionary/hamper; see also* Impair, Merriam-Webster Dictionary, available at *www.merriam-webster.com/dictionary/impair.*

[47] Section 1145.5(d) will be modified to make clear that the burden of proof of establishing infeasibility and undue impairment will be on the objecting carrier. Evidence relating to the types of infeasibility and undue impairment referenced in the rule would be relevant in determining whether an objection to the practicability of a prescription was meritorious.

[48] Minor clarifying changes have been made in the regulatory text of § 1145.6(b) to more closely correspond to the descriptions of these concepts provided in the preamble of the *NPRM* and the final rule.

[49] (AAR Comments 63 (citing 49 CFR 1147.1(b)(1)(iii), which requires, inter alia, that a petition filed under part 1147 contain ''an explanation of how the alternative service would be provided safely without degrading service to the existing customers of the alternative carrier and without unreasonably interfering with the incumbent's overall ability to provide service'').)

[50] CSXT cites *Golden Cat Division of Ralston Purina Co.* v. *St. Louis Southwestern Railway* (*Golden Cat*), NOR 41550 (STB served Apr. 25, 1996), as support for this proposition. However, *Golden Cat* involved a complaint proceeding brought directly under former 49 U.S.C. 11103(a)—not the establishment of a new regulatory framework to efficiently and effectively address requests for reciprocal switching prescriptions under a defined service-based framework. Moreover, in that case, issues relating to which party bore the burden of proof on a particular issue (such as practicability) were not raised or contested, and thus were not before the agency for decision.

[51] AAR similarly recognizes that the issue of practicability ''would likely . . . be addressed in the carrier's reply'' to a petition. (AAR Comments 63.)

AAR asserts that, in assessing practicability under part 1145, the Board should apply the standards that were articulated in *Delaware & Hudson.*[52] (AAR Comments 64.) AAR's underlying assumption is that the prescription of a reciprocal switching agreement under part 1145 could have significant operational impact. AAR argues that added transfers increase operational complexity and introduce a higher risk of failure—effects that, according to AAR, could adversely affect the rail network. (*Id.*) CN argues that under the established test for practicability, relevant factors include existing track and yard usage, capacity, congestion, traffic density, operational interference, safety, the potential for unduly impairing the ability of either carrier to serve its shippers, and the impacts to other carriers, shippers, and the public. (CN Comments 18–19.)

There is, in fact, no significant difference between the standards that the ICC applied in *Delaware & Hudson* and the provisions of part 1145 on practicability. What differs, with respect to practicability, is the level of inquiry that was warranted in *Delaware & Hudson* versus the level of inquiry that will be warranted under part 1145. The reciprocal switching agreement in *Delaware & Hudson* covered all customers in the terminal area, on the tracks of the affected carriers, throughout the city of Philadelphia. It made sense in *Delaware & Hudson* for the ICC to explore, on a broad scale, the possible impacts of the proposed agreement given the wide scope of the agreement. In contrast, a reciprocal switching agreement under part 1145 would be limited in scope because it would apply only to the successful petitioner's facility.

Carriers also oppose the presumption that was proposed in the *NPRM.* Under that presumption, which the incumbent railroad would bear a ''heavy burden'' to overcome, operation under a reciprocal switching agreement would be presumed to be operationally feasible if the incumbent railroad and the alternate railroad had an existing reciprocal switching arrangement in the petitioner's terminal area. *NPRM,* 88 FR at 63915 (proposed § 1145.6(b)). CN suggests that existing voluntary reciprocal switching operations would be only one factor in determining whether a proposed agreement would be practicable. (CN Comments 18–19 (citing *Delaware & Hudson,* 367 I.C.C. at 720).) CSXT asserts that all relevant evidence should be reviewed when determining whether an agreement would be practicable; CSXT contends that the Board therefore should eliminate the use of any presumption.[53] (CSXT Comments 42–44.)

Conversely, the Coalition Associations support the presumption of operational feasibility when a reciprocal switching arrangement already exists in a petitioner's terminal area. (Coal. Ass'ns Comments 5–6, 45.) The Coalition Associations argue, however, that the Board should adopt a similar requirement for any location where the incumbent and alternate carrier interchange traffic. The Coalition Associations reason that the transfer of railcars at an interchange en route on a line haul is operationally the same as the transfer of railcars within a terminal area for a reciprocal switch. (*Id.* at 5–6.) AAR responds that the Coalition Associations' argument is untenable. (AAR Reply 57.) According to AAR, the existence of an interchange that is not associated with reciprocal switching cannot establish that it is feasible to add other switching at that interchange. (*Id.*)

The Board will retain the presumption of operational feasibility based on an existing reciprocal switching arrangement in the petitioner's terminal area. That presumption pertains only to operational feasibility of the reciprocal switch, not to other potential elements of impracticability (such as undue impairment of the incumbent carrier's operations, the infeasibility of the alternate carrier's line-haul service, or undue impairment of the incumbent rail carrier's or the alternate rail carrier's ability to serve its existing customers). An existing reciprocal switching arrangement would demonstrate that railcars could be transferred between carriers within the terminal area. The presumption is rebuttable and the carriers will have the opportunity to demonstrate that the petitioner's traffic could not reasonably be added to switching operations. Further, the Board will retain flexibility to assess all relevant information bearing on the issue of practicability. *See* 49 CFR 1145.6(b).

With respect to the Coalition Associations' proposal to presume operational feasibility at any location where the incumbent and alternate carrier interchange traffic, the Board finds that such a proposal is outside the scope of this proceeding. This rulemaking is limited to establishing criteria for the prescription of reciprocal switching agreements within terminal areas as defined in part 1145.

Some commenters argue that the Board should consider safety as part of its assessment of practicability. (*See, e.g.,* CN Comments 18–19.) The federal government's primary safety agency for freight rail transportation, FRA, and its parent department, DOT, state that the Board should consider safety in assessing a petition under part 1145 but note that, in general, they do not foresee safety concerns with reciprocal switching. (DOT/FRA Comments 3 n.3 (explaining that railroads are required to operate safely and in compliance with all applicable FRA safety regulations at all times, which would include while conducting reciprocal switching moves).) AAR agrees that compliance with relevant safety regulations and practices ''will do much to mitigate safety concerns,'' but argues that unforeseen safety issues may arise in a specific proceeding. (AAR Reply 56.) AAR suggests the Board clarify in the regulatory text that ''the Board will not find a switching arrangement to be practicable and in the public interest if it is unsafe.'' [54]

Part 1145 does not preclude the Board from considering safety in its assessment of a petition filed under part 1145. The proposed rule requires any petition for prescription of a reciprocal switching agreement to be served on FRA. *NPRM,* 88 FR at 36908 (proposed § 1145.5(c)). Therefore, FRA would receive notice and have an opportunity to comment on any petition if it deemed

[52] In *Delaware & Hudson,* the ICC stated that reciprocal switching is ''practicable and in the public interest'' when it generally meets the following criteria: ''(1) interchange and switching must be feasible; (2) the terminal facilities must be able to accommodate the traffic of both competing carriers; (3) the presence of reciprocal switching must not unduly hamper the ability of either carrier to serve its shippers; and (4) the benefits to shippers from improved service or reduced rates must outweigh the detriments, if any, to either carrier.'' *See Del. & Hudson,* 367 I.C.C. 718, 720–22.

[53] Specifically, CSXT states that ''the Board should eliminate its presumption that forced switching in a terminal area would be practicable.'' (CSXT Comments 42.) CSXT misdescribes the presumption, which applies only to operational feasibility, and arises only when the incumbent and alternate carriers have an existing reciprocal switching arrangement in the petitioner's terminal area.

[54] (*Id.* (quoting with modifications *2016 NPRM,* EP 711 et al., slip op. at 18; *see also* CN Comments 22 (asserting that a finding of practicability requires consideration of safety issues associated with the handling of traffic or the alternate route); CSXT Comments 43–44 (noting risk of accidents and employee injuries from increased handlings and safety/security concerns with hazardous materials and TIH shipments).)

BLET also raises concerns that switching ''would impair the safe operations of crews on both the host and guest railroads.'' (BLET Comments 2.) This concern, however, seems to address a trackage rights scenario as opposed to reciprocal switching, as BLET later refers to a guest railroad traversing the tracks of a host railroad. (*Id.*) The Board declines to address the issue raised by BLET here as it appears to go beyond the scope of this proceeding.

necessary. The Board would take FRA's comments into account in determining whether the proposed reciprocal switching was *practicable* and in the public interest. In light of the foregoing, it is not necessary to amend part 1145 to require a specific determination as to safety.

CRC and Metrolink express concern that a reciprocal switching agreement under part 1145 could adversely impact existing agreements between freight rail carriers and passenger rail carriers, including agreements regarding shared use of facilities, on-time performance goals, safety, and dispatching priorities. CRC and Metrolink assert that, given the potential impact reciprocal switching agreements may have on a shared rail corridor, the Board must consider the interests of passenger rail carriers in a proceeding under part 1145. (CRC Comments 4–6; Metrolink Comments 1–2.) To that end, CRC suggests that the Board modify proposed § 1145.6(b) to permit a ''potentially affected rail carrier'' to bring practicability concerns before the Board. (CRC Comments 7–8.)

The Board declines to modify proposed § 1145.6(b) as suggested by CRC. As CRC notes, freight rail carriers and passenger rail carriers already have existing shared use and/or operational agreements. There is no reason to suppose that those agreements would be nullified by the Board's prescription of a reciprocal switching agreement. To the contrary, the Board may assume that the alternate carrier under the prescribed agreement would provide line-haul service to the petitioner in accordance with the alternate carrier's operating agreements with other carriers. In all events, freight rail carriers are in a position to make the Board aware of any practicability issues involving passenger carriers.

Finally, BNSF urges the Board to consider car supply issues when weighing the practicability of a proposed reciprocal switching agreement, including the alternate carrier's ability to supply cars and how added car supply responsibilities will impact the alternate carrier's other customers. (BNSF Comments 8.) BNSF notes that its existing, market-based car-supply programs have substantial built-in lead times and argues that the Board should ensure that these programs are not adversely affected by a prescribed reciprocal switching agreement. (*Id.* at 9–10.)

Although BNSF urges the Board to consider car supply issues when considering the practicability of a reciprocal switch, the Board notes that it is possible that the petitioner and the alternate carrier will have addressed car supply issues in advance of the filing of a petition. Nevertheless, the Board reiterates that, under § 1145.6(b), the Board will not prescribe an agreement if the alternate carrier demonstrates that the provision of line-haul service to the petitioner would be infeasible or that it would unduly impair the alternate rail carrier's ability to serve its existing customers—and will consider evidence, for example, of whether the alternate carrier would be unable to accommodate the car supply needs of the petitioner in the event a reciprocal switching agreement were ordered.

Service Obligation

The Board sought comment on whether a prescription should include a minimum level of switching service, and if so, whether the Board should establish a separate and specific penalty structure to be imposed on carriers that do not meet that level of service. *NPRM,* 88 FR at 63903 n.15.

The Coalition Associations and PCA support establishing such a requirement, along with a specific penalty structure to be imposed on carriers that do not meet the customer's level of service requirements. (Coal. Ass'ns Comments 58; PCA Comments 7–8.) AAR asserts that no such requirement or ''penalty structure'' is appropriate, as the prescribed service will be subject to the common carrier obligation under 49 U.S.C. 11101, and the usual remedies for a failure to provide adequate service upon reasonable request will be available. (AAR Comments 94.)

While the Board expects movements under a prescribed reciprocal switching agreement to occur on a timely and efficient basis, the Board will not attempt through this rule to anticipate or set standards for resolving related disputes. The Board will leave enforcement of carriers' obligations under a prescribed reciprocal switching agreements to other proceedings, should a dispute arise.[55]

Procedures

Negotiations

The *NPRM* proposed that, at least five days prior to filing a petition under part 1145, the petitioner must seek to engage in good faith negotiations to resolve its dispute with the incumbent rail carrier. *NPRM,* 88 FR at 63914. Several rail carriers argue that five days is insufficient for an incumbent carrier to cure a service issue. They urge the Board to extend the negotiation period or require additional pre-filing communication between carriers and petitioners. (*See, e.g.,* AAR Comments 86; CPKC Reply 25; CSXT Comments 35; NSR Comments 11.)

NSR suggests that customers should be required to communicate with the incumbent carrier during the period of the alleged service issue upon which a petition is based. (NSR Comments 11 (stating that it is consistent with the RTP of 49 U.S.C. 10101(2) to promote the private resolution of disputes); *see* AAR Reply 67 (encouraging the Board to adopt NSR's recommendation); CPKC Reply 25 (endorsing NSR's suggestion).) Similarly, AAR suggests that shippers be required to notify an incumbent carrier of the concerns in question as soon as practicable after the 12-week period during which the carrier allegedly failed to meet a performance standard, and that shippers also be required to engage with the incumbent carrier for a reasonable period—such as four weeks—during which the incumbent carrier would be encouraged to remedy the problem.[56] (AAR Comments 88; *see* CSXT Comments 35 (endorsing AAR's recommendation).) According to AAR, allowing an incumbent carrier to cure a service issue is the most efficient approach to achieving ''the Board's ultimate objective.'' (AAR Comments 86–87.)

[55] More broadly, as described in the *NPRM* and throughout this rule, the Board has recognized that the form of intervention, the characteristics of the appropriately defined and scoped switching prescription here, the numerous protections in this rule, and other aforementioned factors enable the Board to balance the aspects of the RTP and set these performance standards in this specific context. As the Board stated in the *NPRM,* it does not view it as appropriate to apply or draw from these standards to regulate or enforce the common carrier obligation. *See, e.g., State of Montana* v. *BNSF Ry.,* NOR 42124, slip op. at 7 (STB served Apr. 26, 2013) (stating what constitutes a reasonable request depends on all relevant facts and circumstances); *Granite State Concrete Co.* v. *STB,* 417 F.3d 85, 92 (1st Cir. 2005); *Union Pac. R.R—Pet. for Declaratory Ord.,* FD 35219, slip op. at 3–4 (STB served June 11, 2009).

[56] CSXT also argues that the Board should only permit petitions for alleged service inadequacies that are ''reasonably contemporaneous with the petition and exist at the time of the petition'' because there is no compelling need for a switching prescription where a service inadequacy no longer exists. (CSXT Comments 35.) As suggested above, though, carriers have misstated the law in suggesting that the Board must find a compelling need as a condition to a prescription under section 11102(c). *See* Legal Authority. Even putting aside the applicable standard, part 1145 properly does not require demonstration of an ongoing service issue as a condition to a prescription. Given the fluid nature of rail operations, what had been an ongoing problem could be temporarily fixed or could recur. It therefore would undermine the purposes of part 1145 to require demonstration of an ongoing service issue. That approach would undermine predictability for shippers and receivers that were considering whether to file a petition under part 1145 and, by undermining predictability, would negate the incentives that part 1145 is designed to introduce.

Rail carriers also argue that an incumbent rail carrier would be better situated to cure a service issue if the Board extended the five-day negotiation period. According to UP, a 30-day negotiation period would allow the customer and carrier ''to resolve issues and make longer-term, permanent changes to address the concerns.'' (UP Comments 14.) BNSF also suggests a 30-day negotiation period and states that, during the 30-day period, Board staff from the OPAGAC or the Rail Customer and Public Assistance Program (RCPA) could assist in resolving disputes. (BNSF Comments 4–5; BNSF Reply 2–3; *see also* AAR Reply 67 (stating that the Board should encourage shippers and carriers to utilize OPAGAC).)

NSSGA responds that carriers' request for additional time to cure a service deficiency shows that carriers can improve service if threatened with the possibility of a reciprocal switching proceeding and are only interested in improving service when a shipper intends to pursue a switching prescription. (NSSGA Reply 4.) NSSGA argues that carriers can improve service at any time, that providing carriers with additional time to cure would delay service improvement, and that carriers may make only temporary improvements to avert a switching prescription. (*Id.*) AFPM also supports the proposed five-day negotiation period. (AFPM Comments 14.)

The Board rejects proposals to extend the five-day negotiation period or to require additional pre-filing communication between rail carriers and shippers or receivers, including during the period of alleged service inadequacy. As a practical matter, the Board expects that—given both the regulatory requirement that a petitioner must seek to engage in good faith negotiations to resolve its dispute and the practical dynamics of the business relationship between carriers and their customers—a shipper or receiver would have communicated with the incumbent carrier during the period of alleged service inadequacy, and parties are encouraged to seek assistance from RCPA to informally resolve disputes.[57] But requiring such communication or resolution would only impose an unnecessary hurdle on petitioners and could result in delaying service improvement. Moreover, AAR errs in asserting that the Board's ''ultimate goal'' in enacting part 1145 is merely to provide for resolution of an immediate service problem. The Board's broader goal is to create appropriate regulatory incentives for Class I railroads to achieve and to maintain higher service levels on an ongoing basis. *NPRM,* 88 FR at 63899. Requiring petitioners to seek private resolution of an ongoing service issue—which is a remedy already available to them—would not accomplish these goals.

[57] RCPA can be reached at (202) 245–0238 and *rcpa@stb.gov.*

Replies and Rebuttals

AAR argues that the Board did not explain why it proposed a 20-day period to reply to a petition, rather than a 30-day period as permitted under 49 CFR 1147.1(b)(2). (AAR Comments 89); *see NPRM,* 88 FR at 63914. AAR states that a 30-day reply period would allow an incumbent railroad to provide a well-informed pleading. (AAR Comments 89.) Similarly, Ravnitzky suggests a 30-day period for both replies and rebuttals. (Ravnitzky Comments 2); *see NPRM,* 88 FR at 63915 (proposing a 20-day period to file a rebuttal to a reply).

The proposed 20-day reply period is consistent with the Board's general regulations, which permit a party to file a reply to any pleading within 20 days after the pleading is filed, unless otherwise provided. *See* 49 CFR 1104.13. As to the rebuttal period, Ravnitzky does not explain why a period longer than 20 days is necessary. Consistent with the RTP, *see* 49 U.S.C. 10101(2), (15), the Board also finds that the 20-day deadlines will promote more efficient proceedings, reflect the guidance in the rule itself regarding the scope of available arguments, and will allow the Board to meet its target for issuing an order addressing a petition within 90 days of it being filed. *See NPRM,* 88 FR at 63908 (proposed § 1145.5(f)). Nevertheless, the Board maintains discretion to extend any deadline upon request and for good cause. *See* 49 CFR 1104.7(b).

Alternate Carriers

Rail carriers urge the Board to clarify the alternate carrier's role in a proceeding for a switching prescription under part 1145. (*See, e.g.,* AAR Comments 89; BNSF Comments 6–7; UP Comments 14–15.) BNSF argues that the Board should require petitioners to engage in pre-petition consultations with the alternate carrier to establish, before a petition is filed, whether switching would be practicable. (BNSF Comments 5–6 (proposing a 30-day pre-filing negotiation period).) BNSF also states that the Board should clarify that an alternate carrier has a right to participate in a formal Board proceeding brought under part 1145. (*Id.* at 7.) According to BNSF, such participation by the alternate carrier would ensure that a new switching prescription improves the petitioner's service without harming service to the alternate's existing customers. (*Id.*)

Other rail carriers argue that the proposed rule should require petitioners to obtain a commitment from the alternate carrier before filing a petition. (*See, e.g.,* AAR Comments 10, 90 (stating that the commitment should include a design plan, which is central to the Board's consideration of issues such as practicability, safety, and impact on other shippers).) CN, CSXT, and UP note that part 1147 requires petitioners to obtain a commitment from an alternate carrier and that, in adopting part 1147, the Board stated that an alternate carrier's participation was ''essential.'' (CN Comments 22; CSXT Comments 37–38; UP Comments 16–17); *see Expedited Relief for Serv. Inadequacies,* 3 S.T.B. at 977, 979 n.19; 49 CFR 1147.1(b)(1)(iii). CSXT states that, if cooperation by the alternate is essential under part 1147, it is essential for nonemergency cases filed under part 1145. (CSXT Comments 38.) Similarly, CN argues that the Board's reasoning in *Expedited Relief for Service Inadequacies* that '''[f]orcing a second carrier to provide service unwillingly could create safety concerns, impair service to its customers, or hurt its finances' . . . . is equally valid in the context of the current NPRM.'' (CN Comments 22 (quoting *Expedited Relief for Serv. Inadequacies,* 3 S.T.B. at 977).) UP also argues that a commitment requirement would incentivize shippers to provide alternate rail carriers with sufficient time to evaluate impacts of the proposed service and would allow the shipper and alternate carrier to negotiate about service and volume. (UP Comments 17.) Alternatively, UP suggests that the Board clarify that it would not require an alternate carrier to provide service if the carrier would need to change service plans, hire crews, or assume capital investments. (*Id.*)

ACD responds that a commitment requirement is unnecessary, as the *NPRM* already requires a switch to be practicable and in the public interest, and that a commitment requirement would delay petitions and make them more difficult to complete. (ACD Reply 5.) WCTL argues that a commitment requirement would essentially require a shipper to contract with what may be the only alternate rail carrier available, providing the alternate with ''significant leverage over the shipper and . . . little incentive to afford substantial value to the aggrieved shipper.'' (WCTL Reply 19.) Other rail users suggest that a potential alternate carrier may be unwilling to enter into an alternate

service commitment. (*See* NGFA Comments 6 (asserting that a lack of interest by the potential alternate carrier is a primary reason that few cases invoking the emergency service rules under part 1147 have not resulted in alternate carrier service); DCPC Reply 7 (stating that, absent an opportunity to compete for all or most of a shipper's business, an alternate may be unwilling to invest in and commit to alternate service).)

The Board will not adopt the suggestion that petitioners should obtain a commitment from an alternate rail carrier before filing a petition. However, for the Board to best meet its information needs and carry out the regulations, the Board will require that an alternate carrier participate in a proceeding under part 1145 by filing a reply to a petition. *See NPRM,* 88 FR at 63914 (proposed § 1145.5(c), requiring a petitioner to serve the petition on the alternate carrier);[58] *see also Revisions to Reguls. for Expedited Relief for Serv. Emergencies,* EP 762, slip op. at 11 (STB served Jan. 24, 2024). In such a reply, an alternate carrier may raise concerns pertaining to practicability. As stated in the *NPRM,* in determining whether to issue an order granting a reciprocal switching prescription, the Board would consider any alternate rail carrier's objections that the provision of line-haul service to the petitioner would be infeasible or unduly hamper the alternate carrier's ability to serve its existing customers.[59] *NPRM,* 88 FR at 63909. And if an alternate carrier needed to make certain investments to accept a petitioner's traffic, the Board would consider whether a longer minimum term for the prescription was necessary for the prescription to be practical. *Id.* at 63910. To ensure carriers have necessary information for their replies, the Board will amend its proposal to require the petitioner to identify the requested duration of the prescription of a reciprocal switching agreement and provide supporting evidence for any request for a prescription longer than the minimum term specified in § 1145.6(c).

The procedures in this rule allow an alternate carrier to meaningfully participate in a Board proceeding while reducing barriers to petitioners. Additionally, requiring an alternate carrier to file a reply to a petition will allow the Board to better assess any concerns relating to practicability and to weigh those concerns against the public interest. In short, the Board rejects rail carriers' assertions that, in the absence of a commitment requirement, an alternate carrier would be forced to offer line-haul service where there are legitimate practicability concerns that would unduly impair the alternate carrier's operations. Finally, requiring a commitment from the alternate carrier would contradict the design of part 1145, which seeks to allow the successful petitioner to choose between available rail carriers as the petitioner sees fit.

Shippers and Receivers

VPA, while noting that the Board ''has appropriately focused its proposed rulemaking on shippers and receivers of freight,'' nevertheless argues that the Board should ''modestly expand the scope'' of the entities eligible to seek a reciprocal switching prescription ''to include ports and port facilities.'' (VPA Comments 5.) VPA asserts that a port, in effect, is the originator or terminator of traffic because every rail movement involving a port either starts or ends at the port, and that ports have a need for reliable, predictable, and efficient rail service similar to that of shippers and receivers. (*Id.* at 6.) VPA also argues that poor rail service creates operational issues at ports, as was shown by the problems experienced recently at West Coast ports. (*Id.* at 6–7.) VPA asserts that any portion of a port facility that is served by only one Class I rail carrier should be eligible for relief; this, VPA argues, would be consistent with the Board's definition of ''practical physical access'' and the proposed rule's coverage of a shipper's traffic in a single eligible lane even if the shipper enjoys practical physical access to multiple carriers with respect to other lanes. (*Id.* at 7–8.)

AAR opposes VPA's request to expand eligibility to ports, arguing that shippers and receivers ''are the entities with the essential economic and operational relationships with the carrier,'' and that expanding eligibility ''would raise numerous questions about how the entities with those economic and operational relationships would properly be heard'' and would ''pose complicated issues related to data confidentiality.'' (AAR Reply 66 n.21.)

While it may be, as VPA suggests, that port facilities can bear certain similarities to shippers and receivers from an operational perspective, it is also true that they serve a distinct function as links in the national and international supply chain. (*See* VPA Comments 5 (noting that The Port of Virginia ''works hard to be an important part of the national intermodal system for the benefit of the shippers, the economy of Virginia, and the nation.'').) And the Board is sensitive to the concerns AAR raises regarding the economic and operational relationships between railroads and the shippers and receivers who are their ultimate customers and users of the supply chain of which ports are a part. Moreover, VPA has not identified any particular reason why it would not be equally effective for the shipper/receiver to petition, or how a port would implement a switch, as it is not a purchaser of common carrier rail service. Therefore, based on the comments received, the current record does not support modifying the rule to expand eligibility to ports or portions thereof. Because the Board is not modifying the rule to include ports as eligible petitioners, the other changes VPA requests need not be addressed, as they would directly flow from those modifications. (*See id.* at 8–12.)

DCPC raises whether a group of shippers in the same terminal area could file for a prescription of a reciprocal switching agreement, giving as an example a group of shippers located in an industrial park. (DCPC Comments 13.) DCPC asserts that groups of shippers served by the same incumbent railroad in the same terminal area that demonstrate inadequate service according to the established standards should be allowed to seek a prescription. (*Id.*) While the Board does not foreclose the possibility that a group of similarly situated shippers could jointly seek a prescription, it need not attempt to define in the abstract a specific set of circumstances, if one exists, wherein individual shippers each would qualify for the same relief in such a similar way that a joint petition would be appropriate. The Board therefore will consider the suitability of a joint petition on a case-by-case basis in the event such a petition is filed.

AAR urges the Board to clarify that ''if the party with the economic relationship to the carriers [*e.g.,* payor of freight] is not the same as the party with the operational relationship to the switching, they *both* need to be before the Board as both interests will be

[58] Consistent with its approach in Docket No. EP 762, *Revisions to Regulations for Expedited Relief for Service Emergencies,* the Board will require a petition to identify at least one possible rail carrier to provide alternative service. Given that a petitioner may have two or more options if it were to receive a reciprocal switching agreement prescription, the Board will amend the proposal to clarify that a petitioner can identify, and must serve the petition on, one or more alternate carriers, and each identified alternate carrier will be required to reply to the petition.

[59] As stated in the *NPRM,* the objecting carrier would have the burden of proof of establishing infeasibility or undue impairment. *NPRM,* 88 FR at 63909. The final regulatory text has been modified to clarify that the objecting rail carrier bears the burden of proving infeasibility or undue impairment. *See* 49 CFR 1145.5(d).

affected.'' (AAR Comments 91.) The Board disagrees. The real parties in interest for these regulations are the shippers and receivers that have directly experienced the service issue. Moreover, considering the business relationship between payors of freight and the shipper or receiver (to the extent those entities are different), and the costs to a shipper or receiver of bringing a case, the Board notes that petitioners would have an incentive to communicate and coordinate as necessary with the payor of freight and to avoid filing cases in which the petitioner could not pursue a switching arrangement from an economic perspective. Based on the record here, the Board sees little value in requiring another entity beyond those parties to also join in a proceeding.

Short Lines, Passenger Rail, and Commuter Rail

Under proposed § 1145.5(c), a petitioner would be required to serve the petition for prescription of a reciprocal switching agreement on the incumbent rail carrier, the alternate rail carrier, and FRA. Several commenters encourage the Board to recognize that other entities may be affected by a prescription and to require that the petition should be served on them also.

AAR argues that shippers should serve notice on short lines and passenger railroads to prevent complications, and that those parties should be permitted to submit comments on a petition if needed. (AAR Reply 65–66.) Similarly, ASLRRA argues that short lines should be notified of switches impacting their traffic—so a short line railroad scheduled to receive a shipment subject to a reciprocal switch prescription earlier in its journey should be notified of the petition as well. (ASLRRA Comments 1, 7.) CSXT supports ASLRRA's proposal to notify short lines of petitions that could affect ''joint line traffic handled by that short line.'' (CSXT Reply 14.) CSXT also argues that pre-Staggers standards for joint use of terminal facilities, which Congress ''imported'' when adopting section 11102(c), made clear that a determination as to whether a prescribed reciprocal switching is in the public interest requires consideration of the relief's impact on other parties. (*Id.* at 13.)

CRC asks the Board to add a definition of ''Potentially Affected Rail Carrier'' that would include any rail carrier—freight or passenger—that operates on track shared with one of the rail carrier parties to a prescribed reciprocal switching agreement, and to amend § 1145.5 to require that the petition be served on potentially affected rail carriers. (CRC Comments 7–8.) CSXT supports CRC's suggestion about notifying affected passenger railroads. (CSXT Reply 14.) Metrolink asks that commuter rail and intercity passenger rail entities be given notice of a proceeding and the ability to comment. (Metrolink Comments 1.) Within a case, Metrolink also asks that the Board consider impacts on passenger rail and those entities' shared-use agreements with Class I carriers. (*Id.* at 1–2.)

With respect to commenter requests for post-prescription notifications, the Board notes that voluntary reciprocal switching arrangements involving a Class I rail carrier are reflected on that carrier's public website,[60] and other rail carriers could observe that a voluntary reciprocal switching agreement is in place. Like a voluntary reciprocal switching arrangement, a prescribed reciprocal switching agreement also would be reflected on the carrier's website and observable; moreover, the fact that it was prescribed would be available on the Board's website. *See also* § 1145.6(d), as amended below. From an operations perspective, given the definitions and protections in this rule, there are substantial similarities between a voluntary reciprocal switching arrangement and one that is prescribed and their resulting impacts. As such, the record does not support requiring special notice to other rail carriers of either prescribed reciprocal switching agreements or the filing of a petition. Furthermore, a shipper or receiver may not be aware of all the rail carriers that use a shared track; it could be burdensome or nearly impossible for the petitioner to ascertain all possible rail carriers using that track because they do not have access to the applicable agreements. The Board also notes that carriers are free to notify any affected entity and consult them in formulating their replies, including in considering or addressing practicability. For those reasons, the Board declines to expand § 1145.5(c) to require notice to entities other than the incumbent carrier, the alternate carrier, and FRA. Should there be concerns with how a prescription could affect other rail carriers, the parties should raise and address them in their pleadings.

Disclosure Under 49 CFR Part 1300

Proposed § 1145.6(d) provides, in part, that upon the Board's prescription of a reciprocal switching agreement, the affected rail carriers must ''include, in the appropriate disclosure under 49 CFR part 1300, the location of the petitioner's facility, indicating that the location is open to reciprocal switching, and the applicable terms and price.'' *NPRM,* 88 FR at 63915. AAR comments that this phrasing is ambiguous and could result in confusion about the proper disclosure, as ''information about a switching agreement is not itself subject to disclosure under 49 CFR part 1300.'' (AAR Comments 95 (asserting that no provision in part 1300 describes such carrier-to-carrier agreements and that terms of switching agreements are generally not disclosed to the public).) AAR also asserts that agreements may include information about a shipper's specific lanes, which could raise confidentiality concerns for the shipper. (*Id.*) AAR argues that, in this context, the only relevant disclosure under part 1300 would be the alternate carrier's line-haul rate and terms for a movement that utilizes the switching services of the incumbent carrier. AAR suggests that ''[t]he Board may wish to refine 1145.6(d) to avoid confusion.'' (*Id.*)

This provision was intended to ensure a measure of public notice in the ordinary course of business (apart from the Board's prescription proceeding itself) that a particular location has become open to reciprocal switching. The Board acknowledges AAR's concern, however, that the *NPRM'*s reference to ''the appropriate disclosure under Part 1300'' is ambiguous and possibly confusing. For that reason, the Board is clarifying this provision to instead require that, in the event of a prescription, the incumbent carrier promptly amend its switching publication(s)[61] as appropriate to reflect the availability of reciprocal switching under the prescription.

Prioritization

USDA suggests that the Board develop a ''ranking component'' to prioritize proceedings under part 1145 based on the severity of the performance lapses and ''help expedite extraordinary cases.'' (USDA Comments 7.) The Board appreciates suggestions for potential ways to enhance the efficiency of Board proceedings. However, the type of system described by USDA would itself be time-consuming (and, in all likelihood, complicated and contentious) to develop. Moreover, the Board is not anticipating a high volume

[60] *See, e.g., https://c02.my.uprr.com/scs/index.html#/external/search* (for UP's website) and *www.bnsf.com/bnsf.was/SCRSWeb/SCRSCentralController* (for BNSF's website).

[61] Here, the term ''switching publication'' refers to the instrument used by a railroad to document for its customers and other railroads which customers are covered by a reciprocal switching agreement and the applicable terms.

of cases under part 1145 each year. *See* Paperwork Reduction Act section. The Board will defer development of any prioritization approach and will devote its resources at this time to expeditiously resolving part 1145 proceedings as they are filed.

Affirmative Defenses

The Board explained in the *NPRM* that an incumbent rail carrier shall be deemed not to fail a performance standard if the carrier demonstrates that its apparent failure to meet a performance standard was caused by conditions that would qualify as an affirmative defense. 88 FR at 63908. If the incumbent carrier makes such a showing, the Board would not prescribe a reciprocal switching agreement.[62] 88 FR at 63908. The Board set forth four affirmative defenses in proposed § 1145.3: (1) extraordinary circumstances beyond a carrier's control; (2) surprise surge in petitioner's traffic; (3) highly unusual shipment patterns; and (4) delays caused by dispatching choices of a third party. *Id.* at 63908–09. The Board further noted that defenses that do not fit within those categories would be evaluated on a case-by-case basis. *Id.* at 63908. The Board also sought comment on what other affirmative defenses, if any, should be specified in the final rule. *Id.*

Several railroads and AAR urge the Board to consider all relevant evidence that may bear on the reasons for the failure to satisfy the relevant performance standard. The carriers also assert that the incumbent railroad must have the opportunity to put the metric-based showing into case-specific context, whereby the incumbent railroad would try to establish that there was no service inadequacy. (AAR Comments 75; CSXT Comments 32; NSR Comments 7; CN Comments 25; CPKC Reply 27; NSR Reply 19–21 (proposing language that would allow for ''any defense relevant to whether there is a service inadequacy for which there is actual necessity or compelling reason for a prescribed switching agreement''); CN Reply 12 (same).) Some carriers and AAR also assert that the proposed affirmative defenses are highly restrictive, reasoning that service quality may be influenced by a variety of factors that are varied and difficult to predict. (AAR Comments 73–74; *see also* CSXT Comments 3 n.3, 9.) They urge the Board to broadly interpret the specified defenses to account for circumstances that were beyond the rail carrier's control or for which the rail carrier could not reasonably prepare. (AAR Comments 80–85; *see, e.g.,* AAR Comments 82–84 (urging an interpretation of ''surprise surge'' to include spikes in demand of shippers other than the petitioner); *see also* CSXT Comments 25 n.21.)

Some railroads and AAR propose additional affirmative defenses that would address situations they contend are likely to recur: the incumbent carrier's curing of the potential service inadequacy during the course of the proceeding, (AAR Comments 75; UP Comments 14); scheduled maintenance and capital improvement projects undertaken by the incumbent, (AAR Comments 75–76; CN Comments 24); conduct of third parties, including action or inaction by the shipper that led to failure to meet a performance standard, (AAR Comments 76–77; BNSF Comments 10–11);[63] valid embargoes, (AAR Comments 77–78); effective intermodal competition, (AAR Comments 78–79); and alternate carrier objections, (AAR Comments 79–80). In reply, the Coalition Associations state that they do not oppose the affirmative defenses proposed by AAR pertaining to third-party conduct or scheduled maintenance and capital improvements, but they oppose the defenses regarding cured service inadequacies, valid embargoes, and intermodal competition. (Coal. Ass'ns Reply 22–23.) PCA opposes AAR's proposed defenses, asserting that they are without legal support and impose barriers in obtaining relief. (PCA Reply 7.)

AFPM generally supports delineating a limited number of affirmative defenses but notes that these should be clearly defined and understood, as ambiguous affirmative defenses could weaken the usefulness of this proposal. (AFPM Comment 15.) AFPM further suggests that the ''surprise surge'' and ''highly unusual shipment patterns'' affirmative defenses are redundant and could potentially be combined. (*Id.*)

The Board will adopt one of the additional affirmative defenses proposed by commenters as part of the final rule. As noted above, the Board already proposed to include a defense for delays caused by dispatching choices of a third party. The suggestion to include, as an affirmative defense, other conduct by third parties is consistent with the reasoning for including the dispatching-related defense, to the extent that conduct is outside the control of the incumbent carrier. *See NPRM,* 88 FR at 63908–09; (*see also* AAR Comments 76–77.) As such, the Board will adopt a separate affirmative defense for third-party conduct that is outside the reasonable control of the incumbent carrier. The Board notes that several shipper groups do not oppose including this defense. (Coal. Ass'ns Reply 22–23.)

To be clear, the affirmative defense for third-party conduct will be narrowly construed to prevent this or any defense from being used as a frivolous tactic to unduly prolong or delay, or unnecessarily increase the cost of the proceeding so as to deter the current or future petitioners from bringing proceedings under this rule. This third-party conduct affirmative defense will include only conduct that had a direct, cognizable impact on the incumbent carrier's meeting the applicable performance standard, and that was outside the reasonable control of the incumbent carrier. To the extent that the impact of the conduct could not have been reasonably prevented, the defense will not apply if the incumbent carrier failed to take reasonable steps to mitigate the impact of the third-party conduct. To the extent the conduct could have been reasonably prevented, the defense will not apply if the incumbent carrier failed to take reasonable steps to prevent and mitigate the impact of the third-party conduct. As with the other affirmative defenses, the burden will be on the incumbent carrier to prove each of these elements.

The Board declines to adopt the other additional affirmative defenses proposed by commenters. The Board is adopting a number of specific affirmative defenses, designed to cover scenarios that should be considered when evaluating whether a reciprocal switching agreement should be prescribed and the Board will also, under proposed § 1145.3, consider on a case-by-case basis affirmative defenses that are not specified in the rule. Though the Board recognizes the variability of rail customers, many of the other suggested defenses undermine the underlying purposes of the rule.

As a general matter, the Board's specified affirmative defenses are focused on reasons that a carrier's service might be below a metric during the relevant 12-week period. The Board

[62] If the incumbent carrier establishes that its failure to meet a performance standard was excused by an affirmative defense, the Board could in its discretion, *see* 49 CFR 1104.11, allow the petitioner to amend its petition to address a 12-week period of service that was unaffected by the affirmative defense.

[63] In response to the Board's request for comment as to whether the definition of ''affiliated companies'' should include third-party agents of Class I carriers, *see NPRM,* 88 FR at 63902 n.9, AAR asserts that the definition should not include third parties, as it might include a Class II or Class III rail carrier serving as a handling carrier at the customer location, thus potentially assigning responsibility to a Class I carrier for failures to meet a metric that were caused by a third party. (AAR Comments 76–77.)

sees less value in potential affirmative defenses that instead focus on whether there is a service inadequacy with certain largely undefined effects based on allegations of a petitioner's particularized service needs or whether the carrier cured the cause of its failure to meet a performance standard. These types of considerations would not inform why the carrier could not meet the relevant performance standard nor would they appear to further the underlying purposes of the rule. Consideration of the presence or absence of intermodal transportation options and/or market dominance is likely to raise similar issues. *See* Legal Framework. As discussed above, part 1145 is designed to provide a shipper with an alternative rail option if the incumbent railroad's performance falls below a defined standard. The rule is not punitive; rather, it mainly serves to introduce an additional rail carrier as a means to provide the appropriate level of service while more broadly incentivizing rail carriers to avoid the drops in network performance that the carriers themselves have recognized as unacceptable. *See* Legal Framework; *see also NPRM,* 88 FR at 63900–01. Finally, the Board declines to treat as an affirmative defense information from the alternate carrier about the possible impact of the proposed reciprocal switching agreement on the alternate carrier's operations and economics. (AAR Comments 78–79.) Related concerns could be raised under the provisions in part 1145 on impracticability, including operational feasibility and undue impairment. *See* 49 CFR 1145.6(b).

The Board clarifies that the ''extraordinary circumstances'' defense in § 1145.3(a) would not be interpreted broadly to include *any* event beyond a railroad's control, as AAR suggests. (*See* AAR Comments 81.) Rather, as indicated in the *NPRM,* the extraordinary circumstances defense will be narrowly construed as applying to the type of events that would qualify a railroad for an emergency trackage rights exemption, including natural disasters, severe weather events, flooding, accidents, derailments, and washouts, though not necessarily resulting in a track outage. *See NPRM,* 88 FR at 63908, 49 CFR 1180.2(d)(9).

The Board appreciates the carriers' suggestion to include ''scheduled maintenance and capital improvement projects'' as an affirmative defense and recognizes that several shipper interests do not oppose such an addition, but the Board finds that such instances are better addressed on a case-by-case basis. The Board does not intend for the rule to disincentivize capital investment and in fact expects that this rule will help promote investments necessary for adequate service. However, the Board observes that the nature of ''scheduled'' maintenance and capital improvement projects suggests that carriers have a degree of control over their execution, and the Board expects carriers to exercise that control with reasonable consideration of shippers' service levels.

Lastly, the Board clarifies that the affirmative defense pertaining to a surprise surge in a petitioner's traffic is distinct from the affirmative defense regarding a petitioner's highly unusual shipment patterns. For the former, a surprise surge is defined by rule as an increase in traffic by 20% or more during the 12-week period in question (compared to the 12 weeks prior for non-seasonal traffic or the same 12-week period during the previous year for seasonal traffic), without timely advance notification from the shipper. *See* § 1145.3(b). In contrast, a shipment pattern might be considered highly unusual if a shipper projected traffic of 120 cars in a month and 30 cars per week, but due to a plant outage for three weeks, the shipper then requests shipment of 120 cars in a single week. *See* § 1145.3(c). Thus, the former would apply to an unexpected increase in traffic of 20% or more over the 12-week period in question, whereas the latter would apply to other types of atypical shipping patterns involving a single week within the 12-week period.

Compensation

The *NPRM* sought comment on two methodologies that the Board could use to set compensation under a reciprocal switching agreement under proposed part 1145, in the event that the affected rail carriers failed to reach agreement on compensation within a reasonable time, as contemplated in 49 U.S.C. 11102(c). Both proposed methodologies would establish a fee based on the incumbent carrier's cost of performing services under the reciprocal switching agreement, as determined by the carrier's embedded and variable costs of providing that service. *NPRM,* 88 FR at 63909.

> *Cost of Service.* One proposed methodology is to set reciprocal switching fees based on the cost-of-service approach that has been used in past cases on switching fees. *See, e.g., Increased Switching Charges at Kan. City, Mo.-Kan.,* 344 I.C.C. 62 (1972). This approach could either use the ICC Terminal Form F, 9–64, Formula for Use in Determining Rail Terminal Freight Service Costs (Sept. 1964), or the Board's Uniform Rail Costing System (URCS) to develop the cost of service.
>
> *SSW Compensation.* The other proposed methodology would adapt the Board's ''SSW Compensation'' methodology to reciprocal switching fees.[64] The Board noted in the *NPRM* that, while SSW Compensation is used primarily in trackage rights cases, where one rail carrier operates over another rail carrier's lines, many of the principles that inform the methodology would apply in the reciprocal switching context as well.

NPRM, 88 FR at 63910.

AAR and NSR assert that, as under part 1147, the Board should take a case-by-case approach to setting fees under part 1145. AAR and NSR reason that the Board plays a limited role in setting compensation under section 11102(c) and that cases in which the Board would need to set compensation would be rare. (NSR Comments 15, 17; AAR Comments 92; *see also* CSXT Comments 52.) AAR also suggests that the methodologies proposed in the *NPRM* would be insufficient to achieve appropriate compensation. AAR contends that compensation based on cost of service would fail to account for differential pricing and revenue adequacy, including the ability of rail carriers to make investments necessary to meet demand. (AAR Comments 92–93 (citing *Intramodal Rail Competition,* 1 I.C.C.2d 822, 835 (1985)); *see also* NSR Comments 15–16.) CSXT adds that neither of the proposed methodologies would enable carriers to recover their full fixed and common costs. (CSXT Comments 52–53.) AAR also asserts that the Board should analyze the impact of part 1145 on revenue adequacy before deciding how to set compensation under part 1145. (AAR Comments 92.) With respect to the SSW Compensation methodology, AAR and NSR assert that the *NPRM* provides no clear explanation for how a methodology that is used to develop trackage rights fees could be used to calculate a reciprocal switching rate. (AAR Comments 94; NSR Comments 16–17.)

The Coalition Associations support the Board's use of the SSW Compensation methodology, (Coal. Ass'ns Comments 59), and suggest that

[64] The SSW Compensation methodology, which has been used by the Board for setting trackage rights compensation, involves calculating the sum of three elements: (1) the variable cost incurred by the owning carrier due to the tenant carrier's operations over the owning carrier's track; (2) the tenant carrier's usage-proportionate share of the track's maintenance and operation expenses; and (3) an interest rental component designed to compensate the owning carrier for the tenant carrier's use of its capital dedicated to the track. *See St. Louis SW Ry.—Trackage Rts. over Mo. Pac. R.R.—Kan. City to St. Louis,* 1 I.C.C.2d 776 (1984), 4 I.C.C.2d 668 (1987), 5 I.C.C.2d 525 (1989) (*SSW Compensation III*), 8 I.C.C.2d 80 (1991), and 8 I.C.C.2d 213 (1991), *aff'd sub nom. Union Pac. Corp.* v. *ICC,* 978 F.2d 745 (D.C. Cir. 1992), *cert. denied,* 508 U.S. 951 (1993).

the SSW Compensation methodology could be adapted for setting reciprocal switching fees as follows: To develop the incumbent carrier's variable costs of transporting the petitioner's traffic between the origin or destination and the point of transfer with the alternate carrier, the Board would use the incumbent carrier's URCS Phase III model. (*Id.,* V.S. Crowley/Fapp 9.) To develop the incumbent carrier's fixed costs of providing the service in question, the Board would use either URCS or a modified STB Average Total Cost (ATC) revenue division methodology. (*Id.*) Finally, under the Coalition Associations' approach, the interest rental component would be based on system average return on investment per car-mile, multiplied by the number of miles that were involved in the reciprocal switching movement. (*Id.,* V.S. Crowley/Fapp 17–20.)

AAR disagrees with the Coalition Associations' proposal because it attempts to set fees based on the incumbent carrier's fully allocated costs, an approach that AAR claims contradicts the Board's precedent. (AAR Reply 70.) According to AAR, approaches that are based on fully allocated costs of service inappropriately use depreciated historic costs rather than forward-looking costs. AAR also argues that these approaches fail to account for revenue adequacy and the ability to engage in demand-based differential pricing. (*Id.* at 70–71.)

LyondellBasell stresses the need for an efficient regulatory process to set a reciprocal switching fee, noting that, while the regulatory process to set compensation is underway, a petitioner that has successfully obtained a reciprocal switching prescription would bear a provisional fee either as a pass through or as part of the alternate carrier's rate for line-haul service. (LyondellBasell Comments 3–4.) According to LyondellBasell, this outcome would discourage use of the reciprocal switching agreement. (*Id.* at 4.) LyondellBasell further asserts that the incumbent carrier would have an incentive to demand an excessive reciprocal switching fee as an indirect means to retain the petitioner's traffic and to apply differential pricing to that traffic. (*Id.* at 3.)

PCA asks the Board to set reciprocal switching fees at levels that facilitate effective, aggressive competition and improved service. (PCA Comments 14–15.) PCA also requests that the final rule incorporate the *NPRM's* finding that it would be inappropriate to use a methodology that would allow the incumbent carrier to recover any loss in profits that the incumbent carrier incurred as a result of losing the petitioner's line-haul service to the alternate carrier. (*Id.* at 15.)

Ravnitzky proposes that, unless otherwise agreed by the parties or determined by the Board based on compelling evidence, the Board should establish a default reciprocal switching fee based on the average cost of providing switching service in similar circumstances. (Ravnitzky Comments 2.)

The Coalition Associations urge the Board to clarify that, even when the carriers agree to a reciprocal switching fee, the petitioner may challenge that fee before the Board using the same methodology that the Board adopts for setting reciprocal switching fees itself. (Coal. Ass'ns Comments 60.) AAR replies that there is no legal basis for allowing the petitioner to challenge a reciprocal switching fee that was mutually agreed upon by the carriers. (AAR Reply 69.) AAR reasons that the Board has no role in establishing a reciprocal switching fee unless the carriers fail to reach agreement within a reasonable period. (*Id.*) AAR further reasons that shippers may not challenge a division of rates between carriers. (*Id.*)

The Board encourages rail carriers that are party to a Board-prescribed reciprocal switching agreement to reach agreement on compensation within a reasonable period, as contemplated in section 11102(c). The Board has concluded that, if the carriers fail to do so, it is appropriate to determine the compensation methodology on a case-by-case basis because the relevant circumstances in a particular case might warrant the use of one methodology over the other.

While the Board thus declines to choose a single methodology by rule, the Board expects that, in individual cases, the two proposed methodologies will be considered in establishing compensation. As stated in the *NPRM,* reciprocal switching fees that allow the incumbent carrier to recover its cost of service are consistent with longstanding practice.[65] While the Board has accounted for differential pricing in rate reasonableness proceedings, the Board has consistently viewed it as appropriate to set reciprocal switching fees based on the direct cost of providing service and not include any lost profits from lost line-haul service. *See, e.g., CSX Corp.—Control & Operating Leases/Agreements—Conrail Inc.,* FD 33388, slip op. at 13 (STB served May 20, 1999) (considering the actual cost of providing a switching service in approving a switching fee). AAR's assertion that reciprocal switching fees should also account for differential pricing appears to be a variation on AAR's assertion that fees for reciprocal switching should account for lost profits, an assertion that the Board fully rejects. *See NPRM,* 88 FR at 63909. To compensate the incumbent carrier for that loss would seem to defeat the purpose of introducing a competing carrier and associated legislative objectives and could be tantamount to rewarding the incumbent carrier for inadequate service. *See id.*

With respect to the SSW Compensation methodology, the Board continues to find that, in some cases, this might inform the Board's determination of the appropriate compensation. The SSW Compensation methodology is a flexible approach that can be (and has been) modified to account for the particular facts of each case, including difficulties in valuation, various types of costs, and the specific nature and extent of the line's use. *See, e.g., CSX Corp.—Control & Operating Leases/Agreements—Conrail Inc.,* 3 S.T.B. 196, 344–45 (1998); *Ark. & Mo. R.R.* v. *Mo. Pac. R.R.,* 6 I.C.C.2d 619, 622–27 (1990), *aff'd sub nom. Mo. Pac. R.R.* v. *ICC,* 23 F.3d 531 (D.C. Cir. 1994); *SSW Compensation III,* 5 I.C.C.2d at 529. This methodology therefore might be useful when there is a significant difference between the incumbent carrier's historic costs and the value of the facilities that would be used for reciprocal switching. The Board remains open to evidence and argument on these points as they apply to a particular case. The Board notes that the facilities that are used to perform reciprocal switching within a terminal area, the value of which might appropriately be considered under the SSW Compensation methodology, are far more limited in geographic scope compared to the facilities that would be used to provide the line-haul. However, the Board reiterates that it would be inappropriate to set reciprocal switching fees to allow the incumbent carrier to

[65] *NPRM,* 88 FR at 63909; *see Increased Switching Charges at Kan. City, Mo.,* 356 I.C.C. 887, 890 (1977) (''[T]he cost of performing the service is the most important factor in determining the justness and reasonableness of a proposed switching charge.''); *Intramodal Rail Competition,* 1 I.C.C.2d 822, 834 (1985) (noting the ''increasing trend for carriers to price each element of their services, including switching, in accordance with its cost''). In *Intramodal Rail Competition,* the ICC stated that compensation for reciprocal switching would be determined on a case-by-case basis. *Id.,* 1 I.C.C.2d at 835. The ICC declined to adopt a proposed methodology that set a price ceiling for reciprocal switch rates because the ICC, in considering the agency's prior costing methodology (Rail Form A), assessed at that time that it did not have ''a satisfactory accounting method of allocating the substantial joint and common costs in the rail industry.'' *Id.*

recover any lost profits associated with line-haul service to the petitioner, as discussed above. *See NPRM,* 88 FR at 63909.

The Board declines to address the Coalition Associations' request (1) to clarify that a petitioner could challenge a reciprocal switching fee that was mutually agreed upon between the carriers, and (2) to identify what methodology the Board would use in such a case. The associated issues are outside the scope of this proceeding.

Duration and Termination

Duration

The Board proposed that a prescribed agreement under part 1145 would ordinarily have a term of two years from the date on which reciprocal switching operations thereunder began and could have a term of up to four years if the petitioner demonstrated that the longer minimum term was necessary for the prescription to be practical given the petitioner's or alternate carrier's legitimate business needs. *NPRM,* 88 FR at 63910. The Board stated that it was essential that the duration of a prescribed agreement be ''sufficiently long to make alternative service feasible and reasonably attractive to potential alternate carriers.'' *Id.* The Board sought comment on whether a minimum term longer than two years and/or a maximum term longer than four years is necessary to make the proposed rule practicable and effective. *Id.*

AAR and some rail carriers assert that a two-year term would be disproportionate to the 12 weeks of service that constituted the basis for the order. (AAR Comments 96; CN Comments 26; CSXT Comments 49.) AAR and CSXT state that the Board should determine the initial duration of a prescribed switching agreement on a case-by-case basis and tailor the remedy to the service problem to ensure that the term corresponds to the actual need that the shipper has shown. (AAR Comments 97; CSXT Comments 50.) CN asserts that a lengthy prescription term with no option for earlier termination would be contrary to the public interest of addressing a ''service inadequacy at present'' and may disincentivize investment in the rail network because of increased uncertainty regarding volumes, density, potential impact on revenues, and return on investment. (CN Comments 26.)

AAR asserts that one year is sufficient to make alternative service attractive and feasible to potential alternate carriers, as an attractive alternate would most likely involve integrating the shipper's lane into the alternate carrier's existing traffic, using existing assets. (AAR Comments 97–98; *see also* CN Comments 26–27 (proposing a presumption that a switching order would be one year in duration).) BNSF argues that, where a switch is practicable, a two-year duration is sufficient to meet the Board's goal. (BNSF Comments 15.)

AAR asserts that the Board should make clear that authorizing a term longer than two years would apply only in cases where such a term is absolutely necessary to remedy the service inadequacy shown, such as situations involving a particularly persistent service failure that would be expected to last for a long time. (AAR Comments 98–99.) BNSF contends that any situation where it would take two years (or more) for an alternate carrier to make service feasible cannot, by definition, satisfy the statutory requirement that switching be practicable. (BNSF Comments 15.)

Shipper interests assert that a five-year minimum term is necessary to provide sufficient incentive for an alternate carrier to make the investment to implement the switch. (Coal. Ass'ns Comments 47 (also proposing a ten-year maximum term); DCPC Comments 11 (same); EMA Comments 3; NSSGA Comments 4; PRFBA Comments 10; *see also* AFPM Comments 16 (supporting a two-year minimum term but removing any maximum term so that the prescription remains in place until the service inadequacy is resolved); Ravnitzky Comments 2 (proposing a four-year term).)

The Coalition Associations argue that, in considering the minimum term, the Board should look to the duration of rail contracts for competitive traffic, which may be longer than three years, as the carrier has an incentive to ''lock up'' competitive traffic for an extended period. (Coal. Ass'ns Comments 48.) The Coalition Associations further note that a longer period may be required for the alternate carrier to recover its investment in competitive rail traffic, as such traffic ''tends to have lower rates.'' (*Id.*) The Coalition Associations also assert that, given the narrow scope of the rule, lower volumes of traffic would likely move under the prescription, thus requiring a longer term to justify an alternate carrier's investment of time and resources. (*Id.*) DCPC asserts that the prescription duration should be based on the complexity of the switching operation and the financial commitment required on behalf of the alternate carrier. (DCPC Comments 11.)

The Board will modify the proposed rule such that, in prescribing a reciprocal switching agreement, the Board shall prescribe a minimum term of three years and may prescribe a longer term of service up to five years, depending on what is necessary for the prescription to be practical given the petitioner's or alternate carrier's legitimate business needs.[66] As noted by the Coalition Associations, the duration of rail contracts for competitive traffic provides useful guidance as to the term of an arrangement that would make alternative rail service feasible and attractive to a potential alternate rail carrier. (Coal. Ass'ns Comments 48.) To this end, the Board finds that a term of three-to-five years would be an adequate duration to facilitate a commercial rail option through prescription of a reciprocal switching arrangement. (*See* Coal. Ass'ns Comments 48 (noting that contracts for competitive rail service may be longer than one to three years); Coal. Ass'ns Reply 24 (asserting that ''the alternate railroad must have the opportunity to compete for and serve the eligible traffic for a typical contract cycle of at least two years and potentially longer depending upon the volume of traffic and any investment requirements''); *see also* DCPC Comments 11 (proposing a five-year minimum term); EMA Comments 3 (same); NSSGA Comments 4 (same); PRFBA Comments 10 (same); Ravnitzky Comments 2 (proposing a four-year prescription term).) At the same time, the Board does not conclude that a five-year minimum term is necessary, as the Coalition Associations and others suggest. The flexibility to prescribe a three-to-five-year term is sufficient to achieve the Board's goal in providing a shipper a rail option consistent with commercial practices.

[66] BNSF comments that the Board should ''clarify that an alternate carrier has a reasonable time period from when the prescription order is entered to establish regular linehaul service.'' (BNSF Comments 7.) BNSF asserts that, although the *NPRM* contemplates a ramp-up period of six months for a ''substantial volume of traffic,'' even less ''substantial'' volumes of new traffic may take some time to be incorporated into the alternate carrier's network (to account for, *e.g.,* possible hiring and training of new crews or qualifying existing crews on new service territories), and the actual amount of ramp-up time needed may turn on many factors that need to be considered. (*Id.* at 8 (citing *NPRM,* 88 FR at 63910 n.36).) BNSF urges that any final rule should allow the Board to design a switching remedy that effectively addresses these issues. (BNSF Comments 8.) As noted in the *NPRM,* the Board recognizes that the legitimate business needs of an alternate carrier (including, among other things, the possible need to hire, train, and/or qualify crews) can bear on the appropriate duration of a reciprocal switch prescription. *See NPRM,* 88 FR at 63910 & n.36. Accordingly, the final rule provides a range within which the Board may set the duration of a reciprocal switch prescription so as to take the relevant considerations into account.

While rail carriers argue that a prescription term should correspond to the time needed to remedy a service inadequacy, the duration of a prescribed reciprocal switching agreement reflects what the Board considers at this time sufficient to introduce competition through a commercial rail option in the petitioner's case and incentivize adequate service throughout the rail industry in general. For the same reason, the duration of a prescribed agreement need not be proportionate to the 12-week period that served as the basis for the Board's prescription.

Moreover, the Board finds that a set time period promotes transparency and certainty for petitioners and carriers and therefore helps ensure the effectiveness of the rule. Setting a clear minimum helps petitioners, who are served by a single rail carrier, better assess whether to incur the costs of bringing a case and changing carriers, (Coal. Ass'ns Comments 50–52), and it helps alternate carriers make complex business decisions about investments needed to provide service on a relatively short-term basis. Meanwhile, a clear maximum helps incumbent carriers plan their businesses and reduces negative effects, if any, that may come from intervention, relative to an indefinite switching arrangement.

Termination Process

Under the timetable set forth in the *NPRM,* the incumbent rail carrier may file a petition to terminate no more than 180 days and no less than 120 days before the end of the prescribed period. *NPRM,* 88 FR at 63915.[67] The Board would endeavor to issue a decision on a petition to terminate within 90 days from the close of briefing. *Id.* If the Board does not act within 90 days from the close of briefing, the prescribed agreement would automatically terminate at the end of the original term. *Id.* If the Board is unable to act within that time period due to extraordinary circumstances, the prescribed agreement would be automatically renewed for an additional 30 days from the end of the current term. *Id.* In such cases, the Board would issue an order alerting the parties to the extraordinary circumstances and the renewal. *Id.*

AAR and some rail carriers assert that the incumbent carrier should be allowed to seek termination once it establishes adequate service. (AAR Comments 101–02 (proposing that, to terminate a switching order, the incumbent demonstrate ''materially changed circumstances'' if it has addressed the circumstances that led to the imposition of a switching order); CN Comments 28–29 (proposing that a switching order automatically terminate ''absent a showing of some enduring actual necessity or compelling reason and practicability put forth by the petitioner''); CSXT Comments 51.) BNSF argues that the switching prescription should automatically terminate after two years, and if the petitioner would like to extend the switching prescription past two years, the petitioner should be required to demonstrate, at the end of the term, that an extension would be in the public interest. (BNSF Comments 15.)

The Coalition Associations express the need for adequate time for a shipper to transition its operations from an alternate carrier to the incumbent carrier upon termination of a switch prescription. (Coal. Ass'ns Comments 50–52.) They assert that time is needed for a shipper to, among other things, negotiate a new contract with the incumbent carrier, update the shipper's internal systems, and assess the need for fleet and supply adjustments. (*Id.*) Given these concerns, the Coalition Associations propose: (1) allowing a switch prescription to continue in effect until 30 days after the Board serves a decision that grants a petition to terminate; and (2) moving the window for the incumbent to file a petition to terminate, so that a petition can be filed no more than 210 days and no less than 150 days before the end of the prescribed period. (*Id.*)

The Board recognizes that a shipper needs adequate lead time prior to the end of a prescription arrangement to switch its operations from the alternate carrier to the incumbent carrier. To this end, the Board will modify the rule by requiring a petition to terminate to be filed no less than 150 days before the end of the prescription period.[68] In doing so, should the Board issue a decision granting a petition to terminate within 90 days from the close of briefing (or not issue a decision within 90 days, such that the prescribed agreement automatically terminates at the end of the prescription period), a shipper would have at least 30 days to transition its operations prior to the expiration of a prescription. (*See* Coal. Ass'ns Comments 50 (noting that, under the proposed process, a Board decision may be issued with only eight days left before the switch prescription expired).) Similarly, the Board will modify the rule to allow for the prescribed agreement to continue in effect until 30 days after the Board serves a decision that grants a petition to terminate or after the end of the prescription period, whichever is later.[69]

The Board declines to adopt the modifications proposed by rail carriers that would allow the incumbent carrier to petition to terminate at any time once it has established adequate service or allow a prescribed agreement to automatically terminate absent a showing of compelling need by the shipper. Rail carriers assert that these proposals are consistent with the notion that a prescription must correspond to a remedial need. However, as discussed, the purpose of the rule is to provide for a rail option as a means to avoid drops in network performance, both with respect to a given petitioner when the incumbent carrier's service failed to meet a performance standard and more generally throughout the network. As noted, the transparency and certainty of a set time range for a switching arrangement are important components for incentivizing performance. Indeed, the duration of three-to-five years is appropriate to securing a rail option as a means to address service issues; the possibility of earlier termination would be less consistent with providing that option and therefore could undermine the purposes of this rule. As also noted in the *NPRM,* the prescription of a reciprocal switching agreement does not prevent the incumbent rail carrier from competing to keep its traffic and attempting to win back the traffic by voluntary agreement of the petitioner at any time during the prescription period. *NPRM,* 88 FR at 63910.

[67] Under proposed § 1145.7, a reply to the petition to terminate would be due within 15 days of the filing of the petition, and a rebuttal may be filed within seven days of the filing of the reply. *NPRM,* 88 FR at 63915. AAR urges the Board to allow more time for the incumbent carrier to reply to a shipper's objections to termination. (AAR Comments 104.) The Board will extend the rebuttal period and finds ten days to be sufficient and consistent with the streamlined process set forth in the rule.

[68] The Board declines to adopt the Coalition Associations' proposal to allow a petition to terminate to be filed 210 days before the end of the prescription term. As proposed in the *NPRM,* a petition to terminate may not be filed more than 180 days before the end of the prescription term so that such petitions are not filed prematurely. 88 FR at 63910. Thus, the final rule provides for a 30-day window of time to file a petition to terminate rather than a 60-day window.

[69] AAR requests that the Board explain the circumstances under which it would extend its timeframe for deciding a pending request for termination. (AAR Comments 104–05.) While the Board finds it unnecessary to delineate specific extraordinary circumstances under which additional time would be required, the Board emphasizes that it expects such circumstances, by their very nature, to arise infrequently, if ever. If the Board does not decide the termination proceeding within 90 days from the close of record, and does not issue an extension order, the switching arrangement will automatically terminate. *See NPRM,* 88 FR at 63910.

Termination Standard

As set forth in the *NPRM,* the Board would grant a petition to terminate a prescribed agreement if the incumbent rail carrier demonstrates that, for a consecutive 24-week period prior to the filing of the petition to terminate, the incumbent rail carrier's service for similar traffic on average met the performance standard that provided the basis for the prescription. *NPRM,* 88 FR at 63915. Under the proposed rule, this requirement includes a demonstration by the incumbent carrier that it consistently has been able to meet, over the most recent 24-week period, the performance standards for similar traffic to or from the relevant terminal area. *Id.* The Board defines ''similar traffic'' as the broad category type (*e.g.,* manifest traffic) to or from the terminal area that is affected by the prescription. *Id.* at 63910.

AAR proposes that, rather than examining ''similar traffic,'' as defined in the rule, the Board should consider the incumbent carrier's performance on any traffic that would cast light on the relevant question before the Board, *i.e.,* whether the carrier has addressed the causes of the prior service shortcoming in such a way to assure adequate service for the traffic then subject to the prescription. (AAR Comments 103.) AAR also proposes that, in a petition to terminate, the rule should require the incumbent to demonstrate that it has met the performance standard over a 12-week period rather than a 24-week period, as, AAR argues, a 24-week period is disproportionate to the 12-week period that served as the basis for the prescription. (*Id.*) AAR states that the language of the standard is ambiguous and requests that the Board clarify that it will grant a termination petition if the carrier's performance for similar traffic on average satisfies the specific service metric that triggered the initial switching prescription (rather than with respect to multiple metrics) during the 24-week period immediately prior to filing the petition. (*Id.* at 103–04.)

The Coalition Associations urge the Board to adopt a narrower definition of ''similar traffic,'' depending on which of the service metrics is being measured, as the proposed definition could lead to ''irrelevant comparisons.'' (Coal. Ass'ns Comments 55.) The Coalition Associations assert that, for the OETA and transit time standards, ''similar traffic'' should be defined as other manifest traffic moving between the terminal where the reciprocal switch occurs and the terminal or local serving yard at the other end of the movement of the switched traffic. (*Id.* at 55–56.) For the ISP service metric, the Coalition Associations assert that only the shipper's own traffic is relevant because the incumbent still provides ISP service for switched traffic. (*Id.* at 56.) The Coalition Associations also propose modifying the rule to require the incumbent carrier to demonstrate compliance with all three standards for similar traffic, reasoning that otherwise the Board could terminate a switch prescription when the incumbent was providing service that would merit a prescription. (*Id.* at 54–55.) AAR opposes this proposal, reasoning that a termination proceeding should be focused on whether the particular service inadequacy that formed the basis of the initial prescription has been remedied. (AAR Reply 79.) AAR asserts that the Board's determination of whether a prescription was warranted for other reasons would be more readily answered in the context of the Board's evaluation of a new petition. (*Id.*)

The Board declines to modify its proposed definition of ''similar traffic.'' While AAR urges the Board to consider *any* traffic relevant to its inquiry, (*see* AAR Comments 103), the Board finds that the incumbent carrier's performance with respect to ''similar traffic,'' as defined in the *NPRM,* provides a strong indication as to whether the incumbent has demonstrated its commitment and ability to provide adequate service, as shown in its service with similar traffic. *NPRM,* 88 FR at 63910. The Board notes that parties having a clearer, common understanding of similar traffic is consistent with the expedited nature of a termination proceeding. The proposed definition also makes it more likely that the incumbent carrier will have a relevant pool of operational data on which to base its petition; limiting what the Board would consider to be ''similar traffic,'' as proposed by the Coalition Associations, (*see* Coal. Ass'ns Comments 55–56), may hamper an incumbent carrier's ability to provide a meaningful representation of its current operations.

The Board will, however, modify the standard for a petition to terminate by requiring an incumbent carrier to demonstrate that it has met all three performance standards for similar traffic on average, rather than only the performance standard that provided the basis for the prescription. As the Coalition Associations note, it would undermine the goal of the rule to terminate a prescribed agreement when an incumbent carrier is providing service that would otherwise warrant a reciprocal switching prescription. (*See* Coal. Ass'ns Comments 54–55.) Moreover, it would be inefficient for the Board to terminate a prescription, only to then have the shipper file a new petition based on operational shortcomings that would have otherwise come to light in the termination proceeding.

The Board will also modify the rule such that the Board would grant a petition to terminate a prescribed agreement if the incumbent rail carrier demonstrates that its service for similar traffic met performance standards for the most recent 12-week period prior to the filing of the petition to terminate, rather than the prior 24-week period. The Board finds that a 12-week period is sufficient to provide the Board an accurate representation of the incumbent carrier's operations, and that it is reasonable to ''harmonize'' the time period that serves as the basis for the prescription to the period examined for purposes of a petition to terminate, as AAR suggests. (*See* AAR Comments 103.) The Board clarifies that this 12-week time period shall be the most recent 12-week period prior to the filing of a petition to terminate.[70]

Automatic Renewal

Under the proposed rule, in the event the incumbent rail carrier does not timely file a petition for termination, or files such a petition and fails to sustain its burden of proof, the prescribed reciprocal switching agreement would automatically renew for the same period as the initial prescription. *NPRM,* 88 FR at 63910. The Board sought comment on whether, alternatively, the renewal should be for only one additional year. *Id.*

AAR and some rail carriers assert that automatic renewal is not consistent with the need for a switching order to address an actual necessity or compelling need. (AAR Comments 99; CN Comments 27–28; CSXT Comments 50.) AAR proposes that, rather than automatic renewal, the Board should provide for an orderly opportunity for the shipper to show that the term of the switching order should be extended, with no break in service. (AAR Comments 100; *see also* CSXT Comments 50 (asserting that the petitioner should bear the burden of establishing a continuing compelling need that justifies ongoing forced

[70] The Board notes that nothing in this rule prevents a shipper/receiver from informing the Board of any changes in relevant circumstances during the pendency of the petition to terminate. The Board may consider such information when determining whether the incumbent railroad has met its burden to demonstrate that the prescription is no longer warranted.

switching); CN Comments 28 (proposing automatic termination absent a showing of some enduring actual necessity or compelling reason and practicability put forth by the petitioner).) AAR asserts that, if the Board declines to remove the automatic renewal provision, ''it should limit the automatic renewal to the period of the initial prescription or a single additional year, whichever is shorter,'' to ''give the incumbent carriers more frequent opportunities to seek to terminate the prescription.'' (AAR Comments 101.)

The Coalition Associations support automatic renewal for the same duration as the initial term, noting that the feasibility and attractiveness of handling a shipper's traffic to an alternate carrier is directly related to the potential contract duration, whether access to that traffic is via an initial or renewed switch prescription. (Coal. Ass'ns Comments 57; *see also* Coal. Ass'ns Reply 24 (''Automatic renewal for the same term keeps in place the competitive incentives to improve service until the incumbent carrier firmly establishes its ability both to achieve and maintain adequate service.'').)

Under the final rule, if the incumbent carrier does not timely file a petition for termination, the prescribed agreement will automatically renew at the end of its term for the same period as the initial prescription. However, the Board will modify the proposed rule so that, if a petition to terminate is denied, the Board will determine, on a case-by-case basis, the appropriate renewal period based on the evidentiary record, but for a duration no longer than the initial prescription. This will allow the Board to account for the unique circumstances presented in a particular termination proceeding. (*See* CN Comments 28.) At the end of the renewed term, if the incumbent carrier does not timely file a petition for termination, the prescribed agreement will automatically renew for the same number of years as the renewed term.[71]

While AAR and rail carriers argue that automatic renewal is inconsistent with the need for a prescription to address an actual necessity or compelling need, the purpose of the rule, as discussed, is to introduce a second rail option when there is sufficient cause based on application of the performance standards in part 1145. Automatically renewing the prescribed agreement, absent a petition to terminate, furthers this goal and is consistent with rule's placement on the incumbent railroad of the burden of demonstrating that the prescription is no longer warranted. Further, the Board reiterates that nothing in the rule prevents the incumbent carrier from competing to keep its traffic or attempting to win back the traffic by voluntary agreement during the prescription period. *See NPRM,* 88 FR at 63910.

Other Issues

Permanent Prescription

The Board sought comment on whether the Board should prescribe a reciprocal switching agreement on a permanent basis when an incumbent rail carrier had been subject to a prescription under part 1145 and when, within a specified time after termination of the prescribed agreement, that carrier again failed to meet a performance standard under part 1145 (without demonstrating an affirmative defense or impracticability as provided for in part 1145). *NPRM,* 88 FR at 63910. The Coalition Associations support the imposition of a permanent prescription following a subsequent failure, as such a provision would serve as a safeguard against an incumbent carrier who may ''deploy resources'' to meet the termination criteria but subsequently remove those resources upon the prescription terminating. (Coal. Ass'ns Comments 57.) AAR asserts that a permanent prescription would ''go well beyond what is necessary to remedy the identified inadequacy.'' (AAR Comments 100.)

The Board declines at this time to adopt a provision that would impose a permanent switching order following a subsequent failure by the incumbent carrier. The Board is not persuaded that ''gamesmanship'' by an incumbent carrier is likely, particularly given that the termination process will require proof that incumbent carrier's operations for similar traffic meet all three standards set forth in this rule for a 12-week period.

Access to Data

The Coalition Associations propose to require the incumbent carrier to provide the shipper with all data for ''similar traffic'' that are relevant to the standards the incumbent must satisfy to terminate a prescription, and assert that this should be the same type of data the incumbent carrier is required to provide to a shipper under proposed § 1145.8(a). (Coal. Ass'ns Comments 53.) AAR urges the Board to reject this proposal, arguing that it is unnecessary, burdensome, and raises significant confidentiality concerns. (AAR Reply 78.) The Board anticipates that an incumbent carrier seeking termination will provide the Board with the relevant data to support its petition to terminate. As noted in the *NPRM,* in a termination proceeding, the shipper/receiver has the right to access and examine the facts and data underlying a carrier's petition to terminate, subject to an appropriate protective order. *NPRM,* 88 FR at 63910. The Board will determine on a case-by-case basis whether any deadlines in the procedural schedule should be adjusted in an individual proceeding based on, for example, time needed to resolve a potential discovery dispute involving a shipper's effort to obtain data from the carrier relevant to a termination petition. The Board expects any discovery requests to be narrowly tailored to the issues presented and that the parties will work diligently to resolve any disputes. To the extent a dispute is brought to the Board, the Board will work expeditiously to resolve it and minimize any potential delay affecting the expected timing of a decision as provided in this rule.

Contract Traffic

In the *NPRM,* the Board requested comments about the application of the proposed rule to traffic that is the subject of a rail transportation contract under 49 U.S.C. 10709. The Board sought comment on ''all legal and policy issues relevant to this question.'' *NPRM,* 88 FR at 63909. In addition, the Board posed two main questions. First, the Board sought ''comment on whether the Board may consider the performance data described above, based on service that a carrier provided by contract, as the grounds for prescribing a reciprocal switching agreement that would become effective after the contract expired.'' *Id.* Related to this first question, the *NPRM* sought comment on ''whether the Board may require a carrier to provide performance metrics to a rail customer during the term of a contract upon that customer's request.'' *Id.* Second, the Board requested comment on ''when, prior to the expiration of a transportation contract between the shipper and the incumbent carrier, the Board may prescribe a reciprocal switching agreement that would not become effective until after the contract expires.'' *Id.* The Board noted that the D.C. Circuit had held, under a different statutory scheme, that the Board was not authorized to order a carrier to file a

[71] BNSF seeks clarification as to whether automatic renewal would apply only to the original term prescribed and not a term established by renewal under proposed § 1145.7. (BNSF Comments 15 n.7.) The Board clarifies that a prescribed agreement would continue to automatically renew until the incumbent seeks, and the Board grants, termination or until the prescribed agreement automatically terminates under § 1145.7(f). As discussed, automatic renewal is consistent with the placement of the burden on the incumbent railroad when formulating a petition to terminate.

common carrier tariff more than a year before contract service was expected to end. *Id.* (citing *Burlington N. R.R.* v. *STB,* 75 F.3d 685, 687 (D.C. Cir. 1996)). The Board asked whether any similar ''legal or policy issues'' should be considered when determining how far in advance of contract expiration, if at all, the Board may prescribe reciprocal switching that would go into effect after expiration. *Id.*

Use of Contract Service Data To Determine Whether an Incumbent Carrier Failed To Meet a Performance Standard

With respect to the first question, AAR and all Class I rail carriers oppose the use of performance data for contract service as the basis for determining that an incumbent carrier is not meeting the performance standards and therefore prescribing a reciprocal switching agreement that would become effective when the contract expires.[72] Their main argument is that 49 U.S.C. 10709 prohibits the use of performance data regarding contract service for this purpose. The subsections of section 10709 relevant to their arguments provide that a party to a contract entered into under section 10709 has no duty in connection with services provided under the contract other than those duties the contract specifies and the contract and transportation under such contract, is not subject to title 49, subtitle IV, part A], and may not be subsequently challenged before the Board or in any court on the grounds that such contract violates a provision of part A. The only remedy for any alleged breach of a contract is an action in an appropriate State court or United States district court, unless the parties otherwise agree.

AAR and several carriers argue that, in light of section 10709(b), the Board may not use performance data for contract traffic as the basis for finding that the performance standards were not met and prescribing post-expiration reciprocal switching because doing so would create a new ''duty''—compliance with the performance standards—that is not ''specified by the terms of the contract.'' (*See, e.g.,* AAR Comments 34; BNSF Comments 12; AAR Reply 1–2, 6–7; CN Reply 14; NSR Reply 4; CPKC Reply 31.) Also, AAR and several carriers argue that evaluating the performance of an incumbent carrier under contract as a basis for reciprocal switching would violate section 10709(c)(1) because it would make the contract traffic ''subject'' to the rule and section 11102(c)(1) and because a reciprocal switching petition would amount to a ''challenge[]'' to contract transportation before the Board. (*See, e.g.,* AAR Comments 33; CN Comments 50–52; AAR Reply 1, 6–7; CN Reply 13–14; NSR Reply 4–5.) CN says that the statutory bar on regulation of ''transportation'' under contract also bars challenges to the ''terms and conditions'' related to that transportation, including allegations of failure to provide adequate service. (CN Comments 52 (citing *Ameropan Oil Corp.* v. *Canadian Nat'l Ry.,* NOR 42161, slip op. at 2, 4 (STB served Apr. 17, 2019)).) In addition, AAR and several carriers argue that reciprocal switching would be a regulatory ''remedy'' for poor performance, which they say would violate section 10709(c)(2)'s requirement that the ''exclusive remedy'' for any alleged breach of contract is an action in court. (*See, e.g.,* CN Comments 51; NSR Comments 19; AAR Reply 7; CN Reply 14; CPKC Reply 31; NSR Reply 5.) In light of section 10709, AAR argues, a shipper under contract may pursue reciprocal switching only by allowing the contract to expire, using common carrier service, and then seeking reciprocal switching if the common carrier service fell short of the performance standards. (AAR Comments 36.)

AAR argues that its position is consistent with the two cases cited in the *NPRM, Burlington Northern* and *FMC Wyoming Corp.* v. *Union Pacific Railroad,* FD 33467 (STB served Dec. 16, 1997). (AAR Comments 36–37; AAR Reply 12–14.) AAR distinguishes *FMC Wyoming*—in which the Board indicated that it could require a railroad to establish a common carrier rate when the contract was set to expire ''in a matter of weeks,'' *FMC Wyo.,* FD 33467, slip op. at 3 n.7—on the ground that ordering a carrier to establish a rate does not ''require any examination of the service provided under the contract,'' whereas ''ordering switching under the Proposed Rule plainly would'' require such examination. (AAR Comments 36–37.) Regarding *Burlington Northern,* AAR says that the D.C. Circuit accepted as a general principle that the Board lacks authority over contract traffic and that, therefore, the only issue before the court was whether the statute that required carriers to file a common carrier rate could overcome section 10709's jurisdictional bar, specifically when the contract was expected to expire in ''more than a year.'' (AAR Reply 12–14.) Here, AAR explains, there is no statute that arguably could overcome section 10709. (*Id.*)

AAR and several carriers also say that applying the proposed rule to traffic that is subject to a transportation contract is bad policy, primarily because they say it would interfere with contract negotiations. (*See, e.g.,* AAR Comments 33–34; BNSF Comments 13; CN Comments 53; NSR Comments 19–20; AAR Reply 16–17; CPKC Reply 33–34.) AAR and CPKC argue that the proposed rule would deny a contracting shipper the option to forgo performance guarantees in exchange for something that the shipper might value more, such as lower rates. (AAR Comments 33–34; CPKC Reply 33–34; *see also* NSR Comments 19–20 (arguing that the rule will require contracting parties to adjust the rate to reflect the ''risk'' that reciprocal switching may be prescribed based on performance); BNSF Comments 13 (''contract parties often consider service levels as part of their economic analysis'').)[73] AAR and several carriers contend that the availability of reciprocal switching based on contract performance would deter carriers from entering contracts, which they say would contravene Congress's intent to promote the use of rail transportation contracts. (BNSF Comments 13; NSR Comments 18–19; AAR Reply 11; BNSF Reply 4.) CN highlights language in the legislative history of section 10709's predecessor that said that ''[r]ail carriers and shippers should be free to negotiate and enter into contracts without concern'' about regulatory interference. (CN Comments 53 (quoting H.R. Rep. No.

[72] (*See* AAR Comments 32–37; BNSF Comments 12–13; CN Comments 50–54; CSXT Comments 8; NSR Comments 17–20; AAR Reply 6–18; BNSF Reply 4–5; CN Reply 12–17; CPKC Reply 30–34; CSXT Reply 7 n.14; NSR Reply 3–9.) Although UP did not mention the contract issue specifically, it joined the opening and reply comments of AAR in their entirety. (*See* UP Comments 1; UP Reply 1 n.1.)

[73] AAR, CN, and CPKC also argue that, because of how the metrics work, using contract data as the basis for reciprocal switching could deter carriers from negotiating contracts that ensure *better* performance. AAR presents a hypothetical example of a contract that requires a railroad, in exchange for a premium rate, to move shipments in half the time it had moved similar shipments in the past. (AAR Comments 34.) When the contract expires and the carrier reverts to its usual transit time, the higher level of performance under contract would become the baseline against which to compare the subsequent common carrier service, creating a risk that the carrier would fail the ''service consistency'' metric. (*Id.*) AAR says that ''no carrier would enter into such a contract,'' as least without insisting on more concessions from the shipper. (*Id.* at 34–35; *see also* CN Comments 53–54 (stating that comparing contract data with non-contract data is especially problematic with the transit time metric); CPKC Reply 34 (stating that comparing contract service with post-expiration service is particularly problematic for contracts that require premium service levels).)

96–1035, at 58 (1980)).) NSR suggests that ''[e]ven unresolved questions'' about the application of the proposed rule to contract traffic could deter the use of contracts. (NSR Comments 20.)

Shippers and shipper organizations that address the contract issue argue that the Board can and should use an incumbent carrier's contract performance data as the basis for post-expiration reciprocal switching prescriptions.[74] The Coalition Associations argue that using contract performance data for this purpose is consistent with section 10709 because it would not amount to regulating or interpreting the contract, nor would it modify any party's contractual obligations or purport to find that the contract violates the law. (Coal. Ass'ns Comments 10; *see also* Coal. Ass'ns Reply 6, 9; WCTL Reply 12–13.) In response to AAR's and the carriers' argument that using contract performance as a basis for post-expiration reciprocal switching would violate section 10709(b) by imposing an additional ''duty'' on the contracting carrier, the Coalition Associations say that the proposed rule would not require the carrier to provide ''any specific level of contract service.'' (Coal. Ass'ns Reply 9.)[75] The Coalition Associations also say that there is no conflict with section 10709(c)(2) because ''Board is not proposing to decide any dispute about contract restrictions that prevent a shipper from using a prescribed switch.'' (Coal. Ass'ns Comments 12 n.11.)

The Coalition Associations make an additional statutory interpretation argument regarding section 10709. They point out that 49 U.S.C. 10705 says that the Board may require a rail carrier to include substantially less than the entire length of railroad in a through route only in certain limited situations, including when required under sections 10741, 10742, or 11102. (Coal. Ass'ns Reply 7.) The Coalition Associations note that section 10741 expressly states that it shall not apply to contracts covered by section 10709, whereas section 11102 (which includes the reciprocal switching provision) and section 10742 have no such statement. (*Id.*) Thus, the Coalition Associations argue, the ''clear inference'' is that the statutory scheme provides that the Board can consider contract transportation when exercising its authority under section 11102. (*Id.*)

The Coalition Associations and other commenters argue that there is precedent for the Board's use of contractual performance data to address service issues. The Coalition Associations and ACD claim that in two decisions—*Midtec* and *Vista Chemical Company* v. *Atchison, Topeka & Santa Fe Railway,* 5 I.C.C.2d 331 (1989)—the ICC considered evidence regarding contract service when deciding whether to prescribe reciprocal switching. (Coal. Ass'ns Comments 11; ACD Reply 3.) The Coalition Associations also point to two decisions involving the fluidity of the rail network in which the Board specifically said that it would examine contract and non-contract traffic. (Coal. Ass'ns 11–12 n.10 (citing *U.S. Rail Serv. Issues,* EP 724, slip op. at 7 (STB served Dec. 30, 2014), and *U.S. Rail Serv. Issues—Performance Data Reporting,* EP 724 (Sub-No. 4), slip op. at 17 (STB served Nov. 30, 2016)).) They also point out that the Board's 1998 decision adopting 49 CFR parts 1146 and 1147 said that ''where no transportation is being provided, we do not believe that the mere existence of a contract precludes us from providing for temporary emergency service upon a proper showing, so that traffic can move while any contract-related issues are being litigated in the courts.'' (Coal. Ass'ns Comments 11–12 n.10 (quoting *Expedited Relief for Serv. Inadequacies,* 3 S.T.B. at 976).) WCTL says that the Board ''routinely evaluates the details of rail transportation contracts when considering the reasonableness of rates provided for common carrier service,'' (WCTL Reply 13–14 (citing cases)), and the Coalition Associations similarly argue that the Board ''will consider contract traffic data in the exercise of its rate review regulatory authority,'' (Coal. Ass'ns Comments 10 n.6 (citing *Simplified Standards for Rail Rate Cases,* EP 646 (Sub-No. 1), slip op. at 83 (STB served Sept. 5, 2007))).[76]

Shipper organizations also make policy arguments in favor of considering contract performance data as the basis for post-expiration reciprocal switching. They say that the overwhelming majority of rail traffic moves under contract and that the proposed rule will provide little benefit to the overall rail network if contract traffic is excluded. (*See, e.g.,* Coal. Ass'ns Reply 5, 9; AFPM Comments 15; WCTL Comments 2–3, 5; ACD Reply 2.) The Coalition Associations say that the contract questions are ''existential'' for any proposal to address inadequate rail service and that ''the Board's entire proposal would be meaningless'' if contract performance cannot be considered. (Coal. Ass'ns Reply 5.)[77] The Coalition Associations also claim that excluding contract performance would set a precedent that would render the alternative reciprocal switching standards in 49 CFR parts 1144 and 1147 ''similarly useless.'' (Coal. Ass'ns Reply 5.) Shipper organizations say that the path proposed by AAR and the carriers—that shippers should allow their rail contracts to expire, accept common carrier service, and wait to see if the carrier meets the performance standards—would be so cumbersome that the proposed rule would rarely, if ever, be used. (*See* Coal. Ass'ns Reply 5–6; WCTL Reply 14–15; ACD Reply 2.) Shipper organizations also explain that railroads do not segregate services and facilities between contract and common carrier traffic, and any proposal to improve the fluidity of the national rail network needs to consider contract traffic performance. (*See* Coal. Ass'ns Reply 8.) AFPM argues that, because facilities often are used for both contract and tariff traffic, it will be ''very difficult for a shipper to show specific poor service only applies to . . . just the tariff shipments.'' (AFPM Comments 15–16; *see also* Coal. Ass'ns Reply 8 (arguing that metrics are necessarily intertwined for common carrier and contract traffic, which ''renders it impractical and unnecessary, if not impossible, to filter for any of these traffic types''); DCPC Comments 3, 5 (discussing logistical problems that limiting the rule to non-contract traffic

[74] (*See, e.g.,* Coal. Ass'ns Comments 9–20; AFPM Comments 15–16; DCPC Comments 5; FRCA/NCTA Comments 4; NMA Comments 7; WCTL Comments 4–5; Coal. Ass'ns Reply 5–10; ACD Reply 2–3; Dow Reply 5; WCTL Reply 6–7, 12–15.)

[75] The Coalition Associations note that the Board said that it does not view it as appropriate to ''apply, or draw from'' the rule's proposed performance standards to regulate or enforce the common carrier obligation. (Coal. Ass'ns Reply 9 (quoting *NPRM,* 88 FR at 63902).) They argue that ''[i]f this proposal does not impose any duty upon common-carrier service, it does not impose any duty upon contract service either.'' (Coal. Ass'ns Reply 9.)

[76] Although the Coalition Associations' discussion of *Burlington Northern* focuses primarily on the second question raised in the *NPRM* (how long in advance of contract expiration the Board may consider a reciprocal switching petition), their arguments suggest that they view *Burlington Northern* as irrelevant to the first question. (*See* Coal. Ass'ns Comments 16–18.) They argue that *Burlington Northern* was not based on section 10709 and that the balancing of carrier and shipper interests in that statutory scheme has no parallel in the reciprocal switching context. (Coal. Ass'ns Comments 16.)

[77] The Coalition Associations propose that if the Board cannot definitively conclude that the proposed rules allow consideration of contract performance, it should reopen Docket No. EP 711 (Sub-No. 1). (Coal. Ass'ns Reply 47–48.) The Coalition Associations also propose modifications that aim to address potential problems with the proposal in the *2016 NPRM.* (Coal. Ass'ns Reply 47–52.)

would create in industries that ship both contract and non-contract traffic)).

Numerous shippers and shipper organizations respond to the arguments made by AAR and the carriers about the purported effects that relying on contract performance data will have on contract negotiations. They argue that shippers, especially captive shippers, are at a disadvantage in contract negotiations with railroads, with contracts often presented on a take-it-or-leave-it basis. (*See, e.g.,* AFPM Comments 15; DCPC Comments 5.) [78] As a result, they say, contractual commitments to maintain a minimum level of service are virtually non-existent. (*See, e.g.,* Coal. Ass'ns Reply 8 n.10; NMA Comments 7; AFPM Comments 15; Dow Reply 5.) DCPC notes that the Board has not defined the word ''contract,'' and it says that some purported contracts are rates published in a non-distribution tariff with ''Contract'' stamped on the title page. (DCPC Comments 5; DCPC Reply 3.) [79] DCPC objects to the railroads' use of this type of ''non-signatory 'Contract' '' and says that contracts ''should be agreed to and signed by all parties to the agreement.'' (DCPC Reply 3.) Some shipper organizations support the proposed rule in part on the ground that the potential for a reciprocal switch will help them in contract negotiations with railroads. (AFPM Comments 16; FRCA/NCTA Comments 4.)

After considering the comments, the Board will not use incumbent carriers' contract performance data as the basis for reciprocal switching prescriptions under part 1145. Using contract performance data as the basis for reciprocal switching under the rule would attach the potential for a regulatory consequence to the carriers' failure to meet Board-specified numerical performance standards while under contract, which the Board views as inconsistent with the limitations that section 10709 imposes. Given the particular design of part 1145, this would effectively create a ''duty'' that was not present in the contract, which does not reasonably align with section 10709(b)'s statement that contracting parties shall have ''no duty in connection with services provided under such contract other than those duties specified by the terms of the contract.'' Shipper organizations are correct that the availability of reciprocal switching would not *require* carriers under contract to comply with the performance standards, (*see, e.g.,* Coal. Ass'ns Reply 9). Even for non-contract traffic, part 1145 does not create a service standard with which carriers must comply; rather, it identifies the service levels under which the Board concludes it is appropriate to consider the introduction of an additional line-haul carrier as a means to address service concerns. *See* Legal Framework. But with regard to traffic moving under contract, the application of part 1145 would introduce a new incentive for carriers to meet those standards, even if their contracts contain different performance requirements or none at all based on negotiated bargaining.[80] Even though the Board recognizes that the potential for future application of a regulation may influence contract negotiation and compliance already, the likely effect on the carriers' incentives if the prescription of a reciprocal switch under part 1145 could be based on contract traffic would be specific and significant enough to implicate section 10709(b).[81] For similar reasons, the Board also agrees with carriers that basing reciprocal switching on contract traffic raises concerns under section 10709(c)(1), which says that contracts and contract transportation ''shall not be subject'' to the entirety of Part IV of the Act, which includes the reciprocal switching statute. Creating numerical standards that apply to contract performance, and prescribing reciprocal switching when performance fell short of the standards, would be tantamount to subjecting the contract transportation to the reciprocal switching statute.[82]

The Coalition Associations' argument based on 49 U.S.C. 10705 is not persuasive. Section 10705 provides that the Board may require a rail carrier to include in a through route substantially less than the entire length of railroad only in certain limited situations, including when required under 49 U.S.C. 10741, 10742, or 11102. The Coalition Associations point out that section 10741 (a discrimination provision) specifically states that the provision shall not apply to contracts described in section 10709, in contrast to section 11102, which is silent as to section 10709 contracts. (Coal. Ass'ns Reply 7–8.) Relying on the principle that ''where Congress includes particular language in one section of a statute but omits it in another . . . , it is generally presumed that Congress acts intentionally and purposely in the disparate inclusion or exclusion,'' the Coalition Associations argue that the lack of a reference to contracts in section 11102 should be interpreted as an intentional congressional choice to allow the Board to apply reciprocal switching to contract traffic. (*Id.* at 7–8 & n.8 (quoting *Russello* v. *United States,* 464 U.S. 16, 23 (1983)).) But inferences based on the statutory structure are appropriate only when the statute's meaning is not clear from the statutory text. *See, e.g., In re Rail Freight Fuel Surcharge Antitrust Litig.,* 34 F.4th 1, 9 (D.C. Cir. 2022) (explaining that statutory interpretation begins ''with the language of the statute itself'' and then, ''if necessary,'' ''may turn to other customary statutory interpretation tools, including structure, purpose, and legislative history'' (quoting *Genus Med. Techs. LLC* v. *FDA,* 994 F.3d 631, 637 (D.C. Cir. 2021))). Section 10709 is clear that the Board may not add duties to the contract or subject contract transportation to ''this part,'' which includes section 11102. In light of this language, it is unnecessary to make inferences based on the statute's structure.

The cases cited by shipper organizations where the agency discussed contract performance in

[78] AFPM says that ''almost three quarters of AFPM members are captive shippers,'' with the result that railroads have all the leverage and the resulting contracts are ''tremendously advantageous'' for the railroads. (AFPM Comments 15.)

[79] DCPC says railroads contend that this kind of purported contract ''becomes binding when the shipper moves traffic on the rate,'' but the shipper has little choice because the rate is presented on a take-it-or-leave-it basis. (DCPC Reply 3.)

[80] Several shipper organizations emphasize that many contracts lack any performance standards. (Coal. Ass'ns Reply 8 n.10; NMA Comments 7; AFPM Comments 15.) But the fact that a contract does not address an issue does not open the door to regulation of that issue. *See, e.g., Ameropan Oil Corp.,* NOR 42161, slip op. at 4 (''[W]here transportation is provided pursuant to a contract, the Board lacks regulatory authority over the terms and conditions related to that transportation, *whether or not explicitly addressed in the contract.*'') (emphasis added).

[81] As noted above, the Coalition Associations argue that if applying the performance standards to common carrier service does not create a duty under the common carrier statute (which they claim is what the *NPRM* meant when it said that the Board would not ''apply, or draw from'' the performance standards to enforce the common carrier obligation), applying the performance standards to contractual service would not create a ''duty'' under section 10709(b) either. (Coal. Ass'ns Reply 9 (quoting *NPRM,* 88 FR at 63902).) This argument misconstrues the *NPRM.* The Board's point was that finding that a carrier violated the common carrier obligation could have consequences beyond a reciprocal switching prescription, such as an obligation to pay compensation to a private party, and, for these and other reasons described in this rule, the proposed rule is not intended (and it would not be appropriate) to apply or draw from these standards to expose carriers to those additional consequences.

[82] Because other provisions of section 10709 bar the application of the rule to contract performance, the Board need not decide whether considering performance during the term of a contract would violate section 10709(c)(2) by creating a non-judicial ''remedy'' for an alleged breach of contract. (*See* CN Comments 51, NSR Comments 19; AAR Reply 7; CN Reply 14; CPKC Reply 31; NSR Reply 5.)

connection with (and ultimately denied) reciprocal switching requests are clearly distinguishable and do not support the conclusion that the Board should use contract performance as the basis for a post-expiration reciprocal switching order under the proposed rule. (*See* Coal. Ass'ns Comments 11; ACD Reply 3.) First, neither *Midtec* nor *Vista Chemical* considered section 10709 (or its predecessor, 49 U.S.C. 10713). Cases in which the Board did not consider the potential implications of section 10709 do not provide meaningful guidance as to the proper interpretation or application of that section. *See, e.g., Cent. Power & Light Co.* v. *S. Pac. Transp. Co.,* 1 S.T.B. 1059, 1074–75 (1996).

Second, *Midtec* and *Vista Chemical* do not stand for the proposition that the Board may prescribe a reciprocal switching agreement based on a determination that a carrier provided inadequate service during the term of a contract. In those cases, the Board considered whether the carrier's commercial practices, as reflected in contracts offered by the carrier, contradicted an allegation that the carrier had engaged in anticompetitive conduct. *See, e.g., Midtec,* 3 I.C.C. at 183; *Vista Chemical,* 5 I.C.C.2d at 338–39. If the agency had prescribed a reciprocal switching agreement in those cases (which it did not), presumably it would have arisen out of a finding of anticompetitive conduct, not out of a determination that the carrier's contract service was inadequate.

In *Midtec,* the shipper asked the ICC to impose a reciprocal switching agreement under part 1144, which provides in relevant part for the prescription of a reciprocal switching agreement based on anticompetitive conduct. The shipper's alleged ground was that the incumbent Chicago and North Western Transportation Company (CNW) was engaging in ''monopolistic'' conduct. *Midtec,* 3 I.C.C.2d at 172. CNW argued that its commercial conduct demonstrated that it did not behave in an anticompetitive manner, pointing out the fact that it had been willing to ''initiate and concur in joint rate proposals and rate reductions in tariffs or rail transportation contracts.'' *Id.* at 183. The ICC agreed, based on CNW's evidence, that ''[t]his is hardly the picture of a monopolist indifferent to the needs of its shipper.'' *Id.* This type of general consideration of the incumbent's commercial conduct in respect of contracts—as one piece of evidence regarding whether the incumbent was acting in an anticompetitive manner that might warrant reciprocal switching—is very different from shippers' proposal here that the Board rely on part 1145's numerical standards for performance under contract as the basis for a reciprocal switching prescription.

Similarly, in *Vista Chemical,* the shipper asked the ICC to prescribe reciprocal switching under part 1144. *Vista Chemical,* 5 I.C.C.2d at 331. The ICC considered whether the incumbent carrier was likely to engage in anticompetitive conduct, taking into account any past anticompetitive conduct by the incumbent. *Id.* at 337–42. The ICC noted that the incumbent carrier had offered contracts at reduced rates and had shown a willingness to amend contracts to make them more favorable to shippers. *Id.* at 338–39. Based on this and other evidence that the incumbent carrier had not engaged in anticompetitive conduct, the ICC declined to prescribe the proposed reciprocal switching agreement. The ICC therefore did not reach the question of whether the agency could have prescribed the proposed agreement under part 1144 based on a determination that the incumbent carrier's contract rates were excessive. Without the ICC having reached that question, nothing in *Vista Chemical* suggests that the Board may apply performance standards to contract traffic as the basis for prescribing a post-termination reciprocal switching agreement.

Nor do *United States Rail Service Issues,* EP 724 (STB served Dec. 30, 2014), and *United States Rail Service Issues—Performance Data Reporting,* EP 724 (Sub-No. 4) (STB served Nov. 30, 2016) support the shipper organizations' position. (*See* Coal. Ass'ns Comments 11 n.10.) Those decisions required reporting of data regarding contract traffic to the Board as part of overall network reporting,[83] but they did not take further action that would regulate contract traffic. In the 2014 proceeding in Docket No. EP 724, BNSF opposed certain proposals made by a party to the proceeding on the ground that ''[t]he Board does not have authority to impose service recovery obligations on BNSF that would over-ride'' contractual obligations. BNSF Reply 13, *U.S. Rail Serv. Issues,* EP 724 (Nov. 3, 2014). While the Board acknowledged that this was a ''significant concern'' and that ''[section] 10709 could have an impact on the scope of any prospective relief,'' it also explained that ''[t]he national rail system carries both regulated and non-regulated traffic and the Board necessarily must look to the fluidity of that network.'' *U.S. Rail Serv. Issues,* EP 724, slip op. at 7. The Board's order required production of data to the Board but did not adopt the farther-reaching service recovery obligations that were the primary focus of BNSF's objections. *Id.* In the 2016 proceeding in Docket No. EP 724 (Sub-No. 4), the Board adopted a final rule requiring Class I railroads to report certain service performance metrics. AAR objected to the requirements on the ground that most coal transportation takes place under contract, but the Board responded that this argument ''does not take into account our statutory responsibility to advance the goals of the RTP, which . . . includes monitoring service in order to ensure the fluidity of the national rail network.'' *U.S. Rail Serv. Issues—Performance Data Reporting,* EP 724 (Sub-No. 4), slip op. at 18 (citing 49 U.S.C. 10101(3), (4)). The Board went on to say: ''The Board is not asserting jurisdiction regarding the rights and obligations of shippers and carriers associated with coal moving under contracts; rather, the Board is taking action to gain a better understanding of and insight into the general flow of traffic on the system.'' *Id.*

Neither decision supports the use of contract performance data as the basis for prescribing a reciprocal switching agreement under part 1145. Both decisions merely affirm that the Board itself may collect general network data that may include contract movements for the purpose of monitoring and understanding network fluidity. Indeed, the 2014 decision in Docket No. EP 724 cautions that section 10709 will limit the scope of prospective relief that the Board can provide with respect to contract traffic, describing this issue as a ''significant concern.'' *U.S. Rail Serv. Issues,* EP 724, slip op. at 7. Thus, the Board recognized that, even though it has broad authority to monitor contract traffic, its authority to order relief with respect to contract traffic, even to promote network fluidity, is far more limited.

The Coalition Associations also argue that language in the Board's decision in *Expedited Relief for Service Inadequacies* supports their position that the Board's actions to promote network fluidity may extend to contract traffic. (Coal. Ass'ns Comments 11–12 & n.10.) In that decision, the Board said that:

> As for transportation that is provided under a rail transportation contract, AAR is correct that we cannot enforce, interpret, or disturb the contracts themselves, nor can we directly regulate transportation that is provided under such a contract. 49 U.S.C.

[83] The Board has authority to require carriers to report information pursuant to 49 U.S.C. 1321 and 49 U.S.C. 11145(a)(1).

10709(b), (c). However, where no transportation is being provided, we do not believe that the mere existence of a contract precludes us from providing for temporary emergency service, upon a proper showing, so that traffic can move while any contract-related issues are being litigated in the courts. Moreover, there may be other instances where it is possible and appropriate to exercise our broad regulatory authority to ensure that traffic can move, as in the recent *UP/SP Service Order.* Thus, we are not inclined to disavow in advance any possible exercise of jurisdiction. Such jurisdictional issues are best left to a case-by-case examination and, again, our assertion of jurisdiction in any specific case will be subject to judicial review.

Expedited Relief for Serv. Inadequacies, 3 S.T.B. at 976.[84]

The Board disagrees that this passage from the Board's 1998 decision in *Expedited Relief for Serv. Inadequacies* supports the Coalition Associations' position. First, the proposed rule here is not designed to provide ''temporary emergency service'' in situations where ''no transportation is being provided,'' so that language has little relevance here. Second, regarding the Board's statements that it would not ''disavow in advance any possible exercise of jurisdiction'' and that it would consider such issues via a ''case-by-case examination,'' the Board does not foresee any situations where it would order reciprocal switching under the proposed rule based on the failure of contract traffic to meet the performance standards for the reasons discussed above. Accordingly, the Board does not need to preserve a ''case-by-case examination'' of this sort with respect to contract traffic under this rule.

Nor do *Burlington Northern* and *FMC Wyoming* support the use of contract performance data as a basis for post-expiration reciprocal switching. Taken together, these cases suggest that the Board can require a carrier to establish a common carriage rate while still under contract—as long as the contract would expire ''within a matter of weeks,'' *FMC Wyo.,* slip op. at 3 n.7, rather than ''more than a year,'' *Burlington N.,* 75 F.3d at 688.[85] But requiring a carrier to file a tariff rate prior to expiration does not attach any regulatory consequences to the carrier's conduct while under contract. Thus, it is not analogous to the use of contract performance data for reciprocal switching, which conflicts with section 10709 precisely because it creates consequences for contractual performance.

The Board's use of contract data in ''Three Benchmark'' rate cases also does not support the use of contract data as the basis for a reciprocal switching prescription under the proposed rule. (*See* Coal. Ass'ns Comments 10 n.6; WCTL Comments 4–5; WCTL Reply 13–14.) The Coalition Associations point to language in *Simplified Standards for Rail Rate Cases,* EP 646 (Sub-No. 1) (STB served Sept. 5, 2007), in which the Board decided that it would look to contract traffic rates to establish a benchmark to determine the maximum lawful rate for the challenged movement in rate cases.[86] (Coal. Ass'ns Comments 10 n.6.) The use of contract rates for this purpose in rate cases is distinguishable from the possible use of contract performance data under the proposed rule. In rate cases, the Board uses contract traffic data as the basis for possible regulatory consequences for similar common carrier traffic, not for the traffic moving under contract. In contrast, using contract traffic data as the basis for reciprocal switching under part 1145 would attach potential regulatory consequences based on performance under the contract itself. Similarly, in the cases that WCTL cites, (*see* WCTL Reply 13–14), the Board looked to contract traffic only as evidence and not as the basis for regulatory action with respect to that traffic. *See W. Fuels Ass'n, Inc.* v. *BNSF Ry.,* NOR 42088, slip op. at 38–39 (STB served Sept. 10, 2007); *Ariz. Elec. Power Coop., Inc.* v. *BNSF Ry.,* NOR 42113, slip op. at 25 (STB served Nov. 22, 2011).

The Board appreciates the concerns of shippers and shipper organizations that the Board's decision not to consider the performance of contract traffic may limit the impact of the proposed rule.[87] As these commenters have noted, a large percentage of rail traffic is shipped under contract, and the rule will be less effective at promoting overall network fluidity if poor contract traffic performance is beyond the direct reach of the rule. (*See, e.g.,* Coal. Ass'ns Reply 5, 9; AFPM Comments 15; WCTL Comments 2–3, 5; ACD Reply 2.)[88] The Board also recognizes the concerns of shipper organizations that excluding contract performance data will create a cumbersome path for contract shippers to take advantage of the rule, requiring them to allow their contracts to expire and accept a period of common carrier service before becoming potentially eligible to seek relief under the rule. (*See* Coal. Ass'ns Reply 5–6; WCTL Reply 14–15; ACD Reply 2.) Congress has limited the Board's statutory authority with respect to contract traffic, as discussed above.[89] To the extent the

[84] In its 2024 decision revising its emergency service regulations, the Board said that it saw ''no reason to revisit'' its statements about contract traffic in *Expedited Relief for Serv. Inadequacies. Expedited Relief for Serv. Emergencies,* EP 762, slip op. at 28.

[85] In the ICC decision that led to the D.C. Circuit decision in *Burlington Northern,* the ICC found that ordering Burlington Northern to file a common carrier rate while still under contract would not violate the former 49 U.S.C. 10713 (the predecessor to section 10709). *W. Tex. Utils. Co.* v. *Burlington N. R.R.,* NOR 41191, slip op. at 4 (ICC served Oct. 14, 1994). The ICC reasoned that it could order carriers to file common carrier rates while still under contract because this was an exercise of authority with respect to future common carrier transportation, not over contract transportation. *Id.* at 4 & n.9. The D.C. Circuit's ruling did not specifically address the ICC's conclusion about section 10713, instead finding that other components of the statutory scheme limited the ICC's ability to order the filing of common carrier rates more than a year before the contract expires. The D.C. Circuit did not, however, suggest that section 10713 or any other provision requires the Commission to wait until *after* expiration to issue such an order.

[86] In that case, carriers argued that contract movements ''cannot be easily compared with a challenged common carrier movement.'' *Simplified Standards for Rail Rate Cases,* EP 646 (Sub-No. 1), slip op. at 82 (STB served Sept. 5, 2007). The Board rejected the argument, observing that contract rates may provide useful information as to the maximum lawful rate and that excluding contract rates may, in some cases, ''leave insufficient movements in the Waybill Sample to perform a statistically meaningful comparison analysis.'' *Id.* at 83.

[87] The Board does not agree with the Coalition Associations, however, that ''the Board's entire proposal would be meaningless'' if contract performance cannot be considered. (*See* Coal. Ass'ns Reply 5.) The Board's jurisdiction is focused on common carrier traffic by congressional design; thus, if the rule can achieve its objectives with respect to common carrier traffic, this would make it worthwhile.

[88] Several shipper organizations argue that common carrier traffic and contract traffic are so intertwined that the rule would be difficult to administer if contract traffic is excluded. (*See, e.g.,* AFPM Comments 15–16; Coal. Ass'ns Reply 8; DCPC Comments 3, 5.) To the extent that these commenters are concerned that it will be difficult to filter the performance of common carrier traffic from that of contract traffic, (*see* AFPM Comments 15–16; Coal. Ass'ns Reply 8), the Board does not share this concern. It is reasonable to expect that shippers will have access to the information they need to know which of their traffic moves under contract and which moves under common carriage, as that is a key factor for Board regulation in general. DCPC argues that shippers will find it difficult to ensure that contract shipments are never inadvertently moved via the alternate carrier because ''for various reasons, whenever people are involved in a process, mistakes happen.'' (DCPC Comments 3.) In light of section 10709, the extension of the rule to contract traffic is not a viable solution to this problem, to the extent it exists.

[89] DCPC suggests that the Board should apply part 1145 to contracts because the term ''rail contract'' is not defined and that railroads sometimes publish rates in non-distribution tariffs, with the word ''contract'' on the title page, that railroads deem binding ''when a shipper moves traffic on the rate,'' even when the shipper has not signed or otherwise agreed to the terms. (DCPC Reply 3; *see also* DCPC Comments 5.) DCPC's concern is beyond the scope of this proceeding. *See Rail Transp. Conts. Under 49 U.S.C. 10709,* EP 676, slip op. at 5 (STB served Jan. 22, 2010) (determining that the Board will ''continue to address on a case-by-case basis the issue of whether a document constitutes'' a contract

rule achieves its objectives with respect to common carrier traffic, the Board expects that it will improve network performance overall, which could benefit contract shippers in this interconnected industry. The Board notes that many trains haul both common carrier and contract traffic, and a congested yard or line can degrade the performance of both types of traffic, whether hauled together or separately. Incentives for the reliability and consistency of common carrier transportation may therefore positively affect both types of traffic by promoting the fluidity of shared facilities.

Requiring a Carrier To Provide Performance Data to a Shipper During the Term of a Contract

Related to the first question, the Board requested comment in the *NPRM* on whether the agency may require a railroad to provide performance metrics to a rail customer during the term of a contract upon that customer's request. *NPRM*, 88 FR at 63909. AAR argues that requiring a rail carrier to provide information to a customer while under contract is barred by section 10709(b) because that would add an additional ''duty'' to the carrier's existing contractual obligation. (AAR Comments 35–36; AAR Reply 14–15.) AAR argues that, if a shipper wants a carrier to provide metrics for performance under contract, then it can bargain for them in contractual negotiations. (AAR Comments 36.) Although AAR recognizes that the Board's decision in *Demurrage Billing Requirements,* EP 759, did not distinguish between contract and common carrier traffic when it required carriers to provide information to their customers in demurrage invoices, AAR says that the decision contains no discussion of section 10709 and is therefore a ''drive-by jurisdictional ruling[]'' that has ''no precedential effect.'' (AAR Reply 15 (quoting *Steel Co.* v. *Citizens for a Better Env't,* 523 U.S. 83, 91 (1998)).)

The Coalition Associations argue that because the Board has authority, in their view, to consider contract performance data when deciding whether to prescribe reciprocal switching, it follows that the Board has authority to require carriers to provide performance data to contract customers. (Coal. Ass'ns Comments 13.) The Coalition Associations point to *Demurrage Billing Requirements,* EP 759, as precedent for requiring railroads to provide information to contract customers, noting that one item required on demurrage invoices is OETA, which is also one of the performance metrics under this rule. (Coal. Ass'ns Comments 13–14.) WCTL notes that the Board requires railroads to provide data to the Board regarding contract service pursuant to 49 U.S.C. 11145 and suggests that requiring them to provide data about contract service to shippers is no different. (WCTL Reply 14.) In addition, WCTL argues that providing data is permitted by section 10709 because it does not fall within the definition of ''transportation'' under 49 U.S.C. 10102. (WCTL Reply 14.)

The Board need not address whether it has statutory authority to require carriers to provide, to the relevant customer, data regarding the railroad's performance under a contract. Because the Board will not prescribe reciprocal switching under part 1145 based on performance during the term of a contract, the Board sees no basis to require railroads to provide the data in question to customers that are not eligible to file a petition under the rule. Though the Board values open communication between carriers and shippers generally and encourages carriers to voluntarily provide performance data relevant to transportation under contract, in this proceeding commenters did not identify any purpose for requiring the provision of contract performance data other than using it as the basis for a petition under part 1145.

Whether a Reciprocal Switching Petition May Be Filed Prior to Contract Expiration

Regarding the second question in the *NPRM*—''when, prior to the expiration of a transportation contract between the shipper and the incumbent carrier, the Board may prescribe a reciprocal switching agreement that would not become effective until after the contract expires''—the Board received only a few comments. AAR asserts that the Board cannot consider a prescription for reciprocal switching until the contract has expired (and any petition must be based on common carrier service that the shipper received after expiration). (*See* AAR Comments 36.) WCTL proposes that, ''consistent with practice in maximum rate cases,'' the rule should allow shippers to seek agency reciprocal switching relief within the final calendar quarter of any given rail transportation contract's term.'' (WCTL Comments 4.) The Coalition Associations propose a schedule that would allow contract shippers to file petitions while the contract is in effect, and the reciprocal switching prescription, if granted, would go into effect no more than one year from the date of the shipper's petition. (Coal. Ass'ns Comments 19.) This would allow shippers to file up to one year before contract expiration and receive the full benefit of the prescription. (*Id.* at 19–20.) CN opposes the Coalition Associations' proposal on the ground that a petition filed one year before the contract expires ''will have no bearing on whether service to that shipper is inadequate one year later.'' (CN Reply 16–17.)

Given the Board's decision not to rely on performance that occurs during the term of a contract as the basis for a prescription under part 1145, it is unnecessary to consider how far in advance of contract termination the Board may issue such a prescription. Because a prescription under part 1145 must be based on common carrier transportation performance, shippers will need to petition under part 1145 after contract termination and after experiencing service under common carriage for at least 12 weeks.

Other Issues

Commenters made additional contract-related suggestions that were not directly related to one of the questions above: (1) allowing reciprocal switching prescriptions to go into effect before contract termination, with respect to volume that exceeds the shipper's minimum volume commitment as specified in a contract; and (2) treating contractual provisions that preclude the application of reciprocal switching relief as violations of the common carrier obligation.[90]

First, the Coalition Associations ''perceive an implicit assumption'' in the *NPRM* that ''the existence of a contract forecloses any reciprocal switching until the contract has expired.'' (Coal. Ass'ns Comments 15.) They argue that this assumption is incorrect because ''many rail contracts do not contain 100% volume commitments,'' and, absent such a commitment, ''there more than likely is some volume that a shipper can tender to an alternate carrier even before its contract with the incumbent carrier expires.'' (*Id.*) Similarly, NMA argues that ''absent any type of minimum annual volume guarantee or exclusive

under section 10709 or a tariff). Consistent with this case-by-case approach, a shipper may seek a determination from the Board as to whether a particular arrangement is not a section 10709 contract, notwithstanding how the document is labeled.

[90] In addition, the Coalition Associations suggested reopening Docket No. EP 711 (Sub-No. 1) as a way of addressing contract performance, given that they view the application of part 1145 to contract performance as ''fraught with appellate risk.'' (Coal. Ass'ns Reply 47–48.) The Board addresses this proposal in the Introduction.

use guarantee with the incumbent,'' a shipper could ''maintain its contract with the incumbent railroad'' and still ''ship with the alternative carrier.'' (NMA Comments 7.) CPKC responds that even if the contract does not specifically prohibit the use of an alternate carrier, the Board cannot prescribe a reciprocal switching agreement that would go into effect during the term of a contract because it would need to base such a prescription on contract performance data. (CPKC Reply 30–33.)

The Board will not extend part 1145 to allow prescribed reciprocal switching agreements to go into effect prior to the expiration of a contract, even with respect to a volume of traffic that exceeds the contract minimum. Doing so would require the Board to use contract performance as the basis for action under part 1145, which, as the Board has explained, is inconsistent with section 10709. Moreover, the *NPRM* did not propose allowing reciprocal switching prescriptions to go into effect during the term of a contract. *See NPRM,* 88 FR at 63909 (asking whether the Board may consider performance data as the grounds for a reciprocal switching agreement ''that would become effective *after the contract expired,*'' and when the Board may prescribe a reciprocal switching agreement ''that would not become effective until *after the contract expires*'' (emphasis added)).[91]

Second, FRCA and NCTA argue that: ''It may become appropriate to consider whether new contracts that preclude the application of reciprocal switching relief for inadequate service are consistent with 49 U.S.C. [] 11101(a) ('Commitments which deprive a carrier of its ability to respond to reasonable requests for common carrier service are not reasonable.').'' (FRCA/NCTA Comments 4.) This suggestion arises in connection with their observation that ''the *NPRM* proposal may become a baseline against which parties negotiate contracts.'' (*Id.*) AAR says that the Board should reject this proposal because ''it comes with no substantive rationale,'' and ''it is unclear why a carrier's contract terms about whether one shipper could seek a switching order would create a danger of the carrier violating its common carrier obligation to other shippers.'' (AAR Reply 17–18.) This issue is beyond the scope of this proceeding. Indeed, FRCA and NCTA do not appear to argue that the Board should act on their proposal in the final rule, framing it instead as something that ''may become appropriate'' in the event that the *NPRM* proposal becomes a baseline against which parties negotiate contracts. (FRCA/NCTA Comments 4.)

Exempt Traffic

In the *NPRM,* the Board noted that ''some transportation that has been exempted from Board regulation pursuant to 49 U.S.C. 10502 could be subject to an order providing reciprocal switching under part 1145.'' *NPRM,* 88 FR at 63909. The Board explained that it retains ''full jurisdiction to deal with exempted transportation, which includes considering whether service received by the petitioner prior to filing the petition meets the performance standards under this proposed part.'' *Id.* The Board further explained that it is ''well established that the Board can revoke the exemption at any time, in whole or in part, under section 10502(d),'' and that the Board ''would do so to the extent required.'' *Id.*

Comments from railroads and AAR focus primarily on three arguments. First, they contend that the Board cannot use performance metrics from the incumbent carrier's exempt traffic as the basis for reciprocal switching prescriptions. (*See, e.g.,* AAR Comments 37–41; CN Comments 55–56; BNSF Comments 13–14.) Even if the Board revokes the exemption, they argue, the Board cannot rely on pre-revocation performance data as the basis for a reciprocal switching prescription because this would amount to unlawful retroactive regulation. (*See, e.g.,* AAR Comments 37–41; CN Comments 55–56; BNSF Comments 13–14.) Instead, they say, a shipper must petition for partial revocation of an exemption to the extent necessary to permit reciprocal switching, and then, if the Board grants partial revocation, the shipper may file a petition for reciprocal switching in the future based solely on the incumbent carrier's post-revocation performance. (*See, e.g.,* AAR Comments 41; CN Comments 56; BNSF Comments 13; AAR Reply 23; BNSF Reply 5.) In support of this argument, they rely on *Pejepscot Industrial Park—Petition for Declaratory Order,* 6 S.T.B. 886 (2003), and *Sanimax USA LLC* v. *Union Pacific Railroad* (*2022 Sanimax Decision*), NOR 42171 (STB served Feb. 25, 2022), both of which concluded that the Board could not award damages for conduct that took place while the relevant traffic was exempt. (*See, e.g.,* AAR Comments 37–41; CN Comments 55–56; BNSF Comments 13–14.)

Second, AAR and some railroads argue that the Board cannot grant partial revocation to allow reciprocal switching based solely on a carrier's failure to meet the performance standards. (*See, e.g.,* AAR Comments 37; AAR Reply 19–20; CPKC Reply 36.) They contend that poor service does not by itself demonstrate that revocation is necessary to carry out the RTP of 49 U.S.C. 10101, as required by the statutory standard for revocation in 49 U.S.C. 10502(d). (*See, e.g.,* AAR Reply 19–20; CPKC Reply 36.) AAR also contends that poor service is not enough to establish that the carrier abused its market power, which AAR says is a required showing for revocation. (*See* AAR Reply 19; *see also* BNSF Reply 5 n.2 (citing cases that discuss the significance of market power in revocation proceedings).) Third, AAR and several railroads reject the arguments of some shippers that the Board could revoke exemptions to the extent necessary to permit reciprocal switching in the final rule, as opposed to in a separate proceeding in the future. (*See, e.g.,* AAR Reply 20–23; BNSF Reply 6; CPKC Reply 34–35.)

Shipper organizations that commented on the issue argue that shippers of exempt traffic should be able to obtain a reciprocal switching prescription without the need for cumbersome proceedings, and they offer various suggestions regarding how the Board could facilitate this. FRCA and NCTA argue that the Board should partially revoke an exemption whenever the performance of exempt traffic becomes ''inadequate,'' because poor service demonstrates that market forces are insufficient to carry out the RTP and to protect shippers from the abuse of market power. (FRCA/NCTA Comments 4.) PCA as well as AF&PA and ISRI urge the Board to revoke certain exemptions[92] in the final rule to the extent necessary to allow reciprocal switching, because this would ensure that shippers will not need to initiate time-consuming revocation proceedings

[91] NMA appears to argue that the *NPRM* did provide notice of this option, stating: ''The STB noted such a scenario in the Decision when it stated that the petitioner, *i.e.,* the shipper, would not be required to rely on the alternate carrier for any portion of the petitioner's traffic during the term of the prescription.'' (NMA Comments 7 & n.17 (citing *NPRM,* 88 FR at 63901).) This statement, which appears outside the contract section of the *NPRM* and makes no reference to contracts, is not enough to provide notice that the Board was contemplating reciprocal switching agreements that would go into effect prior to expiration.

[92] Specifically, AF&PA and ISRI argue for partial revocation of exemptions for certain forest and paper products and scrap metal commodities, as well as the boxcar exemption to the extent it covers transportation of these commodities, and PCA argues for partial revocation of the hydraulic cement exemption. (AF&PA/ISRI Comments 6; PCA Comments 10.) PCA and DCPC, as well as AF&PA and ISRI, also urge the Board to revoke certain exemptions in their entirety, although not necessarily as part of the final rule. (PCA Comments 10; AF&PA/ISRI Reply 15; DCPC Reply 3.)

before they can pursue reciprocal switching. (PCA Comments 10; AF&PA/ISRI Comments 6–7, 10–15.)[93] AF&PA and ISRI argue that partially revoking these exemptions in the final rule would be a logical outgrowth of the *NPRM.* (*See* AF&PA/ISRI Comments 6–7; AF&PA/ISRI Reply 13–15.)[94]

Moreover, AF&PM and ISRI reject the contention that consideration of pre-revocation performance as a basis for reciprocal switching is impermissibly retroactive. (AF&PA/ISRI Reply 10–13.) They point out that the Board's *2022 Sanimax Decision* said that ''prospective relief,'' unlike damages, may be based on pre-revocation facts. (AF&PA/ISRI Reply 12 (citing *2022 Sanimax Decision,* NOR 42171, slip op. at 4).) They argue that reciprocal switching is prospective because it ''would only affect *future* movements and *future* competition between the incumbent and the alternate carrier.'' (AF&PA/ISRI Reply 11; *see also* NSSGA Reply 6 (''[T]he Board has recognized that past periods of exempt service may be rightly considered in future proceedings.'').)

Finally, some shipper organizations suggest that the Board could prescribe a reciprocal switching agreement with respect to some exempt traffic *without* partially revoking the exemptions, because the ''commodities may have been exempted for reasons related to competition,'' but ''that rationale should not extend to this rule which is by contrast explicitly designed to address universally poor service.'' (*See* NSSGA Comments 5; EMA Comments 4–5; PRFBA Comments 5.) AF&PA and ISRI point out that in *PYCO Industries, Inc.—Alternative Rail Service—South Plains Switching, Ltd.* (*June 2006 PYCO Decision*), FD 34802 et al. (STB served June 21, 2006), the Board announced that it could order alternative rail service with respect to exempt traffic when traffic consists of a mix of regulated and exempt commodities and it would not be practical to provide separate service for the two types of traffic. (AF&PA/ISRI Reply 11–12 (citing *June 2006 PYCO Decision,* FD 34802 et al., slip op. at 1, 3–4).)[95]

First, the Board will not, as a general matter, prescribe reciprocal switching or require the production of data under § 1145.8(a) with respect to exempt traffic unless it first revokes the exemption at least to the extent necessary to do so. Although NSSGA, EMA, and PRFBA suggest that the Board may prescribe reciprocal switching with respect to exempt commodities that were exempted ''for reasons related to competition'' rather than service issues, (NSSGA Comments 5, EMA Comments 4–5, PRFBA Comments 5), the Board's commodity exemptions do not make such a distinction. Rather, the commodity exemptions apply to all of Subtitle IV of Title 49 of the U.S. Code, except where otherwise indicated in the exemption or required by statute. Because the reciprocal switching statute, 49 U.S.C. 11102, falls within Subtitle IV, regulations promulgated under this provision generally cannot be applied to these commodities, regardless of the original rationale for the exemption or the purposes of this rule. The only exception is the boxcar exemption, which expressly retains Board regulation with respect to reciprocal switching.[96] With respect to the production of data, the Board will not require carriers to provide performance data for exempt traffic because, as discussed below, the Board will not rely on the performance of exempt traffic as the basis for reciprocal switching under the rule.

As AF&PA and ISRI point out, the Board ordered alternative rail service with respect to exempt traffic in the *PYCO* matter. (*See* AF&PA/ISRI Reply 11–12 (citing *June 2006 PYCO Decision,* FD 34802 et al., slip op. at 1, 3–4).) In *PYCO Industries, Inc.—Alternative Rail Service—South Plains Switching, Ltd.* (*January 2006 PYCO Decision*), FD 34802 (STB served Jan. 25, 2006), without addressing the presence of exempt commodities because it had not been raised by the parties, the Board initially issued an emergency service order under 49 U.S.C. 11123 and 49 CFR part 1146 that covered a mix of exempt and regulated traffic without revoking the exemption. *See January 2006 PYCO Decision,* FD 34802, slip op. at 9. After the exemption issue was raised, the Board extended the emergency service order, stating that when ''the rail traffic at issue consists of both regulated and exempt commodities and it would not be practical to provide separate service for the two types of traffic,'' it could ''order alternative rail service as to all of the shipments.'' *See June 2006 PYCO Decision,* FD 34802 et al., slip op. at 4. Nevertheless, the Board revoked the exemption to the extent necessary to order alternative rail service, *id.,* and did so again in a subsequent alternative rail service order under 49 U.S.C. 11102(a) and part 1147, *PYCO Indus.—Alt. Rail Serv.—S. Plains Switching, Ltd.* (*November 2006 PYCO Decision*), FD 34889 et al., slip op. at 5–6 (STB served Nov. 21, 2006). At most, the *PYCO* decisions indicate that when it is not practical to separate exempt and regulated traffic, the Board could consider issuing an order that affects traffic generally rather than abstaining from regulating the non-exempt traffic, particularly in emergency situations. But it is significant that the Board ultimately revoked the exemption in *PYCO* after the issue was raised. For purposes of part 1145, shippers in a *PYCO*-like situation (with movements that involve both exempt and regulated traffic) should generally obtain revocation before filing a petition for a prescription.[97]

Second, the Board will not partially revoke any exemptions as part of this final rule, as some shipper organizations have requested. (PCA Comments 10; AF&PA/ISRI Comments 6–7, 10–15.) AF&PA and ISRI argue that the *NPRM*'s statement that the Board ''would'' revoke exemptions ''to the extent required,'' *NPRM,* 88 FR at 63909, along with the *NPRM*'s statements indicating that the Board was assessing how to deal with exempt traffic, are sufficient to justify a partial revocation to carve out reciprocal switching in the final rule. (AF&PA/ISRI Reply 13–15.) It was not the Board's intent to propose an exemption revocation in this proceeding, nor did the *NPRM* identify any specific exemptions that it intended to revoke. Thus, the Board concludes that partial revocation in the final rule would not be an appropriate option.[98]

[93] AF&PA and ISRI argue that the procedure proposed by carriers—requiring shippers to petition for revocation, wait at least 12 weeks until the newly regulated service fell short of a performance metric, and then petition for reciprocal switching—would ''effectively exclude[]'' shippers of exempt traffic from the benefits of the rule. (AF&PA/ISRI Reply 15.)

[94] AF&PA and ISRI also argue that if the Board does not partially revoke these exemptions in the final rule due to concerns that it is not a logical outgrowth of the *NPRM,* the agency should issue a supplemental notice of proposed rulemaking or open a new sub-docket to address the issue. (AF&PA/ISRI Reply 15.)

[95] As AF&PA and ISRI acknowledge, the Board in *PYCO* revoked the exemption even though it said that revocation was not necessary. (AF&PA/ISRI Reply 12 (citing *June 2006 PYCO Decision,* FD 34802 et al.).) But AF&PA and ISRI note that the Board initially prescribed alternative rail service without revocation, ''and the Board never stated that that decision was in error.'' (*Id.*)

[96] *See* 49 CFR 1039.14(b)(3). The Board may therefore require the production of data and prescribe reciprocal switching with respect to any traffic that is subject only to the boxcar exemption.

[97] Nothing would prevent shippers with *PYCO*-like mixed traffic from seeking a partial revocation with respect to their exempt traffic to the extent necessary so that the Board can order reciprocal switching with respect to the non-exempt traffic. Shippers would not need to wait until a service issue arises to file such a petition.

[98] AF&PA and ISRI say that if the Board is concerned that partial revocation is not a logical

Continued

As discussed below, however, the Board is exploring future actions that would facilitate swifter access to part 1145 for petitioners with exempt commodities.

Third, regarding the standard the Board will use to evaluate petitions for partial revocation to the extent necessary to permit a prescription of a reciprocal switching agreement, (*see* AAR Comments 37; AAR Reply 19–20; CPKC Reply 36), the Board concludes that a rail carrier's likely failure to meet a performance standard (based on data available from carrier online platforms or other sources) would be strong evidence to support partial revocation, but parties would be allowed to present counterbalancing evidence to demonstrate why partial revocation would not be warranted. The statutory standard for revocation provides that the Board may revoke an exemption when it finds that regulation ''is necessary to carry out the transportation policy of section 10101 of this title.'' 49 U.S.C. 10502(d). Although the statements in the *NPRM* about the RTP of section 10101 could provide support for revocation, *see, e.g., NPRM,* 88 FR at 63898, 63900, 63901, the Board would not prevent parties from making other arguments in revocation proceedings to develop a fuller record. Accordingly, in a proceeding to adjudicate a petition for partial revocation (either in a specific case or on a commodity-wide basis), the Board will consider other evidence that the affected parties believe is relevant regarding whether revocation is necessary to carry out the RTP. Failure to meet a performance standard would be relevant to this inquiry, but it would not necessarily be dispositive.[99] Moreover, evidence of poor service may be relevant to this inquiry even if it would not establish that a rail carrier likely has failed to meet a performance standard. For example, a period of bad service could be relevant to a revocation inquiry even if it would not be long enough to cause a carrier to fail a performance standard.

In addition to RTP evidence, parties in some revocation proceedings also submit evidence regarding whether revocation is necessary to address the potential for abuse of market power. *See, e.g., Sanimax USA LLC* v. *Union Pac. R.R.,* NOR 42171, slip op. at 3, 5 (STB served Nov. 2, 2021). Although the market power inquiry is not required by the statute, the Board may consider and has considered such evidence in case-specific revocation proceedings, and the potential for abuse of market power generally weighs in favor of granting revocation.[100] *See generally Exclusion of Demurrage Regul. From Certain Class Exemptions,* EP 760, slip op. at 6–7 (STB served Feb. 28, 2020). FRCA and NCTA argue that the existence of service inadequacies is sufficient proof that regulation is necessary to protect shippers from abuse of market power, (*see, e.g.,* FRCA/NCTA Comments 4), and carriers retort that service inadequacies might occur for reasons unrelated to market power, (*see, e.g.,* AAR Reply 19–20). Service inadequacies certainly can be indicative of market power, but there may also be other evidence in specific cases. Accordingly, in case-specific revocation proceedings, the Board will consider any relevant evidence submitted by the parties, including evidence, if any, about the existence of (and potential for abuse of) market power.[101]

Fourth, should the Board partially revoke an exemption, the Board clarifies that it will not rely on pre-revocation performance as the basis for a prescription of a reciprocal switching agreement under this rule. As noted above, AAR and several carriers argue that the Board cannot rely on pre-revocation performance as the basis for a prescription under part 1145 because this would amount to retroactive regulation. (*See, e.g.,* AAR Comments 37–41; CN Comments 55–56; BNSF Comments 13–14.) AF&PA and ISRI respond that the Board has considered pre-revocation conduct as the basis for relief in other cases and that reciprocal switching is prospective in nature. (AF&PA/ISRI Reply 10–13.) Given the specific features of this rule, the Board concludes that using pre-revocation data as the basis for a prescription would be retroactive in a way that raises fairness concerns. Although AF&PA and ISRI are correct that the Board has relied on pre-revocation conduct in the past as the basis for relief, the Board will not do so here because of how closely the rule links specific pre-revocation conduct to post-revocation relief.

In *Pejepscot* and *Sanimax,* the Board said that pre-revocation conduct cannot be the basis for damages under the common carrier obligation. *Pejepscot,* 6 S.T.B. at 892–93, 899; *2022 Sanimax Decision,* NOR 42171, slip op. at 4. In *Pejepscot,* the Board reasoned that the railroad's conduct while an exemption was in effect could not have violated the common carrier obligation and that, therefore, the Board could not award damages for violation of the common carrier obligation based on that conduct. *Pejepscot,* 6 S.T.B. at 892–93, 899. *Pejepscot* says that the appropriate path for a shipper in such circumstances is to obtain partial revocation, after which the carrier could be liable for violations of the common carrier obligation based on post-revocation conduct. *Id.* at 893 n.15. Like *Pejepscot, Sanimax* held that a shipper is not entitled to ''relief, including damages,'' for conduct that occurred prior to the Board's revocation of the exemption. *2022 Sanimax Decision,* NOR 42171, slip op. at 4. *Sanimax* explained that ''[p]ermitting regulatory relief for the period the exemptions were in effect'' would be ''contrary to the principle that retroactive application of administrative determinations is disfavored,'' noting that there is a presumption against actions that would ''increase a party's liability for past conduct, or impose new

outgrowth of the *NPRM,* it should issue a supplemental notice of proposed rulemaking or open a new sub-docket to clarify that the Board is contemplating revoking the exemptions in the final rule. (AF&PA/ISRI Reply 15.) As discussed below, the Board will deal separately with any possible exemption revocations and avoid unnecessary delays to the implementation of this rule.

[99] Reliance on a railroad's past conduct as a basis for revocation is not impermissibly retroactive, and carriers do not contend otherwise. Congress expressly gave the Board the power to revoke exemptions and placed no limitations on the type of evidence that the Board may consider when determining whether regulation is necessary to carry out the RTP. Accordingly, the Board must be able to examine carrier actions as the basis for revocation.

[100] The Board has issued exemption revocation decisions without mentioning market power. *See Exclusion of Demurrage Regul. from Certain Class Exemptions,* EP 760, slip op. at 6–7. Nothing in this decision should be construed to suggest that a shipper or receiver needs to argue, let alone prove, that a carrier has market power to succeed on its petition to revoke an exemption.

[101] In the *PYCO* decisions, the Board relied on poor service as the basis for revocation, stating in one decision that ''[w]e view SAW's rail service as having been so inadequate as to amount to an abuse of market power,'' and that revocation will ''ensure the continuation of a sound rail system to meet the needs of the shipping public,'' consistent with 49 U.S.C. 10101(4). *June 2006 PYCO Decision,* FD 34802 et al., slip op. at 4; *see also November 2006 PYCO Decision,* FD 34889 et al., slip op. at 5 (relying on the analysis in the June 21, 2006 decision as the basis for revocation). There were myriad service issues considered in the *PYCO* decisions, based on the record developed by the parties in that case. *See, e.g., January 2006 PYCO Decision,* FD 34802, slip op. at 5 (explaining that the carrier had significantly reduced the number of cars that the shipper could load per day, that the carrier had halted shipping entirely for a six-day period without an adequate explanation, and that the service was so bad that the shipper would need to ''curtail or close operations'' if there was no improvement). There was also evidence that the railroad was not likely to take measures to improve future service. *See, e.g., June 2006 PYCO Decision,* FD 34802 et al., slip op. at 5–6 (describing evidence that the carrier appeared to be unable and unwilling to provide adequate service in the future). Thus, while the *PYCO* proceedings show that bad service can be the basis for revocation under some circumstances, they do not suggest that the Board should treat failure to satisfy a performance standard as dispositive in a partial revocation proceeding.

duties with respect to transactions already completed.'' *Id.* (quoting *Landgraf* v. *USI Film Prods.,* 511 U.S. 244, 280 (1994)).

Although AF&PA and ISRI correctly point out that *Sanimax* left the door open to some consideration of pre-revocation conduct in connection with ''prospective relief,'' (*see* AF&PA/ISRI Reply 12–13), there are important differences between how pre-revocation conduct would be used under part 1145 and how *Sanimax* contemplated that it would be used. In *Sanimax,* the Board said that ''UP's actions prior to [revocation] may be relevant to the Board's ultimate determination about what kind of prospective relief is warranted, if any.'' *2022 Sanimax Decision,* NOR 42171, slip op. at 4. *Sanimax* explains that the Board's ''broad'' discovery regulations allow parties to ''obtain discovery on any matter that is relevant'' and that some ''relevant facts giving rise to the complaint'' may have occurred prior to revocation. *Id.* But, although reciprocal switching under the rule is ''prospective'' in some respects,[102] the rule's numerical performance standards establish a more direct link between pre-revocation conduct and post-revocation regulatory consequences that would have hallmarks of retroactive regulation. If the Board adopts AF&PA and ISRI's approach, pre-revocation performance would be a decisive factor that would serve as the direct basis for a prescription of a reciprocal switching agreement, effectively creating new legal consequences for pre-revocation conduct. This would go beyond merely looking at pre-revocation conduct to the extent it ''may be relevant'' to the scope of prospective relief; rather, it effectively ''[p]ermit[s] regulatory relief for the period the exemptions were in effect.'' *See 2022 Sanimax Decision,* NOR 42171, slip op. at 4.[103]

The two *PYCO* decisions on which AF&PA and ISRI rely, (AF&PA/ISRI Reply 11–12), do not compel the conclusion that the Board should rely on pre-revocation conduct as the basis for a prescription under part 1145. In those decisions, the Board relied on pre-revocation conduct as the basis for prescribing alternative rail service under parts 1146 and 1147.[104] But, under its part 1147 regulation, the Board did so primarily as part of a broader inquiry into the incumbent railroad's conduct, acknowledging the carrier did not oppose PYCO's request for temporary alternative service on the merits. *November 2006 PYCO Decision,* FD 34889 et al., slip op. at 2. In both decisions, the Board determined that service was not likely to improve—a determination that was based primarily on the fact that the incumbent carrier all but refused to serve the petitioner—and ordered prospective relief under parts 1146 and 1147. *See June 2006 PYCO Decision,* FD 34802 et al., slip op. at 5–6; *November 2006 PYCO Decision,* FD 34889 et al., slip op. at 4–5.[105] In contrast, under shippers' proposed application of part 1145, the Board would focus on a single aspect of the railroad's pre-revocation conduct—failure to satisfy a performance standard—and would use that conduct as the very basis for prescribing a reciprocal switching agreement rather than a piece of evidence that supports predictions about future conduct. In effect, in contrast to the *PYCO* rulings, applying part 1145 to pre-revocation performance would specifically create consequences for that past performance.

The Board understands that this determination means that a shipper or receiver would need to obtain partial revocation of the exemption, and then wait until the newly regulated service fell short of the performance standards in part 1145, before filing a petition under part 1145. To mitigate impediments arising from this two-step process, petitions for partial revocation filed in furtherance of part 1145 cases will be prioritized in order to resolve them expeditiously. Moreover, the Board intends to explore whether it should partially revoke all exemptions, on its own initiative, to allow for reciprocal switching petitions, as is currently the case for the boxcar exemption. *See* 49 CFR 1039.14(b)(3) (expressly allowing for regulation of reciprocal switching for rail transportation of commodities in boxcars).[106]

Class II Carriers, Class III Carriers, and Affiliates

The Board proposed to limit prescriptions under part 1145 to situations in which the incumbent rail carrier is a Class I carrier or, for purposes of the industry spot and pull standard, an affiliated company[107] that serves the relevant terminal area. *NPRM,* 88 FR at 63907. The Board explained that the service data the Board had been examining in Docket No. EP 770 (Sub-No. 1) focused on Class I rail carriers and that the Board has not received as many informal or formal complaints about smaller carriers. *Id.* Moreover, the Board noted that data collection may be more burdensome for Class II and Class III rail carriers, as they have not been submitting service-related data to the Board under performance metrics dockets, such as Docket Nos. EP 724 (Sub-No. 4) and EP 770 (Sub-No. 1). *Id.* at 63907–08. Nevertheless, the Board sought comment on whether proposed part 1145 should be broadened to include Class II and Class III rail carriers that are providing inadequate service. *Id.* at 63908.

Some shipper groups fear that the Board's proposal is too limited. NMA asserts that, for a number of its members, the interchanging Class III rail carrier is not affiliated with a Class I rail carrier. (NMA Comments 5.) ACD raises similar concerns, noting that a sizeable

[102] Part 1145 is ''prospective'' in that it is not designed to punish carriers for poor performance or compensate shippers for losses incurred due to poor performance, but rather is intended ''to help ensure that the transportation system as a whole meets the public need.'' *NPRM,* 88 FR at 63902. And, as AF&PA and ISRI point out, reciprocal switching prescriptions ''would only affect *future* movements and *future* competition between the incumbent and the alternate carrier.'' (AF&PA/ISRI Reply 11.)

[103] The Board granted the parties' joint motion for voluntary dismissal in the *Sanimax* proceeding on February 15, 2024. *Sanimax USA LLC* v. *Union Pac. R.R.,* NOR 42171 (STB served Feb. 15, 2024). At the time of dismissal, the Board had not granted prospective relief or addressed in further detail how pre-revocation conduct can be used when determining prospective relief.

[104] Because the *PYCO* decisions partially revoked the exemptions and ordered alternative service in the same decision, they necessarily relied on pre-revocation conduct as the basis for the alternative service. *See June 2006 PYCO Decision,* FD 34802 et al. (partially revoking the exemption to the extent necessary to grant emergency relief under 49 U.S.C. 11123 and 49 CFR part 1146 *and* ordering emergency alternative service in the same decision); *November 2006 PYCO Decision,* FD 34889 et al. (same, with respect to alternative service under 49 U.S.C. 11102(a) and 49 CFR part 1147).

[105] The alternative rail service regulations at issue in the *PYCO* decisions, 49 CFR 1146.1 and 1147.1, require the petition to explain why the incumbent is unlikely to provide adequate rail service in the future. *See* 49 CFR 1146.1(b)(1)(ii) (requiring the petitioner to provide ''the reasons why the incumbent carrier is unlikely to restore adequate rail service consistent with the petitioner's current transportation needs within a reasonable time''); part 1147.1(b)(1)(ii) (same, with minor wording differences).

[106] The Board also notes that its NPRM proposing to revoke certain exemptions in their entirety remains under consideration. *See Rev. of Commodity, Boxcar, & TOFC/COFC Exemptions,* EP 704 (Sub-No. 1) (STB served Mar. 23, 2016); *see also Rev. of Commodity, Boxcar, & TOFC/COFC Exemptions,* EP 704 (Sub-No. 1) (STB served Sept. 30, 2020) (requesting comment on an approach developed by the Board for use in considering revocation issues).

[107] For purposes of the *NPRM* and the proposed regulatory text, the Board proposed that ''affiliated companies'' has the same meaning as ''affiliated companies'' in Definition 5 of the Uniform System of Accounts (49 CFR part 1201, subpart A): ''*Affiliated companies* means companies or persons that directly, or indirectly through one or more intermediaries control, or are controlled by, or are under common control with, the accounting carrier.'' The Board also sought public comment as to whether its definition should also include third-party agents of a Class I carrier. *NPRM,* 88 FR at 63902 n.9.

portion of its members ''receive rail deliveries through short line railroads that take cargo from Class I railroads and are then delivered to a shared railyard.'' (ACD Comments 2.) It asserts that these members are effectively captive and experience many of the same issues addressed in this rulemaking. (*Id.*) NMA also suggests that Class I railroads could limit access to what would otherwise be an effective interchange location. (NMA Comments 6.) Similarly, PCA claims that exempting short lines from these rules may create perverse incentives for Class I carriers to include a short line as their agent in the transportation shipments to avoid the rules altogether. (PCA Comments 15–16; *see also* VPA Comments 8 (seeking clarification of definition of ''affiliated companies'' to specifically include belt railroads in which a Class I carrier has controlling authority).) ACD, NMA, and PCA therefore ask that the Board permit petitioners to seek a prescription based on a short line's service. However, in light of the Board's concerns about smaller railroads being required to comply with the data reporting obligations, ACD suggests that another option could be to limit the application of the rules only to Class II rail carriers, excluding Class III rail carriers. (ACD Comments 2.)

Some groups also argue that the Board should allow a Class II or Class III rail carrier to be an alternate carrier. For example, PCA argues that the Board should allow a reciprocal switching agreement to be prescribed under part 1145 where a Class I railroad provides origin or destination service, but a short line railroad is able to participate in a reciprocal switching arrangement. (PCA Comments 15; *see also* DCPC Comments 12.) ACD adds that short line railroads have historically provided superior service compared to Class I railroads and that it believes short lines would be more receptive to accepting its members' smaller shipments. (ACD Comments 2.)

AAR and ASLRRA oppose permitting a petition under part 1145 to be filed against a short line. ASLRRA asserts that none of the shipper comments cite legal authority or facts supporting their position, only anecdotal conclusory statements. (ASLRRA Reply 6–8.) ASLRRA also argues that there have been very few complaints about the service provided by short lines, that imposing the metrics outlined in the *NPRM* would be burdensome on the short lines, and that short lines provide good service based on local connections with their shippers. (*Id.*) In response to suggestions that an alternate carrier could be a Class II or Class III railroad, AAR suggests that, rather than departing from the *NPRM* and complicating the proposed rule, the Board should simply recognize that part 1147 can be invoked to address the highly unusual situations in which a shipper might want reciprocal switching to a Class II or Class III railroad. (AAR Reply 36; *see also* ASLRRA Reply 5.)

ASLRRA also proposes a definition for ''affiliated companies'' to ensure Class II and III rail carriers are not ''inadvertently covered'' under the new regulations:

> Affiliated companies means companies or persons that directly or indirectly through one or more intermediaries control, or are controlled by, or are under common control with the accounting carrier. . . . [A]n affiliated company is one that is included in a Class I railroad's annual combined rail reporting to the STB and that acts as an operating division of [a Class I] railroad.

(ASLRRA Comments 6.) [108] ASLRRA is also concerned that including the term ''third-party agent'' in the definition of ''affiliated companies'' could theoretically capture any short line that contracts with a Class I railroad to provide functions such as switching services or haulage, which would blatantly contradict the exclusion of Class II and Class III short line railroads from the rule. It asserts that the term ''third-party agent'' is too amorphous and uncertain and should not be included. (ASLRRA Comments 5–7.)

The Board will not extend its rule to permit a petitioner to seek prescription of a reciprocal switching agreement based on a Class II or Class III rail carrier's service. While there are surely times when short line railroads provide a lower level of service, they are historically not a significant source of the service problems this rule seeks to address, and the record here has not demonstrated a need to expand part 1145 to include the smaller carriers.[109] *See NPRM,* 88 FR at 63907; (*see also* ACD Comments 2.) As proposed in the *NPRM,* the final rules adopted here generally will not apply to Class II and Class III rail carriers, except to the extent those carriers are ''affiliated companies'' as defined in Definition 5 of the Uniform System of Accounts (49 CFR part 1201, subpart A).[110] For example, the final rule will not apply to a Class II and III rail carrier where a Class I rail carrier holds a stake but the Class II or III carrier is not an affiliated company of the Class I rail carrier (*e.g.,* the New York, Susquehanna & Western, Railway Corporation or the Indiana Rail Road Company). The Board therefore does not agree with ASLRRA that the definition of ''affiliated companies'' should be revised.[111] As such, the definition of ''affiliated companies'' that was proposed in the *NPRM* will be adopted. The Board will gain experience with this final rule before considering whether to expand the definition to include Class II, Class III, or third-party agents of a Class I carrier.

The Board also will not prescribe a reciprocal switching agreement under part 1145 if the alternate line haul carrier would be a Class II or Class III rail carrier, other than Class II or Class III carriers that are affiliated companies of a Class I carrier. To allow an unaffiliated Class II or Class III rail carrier to serve as an alternate line haul carrier would raise a question of fairness in applying part 1145; a Class I railroad could lose its line haul to a Class II or Class III carrier under part 1145, but the Class II or Class III carrier would not be subject to the same possibility under part 1145. This determination is not meant to address whether a shipper could seek prescription of a reciprocal switching agreement under part 1144 or

[108] To the extent a regulation would permit a switch involving an affiliated company, BMWE argues that the Board should limit the meaning of ''affiliated company'' to subsidiaries or affiliates that are themselves Class I railroads (or are covered by a Class I railroad collective bargaining agreement). (BMWE Comments 4.) BMWE's argument, however, seems to stem from its belief that a Class II or Class III railroad would participate in a switch over the tracks of a Class I railroad or operate over the tracks of a Class I railroad. (*Id.*) BLET also raises concerns about Class II and Class III railroads operating on Class I lines and how that could infringe on collective bargaining rights, (BLET Comments 3), but these organizations' concerns seem to relate to trackage rights rather than reciprocal switching. The Board notes, however, that the Board may impose employee protective conditions on a reciprocal switching order under 49 U.S.C. 11102(c)(2).

[109] ASLRRA also explains that a reciprocal switching prescription resulting in the loss of revenue from even one customer could be financially difficult for short lines because of their light density operations, high infrastructure costs, and smaller number of customers. (ASLRRA Comments 4.) However, if an independent Class II or independent Class III rail carrier is providing poor service, shippers can seek relief under parts 1146 and 1147.

[110] As to PCA's concern that the final rule will create perverse incentives for Class I rail carriers to include a short line as their agent to avoid the rule altogether, the Board finds that scenario unlikely. However, the Board would consider such arguments if they were more developed based on a specific situation.

[111] VPA asks that the Board clarify the definition of ''affiliated companies'' to specifically include belt railroads in which a Class I carrier has controlling authority.'' (VPA Comments 8.) Nothing on the face of the definition excludes belt line railroads, where other conditions in the definition are met. A separate question—one to be addressed on a case-by-case basis, based on the facts of the case at hand—is whether the Board could prescribe a reciprocal switching agreement that would require a belt line railroad to switch traffic with a given Class I carrier.

part 1147 where the alternate carrier would be a Class II or Class III rail carrier.

Labor

AAR suggests that the *NPRM* is unclear on how labor's interests would be taken into account and who would bear the cost of labor protection requirements. (AAR Comments 94.) AAR asserts that, if the Board does not address those matters in this proceeding, it should do so in individual cases. (*Id.* at 95.) Labor interests also raise concerns about reciprocal switching prescriptions. For example, TTD asserts that reciprocal switching can interfere with labor agreements in some cases and cause the dislocation of existing operating employees. (TTD Comments 1.) SMART–TD also expresses concern about the specifics of how reciprocal switching prescriptions would work within the boundaries of its long-established collectively bargained agreements, and how it could be done without treading on the seniority rights that have long been established in the industry's workforce. (SMART–TD Comments 2.)

The Board appreciates these concerns but does not anticipate that the prescription of a reciprocal switching agreement would frequently conflict with the scope clauses of a collective bargaining agreement. Under 49 U.S.C. 11102(c)(2), the Board may require a prescribed agreement to contain provisions for the protection of the interests of affected employees. The Board will consider on a case-by-case basis whether any such provision is appropriate based on the facts of that case.

Environmental Matters

CSXT argues that the potential additional car handlings, yard activity, and transit delays from a Board-ordered switch could lead to more emissions and environmental impacts.[112] (CSXT Comments 48.) It asserts that declines in network efficiency due to more switching could also push traffic to trucks. (*Id.* at 48–49.) CSXT further argues that switching could also alter traffic patterns for toxic by inhalation/poisonous by inhalation (TIH/PIH) traffic or prompt high-volume shippers to add significant new traffic to alternative routes, which could trigger the Board's thresholds for environmental review. (*Id.* at 49.) It claims that the Board should require environmental documentation for switching with the potential to create significant environmental effects pursuant to 49 CFR 1105.6(d).

Environmental review under the National Environmental Policy Act (NEPA), 42 U.S.C. 4321–4370m-11, for operational changes is only required where the Board's thresholds for environmental review would be met. The thresholds for assessing environmental impacts from increased rail traffic on rail lines are an increase in rail traffic of at least 100% (measured in gross ton miles annually) or an increase of at least eight trains per day. 49 CFR 1105.7(e)(5)(i). For rail lines located in areas that are in nonattainment status under the Clean Air Act (42 U.S.C. 7401–7671q), the threshold for air quality analysis is an increase in rail traffic of at least 50% (measured in gross ton miles annually) or an increase of at least three trains per day. 49 CFR 1105.7(e)(5)(ii). Here, however, the Board doubts that a shipper choosing to reroute its traffic to an alternate carrier based on a Board prescription would result in enough rerouted traffic to reach any of these thresholds. Most switches would likely involve additional cars per day rather than additional trains per day.[113] Moreover, because a prescription under this rule would ''involve interchange between two carriers,'' it would be ''closely analogous'' to an order providing for the common use of rail terminals, which is categorically excluded from environmental review under 49 CFR 1105.6(c)(3). *Cape Cod & Hyannis R.R.—Exemption from 49 U.S.C. Subtitle IV,* FD 31229, slip op. at 2 (ICC served Mar. 25, 1988).[114]

For these reasons, the Board will not require specific environmental documentation for proceedings under part 1145 unless a showing is made in a particular case that there is enough potential for environmental impacts to warrant an environmental review. *See* 49 CFR 1105.6(d). Nevertheless, petitioners bringing cases under part 1145, and/or alternate carriers, should address whether environmental review may be needed under § 1105.7(e)(5) at the outset of the proceeding if they have reason to believe the case has the potential for environmental impacts.

Environmental Review

The final rule is categorically excluded from environmental review under 49 CFR 1105.6(c).

Regulatory Flexibility Act

The Regulatory Flexibility Act of 1980 (RFA), 5 U.S.C. 601–612, generally requires a description and analysis of new rules that would have a significant economic impact on a substantial number of small entities. In drafting a rule, an agency is required to: (1) assess the effect that its regulation will have on small entities; (2) analyze effective alternatives that may minimize a regulation's impact; and (3) make the analysis available for public comment. Sections 601–604. In its notice of proposed rulemaking, the agency must either include an initial regulatory flexibility analysis, section 603(a), or certify that the proposed rule would not have a ''significant impact on a substantial number of small entities,'' section 605(b). The impact must be a direct impact on small entities ''whose conduct is circumscribed or mandated'' by the proposed rule. *White Eagle Coop. Ass'n* v. *Conner,* 553 F.3d 467, 480 (7th Cir. 2009).

The final rule is directed at Class I railroads and their affiliated companies. As such, the regulations will not impact a substantial number of small entities.[115] Accordingly, pursuant to 5 U.S.C. 605(b), the Board again certifies that the regulations will not have a significant economic impact on a substantial number of small entities within the meaning of the RFA. A copy of this decision will be served upon the Chief Counsel for Advocacy, Office of Advocacy, U.S. Small Business Administration.

[112] CSXT does not contest that the rulemaking itself is categorically excluded from environmental review. *See NPRM,* 88 FR at 63911 (citing 49 CFR 1105.6(c)).

[113] The Board also doubts that there would be an increase in truck traffic based on prescriptions under part 1145. As discussed in Performance Standards, a number of shippers seeking reciprocal switching reform do so because poor rail service forces them to ship by truck. The better service that could be created by a prescription could therefore lead to less truck traffic, as shippers that experienced rail service problems gain a new rail alternative. And, while CSXT raises concerns about TIH/PIH traffic, as noted in the Practicability section, carriers will be handling traffic subject to existing safety and health regulations. FRA itself, who will be served with all petitions, notes that, in general, it does not foresee safety concerns with reciprocal switching. (DOT/FRA Comments 3 n.3.)

[114] Indeed, the Board may explore whether to propose revising its environmental regulations specifically to include prescriptions made under part 1145 as categorically excluded from environmental review under 49 CFR 1105.6(c).

[115] For the purpose of RFA analysis for rail carriers subject to the Board's jurisdiction, the Board defines a ''small business'' as including only those rail carriers classified as Class III rail carriers under 49 CFR 1201.1–1. *See Small Entity Size Standards Under the Regul. Flexibility Act,* EP 719 (STB served June 30, 2016). Class III rail carriers have annual operating revenues of $46.3 million or less in 2022 dollars. Class II rail carriers have annual operating revenues of less than $1.03 billion but more than $46.3 million in 2022 dollars. The Board calculates the revenue deflator factor annually and publishes the railroad revenue thresholds in decisions and on its website. 49 CFR 1201.1–1; *Indexing the Ann. Operating Revenues of R.Rs.,* EP 748 (STB served June 29, 2023).

Paperwork Reduction Act

The Board sought comments in the *NPRM* pursuant to the Paperwork Reduction Act (PRA), 44 U.S.C. 3501–3521, and Office of Management and Budget (OMB) regulations at 5 CFR 1320.8(d)(3) about the impact of the collection for the Reciprocal Switching for Inadequate Service Regulations (OMB Control No. 2140–00XX), concerning: (1) whether the collections of information, as added in the proposed rule, and further described in Appendix B, are necessary for the proper performance of the functions of the Board, including whether the collections have practical utility; (2) the accuracy of the Board's burden estimates; (3) ways to enhance the quality, utility, and clarity of the information collected; and (4) ways to minimize the burden of the collection of information on the respondents, including the use of automated collection techniques or other forms of information technology, when appropriate. *NPRM,* 88 FR at 63911–12.

In the *NPRM,* the Board estimated that the proposed requirements would add an hourly annual burden of 2,564 hours for six respondents, all Class I railroads. *NPRM,* 88 FR at 63916–17. This estimate consisted of the cumulative total of five types of filings required to collect information and allow the Board to implement the reciprocal switching regulations under part 1145. First, the Board anticipated that the requirement for the Class I railroads to update their internal data collections systems in order to standardize and harmonize them with the proposed reporting requirements would add an estimated total one-time hourly burden of 480 hours across all six Class I rail carriers. *NPRM,* 88 FR at 63912, 63916. Second, the weekly reports on service reliability and industry ISP were estimated to require an annual hour burden of approximately 1,248 hours. *NPRM,* 88 FR at 63916. Third, requests for individualized service data by shippers or receivers were estimated to require approximately 36 hours. *NPRM,* 88 FR at 63912, 63916. In calculating this estimate, the Board assumed that the Class I rail carriers could provide this information by making a minimal number of selections within a computer program once their systems had been updated. Fourth, petitions to initiate a reciprocal switching agreement were estimated to require approximately 700 hours, and fifth, the petitions to terminate a prescription were estimated to require about 100 hours. *NPRM,* 88 FR at 63912, 63916.

The Board received comments from AAR and a number of carriers addressing the Board's burden analysis for two types of collections of information under the PRA.

First, UP challenges the *NPRM's* estimate of 480 hours (80 hours per carrier) for the ''one-time update to data collection software to standardize with the Board's data definition for service reliability and industry spot and pull.'' As noted above in the Implementation section, UP estimates that between one and two years would be required to complete the design, programming, and testing of such systems before they could be implemented. (UP Comments 18.) Similarly, as also discussed in that section, CSXT contends that ''designing and implementing such a platform could take a year.'' (CSXT Reply 16.) As a result, both carriers argue that the required system updates will constitute a significant undertaking, estimating broadly one to two years of burden hours as opposed to the 480 hours estimated in the *NPRM.*[116]

For the reasons explained in the Implementation section, the Board disagrees with UP's stated concern that an entirely new system will be needed to meet the reporting requirements of this rule and similarly disagrees with CSXT's assertion that it will take a year to update its existing software. It is true that the new rule creates a standardized definition of OETA for purposes of part 1145. But, because the railroads' systems already have the code in place to measure OETA (under the demurrage definition), the new definition of OETA should require limited changes to their system codes. Therefore, to meet the new rules, the only change that should be required is an update to the OETA and ISP definitions within the railroads' existing software.

In their conclusory claims about the need for extreme alternatives—creating a whole new system or engaging in a year-long software update—UP and CSXT fail to provide a reasonable basis for the Board to update its estimate of hourly burdens based on either carrier's actual system requirements. Even so, upon further consideration, the Board recognizes that the update of definitions may require more time to edit, test, and implement than estimated in the *NPRM.* For example, the Board recognizes that the change will require some coding, testing, and validity checks upon updating their current software, and that the estimates in the *NPRM* may not have accounted for some of the complexities raised by UP and other railroads. Thus, the Board will revise estimates upwards to reflect that additional complexity. The estimated one-time hourly burden for an update to the carriers' systems will increase from 480 hours (80 hours per carrier) to 1,440 hours (240 hours per carrier). *See Table—Changes in Total Burden Hours from the NPRM to Final Rule.*[117]

Second, CN, CSXT, and UP challenge the data disclosure requirement of proposed § 1145.8(a) (concerning shipper/receiver requests for data from railroads) as vague and overly broad. (CN Comments 35; CSXT Comments 39; UP Reply 3; *see also* CPKC Comments 2 (claiming that its systems are not set up to generate shipper and commodity-specific lane-by-lane statistics but not providing hourly burden data).) As proposed, this information collection would require Class I rail carriers to respond to requests for individualized service data from shippers and receivers. The Board addresses the railroads' broad arguments in the Data Production to an Eligible Customer section and is modifying those requirements.

AAR contends that the estimates in the *NPRM* significantly underestimate the burden to Class I carriers of responding to requests for data from shippers and receivers. (AAR Comments 110.) AAR fails to provide specific hourly estimates to support its contentions, and there is also little or no data in the carriers' comments to support what hourly burden might be required. At the same time, in the adopted regulations, the Board is modifying the data disclosure requirements that were proposed in § 1145.8(a) to make the written data request more limited and specific. These modifications should address AAR's concern about workload burden. In addition, out of an abundance of caution, the Board will increase its estimate of the annual number of written data requests to 72 (12 per carrier) and its estimate of the hourly burden per request to 16 hours. The total estimate for written requests is

[116] Despite UP's and CSXT's general estimate that the proposed rule will take them one to two years to implement, the railroads fail to provide a specific estimate of burden hours.

[117] In *Demurrage Billing Requirements,* the Board recognized a similar one-time burden, which included the time Class I carriers would need to undertake the software redesign necessary to provide minimum information to be included on or with Class I carriers' demurrage invoices. *See Demurrage Billing Requirements,* EP 759, slip op. at 34–35. While the Board estimated a burden of 80 hours per respondent in that case, the Board recognizes that the one-time update in this reciprocal switching rule may pose a greater level of complexity. As noted, the individual burden per carrier is being adjusted to 240 hours, for a total of 1440 hours.

therefore increased to 1,152 hours. *See Table—Changes in Total Burden Hours from the NPRM to Final Rule.*

TABLE—CHANGES IN TOTAL BURDEN HOURS FROM THE NPRM TO FINAL RULE

Type of Filing	NPRM	Final Rule
	Total burden hours	Total burden hours
One-time update to data collection software to standardize with the Board's data definition for service reliability and ISP	480	1,440
Weekly reporting on service reliability and ISP (new 49 CFR 1145.8(b))	1,248	1,248
Written request identifying the specific 12-week period and lane and response to request for individualized service data (new 49 CFR 1145.8(a))	36	1,152
Petition for Prescription of a Reciprocal Switching Agreement (new 49 CFR 1145.5)	700	700
Petition to Terminate Prescription of a Reciprocal Switching Agreement (new 49 CFR 1145.7)	100	100
Total Burden Hours	2,564	4,640

This collection, along with the comments from AAR and the railroads and the Board's response, will be submitted to OMB for review as required under the PRA, 44 U.S.C. 3507(d), and 5 CFR 1320.11. That submission will also address the comments discussed above as part of the PRA approval process.

Congressional Review Act

Pursuant to the Congressional Review Act, 5 U.S.C. 801–808, the Office of Information and Regulatory Affairs has designated this rule as non-major, as defined by 5 U.S.C. 804(2).

List of Subjects in 49 CFR Part 1145

Common carrier, Freight, Railroads, Rates and fares, Reporting and recordkeeping requirements, and Shipping.

It is ordered:

1. The Board adopts the final rule as set forth in this decision. Notice of the adopted rule will be published in the **Federal Register**.

2. This decision is effective on September 4, 2024.

3. A copy of this decision will be served upon the Chief Counsel for Advocacy, Office of Advocacy, U.S. Small Business Administration.

By the Board, Board Members Fuchs, Hedlund, Oberman, Primus, and Schultz. Board Member Primus concurred with a separate expression.

BOARD MEMBER PRIMUS, concurring:

The final rule adopted today is unlikely to accomplish what the Board set out to do under the statute's authorization of reciprocal switching that is ''practicable and in the public interest.'' *See* 49 U.S.C. 11102(c). And, despite my urging, the Board is not taking action to improve access to the statute's other prong, addressing reciprocal switching that is ''necessary to provide competitive rail service.'' *Id.* I am voting for the final rule because something is better than nothing. But there is far less ''something'' here than I had hoped there would be.

This final rule relies on service performance standards, which the incumbent carrier must fail during a 12-week period before a petitioner can seek a reciprocal switching order. The *NPRM* requested comment as to whether the Board may consider performance data based on service provided under a contract. *NPRM,* 88 FR at 63909. In this way, the *NPRM* left open the possibility that a petitioner would already know, before taking any steps towards filing its petition (aside from requesting the data), that 12 weeks of data are available to demonstrate failure under one of the performance standards.

The same is not true, however, with respect to the final rule. A large proportion of rail traffic moves under contract, and the final rule establishes that the Board will not prescribe a reciprocal switching agreement under part 1145 based on performance that occurs during the term of a contract. *See* 49 U.S.C. 10709. In other words, a customer receiving substandard service under a contract cannot seek relief under part 1145. A prospective petitioner would instead need to shift from transportation under a contract to transportation under a tariff and then

[118] The Coalition Associations include the American Chemistry Council, The Fertilizer Institute, and The National Industrial Transportation League. The Board refers to these organizations as the Coalition Associations except when citing to one of their filings.

receive 12 weeks of substandard service before it could seek relief. Changing from contract to tariff transportation is something that rail customers generally prefer to avoid, as tariff rates can be substantially higher than contract rates. *See, e.g.,* Occidental Chem. Corp. Comments 2–3, Oct. 23, 2012, *Rate Regul. Reforms,* EP 715; PPG Indus., Inc. Comments 3–4, Oct. 23, 2012, *Rate Regul. Reforms,* EP 715.

A would-be petitioner under the final rule could incur this ''tariff premium'' indefinitely; 11 weeks into the customer's payment of tariff rates, for example, the carrier's average performance for the period could move above the threshold before falling again. Depending on the magnitude of this blip in the data, the 12-week period could effectively begin again. Rather than incurring the costs of tariff transportation indefinitely—before knowing whether a reciprocal switching petition is even a possibility—I expect contract customers will simply avoid trying to use part 1145.[1]

The decision opines that, ''if the rule can achieve its objectives with respect to common carrier traffic, this would make it worthwhile.'' As the decision acknowledges, however, only a small percentage of traffic moves in common carrier service. And part 1145 does not even apply to all common carrier traffic; the traffic must also be non-exempt, among other requirements.[2] Because the decision ''clarifies that [the Board] will not rely on pre-revocation performance as the basis for a prescription of a reciprocal switching agreement under this rule,'' customers whose transportation is exempt will face obstacles similar to those of contract customers should they wish to seek reciprocal switching. Such a customer would need to obtain partial revocation of the exemption—litigation that may be costly and time-consuming in itself, given the Board's statement that ''parties would be allowed to present counterbalancing evidence to demonstrate why partial revocation would not be warranted'' [3]—before potentially usable performance data even begins to accrue. Similar to contract customers, a customer who litigates and wins a partial revocation would do so unaware of whether it would ever become eligible to file a petition attempting to obtain reciprocal switching.

I disagree with the conclusion that aiming so low is worthwhile, given that the Board could have implemented the public interest prong without the deterrent effect I have described. *See 2016 NPRM,* slip op. at 17–18 (proposing a ''practicable and in the public interest'' test that did not require 12 weeks of performance data). And that is not to mention the fact that the Board is ''choosing to focus reciprocal switching reform on service issues at this time,'' while deferring to some uncertain future date any action on the competitive rail service prong. *Cf. id.,* slip op. at 19, 21–23 (proposing a ''necessary to provide competitive rail service'' test).

Contrary to an assertion in the decision above, the final rule therefore does not provide most rail customers with a reasonably predictable and efficient path toward a prescription under section 11102(c). I also do not share the optimism reflected in the decision's expectation that part 1145 will be a significant step in incentivizing Class I railroads through competition to achieve and maintain higher service levels on an ongoing basis. Rather, the Board's action is likely to have far less benefit than it intends.

This is a missed opportunity. Almost 13 years after the National Industrial Transportation League filed its petition for rulemaking with regard to reciprocal switching, the Board is adopting rules that do nothing with respect to the statute's competitive rail service prong and may not do very much under the public interest prong. We should do more, we should do better, and we should do it without letting another decade pass.

[1] The decision refers to concerns that this process will be ''cumbersome,'' a term that understates the final rule's expectation that prospective petitioners would pay the ''tariff premium'' for an undetermined period of time based on a chance that they might eventually become eligible to file a petition that attempts to secure reciprocal switching. (*See* Coal. Ass'ns Comments 13 (''[I]f the Board could not consider rail performance metrics for contract transportation, that effectively would neutralize the use of reciprocal switching to address the adequacy of rail service, given the large proportion of rail traffic that moves pursuant to contracts. A contract shipper currently experiencing service below the service thresholds in the proposed rules would have to wait for its contract to expire and then ship pursuant to tariff rates while waiting to see if its service improves.''); Coal. Ass'ns Reply 5–6, 47–52 (reiterating these concerns and asking the Board to reopen Docket No. EP 711 (Sub-No. 1)—the docket containing the *2016 NPRM*).)

[2] According to the decision, part 1145 is expected to improve network performance overall, which could benefit contract shippers in this interconnected industry. But this speculation—relying, for example, on the idea that the rule will promote the fluidity of shared facilities—loses sight of just how small the pool of potentially eligible traffic will be. As the decision itself points out, ''only a relatively small portion of all Class I movements are even potentially eligible for a prescription under part 1145,'' because the rule excludes not only contract and exempt traffic, but also shippers and receivers that are served by more than one Class I railroad or are outside a terminal area.

[3] The Board's stated intent to prioritize petitions for partial revocation filed in furtherance of part 1145 cases will have limited effect if the counterbalancing evidence, permitted under today's decision, is sufficiently voluminous or complex.

Jeffrey Herzig,
Clearance Clerk.

Final Rule

■ For the reasons set forth in the preamble, the Surface Transportation Board amends title 49, chapter X, of the Code of Federal Regulations by adding part 1145 to read as follows:

PART 1145—RECIPROCAL SWITCHING FOR INADEQUATE SERVICE

Sec.
1145.1 Definitions
1145.2 Performance standards
1145.3 Affirmative defenses
1145.4 Negotiations
1145.5 Procedures
1145.6 Prescription
1145.7 Termination
1145.8 Data

Authority: 49 U.S.C. 1321 and 11102

§ 1145.1 Definitions.

The following definitions apply to this part:

Affiliated companies has the same meaning as ''affiliated companies'' in Definition 5 of the Uniform System of Accounts (49 CFR part 1201, subpart A).

Cut-off time means the deadline for requesting service during a service window, as determined in accordance with the rail carrier's established protocol.

Delivery means when a shipment is actually placed at a designated destination or is constructively placed at a local yard that is convenient to the designated destination. In the case of an interline movement, a shipment will be deemed to be delivered to the receiving carrier or its agent or affiliate when the shipment is moved past a designated automatic equipment identification reader at the point of interchange or is placed on a designated interchange track, depending on the specific interchange that is involved. For purposes hereof, constructive placement of a shipment at a local yard constitutes delivery only when:

(1) The recipient has the option, by prior agreement between the rail carrier and the customer, to have the rail carrier hold the shipment pending the recipient's request for delivery to the designated destination and the recipient has not yet requested delivery; or

(2) The recipient is unable to accept delivery at the designated destination.

Designated destination means the final destination as specified in the bill

of lading or, in the case of an interline movement, the interchange where the shipment is transferred to the receiving carrier, its agent, or affiliated company.

Incumbent rail carrier means a Class I rail carrier that currently provides line-haul service to the petitioner to or from the point of origin or final destination that would be covered by the proposed reciprocal switching agreement.

Lane means a shipment's point of origin and designated destination. Shipments of the same commodity that have the same point of origin and the same designated destination are deemed to travel over the same lane, regardless of which route(s) the rail carrier uses to move the shipments from origin to destination. In the case of an interline movement, the designated destination is the designated interchange.

Manifest traffic means shipments that move in carload or non-unit train service.

Original estimated time of arrival or *OETA* means the estimated time of arrival that the incumbent rail carrier provides when the shipper tenders the bill of lading or when the incumbent rail carrier receives the shipment from a delivering carrier.

Petitioner means a shipper or a receiver that files a petition hereunder for prescription of a reciprocal switching agreement.

Planned service window means a service window for which the shipper or receiver requested local service, provided that the shipper or receiver made its request by the cut-off time for that window.

Practical physical access means a feasible line-haul option on a rail carrier, including but not limited to: direct physical access to that carrier or its affiliated company; an existing switching arrangement between an incumbent rail carrier and another rail carrier; terminal trackage rights; or contractual arrangement between a local rail carrier and a line-haul carrier.

Receipt of a shipment means when the preceding rail carrier provides a time stamp or rail tracking message that the shipment has been delivered to the interchange.

Reciprocal switching agreement means an agreement for the transfer of rail shipments between one Class I rail carrier or its affiliated company and another Class I rail carrier or its affiliated company within the terminal area in which the rail shipment begins or ends its rail journey. Service under a reciprocal switching agreement may involve one or more intermediate transfers to and from yards within the terminal area.

Service window means a window during which the incumbent rail carrier offers to perform local service (placements and/or pick-ups of rail shipments) at a shipper's or receiver's facility. A service window must be made available by a rail carrier with reasonable advance notice to the shipper or receiver and in accordance with the carrier's established protocol. For purposes of this part, a service window is 12 hours in duration, beginning at the start of the work shift for the crew that will perform the local service, without regard to whether the incumbent rail carrier specified a longer or shorter service window.

Shipment means a loaded railcar that is designated in a bill of lading.

Similar traffic means traffic that is of the same broad type (manifest traffic or unit train) as the traffic that is governed by a prescribed reciprocal switching agreement, and is transported by the incumbent rail carrier or its affiliated company to or from the terminal area in which transfers occur under the prescribed reciprocal switching agreement.

Terminal area means a commercially cohesive area in which two or more railroads engage in the local collection, classification, and distribution of rail shipments for purposes of line-haul service. A terminal area is characterized by multiple points of loading/unloading and yards for such local collection, classification, and distribution. A terminal area (as opposed to main-line track) must contain and cannot extend significantly beyond recognized terminal facilities, such as freight or classification yards. A point of origin or final destination on the rail system must be within a terminal area to be eligible for a prescription under this part.

Time of arrival means the time that a shipment is delivered to the designated destination.

Transit time means the time between a rail carrier's receipt of a shipment, upon either the tender of the bill of lading to that rail carrier or the rail carrier's receipt of the shipment from a delivering carrier and the rail carrier's delivery of that shipment to the agreed-upon destination. Transit time does not include time spent loading and unloading cars.

§ 1145.2 Performance standards.

The performance standards in this section apply only to petitions for prescription of a reciprocal switching agreement under this part.

(a) *Service reliability (original estimated time of arrival).* The service reliability standard applies to shipments that travel as manifest traffic. The service reliability standard measures a rail carrier's success in delivery of a shipment from its original or interchange location by the original estimated time of arrival, accounting for the applicable grace period. Determination of a rail carrier's compliance with the service reliability standard is based on all shipments from the same original or interchange location to the same delivery location over a period of 12 consecutive weeks. A rail carrier meets the service reliability standard when *A/B* ratio is greater than or equal to 70%, where *A* is the number of shipments that are delivered within 24 hours of the original estimated time of arrival, and *B* is the total number of shipments.

(1) A car that is delivered more than 24 hours before or after its OETA will not be considered as being delivered within 24 hours of OETA.

(2) Once a carrier has communicated an original estimated time of arrival to a customer, that time will not be changed by any subsequent changes to the original trip plan of the car, no matter what the cause of the changed trip plan may be.

(b) *Service consistency (transit time).* The service consistency standard applies to shipments in the form of a unit train and to shipments that travel as manifest traffic. The service consistency standard measures a rail carrier's success over time in maintaining the transit time for a shipment. A rail carrier fails the service consistency standard if it fails either the standard in paragraph (b)(1) of this section or the standard in paragraph (b)(2) of this section, with both paragraphs being subject to paragraph (b)(3) of this section.

(1) *Year-to-year comparison. A* is more than 20% longer than *B,* where *A* is the average transit time for all shipments from the same location to the same designated destination over a period of 12 consecutive weeks, and *B* is the average transit time for all shipments from the same location to the same designated destination over the same 12-week period during the previous year.

(2) *Multi-year comparison. A* is more than 25% longer than *B,* where *A* is the average transit time for all shipments from the same location to the same designated destination over a period of 12 consecutive weeks, and *B* is the average transit time for all shipments from the same location to the same designated destination over the same 12-week period during any of the previous three years.

(3) A carrier will not fail the service consistency standard if the increase in

transit time between *B* and *A* is 36 hours or less, notwithstanding the percentages stated in paragraphs (b)(1) and (b)(2) of this section.

(c) *Lanes.* Compliance with the performance standards in paragraphs (a) and (b) of this section is determined separately for each lane of traffic to or from the petitioner's facility. Shipments of the same commodity from the same point of origin to the same designated destination are deemed to travel over the same lane, without regard to the route between the point of origin and designated destination. In the case of an interline movement, the designated destination is the designated interchange.

(d) *Empty railcars.* (1) For private or shipper-leased railcars, a rail carrier fails to meet the service consistency standard in paragraph (b) of this section if the rail carrier's average transit time for delivering empty cars to a designated destination over a 12-week period increases by more than 20% compared to average transit time for delivering empty cars to the same designated destination during the same 12-week period during the previous year or by more than 25% compared to average transit time for delivering empty cars to the same designated destination during the same 12-week periods during any of the previous three years. However, notwithstanding the previous sentence, a carrier will not fail the service consistency standard if the increase in average transit time for delivering empty cars is 36 hours or less.

(2) A rail carrier's failure to meet a performance standard as provided in this paragraph (d) provides the basis for prescribing a reciprocal switching agreement that governs both the delivery of the empty cars and the delivery of the associated shipments of loaded cars.

(e) *Industry spot and pull.* The industry spot and pull standard measures a rail carrier's success in performing local placements (''spots'') and pick-ups (''pulls'') of loaded railcars and unloaded private or shipper-leased railcars at a shipper's or receiver's facility during the planned service window. The industry spot and pull standard does not apply to unit trains or intermodal traffic.

(1) A rail carrier meets the industry spot and pull standard if, over a period of 12 consecutive weeks, the carrier has a success rate of 85% or more in performing requested spots and pulls within the planned service window, as determined based on the total number of planned service windows during that 12-week period.

(2) Failure to spot constructively placed cars that have been ordered in by the cut-off time applicable to the customer for a planned service window is included as a failure in calculating compliance with the industry spot and pull standard.

(3) Failure to spot ''spot on arrival'' railcars for a planned service window results in a missed service window only if the railcars arrived at the local yard that services the customer and are ready for local service before the cut-off time applicable to the customer.

(4) If a rail carrier cancels a service window other than at the shipper's or receiver's request, that window is included as a failure in calculating compliance with the industry spot and pull standard.

(5) When a rail customer causes a carrier to miss a planned service window, that window will not be considered a miss in determining the success rate under this paragraph (e).

(6) If a rail carrier reduces the frequency of its local service to a shipper's or receiver's facility, and if rail carrier cannot demonstrate that reduction is necessary based on a commensurate reduction in customer demand, then the industry spot and pull standard increases to a success rate of 90% for two years.

(f) The performance standards in paragraphs (a) and (b) of this section apply to movements within the United States and to the U.S. portion of movements between the United States and another country, in the latter case when the carrier's general practice with respect to such movements is to record receipt or delivery of the shipment at a point at or near the U.S. border (including where the carrier receives the shipment from or delivers the shipment to an affiliated carrier).

§ 1145.3 Affirmative defenses.

An incumbent rail carrier shall be deemed not to fail a performance standard in § 1145.2 if any of the conditions described in this section are met. The Board will also consider, on a case-by-case basis, affirmative defenses that are not specified in this section.

(a) The rail carrier experiences extraordinary circumstances beyond the carrier's control, including but not limited to unforeseen track outages stemming from natural disasters, severe weather events, flooding, accidents, derailments, and washouts. A carrier's intentional reduction or maintenance of its workforce at a level that itself causes workforce shortage, or, in the event of a workforce shortage, failure to use reasonable efforts to increase its workforce, would not, on its own, be considered a defense for failure to meet any performance standard. A carrier's intentional reduction or maintenance of its power or car supply, or failure to use reasonable efforts to maintain its power or car supply, that itself causes a failure of any performance standard would not, on its own, be considered a defense.

(b) The petitioner's traffic increases by 20% or more during the 12-week period in question, as compared to the preceding 12 weeks (for non-seasonal traffic) or the same 12 weeks during the previous year (for seasonal traffic such as agricultural shipments), where the petitioner failed to notify the incumbent rail carrier at least 12 weeks prior to the increase.

(c) There are highly unusual shipments by the shipper during any week of the 12-week period in question. For example, a pattern might be considered highly unusual if a shipper projected traffic of 120 cars in a month and 30 cars per week, but the shipper had a plant outage for three weeks and then requested shipment of 120 cars in a single week.

(d) The incumbent rail carrier's failure to meet the performance standard is due to the dispatching choices of a third party.

(e) The incumbent rail carrier's failure to meet the performance standard was directly caused by the conduct of a third party. This defense will be narrowly construed to avoid undue delay of the proceeding and unnecessary litigation costs. When presenting a defense under this paragraph (e), the incumbent rail carrier must prove that such conduct was outside its reasonable control. The incumbent rail carrier must also prove that it took reasonable steps to prevent and mitigate the impact of the third-party conduct or, if the impact could not be reasonably prevented, that the incumbent carrier took reasonable steps to mitigate the impact of the third-party conduct.

§ 1145.4 Negotiations.

At least five days prior to petitioning for prescription of a reciprocal switching agreement hereunder, the petitioner must seek to engage in good faith negotiations to resolve its dispute with the incumbent rail carrier.

§ 1145.5 Procedures.

(a) If a shipper or a receiver believes that a rail carrier providing it service failed to meet a performance standard described in § 1145.2, it may file a petition for prescription of a reciprocal switching agreement.

(b) The petition must include the information and documents described in this paragraph (b).

(1) Confirmation that the petitioner attempted good faith negotiations as required by § 1145.4, identify the performance standard the railroad failed to meet over the requisite period of time, identify the requested duration of the prescription of a reciprocal switching agreement, and provide evidence supporting its claim and requested prescription.

(2) Identification of at least one possible rail carrier to provide alternative service.

(3) Identification of any relevant switching publications of the incumbent rail carrier and the potential alternate carrier(s).

(4) A motion for a protective order that would govern the disclosure of data that the rail carrier provided to the petitioner under this part.

(c) The petition must have been served on the incumbent rail carrier, the alternate rail carrier(s), and the Federal Railroad Administration.

(d) A reply to a petition is due within 20 days of a completed petition. The burden of proof of establishing infeasibility and/or undue impairment is on the rail carrier (either the incumbent or the alternate) that is objecting to the petition.

(e) A rebuttal may be filed within 20 days after a reply to a petition.

(f) The Board will endeavor to issue a decision on a petition within 90 days from the date of the completed petition.

§ 1145.6 Prescription.

(a) The Board will prescribe a reciprocal switching agreement under this part if all the conditions in this paragraph (a) are met.

(1) For the lane of traffic that is the subject of the petition, the petitioner has practical physical access to only one Class I carrier that could serve that lane.

(2) The petitioner demonstrates that the incumbent rail carrier failed to meet one or more of the performance standards in § 1145.2 with regards to its shipment.

(3) The incumbent rail carrier fails to demonstrate an affirmative defense as provided in § 1145.3.

(b) Notwithstanding paragraph (a) of this section, the Board will not prescribe a reciprocal switching agreement if the incumbent rail carrier or alternate rail carrier demonstrates that the agreement is not practicable, including: switching service under the agreement, *i.e.,* the process of transferring the shipment between carriers within the terminal area, could not be provided without unduly impairing either rail carrier's operations; switching service under the agreement would be operationally infeasible; or the alternate rail carrier's provision of line-haul service to the petitioner would be infeasible or would unduly impair the incumbent rail carrier or the alternate rail carrier's ability to serve its existing customers. If the incumbent rail carrier and alternate rail carrier have an existing reciprocal switching arrangement in a terminal area in which the petitioner's traffic is currently served, the proposed operation is presumed to be operationally feasible, and the incumbent rail carrier will bear a heavy burden of establishing why the proposed operation should not qualify for a reciprocal switching agreement due to infeasibility.

(c) In prescribing a reciprocal switching agreement, the Board shall prescribe a term of service of three years, provided that the Board may prescribe a longer term of service of up to five years if the petitioner demonstrates that the longer minimum term is necessary for the prescription to be practical given the petitioner's or alternate carrier's legitimate business needs.

(d) Upon the Board's prescription of a reciprocal switching agreement under this part, the affected rail carriers must set the terms of the agreement and offer service thereunder within 30 days of service of the prescription and notify the Board within 10 days of when the carriers offered service that the agreement has taken effect. Additionally, the incumbent carrier must promptly amend its switching publication(s) as appropriate to reflect the availability of reciprocal switching under the prescription.

(e) If the affected carriers cannot agree on compensation within 30 days of the service of the prescription, then the affected rail carriers must offer service and petition the Board to set compensation.

§ 1145.7 Termination.

(a) If the incumbent carrier does not timely file a petition for termination, a prescription hereunder automatically renews at the end of the term established under § 1145.6(c). Automatic renewal is for the same term as the original term of the prescription. If the Board denies a petition to terminate the prescription, it will determine, on a case-by-case basis, the appropriate renewal term based on the evidentiary record, not to exceed the original term of the prescription. At the end of the renewal term, if the incumbent carrier does not timely file a petition for termination, the prescribed agreement will automatically renew for the same number of years as the renewed term.

(b) The Board will grant a petition to terminate a prescription if the incumbent rail carrier demonstrates that, for the most recent 12-week period prior to the filing of the petition to terminate, the incumbent rail carrier's service for similar traffic on average met all three performance standards under this part. This requirement includes a demonstration by the incumbent carrier that it has been able to meet, over the most recent 12-week period, the performance standards for similar traffic to or from the relevant terminal area.

(c) The incumbent rail carrier may submit a petition to terminate a prescription not more than 180 days and not less than 150 days before the end of the current term of the prescription.

(d) A reply to a petition to terminate is due within 15 days of the filing of the petition.

(e) A rebuttal may be filed within 10 days of the filing of the reply.

(f) The Board will endeavor to issue a decision on a petition to terminate within 90 days from the close of briefing.

(1) If the Board does not act within 90 days from the close of briefing, the prescription automatically terminates at the end of the current term of the prescription.

(2) If the Board does not issue a decision due to extraordinary circumstances, as determined by the Board, the prescription is automatically renewed for 30 days from the end of the current term. When there are extraordinary circumstances, the Board will issue an order alerting the parties that it will not issue a decision within the required time period. Under such circumstances, the Board will issue its decision as expeditiously as possible.

(3) A prescribed agreement will continue in effect until 30 days after the Board serves a decision that grants a petition to terminate or after the end of the prescription period, whichever is later.

§ 1145.8 Data.

(a) A shipper or receiver with practical physical access to only one Class I carrier serving the lane of traffic for which individualized performance records are sought, and based on a good faith belief that the Class I carrier has provided service that does not meet at least one performance standard from § 1145.2, may submit a written request to the incumbent rail carrier for all individualized performance records relevant to the performance standard(s) the shipper or receiver believes the rail carrier has failed.

(1) In the request to the rail carrier, the shipper or receiver must identify the

specific performance standard(s) that it believes the rail carrier has failed, and the corresponding date range and lane(s).

(2) Within seven days of the written request, the incumbent rail carrier shall provide the shipper or receiver with the requested individualized performance records.

(3) For purposes of this section, ''individualized performance records'' means the original estimated times of arrival, transit times, and/or industry spot and pull records related to the shipper or receiver's traffic, along with the corresponding time stamps.

(b) All Class I carriers shall report to the Board on a weekly basis, in a manner and form determined by the Board, data that shows: the percentage of shipments on the carrier's system that moved in manifest service and that were delivered within 24 hours of OETA, out of all shipments on the carrier's system that moved in manifest service during that week; and, for each of the carrier's operating divisions and for the carrier's overall system, the percentage of planned service windows during which the carrier successfully performed the requested local service, out of the total number of planned service windows on the relevant division or system for that week, all within the meaning of this part.

(c) Class I carriers shall provide, in the format of their choosing, machine-readable access to the information listed in this section.

(1) *Machine-readable* means data in an open format that can be easily processed by computer without human intervention while ensuring no semantic meaning is lost.

(2) *Open format* is a format that is not limited to a specific software program and not subject to restrictions on re-use.

(d) Class I carriers shall retain all data necessary to respond to a request under paragraph (a) of this section for a minimum of four years.

Management and Protection of the National Petroleum Reserve in Alaska; Final Rule

DEPARTMENT OF THE INTERIOR

Bureau of Land Management

43 CFR Part 2360

[BLM_HQ_FRN_MO4500177994]

RIN 1004–AE95

Management and Protection of the National Petroleum Reserve in Alaska

AGENCY: Bureau of Land Management, Interior.

ACTION: Final rule.

SUMMARY: This rule governs the management of surface resources and Special Areas in the National Petroleum Reserve in Alaska (Reserve or NPR–A). The Bureau of Land Management (BLM) manages the NPR–A consistent with its duties under the Naval Petroleum Reserves Production Act, as amended (NPRPA), Federal Land Policy and Management Act, as amended, (FLPMA), and other authorities. The rule revises the framework for designating and assuring maximum protection of Special Areas' significant resource values and protects and enhances access for subsistence activities throughout the NPR–A. It also incorporates aspects of the NPR–A Integrated Activity Plan (IAP) approved in April 2022.

DATES: This rule is effective on June 6, 2024.

FOR FURTHER INFORMATION CONTACT: James Tichenor, Advisor—Office of the Director, at 202–573–0536 or *jtichenor@blm.gov* with a subject line of ''RIN 1004–AE95.'' For questions relating to regulatory process issues, contact Faith Bremner at *fbremner@blm.gov.*

Individuals in the United States who are deaf, deafblind, hard of hearing, or have a speech disability may dial 711 (TTY, TDD, or TeleBraille) to access telecommunications relay services. Individuals outside the United States should use the relay services offered within their country to make international calls to the point-of-contact in the United States. For a summary of the rule, please see the rule summary document in docket BLM–2023–0006 on *www.regulations.gov.*

SUPPLEMENTARY INFORMATION:

I. List of Acronyms and Abbreviations
II. Executive Summary
III. Background
IV. Section-by-Section Discussion
V. Procedural Matters

I. List of Acronyms and Abbreviations

To ease the reading of this preamble and for reference purposes, the following acronyms and abbreviations are used in the preamble:

ANILCA (Alaska National Interest Lands Conservation Act of 1980)
BLM (Bureau of Land Management)
ASRC (Arctic Slope Regional Corporation)
FLPMA (Federal Land Policy and Management Act of 1976)
IAP (Integrated Activity Plan)
ICAS (Iñupiat Community of the Arctic Slope)
NPR–A or Reserve (National Petroleum Reserve in Alaska)
NPRPA or the Act (Naval Petroleum Reserves Production Act of 1976)
UIC (Ukpeaġvik Iñupiat Corporation)

II. Executive Summary

The Naval Petroleum Reserves Production Act of 1976 (NPRPA) gives the BLM three overarching mandates for managing the Reserve: (1) conduct an oil and gas exploration, leasing, and production program; (2) protect environmental, fish and wildlife, historical, and scenic surface resources from the impacts of that program through mitigation of reasonably foreseeable and significantly adverse effects; and (3) assure maximum protection for significant surface values from the impacts of the oil and gas program, including subsistence use, within Special Areas. Through this rulemaking process, the BLM is developing a more cohesive framework for these three mandates by establishing requirements and procedures for protecting the surface values of the Reserve while conducting the oil and gas program.

The final rule implements the critical components of the statutory framework described above, establishing procedures for the BLM to mitigate reasonably foreseeable and significantly adverse effects of proposed oil and gas activities on the surface resources of the Reserve and to provide maximum protection for surface values within Special Areas for proposed oil and gas activities. The BLM will continue to follow the part 3130 regulations for managing oil and gas leasing and production in the Reserve.

The rule updates the purpose of the subpart 2361 regulations to more accurately and completely reflect the scope of the regulations. The purpose of the updated regulations is to provide standards and procedures to implement 42 U.S.C. 6506a(b), which requires the Secretary to ensure that ''[a]ctivities undertaken pursuant to this Act include or provide for such conditions, restrictions, and prohibitions as [she] deems necessary or appropriate to mitigate reasonably foreseeable and significantly adverse effects on the surface resources of the [NPR–A],'' and to provide standards and procedures to implement 42 U.S.C. 6504(a), under which any exploration in Special Areas ''shall be conducted in a manner which will assure the maximum protection of such surface values to the extent consistent with the requirements of this Act for the exploration of the [NPR–A].''

The rule establishes new standards and procedures for managing and protecting surface resources in the Reserve from the reasonably foreseeable and significantly adverse effects of oil and gas activities. It requires the BLM, in each decision concerning oil and gas activity in the Reserve, to adopt measures to mitigate the reasonably foreseeable and significantly adverse effects on surface resources, taking particular care with surface resources that support subsistence. The rule requires the BLM to manage oil and gas activities in accordance with the IAP, enshrining longstanding BLM practice into regulations. In the BLM's experience, the IAP provides an invaluable means of evaluating management options, engaging the public, and guiding decision-making, consistent with the BLM's duties under NPRPA and the National Environmental Policy Act (NEPA).

The rule codifies the five existing Special Areas and their significant resource values and management as currently established in Secretarial decisions and the 2022 IAP, and it establishes a process for designating, amending, and de-designating Special Areas in the future. The rule sets forth standards and procedures for managing oil and gas activities within Special Areas, confirming that the management priority within Special Areas is to assure maximum protection of significant resource values consistent with the requirements of the NPRPA for exploration of and production from the Reserve. The procedures detail requirements for analyzing proposed oil and gas leasing, exploration, development, or new infrastructure in Special Areas, including providing opportunities for public participation and consulting with federally recognized Tribes and Alaska Native Claims Settlement Act (ANCSA) corporations that use the affected Special Area for subsistence purposes or have historic, cultural, or economic ties to the Special Area. The BLM must evaluate potential adverse effects on significant resource values and consider measures to avoid, minimize, or otherwise mitigate adverse effects to achieve maximum protection of significant resource values.

The rule requires the BLM to manage Special Areas to protect and support

fish and wildlife and their habitats and the associated subsistence use of those areas by rural residents, and it requires the BLM to provide reasonable access to and within Special Areas for subsistence purposes. The rule encourages the BLM to explore co-stewardship opportunities for Special Areas, including co-management, collaborative and cooperative management, and tribally led stewardship, fulfilling the special trust relationship that the Department of the Interior has with Tribes.

III. Background

A. The Need for the Rule

The BLM is promulgating this final rule because the regulatory framework governing the management and protection of environmental, fish and wildlife, other surface resources, and Special Areas in the Reserve needs updating. Conditions throughout the Arctic have changed dramatically since 1977, when the BLM issued the current regulations for management of surface resources and Special Areas in the Reserve. Rapidly changing conditions, including the intensifying impacts of climate change on the Reserve's natural environment and Native communities, make it necessary and appropriate for the BLM to develop new regulations that account for and respond to these changing conditions and that require the BLM to regularly address changing conditions.

In addition, the current regulations do not reflect the full management regime for the Reserve. This rule will provide a framework for management to protect Special Areas and surface resources in the Reserve, which requires a delicate balance between exploration for and development of oil and gas resources and protecting subsistence, recreational, fish and wildlife, historical, scenic, and other values. The applicable legal standards and procedures for management of the Reserve are currently scattered throughout several statutes and BLM regulations, plans, and guidance documents. For example, the existing regulations do not integrate with the BLM's development and use of IAPs, which have been used for more than two decades to guide management of lands within the Reserve. Although the BLM is not required to prepare a resource management plan for the Reserve under FLPMA, see 42 U.S.C. 6506a(c), it has chosen to produce and update the IAP through a public process and supported by analysis in an Environmental Impact Statement (EIS). The IAP allocates land uses in the Reserve and includes oil and gas lease stipulations and infrastructure restrictions that apply to BLM authorizations in Special Areas and other areas throughout the Reserve. The overlay of an updated regulatory regime to govern the Reserve, including the requirement to develop future IAPs to direct management of the lands and resources in the Reserve, will enhance consistency and certainty, particularly with respect to protection of surface resources and Special Areas.

Through the NPRPA, as amended, Congress has given the BLM three overarching mandates for managing the Reserve: (1) conduct an oil and gas exploration, leasing and production program; (2) protect environmental, fish and wildlife, historical, and scenic surface resources from the impacts of that program through mitigation of reasonably foreseeable adverse effects; and (3) assure maximum protection for significant surface values from the impacts of the oil and gas program, including subsistence use, within Special Areas. Through this rulemaking process, the BLM is developing a more cohesive framework for these three mandates by establishing requirements and procedures for protecting the surface values of the Reserve while conducting the oil and gas program, as discussed in more detail below.

1. Conduct an Oil and Gas Leasing, Exploration, and Production Program

The NPRPA directs the Secretary of the Interior to ''conduct an expeditious program of competitive leasing of oil and gas in the Reserve in accordance with this Act.'' In response to this mandate, in 1981 the BLM developed regulations establishing the procedures for administering a competitive leasing program for oil and gas within the Reserve. Those regulations are set forth in 43 CFR part 3130, and they are not being amended in this rulemaking process. Following promulgation of the part 3130 regulations, the BLM held two lease sales in the Reserve in 1982 and one each in 1983 and 1984.[1] After receiving no bids during the 1984 lease sale and determining that the oil and gas industry had ''little interest in another lease sale,'' the BLM discontinued sales in the Reserve for the next 15 years.[2] The BLM restarted lease sales in 1999 and, over the next 2 decades, held a total of 15 sales for the Reserve. These sales initially generated considerable bonus bid revenue for the Federal Government and the State of Alaska; however, bid revenue dropped off significantly as lands in the Reserve with the highest potential for development were leased. Between 1999 and 2019, the BLM offered nearly 60 million acres of leases in the Reserve but received bids on just 12 percent of that acreage.[3]

The BLM continues to authorize oil and gas leasing and production in the Reserve. The most recent oil and gas lease sale in the Reserve occurred in 2019. Under the 2022 IAP, approximately 11.8 million acres of the Reserve's subsurface estate are available for oil and gas leasing. In March 2023, the BLM approved the Willow Master Development Plan Project for construction and operation of new infrastructure in the Bear Tooth Unit within the Reserve. The approved Willow project incorporates substantial resource protection measures, such as reducing the number of proposed drill sites, while authorizing the production and transportation to market of Federal oil and gas resources within the Reserve, consistent with the BLM's statutory directives.

2. Protect Environmental, Fish and Wildlife, Historical, and Scenic Values

Under the NPRPA, the Secretary of the Interior assumes all responsibilities for the protection of environmental, fish and wildlife, and historical or scenic values. The Act authorizes the Secretary to ''promulgate such rules and regulations as [she] deems necessary and appropriate for the protection of such values within the reserve.'' 42 U.S.C. 6503(b). The BLM additionally has a responsibility to ''provide for such conditions, restrictions, and prohibitions as the Secretary deems necessary or appropriate to mitigate reasonably foreseeable and significantly adverse effects [of oil and gas activities] on the surface resources'' throughout the Reserve. 42 U.S.C. 6506a(b). The current regulations, however, provide little detail on the standards and procedures the BLM should use to implement these important requirements. New and revised standards and procedures are needed to ensure that the BLM is fulfilling its statutory duties under the NPRPA, FLPMA, and other authorities to the best of its ability.

The many important surface resources of the Reserve are described in detail in

---

[3] BLM, NPR–A Sale Statistics 1999 to Present, *available at https://www.blm.gov/sites/blm.gov/files/documents/files/Oil_Gas_Alaska_NPR-A_LeaseSale_Statistics_1999toPresent.pdf.*

the preamble to the proposed rule. These include extensive calving grounds for the Teshekpuk Caribou Herd and the Western Arctic Caribou Herd; threatened and sensitive bird species and the Qupałuk Flyway Network Site; marine mammals including polar bears, six whale species, spotted seals, and walruses; and abundant fish species including Pacific salmon. Overall, the implications of climate change for wildlife in the Arctic are substantial, particularly for marine mammals that are threatened by continued Arctic warming and the resulting deterioration of sea ice. The final rule better supports the BLM's ability to manage impacts to surface resources resulting from climate change and to respond to changing conditions more rapidly.

3. Assure Maximum Protection for Significant Surface Values, Including Subsistence Use, Within Specially Designated Areas

The NPRPA requires the BLM to ''assure the maximum protection of [significant subsistence, recreational, fish and wildlife, or historical or scenic] values'' within Special Areas ''to the extent consistent with the requirements of [the NPRPA] for the exploration of the reserve.'' 42 U.S.C. 6504(a). This requirement applies to the impacts of all oil and gas activities. 42 U.S.C. 6504(a); 6506a(n)(2). The final rule improves upon the standards and procedures that implement this requirement. For example, the current regulations identify specific measures the BLM may take to assure maximum protection but provide no further guidance on the evaluation and selection of such measures.

The final rule also maintains and enhances access for long-standing subsistence activities in the Reserve. The importance of subsistence harvesting to the Iñupiat people and residents of communities in and around the Reserve is discussed in depth in the preamble to the proposed rule. Impacts on subsistence are occurring on the North Slope with greater frequency as development expands across the region. Nuiqsut, the community closest to current oil and gas development on the North Slope, has experienced the most impacts. Effects on subsistence and concerns for ongoing subsistence activities have also been documented for Point Lay, Wainwright, Utqiagvik, Atqasuk, and Anaktuvuk Pass. Many of these effects are related to oil and gas exploration and development—including seismic activity and oil and gas-related research, pipelines, and traffic—on caribou and other terrestrial species. Provisions of the rule for management of subsistence uses within Special Areas and co-stewardship opportunities in management of Special Areas and subsistence fulfill the special trust relationship that the Department of the Interior has with Tribes.

In sum, this rule implements the critical components of the statutory framework described above, establishing procedures for the BLM to mitigate reasonably foreseeable and significantly adverse effects of proposed oil and gas activities on the surface resources of the Reserve and to provide maximum protection for surface values within Special Areas for proposed oil and gas activities, consistent with the requirements of the Act related to conducting oil and gas exploration and production—all as explicitly required by the NPRPA. The BLM will continue to follow the part 3130 regulations for managing oil and gas leasing and production in the Reserve. The BLM will also continue to maintain an IAP for the Reserve per the final rule. The IAP addresses management of the Reserve more broadly than oil and gas activities, whereas this rule and the codification of the 2022 IAP in provisions of this rule apply only to oil and gas activities.

Public Comments on the Need for the Rule

During the public comment period, the BLM received approximately 89,000 comments on *regulations.gov* from Tribes, Alaska Native Corporations, State and local governments, organizations, businesses, and individuals. Among them were comments from the Arctic Slope Regional Corporation, Doyon Limited, Iñupiat Community of the Arctic Slope, Kuukpik, Native Village of Kotzebue, and Village of Wainwright.

This preamble responds to comments in the relevant part of the discussion. For example, the following addresses comments on the need for the rule.

Comment: Commenters stated that the Reserve was set aside for the purposes of energy resource development and security in the United States and that they do not think that the BLM should promote any regulations that would slow, deter, or counter these purposes.

BLM Response: The rule implements express statutory direction in the NPRPA, which requires authorizations for oil and gas activities to ''include or provide for such conditions, restrictions, and prohibitions . . . necessary or appropriate to mitigate reasonably foreseeable and significantly adverse effects on the surface resources'' throughout the Reserve. The NPRPA also requires the BLM to ensure maximum protection of Special Areas' significant resource values from oil and gas activities. Please see the Brief Administrative History of the Reserve discussion below for more details.

Comment: The BLM received comments requesting that it remove the climate change justification from the Need for the Rule discussion. The BLM also received comments that balancing oil and gas activities with the protection of surface resources is not enough to address the climate change concerns raised in section II(E), Need for the Rule.

BLM Response: Intensifying impacts from climate change are particularly affecting North Slope Iñupiaq communities and creating substantial uncertainty for managing surface resources in the Reserve. Changes in native plant communities, wildlife habitat, and migration corridors, particularly for caribou, are affecting the availability of and access to subsistence resources. Climate change is also affecting things like permafrost stability and creating engineering challenges for infrastructure. Promulgating this rule now provides industry with assurances regarding management of the Reserve and allows it to better plan for future exploration and development. Updating the regulatory framework will improve the BLM's ability to respond to changing conditions in the Arctic while providing transparency in conservation and development decisions.

Comment: The BLM received comments espousing the position that there is not a need for additional rules to manage the Reserve because the IAP already provides stringent requirements for environmental protection and designates specific areas for oil and gas development.

BLM Response: The 2022 IAP Record of Decision (ROD) provides broad management direction for uses and activities allowed within the Reserve, including requirements for environmentally and socially responsible resource development. The BLM is seeking to codify the 2022 IAP development process and management framework for oil and gas activity into regulations, which currently are over 40 years old and outdated. Additionally, this final rule consolidates the provisions governing the BLM's management of oil and gas activity while mitigating adverse effects on surface resources and managing Special Areas for maximum protection of significant resource values in the Reserve.

Comment: Commenters requested that the BLM cite the need to protect wildlife species, including those with declining

populations like the Arctic peregrine falcon and caribou, in the Need for the Rule.

BLM Response: The concerns raised in this comment are encompassed in the proposed and final rule with references to ''protection and control of the environmental, fish and wildlife, and historical and scenic values of the National Petroleum Reserve in Alaska.''

B. Brief Administrative History of the Reserve

Designated by President Warren G. Harding in 1923 as Naval Petroleum Reserve No. 4, E.O. 3797–A, the Reserve is one of several naval petroleum reserves established on public land in the early part of the 20th Century to serve as an emergency oil reserve for the U.S. Navy. The Reserve extends from the north slope of the Brooks Range to the Arctic Coast and encompasses approximately 23 million acres of public land.

The U.S. Navy explored for oil and gas in the Reserve from 1944 to 1953, resulting in the discovery of two small oil fields (Simpson and Umiat), one prospective oil field (Fish Creek), a gas field (South Barrow), and four prospective gas fields (Meade, Square Lake, Titaluk, and Wolf Creek). The Navy also pioneered numerous methods for oil exploration in the Arctic and collected a tremendous amount of scientific information concerning northern Alaska. By the 1970s, when Congress began debating the role of the naval petroleum reserves in the context of the nation's changing energy needs, the Reserve remained ''largely unexplored and almost completely undeveloped.'' H.R. Rep. No. 94–156, at 3 (1975). In 1976, Congress passed the NPRPA, which transferred administrative jurisdiction over the Reserve from the Secretary of the Navy to the Secretary of the Interior and redesignated the ''Naval Petroleum Reserve Numbered 4, Alaska'' as the ''National Petroleum Reserve in Alaska'' in 1977. Public Law 94–258 (1976) (codified at 42 U.S.C. 6502). It also directed the President to prepare a study to ''determine the best overall procedures'' for exploring, developing, and transporting the reserve's oil and gas resources. *Id.* section 105(b)(1) (codified at 42 U.S.C. 6505(b)).

In the NPRPA, Congress sought to strike a balance between oil and gas exploration and ''the protection of environmental, fish and wildlife, and historical or scenic values'' in the Reserve. It did so by directing the Secretary to ''promulgate such rules and regulations as he [or she] deems necessary and appropriate for the protection of such values within the reserve.'' 42 U.S.C. 6503(b). The Conference Report explained that the Act would immediately vest responsibility for protection of the Reserve's ''natural, fish and wildlife, scenic and historical values . . . in the Secretary of the Interior . . . so that any activities which are or might be detrimental to such values will be carefully controlled.'' H.R. Conf. Rep. No. 94–942 (1976). The report stated the Conference Committee's expectation ''that the Secretary will take every precaution to avoid unnecessary surface damage and to minimize ecological disturbances throughout the reserve.'' *Id.*

Congress further directed that ''[a]ny exploration within the Utukok River, the Teshekpuk Lake areas, and other areas designated by the Secretary of the Interior containing any significant subsistence, recreational, fish and wildlife, or historical or scenic value, shall be conducted in a manner which will assure the maximum protection of such surface values to the extent consistent with the requirements of this Act for the exploration of the reserve.'' 42 U.S.C. 6504(a). The Conference Report elaborated that the Act would ''immediately authorize the Secretary to require that the exploration activities within these designated areas be conducted in a manner designed to minimize adverse impacts on the values which these areas contain.'' H.R. Conf. Rep. No. 94–942 (1976).

To implement the NPRPA, the BLM developed regulations in 1977 to govern management and protection of the Reserve. Those regulations, which have remained unchanged since their original promulgation, are set forth at 43 CFR part 2360, subpart 2361. The regulations provide a purpose and objectives for the protection of the environmental, fish and wildlife, and historical or scenic values of the Reserve and require the BLM to take such action as is necessary to mitigate or avoid unnecessary surface damage and to minimize ecological disturbance throughout the Reserve to the extent consistent with the requirements of the NPRPA for the exploration of the Reserve. Among other provisions, the regulations identify examples of maximum protection measures that may be implemented to protect significant resource values and provide guidance for designating additional Special Areas within the Reserve.

Three years after the BLM developed regulations to govern management of the Reserve, the Department of the Interior Appropriations Act, Fiscal Year 1981, directed the Secretary to ''conduct an expeditious program of competitive leasing of oil and gas'' in the Reserve, while ''provid[ing] for such conditions, restrictions, and prohibitions as the Secretary deems necessary or appropriate to mitigate reasonably foreseeable and significantly adverse effects on . . . surface resources . . . .'' Public Law 96–514, 94 Stat. 2957 (1980). The BLM subsequently developed a new set of regulations to govern the oil and gas leasing program in the Reserve, which were promulgated in 1981 and are set forth at 43 CFR part 3130. The part 3130 regulations did not amend the subpart 2361 regulations, and, as a result, the BLM currently follows two sets of regulations located in different parts of the code governing management of the Reserve.

The Fiscal Year 1981 Appropriations Act also exempted the Reserve from the requirement to prepare land use plans under section 202 of FLPMA. However, the BLM has found that planning is beneficial to ensure compliance with the statutory and regulatory framework governing the Reserve and since 1998 has maintained an IAP for the Reserve. Because planning in the Reserve is exempted from FLPMA section 202, the IAP is not developed as a resource management plan and does not implement multiple use and sustained yield. Instead, the IAP focuses possible future BLM management practices on those uses that are allowable under the NPRPA for the Reserve, and consistent with NEPA regulations at 40 CFR parts 1500 through 1508, the IAP is developed through an EIS process.

The BLM first developed an IAP for the Northeast portion of the Reserve, which was finalized in 1998, and established initial surface protections relevant to the Teshekpuk Lake and Colville River Special Areas. Upon signing the 1998 ROD, the Secretary approved the addition of ''much of the Kikiakrorak and Kogosukruk Rivers and an area approximately two miles on either side of these rivers'' to the Colville River Special Area, thus increasing its size to 2.44 million acres, and the addition of the Pik Dunes to the Teshekpuk Lake Special Area. 64 FR 16747 (April 6, 1999). The 2003 Northwest NPR–A IAP proposed the new Kasegaluk Lagoon Special Area, which the Secretary approved in a ROD in 2004. See 70 FR 9096 (Feb. 24, 2005). The Kasegaluk Lagoon Special Area is located in the northwestern corner of the Reserve and includes important habitat for marine mammals, among other values.

The BLM developed the first IAP for the full Reserve in 2013. Through the 2013 IAP, the Secretary made several

decisions concerning Special Areas. First, the Secretary designated a fifth Special Area: Peard Bay. The 107,000-acre area was designated to ''protect haul-out areas and nearshore waters for marine mammals and a high use staging and migration area for shorebirds and waterbirds.'' (BLM, NPR–A IAP ROD 4 (Feb. 2013), available at *https://eplanning.blm.gov/public_projects/nepa/5251/42462/45213/NPR-A_FINAL_ROD_2-21-13.pdf.*) Second, the Secretary expanded the Teshekpuk Lake Special Area by 2 million acres ''to encompass all the roughly 30-to-50-mile band of land valuable for bird and caribou habitat between Native-owned lands near Barrow and Native-owned lands near Nuiqsut . . . .'' (*Id.* at 19.) Third, the Secretary expanded the Utukok River Uplands Special Area to 7.1 million acres ''to more fully encompass prime calving and insect-relief habitat within the NPR–A . . . .'' (*Id.* at 4.) Finally, the Secretary broadened the purpose of the Colville River Special Area to include the ''protect[ion of] all raptors, rather than the original intent of protection for arctic peregrine falcons.'' (*Id.*)

The current IAP, adopted in April 2022, was informed by a Final EIS issued by the agency in 2020. The EIS evaluated a range of alternatives for managing oil and gas activities and resources in the Reserve. (BLM, NPR–A Final IAP/EIS (June 2020), *available at https://eplanning.blm.gov/eplanning-ui/project/117408/570.*) These alternatives were informed and shaped by extensive outreach efforts with the public and stakeholders, including:

- *Scoping:* During the scoping period from November 21, 2018, to February 15, 2019, the BLM held eight public meetings in Alaska and received approximately 56,000 comment submissions, including form letters.
- *Public Review of the Draft IAP/EIS:* During the comment period for the Draft IAP/EIS from November 25, 2019, through February 5, 2020, the BLM held eight public meetings in Alaska and received more than 82,000 comments, including form letters and signed petitions.
- *Comments received after the Final IAP/EIS was released and prior to the ROD:* In reaching the decision in the 2022 ROD, the BLM reviewed and fully considered comments received after distribution of the Final IAP/EIS on June 26, 2020. The comments did not identify any significant new circumstances or information related to environmental concerns bearing upon the proposed action or its impacts. Instead, they generally reflected concerns already raised by comments submitted during scoping and the public's review of the Draft IAP/EIS.

In addition to the above, the current IAP benefited from suggestions and careful review of the analysis in the IAP/EIS by several cooperating agencies: the Bureau of Ocean Energy Management, Iñupiat Community of the Arctic Slope, National Park Service, North Slope Borough, State of Alaska, and U.S. Fish and Wildlife Service. During the IAP/EIS process, the BLM consulted with:

- Tribes as required by a Presidential Executive Memorandum dated April 29, 1994;
- Communities, Tribal organizations, and Native corporations on the North Slope;
- The U.S. Fish and Wildlife Service and the National Oceanic and Atmospheric Administration—Fisheries pursuant to the Endangered Species Act; and
- Alaska's State Historic Preservation Office pursuant to the National Historic Preservation Act.

Pursuant to Alaska National Interest Lands Conservation Act (ANILCA) section 810(a)(1) and (2), the BLM also conducted hearings in North Slope communities to gather comments regarding potential impacts to subsistence use resulting from the alternatives considered in the IAP/EIS. Section 3.6 of the 2022 IAP details the BLM's process for evaluating impacts to subsistence use and findings based on that evaluation.

The 2022 IAP makes approximately 11.8 million acres (52 percent) of the Reserve's subsurface estate available for oil and gas leasing. The remaining approximately 11 million acres (48 percent) of the Reserve, including the majority of lands within Special Areas and much of the coastal area of the Reserve along the Beaufort Sea, are closed to oil and gas leasing to protect and conserve important surface resources and uses in these areas. The majority of the area closed to oil and gas leasing was determined to be medium or low potential for discovery or development of oil and gas resources in the Reasonably Foreseeable Development Scenario in the 2020 NPR–A Final IAP/EIS. (BLM, NPR–A Final IAP/EIS at B–1 (June 2020), *available athttps://eplanning.blm.gov/public_projects/117408/200284263/20020421/250026625/Volume%202_Appendices%20B-Y.pdf.*) The IAP makes lands available for application for oil and gas infrastructure, including pipelines and other infrastructure necessary for owners of any offshore leases in the State or Federal waters of the Chukchi and Beaufort Seas to bring oil and gas across the Reserve to the Trans-Alaska Pipeline System, while also prohibiting new infrastructure on lands containing habitat of special importance to nesting, breeding, and molting waterfowl as well as those with critical calving and insect relief areas for the Teshekpuk Lake and Western Arctic Caribou Herds. (BLM, NPR–A IAP ROD 1–2 (Apr. 2022))

C. Statutory Authority

The NPRPA is the primary source of management authority for the Reserve. Under the NPRPA, the Secretary must ''assume all responsibilities'' for ''any activities related to the protection of environmental, fish and wildlife, and historical or scenic values'' and ''promulgate such rules and regulations as he [or she] deems necessary and appropriate for the protection of such values within the reserve.'' 42 U.S.C. 6503(b).

Congress has also directed the Secretary to ''conduct an expeditious program of competitive leasing of oil and gas'' in the NPR–A. *Id.* However, the NPRPA also requires the Secretary to ensure all oil and gas activities within the Reserve ''include or provide for such conditions, restrictions, and prohibitions as the Secretary deems necessary or appropriate to mitigate reasonably foreseeable and significantly adverse effects on the surface resources'' throughout the NPR–A. *Id.* at 6506a(b).

The NPRPA also authorizes the Secretary to designate Special Areas to protect ''significant subsistence, recreational, fish and wildlife, or historical or scenic value[s]'' in the NPR–A and provides that any ''exploration'' in Special Areas ''shall be conducted in a manner which will assure the maximum protection of such surface values to the extent consistent with the requirements of this Act for the exploration of the reserve.'' *Id.* at 6504(a).

Other authorities that guide management of the NPR–A include FLPMA and the Alaska National Interest Lands Conservation Act of 1980 (ANILCA). Although Congress in 1980 exempted the NPR–A from FLPMA's land use planning and wilderness study requirements, 42 U.S.C. 6506a(c), it did not exempt the NPR–A from FLPMA's other provisions. Hence, the BLM must ''take any action necessary to prevent unnecessary or undue degradation'' of all BLM-administered public lands, including within the NPR–A. 43 U.S.C. 1732(b).

Similarly, certain portions of ANILCA apply within the Reserve. Of particular importance for this rule, section 810 of ANILCA, which governs subsistence

uses within the Reserve, requires the BLM to ''evaluate the effect'' of proposed activities ''on subsistence uses and needs . . . .'' 16 U.S.C. 3120(a). If such activities will ''significantly restrict subsistence uses,'' then the BLM must hold hearings in affected communities, limit activities to ''the minimal amount of public lands necessary,'' and take ''reasonable steps . . . to minimize adverse impacts upon subsistence uses and resources . . . .'' *Id.* Fulfilling section 810's requirements is of crucial importance for the NPR–A, as more than 40 communities utilize its resources for subsistence purposes.

Public Comments on Statutory Authority

Comments: Some commenters asserted that the proposed rule conflicts with the plain language and congressional intent of the NPRPA, as amended by Public Law 96–514 (codified at 42 U.S.C. 6506a). Other commenters raised concerns that the proposed rule ignores that the NPRPA exempted the Reserve from certain provisions of FLPMA. Others commented that the proposed rule violates the plain language and congressional intent of FLPMA and the application in the rule is therefore inappropriate. Commenters further stated that Congress designated the Reserve to be developed in balance with conservation and that the proposed rule aims to align management of the Reserve with FLPMA in a manner that ignores the unique considerations identified in the NPRPA and would inappropriately restrict oil and gas development and decrease domestic oil supply.

BLM Response: The BLM disagrees with commenters' assertions that the rule conflicts with the NPRPA or FLPMA. This rule appropriately implements the statutory framework in the NPRPA, as amended, to provide for oil and gas exploration and development in the Reserve while ensuring the protection of environmental, fish and wildlife, and historical or scenic values across the Reserve; and specifically within Special Areas to ensure that any oil and gas activity is undertaken in a manner that provides for the maximum protection of surface values to the extent consistent with the requirements of the NPRPA.

Similarly, this rule appropriately implements the applicable provisions of FLPMA to the management of the Reserve. The Department of the Interior and Related Agencies' Fiscal Year (FY) 1981 Appropriations Act (Pub. L. 96–514) exempted management of the Reserve from only two sections of FLPMA: section 202 (43 U.S.C. 1712), which requires the BLM to prepare resource management plans to guide management of public lands; and section 603 (43 U.S.C. 1782), which required the BLM to complete wilderness reviews and describes the procedures for managing any lands recommended to Congress for wilderness designation pending congressional action. The BLM is otherwise obligated to manage public lands within the Reserve pursuant to FLPMA, where consistent with the NPRPA, as amended. Under FLPMA, the BLM has broad authority to regulate the use, occupancy, and development of public lands within the Reserve and must take action ''to prevent unnecessary or undue degradation of the lands'' (43 U.S.C. 1732(b)).

Comments: Other comments suggested that the BLM add a specific reference to ANILCA in § 2361.3.

BLM Response: The BLM agrees with this suggestion and has added a discussion of ANILCA to that section of the final rule.

D. Public Engagement

The BLM published the proposed rule in the **Federal Register** on September 8, 2023 (88 FR 62025), for a 60-day comment period ending on November 7, 2023. In response to public requests for an extension, the BLM extended the comment period for 10 days (88 FR 72985) and then again for 20 days (88 FR 80237). The resulting 90-day comment period closed on December 7, 2023.

During the comment period, the BLM hosted a variety of public outreach activities. The BLM held two virtual public meetings on October 6 and November 6, 2023. Presentation slides and video recordings of the virtual meetings were made available on the BLM website for the rulemaking (*https://www.blm.gov/about/laws-and-regulations/NPR-A-Rule*). The BLM held three in-person meetings in Anchorage (October 10, 2023), Nuiqsut (November 1, 2023), and Utqiagvik (November 2, 2023) to provide an overview of the proposed rule and answer questions from the public. The BLM also held one hybrid meeting in Wainwright on December 4, 2023. A court reporter was present at the Nuiqsut and Utqiagvik meetings to transcribe all comments and questions. The hybrid meeting in Wainwright was recorded via the Zoom platform, and those comments were collected by the BLM on behalf of the commenters and submitted as comments to the rulemaking docket on *regulations.gov (https://www.regulations.gov/docket/BLM-2023-0006*). Additionally, the BLM posted transcripts from the meetings as supporting and related materials to the rulemaking docket on *regulations.gov*.

The BLM also posted a fact sheet, a frequently-asked-questions document, a side-by-side comparison of the proposed rule with the existing regulation, and other background information on the BLM website to further public understanding of the proposed rule (*https://www.blm.gov/about/laws-and-regulations/NPR-A-Rule*).

In addition, during the comment period, the BLM conducted external outreach and participated in meetings to discuss the content of the proposed rule, including congressional briefings; meetings with the State of Alaska; and meetings with industry and other stakeholder interest groups.

Public Comments on Public Engagement

Comments on scope of outreach:

Commenters noted their perception that the BLM did not seek the input of those likely to be affected by the rulemaking prior to issuing the Notice of Intent in the **Federal Register**, as they stated is required by Executive Order (E.O.) 13563. Specifically, commenters stated their position that the BLM did not conduct outreach or engagement with the eight active lessees in the Reserve, State and national trade associations (American Petroleum Institute and Alaska Oil and Gas Association), and numerous Tribal and local government entities including the North Slope Borough, to ''seek their views on the scope or merits of the contemplated proposed rulemaking.''

Commenters also provided input on outreach methods. Commenters suggested that the BLM utilize KBRW as local residents often listen to that station for important announcements including meetings. Commenters also suggested that the BLM reach out to local search and rescue offices in villages because those volunteers directly interact with subsistence users. Comments emphasized that many Tribes and allotment owners do not have cell phones, utilize social media, or own computers; many do not have internet access, and if they do, it is limited and unreliable.

BLM Response: The BLM's intention to initiate this rulemaking was announced in March 2023. On August 25, 2023, the BLM mailed a formal offer for consultation to 45 Tribes and 30 Alaska Native Corporations to engage in consultation on the proposed rule. The BLM did not receive a response to these invitations from any of the Tribes or Alaska Native Corporations. Since the announcement of the proposed rule on

September 8, 2023, the BLM has continued to offer consultation via phone, email, and in-person invitations to Tribes and Alaska Native Corporations that it determined would be most likely to have substantial direct effects from the rule, including the Native Village of Atqasuk; Atqasuk Corporation; Village of Wainwright; Olgoonik Corporation; Native Village of Nuiqsut; Kuupik Corporation; Native Village of Barrow; Ukpeaġvik Iñupiat Corporation (UIC); Arctic Slope Regional Corporation (ASRC); and Iñupiat Community of the Arctic Slope (ICAS). On September 6th, 2023, agency staff called State and local governments to ensure they were aware of the upcoming publication of the proposed rule and to offer opportunities to discuss the rule language.

For some proposed rules, the BLM chose to engage with stakeholders about the broader topic earlier in the rulemaking process. In this instance, however, we believed it would be more productive to engage in more in-depth discussion regarding the content of the proposed changes to the rule with the benefit of the actual proposal for review and discussion.

The BLM worked with communities within the Reserve to host in-person public comment meetings, including posting meeting flyers, amplifying meetings on social media, and announcing the meetings on local CB radios. We always appreciate suggestions on outreach methods and how we might better reach audiences. We note the commenters' specific outreach suggestions for future efforts in the North Slope region.

Comments on timing:

Commenters expressed their concerns that the timeline for review of the rule directly conflicted with hunting and fall subsistence whaling activities. Commenters also noted their perception that the BLM is ignoring local circumstances such as the North Slope Borough's mayoral elections, which they stated prevented meaningful input on the proposed rule from North Slope communities. Comments expressed the opinion that the public comment timeline was inadequate, noting that 60 days was insufficient, and that the additional 30 days of extensions still did not allow North Slope organizations to diligently prepare comments on the rule and to weigh-in to the fullest extent possible. Commenters requested additional time to allow the public to have meaningful opportunity to review the necessary information and provide substantive comments.

Commenters expressed concern that the comment period for the rule overlapped with the comment period for the Coastal Plain Oil and Gas Leasing Program Supplemental EIS comment period.

Commenters emphasized the importance of working with the NPR–A Working Group, as the group consists of important local leaders and provides a forum for discussion of the rule including recommendations. Commenters suggested that certain group members (specifically Utqiagvik) did not receive notification of the meetings and that they should be involved in the discussion.

Commenters noted their opinion that the schedule for in-person and virtual public meetings for the rule did not provide sufficient notice to allow the public to meaningfully participate, nor the opportunity to adjust schedules so as to attend in person. Commenters also noted their opinion that the meetings were hastily scheduled, with only a few days' notice, and that meetings were canceled with little or no notice and often not rescheduled. Commenters requested additional public meetings and requested that those additional meetings be adequately noticed to facilitate public participation and local engagement.

Commenters noted that there is no reason the proposed rule should have substantially less public participation than other, less significant actions that have dictated management of the Reserve as both have been subject to the Administrative Procedure Act (APA). Commenters noted that the APA ensures that BLM rulemaking is a transparent and regular process.

BLM Response: BLM agrees that the timing for the public comment period was difficult and not ideal. Whaling is an incredibly important subsistence activity for North Slope communities, and fall is one of two key times to harvest. While the comment period for the proposed rule was during the fall whaling season, the BLM took steps to ensure that North Slope communities were given the opportunity to provide comments on the proposed rule and engage in the process in a meaningful way. First, the BLM conducted extensive outreach to Reserve communities, holding in-person public meetings in Nuiqsut, Utqiagvik, and Wainwright. Further, we recognize that submitting public comments online or through the mail might pose a challenge to these communities. To facilitate greater participation, we offered opportunities for community members at these sessions to submit their comments for the record through comment cards or through a court reporter. In addition, the agency met with the NPR–A Working Group three times during the public comment period. The NPR–A Working Group is comprised of representatives from North Slope local governments, Alaska Native Corporations, and tribal entities. It is intended to provide a forum for North Slope communities to provide input to management of the Reserve (*https://www.blm.gov/programs/energy-and-minerals/oil-and-gas/about/alaska/NPR-A/npr-a_working_group*). For each meeting in Reserve communities, the BLM coordinated meeting dates, times, and locations with local entities, although some changes still resulted due to unforeseen events or weather. Regarding the comment received specially addressing the November 2 meeting in Utqiagvik, meeting details were finalized in mid-October 2023 and advertised to the community via social media and flyers, in addition to notification to the NPR–A Working Group and posting on the project website.

The BLM received requests to extend the public comment period for the proposed rule; specifically, we were asked to extend the comment period for an additional 90 days, which would have made for a 150-day (5-month) comment period. A 5-month comment period far exceeds the typical duration for rulemaking comment periods. While we were unable to grant the requested extension, the BLM did extend the comment period for 30 days, resulting in a 90-day comment period for the proposed rule. While the comment period for the proposed rule overlapped with the comment period on the Draft Supplemental EIS for the Coastal Plain, the Coastal Plain comment period was 60-days and ended one month before the close of the comment period on the proposed rule.[4] Throughout the comment period and since, the BLM has continued to engage with Reserve region Tribes and Alaska Native Corporations on the rule.

Comments on meeting format:

Commenters provided input on the format of both the in-person and virtual meetings. Commenters noted that public comment and testimony was not part of the meetings, which, in their opinion, confirmed the BLM's ''limited intention to actually gather knowledge or data, or

[4] The Coastal Plain of the Arctic National Wildlife Refuge is approximately 50 miles east of the NPR–A. The 2017 Tax Act (Pub. L. 115–97) directed the BLM to conduct two sales in the Coastal Plain offering at least 400,000 acres of high-potential hydrocarbon lands for bid by 2024. More information on the supplemental environmental impact statement for the Coastal Plain Oil and Gas Leasing Program can be found on that project's website at *https://eplanning.blm.gov/eplanning-ui/project/2015144/570.*

to collaborate.'' Commenters also noted their perception that the BLM limited questions from the public and only answered select written questions submitted in English and then did not read them verbatim but instead paraphrased them. Some commenters stated concern over the format of the virtual meetings and noted that they did not think the meetings were long enough in duration and that they prefer a townhall format over the webinar format that was utilized. Commenters further noted that they would have liked to interact with each other and/or the BLM. Commenters expressed their opinion that the BLM's comment process does not provide special considerations that account for Indigenous groups' understanding of Western institutional public processes, which makes the process less transparent to Indigenous peoples.

Some commenters noted that, in their opinion, the BLM should ''reset the process to allow more public engagement and to receive the benefit of comment from informed stakeholders who can contribute to a better and more durable final rule.''

BLM Response: All members of the public were invited to submit comments to the BLM electronically at *Regulations.gov* or by mail, personal delivery, or messenger delivery. The BLM uploaded comments received by mail, personal delivery, or messenger delivery to *Regulations.gov.* As the official repository of comments, *Regulations.gov* is available to the public, allows the agency to better track and make more effective use of comments, and allows the public to review submissions from other commenters. For public meetings, the agency hosted virtual and in-person informational sessions along with in-person public comment meetings for communities located within the Reserve.

The informational sessions were designed to help the interested public understand the proposed rule and provide a forum to answer questions. The BLM communicated with attendees that comments would not be collected at the informational sessions due to the logistical feasibility of accurately and comprehensively recording comments in those venues. Participants were given both the *Regulations.gov* website and the mailing address for comment submission, and BLM representatives were available to answer questions about how to submit comments. The agency did not receive any questions during information sessions that were not written in English.

The BLM worked with communities within the Reserve to host in-person public comment meetings. We have heard on numerous occasions through other project outreach efforts that submitting public comments online or through the mail often poses a challenge to these communities. To facilitate greater participation, we offered opportunities for community members at these meetings to submit their comments to the record through comment cards or orally through a transcriber.

Comments on public engagement for the 2022 IAP:

Commenters expressed their opinion that the BLM incorrectly relied on the public comment process that informed the 2020 IAP ROD and noted that the BLM should have conducted NEPA review for the proposed rule. Commenters noted their opinion that the BLM streamlined the public involvement process and the actual impacts of the rule by claiming that it is administrative in nature, thus dismissing the need for additional stakeholder input. Commenters also noted their opinion that the rule vastly alters major Federal planning processes and land management standards that were developed using robust public input and that if the BLM wants to move forward with a rule that alters existing Federal land management, then the agency must acknowledge the public involvement process requirements at a minimum.

The BLM received comments stating that ''The State [of Alaska] strongly opposes and finds it disingenuous for BLM to consider and describe stakeholder engagement during the NPR–A IAP relevant stakeholder engagement and as justification for the need of the proposed rule.''

BLM Response: The BLM did not rely on the IAP public comment process as the public comment for this rule. Rather, the BLM provided for public comment on the proposed rule as required by the APA. With respect to NEPA compliance for this rulemaking, it is relevant that the current IAP was supported by an extensive NEPA analysis—including preparation of an EIS. The final rule does not alter any current on-the-ground management, and it meets the criteria set forth at 43 CFR 46.210(i) for a Departmental categorical exclusion in that this rule is ''of an administrative, financial, legal, technical, or procedural nature.'' Additionally, the final rule does not involve any of the extraordinary circumstances listed in 43 CFR 46.215 that would preclude the application of the categorical exclusion. As such, the BLM has complied with NEPA by relying on this categorical exclusion.

E. Tribal Consultation

On August 25, 2023, the BLM invited via mail 45 Tribes and 30 Alaska Native Corporations to engage in consultation regarding the proposed NPR–A rule. Since the announcement of the proposed rule, we have continued to offer consultation to Native Village of Atqasuk, Atqasuk Corporation, Village of Wainwright, Olgoonik Corporation, Native Village of Nuiqsut, Kuupik Corporation, Native Village of Barrow, UIC, ICAS, and ASRC. We met with the Mayor of Atqasuk on October 31, Native Village of Nuiqsut on November 1, ICAS on November 3 and February 6, Village of Wainwright on November 21, Olgoonik Corporation on December 19, ASRC on December 21, and Kuukpik on February 1. In addition, staff met and discussed the proposed rule with the NPR–A Working Group (consisting of representatives from North Slope local governments, Native corporations, and Tribal entities, *https://www.blm.gov/programs/energy-and-minerals/oil-and-gas/about/alaska/NPR-A/npr-a_working_group*) on September 26, October 17, and December 1. We also held in-person public meetings in Nuiqsut, Utqiagvik and Wainwright where verbal comment was recorded, along with three informational sessions—one in Anchorage and two virtual. The BLM will continue to engage in consultation with Tribes and Alaska Native Corporations after the final rule is published.

Public Comments on Tribal Consultation

Commenters expressed their opinion that the Alaska Native Corporations and the federally Recognized Tribes of Alaska were not properly consulted during the rulemaking process. Commenters expressed their opinion that the BLM did not comply with E.O. 13175, Secretary's Order 3043, President Biden's ''Memorandum on Tribal Consultation and Strengthening Nation-to-Nation Relationships'' and ''Memorandum on Uniform Standards for Tribal Consultation,'' and the DOI Policy Manual 512 DM 4 and 5. Comments stated that the BLM letter to Alaska Tribes and Alaska Native Corporations was sent 7 business days before the proposed rule's publication which ''fails to meet the numerous consultation requirements detailed at length'' in the Executive order and Memoranda listed above.

Commenters expressed that because the rule was published during fall whaling season, ''What little

consultation or public meeting process did occur was hastily convened with little to no opportunity for local communities to receive timely notice.''

Commenters requested that the BLM engage in meaningful communication and consultation with local villages and Tribes to ensure the new regulations meet the needs and concerns of the communities who rely on the Reserve. Comments requested that the BLM consultation be more inclusive than just the federally recognized Tribes and ANSCA corporations. One commenter stated: ''Also, the rule seems to treat ANCSA corporations the same as Tribes which needs further clarification.''

Another commenter stated: ''BLM's efforts to avoid working with local stakeholders of the NPR–A is almost impressive in its breadth. Not only has the State been excluded, but also leaders from impacted NPR–A Alaska Native communities, the North Slope Borough, the BLM-created NPR–A Working Group, the congressionally established ASRC, the tribal representatives from the ICAS, the Voice of the Arctic Inupiat (VOICE), and the general public of Alaska and residents of the NPR–A. These process deficiencies are especially stark after so many prior NPR–A-focused planning and permitting efforts featured comprehensive consultation and process. Conversely, this may be the North Slope's most disconnected and disingenuous public process in the modern era.''

BLM Response: Please see our response to similar comments in the discussion of Public Engagement above. We understand that some commenters found the public comment period dissatisfying. We received very helpful input and our outreach complied fully with applicable law and policy.

In addition, 512 DM 6 (*https://doi.gov/sites/doi.gov/files/elips/documents/512-dm-6.pdf*) outlines requirements for consultation between appropriate ANCSA Corporation officials and Department officials. While not considered government-to-government consultation, it is the policy of the Department to recognize and fulfill its legal obligations to consult with ANCSA Corporations on the same basis as Alaska Native Tribes. To the extent that concerns expressed by a federally recognized Tribe and an ANCSA Corporation substantively differ, officials shall give due consideration to the rights of sovereignty and self-government of the Tribe, and to the unique legal status and rights of the ANCSA Corporation.

In its many years of engaging with North Slope communities, the BLM has gained a deep understanding of the connection those communities have with the NPR–A. For example, for the Iñupiat of the North Slope, ''cultural resources are not merely places or things but also provide a link between North Slope history, Iñupiat culture and values, subsistence activities, and the biological and physical environment. These resources have spiritual and cultural importance to residents of the North Slope, and their protection is of utmost importance to the Iñupiat.'' [5] Contemporary Iñupiaq values, including respect for nature, hunting traditions, and family and kinship, are ''inextricably linked with all facets of Iñupiaq life,'' but ''none more so than subsistence hunting and harvesting traditions. Maintaining and passing down cultural values, including knowledge of subsistence hunting and harvesting methods, traditions, and places, is of utmost importance to North Slope residents.'' [6] ''The Iñupiaq people's relationship to the land is characterized by . . . subsistence traditions . . . ; thus, to the Iñupiat, protecting traditional lands and waters and the wild resources that inhabit them is essential to maintaining cultural traditions, knowledge, and identity. Today, the Iñupiat are continuously adapting and responding to various forces of change that challenge their ability to protect these lands and waters and that contribute to social stress within communities.'' [7] Among those forces of change is oil and gas development. ''Given the historical and unique nature of the economic, social, and cultural value Alaska Natives place on subsistence resources in the planning area and the importance of these resources to the nutritional health and food security of Alaska Natives,'' the adverse impacts of oil and gas development are predominately borne by Alaska Natives residing in communities that utilize subsistence resources from the NPR–A.[8]

F. General Public Comments

General Comments About the Rule

Comments: Commenters expressed support that the proposed rule would provide enhanced protection for natural resources for future generations, including wildlife and biodiversity, fragile Arctic environments, and Alaska's unique ecosystem. Commenters believed that the proposed rule would help the BLM address changing conditions, including climate change, improve upon standards and procedures to protect surface values and significant resource values, promote transparency and inclusivity, and would overall result in a more comprehensive plan to manage the Reserve.

BLM Response: We appreciate the recognition of these goals of the proposed rule, and we agree the proposed rule would advance these outcomes. The BLM made changes in the final rule to strengthen resource protection measures and clarify standards and procedures for implementing the rule with transparency and community engagement.

Comments: The BLM received comments expressing concerns that the proposed rule would restrict oil and gas development and could harm local economies that are reliant on oil and gas revenue. Commenters expressed concern that the proposed rule may be contrary to congressional direction set forth in the NPRPA and may not fulfill the purposes of the Reserve. We appreciate commenters raising these concerns through the rulemaking process, and the final rule incorporates changes to clarify the BLM's statutory mandate under the NPRPA for managing the Reserve.

BLM Response: As detailed in discussion and comment responses throughout this preamble to the final rule, the BLM believes managing oil and gas leasing and production under this regulatory framework will best enable the BLM to meet its requirements to ensure protection of environmental, fish and wildlife, historical, and scenic values in the Reserve and will benefit local communities. This rule balances all aspects of the BLM's statutory mandate for managing the NPR–A.

Comments: The BLM also received comments generally addressing recreation in the Reserve and requesting more discussion on how recreation activities and experiences would be affected by the rule.

BLM Response: We did not address recreation directly under the framework of the rule because the rule only addresses management of oil and gas activities in the Reserve. As the BLM implements the rule, there may be indirect effects on recreation activities in the Reserve, such as fewer impacts on recreation experiences associated with oil and gas production due to decisions that minimize and mitigate those impacts on surface resources in the Reserve.

Comments About Climate Change

Comments: The BLM received comments discussing the impacts of climate change already being realized in the Reserve, such as impacts to wildlife habitat and permafrost and the potential loss of associated subsistence food sources. Commenters urged the development of a comprehensive analysis of the climate impacts of Western Arctic oil and gas production. Commenters recommended that an updated climate analysis should incorporate adaptive management practices, which would allow the BLM to manage the Reserve for improved climate resiliency.

Commenters requested that the BLM ensure decisions are consistent with Council on Environmental Quality (CEQ) guidance, Environmental Protection Agency (EPA) guidance, and Secretarial Order 3399 regarding addressing climate impacts. In particular, commenters recommended that the BLM include a requirement in the rule to analyze the social cost of carbon, consider the reasonably foreseeable effects of climate change on infrastructure, and model greenhouse gas emissions. Commenters proposed various frameworks and approaches for incorporating climate analysis and emissions management into the rule.

BLM Response: This rule is focused on impacts to surface values of the Reserve and implementing the BLM's statutory obligation to protect those values when authorizing oil and gas leasing and production. Thus, the BLM is not analyzing or specifically considering the climate impacts of oil and gas development as part of the rulemaking process. We recognize that the changing conditions of surface values in the Reserve are being driven in a significant way by climate change and that changes due to climate change are occurring at an accelerated rate in the Arctic compared to other parts of the planet. Because of the dynamic nature of those impacts on surface resources, however, the BLM must consider and address climate impacts during the implementation of the rule. For example, the BLM will analyze the condition of surface resources, including changing conditions caused by climate impacts, when determining when to update the IAP. We further note that the BLM must analyze and consider greenhouse gas emissions, and climate impacts in general, when conducting NEPA analysis for oil and gas leasing and production activities.

Comments: Some commenters argued that the NPRPA creates an obligation for the BLM to limit greenhouse gas emissions from activities in the Reserve and expressed concern that the proposed rule fails to ''mitigate reasonably foreseeable and significantly adverse effects on the surface resources'' by not addressing emissions from recently approved oil and gas leases.

BLM Response: The BLM agrees that the provisions of the NPRPA that require the BLM to mitigate reasonably foreseeable and significantly adverse effects on surface resources and to assure maximum protection for significant resource values in Special Areas require the BLM to analyze and consider greenhouse gas emissions when it is considering new oil and gas activity in the Reserve. As described above, such analysis and consideration will occur as part of the NEPA process both for any changes to the IAP and for project-level approvals.

Comments About Wildlife

Comments: Commenters provided detailed information about fish and wildlife habitats in the Reserve and the impacts of oil and gas production on specific species and their habitats. In particular, comments documented information about caribou in the Utukok Uplands and their behavioral responses to oil and gas development, as well as polar bear populations within the Reserve and the impacts of oil and gas activities on the species. Commenters recommended the rule include additional protections to build resilient habitats for plants and wildlife, such as establishing connectivity zones between Special Areas. Comments expressed concern that existing mitigation measures do not ensure maximum protection for subsistence of the Teshekpuk Caribou Herd.

BLM Response: The BLM appreciates the wealth of information provided by commenters about wildlife species and habitats in the Reserve and impacts occurring from oil and gas activities. While analyzing specific habitat areas or mitigation measures is outside the scope of this rulemaking process, the BLM believes the final rule strengthens provisions that will support the BLM's management of important wildlife habitat and other surface resources in the Reserve. For example, the final rule requires that all Special Area designation and amendment processes will rely on the best available scientific information, including Indigenous Knowledge, as well as the best available information concerning subsistence uses and resources within the Reserve. The final rule also details procedures for the BLM to avoid the adverse effects of proposed oil and gas activities on the significant resource values of Special Areas.

Comments About Oil and Gas Production

Comments: The BLM received comments stating that the proposed rule disregards congressional intent that the BLM manage the Reserve for oil and gas production, including the NPRPA's requirement that the BLM conduct an expeditious program of competitive leasing of oil and gas in the Reserve. Commenters cited the U.S. Court of Appeals for the Ninth Circuit, which commenters assert has held that the NPRPA did not give the Secretary the discretion not to lease, but rather that the Secretary is given the discretion to provide rules and regulations under which leasing would be conducted.

BLM Response: We believe the final rule appropriately reflects the BLM's mandates in the NPRPA to conduct an oil and gas leasing and production program in the Reserve while protecting environmental, fish and wildlife, and historical and scenic values within the Reserve. In the same section that establishes an oil and gas leasing program in the Reserve, the NPRPA explicitly directs the BLM to ''provide for such conditions, restrictions, and prohibitions as . . . necessary or appropriate to mitigate reasonably foreseeable and significantly adverse effects on the surface resources'' of the Reserve when conducting the oil and gas program (42 U.S.C. 6506a(b)). Further the BLM updated § 2361.40 in the final rule to specifically reference the BLM's mandate under the NPRPA to assure maximum protection of significant resource values in Special Areas ''consistent with the requirements of the NPRPA for exploration and production of the Reserve.'' This is consistent with *Northern. Alaska Environmental. Center* v. *Kempthorne,* 457 F.3d 969 (9th Cir. 2006), which states only that the government could not forbid *all* oil and gas leasing throughout the Reserve, not that it lacks discretion not to lease in some areas. Indeed, in that case, the court upheld an IAP that deferred leasing in a significant portion of the NPR–A.

Comments: The BLM received comments discussing the maximum protection requirements in the proposed rule and the context of the statutory language. Commenters stated that the maximum protection requirement in the NPRPA was not intended to create a presumption against oil and gas activities, but rather to ensure that exploration operations would be conducted to minimize adverse impacts on the environment. Commenters

argued that the maximum protection provisions in the proposed rule are contrary to the plain language of the NPRPA, congressional intent and the 1981 Appropriations Act.

BLM Response: The NPRPA requires the BLM to conduct oil and gas activities in Special Areas ''in a manner which will assure the maximum protection of [any significant subsistence, recreational, fish and wildlife, or historical or scenic] values to the extent consistent with the requirements of this Act.'' The Conference Report on the NPRPA elaborated that the Act would ''immediately authorize the Secretary to require that the exploration activities within these designated areas be conducted in a manner designed to minimize adverse impacts on the values which these areas contain.'' H.R. Conf. Rep. No. 94–942 (1976). The provisions of the rule implementing this requirement enable the agency to fulfill its statutory duty to protect Special Areas. We note that maximum protection measures are not an objective standard but rather are established in the context of resource needs and other uses, including valid existing rights and ongoing oil and gas production in the Reserve. As established in the existing regulation and carried forward to the final rule, maximum protection measures can include limiting types of vehicles and aircraft, requiring use of alternative routes, and rescheduling activities. They can also include restrictions on oil and gas infrastructure or closures to certain oil and gas activities, consistent with prescriptions for the Special Areas and existing leases. Maximum protection measures are and will continue to be developed through public processes with opportunities for public input and consultation with Tribes, ANCSA corporations, and local governments.

Comments: Commenters requested a more detailed explanation of how the rule would apply to and affect existing leases, operations, and activities. Commenters expressed concerns that the rule would adversely affect future proposals for development activities and impermissibly conflict with existing leases, by which the BLM has granted a right to build infrastructure and produce oil. Commenters acknowledged existing leases can be subject to reasonable regulations but argued that the proposed rule is not a reasonable restriction because it would create uncertainty about permit approval. Commenters suggested that leases may expire while the BLM delays action to document uncertainty or denies a permit on the grounds that the proposed infrastructure is not practicable or essential. Other comments discussed that the BLM has authority to take actions it determines are necessary to protect the environment in the Reserve, including through regulatory actions, and that this is acknowledged in the standard language in BLM leases.

BLM Response: The rule includes specific protections for valid existing rights. For example, the final rule allows for new permanent infrastructure on lands within Special Areas that are allocated as unavailable to new infrastructure if necessary to comport with the terms of a valid existing lease. The final rule similarly makes clear that the presumption against new oil and gas activities in Special Areas would be overcome by the need to comport with the terms of a valid existing lease.

At the same time, we note that, while the terms of an existing lease and approved development project or permit will not be affected by the rule, a valid lease does not entitle the leaseholder the unfettered right to drill wherever it chooses or categorically preclude the BLM from considering alternative development scenarios within leased areas, nor does it give the leaseholder the right to produce all economically recoverable oil and gas on the lease. Further, the BLM can condition permits for drilling on implementation of environmentally protective measures and could even deny a specific application altogether if it were to propose development in a particularly sensitive area, and where mitigation measures would not be effective. Future development of an existing lease, by its terms, could be subject to additional terms and conditions. For example, the standard lease for activities in the Reserve states, ''An oil and gas lease does not in itself authorize any on-the-ground activity'' and notes that more restrictive stipulations may be added. Similarly, a standard lease stipulation entitled ''Conservation of Surface Values for NPR–A Planning Area Land'' provides: ''Operational procedures designed to protect resource values will be developed during Surface Use Plan preparation, and additional protective measures may be required beyond the general and special stipulations identified in the above-referenced documents.''

Comments: The BLM received comments expressing concern that oil and gas activities in the Reserve cause negative effects on the environment and wildlife, such as land degradation, air pollution, and threats to ecosystems, all of which affect biodiversity and human health. Commenters recommended the BLM develop a comprehensive cumulative effects analysis and whole Arctic conservation strategy, referencing a 2003 National Research Council report on cumulative effects of oil and gas activities on Alaska's North Slope. Commenters requested that the BLM implement consistent monitoring practices to ensure it has comprehensive data to use in decision-making, which would enable more effective management of oil and gas activities in the Reserve.

BLM Response: The BLM believes the final rule supports decision-making that will provide meaningful protections for environmental and wildlife values in the Reserve from the impacts of oil and gas exploration and production, consistent with the agency's statutory obligation to mitigate reasonably foreseeable and significantly adverse effects on the surface resources of the Reserve. In doing so, the rule will support the BLM's ability to manage for ecosystem services, and particularly their contributions to subsistence use, as the agency makes management decisions under the framework of the rule. (See, *e.g.,* Guidance For Assessing Changes In Environmental And Ecosystem Services In Benefit-Cost Analysis, Office of Management and Budget (Feb. 2024), available at *https://www.whitehouse.gov/wp-content/uploads/2024/02/ESGuidance.pdf.*) The final rule establishes that in managing both the significant resource values of Special Areas and the surface resources of the Reserve broadly, the BLM will adopt conditions, restrictions, or prohibitions that may involve conditioning, delaying action on, or denying some or all aspects of future and proposed oil and gas activities. For example, the BLM might condition or deny development if an operator proposes infrastructure along the Colville River if it is feasible to locate the infrastructure outside of the area closed to protect wildlife and subsistence activities, even if the operator would prefer the location closer to the river. It is not within the scope of this rulemaking process to develop a cumulative effects analysis or establish monitoring protocols, which are better suited to an IAP amendment process.

G. Summary of Changes in the Final Rule

The following paragraphs summarize changes the BLM made from the proposed rule to the final rule. More detailed explanations for the changes are found in the responses to comments and the description of the final rule in section IV of this preamble to the final rule.

Section 2361.3 Authority

The BLM added references to FLPMA and ANILCA in the Authorities section in the final rule, including the caveat that the land use planning and wilderness study requirements of FLPMA do not apply to lands within the Reserve, pursuant to 42 U.S.C. 6506a(c).

Section 2361.5 Definitions

The BLM revised the definition of ''infrastructure'' in the final rule to clarify that the term means, ''a permanent or semi-permanent structure or improvement that is built to support commercial oil and gas activities on BLM-administered lands within the Reserve, such as pipelines, gravel drilling pads, man camps, and other structures or improvements.'' The revised definition further clarifies that ''infrastructure'' does not include structures or improvements that will primarily be used by and provide a benefit to communities located within or in close proximity to the Reserve.

The BLM clarified in the final rule that the term ''significant resource values'' refers to surface values that the BLM identifies as significant, in order to ensure consistency with the language in the NPRPA. Similarly, the BLM made minor clarifications in the definition of the term ''Special Areas'' to ensure consistency with the language in the NPRPA. The final rule defines ''Special Areas'' as: ''areas within the Reserve identified by the Secretary or by statute as having significant resource values and that are managed to assure maximum protection of such surface values, to the extent consistent with the requirements of the Act for the exploration and production of the Reserve.''

The final rule incorporates the definition for the term ''co-stewardship'' that is used in BLM Permanent Instruction Memorandum No. 2022–011 (Co-Stewardship with Federally Recognized Indian and Alaska Native Tribes Pursuant to Secretary's Order 3403).

Section 2361.10 Protection of Surface Resources

The BLM added ''oil and gas'' before the word ''activities'' throughout the section to clarify that the requirements of this rule only apply to oil and gas activities. The final rule replaces ''Bureau'' with ''authorized officer'' to provide clarity about the BLM official responsible for implementing requirements in the rule.

The BLM removed proposed paragraph (b)(3) from the final rule because it is duplicative of environmental analysis requirements under NEPA. The paragraph had provided that, in assessing effects of a decision concerning proposed activity in the Reserve, the Bureau would identify and evaluate any reasonably foreseeable effects of its decision, including effects later in time or farther removed in distance, and effects that result from the incremental effects of the proposed activities when added to the effects of other past, present, and reasonably foreseeable actions.

Section 2361.20 Existing Special Areas

The BLM did not amend the final rule in response to specific comments regarding the significant resource values, boundaries, or management of existing Special Areas. The rule merely codifies the existing Special Areas and their significant resource values and management as currently established in Secretarial decisions and the 2022 IAP. The final rule establishes a process in § 2361.30 for designating, amending, and de-designating Special Areas that will be followed to make changes to Special Areas.

Section 2361.30 Special Areas Designation and Amendment Process

The BLM reorganized § 2361.30 in the final rule, with a new paragraph (a) that outlines requirements applicable to all processes that will designate, de-designate, or otherwise change boundaries or management of Special Areas. These provisions require that the BLM: (1) rely on the best available scientific information, including Indigenous Knowledge; (2) provide the public and interested stakeholders with meaningful opportunities to participate in the evaluation process; (3) consult with any federally recognized Tribes and ANCSA corporations that use the affected Special Area for subsistence purposes or have historic, cultural or economic ties to the Special Area; and (4) base decisions solely on the presence or absence of significant resource values. This new paragraph will provide more consistency to all decision-making processes for Special Areas.

The final rule changes the Special Area evaluation period from 5 to 10 years, while specifying that the BLM may conduct the evaluation sooner if the authorized officer determines that changing conditions warrant earlier review. For example, the BLM may decide to conduct an evaluation in less than 10 years upon receiving nominations or recommendations for Special Area changes. The BLM believes this change addresses concerns about agency and community capacity while ensuring regular reviews occur to maintain an inventory of resource conditions and make management changes as appropriate. The final rule specifies that as part of the evaluation, the BLM will determine whether to require additional measures or strengthen existing measures to assure maximum protection of significant resource values within existing Special Areas.

The BLM also revised the final rule to provide more clarity and certainty around the interim measures provision. The final rule clarifies that interim measures may be implemented at any time after BLM receives a recommendation to designate or modify a Special Area. The final rule also clarifies that any interim measures must be consistent with the governing management prescriptions in the IAP, and the BLM is required to provide public notice that interim measures are in place and reassess such measures to determine if they are still needed if they remain in place for more than 5 years.

Section 2361.40 Management of Oil and Gas Activities in Special Areas

Section 2361.40 is revised in the final rule to state the management priority within Special Areas is to assure maximum protection of significant resource values, ''consistent with the requirements of the NPRPA for exploration [and production] of the Reserve.'' The BLM believes this clarification addresses public comments requesting additional consistency with the language of the NPRPA and reflects the BLM's statutory mandate for managing the Reserve.

The final rule clarifies that the BLM will identify and adopt maximum protection measures for each significant resource value that is present in a Special Area when Special Areas are designated. The BLM will also update maximum protection measures as appropriate thereafter, including in the IAP, lease terms, and permits to conduct oil and gas activities. The final rule also includes maximum protection measures that are identified in the existing regulation but had been eliminated in the proposed rule, as well as additional examples of categories of measures.

On lands within Special Areas that are allocated as closed to leasing or unavailable to new infrastructure, the final rule allows for the BLM to approve new permanent infrastructure related to existing oil and gas leases only if such infrastructure is necessary to comport with the terms of a valid existing lease. This provision removes language in the proposed rule that further specified that the infrastructure must be essential for exploration or development activities

and no practicable alternatives exist which will have less adverse impact on significant resource values of the Special Area.

The final rule provides clarity around how the presumption against new leasing and new infrastructure on lands within Special Areas that are allocated as open for those activities will be addressed through the environmental review process. The rule provides that as part of the environmental analysis, the BLM will document a justification for overcoming the presumption, such as if the proposed infrastructure is necessary to comport with the terms of a valid existing lease, or if it will primarily be used by and provide a benefit to communities located within or in close proximity to the Reserve, and the proposal has been conditioned to avoid, minimize, or otherwise mitigate adverse effects. The public will have an opportunity to review and comment on any justification for overcoming the presumption.

The BLM reorganized § 2361.40 to clarify the requirements for preparing an environmental analysis of proposed leasing, exploration, development, or new infrastructure in Special Areas, and reaching a final decision. These procedures are set forth in a revised § 2361.40(g). The BLM must provide meaningful opportunities for public participation, including responding to comments, and consult with federally recognized Tribes and ANCSA corporations that use the affected Special Area for subsistence purposes or have historic, cultural, or economic ties to the Special Area. The BLM must evaluate potential adverse effects on significant resource values and consider measures to avoid, minimize, or otherwise mitigate adverse effects to achieve maximum protection of significant resource values. The BLM must also document and consider uncertainty about potential adverse effects on significant resource values, and account for any uncertainty when taking actions taken to avoid, minimize, or mitigate adverse effects.

If the BLM determines through the environmental analysis that the proposal cannot avoid adverse effects on significant resource values in a Special Area, then the BLM must prepare a Statement of Adverse Effect. The requirement to prepare a Statement of Adverse Effect was included in the proposed rule, but the final rule provides more clarity around how it fits within the environmental review process. The Statement of Adverse Effect will be incorporated into the environmental analysis and provided to the public for review and comment.

Lastly, the BLM updated the maps for the final rule so that they show the boundaries of the existing Special Areas on the maps from the 2022 IAP showing the current allocations for oil and gas leasing and infrastructure. The maps depict the exact data from the IAP ROD, and do not change any designations or allocations from the 2022 IAP.

Section 2361.50 Management of Subsistence Uses Within Special Areas

The final rule removes the phrase ''to the extent consistent with assuring maximum protection of all significant resource values that are found in such areas'' from this section, so paragraph (b) now simply reads: ''The Bureau will provide reasonable access to and within Special Areas for subsistence purposes.'' This phrase was causing confusion and was unnecessary because § 2361.30 requires the BLM to adopt measures to assure maximum protection of significant resource values when designating Special Areas.

The BLM also revised the language in this section to refer to ''reasonable access'' instead of ''appropriate access'' for consistency with the language in section 811 of ANILCA.

Section 2361.60 Co-Stewardship Opportunities in Management of Special Areas and Subsistence

In the final rule, the title of this section is revised from ''Co-stewardship opportunities in Special Areas.'' The first sentence is also revised to add ''and subsistence resources throughout the Reserve.'' Those revisions reflect that the BLM will seek co-stewardship opportunities not just in managing Special Areas, but also in managing subsistence resources more broadly.

The first sentence is also revised to add ''federally recognized'' to clarify that the BLM engages in co-stewardship only with federally recognized Tribes. Separately, the Bureau may partner with Alaska Native Claims Settlement Act corporations, local governments, or organizations as provided by law, which will not be co-stewardship arrangements but a different type of partnership. The text of the rule has been revised to make this distinction clearer.

IV. Section-by-Section Discussion and Response To Comments on Individual Provisions

Section 2361.1—Purpose

Existing and Proposed Regulations

Existing § 2361.0–1 is redesignated to § 2361.1 in the final rule. The existing provision states that the purpose of the regulations is ''to provide procedures for the protection and control of environmental, fish and wildlife, and historical or scenic values'' in the Reserve. The BLM proposed to revise § 2361.1 to establish a two-part purpose for the rule to more accurately and completely reflect the scope of the regulations. The first purpose was to provide standards and procedures to implement 42 U.S.C. 6506a(b), which requires the Secretary to ensure that ''[a]ctivities undertaken pursuant to this Act include or provide for such conditions, restrictions, and prohibitions as [she] deems necessary or appropriate to mitigate reasonably foreseeable and significantly adverse effects on the surface resources of the [Reserve].''

The second purpose outlined in the proposed rule was to provide standards and procedures to implement 42 U.S.C. 6504(a), under which any exploration in Special Areas ''shall be conducted in a manner which will assure the maximum protection of such surface values to the extent consistent with the requirements of this Act for the exploration of the reserve.'' The standards and procedures to implement these two provisions will also fulfill the BLM's mandate to take action necessary to prevent unnecessary or undue degradation under FLPMA, 43 U.S.C. 1732(b).

Public Comments on § 2361.1

Commenters expressed support for the proposed revisions to § 2361.1 to provide needed clarity, purpose, and priority for the protection and management of Special Areas. We agree that the changes will help.

Commenters recommended that the BLM include oil and gas leasing and production as a purpose of the regulations. We decline this suggestion. Regulations for oil and gas leasing and production within the Reserve are covered in 43 CFR part 3130.

Commenters requested that the BLM revert to the purpose in the original version of § 2361.1. We decline this request. The existing regulations do not reflect the full scope of the BLM's statutory obligations or the scope of this rule. Proposed § 2361.1 accurately and completely reflected that scope.

Commenters requested that the Purpose section include language that is in the current version of 42 U.S.C. 2361.0–2, which recites that the objective of the regulations is to provide environmental protection ''to the extent consistent with the requirements of the Act.'' We believe that is unnecessary. The proposed rule included language in the Purpose section which stated that the regulation was ''pursuant to and consistent with the provisions of the Naval Petroleum Reserves Production

Act of 1976 (90 Stat. 303; 42 U.S.C. 6501 *et seq.*).''

The BLM received comments requesting that the rule explicitly state that the purpose of the regulations is to provide standards and procedures to cease any new oil and gas activities in the Reserve and execute a phase down of all existing oil and gas extraction. The comments suggest that including this language would allow the BLM to meet its statutory requirement to ensure mitigation of reasonably foreseeable and significantly adverse effects and prevent unnecessary or undue degradation. This comment's recommendation would not be consistent with the NPRPA, which directs the Secretary to implement an oil and gas leasing program in the Reserve.

Description of the Final Rule

The BLM did not change this section of the proposed rule in the final rule. The final rule states the purpose of the regulations is to provide procedures for protection and control of the environmental, fish and wildlife, and historical and scenic values of the National Petroleum Reserve in Alaska, including mitigating the significantly adverse effects of oil and gas activities on the surface resources of the Reserve and assuring maximum protection of significant resource values in Special Areas pursuant to and consistent with the provisions of the Naval Petroleum Reserves Production Act of 1976 (90 Stat. 303; 42 U.S.C. 6501 *et seq.*), Alaska National Interest Lands Conservation Act (94 Stat. 2371, 16 U.S.C. 3101 *et seq.*), and other applicable authorities.

Section 2361.0–2—Objectives

Existing and Proposed Regulations

The existing § 2361.0–2 states the objectives of the regulations. The BLM proposed to remove this section because the proposed revision of § 2361.1 would make it redundant.

Public Comments on Existing § 2361.0–2

The BLM received comments requesting that it not amend the Objectives section because the original Objectives section clarified that environmental protections are designed to control exploration and production activities. Commenters expressed the opinion that the existing provision appropriately states the objective of the NPRPA and implements regulations based on Congress's intent to provide for the protection of the environmental and other surface values consistent with the exploration and development of oil and gas resources within the Reserve. Commenters suggested the proposed changes to the Objectives section disregard the BLM's primary purpose under the NPRPA of expeditious leasing, exploration, and development of the Reserve. Commenters recommended the Objectives include the clause: ''. . . maximum protection of such surface values to the extent consistent with the requirements of this Act for the exploration of the reserve'' in accordance with the BLM's obligations under the NPRPA and associated law.

BLM Response: We did not make changes in response to these comments. The existing § 2361.0–2 was removed because the proposed rule's revision of § 2361.1 made it redundant. The proposed rule included language in the Purpose section stating that the regulation is ''pursuant to and consistent with the provisions of the Naval Petroleum Reserves Production Act of 1976 (90 Stat. 303; 42 U.S.C. 6501 *et seq.*).''

Description of the Final Rule

The BLM did not change this section of the proposed rule in the final rule. The final rule removes § 2361.0–2 from the regulations.

Section 2361.3—Authority

Existing and Proposed Regulations

Existing § 2361.0–3 is redesignated to § 2361.3 in the final rule. The existing rule identifies the NPRPA as the only statutory authority for the regulations. In the proposed rule, the BLM included the Department of the Interior Appropriations Act, Fiscal Year 1981 (Pub. L. 96–514), which amended the NPRPA and instructed the Secretary to mitigate reasonably foreseeable and significantly adverse effects on the surface resources in the Reserve (codified at 43 U.S.C. 6506a).

Public Comments on § 2361.3

Commenters recommended the rule include ANILCA as an authority for the rule, in part because section 810 of ANILCA governs subsistence use on public lands in Alaska. Commenters also pointed out that FLPMA generally applies to public land management in Alaska, rather than section 202. We agree that referring to ANILCA is helpful. Other than the land use planning provisions of section 202 and the wilderness inventory requirements in section 603, FLPMA applies to lands within the Reserve.

Description of the Final Rule

The BLM changed the final rule in response to comments, adding references to FLPMA and ANILCA in the Authorities section in the final rule, including the caveat that the land use planning and wilderness study requirements of FLPMA do not apply to lands within the Reserve, pursuant to 42 U.S.C. 6506a(c).

Section 2361.4—Responsibility

Existing and Proposed Regulations

Existing § 2361.0–4 is redesignated to § 2361.4 in the final rule.

The BLM proposed to modify the statement in the existing regulations that, under the NPRPA, the BLM is responsible for managing surface resources in the Reserve to add that BLM is also responsible for managing the subsurface mineral resources in the Reserve. The proposed rule also added that the BLM is responsible for assuring maximum protection of Special Areas' significant resource values. The proposed rule deleted paragraph (b) because the U.S. Geological Survey is no longer responsible for managing exploration in the Reserve. Secretarial Order 3071, 47 FR 4751 (Feb. 2, 1982); Secretarial Order 3087, 48 FR 8982–83 (Mar. 2, 1983).

Public Comments on § 2361.4

Comment: The BLM received a comment stating that the BLM is responsible for managing subsurface resources, and therefore the commenter requested that the rule include a plan for periodic mineral surveys of the Reserve so the BLM can more effectively govern subsurface resources beyond just oil, gas, and coal.

BLM Response: We decline this suggestion because it goes beyond the scope of this rule. In addition, even if mineral surveys were within the scope of BLM's typical activities, they would be inappropriate here. The NPRPA withdrew the Reserve from all forms of entry and disposition under the public land laws, including the mining and mineral leasing laws, with the only exception being certain gravel sales. The 1981 Appropriations Act amended the NPRPA to allow for the oil and gas leasing program (42 U.S.C. 6502).

Comment: Commenters recommended removing the term ''environmental degradation'' from the section but did not provide an explanation for the change.

BLM Response: The BLM declines to make this change. The current regulation at § 2361.0–4 uses the term ''environmental degradation,'' and the use of this term in § 2361.0–4 is consistent with the BLM's duties and obligations under applicable laws, including the NPRPA, FLPMA, and ANILCA.

Comment: Commenters recommended that because the proposed changes to the section discuss the BLM's responsibility for assuring maximum protection of Special Areas' significant resource values, then the section should also discuss the need to balance resource protection with the responsibility to develop the Reserve's oil and natural gas resources.

BLM Response: While the BLM must ''conduct an expeditious program of competitive leasing of oil and gas'' in the Reserve, oil and gas leasing within the Reserve is addressed in 43 CFR part 3130. Hence, it is not necessary to include that in the Responsibility section for this rule.

Description of the Final Rule

The BLM did not change this section of the proposed rule in the final rule. Section 2361.4 in the final rule states that the BLM is responsible for the surface and subsurface management of the Reserve, including protecting surface resources from environmental degradation and assuring maximum protection of significant resource values in Special Areas.

Section 2361.5—Definitions

Existing and Proposed Regulations

Existing § 2361.0–5 is redesignated to § 2361.5 in the final rule.

The BLM proposed to update the definition for ''exploration'' to ensure consistency with NPRPA's definition of ''petroleum'' (42 U.S.C. 6501); update the definition of ''Special Areas'' for consistency with other proposed changes to the regulations; and incorporate a definition for ''Indigenous Knowledge,'' consistent with the guidance set forth in the Memorandum issued by CEQ and the Office of Science and Technology Policy (OSTP) on November 30, 2022. The BLM also proposed to add new definitions for ''Integrated Activity Plan,'' ''infrastructure,'' and ''significant resource value.''

Public Comments on § 2361.5

Comment: Commenters provided a general statement of support for § 2361.6 and the new definition for ''Indigenous Knowledge,'' consistent with the guidance set forth in the Memorandum issued by CEQ and OSTP on November 30, 2022.

BLM Response: We agree that the new definition will provide useful direction for the BLM in taking into account Indigenous Knowledge and add consistency in implementing CEQ and OSTP guidance.

Comment: Comments included a recommendation that the proposed processes for collecting and utilizing Indigenous Knowledge properly includes Alaska Native Corporations. Commenters stated that Alaska Native Corporations have a unique congressional mandate to manage Alaska Native lands for the benefit of their Alaska Native owners and Alaska Native Corporations regularly utilize Indigenous Knowledge to manage Indigenous-owned lands in Alaska. Furthermore, Alaska Native Corporations employ Indigenous Knowledge holders who understand the unique aspects of managing these traditional lands.

BLM Response: We decline this suggestion because the proposed rule's definition of Indigenous Knowledge already encompasses all Alaska Native peoples, including Alaska Native Corporations and other Alaska Native entities, by specifying that it ''is developed by Indigenous Peoples including, but not limited to, Tribal Nations, American Indians, and Alaska Natives.'' Consistent with Departmental policy found in 512 DM 6, the BLM recognizes and respects the distinct, unique, and individual cultural traditions and values of Alaska Native peoples and the statutory relationship between Alaska Native Corporations and the Federal Government.

Comment: Commenters recommended that the BLM consider the following definition of Indigenous Knowledge: ''Indigenous Knowledge means a body of observations, oral and written knowledge, practices, and beliefs developed by Tribes and Indigenous Peoples through interaction and experience with the environment. It is applied to phenomena across biological, physical, social, spiritual, and cultural systems. Indigenous Knowledge can be developed over millennia, continues to develop, and includes understanding based on evidence acquired through direct contact and long-term contact with the environment and long-term experiences, as well as extensive observations, lessons, and skills passed from generation to generation and acquired through multigenerational observations, lessons, and skills over time. Indigenous Knowledge is developed by Indigenous Peoples including, but not limited to, Tribal Nations, American Indians, and Alaska Natives''.

BLM Response: We decline this edit as it does not meaningfully change or improve the definition and would not be consistent with the definition being used by other Federal agencies.

Comment: Commenters requested the BLM clarify the definition of ''Indigenous Knowledge'' or how Indigenous Knowledge would be used in the Reserve. Commenters stated that the proposed definition could be interpreted to mean that any person or entity simply deemed ''Indigenous'' would have a claim to have Indigenous Knowledge and that this proposed definition diminishes the knowledge of those who actually live in the area as opposed to those who do not.

BLM Response: We decline this suggestion. The proposed rule's definition of Indigenous Knowledge encompasses all Alaska Native peoples, including members of Alaska Native Corporations and other Alaska Native entities, by specifying that it ''is developed by Indigenous Peoples including, but not limited to, Tribal Nations, American Indians, and Alaska Natives.'' In the final rule, Indigenous Knowledge, as well as best available information on subsistence resources and uses, will be considered in designating, de-designating and modifying boundaries or management of Special Areas. As a result, the Indigenous Knowledge will need to be specific to the areas and uses at issue, which will necessarily be focused on those informed about resources and uses on the ground, *i.e.,* members of local communities and Tribes.

Comment: Commenters requested the BLM clarify in the proposed rule how traditional knowledge will be used in conjunction with recognized scientific practices and standards of the North Slope Borough and the State of Alaska, particularly as those standards relate to the development in the Arctic and the Reserve.

BLM Response: We decline this suggestion. As the proposed rule states in § 2361.30, Indigenous Knowledge is included as a part of best available scientific information.

Comment: Commenters expressed general support for the reasoning stated for the proposed definition of ''infrastructure.''

BLM Response: The BLM appreciates public support for the proposed approach.

Comment: Commenters recommended amending the definition of ''infrastructure'' by omitting clauses: ''and that is not ephemeral, such as snow or ice roads'' and ''but it does not include exploratory wells that are drilled in a single season.'' The commenter thought these revisions would strengthen the definition.

BLM Response: We decline this suggestion. This definition is based on the framework set out in the IAP to identify which types of new infrastructure are subject to prohibitions within certain areas of the Reserve.

Section 1.2 of the 2022 IAP excludes single season snow and ice infrastructure as well as exploratory wells that are drilled in a single season. Based on comments received, the BLM clarified the definition to provide additional detail about what qualifies as infrastructure and what types of structures or improvements are not considered infrastructure for the purposes of this rule.

Comment: Some commenters stated their opinion that the definition of ''infrastructure'' may violate valid existing lease rights where a new oil and gas location for commercial development would be infrastructure and is restricted in multiple provisions, but exploratory wells drilled in a single season would not be infrastructure nor under the same restrictions.

BLM Response: The BLM disagrees with commenters' assertion. The rule is incorporating the allocations for infrastructure from the IAP and using a similar definition that focuses on permanent or semi-permanent structures. Further, the final rule makes clear that new infrastructure will not be restricted if the location of the proposed structures or improvements is necessary to comport with the terms of a valid existing lease.

Comment: Commenters stated that the proposed definition of ''infrastructure'' creates an arbitrary division between types of infrastructure. Commenters noted that infrastructure built to support science and public safety could have the same characteristics and features as infrastructure built to support commercial oil and gas activities and could support oil and gas activities, or vice versa. In addition, commenters stated that infrastructure associated with oil and gas development often includes new roads and local facilities that benefit the community. On the North Slope, access to subsistence areas and connectivity provided by roads is considered a benefit by many residents. For example, roads associated with industrial development near the Native villages of Utqiagvik and Nuiqsut have improved the ability of residents to pursue subsistence opportunities.

BLM Response: The definition of infrastructure in the final rule applies to permanent or semi-permanent structures or improvements that support oil and gas activities, and does not apply to other, non-oil and gas structures or improvements, because that term is used specifically to implement the Special Area provision of the NPRPA, 42 U.S.C. 6504(a) (as amended), which by its terms applies only to oil and gas exploration and production activities. Although the general mitigation provision of this rule (§ 2361.10) applies only to oil and gas activities, it is not the only tool available to the BLM for requiring mitigation in the Reserve. The BLM has explicit and ample authority under the NPRPA to apply mitigation requirements within the reserve, as well as under NEPA to evaluate potential mitigation measures as part of the analysis for proposed actions. Mitigation for other types of activities, such as siting and construction of infrastructure for scientific research or public safety, may be addressed through other means, such as implementing requirements of the IAP for non-oil and gas infrastructure or as determined through the analysis in project-specific decisions. With regard to infrastructure that benefits communities within the Reserve, § 2361.10 of the final rule provides that, when identifying conditions, restrictions, and prohibitions necessary or appropriate to mitigate the reasonably foreseeable and significantly adverse effects of proposed oil and gas activities in the portions of the Reserve outside Special Areas, the Bureau will fully consider community access and other infrastructure needs. Additionally, in response to comments, the BLM revised the restrictions on new infrastructure in § 2361.40 of the final rule to clarify that within Special Areas, infrastructure that will primarily be used by and provide a benefit to communities located within or in close proximity to the Reserve may be allowed provided that appropriate measures are adopted to assure maximum protection of significant resource values.

Comment: Commenters stated that the definition of ''infrastructure'' would allow for the authorization of temporary infrastructure for exploration, but would delay or prevent the BLM from authorizing infrastructure to support commercial development on existing leases. Comments further stated that this definition may result in a regulatory ''taking'' claim.

BLM Response: The final rule expressly allows for the authorization of new infrastructure, as defined in § 2361.5, that is necessary to honor the terms of a valid existing lease. The final rule will therefore not deprive a leaseholder of its rights under an existing lease.

Comment: Commenters expressed the opinion that defining ''infrastructure'' as ''essentially limited to structures or improvements in support of commercial oil and gas activities'' raises concerns about what types of infrastructure could be allowed within Special Areas and other sensitive regions. For example, ''Lease Stipulation K–1 does not apply to intercommunity roads or other permanent roads constructed with public funds for general transportation purposes. While the presence and use of such roads would have an effect on caribou and other significant resource values, it is not clear to what extent such infrastructure would fall within the proposed definition and thus come under the purview of maximum protection provisions.'' Commenters also stated that additional clarity is needed on ''where access and infrastructure could be allowed and how maximum protection will be assured in such areas.''

BLM Response: The BLM revised the definition of ''infrastructure'' in the final rule to clarify what structures or improvements are regulated by this rule. The final rule defines the term as, ''a permanent or semi-permanent structure or improvement that is built to support commercial oil and gas activities on BLM-administered lands within the Reserve, such as pipelines, gravel drilling pads, man camps, and other structures or improvements.'' The revised definition further clarifies that ''infrastructure'' does not include structures or improvements that will primarily be used by and provide a benefit to communities located within or in close proximity to the Reserve. In addition, the rule is incorporating the IAP's prescriptions on infrastructure, and is not prescribing specific new measures for management of Special Areas.

Comment: Commenters recommended that defining the term ''Integrated Activity Plan'' is not necessary, as the requirement under section 202 of the FLPMA to prepare land use plans does not apply to the Reserve and, therefore, the IAP should not be defined as a land management plan. Commenters suggested the IAP is unique to the Reserve and it should remain that way.

BLM Response: The BLM agrees that it does not develop IAPs to comply with section 202 of FLPMA, though it prepares IAPs to provide a framework for managing the Reserve. The BLM believes that the final rule should define the term ''IAP'' to accurately describe the relationship to the requirements in the rule and IAPs and to assist the BLM when preparing future IAPs.

Comment: Commenters suggested that the BLM revise its proposed new definition of ''significant resource value'' to be consistent with 42 U.S.C. 6504(a) and state ''any significant subsistence, recreational, fish and wildlife, historical, or scenic value identified by the BLM as supporting the designation of a Special Area.''

Commenters noted that omitting the word ''significant'' in the definition in the proposed rule is outside of BLM statutory authority and ''incorrectly lowers the requirements for designation of Special Areas'' to have significant resource values.

BLM Response: The BLM believes that including the word ''significant'' in the definition of ''significant resource value'' is redundant and circular. The definition makes clear that the value supports designation of a Special Area, which makes it significant. This definition is consistent with the NPRPA. To provide additional clarity and consistency with the NPRPA, the final rule specifies that the term ''significant resource values'' refers to surface values.

Comment: Commenters requested a more precise definition of ''significant resource value'' given that ''the creation and expansion of Special Areas that would subsequently preclude or severely limit oil and gas exploration and development is based on the presence of a significant resource value.'' The comment stated that ''this is an inadequate and circular definition.''

BLM Response: The BLM declines this request. The significant resource values that BLM is required to assure maximum protection for are specifically listed in section 104(b) the NPRPA (42 U.S.C. 6504), and this rule is implementing the NPRPA.

Comment: Commenters suggested the BLM revise the definition of ''significant resource value'' because the proposed definition is ''vague and would allow BLM to designate lands as having surface resources to support a special area designation if there are any subsistence, recreational, fish and wildlife, historical, or scenic values contained in the near vicinity.''

BLM Response: The BLM declines this request. The definition comes from the plain language of the NPRPA.

Comment: Commenters believe that the proposed definition of ''significant resource value'' is contrary to statutory authority and should be revised since it is ''contrary to the requirements that Congress established for the designation of Special Areas.'' The comment states that when the definitions for ''Special Areas'' and ''significant resource value'' are considered collectively, the proposed rule could be interpreted to remove the statutory requirement that ''restricts the designation of Special Areas to those areas containing certain significant values.''

BLM Response: The BLM disagrees with the comment's interpretation of the two definitions. The definition of ''significant resource value'' recites the specific surface values listed in the NPRPA that may warrant designation and management of a Special Area by the Secretary of the Interior. The definition of ''Special Area'' makes clear those areas must have significant resource values. These definitions, and the rest of the regulation, do not provide for or imply that the BLM would designate Special Areas in the absence of significant resource values.

Comment: A commenter suggested adopting the definition of ''Areas of Critical Environmental Concern'' as a substitute for the definition of ''Special Areas.''

BLM Response: We decline that suggestion. The NPRPA provides a specific definition of what would be considered a Special Area, which differs from the definition of an Area of Critical Environmental Concern as defined in FLPMA.

Comment: Commenters requested the BLM include oil and gas resources as a ''significant resource value'' given that the economic opportunity and revenue generated by oil and gas production provides significant value to the residents of the North Slope in the form of health and emergency services and other basic needs.

BLM Response: We decline that suggestion. Section 104(b) of the NPRPA (42 U.S.C. 6504) specifically lists the surface resource values that should be considered—''containing any significant subsistence, recreational, fish and wildlife, or historical or scenic value''— and oil and gas is not one of them.

Comment: Commenters opined that the revised definition of ''significant resource value'' exceeds statutory authority in providing that such designated areas would be protected to a maximum standard. Commenters suggested the definition implies that Special Areas are held to a higher standard and that reasonable impacts associated with oil and gas development are not allowed. Commenters also opined that the proposed rule expands the definition of ''Special Areas'' beyond the scope of law. The definition would ''impede development of a competitive leasing and development program'' in the Reserve, as intended by Congress.

BLM Response: We disagree. The definition in the proposed rule is consistent with the NPRPA, which explicitly states, ''to assure the maximum protection of such surface values to the extent consistent with the requirements of this Act.''

Comment: Commenters recommended the definition of ''significant resource value'' explicitly exclude future oil and gas leasing, exploration, and development. Commenters believe that allowing leasing, exploration, and development within Special Areas is ''contrary to the goal of establishing Special Areas.''

BLM Response: The BLM does not agree with this comment. Allowing some leasing, exploration, and development in Special Areas is not automatically inconsistent with the goal of Special Areas, which Congress specifically provided should be given maximum protection for their significant resource values consistent with the requirements of the Act for the exploration and production of oil and gas in the Reserve. This rule does not close areas to any activities beyond the closures already adopted by the IAP and leaves additional protective measures for area-specific analysis, subject to the processes described in this rule.

Comment: The BLM requested comments on whether to include the definition of ''permanent oil and gas facilities'' as defined in the 2022 IAP ROD. Commenters recommended removing the exclusions in the IAP definition because exploration wellheads and seasonal facilities such as ice roads and ice pads can be designed for use in successive winters and therefore should not be excluded. Commenters recommended that the BLM expand this definition to clearly encompass all permanent oil and gas facilities at any stage, including exploration and delineation, development, production, transportation, and decommissioning. Commenters encouraged the addition of water reservoirs and trenching done at any stage to be added to the definitions because these activities have long lasting effects on multiple resources. Commenters suggested that the definition include any development that permanently alters the surface resources or ecological values. Commenters recommended removing ''materials sites such as sand and gravel'' from the definition as they are not necessarily oil and gas related and they can be reclaimed.

BLM Response: Based on the feedback received, the BLM is not including a definition for ''permanent facilities'' in the final rule. We believe that the revised definition of ''infrastructure'' in the final rule adequately encompasses this subject by clarifying that for the purposes of this rule ''infrastructure'' includes permanent and semi-permanent structures and improvements, and by providing explanation and examples of those structures and improvements.

Comment: The BLM requested comments on whether to incorporate a

proposed definition of ''essential'' that resembles provisions of Lease Stipulation K–12 from the 2022 IAP ROD. In response to this request, some commenters stated that defining ''essential'' would provide clarity, and that the language of ''no other feasible and prudent option is available'' is good as a constraining description. Commenters suggested making the definition prioritize resource protection over production. Other commenters opined that the definition of ''essential'' as written in the proposed rule is sufficient and is in line with the purpose of providing maximum protection to Special Areas.

Commenters pointed out that they believe the definition of ''essential'' in the 2022 IAP ROD differs slightly from the definition of essential in § 2361.40(d)(3).

BLM Response: The BLM is not including a definition for ''essential'' in the final rule. After assessing public comment and the structure of the rule, the BLM instead eliminated the provision in the proposed rule that limited new permanent infrastructure related to existing oil and gas leases to that which is ''essential for exploration or development activities and no practicable alternatives exist. . .'' on lands within Special Areas that are allocated as unavailable to new infrastructure. Therefore, the term ''essential'' does not appear in the final rule. The provisions in the IAP, including the definition of the word ''essential'' in the stipulations, will apply.

Comment: Commenters recommended defining the terms ''reasonably foreseeable'' and ''significantly adverse effects.'' Commenters also recommended defining the term ''effects'' to clarify that effects include effects on environmental, fish and wildlife, and historical or scenic values.

BLM Response: We decline this request. These terms have standard accepted meanings and have been further clarified through their use in NEPA. The term ''effects'' is used throughout this rule in reference to environmental analysis that will occur and be documented under NEPA, and so defining the term separately here would create confusion.

Comment: Commenters recommended that since ''rural resident'' is not defined in 50 CFR 100.4 but is defined in ANILCA Title VIII, the proposed rule should not reference 50 CFR 100.4.

BLM Response: The regulations in 50 CFR part 100 implement the Federal Subsistence Management Program on public lands within the State of Alaska pursuant to the authority in Title VIII of ANILCA. While the term ''rural resident'' is used throughout ANILCA, it is not specifically defined; however, 50 CFR 100.4 defines the term ''rural'' and the term ''resident'' and then uses those terms in the definition of ''subsistence uses.'' The BLM will retain this citation.

Comment: Commenters recommending defining the term ''ecological integrity'' in the rule because protecting surface resources requires maintaining the ecological integrity of surface resources. The scientific meaning of ''ecological integrity'' is the capability of supporting and maintaining a balanced, integrated, adaptive community of organisms having a species composition and functional organization comparable to that of the natural habitat of the region.

BLM Response: The BLM did not include the term ''ecological integrity'' in the final rule, and therefore it is not defined in this section of the final rule.

Comment: The BLM received a comment that the phrase ''minimize the disruption of natural flow patterns and changes to water quality'' should be replaced with ''maintain natural flow regimes and the ecological integrity of lotic and lentic ecosystems.'' ''Natural flow regime'' could be defined as the magnitude, frequency, duration, timing, and rate of change of flow events that characterize the hydrology of a natural river environment.

BLM Response: This phrase is used in the 2022 IAP to describe the objectives of restrictions that the IAP applies to new oil and gas leases and infrastructure. The proposed rule and final rule incorporate the phrase to explain restrictions in the 2022 IAP that are codified by the rule. Because the rule is using language that is used in the 2022 IAP, the BLM declines to change the wording here, which would create confusion.

Comment: Commenters recommended defining the following terms in the regulation:

- *Financial readiness* means the lessee's financial capability to honor its contractual obligations.
- *U.S. energy needs* means the projected energy consumption of the United States of America in a given year, which comes from different sources such as nuclear power, natural gas, petroleum, renewable energy, and coal.
- *Financial projection* means the lessee's financial planning to estimate expected revenues, expenses, and cash flows which are normally used to build a company budget.
- *Financial stress* means a financial method designed to simulate the lessee's finances under adversarial situations.
- *Financial balances* means all the financial statements prepared by the lessee for cooperative reasons or to report to other U.S. agencies.

BLM Response: These terms do not appear in the rule text and thus need not be defined in this rule.

Comment: Some commenters recommending eliminating the new definitions for Indigenous Knowledge, Integrated Activity Plan, infrastructure, and significant resource values.

BLM Response: We decline those suggestions. These definitions are needed to ensure clarity and consistency in the implementation of the proposed rule.

Description of the Final Rule

In response to comments, the BLM revised the definition of ''infrastructure'' in the final rule to clarify that the term means, ''a permanent or semi-permanent structure or improvement that is built to support commercial oil and gas activities on BLM-administered lands within the Reserve, such as pipelines, gravel drilling pads, man camps, and other structures or improvements.'' The revised definition further clarifies that ''infrastructure'' does not include structures or improvements that will primarily be used by and provide a benefit to communities located within or in close proximity to the Reserve.

The BLM also clarified in the final rule that the term ''significant resource values'' refers to surface values, in order to ensure consistency with the language in the NPRPA. Similarly, the BLM made minor clarifications in the definition of the term ''Special Areas'' to ensure consistency with the language in the NPRPA. The final rule defines ''Special Areas'' as: ''areas within the Reserve identified by the Secretary or by statute as having significant resource values and that are managed to assure maximum protection of such surface values, to the extent consistent with the requirements of the Act for the exploration and production of the Reserve.''

The final rule incorporates the definition for the term ''co-stewardship'' that is used in BLM Permanent Instruction Memorandum No. 2022–011 (Co-Stewardship with Federally Recognized Indian and Alaska Native Tribes Pursuant to Secretary's Order 3403). This definition was added in response to comments on § 2361.60.

All other definitions included in the proposed rule are carried forward to the final rule without change.

Section 2361.6—Effect of Law

Existing and Proposed Regulations

Existing § 2361.0–7 is redesignated to § 2361.6 in the final rule. The BLM proposed to update this section to conform to existing legal authorities, including adding provisions to implement the Department of the Interior Appropriations Act, Fiscal Year 1981, Public Law 96–514 (Dec. 12, 1980), 94 Stat. 2957, 2964, in revised paragraph (a), and the Barrow Gas Field Transfer Act of 1984, Public Law 98–366 (July 17, 1984), 98 Stat. 468, 470, in new paragraph (b)(4).

Public Comments on § 2361.6

Commenters supported the provision included at proposed § 2361.6(b)(4) authorizing the Secretary to grant such rights-of-way to the North Slope Borough as may be necessary to permit the North Slope Borough to provide energy supplies to villages on the North Slope. We agree with these comments.

Commenters recommended that this section state that the rule does not apply to oil and gas leases issued prior to the effective date of the rule. The BLM addresses the rule's application to existing oil and gas leases in responses to comments in section III(E) earlier in this preamble to the final rule (General Public Comments, Comments about oil and gas production).

Description of the Final Rule

The BLM did not change this section of the proposed rule in the final rule.

Section 2361.7—Severability

Existing and Proposed Regulations

The BLM proposed this new section to establish that if any provision of part 2360 is invalidated, then all remaining provisions would remain in effect.

Public Comments on § 2361.7

Commenters recommended the BLM remove this section from the final rule because they see it as unnecessary or uncharacteristic for a rulemaking. The BLM decided to retain this section as proposed in the final rule because the various components of the rule are distinct and may operate independently. As such, they should be considered separately by a reviewing court, and if any portion of the rule were to be invalidated, the remaining provisions could continue to provide the BLM with necessary tools to manage oil and gas activity and protect important resources in the Reserve.

Many of the provisions simply update the regulations to bring them more into line with the BLM's statutory duties. Those updates would function independently of the rest of the rule. The procedural requirements in § 2361.10(b) for protecting surface resources in the Reserve also would stand alone, as would the codification of existing Special Areas in § 2361.20, the procedural requirements in § 2361.30, the specific requirements for new infrastructure in § 2361.40, and other provisions.

Further, the paragraphs within specific sections may also function independently of each other. For example, the final rule's provisions pertaining to the management of oil and gas activities in Special Areas in § 2361.40 describe how the authorized officer will assure maximum protection for significant resource values while allowing for exploration and production within the Reserve. Within that section, each paragraph serves a separate function, such as requiring the authorized officer to avoid the adverse effects of proposed oil and gas activities on the significant resource values of Special Areas; directing the authorized officer to identify, adopt, and update maximum protection measures; prescribing requirements for considering the authorization of new leases or infrastructure proposed in areas allocated as closed to leasing or unavailable to new infrastructure; prescribing different requirements for considering the authorization of new leases or infrastructure proposed in areas allocated as available for future oil and gas leasing or new infrastructure; and providing the framework for considering new oil and gas activities through a NEPA process. Hence, if a court prevents any provision of one part of this rule from taking effect, that should not affect the other parts of the rule. The remaining provisions would remain in force.

Description of the Final Rule

The BLM did not change this section of the proposed rule in the final rule.

Section 2361.10—Protection of Surface Resources

Existing and Proposed Regulations

Existing § 2361.1 is redesignated to § 2361.10 in the final rule, and the title is changed from ''protection of the environment'' to ''protection of surface resources'' to more closely track with the BLM's statutory authority under 42 U.S.C. 6506a(b), which directs the BLM to ''provide for such conditions, restrictions, and prohibitions as the Secretary deems necessary or appropriate to mitigate reasonably foreseeable and significantly adverse effects on the surface resources of the [Reserve].''

The BLM proposed to establish new standards and procedures for managing and protecting surface resources in the Reserve from the reasonably foreseeable and significantly adverse effects of oil and gas activities. In 1980, Congress authorized the Secretary to mitigate those effects through ''necessary or appropriate'' ''conditions, restrictions, and prohibitions.'' 42 U.S.C. 6506a(b). Existing paragraph (a) requires the authorized officer to take action ''to mitigate or avoid unnecessary surface damage and to minimize ecological disturbance throughout the reserve to the extent consistent with the requirements of the Act for the exploration of the reserve.'' The BLM proposed to amend paragraph (a) to mirror the statutory language. As amended, paragraph (a) also provided further clarification by recognizing that, in some circumstances, the BLM may delay or deny proposed activities that would cause reasonably foreseeable and significantly adverse effects on surface resources.

The proposed rule deleted existing paragraph (b). It concerns coordination between the BLM and the U.S. Geological Survey, which is no longer relevant because the Geological Survey is no longer responsible for managing exploration in the Reserve. Paragraph (b) in the proposed rule spelled out new procedures for protecting surface resources in the Reserve. As explained above, Congress assigned the BLM the duty to protect the surface resources in the Reserve, but BLM regulations do not fully explain the scope of that duty. The proposed rule was drafted to provide direction to the agency and the public in complying with Congress's mandate.

In paragraph (b)(1), the proposed rule directed the BLM to manage oil and gas activities in accordance with the IAP. In doing so, the proposed rule enshrined longstanding BLM practice into regulations. As explained above, in the 1980 Amendments to the NPRPA Congress chose to exempt the Reserve from FLPMA's planning requirements (42 U.S.C. 6506a(c)). Nonetheless, since 1998, the BLM has prepared several IAPs to primarily govern oil and gas activities in the Reserve. The IAP is a form of land use plan that ''addresses a narrower range of multiple use management than a resource management plan.'' 2013 NPR–A IAP ROD at 17. In the BLM's experience, the IAP provides an invaluable means of evaluating management options, engaging the public, and guiding decision-making, consistent with the BLM's responsibilities under applicable

Federal laws, including NPRPA and NEPA. Accordingly, the proposed rule required the BLM to maintain an IAP, which would provide predictability to industry and North Slope communities and help guide BLM use authorizations in the Reserve but would give way to the regulations in the event of a conflict.

Paragraph (b)(2) of the proposed rule required the BLM, in each decision concerning oil and gas activity in the Reserve, to adopt measures to mitigate the reasonably foreseeable and significantly adverse effects on surface resources, taking particular care with surface resources that support subsistence. The BLM would do so by documenting for each decision its consideration of effects and how those effects informed the choice of mitigation measures. Paragraphs (b)(3) and (4) specified that the BLM's effects analysis would include any reasonably foreseeable effects, including indirect effects (those that are ''later in time or farther removed in distance''), cumulative effects (those ''that result from the incremental effects of proposed activities when added to the effects of other past, present, and reasonably foreseeable actions''), and ''any uncertainty concerning the nature, scope, and duration of potential effects.'' For example, if the BLM determined that a proposed lease sale's effects on subsistence resources—when added to the effects of other past, present, and reasonably foreseeable actions—could be significantly adverse, then under this proposed section, the BLM would need to adopt measures to mitigate those effects.

The proposed rule deleted existing paragraphs (c) and (d). Existing paragraph (c) requires the BLM to take maximum protection measures on all actions within Special Areas and identify the boundaries of Special Areas on maps. It also describes some requirements that may constitute ''maximum protection measures.'' Existing paragraph (d) concerns designation of new Special Areas. The proposed rule moved this content to §§ 2361.20, 2361.30, and 2361.40, as most appropriate. Moving this material to those new sections would provide clarification by focusing § 2361.10 on protection of surface resources throughout the Reserve.

Proposed new paragraph (c) clarified that for surface resources in Special Areas, the BLM also would have to comply with the provisions governing Special Areas in §§ 2361.20 through 2361.60. Moving the provisions concerning Special Areas to different sections makes that cross-reference necessary.

Proposed new paragraph (d) required the BLM to include in each oil- and gas-related decision or authorization, ''such terms and conditions that provide the Bureau with sufficient authority to fully implement the requirements of this subpart.'' That provision would ensure that the BLM incorporates into decision documents whatever language is necessary to enable it to implement any final rule.

Existing paragraph (e)(1) provides that ''the authorized officer may limit, restrict, or prohibit use of and access to lands within the Reserve, including special areas.'' The existing rule conditions that authority by requiring it to be exercised ''consistent with the requirements of the Act and after consultation with appropriate Federal, State, and local agencies and Native organizations.'' The proposed rule specified that the authorized officer has that authority ''regardless of any existing authorization.'' That added language would clarify that existing authorizations would not prevent the BLM from limiting, restricting, or prohibiting access to the Reserve consistent with the requirements of the Act. The proposed rule retained the condition that exercises of that authority must be consistent with the NPRPA, and it added ''and applicable law'' to clarify that the authorized officer cannot contradict other legal requirements. Instead of requiring the authorized officer to consult with ''Native organizations,'' the proposed rule provided more specificity by requiring consultation with federally recognized Tribes and Alaska Native Claims Settlement Act corporations. Consistent with the BLM's duty under NPRPA and ANILCA, the proposed rule also amended paragraph (e)(1) to allow the authorized officer to limit, restrict, or prohibit use of and access to the Reserve to protect subsistence uses and resources.

The proposed rule amended existing paragraph (f) to recognize the breadth of Federal laws that apply to the management and protection of historical, cultural, and paleontological resources in the Reserve.

Public Comments on § 2361.10

Comment: Commenters supported ''protection of surface resources'' and establishing new standards and procedures for managing and protecting surface resources in the Reserve from the foreseeable and significantly adverse effects of oil and gas activities.

BLM Response: The BLM appreciates commenters acknowledging the intention of the regulations.

Comment: Commenters recommended changing the title of this section to ''Protection of environmental values, including surface resources,'' to reflect the NPRPA which speaks to ''protection of environmental . . . values'' broadly. 42 U.S.C. 6503(b).

BLM Response: The reference to surface resources is consistent with the NPRPA, which provides: ''Activities undertaken pursuant to this Act shall include or provide for such conditions, restrictions, and prohibitions as the Secretary deems necessary or appropriate to mitigate reasonably foreseeable and significantly adverse effects on the surface resources of the National Petroleum Reserve in Alaska.'' 43 U.S.C. 6506a(b). The BLM did not change the title of this section in the final rule.

Comment: Commenters recommended revising proposed § 2361.10 to emphasize the overarching purpose of the Reserve for oil and gas production by clarifying that the NPRPA requires resource protection ''to the extent consistent with the requirements of this Act for the exploration of the reserve.'' Other commenters recommended revising proposed § 2361.10 to emphasize the overarching purpose of the Reserve for environmental protection by clarifying that the NPRPA requires protection of environmental values, including, but not limited to, surface resources.

BLM Response: The BLM believes § 2361.10 appropriately reflects the mandates in the NPRPA to conduct an oil and gas leasing and production program in the Reserve while protecting environmental, fish and wildlife, and historical and scenic values within the Reserve. The NPRPA specifically directs the BLM to mitigate adverse effects on the surface resources of the Reserve when conducting the oil and gas program. The BLM added the phrase ''oil and gas'' to modify ''activities'' throughout this section of the final rule to clarify that these regulations are specific to the BLM's implementation of its oil and gas program in the Reserve.

We also note that the final rule in § 2361.40 references the BLM's mandate under the NPRPA to assure maximum protection of significant resource values in Special Areas ''consistent with the requirements of the NPRPA for exploration and production of the Reserve.''

Comment: Commenters recommended that the BLM develop and explain the criteria it will use to determine the scope of effects that are both ''reasonably foreseeable'' and ''significantly adverse'' to provide

transparency and promote regulatory certainty.

BLM Response: We decline that suggestion. These terms have a generally accepted meaning, including as a part of any NEPA analysis, and are also covered in the NEPA regulations in 40 CFR part 1500. Providing additional definitions in the rule would not add more clarity.

Comment: Commenters recommended the rule should articulate that continued oil and gas activities at any scale in the Reserve will cause reasonably foreseeable and significantly adverse effects on surface resources in the Reserve and prohibit new leasing and production throughout the Reserve, as well as require delaying or denying proposed activities that would hinder the protection of surface resources.

BLM Response: The BLM does not accept these recommendations. The requirements of the rule are consistent with the plain language of the NPRPA that requires all oil and gas activities in the Reserve be subject to ''such conditions, restrictions, and prohibitions as the Secretary deems necessary or appropriate to mitigate reasonably foreseeable and significantly adverse effects.'' Further, § 2361.10(a) specifically provides for the BLM to condition, delay, or deny some or all proposed activities as may be necessary to fulfill these requirements.

Comment: The BLM received comments stating that, while the preamble states that the Reserve's standards related to the protection of surface values would also fulfill the BLM's mandate to take action necessary to prevent unnecessary or undue degradation, there is no mention of this obligation in the proposed rule. Commenters requested that the BLM add provisions that expressly reference and incorporate unnecessary or undue degradation standards or include cross references to those standards in §§ 2361.10 and 2361.40.

BLM Response: The BLM declines the request to expressly reference FLPMA's unnecessary or undue degradation provision in the rule. FLPMA requires the BLM to prevent unnecessary or undue degradation on all BLM-managed public land. This mandate applies to a broader range of uses within the Reserve than are being addressed in this rule and the BLM will prevent unnecessary and undue environmental degradation within the Reserve whether or not it is specifically identified in §§ 2361.10 and 2361.40. Nevertheless, the BLM did add FLPMA to the Authorities section of the rule.

Comment: The BLM received comments stating that the NPRPA requires mitigation, but commenters expressed concern that the rule focuses on prevention.

BLM Response: The BLM follows a mitigation hierarchy that generally includes avoidance as the first step in mitigating adverse effects on public land resources and values, consistent with the CEQ regulations implementing NEPA, particularly 40 CFR 1508.1(s). In pursuit of the BLM's mandate under the NPRPA to ''provide for such conditions, restrictions, and prohibitions as the Secretary deems necessary or appropriate to mitigate reasonably foreseeable and significantly adverse effects on the surface resources of the [Reserve]'', the rule draws on all steps of the mitigation hierarchy, including preventing impacts entirely through avoidance where appropriate. For example, § 2361.10(a) requires the Bureau to protect surface resources by adopting appropriate measures to mitigate reasonably foreseeable and significantly adverse effects of proposed oil and gas activities; § 2361.10(b)(2) requires the authorized officer to adopt measures to mitigate reasonably foreseeable and significantly adverse effects on surface resources, particularly with regard to those resources that support subsistence use and needs; and § 2361.40(g) requires the authorized officer to evaluate and require mitigation measures to address adverse effects on significant resource values when considering authorizing oil and gas leasing or new infrastructure in a Special Area.

Comment: The BLM received comments concerning the phrase, ''delaying action on, or denying some or all aspects of proposed activities'' in proposed § 2361.10(a). Some commenters suggested that the BLM lacks the statutory authority to delay or deny activities in the Reserve. Other commenters supported the provision in the proposed rule and recommended the BLM describe circumstances that would warrant denying proposed activities. Commenters recommended this provision should discuss mitigating reasonably foreseeable and significantly adverse effects to the climate. Commenters requested the final rule specifically provide that if differences in caribou behavior, distribution, or harvests are detected, BLM will prohibit additional development.

BLM Response: The NPRPA provides the BLM with the authority to ''provide for such conditions, restrictions, and prohibitions as the Secretary deems necessary or appropriate to mitigation reasonably foreseeable and significantly adverse effects on the surface resources of the [Reserve].'' Additionally, the BLM's oil and gas lease forms for leases issued in the Reserve include terms that enable the BLM to require measures deemed necessary to minimize adverse impacts to the land, air, and water; to cultural, biological, visual, and other resources; and to other land uses or users. Examples of how the BLM might exercise this authority would be to reduce the number of drill pads or density of roads in a development proposal to protect caribou calving, restrict timing on drilling activities to protect subsistence activities, or phase project components to limit the amount of habitat being impacted at a given time.

Analyzing climate impacts of oil and gas development is not part of this rule, which is focused on impacts to surface values of special areas and surface resources broadly. Climate change impacts the surface values that the BLM is required to protect, including subsistence resources, fish and wildlife habitat, and recreation opportunities, and those impacts will be analyzed and addressed through NEPA processes when evaluating potential projects. Similarly, the BLM is not addressing specific resource values such as caribou in the rule; however, caribou habitat will be considered as a significant resource value where appropriate as the BLM implements the rule.

Comment: Commenters stated concerns that proposed § 2361.10(a) will result in violations of valid existing lease rights, and that the BLM should provide clear assurance that the government will not withhold approval for reasonable proposals for infrastructure, such as roads and pipelines, necessary to bring valid existing leases into production.

BLM Response: We do not agree with these assertions. The BLM will implement § 2361.10(a) consistent with valid existing lease rights. As discussed in more detail in section III(E) above, while the rule will not affect the terms of an existing lease or approved development project or permit, future development of an existing lease may be subject to additional terms and conditions if necessary to ensure that the BLM's decision is consistent with its statutory responsibility to mitigate reasonably foreseeable adverse effects of oil and gas activity on the surface resources as required by the NPRPA. For example, the Willow Master Development Plan includes numerous lease stipulations, required operating procedures, and mitigation measures intended to avoid, minimize, or otherwise mitigate the effects of oil and gas production on surface resources.

Comment: The BLM received comments stating that the proposed rule

is not adaptive as it only requires future leases to comply with lease stipulations and ''by exempting all the currently authorized activities, the BLM constrains its ability to adapt its resource management strategy in response to climate change.'' The BLM also received comments stating that ''concerns about breach-of-contract claims against the Federal Government are ill-founded as BLM has reserved the right—in the lease itself—to set the rate of production.'' The commenters state that the BLM can use the authority granted in the lease language to create regulations that deny or prohibit additional oil and gas exploration and development as well as suspend operations and production of current drilling. Comments express that the NPRPA gives BLM authority to restrict or suspend activities in the Reserve and state that the BLM ''can do so 'in the interest of conservation of natural resources' or to 'mitigate reasonably foreseeable and significantly adverse effects on surface resources.' ''

BLM Response: The rule will apply to existing leases to the extent it is compatible with the terms of those leases. The BLM is not exempting all currently authorized activities but is constrained by valid existing rights.

Comment: Commenters recommended that the BLM state that its ability to impose mitigation is only related to activities specifically undertaken pursuant to the NPRPA, and that for mitigation to apply, the NPRPA activity must cause effects 'on the surface resources' of the Reserve.

Commenters requested that the BLM make commitments related to mitigation measures for the ecosystems and species affected by oil and gas development, as well as design and adopt a comprehensive mitigation plan for impacts to threatened or endangered species in the Reserve. The BLM received comments requesting the BLM supplement its 2022 IAP with additional mitigation measures that address the impacts of all permitted activities in the Reserve as well as the cumulative impacts of actions outside of agency control.

BLM Response: As discussed above, the BLM has authority to require mitigation of impacts to public lands resources from authorizations and other Federal actions in the Reserve, consistent with the NPRPA and FLPMA. For example, the NPRPA requires that oil and gas authorizations include provisions to mitigate reasonably foreseeable and significantly adverse effects on surface resources. The rule is clear that the mitigation requirements in § 2361.10(b)(2) apply to adverse effects on surface resources of the Reserve, and the final rule specifies in paragraph (b) that the requirements in the section apply to proposed oil and gas activities. The BLM further notes that although this rule would only apply to oil and gas activities, protection of surface resources from other actions may be addressed through other means, such as the IAP and site-specific authorizations. The BLM is not developing mitigation plans or supplementing the 2022 IAP as part of this rulemaking process.

Comment: Commenters recommended adding evaluation procedures before proposed § 2361.10(b)(1) that would require the BLM to evaluate the condition of surface resources within the Reserve at least every 5 years, including a climate impacts assessment.

Commenters recommended adding a new section requiring a commitment to survey and monitor significant surface resources on an on-going basis and to rigorously study changes in and impacts to those resources.

Commenters recommended that the regulations require the BLM to establish baseline data for resources in the Reserve, including specifically caribou distribution and movement, subsistence food contamination, and air quality data.

BLM Response: The BLM does not currently have the resources to conduct a full evaluation of all surface resources in the Reserve every 5 years. Under § 2361.30, the BLM will evaluate the Reserve for significant resource values every 10 years, which will provide important resource inventory and monitoring information at regular intervals and enable the BLM to study changes to those resources over time, including the impacts from a changing climate. Additionally, under § 2361.10(b)(1), the BLM will maintain an IAP addressing management of all BLM-administered lands and minerals throughout the Reserve. The IAP amendment process will provide opportunities for the BLM to evaluate all surface resources within the Reserve on a regular basis and update baseline data for those resources.

Comment: Commenters stated that the BLM must ensure an appropriate framework for IAP development that is consistent with Federal law and follows NEPA's process for public participation. The BLM received a comment requesting that the language in the proposed rule requiring the BLM to maintain an IAP for the Reserve be removed from the rule as it could prematurely restrict the BLM's ability to make informed decisions with respect to future IAPs.

BLM Response: The BLM has been preparing IAPs since 1998 through a NEPA process and is incorporating this requirement into the rule to ensure ongoing, robust public participation in preparation of these management plans. Merely requiring the BLM to maintain an IAP for the Reserve does not restrict decision-making space for future IAP amendments.

Comment: Commenters discussed integrating the 2022 IAP into the rule; some commenters were concerned that the IAP would not address long-term impacts from resource extraction and asked the BLM to perform a comprehensive review of the plan. Other comments requested the BLM support and align with the IAP as it is a system that already works and is ''highly protective of surface resources in the NPR–A, but it does not preclude oil and gas development.''

BLM Response: The 2022 IAP was based on a previous, multi-year environmental analysis and public engagement process. The BLM is not reviewing the plan at this time. The rule aligns with the 2022 IAP and codifies portions of it related to Special Area designation and management.

Comment: Commenters recommended the rule require measures to mitigate reasonably foreseeable and significantly adverse effects on carbon storage, an ecosystem service that is currently provided by boreal peatlands and permafrost. Commenters recommended the rule require measures to mitigate reasonably foreseeable and significantly adverse effects on caribou and their habitat.

BLM Response: The NPRPA requires that oil and gas authorizations including provisions to mitigate reasonably foreseeable and significantly adverse effects on surface resources. The rule is clear that the mitigation requirements in § 2361.10(b)(2) apply to adverse effects on surface resources of the Reserve, and the final rule specifies in paragraph (b) that the requirements in the section apply to proposed oil and gas activities. In addition, the BLM has authority to mitigate impacts to public lands resources from authorizations and other Federal actions in the Reserve, consistent with the NPRPA and FLPMA. The BLM is not developing mitigation measures for specific resources as part of this rulemaking process.

Comment: Commenters suggested that the requirement in proposed § 2361.10(b)(3) to consider any reasonably foreseeable effects, including indirect effects and cumulative effects, unnecessarily duplicates the BLM' s existing obligations under NEPA. Other commenters recommended that the

BLM clarify in proposed § 2361.10(b)(3) that reasonably foreseeable effects include effects from activities that have not yet been proposed but that are induced by the proposed activity. The BLM received comments stating that the NPRPA does not authorize the BLM to consider incremental effects of proposed activities when authorizing activities in the NPRPA nor does it allow the BLM to condition, restrict, or prohibit activities because of potential effects from activities outside of the Reserve.

BLM Response: The BLM removed § 2361.10(b)(3) from the final rule because it was duplicative of the agency's obligations under NEPA and potentially confusing to restate in the rule. We note that NEPA obligates the BLM to analyze direct, indirect, and cumulative impacts, including to consideration of the impacts of reasonably foreseeable future actions, when making decisions about authorizing activities.

Comment: The BLM received comments regarding proposed § 2361.10(b)(4), specifically the use, meaning, and implication of the phrase ''any uncertainty concerning the nature, scope, and duration of potential effects'' in the proposed rule. Some commenters suggested that the BLM lacks the statutory authority to consider ''any uncertainty'' in potential effects and then implement restrictions on proposed activities that ''account for and reflect such uncertainty'' for any impacts. Other commenters supported the requirement in the proposed rule for the BLM to account for uncertainty regarding potential impacts of proposed development and recommended the final rule include more specificity about what qualifies as uncertainty and how it can be considered in decisions.

BLM Response: We decline these suggestions. Considering uncertainty is a standard practice for any Federal agency that completes NEPA analysis. Agencies are required to use high quality information and science and data when conducting their analysis. To the extent there are uncertainties, current regulations in 40 CFR 1502.21(a) address incomplete or unavailable information in analysis and state that ''When an agency is evaluating reasonably foreseeable significant adverse effects on the human environment in an environmental impact statement, and there is incomplete or unavailable information, the agency shall make clear that such information is lacking.'' The text in the regulation builds on the language in the NEPA regulations to require more specific discussion of how the BLM is taking uncertainties into account in making decisions, which is within the BLM's authority and beneficial in light of the rapidly changing conditions in the Arctic.

Comment: Commenters recommended § 2361.10(b)(4) explicitly state that the BLM must base its decisions on the best available science and will not rely solely on the lack of scientific certainty when declining to impose any conditions, restrictions, or prohibitions.

BLM Response: The BLM declines this request. Including this language would be duplicative of the requirements of the NEPA process and other aspects of the regulation.

Comment: Commenters recommended adding a new § 2361.10(b)(5) that states: In assessing effects of a decision concerning proposed activity in the Reserve, the Bureau will identify and evaluate any significantly adverse effects of its decision, including any effects on environmental, fish and wildlife, and historical or scenic values that are individually or collectively significant and any impacts associated with greenhouse gas emissions.

BLM Response: The BLM declines this request. The first part of the proposed requirement is duplicative with the BLM's NEPA process and the requirement in the NPRPA to mitigate significantly adverse effects. Further, analyzing the climate impacts of oil and gas development is not part of this rule, which is focused on addressing impacts to significant resource values of Special Areas and surface resources in the Reserve. The BLM analyzes climate impacts as part of NEPA analysis when evaluating potential projects, including leasing and development decisions.

Comment: Commenters expressed concern with limiting consultation in paragraph (e)(1) to federally recognized Tribes and ANCSA corporations and requested that BLM consultation be more inclusive than just those two groups. Commenters requested the BLM add a requirement to engage in meaningful communication and consultation with local villages and Tribes to ensure the new regulations meet the needs and concerns of the communities who rely on the Reserve.

BLM Response: The BLM did not consider a broader approach to consultation in the proposed rule, and so the final rule does not adopt such an approach. The BLM works closely with local communities when making management decisions for the Reserve and will continue to engage and communicate with local communities in implementing the rule, independent of formal consultation efforts.

While not considered government-to-government consultation, per 512 DM 6, it is the policy of the Department to recognize and fulfill its legal obligations to consult with ANCSA Corporations on the same basis as Alaska Native Tribes. Native organizations are always invited to participate in the public-involvement periods of NEPA projects and lend their voices to management actions within the Reserve or on any BLM-managed public lands.

Comment: Commenters recommended the BLM define the role of the North Slope Science Initiative (NSSI) with respect to surveys and monitoring, the evaluation of effects, recommendations for modified protections and restrictions, and mitigation measures.

BLM Response: The NSSI is an advisory body that is intended to coordinate inventories, monitoring, and research for a better understanding of terrestrial, aquatic, and marine ecosystems of the North Slope of Alaska, and was established by the Secretary pursuant to section 348 of the Energy Policy Act of 2005, Public Law 109–58, 119 Stat. 594, 708 (2005) (codified at 42 U.S.C. 15906). While the NSSI provides valuable information, the BLM does not believe it is appropriate for these regulations that apply only to BLM-managed public lands in the Reserve to define NSSI's role. The NSSI is a body that coordinates scientific efforts between agencies and provides guidance and recommendations to the Secretary, the BLM, and other agencies within the Department.

Comment: Commenters recommended the BLM include a presumption against all oil and gas activities in § 2361.10 similar to the presumption proposed in § 2361.40(c) to ensure protection against significantly adverse effects.

BLM Response: A presumption against all oil and gas activities in the Reserve would not be consistent with the NPRPA, which requires the BLM to conduct an oil and gas leasing program in the Reserve. The NPRPA imposes special requirements on the BLM to protect significant resource values within Special Areas, which is why the presumption is only included in § 2361.40. We note the final rule provides opportunities for the BLM to avoid and mitigate adverse impacts on surface resources generally. For example, § 2361.10(a) requires the BLM to protect surface resources by adopting whatever conditions, restrictions, and prohibitions it deems necessary or appropriate to mitigate reasonably foreseeable and significantly adverse effects of proposed oil and gas activities, including conditioning, delaying action on, or denying some or all aspects of proposed oil and gas activities.

Comment: Commenters recommended the final rule stipulate that the BLM will not waive lease stipulations or mitigation provided by Required Operating Procedures (ROPs) unless the threats to the resources that supported the ROPs no longer exist.

BLM Response: We decline that suggestion. ROPs are a standard practice across the BLM and describe the protective measures that the BLM will impose on applicants during the permitting process. Similar to lease stipulations, the objective of a ROP must be met in order for exceptions, modifications, or waivers to be granted under the 2022 IAP. At the permitting stage, the BLM authorized officer will not include those ROPs that, because of their location or other inapplicability, are not relevant to a specific permit application. We also note that at the permit stage, the BLM may establish additional requirements as warranted to protect the land, resources, and uses in accordance with the BLM's responsibilities under relevant laws and regulations.

Comment: Commenters recommended the rule require the BLM to consider and adopt as necessary measures to specify the rates of development and production in the public interest. Commenters recommended the rule include a provision that the BLM may specify the rate of production and limit or suspend activity on leases. Commenters also requested that the rule update the pricing of bonds or schemes that standardize financial health requirements for lessees (such as those found in the Surface Mining Control and Reclamation Act) and reflect the true cost of development and the increased risk of abandonment for oil and gas projects in the Reserve.

BLM Response: The BLM declines this request. Regulations for oil and gas leasing and production within the Reserve are covered in 43 CFR part 3130, which the BLM is not revising in this rule. The standard lease terms and conditions also provide for the BLM to provide conditions on production.

Comment: Commenters recommended the BLM recognize and enforce water quality standards identified by Native landowners near Utqiagvik and Nuiqsut to protect watersheds that extend beyond Special Areas.

BLM Response: We decline that suggestion. While the BLM requires compliance with applicable laws, this addition would be outside the scope of this rulemaking.

Comment: Commenters asked for clarification in § 2361.10 about subsistence use under ANILCA section 811, and recreational shooting under the Dingell Act.

BLM Response: We decline that suggestion. The proposed rule addresses oil and gas activities and does not limit subsistence use access or preclude recreational shooting.

Comment: Commenters requested increased protections for vegetation, as regeneration of vegetation is dependent on environmental conditions.

BLM Response: We decline this suggestion. Vegetation is included because it is encompassed by ''the environmental, fish and wildlife, and historical and scenic values of the National Petroleum Reserve in Alaska.''

Comment: Commenters expressed concern about the ability to challenge the BLM's oil and gas related decisions.

BLM Response: The regulation does not change procedural requirements for public participation in the BLM's decision-making processes.

Comment: Commenters asked the BLM to include burying pipelines in lease requirements.

BLM Response: This issue is addressed at the project level, as a mitigation measure or design feature associated with a specific development proposal. The BLM declines to include this requirement in this regulation.

Comment: Commenters expressed support for the BLM's integration of the IAP into the proposed rule, including in sections pertaining to protection of surface resources and designation and management of Special Areas, regarding the obligation that the BLM must consult specifically with ''federally recognized Tribes'' not ''Native organizations.''

BLM Response: We appreciate the support.

Comment: Commenters requested that the BLM analyze future development on a case-by-case basis prioritizing consultation and coordination with those people who are directly impacted.

BLM Response: The BLM analyzes specific development proposals on a case-by-case basis through the NEPA process, and that process is unchanged by this regulation. The BLM will continue to consult with appropriate Federal, State, and local agencies, and with federally recognized Tribes, and Alaska Native Claims Settlement Act corporations as required by laws, regulations, and policies governing government-to-government consultation. The BLM also made minor edits to the language of this section for clarity. The BLM will also continue to engage stakeholders, local communities, and the general public in decision-making processes for development projects.

Description of the Final Rule

In response to comments, the BLM removed paragraph (b)(3) from the final rule because it is duplicative of environmental analysis requirements under NEPA. The BLM also added ''oil and gas'' before the word ''activities'' throughout the section to clarify that the requirements of this rule only apply to oil and gas activities. The final rule clarifies that new use authorizations must conform to any designation or modifications of Special Areas that have occurred outside of the IAP.

The final rule replaces ''Bureau'' with ''authorized officer'' to provide clarity about the BLM official responsible for implementing requirements in the rule. The final rule defines authorized officer as ''any employee of the Bureau of Land Management who has been delegated the authority to perform the duties of this subpart.'' This term refers to an employee that carries out duties that are carefully circumscribed by this rule, other relevant regulations, and Bureau policy, such as the BLM delegation of authority manual. This employee's duties are also subject to the control or direction of other executives including the BLM Director, the Assistant Secretary for Land and Minerals Management, the Deputy Secretary, and the Secretary, all of whom are officers of the United States, appointed by the President and confirmed by the Senate. The remainder of the section is unchanged from the proposed rule.

Section 2361.20—Existing Special Areas

Existing and Proposed Regulations

The existing regulations only identify the Colville River, Teshekpuk Lake, and Utukok River Uplands Special Areas by name (§ 2361.1(c)); they do not account for the Kasegaluk Lagoon and Peard Bay Special Areas. Further, the current regulations do not identify or describe the significant resource values associated with each Special Area. Under the NPRPA, the BLM must assure maximum protection of each of these values consistent with exploration of the Reserve. In pursuit of that obligation, the proposed rule established new § 2361.20 to incorporate all five of the existing Special Areas into part 2360 and identify the significant subsistence, recreational, fish and wildlife, historical, and scenic values that are associated with each of them.

The proposed rule required any lands designated as a Special Area to continue to be managed as such for the already-identified values and any additional values identified through the process set forth in new § 2361.30. The existing

regulations (§ 2361.1(c)) require the boundaries of the Special Areas to be depicted on maps available for public inspection in the BLM's Fairbanks District Office. Proposed § 2361.20 specified that a map of each Special Area would be available at the Arctic District Office, which is now the BLM office that oversees the Reserve. The BLM would also publish and maintain copies of these maps on its website.

Public Comments on § 2361.20

Comment: The BLM received comments expressing support of the existing Special Areas section, stating appreciation for proposing to recognize all five of the existing Special Areas and their significant resource values in regulations. Commenters believe that this establishes management priorities against which development proposals can be evaluated and mitigated.

BLM Response: We agree recognizing all existing Special Areas in the regulation will provide increased transparency and clarity for managing these areas and their significant resource values.

Comment: Commenters recommended changes to management of existing Special Areas, such as by closing them to oil and gas leasing and development and strengthening prohibitions against oil and gas infrastructure or development impacts.

BLM Response: The BLM is not changing the specific management prescriptions for existing Special Areas as part of this rulemaking process, as those decisions were most recently identified in the 2022 IAP. The rule codifies the existing Special Areas and their significant resource values as currently established in Secretarial decisions. The final rule establishes a process in § 2361.30 for designating, amending, and de-designating Special Areas. Changes to management of existing Special Areas will follow that process.

Comment: Commenters recommended changes to the boundaries of existing Special Areas and specified additional values associated with existing Special Areas and recommended the BLM add those values to the final rule.

Comments specific to the Teshekpuk Lake Special Area include:

- Polar bears have begun inhabiting the Teshekpuk Lake area due to the receding sea ice and should be identified as a significant resource value;
- Pik Dunes has unique geologic character, insect-relief habitat for caribou, rare endemic plant populations, use by various water and shorebirds, and scenic and recreational value, and should be closed to fluid mineral leasing, new infrastructure, and other activities including sand and gravel mining;
- The Special Area should be expanded to include the area between the Teshekpuk Lake Special Area western boundary and the village of Atqasuk, which has high density of Yellow-billed loons, Red-throated Loons, King Eider, raptor nests, and caribou calving sites;
- The Qupaluk Flyway Network Site be reviewed to ensure that it is not available for leasing or infrastructure; and
- The Special Area is unnecessarily large, and the BLM should re-analyze the Teshekpuk Lake Special Area boundaries before finalizing the rule.

Comments specific to the Colville River Special Area include:

- The final rule should be updated to reflect the following special resource values are present in the Special Area: caribou summer range, winter range, and migratory connectivity; suitable Wild and Scenic Rivers; Yellow-billed loons; raptors; and moose;
- The Colville River Delta is particularly important for birds and should be closed to all to oil and gas leasing;
- The Arctic peregrine falcon has been delisted, so the Special Area should be decreased or eliminated;
- The Special Area should be considered critical habitat for the Arctic peregrine falcon; and
- Parts of the Special Area, specifically Ocean Point, are important for subsistence, yet heavy traffic and long-term impacts from development threaten caribou migration and subsistence hunting.

Comments specific to the Kasegaluk Lagoon Special Area include:

- The Special Area is important for brants, shorebird migration, Red-throated and Yellow-billed loons, and the significant resource values for the Special Area should include high-use staging and migration area for waterfowl, shorebirds, loons, and other waterbirds.

Comments specific to the Utukok River Uplands Special Area include:

- The final rule should be updated to reflect that suitable Wild and Scenic Rivers are special resource values in the Special Area;
- The final rule should designate an area north and west of the Kokolik River near the west boundary of the Reserve as part of the Utukok River Uplands Special Area to help avoid river crossings of the Kokolik River to access potential development areas and better protect the Kokolik River; and
- The final rule should move the northern border of the area unavailable for leasing and new infrastructure to cover all of the Utukok River Upland Special Area as this area was not included in the area made unavailable for leasing and infrastructure in the 2013 IAP. Commenters state that the reasons for excluding it no longer exist and failing to make this area unavailable for leasing infrastructure may lead to Western Arctic Caribou Herd calving habitat loss under possible future developments.

BLM Response: The BLM did not amend the rule in response to specific comments regarding the significant resource values or boundaries of existing Special Areas. The rule merely codifies the existing Special Areas and their significant resource values as currently identified by Secretarial decisions designating or amending the Special Areas. The final rule establishes a process in § 2361.30 for designating, amending, and de-designating Special Areas. Changes to existing Special Areas, including identifying additional values and changing management, will follow that process, recognizing that the BLM may not remove lands from the Teshekpuk Lake and Utukok River Uplands Special Areas unless directed to do so by statute. The protections for a surface value in a Special Area are not limited to those protections in the IAP or other Secretarial decisions relating to the establishment of Special Areas. For example, polar bears are protected by the Marine Mammal Protection Act, 16 U.S.C. 1531 *et seq.,* and the Endangered Species Act, 16 U.S.C. 1531–1544. Indeed, as shown in the 2013 IAP map 3.3.8–6, a significant portion of polar bear denning critical habitat in the Reserve and a number of identified dens are located within the Teshekpuk Lake Special Area, which provides an additional layer of protection for that species.

Description of the Final Rule

The BLM did not change this section of the proposed rule in the final rule. The following existing Special Areas are codified in the final rule:

- Colville River Special Area, which has important habitat for raptor and other bird species, including the Arctic peregrine falcon; important habitat for moose; important habitat for fish; important subsistence activities; important recreational activities; world-class paleontological deposits; and significant cultural resources;
- Kasegaluk Lagoon Special Area, which has important habitat for marine mammals; unique ecosystem for the Arctic Coast; opportunities for primitive

recreational experiences; important habitat for migratory birds; and important subsistence activities;

- Peard Bay Special Area, which has haul-out areas and nearshore waters for marine mammals; and high-use staging and migration areas for shorebirds and waterbirds;
- Teshekpuk Lake Special Area, which has important habitat for a large number of migratory and other waterbirds; important caribou habitat; important shorebird habitat; subsistence hunting and fishing activities; Pik Dunes; and overwintering habitat for fish; and
- Utukok River Uplands Special Area, which has important habitat for the Western Arctic Caribou Herd; subsistence hunting activities; grizzly bear habitat; and important wilderness values.

Additional details on the significant resource values of each Special Area are found in the preamble to the proposed rule.

Section 2361.30—Special Areas Designation and Amendment Process

Existing and Proposed Regulations

The existing regulations provide general direction for recommending and considering additional Special Areas in § 2361.1(d). In the past, the BLM has typically designated Special Areas, and received Special Area recommendations from the public and stakeholders, through the IAP revision and amendment process. Enumerating procedures for designating and amending Special Areas in the regulations will provide clarity for stakeholders and ensure that the BLM fulfills its statutory obligation to assure maximum protection of Special Areas' significant resource values.

The proposed rule added a new section to provide standards and procedures for designating and amending Special Areas. Paragraph (a) required the BLM, at least once every 5 years, to evaluate lands in the Reserve for significant resource values and designate new Special Areas or update existing Special Areas by expanding their boundaries, recognizing the presence of additional significant resource values, or requiring additional measures to assure maximum protection of significant resource values. Paragraph (a)(2) allowed, but did not require, the BLM to conduct this evaluation through the IAP amendment process. Paragraph (a)(3) required the BLM to rely on the best available scientific information, including Indigenous Knowledge, and the best available information concerning subsistence uses and resources.

Paragraph (a)(4) required the BLM to provide meaningful opportunities for public participation in the evaluation process, including review and comment periods and, as appropriate, public meetings. Existing § 2361.1(d) concerns the submission, content, and public review of recommendations for additional Special Areas. Proposed paragraph (a)(4) retained the basic contours of that provision but provided additional specificity. The proposed language allowed the public to participate in the evaluation process, including by recommending new Special Areas, new significant resource values for existing Special Areas, and measures to assure maximum protection of Special Areas' significant resource values. The proposed rule required the BLM to evaluate and respond to such recommendations. Similar to existing § 2361.1, proposed paragraph (a)(4) specified that Special Area recommendations should describe the size and location of the lands, significant resource values, and measures necessary to assure maximum protection of those values.

Proposed paragraph (a)(5) allowed the authorized officer to implement interim measures to assure maximum protection of significant resource values in lands under consideration for designation as a Special Area. This provision was designed to assist the BLM in fulfilling its statutory duty to protect Special Areas.

Paragraph (a)(6) required that the BLM base decisions to designate Special Areas solely on whether significant resource values are present and prohibited the BLM from considering the existence of measures to protect or otherwise administer those values. For example, if lands not within a Special Area contained important caribou calving habitat and those lands were already subject to certain protections under the IAP, the BLM would not be permitted to consider those protections during the decision-making process for the proposed designation or update. The proposed rule explained that this change is needed to align the regulations with the NPRPA, which authorizes the Secretary to designate Special Areas based on the presence of ''any significant subsistence, recreational, fish and wildlife, or historical or scenic value . . . .'' 42 U.S.C. 6504(a).

Proposed paragraph (a)(7) required the BLM, when designating a Special Area or recognizing the presence of additional significant resource values in an existing Special Area, to adopt measures to assure maximum protection of significant resource values. That provision mirrors the BLM's statutory responsibility under the NPRPA. 42 U.S.C. 6504(a). Paragraph (a)(7) was designed to provide needed clarification by specifying that those measures would supersede any inconsistent provisions in the IAP.

Proposed paragraph (a)(8) incorporated the requirement of existing § 2361.1(c) that the BLM publish in the **Federal Register** a legal description of any new Special Area. The proposed rule also required the BLM to publish in the **Federal Register** a summary of the significant resource values supporting the Special Area designation. Rather than requiring publication in local newspapers as the current regulations require, the proposed rule required the BLM to maintain maps of the Special Areas on its website. Those proposals were designed to provide more effective public notice.

Proposed § 2361.30(b) established a framework for removing lands from Special Area designations. Because Congress identified the Utukok River Uplands and Teshekpuk Lake Special Areas in the NPRPA and required them to be managed to protect surface resources, the BLM cannot remove lands from those Special Area designations absent statutory authorization. See Public Law 94–258, sec. 104(b), 90 Stat. 304 (1976). For other Special Areas, the proposed rule permitted the BLM to remove lands from a Special Area designation only when the significant resource values that supported the designation are no longer present (*e.g.,* if important wildlife habitat that supported the designation was no longer present). That provision is consistent with the BLM's statutory duty to ''assure the maximum protection of such surface values consistent with the requirements of [the NPRPA] for the exploration of the reserve.'' *Id.*

Before removing lands from a Special Area designation, proposed paragraph (b) required the BLM to provide the public with the opportunity to review and comment on its proposed decision and consult with federally recognized Tribes and Alaska Native Claims Settlement Act corporations. Finally, the proposed rule required the BLM to document its consideration of those comments. Those requirements would assure public participation in the de-designation process.

Public Comments on § 2361.30

Comment: Commenters requested the BLM explain how new and additional procedural requirements would integrate with the environmental

analysis that the BLM already conducts under NEPA for proposed Federal actions. Commenters recommended the BLM ensure the new procedures are not duplicative of NEPA obligations. Commenters expressed their concern that if they are separate and distinct from each other, it could increase the number of procedural steps, time, and risk for proposed activities in the Reserve.

Commenters recommended that the BLM continue to use the IAP for management of the Reserve including adding, revising, or removing Special Areas. Commenters suggested that requiring a separate 5-year cycle for Special Area review and evaluation may establish a different management framework applicable only to Special Areas which would be separate from the review and management of the entire Reserve through IAP/EIS processes.

Commenters expressed concern that mechanisms provided in the proposed rule that could be used to manage lands as Special Areas could preclude a rigorous public process pursuant to NEPA.

Commenters expressed concern that there is an over-reliance on public participation in the contraction and expansion processes outlined in the proposed rule, and suggested this may allow the Reserve to be managed by outside interest groups instead of prioritizing Native communities and local stakeholders.

BLM Response: The new procedures outlined in § 2361.30 are intended to ensure that the BLM regularly reviews the surface values and environmental conditions in the Reserve specifically for the purpose of managing Special Areas with significant subsistence, recreational, fish and wildlife, historical, and scenic values to assure their maximum protection, as directed by the NPRPA. These procedures will support other NEPA processes by ensuring the BLM has up-to-date baseline conditions for surface values within the Reserve and will specifically support oil- and gas-related NEPA analyses by ensuring necessary measures are in place to protect important resources. It is anticipated that the BLM will often incorporate these procedures into IAP revisions and amendments; however, rapidly changing conditions in the Arctic require that the BLM has the ability to conduct this review and decision-making process outside of an IAP process when necessary.

The final rule has been updated from the proposed rule to ensure that robust public participation is a mandated component of all processes to designate, amend, and de-designate Special Areas. The BLM is required to include and consider input from all members of the public in making decisions governing the public lands. The BLM will continue to work closely with Native communities and local stakeholders when making decisions regarding management of the Reserve.

Comment: Commenters expressed concern that the BLM may not have included a regulatory consultation obligation for expanding Special Areas or increasing protective measures in Special Areas.

BLM Response: We agree with this comment that clarification on consultation would be helpful. We have reorganized § 2361.30 in the final rule, with a new paragraph (a) that outlines requirements applicable to all processes that would designate, de-designate, or otherwise change boundaries or management of Special Areas. In all processes, including those resulting in de-designation or removal of lands from a Special Area, the BLM is required to provide the public and interested stakeholders with meaningful opportunities to participate in the evaluation process, and consult with any federally recognized Tribes and Alaska Native Claims Settlement Act corporations that use the affected Special Area for subsistence purposes or have historic, cultural, or economic ties to the Special Area.

Comment: Commenters expressed the opinion that the requirements in § 2361.30(a)(1) are duplicative of FLPMA section 201 and should be eliminated from the final rule.

BLM Response: FLPMA section 201 requires that the BLM maintain on a continuing basis an inventory of all public lands and their resource and other values, and to keep the inventory current so as to reflect changes in conditions and to identify new and emerging resource and other values. Consistent with FLPMA and the NPRPA, proposed § 2361.30(a)(1) specifies that the BLM must maintain a current inventory of the significant subsistence, recreation, fish and wildlife, historical, and scenic values within the Reserve. This requirement is not duplicative of FLPMA but rather expounds on it by detailing the very specific public lands values that the NPRPA requires the BLM to evaluate and manage for protection in the Reserve.

Comment: Commenters recommended that the process for designating and removing Special Areas should be identical, balanced, reasonable, and should include consultation and environmental analysis to support decision-making. Commenters recommended that Indigenous Knowledge be included in all Special Area designation decisions to fully capture the expertise about resources, such as permafrost, and to appropriately assess impacts to those resources.

BLM Response: The BLM revised the final rule to create a new paragraph (a) that outlines requirements applicable to all processes that would designate, de-designate, or otherwise change boundaries or management of Special Areas. These requirements include relying on the best available scientific information, including Indigenous Knowledge, as well as the best available information concerning subsistence uses and resources within the Reserve. This new paragraph will provide more consistency to all decision-making processes for Special Areas.

Comment: The BLM received multiple comments discussing the timing of the Special Areas review, including:

- Commenters believe that the timing of the Special Area review should be more frequent than the 5 years proposed to account for rapidly changing conditions;
- Commenters expressed support for the 5-year review interval;
- Commenters believe that the 5-year review is restrictive and unfounded in law;
- Commenters suggested including an additional mid-way report to help ensure agency accountability;
- Commenters requested the BLM remove the 5-year review requirement and allow for changes to be made when best available information demonstrates that such changes are necessary;
- Commenters recommended a 10-year interval for Special Area evaluation and suggested that the BLM conduct evaluations in the context of preparing a holistic IAP. Comments suggest that this would bring stability to managing the Reserve and help reduce the needed frequency for stakeholder engagement during large-scale planning efforts;
- Commenters expressed concern that the BLM lacks the staff and resources to engage in 5-year reviews;
- Commenters expressed concern that 5-year interval reviews would place a heavy burden on local communities and preclude or limit local input on the public process; and
- Commenters recommended that at every 5-year period, the BLM should consider removing and decreasing Special Areas, not only creating or expanding Special Areas.

BLM Response: The final rule changes the review period to 10 years, while specifying the BLM may conduct the review sooner if the authorized officer

determines that changing conditions warrant. This requirement is limited to identifying additional or expanding existing Special Areas, additional special values, and additional protective measures in order to address the risks associated with changing circumstances on the ground, which may require additional protections. The BLM believes this change addresses concerns about agency and community capacity while ensuring regular reviews occur to maintain an inventory of resource conditions and make management changes as appropriate.

The NPRPA requires the BLM to manage areas designated by the Secretary to have significant resource values in a manner that assures the maximum protection of those values consistent with exploration and production of the Reserve. Once those values have been identified and designated, they must continue to be managed for protection consistent with the Act. The BLM will only remove Special Area designations when the significant resource values are no longer present. Therefore, the rule does not require the BLM to regularly evaluate eliminating or reducing Special Area designations. The BLM will evaluate the presence or absence of significant resource values in existing Special Areas when updating the IAP, and through that process the public can provide information to BLM regarding the absence of significant resource values to inform de-designation decisions.

Comment: Commenters requested that the proposed rule clarify that the BLM is required not only to identify and adopt new maximum protection measures during the 5-year review, but also evaluate existing measures and strengthen them as needed.

BLM Response: The final rule specifies that as part of the review, the BLM will determine whether to require additional measures or strengthen existing measures to assure maximum protection of significant resource values within existing Special Areas.

Comment: Commenters recommend that during the review process, the BLM should conduct an assessment to determine if Significant Resource Values continue to exist and whether maximum protection is necessary.

BLM Response: The BLM declines this request. The public can submit information regarding the status of significant resource values during the review process, and that information would be taken into account in a future planning process and as applicable in decision-making as part of the NEPA process, *i.e.,* if it is significant new information. The reason for the required regular review is to address risks associated with needing additional protections in light of changing circumstances on the ground.

Comment: Commenters recommended the final rule state that the BLM will designate Special Areas in a manner that maintains the ecological integrity necessary to sustain such values.

BLM Response: The BLM believes this is unnecessary because the final rule requires the BLM to rely on the best available scientific information when making management decisions for Special Areas and maintaining ecological integrity is consistent with adoption and implementation of maximum protective measures.

Comment: Commenters recommended the BLM enable adoption of permanent maximum protection measures in the rule.

BLM Response: Including permanent maximum protection measures is not within the regulatory framework of the rule, which establishes administrative processes by which the BLM will adopt and may change maximum protection measures for significant resource values in Special Areas. The overarching requirement to adopt measures for maximum protection of significant resource values in Special Values continues to apply.

Comment: Commenters requested more explanation of the standards that would be used to determine a resource is significant.

BLM Response: The BLM declines this suggestion. The definitions in the rule and the Special Areas identified in the NPRPA and IAP provide sufficient clarity for the use of this term in the rule. Ultimately, determinations about the significance of subsistence, recreational, fish and wildlife, historical, and scenic values will be at the discretion of the BLM. As stated in the definition of Significant Resource Value in the final rule, it is a surface value ''that the Bureau identifies as significant and supports the designation of a Special Area.'' This evaluation will necessarily be determined in the context of site-specific resources, with input from Tribes, scientific experts, other government agencies, and the public. Therefore, a more specific definition could be overly prescriptive and would not necessarily add more clarity.

Comment: Commenters asked why Indigenous Knowledge is only included in § 2361.30 and not throughout the rest of the proposed rule.

BLM Response: Best available scientific information, including Indigenous Knowledge, is discussed in the context of evaluating resources for designation, de-designation, and management of Special Areas. The BLM expects Indigenous Knowledge would also be part of consultations, which are required throughout all aspects of the rule.

Comment: The BLM received comments expressing the opinion that the NPRPA's maximum protection clause expressly applies only to Special Areas designated by the Secretary of the Interior and should not apply to areas under consideration, therefore proposed § 2361.30(a)(5) regarding interim measures exceeds the BLM's statutory authority. Other commenters expressed the opinion that § 2361.30(a)(5) conflicts with FLPMA section 201. Commenters also generally recommended that § 2361.30(a)(5) be eliminated because areas shouldn't be managed as Special Areas until they are designated as such.

Commenters requested more clarity around the process for implementing interim measures in lands under consideration for designation as a Special Area.

BLM Response: The NPRPA provides the BLM with the direction and authority to provide for such conditions, restrictions, and prohibitions as deemed necessary or appropriate to mitigate reasonably foreseeable and significantly adverse effects on the surface resources of the Reserve. These conditions, restrictions, and prohibitions may include interim measures to protect surface resources within Special Areas under consideration for designation.

The option for the authorized officer to apply interim measures is not inconsistent with the requirement of 42 U.S.C. 6504 to ensure maximum protection of significant resource values to the extent consistent with the requirements of the NPRPA. Rather, this discretion supports the BLM's ability to fulfill this obligation as part of a formal designation of a new Special Area while ensuring any interim management is consistent with both the requirements of the NPRPA and the specific provisions of the current IAP.

The BLM revised the final rule to provide more clarity and certainty around the interim measures provision. The final rule clarifies that interim measures may be implemented at any time after the BLM receives an internal or external recommendation to designate or modify a Special Area. The final rule also clarifies that any interim measures must be consistent with the governing management prescriptions in the IAP, and the BLM is required to provide public notice that interim measures are in place and reassess such measures to determine if they are still

needed if they remain in place for more than 5 years.

Comment: Commenters expressed the opinion that the requirement in § 2361.30(a)(6) to designate Special Areas solely on the basis of the presence of significant resource values is an improper interpretation of 42 U.S.C. 6504. Commenters also recommended the BLM should consider effectiveness of mitigation measures and other management when determining whether to designate Special Areas and suggested that if the values can be managed with existing measures, then a Special Area may not be required.

Other commenters supported the recognition that Special Area designations and expansions be based solely on the presence of significant resource values without regard to the administration of measures to protect the values.

BLM Response: The NPRPA provides for the Secretary to designate Special Areas that contain significant subsistence, recreational, fish and wildlife, or historical or scenic values, and requires the Secretary to assure the maximum protection of those values when authorizing oil and gas activities, to the extent consistent with the requirements of the Act. The NPRPA does not place contingencies on either of those directives, such as considering other management decisions in place that may affect the risk to the resources or the likely effectiveness of mitigation measures to address the impacts of oil and gas activities. Furthermore, management decisions may change over time, and so relying on current overlapping management is not adequate to ensure appropriate protection for significant resource values. Therefore, the BLM believes the most appropriate way to fulfill the congressional directives set forth in the NPRPA is to designate Special Areas where the identified significant resource values exist regardless of other management that may be in place, and to implement maximum protection measures that specifically target those resource values.

Comment: Commenters recommended that the rule should require that Special Areas and areas under consideration for Special Area designation be closed to oil and gas leasing.

BLM Response: Management decisions for Special Areas, including oil and gas allocations, are made through the IAP process and/or the separate Special Area designation process described in the rule. These regulations implement the NPRPA, which requires the BLM to provide maximum protection for significant surface values in Special Areas in the context of conducting an oil and gas leasing and production program in the Reserve. The rule incorporates this directive through a presumption that leasing and production in Special Areas will not be consistent with this standard, while also ensuring consistency with the requirements of the NPRPA and valid existing rights.

Comment: Commenters expressed the opinion that the BLM is not prohibited from removing lands from Teshekpuk Lake and Utukok River Uplands because the NPRPA does not specify a geographic boundary for these areas nor does it make these current designations permanent.

BLM Response: Section 104(b) of the NPRPA (42 U.S.C. 6504) identifies the Utukok River and Teshekpuk Lake areas as special areas containing significant subsistence, recreational, fish and wildlife, or historical or scenic values that are subject to the ''maximum protection'' standard. Congress specifically identified these two Special Areas by naming them in the NPRPA. The BLM does not believe it has the authority to de-designate some or all of the Special Area designations for Teshekpuk Lake and Utukok River Uplands that were explicitly included in the NPRPA, because Congress has expressly directed that the BLM apply the maximum protection standard in those areas.

Comment: Commenters recommended that the BLM not allow for land to be removed from Special Areas where wildlife habitat values are no longer present because the land is no longer inhabitable by the species or because species populations are declining. Commenters suggested that the BLM should not allow for further development and degradation of the land in those circumstances.

BLM Response: This issue is best addressed in the Special Area amendment process, because it is dependent on site-specific circumstances. The regulations are designed to implement the NPRPA, which directs the BLM to designate and manage Special Areas to provide maximum protection for significant resource values. While the rule provides that an authorized officer may only remove areas from Special Area designation if the significant resource values are no longer present, any such decision would be conducted through site-specific processes, with opportunity for public input and consultation regarding the appropriate decisions on types of habitats and desired future conditions.

Comment: Commenters requested more clarity regarding the process by which a resource value will be determined to be sufficiently absent to warrant de-designation of a Special Area.

Commenters recommended that the rule should require the BLM to use the best scientific data available when determining whether the significant resource values that support the designation are no longer present.

BLM Response: The BLM revised the final rule to create a new paragraph (a) that outlines requirements applicable to all processes that will designate, de-designate, or otherwise change boundaries or management of Special Areas. In all processes, including those resulting in de-designation or removal of lands from a Special Area, the BLM is required to rely on the best available scientific information, including Indigenous Knowledge, as well as the best available information concerning subsistence uses and resources within the Reserve. The BLM must also provide the public and interested stakeholders with notice of, and meaningful opportunities to participate in, the evaluation process, and consult with any federally recognized Tribes and Alaska Native Claims Settlement Act corporations that use the affected Special Area for subsistence purposes or have historic, cultural, or economic ties to the Special Area. These requirements will ensure opportunities for public and Tribal input and participation in any evaluation of whether all of the significant resource values that support a Special Area designation are no longer present.

Comment: Commenters suggested establishing an overlay of Indigenous Ancestral Homeland Preservation Special Areas within the NPR–A to protect significant subsistence values.

BLM Response: The BLM would appreciate this information being provided as part of decisions on managing surface values in the Reserve. Specifying this overlay is beyond the current scope of the regulation.

Comment: Commenters expressed concerns that the proposed rule does not quantify the economic impacts of the process of designating new Special Areas nor the economic impacts of limitations on exploration and development within Special Areas and recommended that an economic impact analysis should accompany each decision.

BLM Response: The NPRPA requires the maximum protection of significant resources values in Special Areas subject to the requirements of the Act. Economic impacts are part of NEPA

analysis and will be disclosed as part of any such analysis.

Comment: Commenters requested clarity that Special Area designation will not interfere with the ANILCA section 1111(a) temporary access provisions.

BLM Response: Section 1111(a) of ANILCA requires the Secretary to authorize and permit temporary access by the State or a private landowner to or across certain lands in Alaska that have been designated to specific uses, including the Reserve, but only if such access will not result in permanent harm to the resources of such unit, area, Reserve or lands. This rule is consistent with that provision of ANILCA and would not alter the BLM's implementation.

Description of the Final Rule

Section 2361.30 is reorganized in the final rule, with a new paragraph (a) that outlines requirements applicable to all processes that will designate, de-designate, or otherwise change boundaries or management of Special Areas. In all processes, including those resulting in de-designation or removal of lands from a Special Area, the BLM is required to rely on the best available scientific information, including Indigenous Knowledge, as well as the best available information concerning subsistence uses and resources within the Reserve. The BLM must provide the public and interested stakeholders with meaningful opportunities to participate in the evaluation process and consult with any federally recognized Tribes and Alaska Native Claims Settlement Act corporations that use the affected Special Area for subsistence purposes or have historic, cultural, or economic ties to the Special Area. The BLM must also base decisions solely on the presence or absence of significant resource values and not the existence of measures that have been or may be adopted to protect or otherwise administer those values.

Section 2361.30(b) requires the BLM to evaluate all public lands within the Reserve for the presence of significant subsistence, recreational, fish and wildlife, historical, or scenic values every 10 years, or sooner if the authorized officer determines that changing conditions warrant. As part of this evaluation, the BLM will consider designating new Special Areas, expanding existing Special Areas, recognizing the presence of additional significant resource values in existing Special Areas, and requiring additional measures or strengthening existing measures to assure maximum protection of significant resource values within existing Special Areas. The evaluation may occur through an IAP amendment process but can occur separately.

The BLM is required to consider and respond to recommendations from the public and interested stakeholders in the evaluation process regarding lands that should be considered for designation as a Special Area, significant resource values that should be recognized in Special Areas, and measures that should be required to assure maximum protection of significant resource values within Special Areas. The rule lists information that should be submitted by the public to ensure the BLM can adequately review recommendations, including the size and location of the recommended lands, significant resource values that are present within or supported by the recommended lands, and measures that may be necessary to assure maximum protection of those values.

Section 2361.30(b)(4) provides that the BLM may implement interim measures to protect significant resource values while the agency is considering Special Area designations and changes to management. The BLM could implement interim measures at any point after receiving a recommendation for a new or modified Special Area. These measures must be consistent with the governing management prescriptions in the IAP. The BLM must provide public notice that interim measures are in place and such measures will be reassessed to determine if they are still needed if they remain in place for more than 5 years.

When the BLM decides to designate lands as a Special Area or recognizes the presence of additional significant resource values in a Special Area, the BLM must adopt measures to assure maximum protection of the significant resource values. These measures are not constrained by the provisions of the current IAP. Once adopted, these measures supersede inconsistent provisions of the IAP then in effect for the Reserve and will be incorporated into the IAP during the next revision or amendment. When the BLM designates lands as a Special Area, the agency must publish a legal description of those lands in the **Federal Register**, along with a concise summary of the significant resource values that support the designation. The BLM will maintain up-to-date maps of all designated Special Areas on its website and make maps available for public inspection at the Arctic District Office.

Section 2361.30(c) provides procedures for removing lands from or de-designating a Special Area. Lands may only be removed from Special Area designation when all of the significant resource values that support the designation are no longer present. In making such a determination, the BLM must prepare a summary of its proposed determination, including the underlying factual findings, and provide a public comment opportunity on the proposed determination. The BLM must also comply with all of the requirements in § 2361.30(a). The BLM's final determination must document how the views and information provided by the public, federally recognized Tribes, Alaska Native Claims Settlement Act corporations, federally qualified subsistence users, and other interested stakeholders have been considered. The BLM may not remove lands from the Teshekpuk Lake and Utukok River Uplands Special Areas unless directed to do so by statute.

Section 2361.40—Management of Oil and Gas Activities in Special Areas

Existing and Proposed Regulations

The current regulations paraphrase the maximum protection requirement of the NPRPA and provide examples of measures that the BLM could potentially take to assure maximum protection. See § 2361.1(c). Proposed new § 2361.40 enhanced the specificity of the current regulations on the mechanisms for assuring maximum protection of significant resource values in Special Areas by establishing new standards and procedures for achieving maximum protection of Special Areas' significant resource values, with a specific focus on addressing the impacts of oil and gas activities. Of note, this section affirmatively established that assuring maximum protection of significant resource values is the management priority for Special Areas. Under proposed paragraph (a), the BLM needed to comply with this standard and adopt maximum protection measures for each significant resource value associated with a Special Area. Proposed paragraph (b) required the BLM take such steps to avoid the adverse effects of proposed oil and gas activities on the significant resource values of Special Areas, including by conditioning, delaying action on, or denying proposals for activities.

Proposed paragraph (c) required oil and gas leasing and new infrastructure to conform to the land use allocations and restrictions identified on maps 2 and 4 of the 2022 IAP ROD, unless the BLM makes revisions in accordance with § 2361.30 of these regulations. Map 2 shows the areas of the Reserve that are open and closed to oil and gas leasing. The map reflects that approximately 11.8 million acres are

open to leasing subject to the terms and conditions detailed in the IAP, while approximately 11 million acres are closed, including most of the Teshekpuk Lake and Utukok River Uplands Special Areas. The map also shows areas that are open to leasing but subject to no surface occupancy, and areas that are outside the BLM's subsurface authority.

Map 4 shows the areas of the Reserve that are available and unavailable for new infrastructure. The map shows that new infrastructure is prohibited on approximately 8.3 million acres of the Reserve, limited to ''essential'' infrastructure on approximately 3.3 million acres, and permitted on approximately 10.8 million acres.

The proposed purpose of requiring leasing and infrastructure in Special Areas to conform to IAP maps 2 and 4 was to codify the existing protections and restrictions from the 2022 IAP ROD. The BLM developed that land use plan through a lengthy public planning process involving all stakeholders, which stretches back to the development of the 2013 IAP ROD. The 2022 IAP ROD, which is based in large part on the framework set forth in the 2013 IAP ROD, incorporates aspects of the 2020 IAP ROD, and reflects now-settled expectations about the use of the Reserve. It also reflects what the BLM views as the floor of protections for the Reserve that grew out of the public planning process. By incorporating the two maps into the rule, the BLM intended to incorporate the land use allocations, restrictions, and stipulations from the 2022 IAP ROD into the rule without reprinting lengthy text.

Proposed paragraph (c) also established a presumption against leasing and new infrastructure on lands in Special Areas that are allocated as available for those activities. That presumption could have been overcome if specific information is available to the BLM that clearly demonstrates that those activities can be conducted with no or minimal adverse effects on the significant resource values of the Special Area. The intensive process that led to the IAP resulted in a comprehensive plan for protection of the Special Areas in the Reserve. To fulfill the BLM's statutory duty to assure maximum protection for those areas' significant resource values, the BLM believed that plan should be treated as a regulatory floor, and additional activities should only be allowed when maximum protection is assured.

The proposed definition of ''infrastructure'' in § 2361.5(g) excluded ''exploratory wells that are drilled in a single season; infrastructure in support of science and public safety; and construction, renovation, or replacement of facilities on existing gravel pads at previously disturbed sites where the facilities will promote safety and environmental protection.'' These exceptions were specifically analyzed and adopted in the 2022 IAP ROD. Proposed § 2361.40(d) established three additional exceptions to the oil and gas leasing and new infrastructure prohibitions in paragraph (c). The first exception permitted leasing and infrastructure solely to address drainage of Federal oil and gas resources. Drainage occurs ''when a well that is drilled or is in production adjacent to Federal or Indian leases or unleased lands is potentially draining Federal or Indian oil and gas resources.'' BLM MS–3160, Drainage Protection Manual 1–1 (2015), *available at https://www.blm.gov/sites/blm.gov/files/uploads/mediacenter_blmpolicymanual3160.pdf.* The proposed rule prohibited surface disturbing activities on any lease tract issued for this purpose. The exception for drainage of Federal oil and gas resources was included because the regulations expressly provide for leasing of tracts that are subject to drainage in order to prevent loss of United States oil and gas resources and potential royalties. See 43 CFR 3130.3. No-surface-occupancy leases are an option the BLM may elect to use when the surface management agency has determined that surface oil and gas facilities and operations would pose an unacceptable risk to the surface resources. The second exception permitted the construction of new infrastructure, including roads, transmission lines, and pipelines, that would primarily benefit communities in and around the Reserve or would support subsistence activities. The BLM proposed to include that exception because communities in and around the Reserve must have some infrastructure to survive and thrive. The third exception allowed the BLM to approve new infrastructure if essential to support exploration or development of a valid existing lease and no practicable alternatives exist that would have less adverse impact on significant resource values of the Special Area. That exception was necessary to accommodate the rights of current leaseholders.

Proposed paragraph (e) required the BLM to document and consider any uncertainty regarding potential adverse effects on Special Areas and ensure that its actions account for such uncertainty. That provision was drafted to help the BLM fulfill its statutory mandate to assure maximum protection for Special Areas' significant resource values.

Proposed paragraph (f) required the BLM to prepare a Statement of Adverse Effect whenever it cannot avoid adverse effects on a Special Area. In each statement, the BLM was required to describe the significant resource values that may be affected; the nature, scope, and duration of the effects; measures the BLM evaluated to avoid those effects; a justification for not requiring those measures; and measures it would require to minimize and mitigate the adverse effects on significant resource values. Measures the BLM could require under this provision include compensatory mitigation. Such measures would be developed, evaluated, and, as necessary, adopted in project-specific analyses. Proposed paragraphs (g) and (h) required the BLM to provide the public with an opportunity to review and comment on any Statement of Adverse Effect and consult with federally recognized Tribes and Alaska Native Claims Settlement Act corporations that have ties to the area.

Finally, proposed paragraph (i) required the BLM to include in each oil- and gas-related decision or authorization ''terms and conditions that provide the Bureau with sufficient authority to fully implement the requirements of this section.'' That provision ensured that the BLM incorporates into decision documents the necessary language to implement any final rule.

Public Comments on § 2361.40

Comment: The BLM received comments generally supporting § 2361.40, particularly for reasons of reducing climate change and protecting areas that are important for wildlife habitat and subsistence use.

BLM Response: We agree the rule will help the BLM address these important issues.

Comment: Commenters stated that maximum protection in the proposed rule is being used as a management standard and a baseline to disqualify any resource development activity from proceeding contrary to congressional intent and the NPRPA.

BLM Response: The NPRPA specifically requires that oil and gas activities within Special Areas be ''conducted in a manner which will assure the maximum protection of such surface values to the extent consistent with the requirements of this Act.'' The regulation is implementing this direction from Congress to balance resource development with resource protection, by requiring the application

of maximum protection measures to significant resource values in Special Areas when conducting oil and gas activities. The regulations will not prohibit oil and gas activities but rather ensure they proceed according to the intent of the NPRPA.

Comment: Commenters requested the rule clarify the process for identifying and adopting maximum protection measures for each significant resource value that is present in a Special Area. Commenters also recommended that the BLM be required to evaluate existing measures in addition to identifying new ones, and that this process rely on best available scientific information including Indigenous Knowledge.

Commenters requested the BLM discuss significant resource values and include clear definitions of the measures necessary to ensure maximum protection for each. Comments contained suggestions that the denial or reduction of proposed drilling sites, prohibition of roads, restrictions on sand and gravel extraction and water withdrawals, suspension of activities, and specified rates of development and production should be specifically listed as potential maximum protection measures.

BLM Response: The final rule clarifies that the BLM will identify and adopt maximum protection measures for each significant resource value that is present in a Special Area when Special Areas are designated. The BLM will also update maximum protection measures as appropriate thereafter, including in the IAP, lease terms, and permits to conduct oil and gas activities. The final rule also includes maximum protection measures that are identified in the existing regulation but had been eliminated in the proposed rule, as well as some additional categories of measures that may be included, such as limiting infrastructure and use of roads and restricting use of sand, gravel, and water. The BLM is not analyzing existing measures or adopting new ones for significant resource values in this rulemaking process. The rule provides informative categories of measures that could be applied, subject to existing management prescriptions for each Special Area and the terms of existing leases, and sets forth the process by which measures will be adopted moving forward.

Comment: Commenters expressed concern that the presumption against leasing and new infrastructure on lands within Special Areas that are allocated as open for those activities would affect valid existing rights and could constitute a breach of contract or regulatory taking. Commenters recommended that the rule be revised to expressly state that it does not apply to any existing leases or future activities carried out pursuant to the terms of those leases.

Commenters suggested that the presumption against new leasing and new infrastructure on lands within Special Areas that are allocated as open to those activities is contrary to the NPRPA and ANILCA section 1326.

BLM Response: The provisions of this section are consistent with the BLM's obligations to manage Special Areas to provide maximum protection for significant resource values, subject to the other directives in the NPRPA regarding conducting exploration, leasing, and development. The rule includes specific protections for valid existing rights. At the same time, we note that, while the terms of an existing lease and approved development project or permit would not be affected by the rule, a valid lease does not entitle the leaseholder the unfettered right to drill wherever it chooses or categorically preclude the BLM from considering alternative development scenarios within leased areas, nor does it give the leaseholder the right to produce all economically recoverable oil and gas on the lease. Future development of an existing lease is, by its terms, subject to additional terms and conditions. For example, the standard lease for activities in the Reserve states, ''An oil and gas lease does not in itself authorize any on-the-ground activity'' and notes that more restrictive stipulations may be added. Similarly, a standard lease stipulation entitled ''Conservation of Surface Values for NPR–A Planning Area Land'' provides: ''Operational procedures designed to protect resource values will be developed during Surface Use Plan preparation, and additional protective measures may be required beyond the general and special stipulations identified in the above-referenced documents.''

Comment: Commenters recommended § 2361.40(c) be revised to eliminate the phrase ''or minimal'' so that the presumption would only be overcome if it can be demonstrated that there will be no adverse effects on significant resource values.

BLM Response: The BLM included the term ''minimal'' to address situations where it is not possible to eliminate all adverse effects, and in recognition of the NPRPA's direction to apply the maximum protection standard consistent with exploration and production of the Reserve. However, the remainder of the process set out in this updated section will ensure thorough consideration, opportunity for review and comments, and documentation of how adverse effects have been avoided.

Comment: Commenters recommended the BLM provide a path for an applicant to overcome the presumption against new leasing and new infrastructure on lands within Special Areas that are allocated as open for those activities, such as requiring the applicant to explain why it cannot avoid locating new infrastructure in the Special Area and to provide maximum protection for resource values and subsistence users.

BLM Response: The final rule provides clarity around how the presumption against new leasing and new infrastructure on lands within Special Areas that are allocated as open for those activities would be overcome through the environmental review process. The rule provides that as part of the environmental analysis, the BLM may document justification for overcoming the presumption in § 2361.40(f), such as if the proposed infrastructure is necessary to comport with the terms of a valid existing lease, or if it will primarily be used by and provide a benefit to communities located within or in close proximity to the Reserve, and the proposal has been conditioned to avoid, minimize, or otherwise mitigate adverse effects.

Comment: Commenters recommended that § 2361.40(d)(1) be revised to clarify that seismic exploration is considered a ''surface-disturbing oil and gas activit[y]'' and that restrictions on new infrastructure would not be waived under this provision.

BLM Response: This rule maintains the current approach in the IAP that does not include geophysical exploration as surface occupancy to maintain consistency and because any changes to that approach should be made through the IAP process with associated NEPA analysis. This rule does not address waiver of limitations on infrastructure. However, as discussed above, waivers, exceptions, and modifications are subject to the conditions set out in the IAP.

Comment: Commenters recommended that the community infrastructure exception be clarified that it only applies if it has community benefit and is owned, operated, or managed by the appropriate community or Native entity, the North Slope Borough, of the State of Alaska.

BLM Response: The definition of the term ''infrastructure'' in the final rule has been revised to state that ''infrastructure'' does not include infrastructure that will primarily be used by and provide a benefit to communities located within or in close proximity to the Reserve.

Comment: Commenters urged the BLM to provide greater limits on ''essential infrastructure'' such as allowing permanent infrastructure if it can occur with no adverse impacts on significant resource values, rather than if no practicable alternatives exist that would have less adverse impact.

The BLM received comments stating that limiting infrastructure to that which is essential and for which no practicable alternatives exist would establish an implied presumption that no infrastructure can be installed in Special Areas, which violates the NPRPA and the terms of existing leases.

BLM Response: The BLM is not revising the approach to addressing infrastructure, which is consistent with the provisions of the IAP and the directive in the NPRPA to provide for maximum protection of significant resource values in Special Areas subject to the other purposes of the Act.

Comment: Commenters recommended that the final rule adopt a requirement based on precautionary principles in instances of significant uncertainty, which may mean requiring additional information from applicants or lessees or delaying action until relevant effects are better known.

BLM Response: The BLM believes the language in the rule is adequate for the agency to address uncertainty. The final rule requires the BLM to document and consider uncertainty concerning potential adverse effects on significant resource values of Special Areas and ensure that uncertainty is accounted for when taking actions to avoid, minimize, or mitigate adverse effects. The BLM has the authority under the regulations to delay action on activities where necessary to avoid adverse effects on significant resource values.

Comment: The BLM received comments about the requirement to mitigate residual effects that cannot be avoided or minimized, including:

- Commenters recommended the rule include provisions that authorize the BLM to review and modify mitigation measures as needed after oil and gas operations have commenced.
- Commenters suggested that the BLM lacks statutory authority to require compensatory mitigation, and none is provided in the NPRPA, FLPMA, or ANILCA.
- Commenters expressed concern that despite BLM mitigation and environmental review efforts, impacts to Nuiqsut from oil and gas activities have gotten worse. Commenters state that the current mitigation process requires stakeholders to advocate for mitigation measures, which places an unfair burden on the stakeholder, including Native villages. Commenters recommend the BLM include a regular process for identifying new mitigation measures and updating existing mitigation measures similar to the process for evaluating Special Areas in the proposed rule. Commenters also recommended that the rule include a requirement for establishing baseline data and monitoring of impacts.

BLM Response: The BLM has authority to require appropriate mitigation under a variety of authorities, including the NPRPA and FLPMA. Mitigation measures can continue to be regularly identified and updated through IAP and/or Special Area amendment processes and are also identified at the leasing and permitting stages of development. Similarly, baseline data and monitoring plans are established in NEPA analyses conducted to support amendments or revisions to the IAP and approval of other activities in the Reserve.

Comment: The BLM received comments regarding reclamation and bonding for oil and gas activities, including: the rule should include assessment methods to gauge the financial stability of oil and gas companies and bankruptcy risk before companies are allowed to purchase leases; the rule should require up-front payments to cover costs of damages due to climate change, loss of habitat, spills or accidents, and reclaiming development sites; and the rule should require all development activities to have comprehensive plans for reclamation and remediation.

Commenters requested that the proposed rule revise leasing program operations regarding water withdrawal to address the concern that lake water withdrawals for ice roads are leading to low stream water levels.

BLM Response: The BLM's oil and gas leasing program for the Reserve is governed by regulations at 43 CFR part 3130, which are not being revised in this rule, and additional aspects of operations are addressed in the current IAP. Impacts from water withdrawals for ice roads would be addressed as part of the analysis to permit construction of ice roads.

Comment: Commenters recommended that traditional transportation corridors be considered in the rule and requested clarity on how the proposed rule might affect local community winter access to trail rights-of-way.

BLM Response: The rule would not affect traditional transportation corridors or local community access. The BLM has clarified the definition of infrastructure to limit it to oil and gas activities and to include an exception for community access and projects. In addition, the rule requires consideration of impacts on community access in the development of management measures to protect surface resources.

Comment: Commenters proposed adding a legal mandate that allows the BLM to refrain from authorizing new leases in the Reserve if the U.S. is projected to meet its energy needs as the NPRPA's mandate to meet the energy needs of the nation is being fulfilled by other sources.

BLM Response: This comment is not within the regulatory framework of the rule, which is focused on protecting surface resources in the Reserve as the BLM carries out its oil and gas program. This regulation is not revising 43 CFR part 3130, which are the regulations governing the oil and gas program for the Reserve.

Comment: The BLM received comments regarding the proposal to include two of the 2022 IAP maps in the rule and require that oil and gas leasing and authorization of new infrastructure in Special Areas will conform to those maps. Comments and responses follow.

- Commenters expressed concern that the maps do not provide sufficient information to the public to identify and protect significant resource values, and maps can be misinterpreted. The BLM updated the maps for the final rule by adding the boundaries of the existing Special Areas to the maps from the 2022 IAP that show the current allocations for oil and gas leasing and infrastructure. We believe this addresses concerns that the maps contained in the IAP do not provide sufficient information to identify significant resource values. The maps included with this final rule depict the exact data from the IAP ROD, and do not change any designations or allocations from the 2022 IAP. The BLM believes including maps with the final rule will assist with public understanding of and agency implementation of the regulations, and we do not believe that benefit is outweighed by potential misinterpretation of maps.
- Commenters requested clarity on whether reliance on the maps means the ability to waive, except, and modify the stipulations otherwise applicable under the IAP would still apply. Inclusion of the maps in the final rule does not change the criteria for waivers, exceptions, and modifications adopted in the IAP.
- Commenters noted that maps 2 and 4 do not include the boundaries of the Special Areas themselves and therefore do not provide sufficient information. Commenters recommended that the BLM produce a map that shows the

Special Areas along with the land allocations and restrictions. We agree with this comment. The BLM updated the maps for the final rule by adding the boundaries of the existing Special Areas to the maps from the 2022 IAP that show the current allocations for oil and gas leasing and infrastructure. The maps depict the exact data from the IAP ROD, and do not change any designations or allocations from the 2022 IAP.

• Commenters requested clarity on whether the land use allocations and restrictions in the IAP maps are being considered as maximum protection measures. The allocations and restrictions in the 2022 IAP maps may be considered maximum protection measures, but they do not necessarily represent the full extent of maximum protection measures that may ultimately be required as a result of this rule. The final rule, in § 2361.30(b)(5), requires the BLM to adopt measures to assure maximum protection of significant resource values when designating lands as Special Areas or recognizing the presence of additional significant resource values in existing Special Areas. Once adopted, these measures become part of and supersede inconsistent provisions of the IAP then in effect for the Reserve. The final rule, in § 2361.40(b), also directs the BLM to update maximum protection measures as appropriate thereafter, including in the IAP, lease terms, and other approvals to conduct oil and gas activities.

• Commenters requested clarification on why K–4 areas, such as lagoons, inlets, and associated islands, that are otherwise unavailable for new infrastructure, allow essential pipeline crossings. The IAP decision to allow for essential pipeline crossings in these areas was to ensure that the prohibition on new infrastructure did not completely block development on neighboring Outer Continental Shelf or State Lands. The BLM is not reevaluating IAP decisions as part of this rulemaking process.

• Commenters stated that the Colville River Special Area is much larger than the land use allocations and restricted areas depicted on the maps, and it is not apparent from the proposed rule what maximum protections measures are needed in addition to those depicted on maps 2 and 4 to adequately protect the entire Special Area. Commenters are correct that there are additional protection measures for the Colville River Special Area which are in the Colville River Special Area management plan, which is a separate document from the IAP. The BLM is not adopting or changing management of Special Areas through this rulemaking process. Additional maximum protection measures that may be needed for the Colville River Special Area would be considered and adopted through a Special Area planning process, and/or through a project-level NEPA process for proposed development in the Colville River Special Area.

• Commenters requested that the BLM update the maps to show the level of activities and infrastructure currently in place in the NPR–A. Commenters also suggested that the maps be updated to explain why essential pipeline corridors, which were suggested in the 2020 IAP, are not available. Commenters further recommended the maps be updated to state that the BLM welcomes public participation to designate or expand Special Areas. The BLM declined to change the maps by showing existing levels of activities and infrastructure, discuss essential pipeline corridors, or state that public participation is welcome in Special Area designation decisions because those data are not germane to decisions made in the rule. The BLM's intention with providing maps is to display and help the public understand decisions codified in the rule, which include existing Special Area designations and leasing and infrastructure allocations adopted in the 2022 IAP. The rule does not make decisions regarding existing infrastructure, essential pipeline corridors, or future Special Area designation decisions.

Description of the Final Rule

Section 2361.40 affirms that the management priority within Special Areas is to assure maximum protection of significant resource values, consistent with the requirements of the NPRPA for exploration and production of the Reserve. The section sets forth procedures for fulfilling this duty at each stage in the decision-making process for oil and gas activities in the Reserve.

Section 2361.40(a) requires that the BLM must, to the extent consistent with the NPRPA, take such steps as are necessary to avoid the adverse effects of proposed oil and gas activities on significant resource values in Special Areas. Such steps may include conditioning, delaying action on, or denying proposals for activities.

Section 2361.40(b) directs the BLM to identify and adopt maximum protection measures for each significant resource value that is present in a Special Area when Special Areas are designated, and to update maximum protection measures as appropriate thereafter, including in the IAP, lease terms, and permits to conduct oil and gas activities. Section 2361.40(c) specifies examples of maximum protection measures, including rescheduling activities and use of alternative routes; limiting new infrastructure and roads; limiting extraction of sand and gravel or withdrawal of water; limiting types of vehicles and loadings; limiting types of aircraft in combination with minimum flight altitudes and distances from identified places; and applying special fuel handling procedures.

Section 2361.40(c) provides that oil and gas leasing and authorization of new infrastructure in Special Areas must conform to the land use allocations and restrictions identified on the map published with the final rule, until and unless those allocations are revised by a Special Area designation, amendment, or de-designation process as set forth in § 2361.30. The map shows Special Area designations and oil and gas leasing and new infrastructure allocations adopted in the 2022 IAP. The BLM produced one consolidated map for the final rule that includes multiple data included in the 2022 IAP maps but did not change any of the designations or allocations depicted on the 2022 IAP maps.

The map reflects that approximately 11.8 million acres of the Reserve are open to leasing subject to the terms and conditions detailed in the IAP, while approximately 11 million acres are closed, including most of the Teshekpuk Lake and Utukok River Uplands Special Areas. The map shows that new infrastructure is prohibited on approximately 8.3 million acres of the Reserve, limited to ''essential'' infrastructure on approximately 3.3 million acres, and permitted on approximately 10.8 million acres.

The restrictions identified on the map that would apply to new oil and gas leases and infrastructure are detailed in the 2022 IAP ROD and summarized in the following table.

Stipulation	Objective
K–1—River Setbacks	Minimize the disruption of natural flow patterns and changes to water quality; the loss of spawning, rearing, and over-wintering habitat for fish; and impacts to subsistence cabins and campsites, among other purposes.
K–2—Deep Water Lakes	Minimize the disruption of natural flow patterns and changes to water quality; the loss of spawning, rearing or over-wintering habitat for fish; and the disruption of subsistence activities, among other purposes.
K–4—Kogru River, Dease Inlet, Admiralty Bay, Elson Lagoon, Peard Bay, Wainwright Inlet/Kuk River, and Kasegaluk Lagoon, and their associated islands.	Protect fish and wildlife habitat; preserve air and water quality; and minimize impacts to subsistence activities and historic travel routes on the major coastal waterbodies.
K–5—Coastal Setback Areas	Protect coastal waters and their value as fish and wildlife habitat; minimize hindrance or alteration of caribou movement within caribou coastal insect-relief areas; and prevent impacts to subsistence resources and activities, among other purposes.
K–6—Goose Molting Area	Minimize disturbance to molting geese and loss of goose molting habitat in and around lakes in the Goose Molting Area.
K–8—Brant Survey Area	Minimize the loss or alteration of habitat for, or disturbance of, nesting and brood rearing brant in the Brant Survey Area.
K–9—Teshekpuk Lake Caribou Habitat Area	Minimize disturbance and hindrance of caribou, or alteration of caribou movements through portions of the Teshekpuk Lake Caribou Habitat Area that are essential for all-season use, including calving and rearing, insect-relief, and migration.
K–10—Teshekpuk Lake Caribou Movement Corridor.	Minimize disturbance and hindrance of caribou, or alteration of caribou movements (that are essential for all-season use, including calving and rearing, insect-relief, and migration) in the area extending from the eastern shore of Teshekpuk Lake eastward to the Kogru River.
K–11—Southern Caribou Calving Area	Minimize disturbance and hindrance of caribou, or alteration of caribou movements (that are essential for all-season use, including calving and post calving, and insect-relief) in the area south/southeast of Teshekpuk Lake.
K–12—Colville River Special Area	Prevent or minimize loss of raptor foraging habitat.
K–13—Pik Dunes	Retain unique qualities of the Pik Dunes, including geologic and scenic uniqueness, insect-relief habitat for caribou, and habitat for several uncommon plant species.
K–14—Utukok River Uplands Special Area	Minimize disturbance and hindrance of caribou, or alteration of caribou movements through the Utukok River Uplands Special Area that are essential for all-season use, including calving and rearing, insect-relief, and migration.

Section 2361.40(e) provides for limited circumstances in which certain uses may be authorized on lands within Special Areas that are allocated as closed to leasing or unavailable to new infrastructure. The BLM may issue oil and gas leases in areas closed to leasing if drainage is occurring. The BLM may authorize new roads, pipelines, transmission lines, and other types of infrastructure in unavailable areas if the infrastructure will primarily be used by and provide a benefit to local communities or will support subsistence activities. In those cases, the BLM must adopt measures to assure maximum protection of significant resource values. These measures, which are required by the NPRPA, would be specific to oil and gas activities and would be designed to limit potential impacts on subsistence use. Consistent with this approach, the BLM revised § 2361.50 to make clear that the BLM will ensure reasonable access to and within Special Areas for subsistence uses. The BLM may authorize new permanent infrastructure related to existing oil and gas leases in unavailable areas only if such infrastructure is necessary to comport with the terms of a valid existing lease.

Section 2361.40(f) directs that on lands within Special Areas that are allocated as available for future oil and gas leasing or new infrastructure, the BLM will presume that proposed oil and gas activities should not be permitted unless it can be clearly demonstrated that those activities can be conducted with no or minimal adverse effects on significant resource values, or unless they are necessary to comport with the terms of a valid existing lease. This provision only applies to designated Special Areas within the Reserve, and implements the obligation placed on the BLM by the NPRPA to assure the maximum protection of surface values to the extent consistent with the requirements of the Act. The presumption is based on the BLM's experience managing oil and gas exploration and development in the Reserve that all permitted oil and gas activities within a Special Area will result in significant adverse impacts to surface resources. Therefore, absent the need to honor the terms of a valid existing lease or a demonstration by the leaseholder that activities can be conducted with no or minimal adverse effect, the maximum protection mandate in the NPRPA requires the BLM to adopt this approach.

Section 2361.40(g) sets forth procedures that must be followed when the BLM prepares an environmental analysis of proposed oil and gas leasing, development, or new infrastructure within Special Areas in the Reserve. The BLM must provide meaningful opportunities for public participation, including responding to comments, and consult with federally recognized Tribes and Alaska Native Claims Settlement Act corporations that use the affected Special Area for subsistence purposes or have historic, cultural, or economic ties to the Special Area. The BLM must evaluate potential adverse effects on significant resource values and consider measures to avoid, minimize, or otherwise mitigate adverse effects to achieve maximum protection of significant resource values. The BLM must also document and consider uncertainty about potential adverse effects on significant resource values. Actions taken to avoid, minimize, or mitigate adverse effects must account for any uncertainty. These procedures are foundational to all NEPA processes the agency undertakes, with increased attention given to assuring maximum protection and long-term resilience of significant resource values, consistent with the NPRPA.

If the proposed project is on lands in a Special Area that are allocated as closed to leasing or unavailable to new infrastructure, then the BLM must document how the proposal falls within one of the exceptions provided for in § 2361.40(e). If the proposed project is

on lands in a Special Area that are allocated as available for future oil and gas leasing or new infrastructure, and the BLM proposes to authorize the project, then the BLM must document the justification for overcoming the presumption in § 2361.40(f). Section 2361.40(g)(4) provides examples of how the presumption might be overcome, such as if the proposed infrastructure is necessary to comport with the terms of a valid existing lease, or if it will primarily be used by and provide a benefit to communities located within or in close proximity to the Reserve, and the proposal has been conditioned to avoid, minimize, or otherwise mitigate adverse effects.

If the BLM determines through the environmental analysis that the proposal cannot avoid adverse effects on significant resource values in a Special Area, then the BLM must prepare a Statement of Adverse Effect. The Statement of Adverse Effect must describe the significant resource values that may be adversely affected; the nature, scope, and duration of those adverse effects; measures the BLM evaluated to avoid the adverse effects, including whether any practicable alternatives exist that would have less adverse impact on significant resource values of the Special Area; justification for not requiring those measures; measures the BLM will require to minimize adverse effects on significant resource values of the Special Area; and measures the BLM will require to mitigate any residual adverse effects that cannot be avoided or minimized. The Statement of Adverse Effect would be incorporated into the environmental analysis and provided to the public for review and comment.

Section 2361.40(h) requires that each decision and authorization related to oil and gas activity in the Reserve includes terms and conditions that provide the authorized officer with sufficient authority to fully implement the requirements of this section.

Section 2361.50—Management of Subsistence Uses Within Special Areas

Existing and Proposed Regulations

The BLM proposed this new section to require Special Areas to be managed to protect and support fish and wildlife and their habitats and the associated subsistence use of those areas by rural residents as defined in 50 CFR 100.4, the Department of the Interior's subsistence management regulations for public lands in Alaska. The proposed rule also required the BLM to provide appropriate access to and within Special Areas for subsistence purposes, and explicitly referenced assuring maximum protection of the significant resource values of the Special Areas in the context of providing that access.

Public Comments on § 2361.50

Comment: Commenters expressed concerns about the impacts of oil and gas production in the Reserve on subsistence values and requested the BLM include more information on the collaboration between regulatory agencies, Alaska Native stakeholders, and industry.

BLM Response: The BLM believes the final rule provides meaningful and necessary protections for subsistence values from the impacts of oil and gas production, consistent with the Department of the Interior's subsistence management regulations for public lands in Alaska. For example, the final rule specifies that all Special Area designation and amendment decisions will rely on Indigenous Knowledge and the best available information concerning subsistence uses and resources within the Reserve. It also details procedures for the BLM to avoid the adverse effects of proposed oil and gas activities on the significant resource values of Special Areas, which include subsistence values. The final rule requires the BLM to ensure that Special Areas are managed to protect and support fish and wildlife and fish and wildlife habitat and associated subsistence use, and to provide appropriate access to and within Special Areas for subsistence purposes.

Comment: Commenters recommended the rule protect and enhance access for subsistence activities for local communities and ensure these activities do not harm the fragile ecosystem.

BLM Response: The BLM believes the regulations adequately address this comment. The final rule requires the BLM to ensure that Special Areas are managed to protect and support subsistence use of fish and wildlife and their habitats. It further requires that the BLM will provide appropriate access to and within Special Areas for subsistence purposes.

Comment: Comments noted that ANILCA section 811 requires the BLM to provide reasonable access to and within Special Areas for subsistence use of subsistence resources and recommended the final rule reference these provisions. Other commenters recommended that the BLM eliminate paragraph (b) because it is duplicative of ANILCA section 811.

Commenters requested the BLM clarify the differences between ''appropriate access'' as used in the proposed rule versus ''reasonable access'' under ANILCA section 811 and ensure the rule is not inconsistent with ANILCA. Commenters recommended that the BLM clarify the type of access anticipated by this provision. Commenters requested the rule be revised to clarify that the BLM's authority will never be used to restrict access for local subsistence users.

BLM Response: The final rule retains a separate section requiring management of Special Areas to both protect resources for subsistence and protect access for subsistence activities, in order to address these concerns. The BLM has revised the language in this section to refer to ''reasonable access'' instead of ''appropriate access'' for consistency with the language in section 811 of ANILCA.

Comment: Commenters recommended the BLM add language in the final rule that expressly recognizes section 810 of ANILCA mandates and ensures that the final rule reinforces BLM's duties to reduce or eliminate the use of lands that are needed for subsistence.

BLM Response: The BLM added reference to ANILCA in the Authorities section in the final rule, as discussed in more detail in the Statutory Authority section of this preamble.

Comment: Commenters recommended this section include a statement recognizing the ''traditional and ancestral cultural heritage of the Arctic Indigenous people in and around the NPR–A that continue to rely on critical subsistence resources within the NPR–A for their traditional, cultural, and spiritual way of life.''

BLM Response: The BLM believes this comment is reflected in the preamble of the proposed rule, which discussed in detail: the manner in which subsistence harvesting serves as the cornerstone of the traditional relationship of the Iñupiat people with their environment, such that residents of communities in and around the NPR–A rely on subsistence harvests of plant and animal resources for nutrition and their cultural, economic, and social well-being; how activities associated with subsistence provide a link between contemporary Alaska Natives and their ancestors; how traditional Iñupiaq values, with an emphasis on sharing, are embedded within all facets of Iñupiaq society, including subsistence hunting and harvesting traditions; and how the ability to pass on these values through the continuation of traditional subsistence activities in traditional places is essential to maintaining cultural traditions, traditional knowledge, and identity.

Including the recommended language within the regulatory text is

unnecessary as it does not direct specific action the agency must take. However, we appreciate the intent of the comment, and we believe the regulation will benefit subsistence use in the Reserve.

Comment: Commenters requested that the BLM assess Special Areas' significant resource values in a manner that assesses use for the intended purpose, as subsistence harvest may require more stringent impact assessment valuation than public use. For example, more stringent metrics may need to be used to consider consumption advisories and harmful levels of contaminants for subsistence users.

BLM Response: We appreciate that subsistence harvest may require a different management standard than other uses and protection needs of significant resource values. However, this issue is best addressed in the IAP or other process as provided for in § 2361.30 to address management of Special Areas, so that the BLM can consider and adopt site-specific management decisions to adequately protect subsistence use.

Description of the Final Rule

The final rule adopts the proposed rule but deletes from paragraph (b) the phrase ''to the extent consistent with assuring maximum protection of all significant resource values that are found in such areas.'' This phrase was causing confusion and was unnecessary because § 2361.30 requires the BLM to adopt measures to assure maximum protection of significant resource values when designating Special Areas.

Section 2361.60—Co-Stewardship Opportunities in Management of Special Areas and Subsistence

Existing and Proposed Regulations

The BLM proposed this new section to encourage the BLM to explore co-stewardship opportunities for Special Areas, including co-management, collaborative and cooperative management, and tribally led stewardship. The title of this section in the proposed rule was ''Co-stewardship opportunities in Special Areas.'' This provision was designed to further the Department of the Interior's trust relationship and obligation to protect Tribal interests and further the Nation-to-Nation relationship with Tribes. It also was designed to advance the Federal Government's commitment to strengthening the role of Tribal governments in Federal land management. (Presidential Memorandum on Tribal Consultation and Strengthening Nation-to-Nation Relationships, January 26, 2021; Joint Secretarial Order on Fulfilling the Trust Responsibility to Indian Tribes in the Stewardship of Federal Lands and Waters, Order No. 3403, November 15, 2021.)

Public Comments on § 2361.60

Comment: Commenters generally expressed support for the BLM to maintain and strengthen co-stewardship principles in the final rule.

BLM Response: The BLM appreciates commenters' support for the inclusion of co-stewardship in the rule.

Comment: Commenters requested the rule define co-stewardship more clearly.

BLM Response: The term co-stewardship includes a broad range of cooperative efforts and is also defined in BLM guidance. The BLM has incorporated the definition that is used in BLM Permanent Instruction Memorandum No. 2022–011 (Co-Stewardship with Federally Recognized Indian and Alaska Native Tribes Pursuant to Secretary's Order 3403).

Comment: Commenters recommended that the rule make clear that it is the Tribe or other partnering entity that determines the appropriate mechanism, such as co-management or co-stewardship.

BLM Response: The rule leaves it to the parties to determine the best co-stewardship approach based on their collaborative efforts. There may be limitations on the types of agreements that are available depending on applicable law for specific situations.

Comment: Commenters recommended strengthening this section of the rule to mandate co-stewardship and provide details on management models that may be adopted, rather than consider it as a potential management approach. Commenters recommended that meaningful requirements should include specificity and timelines for actions by the BLM.

Commenters supported use of the term ''tribally led stewardship.'' Commenters recommended strengthening the provision to fully support tribally led stewardship in alignment with the Joint Secretarial Order on Fulfilling the Trust Responsibility to Indian Tribes in the Stewardship of Federal Lands and Waters Order 3403.

BLM Response: The BLM is committed to fulfilling our trust relationship and the directives in the Joint Secretarial Order.[9] We expanded the section to specify that co-stewardship may be used for management of both Special Areas and subsistence resources.

Comment: Commenters requested that the BLM create a Governing Commission with a role for Tribes in decision-making over subsistence harvests and other land use management decisions throughout the NPR–A, that gives Tribal delegates true decision-making authority. Commenters provided detailed recommendations for such a Commission.

Commenters requested that the BLM create Indigenous-led stewardship groups that could perform activities such as monitoring harvests and ensuring permit compliance, collecting data on climate change indicators, invasive species control, collecting Traditional Indigenous Knowledge, and monitoring cultural sites.

Commenters recommended that the BLM establish a ''Western Arctic Indigenous Knowledge (IK) Expert Advisory Group'' to aid with co-management and co-stewardship.

BLM Response: This recommendation is outside the scope of the rule as written. These are very interesting concepts for reaffirming the importance of the Reserve to subsistence and the role of Indigenous Knowledge in management and would not require changes to the rule if implemented. The BLM is interested in further discussions about these ideas as we implement the rule.

Comment: Commenters requested the rule distinguish Tribal interests from those of ANCSA corporations. Commenters also recommended that the rule should not authorize co-stewardship with any non-native or non-local organizations.

BLM Response: Co-stewardship is only available to Tribes. Separately, the Bureau may partner with ANCSA corporations, local governments, or organizations as provided by law, which

[9] The Joint Secretarial Order on Fulfilling the Trust Responsibility to Indian Tribes in the Stewardship of Federal Lands and Waters Order 3403 directs the Interior and Agriculture Departments, and their component Bureaus and Offices, to manage Federal lands and waters in a manner that seeks to protect the treaty, religious, subsistence, and cultural interests of federally recognized Indian Tribes; that such management is consistent with the nation-to-nation relationship between the United States and federally recognized Indian Tribes; and, that such management fulfills the United States' unique trust obligation to federally recognized Indian Tribes and their citizens. The Order enumerates actions the Departments must undertake, such as collaborating with federally recognized Tribes in the co-stewardship of Federal lands and waters, and principles of implementation. The Order is available online at *https://www.doi.gov/sites/doi.gov/files/elips/documents/so-3403-joint-secretarial-order-on-fulfilling-the-trust-responsibility-to-indian-tribes-in-the-stewardship-of-federal-lands-and-waters.pdf.*

would not be co-stewardship arrangements but a different type of partnership. The text of the rule has been revised to make this distinction clearer.

Comment: Commenters requested that BLM consultation be more inclusive than just federally recognized Tribes and ANCSA corporations. Commenters proposed a multi-tiered approach to consultation that provides for additional self-governing bodies or cooperatives to be included in the first tier of consultation alongside the narrower categories of federally recognized Tribes and ANCSA corporations. Second and third tiers of consulting parties would include environmental organizations with close ties to the North Slope and inviting the public to informally comment at any time a consultation occurs.

BLM Response: The BLM did not propose a broader approach to consultation in the proposed rule. Rather, it relied on existing law, regulations, and guidance regarding consultation with Tribes and Alaska Native Corporations. Changing those obligations is beyond the scope of this rulemaking, and, because it was not proposed, the final rule cannot adopt such an approach. The BLM works closely with local communities when making management decisions for the Reserve and will continue to engage and communicate with local communities in implementing the rule, independent of formal Tribal consultation efforts.

Description of the Final Rule

In the final rule, the title is revised to read ''Co-stewardship opportunities in management of Special Areas and subsistence.'' The first sentence is also revised to add ''and subsistence resources throughout the NPR–A.'' Those revisions reflect that the BLM will seek co-stewardship opportunities not just in managing Special Areas, but also in managing subsistence resources more broadly. The first sentence is also revised to add ''federally recognized'' to clarify that the BLM engages in co-stewardship with federally recognized Tribes. This section of the final rule fulfills the special trust relationship that the Department of the Interior has with Tribes.

Section 2361.70—Use Authorizations

Existing and Proposed Regulations

Existing § 2361.2 is redesignated to § 2361.70 in the final rule. Existing paragraph (a) states that all use authorizations require approval from the authorized officer ''[e]xcept for petroleum exploration which has been authorized by the Act.'' The proposed rule omitted that exception. The NPRPA of 1976 authorized the Federal Government to conduct exploration activities; those activities did not require approval by an authorized officer. Since the 1980 amendments initiated a competitive oil and gas leasing program, all oil and gas activities are conducted by oil and gas companies and require authorization from a BLM authorized officer.

No substantive changes were proposed to § 2361.70(b).

The proposed rule modified § 2361.70(c) for clarity purposes and updated § 2361.70(d) to recognize the BLM's duties to protect surfaces resources and assure maximum protection of Special Areas' significant resource values in the NPR–A.

Public Comments on § 2361.70

Commenters recommended that the final rule specifically include trapping as a use that does not require a use authorization. Non-commercial trapping would not require a use authorization under the rule. The examples of activities exempted in § 2361.70(b) are not comprehensive, as indicated by ''*e.g.*'' preceding the lists. The BLM declined to change the final rule, as trapping for recreation and/or subsistence use is already excepted from requiring a use authorization by this section of the rule.

Description of the Final Rule

In paragraph (b), the phrase ''pursuant to §§ 2361.1 and 2361.2 or otherwise'' is deleted as unnecessary. Otherwise, the final rule adopts the proposed rule without changes.

Section 2361.80—Unauthorized Use and Occupancy

Existing and Proposed Regulations

Existing § 2361.3 is redesignated to § 2361.80 in the final rule. No substantive changes were proposed to this section.

Public Comments on § 2361.80

No substantive comments were received specific to this section.

Description of the Final Rule

The final rule adopts the section as proposed, which provides that any person who violates or fails to comply with regulations of this subpart is subject to prosecution, including trespass and liability for damages, pursuant to the appropriate laws.

V. Procedural Matters

Regulatory Planning and Review (Executive Orders (E.O.) 12866, 13563 and 14094)

E.O. 12866, as amended by E.O. 14094, provides that the Office of Information and Regulatory Affairs (OIRA) within the Office of Management and Budget (OMB) will review all significant regulatory actions. OIRA has determined that this rule is significant.

E.O. 13563 reaffirms the principles of E.O. 12866 while calling for improvements in the Nation's regulatory system to promote predictability, to reduce uncertainty, and to use the best, most innovative, and least burdensome tools for achieving regulatory ends. The Executive order directs agencies to consider regulatory approaches that reduce burdens and maintain flexibility and freedom of choice for the public where these approaches are relevant, feasible, and consistent with regulatory objectives. E.O. 13563 emphasizes further that regulations must be based on the best available science and that the rulemaking process must allow for public participation and an open exchange of ideas. We have developed this rule in a manner consistent with these requirements.

The rule revises the framework for designating and assuring maximum protection of Special Areas and associated values and will protect and enhance access for subsistence activities throughout the NPR–A. It also incorporates aspects of the 2022 IAP. The rule will have no effect on currently authorized oil and gas operations in the NPR–A.

BLM's economic analysis concludes that most of the provisions of the final rule are editorial, administrative, or otherwise could have no quantifiable economic cost or benefit. There are two changes that may generate economic costs or benefits. First, the change requiring evaluation of the NPR–A for new Special Areas and associated values every 10 years (or sooner if the authorized officer determines that changing conditions warrant) could generate time and real costs related to public engagement. These can be minimized by combining this process with the existing process for revising the IAP. Second, the rule establishes the current management strategy governing oil and gas activity in Special Areas of the NPR–A in regulation. The current management strategy is described in the 2022 IAP ROD and is the baseline for the economic analysis. Compared to the baseline, there is either no or minimal change in oil and gas management. Future changes to the framework and

process for management of oil and gas activities in relation to Special Areas and surface resources will require regulatory action; changes to management of specific Special Areas or other areas in the NPR–A will be addressed in the process set out in the rule or through an IAP planning revision.

The BLM estimates the annual effect on the economy of the regulatory changes will be less than $200 million and will not adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local or tribal governments or communities. As such, the rule is not significant under section 3(f)(1) of E.O. 12866, as amended by E.O. 14094. Pursuant to E.O. 12866, the BLM is required to conduct an economic analysis in accordance with section 6(a)(3)(B) of that Executive order. The BLM has complied with that directive.

Public Comments on Regulatory Review

Comment: The BLM received comments that the proposed rule would substantively change the BLM's management of the NPR–A, create uncertainty that may lead to reduced investment and economic opportunities, and does not contain merely administrative and procedural changes. The comment suggests that the BLM failed to comply with E.O. 12866, E.O. 13563, and E.O. 13132. The comment requests a full economic analysis, a federalism assessment, and an EIS.

BLM Response: As described in the BLM's economic analysis, this rule incorporates aspects of the 2022 IAP, which is the current management framework for the NPR–A and forms the baseline for the economic analysis. Compared to the baseline, there is either no or minimal change in oil and gas management. The rule will not alter the terms of existing leases and will have no effect on currently authorized oil and gas operations in the NPR–A. The rule establishes a framework for future decision-making processes that would result in management changes, such as requiring the BLM to maintain an IAP, which guides on-the-ground management and which could be updated in the future through a NEPA process, and establishing the process by which Special Areas would be designated, de-designated, and modified in the future. The BLM conducted an economic analysis for the rule consistent with the requirements under E.O. 12866. Comments requesting a federalism assessment and an EIS are responded to in the relevant areas that follow.

Comment: The BLM received comments stating: ''A proposed regulation is economically significant if it will have an annual effect on the economy of $200 million or more (adjusted every 3 years by the Administrator of OIRA for changes in gross domestic product). For economically significant rules, a more rigorous cost-benefit analysis must be prepared pursuant to section 6(a)(3)(C).'' Comments requested BLM provide more background information on how a conclusion of an economic impact of less than $200 million per year was reached and requested participation of the NPR–A working group to provide a more rigorous cost benefit analysis.

BLM Response: The BLM reviewed the provisions of the rule and disclosed the potential impacts of the action relative to the existing management framework for the NPR–A. BLM's economic analysis concludes that most of the provisions of the final rule are editorial, administrative, or otherwise could have no quantifiable economic cost or benefit.

Comment: The BLM received comments expressing concern that neither the 2022 NPR–A IAP ROD nor the proposed rule's economic analysis accounted for the likely recoverable oil within the NPR–A and therefore potentially reduced the impact from the rule on the economic outlook from the NPR–A.

BLM Response: The 2022 NPR–A IAP ROD incorporates the analysis in the 2020 Final Environmental Impact Statement, which evaluated potential development in detail. The rule's use of the IAP as a baseline did not affect the economic analysis of potential impacts and the overall conclusion that the rule will not have substantial impacts on expected levels of oil and gas development in the NPR–A.

Comment: The BLM received comments stating that the economic analysis provided is ''insufficient and omits any analysis of the effects of regulatory provisions that will have economic impacts, such as the proposed presumption against permitting activities in Special Areas.'' Comments requested that if the BLM decides to proceed with the proposed rule, it must first prepare for public review and comment the proper analysis under section 6(a)(3)(C) of E.O. 12866.

BLM Response: The BLM's economic analysis fulfills the requirements of E.O. 12866 as amended. It discusses the incremental effect of the presumption that new leasing and infrastructure should not be permitted unless specific information clearly demonstrates they can be conducted with no or minimal adverse effects on significant resource values relative to the statutory mandate to assure maximum protection of Special Areas. Compared to the baseline for the analysis, the rule will not affect management of existing leases or areas identified as closed to leasing or new infrastructure. For a small portion of existing Special Areas that are not leased and are designated as open to leasing or available for new infrastructure, the rule will have a nominal or minimal effect on management of oil and gas activity. The effect will be nominal if the same leasing stipulations are imposed under the rule that would be imposed under the baseline. Even if the stipulations are more restrictive, the effect is expected to be minimal due to the low revealed demand for leasing in these areas. In the event there is a minimal change in leasing stipulations of the areas considered open for leasing, the welfare effects include those associated with the change in oil and gas production as well as the increased protection of the ecological, subsistence, cultural and other significant resource values.

Comment: The BLM received comments stating that the presumption that no additional leasing, development, and/or infrastructure within Special Areas will be allowed, paired with the proposed discretion of the authorized officer to establish interim/emergency protections on lands considered for Special Areas, is a significant regulatory action. As such, the economic analysis is insufficient to determine a significant regulatory action described in E.O. 12866 section 3(f)(1), as amended by E.O. 14094. The commenter asserts that the BLM's economic analysis fails to even acknowledge this fact.

BLM Response: The BLM's economic analysis discusses the incremental effect of the presumption that new leasing and infrastructure should not be permitted unless specific information clearly demonstrates that the resulting activities can be conducted with no or minimal adverse effects on significant resource values relative to the statutory mandate to assure maximum protection of Special Areas. See the BLM's response to a similar comment immediately preceding this one.

Comment: The BLM received comments stating that the scale of impacts could exceed the $200 million threshold of E.O. 12866. Commenters provided information supporting this statement including comparisons to the Greater Mooses Tooth 1 development that they state would likely exceed $1 billion in today's dollars. They provide

further information on costs for Willow and Pikka and state those projects would be in the multi-billion-dollar range. They use these statements to request that the BLM conduct a thorough economic analysis.

BLM Response: The commenters did not provide quantitative information establishing that the rule would increase costs more than $200 million beyond the costs involved in complying with the existing regulations. The rule will have no effect on currently authorized oil and gas operations in the NPR–A, like Greater Mooses Tooth 1. In addition, it does not affect operations on non-BLM lands or on operations outside of the NPR–A, like Pikka. Currently, the NPR–A is managed according to the 2022 IAP ROD. The rule will alter the procedural steps needed to change management of oil and gas activity within Special Areas in the future, though it will still require a public process, consultation, and appropriate NEPA analysis. The BLM's economic analysis for the rule discusses that incremental change.

Comment: The BLM received comments stating: ''It is unclear how BLM economic analysis considered the Reasonably Foreseeable Development Scenario (Appendix B of the NPR–A IAP). The proposed rule and continue[d] expansion of Special Areas would not allow for the scenarios described in the IAP but does not discuss the economic impacts from those changes/restrictions. Is BLM assuming that under this proposed rule that there would be no change to the reasonably foreseeable development scenario and that the proposed rule would allow for each of the development scenarios described in NPR–A IAP appendix B? If not, then potential impacts from each development scenario should be fully evaluated.'' [10]

BLM Response: We believe that the commenter is referencing the Final Environmental Impact Statement for the 2020 NPR–A IAP, issued in June 2020, which was the analysis used for the BLM's 2022 IAP ROD. This rule incorporates aspects of the 2022 IAP ROD. The economic analysis for this rule concludes that most of the provisions of the final rule are editorial, administrative, or otherwise have no economic cost or benefit. The BLM is not required to analyze alternatives that were posed and analyzed in previous planning efforts.

[10] The Reasonably Foreseeable Development Scenario is defined in appendix B of the 2020 Final IAP/EIS, available at *https://eplanning.blm.gov/public_projects/117408/200284263/20020421/250026625/Volume%202_Appendices%20B-Y.pdf.*

BLM notes that public commenters raised potential distributional impacts to specific communities. BLM expects limited impacts of this rule relative to the 2022 IAP baseline. However, to clarify the impacts to management of these areas when considering future leases or infrastructure, the economic analysis refers to the EIS of the 2022 IAP for a high-level summary of potential impacts to those communities from the broader scope of the IAP. That EIS addressed potential incremental effects to Iñupiat residents of the North Slope Borough and other communities of the North Slope.

Comment: The BLM received comments stating the position that the BLM should use the existing regulations rather than the 2022 IAP ROD as the baseline to compare to the proposed rule. They state that ''the appropriate baseline for this new Proposed Rule is the rule it replaces. The rule being replaced does not presume that leases or surface infrastructure in Special Areas cannot be permitted. The appropriate baseline for economic analysis is clear when the difference between adopting the Proposed Rule and not adopting the Proposed Rule is considered.''

BLM Response: Concerning the commenter's suggestion that the BLM did not use the appropriate baseline, OMB Circular A–4 (September 17, 2003) states that a baseline ''normally will be a 'no action' baseline: what the world will be like if the proposed rule is not adopted.'' If the BLM did not issue this rule, the 2022 IAP ROD would be the prevailing management framework for the NPR–A.

Comment: The BLM received comments stating that while the proposed rule ''argues that there is little interest in leasing of the Special Areas, BLM's own Table 3 in the Economic Analysis summarizes that, since 2011, for 5 out of 9 years, there has been greater leasing in the Special Areas than the rest of the NPRA.'' Commenters asserted that a proposed rule that presumes against development would likely result in decreased oil and gas activity, thereby causing economic impacts that should be acknowledged in the Economic Analysis.

BLM Response: There is no clear evidence of large, unmet demand for oil and gas leases inside current Special Areas (SAs). Three Special Areas (Peard Bay SA, Kasegaluk Lagoon SA, and Utukok River Uplands SA) are of low oil and gas potential and far away from existing infrastructure. As a result, these have been unaffected by past oil and gas activity. No leases have ever been offered or issued in the Kasegaluk Lagoon SA. Lease sales in 2013 and 2017 offered parcels in the Utukok River Uplands SA, but none were acquired. In 2004, one lease was acquired that included a very small overlap with the Peard Bay SA. That lease was relinquished in 2010 with no oil and gas activity recorded. In 2016, there were 933 acres inside the Peard Bay SA offered for lease, none were acquired. Meanwhile, two Special Areas (Colville River SA and Teshekpuk Lake SA) have seen substantial interest in oil and gas development, but large portions of those areas have already been leased or have been offered for lease and not acquired. Approximately 52.5 percent (1,282,050 acres) and 90.3 percent (3,292,338 acres) of the Colville River SA and Teshekpuk Lake SA, respectively, have already been offered for lease at least once since creation of the NPR–A. Since 2011, approximately 12.8 percent (313,000 acres) and 9.9 percent (361,000 acres) within the Colville River SA and the Teshekpuk Lake SA, respectively, were leased.

Comment: The BLM received comments stating that the economic analysis did not consider concepts that commenters suggested should be considered, such as: restricted production; whether royalty receipts would exceed the risks posed by projected oil and gas development; and what funds would be necessary if an oil and gas company fails to plug the wells or reclaim the land, or to clean up oil spills. Comments also suggested that IAPs should incorporate a cost-benefit analysis for future oil and gas leasing.

BLM Response: As described in the BLM's economic analysis, this rule incorporates aspects of the 2022 IAP, which is the current management framework for the NPR–A and forms the baseline for the economic analysis. Compared to the baseline, there is either no or minimal change in oil and gas management. The rule will alter the procedural steps needed to change management of oil and gas activity within Special Areas in the future, though it will still require a public process, consultation, and appropriate NEPA analysis. The rule will not alter the terms of existing leases and will have no effect on currently authorized oil and gas operations in the NPR–A.

Regarding the comments that IAPs should incorporate a cost-benefit analysis, the NEPA process that will occur when changes are made to an IAP does not require formal cost-benefit analysis, but it may examine socio-economic effects of the action, as appropriate. In addition, any future changes to management that require regulatory action are subject to

analytical requirements under E.O. 12866.

Comment: The BLM received comments stating: ''While the SCC [social cost of carbon] was excluded deliberately from the 2020 IAP/EIS, the proposed rule should explicitly implement SCC into its present and future analysis to promote informed, accurate decision making in the NPR–A.'' Commenters stated that the 2020 IAP/EIS correctly states that NEPA does not require a cost-benefit analysis and only requires a consideration of economic and social effects but that they ''believe both the public and future agency decision makers lack the information that could be provided by a robust cost-benefit analysis to make wise choices in this particularly pristine, remote, and vulnerable region. For instance, because the proposed rule does not require the inclusion of SCC in future environmental documents within the NPR–A, it will be difficult to determine the true break-even point of investment. Instead, agency decision makers and the public may miss opportunities to consider how renewable energy alternatives, either in the [NPR–A] or elsewhere, could outcompete the energy output of an oil project, all with minimal SCC.''

BLM Response: As discussed in section III(E) of this preamble above, the rule is focused on addressing impacts to surface values of the Reserve and consolidating and implementing the BLM's statutory obligations, primarily those in the NPRPA, to protect those values when authorizing oil and gas leasing and production. Thus, this rule does not analyze or specifically consider the climate impacts of oil and gas development in the Reserve, which is more appropriately addressed in the IAP or when conducting NEPA analysis for oil and gas leasing and production activities.

Regulatory Flexibility Act

The Secretary of the Interior certifies that this final rule will not have a significant economic effect on a substantial number of small entities under the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*). The BLM is not required to prepare a Final Regulatory Flexibility Analysis with this final rule.

The Small Business Administration (SBA) has developed size standards to carry out the purposes of the Regulatory Flexibility Act (RFA), as amended by the Small Business Regulatory Enforcement Fairness Act. The size standards can be found in 13 CFR 121.201. For a specific industry identified by the North American Industry Classification System (NAICS), small entities are defined by the SBA as an individual, limited partnership, or small company considered at ''arm's length'' from the control of any parent company, which meet certain size standards.

The final rule is most likely to affect business currently operating in the oil and gas sector in the NPR–A. There are eight active lessees in NPR–A. These eight companies (and information about the companies obtained from the public domain) include: The Aklaq Company, Alaska (an Alaska-registered company); Borealis Alaska Oil, Inc (acquired by Pantheon Resources, a United Kingdom-based oil and gas company); Oil Search Alaska, LLC (a subsidiary of Santos Limited, a large Australian oil company); Armstrong Oil and Gas, Inc (a Colorado-based exploration company); North Slope Exploration, LLC (managed by Armstrong Oil and Gas, Inc.); Repsol E&P USA Inc (a subsidiary of Repsol, a large Spanish oil company); ConocoPhillips Alaska, Inc (a subsidiary of ConocoPhillips, a large American multinational corporation); and Emerald House LLC (owned by XCD Energy Ltd, an Australian-based oil company).

SBA size standards identify small business in the crude petroleum extraction (NAICS 211120) and natural gas extraction (NAICS 211130) industries to be those with 1,250 or fewer employees. Of the companies identified, based on information that BLM was able to obtain from the public domain, the BLM believes that the Aklaq Company Alaska, Borealis Alaska Oil Inc, Armstrong and North Slope Exploration, and Emerald House LLC meet the SBA's criteria of a small business. The BLM has determined that this is less than a substantial number of small entities potentially affected.

In addition to small business, the RFA also requires consideration of impacts on small governmental jurisdictions. There are four communities within the Reserve that are likely considered small government jurisdictions: Wainwright, Utqiagvik, Atqasuk, and Nuiqsut. However, this rule will not override the terms or status of existing leases, will not affect authorized operations, and does not impose direct regulatory cost on any business or community.

Further, this rule does not change management decisions regarding future leasing and oil and gas development in areas outside Special Areas, or within Special Areas where leasing or infrastructure is already restricted. In the remaining areas, the impact on future leasing is uncertain but expected to be nominal or minimal for the reasons identified above. Therefore, this rule will not have significant economic impact on small businesses holding these leases or small government jurisdictions in the Reserve.

Comment: The BLM received comments expressing the concern that development of the NPR–A provides a direct economic benefit to the regional government, local villages, and the State of Alaska and that a reduction in production from the NPR–A would mean less revenue to provide services to Alaskans. Commenters stated that the economic analysis fails to consider the impact to local communities of losing future revenues and that they perceive that the analysis does not consider the ''social implications of eliminating or dramatically restricting future development in the NPR–A that would remove jobs and a substantial portion of the tax base''.

BLM Response: The approval of existing development and the terms of existing leases are not affected by the final rule, nor does the rule eliminate or drastically restrict future development in the NPR–A. As discussed in more detail above and in the economic analysis, the BLM does not anticipate substantial impacts on leasing and development. Future development is already subject to conditions in the IAP, the BLM has not received significant interest in new leasing in response to lands offered in sales, and the costs associated with additional protective measures consistent with current lease terms would not impose a significant new cost on operators.

Comment: The BLM received comments expressing the opinion that the BLM constrained the economic analysis to eight active lessees in the NPR–A and did not include ''small government jurisdictions'' or other small entities that operate within the NPR–A. Commenters stated that the North Slope Borough and the four villages located within the NPR–A (Utqiagvik, Wainwright, Atqasuk, and Nuiqsut), and the Inupiat Community of the Arctic Slope all qualify as small government jurisdictions, and they requested these entities be included in the economic analysis. Several of these comments also referenced the benefits it perceives these entities receive from development of the NPR–A, including payments to the Mitigation Grant program, employment opportunities, and development of infrastructure.

BLM Response: The BLM recognizes the government jurisdictions should also be considered under the Regulatory Flexibility Act and has updated the economic analysis accordingly. However, while these small entities exist, the rule does not affect existing

leases and does not prevent future oil and gas development in the NPR–A. As such, the rule is not expected to significantly affect these communities any differently that the current management of the NPR–A.

Congressional Review Act

Based upon the economic analysis, this final rule does not meet the criteria under 5 U.S.C. 804(2), the Congressional Review Act. This rule will not:

(a) Have an annual effect on the economy of $100 million or more.

(b) Cause a major increase in costs or prices for consumers, individual industries, Federal, State, or local government agencies, or geographic regions.

(c) Have significant adverse effects on competition, employment, investment, productivity, innovation, or the ability of U.S. based enterprises to compete with foreign based enterprises.

Unfunded Mandates Reform Act (UMRA)

The final rule will not have a significant or unique effect on State, local, or Tribal governments or the private sector. The final rule contains no requirements that will apply to State, local, or Tribal governments. The costs that the final rule will impose on the private sector are below the monetary threshold established at 2 U.S.C. 1532(a). A statement containing the information required by UMRA (2 U.S.C. 1531 *et seq.*) is therefore not required for the final rule. This final rule is also not subject to the requirements of section 203 of UMRA because it contains no regulatory requirements that might significantly or uniquely affect small governments, because it contains no requirements that apply to such governments, nor does it impose obligations upon them.

Takings (E.O. 12630)

This rule does not affect a taking of private property or otherwise have taking implications under E.O. 12630. Section 2(a) of E.O. 12630 identifies policies that do not have takings implications, such as those that abolish regulations, discontinue governmental programs, or modify regulations in a manner that lessens interference with the use of private property. The rule will not interfere with private property. A takings implication assessment is not required.

Federalism (E.O. 13132)

Under the criteria in section 3 of E.O. 13132, this final rule does not have sufficient federalism implications to warrant the preparation of a federalism summary impact statement. A federalism impact statement is not required.

The final rule does not have a substantial direct effect on the States, on the relationship between the Federal Government and the States, or on the distribution of power and responsibilities among the levels of government. It does not apply to States or local governments or State or local governmental entities. The final rule will affect the relationship between operators, lessees, and the BLM, but it does not directly impact the States. Therefore, in accordance with E.O. 13132, the BLM has determined that this final rule does not have sufficient federalism implications to warrant preparation of a federalism assessment.

Comment: Commenters question the BLM's statement that the rule does not apply to States or local governments and clarifies that the rule only ''affects the relationship between operators and lessees in the NPR–A and their relationships with the BLM.'' Commenters further believe that the area should be managed in a ''joint comprehensive management plan'' under the authority granted to Alaska. The commenter stated that Alaska's resource and regulatory agencies should be ''considered superior to any proposed Federal process and have final authority on any changes or rulemaking that would conflict with existing state programs.'' Commenters suggest that local counties and cities should have the ultimate decision on what happens on the land. The BLM and other stakeholders should provide input, but the State of Alaska and the residents should make the final decision.

BLM Response: While commenters take issue with the management framework Congress established for the Reserve, this is beyond the BLM's authority to address. Further, as discussed in the section III(C) above, the BLM did meet with the State of Alaska regarding the rule and will engage with State and local government agencies in the implementation of this rule, particularly during the development of future IAP and project-specific NEPA processes.

Comment: The BLM received comments that stated the position the proposed rule warrants preparation of a federalism assessment. The commenter recommended that the BLM undertake a federalism assessment to evaluate the impact of the proposed rule on the State's powers. For example, § 2361.50(a) of the proposed rule stated that the BLM ''will ensure that Special Areas are managed to protect and support fish and wildlife.'' The commenter argued that this ''direction conflicts with the State's broad trustee and police powers over fish and wildlife within [its] borders.'' The commenter opined that the BLM therefore needs to prepare a federalism assessment consistent with E.O. 13132. The commenter disagrees with the BLM's assertion that the proposed rule ''would not have a substantial direct effect on the States, on the relationship between the Federal Government and the States, or on the distribution of power and responsibilities among the various levels of government.'' Rather, the commenter argued that because the Federal Government is required to pay 50 percent of all receipts from ''sales, rentals, bonuses, and royalties on leases'' in the NPR–A to the State of Alaska, by revising and creating procedures and requirements for exploration, development, and production in the NPR–A, ''the Proposed Rule has a direct impact on these revenues and, thus, the interests of the State and North Slope Borough. Neither the State nor the North Slope Borough were consulted on the Proposed Rule as E.O. 13132 requires. BLM should conduct the necessary consultation with States and local governments before proceeding with a revised version of the Proposed Rule.''

BLM Response: E.O. 13132 generally prohibits Federal agencies from promulgating rules that might have a substantial direct effect on States or local governments, on the relationship between Federal and State governments, or on the distribution of power and responsibilities among the various levels of government, without meeting certain conditions, such as consulting with elected State and local government officials early in the process to the extent practicable. In particular, administrative rules may not create substantial direct compliance costs for State or local governments that are not otherwise required by statute, and may not expressly or impliedly preempt State law, without Federal agencies undertaking additional processes. While this rule does modify the management approach the BLM will take in the Reserve, the regulations only affect oil and gas activity on Federal public lands; nothing in the rule preempts State law or requires State or local governments to comply with specific provisions. As a result, a federalism summary impact statement is not required. Further, as discussed in the section III(c) above, the BLM did engage with the State of Alaska and the North Slope Borough during the rulemaking process.

Civil Justice Reform (E.O. 12988)

This final rule complies with the requirements of E.O. 12988. More specifically, this final rule:

a. Meets the criteria of section 3(a), which requires agencies to review all regulations to eliminate errors and ambiguity and to write all regulations to minimize litigation; and

b. Meets the criteria of section 3(b)(2), which requires agencies to write all regulations in clear language with clear legal standards.

Consultation With Indian Tribes (E.O. 13175 and Departmental Policy)

The BLM endeavors to maintain and strengthen its government-to-government relationship with Indian Tribes through a commitment to consultation with Indian Tribes and recognition of their right to self-governance and Tribal sovereignty. The BLM evaluated possible effects of the rule on federally recognized Indian Tribes under E.O. 13175, the President's memorandum of April 29, 1994, ''Government-to-Government Relations with Native American Tribal Governments'' (59 FR 22951), and 512 Departmental Manual 2, as part of this rulemaking process and determined that the rule has tribal implications.

In conformance with the Secretary's policy on tribal consultation and 512 Departmental Manual 4–7, on August 25, 2023, the BLM invited via mail 45 Tribes and 30 Alaska Native Corporations to engage in consultation regarding the proposed NPR–A rule. The BLM engaged in Tribal consultation on the decisions and resulting actions related to the IAP, including the 2022 IAP ROD. This regulation incorporates those IAP decisions and also updates a 50-year-old framework to reflect the IAP and lessons learned through preparing IAPs. Prior consultation on the specific procedural changes that were being proposed provided the BLM with valuable feedback on how the regulatory language, in particular, might be improved to better reflect Tribal interests. The BLM felt that it would be more productive to seek new feedback after providing the proposal in the form of a proposed regulation, which necessarily differs from the process, content, and form of a management plan.

The BLM has continued to offer consultation to Tribes and Alaska Native Corporations that it determined would be most likely to have substantial direct effects from the rule, including the Native Village of Atqasuk, Atqasuk Corporation, Village of Wainwright, Olgoonik Corporation, Native Village of Nuiqsut, Kuupik Corporation, Native Village of Barrow, UIC, ICAS, and ASRC. BLM Leadership and State and Field Office staff met with the Mayor of Atqasuk on October 31, Native Village of Nuiqsut on November 1, ICAS on November 3 and February 6, Village of Wainwright on November 21, Olgoonik Corporation on December 19, ASRC on December 21, and Kuukpik Corporation on February 1. In addition, staff met and discussed the proposed rule with the NPR–A Working Group (consisting of representatives from North Slope local governments, Native corporations, and tribal entities, *https://www.blm.gov/programs/energy-and-minerals/oil-and-gas/about/alaska/NPR-A/npr-a_working_group*) on September 26, October 17, and December 1. We also held in-person public meetings in Nuiqsut, Utqiagvik, and Wainwright where verbal comment was recorded, along with three informational sessions—one in Anchorage and two virtual. The BLM will continue to engage in consultation with Tribes and Alaska Native Corporations after the final rule is published.

As detailed in the public engagement section above, the BLM received requests, including from Tribes and Alaska Native Corporations, to extend the 60-day public comment period for the proposed rule for an additional 90 days, which would have resulted in a 150-day (5-month) comment period. A 5-month comment period far exceeds the typical duration for rulemaking comment periods. While the BLM was unable to grant the requested extension, we did extend the comment period for an additional 30 days, resulting in a 90-day comment period for the proposed rule. While the comment period for the proposed rule overlapped with the comment period on the Draft Supplemental EIS for the Coastal Plain, the Coastal Plain comment period was 60 days and ended one month before the close of the comment period on the proposed rule.

During consultation, the Tribes and Alaska Native Corporations raised similar concerns as they submitted during the comment period of the rule, which are addressed in the responses to comment above. Notable concerns raised during consultation include the potential for loss of revenue from oil and gas development, the need for protections to sustain tribal members' subsistence way of life, ensuring adequate consultation going forward, and ensuring that the rule allows access for communities and continued economic development opportunities for community members. Changes made in response to this input, include: revising sections of the rule that relate to consultation to clarify that an economic tie to a Special Area is a basis for consultation; ensuring consultation is consistently required throughout the processes for designating, de-designating and modifying Special Areas and evaluating proposed oil and gas activities in Special Areas; adding subsistence as an area for co-stewardship across the Reserve, broadening the language in the section on co-stewardship beyond opportunities in Special Areas; and revising the language in the section on subsistence to provide for reasonable access, to be consistent with ANILCA, rather than using the term ''appropriate'' access.

Paperwork Reduction Act (PRA)

The Paperwork Reduction Act (PRA) (44 U.S.C. 3501 through 3521) generally provides that an agency may not conduct or sponsor, and not withstanding any other provision of law a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. Collections of information include requests and requirements that an individual, partnership, or corporation obtain information, and report it to a Federal agency. See 44 U.S.C. 3502(3); 5 CFR 1320.3(c) and (k).

This final rule contains an information-collection requirement that is subject to review by OMB under the PRA. This information-collection is located in § 2361.30(a)(4). One of the key principles of the final rule is the inclusion of stakeholder and the public notice and participation in the designation and removal of lands to be included in an SA. To help ensure that the BLM receives the information needed to inform its decision to include lands in an SA, § 2361.30(a)(4) includes a list of criteria that should be addressed when a member of the public recommends lands for such a designation. This information includes the following:

- The size and location of the recommended lands;
- The significant subsistence, recreational, fish and wildlife, historical, or scenic resource values that are present within or supported by the recommended lands;
- Measures that may be necessary to assure maximum protection of those values; and
- Any other pertinent information.

The BLM has submitted a request to OMB for the information-collection requirement contained in this final rule. The estimated burden associated with this information-collection is outlined below.

OMB Control Number: 1004–0221.

Title of Collection: Management and Protection of the National Petroleum Reserve in Alaska—Recommendations for Special Reserve Areas (§ 2361.30).

Form Number: None.

Type of Review: New collection (Request for new OMB Control Number).

Respondents/Affected Public: Person(s) who wish to recommend lands to be designated as a Special Area in the NPR–A.

Respondent's Obligation: Voluntary.

Frequency of Collection: On occasion; every 5 years.

Number of Respondents: 100.

Annual Responses: 100.

Estimated Average Response time: 15 hours.

Annual Burden Hours: 1,500.

Annual Burden Cost: None.

If you want to comment on the information-collection requirements in this final rule, please send your comments and suggestions on this information-collection request within 30 days of publication of this final rule in the **Federal Register** to OMB by going to *www.reginfo.gov.* Click on the link, ''Currently under Review—Open for Public Comments.''

National Environmental Policy Act

This final rule meets the criteria set forth at 43 CFR 46.210(i) for a Departmental categorical exclusion in that this final rule is ''of an administrative, financial, legal, technical, or procedural nature.'' They do not involve any of the extraordinary circumstances listed in 43 CFR 46.215.

Public Comments on NEPA: The BLM received a number of comments objected to the BLM's intent to rely on a categorical exclusion to comply with NEPA and requested that the BLM prepare an environmental analysis, including a range of alternatives for certain aspects of the rule, in order to comply with NEPA.

BLM Response: The BLM disagrees with comments that environmental analysis under NEPA is required, or that extraordinary circumstances apply to this rulemaking. The BLM has determined that the categorical exclusion set out at 43 CFR 46.210(i) applies to this rulemaking. That provision excludes from NEPA analysis and review actions that are ''of an administrative, financial, legal, technical, or procedural nature; or whose environmental effects are too broad, speculative, or conjectural to lend themselves to meaningful analysis and will later be subject to the NEPA process, either collectively or case-by-case.'' That categorical exclusion applies because the final rule sets out a framework for managing oil and gas activity in the Reserve, but is not self-executing, meaning that it does not itself make substantive changes on the ground and does not restrict the BLM's discretion to undertake or authorize future on-the-ground action without new future decisions that implement the rule. As such, the rule fits within the categorical exclusion for rules, regulations, or policies to establish bureau-wide administrative procedures, program processes, or instructions. This final rule does not authorize any project or other on-the-ground activity and therefore will have no significant individual or cumulative effects on the quality of the human environment. The environmental effects of future actions undertaken to implement this rule are too speculative or conjectural to be meaningfully evaluated at this time but will be subject to the appropriate level of NEPA review prior to making a decision. The BLM has also determined that none of the extraordinary circumstances identified at 43 CFR 46.215 apply to this rulemaking. This categorical exclusion documentation is provided in docket BLM–2023–0006 on *regulations.gov*.

Effects on the Nation's Energy Supply (E.O. 13211)

Under E.O. 13211, agencies are required to prepare and submit to OMB a Statement of Energy Effects for significant energy actions. This statement is to include a detailed statement of ''any adverse effects on energy supply, distribution, or use (including a shortfall in supply, price increases, and increase use of foreign supplies)'' for the action and reasonable alternatives and their effects.

Section 4(b) of E.O. 13211 defines a ''significant energy action'' as ''any action by an agency (normally published in the **Federal Register**) that promulgates or is expected to lead to the promulgation of a final rule or regulation, including notices of inquiry, advance notices of proposed rulemaking, and notices of proposed rulemaking: (1)(i) that is a significant regulatory action under E.O. 12866 or any successor order, and (ii) is likely to have a significant adverse effect on the supply, distribution, or use of energy; or (2) that is designated by OIRA as a significant energy action.''

This final rule will not have a significant effect on the Nation's energy supply. It restates existing statutory standards and establishes a procedural framework for ensuring that the BLM meets those standards. It also codifies land use restrictions that already are legally binding in the 2022 IAP ROD. Further, the final rule presumes, in final § 2361.40(c), that oil and gas leasing or infrastructure on lands allocated as available for such activities ''should not be permitted unless specific information available to the Bureau clearly demonstrates that those activities can be conducted with no or minimal adverse effects on significant resource values.'' That presumption merely implements the BLM's existing statutory duty to assure maximum protection of the significant resource values in Special Areas to the extent consistent with the requirements of this Act for the exploration and production of the Reserve. 42 U.S.C. 6504(a). The presumption is consistent with this statutory direction and limited by it, such that the actions that the BLM may take under this framework to assure maximum protection are within the same scope as those that could have been taken without the framework set out in the rule. As discussed in more detail in the regulatory impact analysis (RIA), based on the status of existing leases, most recent lease sales, and the fact that the rule will not alter the terms of approved leases or approved development, the BLM does not expect the rule to have a substantial impact on exploration and production from the Reserve. Therefore, the final rule will not change the supply, distribution, or use of energy.

Public Comments on E.O. 13211

The BLM received comments that the proposed rule constitutes a significant energy action as it would affect the supply, distribution, and use of energy, and thereby fails to comply with E.O. 13211. One commenter specified that ''actions taken to restrict and limit oil and gas development, access to the NPR–A for oil and gas development, and codification of BLM's authority to restrict, deny, and minimize oil and gas development in the NPR–A would logically have an impact on the Nation's energy supply.'' Commenters also asserted that oil production from the NPR–A will extend the economic lifetime of the Trans-Alaska Pipeline and enable domestic oil to reach the rest of the United States. For the reasons stated above, the rule will not change the supply, distribution, or use of energy.

Other commenters cited an estimate from the U.S. Geological Survey that there are 8.7 billion barrels of undiscovered oil in the NPR–A, an important reserve created specifically by Congress for energy production. Commenters added that '' . . . by denying development in the region,

BLM is denying the State of Alaska, and the U.S., billions of dollars in revenue.'' Furthermore, comments stated that BLM's proposed plan will also deny American consumers affordable and reliable energy at a time of persistently high fuel prices; the rule ''undermines the reality that oil produced from the NPR–A can displace imports and will increase the likelihood of imports from less environmentally regulated regions of the world.''

These comments misunderstand the rule; it does not prohibit exploration for and development of oil and gas in the Reserve. Rather, it allows oil- and gas-related activities to continue consistent with the NPRPA by establishing procedures for the BLM to mitigate reasonably foreseeable and significantly adverse effects of proposed oil and gas activities on the surface resources of the Reserve and to provide maximum protection for surface values within Special Areas for proposed oil and gas activities.

The BLM received comments discussing the Russian invasion of Ukraine and the importance of energy security and strengthening the supply chain for the U.S. and its allies. Commenters indicated that ''as one of the largest exporters of petroleum in the world, the United States' ability to facilitate global diversification from Russian energy can only be enhanced by NPR–A development.'' Again, these comments misunderstand the rule; it does not prohibit exploration for and development of oil and gas in the Reserve.

List of Subjects in 43 CFR Part 2360

Alaska, Oil and gas activity, Protection of surface resources, Special areas, Tribes.

Delegation of Signing Authority

This action by the Principal Deputy Assistant Secretary is taken pursuant to an existing delegation of authority.

Steven H. Feldgus,

Principal Deputy Assistant Secretary, Land and Minerals Management.

■ For the reasons set out in the preamble, the Bureau of Land Management revises 43 CFR part 2360 to read as follows:

PART 2360—NATIONAL PETROLEUM RESERVE IN ALASKA

Subpart 2361—Management and Protection of the National Petroleum Reserve in Alaska

Sec.

2361.1 Purpose.
2361.3 Authority.
2361.4 Responsibility.
2361.5 Definitions.
2361.6 Effect of law.
2361.7 Severability.
2361.10 Protection of surface resources.
2361.20 Existing Special Areas.
2361.30 Special Areas designation and amendment process.
2361.40 Management of oil and gas activities in Special Areas.
2361.50 Management of subsistence uses within Special Areas.
2361.60 Co-stewardship opportunities in management of Special Areas and subsistence.
2361.70 Use authorizations.
2361.80 Unauthorized use and occupancy.

Subpart 2362 [Reserved]

Authority: 42 U.S.C. 6501 *et seq.* and 43 U.S.C. 1701 *et seq.*

PART 2360—NATIONAL PETROLEUM RESERVE IN ALASKA

Subpart 2361—Management and Protection of the National Petroleum Reserve in Alaska

§ 2361.1 Purpose.

The purpose of the regulations in this subpart is to provide procedures for protection and control of the environmental, fish and wildlife, and historical and scenic values of the National Petroleum Reserve in Alaska from significantly adverse effects of oil and gas activities on the surface resources of the Reserve and assuring maximum protection of significant resource values in Special Areas pursuant to and consistent with the provisions of the Naval Petroleum Reserves Production Act of 1976 (90 Stat. 303; 42 U.S.C. 6501 *et seq.*), Alaska National Interest Lands Conservation Act (94 Stat. 2371, 16 U.S.C. 3101 *et seq.*), and other applicable authorities.

§ 2361.3 Authority.

The primary statutory authority for this subpart is the Naval Petroleum Reserves Production Act of 1976, as amended by the Department of the Interior Appropriations Act, Fiscal Year 1981 (Pub. L. 96–514). Additional authority is provided by the Federal Land Policy and Management Act (43 U.S.C. 1701 *et seq.*)—other than the land use planning and wilderness study requirements, which do not apply to the Reserve under 42 U.S.C. 6506a(c)—and the Alaska National Interest Lands Conservation Act (16 U.S.C. 3101 *et seq.*).

§ 2361.4 Responsibility.

The Bureau of Land Management is responsible for the surface and subsurface management of the Reserve, including protecting surface resources from environmental degradation and assuring maximum protection of significant resource values in Special Areas. The Act authorizes the Bureau to prepare rules and regulations necessary to carry out surface management and protection duties.

§ 2361.5 Definitions.

As used in this subpart, the term:

Act means the Naval Petroleum Reserves Production Act of 1976 (as amended and codified at 42 U.S.C. 6501–6508).

Authorized officer means any employee of the Bureau of Land Management who has been delegated the authority to perform the duties of this subpart.

Bureau means the Bureau of Land Management (BLM).

Co-Stewardship broadly refers to cooperative and collaborative engagements of Bureau land managers and Tribes related to shared interests in managing, conserving, and preserving natural and cultural resources under the primary responsibility of Federal land managers. Such cooperative and collaborative engagements can take a wide variety of forms based on the circumstances and applicable authorities in each case. Forms of co-stewardship may include, among other forms, sharing of technical expertise; combining Tribal and Bureau capabilities to improve resource management and advance the responsibilities and interests of each; and making Tribal knowledge, experience, and perspectives integral to the public's experience of Federal lands.

Exploration means activities conducted on the Reserve for the purpose of evaluating petroleum resources, including crude oil, gases (including natural gas), natural gasoline, and other related hydrocarbons, oil shale, and the products of any such resources.

Indigenous Knowledge (IK) means a body of observations, oral and written knowledge, practices, and beliefs developed by Tribes and Indigenous Peoples through interaction and experience with the environment. It is applied to phenomena across biological, physical, social, and cultural systems. IK can be developed over millennia, continues to develop, and includes understanding based on evidence acquired through direct contact with the environment and long-term experiences, as well as extensive observations, lessons, and skills passed from generation to generation. IK is developed by Indigenous Peoples including, but not limited to, Tribal Nations, American Indians, and Alaska Natives.

Infrastructure means a permanent or semi-permanent structure or improvement on BLM-administered lands within the Reserve that is built to support commercial oil and gas activities, such as pipelines, gravel drilling pads, man camps, and other structures or improvements. Infrastructure does not include exploratory wells that are drilled in a single season; or construction, renovation, or replacement of facilities on existing gravel pads at previously disturbed sites where the facilities will promote safety and environmental protection. Additionally, infrastructure does not include: structures or improvements intended for use by subsistence hunters, trappers, fishers, berry-pickers, and other subsistence users to facilitate subsistence activities; construction that is ephemeral (such as snow or ice roads); infrastructure constructed in support of science or public safety; or infrastructure that will primarily be used by and provide a benefit to communities located within or in close proximity to the Reserve.

Integrated Activity Plan (IAP) means a land use management plan that governs the management of all BLM-administered lands and minerals throughout the Reserve.

Reserve means those lands within the National Petroleum Reserve in Alaska (prior to June 1, 1977, designated Naval Petroleum Reserve No. 4) which was established by Executive order, dated February 27, 1923, except for tract Numbered 1 as described in Public Land Order 2344 (the Naval Arctic Research–Laboratory—surface estate only) dated April 24, 1961.

Secretary means the Secretary of the Interior.

Significant resource value means any surface value, including subsistence, recreational, fish and wildlife, historical, scenic, or other surface value that the Bureau identifies as significant and supports the designation of a Special Area.

Special Areas means areas within the Reserve identified by the Secretary or by statute as having significant resource values and that are managed to assure maximum protection of such surface values, to the extent consistent with the requirements of the Act for the exploration and production of the Reserve.

Use authorization means a written approval of a request for use of land or resources.

§ 2361.6 Effect of law.

(a) Subject to valid existing rights, and except as provided by the Department of the Interior Appropriations Act, Fiscal Year 1981 (Pub. L. 96–514), all lands within the exterior boundaries of the Reserve are reserved and withdrawn from all forms of entry and disposition under the public land laws, including the mining and mineral leasing laws, and all other acts.

(b) Notwithstanding the provisions of paragraph (a) of this section, the Secretary is authorized to:

(1) Make dispositions of mineral materials pursuant to the Act of July 31, 1947 (61 Stat. 681), as amended (30 U.S.C. 601), for appropriate use by Alaska Natives and the North Slope Borough.

(2) Make such dispositions of mineral materials and grant such rights-of-way, licenses, and permits as may be necessary to carry out the Secretary's responsibilities under the Act.

(3) Convey the surface of lands properly selected on or before December 18, 1975, by Native village corporations pursuant to the Alaska Native Claims Settlement Act, as amended (43 U.S.C. 1601, *et seq.*).

(4) Grant such rights-of-way to the North Slope Borough, under the provisions of title V of the Federal Land Policy and Management Act of 1976 (43 U.S.C. 1761 *et seq.*) or section 28 of the Mineral Leasing Act, as amended (30 U.S.C. 185), as may be necessary to permit the North Slope Borough to provide energy supplies to villages on the North Slope.

(c) All other provisions of law heretofore enacted and actions heretofore taken reserving such lands as a Reserve shall remain in full force and effect to the extent not inconsistent with the Act.

(d) To the extent not inconsistent with the Act, all other public land laws are applicable.

§ 2361.7 Severability.

If a court holds any provision of the regulations in this part or their applicability to any person or circumstances invalid, the remainder of the regulations in this part and their applicability to other people or circumstances will remain unaffected.

§ 2361.10 Protection of surface resources.

(a) In administering the Reserve, the Bureau must protect surface resources by adopting whatever conditions, restrictions, and prohibitions it deems necessary or appropriate to mitigate reasonably foreseeable and significantly adverse effects of proposed oil and gas activities. Such conditions, restrictions, or prohibitions may involve conditioning, delaying action on, or denying some or all aspects of proposed oil and gas activities, and will fully consider community access and other infrastructure needs, after consultation with the North Slope Borough and consistent with § 2361.6.

(b) The Bureau will use the following procedures to protect surface resources from the reasonably foreseeable and significantly adverse effects of proposed oil and gas activities:

(1) The Bureau will maintain an Integrated Activity Plan (IAP) addressing management of all BLM-administered lands and minerals throughout the Reserve. When issuing a use authorization, the authorization must conform to the IAP and this subpart, including any subsequent designation or modifications of Special Areas. To the extent there is any inconsistency between the IAP and this subpart, this subpart governs;

(2) In each decision concerning proposed activity in the Reserve, the authorized officer will document consideration of, and adopt measures to mitigate, reasonably foreseeable and significantly adverse effects on fish and wildlife, water, cultural, paleontological, scenic, and any other surface resource. The authorized officer will take particular care to account for, and mitigate adverse effects on, surface resources that support subsistence uses and needs; and

(3) In assessing effects of a decision concerning proposed activity in the Reserve, the authorized officer will document consideration of any uncertainty concerning the nature, scope, and duration of potential effects on surface resources of the Reserve and shall ensure that any conditions, restrictions, or prohibitions on proposed oil and gas activities account for and reflect any such uncertainty.

(c) When affected surface resources are located in a Special Area, the authorized officer must comply with the procedures and requirements of §§ 2361.20 through 2361.60.

(d) The authorized officer must include in each decision and authorization related to proposed oil and gas activity in the Reserve such terms and conditions that provide the Bureau with sufficient ability to fully implement the requirements of this subpart.

(e)(1) To the extent consistent with the requirements of the Act, other applicable law, and the terms of any applicable existing authorization, and after consultation with appropriate Federal, State, and local agencies, federally recognized Tribes, and Alaska Native Claims Settlement Act corporations, the authorized officer may limit, restrict, or prohibit the use of or access to lands within the Reserve,

including Special Areas. Upon proper notice, as determined by the authorized officer, such actions may be taken to protect fish and wildlife breeding, nesting, spawning, lambing or calving, or migrations; subsistence uses and resources; and other environmental, scenic, or historic values.

(2) The consultation requirement in paragraph (e)(1) of this section is not required when the authorized officer determines that emergency measures are required.

(f) No site, structure, object, or other values of historical, cultural, or paleontological character, including, but not limited to, historic and prehistoric remains, fossils, and artifacts, shall be injured, altered, destroyed, or collected without authorization under an appropriate Federal permit and without compliance with applicable law governing cultural items, archaeological resources, and historic properties.

§ 2361.20 Existing Special Areas.

Any lands within the Reserve designated as a Special Area as of June 6, 2024, will continue to be managed as a Special Area except as modified pursuant to § 2361.30, including:

(a) *Colville River Special Area.* The Colville River Special Area encompasses the area within the boundaries depicted on maps that are published as of June 6, 2024, and available for public inspection at the Arctic District Office. The Colville River Special Area shall be managed to assure maximum protection of the following significant resource values, as well as additional values identified through the process set forth in § 2361.30:

(1) Important habitat for raptor species, including, but not limited to, the Arctic peregrine falcon;

(2) Important habitat for other bird species, including, but not limited to, neotropical migratory birds, shorebirds, loons, waterfowl, inland dwelling sea birds, and passerines;

(3) Important habitat for moose;

(4) Important habitat for fish;

(5) Important subsistence activities;

(6) Important recreational activities;

(7) World-class paleontological deposits; and

(8) Significant cultural resources, including numerous sites from the prehistoric and historic eras.

(b) *Kasegaluk Lagoon Special Area.* The Kasegaluk Lagoon Special Area encompasses the area within the boundaries depicted on maps that are published as of June 6, 2024, and available for public inspection at the Arctic District Office. The Kasegaluk Lagoon Special Area shall be managed to assure maximum protection of the following significant resource values, as well as additional values identified through the process set forth in § 2361.30:

(1) Important habitat for marine mammals;

(2) Unique ecosystem for the Arctic Coast;

(3) Opportunities for primitive recreational experiences;

(4) Important habitat for migratory birds; and

(5) Important subsistence activities.

(c) *Peard Bay Special Area.* The Peard Bay Special Area encompasses the area within the boundaries depicted on maps that are published as of June 6, 2024, and available for public inspection at the Arctic District Office. The Peard Bay Special Area shall be managed to assure maximum protection of the following significant resource values, as well as additional values identified through the process set forth in § 2361.30:

(1) Haul-out areas and nearshore waters for marine mammals; and

(2) High-use staging and migration areas for shorebirds and waterbirds.

(d) *Teshekpuk Lake Special Area.* The Teshekpuk Lake Special Area encompasses the area within the boundaries depicted on maps that are published as of June 6, 2024, and available for public inspection at the Arctic District Office. The Teshekpuk Lake Special Area shall be managed to assure maximum protection of the following significant resource values, as well as additional values identified through the process set forth in § 2361.30:

(1) Important nesting, staging, and molting habitat for a large number of migratory and other waterbirds;

(2) Important caribou habitat;

(3) Important shorebird habitat;

(4) Subsistence hunting and fishing activities;

(5) Pik Dunes; and

(6) Overwintering habitat for fish.

(e) *Utukok River Uplands Special Area.* The Utukok River Uplands Special Area encompasses the area within the boundaries depicted on maps that are published as of June 6, 2024, and available for public inspection at the Arctic District Office. The Utukok River Uplands Special Area shall be managed to assure maximum protection of the following significant resource values, as well as additional values identified through the process set forth in § 2361.30:

(1) Important habitat for the Western Arctic Caribou Herd;

(2) Subsistence hunting activities;

(3) Grizzly bear habitat; and

(4) Important wilderness values.

§ 2361.30 Special Areas designation and amendment process.

(a) In designating, de-designating, or otherwise changing boundaries or management of Special Areas, the authorized officer must:

(1) Rely on the best available scientific information, including Indigenous Knowledge, as well as the best available information concerning subsistence uses and resources within the Reserve;

(2) Provide the public and interested stakeholders with notice of, and meaningful opportunities to participate in, the evaluation process;

(3) Consult with any federally recognized Tribes and Alaska Native Claims Settlement Act corporations that use the affected Special Area for subsistence purposes or have historic, cultural, or economic ties to the Special Area; and

(4) In designating, de-designating, or otherwise changing boundaries of Special Areas, base their decisions solely on the presence or absence of significant resource values and not the existence of measures that have been or may be adopted to protect or otherwise administer those values.

(b) The Bureau must evaluate lands within the Reserve for the presence of significant subsistence, recreational, fish and wildlife, historical, or scenic values and shall designate lands as Special Areas containing such values in accordance with the following procedures:

(1) Every 10 years, or sooner if the authorized officer determines that changing conditions warrant, the authorized officer must evaluate and determine whether to:

(i) Designate new Special Areas;

(ii) Expand existing Special Areas;

(iii) Recognize the presence of additional significant resource values in existing Special Areas; or

(iv) Require additional measures or strengthen existing measures to assure maximum protection of significant resource values within existing Special Areas.

(2) The authorized officer may, but is not required to, conduct the evaluation and otherwise designate and amend Special Areas through amendment of the IAP.

(3) The authorized officer must provide the public and interested stakeholders with the opportunity to recommend lands that should be considered for designation as a Special Area, significant resource values that the authorized officer should consider recognizing for existing Special Areas, and measures that the authorized officer should consider requiring to assure

maximum protection of significant resource values within Special Areas. The authorized officer will evaluate and respond to recommendations that are made in completing its evaluation. Such recommendations should identify and describe:

(i) The size and location of the recommended lands;

(ii) The significant resource values that are present within or supported by the recommended lands;

(iii) Measures that may be necessary to assure maximum protection of those values; and

(iv) Any other pertinent information.

(4) If, at any point after receipt of an internal or external recommendation, the authorized officer determines that interim measures are required to assure maximum protection of significant resource values in lands under consideration for designation as a new or modified Special Area, the authorized officer may implement such measures that are consistent with the governing management prescriptions in the IAP during the period for which the lands remain under consideration; provided, however, that the authorized officer will provide public notice that interim measures are in place and such measures will be reassessed to determine if they are still needed if they remain in place for more than 5 years.

(5) When the authorized officer designates lands as Special Areas or recognizes the presence of additional significant resource values in existing Special Areas, the authorized officer must adopt measures to assure maximum protection of significant resource values. Such measures are not constrained by the provisions of the current IAP. Once adopted, these measures supersede inconsistent provisions of the IAP then in effect for the Reserve and will be incorporated into the IAP during the next revision or amendment.

(6) For any lands designated as a Special Area, the authorized officer will publish a legal description of those lands in the **Federal Register**, along with a concise summary of the significant resource values that support the designation. The Bureau will also maintain a map of the Special Area on its website and available for public inspection at the Arctic District Office.

(c) The Bureau may not remove lands from the Teshekpuk Lake and Utukok River Uplands Special Areas unless directed to do so by statute. The Bureau may remove lands within other Special Areas only when all of the significant resource values that support the designation are no longer present. When determining whether to remove lands from a Special Area designation, the authorized officer must:

(1) Prepare a summary of its proposed determination, including the underlying factual findings;

(2) Provide the public and interested stakeholders with the opportunity to review and comment on the proposed determination; and

(3) Issue a determination that documents how the views and information provided by the public, federally recognized Tribes, Alaska Native Claims Settlement Act corporations, federally qualified subsistence users, and other interested stakeholders have been considered.

§ 2361.40 Management of oil and gas activities in Special Areas.

The management priority within Special Areas is to assure maximum protection of significant resource values, consistent with the requirements of the Act for exploration and production of the Reserve. The Bureau must fulfill this duty at each stage in the decision-making process for oil and gas activities in the Reserve, and in accordance with the following procedures:

(a) The authorized officer must, to the extent consistent with the Act, take such steps as are necessary to avoid the adverse effects of proposed oil and gas activities on the significant resource values of Special Areas. This includes, but is not limited to, conditioning, delaying action on, or denying proposals for activities, either in whole or in part, and ensuring that leasing and production is approved only subject to the provisions of this section.

(b) The authorized officer will identify and adopt maximum protection measures for each significant resource value that is present in a Special Area when Special Areas are designated. The authorized officer will update maximum protection measures as appropriate thereafter, including in the IAP, lease terms, and permits to conduct oil and gas activities.

(c) Maximum protection may include, but is not limited to, requirements for:

(1) Rescheduling activities, including specifying rates of development, and requiring use of alternative routes;

(2) Limiting new infrastructure and roads;

(3) Limiting extraction of sand and gravel or withdrawal of water;

(4) Limiting types of vehicles and loadings;

(5) Limiting types of aircraft in combination with minimum flight altitudes and distances from identified places; and

(6) Applying special fuel handling procedures.

(d) Subject to any revisions made pursuant to § 2361.30, oil and gas leasing and authorization of new infrastructure in Special Areas will conform to the land use allocations and restrictions identified on the maps published as of June 6, 2024, and available for public inspection at the Arctic District Office.

(e) On lands within Special Areas that are allocated as closed to leasing or unavailable to new infrastructure, certain uses may be authorized under limited circumstances:

(1) The authorized officer may issue oil and gas leases in Special Areas if drainage is occurring. Any lease issued for drainage purposes will include provisions that prohibit surface-disturbing oil and gas activities on the entire lease tract.

(2) The authorized officer may approve new roads, pipelines, transmission lines, and other types of infrastructure in Special Areas provided that:

(i) The infrastructure will primarily be used by and provide a benefit to communities located within or in close proximity to the Reserve or will support subsistence activities; and

(ii) Appropriate measures are adopted to assure maximum protection of significant resource values.

(3) The authorized officer may approve new permanent infrastructure related to existing oil and gas leases only if such infrastructure is necessary to comport with the terms of a valid existing lease.

(f) On lands within Special Areas that are allocated as available for future oil and gas leasing or new infrastructure, the authorized officer will presume that proposed oil and gas activities should not be permitted unless specific information available to the authorized officer clearly demonstrates that those activities can be conducted with no or minimal adverse effects on significant resource values or unless they are necessary to comport with the terms of a valid existing lease.

(g) When preparing an environmental analysis of proposed leasing, exploration, development, or new infrastructure in Special Areas, and reaching a final decision, the authorized officer will:

(1) Provide the public with a meaningful opportunity to review and comment, and consider and respond to any relevant comment they receive;

(2) Consult with federally recognized Tribes and Alaska Native Claims Settlement Act corporations that use the affected Special Area for subsistence purposes or have historic, cultural, or economic ties to the Special Area;

(3) Evaluate potential adverse effects and measures to avoid, minimize, or otherwise mitigate such effects to achieve maximum protection of significant resource values;

(4) Document how the proposal falls within one of the exceptions in paragraph (e) of this section or the justification for overcoming the presumption in paragraph (f) of this section, such as if the proposed infrastructure is necessary to comport with the terms of a valid existing lease, or if it will primarily be used by and provide a benefit to communities located within or in close proximity to the Reserve, and the proposal has been conditioned to avoid, minimize, or otherwise mitigate adverse effects;

(5) Document and consider any uncertainty concerning the nature, scope, and duration of potential adverse effects on significant resource values of Special Areas and ensure that any actions taken to avoid, minimize, or mitigate such effects account for and reflect any such uncertainty; and

(6) Prepare a Statement of Adverse Effect, if the authorized officer determines that the proposal cannot avoid adverse effects on significant resource values in a Special Area. The Statement of Adverse Effect will describe the:

(i) Significant resource values that may be adversely affected;

(ii) Nature, scope, and duration of those adverse effects;

(iii) Measures the Bureau evaluated to avoid the adverse effects, including whether any practicable alternatives exist that would have less adverse impact on significant resource values of the Special Area;

(iv) Justification for not requiring those measures;

(v) Measures the authorized officer will require to minimize, to the maximum extent possible, adverse effects on significant resource values of the Special Area; and

(vi) Measures the authorized officer will require to mitigate any residual adverse effects that cannot be avoided or minimized, including compensatory mitigation, along with an explanation of how those measures will assure maximum protection of significant resource values.

(h) The authorized officer must include in each decision and authorization related to oil and gas activity in the Reserve terms and conditions that provide the authorized officer with sufficient authority to fully implement the requirements of this section.

§ 2361.50 Management of subsistence uses within Special Areas.

(a) The Bureau will ensure that Special Areas are managed to protect and support fish and wildlife and fish and wildlife habitat and associated subsistence use of such areas by rural residents as defined in 50 CFR 100.4.

(b) The Bureau will provide reasonable access to and within Special Areas for subsistence purposes.

§ 2361.60 Co-stewardship opportunities in management of Special Areas and subsistence.

In accordance with the Bureau's co-stewardship guidance, the Bureau will seek opportunities to engage federally recognized Tribes in co-stewardship for management of Special Areas and subsistence resources throughout the Reserve. Co-stewardship opportunities may include co-management, collaborative and cooperative management, and tribally led stewardship, and can be implemented through cooperative agreements, memoranda of understanding, self-governance agreements, and other mechanisms. The Bureau may also partner with Alaska Native Claims Settlement Act corporations, local governments, or organizations as provided by law.

§ 2361.70 Use authorizations.

(a) Use authorizations must be obtained from the authorized officer prior to any use within the Reserve. Only uses that are consistent with the purposes and objectives of the Act and this subpart will be authorized.

(b) Except as may be limited, restricted, or prohibited by the authorized officer, use authorizations are not required for:

(1) Subsistence uses (*e.g.,* hunting, fishing, and berry-picking); and

(2) Non-commercial recreational uses (*e.g.,* hunting, fishing, backpacking, and wildlife observation).

(c) Applications for use authorizations shall be filed in accordance with applicable regulations in this chapter. In the absence of such regulations, the authorized officer may consider and act upon applications for uses allowed under the Act.

(d) In addition to other statutory or regulatory requirements, approval of applications for use authorizations shall be subject to such terms and conditions as the authorized officer determines to be necessary to protect the environmental, subsistence, recreational, fish and wildlife, historical, and scenic values of the Reserve and to assure maximum protection of significant resource values within Special Areas.

§ 2361.80 Unauthorized use and occupancy.

Any person who violates or fails to comply with regulations of this subpart is subject to prosecution, including trespass and liability for damages, pursuant to the appropriate laws.

Subpart 2362 [Reserved]

[FR Doc. 2024–08585 Filed 5–6–24; 8:45 am]

Department of Energy

10 CFR Part 430

Energy Conservation Program: Energy Conservation Standards for Miscellaneous Refrigeration Products; Direct Final Rule

DEPARTMENT OF ENERGY

10 CFR Part 430

[EERE–2020–BT–STD–0039]

RIN 1904–AF62

Energy Conservation Program: Energy Conservation Standards for Miscellaneous Refrigeration Products

AGENCY: Office of Energy Efficiency and Renewable Energy, Department of Energy.

ACTION: Direct final rule.

SUMMARY: The Energy Policy and Conservation Act, as amended (''EPCA''), prescribes energy conservation standards for various consumer products and certain commercial and industrial equipment, including miscellaneous refrigeration products. In this direct final rule, the U.S. Department of Energy (''DOE'') is adopting amended energy conservation standards for miscellaneous refrigeration products. DOE has determined that the amended energy conservation standards for these products would result in significant conservation of energy, and are technologically feasible and economically justified.

DATES: The effective date of this rule is September 4, 2024. If adverse comments are received by August 26, 2024 and DOE determines that such comments may provide a reasonable basis for withdrawal of the direct final rule under 42 U.S.C. 6295(o), a timely withdrawal of this rule will be published in the **Federal Register**. If no such adverse comments are received, compliance with the amended standards established for miscellaneous refrigeration products in this direct final rule is required on and after January 31, 2029. Comments regarding the likely competitive impact of the standards contained in this direct final rule should be sent to the Department of Justice contact listed in the **ADDRESSES** section on or before June 6, 2024.

ADDRESSES: The docket for this rulemaking, which includes **Federal Register** notices, public meeting attendee lists and transcripts, comments, and other supporting documents/materials, is available for review at *www.regulations.gov*. All documents in the docket are listed in the *www.regulations.gov* index. However, not all documents listed in the index may be publicly available, such as information that is exempt from public disclosure.

The docket web page can be found at *www.regulations.gov/docket/EERE-2020-BT-STD-0039*. The docket web page contains instructions on how to access all documents, including public comments, in the docket.

For further information on how to submit a comment or review other public comments and the docket, contact the Appliance and Equipment Standards Program staff at (202) 287–1445 or by email: *ApplianceStandardsQuestions@ee.doe.gov*.

The U.S. Department of Justice Antitrust Division invites input from market participants and other interested persons with views on the likely competitive impact of the standards contained in this direct final rule. Interested persons may contact the Antitrust Division at *www.energy.standards@usdoj.gov* on or before the date specified in the **DATES** section. Please indicate in the ''Subject'' line of your email the title and Docket Number of this direct final rule.

I. Synopsis of the Direct Final Rule

The Energy Policy and Conservation Act, Public Law 94–163, as amended (''EPCA''),[1] authorizes DOE to regulate the energy efficiency of a number of consumer products and certain industrial equipment. (42 U.S.C. 6291–6317, as codified) Title III, Part B of EPCA [2] established the Energy Conservation Program for Consumer Products Other Than Automobiles. (42 U.S.C. 6291–6309, as codified) These products include miscellaneous refrigeration products (''MREFs''), the subject of this direct final rule.

Pursuant to EPCA, any new or amended energy conservation standard must, among other things, be designed to achieve the maximum improvement in energy efficiency that DOE determines is technologically feasible and economically justified. (42 U.S.C. 6295(o)(2)(A)) Furthermore, the new or amended standard must result in significant conservation of energy. (42 U.S.C. 6295(o)(3)(B))

In light of the statutory authority above and under the authority provided by 42 U.S.C. 6295(p)(4), DOE is issuing this direct final rule amending the energy conservation standards for MREFs.

The adopted standard levels in this direct final rule were proposed in a letter submitted to DOE jointly by groups representing manufacturers, energy and environmental advocates, consumer groups, and a utility. This letter, titled ''Energy Efficiency Agreement of 2023'' (hereafter, the ''Joint Agreement'' [3]), recommends specific energy conservation standards for MREFs that, in the commenters' view, would satisfy the EPCA requirements in 42 U.S.C. 6295(o). DOE subsequently received letters of support from states, including California, Massachusetts, and New York,[4] as well as San Diego Gas and Electric (''SDG&E'') and Southern California Edison (''SCE'') advocating for the adoption of the recommended standards.[5]

In accordance with the direct final rule provisions at 42 U.S.C. 6295(p)(4), DOE has determined that the recommendations contained therein are compliant with 42 U.S.C. 6295(o). As required by 42 U.S.C. 6295(p)(4)(A)(i), DOE is also simultaneously publishing a notice of proposed rulemaking (''NOPR'') that contains the identical standards to those adopted in this direct final rule. Consistent with the statute, DOE is providing a 110-day public comment period on the direct final rule. (42 U.S.C. 6295(p)(4)(B)) If DOE determines that any comments received may provide a reasonable basis for withdrawal of the direct final rule under 42 U.S.C. 6295(o), or any other applicable law, DOE will publish the reasons for withdrawal and continue the rulemaking under the NOPR. (42 U.S.C. 6295(p)(4)(C)) See section II.A of this document for more details on DOE's statutory authority.

The amended standards that DOE is adopting in this direct final rule are the efficiency levels recommended in the Joint Agreement (shown in Table I.1) expressed in terms of kilowatt hours per year (''kWh/yr'') as measured according to DOE's current MREF test procedure codified at title 10 of the Code of Federal Regulations (''CFR'') part 430, subpart B, appendix A (''appendix A'').

The amended standards recommended in the Joint Agreement are represented as trial standard level (''TSL'') 4 in this document (hereinafter the ''Recommended TSL'') and are described in section V.A of this document. The Joint Agreement's standards for MREFs apply to all products listed in Table I.1 and manufactured in or imported into the United States starting on January 31, 2029.

BILLING CODE 6450–01–P

[1] All references to EPCA in this document refer to the statute as amended through the Energy Act of 2020, Public Law 116–260 (Dec. 27, 2020), which reflect the last statutory amendments that impact Parts A and A–1 of EPCA.

[2] For editorial reasons, upon codification in the U.S. Code, Part B was redesignated Part A.

Table I.1 Energy Conservation Standards for MREFs (Compliance Starting January 31. 2029)

Product Class ("PC")	Equations for maximum energy use (kWh/yr)
	Based on AV (ft^3)
1. Freestanding Compact Coolers (FCC)	5.52AV +109.1
2. Freestanding Coolers (FC)	5.52AV +109.1
3. Built-in Compact Coolers (BICC)	5.52AV +109.1
4. Built-in Coolers (BIC)	6.30AV + 124.6
C-3A. Cooler with all-refrigerator – automatic defrost	4.11AV + 117.4
C-3A-BI. Built-in cooler with all-refrigerator – automatic defrost	4.67AV + 133.0
C-5-BI. Built-in cooler with refrigerator-freezer – automatic defrost with bottom-mounted freezer	5.47AV + 196.2 +28I
C-9. Cooler with upright freezer with automatic defrost without an automatic icemaker	5.58AV + 147.7 + 28I
C-9-BI. Built-in cooler with upright freezer with automatic defrost without an automatic icemaker	6.38AV + 168.8 + 28I
C-13A. Compact cooler with all-refrigerator – automatic defrost	4.74AV + 155.0
C-13A-BI. Built-in compact cooler with all-refrigerator – automatic defrost	5.22AV + 170.5
AV = Total adjusted volume, expressed in ft^3, as determined in appendices A and B of subpart B of 10 CFR part 430. av = Total adjusted volume, expressed in Liters. I = 1 for a product with an automatic icemaker and = 0 for a product without an automatic icemaker.	

A. Benefits and Costs to Consumers

Table I.2 summarizes DOE's evaluation of the economic impacts of the adopted standards on consumers of MREFs, as measured by the average life-cycle cost ("LCC") savings and the simple payback period ("PBP") [6] The average LCC savings are positive for all product classes, and the PBP is less than the average lifetime of MREFs, which varies by product class (see section IV.F of this document).

Table I.2 Impacts of Adopted Energy Conservation Standards on Consumers of MREFs (The Recommended TSL)

MREF Class	Average LCC Savings *2022$*	Simple Payback Period *Years*
BIC	53.56	4.4
BICC	1.53	8.1
C-13A	10.60	7.3
C-13A-BI	12.81	7.1
C-3A	30.95	1.7
C-3A-BI	36.19	1.6
FC	26.22	8.5
FCC	12.97	6.8

BILLING CODE 6450–01–C

DOE's analysis of the impacts of the adopted standards on consumers is described in section IV.F of this document.

B. Impact on Manufacturers [7]

The industry net present value ("INPV") is the sum of the discounted cash flows to the industry from the base year through the end of the analysis period (2024–2058). Using a real discount rate of 7.7 percent, DOE estimates that the INPV for manufacturers of MREFs in the case without amended standards is $807.7 million. Under the adopted standards, which align with the Recommended TSL (*i.e.,* TSL 4) for MREFs, DOE estimates the change in INPV to range

[6] The average LCC savings refer to consumers that are affected by a standard and are measured relative to the efficiency distribution in the no-new-standards case, which depicts the market in the compliance year in the absence of new or amended standards (see section IV.F.9 of this document). The simple PBP, which is designed to compare specific efficiency levels, is measured relative to the baseline product (see section IV.C of this document).

[7] All monetary values in this document are expressed in 2022 dollars. unless indicated otherwise. For purposes of discounting future monetary values, the present year in the analysis was 2024.

from −11.4 percent to −7.5 percent, which is approximately −$92.1 million to −$60.3 million. In order to bring products into compliance with amended standards, it is estimated that industry will incur total conversion costs of $130.7 million.

DOE's analysis of the impacts of the adopted standards on manufacturers is described in sections IV.J and V.B.2 of this document.

C. National Benefits and Costs

DOE's analyses indicate that the adopted energy conservation standards for MREFs would save a significant amount of energy. Relative to the case without amended standards, the lifetime energy savings for MREFs purchased in the 30-year period that begins in the anticipated year of compliance with the amended standards (2029–2058) amount to 0.32 quadrillion British thermal units (''Btu''), or quads.[8] This represents a savings of 26 percent relative to the energy use of these products in the case without amended standards (referred to as the ''no-new-standards case'').

The cumulative net present value (''NPV'') of total consumer benefits of the standards for MREFs ranges from $0.17 billion (at a 7-percent discount rate) to $0.77 billion (at a 3-percent discount rate). This NPV expresses the estimated total value of future operating-cost savings minus the estimated increased product costs for MREFs purchased in 2029–2058.

In addition, the adopted standards for MREFs are projected to yield significant environmental benefits. DOE estimates that the standards will result in cumulative emission reductions (over the same period as for energy savings) of 5.85 million metric tons (''Mt'')[9] of carbon dioxide (''CO_2''), 1.84 thousand tons of sulfur dioxide (''SO_2''), 10.77 thousand tons of nitrogen oxides (''NO_X''), 48.64 thousand tons of methane (''CH_4''), 0.06 thousand tons of nitrous oxide (''N_2O''), and 0.01 tons of mercury (''Hg'').[10]

DOE estimates the value of climate benefits from a reduction in greenhouse gases (''GHG'') using four different estimates of the social cost of CO_2 (''SC–CO_2''), the social cost of methane (''SC–CH_4''), and the social cost of nitrous oxide (''SC–N_2O''). Together these represent the social cost of GHG (''SC–GHG''). DOE used interim SC–GHG values (in terms of benefit per ton of GHG avoided) developed by an Interagency Working Group on the Social Cost of Greenhouse Gases (''IWG'').[11] The derivation of these values is discussed in section IV.L of this document. For presentational purposes, the climate benefits associated with the average SC–GHG at a 3-percent discount rate are estimated to be $0.32 billion. DOE does not have a single central SC–GHG point estimate and it emphasizes the value of considering the benefits calculated using all four sets of SC–GHG estimates. DOE notes, however, that the adopted standards would be economically justified even without inclusion of the estimated monetized benefits of reduced GHG emissions.

DOE estimated the monetary health benefits of SO_2 and NO_X emissions reductions, using benefit per ton estimates from the Environmental Protection Agency (''EPA''),[12] as discussed in section IV.L of this document. DOE estimated the present value of the health benefits would be $0.24 billion using a 7-percent discount rate, and $0.62 billion using a 3-percent discount rate.[13] DOE is currently only monetizing health benefits from changes in ambient fine particulate matter (''$PM_{2.5}$'') concentrations from two precursors (SO_2 and NO_X), and from changes in ambient ozone from one precursor (for NO_X), but will continue to assess the ability to monetize other effects such as health benefits from reductions in direct $PM_{2.5}$ emissions.

Table I.3 summarizes the monetized benefits and costs expected to result from the amended standards for MREFs. There are other important unquantified effects, including certain unquantified climate benefits, unquantified public health benefits from the reduction of toxic air pollutants and other emissions, unquantified energy security benefits, and distributional effects, among others.

BILLING CODE 6450–01–P

[8] The quantity refers to full-fuel-cycle (''FFC'') energy savings. FFC energy savings includes the energy consumed in extracting, processing, and transporting primary fuels (*i.e.,* coal, natural gas, petroleum fuels), and, thus, presents a more complete picture of the impacts of energy efficiency standards. For more information on the FFC metric, see section IV.H.1 of this document.

[9] A metric ton is equivalent to 1.1 short tons. Results for emissions other than CO_2 are presented in short tons.

[10] DOE calculated emissions reductions relative to the no-new-standards-case, which reflects key assumptions in the *Annual Energy Outlook 2023* (''*AEO2023*''). *AEO2023* represents current Federal and State legislation and final implementation of regulations as of the time of its preparation. See section IV.K of this document for further discussion of *AEO2023* assumptions that affect air pollutant emissions.

[11] To monetize the benefits of reducing GHG emissions this analysis uses the interim estimates presented in the *Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates Under Executive Order 13990* published in February 2021 by the IWG. (''February 2021 SC–GHG TSD''). *www.whitehouse.gov/wp-content/uploads/2021/02/TechnicalSupportDocument_SocialCostofCarbonMethaneNitrousOxide.pdf* (last accessed November 29, 2023.)

[12] U.S. EPA. Estimating the Benefit per Ton of Reducing Directly Emitted $PM_{2.5}$, $PM_{2.5}$ Precursors and Ozone Precursors from 21 Sectors. Available at *www.epa.gov/benmap/estimating-benefit-ton-reducing-pm25-precursors-21-sectors* (last accessed November 29, 2023.)

[13] DOE estimates the economic value of these emissions reductions resulting from the considered TSLs for the purpose of complying with the requirements of Executive Order 12866.

Table I.3 Summary of Monetized Benefits and Costs of Adopted Energy Conservation Standards for Miscellaneous Refrigeration Products Shipped in 2029-2058 (TSL 4, the Recommended TSL)

	Billion $2022
3% discount rate	
Consumer Operating Cost Savings	2.00
Climate Benefits*	0.32
Health Benefits**	0.62
Total Benefits†	2.94
Consumer Incremental Product Costs‡	1.23
Net Benefits	1.71
Change in Producer Cashflow (INPV)‡‡	(0.09) - (0.06)
7% discount rate	
Consumer Operating Cost Savings	0.86
Climate Benefits* (3% discount rate)	0.32
Health Benefits**	0.24
Total Benefits†	1.42
Consumer Incremental Product Costs‡	0.69
Net Benefits	0.73
Change in Producer Cashflow (INPV)‡‡	(0.09) - (0.06)

Note: This table presents the costs and benefits associated with MREFs shipped during the period 2029−2058. These results include consumer, climate, and health benefits that accrue after 2058 from the products shipped in 2029−2058.
* Climate benefits are calculated using four different estimates of the social cost of carbon (SC-CO_2), methane (SC-CH_4), and nitrous oxide (SC-N_2O) (model average at 2.5 percent, 3 percent, and 5 percent discount rates; 95th percentile at 3 percent discount rate) (see section IV.L of this document). Together these represent the global SC-GHG. For presentational purposes of this table, the climate benefits associated with the average SC-GHG at a 3 percent discount rate are shown; however, DOE emphasizes the importance and value of considering the benefits calculated using all four sets of SC-GHG estimates. To monetize the benefits of reducing GHG emissions, this analysis uses the interim estimates presented in the *Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates Under Executive Order 13990* published in February 2021 by the IWG.
** Health benefits are calculated using benefit-per-ton values for NO_X and SO_2. DOE is currently only monetizing (for SO_2 and NO_X) $PM_{2.5}$ precursor health benefits and (for NO_X) ozone precursor health benefits but will continue to assess the ability to monetize other effects such as health benefits from reductions in direct $PM_{2.5}$ emissions. See section IV.L of this document for more details.
† Total and net benefits include those consumer, climate, and health benefits that can be quantified and monetized. For presentation purposes, total and net benefits for both the 3-percent and 7-percent cases are presented using the average SC-GHG with 3-percent discount rate.
‡ Costs include incremental equipment costs.
‡‡Operating Cost Savings are calculated based on the life cycle costs analysis and national impact analysis as discussed in detail below. See sections IV.F and IV.H of this document. DOE's national impacts analysis includes all impacts (both costs and benefits) along the distribution chain beginning with the increased costs to the manufacturer to manufacture the product and ending with the increase in price

experienced by the consumer. DOE also separately conducts a detailed analysis on the impacts on manufacturers (*i.e.*, manufacturer impact analysis, or "MIA"). See section IV.J of this document. In the detailed MIA, DOE models manufacturers' pricing decisions based on assumptions regarding investments, conversion costs, cashflow, and margins. The MIA produces a range of impacts, which is the rule's expected impact on the INPV. The change in INPV is the present value of all changes in industry cash flow, including changes in production costs, capital expenditures, and manufacturer profit margins. Change in INPV is calculated using the industry weighted average cost of capital value of 7.7 percent that is estimated in the manufacturer impact analysis (see chapter 12 of the direct final rule TSD for a complete description of the industry weighted average cost of capital). For MREFs, the change in INPV ranges from -$92 million to -$60 million. DOE accounts for that range of likely impacts in analyzing whether a trial standard level is economically justified. See section V.C of this document. DOE is presenting the range of impacts to the INPV under two manufacturer markup scenarios: the Preservation of Gross Margin scenario, which is the manufacturer markup scenario used in the calculation of Consumer Operating Cost Savings in this table; and the Preservation of Operating Profit scenario, where DOE assumed manufacturers would not be able to increase per-unit operating profit in proportion to increases in manufacturer production costs. DOE includes the range of estimated INPV in the above table, drawing on the MIA explained further in section IV.J of this document to provide additional context for assessing the estimated impacts of this direct final rule to society, including potential changes in production and consumption, which is consistent with OMB's Circular A-4 and E.O. 12866. If DOE were to include the INPV into the net benefit calculation for this direct final rule, the net benefits would range from $1.62 billion to $1.65 billion at 3-percent discount rate and would range from $0.64 billion to $0.67 billion at 7-percent discount rate. Parentheses indicate negative (-) values.

The benefits and costs of the adopted standards can also be expressed in terms of annualized values. The monetary values for the total annualized net benefits are (1) the reduced consumer operating costs, minus (2) the increase in product purchase prices and installation costs, plus (3) the value of climate and health benefits of emission reductions, all annualized.[14]

The national operating cost savings are domestic private U.S. consumer monetary savings that occur as a result of purchasing the covered products and are measured for the lifetime of MREFs shipped during the period 2029 – 2058. The benefits associated with reduced emissions achieved as a result of the adopted standards are also calculated based on the lifetime of MREFs shipped during the period 2029–2058. Total benefits for both the 3-percent and 7-percent cases are presented using the average GHG social costs with 3-percent discount rate. Estimates of SC–GHG values are presented for all four discount rates in section IV.L of this document.

Table I.4 presents the total estimated monetized benefits and costs associated with the standards adopted in this direct final rule, expressed in terms of annualized values. The results under the primary estimate are as follows.

Using a 7-percent discount rate for consumer benefits and costs and health benefits from reduced NO_X and SO_2 emissions, and the 3-percent discount rate case for climate benefits from reduced GHG emissions, the estimated cost of the standards adopted in this direct final rule is $72.7 million per year in increased equipment costs, while the estimated annual benefits are $90.6 million in reduced equipment operating costs, $18.3 million in climate benefits, and $25.6 million in health benefits. In this case, the net benefit would amount to $61.7 million per year.

Using a 3-percent discount rate for all benefits and costs, the estimated cost of the standards is $70.8 million per year in increased equipment costs, while the estimated annual benefits are $115 million in reduced operating costs, $18.3 million in climate benefits, and $35.6 million in health benefits. In this case, the net benefit amounts to $98.0 million per year.

[14] To convert the time-series of costs and benefits into annualized values, DOE calculated a present value in 2022, the year used for discounting the NPV of total consumer costs and savings. For the benefits, DOE calculated a present value associated with each year's shipments in the year in which the shipments occur (*e.g.,* 2030), and then discounted the present value from each year to 2022. Using the present value, DOE then calculated the fixed annual payment over a 30-year period, starting in the compliance year, that yields the same present value.

Table I.4 Annualized Benefits and Costs of Adopted Standards for MREFs Shipped 2028 to 2057 (TSL 4, the Recommended TSL)

	Million 2022$/year		
	Primary Estimate	Low-Net-Benefits Estimate	High-Net-Benefits Estimate
3% discount rate			
Consumer Operating Cost Savings	115.0	111.5	116.3
Climate Benefits*	18.3	17.7	18.5
Health Benefits**	35.6	34.5	36.0
Total Monetized Benefits†	168.9	163.7	170.7
Consumer Incremental Product Costs‡	70.8	74.9	68.7
Monetized Net Benefits	98.0	88.8	102.0
Change in Producer Cashflow (INPV)‡‡	(7.7) - (5.0)		
7% discount rate			
Consumer Operating Cost Savings	90.6	88.1	91.5
Climate Benefits* (3% discount rate)	18.3	17.7	18.5
Health Benefits**	25.6	24.9	25.8
Total Benefits†	134.4	130.7	135.7
Consumer Incremental Product Costs‡	72.7	75.8	70.9
Net Benefits	61.7	54.9	64.8
Change in Producer Cashflow (INPV)‡‡	(7.7) - (5.0)		

Note: This table presents the costs and benefits associated with MREFs shipped during the period 2029−2058. These results include consumer, climate, and health benefits that accrue after 2058 from the products shipped in 2029−2058. The Primary, Low Net Benefits, and High Net Benefits Estimates utilize projections of energy prices from the *AEO2023* Reference case, Low Economic Growth case, and High Economic Growth case, respectively. In addition, incremental equipment costs reflect a medium decline rate in the Primary Estimate, a low decline rate in the Low Net Benefits Estimate, and a high decline rate in the High Net Benefits Estimate. The methods used to derive projected price trends are explained in section IV.H.3 of this document. Note that the Benefits and Costs may not sum to the Net Benefits due to rounding.

* Climate benefits are calculated using four different estimates of the global SC-GHG (see section IV.L of this document). For presentational purposes of this table, the climate benefits associated with the average SC-GHG at a 3 percent discount rate are shown, but DOE does not have a single central SC-GHG point estimate, and it emphasizes the importance and value of considering the benefits calculated using all four sets of SC-GHG estimates. To monetize the benefits of reducing GHG emissions, this analysis uses the interim estimates presented in the *Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates Under Executive Order 13990* published in February 2021 by the IWG.

** Health benefits are calculated using benefit-per-ton values for NO_X and SO_2. DOE is currently only monetizing (for SO_2 and NO_X) $PM_{2.5}$ precursor health benefits and (for NO_X) ozone precursor health benefits but will continue to assess the ability to monetize other effects such as health benefits from reductions in direct $PM_{2.5}$ emissions. See section IV.L of this document for more details.

† Total benefits for both the 3-percent and 7-percent cases are presented using the average SC-GHG with 3-percent discount rate, but DOE does not have a single central SC-GHG point estimate.
‡ Costs include incremental equipment costs.
‡‡Operating Cost Savings are calculated based on the life cycle costs analysis and national impact analysis as discussed in detail below. See sections IV.F and IV.H of this document. DOE's national impacts analysis includes all impacts (both costs and benefits) along the distribution chain beginning with the increased costs to the manufacturer to manufacture the product and ending with the increase in price experienced by the consumer. DOE also separately conducts a detailed analysis on the impacts on manufacturers (*i.e.*, manufacturer impact analysis, or "MIA"). See section IV.J of this document. In the detailed MIA, DOE models manufacturers' pricing decisions based on assumptions regarding investments, conversion costs, cashflow, and margins. The MIA produces a range of impacts, which is the rule's expected impact on the INPV. The change in INPV is the present value of all changes in industry cash flow, including changes in production costs, capital expenditures, and manufacturer profit margins. The annualized change in INPV is calculated using the industry weighted average cost of capital value of 7.7 percent that is estimated in the MIA (see chapter 12 of the direct final rule technical support document for a complete description of the industry weighted average cost of capital). For MREFs, the annualized change in INPV ranges from $7.7 million to $5.0 million. DOE accounts for that range of likely impacts in analyzing whether a trial standard level is economically justified. See section V.C of this document. DOE is presenting the range of impacts to the INPV under two manufacturer markup scenarios: the Preservation of Gross Margin scenario, which is the manufacturer markup scenario used in the calculation of Consumer Operating Cost Savings in this table; and the Preservation of Operating Profit scenario, where DOE assumed manufacturers would not be able to increase per-unit operating profit in proportion to increases in manufacturer production costs. DOE includes the range of estimated annual change in INPV in the above table, drawing on the MIA explained further in section IV.J of this document to provide additional context for assessing the estimated impacts of this direct final rule to society, including potential changes in production and consumption, which is consistent with OMB's Circular A-4 and E.O. 12866. If DOE were to include the INPV into the annualized net benefit calculation for this direct final rule, the annualized net benefits would range from $90.3 million to $93.0 million at 3-percent discount rate and would range from $54.0 million to $56.7 million at 7-percent discount rate. Parentheses indicate negative (-) values.

BILLING CODE 6450–01–C

DOE's analysis of the national impacts of the adopted standards is described in sections IV.H, IV.K, and IV.L of this document.

D. Conclusion

DOE has determined that the Joint Agreement was submitted jointly by interested persons that are fairly representative of relevant points of view, in accordance with 42 U.S.C. 6295(p)(4)(A). After considering the analysis and weighing the benefits and burdens, DOE has determined that the recommended standards are in accordance with 42 U.S.C. 6295(o), which contains the criteria for prescribing new or amended standards. Specifically, the Secretary has determined that the adoption of the recommended standards would result in the significant conservation of energy and is technologically feasible and economically justified. In determining whether the recommended standards are economically justified, the Secretary has determined that the benefits of the recommended standards exceed the burdens. The Secretary has concluded that the recommended standards, when considering the benefits of energy savings, positive NPV of consumer benefits, emission reductions, the estimated monetary value of the emissions reductions, and positive average LCC savings, would yield benefits outweighing the negative impacts on some consumers and on manufacturers, including the conversion costs that could result in a reduction in INPV for manufacturers.

Using a 7-percent discount rate for consumer benefits and costs and NOx and SO_2 reduction benefits, and a 3-percent discount rate case for GHG social costs, the estimated cost of the standards for MREFs is $72.7 million per year in increased product costs, while the estimated annual benefits are $90.6 million in reduced product operating costs, $18.3 million in climate benefits, and $25.6 million in health benefits. The net benefit amounts to $61.7 million per year. DOE notes that the net benefits are substantial even in the absence of the climate benefits,[15] and DOE would adopt the same standards in the absence of such benefits.

The significance of energy savings offered by a new or amended energy conservation standard cannot be determined without knowledge of the specific circumstances surrounding a given rulemaking.[16] For example, some covered products and equipment have most of their energy consumption occur during periods of peak energy demand. The impacts of these products on the energy infrastructure can be more pronounced than products with relatively constant demand. Accordingly, DOE evaluates the significance of energy savings on a case-by-case basis.

As previously mentioned, the standards are projected to result in estimated national energy savings of 0.32 quads full-fuel-cycle ("FFC"), the equivalent of the primary annual energy use of 2.1 million homes. In addition, they are projected to reduce cumulative CO_2 emissions by 5.85 million metric tons. Based on these findings, DOE has determined the energy savings from the standard levels adopted in this direct final rule are "significant" within the meaning of 42 U.S.C. 6295(o)(3)(B). A more detailed discussion of the basis for

[15] The information on climate benefits is provided in compliance with Executive Order 12866.

[16] Procedures, Interpretations, and Policies for Consideration in New or Revised Energy Conservation Standards and Test Procedures for Consumer Products and Commercial/Industrial Equipment, 86 FR 70892, 70901 (Dec. 13, 2021).

these conclusions is contained in the remainder of this document and the accompanying technical support document (''TSD'').[17]

Under the authority provided by 42 U.S.C. 6295(p)(4), DOE is issuing this direct final rule amending the energy conservation standards for MREFs. Consistent with this authority, DOE is also simultaneously publishing elsewhere in this issue of the **Federal Register** a NOPR proposing standards that are identical to those contained in this direct final rule. *See* 42 U.S.C. 6295(p)(4)(A)(i).

II. Introduction

The following section briefly discusses the statutory authority underlying this direct final rule, as well as some of the relevant historical background related to the establishment of standards for MREFs.

A. Authority

EPCA authorizes DOE to regulate the energy efficiency of a number of consumer products and certain industrial equipment. Title III, Part B of EPCA [18] established the Energy Conservation Program for Consumer Products Other Than Automobiles, which, in addition to identifying particular consumer products and commercial equipment as covered under the statute, permits the Secretary of Energy to classify additional types of consumer products as covered products. (42 U.S.C. 6292(a)(20)) DOE added MREFs as covered products through a final determination of coverage published in the **Federal Register** on July 18, 2016 (the ''July 2016 Final Coverage Determination''). 81 FR 46768. MREFs are consumer refrigeration products other than refrigerators, refrigerator-freezers, or freezers, which include coolers and combination cooler refrigeration products. 10 CFR 430.2. MREFs include refrigeration products such as coolers (*e.g.,* wine chillers and other specialty products) and combination cooler refrigeration products (*e.g.,* wine chillers and other specialty compartments combined with a refrigerator, refrigerator-freezers, or freezers). EPCA further provides that, not later than 6 years after the issuance of any final rule establishing or amending a standard, DOE must publish either a notice of determination that standards for the product do not need to be amended, or a NOPR including new proposed energy conservation standards (proceeding to a final rule, as appropriate). (42 U.S.C. 6295(m)(1)) Not later than 3 years after issuance of a final determination not to amend standards, DOE must publish either a notice of determination that standards for the product do not need to be amended, or a NOPR including new proposed energy conservation standards (proceeding to a final rule, as appropriate). (42 U.S.C. 6295(m)(3)(B))

The energy conservation program under EPCA, consists essentially of four parts: (1) testing, (2) labeling, (3) the establishment of Federal energy conservation standards, and (4) certification and enforcement procedures. Relevant provisions of the EPCA specifically include definitions (42 U.S.C. 6291), test procedures (42 U.S.C. 6293), labeling provisions (42 U.S.C. 6294), energy conservation standards (42 U.S.C. 6295), and the authority to require information and reports from manufacturers (42 U.S.C. 6296).

Federal energy efficiency requirements for covered products established under EPCA generally supersede State laws and regulations concerning energy conservation testing, labeling, and standards. (42 U.S.C. 6297(a)–(c)) DOE may, however, grant waivers of Federal preemption in limited instances for particular State laws or regulations, in accordance with the procedures and other provisions set forth under EPCA. (*See* 42 U.S.C. 6297(d))

Subject to certain criteria and conditions, DOE is required to develop test procedures to measure the energy efficiency, energy use, or estimated annual operating cost of each covered product. (42 U.S.C. 6295(o)(3)(A) and 42 U.S.C. 6295(r)) Manufacturers of covered products must use the prescribed DOE test procedure as the basis for certifying to DOE that their products comply with the applicable energy conservation standards adopted under EPCA and when making representations to the public regarding the energy use or efficiency of those products. (42 U.S.C. 6293(c) and 6295(s)) Similarly, DOE must use these test procedures to determine whether the products comply with standards adopted pursuant to EPCA. (42 U.S.C. 6295(s)) The DOE test procedure for MREFs appears at appendix A (*Uniform Test Method for Measuring the Energy Consumption of Refrigerators, Refrigerator-Freezers, and Miscellaneous Refrigeration Products*).

DOE must follow specific statutory criteria for prescribing new or amended standards for covered products, including MREFs. Any new or amended standard for a covered product must be designed to achieve the maximum improvement in energy efficiency that the Secretary of Energy determines is technologically feasible and economically justified. (42 U.S.C. 6295(o)(2)(A) and 42 U.S.C. 6295(o)(3)(B)) Furthermore, DOE may not adopt any standard that would not result in the significant conservation of energy. (42 U.S.C. 6295(o)(3))

Moreover, DOE may not prescribe a standard (1) for certain products, including MREFs, if no test procedure has been established for the product, or (2) if DOE determines by rule that the standard is not technologically feasible or economically justified. (42 U.S.C. 6295(o)(3)(A)–(B)) In deciding whether a proposed standard is economically justified, DOE must determine whether the benefits of the standard exceed its burdens. (42 U.S.C. 6295(o)(2)(B)(i)) DOE must make this determination after receiving comments on the proposed standard, and by considering, to the greatest extent practicable, the following seven statutory factors:

(1) The economic impact of the standard on manufacturers and consumers of the products subject to the standard;

(2) The savings in operating costs throughout the estimated average life of the covered products in the type (or class) compared to any increase in the price, initial charges, or maintenance expenses for the covered products that are likely to result from the standard;

(3) The total projected amount of energy (or as applicable, water) savings likely to result directly from the standard;

(4) Any lessening of the utility or the performance of the covered products likely to result from the standard;

(5) The impact of any lessening of competition, as determined in writing by the Attorney General, that is likely to result from the standard;

(6) The need for national energy and water conservation; and

(7) Other factors the Secretary of Energy (''Secretary'') considers relevant.

(42 U.S.C. 6295(o)(2)(B)(i)(I)–(VII))

Further, EPCA, as codified, establishes a rebuttable presumption that a standard is economically justified if the Secretary finds that the additional cost to the consumer of purchasing a product complying with an energy conservation standard level will be less than three times the value of the energy savings during the first year that the consumer will receive as a result of the standard, as calculated under the applicable test procedure. (42 U.S.C. 6295(o)(2)(B)(iii))

[17] The direct final rule TSD is available in the docket for this rulemaking at *www.regulations.gov/docket/EERE-2020-BT-STD-0039/document.*

[18] For editorial reasons, upon codification in the U.S. Code, Part B was redesignated Part A.

EPCA, as codified, also contains what is known as an ''anti-backsliding'' provision, which prevents the Secretary from prescribing any amended standard that either increases the maximum allowable energy use or decreases the minimum required energy efficiency of a covered product. (42 U.S.C. 6295(o)(1)) Also, the Secretary may not prescribe an amended or new standard if interested persons have established by a preponderance of the evidence that the standard is likely to result in the unavailability in the United States in any covered product type (or class) of performance characteristics (including reliability), features, sizes, capacities, and volumes that are substantially the same as those generally available in the United States. (42 U.S.C. 6295(o)(4))

EPCA specifies requirements when promulgating an energy conservation standard for a covered product that has two or more subcategories. A rule prescribing an energy conservation standard for a type (or class) of product must specify a different standard level for a type or class of products that has the same function or intended use if DOE determines that products within such group (A) consume a different kind of energy from that consumed by other covered products within such type (or class); or (B) have a capacity or other performance-related feature which other products within such type (or class) do not have and such feature justifies a higher or lower standard. (42 U.S.C. 6295(q)(1)) In determining whether a performance-related feature justifies a different standard for a group of products, DOE considers such factors as the utility to the consumer of such a feature and other factors DOE deems appropriate. (*Id.*) Any rule prescribing such a standard must include an explanation of the basis on which such higher or lower level was established. (42 U.S.C. 6295(q)(2))

Additionally, pursuant to the amendments contained in the Energy Independence and Security Act of 2007 (''EISA 2007''), Public Law 110–140, final rules for new or amended energy conservation standards promulgated after July 1, 2010, are required to address standby mode and off mode energy use. (42 U.S.C. 6295(gg)(3)) Specifically, when DOE adopts a standard for a covered product after that date, it must, if justified by the criteria for adoption of standards under EPCA (42 U.S.C. 6295(o)), incorporate standby mode and off mode energy use into a single standard, or, if that is not feasible, adopt a separate standard for such energy use for that product. (42 U.S.C. 6295(gg)(3)(A)–(B)) DOE's current test procedure for MREFs addresses standby mode and off mode energy use, as do the amended standards adopted in this direct final rule.

Finally, EISA 2007 amended EPCA, in relevant part, to grant DOE authority to issue a final rule (*i.e.,* a ''direct final rule'') establishing an energy conservation standard upon receipt of a statement submitted jointly by interested persons that are fairly representative of relevant points of view (including representatives of manufacturers of covered products, States, and efficiency advocates), as determined by the Secretary, that contains recommendations with respect to an energy or water conservation standard. (42 U.S.C. 6295(p)(4)) Pursuant to 42 U.S.C. 6295(p)(4), the Secretary must also determine whether a jointly-submitted recommendation for an energy or water conservation standard satisfies 42 U.S.C. 6295(o) or 42 U.S.C. 6313(a)(6)(B), as applicable.

The direct final rule must be published simultaneously with a NOPR that proposes an energy or water conservation standard that is identical to the standard established in the direct final rule, and DOE must provide a public comment period of at least 110 days on this proposal. (42 U.S.C. 6295(p)(4)(A)–(B)) While DOE typically provides a comment period of 60 days on proposed standards, for a NOPR accompanying a direct final rule, DOE provides a comment period of the same length as the comment period on the direct final rule—*i.e.,* 110 days. Based on the comments received during this period, the direct final rule will either become effective, or DOE will withdraw it not later than 120 days after its issuance if: (1) one or more adverse comments is received, and (2) DOE determines that those comments, when viewed in light of the rulemaking record related to the direct final rule, may provide a reasonable basis for withdrawal of the direct final rule under 42 U.S.C. 6295(o). (42 U.S.C. 6295(p)(4)(C)) Receipt of an alternative joint recommendation may also trigger a DOE withdrawal of the direct final rule in the same manner. (*Id.*)

DOE has previously explained its interpretation of its direct final rule authority. In a final rule amending the Department's ''Procedures, Interpretations and Policies for Consideration of New or Revised Energy Conservation Standards for Consumer Products'' at 10 CFR part 430, subpart C, appendix A (''Process Rule''), DOE noted that it may issue standards recommended by interested persons that are fairly representative of relative points of view as a direct final rule when the recommended standards are in accordance with 42 U.S.C. 6295(o) or 42 U.S.C. 6313(a)(6)(B), as applicable. 86 FR 70892, 70912 (Dec. 13, 2021). But the direct final rule provision in EPCA does not impose additional requirements applicable to other standards rulemakings, which is consistent with the unique circumstances of rules issued as consensus agreements under DOE's direct final rule authority. *Id.* DOE's discretion remains bounded by its statutory mandate to adopt a standard that results in the maximum improvement in energy efficiency that is technologically feasible and economically justified—a requirement found in 42 U.S.C. 6295(o). *Id.* As such, DOE's review and analysis of the Joint Agreement is limited to whether the recommended standards satisfy the criteria in 42 U.S.C. 6295(o).

B. Background

1. Current Standards

In a direct final rule published on October 28, 2016 (''October 2016 Final Rule''), DOE prescribed the current energy conservation standards for MREFs manufactured on and after October 28, 2019. 81 FR 75194. These standards are set forth in DOE's regulations at 10 CFR 430.32(aa)(1)–(2). These standards are consistent with a negotiated term sheet submitted to DOE by interested parties representing manufacturers, energy and environmental advocates, and consumer groups.[19]

2. Current Test Procedures

On October 12, 2021, DOE published a test procedure final rule (''October 2021 TP Final Rule'') amending the test procedure for MREFs, at appendix A. 86 FR 56790. The test procedure amendments included adopting the latest version of the relevant industry standard published by the Association of Home Appliance Manufacturers (''AHAM''), updated in 2019, AHAM Standard HRF–1, ''Energy and Internal Volume of Refrigerating Appliances'' (''HRF–1–2019''). 10 CFR 430.3(i)(4). The standard levels adopted in this direct final rule are based on the annual energy use (''AEU'') metrics as measured according to appendix A.

[19] The negotiated term sheets are available in docket ID EERE–2011–BT–STD–0043 on *www.regulations.gov.*

3. History of Standards Rulemaking for MREFs

On April 1, 2015, DOE published a notice announcing its intention to establish a negotiated rulemaking working group under the Appliance Standards Rulemaking Advisory Committee (''ASRAC'') to negotiate energy conservation standards for refrigeration products such as wine chillers. 80 FR 17355. DOE then created a working group of interested parties to develop a series of recommended energy conservation standards for MREFs. On July 18, 2016, DOE published the July 2016 Final Coverage Determination that added MREFs as covered products. 81 FR 46768. In that determination, DOE noted that MREFs, on average, consume more than 150 kilowatt hours per year (''kWh/yr'') and that the aggregate annual national energy use of these products exceeds 4.2 terawatt hours (''TWh''). 81 FR 46768, 46775. In addition to establishing coverage, the July 2016 Final Coverage Determination established definitions for ''miscellaneous refrigeration products,'' ''coolers,'' and ''combination cooler refrigeration products'' in 10 CFR 430.2. 81 FR 46768, 46791–46792.

On October 28, 2016, a negotiated term sheet containing a series of recommended standards and other related recommendations were submitted to ASRAC for approval and, subsequently, DOE published the October 2016 Direct Final Rule adopting energy conservation standards consistent with the recommendations contained in the term sheet. 81 FR 75194. Concurrent with the October 2016 Direct Final Rule, DOE published a NOPR in which it proposed and requested comments on the standards set forth in the direct final rule. 81 FR 74950. On May 26, 2017, DOE published a notice in the **Federal Register** in which it determined that the comments received in response to the October 2016 Direct Final Rule did not provide a reasonable basis for withdrawing the rule and, therefore, confirmed the adoption of the energy conservation standards established in that direct final rule. 82 FR 24214.

4. The Joint Agreement

On September 25, 2023, DOE received a joint statement of recommended standards (*i.e.,* the Joint Agreement) for various consumer products, including MREFs, submitted jointly by groups representing manufacturers, energy and environmental advocates, consumer groups, and a utility.[20] In addition to the recommended standards for MREFs, the Joint Agreement also included separate recommendations for several other covered products.[21] And, while acknowledging that DOE may implement these recommendations in separate rulemakings, the Joint Agreement also stated that the recommendations were recommended as a complete package and each recommendation is contingent upon the other parts being implemented. DOE understands this to mean that the Joint Agreement is contingent upon DOE initiating rulemaking processes to adopt all of the recommended standards in the agreement. That is distinguished from an agreement where issuance of an amended energy conservation standard for a covered product is contingent on issuance of amended energy conservation standards for the other covered products. If the Joint Agreement were so construed, it would conflict with the anti-backsliding provision in 42 U.S.C. 6295(o)(1), because it would imply the possibility that, if DOE were unable to issue an amended standard for a certain product, it would have to withdraw a previously issued standard for one of the other products. The anti-backsliding provision, however, prevents DOE from withdrawing or amending an energy conservation standard to be less stringent. As a result, DOE will be proceeding with individual rulemakings that will evaluate each of the recommended standards separately under the applicable statutory criteria. The Joint Agreement recommends amended standard levels for MREFs as presented in Table II.3. (Joint Agreement, No. 34 at p. 4) Details of the Joint Agreement recommendations for other products are provided in the Joint Agreement posted in the docket.[22]

BILLING CODE 6450–01–P

[20] The signatories to the Joint Agreement include AHAM, American Council for an Energy-Efficient Economy, Alliance for Water Efficiency, Appliance Standards Awareness Project, Consumer Federation of America, Consumer Reports, Earthjustice, National Consumer Law Center, Natural Resources Defense Council, Northwest Energy Efficiency Alliance, and Pacific Gas and Electric Company. Members of AHAM's Major Appliance Division that manufacture the affected products include: Alliance Laundry Systems, LLC; Asko Appliances AB; Beko US Inc.; Brown Stove Works, Inc.; BSH; Danby Products, Ltd.; Electrolux Home Products, Inc.; Elicamex S.A. de C.V.; Faber; Fotile America; GEA, a Haier Company; L'Atelier Paris Haute Design LLG; LGEUSA; Liebherr USA, Co.; Midea America Corp.; Miele, Inc.; Panasonic Appliances Refrigeration Systems (PAPRSA) Corporation of America; Perlick Corporation; Samsung; Sharp Electronics Corporation; Smeg S.p.A; Sub-Zero Group, Inc.; The Middleby Corporation; U-Line Corporation; Viking Range, LLC; and Whirlpool.

[21] The Joint Agreement contained recommendations for 6 covered products: refrigerators, refrigerator-freezers, and freezers; clothes washers; clothes dryers; dishwashers; cooking products; and miscellaneous refrigeration products.

[22] The term sheet is available in the docket at: *www.regulations.gov/document/EERE-2020-BT-STD-0039-0034.*

Table II.1 Recommended Amended Energy Conservation Standards for Miscellaneous Refrigeration Products

Product Class	Level (Based on AV (ft^3))	Compliance Date
1. Freestanding Compact Coolers (FCC)	5.52AV +109.1	January 31, 2029
2. Freestanding Coolers (FC)	5.52AV +109.1	January 31, 2029
3. Built-in Compact Coolers (BICC)	5.52AV +109.1	January 31, 2029
4. Built-in Coolers (BIC)	6.30AV + 124.6	January 31, 2029
C-3A. Cooler with all-refrigerator – automatic defrost	4.11AV + 117.4	January 31, 2029
C-3A-BI. Built-in cooler with all-refrigerator – automatic defrost	4.67AV + 133.0	January 31, 2029
C-5-BI. NEW PRODUCT CLASS: Built-in cooler with refrigerator-freezer – automatic defrost with bottom-mounted freezer	5.47AV + 196.2 +28I	January 31, 2029
C-9. Cooler with upright freezer with automatic defrost without an automatic icemaker	5.58AV + 147.7 + 28I	January 31, 2029
C-9-BI. Built-in cooler with upright freezer with automatic defrost without an automatic icemaker	6.38AV + 168.8 + 28I	January 31, 2029
C-13A. Compact cooler with all-refrigerator – automatic defrost	4.74AV + 155.0	January 31, 2029
C-13A-BI. Built-in compact cooler with all-refrigerator – automatic defrost	5.22AV + 170.5	January 31, 2029
AV = Total adjusted volume, expressed in ft^3, as determined in appendices A and B of subpart B of 10 CFR part 430. I = 1 for a product with an automatic icemaker and = 0 for a product without an automatic icemaker.		

BILLING CODE 6450–01–C

When the Joint Agreement was submitted, DOE was conducting a rulemaking to consider amending the standards for MREFs. As part of that process, DOE published a NOPR and announced a public meeting on March 31, 2023 (''March 2023 NOPR'') seeking comment on its proposed amended standards to inform its decision consistent with its obligations under EPCA and the Administrative Procedure Act (''APA''). 88 FR 19382. DOE held a public webinar on May 2, 2023, to discuss and receive comments on the March 2023 NOPR and NOPR TSD (''May 2, 2023, public meeting''). The NOPR TSD is available at: *www.regulations.gov/document/EERE-2020-BT-STD-0039-0026.* The March 2023 NOPR proposed amended standards defined in terms of the AEU metrics as measured according to appendix A. *Id.* at 88 FR 19383–19384.

Although DOE is adopting the Joint Agreement as a direct final rule and no longer proceeding with its prior rulemaking, DOE did consider relevant comments, data, and information obtained during that rulemaking process in determining whether the recommended standards from the Joint Agreement are in accordance with 42 U.S.C. 6295(o). Any discussion of comments, data, or information in this direct final rule that were obtained during DOE's prior rulemaking will include a parenthetical reference that provides the location of the item in the public record.[23]

III. General Discussion

DOE is issuing this direct final rule after determining that the recommended standards submitted in the Joint Agreement meet the requirements in 42 U.S.C. 6295(p)(4). More specifically, DOE has determined that the recommended standards were submitted by interested persons that are fairly representative of relevant points of view and the recommended standards satisfy the criteria in 42 U.S.C. 6295(o).

A. Scope of Coverage

This direct final rule covers those consumer products that meet the definition of ''miscellaneous refrigeration product,'' as codified at 10 CFR 430.2, which states that it is a consumer refrigeration product other than a refrigerator, refrigerator-freezer, or freezer, which includes coolers and combination cooler refrigeration products.

The differences between miscellaneous refrigeration products and other consumer refrigeration products, which were addressed in a separate rulemaking for refrigerators, refrigerator-freezers, and freezers, are largely in compartment temperature capability. Refrigerators are broadly defined as a cabinet capable of maintaining a compartment temperature above 32 °F and below 39 °F. Freezers are broadly defined as a cabinet capable of maintaining compartment temperature of 0 °F or below. Refrigerator-freezers have two or more compartments, with one capable of maintaining compartment temperatures above 32 °F and below 39 °F (*i.e.,* a fresh food or refrigerator compartment), and the other capable of maintaining a compartment temperature of 8 °F with adjustability down to 0 °F or below (*i.e.,* a frozen food or freezer compartment). Miscellaneous refrigeration products generally include a cooler compartment that is incapable of maintaining the low temperatures achieved by refrigerators, refrigerator-freezers, and freezers.

[23] The parenthetical reference provides a reference for information located in the docket of DOE's rulemaking to develop energy conservation standards for MREFs. (Docket No. EERE–2020–BT–STD–0039, which is maintained at *www.regulations.gov*). The references are arranged as follows: (commenter name, comment docket ID number, page of that document).

Coolers (and cooler compartments) have temperature ranges that either extend no lower than 39 °F, or no lower than 37 °F but at least as high as 60 °F. Combination-coolers contain a fresh food and/or frozen food compartment in addition to one or more cooler compartments. *See* 10 CFR 430.2 for more information regarding consumer refrigeration products definitions.

When evaluating and establishing energy conservation standards, DOE divides covered products into product classes by the type of energy used, or by capacity, or based upon performance-related features that justify a higher or lower standard. (42 U.S.C. 6295(q)) In making a determination whether a performance-related feature justifies a different standard, DOE must consider such factors as the utility of the feature to the consumer and other factors DOE determines are appropriate. (*Id.*)

The Joint Agreement proposed approach for MREF product classes embeds within the energy use equations the difference between classes for MREFs that are otherwise identical except for presence of an icemaker, using a logical variable I (equal to 1 for a product with an icemaker and equal to 0 for a product without an icemaker) multiplied by the constant icemaker energy use adder.

The product class representation simplification in the Joint Agreement is consistent with what was proposed by DOE in the March 2023 NOPR. Based on the comments received in response to the March 2023 NOPR and DOE's evaluation of the Joint Agreement, this direct final rule adopts this change. See section IV.A.1 of this document for further detail and discussion regarding the product classes analyzed in this direct final rule.

B. Fairly Representative of Relevant Point of View

Under the direct final rule provision in EPCA, recommended energy conservation standards must be submitted by interested persons that are fairly representative of relevant points of view (including representatives of manufacturers of covered products, States, and efficiency advocates) as determined by DOE. (42 U.S.C. 6295(p)(4)(A)) With respect to this requirement, DOE notes that the Joint Agreement included a trade association, AHAM, which represents 15 manufacturers of MREFs.[24] The Joint Agreement also included environmental and energy-efficiency advocacy organizations, consumer advocacy organizations, and a gas and electric utility company. As a result, DOE has determined that the Joint Agreement was submitted by interested persons who are fairly representative of relevant points of view. Additionally, DOE received a letter in support of the Joint Agreement from the States of New York, California, and Massachusetts. (See NYSERDA, et al., No. 35 at p. 2) DOE also received a letter in support of the Joint Agreement from the gas and electric utility, SDG&E, and the electric utility, SCE (See SDG&E, et al., No. 36 at p. 1).

C. Technological Feasibility

1. General

In each energy conservation standards rulemaking, DOE conducts a screening analysis based on information gathered on all current technology options and prototype designs that could improve the efficiency of the products or equipment that are the subject of the rulemaking. As the first step in such an analysis, DOE develops a list of technology options for consideration in consultation with manufacturers, design engineers, and other interested parties. DOE then determines which of those means for improving efficiency are technologically feasible. DOE considers technologies incorporated in commercially available products or in working prototypes to be technologically feasible. Sections 6(b)(3)(i) and 7(b)(1) of appendix A to 10 CFR part 430, subpart C (''Process Rule'').

After DOE has determined that particular technology options are technologically feasible, it further evaluates each technology option in light of the following additional screening criteria: (1) practicability to manufacture, install, and service; (2) adverse impacts on product utility or availability; (3) adverse impacts on health or safety and (4) unique-pathway proprietary technologies. Sections 7(b)(2)–(5) of the Process Rule. Section IV.B of this document discusses the results of the screening analysis for MREFs, particularly the designs DOE considered, those it screened out, and those that are the basis for the standards considered in this rulemaking. For further details on the screening analysis for this rulemaking, see chapter 4 of the direct final rule TSD.

2. Maximum Technologically Feasible Levels

When DOE proposes to adopt a new or amended standard for a type or class of covered product, it must determine the maximum improvement in energy efficiency or maximum reduction in energy use that is technologically feasible for such product. (42 U.S.C. 6295(o)(2)(A)) Accordingly, in the engineering analysis, DOE determined the maximum technologically feasible (''max-tech'') improvements in energy efficiency for MREFs, using the design parameters for the most efficient products available on the market or in working prototypes. The max-tech levels that DOE determined for this rulemaking are described in section IV.C of this document and in chapter 5 of the direct final rule TSD.

D. Energy Savings

1. Determination of Savings

For each TSL, DOE projected energy savings from application of the TSL to MREFs purchased in the 30-year period that begins in the year of compliance with the amended standards (2029–2058).[25] The savings are measured over the entire lifetime of products purchased in the 30-year analysis period. DOE quantified the energy savings attributable to each TSL as the difference in energy consumption between each standards case and the no-new-standards case. The no-new-standards case represents a projection of energy consumption that reflects how the market for a product would likely evolve in the absence of amended energy conservation standards.

DOE used its national impact analysis (''NIA'') spreadsheet models to estimate national energy savings (''NES'') from potential amended standards for MREFs. The NIA spreadsheet model (described in section IV.H of this document) calculates energy savings in terms of site energy, which is the energy directly consumed by products at the locations where they are used. For electricity, DOE reports national energy savings in terms of primary energy savings, which is the savings in the energy that is used to generate and transmit the site electricity. For natural gas, the primary energy savings are considered to be equal to the site energy savings. DOE also calculates NES in terms of FFC energy savings. The FFC metric includes the energy consumed in

[24] Manufacturers listed in the Joint Agreement include: Asko Appliances AB, BSH Home Appliances Corporation, Danby Products, Ltd., Electrolux Home Products, Inc, GE Appliances, a Haier Company, Liebherr USA, Co., Electronics America Inc., LG Electronics, Midea America Corp., Miele, Inc., Panasonic Appliances Refrigeration Systems (PAPRSA) Corporation of America, Smeg S.p.A, Sub-Zero Group, Inc., The Middleby Corporation (listed with subsidiaries U-Line Corporation and Viking Range, LLC).

[25] DOE also presents a sensitivity analysis that considers impacts for products shipped in a 9-year period.

extracting, processing, and transporting primary fuels (*i.e.,* coal, natural gas, petroleum fuels), and thus presents a more complete picture of the impacts of energy conservation standards.[26] DOE's approach is based on the calculation of an FFC multiplier for each of the energy types used by covered products or equipment. For more information on FFC energy savings, see section IV.H.2 of this document.

2. Significance of Savings

To adopt any new or amended standards for a covered product, DOE must determine that such action would result in significant energy savings. (42 U.S.C. 6295(o)(3)(B))

The significance of energy savings offered by a new or amended energy conservation standard cannot be determined without knowledge of the specific circumstances surrounding a given rulemaking. For example, some covered products and equipment have most of their energy consumption occur during periods of peak energy demand. The impacts of these products on the energy infrastructure can be more pronounced than products with relatively constant demand. Accordingly, DOE evaluates the significance of energy savings on a case-by-case basis, taking into account the significance of cumulative FFC national energy savings, the cumulative FFC emissions reductions, and the need to confront the global climate crisis, among other factors.

As stated, the standard levels adopted in this direct final rule are projected to result in national energy savings of 0.32 quads (FFC), the equivalent of the primary annual energy use of 2.1 million homes. Based on the amount of FFC savings, the corresponding reduction in emissions, and need to confront the global climate crisis, DOE has determined the energy savings from the standard levels adopted in this direct final rule are ''significant'' within the meaning of 42 U.S.C. 6295(o)(3)(B).

E. Economic Justification

1. Specific Criteria

As noted previously, EPCA provides seven factors to be evaluated in determining whether a potential energy conservation standard is economically justified. (42 U.S.C. 6295(o)(2)(B)(i)(I)(VII)) The following sections discuss how DOE has addressed each of those seven factors in this rulemaking.

[26] The FFC metric is discussed in DOE's statement of policy and notice of policy amendment. 76 FR 51282 (Aug. 18, 2011), as amended at 77 FR 49701 (Aug. 17, 2012).

a. Economic Impact on Manufacturers and Consumers

In determining the impacts of potential amended standards on manufacturers, DOE conducts an MIA, as discussed in section IV.J of this document. DOE first uses an annual cash-flow approach to determine the quantitative impacts. This step includes both a short-term assessment—based on the cost and capital requirements during the period between when a regulation is issued and when entities must comply with the regulation—and a long-term assessment over a 30-year period. The industry-wide impacts analyzed include (1) INPV, which values the industry on the basis of expected future cash flows; (2) cash flows by year; (3) changes in revenue and income; and (4) other measures of impact, as appropriate. Second, DOE analyzes and reports the impacts on different types of manufacturers, including impacts on small manufacturers. Third, DOE considers the impact of standards on domestic manufacturer employment and manufacturing capacity, as well as the potential for standards to result in plant closures and loss of capital investment. Finally, DOE takes into account cumulative impacts of various DOE regulations and other regulatory requirements on manufacturers.

For individual consumers, measures of economic impact include the changes in LCC and PBP associated with new or amended standards. These measures are discussed further in the following section. For consumers in the aggregate, DOE also calculates the national net present value of the consumer costs and benefits expected to result from particular standards. DOE also evaluates the impacts of potential standards on identifiable subgroups of consumers that may be affected disproportionately by a standard.

b. Savings in Operating Costs Compared to Increase in Price (LCC and PBP)

EPCA requires DOE to consider the savings in operating costs throughout the estimated average life of the covered product in the type (or class) compared to any increase in the price of, or in the initial charges for, or maintenance expenses of, the covered product that are likely to result from a standard. (42 U.S.C. 6295(o)(2)(B)(i)(II)) DOE conducts this comparison in its LCC and PBP analysis.

The LCC is the sum of the purchase price of a product (including its installation) and the operating cost (including energy, maintenance, and repair expenditures) discounted over the lifetime of the product. The LCC analysis requires a variety of inputs, such as product prices, product energy consumption, energy prices, maintenance and repair costs, product lifetime, and discount rates appropriate for consumers. To account for uncertainty and variability in specific inputs, such as product lifetime and discount rate, DOE uses a distribution of values, with probabilities attached to each value.

The PBP is the estimated amount of time (in years) it takes consumers to recover the increased purchase cost (including installation) of a more-efficient product through lower operating costs. DOE calculates the PBP by dividing the change in purchase cost due to a more-stringent standard by the change in annual operating cost for the year that standards are assumed to take effect.

For its LCC and PBP analysis, DOE assumes that consumers will purchase the covered products in the first year of compliance with new or amended standards. The LCC savings for the considered efficiency levels are calculated relative to the case that reflects projected market trends in the absence of new or amended standards. DOE's LCC and PBP analysis is discussed in further detail in section IV.F of this document.

c. Energy Savings

Although significant conservation of energy is a separate statutory requirement for adopting an energy conservation standard, EPCA requires DOE, in determining the economic justification of a standard, to consider the total projected energy savings that are expected to result directly from the standard. (42 U.S.C. 6295(o)(2)(B)(i)(III)) As discussed in section IV.H of this document, DOE uses the NIA spreadsheet models to project national energy savings.

d. Lessening of Utility or Performance of Products

In establishing product classes, and in evaluating design options and the impact of potential standard levels, DOE evaluates potential standards that would not lessen the utility or performance of the considered products. (42 U.S.C. 6295(o)(2)(B)(i)(IV)) Based on data available to DOE, the standards adopted in this document would not reduce the utility or performance of the products under consideration in this rulemaking.

e. Impact of Any Lessening of Competition

EPCA directs DOE to consider the impact of any lessening of competition, as determined in writing by the

Attorney General, that is likely to result from a standard. (42 U.S.C. 6295(o)(2)(B)(i)(V)) It also directs the Attorney General to determine the impact, if any, of any lessening of competition likely to result from a standard and to transmit such determination to the Secretary within 60 days of the publication of a proposed rule, together with an analysis of the nature and extent of the impact. (42 U.S.C. 6295(o)(2)(B)(ii)) DOE will transmit a copy of this direct final rule to the Attorney General with a request that the Department of Justice (''DOJ'') provide its determination on this issue. DOE will consider DOJ's comments on the rule in determining whether to withdraw the direct final rule. DOE will also publish and respond to the DOJ's comments in the **Federal Register** in a separate notice.

f. Need for National Energy Conservation

DOE also considers the need for national energy and water conservation in determining whether a new or amended standard is economically justified. (42 U.S.C. 6295(o)(2)(B)(i)(VI)) The energy savings from the adopted standards are likely to provide improvements to the security and reliability of the Nation's energy system. Reductions in the demand for electricity also may result in reduced costs for maintaining the reliability of the Nation's electricity system. DOE conducts a utility impact analysis to estimate how standards may affect the Nation's needed power generation capacity, as discussed in section IV.M of this document.

DOE finds that environmental and public health benefits associated with the more efficient use of energy are important to take into account when considering the need for national energy conservation. The adopted standards are likely to result in environmental benefits in the form of reduced emissions of air pollutants and greenhouse gases (''GHGs'') associated with energy production and use. DOE conducts an emissions analysis to estimate how potential standards may affect these emissions, as discussed in section IV.K of this document; the estimated emissions impacts are reported in section V.B.6 of this document. DOE also estimates the economic value of emissions reductions resulting from the considered TSLs, as discussed in section IV.L of this document.

g. Other Factors

In determining whether an energy conservation standard is economically justified, DOE may consider any other factors that the Secretary deems to be relevant. (42 U.S.C. 6295(o)(2)(B)(i)(VII)) To the extent DOE identifies any relevant information regarding economic justification that does not fit into the other categories described previously, DOE could consider such information under ''other factors.''

2. Rebuttable Presumption

As set forth in 42 U.S.C. 6295(o)(2)(B)(iii), EPCA creates a rebuttable presumption that an energy conservation standard is economically justified if the additional cost to the consumer of a product that meets the standard is less than three times the value of the first year's energy savings resulting from the standard, as calculated under the applicable DOE test procedure. DOE's LCC and PBP analyses generate values used to calculate the effect potential amended energy conservation standards would have on the payback period for consumers. These analyses include, but are not limited to, the 3-year payback period contemplated under the rebuttable-presumption test. In addition, DOE routinely conducts an economic analysis that considers the full range of impacts to consumers, manufacturers, the Nation, and the environment, as required under 42 U.S.C. 6295(o)(2)(B)(i). The results of this analysis serve as the basis for DOE's evaluation of the economic justification for a potential standard level (thereby supporting or rebutting the results of any preliminary determination of economic justification). The rebuttable presumption payback calculation is discussed in section IV.F of this document.

IV. Methodology and Discussion of Related Comments

This section addresses the analyses DOE has performed for this rulemaking with regard to MREFs. Separate subsections address each component of DOE's analyses, including relevant comments DOE received in its separate rulemaking to amend the energy conservation standards for MREFs prior to receiving the Joint Agreement.

DOE used several analytical tools to estimate the impact of the standards considered in this document. The first tool is a spreadsheet that calculates the LCC savings and PBP of potential amended energy conservation standards. The national impacts analysis uses a second spreadsheet set that provides shipments projections and calculates national energy savings and net present value of total consumer costs and savings expected to result from potential energy conservation standards. DOE uses the third spreadsheet tool, the Government Regulatory Impact Model (''GRIM''), to assess manufacturer impacts of potential standards. These three spreadsheet tools are available on the DOE website for this rulemaking: *www.regulations.gov/docket/EERE-2020-BT-STD-0039.* Additionally, DOE used output from the latest version of the Energy Information Administration's (''EIA's'') *Annual Energy Outlook* (''*AEO*'') for the emissions and utility impact analyses.

A. Market and Technology Assessment

DOE develops information in the market and technology assessment that provides an overall picture of the market for the products concerned, including the purpose of the products, the industry structure, manufacturers, market characteristics, and technologies used in the products. This activity includes both quantitative and qualitative assessments, based primarily on publicly-available information. The subjects addressed in the market and technology assessment for this rulemaking include (1) a determination of the scope of the rulemaking and product classes, (2) manufacturers and industry structure, (3) existing efficiency programs, (4) shipments information, (5) market and industry trends, and (6) technologies or design options that could improve the energy efficiency of MREFs. The key findings of DOE's market assessment are summarized in the following sections. See chapter 3 of the direct final rule TSD for further discussion of the market and technology assessment.

1. Product Classes

The Joint Agreement specifies 11 product classes for MREFs. (Joint Agreement, No. 34 at p. 7) In particular, the Joint Agreement recommends a consolidated product class representation, which incorporates icemaker energy adders and door allowances into the energy use equations for product classes in which they are applicable. As discussed further in section IV.A.1.a of this document, DOE notes that the consolidation of product class representation in the Joint Agreement does not combine the product classes, but rather serves to simplify the list of classes, in particular for those product classes with and without icemakers, and facilitates the implementation of a single equation for representation of their maximum allowable energy use. In this direct final rule, DOE is adopting the product classes from the Joint Agreement, as listed in Table IV.1.

Table IV.1 Recommended Product Classes for Miscellaneous Refrigeration Products

Product Class
1. Freestanding Compact Coolers (FCC)
2. Freestanding Coolers (FC)
3. Built-in Compact Coolers (BICC)
4. Built-in Coolers (BIC)
C-3A. Cooler with all-refrigerator – automatic defrost
C-3A-BI. Built-in cooler with all-refrigerator – automatic defrost
C-5-BI. Built-in cooler with all-refrigerator
C-9. Cooler with upright freezer with automatic defrost without an automatic icemaker
C-9-BI. Built-in cooler with upright freezer with automatic defrost without an automatic icemaker
C-13A. Compact cooler with all-refrigerator – automatic defrost
C-13A-BI. Built-in compact cooler with all-refrigerator – automatic defrost

DOE further notes that product classes established through EPCA's direct final rule authority are not subject to the criteria specified at 42 U.S.C. 6295(q)(1) for establishing product classes. Nevertheless, in accordance with 42 U.S.C. 6295(o)(4)—which is applicable to direct final rules—DOE has concluded that the standards adopted in this direct final rule will not result in the unavailability in any covered product type (or class) of performance characteristics, features, sizes, capacities, and volumes that are substantially the same as those generally available in the United States currently.[27] DOE's findings in this regard are discussed in detail in section V.B.4 of this document.

a. Product Classes With Automatic Icemakers

The Joint Agreement includes a proposed simplification of maximum allowable energy and expresses the maximum allowable energy use for both icemaking and non-icemaking classes in the same equation, thus consolidating the presentation of classes and their energy conservation standards. The energy use equations will, for those classes that may or may not have an icemaker, include a term equal to the icemaking energy use adder multiplied by a factor that is defined to equal 1 for products with icemakers and to equal 0 for products without icemakers. This approach does not combine classes that are the same other than the presence of an icemaker but does simplify the list of classes and representation of their maximum allowable energy use, providing for each set of classes with and without ice makers a single equation for maximum energy use. This simplification is consistent with the approach proposed in the March 2023 NOPR. *See* 88 FR 19382, 19395.

In this direct final rule, DOE is adopting the Joint Agreement proposal to express the maximum allowable energy use for any set of classes differing only in whether the class includes an icemaker or not within a single equation. The single equation does this by including the icemaker energy use adder multiplied by logical variable I that is set equal to 1 for a product with an icemaker present and 0 for a product without an icemaker.

b. Addition of Product Class C–5–BI

The Joint Agreement recommends the addition of a new product class C–5–BI (*i.e.,* built-in combination cooler-refrigerator-freezers with bottom-mounted freezers and automatic icemakers) and specific energy efficiency standards for the new product class (''PC''). (Joint Agreement, No. 34 at p. 7) The current energy conservation standards for MREFs do not include a separate product class for products of this configuration. However, DOE has previously proposed establishing a separate product class for C–5–BI configurations in the March 2023 NOPR, with a baseline level of 6.08AV + 246 kWh/yr, based in part on input from commenters, and considered increased efficiency levels using PC C–3A–BI as a proxy. 88 FR 19382, 19395.

The Joint Agreement recommends a standard equation of 5.47AV + 196.2 + 28I kWh/yr for product class C–5–BI. DOE notes that this recommended level is consistent with the level proposed in the March 2023 NOPR for product class C–5–BI, which represents a 10 percent more stringent level than the baseline level identified in the March 2023 NOPR.

Considering that the recommendation is consistent with the proposed level in the March 2023 NOPR and carries support from a broad cross-section of interests, including trade associations representing these manufactures, environmental and energy-efficiency advocacy organizations, consumer advocates, and electric utility providers as well as the support of several States, DOE believes it appropriate to adopt this new product class, C–5–BI, and the recommended standard equation. DOE's direct rulemaking authority under 42 U.S.C. 6295(p)(4) is constrained only by the requirements of 42 U.S.C. 6295(o), which does not include the product class requirements in 42 U.S.C. 6295(q). However, DOE notes that the addition of a PC C–5–BI is warranted as the application of bottom-mounted freezer and icemaker on a built-in cooler with refrigerator-freezer provides consumers the utility of storage compartments at freezing, fresh food, and cooler temperature levels, whereas the current classes combine a cooler compartment with either a freezer or fresh food compartment, but not both. In addition, establishing separate classes of this configuration both with and without automatic icemaking addresses the unique utility of icemaking that may be

[27] EPCA specifies that DOE may not prescribe an amended or new standard if the Secretary finds (and publishes such finding) that interested persons have established by a preponderance of the evidence that the standard is likely to result in the unavailability in the United States in any covered product type (or class) of performance characteristics (including reliability), features, sizes, capacities, and volumes that are substantially the same as those generally available in the United States at the time of the Secretary's finding. (42 U.S.C. 6295(o)(4))

included as part of the product. As a result of this additional utility, the application of a bottom-mounted freezer and icemaker constitutes a performance related feature.

Given the indication from the Joint Agreement that such a product class standard would be beneficial in its implementation, the classification of a bottom-mounted freezer and icemaker as performance related features, and the recommendation's consistency with the other adopted standards, DOE is adopting a PC C–5–BI standard in this direct final rule.

See section V of this document for more information regarding the TSL configuration and discussion of the adopted level for this product class. See chapter 5 of the direct final rule TSD for more discussion regarding the addition of this product class.

2. Technology Options

In the preliminary market analysis and technology assessment, DOE identified 36 technology options initially determined to improve the efficiency of MREFs, as measured by the DOE test procedure. In this direct final rule, DOE considered the technology options listed in Table IV.2, consistent with the table of technology options presented in the March 2023 NOPR. 88 FR 19382, 19395–19396. Chapter 3 of the direct final rule TSD includes a detailed list and descriptions of all technology options identified for MREFs.

BILLING CODE 6450–01–P

Table IV.2 Technology Options Identified for MREFs

Insulation
1. Improved resistivity of insulation (insulation type)
2. Increased insulation thickness
3. Vacuum-insulated panels
4. Gas-filled insulation panels
Gaskets and Anti-Sweat Heat
5. Improved gaskets
6. Double door gaskets
7. Anti-sweat heat
Doors
8. Low-E coatings
9. Inert gas fill
10. Vacuum-insulated glass
11. Additional panes
12. Frame design
13. Solid door
Compressor
14. Improved compressor efficiency
15. Variable-speed compressors
16. Linear compressors
Evaporator
17. Increased surface area
18. Forced-convection evaporator
19. Tube and fin enhancements (including microchannel designs)
20. Multiple evaporators
Condenser
21. Increased surface area
22. Tube and fin enhancements (including microchannel designs)
23. Forced-convection condenser
Defrost System
24. Off-cycle defrost
25. Reduced energy for active defrost
26. Adaptive defrost
27. Condenser hot gas defrost
Control System
28. Electronic temperature control
29. Air-distribution control
Other Technologies
30. Fan and fan motor improvements
31. Improved expansion valve
32. Fluid control or solenoid off-cycle valve
33. Alternative refrigerants
34. Improved refrigerant piping
35. Component location
36. Alternative refrigeration systems

BILLING CODE 6450–01–C

B. Screening Analysis

DOE uses the following five screening criteria to determine which technology options are suitable for further consideration in an energy conservation standards rulemaking:

(1) *Technological feasibility.* Technologies that are not incorporated in commercial products or in commercially viable, existing prototypes will not be considered further.

(2) *Practicability to manufacture, install, and service.* If it is determined that mass production of a technology in commercial products and reliable installation and servicing of the technology could not be achieved on the scale necessary to serve the relevant market at the time of the projected compliance date of the standard, then that technology will not be considered further.

(3) *Impacts on product utility.* If a technology is determined to have a significant adverse impact on the utility of the product to subgroups of consumers, or result in the unavailability of any covered product type with performance characteristics (including reliability), features, sizes, capacities, and volumes that are substantially the same as products generally available in the United States at the time, it will not be considered further.

(4) *Safety of technologies.* If it is determined that a technology would have significant adverse impacts on health or safety, it will not be considered further.

(5) *Unique-pathway proprietary technologies.* If a technology has proprietary protection and represents a unique pathway to achieving a given efficiency level, it will not be considered further, due to the potential for monopolistic concerns.

10 CFR part 430, subpart C, appendix A, sections 6(b)(3) and 7(b).

In sum, if DOE determines that a technology, or a combination of technologies, fails to meet one or more of the listed five criteria, it will be excluded from further consideration in the engineering analysis. The reasons for eliminating any technology are discussed in the following sections.

The subsequent sections include DOE's evaluation of each technology option against the screening analysis criteria and whether DOE determined that a technology option should be excluded (''screened out'') based on the screening criteria.

1. Screened-Out Technologies

In this direct final rule, DOE screened out the technologies presented in Table IV.3 on the basis of technological feasibility, practicability to manufacture, install, and service, adverse impacts on utility or availability, adverse impacts on health and safety, and/or unique-pathway proprietary technologies. Chapter 4 of the direct final rule TSD includes a detailed description of the screening analysis for each of these technology options.

Table IV.3 Technologies Screened Out in the Direct Final Rule

Technologies
Solid doors
Ultra-low-E (reflective) glass doors
Vacuum-insulated glass
Improved gaskets and double gaskets
Linear compressors
Fluid control or solenoid off-cycle valves
Evaporator tube and fin enhancements
Condenser tube and fin enhancements (except microchannel condensers)
Condenser hot gas defrost
Improved refrigerant piping
Component location
Alternative refrigeration systems
Improved VIPs

2. Remaining Technologies

Through a review of each technology, DOE concludes that all of the other identified technologies listed in section IV.B.2 of this document met all five screening criteria to be examined further as design options in DOE's direct final rule analysis. In summary, DOE did not screen out the following technology options:

Table IV.4 Technologies Remaining in the Direct Final Rule

Insulation
1. Improved resistivity of insulation (insulation type)
2. Increased insulation thickness
3. Gas-filled insulation panels
4. Vacuum-insulated panels
Gasket and Anti-Sweat Heat
5. Anti-sweat heat
Doors
6. Low-E coatings
7. Inert gas fill
8. Additional panes
9. Frame design
Compressor
10. Improved compressor efficiency
11. Variable-speed compressors
Evaporator
12. Forced-convection evaporator
13. Increased surface area
14. Multiple evaporators
Condenser
15. Increased surface area
16. Microchannel designs
17. Forced-convection condenser
Defrost System
18. Reduced energy for automatic defrost
19. Adaptive defrost
20. Off-cycle defrost
Control System
21. Electronic Temperature control
22. Air-distribution control
Other Technologies
23. Fan and fan motor improvements
24. Improved expansion valve
25. Alternative Refrigerants

BILLING CODE 6450–01–C

DOE determined that these technology options are technologically feasible because they are being used or have previously been used in commercially-available products or working prototypes. DOE also finds that all of the remaining technology options meet the other screening criteria (*i.e.,* practicable to manufacture, install, and service and do not result in adverse impacts on consumer utility, product availability, health, or safety). For additional details, see chapter 4 of the direct final rule TSD.

C. Engineering Analysis

The purpose of the engineering analysis is to establish the relationship between the efficiency and cost of MREFs. There are two elements to consider in the engineering analysis; the selection of efficiency levels to analyze (*i.e.,* the ''efficiency analysis'') and the determination of product cost at each efficiency level (*i.e.,* the ''cost analysis''). In determining the performance of higher-efficiency products, DOE considers technologies and design option combinations not eliminated by the screening analysis. For each product class, DOE estimates the baseline cost, as well as the incremental cost for the product/equipment at efficiency levels above the baseline. The output of the engineering analysis is a set of cost-efficiency ''curves'' that are used in downstream analyses (*i.e.,* the LCC and PBP analyses and the NIA).

1. Efficiency Analysis

DOE typically uses one of two approaches to develop energy efficiency levels for the engineering analysis: (1) relying on observed efficiency levels in the market (*i.e.,* the efficiency-level approach), or (2) determining the

incremental efficiency improvements associated with incorporating specific design options to a baseline model (*i.e.,* the design-option approach). Using the efficiency-level approach, the efficiency levels established for the analysis are determined based on the market distribution of existing products (in other words, based on the range of efficiencies and efficiency level ''clusters'' that already exist on the market). Using the design option approach, the efficiency levels established for the analysis are determined through detailed engineering calculations and/or computer simulations of the efficiency improvements from implementing specific design options that have been identified in the technology assessment. DOE may also rely on a combination of these two approaches. For example, the efficiency-level approach (based on actual products on the market) may be extended using the design option approach to interpolate to define ''gap fill'' levels (to bridge large gaps between other identified efficiency levels) and/or to extrapolate to the ''max-tech'' level (particularly in cases where the ''max-tech'' level exceeds the maximum efficiency level currently available on the market).

The approach used for this direct final rule to define the efficiency levels for analysis is largely the same as the approach DOE had used for the March 2023 NOPR analysis.

For its analysis in this direct final rule, DOE used a combined efficiency level and design option approach to directly analyze five products classes: freestanding compact coolers, freestanding coolers, and combination cooler classes C–13A, C–3A, and C–9. First, an efficiency-level approach was used to establish an analysis tied to existing products on the market. Several products from the cooler class (compact and standard size) and one product from the combination cooler class (C–13A) were used in physical teardowns. Additional analyses were conducted on classes C–3A and C–9; however, a lack of physical teardown products for these classes led DOE to rely heavily on adjusted analyses from the consumer refrigerator, refrigerator-freezer, and freezers (''RF'') classes 3 and 9, respectively. Then, a design option approach was used to extend the analysis through ''built-down'' efficiency levels and ''built-up'' efficiency levels where there were gaps in the range of efficiencies of products that were reverse engineered. As discussed in the section that follows, DOE applied its direct analyses of freestanding products to the corresponding built-in product classes. DOE's direct analysis informed the adopted standards for those product classes that were not directly analyzed. See section 5.4.1 of the direct final rule TSD for more discussion on DOE's efficiency analysis.

a. Built-in Classes

In this direct final rule analysis, DOE used the freestanding MREF classes as proxies for built-in classes. DOE conducted analysis of the current market for miscellaneous refrigeration products and found that built-in and freestanding products occupy the same range of efficiencies, and DOE did not identify any unique characteristic that would inhibit efficiency improvements for built-in products relative to freestanding products based on a review on the market. As a result, DOE chose to apply its freestanding products analyses to built-in classes.

In response to the March 2023 NOPR, AHAM and Sub-zero Group Inc. (''Sub-zero'') argued that freestanding product classes are not a proxy for built-in product classes and DOE should evaluate them separately. (AHAM, No. 31 at p. 6; Sub-zero, No. 30 at p. 1) AHAM and Sub-zero stated that built-in products have constraints, such as incorporation into kitchen designs and needing to be flush with cabinetry, that affect that the technology options for achieving higher efficiency levels. (AHAM, No. 31 at pp. 6–7; Sub-zero, No. 30 at p. 2) AHAM and Sub-Zero also stated that different testing requirements for built-ins (*e.g.,* two inches or less of rear clearance for freestanding products as opposed to no rear clearance for built-in products) creates inherent design differences between the freestanding and built-in products. *Id.* AHAM and Sub-zero encouraged DOE to revise its analysis to separately analyze freestanding and built-in products, contending that these products are fundamentally different. (AHAM, No. 31 at p. 7; Sub-zero, No. 30 at p. 2)

As discussed in section IV.C.1.c of this document, the efficiency levels analyzed for this direct final rule represent a percentage reduction in energy use below the currently applicable standard for each product class. DOE's analysis of the freestanding product classes as a proxy for the built-in product classes does not presume that the two product types have the same nominal costs at each higher efficiency level, but rather reflects that *incremental* design changes associated with reducing energy use on a percentage basis—relative to the currently applicable standard for each respective product type—are substantially similar between freestanding and built-in products. To reflect the inherent design differences between built-in products compared to free-standing products, as described by commenters, DOE applied a $30, $50, or $150 adder (depending on product size) to the baseline costs for the built-in product classes compared to their freestanding counterparts. *See* chapter 5 of the direct final rule TSD for further details regarding the engineering analysis conducted for each product class.

b. Baseline Efficiency/Energy Use

For each product class, DOE generally selects a baseline model as a reference point for each class, and measures changes resulting from potential energy conservation standards against the baseline. The baseline model in each product class represents the characteristics of a product/equipment typical of that class (*e.g.,* capacity, physical size). Generally, a baseline model is one that just meets current energy conservation standards, or, if no standards are in place, the baseline is typically the most common or least efficient unit on the market. When selecting units for the analysis, DOE selects units at baseline from various manufacturers for each directly analyzed product class.

For this direct final rule, DOE chose baseline efficiency levels represented by the current Federal energy conservation standards, expressed as maximum annual energy consumption as a function of the product's adjusted volume. The baseline levels differ for coolers and combination coolers to account for design differences; all coolers share the same baseline level, *i.e.,* the baseline is the same function of adjusted volume for both freestanding and built-in models, for both compact and standard-size models. The current standards incorporate an allowance of a constant 84 kWh/yr icemaker adder for product classes with automatic icemakers, consistent with the current test procedure, which requires adding this amount of annual energy use to the products tested performance if the product has an automatic icemaker. DOE adjusted the baseline energy usage levels for each class to account for the planned revision in the test procedure to reduce the icemaker energy use adder to 28 kWh/yr.[28]

[28] See the October 12, 2021, test procedure final rule for refrigeration products for more information regarding the adoption of the 28 kWh/yr icemaker adder. 86 FR 56790.

DOE directly analyzed a sample of market representative models from within five product classes from multiple manufacturers. Directly analyzed classes include three different AV coolers (AVs of 3 ft^3, 5 ft^3, and 15 ft^3) and three combination cooler classes (C–13A, C–9 and C–3A). In conducting these analyses, eight teardown units were used in construction of cost curves, and their characteristics were determined in large part by testing and reverse-engineering. Further information on the design characteristics of specific analyzed baseline models is summarized in section 5.4.1 of the direct final rule TSD.

c. Higher Efficiency Levels

As part of DOE's analysis, the maximum available efficiency level is the highest efficiency unit currently available on the market. DOE also defines a ''max-tech'' efficiency level to represent the maximum possible efficiency for a given product.

For this direct final rule, DOE analyzed up to five incremental efficiency levels beyond the baseline for each of the analyzed product classes. The efficiency levels begin at EL 1, which was 10 percent more efficient than the current MREF energy conservation standards. For the compact coolers analysis, DOE extended the efficiency levels in steps of 10 percent of the current energy conservation standard up to EL 4 at 40 percent; for full-size coolers, EL 4 is analyzed at 35 percent. For combination coolers (excluding C–9) efficiency levels above EL 1 are in steps of roughly 5 percent up to EL 4. Finally, EL 5 represents maximum technology (''max-tech''), which uses design option analysis to extend the analysis beyond EL 4 by using all applicable design options, including max efficiency variable-speed compressors and maximum practical use of vacuum-insulated panels (''VIPs''). For compact coolers, max tech stands at either 59 percent or 50 percent for the two directly analyzed AVs—3.1 ft^3 and 5.1 ft^3 respectively; full-size coolers max-tech stands at 38 percent. For combination coolers C–13A and C–3A, max tech stands at 28 percent and 24 percent, respectively.

DOE conducted analysis for product class C–9 starting with analysis for a class 9 upright freezer with comparable total refrigerated volume. In its analysis, DOE concluded that application of all of the design options being considered at max-tech would be required for the product to be compliant with the current energy conservation standards. Currently, the Compliance Certification Database (''CCD'') includes only one product that is certified as C–9—an LG product certified with energy use 17 percent below the standard. DOE did not purchase, test, and reverse-engineer this product, in-part because of the limited product offering and expected insignificant potential for energy savings for the class. Thus, DOE is relying primarily on its analysis of the RF product class 9 freezer, to suggest that opportunities for energy savings are likely limited and likely not cost-effective, even if improved efficiency is technically feasible. DOE has not analyzed efficiency levels beyond baseline for this product class in this direct final rule but has taken into consideration all design options applied at max-tech in its analysis.

DOE notes the current Energy Star specifications correspond to EL 1 for freestanding full-size coolers (10 percent), EL 2 for freestanding compact coolers (20 percent), and EL 3 for both classes of built-in coolers (30 percent).[29]

The efficiency levels analyzed beyond the baseline are shown in Table IV.5 as follows.

Table IV.5 Incremental Efficiency Levels for Analyzed Products (% Energy Use Less than Baseline)

	Coolers			Combination Coolers	
Product Class (AV, cu.ft.)	FCC (3.1)	FCC (5.1)	FC (15.3)	C-13A (5)	C-3A (21)

* Efficiencies at or slightly better than the ENERGY STAR® efficiency

d. Variable-Speed Compressor Supply Chain

In response to the March 2023 NOPR, AHAM suggested that DOE evaluate the robustness of the supply chains for variable-speed compressors (''VSCs'') while considering the growing demand given more stringent standards for cooling appliances, including both air conditioning and refrigeration. (AHAM, No. 31 at p. 5)

In considering this comment and comments provided in response to the RF rulemaking, DOE interviewed relevant compressor manufacturers to gather information regarding the level of VSC implementation that would be required at the efficiency levels analyzed in this direct final rule, the current and predicted supply of VSCs into the U.S. market, the predicted time to ramp up production of VSCs, and pricing of VSCs and components. None of the compressor manufacturers interviewed expressed any concerns regarding the ability to ramp-up VSC capacity in response to more stringent MREF standards. Compressor manufacturers additionally noted that any previous bottlenecks in the VSC supply chain are no longer a factor at this time, and that they have been modifying sourcing strategies to ensure a reliable supply of VSCs going forward. DOE concluded from these interviews that compressor manufacturers will be able to readily meet any increased demand for VSCs as a result of the adopted standards within the 5-year

timeframe between publication of this direct final rule and the compliance date. DOE further notes that the amended standards adopted in this final rule reflect the recommendations of the Joint Agreement, of which AHAM was a signatory.

2. Cost Analysis

The cost analysis portion of the engineering analysis is conducted using one or a combination of cost approaches. The selection of cost approach depends on a suite of factors, including the availability and reliability of public information, characteristics of the regulated product, the availability and timeliness of purchasing the product on the market. The cost approaches are summarized as follows:

☐ *Physical teardowns:* Under this approach, DOE physically dismantles a commercially available product, component-by-component, to develop a detailed bill of materials for the product.

☐ *Catalog teardowns:* In lieu of physically deconstructing a product, DOE identifies each component using parts diagrams (available from manufacturer websites or appliance repair websites, for example) to develop the bill of materials for the product.

☐ *Price surveys:* If neither a physical nor catalog teardown is feasible (for example, for tightly integrated products such as fluorescent lamps, which are infeasible to disassemble and for which parts diagrams are unavailable) or cost-prohibitive and otherwise impractical (*e.g.,* large commercial boilers), DOE conducts price surveys using publicly available pricing data published on major online retailer websites and/or by soliciting prices from distributors and other commercial channels.

In the present case, DOE conducted the analysis using primarily physical teardowns. Where possible, physical teardowns were used to provide a baseline of technology options and pricing for a specific product class at a specific EL. Then with technology option information, DOE estimated the cost of various design options including compressors, VIPs, and insulation, by extrapolating the costs from price surveys. With specific costs for technology options, DOE was then able to ''build-up'' or ''build-down'' from the various teardown models to finish the cost-efficiency curves. DOE used this approach to calibrate the analysis to certified or measured energy use of specific available models where possible, while allowing a broader range of potential efficiency levels to be considered.

The resulting bill of materials provides the basis for the manufacturer production cost (''MPC'') estimates.

To account for manufacturers' non-production costs and profit margin, DOE applies a multiplier (the manufacturer markup) to the MPC. The resulting manufacturer selling price (''MSP'') is the price at which the manufacturer distributes a unit into commerce. DOE developed an average manufacturer markup by examining corporate annual reports and Securities and Exchange Commission (''SEC'') 10–K reports [30] filed by publicly traded manufacturers in primarily engaged in appliance manufacturing and whose combined product range includes MREFs. DOE then compared the manufacturer markups derived from the financials to the manufacturer markups estimated in the October 2016 Direct Final Rule. 81 FR 75194, 75224–75225. See chapter 12 of the direct final rule TSD for additional detail on the manufacturer markup.

[30] U.S. Securities and Exchange Commission, Electronic Data Gathering, Analysis, and Retrieval (EDGAR) system. Available at *www.sec.gov/edgar/search/* (last accessed January 30, 2024).

3. Cost-Efficiency Results

The results of the engineering analysis are reported as cost-efficiency data (or ''curves'') in the form of AEU (in kWh) versus MPC (in dollars), which form the basis for subsequent analyses.

DOE developed estimates of MPCs for each unit in the teardown sample, and also performed additional modeling for each of the teardown samples, to extend the analysis to cover the range of efficiency levels appropriate for a representative product. To estimate the MPCs necessary to achieve higher efficiency levels, in particular those beyond the highest-efficiency products in the test sample, DOE considered design options that were most likely to be considered and implemented by manufacturers to achieve the higher efficiency levels. Based on input from manufacturers and an understanding of the markets, DOE then estimated the costs associated with those design options to determine the MPCs at each of the analyzed efficiency levels.

The resulting weighted average incremental design option by efficiency level and cost curves for each directly analyzed product class are (*i.e.,* the additional costs manufacturers would likely incur by producing miscellaneous refrigeration products at each efficiency level compared to the baseline) are provided in Tables IV.6 and IV.7 as follows. See chapter 5 of the direct final rule TSD for additional detail on the engineering analysis and formulation of cost curves.

D. Markups Analysis

The markups analysis develops appropriate markups (*e.g.,* retailer markups, distributor markups, contractor markups) in the distribution chain and sales taxes to convert the MSP estimates derived in the engineering analysis to consumer prices, which are then used in the LCC and PBP analysis. At each step in the distribution channel, companies mark up the price of the product to cover business costs and profit margin.

For MREFs, DOE identified two distribution channels: (1) manufacturers to retailers to consumers, and (2) manufacturers to wholesalers to dealers/retailers to consumers. The parties involved in the distribution channel are retailers, wholesalers, and dealers.

DOE developed baseline and incremental markups for each actor in the distribution chain. Baseline markups are applied to the price of products with baseline efficiency, while incremental markups are applied to the difference in price between baseline and higher-efficiency models (the incremental cost increase). The incremental markup is typically less than the baseline markup and is designed to maintain similar per-unit operating profit before and after new or amended standards.[31]

DOE relied on economic data from the U.S. Census Bureau to estimate average baseline and incremental markups. Specifically, DOE used the 2017 Annual Retail Trade Survey for the ''electronics and appliance stores'' sector to develop retailer markups,[32] and the 2017 Annual Wholesaler Trade Survey for the ''household appliances, and electrical and electronics goods merchant wholesalers'' sector to estimate wholesaler markups.[33] For the wholesaler to dealer/retailer channel, DOE assumed that the dealer markups are half of the retailer markups in the retailer channel.

For this direct final rule, DOE considered comments it had received regarding the markups analysis conducted for the March 2023 NOPR. The approach used for this direct final rule is largely the same as the approach DOE had used for the March 2023 NOPR analysis.

In response to the March 2023 NOPR, AHAM commented on DOE's reliance on the concept of incremental markups, stating that it is based on discredited theory, and it is in contradiction to empirical evidence provided by AHAM during a 2014 proposed rulemaking for energy conservation standards for residential dishwashers. (AHAM, No. 31 at p. 9)

DOE's incremental markup approach assumes that an increase in profitability, which is implied by keeping a fixed markup when the product price goes up due to higher efficiency standards, is unlikely to be viable over time in a reasonably competitive market like household appliance retailers. The Herfindahl-Hirschman Index (''HHI'') reported by the 2017 Economic Census indicates that the household appliance stores sector (NAICS 443141) is a highly competitive marketplace.[34] DOE recognizes that actors in the distribution chains are likely to seek to maintain the same markup on appliances in response to changes in manufacturer selling prices after an amendment to energy conservation standards. However, DOE believes that retail pricing is likely to adjust over time as those actors are forced to readjust their markups to reach a medium-term equilibrium in which per-unit profit is relatively unchanged before and after standards are implemented.

DOE acknowledges that markup practices in response to amended standards are complex and vary with business conditions. However, DOE's analysis necessarily only considers changes in appliance offerings that occur in response to amended standards and isolate the effect of amended standards from other factors. Obtaining data on markup practices in the situation described previously is very challenging. Hence, DOE continues to maintain that its assumption that standards do not facilitate a sustainable increase in profitability is reasonable.

Chapter 6 of the direct final rule TSD provides details on DOE's development of markups for MREFs.

E. Energy Use Analysis

The purpose of the energy use analysis is to determine the annual energy consumption of MREFs at different efficiencies in representative U.S. households, and to assess the energy savings potential of increased MREF efficiency. The energy use analysis estimates the range of energy use of MREFs in the field (*i.e.,* as they are actually used by consumers). The energy use analysis provides the basis for other analyses DOE performed, particularly assessments of the energy savings and the savings in consumer operating costs that could result from adoption of amended or new standards.

DOE determined a range of annual energy use of MREFs as a function of unit volume. As shown in Table IV.8, DOE developed distributions of adjusted volume of product classes with more than one representative unit base on the capacity distributions reported in the TraQline® wine chiller data spanning from 2020 Q1 to 2022 Q1.[35] DOE also developed a sample of households that use MREFs based on the TraQline wine chiller data (see section IV.F of this document for details). For each volume and considered efficiency level, DOE derived the energy consumption as measured by the DOE MREF test procedure at appendix A.

[31] Because the projected price of standards-compliant products is typically higher than the price of baseline products, using the same markup for the incremental cost and the baseline cost would result in higher per-unit operating profit. While such an outcome is possible, DOE maintains that in markets that are reasonably competitive it is unlikely that standards would lead to a sustainable increase in profitability in the long run.

[34] 2017 Economic Census, Selected sectors: Concentration of largest firms for the U.S. Available at *www.census.gov/data/tables/2017/econ/economic-census/naics-sector-44-45.html.* The Herfindahl-Hirschman Index value can be found by navigating to the ''Concentration of largest firms for the U.S.'' table and then filtering the industry code to NAICS 443141.The Herfindahl-Hirschman Index reported for the largest 50 firms in household appliance stores sector, is 123.8. Generally, a market with an HHI value of under 1,000 is considered to be competitive.

[35] TraQline is a market research company that specialized in tracking consumer purchasing behavior across a wide range of products using quarterly online surveys.

C-13A	
5	100.0

For this direct final rule, DOE considered comments it had received regarding the energy use analysis conducted for the March 2023 NOPR. The approach used for this direct final rule is largely the same as the approach DOE had used for the March 2023 NOPR analysis.

In response to the March 2023 NOPR, AHAM commented that DOE relies heavily on the EIA's Residential Energy Consumption Survey (''RECS'') data for estimating energy use and how consumption varies at the household level. Specifically, AHAM expressed concern that the use of RECS data to estimate energy consumption at the household level may introduce ''outlier values,'' resulting in uncertainty and inaccuracies (AHAM, No. 31 at p. 11) In this direct final rule, as well as in the March 2023 NOPR, DOE did not tie the energy consumption of MREFs to RECS survey data. 87 FR 35678. No household or demographic information from RECS was used in the energy use analysis for MREFs. Instead, as mentioned above, DOE used the TraQline wine chiller data to develop a sample of households representing MREF purchasers and derived the energy consumption of MREFs as measured by the DOE MREF test procedure. DOE further notes that AHAM is a party to the Joint Agreement and is supportive of the recommended standards adopted in this direct final rule.

Chapter 7 of the direct final rule TSD provides details on DOE's energy use analysis for MREFs.

F. Life-Cycle Cost and Payback Period Analysis

DOE conducted LCC and PBP analyses to evaluate the economic impacts on individual consumers of potential energy conservation standards for MREFs. The effect of new or amended energy conservation standards on individual consumers usually involves a reduction in operating cost and an increase in purchase cost. DOE used the following two metrics to measure consumer impacts:

□ The LCC is the total consumer expense of an appliance or product over the life of that product, consisting of total installed cost (manufacturer selling price, distribution chain markups, sales tax, and installation costs) plus operating costs (expenses for energy use, maintenance, and repair). To compute the operating costs, DOE discounts future operating costs to the time of purchase and sums them over the lifetime of the product.

□ The PBP is the estimated amount of time (in years) it takes consumers to recover the increased purchase cost (including installation) of a more-efficient product through lower operating costs. DOE calculates the PBP by dividing the change in purchase cost at higher efficiency levels by the change in annual operating cost for the year that amended or new standards are assumed to take effect.

For any given efficiency level, DOE measures the change in LCC relative to the LCC in the no-new-standards case, which reflects the estimated efficiency distribution of MREFs in the absence of new or amended energy conservation standards. In contrast, the PBP for a given efficiency level is measured relative to the baseline product.

For this direct final rule, DOE considered comments it had received regarding the LCC analysis conducted for the March 2023 NOPR. The LCC approach used for this direct final rule is largely the same as the approach DOE had used for the March 2023 NOPR analysis.

During the May 2, 2023, public meeting, Edison Electric Institute (''EEI'') questioned the cost-effectiveness of the proposed TSL (TSL 4), due to the high percentage of consumers experiencing a net LCC cost and the simple payback period results ranging from 6.8 to 8 years, and urged DOE to consider selecting another TSL that may be more cost-effective for consumers. (May 2, 2023, Public Meeting Transcript, No. 33 at pp. 5–6). In response, DOE notes that when deciding whether a proposed standard is economically justified, DOE determines whether the benefits of the standard exceed its burdens by considering the seven statutory factors discussed in section II.A of this document. DOE considered the seven statutory factors when evaluating the Recommended TSL in the Joint Agreement. As discussed in section V.C.1 of this document, overall, the LCC savings would be positive for all MREF product classes, and, while 43.7 percent of MREF consumers would experience a net cost, slightly more than half of MREF consumers would experience a net benefit (52.9 percent). DOE provides a detailed comparative discussion and rigorous justification on the adopted

TSL (the Recommended TSL) in section V.C.1 of this document.

For each considered efficiency level in each product class, DOE calculated the LCC and PBP for a nationally representative set of MREF purchasers. As stated previously, DOE developed purchaser samples based on TraQline wine chiller survey data. The survey panel is weighted against the U.S. Census based on their demographic characteristics to make the sample representative of the U.S. population. The wine chiller survey asked respondents about the product features of the wine chillers they recently purchased, as well as the purchasing channel of the products. To account for the more recent MREF consumers, DOE used the last 2 years of survey data (2020 Q1 to 2022 Q1) to construct the household sample used in this direct final rule.

For each sample purchaser, DOE determined the energy consumption for the MREFs and the appropriate energy price. By developing a representative sample of purchasers, the analysis captured the variability in energy consumption and energy prices associated with the use of MREFs.

Inputs to the calculation of total installed cost include the cost of the product—which includes MPCs, manufacturer markups, retailer and distributor markups, and sales taxes—and installation costs. Inputs to the calculation of operating expenses include annual energy consumption, energy prices and price projections, repair and maintenance costs, product lifetimes, and discount rates. DOE created distributions of values for product lifetime, discount rates, and sales taxes, with probabilities attached to each value, to account for their uncertainty and variability.

The computer model DOE uses to calculate the LCC relies on a Monte Carlo simulation to incorporate uncertainty and variability into the analysis. The Monte Carlo simulations randomly sample input values from the probability distributions and MREF user samples. The model calculated the LCC for products at each efficiency level for 10,000 MREF purchasers per simulation run. The analytical results include a distribution of 10,000 data points showing the range of LCC savings for a given efficiency level relative to the no-new-standards case efficiency distribution. In performing an iteration of the Monte Carlo simulation for a given consumer, product efficiency is chosen based on its probability. If the chosen product efficiency is greater than or equal to the efficiency of the standard level under consideration, the LCC calculation reveals that a consumer is not impacted by the standard level. By accounting for consumers who already purchase more-efficient products, DOE avoids overstating the potential benefits from increasing product efficiency.

DOE calculated the LCC for consumers of MREFs as if each were to purchase a new product in the first year of required compliance with amended standards. As discussed earlier in this document, the compliance date of amended standards is January 31, 2029, for TSL 4 (the Recommended TSL detailed in the Joint Agreement). For all other TSLs considered in this direct final rule, standards apply to MREFs manufactured 5 years after the date on which any amended standard is published. (42 U.S.C. 6295(l)(2)) Therefore, DOE used 2029 as the first year of compliance with any amended standards for MREFs for all TSLs.

Table IV.9 summarizes the approach and data DOE used to derive inputs to the LCC and PBP calculations. The subsections that follow provide further discussion. Details of the spreadsheet model, and of all the inputs to the LCC and PBP analyses, are contained in chapter 8 of the direct final rule TSD and its appendices.

Table IV.9 Summary of Inputs and Methods for the LCC and PBP Analysis*

Inputs	Source/Method
Product Cost	Derived by multiplying MPCs by manufacturer and retailer markups and sales tax, as appropriate. Used historical data to derive a price scaling index to project product costs.
Installation Costs	Assumed no change with efficiency level. Not considered in the analysis.
Annual Energy Use	Derived from engineering inputs (see chapter 5 of the direct final rule TSD). Variability: Based on the product class and rep unit volume, where applicable.
Energy Prices	Electricity: Based on 2022 average and marginal electricity price data from the Edison Electric Institute. Variability: Electricity prices vary by region.
Energy Price Trends	Based on *AEO2023* price projections.
Repair and Maintenance Costs	Assumed no change with efficiency level. Not considered in the analysis.
Product Lifetime	Sample weighted average: 12.6 years
Discount Rates	Approach involves identifying all possible debt or asset classes that might be used to purchase the considered appliances or might be affected indirectly. Primary data source was the Federal Reserve Board's Survey of Consumer Finances.
Compliance Date	2029

* Not used for PBP calculation. References for the data sources mentioned in this table are provided in the sections following the table or in chapter 8 of the direct final rule TSD.

In response to the March 2023 NOPR, AHAM commented that should be conducting a purchase decision analysis in its LCC model to reflect the actual conditions and expectations of the purchaser rather than relying on an outcome modeling approach. (AHAM, No. 31 at pp. 8–9) In the current setup of LCC analysis, DOE is not explicitly modeling the purchase decision made by purchasers when the standard becomes effective. DOE's analysis is intended to model the range of individual outcomes likely to result from a hypothetical amended energy

conservation standard at various levels of efficiency. DOE does not discount the consumer decision theory established in the broad behavioral economics field but rather notes that its methodological decision was made after considering the existence of various systematic market failures and their implication in rational versus actual purchase behavior. Furthermore, the outcome of the LCC is not considered in isolation, but in the context of the broader set of analyses, including the NIA. Moreover, the type of data required to facilitate a robust consumer choice modeling of a specific household appliance at the individual household level is currently lacking and AHAM did not provide much data. DOE further notes that AHAM is a party to the Joint Agreement and is supportive of the recommended standard adopted in this direct final rule.

1. Product Cost

To calculate consumer product costs, DOE multiplied the MPCs developed in the engineering analysis by the markups described previously (along with sales taxes). DOE used different markups for baseline products and higher-efficiency products, because DOE applies an incremental markup to the increase in MSP associated with higher-efficiency products.

Economic literature and historical data suggest that the real costs of many products may trend downward over time according to ''learning'' or ''experience'' curves. Experience curve analysis implicitly includes factors such as efficiencies in labor, capital investment, automation, materials prices, distribution, and economies of scale at an industry-wide level.[36] In the experience curve method, the real cost of production is related to the cumulative production or ''experience'' with a manufactured product. As MREFs use similar technologies to RF, DOE applied the same experience curve developed for RF to MREFs. DOE used inflation-adjusted historical Producer Price Index (''PPI'') data for ''household refrigerator and home freezer manufacturing'' from the Bureau of Labor Statistics' (''BLS'') spanning the time period between 1981 and 2022,[37] along with the cumulative production of RF to derive the experience curve. The estimated learning rate (defined as the fractional reduction in price expected from each doubling of cumulative production) is 39.4 ± 1.9 percent.

DOE included variable-speed compressors as a technology option for higher efficiency levels. To develop future prices specific for that technology, DOE applied a different price trend to the controls portion of the variable-speed compressor, which represents part of the price increment when moving from an efficiency level achieved with the highest efficiency single-speed compressor to an efficiency level with variable-speed compressor. DOE used PPI data on ''semiconductors and related device manufacturing'' between 1967 and 2022 to estimate the historic price trend of electronic components in the control.[38] The regression, performed as an exponential trend line fit, results in an R-square of 0.99, with an annual price decline rate of 6.3 percent. See chapter 8 of the TSD for further details on this topic.

In response to the March 2023 NOPR, AHAM commented that there is no theoretical underpinning for the implementation of an experience or learning curve and the functional form it should take. In addition, AHAM stated that the data that DOE used merely represents an empirical relationship, and a clear connection between the actual products in question and the data used needs to be made. AHAM noted that there is little reason to support the concept that price learning through manufacturing efficiencies should extend beyond the labor and materials in the product itself, and that such a relationship should not hold for other cost components. (AHAM, No. 31 at p. 10)

DOE notes that there is considerable empirical evidence of consistent price declines for appliances in the past few decades. Several studies examined retail prices of a wide range of household appliances during different periods of time and showed that prices had been steadily falling while efficiency had been increasing, for example Dale, *et al.* (2009) [39] and Taylor, *et al.* (2015).[40] As mentioned in Taylor and Fujita (2013),[41] Federal agencies have adopted different approaches to account for ''the changing future compliance costs that might result from technological innovation or anticipated behavioral changes.'' Given the limited data availability on historical manufacturing costs broken by different components, DOE utilized the PPI published by the BLS as a proxy for manufacturing costs to represent the analyzed product as a whole.[42] While products may experience varying degrees of price learning during different product stages, given that MREFs share similar cooling technologies with RF, DOE applied the same learning rate developed for RF to MREFs. DOE modeled the average learning rate based on the full historical PPI series for ''household refrigerator and home freezer manufacturing'' to capture the overall price evolution in relation to the cumulative shipments. DOE also conducted sensitivity analyses that are based on a particular segment of the PPI data to investigate the impact of alternative product price projections (low price learning and high price learning) in the NIA of this direct final rule. DOE further notes that AHAM is a party to the Joint Agreement and is supportive of the recommended standard adopted in this direct final rule.

2. Installation Cost

Installation cost includes labor, overhead, and any miscellaneous materials and parts needed to install the product. DOE is not aware of any data that suggest the cost of installation changes as a function of efficiency for MREFs. DOE therefore assumed that installation costs are the same regardless of EL and do not impact the LCC or PBP. As a result, DOE did not include installation costs in the LCC and PBP analysis.

3. Annual Energy Consumption

For each sampled consumer, DOE determined the energy consumption for MREFs at different efficiency levels using the approach described previously in section IV.E of this document.

[42] PPI is a proxy for manufacturing costs as certain effects (such as market structure and competitive effects) could influence PPI in a way that would not be reflected in manufacturing costs.

4. Energy Prices

Because marginal electricity price more accurately captures the incremental savings associated with a change in energy use from higher efficiency, it provides a better representation of incremental change in consumer costs than average electricity prices. Therefore, DOE applied average electricity prices for the energy use of the product purchased in the no-new-standards case, and marginal electricity prices for the incremental change in energy use associated with the other efficiency levels considered.

DOE derived electricity prices in 2022 using data from EEI Typical Bills and Average Rates reports. Based upon comprehensive, industry-wide surveys, this semi-annual report presents typical monthly electric bills and average kilowatt-hour costs to the customer as charged by investor-owned utilities. For the residential sector, DOE calculated electricity prices using the methodology described in Coughlin and Beraki (2018).[43]

DOE's methodology allows electricity prices to vary by sector, region, and season. In the analysis, variability in electricity prices is chosen to be consistent with the way the consumer economic and energy use characteristics are defined in the LCC analysis. See chapter 8 of the direct final rule TSD for details.

To estimate energy prices in future years, DOE multiplied the 2022 energy prices by the projection of annual average price changes from the Reference case in *AEO2023,* which has an end year of 2050.[44] To estimate price trends after 2050, the 2046–2050 average was used for all years.

5. Maintenance and Repair Costs

Repair costs are associated with repairing or replacing product components that have failed in an appliance; maintenance costs are associated with maintaining the operation of the product. Typically, small incremental increases in product efficiency entail no, or only minor, changes in repair and maintenance costs compared to baseline efficiency products. DOE is not aware of any data that suggest the cost of repair or maintenance for MREFs changes as a function of efficiency. DOE therefore assumed that these costs are the same regardless of EL and do not impact the LCC or PBP. As a result, DOE did not include maintenance and repair costs in the LCC and PBP analysis.

6. Product Lifetime

For MREFs, DOE used lifetime estimates from products that operate using the same refrigeration technology: covered refrigerators and refrigerator-freezers, based on the Refrigerators, Refrigerator-Freezers, and Freezers direct final rule analysis. 89 FR 3026 (January 17, 2024). DOE estimated a maximum lifetime of 40 years for all product classes and an average lifetime of 10.6 years for compact coolers and 14.6 years for full-size coolers. The weighted average lifetime over the sample population, considering the market distribution, was 12.6 years. DOE also assumed that the probability function for the annual survival of MREFs would take the form of a Weibull distribution. See chapter 8 of the direct final rule TSD for a more detailed discussion.

7. Discount Rates

In the calculation of LCC, DOE applies discount rates appropriate to households to estimate the present value of future operating cost savings. DOE estimated a distribution of discount rates for MREFs based on consumer financing costs and the opportunity cost of consumer funds.

DOE applies weighted average discount rates calculated from consumer debt and asset data, rather than marginal or implicit discount rates.[45] The LCC analysis estimates net present value over the lifetime of the product, so the appropriate discount rate will reflect the general opportunity cost of household funds, taking this time scale into account. Given the long-time horizon modeled in the LCC, the application of a marginal interest rate associated with an initial source of funds is inaccurate. Regardless of the method of purchase, consumers are expected to continue to rebalance their debt and asset holdings over the LCC analysis period, based on the restrictions consumers face in their debt payment requirements and the relative size of the interest rates available on debts and assets. DOE estimates the aggregate impact of this rebalancing using the historical distribution of debts and assets.

To establish residential discount rates for the LCC analysis, DOE identified all relevant household debt or asset classes in order to approximate a consumer's opportunity cost of funds related to appliance energy cost savings. It estimated the average percentage shares of the various types of debt and equity by household income group using data from the Federal Reserve Board's triennial Survey of Consumer Finances[46] (''SCF'') starting in 1995 and ending in 2019. Using the SCF and other sources, DOE developed a distribution of rates for each type of debt and asset by income group to represent the rates that may apply in the year in which amended standards would take effect. DOE assigned each sample household a specific discount rate drawn from one of the distributions. The average rate across all types of household debt and equity and income groups, weighted by the shares of each type, is 4.2 percent. See chapter 8 of the direct final rule TSD for further details on the development of consumer discount rates.

8. Energy Efficiency Distribution in the No-New-Standards Case

To accurately estimate the share of consumers that would be affected by a potential energy conservation standard at a particular efficiency level, DOE's LCC analysis considered the projected distribution (market shares) of product efficiencies under the no-new-standards case (*i.e.,* the case without amended or new energy conservation standards).

For this direct final rule, DOE is using the efficiency distribution by product class as provided by AHAM in response to a notice of public meeting and availability of the preliminary technical support document for MREFS. 87 FR 3229 (Jan. 21, 2022) (See AHAM, No. 18, pp. 2–5) DOE understands that this approach inherently assumes that the rest of the MREF market has a similar distribution of efficiencies. However, due to lack of efficiency data from non-AHAM members, DOE has no reason to question that assumption. DOE also assumed that the current distribution of product efficiencies would remain constant in 2029, and during the

[43] Coughlin, K. and B. Beraki.2018. Residential Electricity Prices: A Review of Data Sources and Estimation Methods. Lawrence Berkeley National Lab. Berkeley, CA. Report No. LBNL–2001169. Available at *https://ees.lbl.gov/publications/residential-electricity-prices-review.*

[44] EIA. Annual Energy Outlook 2023. Available at *www.eia.gov/outlooks/aeo/* (last accessed November 29, 2023).

[45] The implicit discount rate is inferred from a consumer purchase decision between two otherwise identical goods with different first cost and operating cost. It is the interest rate that equates the increment of first cost to the difference in net present value of lifetime operating cost, incorporating the influence of several factors: transaction costs; risk premiums and response to uncertainty; time preferences; interest rates at which a consumer is able to borrow or lend. The implicit discount rate is not appropriate for the LCC analysis because it reflects a range of factors that influence consumer purchase decisions, rather than the opportunity cost of the funds that are used in purchases.

analysis period, in the no-new-standards case.

The estimated market shares for the no-new-standards case for MREFs are shown in Table IV.10. See chapter 8 of the direct final rule TSD for further information on the derivation of the efficiency distributions.

Table IV.10 Efficiency Distributions for the No-New-Standards Case in the Compliance Year

Product Class	Total Adjusted Volume (cu. ft.)	2029 Market Share (%)						
		EL 0	EL 1	EL 2	EL 3	EL 4	EL 5	Total*
Cooler-FC	3.1	79	18	3	0	0	0	100
	5.1							
Cooler-BIC	3.1	18	6	1	1	0	74	100
	5.1							
Cooler-F	15.3	42	58	0	0	0	0	100
Cooler-BI	15.3	72	8	20	0	0	0	100
C-13A	5	99	1	0	0	0	0	100
C-3A	21	100	0	0	0	0		100

* The total may not sum to 100% due to rounding.

The LCC Monte Carlo simulations draw from the efficiency distributions and randomly assign an efficiency to the MREF purchased by each sample household in the no-new-standards case. The resulting percent shares within the sample match the market shares in the efficiency distributions.

9. Payback Period Analysis

The payback period is the amount of time (expressed in years) it takes the consumer to recover the additional installed cost of more-efficient products, compared to baseline products, through energy cost savings. Payback periods that exceed the life of the product mean that the increased total installed cost is not recovered in reduced operating expenses.

The inputs to the PBP calculation for each efficiency level are the change in total installed cost of the product and the change in the first-year annual operating expenditures relative to the baseline. DOE refers to this as a ''simple PBP'' because it does not consider changes over time in operating cost savings. The PBP calculation uses the same inputs as the LCC analysis when deriving first-year operating costs.

As noted previously, EPCA establishes a rebuttable presumption that a standard is economically justified if the Secretary finds that the additional cost to the consumer of purchasing a product complying with an energy conservation standard level will be less than three times the value of the first year's energy savings resulting from the standard, as calculated under the applicable test procedure. (42 U.S.C. 6295(o)(2)(B)(iii)) For each considered efficiency level, DOE determined the value of the first year's energy savings by calculating the energy savings in accordance with the applicable DOE test procedure, and multiplying those savings by the average energy price projection for the year in which compliance with the amended standards would be required.

G. Shipments Analysis

DOE uses projections of annual product shipments to calculate the national impacts of potential amended or new energy conservation standards on energy use, NPV, and future manufacturer cash flows.[47] The shipments model takes an accounting approach, tracking market shares of each product class and the vintage of units in the stock. Stock accounting uses product shipments as inputs to estimate the age distribution of in-service product stocks for all years. The age distribution of in-service product stocks is a key input to calculations of both the NES and NPV, because operating costs for any year depend on the age distribution of the stock.

DOE defined two broad MREF product categories (coolers and combination cooler refrigeration products) and developed models to estimate shipments for each category. DOE used various data and assumptions to develop the shipments for each product class considered in this rulemaking.

Given the limited available data sources on historical shipments of coolers, DOE assumed a constant penetration rate of 13.3 percent in the U.S. households throughout the analysis period based on online surveys[48] to estimate the annual shipments starting from 2016.[49 50] DOE multiplied the estimated penetration by the total number of households from the *AEO2023,* and then determined the number of new shipments by dividing the total stock by the mean product lifetime. DOE projected the annual shipments by incorporating the lifetime distributions by product class and assuming that the growth of new sales is consistent with the housing

[47] DOE uses data on manufacturer shipments as a proxy for national sales, as aggregate data on sales are lacking. In general, one would expect a close correspondence between shipments and sales.

[48] DOE also reviewed the recent release of the EIA 2020 RECS (''RECS 2020''), which identified wine chillers in representative U.S. households. DOE found that the penetration rate of wine chillers in RECS 2020 is significantly lower compared to that estimated by DOE for MREFs based on previous market surveys. Due to the uncertainty on the breakdown of MREFs between wine chillers and other miscellaneous refrigeration applications in the U.S. market, DOE continued to use the 13.3 percent penetration rate for MREFs in this direct final rule. However, DOE also modeled an alternative shipments scenario based on the lower penetration rate of MREFs in American homes derived from the RECS 2020 data. For more details on this alternative scenario and the resulting NES and NPV results, see chapter 9 and appendix 10C of the direct final rule TSD, respectively.

projections from *AEO2023.* To estimate shipments prior to 2016, DOE assumed a flat historical shipment trend at the 2016 level. With even more limited available data sources on historical shipments of combination cooler refrigeration products, DOE estimated total shipments of combination cooler refrigeration products in 2014 to be 36,000 units, based on feedback from manufacturers from the October 2016 Direct Final Rule. DOE assumed sales would increase in line with the increase in the number of households in *AEO2023.* Finally, DOE incorporated the 2021 shipment data provided by AHAM (see AHAM, No. 18 at pp. 3, 5) [51] to re-calibrate total shipments for each product class considered in this rulemaking.

DOE used the efficiency distributions by product class to match the data submitted by AHAM. DOE also assumed that the market share of each product class (in relation to the total MREF shipments) matched the market shares provided by AHAM. To estimate total MREF shipments, DOE utilized the AHAM shipments data and AHAM-member information and reviewed the TraQline data from 2020 Q1 to 2022 Q1 to estimate non-AHAM-member shipments.[52] Based on this approach, DOE's estimate of the MREF shipments for the whole market was consistent with the total number of shipments estimated using DOE's approach discussed earlier and used in the March 2023 NOPR. Hence, DOE continued using the same approach to develop the total MREF shipments in this direct final rule but incorporated the product class breakdown provided by AHAM to re-distribute the total shipments by product class.

H. National Impact Analysis

The NIA assesses the NES and the NPV from a national perspective of total consumer costs and savings that would be expected to result from new or amended standards at specific efficiency levels.[53] ("Consumer" in this context refers to consumers of the product being regulated.) DOE calculates the NES and NPV for the potential standard levels considered based on projections of annual product shipments, along with the annual energy consumption and total installed cost data from the energy use and LCC analyses. For the present analysis, DOE projected the energy savings, operating cost savings, product costs, and NPV of consumer benefits over the lifetime of MREFs sold from 2029 through 2058.

DOE evaluates the impacts of new or amended standards by comparing a case without such standards with standards-case projections. The no-new-standards case characterizes energy use and consumer costs for each product class in the absence of new or amended energy conservation standards. DOE compares the no-new-standards case with projections characterizing the market for each product class if DOE adopted new or amended standards at specific energy efficiency levels (*i.e.,* the TSLs or standards cases) for that class. For the standards cases, DOE considers how a given standard would likely affect the market shares of products with efficiencies greater than the standard.

DOE uses a spreadsheet model to calculate the energy savings and the national consumer costs and savings from each TSL. Interested parties can review DOE's analyses by changing various input quantities within the spreadsheet. The NIA spreadsheet model uses typical values (as opposed to probability distributions) as inputs.

Table IV.11 summarizes the inputs and methods DOE used for the NIA analysis for this direct final rule. Discussion of these inputs and methods follows the table. See chapter 10 of the direct final rule TSD for further details.

Table IV.11 Summary of Inputs and Methods for the National Impact Analysis

Inputs	Method
Shipments	Annual shipments from shipments model.
Compliance Date of Standard	2029
Efficiency Trends	No trend assumed.
Annual Energy Consumption per Unit	Calculated for each efficiency level based on inputs from energy use analysis.
Total Installed Cost per Unit	Calculated for each efficiency level based on inputs from energy use analysis.
Annual Energy Cost per Unit	Calculated for each efficiency level using the energy use per unit, and electricity prices and trends.
Repair and Maintenance Cost per Unit	Annual values do not change with efficiency level.
Energy Price Trends	*AEO2023* projections (to 2050) and fixed at 2050 prices thereafter.
Energy Site-to-Primary and FFC Conversion	A time-series conversion factor based on *AEO2023*.
Discount Rate	Three and seven percent.
Present Year	2024

1. Product Efficiency Trends

A key component of the NIA is the trend in energy efficiency projected for the no-new-standards case and each of the standards cases. Section IV.F.8 of this document describes how DOE developed an energy efficiency distribution for the no-new-standards case (which yields a shipment-weighted average efficiency) for each of the considered product classes for the year of anticipated compliance with an amended standard.

For the standards cases, DOE used a "roll-up" scenario to establish the

[51] This shipments information was provided by AHAM in a confidential document. The reference points to the public version of this document, where confidential business information is redacted.

[52] DOE also collected and reviewed manufacturer interview data but was unable to collect a representative sample that would allow it to estimate non-AHAM-member shipments data.

[53] The NIA accounts for impacts in the United States and U.S. territories.

shipment-weighted efficiency for the year that standards are assumed to become effective (2029). In this scenario, the market shares of products in the no-new-standards case that do not meet the standard under consideration would ''roll up'' to meet the new standard level, and the market share of products above the standard would remain unchanged.

In the absence of data on trends in efficiency, DOE assumed no efficiency trend over the analysis period for both the no-new-standards and standards cases. For a given case, market shares by efficiency level were held fixed to their 2029 distribution.

2. National Energy Savings

The NES analysis involves a comparison of national energy consumption of the considered products between each potential standards case (''TSL'') and the case with no new or amended energy conservation standards. DOE calculated the national energy consumption by multiplying the number of units (stock) of each product (by vintage or age) by the unit energy consumption (also by vintage). DOE calculated annual NES based on the difference in national energy consumption for the no-new-standards case and for each higher efficiency standard case. DOE estimated energy consumption and savings based on site energy and converted the electricity consumption and savings to primary energy (*i.e.,* the energy consumed by power plants to generate site electricity) using annual conversion factors derived from *AEO2023.* Cumulative energy savings are the sum of the NES for each year over the timeframe of the analysis.

Use of higher-efficiency products is sometimes associated with a direct rebound effect, which refers to an increase in utilization of the product due to the increase in efficiency. DOE did not find any data on the rebound effect specific to MREFs that would indicate that consumers would alter their utilization of their product due to an increase in efficiency. MREFs are typically plugged in and operate continuously; therefore, DOE assumed a rebound rate of 0. DOE did not receive any comments regarding this assumption in response to the March 2023 NOPR.

In 2011, in response to the recommendations of a committee on ''Point-of-Use and Full-Fuel-Cycle Measurement Approaches to Energy Efficiency Standards'' appointed by the National Academy of Sciences, DOE announced its intention to use FFC measures of energy use and greenhouse gas and other emissions in the national impact analyses and emissions analyses included in future energy conservation standards rulemakings. 76 FR 51281 (Aug. 18, 2011). After evaluating the approaches discussed in the August 18, 2011 notice, DOE published a statement of amended policy in which DOE explained its determination that EIA's National Energy Modeling System (''NEMS'') is the most appropriate tool for its FFC analysis and its intention to use NEMS for that purpose. 77 FR 49701 (Aug. 17, 2012). NEMS is a public domain, multi-sector, partial equilibrium model of the U.S. energy sector [54] that EIA uses to prepare its *Annual Energy Outlook.* The FFC factors incorporate losses in production and delivery in the case of natural gas (including fugitive emissions) and additional energy used to produce and deliver the various fuels used by power plants. The approach used for deriving FFC measures of energy use and emissions is described in appendix 10B of the direct final rule TSD.

3. Net Present Value Analysis

The inputs for determining the NPV of the total costs and benefits experienced by consumers are (1) total annual installed cost, (2) total annual operating costs (energy costs and repair and maintenance costs), and (3) a discount factor to calculate the present value of costs and savings. DOE calculates net savings each year as the difference between the no-new-standards case and each standards case in terms of total savings in operating costs versus total increases in installed costs. DOE calculates operating cost savings over the lifetime of each product shipped during the projection period.

As discussed in section IV.F.1 of this document, DOE developed MREF price trends based on an experience curve calculated using historical PPI data. DOE applied the same trends to project prices for each product class at each considered efficiency level including baseline. By 2058, which is the end date of the projection period, the average price of single-speed compressor MREFs is projected to drop 33.2 percent and the average price of MREFs with a variable-speed compressor is projected to drop about 33.8 percent relative to 2029.

To evaluate the effect of uncertainty regarding the price trend estimates, DOE investigated the impact of different product price projections on the consumer NPV for the considered TSLs for MREFs. In addition to the default price trend, DOE considered high and low-price-decline sensitivity cases. For the single-speed compressor MREFs and the non-variable- speed controls portion of MREFs, DOE estimated the high-price- decline and the low- price-decline scenarios based on household refrigerator and home freezer PPI data limited to the period between the period 1981–2008 and 2009–2022, respectively. For the variable-speed controls portion of MREFs, DOE estimated the high price decline and the low- price- decline scenarios based on an exponential trend line fit of the semiconductor PPI between the period 1994–2022 and 1967–1993, respectively. The derivation of these price trends is described in Chapter 8 and the results of these sensitivity cases are given in appendix 10C of the direct final rule TSD.

The energy cost savings are calculated using the estimated energy savings in each year and the projected price of the appropriate form of energy. To estimate energy prices in future years, DOE multiplied the average regional energy prices by the projection of annual national-average residential energy price changes in the Reference case from *AEO2023,* which has an end year of 2050. To estimate price trends after 2050, the 2046–2050 average was used for all years. As part of the NIA, DOE also analyzed scenarios that used inputs from variants of the *AEO2023* Reference case that have lower and higher economic growth. Those cases have lower and higher energy price trends compared to the Reference case. The resulting consumer NPV for the low-economic growth scenario, combined with the low-price-decline scenario is up to 24% lower compared to the Reference case scenario, while the consumer NPV for the high-economic growth scenario combined with the high-price-decline scenario is up to 12% higher compared to the Reference case. See appendix 10C of the direct final rule TSD for more details.

In calculating the NPV, DOE multiplies the net savings in future years by a discount factor to determine their present value. For this direct final rule, DOE estimated the NPV of consumer benefits using both a 3-percent and a 7-percent real discount rate. DOE uses these discount rates in accordance with guidance provided by the Office of Management and Budget (''OMB'') to Federal agencies on the development of regulatory analysis.[55]

[54] For more information on NEMS, refer to *The National Energy Modeling System: An Overview 2009,* DOE/EIA–0581(2009), October 2009. Available at *www.eia.gov/analysis/pdfpages/0581(2009)index.php* (last accessed November 29, 2023).

[55] United States Office of Management and Budget. *Circular A–4: Regulatory Analysis.* September 17, 2003. Section E. Available at *https://www.whitehouse.gov/wp-content/uploads/*

The discount rates for the determination of NPV are in contrast to the discount rates used in the LCC analysis, which are designed to reflect a consumer's perspective. The 7-percent real value is an estimate of the average before-tax rate of return to private capital in the U.S. economy. The 3-percent real value represents the ''social rate of time preference,'' which is the rate at which society discounts future consumption flows to their present value.

I. Consumer Subgroup Analysis

In analyzing the potential impact of new or amended energy conservation standards on consumers, DOE evaluates the impact on identifiable subgroups of consumers that may be disproportionately affected by a new or amended national standard. The purpose of a subgroup analysis is to determine the extent of any such disproportional impacts. DOE evaluates impacts on particular subgroups of consumers by analyzing the LCC impacts and PBP for those particular consumers from alternative standard levels. For this direct final rule, DOE analyzed the impacts of the considered standard levels on senior-only households. Low-income consumers were not considered in the subgroup analysis, as MREFs are not products generally used by this subgroup. Based on the TraQline wine chiller data, less than 4 percent of MREF owners are below the Federal household income threshold for poverty. The analysis used a subset of the TraQline consumer sample composed of households that meet the criteria for this subgroup. DOE used the LCC and PBP computer model to estimate the impacts of the considered efficiency levels on senior-only households. Chapter 11 in the direct final rule TSD describes the consumer subgroup analysis.

J. Manufacturer Impact Analysis

1. Overview

DOE performed an MIA to estimate the financial impacts of amended energy conservation standards on manufacturers of MREFs and to estimate the potential impacts of such standards on employment and manufacturing capacity. The MIA has both quantitative and qualitative aspects and includes analyses of projected industry cash flows, the INPV, investments in research and development (''R&D'') and manufacturing capital, and domestic manufacturing employment. Additionally, the MIA seeks to determine how amended energy conservation standards might affect manufacturing employment, capacity, and competition, as well as how standards contribute to overall regulatory burden. Finally, the MIA serves to identify any disproportionate impacts on manufacturer subgroups, including small business manufacturers.

The quantitative part of the MIA primarily relies on the GRIM, an industry cash flow model with inputs specific to this rulemaking. The key GRIM inputs include data on the industry cost structure, unit production costs, product shipments, manufacturer markups, and investments in R&D and manufacturing capital required to produce compliant products. The key GRIM outputs are the INPV, which is the sum of industry annual cash flows over the analysis period, discounted using the industry-weighted average cost of capital, and the impact on domestic manufacturing employment. The model uses standard accounting principles to estimate the impacts of more-stringent energy conservation standards on a given industry by comparing changes in INPV and domestic manufacturing employment between a no-new-standards case and the various standards cases (*i.e.,* ''TSLs''). To capture the uncertainty relating to manufacturer pricing strategies following amended standards, the GRIM estimates a range of possible impacts under different manufacturer markup scenarios.

The qualitative part of the MIA addresses manufacturer characteristics and market trends. Specifically, the MIA considers such factors as a potential standard's impact on manufacturing capacity, competition within the industry, the cumulative impact of other DOE and non-DOE regulations, and impacts on manufacturer subgroups. The complete MIA is outlined in chapter 12 of the direct final rule TSD.

DOE conducted the MIA for this rulemaking in three phases. In Phase 1 of the MIA, DOE prepared a profile of the MREF manufacturing industry based on the market and technology assessment and publicly-available information. This included a top-down analysis of MREF manufacturers that DOE used to derive preliminary financial inputs for the GRIM (*e.g.,* revenues; materials, labor, overhead, and depreciation expenses; selling, general, and administrative expenses (''SG&A''); and R&D expenses). DOE also used public sources of information to further calibrate its initial characterization of the MREF manufacturing industry, including corporate annual reports filed by publicly traded manufacturers in primarily home appliance manufacturing and MREFs, the U.S. Census Bureau's *Annual Survey of Manufactures* (''*ASM*''),[56] and reports from D&B Hoovers.[57]

In Phase 2 of the MIA, DOE prepared a framework industry cash-flow analysis to quantify the potential impacts of amended energy conservation standards. The GRIM uses several factors to determine a series of annual cash flows starting with the announcement of the standard and extending over a 30-year period following the compliance date of the standard. These factors include annual expected revenues, costs of sales, SG&A and R&D expenses, taxes, and capital expenditures. In general, energy conservation standards can affect manufacturer cash flow in three distinct ways: (1) creating a need for increased investment, (2) raising production costs per unit, and (3) altering revenue due to higher per-unit prices and changes in sales volumes.

In addition, during Phase 2, DOE developed interview guides to distribute to manufacturers of MREFs in order to develop other key GRIM inputs, including product and capital conversion costs, and to gather additional information on the anticipated effects of energy conservation standards on revenues, direct employment, capital assets, industry competitiveness, and subgroup impacts.

In Phase 3 of the MIA, DOE conducted structured, detailed interviews with representative manufacturers. During these interviews, DOE discussed engineering, manufacturing, procurement, and financial topics to validate assumptions used in the GRIM and to identify key issues or concerns. As part of Phase 3, DOE also evaluated subgroups of manufacturers that may be disproportionately impacted by amended standards or that may not be accurately represented by the average cost assumptions used to develop the industry cash flow analysis. Such manufacturer subgroups may include small business manufacturers, low-volume manufacturers, niche players, and/or manufacturers exhibiting a cost structure that largely differs from the industry average. DOE identified one subgroup for a separate impact analysis:

legacy_drupal_files/omb/circulars/A4/a-4.pdf (last accessed November 10, 2023).

[56] U.S. Census Bureau, *Annual Survey of Manufactures.* ''Summary Statistics for Industry Groups and Industries in the U.S. (2021).'' Available at *www.census.gov/programs-surveys/asm/data.html* (last accessed July 5, 2023).

[57] The D&B Hoovers login is available at *app.dnbhoovers.com* (last accessed November 29, 2023).

small business manufacturers. The small business subgroup is discussed in chapter 12 of the direct final rule TSD.

2. Government Regulatory Impact Model and Key Inputs

DOE uses the GRIM to quantify the changes in cash flow due to new or amended standards that result in a higher or lower industry value. The GRIM uses a standard, annual discounted cash-flow analysis that incorporates manufacturer costs, markups, shipments, and industry financial information as inputs. The GRIM models changes in costs, distribution of shipments, investments, and manufacturer margins that could result from an amended energy conservation standard. The GRIM spreadsheet uses the inputs to arrive at a series of annual cash flows, beginning in 2024 (the base year of the analysis) and continuing to 2058. DOE calculated INPVs by summing the stream of annual discounted cash flows during this period. For manufacturers of MREFs, DOE used a real discount rate of 7.7 percent, which was derived from industry financials and then modified according to feedback received during manufacturer interviews.

The GRIM calculates cash flows using standard accounting principles and compares changes in INPV between the no-new-standards case and each standards case. The difference in INPV between the no-new-standards case and a standards case represents the financial impact of the new or amended energy conservation standard on manufacturers. As discussed previously, DOE developed critical GRIM inputs using a number of sources, including publicly available data, results of the engineering analysis, results of the shipments analysis, and information gathered from industry stakeholders during the course of manufacturer interviews. The GRIM results are presented in section V.B.2 of this document. Additional details about the GRIM, the discount rate, and other financial parameters can be found in chapter 12 of the direct final rule TSD.

a. Manufacturer Production Costs

Manufacturing more efficient products is typically more expensive than manufacturing baseline products due to the use of more complex components, which are typically more costly than baseline components. The changes in the MPCs of covered products can affect the revenues, gross margins, and cash flow of the industry. For its analysis in this direct final rule, DOE used a combined efficiency level and design option approach. First, an efficiency-level approach was used to establish an analysis tied to existing products on the market. A design option approach was then used to extend the analysis through ''built-down'' efficiency levels and ''built-up'' efficiency levels where there were gaps in the range of efficiencies of products that were reverse engineered.

For a complete description of the MPCs, see section IV.C of this document and chapter 5 of the direct final rule TSD.

b. Shipments Projections

The GRIM estimates manufacturer revenues based on total unit shipment projections and the distribution of those shipments by efficiency level. Changes in sales volumes and efficiency mix over time can significantly affect manufacturer finances. For this analysis, the GRIM uses the NIA's annual shipment projections derived from the shipments analysis from 2024 (the base year) to 2058 (the end year of the analysis period). See section IV.G of this document and chapter 9 of the direct final rule TSD for additional details.

c. Product and Capital Conversion Costs

New or amended energy conservation standards could cause manufacturers to incur conversion costs to bring their production facilities and product designs into compliance. DOE evaluated the level of conversion-related expenditures that would be needed to comply with each considered efficiency level in each product class. For the MIA, DOE classified these conversion costs into two major groups: (1) product conversion costs; and (2) capital conversion costs. Product conversion costs are investments in research, development, testing, marketing, and other non-capitalized costs necessary to make product designs comply with new or amended energy conservation standards. Capital conversion costs are investments in property, plant, and equipment necessary to adapt or change existing production facilities such that new compliant product designs can be fabricated and assembled.

Product Conversion Costs

DOE based its estimates of the product conversion costs necessary to meet the varying efficiency levels on information from manufacturer interviews, the design paths analyzed in the engineering analysis, the prior MREF rulemaking analysis (*see* 81 FR 75194), and market share and model count information. Generally, manufacturers indicated a preference to meet amended standards with design options that were direct and relatively straightforward component swaps. However, at higher efficiency levels, manufacturers anticipated the need for platform redesigns. Efficiency levels that significantly altered cabinet construction would require very large investments to update designs. Manufacturers noted that increasing foam thickness would require complete redesign of the cabinet, liner, and shelving due to loss of interior volume. Additionally, extensive use of VIPs would require redesign of the cabinet to maximize the benefits of VIPs.

Capital Conversion Costs

DOE relied on information from manufacturer interviews and the engineering analysis to evaluate the level of capital conversion costs would likely incur at the considered standard levels. During interviews, manufacturers provided estimates and descriptions of the required tooling changes that would be necessary to upgrade product lines to meet the various efficiency levels. Based on these inputs, DOE modeled incremental capital conversion costs for efficiency levels that could be reached with individual components swaps. However, based on feedback, DOE modeled higher capital conversion costs when manufacturers would have to redesign their existing product platforms. DOE used information from manufacturer interviews to determine the cost of the manufacturing equipment and tooling necessary to implement complete redesigns.

Increases in foam thickness require either reductions to interior volume or increases to exterior volume. Many MREFs are sized to fit standard widths, meaning any increase in foam thickness would likely result in the loss of interior volume. Additionally, many MREFs are sized to maximize storage of specific products (*e.g.,* canned beverages or wine bottles) and small changes in wall thickness could dramatically decrease the unit storage capacity for those products. The reduction of interior volume has significant consequences for manufacturing. Redesigning the cabinet to increase the effectiveness of insulation likely requires manufacturers to update designs and tooling associated with the interior of the product. This could require investing in new tooling to accommodate changes to the liner, shelving, drawers, and doors.

To minimize reductions to interior volume, manufacturers may choose to adopt VIP technology. Extensive incorporation of VIPs into designs requires significant upfront capital due to differences in the handling, storing, and manufacturing of VIPs as compared to typical polyurethane foams. VIPs are

relatively fragile and must be protected from punctures and rough handling. If VIPs have leaks of any size, the panel will eventually lose much of its thermal insulative properties and structural strength. If already installed within a cabinet wall, a punctured VIP may significantly reduce the structural strength of the MREF cabinet. As a result, VIPs require careful handling and installation. Manufacturers noted the need to allocate special warehouse space to ensure the VIPs are not jostled or roughly handled in the manufacturing environment. VIPs require significantly more warehouse space than polyurethane foams. The application of VIPs can be difficult and may require investment in hard-tooling or robotic systems to ensure the panels are positioned properly within the cabinet or door. Manufacturers noted that producing cabinets with VIPs are much more labor and time intensive than producing cabinets with typical polyurethane foams and the increase in labor can affect total production capacity.

To develop industry conversion cost estimates, DOE estimated the number of product platforms in DOE's CCD [58] and California Energy Commission's Modernized Appliance Efficiency Database System (''MAEDbS'') [59] and scaled up the product and capital conversion costs associated with the number of product platforms that would require updating at each efficiency level. DOE adjusted the conversion cost estimates developed in support of the March 2023 NOPR to 2022$ for this analysis.

DOE acknowledges that manufacturers may follow different design paths to reach the various efficiency levels analyzed. An individual manufacturer's investments depend on a range of factors, including the company's current product offerings and product platforms, existing production facilities and infrastructure, and make vs. buy decisions for components. DOE's conversion cost methodology incorporated feedback from all manufacturers that took part in interviews and extrapolated industry values. While industry average values may not represent any single manufacturer, DOE's model provides reasonable estimates of industry-level investments.

In general, DOE assumes all conversion-related investments occur between the year of publication of the direct final rule and the year by which manufacturers must comply with the new standard. The conversion cost figures used in the GRIM can be found in section V.B.2 of this document. For additional information on the estimated product and capital conversion costs, see chapter 12 of the direct final rule TSD.

d. Manufacturer Markup Scenarios

MSPs include direct manufacturing production costs (*i.e.,* labor, materials, and overhead estimated in DOE's MPCs) and all non-production costs (*i.e.,* SG&A, R&D, and interest), along with profit. To calculate the MSPs in the GRIM, DOE applied manufacturer markups to the MPCs estimated in the engineering analysis for each product class and efficiency level. Modifying these manufacturer markups in the standards case yields different sets of impacts on manufacturers. For the MIA, DOE modeled two standards case scenarios to represent uncertainty regarding the potential impacts on prices and profitability for manufacturers following the implementation of amended energy conservation standards: (1) a preservation-of-gross-margin-percentage scenario; and (2) a preservation-of-operating-profit scenario. These scenarios lead to different manufacturer markup values that, when applied to the MPCs, result in varying revenue and cash flow impacts.

Under the preservation-of-gross-margin-percentage scenario, DOE applied a single uniform ''gross margin percentage'' markup across all efficiency levels, which assumes that manufacturers would be able to maintain the same amount of profit as a percentage of revenues at all efficiency levels within a product class. As manufacturer production costs increase with efficiency, this scenario implies that the per-unit dollar profit will increase. DOE assumed a gross margin percentage of 20 percent for FCC and 28 percent for all other product classes.[60] Manufacturers tend to believe it is optimistic to assume that they would be able to maintain the same gross margin percentage as their production costs increase, particularly for minimally efficient products. Therefore, this scenario represents a high bound of industry profitability under an amended energy conservation standard.

In the preservation-of-operating-profit scenario, as the cost of production goes up under a standards case, manufacturers are generally required to reduce their manufacturer markups to a level that maintains base-case operating profit. DOE implemented this scenario in the GRIM by lowering the manufacturer markups at each TSL to yield approximately the same earnings before interest and taxes in the standards case as in the no-new-standards case in the year after the expected compliance date of the amended standards. The implicit assumption behind this scenario is that the industry can only maintain its operating profit in absolute dollars after the standard takes effect.

A comparison of industry financial impacts under the two manufacturer markup scenarios is presented in section V.B.2.a of this document.

3. Discussion of MIA Comments

For this direct final rule, DOE considered comments it had received regarding its MIA presented in the March 2023 NOPR. The approach used for this direct final rule is largely the same approach DOE had used for the March 2023 NOPR analysis.

In response to the March 2023 NOPR, AHAM stated that it cannot comment on the accuracy of DOE's approach for including how manufacturers might or might not recover potential investments (*i.e.,* the accuracy of DOE's manufacturer markup scenarios) but that AHAM supports DOE's intent in the microwave ovens supplemental notice of proposed rulemaking (''SNOPR'') (''August 2022 SNOPR'') energy conservation standards rulemaking to include those costs and investments in the actual costs of products and retail prices. (AHAM, No. 31 at p. 12) AHAM urged DOE to apply the same conceptual approach used in the August 2022 SNOPR in the MREF rulemaking and all future rulemakings (*i.e.,* to analyze a conversion-cost-recovery manufacturer markup scenario). (*Id.*)

As discussed in section IV.J.2.d of this document, DOE modeled two standards-case manufacturer markup scenarios to represent the uncertainty regarding the potential impacts on prices and profitability for manufacturers following the implementation of amended energy conservation standards. For the March 2023 NOPR, DOE applied the preservation-of-gross-margin-percentage scenario to reflect an upper bound of industry profitability and a preservation-of-operating-profit scenario

[58] U.S. Department of Energy's Compliance Certification Database is available at *www.regulations.doe.gov/certification-data/#q=Product_Group_s%3A** (last accessed August 17, 2023).

[59] California Energy Commission's Modernized Appliance Efficiency Database System is available at *cacertappliances.energy.ca.gov/Pages/ApplianceSearch.aspx* (last accessed August 17, 2023). DOE used this database to gather product information not provided in DOE's CCD *(e.g.,* manufacturer names).

[60] The gross margin percentages of 20 percent and 28 percent are based on manufacturer markups of 1.25 and 1.38 percent, respectively.

to reflect a lower bound of industry profitability under amended standards. DOE used these scenarios to reflect the range of realistic profitability impacts under more stringent standards. Manufacturing more efficient MREFs is generally more expensive than manufacturing baseline MREFs, as reflected by the MPCs estimated in the engineering analysis. Under the preservation-of-gross-margin scenario for MREFs, incremental increases in MPCs at higher efficiency levels result in an increase in per-unit dollar profit per unit sold. In interviews, manufacturers stated the industry relies on competitive pricing, so they would likely not increase their manufacturer markups that would allow them to recover their full investments. The preservation-of-gross-margin-scenario reflects an upper bound of industry profitability in which manufacturers would be able to maintain the same amount of profit as a percentage of revenues at all efficiency levels within a product class. Applying the approach used in the August 2022 SNOPR (*i.e.,* a conversion-cost-recovery scenario) would result in the MREF industry increasing manufacturer markups under amended standards. Based on information gathered during confidential interviews in support of the March 2023 NOPR, DOE does not expect that the MREF industry would increase manufacturer markups under an amended standard. Furthermore, in response to the March 2023 NOPR, DOE did not receive any public or confidential data indicating that industry would increase manufacturer markups in response to more stringent standards. Therefore, DOE used the same manufacturer markup scenarios from the March 2023 NOPR for this direct final rule analysis.

In response to the March 2023 NOPR, AHAM commented the cumulative regulatory burden is significant for home appliance manufacturers when needing to redesign products and product lines for the proposed levels for MREFs, for consumer clothes dryers, residential clothes washers, consumer conventional cooking products, dishwashers, RF, and the finalized levels for room air conditioners and microwave ovens. (*Id.* at p. 13). AHAM asserted that engineers will therefore need to spend all their time redesigning products to meet more stringent energy efficiency standards, pulling resources from other development efforts and business priorities. AHAM suggested that DOE could reduce cumulative regulatory burden by spacing out the timing of final rules, allowing more lead time by delaying the publication of final rules in the **Federal Register** after they have been issued, and reducing the stringency of standards such that fewer products would require redesign. (*Id.* at p. 14)

DOE analyzes cumulative regulatory burden in accordance with section 13(g) of the Process Rule. DOE details the rulemakings and expected conversion expenses of Federal energy conservation standards that could impact MREF original equipment manufacturers (''OEMs'') that take effect approximately 3 years before and after the 2029 compliance date in section V.B.2.e of this document. As shown in Table V.23 in section V.B.2.e of this document, DOE considers the potential cumulative regulatory burden from other DOE energy conservation standard rulemakings for consumer clothes dryers, residential clothes washers, consumer conventional cooking products, dishwashers, RF, room air conditioners, and microwave ovens in this direct final rule analysis.

Regarding AHAM's suggestion about spacing out the timing of final rules for home appliance rulemakings, DOE has statutory requirements under EPCA on the timing of rulemakings. For consumer clothes dryers, residential clothes washers, consumer conventional cooking products, dishwashers, RF, room air conditioners, and microwave ovens, amended standards apply to covered products manufactured 3 years after the date on which any new or amended standards are published. (42 U.S.C. 6295(m)(4)(A)(i)) For MREFs, amended standards apply 5 years after the date on which any new or amended standard is published. (42 U.S.C. 6295(l)(2)) And the multi-product Joint Agreement, where stakeholders can recommend different compliance dates under DOE's direct final rule authority, stated ''jointly recommended compliance dates will achieve the overall energy and economic benefits of this agreement while allowing necessary lead-times for manufacturers to redesign products and retool manufacturing plants to meet the recommended standards across product categories.'' (Joint Agreement, No. 34 at p. 2) The staggered compliance dates between the statutorily-required dates and the dates recommended in the Joint Agreement help mitigate manufacturers' concerns resource allocation and concurrent amended standards. See section II.B.4 of this document for compliance dates of rulemakings recommended in the Joint Agreement.

In response to the March 2023 NOPR, the Appliance Standards Awareness Project (''ASAP'') *et al.*[61] commented that DOE may have overestimated the decrease in INPV, and described some perceived inconsistencies. ASAP *et al.* pointed out that although DOE estimated a 10 percent reduction in shipments based on a 10 percent increase in production cost, ignoring the efficiency elasticity, the shipments decline should be no more than 4.5 percent at the compliance year. (ASAP *et al.,* No. 32 at pp. 1–2) In response to this comment, DOE re-evaluated its base assumptions and corrected its shipments estimates. The reduction in shipments in the projected compliance year for the Recommended TSL (*i.e.,* TSL 4) is now estimated to be 3.4 percent. For more details, see chapter 9 of the direct final rule TSD.

K. Emissions Analysis

The emissions analysis consists of two components. The first component estimates the effect of potential energy conservation standards on power sector and site (where applicable) combustion emissions of CO_2, NO_X, SO_2, and Hg. The second component estimates the impacts of potential standards on emissions of two additional greenhouse gases, CH_4 and N_2O, as well as the reductions in emissions of other gases due to ''upstream'' activities in the fuel production chain. These upstream activities comprise extraction, processing, and transporting fuels to the site of combustion.

The analysis of electric power sector emissions of CO_2, NO_X, SO_2, and Hg uses emissions intended to represent the marginal impacts of the change in electricity consumption associated with amended or new standards. The methodology is based on results published for the *AEO,* including a set of side cases that implement a variety of efficiency-related policies. The methodology is described in appendix 13A in the direct final rule TSD. The analysis presented in this document uses projections from *AEO2023.* Power sector emissions of CH_4 and N_2O from fuel combustion are estimated using Emission Factors for Greenhouse Gas Inventories published by the EPA.[62]

FFC upstream emissions, which include emissions from fuel combustion during extraction, processing, and transportation of fuels, and ''fugitive''

[61] ''ASAP *et al.*'' refers to a joint comment from Appliance Standards Awareness Project, American Council for an Energy-Efficient Economy, National Consumer Law Center, New York State Energy Research and Development Authority, and Northwest Energy Efficiency Alliance.

[62] Available at *www.epa.gov/sites/production/files/2021-04/documents/emission-factors_apr2021.pdf* (last accessed November 12, 2023).

emissions (direct leakage to the atmosphere) of CH_4 and CO_2, are estimated based on the methodology described in chapter 15 of the direct final rule TSD.

The emissions intensity factors are expressed in terms of physical units per MWh or MMBtu of site energy savings. For power sector emissions, specific emissions intensity factors are calculated by sector and end use. Total emissions reductions are estimated using the energy savings calculated in the national impact analysis.

1. Air Quality Regulations Incorporated in DOE's Analysis

DOE's no-new-standards case for the electric power sector reflects the *AEO,* which incorporates the projected impacts of existing air quality regulations on emissions. *AEO2023* reflects, to the extent possible, laws and regulations adopted through mid-November 2022, including the emissions control programs discussed in the following paragraphs, and the Inflation Reduction Act.[63] SO_2 emissions from affected electric generating units (''EGUs'') are subject to nationwide and regional emissions cap-and-trade programs. Title IV of the Clean Air Act sets an annual emissions cap on SO_2 for affected EGUs in the 48 contiguous States and the District of Columbia (''DC''). (42 U.S.C. 7651 *et seq.*) SO_2 emissions from numerous States in the eastern half of the United States are also limited under the Cross-State Air Pollution Rule (''CSAPR''). 76 FR 48208 (Aug. 8, 2011). CSAPR requires these States to reduce certain emissions, including annual SO_2 emissions, and went into effect as of January 1, 2015.[64] The *AEO* incorporates implementation of CSAPR, including the update to the CSAPR ozone season program emission budgets and target dates issued in 2016. 81 FR 74504 (Oct. 26, 2016). Compliance with CSAPR is flexible among EGUs and is enforced through the use of tradable emissions allowances. Under existing EPA regulations, for states subject to SO_2 emissions limits under CSAPR, any excess SO_2 emissions allowances resulting from the lower electricity demand caused by the adoption of an efficiency standard could be used to permit offsetting increases in SO_2 emissions by another regulated EGU.

However, beginning in 2016, SO_2 emissions began to fall as a result of the Mercury and Air Toxics Standards (''MATS'') for power plants.[65] 77 FR 9304 (Feb. 16, 2012). The final rule establishes power plant emission standards for mercury, acid gases, and non-mercury metallic toxic pollutants. Because of the emissions reductions under the MATS, it is unlikely that excess SO_2 emissions allowances resulting from the lower electricity demand would be needed or used to permit offsetting increases in SO_2 emissions by another regulated EGU. Therefore, energy conservation standards that decrease electricity generation will generally reduce SO_2 emissions. DOE estimated SO_2 emissions reduction using emissions factors based on *AEO2023.*

CSAPR also established limits on NO_X emissions for numerous States in the eastern half of the United States. Energy conservation standards would have little effect on NO_X emissions in those States covered by CSAPR emissions limits if excess NO_X emissions allowances resulting from the lower electricity demand could be used to permit offsetting increases in NO_X emissions from other EGUs. In such case, NO_X emissions would remain near the limit even if electricity generation goes down. Depending on the configuration of the power sector in the different regions and the need for allowances, however, NO_X emissions might not remain at the limit in the case of lower electricity demand. That would mean that standards might reduce NO_X emissions in covered States. Despite this possibility, DOE has chosen to be conservative in its analysis and has maintained the assumption that standards will not reduce NO_X emissions in States covered by CSAPR. Standards would be expected to reduce NO_X emissions in the States not covered by CSAPR. DOE used *AEO2023* data to derive NO_X emissions factors for the group of States not covered by CSAPR.

The MATS limit mercury emissions from power plants, but they do not include emissions caps and, as such, DOE's energy conservation standards would be expected to slightly reduce Hg emissions. DOE estimated mercury emissions reduction using emissions factors based on *AEO2023,* which incorporates the MATS.

L. Monetizing Emissions Impacts

As part of the development of this direct final rule, for the purpose of complying with the requirements of Executive Order 12866, DOE considered the estimated monetary benefits from the reduced emissions of CO_2, CH_4, N_2O, NO_X, and SO_2 that are expected to result from each of the TSLs considered. In order to make this calculation analogous to the calculation of the NPV of consumer benefit, DOE considered the reduced emissions expected to result over the lifetime of products shipped in the projection period for each TSL. This section summarizes the basis for the values used for monetizing the emissions benefits and presents the values considered in this direct final rule.

To monetize the benefits of reducing GHG emissions, this analysis uses the interim estimates presented in the *Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates Under Executive Order 13990* published in February 2021 by the IWG (''February 2021 SC–GHG TSD'').

1. Monetization of Greenhouse Gas Emissions

DOE estimates the monetized benefits of the reductions in emissions of CO_2, CH_4, and N_2O by using a measure of the SC of each pollutant (*e.g.,* SC–CO_2). These estimates represent the monetary value of the net harm to society associated with a marginal increase in emissions of these pollutants in a given year, or the benefit of avoiding that increase. These estimates are intended to include (but are not limited to) climate-change-related changes in net agricultural productivity, human health, property damages from increased flood risk, disruption of energy systems, risk of conflict, environmental migration, and the value of ecosystem services.

DOE exercises its own judgment in presenting monetized climate benefits as recommended by applicable Executive orders, and DOE would reach the same conclusion presented in this proposed rulemaking in the absence of the estimated benefits from reductions in GHG emissions. That is, the social

[63] For further information, see the Assumptions to *AEO2023* report that sets forth the major assumptions used to generate the projections in the Annual Energy Outlook. Available at *www.eia.gov/outlooks/aeo/assumptions/* (last accessed Nov. 22, 2023).

[64] CSAPR requires states to address annual emissions of SO_2 and NO_X, precursors to the formation of fine particulate matter (''$PM_{2.5}$'') pollution, in order to address the interstate transport of pollution with respect to the 1997 and 2006 $PM_{2.5}$ National Ambient Air Quality Standards (''NAAQS''). CSAPR also requires certain states to address the ozone season (May-September) emissions of NO_X, a precursor to the formation of ozone pollution, in order to address the interstate transport of ozone pollution with respect to the 1997 ozone NAAQS. 76 FR 48208 (Aug. 8, 2011). EPA subsequently issued a supplemental rule that included an additional five states in the CSAPR ozone season program; 76 FR 80760 (Dec. 27, 2011) (Supplemental Rule), and EPA issued the CSAPR Update for the 2008 ozone NAAQS. 81 FR 74504 (Oct. 26, 2016).

[65] In order to continue operating, coal power plants must have either flue gas desulfurization or dry sorbent injection systems installed. Both technologies, which are used to reduce acid gas emissions, also reduce SO_2 emissions.

costs of greenhouse gases, whether measured using the February 2021 interim estimates presented by the Interagency Working Group on the Social Cost of Greenhouse Gases or by another means, did not affect the rule ultimately proposed by DOE.

DOE estimated the global social benefits of CO_2, CH_4, and N_2O reductions using SC–GHG values that were based on the interim values presented in the *Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates under Executive Order 13990,* published in February 2021 by the IWG (''February 2021 SC–GHG TSD''). The SC–GHG is the monetary value of the net harm to society associated with a marginal increase in emissions in a given year, or the benefit of avoiding that increase. In principle, the SC–GHG includes the value of all climate change impacts, including (but not limited to) changes in net agricultural productivity, human health effects, property damage from increased flood risk and natural disasters, disruption of energy systems, risk of conflict, environmental migration, and the value of ecosystem services. The SC–GHG therefore, reflects the societal value of reducing emissions of the gas in question by one metric ton. The SC–GHG is the theoretically appropriate value to use in conducting benefit-cost analyses of policies that affect CO_2, N_2O and CH_4 emissions. As a member of the IWG involved in the development of the February 2021 SC–GHG TSD, DOE agreed that the interim SC–GHG estimates represent the most appropriate estimate of the SC–GHG until revised estimates were developed reflecting the latest, peer-reviewed science. *See* 87 FR 78382, 78406–78408 for discussion of the development and details of the IWG SC–GHG estimates.

There are a number of limitations and uncertainties associated with the SC–GHG estimates. First, the current scientific and economic understanding of discounting approaches suggests discount rates appropriate for intergenerational analysis in the context of climate change are likely to be less than 3 percent, near 2 percent or lower.[66] Second, the IAMs used to produce these interim estimates do not include all of the important physical, ecological, and economic impacts of climate change recognized in the climate change literature and the science underlying their ''damage functions''—*i.e.,* the core parts of the IAMs that map global mean temperature changes and other physical impacts of climate change into economic (both market and nonmarket) damages—lags behind the most recent research. For example, limitations include the incomplete treatment of catastrophic and non-catastrophic impacts in the integrated assessment models, their incomplete treatment of adaptation and technological change, the incomplete way in which inter-regional and intersectoral linkages are modeled, uncertainty in the extrapolation of damages to high temperatures, and inadequate representation of the relationship between the discount rate and uncertainty in economic growth over long time horizons. Likewise, the socioeconomic and emissions scenarios used as inputs to the models do not reflect new information from the last decade of scenario generation or the full range of projections. The modeling limitations do not all work in the same direction in terms of their influence on the SC–CO_2 estimates. However, as discussed in the February 2021 SC–GHG TSD, the IWG has recommended that, taken together, the limitations suggest that the interim SC–GHG estimates used in this final rule likely underestimate the damages from GHG emissions. DOE concurs with this assessment.

In the February 2021 SC–GHG TSD, the IWG stated that the models used to produce the interim estimates do not include all of the important physical, ecological, and economic impacts of climate change recognized in the climate change literature. For these same impacts, the science underlying their ''damage functions'' lags behind the most recent research. In the judgment of the IWG, these and other limitations suggest that the range of four interim SC–GHG estimates presented in the TSD likely underestimate societal damages from GHG emissions. The IWG is in the process of assessing how best to incorporate the latest peer-reviewed science and the recommendations of the National Academies to develop an updated set of SC–GHG estimates, and DOE remains engaged in that process.

DOE is aware that in December 2023, EPA issued a new set of SC–GHG estimates in connection with a final rulemaking under the Clean Air Act.[67] As DOE had used the IWG interim values in proposing this rule and is currently reviewing the updated 2023 SC–GHG values, for this final rule, DOE used these updated 2023 SC–GHG values to conduct a sensitivity analysis of the value of GHG emissions reductions. DOE notes that because EPA's estimates are considerably higher than the IWG's interim SC–GHG values applied for this direct final rule, an analysis that uses the EPA's estimates results in significantly greater climate-related benefits. However, such results would not affect DOE's decision in this direct final rule. As stated elsewhere in this document, DOE would reach the same conclusion regarding the economic justification of the standards presented in this direct final rule without considering the IWG's interim SC–GHG values, which DOE agrees are conservative estimates. For the same reason, if DOE were to use EPA's higher SC–GHG estimates, they would not change DOE's conclusion that the standards are economically justified.

DOE's derivations of the SC–CO_2, SC–N_2O, and SC–CH_4 values used for this NOPR are discussed in the following sections, and the results of DOE's analyses estimating the benefits of the reductions in emissions of these GHGs are presented in section V.B.6 of this document.

a. Social Cost of Carbon

The SC–CO_2 values used for this final rule were based on the values developed for the February 2021 SC–GHG TSD, which are shown in Table IV.12 in 5-year increments from 2020 to 2050. The set of annual values that DOE used, which was adapted from estimates published by EPA,[68] is presented in appendix 14A of the direct final rule TSD. These estimates are based on methods, assumptions, and parameters identical to the estimates published by the IWG (which were based on EPA modeling), and include values for 2051 to 2070. DOE expects additional climate benefits to accrue for products still operating after 2070, but a lack of available SC–CO_2 estimates for emissions years beyond 2070 prevents DOE from monetizing these potential benefits in this analysis.

[66] Interagency Working Group on Social Cost of Greenhouse Gases. 2021. Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates under Executive Order 13990. February. United States Government. Available at: *www.whitehouse.gov/briefing-room/blog/2021/02/26/a-return-to-science-evidence-based-estimates-of-the-benefits-of-reducing-climate-pollution/.*

[68] *See* EPA, Revised 2023 and Later Model Year Light-Duty Vehicle GHG Emissions Standards: Regulatory Impact Analysis, Washington, DC, December 2021. Available at *nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P1013ORN.pdf* (last accessed November 21, 2023).

Table IV.12. Annual SC-CO_2 Values from 2021 Interagency Update, 2020–2050 (2020$ per Metric Ton CO_2)

Year	Discount Rate and Statistic			
	5%	3%	2.5%	3%
	Average	Average	Average	95th percentile
2020	14	51	76	152
2025	17	56	83	169
2030	19	62	89	187
2035	22	67	96	206
2040	25	73	103	225
2045	28	79	110	242
2050	32	85	116	260

DOE multiplied the CO_2 emissions reduction estimated for each year by the SC–CO_2 value for that year in each of the four cases. DOE adjusted the values to 2022$ using the implicit price deflator for gross domestic product (''GDP'') from the Bureau of Economic Analysis. To calculate a present value of the stream of monetary values, DOE discounted the values in each of the four cases using the specific discount rate that had been used to obtain the SC–CO_2 values in each case.

b. Social Cost of Methane and Nitrous Oxide

The SC–CH_4 and SC–N_2O values used for this direct final rule were based on the values developed for the February 2021 SC–GHG TSD. Table IV.13 shows the updated sets of SC–CH_4 and SC–N_2O estimates from the latest interagency update in 5-year increments from 2020 to 2050. The full set of annual values used is presented in appendix 14–A of the direct final rule TSD. To capture the uncertainties involved in regulatory impact analysis, DOE has determined it is appropriate to include all four sets of SC–CH_4 and SC–N_2O values, as recommended by the IWG. DOE derived values after 2050 using the approach previously described for the SC–CO_2.

Table IV.13. Annual SC-CH_4 and SC-N_2O Values from 2021 Interagency Update, 2020–2050 (2020$ per Metric Ton)

Year	SC-CH_4				SC-N_2O			
	Discount Rate and Statistic				Discount Rate and Statistic			
	5%	3%	2.5%	3%	5%	3%	2.5 %	3%
	Average	Average	Average	95th percentile	Average	Average	Average	95th percentile
2020	670	1500	2000	3900	5800	18000	27000	48000
2025	800	1700	2200	4500	6800	21000	30000	54000
2030	940	2000	2500	5200	7800	23000	33000	60000
2035	1100	2200	2800	6000	9000	25000	36000	67000
2040	1300	2500	3100	6700	10000	28000	39000	74000
2045	1500	2800	3500	7500	12000	30000	42000	81000
2050	1700	3100	3800	8200	13000	33000	45000	88000

DOE multiplied the CH_4 and N_2O emissions reduction estimated for each year by the SC–CH_4 and SC–N_2O estimates for that year in each of the cases. DOE adjusted the values to 2022$ using the implicit price deflator for GDP from the Bureau of Economic Analysis. To calculate a present value of the stream of monetary values, DOE discounted the values in each of the cases using the specific discount rate that had been used to obtain the SC–CH_4 and SC–N_2O estimates in each case.

c. Sensitivity Analysis Using Updated 2023 SC–GHG Estimates

In December 2023 EPA issued a new set of SC–GHG estimates (2023 SC–GHG) in connection with a final rulemaking under the Clean Air Act.[69] These estimates incorporate recent research and address recommendations of the National Academies (2017) and comments from a 2023 external peer review of the accompanying technical report. For this rulemaking, DOE used these updated 2023 SC–GHG values to conduct a sensitivity analysis of the value of GHG emissions reductions associated with alternative standards for circulator pumps. This sensitivity analysis provides an expanded range of potential climate benefits associated with amended standards. The final year of EPA's new 2023 SC–GHG estimates is 2080; therefore, DOE did not monetize the climate benefits of GHG emissions reductions occurring after 2080.

The overall climate benefits are greater when using the higher, updated SC–GHG 2023 estimates, compared to the climate benefits using the older IWG SC–GHG estimates. The results of the sensitivity analysis are presented in appendix 14C of the direct final rule TSD.

2. Monetization of Other Emissions Impacts

For this direct final rule, DOE estimated the monetized value of NO_X and SO_2 emissions reductions from electricity generation using benefit per ton estimates for that sector from the

[69] *See www.epa.gov/environmental-economics/scghg.*

EPA's Benefits Mapping and Analysis Program.[70] DOE used EPA's values for $PM_{2.5}$-related benefits associated with NO_X and SO_2 and for ozone-related benefits associated with NO_X for 2025 and 2030, and 2040, calculated with discount rates of 3 percent and 7 percent. DOE used linear interpolation to define values for the years not given in the 2025 to 2040 range; for years beyond 2040 the values are held constant. DOE combined the EPA regional benefit-per-ton estimates with regional information on electricity consumption and emissions from *AEO2023* to define weighted-average national values for NO_X and SO_2 (see appendix 14B of the direct final rule TSD).

DOE multiplied the site emissions reduction (in tons) in each year by the associated $/ton values and then discounted each series using discount rates of 3 percent and 7 percent as appropriate.

M. Utility Impact Analysis

The utility impact analysis estimates the changes in installed electrical capacity and generation projected to result for each considered TSL. The analysis is based on published output from the NEMS associated with *AEO2023.* NEMS produces the *AEO* Reference case, as well as a number of side cases that estimate the economy-wide impacts of changes to energy supply and demand. For the current analysis, impacts are quantified by comparing the levels of electricity sector generation, installed capacity, fuel consumption and emissions in the *AEO2023* Reference case and various side cases. Details of the methodology are provided in the appendices to chapters 13 and 15 of the direct final rule TSD.

The output of this analysis is a set of time-dependent coefficients that capture the change in electricity generation, primary fuel consumption, installed capacity and power sector emissions due to a unit reduction in demand for a given end use. These coefficients are multiplied by the stream of electricity savings calculated in the NIA to provide estimates of selected utility impacts of potential new or amended energy conservation standards.

N. Employment Impact Analysis

DOE considers employment impacts in the domestic economy as one factor in selecting a standard. Employment impacts from new or amended energy conservation standards include both direct and indirect impacts. Direct employment impacts are any changes in the number of employees of manufacturers of the products subject to standards. The MIA addresses those impacts. Indirect employment impacts are changes in national employment that occur due to the shift in expenditures and capital investment caused by the purchase and operation of more-efficient appliances. Indirect employment impacts from standards consist of the net jobs created or eliminated in the national economy, other than in the manufacturing sector being regulated, caused by (1) reduced spending by consumers on energy, (2) reduced spending on new energy supply by the utility industry, (3) increased consumer spending on the products to which the new standards apply and other goods and services, and (4) the effects of those three factors throughout the economy.

One method for assessing the possible effects on the demand for labor of such shifts in economic activity is to compare sector employment statistics developed by the Labor Department's BLS. BLS regularly publishes its estimates of the number of jobs per million dollars of economic activity in different sectors of the economy, as well as the jobs created elsewhere in the economy by this same economic activity. Data from BLS indicate that expenditures in the utility sector generally create fewer jobs (both directly and indirectly) than expenditures in other sectors of the economy.[71] There are many reasons for these differences, including wage differences and the fact that the utility sector is more capital-intensive and less labor-intensive than other sectors. Energy conservation standards have the effect of reducing consumer utility bills. Because reduced consumer expenditures for energy likely lead to increased expenditures in other sectors of the economy, the general effect of efficiency standards is to shift economic activity from a less labor-intensive sector (*i.e.,* the utility sector) to more labor-intensive sectors (*e.g.,* the retail and service sectors). Thus, the BLS data suggest that net national employment may increase due to shifts in economic activity resulting from energy conservation standards.

DOE estimated indirect national employment impacts for the standard levels considered in this direct final rule using an input/output model of the U.S. economy called Impact of Sector Energy Technologies version 4 (''ImSET'').[72] ImSET is a special-purpose version of the ''U.S. Benchmark National Input-Output'' (''I–O'') model, which was designed to estimate the national employment and income effects of energy-saving technologies. The ImSET software includes a computer- based I–O model having structural coefficients that characterize economic flows among 187 sectors most relevant to industrial, commercial, and residential building energy use.

DOE notes that ImSET is not a general equilibrium forecasting model, and that the uncertainties involved in projecting employment impacts, especially changes in the later years of the analysis. Because ImSET does not incorporate price changes, the employment effects predicted by ImSET may over-estimate actual job impacts over the long run for this direct final rule. Therefore, DOE used ImSET only to generate results for near-term timeframes (2029–2033), where these uncertainties are reduced. For more details on the employment impact analysis, see chapter 16 of the direct final rule TSD.

O. Other Comments

As discussed previously, DOE considered relevant comments, data, and information obtained through the 2023 NOPR public comment process in determining whether the recommended standards from the Joint Agreement are in accordance with 42 U.S.C. 6295(o). And while some of those comments were directed at specific aspects of DOE's analysis of the Joint Agreement under 42 U.S.C. 6295(o), others were more generally applicable to DOE's energy conservation standards rulemaking program as a whole. The ensuing discussion focuses on these general comments concerning energy conservation standards issued under EPCA.

The National Academies of Sciences, Engineering, and Medicine (''NAS'') periodically appoint a committee to peer review the assumptions, models, and methodologies that DOE uses in setting energy conservation standards

for covered products and equipment. The most recent such peer review was conducted in a series of meetings in 2020, and NAS issued the report[73] in 2021 detailing its findings and recommendations on how DOE can improve its analyses and align them with best practices for cost-benefit analysis.

In response to the March 2023 NOPR, AHAM stated that despite previous requests from AHAM and others, DOE has failed to review and incorporate the recommendations of the NAS report, instead indicating that it will conduct a separate rulemaking process without such a process having been initiated. (AHAM, No. 31 at p. 8) AHAM further stated that DOE seems to be ignoring the recommendations in the NAS Report and even conducting analysis that is opposite to the recommendations. AHAM commented that DOE cannot continue to perpetuate the errors in its analytical approach that have been pointed out by stakeholders and the NAS report as to do so will lead to arbitrary and capricious rules. (*Id.*)

As discussed, the rulemaking process for establishing new or amended standards for covered products and equipment are specified at appendix A to subpart C of 10 CFR part 430 (the Process Rule). DOE periodically examines and revises these provisions in separate rulemaking proceedings. The recommendations provided in the NAS Report, which pertain to the processes by which DOE analyzes energy conservation standards, will be considered by DOE in a separate, forthcoming rulemaking process.

V. Analytical Results and Conclusions

The following section addresses the results from DOE's analyses with respect to the considered energy conservation standards for MREFs. It addresses the TSLs examined by DOE, the projected impacts of each of these levels if adopted as energy conservation standards for MREFs, and the standards levels that DOE is adopting in this direct final rule. Additional details regarding DOE's analyses are contained in the direct final rule TSD supporting this document.

A. Trial Standard Levels

In general, DOE typically evaluates potential new or amended standards for products and equipment by grouping individual efficiency levels for each class into TSLs. Use of TSLs allows DOE to identify and consider manufacturer cost interactions between the product classes, to the extent that there are such interactions, and price elasticity of consumer purchasing decisions that may change when different standard levels are set.

In the analysis conducted for this direct final rule, DOE analyzed the benefits and burdens of five TSLs for MREFs. DOE developed TSLs that combine efficiency levels for each analyzed product class. TSL 1 represents a 10 percent increase in efficiency, corresponding to the lowest analyzed efficiency level above the baseline for each analyzed product class. TSL 2 represents efficiency levels consistent with Energy Star requirements for coolers, which in most cases except freestanding coolers (''FC'') represent an increase compared to TSL 1, and a modest increase in efficiency for certain combination cooler product classes compared to TSL 1. TSL 3 increases the efficiency for FC by an additional 10 percent compared to TSLs 1 and 2 and built-in coolers (''BIC'') by an additional 10 percent compared to TSL 1[74], while maintaining the same efficiency levels as TSL 2 for combination coolers. TSL 4 (the recommended TSL) further increases the standard level adopted in this direct final rule for all product classes except built-in compact cooler (''BICC''), BIC, C–3A and C–3A–BI, which remain at the same level as in TSL 3. TSL 5 represents max-tech for each product class, which represents an increase from TSL 4 in all cases. DOE presents the results for the TSLs in this document, while the results for all efficiency levels that DOE analyzed are in the direct final rule TSD.

Table V.1 presents the TSLs and the corresponding efficiency levels that DOE has identified for potential amended energy conservation standards for MREFs.

Table V.1 Trial Standard Levels for MREFs

	FCC	FC	BICC	BIC	C-13A	C-13A-BI	C-3A	C-3A-BI
TSL 1	EL1 (10%)	EL 1 (10%)	EL 1 (10%)	EL 1 (10%)	EL 1 (10%)	EL 1 (10%)	EL 1 (10%)	EL 1 (10%)
TSL 2	EL 2 (20%)	EL 1 (10%)	EL 3 (30%)	EL 3 (30%)	EL 2 (16%)	EL 2 (16%)	EL 1 (10%)	EL 1 (10%)
TSL 3	EL 2 (20%)	EL 2 (20%)	EL 3 (30%)	EL 2 (20%)	EL 2 (16%)	EL 2 (16%)	EL 1 (10%)	EL 1 (10%)
TSL 4	EL 3 (30%)	EL 3 (30%)	EL 3 (30%)	EL 2 (20%)	EL 3 (20%)	EL 3 (20%)	EL 1 (10%)	EL 1 (10%)
TSL 5	EL 5 (59%, 50%)*	EL 5 (38%)	EL 5 (59%, 50%)*	EL 5 (38%)	EL 5 (28%)	EL 5 (28%)	EL 4 (24%)	EL 4 (24%)

* Corresponding to 3.1 cu. ft. and 5.1 cu. ft. representative units, respectively.

[74] For BIC, the considered EL is lower at TSL 3 than TSL 2 due to the relatively high Energy Star level included in TSL 2.

B. Economic Justification and Energy Savings

1. Economic Impacts on Individual Consumers

DOE analyzed the economic impacts on MREF consumers by looking at the effects that potential amended standards at each TSL would have on the LCC and PBP. DOE also examined the impacts of potential standards on selected consumer subgroups. These analyses are discussed in the following sections.

a. Life-Cycle Cost and Payback Period

In general, higher-efficiency products affect consumers in two ways: (1) purchase price increases and (2) annual operating costs decrease. Inputs used for calculating the LCC and PBP include total installed costs (*i.e.,* product price plus installation costs), and operating costs (*i.e.,* annual energy use, energy prices, energy price trends, repair costs, and maintenance costs). The LCC calculation also uses product lifetime and a discount rate. Chapter 8 of the direct final rule TSD provides detailed information on the LCC and PBP analyses.

Tables V.2 through V.17 show the LCC and PBP results for the TSLs considered for each product class. In the first of each pair of tables, the simple payback is measured relative to the baseline product. In the second table, the impacts are measured relative to the efficiency distribution in the no-new-standards case in the compliance year (see section IV.F.8 of this document). Because some consumers purchase products with higher efficiency in the no-new-standards case, the average savings are less than the difference between the average LCC of the baseline product and the average LCC at each TSL. The savings refer only to consumers who are affected by a standard at a given TSL. Those who already purchase a product with efficiency at or above a given TSL are not affected. Consumers for whom the LCC increases at a given TSL experience a net cost.

BILLING CODE 6450–01–P

Table V.2 Average LCC and PBP Results for BIC

TSL	Efficiency Level	Average Costs *2022$*				Simple Payback *Years*	Average Lifetime *years*
		Installed Cost	First Year's Operating Cost	Lifetime Operating Cost	LCC		
--	Baseline	1,877.84	39.78	469.37	2,347.21	-	14.5

b. Consumer Subgroup Analysis

In the consumer subgroup analysis, DOE estimated the impact of the considered TSLs on senior-only households, which account for 8.7% of the total MREF household sample. DOE did not consider low-income consumers in this direct final rule because MREFs are not products generally used by this subgroup, as they typically cost more than comparable compact refrigerators, which are able to maintain lower temperatures compared to MREFs, and therefore serve a wider range of applications. Based on the TraQline wine chiller data, less than 4 percent of MREF owners are below the federal household income threshold for poverty. Table V.18 compares the average LCC savings and PBP at each efficiency level for the senior-only consumer subgroup with similar metrics for the entire consumer sample for all product classes. In most cases, the average LCC savings and PBP for senior-only households at the considered efficiency levels are improved (*i.e.,* higher LCC savings and equal or lesser payback periods) from the average for all households. Chapter 11 of the direct final rule TSD presents the complete LCC and PBP results for the subgroup.

Table V.18 Comparison of LCC Savings and PBP for Senior-Only Consumer Subgroup and All Consumers

BILLING CODE 6450–01–C

c. Rebuttable Presumption Payback

As discussed in section IV.F.9 of this document, EPCA establishes a rebuttable presumption that an energy conservation standard is economically justified if the increased purchase cost for a product that meets the standard is less than three times the value of the first-year energy savings resulting from the standard. (42 U.S.C. 6295(o)(2)(B)(iii)) In calculating a rebuttable presumption payback period for each of the considered TSLs, DOE used discrete values and, as required by EPCA, based the energy use calculation on the DOE test procedure for MREFs. In contrast, the PBPs presented in section V.B.1.a of this document were calculated using distributions that reflect the range of energy use in the field.

Table V.19 presents the rebuttable-presumption payback periods for the considered TSLs for MREFs. While DOE examined the rebuttable-presumption criterion, it considered whether the standard levels considered for this rule are economically justified through a

more detailed analysis of the economic impacts of those levels, pursuant to 42 U.S.C. 6295(o)(2)(B)(i), that considers the full range of impacts to the consumer, manufacturer, Nation, and environment. The results of that analysis serve as the basis for DOE to definitively evaluate the economic justification for a potential standard level, thereby supporting or rebutting the results of any preliminary determination of economic justification.

Table V.19 Rebuttable-Presumption Payback Periods

Efficiency Level	Rebuttable Payback Period *Years*							
	FCC	**FC**	**BICC**	**BIC**	**C-13A**	**C-13A-BI**	**C-3A**	**C-3A-BI**

5	11.7	26.8	13.9	28.5	17.6	17.1	--	--

2. Economic Impacts on Manufacturers

DOE performed an MIA to estimate the impact of amended energy conservation standards on manufacturers of MREFs. The next section describes the expected impacts on manufacturers at each considered TSL. Chapter 12 of the direct final rule TSD explains the analysis in further detail.

a. Industry Cash Flow Analysis Results

In this section, DOE provides GRIM results from the analysis, which examines changes in the industry that would result from a standard. The following tables summarize the estimated financial impacts (represented by changes in INPV) of potential amended energy conservation standards on manufacturers of MREFs, as well as the conversion costs that DOE estimates manufacturers of MREFs would incur at each TSL.

The impact of amended energy conservation standards was analyzed under two scenarios: (1) the preservation-of-gross-margin percentage; and (2) the preservation-of-operating-profit, as discussed in section IV.J.2.d of this document. The preservation-of-gross-margin percentages applies a ''gross margin percentage'' of 20 percent for FCC and 28 percent for all other product classes.[75] This scenario assumes that a manufacturer's per-unit dollar profit would increase as MPCs increase in the standards cases and represents the upper-bound to industry profitability under potential new or amended energy conservation standards.

The preservation-of-operating-profit scenario reflects manufacturers' concerns about their inability to maintain margins as MPCs increase to reach more stringent efficiency levels. In this scenario, while manufacturers make the necessary investments required to convert their facilities to produce compliant products, operating profit does not change in absolute dollars and decreases as a percentage of revenue. The preservation-of-operating-profit scenario results in the lower (or more severe) bound to impacts of potential amended standards on industry.

Each of the modeled scenarios results in a unique set of cash flows and corresponding INPV for each TSL. INPV is the sum of the discounted cash flows to the industry from the base year through the end of the analysis period. The ''change in INPV'' refers to the difference in industry value between the no-new-standards case and standards case at each TSL. To provide perspective on the short-run cash flow impact, DOE includes a comparison of free cash flow between the no-new-standards case and the standards case at each TSL in the year before amended standards would take effect. This figure provides an understanding of the magnitude of the required conversion costs relative to the cash flow generated by the industry in the no-new-standards case.

Conversion costs are one-time investments for manufacturers to bring their manufacturing facilities and product designs into compliance with potential amended standards. As described in section IV.J.2.c of this document, conversion cost investments occur between the year of publication of the direct final rule and the year by which manufacturers must comply with the amended standards. The conversion costs can have a significant impact on the short-term cash flow of the industry and generally result in lower free cash flow in the period between the publication of the direct final rule and the compliance date of potential amended standards. Conversion costs are independent of the manufacturer markup scenarios and are not presented as a range in this analysis.

[75] The gross margin percentages of 20 percent and 28 percent are based on manufacturer markups of 1.25 and 1.38 percent, respectively.

Table V.20 Manufacturer Impact Analysis Results for Miscellaneous Refrigeration Products

	Unit	No-New-Standards Case	TSL 1	TSL 2	TSL 3	TSL 4	TSL 5
INPV	*2022$ Million*	807.7	773.7 to 777.2	758.7 to 770.6	761.9 to 772.1	715.6 to 747.4	386.7 to 524.5
Change in INPV*	*%*	-	(4.2) to (3.8)	(6.1) to (4.6)	(5.7) to (4.4)	(11.4) to (7.5)	(52.1) to (35.1)
Free Cash Flow (2028)	*2022$ Million*	60.4	41.5	34.3	35.8	13.2	(169.9)
Change in Free Cash Flow (2028)	*%*	-	(31.2)	(43.1)	(40.7)	(78.2)	(381.5)
Product Conversion Costs	*2022$ Million*	-	54.0	68.4	70.8	104.1	375.3
Capital Conversion Costs	*2022$ Million*	-	1.3	6.4	1.3	26.6	179.7
Total Conversion Costs	*2022$ Million*	-	55.3	74.8	72.1	130.7	555.1

*Parentheses denote negative (-) values.

The following cash flow discussion refers to product classes as defined in Table I.1 in section I of this document and the efficiency levels and design options as detailed in Table IV.4 in section IV.C.3 of this document.

At TSL 1, the standard represents a modest increase in efficiency, corresponding to the lowest analyzed efficiency level above baseline for all classes, except product classes C–9 and C–9–BI at baseline efficiency. The change in INPV is expected to range from –4.2 to –3.8 percent. At this level, the free cash flow is estimated to decrease by 41.5 percent compared to the no-new-standards case value of $60.4 million in the year 2028, the year before the standards year. Currently, 24.4 percent of MREF shipments meet the efficiencies required at TSL 1. See Table V.21 for the percentage of shipments that meet each TSL by product class.

DOE analyzed implementing various design options for the range of directly analyzed product classes. These design options could include implementing more efficient single-speed compressors, tube and fin evaporators and/or condensers, hot walls, and argon-filled glass. At TSL 1, capital conversion costs are minimal because most manufacturers can incorporate design options with component changes. Product conversion costs may be necessary for sourcing components, building prototypes, and testing new components. DOE estimates capital conversion costs of $1.3 million and product conversion costs of $54.0 million. Conversion costs total $55.3 million.

At TSL 1, the shipment-weighted average MPC for all MREFs is expected to increase by 0.7 percent relative to the no-new-standards case shipment-weighted average MPC for all MREFs in 2029. Given the relatively small increase in production costs, DOE does not project a notable drop in shipments in the year the standard takes effect. In the preservation-of-gross-margin percentage scenario, the minor increase in cashflow from the higher MSP is slightly outweighed by the $55.3 million in conversion costs, causing a small negative change in INPV at TSL 1 under this scenario. Under the preservation-of-operating-profit scenario, manufacturers earn the same per-unit operating profit as would be earned in the no-new-standards case, but manufacturers do not earn additional profit from their investments. In this scenario, the manufacturer markup decreases in 2030, the year after the analyzed 2029 compliance year. This reduction in the manufacturer markup and the $55.3 million in conversion costs incurred by manufacturers cause a slightly negative change in INPV at TSL 1 under the preservation-of-operating-profit scenario. See section IV.J.2.d of this document for details on the manufacturer markup scenarios.

TSL 2 represents efficiency levels consistent with ENERGY STAR requirements for coolers and a modest increase in efficiency for certain combination cooler product classes. The change in INPV is expected to range from –6.1 to –4.6 percent. At this level, the free cash flow is estimated to decrease by 43.1 percent compared to the no-new-standards case value of $60.4 million in the year 2028, the year before the standards year. Currently, 12.6 percent of MREF shipments meet the efficiencies required at TSL 2.

The design options DOE analyzed for most product classes include implementing similar design options as TSL 1, such as more efficient single-speed compressors. For FCC, C–13A, and C–13A–BI, TSL 2 corresponds to EL 2. For BICC and BIC, TSL 2 corresponds to EL 3. For the remaining product classes, the efficiencies required at TSL 2 are the same as TSL 1. The increase in conversion costs compared to TSL 1 are largely driven by the higher efficiencies required for BICs, which account for 3.5 percent of MREF shipments. For BIC products that do not

meet this level, increasing insulation thickness would likely mean new cabinets, liners, and fixtures as well as new shelf designs. Implementing variable-speed compressors could require more advanced controls and electronics and new test stations. DOE estimates capital conversion costs of $6.4 million and product conversion costs of $68.4 million. Conversion costs total $74.8 million.

At TSL 2, the shipment-weighted average MPC for all MREFs is expected to increase by 3.4 percent relative to the no-new-standards case shipment-weighted average MPC for all MREFs in 2029. In the preservation-of-gross-margin percentage scenario, the minor increase in cashflow from the higher MSP is slightly outweighed by the $74.8 million in conversion costs, causing a small negative change in INPV at TSL 2 under this scenario. Under the preservation-of-operating-profit scenario, manufacturers earn the same per-unit operating profit as would be earned in the no-new-standards case, but manufacturers do not earn additional profit from their investments. In this scenario, the manufacturer markup decreases in 2030, the year after the analyzed compliance year. This reduction in the manufacturer markup and the $74.8 million in conversion costs incurred by manufacturers cause a negative change in INPV at TSL 2 under the preservation-of-operating-profit scenario.

TSL 3 increases the efficiency for FCs by an additional 10 percent compared to TSL 2, and TSL 3 decreases the efficiency for BICs by 10 percent. Combination coolers are at the same efficiency levels as TSL 2. The change in INPV is expected to range from –5.7 to –4.4 percent. At this level, free cash flow is estimated to decrease by 40.7 percent compared to the no-new-standards case value of $60.4 million in the year 2028, the year before the standards year. Currently, approximately 5.8 percent of domestic MREF shipments meet the efficiencies required at TSL 3.

At this level, DOE analyzed similar design options as TSL 1 and TSL 2, such as implementing incrementally more efficient single-speed compressors. For all product classes except FC and BIC, the efficiencies required at TSL 3 are the same as TSL 2. For FC, TSL 3 corresponds to EL 2. For BIC, TSL 3 reflects a lower efficiency level (EL 2) as compared to TSL 2 (EL 3). Industry capital conversion costs decrease at TSL 3 as compared to TSL 2 due to the lower efficiency level required for BIC. As previously discussed, DOE expects manufacturers of BIC would likely need to increase insulation thickness at TSL 2 (EL 3) and incorporate variable-speed compressors. However, at TSL 3, DOE's engineering analysis and manufacturer feedback indicate that manufacturers could achieve EL 2 efficiencies for BIC with relatively straightforward component swaps versus a larger product redesign associated with increasing insulation. DOE estimates capital conversion costs of $1.3 million and product conversion costs of $70.8 million. Conversion costs total $72.1 million.

At TSL 3, the shipment-weighted average MPC for all MREFs is expected to increase by 3.2 percent relative to the no-new-standards case shipment-weighted average MPC for all MREFs in 2029. In the preservation-of-gross-margin-percentage scenario, the slight increase in cashflow from the higher MSP is outweighed by the $72.1 million in conversion costs, causing a slightly negative change in INPV at TSL 3 under this scenario. Under the preservation-of-operating-profit scenario, the manufacturer markup decreases in 2030, the year after the analyzed compliance year. This reduction in the manufacturer markup and the $72.1 million in conversion costs incurred by manufacturers cause a slightly negative change in INPV at TSL 3 under the preservation-of-operating-profit scenario.

At the Recommended TSL (*i.e.,* TSL 4), the standard reflects an increase in efficiency level for the product classes that make up the vast majority of MREF shipments (FCC, FC, C–13A). The Recommended TSL further increases the standard level adopted in this direct final rule for all product classes except BICC, BIC, C–3A, and C–3A–BI. The change in INPV is expected to range from –11.4 to –7.5 percent. At this level, free cash flow is estimated to decrease by 78.2 percent compared to the no-new-standards case value of $60.4 million in the year 2028, the year before the standards year. Currently, approximately 3.9 percent of domestic MREF shipments meet the efficiencies required at the Recommended TSL.

At the Recommended TSL, all product classes correspond to EL 3, except BIC, C–3A, C–3A–BI, C–9, and C–9–BI. For BIC, the Recommended TSL corresponds to EL 2. For C–3A, the efficiencies required at the Recommended TSL are the same as TSL 3 (EL 1). For C–3A–BI, the Recommended TSL corresponds to EL 1. Both C–9 and C–9–BI correspond to baseline efficiency. At this level, conversion costs are largely driven by the efficiencies required for FC, which accounts for approximately 11.8 percent of industry shipments. DOE's shipments analysis estimates that no FC shipments currently meet the efficiencies required at the Recommended TSL. All manufacturers would need to update their product platforms, which could include increasing insulation thickness and implementing variable-speed compressors. Increasing insulation thickness would likely result in the loss of interior volume or an increase in exterior product dimensions. A decrease of interior volume would require redesign of the cabinet as well as the designs and tooling associated with the interior of the product, such as the liner, shelving, racks, and drawers. DOE estimates capital conversion costs of $26.6 million and product conversion costs of $104.1 million. Conversion costs total $130.7 million.

At the Recommended TSL, the shipment-weighted average MPC for all MREFs is expected to increase by 8.1 percent relative to the no-new-standards case shipment-weighted average MPC for all MREFs in 2029. Given the projected increase in production costs, DOE expects an estimated 4 percent drop in shipments in the year the standard takes effect relative to the no-new-standards case. In the preservation-of-gross-margin-percentage scenario, the increase in cashflow from the higher MSP is outweighed by the $130.7 million in conversion costs and the drop in annual shipments, causing a negative change in INPV at the Recommended TSL under this scenario. Under the preservation-of-operating-profit scenario, the manufacturer markup decreases in 2030, the year after the analyzed compliance year. This reduction in the manufacturer markup, the $130.7 million in conversion costs incurred by manufacturers, and the drop in annual shipments cause a negative change in INPV at the Recommended TSL under the preservation-of-operating-profit scenario.

TSL 5 represents max-tech efficiency levels for all product classes. The change in INPV is expected to range from –52.1 to –35.1 percent. At this level, free cash flow is estimated to decrease by 381.5 percent compared to the no-new-standards case value of $60.4 million in the year 2028, the year before the standards year. Currently, approximately 2.9 percent of domestic MREF shipments meet the efficiencies required at TSL 5.

DOE's shipments analysis estimates that no shipments meet the efficiencies required across all product classes except for BICC, which account for only 4 percent of industry shipments. A max-tech standard would necessitate significant investment to redesign

nearly all product platforms and incorporate design options such as the most efficient variable-speed compressors, triple-pane glass, increased foam insulation thickness, and VIP technology. Capital conversion costs may be necessary for new tooling for VIP placement as well as new testing stations for high-efficiency components. Increasing insulation thickness would likely result in the loss of interior volume or an increase in exterior product dimensions. Loss of interior volume would require redesign of the cabinet as well as the designs and tooling associated with the interior of the product, such as the liner, shelving, racks, and drawers. Product conversion costs at max-tech are significant as manufacturers work to completely redesign their product platforms. For products implementing VIPs, product conversion costs may be necessary for prototyping and testing for VIP placement, design, and sizing. Manufacturers implementing triple-pane glass may need to redesign the door frame and hinges to support the added thickness and weight. DOE estimates capital conversion costs of $179.7 million and product conversion costs of $375.3 million. Conversion costs total $555.1 million.

At TSL 5, the large conversion costs result in a free cash flow dropping below zero in the years before the standards year. The negative free cash flow calculation indicates manufacturers may need to access cash reserves or outside capital to finance conversion efforts.

At TSL 5, the shipment-weighted average MPC for all MREFs is expected to increase by 32.7 percent relative to the no-new-standards case shipment-weighted average MPC for all MREFs in 2029. Given the projected increase in production costs, DOE expects an estimated 13 percent drop in shipments in the year the standard takes effect relative to the no-new-standards case. In the preservation-of-gross-margin-percentage scenario, the increase in cashflow from the higher MSP is outweighed by the $555.1 million in conversion costs and drop in annual shipments, causing a significant negative change in INPV at TSL 5 under this scenario. Under the preservation-of-operating-profit scenario, the manufacturer markup decreases in 2030, the year after the analyzed compliance year. This reduction in the manufacturer markup, the $555.1 million in conversion costs incurred by manufacturers, and the drop in annual shipments cause a significant decrease in INPV at TSL 5 under the preservation-of-operating-profit scenario.

Table V.21 Percentages of 2024 Shipments that Meet each TSL by Product Class

Product Class	TSL 1	TSL 2	TSL 3	TSL 4	TSL 5
FCC	21.0%	3.0%	3.0%	0.0%	0.0%
FC	58.0%	58.0%	0.0%	0.0%	0.0%
BICC	82.0%	75.0%	76.0%	76.0%	74.0%
BIC	28.0%	28.0%	28.0%	28.0%	0.0%

C-9	100.0%	100.0%	100.0%	100.0%	100.0%
C-9-BI	0.0%	0.0%	0.0%	0.0%	0.0%
C-13A	1.0%	0.0%	0.0%	0.0%	0.0%
C-13A-BI	0.0%	0.0%	0.0%	0.0%	0.0%
Total	24.4%	12.6%	5.8%	3.9%	2.9%

b. Direct Impacts on Employment

To quantitatively assess the potential impacts of amended energy conservation standards on direct employment in the MREF industry, DOE used the GRIM to estimate the domestic labor expenditures and number of direct employees in the no-new-standards case and in each of the standards cases during the analysis period. For this direct final rule, DOE used the most up-to-date information available. DOE calculated these values using statistical data from the 2021 *ASM*,[76] BLS employee compensation data,[77] results from the engineering analysis, and manufacturer interviews conducted in support of the March 2023 NOPR.

Labor expenditures related to product manufacturing depend on the labor intensity of the product, the sales volume, and an assumption that wages remain fixed in real terms over time. The total labor expenditures in each year are calculated by multiplying the total MPCs by the labor percentage of MPCs. The total labor expenditures in the GRIM were then converted to total production employment levels by dividing production labor expenditures by the average fully burdened wage multiplied by the average number of hours worked per year per production worker. To do this, DOE relied on the *ASM* inputs: Production Workers Annual Wages, Production Workers Annual Hours, Production Workers for Pay Period, and Number of Employees. DOE also relied on the BLS employee compensation data to determine the fully burdened wage ratio. The fully burdened wage ratio factors in paid leave, supplemental pay, insurance, retirement and savings, and legally required benefits.

The number of production employees is then multiplied by the U.S. labor Percentage to convert total production employment to total domestic production employment. The U.S. labor percentage represents the industry fraction of domestic manufacturing

[76] U.S. Census Bureau, *Annual Survey of Manufactures.* ''Summary Statistics for Industry Groups and Industries in the U.S (2021).'' Available at *www.census.gov/programs-surveys/asm/data.html* (last accessed July 5, 2023).

[77] U.S. Bureau of Labor Statistics. *Employer Costs for Employee Compensation—June 2023.* September 12, 2023. Available at *www.bls.gov/news.release/pdf/ecec.pdf* (last accessed October 30, 2023).

production capacity for the covered product. This value is derived from manufacturer interviews, product database analysis, and publicly available information. Consistent with the March 2023 NOPR, DOE estimates that 7.8 percent of MREFs are produced domestically.

The domestic production employees estimate covers production line workers, including line supervisors, who are directly involved in fabricating and assembling products within the OEM facility. Workers performing services that are closely associated with production operations, such as materials-handling tasks using forklifts, are also included as production labor. DOE's estimates only account for production workers who manufacture the specific products covered by this rulemaking.

Non-production workers account for the remainder of the direct employment figure. The non-production employees estimate covers domestic workers who are not directly involved in the production process, such as sales, engineering, human resources, and management.[78] Using the amount of domestic production workers calculated above, non-production domestic employees are extrapolated by multiplying the ratio of non-production workers in the industry compared to production employees. DOE assumes that this employee distribution ratio remains constant between the no-new-standards case and standards cases.

Using the GRIM, DOE estimates in the absence of amended energy conservation standards there would be 211 domestic production and non-production workers for MREFs in 2029. Table V.22 shows the range of the impacts of energy conservation standards on U.S. manufacturing employment in the MREF industry. The following discussion provides a qualitative evaluation of the range of potential impacts presented in Table V.22.

Table V.22 Domestic Direct Employment Impacts for MREF Manufacturers in 2029

	No-New-Standards Case	TSL 1	TSL 2	TSL 3	TSL 4	TSL 5
Direct Employment in 2029 (Production Workers + Non-Production Workers)	211	210	207	207	204	201
Potential Changes in Direct Employment Workers *	-	(188) to (1)	(188) to (3)	(188) to (3)	(188) to (6)	(188) to (9)

*DOE presents a range of potential employment impacts. Numbers in parentheses denote negative values.

The direct employment impacts shown in Table V.22 represent the potential domestic employment changes that could result following the compliance date for the MREF product classes in this direct final rule. The upper bound estimate corresponds to a change in the number of domestic workers that would result from amended energy conservation standards if manufacturers continue to produce the same scope of covered products within the United States after compliance takes effect. The lower bound estimate represents the maximum decrease in production workers if manufacturing moved to lower labor-cost countries. At lower TSLs, DOE believes the likelihood of changes in production location due to amended standards are low due to the relatively minor production line updates required. However, as amended standards increase in stringency and both the complexity and cost of production facility updates increases, manufacturers may reevaluate domestic production siting options. Specifically, implementing VIPs could necessitate additional labor content and significant capital investment. However, at the Recommended TSL (*i.e.,* TSL 4), none of the analyzed product classes would likely require VIPs to meet the recommended efficiency levels. Furthermore, DOE notes that of the six manufacturers with U.S. manufacturing facilities producing MREFs, five manufacturers are AHAM members, a key signatory of the Joint Agreement.

Additional detail on the analysis of direct employment can be found in chapter 12 of the direct final rule TSD. Additionally, the employment impacts discussed in this section are independent of the employment impacts from the broader U.S. economy, which are documented in chapter 16 of the direct final rule TSD.

c. Impacts on Manufacturing Capacity

In interviews, manufacturers noted that the majority of MREFs—namely FCC—are manufactured in Asia and rebranded by home appliance manufacturers. Manufacturers had few concerns about manufacturing constraints below the max-tech level and the implementation of VIPs. However, at max-tech, some manufacturers expressed technical uncertainty about industry's ability to meet the efficiencies required as few OEMs offer products at max-tech today. For example, DOE is not aware of any OEMs that currently offer FCC that meet TSL 5 efficiencies. DOE's shipments analysis estimates that except for BICC, which only accounts for 4 percent of MREF shipments, no shipments of other product classes meet the max-tech efficiencies.

Some low-volume domestic and European-based OEMs offer niche or high-end MREFs (*i.e.,* built-ins, combination coolers, FCCs that can be integrated into kitchen cabinetry). In interviews, these manufacturers stated that, due to their low volume and wide range of product offerings, they could face engineering resource constraints

[78] The comprehensive description of production and non-production workers is available at ''Definitions and Instructions for the Annual Survey of Manufacturers, MA–10000'' (pp. 13–14) *www2.census.gov/programs-surveys/asm/technical-documentation/questionnaire/2021/instructions/MA_10000_Instructions.pdf* (last accessed September 9, 2023).

should amended standards necessitate a significant redesign, such as requiring insulation thickness changes for FCs at the Recommended TSL (*i.e.,* TSL 4) or requiring VIPs for all product classes at TSL 5. These manufacturers further stated that the extent of their resource constraints depend, in part, on the outcome of other ongoing DOE energy conservation standards rulemakings that impact related products, in particular, the energy conservation standards for RF. DOE notes that the January 2024 RF Direct Final Rule amending the energy conservation standards for RF was published in the **Federal Register** on January 17, 2024. 89 FR 3026. In that direct final rule, compliance with amended standards would be required in 2029 or 2030, depending on the product class, instead of 2027, as analyzed in the RF NOPR published in the **Federal Register** on February 27, 2023. *See* 88 FR 12452. Thus, manufacturers will have more time to redesign RF products to meet amended standards, compared to the EPCA-specified compliance period. Additionally, for OEMs that manufacture both MREFs and RFs, DOE expects that the alignment of the compliance dates for these covered products would help mitigate regulatory burden by reducing the number of times manufacturers would need to reorganize production lines.

d. Impacts on Subgroups of Manufacturers

Using average cost assumptions to develop industry cash-flow estimates may not capture the differential impacts among subgroups of manufacturers. Small manufacturers, niche players, or manufacturers exhibiting a cost structure that differs substantially from the industry average could be affected disproportionately. DOE investigated small businesses as a manufacturer subgroup that could be disproportionally impacted by energy conservation standards and could merit additional analysis.

DOE analyzes the impacts on small businesses in a separate analysis for the standards proposed in the NOPR published elsewhere in this issue of the **Federal Register** and in chapter 12 of the direct final rule TSD. In summary, the SBA defines a ‘‘small business’’ as having 1,500 employees or less for NAICS 335220, ‘‘Major Household Appliance Manufacturing’’ or as having 1,250 employees of less for the secondary NAICS code of 333415: ‘‘Air-Conditioning and Warm Air Heating Equipment and Commercial and Industrial Refrigeration Equipment Manufacturing.’’ Using the more conservative (*i.e.,* more inclusive) threshold of 1,500 employees, DOE identified one domestic OEM that qualifies as small business and is not foreign-owned and operated. For a discussion of the impacts on the small business manufacturer group, see chapter 12 of the direct final rule TSD.

e. Cumulative Regulatory Burden

One aspect of assessing manufacturer burden involves looking at the cumulative impact of multiple DOE standards and the regulatory actions of other Federal agencies and States that affect the manufacturers of a covered product or equipment. While any one regulation may not impose a significant burden on manufacturers, the combined effects of several existing or impending regulations may have serious consequences for some manufacturers, groups of manufacturers, or an entire industry. Multiple regulations affecting the same manufacturer can strain profits and lead companies to abandon product lines or markets with lower expected future returns than competing products. For these reasons, DOE conducts an analysis of cumulative regulatory burden as part of its rulemakings pertaining to appliance efficiency.

For the cumulative regulatory burden analysis, DOE examines Federal, product-specific regulations that could affect MREF manufacturers that take effect approximately 3 years before and after 2029 the compliance date. This information is presented in Table V.23.

BILLING CODE 6450–01–P

Table V.23 Compliance Dates and Expected Conversion Expenses of Federal Energy Conservation Standards Affecting Miscellaneous Refrigeration Products Original Equipment Manufacturers

Federal Energy Conservation Standard	Number of OEMs*	Number of OEMs Affected by This Rule**	Approx. Standards Compliance Year	Industry Conversion Costs *(Millions)*	Industry Conversion Costs / Equipment Revenue***
Automatic Commercial Ice Makers† 88 FR 30508 (May 11, 2023)	23	5	2027	$15.9 (2022$)	0.6%

* This column presents the total number of OEMs identified in the energy conservation standard rule that is contributing to cumulative regulatory burden.
** This column presents the number of OEMs producing MREFs that are also listed as OEMs in the identified energy conservation standard that is contributing to cumulative regulatory burden.
*** This column presents industry conversion costs as a percentage of equipment revenue during the conversion period. Industry conversion costs are the upfront investments manufacturers must make to sell compliant products/equipment. The revenue used for this calculation is the revenue from just the covered product/equipment associated with each row. The conversion period is the time frame over which conversion costs are made and lasts from the publication year of a final rule to the compliance year of the energy conservation standard. The conversion period typically ranges from 3 to 5 years, depending on the rulemaking.
† These rulemakings are at the NOPR stage, and all values are subject to change until finalized through publication of a final rule.
‡ For the refrigerators, refrigerator-freezers, and freezers energy conservation standards direct final rule, the compliance year (2029 or 2030) varies by product class.

BILLING CODE 6450–01–C

As shown in Table V.23, most of the rulemakings with the largest overlap of MREF OEMs include RFs, consumer conventional cooking products, residential clothes washers, consumer clothes dryers, and MREFs, which are all part of the multi-product Joint Agreement submitted by interested parties.[79] The multi-product Joint Agreement states the ''jointly recommended compliance dates will achieve the overall energy and economic benefits of this agreement while allowing necessary lead-times for manufacturers to redesign products and retool manufacturing plants to meet the recommended standards across product categories.'' (Joint Agreement, No. 34 at p. 2) As discussed previously, the staggered compliance dates help mitigate manufacturers' concerns about their ability to allocate sufficient resources to comply with multiple concurrent amended standards and about the need to align compliance dates for products that are typically designed or sold as matched pairs. See section IV.J.3 of this document for stakeholder comments about cumulative regulatory burden. See Table V.24 for a comparison of the estimated compliance dates based on EPCA-specified timelines and the compliance dates detailed in the Joint Agreement.

[79] The microwave ovens energy conservation standards final rule (88 FR 39912), which has 8 overlapping OEMs, was published prior to the joint submission of the multi-product Joint Agreement.

Table V.24 Expected Compliance Dates for Multi-Product Joint Agreement

Rulemaking	Estimated Compliance Year based on EPCA Requirements	Compliance Year in the Joint Agreement
Consumer Clothes Dryers	2027	2028
Residential Clothes Washers	2027	2028
Consumer Conventional Cooking Products	2027	2028
Dishwashers	2027	2027*
Refrigerators, Refrigerator-Freezers, and Freezers	2027	2029 or 2030 depending on the product class
Miscellaneous Refrigeration Products	2029	2029

*Estimated compliance year. The Joint Agreement states, "3 years after the publication of a final rule in the *Federal Register.*" (Joint Agreement, No. 34 at p. 2)

3. National Impact Analysis

This section presents DOE's estimates of the national energy savings and the NPV of consumer benefits that would result from each of the TSLs considered as potential amended standards.

a. Significance of Energy Savings

To estimate the energy savings attributable to potential amended standards for MREFs, DOE compared their energy consumption under the no-new-standards case to their anticipated energy consumption under each TSL. The savings are measured over the entire lifetime of products purchased in the 30-year period that begins in the year of anticipated compliance with amended standards (2029–2058). Table V.25 presents DOE's projections of the national energy savings for each TSL considered for MREFs. The savings were calculated using the approach described in section IV.H.2 of this document.

Table V.25 Cumulative National Energy Savings for MREFs; 30 Years of Shipments (2029–2058)

	Trial Standard Level				
	1	2	3	4	5
	Quads				
Primary energy	0.10	0.20	0.21	0.31	0.54
FFC energy	0.10	0.20	0.22	0.32	0.55

OMB Circular A–4 [80] requires agencies to present analytical results, including separate schedules of the monetized benefits and costs that show the type and timing of benefits and costs. Circular A–4 also directs agencies to consider the variability of key elements underlying the estimates of benefits and costs. For this rulemaking, DOE undertook a sensitivity analysis using 9 years, rather than 30 years, of product shipments. The choice of a 9-year period is a proxy for the timeline in EPCA for the review of certain energy conservation standards and potential revision of and compliance with such revised standards.[81] The review timeframe established in EPCA is generally not synchronized with the product lifetime, product manufacturing cycles, or other factors specific to MREFs. Thus, such results are presented for informational purposes only and are not indicative of any change in DOE's analytical methodology. The NES sensitivity analysis results based on a 9-year analytical period are presented in Table V.26. The impacts are counted over the lifetime of MREFs purchased in 2029–2037.

[80] U.S. Office of Management and Budget. *Circular A–4: Regulatory Analysis.* Available at *www.whitehouse.gov/omb/information-for-agencies/circulars/* (last accessed January 5, 2024). DOE used the prior version of Circular A–4 (2003) as a result of the effective date of the new version.

[81] EPCA requires DOE to review its standards at least once every 6 years, and requires, for certain products, a 3-year period after any new standard is promulgated before compliance is required, except that in no case may any new standards be required within 6 years of the compliance date of the previous standards. (42 U.S.C. 6295(m)) While adding a 6-year review to the 3-year compliance period adds up to 9 years, DOE notes that it may undertake reviews at any time within the 6-year period and that the 3-year compliance date may yield to the 6-year backstop. A 9-year analysis period may not be appropriate given the variability that occurs in the timing of standards reviews and the fact that for some products, the compliance period is 5 years rather than 3 years.

Table V.26 Cumulative National Energy Savings for MREFs; 9 Years of Shipments (2029–2037)

	Trial Standard Level				
	1	2	3	4	5
	quads				
Primary energy	0.03	0.05	0.06	0.09	0.15
FFC energy	0.03	0.06	0.06	0.09	0.15

b. Net Present Value of Consumer Costs and Benefits

DOE estimated the cumulative NPV of the total costs and savings for consumers that would result from the TSLs considered for MREFs. In accordance with OMB's guidelines on regulatory analysis,[82] DOE calculated NPV using both a 7-percent and a 3-percent real discount rate. Table V.27 shows the consumer NPV results with impacts counted over the lifetime of products purchased in 2029–2058.

Table V.27 Cumulative Net Present Value of Consumer Benefits for MREFs; 30 Years of Shipments (2029–2058)

	Trial Standard Level				
	1	2	3	4	5
	Billion 2022$				
3 percent	0.49	0.72	0.87	0.77	-1.68
7 percent	0.19	0.24	0.31	0.17	-1.36

The NPV results based on the aforementioned 9-year analytical period are presented in Table V.28. The impacts are counted over the lifetime of products purchased in 2029–2037. As mentioned previously, such results are presented for informational purposes only and are not indicative of any change in DOE's analytical methodology or decision criteria.

Table V.28 Cumulative Net Present Value of Consumer Benefits for MREFs; 9 Years of Shipments (2029–2037)

	Trial Standard Level				
	1	2	3	4	5
	Billion 2022$				
3 percent	0.17	0.23	0.29	0.20	-0.91
7 percent	0.09	0.10	0.14	0.04	-0.83

The previous results reflect the use of a default trend to estimate the change in price for MREFs over the analysis period (see section IV.H.3 of this document). DOE also conducted a sensitivity analysis that considered a low benefits scenario which combines a lower rate of price decline and AEO 2023 Low Economic Growth, as well as a high benefits scenario which combines a higher rate of price decline and AEO 2023 High Economic Growth. The results of these alternative cases are presented in appendix 10C of the direct final rule TSD. In the high benefits scenario where high-price-decline case is applied, the NPV of consumer benefits is higher than in the default case. In the low benefits scenario where low-price-decline case is applied, the NPV of consumer benefits is lower than in the default case.

c. Indirect Impacts on Employment

DOE estimates that amended energy conservation standards for MREFs will reduce energy expenditures for consumers of those products, with the resulting net savings being redirected to other forms of economic activity. These expected shifts in spending and economic activity could affect the demand for labor. As described in section IV.N of this document, DOE used an input/output model of the U.S. economy to estimate indirect employment impacts of the TSLs that DOE considered. There are uncertainties involved in projecting employment impacts, especially changes in the later years of the analysis. Therefore, DOE generated results for near-term timeframes (2029–2033), where these uncertainties are reduced.

The results suggest that the adopted standards are likely to have a negligible impact on the net demand for labor in the economy. The net change in jobs is so small that it would be imperceptible in national labor statistics and might be offset by other, unanticipated effects on employment. Chapter 16 of the direct final rule TSD presents detailed results regarding anticipated indirect employment impacts.

4. Impact on Utility or Performance of Products

As discussed in section III.E.1.d of this document, DOE has concluded that the standards adopted in this direct final rule will not lessen the utility or performance of the MREFs under consideration in this rulemaking. Manufacturers of these products

[82] U.S. Office of Management and Budget. *Circular A–4: Regulatory Analysis.* Available at *www.whitehouse.gov/omb/information-for-agencies/circulars/* (last accessed January 5, 2024). DOE used the prior version of Circular A–4 (2003) as a result of the effective date of the new version.

currently offer units that meet or exceed the adopted standards.

5. Impact of Any Lessening of Competition

DOE considered any lessening of competition that would be likely to result from amended standards. As discussed in section III.E.1.e of this document, EPCA directs the Attorney General of the United States (''Attorney General'') to determine the impact, if any, of any lessening of competition likely to result from a proposed standard and to transmit such determination in writing to the Secretary within 60 days of the publication of a proposed rule, together with an analysis of the nature and extent of the impact. To assist the Attorney General in making this determination, DOE is providing DOJ with copies of this direct final rule and the direct final rule TSD for review.

6. Need of the Nation To Conserve Energy

Enhanced energy efficiency, where economically justified, improves the Nation's energy security, strengthens the economy, and reduces the environmental impacts (costs) of energy production. Reduced electricity demand due to energy conservation standards is also likely to reduce the cost of maintaining the reliability of the electricity system, particularly during peak-load periods. Chapter 15 in the direct final rule TSD presents the estimated impacts on electricity-generating capacity, relative to the no-new-standards case, for the TSLs that DOE considered in this rulemaking.

Energy conservation resulting from potential energy conservation standards for MREFs is expected to yield environmental benefits in the form of reduced emissions of certain air pollutants and greenhouse gases. Table V.29 provides DOE's estimate of cumulative emissions reductions expected to result from the TSLs considered in this rulemaking. The emissions were calculated using the multipliers discussed in section IV.K of this document. DOE reports annual emissions reductions for each TSL in chapter 13 of the direct final rule TSD.

Table V.29 Cumulative Emissions Reduction for MREFs Shipped in 2029–2058

	Trial Standard Level				
	1	2	3	4	5
Electric Power Sector and Site Emissions					
CO_2 (*million metric tons*)	1.64	3.33	3.63	5.32	9.12

Hg (*tons*)	0.00	0.00	0.00	0.00	0.00
Total FFC Emissions					
CO_2 (*million metric tons*)	1.81	3.66	3.99	5.85	10.03
CH_4 (*thousand tons*)	15.02	30.44	33.15	48.64	83.41
N_2O (*thousand tons*)	0.02	0.04	0.04	0.06	0.10
NO_x (*thousand tons*)	3.33	6.75	7.34	10.77	18.47
SO_2 (*thousand tons*)	0.57	1.15	1.25	1.84	3.15
Hg (*tons*)	0.00	0.01	0.01	0.01	0.02

As part of the analysis for this direct final rule, DOE estimated monetary benefits likely to result from the reduced emissions of CO_2 that DOE estimated for each of the considered TSLs for MREFs. Section IV.L of this document discusses the estimated SC–CO_2 values that DOE used. Table V.30 presents the value of CO_2 emissions reduction at each TSL for each of the SC–CO_2 cases. The time-series of annual values is presented for the selected TSL in chapter 14 of the direct final rule TSD.

Table V.30 Present Value of CO_2 Emissions Reduction for MREFs Shipped in 2029–2058

TSL	SC-CO_2 Case			
	Discount Rate and Statistics			
	5%	3%	2.5%	3%
	Average	Average	Average	95th percentile
	million 2022$			
1	18.2	77.6	121.3	235.6
2	36.9	157.5	246.1	478.1
3	40.0	170.8	266.8	518.2
4	58.6	250.3	391.1	759.4
5	100.5	429.5	671.2	1,303.2

As discussed in section IV.L.2 of this document, DOE estimated the climate benefits likely to result from the reduced emissions of methane and N_2O that DOE estimated for each of the considered TSLs for MREFs. Table V.31 presents the value of the CH_4 emissions reduction at each TSL, and Table V.32 presents the value of the N_2O emissions reduction at each TSL. The time-series of annual values is presented for the selected TSL in chapter 14 of the direct final rule TSD.

Table V.31 Present Value of Methane Emissions Reduction for MREFs Shipped in 2029–2058

TSL	SC-CH_4 Case			
	Discount Rate and Statistics			
	5%	3%	2.5%	3%
	Average	Average	Average	95th percentile
	million 2022$

Table V.32 Present Value of Nitrous Oxide Emissions Reduction for MREFs Shipped in 2029–2058

TSL	SC-N_2O Case			
	Discount Rate and Statistics			
	5%	3%	2.5%	3%
	Average	Average	Average	95th percentile
	million 2022$			
1	0.1	0.3	0.4	0.7
2	0.1	0.6	0.9	1.5
3	0.2	0.6	0.9	1.6
4	0.2	0.9	1.4	2.4
5	0.4	1.5	2.4	4.1

DOE is well aware that scientific and economic knowledge about the contribution of CO_2 and other GHG emissions to changes in the future global climate and the potential resulting damages to the global and U.S. economy continues to evolve rapidly. DOE, together with other Federal agencies, will continue to review methodologies for estimating the monetary value of reductions in CO_2 and other GHG emissions. This ongoing review will consider the comments on this subject that are part of the public record for this and other rulemakings, as well as other methodological assumptions and issues. DOE notes, however, that the adopted standards in this direct final rule would be economically justified even without inclusion of monetized benefits of reduced GHG emissions.

DOE also estimated the monetary value of the economic benefits associated with NO_X and SO_2 emissions reductions anticipated to result from the considered TSLs for MREFs. The dollar-per-ton values that DOE used are discussed in section IV.L of this document. Table V.33 presents the

present value for NO_X emissions reduction for each TSL calculated using 7-percent and 3-percent discount rates, and Table V.34 presents similar results for SO_2 emissions reductions. The results in these tables reflect application of EPA's low dollar-per-ton values, which DOE used to be conservative. The time-series of annual values is presented for the selected TSL in chapter 14 of the direct final rule TSD.

Table V.33 Present Value of NO_X Emissions Reduction for MREFs Shipped in 2029–2058

TSL	3% Discount Rate	7% Discount Rate
	million 2022$	
1	155.0	60.6
2	314.4	123.0
3	341.0	133.0
4	499.7	194.6
5	857.1	333.1

Table V.34 Present Value of SO_2 Emissions Reduction for MREFs Shipped in 2029–2058

TSL	3% Discount Rate	7% Discount Rate
	million 2022$	
1	37.1	14.7
2	75.3	29.9
3	81.6	32.3
4	119.6	47.2
5	205.1	80.8

Not all the public health and environmental benefits from the reduction of greenhouse gases, NO_X, and SO_2 are captured in the values above, and additional unquantified benefits from the reductions of those pollutants as well as from the reduction of direct PM and other co-pollutants may be significant. DOE has not included monetary benefits of the reduction of Hg emissions because the amount of reduction is very small.

7. Other Factors

The Secretary of Energy, in determining whether a standard is economically justified, may consider any other factors that the Secretary deems to be relevant. (42 U.S.C. 6295(o)(2)(B)(i)(VII)) No other factors were considered in this analysis.

8. Summary of Economic Impacts

Table V.35 presents the NPV values that result from adding the estimates of the economic benefits resulting from reduced GHG and NO_X and SO_2 emissions to the NPV of consumer benefits calculated for each TSL considered in this rulemaking. The consumer benefits are domestic U.S. monetary savings that occur as a result of purchasing the covered MREFs and are measured for the lifetime of products shipped in 2029–2058. The climate benefits associated with reduced GHG emissions resulting from the adopted standards are global benefits and are also calculated based on the lifetime of MREFs shipped in 2029–2058.

Table V.35 Consumer NPV Combined with Present Value of Climate Benefits and Health Benefits

Category	TSL 1	TSL 2	TSL 3	TSL 4	TSL 5
Using 3% discount rate for Consumer NPV and Health Benefits (billion 2022$)					
5% Average SC-GHG case	0.7	1.1	1.3	1.3	-1.0
3% Average SC-GHG case	0.8	1.2	1.4	1.6	-0.6
2.5% Average SC-GHG case	0.8	1.4	1.6	1.7	-0.4
3% 95th percentile SC-GHG case	1.0	1.6	1.9	2.2	0.4
Using 7% discount rate for Consumer NPV and Health Benefits (billion 2022$)					
5% Average SC-GHG case	0.3	0.4	0.5	0.4	-1.1
3% Average SC-GHG case	0.4	0.6	0.7	0.7	-0.6
2.5% Average SC-GHG case	0.4	0.7	0.8	0.8	-0.4
3% 95th percentile SC-GHG case	0.6	1.0	1.1	1.3	0.4

C. Conclusion

When considering new or amended energy conservation standards, the standards that DOE adopts for any type (or class) of covered product must be designed to achieve the maximum improvement in energy efficiency that the Secretary determines is technologically feasible and economically justified. (42 U.S.C. 6295(o)(2)(A)) In determining whether a standard is economically justified, the Secretary must determine whether the benefits of the standard exceed its burdens by, to the greatest extent practicable, considering the seven statutory factors discussed previously. (42 U.S.C. 6295(o)(2)(B)(i)) The new or amended standard must also result in significant conservation of energy. (42 U.S.C. 6295(o)(3)(B))

For this direct final rule, DOE considered the impacts of amended standards for MREFs at each TSL, beginning with the maximum technologically feasible level, to determine whether that level was economically justified. Where the max-tech level was not justified, DOE then considered the next most efficient level and undertook the same evaluation until it reached the highest efficiency level that is both technologically feasible and economically justified and saves a significant amount of energy.

To aid the reader as DOE discusses the benefits and/or burdens of each TSL, tables in this section present a summary of the results of DOE's quantitative analysis for each TSL. In addition to the quantitative results presented in the tables, DOE also considers other burdens and benefits that affect economic justification. These include the impacts on identifiable subgroups of consumers who may be disproportionately affected by a national standard and impacts on employment.

DOE also notes that the economics literature provides a wide-ranging discussion of how consumers trade off upfront costs and energy savings in the absence of government intervention. Much of this literature attempts to explain why consumers appear to undervalue energy efficiency improvements, an issue known as the ''energy efficiency gap''. There is evidence that consumers undervalue future energy savings as a result of (1) a lack of information; (2) a lack of sufficient salience of the long-term or aggregate benefits; (3) a lack of sufficient savings to warrant delaying or altering purchases; (4) excessive focus on the short term, in the form of inconsistent weighting of future energy cost savings relative to available returns on other investments; (5) computational or other difficulties associated with the evaluation of relevant tradeoffs; and (6) a divergence in incentives (for example, between renters and owners, or builders and purchasers).[83] Having less than perfect foresight and a high degree of uncertainty about the future, consumers may trade off these types of investments at a higher than expected rate between current consumption and uncertain future energy cost savings.

In DOE's current regulatory analysis, potential changes in the benefits and costs of a regulation due to changes in consumer purchase decisions are included in two ways. First, if consumers forgo the purchase of a product in the standards case, this decreases sales for product manufacturers, and the impact on manufacturers attributed to lost revenue is included in the MIA. Second, DOE accounts for energy savings attributable only to products actually used by consumers in the standards case; if a standard decreases the number of products purchased by consumers, this decreases the potential energy savings from an energy conservation standard. DOE provides estimates of shipments and changes in the volume of product purchases in chapter 9 of the direct final rule TSD. However, DOE's current analysis does not explicitly control for heterogeneity in consumer preferences, preferences across subcategories of products or specific features, or consumer price sensitivity variation according to household income.[84]

DOE continues to explore additional potential updates to the quantifiable framework for estimating the benefits and costs of changes in consumer purchase decisions due to an energy conservation standard, and DOE is committed to developing a framework that can support empirical quantitative tools for improved assessment of the consumer welfare impacts of appliance standards. DOE has posted a paper that discusses the issue of consumer welfare impacts of appliance energy conservation standards and potential enhancements to the methodology by which these impacts are defined and estimated in the regulatory process.[85] DOE welcomes comments on how to more fully assess the potential impact of energy conservation standards on consumer choice and how to quantify this impact in its regulatory analysis in future rulemakings.

1. Benefits and Burdens of TSLs Considered for MREF Standards

Tables V.36 and V.37 summarize the quantitative impacts estimated for each TSL for MREFs. The national impacts are measured over the lifetime of MREFs purchased in the 30-year period that begins in the anticipated year of compliance with amended standards (2029–2058). The energy savings, emissions reductions, and value of emissions reductions refer to full-fuel-cycle results. DOE is presenting monetized benefits of GHG emissions reductions in accordance with the applicable Executive orders and DOE would reach the same conclusion presented in this document in the absence of the estimated benefits from reductions in GHG emissions, including the Interim Estimates presented by the Interagency Working Group. The efficiency levels contained in each TSL are described in section V.A of this document.

Consumer Net Benefits	0.19	0.24	0.31	0.17	-1.36
Total Net Benefits	0.37	0.60	0.69	0.73	-0.40

Note: This table presents the costs and benefits associated with MREFs shipped during the period 2029−2058. These results include benefits to consumers which accrue after 2058 from the products shipped in 2029−2058.

* Climate benefits are calculated using four different estimates of the SC-CO_2, SC-CH_4 and SC-N_2O. Together, these represent the global SC-GHG. For presentational purposes of this table, the climate benefits associated with the average SC-GHG at a 3 percent discount rate are shown; however, DOE emphasizes the importance and value of considering the benefits calculated using all four sets of SC-GHG estimates. To monetize the benefits of reducing GHG emissions, this analysis uses the interim estimates presented in the *Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates Under Executive Order 13990* published in February 2021 by the IWG.

** Health benefits are calculated using benefit-per-ton values for NO_X and SO_2. DOE is currently only monetizing (for NO_X and SO_2) $PM_{2.5}$ precursor health benefits and (for NO_X) ozone precursor health benefits but will continue to assess the ability to monetize other effects such as health benefits from reductions in direct $PM_{2.5}$ emissions. The health benefits are presented at real discount rates of 3 and 7 percent. See section IV.L of this document for more details.

† Total and net benefits include consumer, climate, and health benefits. For presentation purposes, total and net benefits for both the 3-percent and 7-percent cases are presented using the average SC-GHG with 3-percent discount rate.

‡ Costs include incremental equipment costs.

BILLING CODE 6450–01–C

DOE first considered TSL 5, which represents the max-tech efficiency levels. For coolers (*i.e.,* FCC, FC, BICC, and BIC), which account for approximately 82 percent of MREF shipments, DOE expects that products would require use of VIPs, VSCs, and triple-glazed doors at this TSL. DOE expects that VIPs would be used in the products' side walls. In addition, the products would use the best-available-efficiency variable-speed compressors, forced-convection heat exchangers with multi-speed brushless-DC (''BLDC'') fans, and increase in cabinet wall thickness as compared to most baseline products. TSL 5 would save an estimated 0.55 quads of energy, an amount which DOE considers significant. Under TSL 5, the NPV of consumer benefit would be negative, *i.e.,* −$1.36 billion using a discount rate of 7 percent, and −$1.68 billion using a discount rate of 3 percent.

The cumulative emissions reductions at TSL 5 are 10.0 Mt of CO_2, 3.15 thousand tons of SO_2, 18.5 thousand tons of NO_X, 0.02 tons of Hg, 83.4 thousand tons of CH_4, and 0.10 thousand tons of N_2O. The estimated monetary value of the climate benefits from reduced GHG emissions (associated with the average SC–GHG at a 3-percent discount rate) at TSL 5 is $0.6 billion. The estimated monetary value of the health benefits from

reduced SO_2 and NO_X emissions at TSL 5 is $0.4 billion using a 7-percent discount rate and $1.1 billion using a 3-percent discount rate.

Using a 7-percent discount rate for consumer benefits and costs, health benefits from reduced SO_2 and NO_X emissions, and the 3-percent discount rate case for climate benefits from reduced GHG emissions, the estimated total NPV at TSL 5 is −$0.4 billion. Using a 3-percent discount rate for all benefits and costs, the estimated total NPV at TSL 5 is −$0.07 billion. The estimated total monetized NPV is provided for additional information, however, consistent with the statutory factors and framework for along with appropriate consideration of its full range of statutory factors when determining whether a proposed standard level is economically justified, DOE considers a range of quantitative and qualitative benefits and burdens, including the costs and cost savings for consumers, impacts to consumer subgroups, energy savings, emission reductions, and impacts on manufacturers.

At TSL 5, for the product classes with the largest market share, which are FCC, FC, and C–13A and together account for approximately 92 percent of annual shipments, the LCC savings are all negative (−$45.3, −$178.8, and −$73.4, respectively) and their payback periods are 13.0 years, 29.9 years, and 19.5 years, respectively, which are all longer than their corresponding average lifetimes. For these product classes, the fraction of consumers experiencing a net LCC cost is 81.6 percent, 98.2 percent, and 93.9 percent due to increases in first cost of $185.0, $420.5, and $167.5, respectively. Overall, a majority of MREF consumers (84.5 percent) would experience a net cost and the average LCC savings would be negative for all analyzed product classes.

At TSL 5, the projected change in INPV ranges from a decrease of $421.0 million to a decrease of $283.2 million, which corresponds to decreases of 51.2 percent and 35.1 percent, respectively. DOE estimates that industry must invest $555.1 million to comply with standards set at TSL 5.

DOE estimates that approximately 2.9 percent of current MREF shipments meet the max-tech levels. For FCC, FC, and C–13A, which together account for approximately 92 percent of annual shipments, DOE estimates that zero shipments currently meet max-tech efficiencies.

At TSL 5, manufacturers would likely need to implement all the most efficient design options analyzed in the engineering analysis. Manufacturers that do not currently offer products that meet TSL 5 efficiencies would need to develop new product platforms, which would require significant investment. Conversion costs are driven by the need for changes to cabinet construction, such as increasing foam insulation thickness and/or incorporating VIP technology. Increasing insulation thickness could result in a loss of interior volume or an increase in exterior volume. If manufacturers chose to maintain exterior dimensions, increasing insulation thickness would require redesign of the cabinet as well as the designs and tooling associated with the interior of the product, such as the liner, shelving, racks, and drawers. Incorporating VIPs into MREF designs could also require redesign of the cabinet to maximize the efficiency benefit of this technology. In addition to insulation changes, manufacturers may need to implement triple-pane glass, which could require implementing reinforced hinges and redesigning the door structure.

At this level, DOE estimates a 13-percent drop in shipments in the year the standard takes effect compared to the no-new-standards case, as some consumers may forgo purchasing a new MREF due to the increased upfront cost of baseline models.

At TSL 5 for MREFs, the Secretary concludes that the benefits of energy savings, emission reductions, and the estimated monetary value of the emissions reductions would be outweighed by the economic burden on many consumers, negative NPV of consumer benefits, and the impacts on manufacturers, including the significant potential reduction in INPV. A majority of MREF consumers (84.5 percent) would experience a net cost and the average LCC savings would be negative. Additionally, manufacturers would need to make significant upfront investments to update product platforms. The potential reduction in INPV could be as high as 52.1 percent. Consequently, the Secretary has concluded that TSL 5 is not economically justified.

DOE then considered the Recommended TSL (*i.e.,* TSL 4), which represents EL 3 for all analyzed product classes except for C–3A and C–3A–BI, for which this TSL corresponds to EL 1 and BIC, for which this TSL corresponds to EL 2. At the Recommended TSL, products of most classes would use high-efficiency single-speed compressors with forced-convection evaporators and condensers using brushless DC fan motors. Doors would be double-glazed with low-conductivity gas fill (*e.g.,* argon) and a single low-emissivity glass layer. Products would not require use of VIPs, but the FC product class would require thicker walls than corresponding baseline products. The Recommended TSL would save an estimated 0.32 quads of energy, an amount DOE considers significant. Under the Recommended TSL, the NPV of consumer benefit would be $0.17 billion using a discount rate of 7 percent, and $0.77 billion using a discount rate of 3 percent.

The cumulative emissions reductions at the Recommended TSL are 5.9 Mt of CO_2, 1.8 thousand tons of SO_2, 10.8 thousand tons of NO_X, 0.01 tons of Hg, 48.6 thousand tons of CH_4, and 0.06 thousand tons of N_2O. The estimated monetary value of the climate benefits from reduced GHG emissions (associated with the average SC–GHG at a 3-percent discount rate) at the Recommended TSL is $0.3 billion. The estimated monetary value of the health benefits from reduced SO_2 and NO_X emissions at the Recommended TSL is $0.2 billion using a 7-percent discount rate and $0.6 billion using a 3-percent discount rate.

Using a 7-percent discount rate for consumer benefits and costs, health benefits from reduced SO_2 and NO_X emissions, and the 3-percent discount rate case for climate benefits from reduced GHG emissions, the estimated total NPV at the Recommended TSL is $0.7 billion. Using a 3-percent discount rate for all benefits and costs, the estimated total NPV at the Recommended TSL is $1.7 billion. The estimated total monetized NPV is provided for additional information, however, consistent with the statutory factors and framework for determining whether a standard level is economically justified, DOE considers a range of quantitative and qualitative benefits and burdens, including the costs and cost savings for consumers, impacts to consumer subgroups, energy savings, emission reductions, and impacts on manufacturers.

At the Recommended TSL, for the product classes with the largest market share, which are FCC, FC, and C–13A, the LCC savings are $12.6, $28.0, and $12.0, respectively, and their payback periods are 6.8 years, 8.5 years, and 7.3 years, respectively, which are all shorter than their corresponding average lifetimes. For these product classes, the fraction of consumers experiencing a net LCC cost is 46.8 percent, 44.0 percent, and 47.2 percent, and increases in first cost for these classes are $91.7, $360.9, and $124.3, respectively. Overall, the LCC savings would be positive for all MREF product classes, and, while 43.7

percent of MREF consumers would experience a net cost, slightly more than half of MREF consumers would experience a net benefit (52.9 percent).

At the Recommended TSL (*i.e.,* TSL 4), the projected change in INPV ranges from a decrease of $92.1 million to a decrease of $60.3 million, which correspond to decreases of 11.4 percent and 7.5 percent, respectively. DOE estimates that industry must invest $130.7 million to comply with standards set at Recommended TSL.

DOE estimates that approximately 3.9 percent of shipments currently meet the required efficiencies at the Recommended TSL. For most product classes (*i.e.,* FCC, BICC, BIC, C–13A, C–13A–BI, C–3A, C–3A–BI), DOE expects manufacturers could reach the required efficiencies with relatively straightforward component swaps, such as implementing incrementally more efficient compressors, rather than the full platform redesigns required at max-tech. DOE expects that FC manufacturers would need to increase foam insulation thickness and incorporate variable-speed compressor systems at this level. At the Recommended TSL, DOE estimates a 4-percent drop in shipments in the year the standard takes effect compared to the no-new-standards case, as some consumers may forgo purchasing a new MREF due to the increased upfront cost of baseline models.

After considering the analysis and weighing the benefits and burdens, the Secretary has concluded that at a standard set at the recommended TSL for MREFs would be economically justified. At this TSL, the average LCC savings are positive for all product classes for which an amended standard is considered, with a shipment-weighted average of $15.2 savings. The FFC national energy savings are significant and the NPV of consumer benefits is positive using both a 3-percent and 7-percent discount rate. The standard levels at TSL 4 are economically justified even without weighing the estimated monetary value of emissions reductions. When those emissions reductions are included—representing $0.3 billion in climate benefits (associated with the average SC–GHG at a 3-percent discount rate), and $0.6 billion (using a 3-percent discount rate) or $0.2 billion (using a 7-percent discount rate) in health benefits—the rationale becomes stronger still.

As stated, DOE conducts the walk-down analysis to determine the TSL that represents the maximum improvement in energy efficiency that is technologically feasible and economically justified as required under EPCA. The walk-down is not a comparative analysis, as a comparative analysis would result in the maximization of net benefits instead of energy savings that are technologically feasible and economically justified, which would be contrary to the statute. See 86 FR 70892, 70908. Although DOE has not conducted a comparative analysis to select the adopted energy conservation standards, DOE notes that the Recommended TSL represents the option with positive LCC savings ($15.2) for all product classes compared to TSL 5 (−$99.5). Further, when comparing the cumulative NPV of consumer benefit using a 7% discount rate, TSL 4 ($0.7 billion) has a higher benefit value than TSL 5 (−$0.4 billion), while for a 3-percent discount rate, TSL 4 ($1.7 billion) is also higher than TSL 5 (−$0.07 billion), which yields negative NPV in both cases. These additional savings and benefits at the Recommended TSL are significant. DOE considers the impacts to be, as a whole, economically justified at the Recommended TSL.

Although DOE considered amended standard levels for MREFs by grouping the efficiency levels for each product class into TSLs, DOE evaluates all analyzed efficiency levels in its analysis. For all product classes, except for BIC and C–3A–BI, the amended standard level represents the maximum energy savings that does not result in negative LCC savings. DOE did not include efficiency levels with negative LCC savings in any TSLs with the exception of TSL 5, which represents the max-tech efficiency levels. Specifically, for FC, FCC, BICC, C–13 A, and C13–A–BI, DOE did not include EL4 in a TSL due to negative LCC savings, and for C–3A, DOE did not include EL 2 or 3, and for C–3A–BI, DOE did not include EL 3 for the same reason. For BIC and C–3A–BI, the standard level represents the maximum energy savings that is economically justified. For BIC, DOE did not include EL4 in any TSL due to negative LCC savings. TSL 4, the Recommended TSL and the one adopted here, includes an EL for BIC that is lower than the EL at TSL 2. That is because TSL 2 represents ENERGY STAR for all product classes for which an ENERGY STAR criterion exists, including EL 3 for BIC. As such, DOE analyzed TSL 2 with a higher efficiency level for BIC than TSL 4 because of the ENERGY STAR criterion. TSL 4 also includes an EL for C–3A–BI, EL1, that is lower than another EL, EL2, that has positive LCC savings. DOE has considered standards at those ELs for those products and found them not to be economically justified. Although these ELs have positive LCC savings, they would result in a majority of purchasers experiencing a net cost (53% and 57%, respectively). Further, for BIC products, DOE expects some manufacturers would likely need to increase insulation thickness to meet efficiency levels above EL 2, which could require new cabinet designs and fixtures. Due to the high percentage of consumers with a net cost and the extensive redesigns that would be needed to support EL3, DOE has concluded that this efficiency level for BIC is not economically justified. However, at the Recommended TSL (EL 2 for BIC), DOE expects manufacturers could likely meet the efficiency level required for BIC without significant redesign. The ELs at the amended standard level result in positive LCC savings for all product classes and reduce the decrease in INPV and conversion costs to the point where DOE has concluded they are economically justified, as discussed for the Recommended TSL in the preceding paragraphs.

Therefore, based on the previous considerations, DOE adopts the energy conservation standards for MREFs at the Recommended TSL.

While DOE considered each potential TSL under the criteria laid out in 42 U.S.C. 6295(o) as discussed in the preceding paragraphs, DOE notes that the Recommended TSL for MREFs in this direct final rule is part of a multi-product Joint Agreement covering six rulemakings (RFs; MREFs; conventional cooking products; residential clothes washers; consumer clothes dryers; and dishwashers). The signatories indicate that the Joint Agreement for the six rulemakings should be considered as a joint statement of recommended standards, to be adopted in its entirety. As discussed in section V.B.2.e of this document, many MREF OEMs also manufacture RFs, conventional cooking products, residential clothes washers, consumer clothes dryers, and dishwashers. Rather than requiring compliance with five amended standards in a single year (2027),[86] the negotiated multi-product Joint Agreement staggers the compliance dates for the five amended standards

[86] The refrigerators, refrigerator-freezers, and freezers rulemaking (88 FR 12452); consumer conventional cooking products rulemaking (88 FR 6818); residential clothes washers rulemaking (88 FR 13520); consumer clothes dryers rulemaking (87 FR 51734); and dishwashers rulemaking (88 FR 32514) utilized a 2027 compliance year for analysis at the proposed rule stage. The miscellaneous refrigeration products rulemaking (88 FR 12452) utilized a 2029 compliance year for the NOPR analysis.

over a 4-year period (2027–2030). In response to the March 2023 NOPR, AHAM expressed concerns about the timing of ongoing home appliance rulemakings. Specifically, AHAM commented that the combination of the stringency of DOE's proposals, the short lead-in time required under EPCA to comply with standards, and the overlapping timeframe of multiple standards affecting the same manufacturers represents significant cumulative regulatory burden for the home appliance industry. (AHAM, No. 31 at p. 13) AHAM has submitted similar comments to other ongoing consumer product rulemakings.[87] However, as AHAM is a key signatory of the Joint Agreement, DOE understands that the compliance dates recommended in the Joint Agreement would help reduce cumulative regulatory burden. These compliance dates help relieve concern on the part of some manufacturers about their ability to allocate sufficient resources to comply with multiple concurrent amended standards, about the need to align compliance dates for products that are typically designed or sold as matched pairs, and about the ability of their suppliers to ramp up production of key components. The Joint Agreement also provides additional years of regulatory certainty for manufacturers and their suppliers while still achieving the maximum improvement in energy efficiency that is technologically feasible and economically justified.

The amended energy conservation standards for MREFs, which are expressed in kWh/yr, are shown in Table V.38.

BILLING CODE 6450–01–P

Table V.38 Amended Energy Conservation Standards for MREFs

Product class	Equations for maximum energy use (kWh/yr)
1. Freestanding compact coolers ("FCC")	5.52AV + 109.1
2. Freestanding coolers ("FC")	5.52AV + 109.1
3. Built-in compact coolers ("BICC")	5.52AV + 109.1
4. Built-in coolers ("BIC")	6.30AV + 124.6
C-3A. Cooler with all-refrigerator—automatic defrost	4.11AV + 117.4
C-3A-BI. Built-in cooler with all-refrigerator—automatic defrost	4.67AV + 133.0
C-5-BI. Built-in cooler with refrigerator-freezer -automatic defrost with bottom-mounted freezer	5.47AV + 196.2 + 28I
C-9. Cooler with upright freezer with automatic defrost without an automatic icemaker	5.58AV + 147.7 + 28I
C-9-BI. Built-in cooler with upright freezer with automatic defrost without an automatic icemaker	6.38AV + 168.8 + 28I
C-13A. Compact cooler with all-refrigerator—automatic defrost	4.74AV + 155.0
C-13A-BI. Built-in compact cooler with all-refrigerator—automatic defrost	5.22AV + 170.5
AV = Total adjusted volume, expressed in ft^3, as determined in appendix A to subpart B of 10 CFR part 430. I = 1 for a product with an automatic icemaker and = 0 for a product without an automatic icemaker.	

[87] AHAM has submitted written comments regarding cumulative regulatory burden for the other five rulemakings included in the multi-product Joint Agreement. AHAM's written comments on cumulative regulatory burden are available at: *www.regulations.gov/document/EERE-2017-BT-STD-0003-0069* (pp. 19–22) for refrigerators, refrigerator-freezers, and freezers; *www.regulations.gov/comment/EERE-2014-BT-STD-0005-2285* (pp. 44–47) for consumer conventional cooking products; *www.regulations.gov/comment/EERE-2017-BT-STD-0014-0464* (pp. 40–44) for residential clothes washers; *www.regulations.gov/comment/EERE-2014-BT-STD-0058-0046* (pp. 12–13) for consumer clothes dryers; and *www.regulations.gov/comment/EERE-2019-BT-STD-0039-0051* (pp. 21–24) for dishwashers.

2. Annualized Benefits and Costs of the Adopted Standards

The benefits and costs of the adopted standards can also be expressed in terms of annualized values. The annualized net benefit is (1) the annualized national economic value (expressed in 2022$) of the benefits from operating products that meet the adopted standards (consisting primarily of operating cost savings from using less energy), minus increases in product purchase costs, and (2) the annualized monetary value of the climate and health benefits.

Table V.39 shows the annualized values for MREFs under the Recommended TSL, expressed in 2022$. The results under the primary estimate are as follows.

Using a 7-percent discount rate for consumer benefits and costs and NO_X and SO_2 reduction benefits, and a 3-percent discount rate case for GHG social costs, the estimated cost of the standards for MREFs is $72.7 million per year in increased product costs, while the estimated annual benefits are $90.6 million in reduced product operating costs, $18.3 million in climate benefits, and $25.6 million in health benefits. The net benefit amounts to $61.7 million per year. Using a 3-percent discount rate for all benefits and costs, the estimated cost of the adopted standards for MREFs is $70.8 million per year in increased equipment costs, while the estimated annual benefits are $115 million in reduced operating costs, $18.3 million in climate benefits, and $35.6 million in health benefits. The net benefit amounts to $98 million per year.

Table V.39 Annualized Benefits and Costs of Adopted Standards Shipped in 2029-2058 (TSL 4, the Recommended TSL) for MREFs

	Million 2022$/year		
	Primary Estimate	Low-Net-Benefits Estimate	High-Net-Benefits Estimate
3% discount rate			
Consumer Operating Cost Savings	115.0	111.5	116.3
Climate Benefits*	18.3	17.7	18.5
Health Benefits**	35.6	34.5	36.0
Total Monetized Benefits†	168.9	163.7	170.7
Consumer Incremental Product Costs‡	70.8	74.9	68.7
Net Benefits	98.0	88.8	102.0
Change in Producer Cashflow (INPV)‡‡	(7.7) - (5.0)		
7% discount rate			
Consumer Operating Cost Savings	90.6	88.1	91.5
Climate Benefits* (3% discount rate)	18.3	17.7	18.5
Health Benefits**	25.6	24.9	25.8
Total Benefits†	134.4	130.7	135.7
Consumer Incremental Product Costs‡	72.7	75.8	70.9
Net Benefits	61.7	54.9	64.8
Change in Producer Cashflow (INPV)‡‡	(7.7) - (5.0)		

Note: This table presents the costs and benefits associated with MREFs shipped during the period 2029−2058. These results include consumer, climate, and health benefits that accrue after 2058 from the products shipped in 2029−2058. The Primary, Low Net Benefits, and High Net Benefits Estimates utilize projections of energy prices from the *AEO2023* Reference case, Low Economic Growth case, and High Economic Growth case, respectively. In addition, incremental equipment costs reflect a medium decline rate in the Primary Estimate, a low decline rate in the Low Net Benefits Estimate, and a high decline rate in the High Net Benefits Estimate. The methods used to derive projected price trends are explained in section IV.H.3 of this document. Note that the Benefits and Costs may not sum to the Net Benefits due to rounding.

* Climate benefits are calculated using four different estimates of the global SC-GHG (see section IV.L of this document). For presentational purposes of this table, the climate benefits associated with the average SC-GHG at a 3 percent discount rate are shown, but DOE does not have a single central SC-GHG point estimate, and it emphasizes the importance and value of considering the benefits calculated using all four sets of SC-GHG estimates. To monetize the benefits of reducing GHG emissions, this analysis uses the interim estimates presented in the *Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates Under Executive Order 13990* published in February 2021 by the IWG.

** Health benefits are calculated using benefit-per-ton values for NO_X and SO_2. DOE is currently only monetizing (for SO_2 and NO_X) $PM_{2.5}$ precursor health benefits and (for NO_X) ozone precursor health benefits but will continue to assess the ability to monetize other effects such as health benefits from reductions in direct $PM_{2.5}$ emissions. See section IV.L of this document for more details.

† Total benefits for both the 3-percent and 7-percent cases are presented using the average SC-GHG with 3-percent discount rate, but DOE does not have a single central SC-GHG point estimate.
‡ Costs include incremental equipment costs.
‡‡Operating Cost Savings are calculated based on the life cycle costs analysis and national impact analysis as discussed in detail below. See sections IV.F and IV.H of this document. DOE's national impacts analysis includes all impacts (both costs and benefits) along the distribution chain beginning with the increased costs to the manufacturer to manufacture the product and ending with the increase in price experienced by the consumer. DOE also separately conducts a detailed analysis on the impacts on manufacturers (*i.e.*, manufacturer impact analysis, or "MIA"). See section IV.J of this document. In the detailed MIA, DOE models manufacturers' pricing decisions based on assumptions regarding investments, conversion costs, cashflow, and margins. The MIA produces a range of impacts, which is the direct final rule's expected impact on the INPV. The change in INPV is the present value of all changes in industry cash flow, including changes in production costs, capital expenditures, and manufacturer profit margins. The annualized change in INPV is calculated using the industry weighted average cost of capital value of 7.7 percent that is estimated in the manufacturer impact analysis (see chapter 12 of the direct final rule TSD for a complete description of the industry weighted average cost of capital). For MREFs, the annualized change in INPV ranges from $7.7 million to $5.0 million. DOE accounts for that range of likely impacts in analyzing whether a trial standard level is economically justified. See section V.C of this document. DOE is presenting the range of impacts to the INPV under two manufacturer markup scenarios: the Preservation of Gross Margin scenario, which is the manufacturer markup scenario used in the calculation of Consumer Operating Cost Savings in this table; and the Preservation of Operating Profit scenario, where DOE assumed manufacturers would not be able to increase per-unit operating profit in proportion to increases in manufacturer production costs. DOE includes the range of estimated annual change in INPV in the above table, drawing on the MIA explained further in section IV.J of this document to provide additional context for assessing the estimated impacts of this direct final rule to society, including potential changes in production and consumption, which is consistent with OMB's Circular A-4 and E.O. 12866. If DOE were to include the INPV into the annualized net benefit calculation for this direct final rule, the annualized net benefits would range from $90.3 million to $93.0 million at 3-percent discount rate and would range from $54.0 million to $56.7 million at 7-percent discount rate. Parentheses indicate negative (-) values.

BILLING CODE 6450–01–C

VI. Procedural Issues and Regulatory Review

A. Review Under Executive Orders 12866, 13563, and 14094

Executive Order ("E.O.") 12866, "Regulatory Planning and Review," as supplemented and reaffirmed by E.O. 13563, "Improving Regulation and Regulatory Review," 76 FR 3821 (Jan. 21, 2011) and amended by E.O. 14094, "Modernizing Regulatory Review," 88 FR 21879 (April 11, 2023), requires agencies, to the extent permitted by law, to (1) propose or adopt a regulation only upon a reasoned determination that its benefits justify its costs (recognizing that some benefits and costs are difficult to quantify); (2) tailor regulations to impose the least burden on society, consistent with obtaining regulatory objectives, taking into account, among other things, and to the extent practicable, the costs of cumulative regulations; (3) select, in choosing among alternative regulatory approaches, those approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages; distributive impacts; and equity); (4) to the extent feasible, specify performance objectives, rather than specifying the behavior or manner of compliance that regulated entities must adopt; and (5) identify and assess available alternatives to direct regulation, including providing economic incentives to encourage the desired behavior, such as user fees or marketable permits, or providing information upon which choices can be made by the public. DOE emphasizes as well that E.O. 13563 requires agencies to use the best available techniques to quantify anticipated present and future benefits and costs as accurately as possible. In its guidance, the Office of Information and Regulatory Affairs ("OIRA") in the Office of Management and Budget ("OMB") has emphasized that such techniques may include identifying changing future compliance costs that might result from technological innovation or anticipated behavioral changes. For the reasons stated in this preamble, this final regulatory action is consistent with these principles.

Section 6(a) of E.O. 12866 also requires agencies to submit "significant regulatory actions" to OIRA for review. OIRA has determined that this final regulatory action constitutes a "significant regulatory action" within the scope of section 3(f)(1) of E.O. 12866. DOE has provided to OIRA an assessment, including the underlying analysis, of benefits and costs anticipated from the final regulatory action, together with, to the extent feasible, a quantification of those costs; and an assessment, including the underlying analysis, of costs and benefits of potentially effective and reasonably feasible alternatives to the planned regulation, and an explanation why the planned regulatory action is preferable to the identified potential alternatives. These assessments are summarized in this preamble and further detail can be found in the technical support document for this rulemaking.

B. Review Under the Regulatory Flexibility Act

The Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*) requires preparation of an initial regulatory flexibility analysis ("IRFA") and a final regulatory flexibility analysis ("FRFA") for any rule that by law must be proposed for public comment, unless the agency certifies that the rule, if promulgated, will not have a significant economic impact on a substantial number of small entities. As required by E.O. 13272,

''Proper Consideration of Small Entities in Agency Rulemaking,'' 67 FR 53461 (Aug. 16, 2002), DOE published procedures and policies on February 19, 2003, to ensure that the potential impacts of its rules on small entities are properly considered during the rulemaking process. 68 FR 7990. DOE has made its procedures and policies available on the Office of the General Counsel's website (*www.energy.gov/gc/office-general-counsel*).

DOE is not obligated to prepare a regulatory flexibility analysis for this rulemaking because there is not a requirement to publish a general notice of proposed rulemaking under the Administrative Procedure Act. *See* 5 U.S.C. 601(2), 603(a). As discussed previously, DOE has determined that the Joint Agreement meets the necessary requirements under EPCA to issue this direct final rule for energy conservation standards for MREFs under the procedures in 42 U.S.C. 6295(p)(4). DOE notes that the NOPR for energy conservation standards for MREFs published elsewhere in this **Federal Register** contains an IRFA.

C. Review Under the Paperwork Reduction Act

Manufacturers of MREFs must certify to DOE that their products comply with any applicable energy conservation standards. In certifying compliance, manufacturers must test their products according to the DOE test procedures for MREFs, including any amendments adopted for those test procedures. DOE has established regulations for the certification and recordkeeping requirements for all covered consumer products and commercial equipment, including MREFs. (*See generally* 10 CFR part 429). The collection-of-information requirement for the certification and recordkeeping is subject to review and approval by OMB under the Paperwork Reduction Act (''PRA''). This requirement has been approved by OMB under OMB control number 1910–1400. Public reporting burden for the certification is estimated to average 35 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information.

Notwithstanding any other provision of the law, no person is required to respond to, nor shall any person be subject to a penalty for failure to comply with, a collection of information subject to the requirements of the PRA, unless that collection of information displays a currently valid OMB Control Number.

D. Review Under the National Environmental Policy Act of 1969

Pursuant to the National Environmental Policy Act of 1969 (''NEPA''), DOE has analyzed this proposed action rule in accordance with NEPA and DOE's NEPA implementing regulations (10 CFR part 1021). DOE has determined that this rule qualifies for categorical exclusion under 10 CFR part 1021, subpart D, appendix B5.1 because it is a rulemaking that establishes energy conservation standards for consumer products or industrial equipment, none of the exceptions identified in B5.1(b) apply, no extraordinary circumstances exist that require further environmental analysis, and it meets the requirements for application of a categorical exclusion. *See* 10 CFR 1021.410. Therefore, DOE has determined that promulgation of this direct final rule is not a major Federal action significantly affecting the quality of the human environment within the meaning of NEPA, and does not require an environmental assessment or an environmental impact statement.

E. Review Under Executive Order 13132

E.O. 13132, ''Federalism,'' 64 FR 43255 (Aug. 10, 1999), imposes certain requirements on Federal agencies formulating and implementing policies or regulations that preempt State law or that have federalism implications. The Executive order requires agencies to examine the constitutional and statutory authority supporting any action that would limit the policymaking discretion of the States and to carefully assess the necessity for such actions. The Executive order also requires agencies to have an accountable process to ensure meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications. On March 14, 2000, DOE published a statement of policy describing the intergovernmental consultation process it will follow in the development of such regulations. 65 FR 13735. DOE has examined this direct final rule and has determined that it would not have a substantial direct effect on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. EPCA governs and prescribes Federal preemption of State regulations as to energy conservation for the products that are the subject of this direct final rule. States can petition DOE for exemption from such preemption to the extent, and based on criteria, set forth in EPCA. (42 U.S.C. 6297) Therefore, no further action is required by Executive Order 13132.

F. Review Under Executive Order 12988

With respect to the review of existing regulations and the promulgation of new regulations, section 3(a) of E.O. 12988, ''Civil Justice Reform,'' imposes on Federal agencies the general duty to adhere to the following requirements: (1) eliminate drafting errors and ambiguity, (2) write regulations to minimize litigation, (3) provide a clear legal standard for affected conduct rather than a general standard, and (4) promote simplification and burden reduction. 61 FR 4729 (Feb. 7, 1996). Regarding the review required by section 3(a), section 3(b) of E.O. 12988 specifically requires that Executive agencies make every reasonable effort to ensure that the regulation (1) clearly specifies the preemptive effect, if any, (2) clearly specifies any effect on existing Federal law or regulation, (3) provides a clear legal standard for affected conduct while promoting simplification and burden reduction, (4) specifies the retroactive effect, if any, (5) adequately defines key terms, and (6) addresses other important issues affecting clarity and general draftsmanship under any guidelines issued by the Attorney General. Section 3(c) of E.O. 12988 requires Executive agencies to review regulations in light of applicable standards in section 3(a) and section 3(b) to determine whether they are met or it is unreasonable to meet one or more of them. DOE has completed the required review and determined that, to the extent permitted by law, this direct final rule meets the relevant standards of E.O. 12988.

G. Review Under the Unfunded Mandates Reform Act of 1995

Title II of the Unfunded Mandates Reform Act of 1995 (''UMRA'') requires each Federal agency to assess the effects of Federal regulatory actions on State, local, and Tribal governments and the private sector. Public Law 104–4, sec. 201 (codified at 2 U.S.C. 1531). For a regulatory action likely to result in a rule that may cause the expenditure by State, local, and Tribal governments, in the aggregate, or by the private sector of $100 million or more in any one year (adjusted annually for inflation), section 202 of UMRA requires a Federal agency to publish a written statement that estimates the resulting costs, benefits, and other effects on the national economy. (2 U.S.C. 1532(a), (b)) The UMRA also requires a Federal agency to develop an effective process to permit timely input by elected officers of State, local, and Tribal governments on a

''significant intergovernmental mandate,'' and requires an agency plan for giving notice and opportunity for timely input to potentially affected small governments before establishing any requirements that might significantly or uniquely affect them. On March 18, 1997, DOE published a statement of policy on its process for intergovernmental consultation under UMRA. 62 FR 12820. DOE's policy statement is also available at *www.energy.gov/sites/prod/files/gcprod/documents/umra_97.pdf.*

DOE has concluded that this direct final rule may require expenditures of $100 million or more in any one year by the private sector. Such expenditures may include (1) investment in research and development and in capital expenditures by MREF manufacturers in the years between the direct final rule and the compliance date for the new standards and (2) incremental additional expenditures by consumers to purchase higher-efficiency MREFs, starting at the compliance date for the applicable standard.

Section 202 of UMRA authorizes a Federal agency to respond to the content requirements of UMRA in any other statement or analysis that accompanies the direct final rule. (2 U.S.C. 1532(c)) The content requirements of section 202(b) of UMRA relevant to a private sector mandate substantially overlap the economic analysis requirements that apply under section 325(o) of EPCA and Executive Order 12866. This **SUPPLEMENTARY INFORMATION** section and the TSD for this direct final rule respond to those requirements.

Under section 205 of UMRA, DOE is obligated to identify and consider a reasonable number of regulatory alternatives before promulgating a rule for which a written statement under section 202 is required. (2 U.S.C. 1535(a)) DOE is required to select from those alternatives the most cost-effective and least burdensome alternative that achieves the objectives of the rule unless DOE publishes an explanation for doing otherwise, or the selection of such an alternative is inconsistent with law. As required by 42 U.S.C. 6295(m), this direct final rule establishes amended energy conservation standards for MREFs that are designed to achieve the maximum improvement in energy efficiency that DOE has determined to be both technologically feasible and economically justified, as required by 6295(o)(2)(A) and 6295(o)(3)(B). A full discussion of the alternatives considered by DOE is presented in chapter 17 of the TSD for this direct final rule.

H. Review Under the Treasury and General Government Appropriations Act, 1999

Section 654 of the Treasury and General Government Appropriations Act, 1999 (Pub. L. 105–277) requires Federal agencies to issue a Family Policymaking Assessment for any proposed rule or policy that may affect family well-being. Although this direct final rule would not have any impact on the autonomy or integrity of the family as an institution as defined, this rule could impact a family's well-being. When developing a Family Policymaking Assessment, agencies must assess whether: (1) the action strengthens or erodes the stability or safety of the family and, particularly, the marital commitment; (2) the action strengthens or erodes the authority and rights of parents in the education, nurture, and supervision of their children; (3) the action helps the family perform its functions, or substitutes governmental activity for the function; (4) the action increases or decreases disposable income or poverty of families and children; (5) the proposed benefits of the action justify the financial impact on the family; (6) the action may be carried out by State or local government or by the family; and (7) the action establishes an implicit or explicit policy concerning the relationship between the behavior and personal responsibility of youth, and the norms of society.

DOE has considered how the proposed benefits of this direct final rule compare to the possible financial impact on a family (the only factor listed that is relevant to this rule). As part of its rulemaking process, DOE must determine whether the energy conservation standards contained in this direct final rule are economically justified. As discussed in section V.C.1 of this document, DOE has determined that the standards are economically justified because the benefits to consumers far outweigh the costs to manufacturers. Families will also see LCC savings as a result of this direct final rule. Further, the standards will also result in climate and health benefits for families.

I. Review Under Executive Order 12630

Pursuant to E.O. 12630, ''Governmental Actions and Interference with Constitutionally Protected Property Rights,'' 53 FR 8859 (March 18, 1988), DOE has determined that this rule would not result in any takings that might require compensation under the Fifth Amendment to the U.S. Constitution.

J. Review Under the Treasury and General Government Appropriations Act, 2001

Section 515 of the Treasury and General Government Appropriations Act, 2001 (44 U.S.C. 3516, note) provides for Federal agencies to review most disseminations of information to the public under information quality guidelines established by each agency pursuant to general guidelines issued by OMB. OMB's guidelines were published at 67 FR 8452 (Feb. 22, 2002), and DOE's guidelines were published at 67 FR 62446 (Oct. 7, 2002). Pursuant to OMB Memorandum M–19–15, Improving Implementation of the Information Quality Act (April 24, 2019), DOE published updated guidelines which are available at *www.energy.gov/sites/prod/files/2019/12/f70/DOE%20Final%20Updated%20IQA%20Guidelines%20Dec%202019.pdf.* DOE has reviewed this direct final rule under the OMB and DOE guidelines and has concluded that it is consistent with applicable policies in those guidelines.

K. Review Under Executive Order 13211

E.O. 13211, ''Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use,'' 66 FR 28355 (May 22, 2001), requires Federal agencies to prepare and submit to OIRA at OMB, a Statement of Energy Effects for any significant energy action. A ''significant energy action'' is defined as any action by an agency that promulgates or is expected to lead to promulgation of a final rule, and that (1) is a significant regulatory action under Executive Order 12866, or any successor order; and (2) is likely to have a significant adverse effect on the supply, distribution, or use of energy, or (3) is designated by the Administrator of OIRA as a significant energy action. For any significant energy action, the agency must give a detailed statement of any adverse effects on energy supply, distribution, or use should the proposal be implemented, and of reasonable alternatives to the action and their expected benefits on energy supply, distribution, and use.

DOE has concluded that this regulatory action, which sets forth amended energy conservation standards for MREFs, is not a significant energy action because the standards are not likely to have a significant adverse effect on the supply, distribution, or use of energy, nor has it been designated as such by the Administrator at OIRA. Accordingly, DOE has not prepared a Statement of Energy Effects on this direct final rule.

L. Information Quality

On December 16, 2004, OMB, in consultation with the Office of Science and Technology Policy (''OSTP''), issued its Final Information Quality Bulletin for Peer Review (''the Bulletin''). 70 FR 2664 (Jan. 14, 2005). The Bulletin establishes that certain scientific information shall be peer reviewed by qualified specialists before it is disseminated by the Federal Government, including influential scientific information related to agency regulatory actions. The purpose of the Bulletin is to enhance the quality and credibility of the Government's scientific information. Under the Bulletin, the energy conservation standards rulemaking analyses are ''influential scientific information,'' which the Bulletin defines as ''scientific information the agency reasonably can determine will have, or does have, a clear and substantial impact on important public policies or private sector decisions.'' 70 FR 2664, 2667.

In response to OMB's Bulletin, DOE conducted formal peer reviews of the energy conservation standards development process and the analyses that are typically used and prepared a report describing that peer review.[88] Generation of this report involved a rigorous, formal, and documented evaluation using objective criteria and qualified and independent reviewers to make a judgment as to the technical/scientific/business merit, the actual or anticipated results, and the productivity and management effectiveness of programs and/or projects. Because available data, models, and technological understanding have changed since 2007, DOE has engaged with the National Academy of Sciences to review DOE's analytical methodologies to ascertain whether modifications are needed to improve DOE's analyses. DOE is in the process of evaluating the resulting report.[89]

M. Congressional Notification

As required by 5 U.S.C. 801, DOE will report to Congress on the promulgation of this direct final rule prior to its effective date. The report will state that the Office of Information and Regulatory Affairs has determined that this action meets the criteria set forth in 5 U.S.C. 804(2).

VII. Approval of the Office of the Secretary

The Secretary of Energy has approved publication of this direct final rule.

List of Subjects in 10 CFR Part 430

Administrative practice and procedure, Confidential business information, Energy conservation, Household appliances, Imports, Intergovernmental relations, Reporting and recordkeeping requirements, Small businesses.

Signing Authority

This document of the Department of Energy was signed on April 10, 2024, by Jeffrey Marootian, Principal Deputy Assistant Secretary for Energy Efficiency and Renewable Energy, pursuant to delegated authority from the Secretary of Energy. That document with the original signature and date is maintained by DOE. For administrative purposes only, and in compliance with requirements of the Office of the Federal Register, the undersigned DOE Federal Register Liaison Officer has been authorized to sign and submit the document in electronic format for publication, as an official document of the Department of Energy. This administrative process in no way alters the legal effect of this document upon publication in the **Federal Register**.

Signed in Washington, DC, on April 11, 2024.

Treena V. Garrett,

Federal Register Liaison Officer, U.S. Department of Energy.

For the reasons set forth in the preamble, DOE amends part 430 of chapter II, subchapter D, of title 10 of the Code of Federal Regulations, as set forth below:

PART 430—ENERGY CONSERVATION PROGRAM FOR CONSUMER PRODUCTS

■ 1. The authority citation for part 430 continues to read as follows:

Authority: 42 U.S.C. 6291–6309; 28 U.S.C. 2461 note.

■ 2. Amend § 430.32 by revising paragraph (aa) to read as follows:

§ 430.32 Energy and water conservation standards and their compliance dates.

* * * * *

(aa) *Miscellaneous refrigeration products.* The energy standards as determined by the equations of the following table(s) shall be rounded off to the nearest kWh per year. If the equation calculation is halfway between the nearest two kWh per year values, the standard shall be rounded up to the higher of these values.

(1) *Coolers.* (i) Coolers manufactured on or after October 28, 2019, and before January 31, 2029, shall have an Annual Energy Use (AEU) no more than:

Product class	AEU (kWh/yr)
(A) Freestanding compact.	7.88AV + 155.8
(B) Freestanding.	7.88AV + 155.8
(C) Built-in compact.	7.88AV + 155.8
(D) Built-in.	7.88AV + 155.8

Note: AV = Total adjusted volume, expressed in ft^3, as determined in appendix A to subpart B of this part.

(ii) Coolers manufactured on or after January 31, 2029, shall have an Annual Energy Use (AEU) no more than:

Product class	AEU (kWh/yr)
(A) Freestanding compact.	5.52AV + 109.1
(B) Freestanding.	5.52AV + 109.1
(C) Built-in compact.	5.52AV + 109.1
(D) Built-in.	6.30AV + 124.6

Note: AV = Total adjusted volume, expressed in ft^3, as determined in appendix A to subpart B of this part.

(2) *Combination cooler refrigeration products.* (i) Combination cooler refrigeration products manufactured on or after October 28, 2019, and before January 31, 2029, shall have an Annual Energy Use (AEU) no more than:

Product class	AEU (kWh/yr)
(A) C–3A. Cooler with all-refrigerator—automatic defrost	4.57AV + 130.4
(B) C–3A–BI. Built-in cooler with all-refrigerator—automatic defrost	5.19AV + 147.8
(C) C–9. Cooler with upright freezer with automatic defrost without an automatic icemaker	5.58AV + 147.7
(D) C–9–BI. Built-in cooler with upright freezer with automatic defrost without an automatic icemaker	6.38AV + 168.8
(E) C–9I. Cooler with upright freezer with automatic defrost with an automatic icemaker	5.58AV + 231.7

[88] The 2007 ''Energy Conservation Standards Rulemaking Peer Review Report'' is available at the following website: *energy.gov/eere/buildings/downloads/energy-conservation-standards-rulemaking-peer-review-report-0* (last accessed November 29, 2023).

[89] The report is available at *www.nationalacademies.org/our-work/review-of-methods-for-setting-building-and-equipment-performance-standards* (last accessed November 29, 2023).

Product class	AEU (kWh/yr)
(F) C–9I–BI. Built-in cooler with upright freezer with automatic defrost with an automatic icemaker	6.38AV + 252.8
(G) C–13A. Compact cooler with all-refrigerator—automatic defrost	5.93AV + 193.7
(H) C–13A–BI. Built-in compact cooler with all-refrigerator—automatic defrost	6.52AV + 213.1

Note: AV = Total adjusted volume, expressed in ft^3, as determined in appendix A to subpart B of this part.

(ii) Combination cooler refrigeration products manufactured on or after January 31, 2029, shall have an Annual Energy Use (AEU) no more than:

Product class	AEU (kWh/yr)
(A) C–3A. Cooler with all-refrigerator—automatic defrost	4.11AV + 117.4
(B) C–3A–BI. Built-in cooler with all-refrigerator—automatic defrost	4.67AV + 133.0
(C) C–5–BI. Built-in cooler with refrigerator-freezer with automatic defrost with bottom-mounted freezer	5.47AV + 196.2 + 28I
(D) C–9. Cooler with upright freezer with automatic defrost without an automatic icemaker	5.58AV + 147.7 + 28I
(E) C–9–BI. Built-in cooler with upright freezer with automatic defrost without an automatic icemaker	6.38AV + 168.8 + 28I
(F) C–13A. Compact cooler with all-refrigerator—automatic defrost	4.74AV + 155.0
(G) C–13A–BI. Built-in compact cooler with all-refrigerator—automatic defrost	5.22AV + 170.5

Note: AV = Total adjusted volume, expressed in ft^3, as determined in appendix A to subpart B of this part. I = 1 for a product with an automatic icemaker and = 0 for a product without an automatic icemaker.

ELECTRONIC RESEARCH

World Wide Web

Full text of the daily Federal Register, CFR and other publications is located at: **www.govinfo.gov.**

Federal Register information and research tools, including Public Inspection List and electronic text are located at: **www.federalregister.gov.**

E-mail

FEDREGTOC (Daily Federal Register Table of Contents Electronic Mailing List) is an open e-mail service that provides subscribers with a digital form of the Federal Register Table of Contents. The digital form of the Federal Register Table of Contents includes HTML and PDF links to the full text of each document.

To join or leave, go to **https://public.govdelivery.com/accounts/USGPOOFR/subscriber/new**, enter your email address, then follow the instructions to join, leave, or manage your subscription.

PENS (Public Law Electronic Notification Service) is an e-mail service that notifies subscribers of recently enacted laws.

To subscribe, go to **http://listserv.gsa.gov/archives/publaws-l.html and select** *Join or leave the list (or change settings);* then follow the instructions.

FEDREGTOC and **PENS** are mailing lists only. We cannot respond to specific inquiries.

Reference questions. Send questions and comments about the Federal Register system to: **fedreg.info@nara.gov**

The Federal Register staff cannot interpret specific documents or regulations.

LIST OF PUBLIC LAWS

Note: No public bills which have become law were received by the Office of the Federal Register for inclusion in today's **List of Public Laws**.

Last List April 26, 2024

Public Laws Electronic Notification Service (PENS)

PENS is a free email notification service of newly enacted public laws. To subscribe, go to *https://portalguard.gsa.gov/*_layouts/PG/register.aspx.

Note: This service is strictly for email notification of new laws. The text of laws is not available through this service. **PENS** cannot respond to specific inquiries sent to this address.
